## Preface and Acknowledgments

**A**pocryphal though the story may be, it has long been asserted that when, at the close of the Battle of Waterloo, General Cambronne, commander of Napoleon's Imperial Guard, found himself confined in a square of grenadiers and surrounded at close quarters by British troops, he answered the summons to surrender with a declaration as eloquent as it was defiant: "The Guard dies but does not surrender!" Other accounts dismiss this as sentimental nonsense, insisting that he merely cried out a simple expletive.

Perhaps it matters little to which version of events one ascribes the truth, for the French Revolutionary and Napoleonic Wars produced so many instances of heroism, folly, triumph, and tragedy that one may be forgiven for regarding the characters and events of the time as somehow larger than life. Indeed, the extraordinary and undying appeal of the subject is easily explained, for it was an age when soldiers, resplendent in ornate uniforms, still stood shoulder to shoulder in the firing line, or fought on horseback, wielding sword, saber, or lance. The impersonal era of the "invisible battlefield" had not yet dawned; a soldier in 1815 usually confronted his opponent at less than a hundred yards' distance—and often hand-to-hand. He could even trace the path of a round shot, emerging from the smoke of the cannon whence it came, bounding toward him.

It was an age when great literature and great music flourished; when empires could be vanquished in a few short months, only to rise again to renew the struggle a few years later; an age when a single day's encounter—as at Trafalgar or Waterloo—could literally change the course of history. It was an age when the snows of Russia could expose the vulnerability of the greatest commander of his—and perhaps of every other—time and reduce his army of gargantuan proportions to a shadow of its former self. It was an age when new principles and ideologies—some enthusiastically welcomed, others detested—were spread with reforming zeal at the point of the bayonet; a time when political objectives ceased to

have limits and battle became a brutal contest for a decisive result rather than a distasteful measure of last resort. If military technology had changed little in the preceding century, the end to which it was applied unmistakably had. For these reasons, among many others, the French Revolutionary and Napoleonic Wars continue to fascinate students, scholars, and a respectable portion of the public alike.

My motives in preparing this encyclopedia have been numerous, including a desire to produce a useful work of reference while the bicentennial of so many seminal events is now heightening both public and scholarly interest in this period; to present a much more thorough coverage of the conflict than has been possible in existing single-volume dictionaries and encyclopedias; to provide a resource that includes exhaustive listings of the vast and ever-expanding literature on the subject; and to bring together the wider social, cultural, scientific, and economic aspects of the period in order to place the military conflict into proper perspective.

However ambitious my intentions when this project commenced, I soon discovered that a work of this size can neither be assembled seamlessly nor present facts—not least troop strengths and losses—with definitive accuracy. If Cambronne took pause at the prospect of imminent death (cruel fate, in the event, left him merely wounded), at least he was spared the daunting prospect of editing a work of some 980,000 words. Still, it has been, for the most part, a labor of love, for I have been fortunate in having been able to draw upon the expertise of contributors—many of them leading authorities in their particular fields—from around the world, including the United States, Canada, Britain, France, Germany, Austria, Italy, Poland, Russia, Australia, and elsewhere. Their efficiency and dedication ensured that mercifully few were the moments when I felt myself struggling to cross an editorial Berezina, with howling Cossacks at my heels on one side of the icy river and, worse still, imminent deadlines looming on the other.

THE ENCYCLOPEDIA OF

*the* French Revolutionary  
*and* Napoleonic Wars

A Political, Social, and Military History

## Notes on Technical Points

### *Aristocratic and Other Titles*

A good deal of time can be spent trying to master the intricacies of aristocratic titles of this period, though one risks premature death doing so. Titles given in the entry head are those by which the individual was known by the end of the Napoleonic Wars in 1815, and it is important to stress that they may not have received such a title until well into the period under study. Indeed, many titles were not granted until the first defeat of France in 1814, in recognition for the services rendered by the recipient.

The full title of an individual may be found in the headword, except in the cases of French marshals, who often held such lengthy titles as to render their headwords unwieldy. Their full titles may be found in the entry “*Marshalate*.”

Great care has been taken to render all aristocratic titles as accurately as possible in the text, notwithstanding the acknowledged problems that they present. As many titles in use on the Continent defy perfect English translation, recourse has been made wherever possible to supply their proper title in their native language. Hence, *comte* is preferred to *count*; *freiherr* instead of the loosely translated *baron*; *graf* instead of the inadequate semi-equivalent, *count*; these are to name but a few examples. It should also be noted that in Britain, *marquis* can be spelled *marquess*.

Even if one masters an understanding of this minefield, there is always the problem of advancement up the ladder of ranks. The case of the Duke of Wellington is a good example of this. He began his service in the Iberian Peninsula in 1808 as Lieutenant General Sir Arthur Wellesley; that is to say, while he had been knighted, he had not yet been raised to the peerage. After the Battle of Talavera in 1809, however, he became Viscount Wellington; in February 1812, the Earl of Wellington; in October of that year, the Marquis (or the anglicized *Marquess*, which is not used in this work) of Wellington; and finally, Duke of Wellington, after the fall of France in 1814. Technically speaking, therefore, he cannot in all accuracy be referred to as the Duke of Wellington during his period of service in Iberia, notwithstanding frequent errors to the contrary in numerous sources. Thus, with respect to Wellington, and indeed with all other individuals—whatever their nationality—holding aristocratic rank, considerable care has been taken to ensure that the subject’s title is correct within the context under discussion. In a few cases, a series of changing titles can cause confusion, such as with the Duke of Wellington’s brother, Richard Colley Wellesley, who moved progressively from first Viscount Wellesley, to the second Earl of Mornington, to first Marquis Wellesley. Consistency

dictates that he is identified by his proper title according to the period under discussion.

Those British officers who in the course of their careers received a knighthood are identified as such with the title *Sir* appearing before their names. Where, however, they subsequently received a peerage, it is common practice to drop *Sir* in favor of the aristocratic title.

A number of the more prominent Prussian generals received aristocratic titles in the wake of the campaign of 1813; hence, readers will note references to “Gebhard von Blücher” in numerous entries, for instance, yet “Gebhard Blücher von Wahlstatt” in those covering the period after which he received his new title. Metternich held the title *Graf* (Count) until late 1813, after which he became *Fürst* (Prince), though he did not use the title *von*. He thus appears in slightly different guises between 1813 and 1814. Similarly, Napoleon made many of his generals counts beginning in 1808, and thus readers will find this designation for those individuals so ennobled, but only in those entries which cover the period after which the title was conferred. It is also often the case that readers will encounter an abbreviated form of a title on first mention, the full treatment being reserved for the headword of the entry.

In a few cases there is dispute as to whether or not an individual was entitled to hold a particular title, such as with *Sir* Sidney Smith and August *von* Gneisenau. In both cases, common acceptance has prevailed, and these men are identified as bearing the titles identified above. Then there is the considerably simpler problem of correcting historical error, such as the widely but mistaken belief that General Jean Andoche Junot was a marshal, which he was not. Nor, as mentioned above, was Wellington a duke until after Napoleon’s first defeat.

Individuals bearing aristocratic names are often identified solely by such names, and not by their family names, though it is important to note that a number of personalities were identified by their first names, as with Archduke Charles, or Eugène de Beauharnais—the latter always being known as Eugène and never as Beauharnais. The form of address for Napoleon also raises difficulties, which is dealt with at length below under “*Personal Names*.”

### *Medals, Decorations, and Orders*

For purposes of space, discussion of the names of the medals, decorations, and orders held by individuals mentioned in the text has, in most cases, been excluded.

### *Punctuation, Spelling, Capitalization, and General Usage*

Readers should note that the encyclopedia, with significant exceptions, as where concessions have been made to scholarly convention in the field, generally conforms to the not universally accepted *Chicago Manual of Style* (CMS).

Some capitalization decisions will cause raised eyebrows on the European side of the Atlantic, where titles are normally capitalized, for example, *Emperor* of Austria, as opposed to *emperor* of Austria or *king* of Italy. With respect to French titles, this work conforms to the French method, employing lower case for aristocracy, such as *comte* de Provence. Britons may find such forms as *chancellor of the exchequer*, *leader of the House of Commons*, and *secretary of state for war and the colonies*, rather offensive to the eyes; however, in an effort to bridge CMS style and scholarly convention I have tried (whether boldly or foolishly) to reach a compromise in favor of historians. It should be noted that the CMS does make concessions to using uppercase for British aristocratic titles, if not so much for political offices. This work has also deviated in some cases from the CMS with respect to the capitalization of *Emperor*, when referring to Napoleon, as well as with respect to (among others) *Revolutionary*, *Romanticism*, *Allied*, and *Allies*, the latter in reference to belligerent states forming part of a coalition against France. Conferred French titles, such as *King of Rome*, for Napoleon's son, and *King of Spain*, for Joseph, Napoleon's brother, also appear capitalized, whereas this is not the case for hereditary titles.

Hyphens used in the French language can pose particular problems for an editor, not least because different sources identify individuals both with and without hyphens between forenames. For example, *Marie Louise* appears sometimes with, sometimes without hyphens, depending on the source.

Punctuation presented various problems, not least because, like grammar and spelling, it is employed slightly differently on either side of the Atlantic. It is of course simple enough to use American spelling uniformly, and thus one will not find *centre*, but *center*, and *caliber* instead of *calibre*; *while* instead of *whilst*; *that* instead of *which*; *waggon* instead of *wagon*; *color* instead of *colour*; *toward* instead of *towards*, and so on. The dominance of American, over British, English in this work is no more apparent than in the presence of the split infinitive, abhorrent to British eyes and ears, yet a common and acceptable feature of English as spoken and written in North America. "To boldly go where no man has gone before" continues to produce smiles of derision in Britain, and not for reasons of poor grammar alone. Those accustomed to British English will also note that this work follows the recent American practice of dropping hyphens between compound nouns or with ranks, thus producing such words such *antirevolutionary*, *noncommissioned*, and *Vice Admiral*; still, I have allowed some hyphens to be retained, as with *demi-brigade*, *pro-royalist*, and *sans-culotte*. The original orthography for *flèche* (a V-shaped earthwork) is preferred over the more modern *flèche*.

Where *revolutionary* refers specifically to the French Revolution it appears capitalized: The French *Revolutionaries*; a wave of *Revolutionary* fervor; *Revolutionary* governments in France, and so on. Not so, however, for *royalist*, *republican*, or other descriptive terms which have no association with a recognized major political movement.

The use of *army* and *Army* has been dictated by the following rule: Where discussion focuses on the entire institution, it is capitalized; where it discusses a specific army in the field or a specific fleet at sea, it is rendered in lower case. Hence, it may be said that thousands of Irishmen enlisted in the British *Army* during the course of the Napoleonic Wars, whereas the British *army* landed in Portugal in 1808. Similarly, the Prussian *Army* underwent numerous reforms between 1808 and 1813, whereas the Prussian *army* in 1813 was led by General Gebhard von Blücher. Readers should also note that where the term *Royal Navy* appears, this is invariably a reference to the naval establishment of Britain, there being no such institution, technically speaking, as the "British Navy," in the same way that one may properly refer to the *U.S. Army* but not to the "American Army."

Where the names of armies do not always betray their nationality, they are identified, thus: (French) Army of Italy; (French) Army of Rome; (French) Army of Batavia; (Russian) Army of Poland; and so on.

#### *Personal Names*

Except in the cases of those known better by their aristocratic name, every effort has been made to supply the forename as well as the surname of every individual mentioned in the text. Yet forenames are sometimes disputed by historians, and even an individual's entire name can appear in various texts in a bewildering array of combinations, not least in the cases of Claude Perrin Victor and Toussaint Louverture.

There is also the conundrum of the manner by which the leader of France should be identified: whether *Bonaparte* as in his early years, *Bonaparte* somewhat later, or *Napoleon* (or, strictly properly, *Napoléon*) throughout. *Bonaparte* is used in the present work for the period until his assumption of the Imperial title in 1804, and *Napoleon* thereafter. Readers should therefore not be surprised to find that the same person may appear as *Bonaparte* and *Napoleon* in the same entry, depending on the period under discussion. For obvious purposes of space and redundancy, readers will not find "Bonaparte, Napoleon" in the "See also" section of the entries. Nor have Napoleon and Josephine been identified as *Napoléon* and *Joséphine* which, though technically correct, are very rarely rendered as such in an English-speaking context.

It was a common feature of this period for nationals of one country to serve in the army of another. Thus, numerous Germans held senior positions in the Russian Army; hence, one may encounter names that seem out of place, such as Peter Khristianovich (originally Ludwig Adolf) Graf zu Wittgenstein, the son of a Westphalian nobleman who settled in Russia. Similarly, some officers, as the descendants of immigrants, appear to have unlikely names. Thus, there was Joaquín Blake, a Spanish general of Irish descent, and Jacques Etienne Macdonald, a French marshal of Scottish extraction. Various Italians and Walloons served in the Austrian Army, on the basis of whose names alone, given no other information, one could be forgiven for assuming that they fought for the French.

In cases where an individual is best known by his or her name in its anglicized form, it has been rendered so. Thus, the Austrian emperor is given as *Francis* rather than *Franz*, the king of Prussia as *Frederick William* rather than as *Friedrich Wilhelm*, and the king of Spain as *Charles* rather than *Carlos*.

Russian names, being transliterated by different historians in different permutations, will lead one to find, between sources, *Kamenski*, *Kamensky*, and *Kamenskoi*; and *Kutusov* and *Kutuzov*. *Alsusieff*, *Olsusieff*, and *Olsufiev*, which appear in some sources, have been reduced to one form here, as with *Seniavin* versus *Senyavin*. In all such cases, care has been taken to provide the closest transliteration possible.

Individuals with hyphenated names are identified first by their full names, but subsequently by the generally accepted shortened version, if one exists. Thus, *Saxe-Coburg-Saalfeld* appears as *Saxe-Coburg*, *Kolowrat-Krakowsky* as *Kolowrat*, and so on. Where two or more forms are possible, such as *Villaret-Joyeuse* and *Villaret de Joyeuse*, the more commonly accepted of the two has been given.

#### *Military Ranks*

Military ranks naturally varied between armies, many of which had no equivalents elsewhere, thus presenting the military historian with a veritable minefield of problems concerning proper translation. This work provides the specific ranks for the Austrians and British, but has not done so for the French, Russians, or Prussians, on the basis that, in the case of the latter three, it may usually be assumed that a general commanding a brigade held the rank of brigadier or *général de brigade*, and if in command of a division, then a major general or *général de division*, and a lieutenant general if commanding an entire army.

Naturally, numerous officers mentioned in the text received promotion through the course of their respective careers. Readers should be aware, therefore, that whereas a general officer may be identified as a brigadier general in

one entry, he may appear as a major general or lieutenant general in another, as appropriate. Similarly, a French general officer whose name appears in the context of the 1790s may be identified later as a marshal. In short, attention has been paid to provide the correct rank of individuals according to the period under discussion. As such, Nelson is variously identified as Captain Horatio Nelson, Commodore Sir Horatio Nelson, and Vice Admiral Horatio Nelson, Viscount Nelson, as the period in his career dictates.

#### *Ships' Names*

Ships' names have been given as they were known by the navies that commissioned them, as it is never acceptable to translate them. Having said this, the reader must be aware of the fact that the Royal Navy, on capturing an enemy vessel and choosing to incorporate it into its own service, sometimes retained the prize's original name, a practice that accounts for the large number of ships in the Royal Navy of the time that bore French names. This practice also accounts for the fact that the rival fleets at Trafalgar possessed several ships bearing the same, or very similar, names. Readers should also be aware that a ship's armament, that is, the number of guns it carried, is indicated on the first reference, for example, *Bellerophon* (74 guns), but thereafter *guns* is not repeated, as being superfluous.

Where foreign terms arise, a translation is sometimes provided, though the original is usually preferred. Such is the case with the names of the various French armies of the Revolutionary period. One may encounter the *Armée du Nord* in one entry, or the *Army of the North* in another; the *Sambre-et-Meuse* in one, and the *Sambre and Meuse* in another. The decision to render such names in French or English has largely been left to the discretion of the contributors themselves, since there is no risk of confusion for the reader. In the cases of the principal Allied armies of 1813, that is, of *Silesia*, of *Bohemia*, and of *the North*, English is used, consistent with the practice adopted by all English-language texts covering this campaign.

#### *Dates*

It is reasonable to assume that dates ought to pose no problems for the student of history. Not so: Until 1917 the Russians used the Julian Calendar, by which dates were rendered eleven days behind the Gregorian Calendar, which prevailed throughout the rest of Europe. All "old style" Russian dates have been converted to "new style" so as to avoid confusion.

There is occasional dispute concerning the exact dates on which a battle occurred if the fighting took place over the course of more than a single day. Hence, the Battle of the Nile is usually given as 1 August 1798, when in

fact, to be strictly accurate, it extended into the early hours of 2 August, and hence is described here as having taken place over two days. Likewise, the battles of Eylau, Talavera, Wavre, and others, are sometimes described as one-day affairs, when in fact they were fought over the course of two days, if only a fraction of the first, or of the second, day.

The date of Napoleon's abdication is traditionally given as 6 April, and is so here, but it is important to point out that in fact the Allies rejected the conditions under which the Emperor first tendered it, which led to subsequent negotiations and the conclusion of a definitive agreement the following week. This stands as but one example of how two or more dates may be offered by two or more competent sources to identify the timing of a particular event.

Even the dates of treaties are sometimes in dispute: Does one use the date of signing, the date on which the treaty is to take effect, or the date of its ratification? Some treaties, like Chaumont, were signed on one day but not published until later, such that some historians offer one date, and others another. The Convention of El Arish, concluded in January 1800, is variously given as 21, 24, or 28 January. Worse still, it was disavowed by the British government and therefore never even took effect. The matter is easily solved, however: The dates provided for treaties are those on which the agreement was signed, even if ratification could not take place for weeks or, in some months, even months. This conforms to the principles followed in diplomatic historiography.

A few other points on dating matters follow. To avoid confusion some events, known historically by the same generic name, such the Russo-Turkish War, are distinguished by their dates, for example, 1787–1792, or 1806–1812. To avoid cluttering the text, life dates are not used, except in the headwords, though the period of a monarch's reign is usually provided. Also please note that the CMS preference for *B.C.E.* (before the Christian era) is used, in place of *B.C.*

#### *Place Names and Battle Names*

Geographically speaking, apart from Britain, France, Spain, and Portugal, the European continent has altered dramatically in the past two centuries, not only as a result of the changes wrought by the Congress of Vienna in 1815, but as a result of the wars of German and Italian unification, the independence of the Ottoman Empire's European possessions, the Versailles Settlement of 1919 (especially the breakup of the Austro-Hungarian Empire and the creation of the so-called Successor States), by the massive upheavals of the Second World War—particularly the westward shift of the borders of the Soviet Union and

Poland—and, more recently, by the reunification of Germany and the breakup of Yugoslavia.

With so many shifting borders, the names of places have often changed, either entirely as a consequence of their alteration into the language of the new proprietor, or in some other fashion over the course of time. In most cases, the reader will find in parentheses the modern name of places identified in the text. Thus, the contemporary name, *Ratisbon*, is identified parenthetically as *Regensburg*. No attempt to modernize place names has been attempted. Were this practice followed, *Austerlitz* would be known as *Slavkov u Brna*, causing utter confusion to students and scholars alike. Where spelling varies according to the nationality of the writer, recourse has been made to the form more commonly used by native-born English speakers. Thus *Mainz* is preferred to *Mayence*, *Basle* to *Basel*, *Lyons* to *Lyon*, and so on. *Berne* is used here instead of *Bern*; however, we've taken the American form of *Bosporus* instead of *Bosphorus*. In the case of Spanish towns, the anglicized version is sometimes preferred for the sake of easy identification by English-speaking readers: thus, *Corunna* is used in lieu of *La Coruña*, and *Saragossa* over *Zaragoza*; in many instances I have provided the Spanish-language orthography in parentheses. Some places with names still familiar to use today have changed their spellings, even if only slightly, for example, *Valetta* to *Valletta*.

While it has long been the custom to name a battle after a local geographical or political feature, whether a river, lake, village, or town, the rival sides did not always agree on usage, a fact that should come as no surprise to anyone: Nations that fight over great political questions can hardly be expected to agree on the names they ascribe to the battles fought between them. Thus, the battles of the Glorious First of June, Borodino, and even Waterloo, to name but a few, are familiar to English speakers, but are not used as such by the French, even if they familiar to them. There is also some disagreement over the spelling of some battles' names, including Auerstädt (Auerstedt), and Arcola (Arcole). The most commonly used form in the English-speaking world has been adopted in this work in an effort to reduce confusion as much as possible. Even still, there are sometimes alternative names. What to contemporaries in Britain was known as the (naval) Battle of Aboukir, is better known today as the Battle of the Nile, the former name being reserved in this text for a lesser known (land) battle fought the following year.

Some place names in particular have caused endless problems for students and historians, especially those connected with the Low Countries. Such terms as the *Austrian Netherlands*, *Belgium*, and the *Netherlands*, must be used carefully, and every effort has been made to prevent confusion in the text. This must be cleared up here and now:

The Austrian Netherlands was a possession of the Habsburg Empire, roughly constituting what is now Belgium and Luxembourg. It is frequently and erroneously confused with the United Provinces of the Netherlands, generally known as Holland, lying immediately to the north of it. References in this text to the Austrian Netherlands are to the territory described here. The Netherlands came into being in 1814, and was an amalgamation of the former Austrian Netherlands and the Kingdom of Holland established under Napoleonic auspices in 1806. The term *Netherlands* is not used in this work except to describe the nation created in 1814, so that readers are aware of its distinction with the *Austrian Netherlands*. With respect to Belgium, though technically the country by this name was not formally established until 1830, the term was commonly used before that time to mean the territory that comprised the Austrian Netherlands until French occupation in the 1790s. It was also sometimes referred to broadly as *Flanders*, which itself has been divided politically in various ways over the centuries.

Readers should also be aware that the terms *Germany*, *Italy*, and *Poland* are used in broad geographical terms to mean those areas where, respectively, the German, Italian, and Polish language and culture were predominant. The fact that none of these countries existed under such names until very much later (Italy and Germany in 1870 and 1871, respectively, and Poland in 1919, having been extinguished by the final partition of 1795) has never deterred historians from using them judiciously to describe large areas of Europe where no other description proves adequate to the task.

Some place names continue in use today, but in fact refer to altogether different places. Thus, *Syria* during this period was in fact in what is today Israel, a circumstance rendered even more confused by the fact that it is sometimes referred to as *Palestine* in some histories of Bonaparte's campaign there in 1799. Further, what was known to contemporaries as *the Tyrol*, a recognized Alpine region, is today simply known as *Tyrol* or *Tirol*, parts of which belong to Austria and Italy, respectively.

In some cases, there is no agreement on the spelling of places, as evidenced by the numerous variations in historical texts by which one may encounter the name of the town where the Allies concluded their armistice with France in the summer of 1813: *Pläiswitz*, *Plaswitz*, *Pleischwitz* (the latter being the form we've used), and so on. Disagreement also sometimes arises over the presence or absence of an accent, as with *Dunaberg* or *Dünaberg*; *Guttstadt* or *Guttstädt*; *Durrenstein*, *Dürnstein*, or *Durnstein*; and *Hollabrunn* or *Hollabrünn*.

Transliterated names also raise questions about proper spelling, such as in the case of *Krasnoe* versus *Krasnyi*. In

the case of place names requiring transliteration, particularly from the Russian, readers will find spellings which come closest to capturing the correct pronunciation of the place concerned.

#### *Names of Weaponry*

By modern standards the armies of this period fought with a very narrow range of weapons, with identification and description a relatively simple matter. However, readers should be aware that the term *gun* never refers to small arms, but always to artillery ordnance. Thus, an army which is said to possess 85 *guns* means that it has 85 *cannon*, a term whose plural form is also *cannon*, not *cannons*.

Naval terminology, which forms a large language of its own, can easily cause confusion, not least because of variations in spelling; thus: *mizzenmast*, *mizzen mast* or *mizen mast*; and *ship of the line* or *ship-of-the-line*, to offer but two examples. One must grapple with such arcane questions as whether or not to use a hyphen in the noun form of *first rate* when describing a class of vessel, or only in its adjective form. Suffice it to say that the editor hopes that this work has resolved such issues in a manner satisfactory to most readers.

#### *“Battles,” “Engagements,” and “Actions”*

Any hostile encounter between rival forces that involved a force of division strength or greater, that is, several thousand men on either side, has been designated a *battle*. Minor encounters have been described as an *engagement* or *action*. In North America, where armies were considerably smaller, what constituted a battle would not be designated so in Europe, where fighting was conducted on a greater scale than ever before. There can be no scientific formula applied here as to what genuinely qualifies as a battle. Common sense must therefore be the guiding rule. A clash between forces of battalion strength, for instance, cannot be regarded as a battle.

#### *Statistics*

All military historians must struggle with the unsettling fact that accurate statistics are all but impossible to obtain. The nature of military and naval records, deliberately falsified claims of losses and strengths, missing tallies of the wounded and missing, and the problems of tabulation associated with the arrival of reinforcements concurrent with losses through desertion—and many other factors to boot—render any hope of acquiring precise figures frustratingly elusive. Having said this, the figures for strengths and losses contained herein are considered the most accurate possible under the circumstances described above; suffice it to say that readers will sometimes find discrepancies with other sources, which they are actively invited to

consult via the “References and Further Reading” section appended to each entry.

#### *Regimental Designations and Distinctions*

Readers interested in the minutiae connected with the study of the individual regiments and other formations that comprised the armies of the European powers, great and small, can consult the books on such subjects referred to in the “References and Further Reading” sections accompanying the appropriate entries. No attempt at standardizing the manner of introducing regiments has been attempted here, as this would throw the whole subject into confusion. Thus, British regiments are given their proper names or numbers as they were known to contemporaries. The names or numbers of French regiments are either provided in French, or have been translated into English—but only where an exact translation can be offered. The same principle has been applied to all other armies, though obviously Russian names have undergone the process of transliteration, with the most accurate spelling offered.

#### *References and Further Reading*

Finally, readers should note that each entry contains a list of sources either used in the preparation of the entry, or offered as suggested further reading, or both. Many, especially the more recent sources, were added by the editor to assist readers in making use of the latest publications. Where possible, foreign language sources have been included. The latest editions available of classic texts in the literature have been provided, with basic information; full bibliographic details have not been included, in the interests of space, as in the case of the eminent historian Duff Cooper’s biography of Prince Talleyrand, now more than 70 years old, which is given in its 2001 edition.

## Acknowledgments

My thanks go to the two distinguished members of my advisory board: the late Professor David Chandler, who served for many years as head of the Department of War Studies at the Royal Military Academy Sandhurst, and whose eminence in the field of Napoleonic scholarship has stood the test of many decades; and Professor Charles Esdaile, of the School of History at the University of Liverpool, who not only offered much useful advice, but contributed many excellent entries of his own to this work.

David Hollins, a major contributor to this work and an authority on Austrian military and political affairs, very

generously gave of his advice, and offered substantial assistance in the revision of entries where needed. Peter Hofschröder, well known for his studies of this period, particularly from the Prussian and wider German perspective, helpfully answered my many questions relating to his area of expertise.

I am grateful for the help and assistance provided by numerous members of the staff at ABC-CLIO. Acquisitions editor Peter Westwick read the entire manuscript and offered profitable suggestions. His successor, submissions editor Alexander Mikaberidze, an authority in his own right on the subject of this encyclopedia as well as a prolific contributor, proved exceptionally helpful in the final stages, making revisions to various entries and supplying much useful information, particularly on Russian affairs. Wendy Roseth, project assistant, unfailingly performed administrative miracles over the course of many months, thus easing my task considerably. Ellen Rasmussen, media editor, assisted with obtaining the illustrations that appear in this work; Ellen Brenna Dougherty, media image coordinator, prepared the illustrations for print; Anna Moore helped in combining and checking page corrections; Alisha Martinez, editorial assistant, assisted in the review of map revisions; Paula Gerard, file management coordinator, served as a liaison with manufacturing and also made final revisions to the maps; Diane Nelson, proofreader, made a careful examination of the text; Kate Bowman undertook the massive task of indexing this work; and Don Schmidt, production manager, generously provided additional time for its completion.

My thanks also to George Barile, of Accurate Art, Holbrook, New York, for map production, and to George Zirfas, Chez D’Art, Colorado Springs, who provided map revisions and graphic assistance. Andrew Berry, of Letra Libre, in Boulder, in the designing and typesetting of this work has given it a most attractive look. I also wish to thank Kathy Delfosse and Silvine Farnell, for their superb copyediting skills. Any errors that remain are, of course, the responsibility of the editor.

My greatest thanks are reserved for Martha Gray, production editor, who oversaw the final ten months of this project, proving herself indispensable in her painstaking scrutiny of both the text and the maps, and by her scrupulous attention to all other details, including copyediting and proofreading. All these tasks, performed with good humor and cheerful patience, not only preserved my sanity, but helped to raise the standard of the work in all respects.

# Introduction

As a member of the advisory board who helped to put together this work, I am delighted to have been asked to write a few words of introduction to its pages. Yet it is not without sadness that I do so. But for his recent death, my eminent colleague and old friend, David Chandler, would doubtless have filled the role in his usual inimitable style, and I greatly regret that he is not here to see this work's publication. I do trust, however, that he would have approved of its contents. And in standing in for him, I can at least say something about this most larger than life of figures.

I first came across the works of David Chandler when I was still a schoolboy. Accessible, fascinating, and positively brimming over with enthusiasm for their subject, they fired my imagination, and helped fuel the love of history that led me into the career that I have now followed for nearly thirty years. I would like to say here, of course, that it was *The Campaigns of Napoleon* that first got me interested in the Napoleonic period, but life, alas, is not that simple! However, what is true is that when as a young scholar in his twenties I first got to meet David in the flesh, he treated me with much kindness—kindness that he had no need to show, and kindness that undoubtedly helped me on my way as I fought my way through the maze of defenses through which the proverbial ivory tower is wont to be surrounded.

In those years, too, I learned more about David as a scholar and as a human being. In the former capacity he could be quirky and in the latter unpredictable. However, what shone through in public lecture after public lecture was—again—his immense verve and enthusiasm, and, above all, his genius as a showman. Listening to David—watching David even—was a joy, and his ability both to generate an air of real excitement and to communicate it to his audience is something that I envy even now. One had the feeling, indeed, that had he only had a top hat on the table beside him, a wave of his hand would have been enough to have the entire Imperial Guard march forth from its depths. Quite simply, he was a wonderful draw,

and, if this meant that an unfortunate timetable clash at a conference in Lisbon—unfortunate in that it prevented me from hearing his lecture—left me speaking to an audience of eight, of whom it turned out that six could only speak Portuguese, in an auditorium built for 500, I can only say that it is a story that I shall cherish to the end of my days.

Then, besides David the man of courage—his last years were a show of gallant defiance in the face of terrible adversity—there was David the Romantic: the David who sincerely admired Napoleon and candidly forgave him the fact that he was, in his own words, a “bad man.” This side to his work could sometimes grate upon the reader, but his friends knew that it was accompanied by a strong streak of self-parody: Like me, they will remember with affection the wonderful cartoons in which he had himself portrayed as a distinctly portly Bonaparte! Such memories, alas, must necessarily be private affairs, but for all those interested in the Napoleonic epoch David should remain a great figure. If there were limits to his scholarship, there were no limits to his capacity to inspire interest in his subject, and I am sure that I am not the only academic historian who is honest enough to recognize that without such figures we would be lecturing to halls that are far emptier. And if just one of my books was to have the same impact as *The Campaigns of Napoleon*, I would be a happy man.

Before going on to talk about this new encyclopedia, there is one other figure whom I should like to mention. I here refer to the American historian, Gunther Rothenberg, who was another casualty of the year 2004. The leading Anglophone specialist on the Habsburg empire of the Napoleonic period, Gunther was a veteran of the Second World War who served with the British army in the Western Desert, Italy, Yugoslavia, and Austria, and went on to make a long and distinguished academic career at Purdue University in Indiana. Like David, he, too, was very generous to me on the numerous occasions that we met at conferences in the States, and his advice not to overspecialize has stayed with me to this day—indeed, in some respects it has shaped my entire career. Kindly and wise, Gunther was

also a fine scholar, and the series of works that he produced on the Napoleonic Wars, and, in particular, the Austrian army, remain major reference points for all those interested in the period. Among all those who knew him he is much missed.

What then of the current work? With its three volumes and nearly one million words, it is clearly a massive enterprise, and one that may justly be said to surpass anything else that is in the field. And that it reaches areas of the French Revolutionary and Napoleonic era that previous encyclopedias have not touched there can be no doubt. There will always be gaps, of course, but at least the experience of finding that the entries relate only to things that one already knows about, and that the things one really needs are not there, should be a little less common than before.

For example, we discover that the Wars were not just waged in the heartlands of the continent of Europe, but also in such outermost peripheries as Scandinavia, the Balkans, and the Middle East. Contained within its pages, too, is much material on not just matters military and naval, but also the social, political, cultural, and economic aspects of the period, while we meet not just bemedaled generals and field marshals, but also many of the statesmen who struggled to articulate the demands of a war effort that far surpassed anything that had previously been experienced in human history.

Nor is this surprising: Many of the contributors in the team put together by Gregory Fremont-Barnes are at the forefront of the academic research that has in recent years so greatly increased our appreciation of the importance and complexity of the French Revolutionary and Napoleonic Wars. At the same time Gregory can justly take great pride in the work's very full notes on further reading. As these draw on the most recent sources possible, what is offered is not just a historical encyclopedia but a major bibliography that will greatly assist students of the period. The encyclopedia also contains 65 maps, a section of source documents, two glossaries, and a chronology.

The work that I am introducing, then, is very useful, but, if so, it is also extremely timely. As it is going to press, Europe is in bicentennial mode insofar as the Napoleonic era is concerned. By this time two hundred years ago, the Grande Armée had already decisively defeated the Austro-Russian army at Austerlitz, on 2 December 1805, while only five weeks before Viscount Nelson had crushed the Franco-Spanish fleet at Trafalgar. Britain may have confirmed herself as mistress of the seas, but Napoleon was poised to defeat the next continental Great Power: Prussia, the bicentenary of which is fast approaching.

In Britain, at least, television and radio programs that relate to the Napoleonic period seem ever more frequent,

while there is hardly a museum that is not holding an exhibition on the subject, not to mention hardly a bookshop whose shelves are not currently groaning with biographies of Nelson. The literature of the Napoleonic era continues to fascinate a large readership, as well, not least because of the wild popularity of the late Patrick O'Brian in the United States since the publication of his novels there fifteen years ago, and the superbly produced 2003 Hollywood movie, based on the O'Brian series, *Master and Commander: The Far Side of the World*.

More than one writer, indeed, have made their fortunes through tales of military and naval derring-do in the French Revolutionary and Napoleonic Wars, and even in the academic world there are rumors of publishing contracts running into six figures. And as in Britain so in France, where a lavish television series on Napoleon in 2002 was accompanied by the rediscovery of the Emperor's old soldiers: In a development of great help to researchers, the latter's memoirs are being reprinted by the dozen. All this, of course, is likely to generate considerable sound and fury—recent debates concerning whether or not the Battle of Waterloo was a “German” victory are a case in point.

There is in addition the issue of the European Union. Thanks to the coming of the Euro and the controversy that surrounds the Union's proposed constitution, Napoleon is also very much in the forefront of political debate. Enthusiastic Bonapartists claim that the Emperor was the forefather of European union, while ardent Euro-skeptics proclaim that the Battle of Waterloo is being lost every day just a few miles up the road at the headquarters of the European Commission in Brussels. Both claims, of course, are to be taken with a pinch of salt: Napoleon's talk of liberating the nations of Europe and uniting them in a great federation governed by a single code of law is a creation of the legend of St. Helena designed to cover the fact that the French imperium was little more than a vehicle for economic, military, and political exploitation held together by a mixture of manipulation and brute force, while, the views of British Euro-skeptics notwithstanding, the European Union has no more in common with the Napoleonic empire than it does with the united Europe presided over in the mid-twentieth century by another “little corporal,” whose short-lived Reich cost Europe tens of millions of lives.

It is to be hoped, then, that this work will help to confound those who seek to plunder the past to buttress their views of the future. Yet there are many other reasons why it is worth producing a historical encyclopedia on the subject of the French Revolutionary and Napoleonic era. Not the least of these is the fact that right up until 1914, the years from 1792 till 1815 were at the very center of Europe's historical consciousness. It was they that were suggested by

the words “the Great War,” and it was they that provided the growing cities of Europe with a considerable part of the furniture of urban life. Square after square, then, was dominated by statues of one successful general or another, just as tavern after tavern and street after street was named after heroes of the conflict. Streets and squares, too, became the vehicle by which important battles could be remembered, while London’s Waterloo Rail Station had its counterpart in Paris’s Gare d’Austerlitz.

A staple of the historical novels devoured by the newly literate masses, in country after country the wars had also emerged as a central plank of the national myth, defining national enemies and establishing models of national behavior that carried considerable weight in times of crisis. It is arguable, for example, that the Britain that had liberated Spain in 1814 could not be the Britain that failed to fight for Belgium in 1914. Having come to the aid of one country suffering at the hands of another that sought continental hegemony, Britain could not sit idly by in 1914 and allow a new disturber of the European balance of power to swallow up its weaker neighbor. Whether the aggressor happened to be France, in the first case, or Germany in the second, mattered little to Britain; the principle behind British military intervention on the Continent remained the same.

Note, too, the fact that the outbreak of the First World War coincided with a period in which Europe had been celebrating the centenary of the Napoleonic Wars and in which a number of participants in the political process had had good reason to seize upon its history for their own ends. Just as is the case today, the same phenomena could sometimes be used for causes that were diametrically opposed to one another. In the Spain of 1908, then, while the Conservative government of Antonio Maura sought hard to make use of images of the Spanish uprising against Napoleon as one more means of achieving its goal of integrating the Spanish masses with the Restoration Monarchy, so in Catalonia, scholars associated with the growing nationalist movement worked hard to create a Catalan myth in which the region’s inhabitants had not only fought heroically against the French, but also fought more heroically than their counterparts in the rest of Spain.

It was, in short, an age of popular nationalism, and, moreover, one that happened at a time when the Napoleonic Wars were a most potent symbol. Still, worse, many of these myths, and the hostility and prejudice to which they have given rise, are still around to this day, which is yet another reason why the period should continue to merit the attention of historians.

To go back to the issue of historical perspective, an understanding of the Revolutionary and Napoleonic epoch, or at least the manner in which it was remembered and

manipulated by subsequent generations, is crucial to an understanding of much of what was to occur in the twentieth century. But insofar as the First World War is concerned, the wars of 1792–1815 are in one sense even more important. Much more than succeeding conflicts—the American Civil War of 1861–1865 is the obvious example—they epitomized the shape of wars to come in the popular imagination. In a number of states a variety of regiments still paraded in uniforms that recalled those that had been worn in 1815, while in one or two instances they even went to war in them. Equally, many of the tunes still played by military bands had been heard at Waterloo, Leipzig, or Austerlitz. And, finally, pictorial depictions of, say, the Franco-Prussian War of 1870–1871 were very much inclined to mirror the art of the Napoleonic era.

But from this there followed something else. Precisely because the French Revolutionary and Napoleonic Wars still provided the idiom in which war was understood in the popular mind, they to a certain extent anesthetized it against its horrors. At first sight, this may seem paradoxical: As we shall shortly discover, the years from 1792 to 1815 were as traumatic as any that had hitherto been experienced in European history. But in most of the states that went to war in 1914, the memory of the campaigns of the Revolution and Napoleon was centered on the concept of the great battle—the decisive clash that could, like Austerlitz, Jena, Friedland, Leipzig, or Waterloo, seal the fate of a campaign at a stroke and thus ensure that war was relatively painless.

At the Battle of Sadowa in 1866, during Prussia’s second brief war with Austria, the trick had been pulled off again, and those who thought that this would not be the case in 1914 were few and far between. Indeed, it is even arguable that the obsession with the decisive battle was by no means guiltless in the process that finally took Europe into a new “great war”: What was Imperial Germany’s Schlieffen Plan if not a particularly grandiloquent version of the Napoleonic *manoeuvre sur les derrières*—a grand, decisive encircling movement designed to clinch victory without the necessity of drawn-out fighting? Yet, by a curious process of osmosis, the passage of a century from the wars of the Revolutionary and Napoleonic era had transformed them from looming specter to source of reassurance.

Nevertheless, it was very much as looming specter that they deserved to be remembered. Prior to the First World War, only the Thirty Years’ War of 1618–1648 had come close to rivaling them in the human experience in terms of death and destruction, while the latter had been much more restricted in terms of the area that it affected in geographical terms. How many soldiers and civilians died as a direct result of the fighting, of hunger and privation, or in consequence of the terrible epidemics of disease (above all,

typhus) that the different armies carried in their train is impossible to say, but five million is probably the very smallest figure that is acceptable, and the real total may well be much higher. And behind the bare figures lies an image of hell: With knowledge of modern medicine and sanitation as limited as the facilities that existed to assist the sick and wounded, the human suffering that all this represented is scarcely within the bounds of comprehension. Given the image of military pomp that surrounds the Revolutionary and Napoleonic Wars—an image given further credence by the fact that, at least on the parade ground, the uniforms of the French and their opponents were probably more dazzling than anything worn by any soldiers before or since—it is worth reflecting on these realities.

All the more is this necessary given the survival of the Napoleonic legend. Thus, in testimony to his brilliance as a propagandist, the Emperor continues to seize the imagination of many observers who are convinced they see in him the little man made good, the perpetual underdog, the man of the French Revolution struggling to liberate the

peoples of Europe, the man of the future dragging Europe willy-nilly into the modern age, and, perhaps above all, the quintessential Romantic hero. Whether Napoleon was genuinely any of those things is a matter of debate, but what cannot be denied is that each and every one of them came at a terrible cost.

It will, of course, here be argued by loyal Bonapartists that none of this was Napoleon's fault—that all of the evils associated with the French Revolutionary and Napoleonic Wars, indeed, came from the stubborn refusal of the monarchs of Europe to allow France and her revolution any place in their world. Well, perhaps, but to make such a claim involves raising so many questions that one is again forced back on the need to study the period in detail, and, by extension, to recognize that the current work is an extremely useful addition to the literature of an epoch that is not just distant history, but a defining point of reference for the age in which we live.

## About the Editor

Gregory Fremont-Barnes holds a doctorate in modern history from the University of Oxford, where he studied under the distinguished military historians Sir Michael Howard, Regius Professor of Modern History, and Robert O'Neill, Chichele Professor of the History of War. After leaving Oxford he lived briefly in London before moving to Japan, where he spent eight years as a university lecturer in European and American history. He is the author of numerous books, including *The French Revolutionary Wars*; *The Peninsular War, 1807–1814*; *The Fall of the French Empire, 1813–1815*; *The Boer War, 1899–1902*; *Trafalgar 1805: Nelson's Crowning Victory*; *Nelson's Sailors*; and *The Wars of the Barbary Pirates: To the Shores of Tripoli, the Rise of the U.S. Navy and Marines*. He is also coeditor of the five-volume *Encyclopedia of the American Revolutionary War*. Dr. Fremont-Barnes's next book will be *The Indian Mutiny, 1857–1858*. He lives near Oxford with his wife and two sons.

# Glossary of Military Terms

The terminology associated with warfare on land and at sea during the period 1792–1815 is very large and can fill several books. Siege warfare alone produced a unique language of its own, mainly connected with the parts of fortifications and the craft associated with their defense or reduction. Below are some of the technical terms referred to in this work, as well as others commonly associated with the period.

*à cheval*: mounted

*à pied*: on foot

*abatis*: barricade of felled trees or interwoven branches

adjutant-general: staff colonel sometimes assigned to serve as a chief of staff at division or corps level

*Afrancesados*: Spanish Francophiles, associated with those who supported the French occupation of Spain from 1808

aide-de-camp: junior staff officer attached to a general or marshal

*Amalgame*: amalgamation of regular French infantry regiments and volunteer units to form a composite units

approaches: trenches or siege lines dug toward the enemy positions

*arme blanche*: generic term for cavalry

ataman: senior Cossack officer

Bashkirs: primitively armed and equipped light cavalry from Asiatic Russia

bastion: four-sided fortification

battery: gun emplacement or company of artillery; batteries could number six, eight or twelve guns

breaking ground: beginning a siege

breastplate: steel plate worn by cuirassiers to protect their fronts; badge worn on the shoulder-belt

breastwork: parapet, usually on a field fortification, to protect the defenders

brigade: tactical formation consisting of two or more battalions of infantry or regiments of cavalry

*cadre*: important officers, enlisted men and other staff needed to organize and train a unit

caisson: ammunition wagon

caliber: the internal diameter of the barrel of the weapon, and approximately the diameter of the projectile fired

canister: artillery ammunition consisting of small lead balls encased in a tin

cannon: informal term for artillery piece

carbine: short cavalry musket

carabinier: type of heavily-armed cavalryman, similar to a cuirassier

carbine: type of musket carried by cavalry, shorter and lighter than the standard infantry musket

carriage: wooden frame which supports the barrel of a cannon

cartouche: cartridge box

case shot: type of artillery ammunition, effectively the same as canister

*chasseurs à cheval*: light cavalry

*chasseurs à pied*: light infantry

*chef*: colonel-proprietor of a regiment in the Russian Army

*chef de bataillon*: major; commander of a French battalion

*chef d'escadron*: major; commander of a cavalry squadron

*cheval-de-frise*: planks or beams studded with spikes or blades, used as a barricade

*chevaléger/cheval-léger*: light cavalry, usually French

*chevauxléger*: light cavalry, usually German

chouan: Royalist insurgent from Brittany

citadel: component of a fortification, consisting of four or five sides

class: annual proportion of the population liable

cockade: rosette bearing the national colors worn on a hat or helmet

color/colour: infantry flag, battalion or regimental

commissariat: army department responsible for supply

company: small tactical unit of infantry or cavalry, or

battery of artillery; a subdivision of a battalion

cornet: lowest officer rank in the cavalry; second lieutenant

- corps: self-contained formation, and the largest tactical unit in an army, containing elements of infantry, cavalry, artillery, and staff; a corps consisted of two or more divisions
- Cortes*: the parliament of Spain
- Cossack: generic name for irregular Russian cavalry
- court-martial: military court
- cuirass: metal breastplate or backplate worn by heavy cavalry
- cuirassier: heavy cavalymen wearing a steel cuirass and helmet
- debut: to issue from a ravine or wood into open ground
- defile: narrow way through which troops can only march on a very confined front
- demi-brigade: French unit of the Revolutionary period consisting of one regular and two volunteer or conscript battalions
- department/*département*: geographical sub-division of France used for administrative purposes
- division: military formation comprising two or more brigades, comprising several thousand infantry and cavalry supported by artillery
- dragoon: medium cavalry capable of fighting mounted or on foot, though almost invariably playing the former role
- eagle: standard consisting of an bronze Imperial eagle mounted on a staff and presented to most units of the French Army from 1804
- embrasure: opening of a parapet of a fortress or field fortification through which artillery (or small arms) could be fired
- émigrés*: Royalists who fled France after the outbreak of Revolution in 1789
- enfilade: to fire on the flank of an opponent
- ensign: the lowest rank in the infantry; second lieutenant
- Erzherzog*: Archduke; an Austrian title
- escadron*: squadron of cavalry
- esplanade: open area separating a citadel from surrounding buildings
- état-major*: regimental staff
- evolution: drill movement, including marching and weapons handling
- facings: distinctive colors on a uniform, usually the collar and cuffs, which differentiate units
- fascine: bundle of brushwood used to fortify a position or to fill ditches during an assault
- field marshal: highest rank in the British, Russian, and Prussian armies
- foot: infantry
- flèche* (modern spelling, *flèche*): V-shaped fortification whose rear is left open, from the French for “arrow”
- flintlock: most common form of musket of the eighteenth and early nineteenth centuries
- forlorn hope: advance storming party, usually that sent ahead of the main assault into the breach of a city or fortress wall
- Freiherr: title used throughout German-speaking territories, roughly equivalent to *Baron*
- Freikorps*: independently-raised units, usually from Prussia or Austria; bands of volunteers
- Fürst: title used in German-speaking territories, roughly equivalent to *Prince*
- fusil: musket
- gabion: wicker basket filled with earth used in fortification
- général de brigade*: rank in the French army usually accorded to the senior officer commanding a brigade; brigadier general
- général de division*: rank in the French army usually accorded to the senior officer commanding a division; major general
- glacis: slope leading up to a fortification
- Graf: Title used in German-speaking territories, roughly equivalent to *Count*
- Grapeshot: type of artillery ammunition, only effective at short range, consisting of a cloth bag filled with musket balls which spread on leaving the barrel
- grand battery: tactical amalgamation of several artillery batteries in order to produce a massive concentration of fire
- Grande Armée: From 1805, the main body of the French army and any allied forces serving under Napoleon’s personal command
- grenadier: elite infantry, no longer armed with hand grenades, often used to spearhead an attack; they could operate as entire units or form a single company of a battalion
- Grenzer*: troops serving on the Austrian frontiers with the Ottoman Empire
- guard: term accorded to elite troops, usually regarded as the best in the army; in both French and German, spelled “Garde”
- guerrilla: irregular fighter
- guidon: cavalry standard
- gun: an artillery piece (cannon); not to be confused with small arms, which were known by type, that is, musket, fusil, rifle, pistol, etc.
- handspike: metal lever used to manhandle a cannon into a desired position
- haversack: bag carried by an infantryman containing food and personal effects, usually worn slung on the hip, as opposed to a knapsack
- hornwork: part of a fortification comprising the front of a bastion and two side extensions

- horse artillery: light caliber guns drawn by horse teams whose crew either rode on the limbers or on horseback, thus giving them greater speed over the foot artillery
- howitzer: short-barrelled cannon used to lob shells using a high trajectory
- Hundred Days, The: term used to describe the period of Napoleon's short reign between March and June 1815
- hussar: type of elaborately costumed light cavalry; originally Hungarian
- Imperial Guard: elite formation of the French and Russian armies, in the case of the former divided into the Young, Middle, and Old Guard. This formed Napoleon's tactical reserve and was seldom committed to battle until the campaign of 1813
- invest: in siege warfare, to surround a town or city in preparation for the establishment of formal siege works
- Insurrection: militia from Hungary and Croatia
- Jäger/jäger*: literally, huntsman, in German; rifleman or other type of light infantryman, usually from a German-speaking area
- Junker*: East Prussian aristocracy
- Kalmuk: type of light cavalry from Asiatic Russia
- knapsack: pack worn by infantry on the back
- Korps*: Austrian army corps
- Krümper*: Prussian reservist serving between 1808 and 1812
- lancer: light cavalryman armed with a lance
- Landwehr*: militia or newly-recruited infantry unit, from German-speaking states
- légère*: light, indicating types of infantry or cavalry
- legion/*légion*: a military formation usually consisting of a combination of infantry, cavalry and artillery, often of foreign troops forming part of another army
- levée en masse*: universal male conscription introduced by the French during a period of national emergency in 1793
- light dragoon: type of light cavalry
- ligne*: line; standard form of (usually) infantry meant to fight in the battle line
- light infantry: equipped like line infantry, but employed in a more mobile capacity on the battlefield, especially by operating in open, or skirmish, order
- limber: two-wheeled carriage with ammunition box which connects a team of horses to a cannon to facilitate movement
- limber up: to attach a cannon to a limber in order to move the former
- line: in French, *ligne*; for example, standard form of (usually) infantry meant to fight in the battle line
- "line infantry" or "infantry of the line" (*infanterie de la ligne*)
- line of communication: route behind an army, either by road or river or both, by which supplies, reinforcements, and couriered messages traveled
- line of march: general route taken by an army on the march
- line operations: as with line of march, but normally applied to enemy territory
- line of retreat: general route of withdrawal taken by a (usually defeated) army
- loophole: opening made in a wall to enable the defenders to fire through with small arms
- lunette: triangular fortification atop a glacis or beside a ravelin
- magazine: place of storage for ammunition
- Mameluke: from the Turkish *mamluk* (slave), a type of Egyptian horseman, variously and elaborately armed, though also referring to those serving in the French Imperial Guard
- marines: troops specifically trained to fight at sea
- marshal: highest rank in the French Army from May 1804
- militia: forces raised for home defense
- National Guard: troops raised in France (*Garde Nationale*) for home defense
- Oberst*: colonel
- opolchenye*: untrained Russian militia
- Ordenança*: Portuguese militia
- outpost: infantry or cavalry occupying an advanced position to facilitate observation of the enemy or early warning of its approach
- palisade: sharpened wooden stakes used mainly for defense against cavalry
- parallel: large trench dug during siege operations which runs parallel to the enemy fortification; manned by troops and supplies in anticipation of the assault
- parapet: stone wall or bank of earth offering protection to troops occupying a fortified position
- partisans: guerrillas; irregular troops
- piece: a cannon, regardless of caliber
- picket/*picquet*: sentry or a small outpost
- pioneer: regimental carpenter or other skilled craftsman
- pontoon: boats specifically designed to be laid adjacent to one another to form a bridge
- pontonier: engineer trained to build pontoons or temporary bridges
- quarters: soldiers' accommodation, whether barracks or civilian lodgings
- rampart: wall of earth or stone comprising the main part of a fortress
- ravelin: detached, triangular-shaped fortification positioned in front of a fortress wall

- redoubt: field fortification, usually dug just prior to battle, armed with infantry and often artillery
- representative on mission/*représentant en mission*: deputy of the Convention or other Revolutionary government official, armed with sweeping powers, sent on specific missions to various regions or armies; political commissars
- rifle: infantry firearm with a grooved or “rifled” bore, thus providing spin—and therefore greater accuracy—than its smooth-bore counterpart, the ordinary musket
- round shot: the most common form of artillery ammunition, consisting of a solid cast-iron sphere, now commonly referred to as a “cannonball”; the weight of the ball varied according to the caliber of the gun from which it was fired
- saber/sabre: cavalry sword with a curved blade, generally used by light cavalry and general officers
- sap: narrow siege trench
- sapper/*sapeur*: combat engineer; often used to construct or demolish field fortifications, and to dig saps during siege operations
- sans-culottes*: extremist revolutionaries in France, generally associated with Paris
- Schützen: German riflemen
- shako: cylindrical military headdress, usually of leather, with a peak and usually a chin-strap
- shell: explosive projectile
- shot: abbreviation for round shot, the most common form of artillery ammunition
- shrapnel: type of artillery ammunition, unique to the British Army, consisting of a hollow sphere packed with musket balls and powder, which when detonated in the air by a fuse showered its target with its contents
- skirmisher: soldier operating in open or extended order to snipe at the enemy individually or as part of a screen to mask friendly troops
- spiking: the means by which a cannon can be made inoperable by the hammering of a spike down the touchhole
- squadron: subdivision of a cavalry regiment, usually consisting of two companies or troops
- square: infantry formation assumed as a defense against cavalry
- standard: cavalry flag, usually rectangular in shape
- sutler: camp-follower who sells food and drink to soldiers, either on the march or in camp
- tirailleur*: skirmisher or light infantryman, usually French and serving together as a unit rather than in the light company of a line regiment
- train: transport service of an army, responsible for conveying supplies, artillery, bridging equipment, and all the other paraphernalia of war
- Tricolor: French national flag, adopted during the Revolution, consisting of blue, white and red bands
- troop: unit of cavalry smaller than a squadron, usually the equivalent of an infantry company
- uhlan*: Polish for *lancer*, usually applied to those serving in German-speaking states or in the Russian Army
- vedette*: cavalry sentry or scout
- vivandière*: female sutleress who accompanies an army on campaign and provides food and sundry services, such as cooking and clothes washing, for a fee
- voltigeur*: from the French for “vaulter,” a light infantryman usually serving in the light company of a line regiment, usually deployed in extended order to form a skirmisher screen ahead of infantry or cavalry
- winter quarters: the quarters occupied by an army during that season, when fighting usually entered a period of hiatus until spring

# Glossary of Naval Terms

- aloft: up in the masts or rigging  
*amiral*: admiral in the French Navy  
astern: behind the vessel  
boarding: coming aboard an enemy vessel by force  
bow: the forward (front-most) part of a vessel  
brig: a lightly-armed (ca. 14 guns), maneuverable, square-rigged, two-masted vessel, smaller than a sloop  
broadside: the simultaneous firing of all the guns positioned on one side of the ship  
canister shot: a type of ammunition consisting of a cylindrical tin case packed with many iron balls which when fired from a cannon at short range spread out to kill and maim enemy personnel  
carronade: a short-barrelled, heavy calibre gun used only at close range for devastating results against the enemy's hull and crew; only the Royal Navy carried such weapons, which were not counted in the rating of vessel  
chain shot: a type of ammunition comprising two iron spheres or half-spheres, connected by a short length of chain, mainly used to damage rigging and sails  
*contre-amiral*: rear admiral in the French Navy  
double: to attack an enemy vessel from both sides simultaneously  
fireship: vessel packed with combustibles, steered into the enemy, and set on fire  
flagship: the ship of the officer commanding a squadron or fleet, usually a vice- or rear-admiral, and flying his flag  
fleet: a force of more than ten warships  
flotilla: a force of small vessels, sometimes troop ships and gun boats  
frigate: a single-decked warship mounting between 24 and 44 guns  
grapeshot: a type of ammunition consisting of a canvas bag filled with small iron balls which when fired from a cannon spread out to kill and maim enemy personnel  
grog: drink made from a mixture of rum and water  
gun: a cannon; these fired round shot weighing between 12 and 36 lbs; small arms, technically speaking, were not "guns," but referred to by their specific type, for example, musket, pistol, etc.  
line ahead: formation by which all vessels follow one another in a line, bow to stern; the standard formation for attack  
line of battle: the positioning of warships in a line with their broadsides facing an enemy against whom they intend to engage in battle  
line of battle ship: ship of the line; vessels carrying at least 64 guns and thus large enough to sail in the line of battle, as opposed to frigates and other, smaller vessels  
magazine: place of storage for ammunition  
marines: troops specifically trained to fight at sea  
port: the lefthand side of a ship when looking toward the bow; opposite of "*starboard*"  
prize: a captured enemy vessel  
rake: to fire at an enemy ship's bow or stern when it is at right angle to one's own vessel, so enabling the shot to travel down the length of the enemy ship  
ship: in distinction from a boat, a square-rigged vessel with three masts  
ship of the line: warship carrying a minimum of 64 guns that by virtue of its size and armament could fight in a line of battle; the standard type was the 74  
sloop: a single-decked warship slightly smaller than a sixth-rate (frigate) but larger than a brig  
starboard: the right-hand side of a vessel as one looks forward; opposite of "*port*"  
stern: the rear-most part of the hull, usually ornamented and especially vulnerable to enemy fire  
strike (one's colors): to haul down the national flag to indicate a desire to surrender  
tack: to change course by turning the bow through the wind  
*vice-amiral*: vice admiral in the French Navy  
wear: to change a ship's course by turning her stern to windward; opposite of tacking

## **The Outbreak of the French Revolutionary Wars**

It might seem logical to presume that the European monarchs, witnessing the fall of the Bastille in July 1789, the deposing of the French king, and the establishment of constitutional government, should immediately have gone to war against the Revolutionaries, if only to prevent similar uprisings in their own countries. But it was not to be, largely because of events elsewhere in Europe, particularly in the East. The Prussian king, Frederick William III,

supremely smug from his conquest of Holland in 1787 and already a beneficiary of the First Partition of Poland, had his eye on further gains, particularly Danzig and Thorn, while the Austrians and Russians were engaged in conflicts of their own against Sweden and Turkey. The fact that all the continental Great Powers were engaged for two years in intrigues and conflicts in eastern Europe meant that France and its nascent revolution remained undisturbed—indeed almost entirely ignored—by its powerful and otherwise suspicious neighbors.

It is also important to remember that, far from being disturbed by the implications of the French Revolution, many of Britain's leaders and politicians actually welcomed the upheavals in France. As the Revolution developed, many British observers suggested that France appeared to be embracing the principles of Britain's own "Glorious Revolution" of 1688. What better way to maintain good relations than to deal with another constitutional democracy, particularly one distracted from colonial gain and commercial competition by internal political upheaval? In short, a self-obsessed France could hardly threaten British trade or interests abroad.

In fact, none of the continental powers was prepared to lead a counterrevolution. Indeed, the Holy Roman Emperor (who was also emperor of Austria) Joseph II was determined to remain neutral, whatever the fate of the French king and the queen, his sister. The Prussians were equally blasé. Catherine of Russia, despite her hostility to the ideas of the Revolution, effectively did nothing, while Charles IV of Spain, cousin of Louis XVI, made vague threats that in reality amounted to nothing more than mere bluster. In any event, he was soon caught up in a nasty disagreement with Britain over far-off Vancouver Island—the Nootka Sound incident—which brought the two countries to the brink of war in 1790. Thus the French Revolutionaries had absolutely no reason to fear intervention by the absolute monarchs. Put in simple terms, in the first two years of the Revolution, every potential enemy of significant power had other matters to contend with: in

1787, Turkey was at war with Russia and Austria, and Prussia invaded Holland; in 1788, Sweden and Russia were at war; in 1790, Prussia and Poland came close to war with Austria, and Britain and Spain narrowly escaped conflict; in 1791, Britain and Prussia nearly fought Russia.

How, then, did this atmosphere of complacency and even satisfaction change to one of open hostility? The simple answer is that, by the middle of 1791, all of these conflicts or disputes had been settled, or were on the point of being settled. The most serious of them, in which Russia and Austria were allied against Turkey, ended in August. Now all these countries could consider the problem of France. But the origins of the French Revolutionary Wars also owed much to the vociferous and consistent pleas of royalist émigrés, who tirelessly agitated for armed foreign intervention against the forces of radicalism. The hawkish policies of radical politicians in Paris and the gradually mounting antagonisms of the German monarchies also played a significant role in bringing about war.

Up until the spring of 1792, few obstacles existed to prevent the flight from France of the aristocracy, nobles, clergy, and army officers. Large numbers left, swelling the population of disaffected expatriates longing for a return to the old order. They were right to leave, for their lives and livelihoods were under grave threat, and the political changes forced upon them were naturally quite intolerable to them, given the life of unchecked privilege that they had previously enjoyed for so long. The leading émigré was the king's younger brother, the comte d'Artois, who left France soon after the fall of the Bastille and became the focal point for dispossessed aristocrats. From their base at Turin, Artois and his adherents established a committee, which throughout 1789–1790 produced plans to extricate the king from Paris, establish counterrevolutionary insurrections inside France, and secure foreign aid in a royalist crusade to crush the Revolution and reestablish legitimate Bourbon rule.

Yet such plans failed completely, for they were unable to attain the aid necessary from powerful foreign governments, without which any hopes of a return to absolute rule were illusory. Although Austria seemed the natural ally of the émigrés—after all, Marie Antoinette was sister to Joseph II—the fact remained that from the outbreak of the Revolution until 1792 the Habsburg monarchy never showed much enthusiasm for the cause of the émigrés. Indeed, Joseph had demanded their departure from his domains in the Austrian Netherlands, and when his brother Leopold succeeded to the imperial throne at the beginning of 1790, he showed little interest in the cause of restoring Bourbon rule on its previous footing.

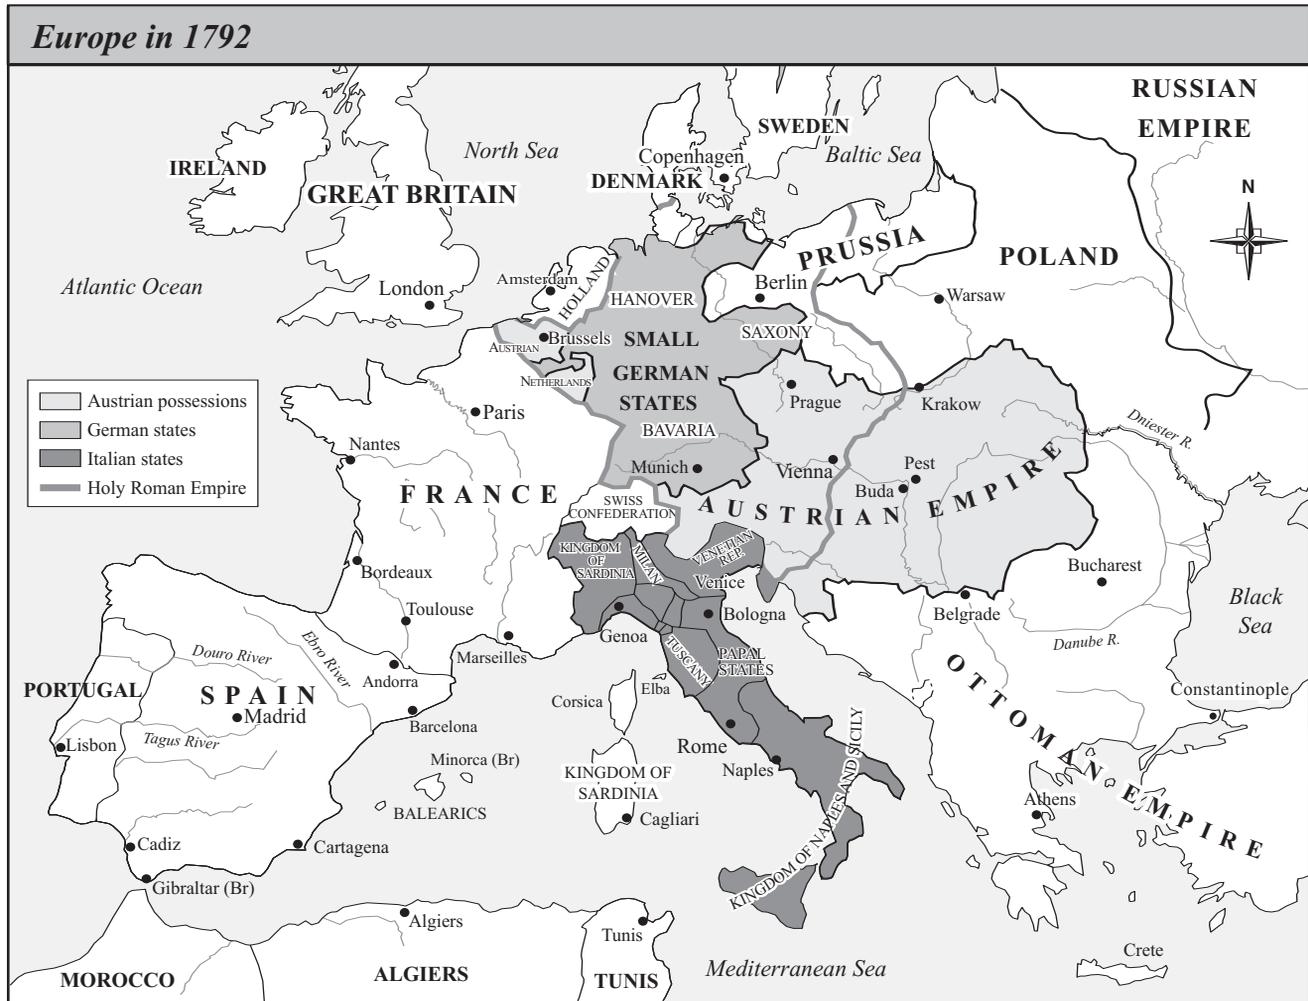

In any event, the pressing internal problems that Leopold confronted necessarily took precedence over for-

ign affairs: rebellion in the Austrian Netherlands and near revolt in Hungary, together with more moderate, but nevertheless widespread, dissent across Habsburg domains. These domestic problems were compounded by failures in the war against the Ottoman Empire. Thus, in the course of his two years in power (1790–1792), Leopold chose to placate internal opposition and implement reforms rather than confront Revolutionary France.

Yet if Leopold's conduct exasperated émigrés for a time, French domestic events gradually altered his views and, with them, his policies. Louis's flight from Paris to Varennes in June 1791 was important in prompting Austrian intervention. Louis had consistently rejected proposals to leave France and return at the front of an army determined on reestablishing Bourbon rule. Duty to the nation and to himself as sovereign—however restricted his political role had become—encouraged him to remain in Paris. But by the spring of 1791 the king had come round to the idea, for by then it had become all too clear that the Revolution was no mere passing phase and that the concessions now forced on him were only going to increase in the future. Now persuaded that the only sensible measure was to flee the country to secure foreign aid, Louis made his historic escape from the capital, only to be arrested at Varennes and returned to Paris a prisoner. The suspension of his royal powers soon followed, and all government matters were now the responsibility of the Constituent Assembly.

The king's attempt to leave France had far-reaching consequences, triggering fears inside the country that foreign armies would soon be on the march to save the captive sovereign. Vigorous military measures were undertaken, and the widespread belief that foreign intervention was only a matter of time began to affect the political scene throughout the country. The king's arrest had still more significance abroad, for throughout Europe, both at court and among the populace, there emerged a groundswell of sympathetic support for the French royal family and a sense of apprehension for their safety. Such sentiment was encouraged by the constant calls for aid from Marie Antoinette. Action soon resulted: in July 1791, Leopold approached the other crowned heads with a proposal for a joint declaration demanding the release of the French royal family, the "Padua Circular." This did not amount to a threat of war—which Leopold did not seek—but was rather a demonstration of royalist unity meant to overawe the Republican government.

In fact, there was no unified opposition to the French Revolutionary movement at the courts of Europe, though each of them provided substantial financial assistance to the émigré cause. Tsarina Catherine adamantly opposed the Revolution, but her foreign policy remained focused

Adapted from Fremont-Barnes 2001, 23.

on acquiring territory at the expense of Poland and Turkey, both weak and easy prey. Sweden, under Gustavus III, wholeheartedly embraced military action against the Revolutionaries, but his country's geographical isolation and meager resources precluded any unilateral intervention on his part. In any event, Gustavus was assassinated in March 1792. The Prussian king repeatedly declared his desire for a military solution to French internal upheaval and the threats that Revolutionary ideas posed abroad. Nonetheless, like Catherine, Frederick William had an eye on Polish land and was not prepared to fight unaided. Thus, in the summer of 1791, in spite of growing antagonism within the courts of several capitals, the likelihood of joint military intervention in France remained slight.

That situation soon took a decisive turn, however, for since Leopold had assumed the imperial throne, Austro-Prussian relations—traditionally tense and occasionally outwardly hostile—had warmed considerably. This improvement made possible a joint declaration by the respec-

tive sovereigns, issued at Pillnitz on 27 August 1791, which expressed their anxieties over Louis's predicament and their hope that the leading royal houses of Europe would make a joint effort to assist him. Though outwardly threatening, it was not a general call to arms, and in any event, it did not commit Austria and Prussia to anything without the cooperation of other powers. While it aimed to reestablish the legitimate power of the king, no such cooperation was forthcoming, and Pillnitz remained for a time nothing more than bluster and intimidation.

However ineffective the declaration appeared for the moment, it nevertheless added to the general sense of impending danger within France. As the year progressed, moreover, the prospect of war became an ever-more-attractive option for those politicians in Paris who viewed it as an opportunity to attain their own specific aims. This was particularly the case among the war party under the leadership of Jacques-Pierre Brissot, whose popularity continued to rise as the new year began. His followers, the

Brissotins, or Girondins, held an aggressive stance in the Legislative Assembly. The thirty-seven-year-old Brissot, an unsuccessful writer with a grudge against the ruling establishment, had been one of the first to call for the abolition of the monarchy. Brissot was not alone. By the winter of 1791–1792, the Jacobins could more than match the Girondins for radicalism. Speeches before the Assembly were clear: the Republic must have war; a war with total victory or total defeat. The nation was to live free or die in the defense of liberty, while those at home who threatened France from within would be crushed.

At the same time, those at the opposite end of the political spectrum—the monarchy and its traditional ally, the aristocracy—increasingly viewed war as an answer to their rapidly declining political fortunes. Into this cauldron of hostility were thrown the still active efforts of the émigrés to restore the status quo, and however little their efforts might have as yet achieved, their very existence assumed an importance out of all proportion to the actual danger to the Revolution that they presented. The recent growth of an émigré presence in the Rhineland, an area used as the springboard for the émigrés’ subversive schemes, naturally raised concerns for the Republican government, ever vigilant for evidence of counterrevolutionary enemies within and without.

Artois and his adherents amounted to a sort of royalist government in exile, based at Coblenz; although their influence in foreign courts was minimal, seen together with the Declaration of Pillnitz, the émigrés were erroneously assumed to be a real and powerful threat to the Revolution. In addition to receiving large amounts of financial aid, Artois could boast of a respectably sized émigré army in the Rhineland. The threat posed by such forces was negligible in military terms, but the very presence of this émigré army caused widespread alarm in France, where war fever was spreading.

Austria was not only pressured by the émigrés but also miscalculated the situation: by adopting an increasingly threatening attitude designed to intimidate but not provoke the Republican government in Paris, Leopold paradoxically achieved the reverse of his intentions. Hoping to lend weight to the power of the moderates in Paris, he in fact increased the power of the radicals. Thus was created a vicious circle: increasing French fears of émigré activity on their borders and the apparently menacing posture of Austria and Prussia contributed to the general atmosphere of paranoia and the prospect of not only counterrevolution, but also armed foreign intervention.

Events took on a new momentum on 1 March 1792, with the succession of Francis. Consistently unwilling to embrace the more bellicose views of the Prussian king, the princes of the Empire, and the émigrés, Leopold had preferred merely to pressure France rather than openly

threaten it with force. True, he had shown greater support for the restoration to power of Louis XVI—briefly suspended by the National Assembly after Varennes before moderates reinstated him in September 1791—than most other crowned heads, yet Leopold’s death ushered in an entirely new Habsburg attitude toward foreign affairs. Leopold had acted with caution and restraint; Francis tended more toward belligerence. The hawkish elements of the court grew in influence, while the new cabinet, particularly with the replacement of the more pacific chancellor, Graf Kaunitz, opened the way for an altogether more hostile policy toward Revolutionary France. The road to war was now free of its former obstacles.

As politicians in Paris were rightly perceiving the changing mood in Vienna, they were growing more vocal and bellicose themselves. The new foreign minister, Charles Dumouriez, came to office from relative obscurity amid the growing war fever. Long hostile to Austria, Dumouriez demanded immediate military action. War now seemed inevitable. Indeed, it was not long in coming: on 20 April, France formally declared war on Austria, disavowing any interest in prosecuting a war of conquest, but professing only a desire to maintain its own liberty and independence. The war, declared the Revolutionary government, was not a conflict of nation against nation, but the actions of a free people defending its rights against the aggression of a king. Little did anyone know that this war—which all sides believed would be short—would eventually engulf all Europe in more than two decades of conflict.

Neither side bore sole responsibility for the war. The conflict cannot be said to have originated exclusively in either Paris or Vienna. Nor was it only kings and politicians who shaped foreign policy; prevailing views among the general populace in both capitals played their role. In the end both sides sought war, but their objectives proved very different. Austria, joined shortly by Prussia on 21 May, wished to restore the old order in France, whereas for the Revolutionaries this was to be an ideological struggle between a free people and the tyranny of monarchical rule. This had been the philosophy so stridently advocated by Brissot since the autumn of 1791. Toward this end, the Revolutionaries were confident in their hopes of seeing a general rising of the minority nationalities of the Habsburg Empire: they were to be sorely disappointed.

Those powers ranged against France clung steadfastly to a policy more than merely ideological: there were distinct territorial gains to be made, a wholly realistic aim when one considers the Allies’ complete confidence in the superiority of their professional, highly trained, highly disciplined armies over the rabble that appeared to them to constitute the forces of the Republic. It is therefore not surprising that the Allies did not yet appreciate the immense threat to the

political stability of Europe's monarchies posed by the armies marching in the name of "the People," for those armies were as yet untested. They could hardly then know—and indeed it would be to the astonishment of all—that the Revolutionary armies would, despite some serious setbacks, achieve remarkable triumphs in the field between 1792 and 1795, rapidly annexing neighboring territories in great swathes never even imagined—much less achieved—by Louis XIV or Louis XV. Nor could the Allies have dared to imagine the full horror that lay ahead for them: seemingly unstoppable Revolutionary forces carrying with them the banner of *liberté, égalité, et fraternité* across western and central Europe, challenging the very legitimacy of monarchical rule. Only then was the war perceived as the grave threat to European political and social stability that it actually was.

## Military Operations of the French Revolutionary Wars (1792–1802)

### War of the First Coalition (1792–1797)

#### *The First Phase: Operations in 1792–1795*

We have seen how the events of 1791–1792 shaped French foreign policy and eventually drove France to declare war on Austria. Conflict between France and the principal German powers had become inevitable when, in the Declaration of Pillnitz, issued on 2 August 1791, King Frederick William II of Prussia and Leopold II, the Holy Roman Emperor (and thus emperor of Austria, as well), had called upon other monarchies to restore the power of the Bourbon dynasty in France. An alliance between Austria and Prussia was eventually formed on 7 February 1792; France declared war on Austria on 20 April, and the Austro-Prussian partnership became formally established as the First Coalition on 26 June. Britain later joined the Allies on 1 February 1793, followed by Spain in March. It seemed that, faced with such an impressive array of powers, France would be defeated and the Revolution crushed. But it was not to be, and the conflict that was to become known as the French Revolutionary Wars in fact lasted for a decade.

Despite the general exodus of royalist army officers during the chaos that had followed the fall of the Bastille, enough had remained in the French service, particularly in the artillery, to enable the Republican armies—bolstered by the middle-class National Guard and a massive influx of volunteers and conscripts in 1792—to hold their own, relying for first survival, and then military success, on quantity if not quality.

The Allies, with 40,000 Prussians and 30,000 Austrians and other nationalities under the Prussian commander, the Duke of Brunswick, invaded France on 19 August, taking a series of fortresses during their slow but seemingly inexorable advance on Paris. As far as Allied generals were concerned, the rabble that now constituted the French armies would be swept aside by the disciplined and well-trained regulars of the *ancien régime* powers. But the course of history—not simply the campaign—was to be changed when a French army under General Kellermann, and part of another led by Dumouriez, confronted Brunswick at Valmy on 20 September. The battle hardly has the right to call itself such, as it constituted little more than an exchange of artillery fire; but the French gunners, mostly from the old royalist army, inflicted sufficient damage on the Prussian infantry to persuade Brunswick to withdraw back into Germany, thus saving the nascent republic. Thus emboldened, the Revolutionaries in Paris abolished the monarchy on the following day. The Republic was saved, and Europe, not to mention the world, would never be the same.

At the same time, French forces under General Adam Custine also crossed the Rhine from Alsace, while after Valmy, Dumouriez moved into the Austrian Netherlands (modern-day Belgium), obliging the Austrian defenders to withdraw before the unexpectedly rapid French advance. Dumouriez, however, caught up with them and inflicted a stinging defeat at Jemappes on 6 November, after which Republican forces occupied Brussels. Brunswick, for his part, counterattacked from Germany, driving Custine back and retaking Frankfurt.

But if French fortunes appeared in the ascendant in the first year of the war, they fell rapidly in the second. King Louis XVI was beheaded on the guillotine on 21 January 1793, an act which, after a build-up of Anglo-French tension in the preceding three months, precipitated war between Britain and France, the former not only upset by the precedent of regicide, but horrified by public declarations from Paris promising military aid to any people prepared to rise up and overthrow their monarchical masters. The invasion of the Austrian Netherlands and the opening of the Scheldt estuary struck at the heart of British security and trade. The closure of the Scheldt by the Treaty of Westphalia in 1648 had shifted trade from the Belgian ports of Ghent and Antwerp to Amsterdam. By reopening

**France:** Valmy (1792); Valenciennes, Perpignan, Truillas, Hondshoote, and Wattignies (1793); Le Boulou and Tourcoing (1794).

*Adapted from Fremont-Barnes 2001, 6.*

a river of such commercial and strategic significance, the French thereby obtained for themselves access to the North Sea for their naval and merchant vessels. This Britain could not countenance, for such a violation of international law not only rendered inevitable the subjugation of Belgium, but presaged the occupation of Holland, as well. The Revolution, it seemed to William Pitt, the British prime minister, was not to be confined within the borders of France, but exported wherever its adherents saw fit to raise the banner of *liberté, égalité, et fraternité*.

British concerns were not unfounded; the French soon thereafter declared war on Spain and the United Provinces (Holland), and formally annexed the Austrian Netherlands (Belgium). The Allies opened a new offensive, with Brunswick besieging Custine in Mainz, in the Rhineland, and a Habsburg army under Friedrich Graf von Saxe-Coburg seeking to liberate the Austrian Netherlands. The French were thoroughly drubbed at Neerwinden on 18 March, and Brussels was retaken by the Austrians. Dumouriez defected to the Allies, and Custine failed to stem the tide near Valenciennes on 21–23 May, for which the unfortunate general was, like others perceived to have failed in their duty to the Republic, executed by Maximilien Robespierre's government, now infamous for the powers invested in the twelve-member Committee of Public Safety, whose reign of terror led to the execution of tens of thousands of French royalists and others branded enemies of the Revolution. As France was wracked by internal conflict and political upheaval, her forces were meanwhile reeling from the Allied onslaught. A number of fortified towns rapidly fell, including Condé on 10 July, Valenciennes on 29 July, and Mainz in August. France herself was undergoing a counterrevolution, with royalist revolts in the Vendée to the west and at Toulon in the south, where pro-royalist forces and an Anglo-Spanish fleet controlled the city and the naval installations of the French Mediterranean fleet.

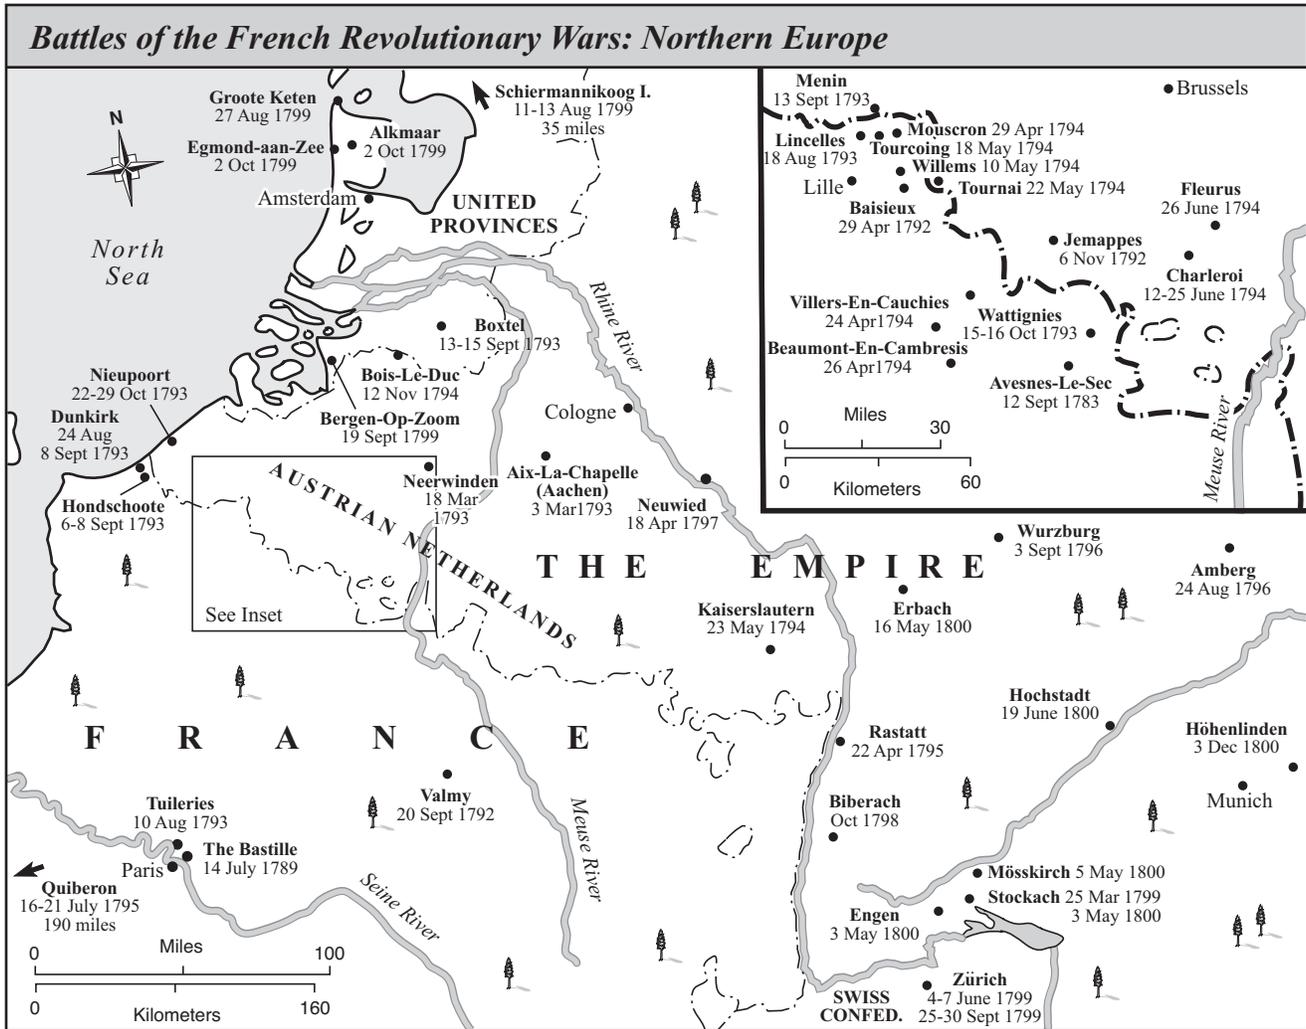

On 23 August 1793, confronted by advancing enemies from without and struggling to cope with political upheaval and internal enemies from within, the Committee of Public Safety issued the *levée en masse*, a form of universal conscription that called upon every adult male to flock to the colors and the nation's defense. Throngs of eager young men appeared in town squares the length and breadth of the nation to receive rudimentary training and march to the front. The *levée*, the masterwork of Minister of War Lazare Carnot, soon brought dividends to the Republic, as massive new armies were created. To be sure, they were virtually untrained and poorly disciplined, but they were large, and the men were often filled with revolutionary zeal.

Events turned for the better for the French when General Houchard met the Duke of York's Anglo-Hanoverian army at Hondshoote, in Flanders, driving the Allies back by sheer force of numbers. Jourdan, replacing the guillotined

Houchard, proceeded to relieve Maubeuge by defeating Saxe-Coburg at Wattignies on 15–16 October, thus turning the tide of war against the First Coalition. Two months later the French drove out the Anglo-Spanish force occupying Toulon, a feat partly attributable to an obscure captain of artillery, Napoleon Bonaparte, who directed his guns from the heights above the harbor down onto Admiral Hood's vessels, so making a continued Allied presence impossible. Thousands of royalists were evacuated by the Royal Navy, but when Republican forces eventually broke into the city, a wholesale massacre of pro-royalist soldiers and civilians ensued. In the West, troops loyal to the Convention in Paris managed to suppress the revolt in the Vendée (with excessive harshness), and along the Rhine Hoche defeated the Prussians and Austrians in separate actions in December. Mainz was retaken the following month, and the French position on the Rhine was out of peril.

As 1794 opened, the French continued to make strides, particularly in the Austrian Netherlands, where Saxe-Coburg lost the contest at Tourcoing on 18 May. Jourdan invested Charleroi on 12 June and soundly defeated Saxe-Coburg at Fleurus on 26 June. The French retook Brussels on 10 July and Antwerp on 27 July, thereby permanently ejecting the Austrians from Belgium. On the Rhine front, Moreau drove back the Allies and invested Mainz, while the French kept the Spanish at bay on the Pyrenean front and ejected the Allies from Savoy southeast of France. Against the British in the Mediterranean, French naval forces fared less well, partly as a result of losses sustained at Toulon, where part of the fleet had been burned by the British, who also captured Corsica on 10 August. In the West Indies, too, the British assumed the offensive, seizing several French colonies. In European waters, at the Battle of the Glorious First of June, Earl Howe defeated a French fleet under Admiral Villaret-Joyeuse, taking several of his ships, but failing to attain the larger strategic goal of intercepting the large grain convoy originating in the United States and bound for the starving French population.

By 1795 the Republic was no longer under threat of invasion. Much to the chagrin of the British, General Pichegru advanced from the Austrian Netherlands into the United Provinces (Holland), capturing the Dutch fleet trapped in the ice at Texel, and establishing the satellite Batavian Republic—the first of several client states to spring up in the course of the Revolutionary Wars. By the summer, the Prussians, distracted by the Partitions of Poland, conducted by themselves, the Russians, and the Austrians in 1793 and 1795, had lost their enthusiasm for campaigning with no tangible results, and signed a separate peace with France at Basle, thus withdrawing from the First Coalition. Spain soon followed suit, as did several minor German states, leaving only Britain and Austria as

Adapted from Calvert and Young 1979, 198.

the principal opponents of France. Operations in this year were consequently conducted on a rather smaller scale than in the previous two, including a British-backed royalist émigré landing at Quiberon Bay in June intended to spark a revolt in Brittany. Hoche routed the invaders, and then, proceeding into the troubled Vendée, he employed his usual brutal methods to put down another counterrevolution. On the Italian front, General Masséna defeated the Austrians in a minor action at Loano on 23–25 November, but most of the fighting took place on the Rhine front, where Jourdan failed in his attempt to invade Germany in the autumn, and Pichegru was defeated at Mainz on 29 October. Still, the Austrians, requiring a respite and reinforcements, called for an armistice, just as the situation was growing increasingly awkward for the French.

#### *The Second Phase: Operations in 1796–1797*

With Prussia and Spain out of the war, from 1796 France only faced Austria and Britain, the only serious threat from

the latter being at sea. Operations on land were confined to two fronts: Germany and Italy. In the former, Jourdan and Moreau worked together to oppose the newly appointed Austrian commander, Archduke Charles, brother of the emperor. Jourdan's offensive across the Rhine, which opened on 10 June, enabled Moreau to cross the river at Strasbourg. Charles concentrated his attentions on the latter general, achieving only a stalemate at Malsch on 9 July before returning across the Danube. He then turned on Jourdan, whom he soundly defeated at Amberg on 24 August. Charles defeated him again at Würzburg on 3 September, forcing the French back along the Rhine and leading to an armistice. Moreau had meanwhile defeated an Austrian force at Friedberg on 23 August, but after hearing of Jourdan's repulse, he crossed the Rhine on 26 October.

In Italy, the ragged and demoralized French army received a new commander in chief in the person of General Napoleon Bonaparte, whose example at Toulon had not gone unrecognized. Arriving at the front in March, the

young general found the troops short of all manner of supplies, including food and uniforms. Facing an Austrian army under *Feldmarschalleutnant* Johann Peter Freiherr von Beaulieu and a Piedmontese army under Freiherr Colli, Bonaparte rapidly took the initiative and proceeded to drive a wedge between his two adversaries, securing their separation at Montenotte on 12 April. He increased the pressure at Dego on 14–15 April, defeating Beaulieu there before turning his attention to Colli, whom he crushed at Mondovi on 21 April. Colli signed an armistice two days later; Piedmont was knocked out of the war with the separate peace it concluded on 28 April. Bonaparte, placing himself at the head of his troops, followed up this success with an assault on Beaulieu's rearguard at Lodi on 10 May. Beaulieu withdrew into the Tyrol, so abandoning all of northern Italy to the French, apart from the fortress city of Mantua, which remained in Austrian possession.

On 4 June Bonaparte invested the place. The Austrians made strenuous attempts to come to the city's relief. Forces under *Feldmarschall* Graf Würmser advanced from the Tyrol in two parts: the first, under his personal command, made for Mantua itself, while the second, under *Feldmarschalleutnant* Peter Vitus Freiherr von Quosdanovich, proceeded with the intention of cutting the French line of communications. As before, Bonaparte was confronted by two hostile forces moving simultaneously to defeat him—an ideal situation for a general who understood the strategy of defeating the enemy's formations in succession. With this plan in view, Bonaparte interposed himself between the two Austrian formations, fighting a holding action to keep Würmser in place while he confronted Quosdanovich at Lonato on 3 August. With Quosdanovich dealt with, Bonaparte then turned to face Würmser, whom he decisively defeated at Castiglione on 5 August, forcing him to take refuge in the Tyrol.

Würmser managed to regroup, but, while making a second attempt to relieve Mantua, he foolishly repeated his previous error of dividing his forces, ordering *Feldmarschalleutnant* Paul Freiherr von Davidovich to hold the Tyrol, while Würmser himself moved on Mantua via the Brenta valley. Bonaparte resumed his strategy of defeating his enemies in turn; at Caliano he defeated Davidovich on 5 September, and on receiving news of Würmser's movements, raced to meet him, which he did at Bassano on 8 September. Würmser managed to throw part of his force into Mantua, but the remainder fled the field in confusion. The 28,000-man garrison sought to break out on 15 September, but Masséna's besieging force repulsed their sortie.

The Austrians sent yet another relief force, now under *Feldzeugmeister* Freiherr Alvinczy. The smaller of the columns under Davidovich was held up by a subsidiary French formation, while the bulk of the French troops under Bonaparte confronted Alvinczy's main force at

Caldiero on 12 November. The Austrians were initially held up, but were driven to flight a few days later at Arcola on 15–17 November.

At sea there were no more major encounters in 1796, though the Treaty of San Ildefonso concluded between France and Spain had important implications for the Royal Navy, which did not have the strength to confront both major navies in the Mediterranean, which the British were ignominiously forced to abandon. With the fleet proceeding west to anchor at Gibraltar, the army had no choice but to abandon its control of Corsica, occupied since 1794.

At the beginning of 1797, the Austrians made a fourth attempt at relieving Mantua, with Alvinczy attacking Bonaparte at Rivoli on 14 January. The action might have favored the Austrian commander, had not French reinforcements under Masséna reached the field and ensured that Bonaparte would emerge successful. With yet another victory behind him, Bonaparte marched on Mantua, where he sought to assist Sérurier, whose siege lines were threatened both from beyond the perimeter by a force under Provera, as well as from Würmser's sorties. Sérurier managed to contain the garrison and force it back into the town, while Bonaparte encircled Provera and obliged his capitulation. Finally, on 2 February, after having suffered from disease and lost 18,000 men, the garrison of Mantua surrendered. Bonaparte, now in control of all of northern Italy, could invade Austria itself.

As before, Bonaparte positioned his army between the divided Austrians, with those in the Tyrol kept under observation by Jourdan, while Bonaparte observed the movements of Alvinczy's successor, Archduke Charles. Crossing the Alps with three columns, and later joined by Joubert, Bonaparte came within a hundred miles of Vienna before Emperor Francis requested an armistice, which was signed at Leoben on 18 April. In an extraordinary move for a general, Bonaparte laid out the treaty terms without consulting the government in Paris. The preliminary peace of Leoben was later confirmed on 17 October in the Treaty of Campo Formio, whose terms proved exceptionally advantageous to France: the Austrian Netherlands were incorporated into the French Republic, and Austria agreed to recognize the Cisalpine Republic, a northern Italian satellite state of France. As a sop to Habsburg pride, Bonaparte offered Austria the former Venetian Republic. Thus ended the War of the First Coalition, with France in control of the Rhineland, Belgium, and northern Italy. After five years of fighting, French territory extended to the "natural" frontiers long desired by the Bourbon kings: the Rhine, the Alps, and the Pyrenees.

Austrian fortunes had been no better on the German front, where the French had recrossed the Rhine and Moselle, from the latter of which they pushed the Austrians back. Even as the two sides were concluding an

armistice at Leoben, Habsburg forces were in the midst of withdrawing from this front.

The only theater in 1797 in which the Allies enjoyed any real success was at sea. Admiral Sir John Jervis, with fifteen ships of the line, intercepted Admiral de Cordova's twenty-seven vessels off Cape St. Vincent while the Spaniard was attempting to link up with a French fleet in Brest, preparatory to an invasion of England. On 14 February the two fleets fought a remarkable action in which Commodore Nelson broke the Spanish line in unorthodox fashion, so enabling the battle to develop into the sort of individual ship-to-ship action that so favored the superior British crews. The Royal Navy, however, had much to contend with in home waters, where the fleets at Spithead and the Nore, later in the year, mutinied in protest at the poor conditions of service. Still, the French were not in a position to take advantage of this crisis, and British authorities managed either to suppress or to assuage the mutineers. The British then scored a second significant victory in 1797 when Admiral Adam Duncan, in a hard-fought action off Camperdown in October, defeated the Dutch fleet under Admiral de Winter, and captured nine of his fifteen ships of the line.

### **War of the Second Coalition (1798–1802)**

#### *The French Campaign in Egypt*

Operations in 1798 focused on the unlikely place of Egypt, though there was some fighting in Europe as well. The French occupied Rome in February and Switzerland in April, creating in their place satellite states known as the Roman and Helvetic Republics, respectively. The French attempted to land an expedition in Ireland in support of the rebellion there, but General Jean Humbert's small force arrived too late, for the British had already decisively defeated the rebels at Vinegar Hill on 12 June. After Humbert belatedly disembarked his troops at Killala Bay on 22 August, he was surrounded and forced to surrender by Lord Cornwallis on 8 September.

With Austria knocked out of the war and Britain unable to supply a large army to oppose France on the European mainland, France sought a means of striking at Britain, if only indirectly. With the Royal Navy too powerful to challenge openly, and with the invasion of Britain out of the question in the wake of St. Vincent and Camperdown, France could only hope to weaken Britain by striking at her trade. A French occupation of Egypt, a province under nominal Ottoman control, would not only strengthen the French presence in the Mediterranean but might even enable Bonaparte to strike overland to threaten British possessions in India. An expedition under Bonaparte duly sailed from Toulon on 19 May aboard a fleet commanded by Vice Admiral Brueys. On 12 June, French troops landed on Malta and seized the island, before the expedition continued on to Alexandria,

where 30,000 troops disembarked and marched through the sand to Cairo. On 21 July a large Mameluke force tried to halt Bonaparte's advance at the Battle of the Pyramids, but the crudely armed horsemen, employing the tactics of a bygone era, charged vainly into the disciplined fire of the French infantry arrayed in square. Bonaparte entered the capital on the following day. The decisive action of the campaign was, however, fought at sea, when on 1 August Nelson discovered Brueys's fleet anchored in Aboukir Bay, just east of Alexandria, and annihilated it, apart from two ships. The Battle of the Nile restored the Royal Navy's presence in the Mediterranean and left Bonaparte totally isolated, with no hope either of reinforcement or of evacuation.

The Turks, meanwhile, had naturally joined the war on Britain's side, and assembled troops for a counteroffensive staged from Rhodes and Syria. In order to preempt such attacks, Bonaparte seized the initiative and marched north into Syria with 8,000 men, taking El Arish (14–15 February 1799) and Jaffa (3–7 March) en route. He laid siege to the coastal city of Acre, which was held by the Turks with assistance from British naval captain Sir Sidney Smith, who inspired the garrison to offer a stout defense. All the while, the French army was withering away through fatigue, battle casualties, and plague. The Turks, seeking to relieve the siege, met the French in battle at Mount Tabor on 17 April, but were driven off with heavy losses. Nevertheless, weakened by disease and lacking an adequate siege train, the French abandoned the siege and withdrew back to Egypt. Three months later, an Ottoman army landed at Alexandria and constructed field fortifications near the beaches, but on 25 July Bonaparte stormed them, drove many of the defenders into the sea, and forced the fortress at Aboukir to surrender on 2 August. With the French army now secure, albeit stranded, in Egypt, Bonaparte returned to France, arriving on 9 October.

His successor in Egypt, General Kléber, appreciating that his situation was now untenable, on 24 January 1800 concluded with Turkish officials the Convention of El Arish, by which the French were to be evacuated back home in British ships. When, however, the British government disavowed the arrangement, which it had not authorized, Kléber resumed operations, defeating the Ottomans at Heliopolis on 20 March and retaking Cairo. When an Egyptian assassinated Kléber in June, Menou succeeded to command. The French position in Egypt was, despite their recent success against the Turks, doomed. A British expeditionary force under Sir Ralph Abercromby landed at Aboukir in the face of ferocious French resistance on 8 March 1801 and two weeks later defeated the French at Alexandria before pushing on to Cairo, which they captured in July. After Menou surrendered his army on 31 August, British transports repatriated his troops.

*Operations in Europe, 1799–1801*

As noted earlier, from 1798 the Ottoman Empire had joined Britain in opposing France. The Russians, concerned by French incursions into the Mediterranean, concluded a treaty with Britain in December, and the Second Coalition expanded again with the addition of Austria on 22 June 1799. Naples, the Papal States, and Portugal also added their weight to the Allied effort. The Neapolitans captured Rome on 29 November 1798, but two weeks later the French retook the city. Nevertheless, with erstwhile victor Bonaparte away in Egypt, and with the Allies advancing in superior numbers on several fronts, the Republic found itself hard-pressed.

Fighting was concentrated on three fronts: in North Holland, where the Duke of York's combined British and Russian expeditionary force made a landing; in Italy, where a combined Austrian and Russian army under the veteran Russian commander Alexander Suvorov scored several notable victories; and in Germany, where Archduke Charles also achieved significant gains against the French.

In Italy, the French under General Championnet invaded the Kingdom of Naples and set up the Parthenopean Republic, a satellite state into which French political principles were introduced under the watchful eyes of an army of occupation. To the north, however, at Magnano on 5 April 1799, General Schérer failed to defeat Kray's Austrians before the Russians could arrive to reinforce their allies. Suvorov linked up with the Austrians shortly thereafter, routing the French, now under Moreau, at Cassano on 27 April. He then followed up his victory by retaking Milan and Turin in quick succession. Suvorov secured victory again, on an even greater scale, at the Trebbia River on 17–19 June, when he savaged Macdonald, who had arrived from southern Italy to assist Moreau. Suvorov then pursued the two generals toward the coast. At Novi, on 15 August, Moreau's successor, Joubert, was killed and his army chased off in headlong retreat. Suvorov intended to pursue and capitalize on his great success, but was ordered instead to shift operations to Switzerland. In Italy, the remaining Austrians and Russians under *Feldmarschalleutnant* Freiherr von Melas defeated Championnet's forces at Genoa on 4 November. Thus, in the course of one campaign, Suvorov had reversed practically all of Bonaparte's achievements in the Italians campaigns of 1796–1797.

In Germany, Jourdan confronted Archduke Charles, who fought the French general to a standstill at Ostrach on 21 March. Four days later they renewed their contest at Stockach, where after initial success the French were finally pushed back and obliged to retire to the Rhine. In Switzerland, Masséna fortified his position at Zürich, but he was unable to withstand the Austrian assaults on 4–7 June and retired to the west, only to try again and suffer defeat before Zürich on 14 August. Before Suvorov could arrive from

Italy, Masséna struck at the Russian forces under General Rimsky-Korsakov, drubbing him comprehensively at Zürich on 25 September. Suvorov's troops displayed remarkable endurance in their fighting progress through the Alps, but with the French now in the ascendant in Switzerland, and the mentally unbalanced Tsar Paul recalling Suvorov, the tide was turning against the Allies in that theater.

In Holland, too, the French managed to hold their own. Arriving by sea in August, the Duke of York's Anglo-Hanoverians were joined by a small Russian force and advanced against Brune's French and Batavian force, which blunted the Allied offensive at Bergen on 19 September. In a second action at Bergen on 2 October, York was victorious, but with defeat only days later at Castricum and tension rising between British and Russian forces, York loaded his troops onto Royal Navy transports and crossed the Channel to safety.

The year's campaigning ended with mixed results. Although the Allies had retaken virtually all of northern Italy from the French, their various forces had failed to cooperate on the Dutch and Swiss fronts, with predictable results. The tsar, angered by these failures and already shifting his foreign policy toward rapprochement with France, withdrew Russia from the coalition in December. The month before, Bonaparte, now back in France, overthrew the Directory in Paris and established the Consulate, with himself at the forefront of government. With full political power welded to his military brilliance, Bonaparte now sought to knock Austria out of the war as he had done two years before.

The campaign of 1800 did not open fortuitously for the French, for Masséna found himself besieged by the Austrians in Genoa, while Melas pushed other French contingents westward along the Riviera. Bonaparte now opened the campaign with an offensive of his own: an invasion of Italy via Switzerland, marching his army amid the most atrocious winter conditions across the Alps into the Lombard plain. Melas doubled back on learning of Bonaparte's appearance, while Masséna's forces in Genoa finally succumbed to starvation and capitulated to *Feldmarschalleutnant* Karl Peter Ott Freiherr von Bartokez on 4 June. Nevertheless, on 11 June, Ott's forces were soundly defeated by Lannes at Montebello, a reverse that obliged the Austrians to fall back on Alessandria. Nearby, at Marengo, on 14 June, Bonaparte, his divisions marching dangerously separated and operating on the assumption that Melas was at Turin, stumbled upon the main Austrian force double the size of his own army. Melas had all but won the day by the afternoon, but General Desaix arrived with two French divisions, counterattacked, and routed the Austrians, though at the cost of his own life. Bonaparte's army—and reputation—was saved, and the Habsburg military presence in Italy virtually evaporated. When Melas capitulated on 15 June, operations on this front came to an

end, with Bonaparte's military reputation enhanced to new heights.

In Germany, Moreau scored a series of successes against the Austrians under Kray at Stockach (3 May), Möskirch (5 May), and Hochstädt (19 June). Hostilities were suspended by an armistice between July and November, but when the fighting resumed, Archduke John, Kray's successor, lost in catastrophic fashion to Moreau at Hohenlinden on 3 December. Moreau wasted no time in exploiting his success by advancing directly on Vienna, supported by two formations: a French army under Brune proceeding from Italy via the Alps, and Macdonald moving into the Tyrol from Switzerland. Habsburg authorities in Vienna accepted that further resistance was useless and, after calling for a truce on Christmas Day, signed a treaty of peace on 9 February 1801 at Lunéville, an agreement that largely mirrored that reached at Campo Formio, with some additional concessions from Austria. The Second Coalition now hardly deserved the name, for without the participation of Russia and Austria, Britain remained the only major belligerent facing a triumphant France.

Britain, for her part, was not idle, though her role continued largely to be confined to naval operations, apart from the expedition to Egypt and operations on Malta, which fell in 1800 to the British after a two-year siege, assisted by a Maltese rebellion against French rule. Elsewhere, although the Royal Navy had already defeated French, Spanish, and Dutch fleets in recent years, it now faced a new threat: the League of Armed Neutrality—a pact of neutral Baltic nations that included Russia, Denmark, Sweden, and Prussia—inspired by Paul I of Russia and intended to combat the British maritime policy of searching and seizing neutral vessels that Britain suspected of carrying contraband materials bound for French or French-controlled ports. The Admiralty dispatched a fleet under Admiral Sir Hyde Parker who sent his second in command, Nelson, to confront the Danish fleet at Copenhagen. After a ferocious day's fighting, Nelson defeated the Danes, caused extensive damage to their fleet, and prepared to move east against Russia's Baltic Fleet at Revel. The assassination of the mad Tsar Paul put his Anglophile brother Alexander on the imperial throne, so obviating the need for a naval confrontation with Britain and bringing an end to the League of Armed Neutrality.

With France dominant on land, Britain supreme at sea, and both sides wearied by a decade of uninterrupted conflict, peace was concluded at Amiens on 27 March 1802, bringing an uneasy end to the French Revolutionary Wars. This was to be merely a brief respite—only fourteen months—and the only period of peace to be established between 1792 and 1815. The Napoleonic Wars began with the renewal of Anglo-French hostilities in May 1803, and within two years Britain, Russia, Austria, and Sweden had assembled yet a third coalition with which to confront a

nation considerably more powerful than it had been during its Republican phase.

## The Outbreak of the Napoleonic Wars

In the course of Britain's war against Revolutionary France between 1793 and 1802, the dominant theme of British

foreign policy was the prevention of French territorial expansion and the reestablishment of the balance of power on the Continent. Principally a naval power, Britain found itself unable to challenge French aggression unassisted. As in the wars against Louis XIV and the various struggles of the mid-eighteenth century, Britain sought to achieve its war aims through the construction of coalitions with the Great Powers of Europe and the seizure of French overseas colonies. Until the wars against Revolutionary France, such policies had consistently proved successful. The new enemy, no longer constrained by limited military and political objectives, was sustained by a revolutionary spirit absent in the wars of the Bourbon kings. Thus, the traditional reliance on coalition warfare and maritime supremacy was rendered far less effective.

The fate of the First and Second Coalitions (1792–1797 and 1798–1802, respectively) was a bitter testament to the fact; failure of Allied military coordination, mutual jealousies over the territorial spoils of war, ill-conceived strategy, and the distractions caused by the Partitions of Poland led to the defection of some powers and the defeat of others. At sea Britain established undisputed command of the waves and conquered virtually the entire French colonial empire, yet was unable to compensate for the continental advantages reaped by the Revolutionary armies in the Low Countries, Germany, Switzerland, and northern Italy. France, wearied by the wars spawned by revolution and fuelled by its own success, nevertheless desired peace. So long as Britain remained supreme at sea, Napoleon was unable to reestablish the French New World empire. By virtue of distance, the recent acquisition of Louisiana from Spain could not be exploited, nor could France hope to recover Haiti from the native rebels who had liberated it in 1801. With its overseas trade severely curtailed by British blockade and fleet action, France found it could no longer reap the benefits which war on the Continent had provided since 1792. The death of Tsar Paul of Russia, neutral though Francophile, as well as British successes in Egypt in 1801, signaled the end of any prospect of Franco-Russian cooperation against Turkey or Britain.

In Britain calls for peace were equally pressing. By 1801 the country found itself without continental allies as a result of a series of separate arrangements between France and Austria, Russia, and Prussia in the course of the Wars of the First and Second Coalitions. The European states had, in fact, begun to turn against Britain's maritime policies of blockade and the search and seizure of neutral vessels. No longer would they tolerate the country's practice of exhorting the Continent to arms, accruing to itself the advantages of colonial acquisitions and overseas markets without the losses attendant upon direct operations against France. In short, while the continental powers stood to lose vast stretches of territory to France, Britain remained relatively

secure from attack. Finally, few enemy colonies still resisted capture, while many of the most important ports of the Continent remained closed to British trade in any event and others still open, such as those of Portugal, were on the verge of seizure by hostile Spain. Thus, with Britain mistress of the seas and France supreme on land, both sides regarded further recourse to arms as futile. Protracted negotiations ended the stalemate; in Britain, Henry Addington, the prime minister, finally authorized the signature of the Treaty of Amiens in March 1802, thus bringing an uneasy termination to nine years of uninterrupted war.

Just as the origins of the Second World War may be traced back to the Treaty of Versailles of 1919, the origins of the Napoleonic Wars may be found in the circumstances surrounding the Treaty of Amiens, a peace settlement that numbers, like Versailles, among the most controversial ever reached by a British government. The key elements stipulated that all French and Dutch overseas colonies, including the Cape Colony at the southern end of Africa, were to be restored by Britain. France was to receive Elba, while Minorca and Malta were to be returned to Spain and the Knights of St. John, respectively. France, for its part, agreed to evacuate the Kingdom of Naples and the Papal States, as well as Egypt, which was to be restored to Turkey.

Britain's extensive cessions caused alarm and despondency among the Pittites, who had only recently left office; with evidence seeming daily to confirm the aggressive tendencies of Napoleon Bonaparte, First Consul since 1799, those sacrifices were being keenly felt. The surrender of strategic points around the globe prompted stinging criticism from Lord Grenville and William Windham, the former secretaries of state for foreign affairs and of war and the colonies, respectively. To such men, the return of all French colonial possessions, along with the return of the Cape Colony and Malta—whose superb port of Valetta served as the Royal Navy's vital strategic base in the central Mediterranean—constituted an act of weakness and humiliation. Nevertheless, the prevailing view in Britain held that the war-weary nation required the respite offered by peace. From the government's perspective, disadvantageous as the terms might be, Britain was in no position to demand extensive indemnities from France. In the end, however, Amiens offered Britain virtually no security, only a short-lived and costly truce.

The absence of Britain as a signatory to the Treaty of Lunéville, concluded between France and Austria in 1801, had far-reaching consequences, most notably the great potential offered to France for territorial acquisitions on the Continent without the legal interference of Britain. Napoleon was not required to evacuate Dutch territory or recognize the Batavian Republic's independence; therefore the Cape of Good Hope, a Dutch possession, lay subject to

his influence. Nor did arrangements at Amiens require French recognition of the sovereignty of the Helvetic (Swiss), Cisalpine (northern Italian), or Ligurian (Genoese) Republics, whose independence Lunéville exclusively guaranteed. Consequently, with Austria cowed and exhausted by its defeat in numerous disastrous campaigns stretching back to 1792, the terms of Lunéville could be respected or violated at the First Consul's will, and it is not surprising that contemporary opinion regarded France as the major beneficiary of Amiens. The king himself referred to the peace as "experimental," forced on Britain by the abandonment of its allies. Certainly it was not long before France reaped the advantages offered at Lunéville and Amiens.

The causes of the rupture of peace are both varied and complex, and no detailed effort need be taken here to chronicle the numerous violations perpetrated by the signatories or to apportion to them relative blame. Britain's mounting discontent with the situation after the signature of the treaty and, ultimately, the country's desire for war, rested on three factors: the economic isolation caused by the closure of continental ports to its exports, the encroachments of France on its weak neighbors, and the assembly of military and naval forces along the Channel coast, which Britain interpreted as preparations for invasion.

References to commercial relations were not included in the terms of Amiens. The war had provided Britain with a virtual monopoly over French overseas markets and stimulated commerce with its own colonies. The restitution of enemy colonies ended French dependence on British goods, thus severely damaging those exporters and manufacturers whose livelihood depended largely on the French market. French control of virtually the entire European coastline from the Scheldt to the Adriatic and the imposition of heavy customs duties on British goods all but expelled those goods from continental markets. The renewal of peace also permitted the legitimate pursuit of overseas markets by France without British interference. The extent to which these circumstances may have aroused warlike sentiments on the part of London commercial interests is difficult to assess; but that they served as an inducement to war there seems little doubt. Since the peace France had, moreover, embarked upon a large ship-building program, ostensibly for colonial expeditions against the rebellious colony of St. Domingue, that would in a few years make its navy large enough to challenge Britain's mastery of the seas.

French continental aggrandizement was the chief cause of the renewal of war. France's territorial acquisitions during the interlude of peace were extensive. In Italy, Bonaparte proclaimed himself president of the Cisalpine Republic in early 1802 and formally annexed Piedmont, and later Parma, in September of that year. Spain ceded Elba to France, and French troops occupied Switzerland in October on the pretext of serving a mediating role in internal dis-

putes over the form of government under which the Swiss wished to be ruled. The terms of Lunéville guaranteed the Swiss the right to self-determination. In Britain reaction was fierce, even to the point that some Whigs, normally sympathetic to France, expressed outrage at the interference with Switzerland's right to self-determination. For the present, at least, British diplomatic language on the affair was dignified, firm, and restrained, demonstrating that Anglo-French relations had not collapsed irreparably. The foreign secretary, Lord Hawkesbury, reminded the French ambassador in London that Bonaparte's declared intention, published in the official government paper, the *Moniteur*, to mediate in the civil disputes in Switzerland violated the pledge to uphold Swiss independence that he had made at Lunéville. France, in short, was to keep its nose out of Swiss affairs. The Swiss gave way to French pressure, and when troops arrived, the Swiss made no appeal to arms.

French encroachments were not limited to central Europe. On 9 October the Dutch government was informed by the French representative at The Hague that a revolutionary movement was active in Holland and threatening its constitution. In consequence, the First Consul felt it his duty to come to the country's assistance. By the end of the month Bonaparte resolved, in violation of Lunéville, to retain his 10,000 troops of occupation and continued his demand that the republic provide for the maintenance of those forces. The Dutch voiced their objections through their ambassador in Paris, but it was to no avail. No resistance was offered; disregarding the Dutch rejection of a constitution inspired by himself, Bonaparte ordered its forcible imposition.

Thus, in the brief period between March 1802 and May 1803, France came to dominate Holland, Switzerland, and north and central Italy without provoking the intervention of the Great Powers. These acquisitions did not constitute infractions of the Treaty of Amiens in either spirit or letter, and therefore Britain's objections could find no foundation in international law. Nevertheless, by the autumn of 1802, barely six months after the signature of the treaty, Britain was already on the brink of going to war.

Anglo-French relations now deteriorated rapidly. As a result of French depredations on the Continent, Addington soon resolved not to act on his pledge to withdraw British troops from Malta, thus preserving some point of strategic value from which to check, if necessary, French encroachments into the Mediterranean. Malta's strategic value had long been recognized by the European powers. It had been occupied by Bonaparte in 1798 on his expedition to Egypt in that year and retaken after a two-year siege by British troops on land and a squadron of the Royal Navy at sea. Although British diplomats made great efforts at the peace conference for the island's annexation, Bonaparte steadfastly refused to accept this provision and instead

proposed its neutrality under the guarantee of a third party, Naples. Britain considered the establishment of a Neapolitan garrison, to deter future French designs on Malta, a ridiculous proposition; pending the accession of the other Great Powers to an article guaranteeing the island's independence, later known as Article X, it ultimately acquiesced to the condition.

Nevertheless, Britain was remiss in failing to evacuate the island and admit the 2,000 men of the Neapolitan garrison within the three-month period allowed after the signature of the treaty. Britain promised France it would withdraw. Britain had, moreover, failed to evacuate entirely its garrison from Egypt; a portion of its troops had remained in Alexandria since Egypt's restoration to Turkey. It was not until the First Consul issued a demand for its complete withdrawal that Britain satisfied the conditions of the treaty on this point.

By the new year, a crisis in Anglo-French relations was growing. Austria had already acceded to the article guaranteeing the sovereignty and independence of Malta, and Russia, despite the conditional nature of its acceptance, was thought amenable to accession. In London, however, the prime minister contemplated retaining the island. Addington's continued delay in removing British troops soon amounted to an overt violation of the treaty; France was not prepared to let this pass unnoticed, and on 27 February Talleyrand reminded Lord Whitworth of Britain's solemn obligations. Only the accession of Russia to Article X and the election of a new Grand Master of the Order of Malta were wanting, the foreign minister stated. Thus, the time for delay afforded by a pretext for continued occupation would soon come to an end.

Although Britain had originally agreed to Malta's evacuation in good faith, in the light of French depredations on the Continent since the signature of Amiens, Addington balked at relinquishing the island to an uncertain fate under a Neapolitan garrison, notwithstanding pledges from Russia, Prussia, Austria, and other powers to guarantee the island's independence. Moreover, various reports from British envoys, including Sir John Warren at St. Petersburg and the Earl of Elgin, former ambassador to Turkey, aroused suspicions at Downing Street that France was contemplating a renewal of its previous designs on Turkey. If these reports alone did not convince the cabinet to retain the garrison indefinitely, a report published in the *Moniteur* in January 1803 reconfirmed Addington's conviction that Malta's evacuation would be catastrophic to British interests in the Mediterranean in general, to Egypt specifically, and by extension, to India. Similarly, it reinforced prevailing views within British political and public circles that Bonaparte's ambitions were boundless.

The report was the product of the mission of Colonel Horace Sébastiani, a French infantry (later cavalry) officer,

who was temporarily charged as an envoy to Turkey. Sébastiani was ordered to make extensive travels in Egypt, the Levant, and the Balkans on a mission in order, ostensibly, to acquire commercial information on these regions. Irrespective of its true purpose, the mission yielded valuable intelligence on the state of defense of various Ottoman provinces for purposes of future French conquest. The publication of Sébastiani's report, in which, among other conclusions, he observed that 6,000 troops could easily subdue Egypt, excited indignation in Britain and resolved Addington to refuse the evacuation of Malta as agreed to at Amiens.

Lord Whitworth was instructed in early February to inform the French government that Malta would be retained in compensation for the extensive territorial gains acquired by France since the signature of Amiens. These gains had completely overturned the balance and stability that both powers had pledged to uphold. As the state of possession had been so radically altered, Britain reserved the right, the government argued, to seek compensation on the basis of diplomatic precedence in international law and the assumed sanction of this principle by France. In view of French gains in Holland, Switzerland, and Italy, Whitworth was instructed in early February that his country believed it consistent with the terms of Amiens to claim for itself compensation in order to balance the threat to its security that these continental acquisitions represented; in short, Britain demanded a counterweight to French gains. The Sébastiani report, moreover, suggested continued French designs on Egypt—a wholly unacceptable prospect in British eyes. Whitworth recapitulated these arguments to the foreign minister in mid-February. Talleyrand assured him that France entertained no designs on Egypt or India and referred to Sébastiani's mission as a strictly commercial venture. The First Consul, he continued, had no desire to disturb the peace reached at Amiens, and he claimed that French finances would not, in any event, enable him to wage war. Finally, he expressed surprise that the British government should hold any suspicion of French intentions.

Within days, Napoleon had summoned Whitworth to the Tuileries to explain his position in person. The First Consul enumerated the various provocations for which he held Britain accountable and referred particularly to its failure to evacuate Malta and Egypt in accordance with Amiens. France, he declared, could not tolerate British possession of Malta. He complained about the virulent personal attacks made against him in the British press and accused Britain of harboring French émigrés who, he claimed, had conspired to overthrow his government. If he had intended to invade Egypt, the First Consul informed Whitworth, it would already have been accomplished. Napoleon claimed that he would not conquer Egypt, much as he would like it as a colony, because he could obtain it without recourse to war as a result of the inevitable collapse

and dismemberment of the Ottoman Empire, or by some private arrangement with the sultan.

On the strength of such words, it was clear in Britain by the first months of 1803 that the conduct of France could no longer be tolerated, and many politicians, both within the government and on the opposition benches in Parliament, were either calling for war or held the view that it was only a matter of time before events forced Addington's hands and made hostilities unavoidable. Accepting the situation, on 6 March, with war looming on the horizon and naval preparations actively underway in French and Dutch ports, Addington directed the cabinet to sit and consider the defense of the nation. By the end of the month, measures were in hand to strengthen British defenses in the West Indies, and new naval commanders were assigned to stations operating in home waters.

For its part, France rightly accused Britain of delinquency in evacuating Malta, which, as noted earlier, was subject to retrocession to the Knights of St. John. Though Britain was prepared to evacuate the island as soon as a new Grand Master of the Order was elected and the Great Powers agreed to guarantee the island's independence, neither of these conditions was ever fulfilled, principally owing to the renewal of war. In any event, there was reason to believe that the Knights of St. John and the Neapolitan envoy at Malta were colluding with French officials. The island therefore continued firmly under British occupation.

After numerous abortive attempts by Whitworth to settle the Malta question, the ambassador left Paris. His departure heralded nothing unexpected in Britain, for by May repeated French provocations had, for many, long justified a declaration of war. In support of his belligerent policy, Addington laid before Parliament a large collection of Foreign Office dispatches that concerned the course of negotiations with France since Amiens, as well as supplementary materials equally damning of the First Consul. Many in Parliament and in the nation at large believed circumstances vindicated Britain's cause, and on 18 May the House of Commons voted its approval for a declaration of war on France.

The decision was grimly taken, for although some observers expressed hopelessly optimistic views on the nation's prospects of success, the fact remained that Britain embarked on war without a single ally. Moreover, if the "Amiens interlude" had clearly enabled Napoleon to aggrandize his power at the expense of his weaker neighbors, with hostilities resumed with Britain he was all the better placed to capitalize on circumstances. The large French force assembled in Holland promptly invaded the Electorate of Hanover, the hereditary protectorate of King George III, enabling the French to exclude British commerce from much of the northwest German coast and provoking Britain to retaliate with a naval blockade. In the

Mediterranean, French troops occupied the remainder of the Italian peninsula. Only a portion of the Kingdom of Naples remained unoccupied; it stood under constant menace. Britain's greatest concern, however, was the concentration at Boulogne of enemy forces, whose presence foreshadowed the direct invasion of the island kingdom itself.

The rupture of the peace fourteen months after its signature ushered in a new era of conflict, which soon assumed global proportions and was to span another twelve years. The two great rivals pitted their energy and resources against one another in a struggle to decide between French continental hegemony and the restoration of the balance of power. No longer regarding the Treaty of Amiens as an adequate guarantee against the encroachments of France, Britain again assumed her traditional role as the architect of coalitions.

## Military Operations of the Napoleonic Wars (1803–1815)

### Renewal of the Anglo-French Conflict

The renewed conflict, which began in May 1803, initially involved only Britain and France. As the dominant naval power, Britain naturally reverted to its time-honored strategy of reimposing its blockade of the major French ports such as Rochefort, Brest, and Toulon, and preying on French commercial shipping. The French, at the same time, resumed the construction of shallow-draught transports in preparation for a cross-Channel invasion of England. Over the subsequent months the main construction area around Boulogne grew substantially, as did the concentration of

troops established in camps there. Napoleon understood that so as to facilitate an invasion it was vital to distract a large proportion of the Royal Navy's ships, in order to ensure that the Channel was clear for his highly vulnerable invasion craft. Napoleon, who was ignorant of naval strategy and failed to appreciate that the principles that applied to warfare on land did not necessarily apply to those at sea, devised many plans of varying complexity.

None of these was in fact carried out until April 1805, when Admiral Villeneuve emerged from Toulon, linked up with a Spanish fleet at Cádiz, and sailed for the West Indies, with Vice Admiral Nelson in pursuit. In June Villeneuve then returned to European waters, unintentionally falling in with a British squadron off Cape Finisterre on 22 July 1805; the engagement was indecisive in itself, but it obliged Villeneuve to make for Cádiz instead of the Channel. In any event, the Brest fleet had been unable to evade the blockade and was still in port. Villeneuve, with thirty-three ships of the line, then received orders to sail for the Mediterranean, to aid in diversionary operations in Italy. Nelson, however, with twenty-seven ships of the line, intercepted him off Cape Trafalgar on 21 October, achieving a decisive victory over the Combined Fleet (as the united French and Spanish fleet was known) and ending all possibility of a French invasion for the remainder of the Napoleonic Wars. Immensely important though the Battle of Trafalgar was, it did not affect the vital operations then being simultaneously conducted on land, for Napoleon had, by the time of the battle, already changed his plans, temporarily abandoning his scheme for a landing on the English coast in order to free up the Grande Armée, as his main force became known, for operations against the Austrians and Russians.

### War of the Third Coalition (1805)

William Pitt, the British prime minister, was instrumental in organizing the Third Coalition, which came to fruition on 11 April 1805 with the conclusion of an Anglo-Russian alliance, to which Austria acceded on 9 August. Sweden, a comparatively minor power, joined the coalition shortly thereafter. Napoleon broke up his invasion camp at Boulogne at the end of August and marched for the Danube in order to confront Austro-Russian forces. At the same time, an Austrian army under Freiherr Mack who had no knowledge that the French were moving east, invaded Bavaria, a French ally, on 2 September.

Archduke Charles meanwhile advanced into Italy to confront the French forces there under Marshal Masséna, while further east a Russian army under General Mikhail Kutuzov slowly advanced through Poland to assist the Austrians in Moravia. The Austrians were shocked to discover that Napoleon had made such remarkably rapid progress, crossing the Rhine on 26 September and reaching the Danube on 6 October. In the course of this march, the French had moved

in a broad arc around Mack's army near Ulm, cutting his lines of communication and isolating him from reinforcement. After a feeble attempt to break through the cordon at Elchingen on 14 October, Mack surrendered his entire force of 27,000 men on 17 October, making the encirclement at Ulm one of history's greatest strategic maneuvers.

With Mack's force neutralized, Napoleon advanced on and occupied Vienna, forcing the Russians back at Dürnstein on 11 November and Hollabrunn on 15–16 November. In Italy, Masséna was victorious at Caldiero, forcing Charles to retire back across the Alps, though detached formations from the principal French forces prevented him from linking up with the main Austro-Russian army, for which Napoleon set a trap. By moving north of the Austrian capital to expose his lines of communications, Napoleon tempted Kutuzov to sever these lines. The ploy worked. As the Allies attempted to envelop the French flank at Austerlitz on 2 December, Napoleon launched his forces through the Allied center, dividing it and crushing the enemy left, making Austerlitz one of Napoleon's greatest victories. Two days later Emperor Francis surrendered, and Kutuzov, with Tsar Alexander attached to Russian headquarters, promptly withdrew his forces east. Peace between France and Austria was reached on 26 December at Pressburg, where Francis agreed to cede territory to France and her allies in both Germany and Italy.

### War of the Fourth Coalition (1806–1807)

Although Austria withdrew from the coalition after Austerlitz, Britain and Russia remained at war with France. The Fourth Coalition came into being in the autumn of 1806 after a breakdown in Franco-Prussian relations, largely the result of Napoleon's failure to cede Hanover (formerly a hereditary possession of George III) to Prussia, as promised, and of the establishment of the Confederation of the Rhine—a new political entity replacing the Holy Roman Empire (abolished in 1806) consisting of various German states all allied to, or dependent on, France. Prussia had remained neutral during the 1805 campaign—in hindsight a grave strategic error on its part—but with the growing influence of France in German affairs it threw in its lot and, together with its ally, the Electorate of Saxony, declared war.

The Grande Armée, situated in northeast Bavaria, prepared to invade Prussia; the Prussians were commanded by the Duke of Brunswick, a veteran of the wars of Frederick the Great. With remarkable speed the French began their advance on 8 October, achieving complete surprise. Marshal Lannes, in a minor action at Saalfeld on 10 October, defeated a small Prussian force and killed Prince Louis Ferdinand of Prussia, while the main French army turned the Prussian left flank while making for Berlin. Napoleon fought part of the main Prussian army under Fürst Hohenlohe (Friedrich Ludwig Fürst zu Hohenlohe-Ingelfingen) at

Jena on 14 October. Hohenlohe's command was, however, merely a small force meant to protect Brunswick's rear; Napoleon's numerical superiority predictably told, and Hohenlohe was routed. At Auerstädt, a short distance to the north, on the same day, Davout, who had been sent to cut Prussian communications, encountered the main Prussian force under Brunswick. There the odds were rather different, with Davout outnumbered by a force more than twice the size of his own. He managed to hold on, however, and when Bernadotte arrived, the tide turned decisively in the French favor, with the Prussians routed there as well, and the Duke of Brunswick mortally wounded.

The destruction of Prussia's main army effectively spelled the end of resistance, and the remainder of the campaign consisted of the French pursuit of small contingents, virtually all of which eventually put down their arms, and the capture of fortresses. Berlin itself fell on 24 October, and the last major force to hold out, near Lübeck, surrendered a month later. A small Prussian contingent managed to make contact with the Russians in Poland, into which Napoleon immediately proceeded, taking Warsaw in an effort to prevent the Russians from assisting their vanquished allies.

Adhering to the principle that the key to victory lay in confronting and decisively defeating the main enemy force, Napoleon sought out the Russian army under General Bennigsen, the first encounter taking place on 26 December at Pultusk, where the Russians were bruised but nothing more. The rival armies went into winter quarters in January 1807 amid bitterly cold temperatures, but the campaign resumed the following month, when Bennigsen began to move and Napoleon went in pursuit. Though outnumbered and caught in a blizzard, Napoleon reached the Russians at Eylau, where on 8 February the two sides inflicted severe losses on one other with no decisive result. Bennigsen withdrew, but with appalling losses and atrocious weather, Napoleon declined to follow. Both sides returned to winter quarters to recover from the carnage, with the renewal of hostilities planned for the spring.

Bennigsen and Napoleon each planned to assume the offensive, but when Bennigsen advanced first, he was stopped at Heilsberg on 10 June. Four days later the decisive encounter of the campaign took place at Friedland, where Bennigsen foolishly placed his army with the river Alle at his back. The Russians resisted enemy attacks with magnificent stoicism, eventually collapsing. With no route of escape, the campaign was over. Tsar Alexander, his army in tatters, and accompanied at headquarters by Frederick William III of Prussia, requested a conference to discuss peace. The three sovereigns concluded the Treaty of Tilsit between 7 and 9 July, putting the seal on Napoleonic control of western Europe. Frederick William was humiliated, having given up

those portions of his Polish possessions originally taken during the Partitions of Poland more than a decade before to the newly established duchy of Warsaw, a French satellite state. To the Confederation of the Rhine, Prussia ceded all its territory between the Rhine and the Elbe, most of this forming the new Kingdom of Westphalia under Napoleon's brother, Jérôme. A French army of occupation was to remain on Prussian soil until a huge war indemnity was paid. Russia was required to enter into an alliance with France against Britain and to recognize the duchy of Warsaw. With Russia and Prussia knocked out of the war, only Britain remained to face France, now at the height of its power.

### War of the Fifth Coalition (1809)

The Fifth Coalition hardly justified the name, for when Austria once again chose to oppose France, it did so without allies to assist it on land. Britain, of course, carried on operations at sea and offered substantial subsidies and loans as it had since 1793, but it could do little more on land than send an expedition in July to Walcheren Island, off the Dutch coast, where disease soon rendered the whole affair a disaster and obliged the British to withdraw in October. Nevertheless, the Austrians had some reason to be hopeful, for in fielding a sizable army in the spring of 1809, they took advantage of the absence from central Europe of large numbers of French troops who had been diverted to serve in operations in Spain. Yet, with misplaced optimism, they underestimated Napoleon's ability to muster his forces and concentrate them quickly, for by the time the Habsburg armies were ready to fight, the French had shifted reinforcements from the Iberian Peninsula to meet this revived threat.

The main Austrian army under Archduke Charles invaded the principal member of the Confederation of the Rhine, Bavaria, which also had to contend with an Austrian-inspired revolt in the Tyrol, a region formerly under Habsburg control. At the same time, Archduke John crossed the Alps to invade northern Italy, repulsing Eugène de Beauharnais, the viceroy of Italy and a staunch ally of France, at Sacile on 16 April. When Napoleon arrived from Spain, he moved immediately to the offensive, crossing the Danube and defeating an Austrian force at Abensberg on 19–20 April before turning on Charles, then under observation by Davout. Charles struck first, confronting Davout at Eggmühl but failing, despite overwhelming numerical superiority, to defeat him, as a result of Napoleon's arrival. French exhaustion from three days' engagements (at Abensberg, Landshut, and Eggmühl) denied them the opportunity to pursue Charles, though they managed to storm and seize Ratisbon on 23 April. Three weeks later French troops occupied Vienna without a shot being fired.

Charles meanwhile concentrated his army on the north bank of the Danube. Napoleon ordered pontoon bridges

constructed to span the river to Lobau Island, and then to the other side, where troops positioned themselves in the villages of Aspern and Essling. On 21–22 May the two sides fought bitterly for possession of these villages, but the French refused to be dislodged. However, with the single French bridge unable to allow substantial numbers of reinforcements to be fed to the north side of the river, Napoleon withdrew his forces to the opposite bank, marking out Aspern-Essling as the Emperor's first defeat. Napoleon intended to recross the Danube and confront Charles for a second time, but he knew he must first develop another plan to do so. Meanwhile, on the Italian front, Archduke John was obliged to withdraw back over the Julian Alps, followed by Eugène, who was successful at Raab on 16 June and subsequently moved to link up with the main French army on the Danube.

Hoping to defeat Charles before he could be reinforced by Archduke John, Napoleon recrossed the Danube on the night of 4–5 July. The Austrians offered no resistance to the crossing, but on 5 and 6 July heavy fighting took place at Wagram, where Charles attempted to isolate Napoleon from his bridgehead. This maneuver, however, failed; the Austrian center was pierced, and Charles was obliged to retreat, albeit with very heavy losses suffered by both sides. Austria could no longer carry on the war. Vienna was under enemy occupation, the main army had been beaten, though not destroyed, and Russia had not joined the campaign as Austria had hoped. Francis duly sued for peace on 10 July and three months later signed the Treaty of Schönbrunn, by which he relinquished large portions of his empire to France and its allies and promised to adhere to Napoleon's Continental System, by which the Emperor sought to impose an embargo on the importation of British goods to the Continent and the exportation of continental goods to Britain in an effort to strangle its economy.

### **The Peninsular War (1807–1814)**

Quite separate from the other campaigns waged in Europe, the Peninsular War, fought on the Iberian Peninsula, constituted the principal theater in which Britain could at last contribute substantial land forces to the war against Napoleon. Portuguese and above all Spanish resistance, involving both regular and guerrilla forces, over time contributed much to the diversion of French troops from other theaters of conflict, and to the continual drain on French manpower. After the Treaty of Tilsit and the introduction of the Continental System, only Portugal continued to defy the ban by accepting British imports. In an effort to close this final avenue of trade, Napoleon sent troops through Spain to Portugal, taking advantage of the opportunity to impose his will on the Spanish as well.

In November 1807 General Junot began his march through Spain, entering Lisbon in December. The Por-

tuguese royal family was evacuated by the Royal Navy and transported to Brazil, while the Provisional Government left behind sought assistance from Britain. Napoleon then revealed his full intentions, when in March 1808 Marshal Murat entered Spain at the head of a large army, occupied Spanish fortresses and disarmed their garrisons under false pretences, and deposed both King Charles IV and his son Ferdinand, who were replaced by Napoleon's brother Joseph, backed by pro-Bonapartist elements in Madrid. The French occupation was never fated to go smoothly: on 2 May the populace of Madrid rose up in revolt, and the spirit of resistance soon spread throughout the country, where guerrilla bands began to spring up and prey on French detachments, couriers, and isolated outposts. The regular Spanish armies fought a number of pitched battles against the French in 1808–1809, but they were generally defeated, sometimes disastrously. Spanish resistance also manifested itself in a number of epic sieges in which civilians played a prominent part, most notably that of Saragossa, northeast of Madrid, where in the summer of 1808 the inhabitants managed to stave off repeated French attempts to storm the city. The one significant Spanish success in the field came at Bailén, in Andalusia, where on 19 July 1808, General Dupont surrendered an army of 23,000 men, causing shock waves across Europe and destroying the myth of French invincibility.

The war in the Peninsula took on an entirely different character from August 1808, when a British expeditionary force led by Lieutenant General Sir Arthur Wellesley (later the Duke of Wellington) arrived in Portugal and defeated Junot at Vimeiro on 21 August, thus securing a foothold for the British army. By the Convention of Cintra, senior British commanders granted the French generous terms, which allowed them to be transported home with their weapons in British ships. Wellesley alone was cleared by the court of inquiry that convened in London and cashiered the generals responsible for what in Britain were considered the disgraceful terms agreed to at Cintra.

With Portugal cleared of French troops and British reinforcements arriving under Lieutenant General Sir John Moore, an opportunity now offered itself for an offensive into Spain. Moore, with promises of Spanish support, therefore advanced in the autumn of 1808. When the Spanish support failed to materialize, however, Moore faced numerically superior forces under Napoleon himself, who had arrived in Spain determined to drive the British out of the Iberian Peninsula once and for all. He occupied Madrid on 4 December and pursued the British commander, obliging Moore to make a long, punishing retreat through winter conditions to Corunna (and another, smaller column to retreat to Vigo) on the northwest Spanish coast. The diversion of French attention toward

the retreating British columns gave the Spanish armies a much-needed respite. Believing Moore at risk of imminent defeat at the hands of Marshal Soult, and with war looming with Austria, Napoleon left for France. Moore was harassed for much of the journey, but on reaching Corunna he turned to face Soult before evacuating his troops onto Royal Navy transports. Moore died in the ensuing battle, but his ragged army was saved, and by that time Lisbon had been sufficiently fortified to prevent the French from retaking it. Saragossa, however, finally surrendered, after a second enormously costly siege in February 1809.

Wellesley returned to Portugal in command of the army there, to be supplemented by Portuguese forces reorganized on the British model by Marshal Beresford. Soult invaded Portugal in the spring of 1809, but Wellesley ejected him after fighting at Oporto, on the Douro River, on 12 May. Exploiting his success, Wellesley crossed the border into Spain to cooperate with the Spanish commander, General García de la Cuesta, who in the event failed to assist Wellesley at Talavera on 28 July, when he came under attack by Marshal Victor and Joseph Bonaparte. The Anglo-Portuguese narrowly held off the French, as a reward for which Wellesley was raised to the peerage as Marquis Wellington, finishing the Peninsular War as the Duke of Wellington. Meanwhile the Spanish armies showed themselves to be incapable of confronting the French, who defeated them comprehensively at Ocaña on 19 November. Unable to take the war into Spain, for the moment Wellington concentrated on defending Portugal, where Lisbon was established as an easily accessible base at which supplies and troops could be landed from Britain, and which held complete command of the maritime route from home. Wellington ensured that the defenses could sustain an attack on any scale by ordering the construction of a line of impregnable fortifications, known later as the Lines of Torres Vedras, across the peninsula on which Lisbon was situated.

Masséna opened the campaign of 1810 with yet another French invasion of Portugal, in July, but he was defeated at Busaco on 27 September by Wellington, who then withdrew behind the protection afforded by the completed Lines of Torres Vedras. Masséna followed him, but upon discovering the Lines made one attempt at penetrating them before realizing that they were unassailable. He therefore camped his troops before the Lines for the remainder of the year and into 1811, with very little food to be foraged or requisitioned in the area, as a result of Wellington's scorched earth policy. The French also sought to capture Cádiz, in the far south of the country, where the Spanish had established an alternative capital to occupied Madrid. At Cádiz a small British force under Sir Thomas

Graham repulsed the French at Barrosa on 5 March, securing the port city's safety. Masséna fought Wellington at Fuentes de Oñoro on 5 May, while to the south Beresford's Anglo-Spanish army beat Soult, himself seeking to aid French troops besieged at Badajoz. Losses were very heavy on both sides, and though Soult was unable to relieve the garrison, the fortress remained in French hands and thus prevented Wellington from taking the war into Spain. The French were successful elsewhere; in the south, Marshal Louis Suchet captured Tarragona on 28 July and Valencia on 9 January 1812.

The campaign of 1812 opened with Wellington assuming the offensive, seizing the border fortresses of Ciudad Rodrigo on 19 January and Badajoz on 6 April, the latter taken only after the British storming parties suffered tremendous losses in a series of desperate assaults. Notwithstanding the heavy price paid for possession of these towns, Wellington could at last carry the war into Spain, where he scored a decisive victory over Marshal Marmont at Salamanca on 22 July. Wellington occupied Madrid for a short time in August, but with the failure of his assault on Burgos as a result of inadequate siege equipment, he was obliged to retreat as far as Portugal. Nevertheless, large numbers of French troops had been withdrawn for the Russian campaign, and years of guerrilla warfare had taken a heavy toll on both French strength and morale.

In 1813 Wellington was enabled to return to the offensive, routing Joseph's army at Vitoria on 21 June, thus ending Bonapartist rule and forcing the French from most of the country to a narrow band of territory in the extreme north. Wellington continued to drive the French before him, taking San Sebastian and Pamplona and fighting his way through several passes in the Pyrenees to invade France herself. He defeated Soult, first at Orthez on 27 February 1814, and again in the final major action of the war, on 10 April at Toulouse, where news had not yet arrived that Napoleon had already abdicated in Paris a few days earlier. The Peninsular War had not only brought to the fore one of Britain's greatest commanders, it had drained French resources over the course of many years, thus making an important contribution to Napoleon's ultimate downfall.

### **The Russian Campaign (1812)**

With the Continental System eventually cutting hard into the Russian economy and Alexander growing increasingly concerned about the presence of the duchy of Warsaw on his borders, war between Russia and France became inevitable. Napoleon, gathering a massive army of unprecedented size and composed of every nationality from his empire, pushed across the Niemen River with over half a

million men on 22 June 1812. The two main Russian armies, one under General Barclay de Tolly and the other under Prince Bagration, found themselves unable to resist a force of this size, and withdrew east, uniting at Smolensk on 3 August. Unable to outflank his opponents, Napoleon chose to engage them first on 17 August at Smolensk, where he took the city by storm, and again at Valutino two days later, where he scored a minor success, the Russians simply withdrawing deeper into the interior and obliging the French to extend their increasingly vulnerable lines of communication even farther.

The Russian commander in chief, Barclay de Tolly, was replaced by Kutuzov, who on 7 September made an extremely hard-fought stand at Borodino, where rather than attempting any elaborate maneuvers to envelop the stationary Russians, Napoleon launched a simple frontal assault against prepared positions held by troops committed to defend “Holy Russia” with the utmost determination. The battle degenerated into a horrendous bloodletting with no decisive result. Kutuzov withdrew further east, the

exhausted French unable to pursue in the short term. The Russians made no further attempt to defend Moscow, which the French entered on 14 September. Nevertheless, much of the city was almost immediately destroyed by fire—probably deliberately set by the Russians—though enough remained of Moscow to provide shelter for Napoleon’s dwindling army for the month that the Emperor chose to remain there, all the while hoping that the tsar would sue for peace. Alexander sent no such overtures, and by the time Napoleon began his retreat on 19 October, winter had nearly arrived.

The story of the retreat from Moscow is well known: snow soon began to fall, and the army, harassed by Cossacks and suffering from hunger, cold, and lack of horse transport, disintegrated into a mass of fugitives, most of whom could offer little or no resistance to the increasingly vengeful Russians. The entire path of the army was strewn with bodies, abandoned equipment, and the spoils of war. On 24 October the Russians caught up with the corps, mostly Italians, under Eugène de Beauharnais at

Napoleon receiving a report during the retreat from Moscow. His invasion of Russia proved the greatest strategic blunder of his career. His failure to appreciate the vast distances to be covered and the extreme temperatures to be endured led to the destruction of the largest army hitherto known. (Print by W. Wereschtschagin from *Illustrierte Geschichte der Befreiungskriege* by Julius von Pflugk-Harttung, 1913)

Maloyaroslavets, inflicting a serious blow, and when the army finally reached Smolensk, it was hardly worthy of the name. Stragglers and camp followers were regularly butchered by the Cossacks, and discipline and morale gradually collapsed. Kutuzov cut off part of the Grande Armée at Krasnyi on 16–17 November, though Napoleon managed to rescue it, and the whole struggled on to the Berezina River. There, engineers, working under the most difficult circumstances, managed to throw two makeshift bridges across the river, enabling thousands to cross, while what units that could be cobbled together fought on the east bank to hold back the attacks of the regular Russian army. Eventually the bridges gave way under the weight of the fugitives, leaving thousands to be captured or killed on the Russian side of the river. Fewer than 100,000 survivors eventually reached the Niemen at the end of December, when the Russians halted their pursuit of an army that had dissolved into mere rabble. The Grande Armée had effectively ceased to exist, but Napoleon had already gone ahead to Paris to assemble a new army.

### **The Campaign in Germany (1813)**

However immense the losses suffered by Napoleon in Russia, his extraordinary administrative skills enabled him to rebuild his army by the spring of 1813, though neither the men nor the horses could be replaced in their former quality or quantity. The Sixth Coalition, which had been formed by Britain, Russia, Spain, and Portugal in June 1812, now expanded as other states became emboldened to oppose Napoleonic hegemony in Europe. The Prussian corps, which had reluctantly accompanied the Grande Armée into Russia, declared its neutrality by the Convention of Tauroggen on 30 December 1812, and on 27 February 1813 Frederick William formally brought his country into the coalition by the terms of the Convention of Kalisch, signed with Russia. The Austrians remained neutral during the spring campaign, with Fürst Schwarzenberg's corps, which had covered the southern flank of the French advance into Russia, withdrawing into Bohemia.

By the time the campaign began in the spring, Napoleon had created new fighting formations from the ashes of the old, calling up men who had been exempted from military service in the past, those who had been previously discharged but could be classed as generally fit, and those who, owing to their youth, would not normally have been eligible for front-line duty for at least another year. With such poorly trained and inexperienced, yet still enthusiastic, troops Napoleon occupied the Saxon capital, Dresden on 7–8 May, and defeated General Wittgenstein, first at Lützen on 2 May and again at Bautzen on 20–21 May. Both sides agreed to an armistice, which stretched

from June through July and into mid-August, during which time the French recruited and trained their green army, while the Allies assembled larger and larger forces, now to include Austrians, Swedes, and troops from a number of former members of the Confederation of the Rhine.

When the campaign resumed, the Allies placed three multinational armies in the field: one under Schwarzenberg, one under Blücher, and a third under Napoleon's former marshal, Bernadotte. The Allies formulated a new strategy, known as the Trachenberg Plan, by which they would seek to avoid direct confrontation with the main French army under Napoleon, instead concentrating their efforts against the Emperor's subordinates, whom they would seek to defeat in turn. The plan succeeded: Bernadotte drubbed Oudinot at Grossbeeren on 23 August, and Blücher won against Macdonald at the Katzbach River three days later. Napoleon, for his part, scored a significant victory against Schwarzenberg at Dresden on 26–27 August, but the Emperor failed to pursue the Austrian commander. Shortly thereafter, General Vandamme's corps became isolated during its pursuit of Schwarzenberg and was annihilated at Kulm on 29–30 August.

The end of French control of Germany was nearing. First, Bernadotte defeated Ney at Dennewitz on 6 September; then Bavaria, the principal member of the Confederation of the Rhine, defected to the Allies. The decisive battle of the campaign was fought at Leipzig from 16–19 October, when all three main Allied armies converged on the city to attack Napoleon's positions in and around it. In the largest battle in history up to that time, both sides suffered extremely heavy losses, and though part of the Grande Armée crossed the river Elster and escaped before the bridge was blown, the Allies nevertheless achieved a victory of immense proportions that forced the French out of Germany and back across the Rhine. A Bavarian force under General Wrede tried to stop Napoleon's retreat at Hanau on 30–31 October, but the French managed to push through to reach home soil a week later. Napoleon, his allies having either deserted his cause or found themselves under Allied occupation, now prepared to oppose the invasion of France by numerically superior armies converging on several fronts.

### **The Campaign in France (1814)**

Convinced that he could still recover his vast territorial losses, Napoleon chose to fight on against all the odds, rejecting offers from the Allies that would have left France with its "natural" frontiers: the Rhine, the Alps, and the Pyrenees. French forces were under pressure on several fronts. Wellington's Anglo-Portuguese and Spanish forces stood poised along the Pyrenees; the Austrians were already operating in northern Italy; and several armies were

making seemingly inexorable progress from the east: Schwarzenberg approaching from Switzerland, Blücher through eastern France, and Bernadotte from the north through the Netherlands. To oppose these impressive forces, Napoleon possessed little more than a small army consisting of hastily raised units, National Guardsmen, and anyone who had somehow avoided the call-ups of the past. Somehow, at least in the initial stages of the campaign, the Emperor managed to summon up the kind of energy and tactical brilliance for which he had become renowned during the Italian campaigns of 1796–1797.

In swift succession he drubbed Blücher at Brienne on 29 January, at La Rothière on 30 January, at Champaubert on 10 February, at Montmirail on 11 February, at Château-Thierry on 12 February, and at Vauchamps on 14 February. Napoleon then turned to confront Schwarzenberg at Montereau on 18 February, before again fighting Blücher, at Craonne, near Paris, on 7 March. Yet, however many enemies he could repel in turn, Napoleon could not be everywhere at once, and his corps commanders, despite the continued enthusiasm for battle displayed by the troops themselves, could not achieve the same results in the field as the Emperor. The French could not stand up to the numbers facing them at Laon on 9–10 March, and though there were still successes in March such as at Rheims on the thirteenth, there were also setbacks such as at Arcis-sur-Aube on 20–21 March. Schwarzenberg then defeated two of Napoleon's subordinates at La-Fère-Champenoise on 25 March, before linking up with Blücher on the twenty-eighth.

The Allies were now very close to Paris, where Joseph Bonaparte had failed to make adequate provision for the capital's defense. After token resistance at Clichy and Montmartre on 30 March, Marmont refused to fight on, and the Allies entered the capital the following day. At a conference with his marshals, Napoleon found himself surrounded by men finally prepared to defy him; the troops, they declared, would listen to their generals, not the Emperor. With no alternative, Napoleon abdicated unconditionally on 11 April and, by the terms of the Treaty of Paris, took up residence on Elba, off the Italian coast, while the Bourbon line in France was restored under King Louis XVIII.

### **The Waterloo Campaign (1815)**

Napoleon was not content to remain on Elba and manage the affairs of his tiny island kingdom. Landing in France in March 1815 with a small band of followers, he marched on Paris, gathering loyal veterans and adherents from the army as he went, including Ney, whom the king had specifically sent to apprehend the pretender to the throne. Allied leaders were at the time assembled at Vienna, there to re-

draw the map of Europe, which had been so radically revised by more than two decades of war. The Seventh Coalition was soon on the march, with effectively the whole of Europe in arms and marching to defeat Napoleon before he could raise sufficient troops to hold off the overwhelming numbers which the Allies had now set in motion toward the French frontiers. With the speed characteristic of his earlier days in uniform, Napoleon quickly moved north to confront the only Allied forces within reach: an Anglo-Dutch army under Wellington and a Prussian one under Blücher, both in Belgium. Napoleon could only hope to survive against the massive onslaught that would soon reach France by defeating the Allied armies separately; to this end he sought to keep Wellington and Blücher—who together easily outnumbered him—apart.

On 16 June, after a rapid march that caught Wellington, then at Brussels, entirely off guard, Napoleon detached Ney to seize the crossroads at Quatre Bras, then occupied by part of Wellington's army, while with the main body of the *Armée du Nord* he moved to strike Blücher at Ligny. Ney failed in his objective, and though on the same day Napoleon delivered a sharp blow against the Prussians, the crucial result was that the two Allied armies continued to remain within supporting distance of one another. Blücher, having promised to support Wellington if he were attacked by Napoleon's main body, took up a position at Wavre. Two days later Napoleon did precisely that, focusing his attention on Wellington while the two Allied armies lay apart. Having detached Marshal de Grouchy to follow the Prussians and prevent them from linking up with Wellington, the Emperor launched a frontal assault on Wellington's strong position around Mont St. Jean, near Waterloo.

The hard-pressed Anglo-Allied troops held on throughout the day, gradually reinforced by elements of Blücher's army that managed to leave Wavre while Grouchy, busily engaged with a Prussian holding force, refused to march to the sound of the guns at Waterloo. The French made strenuous attempts to dislodge Wellington's troops, who in turn showed exceptional determination to hold their ground, and as the Prussians gradually made their presence felt on the French right flank, the battle began to turn in the Allies' favor. In a final gamble to break Wellington's center and clinch victory, Napoleon sent forward the Imperial Guard, but when his veterans recoiled from the intense, point-blank musket and artillery fire they received on the slope, the rest of the army dissolved into a full-scale rout.

With no possibility of retaining power, Napoleon abdicated in Paris a few days later. By the second Treaty of Paris, the Bourbons were restored to the throne, France was reduced to her pre-1792 borders, forced to support an army of occupation and pay a sizable indemnity. As for

Napoleon, his hopes of obtaining permission to reside in Britain were dashed; on surrendering himself, he was taken as a captive to spend the remainder of his life on the remote South Atlantic island of St. Helena, where he died on 5 May 1821.

## Napoleon Bonaparte (1769–1821)

The identity of Napoleon Bonaparte is a major concern for today's historians, as they seek to add more than just further detail to the familiar outline of his military and political career. They have begun exploring the construction of his personality, and the images and representations that were generated in the process. A myth was certainly manufactured after his death, but its fabrication commenced during his own lifetime, elaborated not simply by contemporaries but through Napoleon's own deliberate efforts. He had History in his sights from the outset, and was constantly reinventing himself, from Buonaparte a Corsican patriot, to Bonaparte the Revolutionary General and Republican Consul, to, finally, in 1804, Napoleon the Emperor. In the Hundred Days the revolutionary aspect briefly resurfaced, before the embellishment of the legend on St. Helena was undertaken during the last years of his life. This final endeavor carried his appeal still further, and Bonapartism became established as a significant political option in nineteenth-century France. Together with the sheer scale of his ambition and a series of stunning military victories, this protean character, reflected in a vast array of printed and visual imagery, helps to explain his unparalleled longevity in the global memory. Though the achievement ultimately fell short of his vast reach, it lent a romantic aura to an astonishing individual who has prompted more ink to flow than any modern figure.

The future Emperor of the French was barely born a subject of Louis XVI. He arrived in the world on 15 August 1769, at Ajaccio, in the southwest of the beautiful, but wild, Mediterranean island of Corsica, which had been transferred to France by the Genoese just a year earlier. Corsica had a long history of rebellion, and it was in the throes of another insurrection, which Napoleon's father supported. When it became evident that the French were determined to overcome some typically stubborn resistance, Carlo

Buonaparte made his peace with the island's latest masters. Although he died relatively young, leaving his strong-willed wife Laetitia to run the family, he thus secured a place for his family in the new order. Napoleon, the second eldest of five sons, was packed off at a tender age to a military school at Brienne in Burgundy, where he cut a rather sad and solitary figure, homesick and struggling with the northern climate. Rather than showing precocious genius, as many commentators have suggested, he was often mocked for his lesser gentry origins and, above all, his Corsican accent (which he retained throughout his life).

Even after he graduated to the *Ecole Militaire* in Paris, he continued to spend a good deal of his spare time reading and writing. Indeed, his adolescent literary endeavors shed much light on these early years when, like many of his generation, he aspired to become an author as much as a soldier. Influenced by the classics and, among contemporary authors, by Rousseau, he nurtured a number of projects: these included an Egyptian tale, as well as a dissertation on suicide, an indication of his troubled state of mind. By the time the Revolution broke out in 1789, he had been commissioned as a sub-lieutenant, albeit in the less prestigious artillery. In the stultifying garrison atmosphere of Valence, in the Rhône valley, it was a prize essay competition for the Academy of Lyons that preoccupied him, but his *Discourse on Happiness* failed to gain a prize. Yet the author manqué would become as great a communicator as he was a conqueror. He was extremely well-read, and books would always accompany him on campaign, in the form of a mobile library.

Another of Buonaparte's youthful projects was an unfinished history of Corsica. Army service was punctuated by generous periods of leave, and he frequently returned to his native island. His entry into Revolutionary politics was, not unnaturally, a Corsican one, as a patriotic follower of Pasquale Paoli, who had led the struggle against France in the late 1760s and now reemerged to renew the long struggle to liberate his homeland. Corsica was given departmental status like other areas of France, but this was insufficient for its independent-minded partisans. Buonaparte lent his military skills to the newly formed Corsican National Guard and was accordingly absent from the general review of army officers that took place under the reformed regime in France early in 1792. Yet his incarnation as a Corsican patriot was short lived. In 1793, the whole Buonaparte clan was obliged to leave the island after falling out with Paoli; Buonaparte was to see his native island only once more, briefly, on his return from Egypt in 1799. He became a perpetual exile, and his quest for global supremacy might be seen as a means of overcoming this deep sense of isolation.

Returning to the mainland, Buonaparte sought to rejoin the army. He was fortunate that the nascent Republic

was so much in need of help and could overlook his recent failure to rally to the colors. The outbreak of war in the spring of 1792, coupled with the wholesale desertion of the ranks by aristocratic officers who had gone into exile, facilitated his reintegration and also offered the possibility of distinction in both internal and external campaigns. In the summer of 1793, he was active in the Midi, participating in the suppression of the so-called federalist revolts, Republican insurrections against the Jacobins who had seized power in Paris. In a pamphlet he published at his own expense, entitled, *Le souper de Beaucaire* (The Supper of Beaucaire), Napoleon not only revealed a propagandist bent, but also showed the effects of his literary apprenticeship, siding with the Jacobin cause against a disaffected merchant from Marseille. He was an obvious choice to assist in ending the siege of neighboring Toulon, where a moderate rebellion had turned into full-blown counterrevolution, with the entry of the British fleet into the Mediterranean naval base. Rendering the roadstead untenable demanded vigorous use of the artillery that Napoleon led and, by the end of 1793, Toulon, like other rebel cities, had been reduced to submission.

In retrospect, the recapture of Toulon was a milestone in his career, but it went virtually unnoticed at the time. The repression that accompanied these operations, though it did not directly involve him, was much more widely publicized. It inevitably meant that he incurred some guilt by association, and when the Jacobins fell from power in 1794, Napoleon's prospects took a turn for the worse: the youthful brigadier general (he was still just twenty-four years old) found himself out of favor, though not for long. The Thermidorian Reaction was swinging too far in a conservative direction, and even middle-of-the-road Republican politicians felt threatened. In saving the day for those politicians in Vendémiaire (October 1795) with his famous "whiff of grapeshot" against right-wing rebels in Paris, Napoleon not only resurrected his career but teamed up for a second time with Paul Barras, who became a long-serving member of the new executive Directory.

The southern politician, whom Buonaparte had first encountered at Toulon, also introduced him to Josephine de Beauharnais, the society widow whom the newly promoted general married in 1796. This ill-fated liaison was to cause him much pain, as well as prompting the disapproval of his mother. Madame Mère, as she became known when Buonaparte was elevated to the imperial dignity as Emperor Napoleon I, pointedly refused to attend the great coronation at Notre Dame in 1804, and it was left to the artist David to literally paint her into the picture (which showed Josephine being crowned empress by her husband). Significantly, he styled himself as Buonaparte in the marriage register, gallicizing his name, though opponents (notably the

British and royalists) would doggedly persist in employing the original, Corsican orthography, Buonaparte.

Command of the Army of Italy soon followed, though at that point Italy was something of a sideshow compared to the crucial northeastern front, and the Republican general was merely one of a series of talented young soldiers who had recently risen up the ranks, such as Louis Hoche or Barthélemy Joubert. It was Napoleon, however, who seized the opportunity to make a name for himself, and the legend was born as much on the plains of Lombardy as on St. Helena twenty years later. What stands out from the Italian campaigns of 1796–1797 are not simply the military victories at Lodi or Rivoli, but the way in which Bonaparte, quickly dubbed the *héros italique* in the press, exploited his prowess. On the one hand there was the conscious crafting of a reputation, reflected in journalism; not content with the adulation he was receiving from others, he founded his own newspapers, which foreshadowed the famous *Bulletins de la Grande Armée*. There was also visual propaganda, seen in the first portraits, while paintings like Gros's *Bridge at Arcola* were turned into prints, and a profusion of medals were coined. At the same time he began to play a significant political role and acquire administrative expertise. His victories were followed by setting up pro-French regimes in the territories he had conquered, notably the Cisalpine Republic based on Milan, and he made treaties like Campo Formio with the Austrians in 1797, with little authorization from the Directory. He was even involved in the internal politics of France, where the government was increasingly reliant upon the army to preserve its contested authority.

The celebrated expedition to Egypt should be regarded in this light: an amazing piece of private enterprise on the part of Bonaparte, who perhaps instinctively grasped that the invasion of England was a hopeless task. Challenging British imperial interests in the Middle East was a long shot, but the government was content to see him occupied outside the country. Bonaparte nearly came to grief, yet, as so often, he was able to turn the whole affair to his advantage: a military disaster was transformed into a propagandist triumph. Elected to the French Institute in 1797, having earned an intellectual reputation from his enterprises in Italy (though much of his accomplishment involved plundering huge quantities of art for transfer to Paris), he gave the Egyptian expedition a scientific aspect by including the artists, architects, and astronomers who founded the discipline of Egyptology. It took a huge slice of good fortune—he once said that a successful general needed three things: luck, more luck, and yet more luck—for him to emerge unscathed from the Middle Eastern debacle. When he decided in August 1799 to leave his army behind and return to France, he was technically deserting

his troops (the Directory did momentarily consider arresting him when he set foot back in France, but abandoned the idea when he was so well received by the people). Moreover, he was risking maritime interception, since the fleet that carried his army to Egypt had been wiped out at the Battle of the Nile by Rear Admiral Sir Horatio Nelson, leaving the British unchallenged in the Mediterranean.

When he landed in Provence in September, the military crisis that the invasion of Egypt had provoked was more or less over, but he was received as a hero and feted all the way to Paris. Once in the capital, he was content to keep a low profile, appearing out of uniform and cultivating all shades of intellectual and political opinion, presenting himself as the “most civilian of all the generals.” He was not the first choice of veteran politician Sieyès as the general who would take charge of security during a plot to overturn the Directory. Indeed, his ineptitude when faced with resistance on the second, crucial day of a “legal” coup d'état at Saint-Cloud (the parliamentary deputies had been moved out of Paris on the pretext of a Jacobin plot) almost sabotaged the whole affair; it took his younger brother Lucien to save the day. Ironically, but typically, the force that was subsequently applied to oust the opposition gave Bonaparte greater influence in the political arrangements that followed. He was able to impose his vision of a post-directorial order, making himself First Consul with supreme power, rather than the figurehead that Sieyès proposed. He was just thirty years old when he took charge of an expanding French Republic of almost 100 departments and some 30 million inhabitants.

Bonaparte's ambition, energy, and sheer ability were displayed to their fullest extent under the Consulate, the most fruitful period of his dominion. It was not devoid of military success, of course, though the victory at Marengo in 1800 was an extremely close-run thing that could have prematurely curtailed his newly won political authority. As he himself recognized, military defeat would be his undoing, though that recognition did not prevent him staking everything on continuing success. As it was, peace on the continent of Europe in 1801 was followed by the Treaty of Amiens with Britain in 1802. This welcome respite from constant warfare helped shift attention to internal achievements, though some of the greatest measures were already underway. It was in completing projects and, above all, resolving, if not always permanently then at least for a lengthy period, some of the thorniest problems thrown up by the Revolution, that Bonaparte revealed his true genius.

As might be expected from a soldier (though accusations of military dictatorship are well wide of the mark), Bonaparte imposed an authoritarian solution in most domains. Nomination replaced election for the most part;

opponents were treated harshly; and for one recent historian, H. G. Brown, the measures taken to restore law and order amounted to an incipient security state. This overstates the case, for to accept this conclusion would be to ignore the restraints that were self imposed: there was no return to the Terror, despite instances of cruelty toward some Jacobins and royalists, for the general did not scruple to spill blood when he deemed it necessary. The Jacobins were punished for an attempt on his life in 1800 (though the detonation of a *machine infernale* just outside the Louvre, where he now resided, was known to be perpetrated by royalists). The subsequent monarchist conspiracy of 1803 ended with the execution of a Bourbon blood relative, the duc d'Enghien, who was abducted from his residence in Baden; this execution destroyed any lingering hope of a compromise with the royalist cause. Yet Bonaparte introduced many elements of reconciliation as well as repression, witnessed in his choice of collaborators from across the political spectrum, or in efforts to repatriate the émigrés, for example. This effective combination of carrot and stick is especially apparent in his settlement with the Catholic Church, which resulted in the restoration of public worship, largely on Bonaparte's terms. This hard-driven bargain both rallied many of the French people and deprived proponents of a monarchical restoration of a vital weapon in their armory, with which Republicans had signally failed to deal.

The Concordat reflected Bonaparte's opportunism, even cynicism, for he stated that he would do similar deals with Muslims and Protestants if his authority required it. A nominal Catholic, his birthday on the Feast of the Assumption (a major feast day in the church calendar) became the Saint-Napoléon, after a hitherto unknown martyr was unearthed by supporters. Raised under the influence of the ideas of the Enlightenment, he lacked a personal religious faith, yet, unlike many of his counterparts, he understood how much it meant to some people. He was also able to synthesize elements of the *ancien régime* with principles of the new order, choosing freely from both. For instance, his management, not to say manipulation, of popular sovereignty was symbolized by the plebiscites that secured general assent for the growth of his power. The great Napoleonic Code, which brought the labors of a decade to fruition, definitively enshrined the new order of legal equality, though at the price of a patriarchal settlement. Where the Revolutionaries had experimented, he consolidated. In the confronting of issues unresolved or unfinished by the Revolution, his lack of a political past could be put to good advantage, while his unorthodox background endowed him with a greater degree of objectivity than most of his contemporaries; his claim to stand above parties seemed to ring true.

On the other hand, a fierce, clannish loyalty to his own family, together with an insatiable urge toward greater personal power, served as a drawback that manifested itself more strongly the longer his rule continued. Under the First Empire, established in 1804, Napoleon (as he was now known) adopted a more conservative outlook and many compromises of the Consular period were adulterated. It might have been said earlier that he discarded the liberty of the Revolution while retaining its principle of equality (his own rise to power, after all, represented the triumph of the principle of "careers open to talent," and, at the *sacre* (coronation) of 2 December, he crowned himself to symbolize this fact), but the imperial decade threatened such social fluidity. Initially at least, even greater glory was achieved on the battlefield, with Austerlitz coinciding with the first anniversary of the coronation and Prussia crushed at Jena-Auerstädt the following year. Thereafter the tide gradually turned toward disaster, in Spain and above all in Russia, but the Empire was also a much less productive period from the political point of view. The reestablishment of heredity and the re-creation of a court encouraged the reemergence of a more aristocratic and less meritocratic society.

With the benefit of hindsight, the imperial evolution might seem a foregone conclusion, yet it was almost as contingent as Bonaparte's rise to power. The granting of a Life Consulate in 1802 had, after all, bestowed on Bonaparte the right to nominate his own successor, and at that point, his marriage to Josephine proving barren, he had no heir. It was the resumption of war in 1803, plus the continued plotting of royalists, that convinced many contemporaries, as well as Bonaparte himself, that a truly hereditary regime offered better safeguards than the present arrangements, as well as a greater chance of perpetuating the current situation beyond the death of the present incumbent. So the Republican Consul became Emperor Napoleon. Comparisons with Washington were already out of date, for there was no possibility of retirement; instead, reference to Caesar or Charlemagne grew more relevant.

In fact, the Empire was less popular with the electorate than the Life Consulate had been, though the resumption of war had much to do with this, since a cooling of enthusiasm was especially marked in maritime areas, which suffered most from renewed (and once more disastrous) naval conflict with Britain. But though France technically remained a republic, with an emperor at the helm who promised to uphold liberty and equality, practices from the old regime gradually insinuated themselves to a greater extent. Some had bridled at the institution of the Legion of Honor in 1802, since it reintroduced distinctions between citizens. A court, however, presupposed a nobility, which was duly resurrected in 1808, and, though it was far less privileged than its old regime predecessor, new nobles were

permitted to entail their estates. The granting of titles and land to former Revolutionaries—Sieyès became a count, while Fouché took the title of duke, for instance—was somewhat unedifying, but the return of increasing numbers of former nobles to the heart of the regime in the military and administration was still more indicative of its evolution. Napoleon clearly loved a lord, cultivated the traditional elite, and encouraged an aristocratic reaction.

Nonetheless, it is often said that Napoleon remained a Jacobin abroad, and it is certainly true that the expanding Empire (which reached 130 departments at its height, including Baltic and Illyrian, as well as German and Italian provinces) did destroy clerical dominion and much customary practice. Yet the pattern of sister republics that Bonaparte had helped to shape before and after 1799 was now replaced with satellite kingdoms, several of them ruled by members of Napoleon's family, notwithstanding their variable political ability. Louis was given charge of Holland and Joseph dispatched to Spain, for example, while Murat (who had married Napoleon's sister Caroline) was given Naples. The process was literally crowned in 1809 when Napoleon divorced the childless Josephine and, the following year, married Marie Louise, daughter of the emperor of Austria. She succeeded in delivering the long-awaited male heir, though he never ruled as Napoleon II, and also encouraged further genuflections toward the established ruling houses with which Napoleon increasingly identified himself. In fact, it was the old dynasties for whom Napoleon now evinced such respect that eventually overturned him in 1814, through the adoption of some of his modernizing agenda, but, most of all, through a concerted effort against the waning resources of an exhausted, overstretched French Empire.

Yet this was not the end of Napoleon, merely the opportunity for another beginning. Less than a year later, in 1815, Napoleon escaped from the Mediterranean island of Elba where he had been confined in comfortable circumstances and began his celebrated Hundred Days. Not only was he back in charge of France between March and July 1815 but, most important, he recast himself in a Revolutionary role. He was once more Emperor, but he resurrected a Jacobin image and proposed a liberal version of his erstwhile regime. This studied ambiguity recalled the good old days of the Consulate, when nobles and priests were subordinate to General Bonaparte, not dominating the recently restored monarchy. The episode was inevitably short-lived, and when he came to grief at Waterloo, Napoleon was shipped off to St. Helena in the south Atlantic, whence there would be no return, until his remains were entombed at the Invalides in Paris in 1840. But the importance of the Hundred Days was posthumous; it was crucial in turning the image of the Emperor

from tyrant to liberator, a remarkable transformation that set the scene for the emergence of Bonapartism in the nineteenth century.

Napoleon himself returned to his original vocation as a writer during the final years of his life, which were spent, like his early years, on a remote island. Until his death from cancer in 1821 (persistent rumors that he was poisoned by the British are ill-founded), the pen once more predominated over the sword. The great dictator became literally that, employing Emmanuel, comte de Las Cases to write down his thoughts in the *Mémorial de Sainte-Hélène*, which has been rightly hailed as one of the most influential books of the century that followed. Much of the legend that was spun by Napoleon was contradictory and some of it downright mendacious, yet, in the light of the Hundred Days and his apparent ill-treatment by his British captors, it struck a tremendous chord with many of the French of all classes and conditions. The combination of glory and bathos, mixed with the meteoric rise and fall of the self-made man, who aroused the hostility of the establishment, but offered order and security, was to have broad appeal on both Right and Left. It was especially attractive to liberals and republicans who bitterly opposed the restored monarchy after 1815 and found the legend a potent rallying cry. Such was its appeal that the July Monarchy of Louis Philippe, founded in 1830 when the Bourbons provoked another revolution, sought to annex the Bonapartist inheritance to its own account, if to no lasting effect.

With the demise of this moderate form of monarchy in 1848, the way was paved for Napoleon's determined nephew to offer the real thing, by creating a Second Empire that consciously imitated the First. Louis Napoleon traded on a legend that was fostered by widespread propaganda and personal memories, by artists and ordinary people, and not least by the thousands of army veterans who were officially feted by the new imperial regime after 1852. Like his uncle, the second emperor employed an amalgam of authoritarianism and democracy, but having promised peace, like his predecessor he too was undone by war. The eventual establishment of the Republic after 1870 reduced Bonapartism to a fringe doctrine, with most appeal on the extreme Right. Yet its demise was by no means complete, and one might regard the advent of General de Gaulle and the Fifth French Republic in 1958 as something of a latter-day incarnation of the Bonapartist tradition. What is astounding, as we commemorate the bicentenary of Napoleon's First Empire, is that the individual himself continues to inspire so many and varied reactions. He left a massive legacy as a statesman, in addition to the reputation for outstanding military success, for which he is best known. Above all, at a popular level, the silhouette, the trademark tricorne hat, or the arm in the jacket, remain in-

stantly recognizable. There can be no greater testimony to the sheer longevity of a figure born in obscurity more than two hundred years ago who, as he himself predicted, continues to fascinate the entire world.

## French Revolutionary Political Thought and Ideology

The French Revolution sparked the beginning of a new sociopolitical order in Europe. The forces and ideas it unleashed swept away centuries of tradition and privilege.

The French Revolution made famous the political ideals expressed in the slogan, "Liberty, Equality, Fraternity." These ideals, however, are contradictory. It is impossible to realize them all simultaneously. The more that people are free to be or do things that are of interest to them, the more unequal they will become. And conversely the more people are made equal, the less free to be different they will be. These contradictory ideals are representative of the numerous ideas, many of them also contradictory, that were advanced during the French Revolution and its aftermath.

The French Revolution, as historians have observed, was not simply the product of ideas. Rather it was the unfolding of events in which numerous ideas played a role. The source for many of the ideas can be found in the work of foreign philosophers, in the critique of the *ancien régime* made by the French philosophes, in French social circles, and in the complaints of the lower classes.

A very important influence on both the French Revolution and the American Revolution was the social contract political theory of John Locke. Locke wrote two treatises on civil government. *The First Treatise on Civil Government* (1690) refuted the theory of the divine right of kings that had been laid out by Sir Robert Filmer (*Patriarcha*, 1680). Locke's *Second Treatise on Civil Government* (1690), which argued that legitimate civil government rested on a social contract, was known in France prior to the Revolution.

In the decades prior to the French Revolution, there were numerous critics of the *ancien régime*. The French monarchy had by a long process in the preceding centuries become an absolute monarchy. For practical purposes, most power was centered in the person of the king, which was, in turn, synonymous with the state. Louis XIV had expressed this theory in his famous assertion, *L'état c'est moi* (I am the state). One of the justifications for this status quo was the theory of divine right. The basic claim was that the monarch had been born and ascended the throne according to the will of God and was therefore rightly to be obeyed. Divine right supporters put forth numerous theologically grounded justifications. Some argued that God had given humans his law in the form of the Ten Commandments. Since the commandment to honor one's father and mother could biblically be punished with death, the same penalty should apply to those who disobeyed the Father of France, namely the king.

In the process of consolidating the power of the French monarchy, the rising middle class (the bourgeoisie) had supported the king. Consolidation of power into a single unified government gave the bourgeoisie a broad market and put an end to large numbers of petty principalities ruled by nobles who collected taxes or fees on goods in transit across France. As a consequence, the power of the nobility had been greatly reduced by the rise in power of the monarchy.

It was the concern for the loss of power by the nobility that had driven Baron de Montesquieu to search for liberty (for the nobility) as a way to recover some of their power. His literary criticisms of the "corruptions" of the *ancien régime* were recorded in the *Persian Letters* (1721). Separation of powers was the solution to the problem of liberty set forth in his *Spirit of the Laws* (*De l'esprit des lois*, 1747).

Montesquieu was not seeking liberty for all, but for the nobility. He was arguing for a balance of privilege among the elite bodies in the state. However, supporters of the king advocated ideas such as absolutism, inequality, privilege, slavery, and the unity of church and state in support of the status quo.

The philosophes were a varied assortment of thinkers who criticized many aspects of French government and politics in the decades prior to the Revolution. Pierre Bayle's *Dictionnaire historique et critique* (1697) paved the way for more forward-looking criticism such as that in Denis Diderot's *L'Encyclopédie* (1751–1765), which contained articles written by many social and political critics.

Even more egalitarian in outlook was Jean-Jacques Rousseau. Often considered one of the forerunners of the Romantic movement, since, unlike the more rationalist philosophes, he exalted the emotions of the uncorrupted human heart, he published a number of books and articles advocating equality. However, his ideas on social contract theory in *The Social Contract* (*Du contrat social*, 1762) did not become popular until the time of the Revolution.

Economic ideas were advocated by a group of French economists, the Physiocrats, who argued for the free circulation of wealth unhindered by government control. Their political economic theory, which based the theory of the need for free circulation of wealth on the analogy between society and the human body, with its need for free circulation of blood, was to influence Adam Smith, the author of *The Wealth of Nations* (1776). However, he rejected their ideas about agriculture as the prime source for the creation of wealth.

At the time of the Revolution, the Estates-General (*états généraux*, also called the States-General), the French legislative body, was organized into three estates. The First Estate was composed of the clergy. The Roman Catholic Church was a powerful institution that supervised laws on marriage and family, as well as administered cases involving this area of the law. It was also the owner of at least a tenth of the country's land. The Second Estate was composed of the king and the nobility. The First and Second Estates were exempted from most taxation. The Third Estate represented all the peasants, urban workers, middle-class merchants, and wealthy merchants. Many wealthy members of the Third Estate were innovative leaders and important contributors to French socioeconomic life. There was great resentment among the members of the Third Estate because they paid most of the taxes and had the lowest social standing. Legally they were almost always at a disadvantage in the courts. Great numbers of peasants and urban workers were also the victims of grinding poverty.

The French Revolution began partly as a consequence of the bankruptcy of the French state. The financial crisis

was the product of several factors, not the least of which was the expense of the Seven Years' War (in America known as the French and Indian War, 1756–1763) and French participation in the American Revolutionary War (1775–1783). The Parlement de Paris (the high court of France) wanted the king either to borrow more or to raise taxes. Louis XVI reluctantly called the Estates-General into session on 5 May 1789. This was its first meeting since 1614. Many of the members of the First and Second Estates wanted the three estates to meet and vote separately. However, the Third Estate demanded a unified national assembly, with each representative to have one vote. In addition, it wanted the Estates-General to frame a constitution. When the king, along with the First and Second Estates, rejected the demands of the Third Estate, its members met on the tennis court at Versailles and vowed (in what is known as the Oath of the Tennis Court) to remain in session until a new written constitution was adopted. Louis XVI sought to gain time in which to organize troops to remove the Third Estate. To do so, he acceded to their demands by allowing the three estates to merge into a single National Assembly.

Inherent in the actions of the Third Estate was the demand for a unified legislature for the country that would serve as the primary source of law. In addition, the demand for a constitution was a demand for limited government embracing clearly stated laws that were "rationally" adopted. Finally, implicit in the merging of the three estates was the idea of equality.

Popular direct action took place on 14 July 1789, when masses of Parisians stormed the Bastille, a fortress-prison hated for its association with arbitrary incarceration of political dissidents. A revolutionary government was formed in the capital, and in the countryside peasants rose up against many of the nobles. Some of the nobility decided to flee to safety in foreign lands as émigrés. Government property, officials, and members of the nobility were considered natural and justifiable targets of Revolutionary attacks, though in some cases simple personal vengeance was at work.

On 4 August 1789 the National Assembly adopted what has become known as the Decrees of 4 August. In a dramatic all-night session, the members of the National Assembly dismantled the feudal system, renouncing for the good of the nation all privileges of classes, cities, and provinces.

A permanent contribution to politics made by the Revolution was the concept of ordering political representatives or actors according to a range of political ideas from left to right. The delegates in the French assembly seated themselves with the supporters of the king and the nobility on the right, with the middle class in the center and the more radical elements on the left. This formation

has since the period of the Revolution been used (often simplistically) to identify conservatives as on the right, moderates in the middle, and various reformists and radicals on the left.

On 26 August 1789 the National Assembly adopted the Declaration of the Rights of Man and the Citizen. The Declaration's first points asserted that all men are born free and equal, with rights that are natural and inalienable. Social distinctions could only be permitted for the common good. Moreover the Declaration stated that the goal of all political associations is the preservation of the inherent rights of man, which include liberty, property, security, and resistance to oppression. The Declaration also lodged ultimate power (sovereignty) in the nation, thereby removing it from the person of the king. Consequently any attempts or claims to authority not derived from the nation were illegitimate. The Declaration promulgated the idea that liberty was paramount and inherent in all men. Liberty could only be restricted by laws that prohibited activity deemed harmful to society.

Rousseau's influence was apparent, in that law was defined as an expression of the "general will" (a key concept in Rousseau's thought, expounding his belief that the good of all could be promoted by legislators who mysteriously would be able to know what the "general will" of the whole community was, as opposed to the will of each individual or special interest to achieve its own ends). It also declared that every person was a citizen, equal before the law without distinctions, except those produced by virtues or talents.

The Declaration prohibited arrest except as permitted by law. Similarly, punishment was only to be prescribed by law. *Ex post facto* laws were also prohibited. The principle of the presumption of innocence was enshrined, and police abuse of power was prohibited. Points 10 and 11 of the Declaration stated that there was to be freedom of speech and liberty of conscience in religious expression. To secure the rights of man and of the citizen, armed forces were necessary, but only for the common good. The costs of supporting the military were to be borne proportionally, with the greater burden resting on the shoulders of the rich. There were, moreover, to be readily available public accountings of all taxes and appropriations, with public accountability of all public officials. The last point in the Declaration asserted that property was an inviolable and sacred right. Despite the rhetorical absoluteness of this claim, it went on to specify how property could be legally taken with just compensation.

The National Assembly eventually adopted a constitution that turned France into a limited constitutional monarchy with a unicameral legislature. The court system was reorganized, and a beginning made toward adopting a

civil code. France was organized into eighty-three regional units of government called departments. Each was to have an elected council. However, the right to vote was limited to citizens who paid a certain level of taxes. In the minds of many, these reforms were the result of a properly rational approach to ordering the state.

The National Assembly also seized the property of the Roman Catholic Church. Proceeds from sales were used to reduce the French national debt. The National Assembly also reorganized the Catholic Church, closed the monasteries and convents, and mandated the election of priests and bishops (though this provision did not last). Finally, religious tolerance was granted to Protestants and Jews. The National Assembly adjourned at the end of September 1791. The members were under the impression that the Revolution was over, and that the incoming Legislative Assembly would now govern. The Legislative Assembly convened on 1 October 1791. Shortly thereafter it was forced to deal with the opposition of the king and nobility, along with the opposition of many Roman Catholics.

By April 1792, Austria and Prussia were at war with France. The king, however, was hoping for foreign help in defeating the Revolution. Consequently mobs in Paris and Revolutionaries throughout France demanded that the king be dethroned. In August, a crowd of Parisians took custody of the king and his family. The constitutional monarchy was over, and the Revolution was moving toward regicide. The Legislative Assembly responded to these events by calling for a National Convention, which would draft a new constitution.

In early September, French military defeats panicked Parisians into taking control of the growing number of prisoners in the city. One thousand people were summarily executed in the September Massacres. The French victory at Valmy on 20 September helped to restore calm. The dethronement of the king ended the first phase of the Revolution, which up to that time had been a liberal middle-class reform movement seeking a constitutional monarchy. The second stage of the Revolution brought more radical and democratically minded people to power. The National Convention convened on 12 September, declaring France a republic with the official slogan of "Liberty, Equality, and Fraternity." It also put Louis on trial for treason. He was found guilty and beheaded on the guillotine on 21 January 1793.

The Revolution soon became a struggle for power between radical leaders. In the Convention, the Mountain faction, the most extreme element of the Jacobins, the party of the Left (led by Maximilien Robespierre, Georges-Jacques Danton, and Jean-Paul Marat) opposed the Girondist faction, the party of the Right and sought to form alliances with the Plain faction, the neutral majority

within the National Convention. In the ensuing power struggle, Charlotte Corday, a Girondist sympathizer, assassinated Marat in July. This and other incidents allowed the Jacobin faction led by Robespierre to defeat the Girondists.

The Jacobin government instituted both democratic and dictatorial policies. Democratically it created a new citizen army filled by recruits from a national draft. The transformation of the army led to a radical change in military tactics. The more democratic the army became, the more destructive became the battles it fought, since instead of professionals fighting limited engagements, now citizens, promoted by merit, were fighting in a total war for the very survival of their revolutionary cause. The government (that is, the Convention) also extended the benefits of the Revolution to the lower classes. They provided public assistance, universal public education at the primary level, price controls, and taxes based on income. In addition they sought to abolish slavery in the colonies. These democratic reforms were not completely instituted; as a result, France remained socially fractured thereafter.

The Thermidorian Reaction on 27 July 1794 ended the Reign of Terror and sent Robespierre to the guillotine. Conservative forces gained control of the Convention and quickly repealed many of the democratic reforms of the Jacobins. A new constitution was adopted in 1795, and France was ruled by an executive body of five, known as the Directory, chosen by a legislature elected according to more conservative principles. To deal with its enemies, the Directory appealed to a young French general, Napoleon Bonaparte, who dispersed a hostile crowd in the streets of Paris on 5 October. A few years later, after building on his military successes, he was able to seize control of the government on 9–10 November 1799 (18–19 Brumaire in the Revolutionary calendar) and end the Revolution, bringing into being the Consulate.

Explicit or implicit in the numerous reforms adopted by the several revolutionary legislative bodies were ideas that became permanently enshrined and that sometimes bore fruit. The marquis de Condorcet, a Girondist who died in prison before he could be tried, left a literary corpus that stimulated the development of the idea of progress, while Antoine Louis Claude Destutt, comte de Tracy, developed ideas on ideology.

Foreign observers often opposed the basic idea of the French Revolution, namely that rationalism, the application of pure human thought, is sufficient for the creation of the best form of government. Edmund Burke disagreed in his *Reflections on the Revolution in France* (1790). His *Reflections* argued that tradition and the wisdom of the ages provided better guidance than the claims of Reason. Burke was attacked by a number of writers, but most especially by Thomas Paine who had been a very important

pamphleteer in the American Revolution, authoring *Common Sense* (1776) and other inspiring pamphlets. Paine wrote *The Rights of Man* (1791–1792) to refute Burke's criticisms. Another foreigner stimulated by the French Revolution was Johann Gottlieb Fichte. The concept of fraternity was reduced by Fichte from one of universal rights to what would become one of the most influential ideas of the nineteenth century—nationalism—which argued that peoples sharing a common language, culture, and heritage ought to establish for themselves a unified nation. The Revolution also stimulated egalitarian revolutionary socialism, another prominent feature of nineteenth-century European political culture.

## Literature and the Romantic Movement

The prose, poetry, criticism, and drama produced during the French Revolution and the Napoleonic Wars offer a cultural insight into the sentiments of the period. The work of some writers responded to the tumultuous contemporary events that surrounded them, either supporting or protesting these events. Other writers shied away from the chaos of daily life, concentrating instead on themes that gave an alternative to the turmoil of French life. Many of the writers were actually caught up in the politics of the day, and some were either executed or exiled from their country. Around the turn of the century, the Classicism that had dominated the eighteenth century literary scene began to slowly be replaced by Romanticism, a movement that came into full bloom in the post-Napoleonic era.

Prior to the Revolution of 1789, censorship of literature was very tight within France. Writers relied on the patronage of the aristocracy for their livelihood, and literature was considered a mainly upper-class pursuit. Some writers, however, were tapping into Revolutionary feelings prior to 1789, such as Pierre Choderlos de Laclos, whose 1782 *Les Liaisons dangereuses* (Dangerous Liaisons) reflected on the perceived decadence of the aristocracy.

Between 1780 and 1800, significantly, many texts were produced, but not many of them rose to the level of literature. In the Revolutionary years, censorship was officially ended, but texts that ran contrary to Revolutionary ideals were banned. Old printing houses went bankrupt in the shake-up, while new ones opened. Many of the texts that were produced in the last decade of the eighteenth century have long been forgotten. Toward the end of the eighteenth century, fiction started to assert its authority as the dominant form of discourse. Novels, rather than poetry or drama, suited the taste of the time best.

Even in poetry and drama, however, the 1790s were not a complete literary wasteland. Standing out as a light of late eighteenth-century literature is André Chénier, considered by many to be the best French poet of the eighteenth century. Chénier's literary style was marked by his use of iambic meter, and his fondness of the style of odes and hymns. An early supporter of the Revolution, Chénier became disenchanted with its later excesses. He was imprisoned during the height of the Terror and executed. During his lifetime, only two of his poems were published, *Le Serment du Jeu de Paume* (The Oath of the Tennis Court) and the *Hymne sur l'entrée triomphale des Suisses révoltés du régiment de Châteaueux* (Hymn on the Triumphant Entry of the Rebellious Swiss of the Regiment of Châteaueux), but from 1819, more of his poems began to appear, and he was read and much admired by the Romantics of the nineteenth century. While Classical in their subject matter, Chénier's poems were experimental in style, hinting toward what was to come with the Romantic movement. Victor Hugo, considered the head of the French Romantic movement, was deeply influenced by Chénier's work, particularly in *Les Châtiments* (The Punishments). The epic fragments found in Chénier's work were another preview of Hugo's work, which followed in the nineteenth century.

Through Chénier's poetry of the Revolution, the reader can see a very perceptible change in the poet's mood. The poems of the early Revolution show hope in the future, hope that the changes were to be for the better. As the Revolution progressed, though, Chénier's poems moved away from their early optimism to disgust and fury at the excesses of the Revolutionaries.

Bernardin de Saint-Pierre, a follower and student of Jean-Jacques Rousseau, continued his career as a writer through the 1790s. His two most influential works—*Etudes de la nature* (Study of Nature) and *Paul et Virginie*—were published before the Revolution, but his work continued through the century. His output, though small, was influential in the Romantic movement with its ideas—similar to those found in Rousseau—of the essential goodness of man.

In direct opposition to the views espoused by Saint-Pierre and Rousseau was the controversial figure Donatien-Alphonse-François de Sade. In his writing, de Sade promoted the notion that all human behavior is driven by debauchery, and that evil and lust propel actions. Well into the twentieth century, de Sade's work was banned by censors, and he was imprisoned under both the *ancien régime* and the Revolution. The pornographic *La Philosophie dans le boudoir* (Philosophy in the Bedroom, 1795), like much of de Sade's writing, contained political commentary. In the fifth dialogue of the novel (which was broken into seven dialogues), the reader finds a political tract

entitled “*Français, encore un effort si vous voulez être républicains*” (Frenchmen! One more effort if you want to become republicans). De Sade’s writing was particularly influential for the nineteenth-century Romantic poet Alphonse-Marie-Louis de Prat de Lamartine.

Another author of the same period whose work was considered by some to be marred by obscenity was Nicolas-Edmé Restif de la Bretonne. Writing mainly about ordinary people, with women central to his texts, Restif de la Bretonne’s most important work was completed prior to the Revolution. *Monsieur Nicolas*, however, was written in 1796–1797. Although not of a particularly high literary standard, the novel is interesting because of the unique view of life it offers the reader.

Drama flourished in Revolutionary France. In the decade after 1789, 1,000 new plays were written. Revolutionary and patriotic in flavor, antireligion and antiaristocracy in sentiment, not many were of particularly high quality. Popular in the early part of the Revolution was a play by Marie-Joseph Chénier (brother of poet André Chénier), *Charles IX ou la Saint-Barthélemy* (Charles IX, or Saint Bartholomew), later retitled *Charles IX ou l’École de rois* (Charles IX, or the School of Kings). A five-act tragedy, *Charles IX* appealed to the Revolutionaries with its theme of a corrupt monarchy. The play fell out of favor during the Terror.

Sylvain Maréchal’s *Jugement dernier des rois* (Last Judgment of Kings) was first staged in October 1793, at the height of the Terror. The final scene depicted a volcano erupting, blowing all the European monarchs and the pope off the earth.

The plays of René-Charles Guilbert de Pixérécourt were based on successful novels of the day. Pixérécourt’s plays were melodramas, which was then a new style of drama. His first success was with *Victor ou l’Enfant de la forêt* (Victor, or the Child of the Forest, 1797), followed by the even more successful *Caelina ou l’Enfant du mystère* (Caelina, or the Child of Mystery, 1800). Both were based on novels by François-Guillaume Ducray-Duminil.

Dramatist Népomucène Lemerrier’s 1797 play in verse *Agamemnon* was considered a stunning success by his contemporaries. Lemerrier’s reputation persists, though, as the creator of French historical comedy in *Pinto ou la Journée d’une conspiration* (Pinto, or the Day of a Conspiracy, 1800), based on the revolution of 1640 that saw Spain pushed out of Portugal.

Pierre-Augustin Caron de Beaumarchais, one of the most significant French playwrights of the eighteenth century, produced one play after 1789, a drama: *L’Autre Tartuffe, ou la Mère coupable* (The Other Sanctimonious Hypocrite, or the Guilty Mother, 1792). It did not, however, live up to his earlier comedies, such as *Le Mariage de Figaro* (The Marriage of Figaro, 1784).

Supporter of the Revolution Ponce-Denis Écouchard-Lebrun’s poems were very much in vogue during the latter part of the eighteenth century, but quickly faded to obscurity in the nineteenth century. His most celebrated ode was *Sur le vaisseau “Le Vengeur”* (On the Vessel *Le Vengeur*). It told a story of a French man-of-war that was sunk in 1794 rather than surrender to the British. His poetry had very little literary quality but tapped in to popular sentiments of the day. The official coloring of Lebrun’s poetry is undeniable.

Denis Diderot’s posthumously published novel, *Jacques le fataliste*, first appeared in German in 1792. It was another four years before the French version was published. In *Jacques*, Diderot flouted literary conventions in a style influenced by Laurence Sterne’s *Tristram Shandy* (1759–1766). A mix of forms, the uncertainty of the novel reflected the uncertainty of the times in which it was published.

The novels of Pigault-Lebrun were extremely popular around the turn of the century, and were widely read. Novels such as *L’Enfant du Carnaval* (Child of the Carnival, 1792) and *Monsieur Botte* (1802) found a large audience, and Pigault-Lebrun’s influence was felt by the Romantics who followed him, who were inspired by his realistic writing style, which mirrored the confusion of everyday life. Many of Pigault-Lebrun’s novels were set against a Revolutionary backdrop, and they were filled with adventure and excitement.

Also very popular around the turn of the century were the novels of Madame “Sophie” Cottin. Cottin wrote five novels, including *Claire d’Alba* (1799), which were sentimental and moralistic.

The early nineteenth century was not a particularly high point in the production of French literature. Book production and distribution was expensive, and sales were comparatively low. In 1800 Bonaparte, then First Consul in the Consulate government, tried to get literature moving again in France. He assigned people such as Louis de Fontanes and Joseph Joubert to encourage the production of literature. Things did not change, though, until the July Revolution of 1830, with its associated changes. A few writers, however, do stand out, both for their intrinsic interest and for their influence on the Romantic movement.

Possibly one of the most influential writers of the period, and definitely one of the most interesting, was Anne-Louise-Germaine Necker, better known as Madame de Staël. De Staël was exiled by Napoleon in 1803, 1806, and 1810. She finally returned to Paris in 1814. She was both hated and feared by Napoleon, who did not know how to deal with women of genius. In the last years of the eighteenth century, her *salon* was one of the most important in Paris.

De Staël wrote two novels, *Delphine* (1802) and *Corinne, ou l’Italie* (1807). Both of these works presented Revolutionary sympathies, and both offer models of femi-

nine determination. Although not implicitly protesting Napoleon, de Staël did go against the French leader by challenging his beliefs. This is most evident in *Delphine*, where the story's protagonist is extremely forward-thinking in her attitudes. Women's rights are supported through the narrative, and religious bigotry is attacked.

The most important of de Staël's works were *De la littérature considérée dans ses rapports avec les institutions sociales* (Literature Considered in Its Relationship with the Social Institutions, 1800) and *De l'Allemagne* (From Germany, 1810). *De la littérature* was a work of literary criticism that reviewed literature from different periods, demonstrating that they reflected the notions of the society in which they were produced. *De l'Allemagne*, another work of literary criticism which was first published in France in 1810 but which was seized and destroyed by police, was first released in Britain in 1813. De Staël emphasized the contrast between German and French literature. She saw Classicism as being essentially non-French in character, while she wrote that romance was essentially French in character. Not only did de Staël help strengthen the Romantic movement in France with such assertions, but she also introduced French readers to a number of German writers and philosophers who hitherto had been unknown to the French.

Standing alongside of de Staël in terms of influence in the Revolutionary and Napoleonic periods but with more pure literary genius was François René, vicomte de Chateaubriand, a royalist who was exiled during the Revolution. During his exile in England, Chateaubriand wrote *Les Natchez*, a prose epic in twelve books that was not published until 1826.

On returning to France in 1800, Chateaubriand soon established his literary reputation with *Atala, ou les Amours de deux sauvages dans le désert* (Atala, or the Love of Two Savages in the Desert, 1801), a tale that was originally to be part of *Les Natchez*. After abandoning the idea of publishing *Atala* as part of *Les Natchez*, he planned on publishing it as part of *Le Génie du christianisme* (The Genius of Christianity), but also relinquished that idea, and published *Atala* on its own. The short tale secured Chateaubriand's fame in his home country.

When *Le Génie du christianisme* was published in 1802, Roman Catholicism was just being reinstated as the official religion of France, and the Christian apologetics contained therein tapped in to a common emotion running through French society at the time. The publication also gained favor with Bonaparte, whose support Chateaubriand welcomed at first, but from which he later turned away.

Within *Le Génie* was the tale of *René*, which was published separately in 1805. *René* contained all the world-

weariness and yearning that categorized the writings of the early Romantic movement. A beautifully written work, *René* handled the young style of Romanticism magnificently. At the turn of the century, de Staël and Chateaubriand stood marking the change from the eighteenth to nineteenth centuries, and the change from Classicism to Romanticism as the dominant literary mode.

Chateaubriand's *Les Martyrs* (1809) contained many allusions to contemporary politics, and was as close as many got to protest literature against the Napoleonic regime. Set in the third century, *Les Martyrs* took the form of a prose epic. Many have drawn similarities between Napoleon and Diocletian; fewer have drawn comparisons with Fouché, Napoleon's chief of police, and *Les Martyrs*'s vicious Hiérocès.

Joseph Joubert published extremely little during his lifetime, but was considered very important and influential in his role as philosopher and counselor to some of the period's foremost thinkers, including Chateaubriand. His reputation as a critic was protected after editions of his writings were published posthumously by Chateaubriand in 1838. Although his literary output in the Revolutionary and Napoleonic periods was negligible, the impact of his thought on other writers of the time cannot be discounted.

Another forerunner of Romanticism was Étienne Pivert de Senancour, whose *Obermann* (1804) inspired many of the Romantics who followed. Unlike Chateaubriand, though, Senancour's *Obermann* was largely ignored in the first few decades of the nineteenth century. It was not until 1833 that it really came to the public's attention. Appearing under the title *Aldomen* in 1795, Senancour's work was confessional and written in the style of letters. The melancholy that Senancour entwined with his descriptions of nature make *Obermann* a precursor to the Romantic movement. Although fault can be found with the work, it also has very strong merits. *Obermann* was a much more candid form of literature than had been seen before, or would be seen for a considerable time after.

Benjamin Constant's *Adolphe*, written in 1807 and published in 1816, can be constructed as a bridge between the Classicists of the eighteenth century and the Romantics of the nineteenth century. The novel, written by de Staël's longtime companion, combined the analysis of the Classicists with the Romantic theme of the disunited self. More important than the bridging quality of the novel, though, is the fact that *Adolphe* was a predecessor of the modern psychological novel.

What is considered by many to be the first good short story of nineteenth-century French literature did not actually originate in France, but from within Russia. Xavier de Maistre was a French novelist living in Russia. His story,

*Les Prisonniers du Caucase* (Prisoners of the Caucasus, 1815), was considered something of a literary masterpiece.

The literature of the eighteenth century had been dominated by Classicism. Reasoned, clear, and objective, Classicism was focused away from the personal and toward ideas of “taste.” Romanticism rebelled against the reason and will of Classicism, focusing instead on imagination and feeling, and rejected the ideas of a limited imagination. Around the turn of the century, senses and emotions in literature began to come into vogue. Melancholy, dreams, and happiness were aligned with the natural world. The political upheaval of the times and the unsettled nature of society at the time meant that French literature was set to head in a new direction. The returning *émigrés* added their newly broadened minds to this shift away from the old guard. The novels of Chateaubriand and the criticism of de Staël also directed this change to romance being the dominant mode of French literature. Classicism was too rigid to accommodate the emotions and feelings that French writers felt the need to express. Although the full bloom of the Romantic movement did not come until after Waterloo, its beginnings were important in Revolutionary and Napoleonic France.

## Empire-Building within Europe and Abroad

The Napoleonic era did not usher in the age of empire in Europe, but the rise of nationalism and the need for increased trade and raw materials during that era accelerated the development of imperialist policies among the major powers of the day. Though the Napoleonic Wars did hasten the demise of some of the minor imperial states, they also contributed to the expansion of empire for countries such as Britain and Russia. Certain major powers such as Britain were able to expand their empire abroad, while other states attempted to enhance their territories within Europe. Meanwhile, states such as France lost much of their external empire, while many minor states of Europe were absorbed into the Great Powers of the Continent.

The French Revolution and the subsequent Napoleonic Wars followed a period of intense imperial rivalry between France and Britain. By 1789, Britain had dramatically expanded its empire (even with the loss of those colonies that became the United States). Britain emerged from the Seven Years' War (1756–1763) and the American Revolution (1775–1783) with new colonies in India, Canada, and the Caribbean. France, meanwhile, lost its Indian and North American colonies, but it retained the richest of its Caribbean territories, including St. Domingue, Martinique, and Guadeloupe. Significantly, the French colonies in the Caribbean were twice the size of their British counterparts and produced twice the revenue.

The Napoleonic Wars represented for the British an opportunity to displace France from the Caribbean and take control of its rich colonies. This expansion assured British international economic hegemony and dominance of world trade. With this end in view, when war commenced between France and Britain in February 1793, the British immediately launched expeditions that captured Martinique and Guadeloupe. As countries were conquered or switched sides during the successive wars, the British steadily gained new territories. For instance, at the Peace of Amiens in 1802, the British restored the colonies taken

from the French, but they retained possession of the strategic territories of Ceylon (formerly Dutch) and Trinidad (formerly Spanish). When war resumed the next year, the British were able to capture the last French trading post in India. They later seized a number of colonies that were part of the empires of minor European states under the sway of Napoleon, including Holland. For example, in 1806 the British captured the Cape Colony in southern Africa, and in 1811 they overran the Dutch East Indies.

While the British sought to expand their overseas empire to support industrialization and strengthen commerce, they did not seek territory on the European continent. Instead, British policy was based on efforts to ensure a rough balance of power among the major European states. Even at the end of the Napoleonic Wars, the British did not seek to dismember France, but to maintain its viability as a check on the other imperial powers.

For France, the Napoleonic era was marked by dichotomous official and popular sentiment toward the colonies. On the one hand, the tenets of the Revolution—liberty, equality, and fraternity—were at odds with grand notions of empire. On the other hand, the effort to export these ideals, indeed to export the Revolution itself, led French leaders to launch invasions and acquire new territory. As the Napoleonic Wars progressed, France also found it increasingly important to promote its economic interests by securing its existing colonies or by gaining new ones in order to expand its markets. Military forces were sent to retake Guadeloupe and Martinique and to launch an invasion of St. Vincent.

One example that illustrates the contradictory nature of French sentiments was the nation's policy toward slavery. Although the deputies of the National Assembly initially sought to reconcile the themes of the Declaration of the Rights of Man and the Citizen with slavery, a slave revolt in Saint-Domingue in 1791 led the government to abolish slavery three years later, in an effort to maintain control of the territory. However, after Bonaparte became First Consul, he restored the institution of slavery in French colonies and launched a disastrous expedition to quell the slave revolt. In 1804, Saint-Domingue became the independent country of Haiti, though Bonaparte was able to reestablish slavery in the other French colonies.

The French effort to develop a Continental empire began as a result of policies to liberate the peoples of Europe from royal tyranny by destroying the Continent's monarchical system. The French desire to "republicanize" the other states of Europe reflected a broad effort at a supranational cultural and political revolution and a concurrent drive to protect France by establishing similar anti-monarchical governments in neighboring states that would no longer pose a threat to the Republic. It later con-

tinued through efforts to actually end the war. Although war began in 1792 as an effort to forestall a counterrevolutionary incursion by Austria, within a year France was at war with every major European power except Russia. Imperial temptations saved the nascent French Republic, as Austria and Prussia, along with Russia, became distracted by their 1793 partition of Poland (which was followed by the 1795 partition, which eliminated Poland from the map). While the monarchies were preoccupied, the Directory was able to draft a massive army of 700,000 and turn the tide of the war.

In 1794, the French armies conquered and annexed territories ranging from the Austrian Netherlands (Belgium) to Mainz and Savoy. While the French marched to "liberate" these new territories, the inhabitants of the newly acquired regions soon realized that the French were an occupying force. Instead of exporting the ideals of the Revolution, France viewed these regions as resources to support the Revolutionary government, as they essentially became colonies. In 1795, French troops invaded Holland and established the Batavian Republic as a "sister state" to France, but the territory remained a satellite state instead. In 1795, the Directory dispatched the young General Napoleon Bonaparte to invade the Italian states as a means of forcing Austria out of the war. Bonaparte placed new territories under French control and forced the local citizenry to pay taxes to support his armies.

The ability of the Directory to harness the growing nationalism of the French people marked a major turning point in the age of imperialism. As nationalism and imperialism became intertwined, the emerging nation-states of Europe, with their growing industrial bases, were able to field larger and more powerful armies, albeit with weapons largely unchanged in decades, but with ever-more-sophisticated tactics. Efforts by various powers to enforce trade blockades, especially against the French and British, reinforced the need for states to secure sources for raw materials and markets for manufactured goods by establishing colonies or gaining political authority over regions.

In 1798, French armies also invaded Switzerland and the Papal States, and Bonaparte launched his abortive invasion of Egypt. By this time, the Directory had adopted ever-grander imperial aims to gain new territories, both to support the French domestic economy and to establish strategic bases to thwart the imperial ambitions of other European states. For instance, the Egyptian expedition was designed to restrict British access to India and to provide a French presence in the eastern Mediterranean. The Directory also needed new territories to provide new markets because of the ever-more-effective British naval blockade, which prevented France from trading with its extra-European colonies. Concurrently, however, the Directory

faced growing discontent among its newly acquired territories in Europe. Belgium revolted against new conscriptions, and other states chafed under French control.

In May 1804, the First Empire was proclaimed and confirmed by a plebiscite. Subsequent constitutions made Napoleon Emperor of France, and his coronation took place on 2 December. In May 1805, he also crowned himself king of Italy. The ascension of Napoleon as Emperor ended any real pretense of exporting the republicanism of the French Revolution. From 1799 onward, Napoleon attempted to develop an integrated European state system under French suzerainty. He exported his civil and legal codes and endeavored to establish civil authorities that would be loyal to himself. He also restored some aspects of the autocratic *ancien régime*, including its styles, to his court.

After he became Emperor, Napoleon created 3,000 nobles in France (including a large number that had belonged to the old regime). He aspired to rival the ancient Greek and Roman empires and envisioned his modern European-based Empire as a revival of the empire of Charlemagne. In order to ensure the loyalty of conquered territories, Napoleon placed members of his family or trusted military officers on often newly created thrones to rule monarchies that were subservient to Paris. The Netherlands, for instance, was converted from the Batavian Republic to the Kingdom of Holland under Napoleon's brother Louis, while his brother Joseph was first made the king of Naples and later placed on the Spanish throne. Other relatives and favored generals were given titles to various duchies and provinces.

These territories and the institutions of French control throughout Europe were the manifestation of a renewed feudalism. The new monarchs were directly responsible to Napoleon, and to him alone, as vassals had been to feudal monarchs, and the Emperor used territorial conquest to reward family members and military subordinates. He titled his creation "the Grand Empire."

The power of the Royal Navy and the military success he enjoyed on the Continent gradually lessened the appeal of overseas colonies for Napoleon. In the aftermath of the disastrous military expedition to recapture Haiti in 1803, the Emperor decided to sell the secretly acquired (from Spain) Louisiana Territory to the United States. Once war resumed after the Peace of Amiens in 1803, the British went on to capture the remaining French colonies in the Western Hemisphere, including Guiana (Guyana), Guadeloupe, Martinique, and several smaller islands.

Throughout the Napoleonic Wars, Spain retained its major possessions in North America and the Caribbean. However, its hold on these territories was tenuous at best and subject to the vagaries of both internal colonial poli-

tics and the machinations of the international system. In 1793, its forces launched attacks on St. Domingue and Spain offered freedom to slaves who rose in rebellion against the French colonial government.

When Napoleon invaded Spain in 1808, the Spanish colonies in South America refused to recognize Joseph Bonaparte as king. They increasingly asserted their independence and began trading with the British. Argentina and Paraguay (as they later became known) launched revolutions and became independent states. Other territories, including Chile, Colombia, Ecuador, Mexico, and Venezuela also revolted against Spanish rule. Although the Crown was able to reassert its authority in these regions, within a decade after the Napoleonic Wars, most of the major Spanish colonies in South America had gained their independence.

The Napoleonic Wars also hastened independence movements in the Balkans. Napoleon was able to convince the Ottoman Empire to go to war with Britain (1806–1809) and with Russia (1806–1812). While the French Emperor sought to use the Turks to divert Russian forces, St. Petersburg used the opportunity to encourage uprisings against the Turks by groups such as the Serbs and the Romanians. The Russians also sought to acquire territory from the ailing Ottoman Empire. For instance, when war broke out in 1806, the Russians invaded and captured the Danubian provinces of Wallachia and Moldavia (portions of the territories were returned to the Turks in 1812 as part of a peace agreement).

Rebellion against the French in Spain in the Peninsular War demonstrated the risks of empire for the French and began the process of Napoleon's decline. Combined British, Portuguese, and Spanish regular forces, together with guerrillas were able to tie down French troops and inflict several humiliating defeats on the occupiers. By 1813 Joseph had been driven from Spain. This development drew Austria back into war with France—already being waged by Russia and Prussia—in the autumn of that year.

As the struggle raged in Spain, French efforts to strengthen imperial rule in German-speaking areas created tensions with Tsar Alexander I and led to Napoleon's greatest imperial gamble: the invasion of Russia. By 1812 Napoleon's Empire was the greatest that Europe had seen since the heyday of imperial Rome. France itself was twice the size it had been in 1789, thanks to the annexation of territories, and vast areas of the Continent were under the control of hand-picked kings or nobles loyal to Napoleon. The French Emperor sought to secure legitimacy for his Empire by marrying the Archduchess Marie Louise of Austria in 1810. Nevertheless, the other major powers of Europe continued to seek the demise of the French Empire.

Adapted from Rothenberg 2000, 135.

As Russia prepared to reenter the war, Napoleon launched his greatest military invasion at the head of the 600,000 troops of the Grande Armée. His aim was not the conquest of new territories, but to eliminate Russia as a major enemy. The disaster of the campaign, combined with British victories in Spain, led to the unraveling of the Empire. As Napoleon sought to preserve his far-flung dominions, countries such as Prussia and Austria reentered the war in 1813 in an effort to restore the old order and recapture lost provinces, or to simply gain new territories.

Through the winter of 1813–1814, the Allies sought to agree on a common strategy and establish a coordinated front against Napoleon. When the goals of the coalition were finally agreed on, they reflected broad imperial aspirations. Britain demanded and received assurances that it would be given wide latitude in colonial settlements, including the resolution of the fate of the Dutch colonies and Malta. Austria would regain hegemony over northern Italy and its former territories in the Balkans. Prussia and Aus-

tria would acquire territories from the German states. Russia sought territory in central and eastern Europe, particularly in Poland. Finally, in return for his defection from Napoleon, Bernadotte as king of Sweden would receive Denmark and Norway.

As the Allied forces marched on Paris, Napoleon abdicated. Under the terms of the Treaty of Fontainebleau (11 April 1814) and the Treaty of Paris (3 May 1814), Napoleon was exiled to Elba with an income from France, and Louis XVIII was installed as king. France was reduced so that the nation retained only its borders of 1792. It lost all of its empire, but skillful negotiating by Talleyrand secured the retention of Savoy, Avignon, and parts of both Belgium and the Rhineland. Britain made the most concessions. It kept Malta, Ceylon, Cape Colony, and some minor French colonies, but returned the main French and Dutch possessions in return for the creation of an integrated Dutch-Belgian state that the British hoped would be able to deter future French aggression. By 1814, the British

were paying massive subsidies to their allies, and even the lure of greater empire was overcome by the temptation to end the great fiscal drain on the treasury. The British ultimately became more interested in maintaining the balance of power on the Continent than in gaining widespread minor colonies (although those they kept had great strategic importance). The broader terms of the settlement were left to be decided by the Congress of Vienna, which convened in September 1814.

The Allies bickered among themselves as they divided the French Empire. The most significant controversy arose over how much territory Russia would gain in central Europe (it sought all of Poland). Austria and Britain found themselves arrayed against Russia and Prussia (the latter of which supported Russian claims on Poland in return for a Russian pledge to turn Saxony over to Prussia). Talleyrand, representing the restored French monarchy, allied France with Austria and Britain, so that Russia only received a portion of Poland and Saxony remained free of Prussian domination.

During the Congress, Napoleon returned from exile, in February 1815, and entered Paris as Louis XVIII fled. His reign lasted about 100 days (hence, the period known as the Hundred Days) before his final defeat at Waterloo. Napoleon was exiled to the remote island of St. Helena, while the Congress of Vienna finished reordering the map of Europe. Publicly, the Congress sought to apply the principle of legitimacy and restore the monarchs of the *ancien régime* across Europe. Nonetheless, in those areas where legitimacy collided with the imperial ambitions of the major powers, the principle of legitimacy was ignored. A reduced Poland was reincarnated as a kingdom with the tsar as king. Other Polish territories, including Galicia, went to Austria and Prussia. Austria's borders were restored, and it gained additional territories in Italy and central Europe and the Balkans. Prussian territory was also restored, and the kingdom received half of Saxony, Saarland, Swedish Pomerania, and areas of the Rhineland such as Cologne and Mainz. France was further reduced to her 1789 borders and lost territory to Prussia, Holland, Sardinia, and the Swiss Confederation. Finally, Belgium and Holland were combined to form the Kingdom of the Netherlands.

Napoleon's efforts to rule German and Italian territories had led him to consolidate the myriad duchies, principalities, and bishoprics of the regions into administrative units. Thus, the German territories were reduced in number from 600 in 1789 to 39 in 1815, after the Vienna settlement. The impact of his military campaigns and his civil actions helped encourage nationalist sentiments, which later manifested themselves in the creation of modern states such as Germany and Italy, and in domestic support

for the expansion of empire among colonial powers such as Britain and France. Increased nationalism and the continued drive for further markets launched a new wave of imperialism in the nineteenth century, both in Europe and abroad.

## Science, Exploration, and Technology

The French Revolutionary and Napoleonic Wars deeply involved some of the most technologically and scientifically advanced nations in the world, particularly France and Britain. Science, exploration, and technology were all affected by the needs of war. Two decades of war thus had a strong effect on these fields in both countries, but it was in France that the impact, first of the Revolution and then of the reign of Napoleon, changed much in the way of science was practiced. Since France led the world in science, these changes in France affected the whole world.

### War and Science

The longstanding connection between war and science in the West intensified during the French Revolutionary and Napoleonic era. Armed forces depended on scientific and technological expertise in many areas. Different service branches had different needs. One particularly marked by dependence on science was the artillery, since it was vital that guns be aimed correctly to inflict the most damage on enemy forces. Mathematics had only a limited impact on the actual practice of gunnery, which remained heavily influenced by rules of thumb and trial and error, but an appreciation of the value of applying mathematics to the science of gunnery did encourage armies to train their artillery officers in this discipline. Armies and navies also required scientifically educated men to satisfy the military need for gunpowder. The chemist Antoine-Laurent Lavoisier, a great scientific administrator, was the head of the French commission on powders in the old regime (1775–1783), meeting the needs of the American Revolutionary War and later the vastly greater conflicts of the French Revolutionary and Napoleonic Wars.

The increasing professionalization of the officer corps of the European powers, and later of the United States, led to the integration of scientific training in military education, particularly for the artillery. Their common mathematical training helped form artillery officers into a cohesive body. This cohesion was particularly important in the French military, as the artillery officers held a socially inferior position with respect to cavalry and infantry officers. The ranking of students by their scores on mathematical exams helped form the artillery's meritocratic culture, contrasting with other branches of the service where noble birth was more important.

Navies were also heavily dependent on science. In addition to the complex problems of firing guns effectively from ships rather than stationary platforms, navigation required a sophisticated knowledge of astronomy and mathematics. The world's leading navy, Britain's Royal Navy, required that its navigators be schooled in the method of

lunar distances, which relied on careful observations of the moon to determine a ship's longitude, a method developed in the eighteenth century. Cartography was also necessary to navies. The increasingly global wars of the eighteenth century had put a military premium on worldwide cartographic and hydrographic knowledge. Efforts to form a more complete and exact knowledge of the world's seas and coasts were frequently and increasingly linked with navies. Captain James Cook's voyages earlier in the century had begun a tighter, although not totally harmonious, relationship between British exploration and the Admiralty, one that became even closer during the Revolutionary and Napoleonic Wars. The leading hydrographer in late eighteenth-century Britain, Alexander Dalrymple, left his post at a private trading concern, the East India Company, to become the hydrographer to the Admiralty when the post was founded in 1795.

The Pacific was the most active site of oceanic exploration, particularly as expeditions were driven by imperial competition between Britain, France, the Netherlands, Spain, and Russia. The most active nations in Pacific exploration before the French Revolution were France and Britain. The Royal Navy expelled their French rivals from the high seas during the Revolutionary and Napoleonic Wars and continued Pacific exploration, sending George Vancouver to map the northwestern coast of North America from 1790 to 1795 and Matthew Flinders in the *Investigator* to circumnavigate Australia and examine its natural history from 1801 to 1805. Spain had lagged behind Britain and France, but by the late eighteenth century was attempting both to catch up scientifically and to assert its power over its North American colonies with a mission under the naval officer Alejandro Malaspina, which surveyed the Pacific coast of North America up to Nootka Sound in 1792. Continental exploration, such as America's Lewis and Clark Expedition of 1804 to 1806, also had military implications and drew on military talent.

### Science and Technology during the French Revolution

Eighteenth-century French science, under the leadership of Paris's Royal Academy of Sciences, had led the world. The French Revolution had effects both creative and destructive on French science. In addition to causing the death of several leading scientists, the Revolution ended the existence of most French scientific institutions, most notably the Royal Academy. However, it gave birth to several other institutions and advanced the careers of many other scientists and engineers who then went on to maintain French predominance in science into the Napoleonic era. French scientists and engineers generally supported the Revolution in its early stages, hoping for social and

political reform along Enlightenment lines. No prominent French scientist joined the royalist emigration, and the technically trained artillery officers were more likely to support the Republic than infantry or cavalry officers. The Revolution, even in its most violent phases, was a high-water mark in the involvement of scientists, engineers, and mathematicians in politics. Several, including the marquis de Condorcet, Lavoisier, the biologist Jean-Baptiste Lamarck, and the mathematician Gaspard Monge, were active in a moderate revolutionary group, the Society of 1789. The most prominent scientists to be victims of the French Revolution included Lavoisier, executed for his pre-Revolutionary role as a tax farmer; Condorcet, who committed suicide rather than be brought before the Revolutionary tribunal; and the astronomer Jean-Sylvain Bailly, who reached the high positions of president of the National Assembly and mayor of Paris before being guillotined in the Terror.

Not all politically active scientists had careers that ended so disastrously. Lazare Carnot, later known as the Organizer of Victory, sat as one of the twelve-man body that ruled France during the Terror, the Committee of Public Safety, as did his fellow military engineer, Prieur de la Marne (Pierre Louis Prieur). Monge and the chemists Antoine-Francois Fourcroy and Louis Bernard Guyton de Morveau also served at the higher levels of the Revolutionary government.

The havoc the Revolution wrought among France's traditional scientific institutions was less because they were scientific than because they were inextricably associated with the old regime and "aristocratic" culture and society. Jean-Paul Marat, a physician and minor experimental physicist specializing in optics before the Revolution, had been trying to storm the barriers of the Royal Academy of Sciences for years. As a Revolutionary politician, Marat attacked the Academy viciously, and many agreed that it, along with the other royal academies, needed reorganization or suppression in the new France. The Royal Academy was suppressed on 8 August 1793. Eventually, a reorganized Academy of Science was established as the first section of the Institute of France, founded in 1795 under the more conservative rule of the Directory.

The financial costs of war and revolution also weakened French scientific institutions. Before its abolition, the Royal Academy had to abandon a project to build a large reflecting telescope to compete with that of the English astronomer William Herschel, and donate the money collected to the Convention. (Of course, British science also suffered from the costs of war. The government, desperate for cash, introduced a new tax on glass, devastating the optical industry and contributing to Britain's loss of the lead in scientific instrument-making to Germany in the early

nineteenth century.) Important scientific periodicals, such as the *Journal des Savants* and Lavoisier's *Annals de Chimie* were also forced to shut down for lack of resources. But French military success also strengthened French science, as victorious commanders sent back to Paris collections of scientific artifacts and instruments from conquered lands. In 1795, for example, the Dutch *stadtholder's* collection became one of the largest of the many natural history collections sent back to the Museum of Natural History in Paris (founded in 1793 at the location of the former Royal Botanical Gardens) by the conquering French armies.

The major medical associations such as the medical faculties of the universities of Paris and Montpellier, the Royal Society of Medicine, and the Royal Academy of Surgeons were also eliminated in the Revolution as bastions of monarchism and aristocratic privilege. Medically, surgeons, with their more pragmatic approach, were the gainers over theoretically minded physicians, as the distinction between the two professions ceased to exist. Physicians, who held actual medical degrees, constituted the more senior of the two types of doctors. Surgeons often did not have the benefit of formal training and generally knew considerably less about medicine, apart from the practice of amputation. The intellectual center of French medicine shifted from the colleges, academies, and universities to the hospitals, particularly the Paris Hospital, which the Revolution removed from the control of the church and placed in the hands of the medical profession. The most important medical scientist in revolutionary Paris, Marie-Francois-Xavier Bichat, had a career associated with hospitals, not universities. His central theoretical innovation was the substitution of the membrane or tissue for the organ as the fundamental unit in the analysis of health and disease.

The new institutions founded by the Revolutionaries were mainly for applied science, technology, and medicine. Among the most important of these institutions were the Institute, the Museum of Natural History, and the Ecole polytechnique, founded in 1794, which under the leadership of Monge became Europe's leading center of mathematics, the foundation of French mathematical supremacy. The Ecole polytechnique was increasingly devoted to military training, culminating in the outright militarization of the school by Napoleon in 1804.

### Scientific Exploration on Bonaparte's Egyptian Expedition

The most elaborate work of exploration and science undertaken by Revolutionary France under military auspices took place during Bonaparte's expedition to Egypt. Bonaparte, a science enthusiast, was able to bring about the establishment of the Commission of Arts and Sciences to accompany his army. The most prominent among the

many scientists who accompanied Bonaparte included the chemist Claude-Louis Berthollet (already acquainted with Bonaparte, as he had accompanied him on the Italian campaign and helped locate the most important Italian cultural and scientific treasures to send back to Paris), the zoologist Etienne Geoffroy Saint-Hilaire, the geologist Dodot de Dolomieu, and the mathematicians Monge and Joseph Fourier. All the leading scientific institutions of Revolutionary France—the Institute of France, the Ecole Polytechnique, the Museum of Natural History, and the Paris Observatory—were represented on the commission, as well as engineers, surveyors, draftsmen, and students of Oriental languages. The membership of the commission totaled 167 on the eve of departure.

In Egypt, members of the commission worked primarily on projects benefiting the French occupation. The language experts served as interpreters or supervised the printing of Napoleon's proclamations in Arabic, the engineers adapted Egyptian infrastructure to French needs, and the medical men set up facilities and treated the many stricken by heat or disease. These immediate practical tasks were not the sole reason for the presence of so many savants, however. Napoleon promoted the setting up of an Institute of Egypt, on the model of the Institute of France. It was divided into four sections—mathematics, physics (including chemistry, medicine, and zoology), political economy, and literature and art, all of which were filled by French scholars rather than Egyptians. Each section was supposed to have twelve members, but was actually smaller. The first meeting of the Institute of Egypt took place on 23 August 1798. Bonaparte, a member of the mathematical section, proposed that the institute concentrate on problems such as improving Egyptian baking and purifying the waters of the Nile, as well as improving the Egyptian legal and educational system. The scholars of the expedition performed extensive fieldwork, of which the most notable product was the discovery of the Rosetta Stone, which eventually led to the deciphering of ancient Egyptian hieroglyphics. Egypt was surveyed for the first time according to European techniques, resulting in more accurate maps. Natural historians collected a huge variety of fossils, plants, birds, fish, and other animals unknown to European science. Particularly interesting were the mummified remains of ancient animals. The Institute's proceedings and the works of its scholars filled the pages of the French occupation's periodical, *La Decade Egyptienne*.

Many of the expedition's savants, after the first excitement of discovery had faded, longed to return to France. This occurred when British control of the Mediterranean made the French position untenable and the army in Egypt surrendered in 1801. Saint-Hilaire became a hero of French science by preserving the specimens collected by

the expedition from falling into British hands as the French were forced to leave. The savants' work was commemorated in the twenty-three volume *Description of Egypt*, begun with French government sponsorship in 1803 and published from 1809 to 1826. This scientific classic was the textual basis of the Western study of Egypt through the nineteenth century.

### Science in the Napoleonic Period

Napoleon's rule over France supported and maintained French international scientific dominance. In part this was due to Napoleon's continued support of Revolutionary scientific institutions, such as the Ecole Polytechnique, the Museum of Natural History, and the Institute of France, as well as Napoleon's own enthusiasm for, and personal patronage of, science. Napoleon, trained in mathematics as an artillery officer, enjoyed the company of scientists, preferring them to literary people, whom he viewed as politically unreliable. He took pride in his membership in the Institute of France, to which he was elected in 1797, and took an active part in its deliberations, attending meetings and serving on committees. He even signed some of his military dispatches as "Member of the Institute." However, he stopped attending Institute meetings in 1802, after he attained the position of Consul for Life. Science was not only useful to Napoleon as a military commander, but restoring the primacy of Paris in the international scientific community was also testimony to his personal glory.

As a patron of science, Napoleon worked through and expanded the traditional eighteenth-century method of prize competitions, announcing a huge prize of 60,000 francs for discoveries in electricity comparable to those of Benjamin Franklin and Alessandro Volta, whom he tried to lure to Paris. (Napoleon's prizes had the advantage over many prizes of the period in that they were not merely awarded but actually paid.) This prize was never awarded, but a smaller one was granted to the British chemist Humphry Davy. Awarding a prestigious and lucrative prize to a foreigner was not exceptional, as Napoleon, like previous French rulers, believed that one effective way to advance French science to lure outstanding foreign scientists to Paris and encouraging them to settle. Napoleon also continued the Revolutionary policy of ransacking foreign scientific collections to send them back to Paris, and raised scientists' social prestige by granting them titles of nobility or membership in orders of chivalry.

The scientists Napoleon liked were apolitical, more concerned with advancing science, technology, and French military power than with social and cultural reform in the Enlightenment tradition. Napoleon encouraged French scientists to think in nationalistic terms, rather than seeing

themselves as part of an international scientific community, a task made considerably easier by the near-constant state of war. Several leading scientists played important roles in his regime, particularly in his vast reorganization of French education. The physicist and mathematician Pierre-Simon Laplace, after a brief and unsuccessful period as minister of the interior, received the largely honorary but lucrative position of chancellor of the French Senate. Berthollet, probably Napoleon's closest friend among French scientists, was a senator, was made a count of the Empire, was paid 150,000 francs to clear his debts in 1807, and received a pension enabling him to support himself and his scientific activities.

As with previous French regimes, Napoleon hoped that science could contribute to economic development. For example, he planned a system of institutions to train a hundred chemists in improved means of extracting sugar from sugar beets, hoping to make France self-sufficient in sugar and end its dependence on cane sugar imported from the Caribbean, vulnerable to the Royal Navy. (Napoleon fell from power before these institutions were set up, and France went back to importing cane sugar.) He also encouraged the development of a French manufacturing sector that he hoped would eclipse that of Britain, which was undergoing its Industrial Revolution. (Although the technology of the Industrial Revolution, such as the improved steam engine, had curiously few direct military applications, the economic power it brought Britain was essential to its war effort.)

Despite Napoleon's emphasis on the services scientists could do for the state, scientific internationalism was not wholly eliminated under the Empire. A leader in maintaining scientific communication between Britain and France during the entire period was Sir Joseph Banks, president of Britain's Royal Society, its leading scientific organization, from 1778 to his death in 1820. His diplomatic nature and connections with the British government and military, along with French respect for him, enabled Banks to maintain scientific communication between the two countries, as well as on occasion to procure the release of British savants held by the French and Frenchmen held by his own government.

Ironically, Napoleon's preference for apolitical scientists meant that many he favored quickly reconciled themselves with the new regime after his fall. Even Berthollet signed the Act of Deposition of 1814, and Laplace voted in the Senate for Napoleon's exile to St. Helena.

## **The Economic Background of the French Revolutionary and Napoleonic Wars**

The eighteenth century was a time of dramatic change in the economy of Europe, so much so that it is often referred to as revolutionary. Ironically, many of the structures, ideas, and systems that characterized these revolutions were not new, but had their roots in preceding centuries. The revolutionary nature of the changes of the eighteenth century involved the application and intensification of these systems on an unprecedented scale.

European rulers realized that they had a vested interest in increasing the economies of their respective countries. Prosperity contributed to political stability and to tax coffers. In the early modern period, a number of ideas about how governments could increase growth, especially

through trade, floated around Europe, and historians have grouped them all under the umbrella term *mercantilism*. The basic tenet of mercantilism is that there is a fixed amount of wealth in the world, usually measured in specie, or gold and silver coins. If a country wishes to gain more specie, it has to do so at the expense of other countries. These ideas promoted aggressive tactics, including trade wars such as the four Anglo-Dutch wars of the seventeenth century, aimed at forcibly taking over profitable trade routes, ships, and market. They also encouraged control over imports and exports. Too many imports meant that specie was leaving the country, so very high tariffs, or taxes on imports, were the order of the day. To promote exports, rulers used monopolies, special privileges, and tariff protection to encourage domestic industries that produced goods for export.

While mercantilists focused on trade, the Physiocrats (French economists and philosophers whose theories rested on the basis that the origin of all wealth could be traced to agriculture) believed that the most natural and productive source of economic growth was not industry or trade, but agriculture. By their logic, trade simply moved goods around, and industry merely took already existing parts and put them together; neither created anything really new. In agriculture, a single small seed could produce bushels of wheat. In order to realize this potential, farmers needed to be free to pursue cultivation in the best possible ways, and so all the restrictions they faced needed to be removed. Using a medical metaphor, the Physiocrats based their system on the idea of balance, arguing that each part of the social “body” had to be free to develop on its own terms, lest it disturb the natural working order of all its parts. In eastern European countries such as Prussia and Austria, the doctrine of cameralism adopted elements of both philosophies, emphasizing the importance of both agricultural and industrial development, while seeking a balance between the interests of the state and the well-being and best interests of its citizens.

Despite these noble theories, rulers employed mercantilism and cameralism first and foremost because they needed money. Before the eighteenth century, most European states raised money in similar ways. The monarch was usually a large landowner and would use the proceeds from the royal lands as state funds. There were also customary tax arrangements, usually not applicable to the highest ranks of society, the nobility, or the clergy. Without large bureaucracies to help them, rulers found their tax systems difficult, if not impossible to adjust, and taxes themselves nearly as difficult to collect. Rulers could also acquire revenue from providing special services, contracts, or privileges. When these efforts failed, they usually resorted to forced loans from wealthy citizens. Trade could

be an especially lucrative source of income, as it was not usually covered by long-standing traditional arrangements. Rulers sold monopolies on trade in certain areas or in certain goods and heavily taxed imports and exports. Despite rising trade, European rulers found themselves chronically short of cash. Warfare was increasingly expensive, and states that found themselves nearly continually at war also faced the largest deficits.

The first country to radically alter state finance was the Dutch Republic. The newly created United Provinces of the Netherlands was a republic, not a monarchy, so their financial system relied on a system of credit and taxation used by the town governments. Under this system, excise taxes were levied on the consumption of goods, such as wine and paper. These taxes brought in more, and more stable, income than the traditional system of taxes on property or wealth, and they were somewhat easier to collect. As an additional benefit, they applied to all segments of society and exemption was the exception, not the rule, even for the elite. The towns also issued municipal bonds, which permitted them to borrow money against future tax revenues. A bond was simply a loan to the government on the part of its purchaser, in return for which the government paid the bondholder interest. Because the towns of Holland had built up a sterling reputation for good credit, the bonds were considered a secure investment. Through issuing bonds, the young republic could borrow more money, at lower interest rates, and for longer terms than the much larger monarchies around them. The Dutch then used the income from the interest to become great foreign investors. Even after Dutch economic might waned, Amsterdam reigned as the financial capital of Europe.

By the eighteenth century, the Dutch had been dragged into so many wars that their debt, once a source of strength, had become a source of weakness. Much of their state budgets had to be devoted to debt servicing and reduction. The government avoided bankruptcy by raising taxes, but this made the prices of their goods relatively high and affected their competitiveness in trade. Another country, however, was able to use their innovations more effectively—England. In 1688, William of Orange, a leading Dutch nobleman, became king of England through his marriage to Mary Stuart. He brought with him a wealth of knowledge about Dutch finance. By the end of the century, the English had transformed their finances along Dutch lines, established a central banking system with more extensive lending powers than its Dutch counterpart, introduced the use of paper currency, and streamlined their fiscal operations. Along with a supportive Parliament, the government parlayed this financial revolution into political and military success in the eighteenth century. The French lagged behind in reforming their state finances,

which ultimately became one of the causes of the French Revolution.

The expansion of trade, finance, and industry in the eighteenth century receive a great deal of attention from scholars. It is easy to forget, however, that for most Europeans, life did not differ much from what it had been for hundreds of years. The majority of Europeans, approximately three out of every four, were peasants and worked in agriculture. Most owned some land of their own, but often worked the land of others as well. Their lives were dominated by a struggle to feed themselves and their families.

Agricultural practices did change during the period, especially in relatively advanced areas such as England and the Netherlands. The most significant changes were not, on the surface, spectacular, but they did contribute to increased harvest ratios and greater security for agricultural workers. Since the Middle Ages, farmers customarily divided their fields into two parts. One half was cultivated, usually with wheat or other grains, and the other was left fallow, or uncultivated, so that the soil could recover nutrients. Introduced in the seventeenth century, three-course crop rotation divided fields into three parts, cultivating two and leaving one fallow. This increased production simply by putting more land into use, but farmers then began to experiment with other crops in addition to wheat. The cultivation of oats and rye allowed farmers to own more livestock and horses. With these new crops, it also became possible for the motivated peasant (it required considerably more work) to get rid of fallow land altogether by using manure to fertilize the soil. An entire science of agriculture developed, complete with journals and treatises, which were eagerly read by rulers and farmers alike.

In England, the effects were especially dramatic. In 1700, over 20 percent of English croplands lay fallow each season. By 1871, that figure had dropped to only 4 percent. Innovators such as Jethro Tull (mechanical seed drill) and Charles Townshend (turnips) were credited with developing new tools and methods to increase agricultural efficiency. Perhaps more importantly, the British government passed the first Enclosure Act in 1710. Prior to enclosures, the fields in large farms had been divided into small strips and parceled out to numerous peasants, who might own multiple strips spread throughout the property. The peasants also had rights to use designated areas for pasture. Enclosure laws permitted land owners to enclose all of their lands into larger and more efficient farming units, but at the expense of peasant ownership. By 1810, Parliament had passed over 1,000 such acts.

The new practices spread slowly and sporadically, arriving latest in parts of France, Spain, and eastern Europe. Their effects were remarkable. By significantly raising the

fertility of the soil, they made food more plentiful, and the new crops, especially root crops such as turnips and legumes such as peas, alfalfa, and beans, contributed to better and more varied diets for the peasants and their animals. After a long period of slow or negative growth, the population of Europe began to rise slowly and, after 1750, quite rapidly. In Britain, population nearly doubled.

In agriculture, the eighteenth century witnessed the more rapid dissemination of techniques that were largely already known. The same can perhaps be said of trade, as the European trading system came into existence in the sixteenth century and was well established by the seventeenth. In the eighteenth century, trade, like agriculture, intensified, propelled by state governments looking to increase their share of the wealth of the world. New products created new opportunities, and those countries content to rest on their laurels found themselves left behind by the increased competition.

Overseas trade was not the only kind of trade that Europeans engaged in profitably. Countries such as Britain and the Netherlands took advantage of good systems of internal navigation to sell more to the populations within their own borders. The British also promoted trade on their island and across their colonial empire by removing all obstacles to the free movement of goods and people. The French followed suit, instituting a tariff union known as the Five Great Farms, which eradicated many of the tolls and other taxes that had hampered the distribution of goods. Trade around Europe also accelerated. Historians have often overlooked the importance of the increase in domestic and European trade, perhaps because it seemed so unexciting when compared to the amazing exploits of overseas traders.

Long-distance trade was still expensive and risky in the eighteenth century, though the development of maritime insurance served as a cushion. Still, potential profits needed to be high in order to justify investments in trading ventures. Most trade was instigated for luxury items that were in short supply and high demand, especially by wealthy consumers. Silk, silver, pepper, and other spices had enticed Europeans to begin to exploit trade in Asia and Spanish America. Enormous profits justified the creation of armed fleets to forcibly acquire territory and to build fortresses, called factories, to protect merchants. As more countries became involved in trade and the production of goods, however, profits fell. By the late seventeenth century, the price on pepper had fallen more than 80 percent. For most trading companies, it was no longer worth it.

Because of their considerable investment in infrastructure, merchants found it to their advantage to try to find new, more profitable products. In the eighteenth century, those products were tobacco, sugar, tea, and coffee. It

is no coincidence that the three most sought-after products of the eighteenth century were all addictive substances. This ensured their salability in Europe, and as the prices fell, these products became available to more and more people. Profit margins became less spectacular, but larger markets with nearly guaranteed repeat consumers lowered risks. As European populations in most colonies grew, governments introduced protectionist acts that required them to buy goods from the home country, another source of security.

Europeans took advantage of their central position in a world economic system to exploit new opportunities. Sugar, for example, required even greater investment than earlier products because it had to be grown, cut, and harvested, which required considerable amounts of semi-skilled labor, and then processed, which required building refineries. The Portuguese discovered sugar in Asia and tried to grow it in Europe, but they found cultivators unwilling to switch over to the new crop. Instead, they began to cultivate sugar in their colony of Brazil and to import slave labor from Africa, as the natives also proved to be unsuited to the hard labor of sugar production. Attracted by the high profits the Portuguese earned from sugar, other countries jumped into the fray. By the eighteenth century, the Dutch had instituted sugar production in Demerara, France in St. Domingue, the British in Jamaica and Barbados, and the Spanish in Cuba. In each place, they set up large plantations and imported slave labor, which greatly accelerated the slave trade. Between 1700 and 1786, over 600,000 Africans were brought to Jamaica alone. Sugar became a significant export, especially for the British. From 1713 to 1792, Britain exported over £162 million worth of goods from its islands; nearly all of it was sugar. As more countries produced sugar, its price began to fall. Looking for new sources of profit, the Dutch turned to coffee, which they began to grow in the East Indies, especially on the island of Java, and the British to tea, which they grew in India. There were also early experiments with chinaware and cotton, the latter providing a boost to industrial changes.

In the seventeenth century, trade, especially trade to Asia, belonged to the Dutch, who enjoyed their Golden Age. Though still wealthy in the eighteenth century, they became more content to hold on to their gains, and their tactics were, overall, less aggressive and more conservative. The Dutch East India Company was still quite profitable, and many other countries emulated its organization as a joint stock company, a private, limited liability organization that enjoyed government support. While most of these companies failed, the French and British East India companies gained strength (and money) from following the Dutch model. The British used their leverage to control

trade in the Americas and India, and the French used theirs to control trade in Europe and the Middle East. Given that they held roughly equal shares in the overall volume of trade, it is no surprise that the two countries participated in frequent wars against each other, each hoping to gain at the expense of the other.

Trade, especially in the Atlantic world, was an important motor for growth in industry, and export industries showed the greatest increases in production and were the first to be revolutionized. Also, of course, as every history of the Industrial Revolution makes clear, there were a number of spectacular inventions—the steam engine, mechanized spinning, and the iron smelting process—that led to dramatic increases in the production of goods, especially cotton textiles, and similarly dramatic changes in the organization of work, such as the development of the factory.

Because of what occurred in later centuries, it is easy to overestimate the impact of these changes on the economy of the eighteenth century. Even in Britain, the effects were not significant until the latter half of the century and even then only a minority of the population worked in industry, though the percentage continued to rise.

At the end of the seventeenth century, the French finance minister Jean-Baptiste Colbert, inspired by a mercantilist desire to increase exports, began an ambitious program of industrial development and expansion. Though he was not entirely successful, French industrial production was still larger than England's, despite the fact that it was centered on handicraft production, usually carried out in homes or shops and not factories. Industrial production rose in pockets across Europe, usually organizing workers to perform different steps toward the creation of a finished product, a process that historians have termed *proto-industrialization*.

By the end of the century, English production far outstripped its competitors, and this success translated into enormous wealth in the future. Many historians have pondered the secrets of their success and, conversely, the failure of other countries to achieve the same results. Certainly, their success provoked a great deal of jealousy. The British guarded their industrial secrets more closely than their military ones, but continental rulers lured British engineers and skilled workers to their countries, conspired to steal blueprints and other pertinent information, and tried to limit the import of British goods—all to practically no avail before the nineteenth century.

While there are many reasons for British success, two factors stand out in relation to her closest rivals, France and the Netherlands. Like the British, the Dutch underwent an agricultural revolution. In the seventeenth century, the proportion of Dutch agricultural workers was the

lowest in Europe. Their rates of urbanization, literacy, and innovation were all quite advanced. They had several competitive industrial sectors as well, including textiles, ship building, and sugar refining. By the eighteenth century, however, Dutch industry suffered severely from the inability to export their products to most of Europe because of high tariffs. Also, Dutch prominence had evoked jealousy, and its trading rivals engaged in nearly continuous warfare, which the republic, despite its advanced financial system, could ill afford. The Dutch government lacked the ability and the will to support the promotion of its trade and industry as effectively as larger states.

France was the largest state in Europe, in size and population, and throughout most of the century possessed the largest industrial output. The French state was dedicated to supporting economic growth in trade and industry, and was not afraid to use its large army to protect economic interests. The French did not lack in state protection, but they were far behind the revolutionary changes that had propelled Dutch and British success. France did not have the equivalent of Enclosure Acts, and the average French farm was very small, and so less suited to commercial agriculture. Despite the burdens of the feudal system, they were understandably reluctant to leave them and pursue opportunities in other sectors. They had also failed to revolutionize their tax system while still engaging in costly wars. State action was hindered by mounting debt and political unrest, which ultimately led to a complete change in government. The Revolutionary government changed the structure of land ownership, favoring small producers even more than before, but constant food shortages contributed to rampant inflation, which the government found itself relatively powerless to address. For the eighteenth century as a whole, it might be said that the Dutch had a financial revolution, the British had an industrial revolution, and the French had a political revolution.

## Abensberg, Battle of (20 April 1809)

Napoleon's opening advance in his counterattack against the Austrian army under Archduke Charles in Bavaria in April 1809. Based at Abensberg 25 kilometers southwest of Ratisbon, Napoleon directed two forces, a provisional corps under Marshal Jean Lannes toward Rohr and a Rheinbund force (that is, a force from the Confederation of the Rhine) under Marshal François Lefebvre toward Schweinbach, striking the weakest point in the Austrian line and splitting it in two. The Austrian left wing led by *Feldmarschalleutnant* Johann Hiller withdrew on Landshut, leaving the main force under Charles south of Regensburg. Napoleon headed for Landshut, while Marshal Louis Davout turned east to engage Charles.

The main Austrian advance (III, IV, and I Reserve Korps) into Bavaria had stalled at Teugn-Hausen on 19 April with three Korps extended southward to protect the western flank. That evening, Napoleon planned to counterattack across a wide front with the intention of enveloping his opponent's army. Assuming that the Austrian army would retreat southward, pressured by Davout, the French emperor formed a provisional corps under Lannes (elements of III Korps and the French reserve light and heavy cavalry), which was sent east from Abensberg toward Rohr to cut the Austrian line of communications, while a combined Bavarian-Württemberg force would intercept any forces reaching the Grosse Laaber river crossings on the road south to Landshut, toward where Marshal André Masséna with IV Korps was marching.

In the late morning, Lannes approached Bachl, forcing *Generalmajor* Joseph Freiherr von Pfanzelter's small flank force from the Austrian III Korps eastward. The 1st and 3rd Bavarian Divisions with Joseph-Laurent Demont's reserve division headed for Offenstetten and around 10:00 A.M., defeated *Generalmajor* Ludwig Ritter von Thierry's small detachment, forcing him back on Bachl as Lannes approached from the north. Thierry hastily withdrew to Rohr, which he reached at 2:00 P.M., but its defenders, *Feld-*

*marschalleutnant* Vincenz Freiherr von Schustekh-Herve's small contingent from V Korps, could do nothing to halt Lannes. The French provisional corps chased the Austrian troops south to the Grosse Laaber crossing at Rottenburg, where they engaged Hiller's VI Korps from 4:30 P.M. until nightfall but failed to cross the river. Meanwhile, the Württemberg contingent and the Bavarian 2nd Division directed by Lefebvre and reinforced by General Jean-Victor Baron Tharreau's cavalry from Marshal Nicolas Oudinot's II Korps had attacked the right flank of Archduke Ludwig's V Korps on the Abens river crossing at Biburg. Nevertheless, *Generalmajor* Vincenz Freiherr von Bianchi's brigade held them off until ordered to withdraw at 2:00 P.M. The V and II Reserve Korps were pulled back eastward to guard the other Laaber crossing at Pfeffenhausen.

Napoleon's maneuver had split the main Austrian army to the north under Charles (five Korps, including I and II Korps north of Regensburg) from the three Korps (V, VI and II Reserve) to the southwest, forcing Hiller to lead them back on Landshut in some disorder early on 21 April. Napoleon wrongly believed that he had attacked the main Austrian force that day and pursued Hiller's troops, leaving Davout with III Korps to engage Charles.

## Abercromby, Sir Ralph (1734–1801)

Victorious general at the landings at Aboukir in 1801, Abercromby's victory in Egypt secured British India from eventual attack and marked a turning point for the British

Army in its struggle against the French. Abercromby, a small, quiet man with terrible eyesight, was born in 1734 to an established family of the Scottish gentry. Originally his family had intended him for the law, but he desired a military career and entered the army in 1756 and served in Germany during the Seven Years' War, where he was influenced by the military tactics of Frederick the Great. He avoided active service during the American Revolution, since he possessed liberal sensibilities and sympathized with the colonists' desire for independence. From 1774 to 1780 he served in Parliament without any particular distinction. In 1781 he rose to the rank of colonel of the King's Irish Infantry, but when that regiment was disbanded in 1783, he retired to his home in Edinburgh.

When war broke out with France in 1793, Abercromby, at age fifty-eight, volunteered for service and was given a command under the Duke of York. Abercromby felt it was necessary to keep the Low Countries from French domination, but he was not hostile to the Revolution and did not wish to see the war lead to the overthrow of the French government. He led the advanced force at the Battle of Le Cateau (1794) and was wounded at the siege of Nijmegen (1794). He did a brilliant job of shielding the British army as it withdrew from Holland in 1794–1795, which was acknowledged by his being made a Knight of the Bath. In 1795 he was placed in charge of the British forces in the West Indies. Always a humane officer, upon his arrival he introduced a series of reforms, including improving sanitation and health conditions and altering uniforms to better suit the tropical weather. He met with great success in the West Indies and captured most of the French Caribbean possessions.

Abercromby, now a lieutenant general, was placed in charge of the British forces in Ireland in 1797 and immediately recognized that the army's attempt to enforce control over the seething nation was counterproductive. He forbade his troops from firing on civil rioters without a magistrate's authority, but Lord Camden, the Lord Lieutenant of Ireland, rescinded the order and removed the army from the control of civil authority. Abercromby angrily issued a general order describing his ragtag forces as being "in a state of licentiousness which must render it formidable to everyone but the enemy" (Abercromby 1861, 69) and resigned his command.

Abercromby once again served under York during the expedition to north Holland in 1799. The campaign ended in disaster, but Abercromby acquitted himself well. In 1801 the British government named him commander in chief in the Mediterranean, with orders to push the French out of Egypt. His troops made an opposed landing at Aboukir Bay and began to advance toward Alexandria. Two weeks after landing in Egypt, Abercromby met the

enemy at Alexandria on 21 March and thoroughly defeated them, though he died from wounds received in action. He was buried on Malta and is honored with a monument in St. Paul's Cathedral. Several years earlier he had declined a peerage, but after his death his wife was created Baroness Abercromby of Aboukir and Tullibody.

## Aboukir, Battle of (25 July 1799)

The last major military action of Bonaparte's Egyptian campaign, solidifying his control by removing the last Turkish threat to French dominance of the region.

General Bonaparte led an army into Egypt in 1798 in an attempt to overthrow the Mamelukes, a warrior class with origins in Georgia that had ruled Egypt for centuries. While the Mamelukes ostensibly ruled in the name of Ottoman Turkey, they had generally ignored that connection. France hoped Bonaparte's campaign would return Egypt to Turkish control and increase French influence and access to trade routes.

Turkey, however, did not see the French invasion as friendly and supported the Mamelukes against Bonaparte's army. Bonaparte defeated the Mamelukes, most notably at the Battle of the Pyramids (21 July 1798) and the Battle of Mount Tabor (16 April 1799), and with the major exception of Acre (besieged 18 March–20 May 1799) had achieved some measure of success.

Turkey, however, was not yet willing to concede, and another Ottoman army of approximately 9,000 men was arriving by sea from Rhodes on some sixty transports, accompanied by a Royal Navy squadron under Commodore Sir William Sidney Smith. On 11 July 1799, led by Mustapha Pasha, the so-called Army of Rhodes landed near Alexandria at Aboukir. They quickly defeated the small French outpost and after a short siege gained control of Aboukir Castle. Rather than march toward Alexandria or Cairo, they prepared defensive positions and waited for the French to attack. Their inexplicable inac-

tion gave Bonaparte all the time he needed to prepare his response.

Bonaparte had pulled together all available resources and was ready for them. He had about 10,000 men, including 1,000 cavalry led by the dashing General Joachim Murat. Only General Jean-Baptiste Kléber's division had not yet arrived, but Bonaparte wanted to take full advantage of the Turkish army's lethargy and strike immediately. On 25 July he attacked the Turkish positions and achieved a total victory. The French cavalry swept the field. Murat overran the Turkish command post, killed or captured most of the leadership, and personally captured Mustapha Pasha. The future Marshal Jean Lannes led the infantry and gained control of the redoubt. The bulk of the Turkish army was driven into the sea. Of the 9,000 Turks, 7,000 were killed, many as they attempted to swim back to their ships, and the rest captured. The battle concluded a week later when General Jacques-François Menou forced the capitulation of the remaining Turks who had remained in the castle. French losses were slight, with only some 220 killed and 750 wounded.

Bonaparte was now, at least for the moment, secure in his position in Egypt. He had defeated the Mamelukes and both Turkish armies sent to dislodge him. He would not stay long to savor his success, however, and within a month was on his way back to France for an appointment with destiny.

## Acre, Siege of (18 March–20 May 1799)

The French siege of the seaport of Acre in Palestine during the so-called Syrian campaign, where General Napoleon Bonaparte received the first serious check of his career. After conquering Egypt, Bonaparte had received reports that he would be attacked by two Turkish armies—one forming at El Arish in the Sinai desert and the other at Rhodes, which would attack by sea. He decided to preempt them by striking against the forces of the pasha of Acre, Ahmad “the Butcher” al-Jazzār (or Djezzar as the French

knew him) and his Mameluke ally Ibrahim Bey. After destroying their supply dumps, he would return to Egypt and concentrate on the seaborne assault, which he expected to arrive midsummer.

On 6 February 1799, 13,000 men set off for El Arish, taking the village and attacking a Mameluke camp on the night of 14–15 February. However, the local fort held out until 20 February, when Bonaparte paroled the garrison. The French army entered Palestine at Khan Yunis and captured Gaza on the twenty-fourth. At Jaffa resistance stiffened. The city was taken by assault (7 March) and left open to atrocity. When some of those paroled at El Arish were found to have fought in Jaffa, Bonaparte had over 3,000 prisoners executed outside the city. The following day the French first noticed an outbreak of bubonic plague. On 17 March, the army reached Haifa and invested the port of Acre the next day. Bonaparte's first assault on 28 March completely failed, as did the second on 1 April.

While the French did prevent the arrival of a relief column from Damascus at the battles of Nazareth (5 April) and Mount Tabor (16 April), Bonaparte's repeated attempts to take Acre by storm were thwarted by the tenacious Turkish pasha. Al-Jazzār and his troops were greatly assisted by the British commodore Sir Sidney Smith, whose men served the city's batteries and brought supplies in from the sea. Bonaparte's men were equally hampered by a lack of proper siege artillery (having been intercepted by the British at sea), a lack of ammunition, mounting casualties, and the continued presence of bubonic plague. As the French threw away their last reserves in a series of heavy assaults (8–10 May), Turkish reinforcements began arriving by sea. Fearing the Turks would soon land in Egypt, Bonaparte abandoned the siege on 20 May, losing most of his equipment and enduring one of the most severe marches ever experienced by a French army.

Having prevented the overland invasion, Bonaparte entered Cairo in triumph on 14 June. While he had arrived in time to defeat the seaborne invasion at the Battle of Aboukir on 25 July, the heavy casualties (2,200 killed or dead from plague, with as many sick or wounded) and the failure to take Acre dented the soldiers' confidence in their commander in chief. On 23 August, Bonaparte abandoned his army and returned to France.

### Addington, Henry (1755–1844)

Henry Addington (Viscount Sidmouth after 1805) was the only British prime minister of a peacetime administration during the wars against Revolutionary and Napoleonic France. Speaker of the House of Commons since 1789, in 1801 he suddenly found himself as the head of government when the prime minister, William Pitt, was prevented from following the Irish union with Catholic emancipation as a result of divisions within the cabinet and the adamant refusal of George III. The landowners who dominated Parliament were also clamoring for relief from the cost of an inconclusive war, and it now seemed that there was a good prospect for favorable negotiations with the apparently well-disposed First Consul of France, Napoleon Bonaparte. Pitt understood the necessity of this peace but had no desire to take the responsibility for the concessions that would have to be made.

Both Pitt (Addington's close friend) and the king urged him to form a ministry committed to peace and to maintaining restrictions on Catholics. Pitt considered this to be a kind of caretaker government that he would direct from outside, and he counseled four of his ministers to remain in office. The fragile peace in 1801 was certainly popular, though the terms exacted by the French foreign minister, Talleyrand, and Bonaparte in the Treaty of Amiens, signed in March 1802, were bitterly criticized by some. All colonial acquisitions were returned to France and its allies save Ceylon and Trinidad. Addington and his foreign secretary, Lord Hawkesbury, pointed to Britain's retention of both Ceylon and Trinidad as sufficient compensation for the war and insisted that restoring the other possessions was a necessary price for international peace. The income tax, paid by the well-to-do, was abolished but had to be reimposed when the peace turned out to be a mere truce. Addington's government was soon suspicious of France's continuing expansion in Europe, and by the beginning of 1803 there was a general feeling that the renewal of war was inevitable. The government refused to surrender the vital Mediterranean base of Malta without sufficient guarantees from France, and on this issue Britain went to war again on 18 May 1803. With no ready allies, Addington's ministry concentrated on the defense of Britain, though it did build up an expeditionary force for future use. Addington himself, however, did not inspire confidence as a war leader. "Pitt is to Addington as London is to Paddington," went a popular catchphrase. In May 1804 Pitt became prime minister once more.

Addington later accepted a nominal post in Pitt's cabinet and continued in the so-called Ministry of All the Talents (1806–1807), which he helped destroy by telling the king of its plans to open military ranks above colonel to Catholics. He returned to office in 1812 and served as home secretary from 1812 to 1822. Thoroughly alarmed by the reports of disturbances around the country in the tense years after 1815, he was the chief instigator of repressive legislation, including the Six Acts of 1819. Following Catholic emancipation in 1829 and the reform of Parliament in 1832, both of which he opposed, he practically withdrew from politics in the last fifteen years of his long life.

### Afrancesados

Spanish supporters of the aims of the French Revolution in general and of Napoleon and King Joseph of Spain in particular. Among the Afrancesados, however, there were two very different elements that were united primarily by their support of the French and King Joseph. The Afrancesados were made up of well-educated members of the upper classes and the intelligentsia and by many of the grandees, or upper nobility.

The first group was to a large extent a product of the Enlightenment and saw the French, Napoleon, and Joseph as the means to introduce sweeping reforms into Spanish society and government. They were opposed to the absolute rule of the Bourbon kings of Spain, specifically to Charles IV and his dictatorial and mercurial first minister Manuel de Godoy. They were in favor of a "constitutional" monarchy in which they would have a significant voice, unlike the government of the past, when the nobility and the church had shut these members of the professional classes out of court influence. These Afrancesados were to a large extent anticlerical, though some clerics figured among them, in that they opposed the strong degree of influence of the Catholic Church in Spanish society, especially the activities of the Inquisition.

The second group of Afrancesados was composed of members of the grandee class, who also objected to the dictatorial rule of Godoy as first minister but who also

looked upon the popular uprising that drove him from office and forced Charles to abdicate as a dangerous development that only Napoleon and the French had the forces to subdue. They were more concerned with protecting their own positions of power, wealth, and influence than in leading change in Spain.

Although Joseph attempted to rule with the *Afrancesados* at least providing a Spanish face to his foreign-imposed rule, he was unsuccessful because of the intensely nationalistic though very conservative nature of the popular uprising against his rule. The minor nobility, the inhabitants of small towns, the church, and the peasants that made up the vast majority of the opposition to French rule were opposed to the ideals of both the French Revolution and the Enlightenment that the first, “liberal,” group of *Afrancesados* supported. They were also opposed to the continued power and influence of the *grandees*, who had been seen as an oppressive class even before the French invasion.

The *Afrancesados* were targeted by the partisans for assassination and their property was destroyed. They became the most hated of the partisans’ opponents even though they contributed little actual strength to the French forces occupying Spain. This hatred lent a particularly brutal character to partisan war because it was not simply a war against French occupiers; rather, it was also to some extent a civil war against what was perceived as both a traitorous and formerly privileged class. The *Afrancesados* were frequently a burden to the French forces, especially as the tide began to turn against Joseph. In addition to diverting troops for their protection and escort, they added to the noncombatant trains moving on the barely adequate Spanish roads. For instance, long columns of *Afrancesados* and their baggage were among those fleeing after the disastrous Battle of Vitoria.

In the aftermath of the Peninsular War the *Afrancesados* were targeted as traitors and were enthusiastically victimized. The legacy of the *Afrancesados* continued to affect Spanish politics as the liberals seeking change and constitutional government were often associated with their memory and were in some cases accused of being *Afrancesados*.

## Alba de Tormes, Battle of (28 November 1809)

Fought on 28 November 1809, the Battle of Alba de Tormes was an important French victory in the Peninsular War and one of the few occasions in the Napoleonic era when a force of all arms was broken by cavalry alone. In brief, the aftermath of the Talavera campaign had found the provisional government established to rule Patriot Spain in 1808 (the Junta Central) in a difficult situation. Thus, Viscount Wellington had resolved to refrain from engaging in any further joint operations with the Spanish armies unless they were placed under his command, while the Junta’s many internal enemies were plotting its overthrow. Only a dramatic victory could save the day, and the Junta therefore ordered its three main armies to launch a concentric advance on Madrid. To the northwest of the capital the force involved was the 26,000-strong Army of the Left commanded by the Duque del Parque.

In early October these troops, which outnumbered the opposing French forces by three to two, duly advanced on Salamanca and won a minor victory at Tamames. Thus encouraged, del Parque then occupied Salamanca, only to fall back southwestward as soon as the French showed signs of concentrating against him in strength. No pursuit was forthcoming, however—not only had the invaders had to send some of their troops back to ward off guerrilla attacks on such towns as Valladolid, but the Spanish general had holed up in the towering Sierra de Gredos—and on 18 November del Parque therefore once more marched on Salamanca. Heavily outnumbered once again, the French pulled back to Medina del Campo, where they were attacked by the Spanish advance guard on 23 November.

At this point, however, del Parque heard of the defeat of the Spanish Army of the Center at Ocaña. Realizing that the French were now likely to concentrate against him in overwhelming numbers, he therefore embarked on a hasty retreat in the direction of his base at Ciudad Rodrigo. En route, however, he came to grief. Believing that he was well out of reach of the French, on 28 November he allowed his men to bivouac in a weak position at Alba de Tormes. To make matters worse, meanwhile, his cavalry did not keep adequate watch. Had the French really been far away, then all would have been well, but this was not the case. By riding hard, 3,000 cavalry under General Kellermann arrived on the scene an hour before sunset. Unwilling to let his foe escape, the French general decided to attack without waiting for the infantry who were coming up behind him. Charging home with the élan characteristic of Napoleonic cavalry, Kellermann’s dragoons and hussars drove all before them, and the Spanish retired in great disorder, having lost nine guns, a considerable quantity of baggage, and

some 3,000 men. French losses, meanwhile, were at most 300 men. Since many other Spanish soldiers deserted in the subsequent retreat, for the time being the Army of the Left was out of the war.

### Albeck, Battle of (11 October 1805)

The Battle of Albeck occurred when Austria’s *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich and Archduke Ferdinand made an attempt to break out from the French forces that were surrounding them at Ulm on 11 October 1805. Mack had sent a force of 25,000 troops eastward along the bank of the Danube. At Albeck, around 6 miles northeast of Ulm, they found the French division of General Dupont, which was part of Marshal Ney’s corps. Dupont was in this isolated position as a result of confusing orders given to Ney by Marshal Murat. Ney had been instructed by Napoleon to take his orders from Murat in the final stages of the encirclement at Ulm. Ney had been told to cross the Danube with his entire corps but had protested that this would give the Austrians a chance to escape. As a compromise Murat allowed Ney to leave Dupont at Albeck. Although this did not satisfy Ney, he grudgingly followed his orders. Dupont had only 4,000 infantry, 1,000 cavalry, and eight pieces of artillery, and his nearest support was a division of dragoons under the command of General Baraguey d’Hillier.

Dupont decided to attack the advancing Austrian force in the hope that he could blunt their attack and at the same time convince them that he had a greater force at his disposal than was in fact the case. Throughout the day the French were able to launch a series of holding attacks against the Austrian force, the fiercest taking place at the village of Jungingen just to the west of Albeck. Here the church was held by the 9e Légère (light infantry) commanded by General Jean Victor Rouyer. Rouyer fortified the church and sent skirmishers forward to blunt the Austrian attacks. He then sent forward reserve columns that had been held outside the village when the Austrian assault slowed at the church. Mack was unable to make effective use of his massive superiority in cavalry because woods to the north of Dupont’s position protected that general’s flank. At nightfall Dupont was able to withdraw his ex-

hausted troops toward Brenz. Mack and Ferdinand withdrew back into Ulm.

Following this failure to break out, Mack was to try again two days later at the Battle of Elchingen. After the fighting at Albeck a furious argument broke out between Ney and Murat as to who was responsible for the danger into which Dupont had been placed. Napoleon intervened in this altercation, in the end supporting Ney.

### Albuera, Battle of (16 May 1811)

One of the bloodiest actions of the Peninsular War, the Battle of Albuera was the result of an attempt on the part of Marshal Nicolas Soult to relieve Badajoz, which had just been besieged by Anglo-Portuguese forces under the command of Sir William Beresford. Outnumbering Soult’s forces by almost three to two, Beresford’s army, which had been joined by two Spanish forces under generals Joaquín Blake and Francisco de Castaños, was drawn up in a strong position along the crest of a line of low hills. In the center of the Allied position, of which the Anglo-Portuguese occupied the left and center and the Spaniards the right—the village of Albuera provided a natural defensive redoubt, while the ridge provided plenty of opportunity for the defenders to take shelter behind the skyline. Soult, however, was a fine general, and he made use of the olive and ilex groves that screened his own position to outflank the Allied right with a large force of infantry and cavalry.

In the face of this threat, the Allied generals were slow to react—they seem, indeed, to have been convinced that Soult’s maneuver was a feint—and their whole army might have been rolled up had a single Spanish brigade not checked the French assault. Finally waking up to the danger of his situation, Beresford rushed most of his British infantry to reinforce the Spanish. The first brigade to arrive was, however, massacred when its divisional commander, Sir William Stewart, launched a premature attack that led to his brigade’s being charged in the flank by a regiment of Polish lancers. (Beresford himself was almost among the victims of this charge; he was caught up in the melee and was forced to defend himself hand-to-hand.)

Adapted from Fremont-Barnes 2002a, 54.

The Allies were only saved by the fact that the French flanking column had no space to deploy and had been forced to come to a halt. As a result the British brigades of Major General Daniel Hoghton and Lieutenant Colonel Abercrombie had time to relieve the Spanish in the path of the French and advance against them in line. In the terrible ensuing firefight, the British suffered heavy casualties and the battle once again hung in the balance. Seeing this, Beresford should have launched an immediate assault with the considerable forces he now had echeloned facing the left flank of the French flanking column, but exhaustion, indecision, and lack of confidence had sapped his will, and he failed to take the necessary action. Luckily for Beresford, however, an exasperated staff officer rode over to the commander of the 4th Division, Lieutenant General Sir Lowry Cole, and urged him to take the offensive.

Soult assailed the oncoming Allied troops with infantry, cavalry, and artillery, only to see his men repulsed

at every turn. Still worse, the French troops on the ridge were now assaulted by some British infantry who had been sheltered from the worst of the firefight. The French forces disintegrated and the fighting abated, with the whole of Soult's left wing retreating in a rout.

Thus ended a terrible day. Not counting several hundred prisoners, the Allied armies had lost 5,380 men dead or wounded, and Beresford was so shaken that he appears to have suffered a nervous breakdown. Soult's losses were still worse, the marshal having lost at least a quarter and possibly a third of his 24,000 men. The French had been thrown back—and burdened by 4,000 wounded, Soult had to retreat—but Beresford's generalship had been very poor, and Badajoz was not to fall for another eleven months.

## Alexander I, Tsar (1777–1825)

Tsar Alexander I (ruled 1801–1825) was one of the key protagonists of the Napoleonic Wars. During his reign, Russia's international status was transformed. In the early years of his reign, Alexander was able to achieve military success against Napoleonic France. Napoleon's superiority was confirmed at the Treaty of Tilsit in 1807. This was an alliance between Russia and France in which Russia was clearly the junior partner. The costly invasion of Russia in 1812, however, fatally weakened Napoleon. In 1813 Alexander became the leader of the Sixth Coalition, which defeated the Napoleonic forces and culminated in Napoleon's first period of exile. Alexander dominated the peace settlements at the Congress of Vienna in 1815. By this date, Russia had become the strongest military power on the Continent, and her status as a European great power was confirmed. Alexander's character is difficult to penetrate.

Tsar Alexander I, whose commitment to the defeat of France left his army the most powerful force in Europe at the end of the Napoleonic Wars. (Artist unknown/Hermitage, St. Petersburg, Russia)

He was sometimes irresolute but could be stubborn; he always wanted to please his companion, be he one of his “young friends” or Napoleon; he was educated as a liberal but became heavily influenced by mysticism later in his reign. These complexities and contradictions are evident in his foreign policy.

Alexander had been educated by the Swiss republican Frédéric César de La Harpe. An impressionable young man, Alexander enthusiastically absorbed La Harpe’s ideas about the benefits of republican government and the evils of despotism. As a result, he found the seemingly capricious and arbitrary rule of his father Paul I (ruled 1796–1801) dangerous and oppressive. Paul’s erratic behavior, both at home and abroad, offended significant sections of the Russian nobility and military elite. On the night of 23 March 1801, Paul was murdered when a group of conspirators, with Alexander’s knowledge, burst into his room and attempted to remove him by force. Alexander was shocked by the all-too-predictable fate of his father; his remorse and a fear of conspiracy remained during the rest of his reign.

Alexander inherited a difficult state of foreign affairs from his father. Paul had abruptly pulled out of the Second Coalition in 1799 and had then pursued a number of unpopular anti-British policies, including placing an embargo on British trade and dispatching a Cossack expedition supposedly intended to invade India. Alexander’s upbringing had neglected foreign affairs, and his first statements and policies naively envisaged creating a European peace under Russian leadership. In practical terms, this

meant establishing peaceful relations with Britain and France. In less practical terms, it meant an offer to mediate between Britain and France in 1803, and a proposal put to British ministers in 1804, probably written by Prince Adam Czartoryski, for Europe to become a league of liberal and constitutional states, in which all would live in peace, protected and controlled by the benign benevolence of Britain and Russia. The British government had neither the inclination nor the need to accept such an ambitious and impractical scheme.

Rising tensions over France nevertheless pushed Alexander toward alliances with Austria and Britain (war had broken out between France and Britain in 1803). Alexander had been offended by the execution of the duc d’Enghien (who had been seized in neutral Baden, which was the homeland of Alexander’s wife, Elizabeth), by Napoleon’s claiming the title of emperor and, more fundamentally, by a growing recognition of the threat posed by Napoleonic France to the balance of power in Europe in general and to the eastern Mediterranean in particular. By November 1804 Russia had signed a defensive alliance with Austria; in April 1805 this was followed by an Anglo-Russian alliance, to which Austria adhered in August.

Alexander’s first experience of war was traumatic. He was present with the Russian forces at the Battle of Austerlitz on 2 December 1805. The combined Austrian and Russian forces were routed by Napoleon with the loss of some 25,000–30,000 men. Alexander had to share some of the blame for the defeat. Not only had he put himself at the head of the Russian forces (the first Russian ruler to do so since Peter the Great), but he had also overruled the advice of his own commander in chief to delay operations. Far from appearing as a heroic leader of men, he had to flee hastily from the scene of the battle and almost suffered the indignity of capture. The tsar spent the night after the battle on the floor of a peasant’s hut, suffering from stomach cramps. Defeat was swiftly followed by Austrian capitulation. Prussia joined with Russia the following year and suffered shattering defeats at the battles of Jena and Auerstädt before Alexander’s troops could assist. Russian forces, now fighting Napoleon alone, were defeated at the battles of Eylau and Friedland, at the cost of some 30,000 lives. Alexander had little choice but to come to terms with Napoleon.

The two emperors famously met on a specially constructed raft on the Niemen River at the town of Tilsit on the border between Prussian Polish lands and Russia. Napoleon and Alexander tried to outdo each other with expressions of endearment, charm, and flattery. Alexander, as befitted the pupil of La Harpe, apparently expressed to the French emperor his admiration of republics and of non-hereditary succession. The practical results, however, of the Tilsit treaty were of immense significance and firmly estab-

lished French dominance in central Europe and the Mediterranean. Russia suffered few territorial losses—the Ionian Islands and Cattaro (on the Dalmatian coast)—but it had to agree to abandon the Adriatic, to adhere to the Continental System and to accept the creation of the duchy of Warsaw from formerly Prussian Polish territory. Alexander put a brave face on events; he wrote to his sister Catherine that “God has saved us: instead of sacrifices we have emerged from the contest with a sort of lustre” (Hartley 1994, 78). But the unpalatable truth was that Russia had not only been humiliated militarily but had also been forced to abandon important economic and strategic interests in Europe. It was little compensation that Napoleon now encouraged Alexander in the (in Napoleon’s view) harmless conquest of Finland (in 1808–1809) at the expense of Sweden. Alexander returned from Tilsit to face unpopularity at home and with Russia’s international status severely diminished.

The Tilsit settlement was inherently unstable. At least in principle, Russia’s adherence to the Continental System stopped all Anglo-Russian trade. This particularly hit Russian exports to Britain of iron, wood, hemp, and flax (Britain depended heavily on Russia for naval stores). The Russian nobility, already unhappy at what they regarded as the humiliation of the Treaty of Tilsit, also resented the loss of imported luxury goods. The curtailment of trade also meant that the Russian government lost vital income from customs on exported and imported goods. The situation was unsustainable, and in 1810 Alexander in effect withdrew from the Continental System when he imposed duties on French imports. Russia also resented French influence in the Balkans and the restrictions on Russian activities there. The greatest obstacle to peace, however, was the existence of the Grand Duchy of Warsaw, which was in effect a French satellite on Russia’s borders. Alexander had long expressed a desire to recreate an independent Polish state, and he had condemned as immoral the disappearance of Poland-Lithuania in the three partitions in the reign of his grandmother, Catherine II. But he wanted such a re-creation to be on his terms and under Russian control; the dominance of a Polish state by the most powerful country in Europe, and a potential rival and enemy, was simply intolerable. By the summer of 1811 it was obvious that diplomatic relations were breaking down and that Napoleon was preparing for war.

The Russian campaign of 1812 was a turning point in the Napoleonic Wars. Napoleon’s inability to force Alexander to come to terms despite the defeat at Smolensk and the costly stalemate at Borodino and the subsequent occupation of Moscow stretched Napoleon’s supply lines beyond their limits. It has been estimated that at least 400,000 French and French-allied troops perished or were

captured in the Russian campaign. In addition to the devastating human and material losses, Napoleon lost his image of military invincibility. The campaign was also a turning point for Alexander himself. His determination not to negotiate with Napoleon enhanced his image at home and abroad, although in truth he had little choice in the matter. Alexander was acutely aware of his unpopularity and vulnerability after initial setbacks and the occupation of Moscow; furthermore, the fate of his father was never far from his mind. Alexander, by upbringing and education a typical product of the Enlightenment, underwent a profound religious experience during this traumatic time and found solace in Bible study and spiritual matters. From this time onward, his vision of international affairs was couched in religious and spiritual language.

Russian troops crossed Europe in pursuit of Napoleonic forces, and Alexander was now the leader of the Sixth Coalition. Alexander had learned from his unfortunate experience at the Battle of Austerlitz and did not attempt to join the army at the victorious Battle of Leipzig in October 1813. He did, however, make sure that he led his troops triumphantly into Paris on 31 March 1814 after Napoleon’s abdication. Magnanimous in his newfound role as the savior of Europe, Alexander could put the humiliations of Austerlitz, Tilsit, and Moscow behind him and he pronounced to the people of Paris: “I come not as an enemy. I come to bring you peace and commerce” (Hartley 1994, 124). Alexander followed his entry into Paris with a trip to Britain, where he was greeted enthusiastically, at least by the crowds, as a hero and the vanquisher of Napoleon, although, it has to be said that he made a less favorable impression on British ministers: “A vain, silly fellow” was the unkind verdict of Lord Grey (Hartley 1994, 126). Napoleon’s escape from Elba put celebrations on hold, but the final defeat of Napoleon at Waterloo (without the participation of Russian troops) meant that the settlement of Europe could now proceed.

Alexander’s ambitions and Russia’s newfound military authority in Europe dominated the diplomatic proceedings at the Congress of Vienna. The Allies were relatively little concerned about the fate of France, which could be effectively restrained at its borders, but were greatly troubled by Poland’s fate, which potentially affected the whole balance of power in central Europe. While professing his desire for a free and constitutional Poland and his forgiveness for the participation of some 100,000 Poles in the Napoleonic army that had invaded Russia in 1812, Alexander made it clear that Poland would be firmly part of the Russian sphere of influence. The issue of Poland almost provoked a split among the Allies, but in the end the issue was settled to Russia’s advantage. Almost all the land that Prussia had acquired in the partitions, and that had then

formed the Duchy of Warsaw, now became the Congress Kingdom of Poland, nominally with a degree of independence (and with its own representative institutions) but in practice tied to Russia through the person of the tsar, who was also the constitutional king of Poland.

Russia gained territory as a consequence of victory in the Napoleonic Wars: In addition to the Congress Kingdom of Poland, Russia had acquired Finland from Sweden in 1809 and Bessarabia from the Ottoman Empire in 1812. Furthermore, Alexander was able to dominate the constitutional and territorial settlements of other, smaller states and to determine the very *language* of international agreements after 1815. In 1804, it had been possible for the British government to brush aside Alexander's sweeping, and unrealistic, proposals for European organization. In 1815, it was not possible to ignore his "Holy Alliance"—an agreement by which rulers would act together in union guided by Christian principles to maintain order, peace, and justice. Despite widespread skepticism, and even mockery, of Alexander's scheme, the only prominent individuals who were able to resist joining the alliance were the Prince Regent of Britain and the pope, both of whom refused to sign, and the Turkish sultan, who was not invited. The language of the Holy Alliance and of the pronouncements of the congresses that met between 1818 and 1821 not only was the product of Alexander's own spiritual state of mind but was also a reflection of the newly established power of Russia and of its ruler.

### Alexandria, Battle of (20–21 March 1801)

A British victory, the Battle of Alexandria ended the French occupation of Egypt, which had begun when Bonaparte had conquered the country in 1798.

In 1800 the British and the Ottoman Turks had planned a three-pronged full-scale invasion by British troops, Ottoman forces, and Anglo-Indian forces. The 5,000-strong Anglo-Indian force under General Sir David Baird would advance by way of the Red Sea. Vice Admiral Viscount Keith had 164 vessels—2 frigates, 100 transports, 5 ships of the line, and 57 Turkish vessels at his disposal. The army commander, General Sir Ralph Abercromby, was well respected, and his professionalism brought new life to the expedition. His subordinate was Major General Sir John Moore, later to become famous for his role in the Peninsular War.

The first battle prior to the capture of Alexandria was fought on 8 March 1801 after an astounding amphibious operation disembarked 6,000 British troops at Aboukir Bay. The fifty men to each boat carried sixty rounds of ammunition and three days' rations. The British, supported by gunboats, overcame strenuous opposition from the French and established a foothold. The French Armée d'Orient, commanded by General Menou, were quickly driven off the beach. On 13 March the British also won at Mandora, the land jutting out between Lake Aboukir and the Mediterranean Sea. The French used cavalry and artillery in an attempt to stop British advances on the sandhills. The hard-won victory cost the British 1,400 casualties; the French lost 700 men.

The Battle of Alexandria, beginning late on the night of 20 March and lasting until just before dawn of the following day, was fought at Nicopolis, some 12 miles from Alexandria, a town of 4,000 people. After constructing field fortifications, 14,000 British troops were deployed—three brigades on the left; Moore's reserve division on the right, facing southwest toward Alexandria; the Foot Guards in the center; and a second line consisting of dismounted cavalry and two infantry brigades.

The British were fully prepared for battle before sunrise on the twenty-first. However, British intelligence had been faulty, and the unexpectedly high number of French troops—12,000—concerned Abercromby. The French were ordered to drive the British into the lake, and they attacked under cover of darkness, before Baird's reinforcement would arrive. Moore's reserve, the 28th (North Gloucestershire) Foot, as well as the 23rd (Royal Welch

Fusiliers), 42nd Highlanders (the Black Watch), 58th (Rutlandshire) Foot, and four companies of the 40th (2nd Somersetshire) Foot, repulsed the first French attack.

The French twice renewed their attacks. The British, with bayonets fixed, dashed up sandhills to capture the French guns; they were supported by heavy guns from the Royal Navy ships at anchor, which also defended the ground already captured. French grenadiers and cavalry penetrated between the lines of the 28th Foot and the Highlanders, surrounding them front and rear in their vulnerable unfinished redoubt. However, the order "Rear rank 28th; Right About Face" was given, resulting in ferocious hand-to-hand combat by the stubborn and determined British troops, who fought for four hours. By facing about and offering staunch resistance, the regiment saved itself from destruction; as a result, they were thereafter granted the right to wear regimental badges on the backs of their headdresses.

The Black Watch was attacked twice, suffering many casualties, but it eventually captured the colors of an opposing regiment, most of whom had become casualties. The volleys of the Fusiliers throughout the battle were particularly beneficial; the French, to their cost, did not employ infantry in this fashion, instead relying on cavalry and artillery. The cannonades from the British gunboats caused appallingly high French casualties. The fighting was over by 10:00 A.M. Menou's final charge resulted in slaughter; he lost 3,000 killed and wounded.

In the course of the battle, Abercromby personally fought some French dragoons, suffering a fatal wound in his leg, though he remained engaged and in command until his collapse on the field. He died of his wounds on 28 March. Moore was also wounded but recovered. The British suffered 1,468 casualties. Moore pushed the French into Alexandria, which fell in April. Menou, with only 7,300 French effectives, surrendered Cairo in June and, later, Alexandria on 2 September. The French occupation of Egypt was at an end.

## Algeciras, First Battle of (6 July 1801)

Minor naval action fought off Gibraltar between British and French squadrons. Rear Admiral C. A. L. Durand, comte de Linois, with instructions to proceed to Cadiz, left the French Mediterranean port of Toulon on 13 June 1801 with three ships of the line and one 40-gun frigate. He was sighted off Gibraltar on 1 July and four days later word reached Rear Admiral Sir James Saumarez, then watching Cadiz, that a French squadron was sailing west. On learning that Saumarez led a superior force, Linois decided to postpone his arrival and made for the port of Algeciras, anchoring off the town, and in easy sight of Gibraltar, on 4 July. Light winds delayed Saumarez's arrival in Gibraltar Bay until the early hours of the sixth, at which time he had five 74s and one 80-gun ship. At 7:00 A.M. the lead British vessel, the *Venerable* (74), spotted the French warping toward the shore batteries, whereupon Saumarez ordered the squadron to engage his opponent's vessels in succession. Linois was anchored in shallow water, with intervals of approximately 500 yards between his ships. On shore he had the support of guns in Fort Santa Garcia, a mile and a half to the south, a battery on Isla Verde at the southern end of his line, and another battery at Santiago, at his northern end. Still more guns were sited at La Villa Vieja and at Almirante. Close to shore lay fourteen heavy Spanish gunboats. The weak breeze prevented the British ships from assuming the formation intended for them, so they took up various positions and anchored.

The action began at 7:50 A.M. when the British ship the *Pompée* (74) received broadsides from all four French ships in succession before anchoring at 8:45 very near the French flagship, the *Formidable* (80). A few minutes later the *Audacious* (74) anchored close to the *Indomptable* (80), and at 9:00 the *Venerable* anchored some distance from the *Desaix* (74) and the *Formidable*. A spirited cannonade soon ensued, during which the French ships continued to warp slowly toward the shore. Around 9:15 Saumarez's flagship, the *Caesar* (80), opened fire on the *Desaix*. Five minutes later the *Hannibal* (74) approached, and anchored near the *Caesar*. The last vessel, the *Spencer* (74), was far to leeward and, like her sister ships, could not maneuver in the light, intermittent breeze and unfavorable current. She thus played little part in the action. A few minutes after 10:00 Saumarez ordered the *Hannibal* to rake the *Formidable*. The *Hannibal* managed to interpose herself between that ship and the shore, but in so doing grounded on the shoals, with the *Formidable* on her port

side and the Almirante Tower, the battery at Santiago, and several Spanish gunboats to the starboard. The *Hannibal* fired on all these targets while simultaneously seeking to get afloat. Attempts to rescue her crew failed when the boats sent by other vessels were sunk.

At 11:15 Linois, fearing that other ships from Saumarez's squadron might attempt to maneuver between his line and the shore, ordered his vessels to drift ashore. As this put the French out of range, Saumarez sought to approach closer, but the constant shifting of the breeze, the difficult current, and the rocks and shoals scattered inside the harbor made this impossible. The current had earlier swung the *Pompée* into an unnavigable position, and when the attack could no longer be pursued Saumarez ordered the boats of the squadron to tow the *Pompée* from her vulnerable anchorage. The others had been destroyed in the fighting, and when at 1:30 P.M. action ceased and Saumarez withdrew, he had to abandon even the *Pompée* in order to take under tow the dismantled and grounded *Hannibal*, whose crew had however already been taken prisoner by the French. Both sides suffered very heavily. Saumarez lost 121 killed and 252 wounded, plus the prisoners taken off the *Hannibal*. Linois lost 306 killed and 280 wounded. Three of Saumarez's ships and all of Linois's were heavily damaged.

### Algeciras, Second Battle of (12–13 July 1801)

The second of two minor naval actions fought between British and French squadrons near Gibraltar. In the wake of the first action of 6 July, Rear Admiral Sir James Saumarez brought his battered ships into Gibraltar, where with unprecedented speed his crews refitted and repaired the vessels in preparation for another bout with Rear Admiral C. A. L. Durand, comte de Linois's squadron off Algeciras. In the meantime Linois sent word to Cadiz, requesting urgent assistance, as he expected a second engagement with Saumarez. At Cadiz, Rear Admiral Pierre Dumanoir Le Pelley commanded a French force of six

ships of the line and two frigates, though these were short of their full complements. On the eighth, however, he was joined by Vice Admiral Don Juan Joaquín de Moreno with five Spanish and one Franco-Spanish ship of the line and three frigates. On the morning of the ninth they embarked, and they joined Linois off Algeciras that afternoon, bringing their total force to nine ships of the line and three frigates. By the morning of the twelfth Saumarez had completed his repairs and had a squadron consisting of the *Caesar* (80 guns), *Venerable* (74), *Superb* (74), *Spencer* (74), *Audacious* (74), *Thames* (32), and three smaller vessels. The *Pompée*, present in the previous action, was left behind. He put to sea to meet his opponent, who early that afternoon also weighed anchor so as to confront Saumarez on the open sea. When the Franco-Spanish force came in sight near Cabareta Point, Saumarez gave chase, his ships forming in line ahead.

Action did not begin until nightfall, by which time Saumarez's squadron was widely separated. At about 11:20 P.M. the *Superb* encountered in the darkness the *Real Carlos* (112), the *San Hermenegildo* (112), and the *St. Antoine* (74) on her port side. Despite these terrible odds, the *Superb* engaged the *Real Carlos*, and after firing three broadsides had brought down her fore-topmast. When the Spaniard caught fire the *Superb* sailed on. Owing to some confusion the *Real Carlos* then mistakenly began to fire at the two friendly ships nearby, evidently mistaking them in the darkness for British vessels. At around midnight the *Superb* engaged the *St. Antoine*, sometimes at close quarters, for half an hour, before the French ship struck her colors. In the meantime the *Real Carlos*, still on fire, had fouled the *San Hermenegildo*, setting her ablaze as well. Shortly before the *St. Antoine* surrendered, the *Real Carlos* exploded, followed at 12:30 by the *San Hermenegildo*. A total of about 300 survivors reached the *Superb* and other British ships, but the remaining troops, approximately 1,700 men, were killed in the explosions. The *Superb* and four smaller vessels secured the French prize, while the remainder of the squadron continued its pursuit of the other ships.

Again the vessels were widely separated, and by 4:00 A.M. the wind, which had earlier increased to a gale, began to lighten to a breeze, and only the *Venerable* and the *Thames* could make headway. At 5:15 a fierce action commenced between the *Formidable* (80) and the *Venerable* in which the two sides fired broadsides at such short range that musket fire was also exchanged. At 5:30 the *Venerable* lost her mizzen topmast, and fifteen minutes later the *Thames* was able to rake the *Formidable* across her stern. At 6:45 the *Venerable* lost her mainmast overboard, leaving her effectively crippled. Meanwhile the *Caesar* and *Spencer*, owing to failing winds, proved unable to press on into effective range. Around 8:00 the *Venerable* lost her foremast,

struck a shoal, and lost her mizzenmast over the side, leaving her dead in the water. The Franco-Spanish were prevented from capturing her, however, by the approach from the south of the *Audacious* and the *Superb*, and rather than continue the contest the Franco-Spanish squadron entered the safety of Cadiz. Saumarez returned to Gibraltar with his prize and the *Venerable* in tow.

The British lost fewer than 150 men, mostly aboard the *Venerable*, which suffered 18 dead and 87 wounded. The French alone reported losses of 25 killed and wounded, which is almost certainly a wild underestimate. To this, of course, must be added the loss of the *St. Antoine* and her crew as prisoners, plus the severe Spanish losses of two ships of 112 guns destroyed and their entire crews either killed or captured. The action was not of great strategic significance, yet Saumarez had shown great daring and skill at chasing and defeating his opponent, having hastily refitted his heavily damaged squadron in the wake of the first encounter off Algeciras only six days previously. The two actions confirmed the correctness of then-current British naval policy: hemming their opponents' vessels into port and confronting any that dared venture out could succeed, even against heavy odds.

## Almeida, Sieges of (1810, 1811)

Almeida was one of a pair of Portuguese fortresses that guarded the only two major points of entry for invading armies from Spain, known together as the Gates to Portugal. Almeida, like its more famous Spanish counterpart (Ciudad Rodrigo), sits along the northern route. The fortress's primary mission was to protect the crossings on the Coa River, which created a natural defensive barrier between the two countries. Because of its strategic value, Almeida was the site of two important sieges during the Peninsular War.

In July 1810 Viscount Wellington knew his small British army could not stop the invading French, commanded by Marshal André Masséna, from entering Portu-

gal. Wellington's plan was to make a strategic withdrawal, letting the fort at Almeida hold off the French until October, when autumn rains would make future campaigning very difficult. Almeida was in a strong position to withstand a siege: It was garrisoned by over 5,000 troops with over 100 guns and was amply supplied with food and ammunition, all under the command of the very capable British colonel William Cox, who held the rank of brigadier general in the Portuguese Army.

The siege began on 24 July, when the French pushed the British across the Coa, cutting Almeida off from reinforcements. Masséna began digging siege trenches on 15 August, and the following day he began shelling the fortress. In the first thirteen hours of the siege, the French fired 6,177 rounds (using nine tons of powder) with little effect, until fate played a major role. A howitzer round landed near the main powder magazine and, through a still-unknown chain of events, ignited the million infantry cartridges and 150,000 pounds of gunpowder inside. The ensuing explosions destroyed the center of the fortress and all its supply of powder. Almeida was practically defenseless and surrendered on 28 August. Masséna consolidated his position and in September moved further into Portugal, meeting the British at the Battle of Busaco on 27 September.

The fortress of Almeida remained under French control until spring 1811, when the British began their siege on 4 April. Like Masséna the year before, Wellington knew he had to take the fortress in order to safely control the road. The French attempted to relieve the fortress but were blocked by Wellington's Anglo-Portuguese forces at the Battle of Fuentes de Oñoro on 5 May. Upon hearing the news of the defeat, the 1,300 men of the French garrison abandoned the fortress and fought their way through British lines and escaped.

The departure of the French garrison ended the invasion of Portugal. Never again would the French enter that country in any numbers larger than a raiding party. These two sieges epitomize Wellington's style of defensive strategic warfare and his reliance on foresight, patience, and determination to achieve victory in the Peninsular War.

### Altenkirchen, Battle of (19 September 1796)

Fought 50 kilometers east of Bonn, the Battle of Altenkirchen was the final victory of Archduke Charles's Austrian army over General Jean-Baptiste Jourdan's French Army of the Sambre and Meuse, which forced the French to withdraw across the Rhine. Leaving a screen, the archduke could march south to attack General Jean Moreau's Army of the Rhine and Moselle. The noted French commander General François-Severin Marceau-Desgraviers, was fatally wounded in the fighting.

Following his defeat at Würzburg on 3 September 1796, Jourdan retreated with his army northwest toward the Lahn River to join his force previously blockading Mainz. Charles's army pursued the French, attempting an outflanking move toward Aschaffenburg, where they defeated a small French force on 6 September. Between 9 and 12 September the French withdrew across the Lahn around Wetzlar. Austrian diversionary attacks occupied French attention on the river valley for another four days, while Charles massed toward Limburg in the west, threatening Jourdan's retreat on the Rhine. The archduke attacked and defeated the French right under Marceau on 16 September, forcing Jourdan to withdraw on Altenkirchen to secure the Hachenburg defile, through which the Wetzlar road ran toward the Rhine. His retreat was covered by Marceau's steady withdrawal against the Austrian advance guard under Freiherr Kray, whose lead units drove the French from Herborn and reached Luisenlust early on 19 September.

General Jean-Baptiste-Jules Bernadotte's division had reached Altenkirchen on the morning of 19 September and took a position between the road and the Wiedbach stream. He was followed by General Paul Grenier's and François Lefebvre's divisions, which formed the French main force in two battle lines, while General Jean-Etienne Championnet moved to Weyerbusch, leaving the cavalry to cover Marceau's withdrawal through Hachenberg to Freilingen. The archduke's main body (18,000 men) had reached Molsberg with Kray (9,000 men) at Hahn.

On 19 September, Marceau abandoned Freilingen and withdrew his infantry through the Höchstebach Forest, protected by his cavalry until Kray's cavalry outflanked them. The main French army (25,000 men) established a position behind the Weidbach stream and then covered the rear guard's withdrawal, but during this action Marceau was fatally wounded. General André Poncet took command and joined Bernadotte's left with the cavalry massed behind him. Meanwhile, Kray had taken Höchstebach village and secured the forest, although a fierce rearguard action was mounted by the French around the Walrod mill, action that prevented the Austrian advance guard from

reaching the main French positions. The archduke's army camped at Freilingen. During the night Jourdan continued his retreat and withdrew across the Rhine two days later. By the time Austrian troops reached the former French positions, Marceau was dead. At dawn on 21 September, his body was returned with full military honors. Charles left a screen under Werneck and headed south to confront Moreau.

### Alvinczy, Joseph Freiherr von Berberk (1735–1810)

Austrian general defeated by Bonaparte at Arcola and Rivoli at the end of the 1796–1797 Italian campaign. Although he was a brave, experienced, and decorated hero of the wars of the later eighteenth century, ill health curtailed his effectiveness. A popular commander, he was also enthusiastic about science and became a trusted imperial adviser in his later years.

A Transylvanian commoner, Alvinczy joined the army as a *Fähnrich* (ensign/cadet officer) at the age of fourteen and served for fifty-seven years. Promoted to *Hauptmann* (captain) in 1753, he commanded a grenadier company. His courageous leadership at the battles of Torgau and Teplitz during the Seven Years' War (1756–1763) won him promotion to *zweiter* (second) major. After the war, he worked on the implementation of *Feldmarschall* Franz Moritz Graf Lacy's new 1769 uniform and drill regulations. Promoted to *Oberst* (colonel) commanding Infanterie Regiment 19 in 1774, he led his men from the front through the War of Bavarian Succession (1778–1779), taking the "Bohemian Gate" pass and capturing the Prussian commander, Prince Hessen-Phillipsthal. These feats won him promotion to *Generalmajor* (major general) and the Knight's Cross of the Order of Maria Theresa. After a short period instructing the future emperor, Archduke Francis,

in military tactics, he returned to Infanterie Regiment 19 as its *Inhaber* (honorary colonel).

Under *Feldmarschall* Gideon Freiherr von Laudon, he fought in the Austro-Turkish War (1788–1791), but bad weather prevented him from successfully assaulting Belgrade. Promoted to *Feldmarschalleutnant* (lieutenant general), he went to the Austrian Netherlands in 1790 to suppress the Belgian rebellion, until a fall from his horse forced him to retire. Returning in 1792, he commanded a division and steadied his demoralized men at the Battle of Neerwinden (18 March 1793) before leading them in the capture of the village. Commanding an auxiliary Austrian Korps supporting the British, he fought at Landrecies and Fleurus before being wounded at Mariolles. Promoted to *Feldzeugmeister* (general), Alvinczy advised the Prince of Orange in the successful relief of Charleroi in June 1794, losing two horses from under him. Rewarded with the Grand Cross, he was recalled to Vienna to serve on the Hofkriegsrat (Imperial War Council) in 1795.

After organizing the Tyrolean militia to face the advancing French in 1796, Alvinczy was charged with relieving Mantua from Bonaparte's siege. With an army largely composed of new recruits and with few experienced officers, but aided by his chief of staff, Major Franz Ritter Freiherr von Weyrother, he won victories at the Battle of Bassano (6 November 1796) and, five days later, the first Battle of Caldiero before being defeated at the Battle of Arcola (15–17 November). Despite deteriorating health and bad weather, he regrouped and tried again, but he suffered a second defeat at Rivoli (13–15 January 1797). Bedridden with swollen feet, he was relieved by Archduke Charles in February. Thereafter, he was *General Kommandant* (military governor) in Hungary and a *geheimer Rat* (imperial adviser), directing the introduction of the new 1798 pattern equipment.

## Amberg, Battle of (24 August 1796)

Indecisive Austrian victory over the French in northern Bavaria, east of Nuremberg. After the Battle of Rastatt, Archduke Charles had withdrawn eastward with *Feldmarschalleutnant* Maximilian Graf Baillet von Latour's

Army of the Upper Rhine, before fighting General Jean Moreau's Army of the Rhine and Moselle to a standstill around Neresheim over 11–13 August. Charles's daring strategy, utilizing the maneuver of the central position to achieve a local numerical superiority, was to march north to catch General Jean-Baptiste Jourdan's Army of the Sambre and Meuse in a pincer movement with *Feldzeugmeister* Wilhelm Graf Wartensleben's northern corps. After defeating this French army, he would move south again to cut Moreau's links with France. Although the maneuver split the French armies, Jourdan narrowly escaped the trap and retreated west.

On 17 August, Charles left Latour and marched north with 28,000 men. In the north, Wartensleben had been driven 20 kilometers east of Amberg by Jourdan's army, which had halted in the town. The archduke marched north on 22 August to attack General Bernadotte's division around Neumarkt. After two days of fighting, Bernadotte withdrew northwest, leaving the road to Amberg open.

Aware of Bernadotte's defeat, Jourdan was preparing to evacuate the town. To protect his heavy artillery, the 40,000 troops of the Sambre and Meuse army were positioned in a broad sweep in front of Amberg, with a reinforced right flank, since Jourdan expected Charles, with 18,000 men, to make the main attack. The Austrians had observed the withdrawal of the French guns, and Wartensleben realized that he had to pin Jourdan down to allow Charles time to arrive. During the afternoon of 23 August, he pushed four cavalry regiments across the Naab, followed by a general advance supported by heavy artillery. The French army initially held its ground, but around 11:00 p.m. began to retreat back toward Amberg.

Skirmishing continued through the night, and in the morning, Charles was driving General Jacques-Philippe Bonnaud's French cavalry back through Kastel. To Jourdan's surprise, the main Austrian assault broke from the east as Wartensleben's 35,000 men advanced in three columns onto the hills above the town, which was divided by the Vils River. To the south were the divisions of generals Championnet and Paul Grenier, and to the east stood General Colaud's division. Wartensleben's first two columns (under Paul Kray Freiherr von Krajova and himself) overwhelmed Colaud and reached the southeastern part of Amberg; from there they opened up a heavy artillery bombardment. Meanwhile *Generalmajor* Karl Graf Hadik's third column linked with Charles's troops advancing from the Ursenum wood on the south side. The battle became a rearguard action in the town as Jourdan hastened the retreat of the Sambre and Meuse army northwest to avoid being cut off by *Generalmajor* Johann Hotze's column, which was pursuing Bernadotte toward the Nuremberg road. The last-minute French withdrawal had denied

Charles a decisive victory, but Jourdan had lost 2,000 men against the Austrians' 400 and would now withdraw westward toward Würzburg and away from Moreau.

**Amiens, Treaty of (25 March 1802)**

The Treaty of Amiens granted a rare period of peace between Britain and France and formally ended the French

Revolutionary Wars. It gave Europe a respite from conflict and British citizens a chance to visit Paris and trade with France, but it lasted barely a year.

The Treaty of Lunéville, signed in February 1801 between France and Austria, left Britain isolated in the war against France. Under the prime minister, William Pitt, Britain had twice raised unsuccessful continental coalitions against France. This was too much for the British business class to tolerate, and Pitt, over a dispute with King George III about Catholic emancipation, unwillingly retired from government in March 1801. The British public was tired of war and its enormous cost, and although the Royal Navy held command of the seas, Napoleon had established France as the uncontested power on the European continent.

The new British government, led by Pitt's successor, Henry Addington, reluctantly entered into peace negotiations with France. The two sides reached preliminary agreement on 1 October 1801. Lord Cornwallis then continued negotiations with France, represented by Napoleon's

*Adapted from Fremont-Barnes 2001, 87.*

brother Joseph Bonaparte, at the French town of Amiens. British success in Egypt and the destruction of the Danish fleet at Copenhagen led Britain to believe that it would have the upper hand, but quite the opposite was the actual case. The Treaty of Amiens, formally ratified on 25 March 1802, was a diplomatic coup for France and Napoleon. It effectively ended all opposition to French forces on the Continent. Egypt was to be returned to Turkey, and the Knights of St. John were to regain control of the island of Malta, both regions currently occupied by the British. France, on the other hand, kept all territory within its “natural” frontiers (the Rhine, the Alps, and the Pyrenees) as well as Holland and several territories in Italy. Various islands in the West Indies were returned to the Dutch and the Spanish, French allies. While the British public breathed a sigh of relief, the French were exuberant.

All of Europe celebrated the peace, though perhaps the number who thought it would last was somewhat fewer than the number of celebrants. Trade flourished in Britain, France, and the rest of Europe. British tourists flocked to Paris to see Napoleon, joining thousands of other tourists from all over Europe. To many, it seemed that the peace could last forever.

For Napoleon, the Treaty of Amiens was a triumph that built on other accomplishments and brought him his twin goals of domestic and foreign peace. The Concordat with Pope Pius VII had been signed in August 1801, and these two items made Napoleon a hero to his people and a source of wonderment to Europe. Free from conflict, Napoleon concentrated on his much-desired domestic reforms. He also eliminated another foreign entanglement when he agreed to sell the Louisiana Territory to the United States, by a deal consummated on 30 April 1803.

Many in the British government had not trusted the French, even as they agreed to the peace. The British ambassador to France, Lord Whitworth, sent a veritable deluge of reports to his government, filled with denunciations of Napoleon and rather absurd claims that the French people were dissatisfied with him. These reports, coupled with continued fears that Napoleon might use the time of peace to prepare for war against Britain, gave ammunition to those who wished to scuttle the treaty. The British government violated the treaty by refusing to leave either Malta or Egypt, even though France had complied with her territorial treaty obligations.

British newspapers began a public relations campaign against Napoleon, whom they had only recently been praising. They published a report by French colonel Horace Sébastiani that suggested that France could easily retake Egypt. The *Times* of London printed large passages from Sir Robert Wilson’s *History of the British Expedition to Egypt* that made the claim that Napoleon had poisoned his

own sick at Jaffa (a claim with some foundation). Personal attacks on Napoleon were hardly a sign of a desire for peace and friendship. Nevertheless, the attacks, including a barrage of cartoons that lambasted Napoleon, increased and spread to attacks on Josephine and other family members. The work of caricaturists like James Gillray, George Cruikshank, and Thomas Rowlandson had a significant political impact. Napoleon’s rage at the failure of the British, in an era of widespread censorship, to suppress such vicious attacks may have been an important factor in the breakdown of the Peace of Amiens.

It is entirely conceivable that a lasting peace between Britain and France was simply not possible. Even so, diplomatic efforts to avoid war continued. Napoleon made numerous proposals regarding Malta and Egypt, but the British government rejected them all, meanwhile denouncing, with some justice, Napoleon’s intervention in the domestic affairs of Holland, Switzerland, and the northern Italian states—all violations of France’s agreement with Austria under the terms of the Treaty of Lunéville but not, strictly speaking, the business of Britain, which was not a signatory to that agreement. On 16 May 1803 King George III held a council on the subject of war or peace, and two days later, the Royal Navy began to seize French ships. Napoleon retaliated by detaining—in defiance of international law—British citizens on French territory. The Peace of Amiens had come to an end, and peace between Britain and France would not be restored again until May 1814.

Though it would be some time before actual fighting began—apart from minor operations at sea—France and Britain were again at war. There was little advantage accruing to either side at the outset. Neither was prepared for hostilities, and the citizens of both nations had been quite happy with peace, as was the whole of Europe. The rupture of the Peace of Amiens led to over a decade of almost-constant war. Napoleon was ultimately defeated, but at a huge cost that might never have been paid had peace prevailed.

### Amstetten, Battle of (5 November 1805)

A rearguard action between Russian and French forces during the War of the Third Coalition. After the Austrian debacle at Ulm, Russian general Mikhail Kutuzov had no other choice but to beat a hasty retreat, which he ordered on 4 November. He left Prince Peter Bagration, with approximately 6,000 infantry and 1,900 cavalry, to cover his movement and hold back the French for as long as possible. The road from Enns ran through a dense forest with a few clearings, and Bagration made a fighting retreat along this road to Amstetten pursued by superior French forces. After making previous stands at Altenhofen and Oed, Bagration decided to fight near Amstetten. Marshal Joachim Murat's troops were in close pursuit of Bagration. The weather also hindered movement since thick snow covered the terrain. Bagration arranged his troops in two lines on the hill on both sides of the road while the artillery was set up on the road itself, protected by the cavalry. The first line comprised Austrian cavalry, while the Russian troops were deployed in the second.

Seeing the enemy lines, Murat ordered the elite companies of the 9th and 10th Hussars to charge them. However, the Austrian cavalry overwhelmed the French. The French were saved by the decisive actions of their artillery, which forced the Austrian cavalry to retreat and gave Murat time to rally his troops and launch another attack with larger forces. General Nicolas Oudinot arrived at the battlefield in time to support this attack with his grenadiers. The French overwhelmed the Austrian cavalry, penetrated the first line of Bagration's defense, and attacked the second, driving the Russians back to Amstetten. Bagration appealed for reinforcements to Kutuzov, who moved rearguard reserves (four infantry regiments, ten cavalry squadrons and one and a half artillery companies) under Mikhail Miloradovich. Fresh Russian regiments were moved to the first line, while Bagration's forces were withdrawn to the second. The fighting continued for the rest of the day, with Bagration and Miloradovich holding their ground and occasionally counterattacking. The fighting was savage on both sides. Around 9:00 P.M. the Russians disengaged and marched through Amstetten following the main forces.

Both sides exaggerated in their reports of the action, claiming victory against superior forces. Murat wrote to Napoleon, declaring, "The action at Amstetten has been one of the most stubborn and one of the most brilliant that the corps ever had: 5,000 men made headway against 15,000 men. . . . Oudinot's division covered itself with

glory; it withstood, repelled and defeated a corps three times as strong as it, fighting under the eyes of Kutuzov and led by the best generals." (Alombert-Goget 1902, 4:512). The Russians also considered Amstetten a great success, since their main goal was to delay the French advance. Bagration and Miloradovich even claimed that the numerically superior French forces were forced to flee with considerable casualties. According to Russian sources, the Allies suffered around 2,000 casualties.

### Antommarchi, Francesco (1789–1838)

A Corsican by birth, Francesco Antommarchi served as Napoleon's physician during the former emperor's last days of exile on St. Helena. An anatomist by specialty, Antommarchi studied medicine in Italy, where he set up his practice. Sir Hudson Lowe was anxious for Napoleon to have adequate medical care, fearful of negative publicity if he did not. When Napoleon refused to see British doctors on the island, such as James Verling, Lowe turned to Napo-

leon's family to select a doctor. Antommarchi was chosen by Cardinal Joseph Fesch (Napoleon's uncle) and Madame Mère (Napoleon's mother).

Antommarchi first visited Napoleon in September 1819, having arrived a few days earlier. He stayed until Napoleon's death in 1821. Napoleon had no faith in Antommarchi's abilities, suggesting that he was better able to dissect horses than humans. Napoleon's lack of confidence in his fellow Corsican was probably justified, and Napoleon was reluctant to follow any of his medical advice.

When Napoleon died on 5 May 1821, Antommarchi conducted the postmortem examination under the watchful eye of a number of British doctors, but he refused to sign the official report, notwithstanding his general agreement with that report's conclusions. In 1825 Antommarchi published his memoirs of his experiences on St. Helena in *Derniers moments de Napoléon* (Last Moments of Napoleon), which was soon thereafter translated into English. A few years later he promoted sales of a death mask of Napoleon that he claimed to have made, though those claims are considered suspect.

### **Arakcheyev, Aleksey Andreyevich, Count (1769–1834)**

Russian general and minister of war, Arakcheyev was born on 4 October 1769 to a minor noble family in the Tver *gubernia* (province). He graduated from the Artillery and Engineer Cadet Corps with the rank of sub-lieutenant on 8 October 1787 and remained at the corps as an instructor and librarian. In 1790–1792 he served as a senior adjutant to the director of the corps. In 1792 he was appointed commander of the Gatchina Artillery with the rank of captain. He became very close with Grand Duke Paul, and over the next three years was promoted, first to major and then to colonel, and became the infantry inspector at Gatchina. After Paul became tsar in November 1796, Arakcheyev rose to major general and received command of a battalion of the Life Guard Preobrazhensk Regiment, quickly followed by appointment as the commandant of

St. Petersburg. On 16 April 1797, he was given the title of baron and, on 30 April of the same year, he became the quartermaster general of the Russian Army.

However, at the whim of the quixotic tsar, Arakcheyev was dismissed with the rank of lieutenant general on 29 March 1798. Paul soon forgave him and returned him to service in January 1799, making him commander of the Life Guard Artillery Battalion and the inspector of all Russian artillery. On 16 May 1799 he was given the title of count of the Russian Empire with the motto "Devoted without Flattery," composed by Paul himself. However, Arakcheyev's aloofness, gloomy personality, straightforwardness, and rough character made him disliked by many. In the fall of 1799 he was dismissed for concealing his brother's financial machinations. He remained at his estate in Gruzino for the next four years, except for a brief trip to St. Petersburg on the eve of Paul's assassination.

Arakcheyev was reinstated to his position of inspector of all artillery in 1803 and was instrumental in launching artillery reforms in the Russian Army. On 9 July 1807 he was promoted to general of artillery. In 1808 Tsar Alexander I appointed him the minister of war and general inspector of the infantry and artillery. In September 1808 the Rostov Musketeer Regiment was renamed as Count Arakcheyev's Musketeer (later Grenadier) Regiment. In 1809, Arakcheyev briefly ventured to Finland, where he participated in Prince Peter Bagration's crossing of the Gulf of Bothnia during the Russo-Swedish War. In 1810 he presided over the Department of War within the State Council. In early 1812 Arakcheyev remained with the imperial headquarters attached to the 1st Western Army and then traveled to St. Petersburg. He returned to the army in December 1812 and served as the head of the Imperial Field Chancellery in 1813–1814. In April 1814 Alexander promoted him to field marshal, but Arakcheyev asked him to annul this order because he did not command any troops. Instead, Arakcheyev received a portrait, set with diamonds, of the tsar.

Arakcheyev's power increased beginning in 1815, when Alexander was preoccupied with foreign affairs and depended on him for domestic administration. He served as the inspector of all infantry and artillery and supervised the State Council and the Cabinet of Ministers during Alexander's absence. He was in charge of the infamous system of military colonies and created a network of settlements populated with some 400,000 men. This period was often referred to as *Arakcheyevschina* (Era of Arakcheyev). Arrogant and ruthless, Arakcheyev virtually governed the Russian Empire of his time and made numerous enemies through his callous and brusque decisions. By the end of Alexander's reign, he was one of the most despised, yet feared, men in the empire. Immediately after Alexander's

death, Tsar Nicholas I removed him from all positions of power. Arakcheyev retired to his estate at Gruzino, where he died on 4 June 1834 and was buried in a local church.

**Arcis-sur-Aube, Battle of (20–21 March 1814)**

The Battle of Arcis-sur-Aube was fought between Napoleon’s troops and Karl Fürst zu Schwarzenberg’s Army of Bohemia (mostly Austrians) during the campaign in France in 1814. Schwarzenberg proved victorious in this battle primarily because Napoleon underestimated him. Arcis-sur-Aube would prove to be the beginning of the end

for the French; it was the last major battle fought by Napoleon himself before Paris fell.

After Napoleon had retaken Rheims from the Allies on 13 March 1814, he sought to check the Austrian advance on Paris. There were several routes possible. Marshal Jacques Macdonald had been forced to retreat along the Seine, and Napoleon considered joining up with him near Meaux, but he feared that move would reveal his intentions. He could attempt to break up the Allied forces at Sézanne, but that route risked the use of bad roads in order to divide the enemy. Napoleon instead chose to follow Schwarzenberg, who was retreating toward Troyes to the south. This plan promised greater strategic rewards: Schwarzenberg’s forces were spread out for 80 miles, and if Napoleon could deliver a decisive blow and remove Schwarzenberg from the campaign (or at the very least disrupt the Allies’ communications with their respective capitals), he would be better placed to engage the Army of Silesia (mostly Prussians) in the north.

The miscalculations of the two leaders produced very different results. Napoleon planned to scare the Austrians off by a show of force at Arcis-sur-Aube, which he had

*Adapted from Chandler 1966, 995.*

been told was held by a small Allied rear guard. With Schwarzenberg already in retreat, Napoleon concluded that an offensive push at Arcis would force the traditionally cautious Schwarzenberg even farther from Paris. Apart from marshals Auguste Marmont and Adolphe Mortier, who were left to hold off the Prussians under General Gebhard von Blücher, Napoleon concentrated his 23,000 men at Arcis, on the Aube River, convinced that he was facing a small force that he outnumbered. But Schwarzenberg did not follow Napoleon's expectations. When he learned of the advance, he concluded that the French were moving on his headquarters at Troyes, and he stopped to face them near Arcis.

On the morning of 20 March, Napoleon's advance forces crossed the Aube and took Arcis unopposed. As intelligence had failed to indicate the presence of the enemy, Marshal Michel Ney was caught by General Karl Freiherr von Wrede's Bavarians at Torcy, a mile and a half east of Arcis, while most of the rest of the Allied cavalry crashed into two French divisions in the town itself, driving back in confusion the Imperial Guard cavalry under generals Eduard Colbert and Rémi Exelmans. Had not Louis Friant's division of the Old Guard appeared at the bridge over the Aube at this moment, a rout might have ensued, but the sight of their bearskins heartened the fugitives, aided by the timely presence of Napoleon himself, who rode about the field rallying the troops, though nearly at the cost of his own life: A live howitzer shell burst near the Emperor as he rode; the explosion killed his horse but left its rider unharmed. Allied assaults petered out around dusk.

During the night both sides received reinforcements, and by the morning of the twenty-first Schwarzenberg was able to deploy more than 80,000 troops, opposed by fewer than 30,000 French. Cautiously, and greatly underestimating French strength, Schwarzenberg delayed his attack until late afternoon. But by then it was too late. Napoleon, having been unable to ascertain the enemy's true strength because of rising ground between the opposing forces, had that morning sent out his cavalry to reconnoiter their position. On learning that nothing less than the entire Allied army of 100,000 men was assembled before him, the Emperor decided to retreat. With bridging equipment fresh from Paris, most of the French forces were already safely across to the north bank of the river when Schwarzenberg finally ordered an attack around 3:00 P.M. Marshal Nicolas Oudinot, leading the rear guard, fought furiously, holding back the Allies until 6:00 P.M., when he withdrew across the river and blew the bridge behind him.

Schwarzenberg's hesitation had saved Napoleon's army, which lost approximately 3,000 men in the fighting, giving it the opportunity to retreat once the Emperor realized that he faced more than the rear guard he had ex-

pected. Napoleon proceeded toward Vitry, intending to goad Schwarzenberg into chasing him to St. Dizier rather than advancing to Paris. But the Austrian commander, who had lost about 4,000 killed and wounded at Arcis, ignored this ruse and chose not to pursue. Instead, his forces defeated Mortier and Marmont four days later at La-Fère-Champenoise before uniting with Blücher on the twenty-eighth at Meaux and marching directly on Paris.

### Arcola, Battle of (15–17 November 1796)

Fought over marshy ground between the Adige River and its tributary, the Alpone, in the vicinity of Verona, the Battle of Arcola (Arcole) was one of the hardest-fought victories of Bonaparte's first Italian campaign and resulted in checking the third Austrian attempt at relieving the besieged fortress of Mantua.

In October 1796 a tired, hungry, and severely under-strength (French) Armée d'Italie anxiously waited for replacements and supplies, which arrived in too little quantity and too slowly. The number of the sick, especially among the troops assigned to the blockade of Mantua, increased daily. Peasant insurgencies and brigandage in the rear constantly caused the French considerable trouble. Reports announced that the Austrians had the upper hand in Germany, thus sweeping away any hope that the French armies on either side of the Alps could link up.

Despite recent reverses, the Austrian prospects looked relatively better. After his failed attempt at rescuing Mantua in September, *Feldmarschall* Dagobert Graf Würmser had managed to lead 13,000 men behind the fortress walls, thereby reinforcing the city garrison (also plagued with epidemics) but at the same time raising the demand on the exhausted local community for food, fodder, and other supplies. The blockade of Mantua, nonetheless, had the effect of stripping Bonaparte of field troops. After the

The young General Bonaparte, tricolor in hand, leads an attack across the bridge at Arcola, where he saved French forces from imminent defeat at the hands of a numerically superior Austrian army. (Ridpath, John Clark, *Ridpath's History of the World*, 1901)

victories in Germany, the Austrian Aulic Council moved troops to Italy and devised a new plan to relieve Mantua. Once again two separated armies, under *Feldzeugmeister* Joseph Alvinczy, would deliver a pincer attack. An army with about 27,000 men and seventy-four guns was to advance westward from Frioul. Another army, with 17,000 men and sixty guns under *Feldmarschalleutnant* Paul Freiherr von Davidovich, was to descend from Tyrol down the upper Adige valley. According to the plan, they would join at Verona. Long distances and rough terrain, however, made communication between the two armies difficult, a principal reason for their eventual failure.

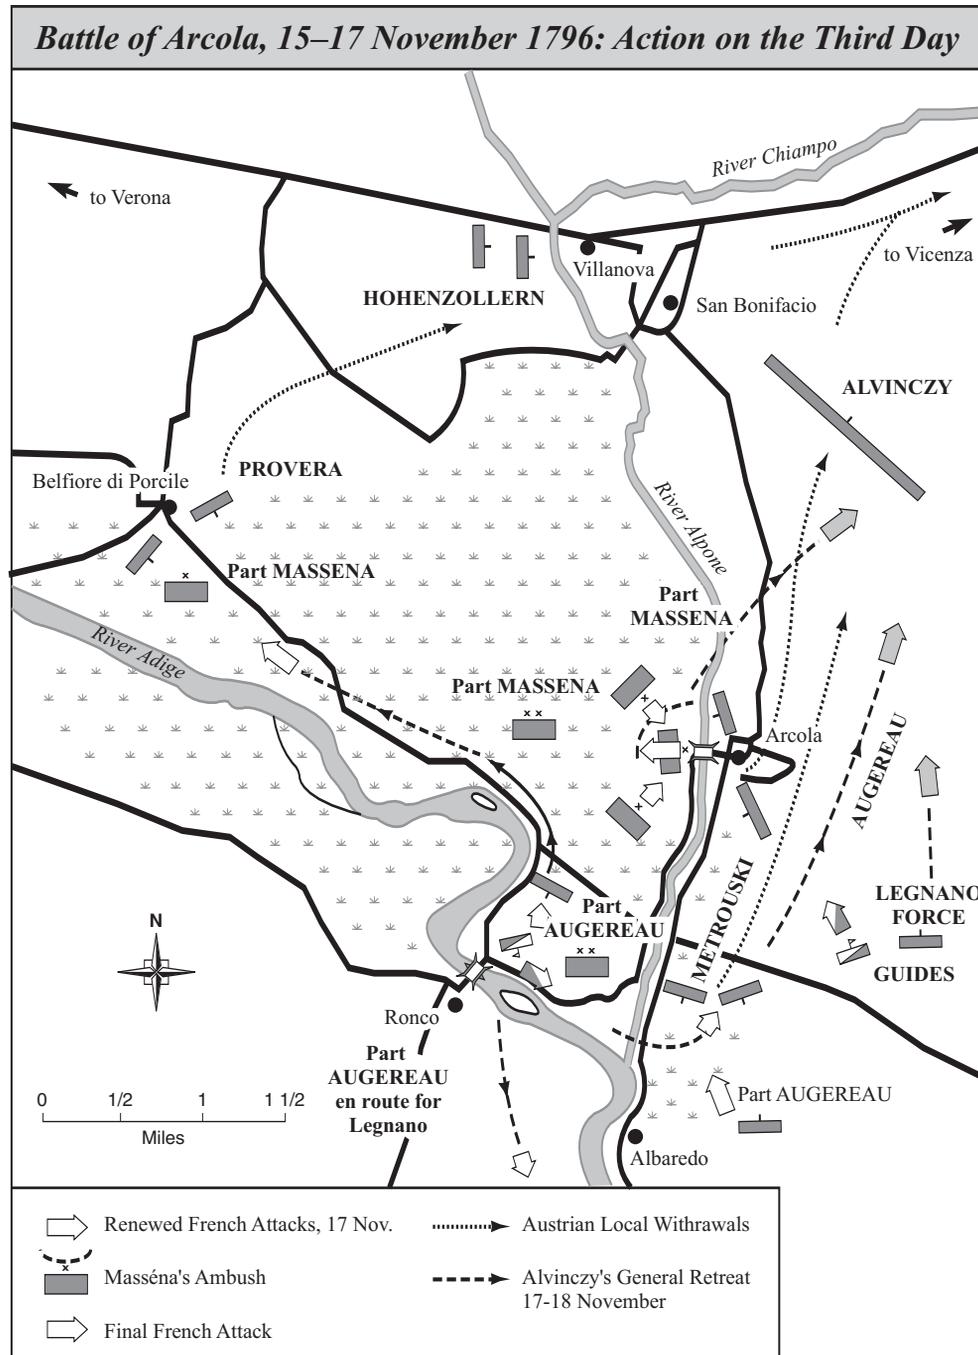

By 2 November, when the Austrian offensive began both from Tyrol and Frioul, the *Armée d'Italie* had 42,000 men, with a large proportion of them unfit for service. To cover the corps around Mantua (8,800 under General Charles Kilmaine), Bonaparte had General Charles-Henri Vaubois (10,500) at Trent, André Masséna (9,500) at Bas-

sano, and Pierre Augereau (8,300) on the Adige. The army reserve was kept behind Verona.

Bonaparte may have undervalued the threat from Tyrol. Outnumbered, Vaubois soon started retreating down the Adige. Had Davidovich succeeded in pushing him back to Verona by mid-November, the course of the campaign would have been different. In fact, the Austrian commander wasted many days at Rivoli before resuming his advance and debouching on the plain on the seventeenth. By that time, however, Bonaparte had won at Arcola and could turn west to dispose of Davidovich.

The events leading to the decisive battle began on 6 November, as Alvinczy's army crossed the Brenta. The French soon withdrew to Verona with the Austrians in pursuit. On the twelfth, Masséna and Augereau mounted an unsuccessful counterattack at Caldiero. With the enemy now lurking from the heights just east of Verona, Bonaparte altered his strategy and redirected his divisions to Ronco, a village a dozen miles southeast of Verona on the right bank of the Adige, not far from the confluence with the Alpone. By crossing there on a pontoon bridge, the French would fall on Alvinczy's left flank, or possibly on his rear, at Villanova. Only two narrow roads running across dykes were available to proceed through the wide marshy triangle between the two rivers, one leading to the hamlet of Porcile, northwest of Ronco, the other heading north to the wooden bridge at Arcola, a village on the eastern bank of the Alpone. The French maneuver began on 15 November at daybreak, with Masséna's and Augereau's advance guards soon clashing with the reconnoitering parties Alvinczy had sent toward Ronco and along the Alpone. A protracted and confused battle ensued, whose exact development remains a mystery, with several events still not entirely understood.

On the first day, Masséna succeeded in dislodging *Generalmajor* Giovanni, Marquis Provera's man from Bionde and Porcile. On the right, Augereau made slow progress toward the bridge at Arcola, his line of advance being exposed to murderous fire from the dyke running parallel on the far bank of the Alpone. Once in sight of the bridge, a few officers (apparently including Bonaparte) put themselves ahead of the French column to spur their discouraged soldiers to break through the defile. The attack, however, was soon aborted, and Bonaparte had a near escape from capture after falling in the swamp during the Austrian counterattack that forced Augereau to withdraw. Later in the afternoon, a brigade under General Jean-Joseph Guieu was ferried across the Adige farther south at Albaredo, where it came up along the eastern bank of the Alpone and succeeded in taking Arcola at dusk. Strangely enough, however, Bonaparte recalled Guieu back to Ronco, where the rest of the army had rallied for the night.

Adapted from Chandler 1966, 109.

Alvinczy had meanwhile started to withdraw his troops from Verona, thus avoiding entrapment.

On the second day, the battle continued to rage over the marshy ground and the causeways, neither party prevailing. A French extemporaneous attempt at crossing the Alpone just north of its confluence with the Adige failed miserably. Perhaps more concerned with what was happening in the upper Adige valley between Vaubois and Davidovich, neither commander did much to break the stalemate.

On 17 November the last stage of the battle saw the French advancing on Arcola from two different directions. While Jean-Gilles-André Robert's brigade (in Masséna's division) pushed forward on the western bank of the Alpone, most of Augereau's division crossed on a pontoon bridge farther downstream, and—with some reinforcements from Legnago—engaged the enemy just south of Arcola. According to French sources, Bonaparte ordered a feigned cavalry charge on the Austrian left flank, with trumpet calls

spreading panic among the lines of infantry. On the left wing, the rest of Masséna's division easily broke through at Porcile. Those events sped up Alvinczy's decision to abandon the battlefield and retreat eastward to Montebello. At Arcola the French suffered 4,500 casualties, the Austrians 7,000.

### Argüelles Alvarez, Agustín (1776–1843)

Like the Conde de Toreno, an Asturian, a graduate of the University of Oviedo, and an early adherent of Spanish liberalism, in 1808 Agustín Argüelles Alvarez was an official of the Ministry of Finance. Sent on a secret mission to Britain in 1806 to sound out the possibility of an alliance against France, he was still in London when Spain rose in revolt against Napoleon. Returning to Spain, in June 1809 he became the secretary of the commission that had been set up to oversee the establishment of a new national assembly. Elected to this body as a deputy for Asturias, he played a leading role in its debates and gained such a reputation for his oratory that he was nicknamed “the divine.”

A strong supporter of the liberal revolution, in 1814 he was imprisoned by King Ferdinand VII. Released by the Revolution of 1820, he became minister of the interior and began to veer more and more to the right. Fleeing to London in the wake of the revolution's collapse in 1823, he remained in exile for the next ten years, but the restoration of constitutional politics brought him home in 1834. Though never again a minister, he continued to sit in the Cortes as a deputy and in 1841 became the tutor of the young Queen Isabel II.

### Armed Neutrality, League of (1801)

In 1800, the Baltic nations of Russia, Prussia, Denmark, and Sweden formed the League of Armed Neutrality to protect their vessels against inspection and seizure by British warships and to guard against full-scale incursions by the Royal Navy in the Baltic.

By 1800 the burden of the fighting on the Continent essentially rested on the shoulders of the French and Austrians, the former governed by the Consulate from late 1799, under Napoleon Bonaparte. Between 1800 and 1801 Britain had instituted a policy of armed impressment (the seizure of men to serve aboard warships) against all nations, including neutral states. Utilized primarily as a policy to acquire manpower from any opposing nations, impressment became a problem for neutral nations like the United States and Denmark. The United States challenged European impressment in 1798 with its so-called quasi war with the French Revolutionary government.

Denmark, however, was a different case. A number of European nations, like Denmark, believed that neutrality was the most efficient policy in regards to the Anglo-French conflict. In 1801 Russia and Denmark assumed an aggressive stance through the formation of an alliance called the League of Armed Neutrality. Britain had engaged in an aggressive policy of confiscating neutral ships. In addition, numerous British privateers harassed Danish ships in 1800, and late in that year a large British fleet forced Denmark to reconsider its passive neutrality policy. Essentially, Denmark initiated a policy of arming its maritime convoys. This policy, however, proved to be insufficient, as British privateers continued to pester Danish ships with impunity. Tsar Paul I of Russia decided to reintroduce the League of Armed Neutrality.

Originally formed in the 1780s to counter French aggression on the high seas, especially during the latter phases of the American Revolution, the League served the temporary purpose of aligning the neutral nations of Russia, Denmark, the Netherlands, Sweden, and Prussia. It seemed that the alliance could act as a regional balance to British hostility. In 1801, however, that hope went unfulfilled. In the summer of 1801 the British attacked and decisively defeated the Danish fleet at the Battle of Copenhagen, a victory by which the League of Armed Neutrality was instantly discredited on the diplomatic stage, with a final and mortal blow being dealt by news of the assassination of Tsar Paul, which had occurred on 23 March. His successor, Alexander I, had no interest in upholding the principles of the League, and Russia's arrangement with the other Baltic states came to a formal end in June 1801. The regional aspect of the League of Armed Neutrality vanished as quickly as it had appeared. Its long-term sig-

nificance was that it had introduced the idea of uniting neutral nations in a cause against the aggressive naval powers. This was a concept that lingered for the next century.

### Armistice of 1813 (2 June 1813)

The spring campaign of 1813 ended on a very uncharacteristic note for Napoleon: a negotiated armistice with the representatives of Austria and Russia at Pleischwitz on 4 June. After the campaign the main Russian and Prussian armies were bruised but unbroken. Nevertheless, Napoleon had rebounded in the spring and had reestablished his reputation through his victories at Lützen (2 May) and Bautzen (21–22 May). However, Napoleon's army was as damaged physically by these victories as were the Allies, and his huge losses in Russia the previous year had reduced his cavalry to near impotence in its most important function: the pursuit of beaten enemies after tactical victories in the field.

The terms of the armistice, signed on 2 June, were as follows: It would last for six weeks (to 20 July) and included an option by either side for its extension (though the Allies would have to agree together on this point) and provisions for Austrian mediation toward a lasting peace. Eventually the armistice was extended for the remainder of the summer to 10 August, but hostilities did not resume until 15 August. Napoleon retired his forces across the Bober River but remained the master of Saxony and held key positions inside Prussia and along the Elbe as well. Significantly, large French garrisons at Danzig and along the Oder River remained cut off and under siege.

A question must therefore remain as to why Napoleon agreed to the armistice. His reasons were both military and political: Not only had he lost his cavalry, but his logistics had collapsed and his army was slowly melting as his starving, young, inexperienced conscripts straggled away. In addition, Cossacks and Prussian irregulars bedeviled French lines of communication back through Germany—one particularly audacious band had actually captured Leipzig on the eve of the armistice. Politically, given Austria's increasingly hostile attitude and threats of armed mediation, Napo-

leon felt he had no choice but to accept. As a result he also agreed to a cessation of hostilities to prevent adding the considerable military might of Austria to that of his opponents.

For the exhausted Russians and Prussians the armistice was a godsend. Their armies were in a strategic cul-de-sac in Silesia, and another hard blow would have caused the Russians to abandon the Prussians and retreat to the north and away from their allies. Austria too was relieved at Napoleon's decision because it was not ready to mobilize and deploy significant military force. Had Napoleon remained on the offensive, there was very little that the cautious Austrians could have done to interfere with Napoleon in Silesia. That said, Napoleon knew little of these matters, and his army and marshals also agreed with his decision. The Allies also benefited financially: on 15 June, Russia and Prussia each received £2 million in subsidies from Britain, and Austria was offered £500,000 as an inducement to join the coalition.

In hindsight, most experts agree that this armistice was a strategic mistake for Napoleon. Austria, which had by the Convention of Reichenbach on 19 July agreed to join the Allies if Napoleon refused Vienna's terms as mediator, formally did so on 12 August—followed shortly by Sweden, which had provisionally offered support on 7 July. The long period served the Allies far better than it did Napoleon, for the British landed huge amounts of supplies and arms in northern Europe via the Baltic ports. Moreover, the Allies gathered in July at Trachenberg and crafted an attritional strategy that would ultimately counter Napoleon's generalship by avoiding battle with him and beating his subordinates. The armistice of 1813 is another indicator that Napoleon was no longer the adept political strategist that he had been in his heyday at Leoben (1797) and Tilsit (1807). At the beginning of the armistice Napoleon was on the verge of total victory and outnumbered his foes; at the end the Allies were twice as strong as he, well rested, and united in their purpose to eject him once and for all from Germany.

### Arroyomolinos de Montánchez, Battle of (28 October 1811)

While the action at Arroyomolinos barely merits being called a battle, it was nevertheless a significant engagement in the 1811 campaigns fought in the province of Estramadura of western Spain, which resulted in the effective destruction of most of General Jean-Baptiste Girard's division of Jean-Baptiste Drouet's V Corps.

General Sir Rowland Hill's 2nd Division, along with Portuguese infantry and British cavalry attached to him, had been assigned the task of observing Drouet's force in the province of Estramadura. Drouet's corps was the linking element between the French forces under Marshal Nicolas Soult in the south, who were besieging Cadiz, pursuing Spanish guerrillas, and preparing to besiege the city of Tarifa; and the French forces in the north, who were covering Badajoz and Ciudad Rodrigo. Drouet's position had become even more important following the transfer of two divisions from the Army of Portugal to the forces in the south, who were conducting a campaign against the Spanish around Valencia.

Both Hill and Drouet were directed to observe the other and were instructed not to bring on decisive combat, as they were equally matched and success was unlikely unless one of them made a serious mistake. Drouet did exactly that by allowing one of his divisional commanders, Girard, to move his division 50 miles north from his base in Merida, out of supporting distance from the second division of the corps. Girard moved north to pursue guerrillas, to find new areas in which to gather provisions, and to establish better contact with the forces of Marshal Auguste Marmont and the (French) Army of Portugal.

Once Hill became aware of Girard's isolation, he requested permission from Viscount Wellington to maneuver against Girard with the object of taking him by sur-

prise and defeating his isolated division. Wellington concurred, and Hill began to move the bulk of his force against Girard. Hill also requested assistance from General Francisco de Castaños, who commanded a force of Spanish infantry in the area. Hill would provide two British brigades, nine battalions of Portuguese infantry, 900 cavalry, and two batteries of artillery. Castaños would add 2,000 infantry and 600 cavalry; the two combined would outnumber Girard by about 2 to 1.

By a series of forced marches beginning on 23 October, Hill moved his combined British and Portuguese force without alerting Girard of his approach and without letting Drouet becoming aware of the reduction in the forces facing him farther south. By the twenty-eighth the Allied forces were united and closing in on Girard, who had only a vague notion that there were any British or Portuguese forces in his area. Girard's cavalry, nearly 1,000 strong, had not detected Hill's approach.

Starting out at 2:00 A.M. in a heavy thunderstorm, Hill marched the last 5 miles to Arroyomolinos and deployed his troops less than half a mile from the town without encountering any French resistance or warning. Girard had ordered about half his force, under General Charles-François Remond, to begin marching, and they had just left the town when Hill's forces struck. Hill had blocked every road leading out of the town, and as Girard attempted to escape, his troops ran into one Allied column after another. They were pinned against steep hills by rapidly advancing British light infantry, which held them just long enough for the pursuing brigades to capture all but 500 men of General Jan Henryk Dumbrowski's French brigade, who escaped by clambering up the steep slope accompanied by their commander and Girard. Remond's brigade escaped the debacle, but only by tireless marching. Hill captured or killed 1,600 French and took over thirty officers and three cannon for the loss of seventy-one men.

In the short run, the action at Arroyomolinos separated the Army of Portugal under Marmont from the Army of the South under Soult and forced the French to detach further troops to close the gap and to deal with renewed Spanish guerrilla raiding in the province of Estramadura. Girard was disgraced and relieved of command for a time, although he was later to serve again as a divisional commander, eventually being killed at Hougoumont during the Battle of Waterloo in 1815. Hill would rejoin Wellington's forces in time for the 1812 campaign and the sieges of Badajoz and Ciudad Rodrigo. Finally, this small episode confirmed Hill as a competent independent commander in Wellington's eyes—one of his few—and generated additional confidence among Wellington's British and Portuguese troops.

## Art Treasures (Plundered by the French)

During the French Revolution, and especially during the Napoleonic period, thousands of works of art were taken to France, where they enriched the Louvre's collections.

Many masterpieces had been destroyed "in the fire of the Revolution," but with time the value of art began to be better appreciated and works of art to be regarded as national treasures. The French government created favorable conditions for the opening of public museums and the trade in antiques. The Louvre Palace, which initially was the king's official residence, was to become the Musée des Monuments Français. The first masterpieces displayed there came from the collections of King Louis XVI and the comte d'Angéviller and from other private collections. All the art collections established by the nobility in the eighteenth century had been acquired through private purchase. Hitherto, until the expulsion of the Jesuits and the onset of the French Revolution, no thought had existed of enlarging art collections by treating artworks as part of the spoils of war.

One of the earliest significant acquisitions for the Louvre took place in the middle of 1795: The first Dutch campaign brought to its rooms over 200 Flemish masterpieces, including 55 paintings by Rubens and 18 by Rembrandt. It was not until Bonaparte's Italian campaigns of 1796–1797, however, that theft emerged as a regular by-product of the war. The Directory was the first French government that promoted the confiscation of masterpieces, ordering Bonaparte to accumulate art stolen from Italy, "the kingdom of beauty," and bring it to France, "the kingdom of liberty." The purpose of such a policy was the enrichment of the national museums with the most famous works of European art. Loreto, the famous sanctuary situated in Marche, was saved by an insurrection from thorough plundering, though the ancient Statue of Our Lady (which had been venerated there) was sent to Paris, to be returned only in 1801. Bonaparte easily justified his thefts, describing them in the peace treaties as contributions of war.

Bonaparte's primary goal was to transport the most valuable pieces to France. As such, after he had signed an armistice with the king of Sardinia at Cherasco on 28 April

1796, Bonaparte wrote from Acqui to the French plenipotentiary in Genoa, Guillaume-Charles Faypoult de Maisoncelle, asking him to compile a list of the most important galleries in northern Italy. In August of the same year Bonaparte informed the Directory that 110 masterpieces were en route to Paris: 25 from Milan, 15 from Parma, 30 from Modena, and 40 from Bologna, and promised many more. The Cathedral of Monza alone was forced to hand over to Bonaparte a contribution of 11,300 kilograms of gold and 184 kilograms of silver (obtained by melting liturgical artifacts). Soon thereafter, by the terms of the Treaty of Tolentino, Bonaparte secured the confiscation and transfer to France of all works of art in the Papal States. Bonaparte boasted to the Directory of his acquisitions in Ravenna, Rimini, Pesaro, Ancona, and Perugia. The masterpieces plundered in those places were sent directly to Paris.

Along with the works of art taken from Rome, Bonaparte stole the best Italian masterpieces. From the Vatican museums alone he took such ancient statues as the Laocoön, the Apollo, and the Torso of Belvedere. Paintings went too: masterpieces by Raphael (*Transfiguration and Ascension*), Michelangelo da Caravaggio (*Deposition*), Giulio Romano (*The Holy Family*), and Guido Reni. In 1797 the French conquered Venice and despoiled it of such masterpieces as the bronze horses of St. Mark, which first were placed in the Jardin des Tuileries and then on the Arc de Triomphe. The symbol of the city, the bronze lion from St. Mark's Square, was used as the fountain ornament at the Hôtel des Invalides. The greatest period of plundering in Italy took place after 1798, with the separation of Savoy from Piedmont and the imposition of French government after the Battle of Marengo. This was merely a prelude to the subsequent occupation of the Kingdom of the Two Sicilies (Naples) and of the neutral Grand Duchy of Tuscany.

The enormous quantity of confiscated works of art was entrusted to Dominique Vivant, Baron Denon, who from 1795 onward had helped establish the Louvre, which from 1803 was called the Musée Napoléon. Denon put the various pieces in order and placed them on exhibit. He worked for the Emperor for twenty years, not only in France but also in the course of seven military campaigns (from the campaign in Egypt in 1798 until the invasion of France in 1814), organizing the plunder of precious art and at the same time participating in the battles of the various campaigns. After 1800 he handled the distribution of masterpieces among twenty-two museums that he had opened in different French provinces and towns. By 1802, 846 fine paintings were on display, along with those stolen from French churches, monasteries, and nunneries and from the nobility.

In 1806 Denon began to confiscate art first in Germany, soon thereafter in Spain (whence, beginning in

1808, he took paintings by Titian, Bartolomé Murillo, and Raphael), and then in Austria during the campaign of 1809. Denon's last visits to Italy took place in 1811 and 1812, when he wanted to enrich the Musée Napoléon with the masterpieces of such primitive Tuscan painters as Duccio di Boninsegna, Giotto di Bondone, and Giovanni Cimabue. During this period Denon also stole medallions and valuable manuscripts preserved in various archives and libraries.

After Napoleon's final defeat in 1815, delegates (including Antonio Canova from the Papal States) arrived in Paris from various nations whose works of art had been stolen, demanding the return of their masterpieces. However, securing the restoration of their respective collections proved difficult and at times impossible. In the end, 248 out of the 506 Italian paintings in France remained there after the Napoleonic Wars. Other countries faced similar circumstances. On 5 November 1815, Secretary General Athanase Lavallée informed Count Pradel that the process of restitution had come to an end, with 2,000 masterpieces returned out of a total of 5,233 items overall.

## Artillery (Land)

Artillery during the Napoleonic Wars served a number of functions. The main function in battle was to fire upon enemy infantry, who represented a relatively static target. It was also used to support attacks on fortified positions and built-up areas. Artillery could also be employed to control bridges and other bottleneck points and it could be used to disrupt forming-up areas. Artillery at the end of the eighteenth century consisted of two types of weapon. First was the gun, or cannon, the barrel of which by convention was approximately 6 feet or more in length; weapons with shorter barrels were termed howitzers and were used for high-angle fire to enable fire to lob shells over obstacles. Guns were normally classified by the weight of the shot they fired, so a light 3-pounder gun fired a solid iron ball weighing 3 pounds, and a 12-pounder used 12-pound shot.

The improvements in gunpowder and barrel making meant that guns were increasingly lighter and could be

horse drawn, increasing their mobility both on the march and on the field of battle. On the march the guns traveled in a column with all their support elements. In battle the guns themselves and their ammunition wagons were set up facing the enemy, and horses and noncombatant elements moved to the rear. Every gun had a gunner, who was in charge of the weapon, and a gun crew. The officer in charge chose where his guns were to be placed and directed its fire. The crew was responsible for moving the gun into position, preparing it for battle, loading and firing the gun, sponging it out between rounds, and hitching and unlimbering. Gunner drills were practiced during training so that operating and firing the gun in battle was as smooth as circumstances permitted.

All armies organized their artillery in groups, often known as batteries or troops within their parent regiment. A battery frequently consisted of between three and six guns depending on the gun caliber. Larger guns were grouped in smaller numbers. A 9-inch battery might have between six and twelve guns, and there would be two or more batteries per regiment. To many gunners, the loss in battle of a gun to the enemy was the same as the loss of its colors (flag) was to an infantry regiment. Artillery regarded itself as a superior arm of the military and developed many traditions to reflect this.

Guns fired a number of projectiles, one of which was the spherical ball. Guns also fired grapeshot and canister, both of which consisted of a number of smaller caliber balls bagged or placed in an open-ended canister and loaded in place of a standard full-caliber shot. This was used to fire on cavalry or infantry presenting itself en masse, and had the same effect as a shotgun but on a much larger scale. The individual balls often had a greater effect at shorter ranges than a single, full-caliber ball. Guns could also fire shrapnel, which burst in the air above the target if the fuse setting was correct. Guns could also fire what was known as shell, which was a hollow case shot with an explosive charge detonated by a fuse. Shell was fired mainly by howitzers, and if the fuse setting was correct, such projectiles were very effective, particularly if they burst in enclosed spaces. Whichever projectile was used, if the gun crew was effective, the damage the guns could inflict on infantry or cavalry was significant, and well-concentrated gunfire could be decisive.

The French Army that Napoleon commanded inherited its artillery from the monarchy, with great improvements having been made by Jean-Baptiste de Gribeauval, inspector general of Artillery in the second half of the eighteenth century. He followed Gustavus Adolphus in believing that artillery needed to be better made and more mobile. He improved French artillery manufacture by having the guns made more accurately, and he also lightened

the gun carriages. The result was a highly mobile artillery which was more effective in battle and able to move more readily. Napoleon tried to improve on this by shortening barrels even further and using a smaller powder charge, but the attempt was a failure. However, all the Austrian and Prussian 6-pounders that were captured were pressed into service by the French and proved to be excellent weapons. Napoleon had trained as a gunner and fully appreciated the value of artillery in battle. As the quality of his army declined, he tried to substitute guns for musket power and began to use grand batteries, which consisted of several dozen guns massed together for concentrated fire. His aim was to use the power of his guns to shred the enemy line so that his infantry could advance.

British artillery equipment also underwent certain changes, the most important of which was the introduction of the single-block trail carriage. This meant that British artillery was as maneuverable as that of the French. British guns after 1804 were able to fire shrapnel shell, which the French never had and which French infantry hated. The range of artillery in direct fire was a maximum of 500 to 600 yards; this of course meant that the guns would be able to engage enemy infantry or cavalry for a much longer period before the muskets of the infantry and the sabers and pistols of the cavalry could harm them. The guns were always placed under infantry protection. The Duke of Wellington used artillery selectively, never in large numbers, but at the right time and right place, so that artillery played a small but important role in his defensive tactics.

## Artillery (Naval)

Naval guns of the French Revolutionary and Napoleonic period were muzzle loaders, and virtually all larger ship guns were of iron, which was far less expensive but heavier than bronze. Long guns were mounted in broadsides on wooden truck carriages. Guns were denominated by the weight of the solid shot they fired rather than by the diameter of the gun bore as is common today.

In frigates and ships of the line, the heaviest guns were mounted on the lowest deck to aid in stability. In addition, one or more long pieces, known as chase guns, were mounted on the top deck, forward, in order to engage an enemy vessel at long range in pursuit. The largest long gun in common use at sea during the French Revolutionary and Napoleonic period was the 32-pounder for the British and the 36-pounder for the French. Ships were rated according to the number of guns they carried. At the Battle of Trafalgar (1805), for example, the British first-rate (100 guns or more), the *Victory*, mounted thirty 32-pounders, twenty-eight 24-pounders, thirty 12-pounders, twelve quarterdeck 12-pounders, and two 68-pounder carronades. British frigates mounted only 18-pounders, while American frigates in the War of 1812 were armed with 24-pounders. A mix of calibers presented problems, and one trend of the period was a movement toward single-caliber armament, which might mean a mix of long guns and carronades of the same caliber, at least on smaller vessels. Another trend was the movement toward smoother, more functional designs.

The standard length of U. S. Navy long guns was equivalent to the diameter of about 18 shot (approximately 6 feet long), but this varied widely; chase guns, which had the greatest range, were always the longest; lower deck guns were the shortest. The ideal ratio between the weight of long guns and their shot was thought to be about 200 pounds of metal per 1 pound of shot.

Small howitzers carried in the fighting tops of larger vessels were used as antipersonnel weapons. Small guns in cannon form, known as swivels, might be mounted on the rails of smaller vessels, again as antipersonnel weapons. Howitzers and swivels were normally not counted as part of a ship's armament rating.

Most guns of the period were long guns, but carronades had been growing in popularity. The carronade was the most important innovation in naval ordnance at the end of the eighteenth century. A short, light gun of large bore, first manufactured by the Carron Company of

Scotland in 1776, the carronade was lighter than a long gun of comparable caliber, which enabled it to be employed where a heavier gun could not be supported, as on the poop or forecastle. The savings in weight made it especially popular for smaller vessels. Generally speaking, the carronade came to replace the smaller long guns on naval vessels. While in the smaller ships there was a shift to carronades, in the larger vessels the long gun remained in favor—although there, too, some carronades were included. The largest carronades were 68-pounders carried on the forecastle of first-rate ships of the line.

Unlike the long gun, the carronade had no trunnions (lugs on the side of the barrel that supported it in its carriage) and was mounted on its bed by means of a bolt through a loop cast on the underside of the piece. All carronades were short, only about seven calibers in length (equivalent of the diameter of about seven shot), with the ratio between the weight of carronades and their shot being about 50 to 60 pounds of metal for every pound of shot. This was in contrast to a ratio of as much as 150 to 200 pounds per pound of shot in long guns. The carronade used approximately one-third the powder charge of a long gun of similar caliber. Owing to its low muzzle velocity, the windage on the carronade could be sharply reduced. The ball fired by the carronade moved at a relatively slow velocity but produced a large irregular hole and considerable splintering, the chief cause of casualties in a naval battle in the age of sail.

The carronade was ideally suited for close actions, but it had its disadvantages, chief of which was its lack of range. Carronades were employed at point-blank range, which meant about 450 yards for a 68-pounder and 230 yards for a 12-pounder. If the fighting was at long range, the carronade was a liability, as was revealed during the War of 1812.

Projectiles consisted principally of solid shot, but case shot (canister) and grapeshot, totaling approximately the same weight, were available for close action, as was explosive shell. There was also disabling and chain shot, designed to damage spars and rigging. The most common projectile for engaging another vessel was solid shot, and in close actions guns might be double- or even triple-shotted—the loading of two or three rounds of ammunition at the same time. As holes could be easily patched by a ship's carpenter, shot was primarily employed for inflicting casualties on personnel. Warships could absorb a tremendous amount of punishment and were rarely sunk in battle; those that did sink usually succumbed to fire or the explosion of the magazine. Most that surrendered did so in consequence of excessive personnel casualties or after being overpowered by boarding.

Generally speaking, because of limitations of crew size, guns could only be effectively fought on one side of the ship

at a time. Thus, a ship doubled, that is, with an enemy warship on both sides at once, found itself at a real disadvantage. Speed of loading was most important in battle, and well-trained crews often made the difference in outcome, as was demonstrated in the frigate engagement between HMS *Shannon* and USS *Chesapeake* in 1813. Moreover, at the Battle of Trafalgar in 1805, the fact that British gun crews could fire their cannon twice as fast as their French and Spanish counterparts more than made up for the British deficiency in number of guns (2,148 to 2,568).

Range varied according to powder charge and elevation. For example, in 1812 the shot for a long gun charged with powder one-third the weight of the ball and at an elevation of 2 degrees would reach 1,200 yards on the first graze (that is, at the point of first impact). But most ship engagements in the age of fighting sail were fought at very close range, almost at dueling-pistol range.

There were also mortars for shore bombardment. Carried in special ships known as bomb vessels, or simply as bombs, their most common sizes were 10- and 13-inch. Sea mortars generally fired exploding shell.

### **Artois, Charles Philippe de Bourbon, comte d' (1757–1836)**

Charles Philippe, comte d'Artois, was the youngest brother of kings Louis XVI and Louis XVIII. He was instrumental in leading the counterrevolution of the Vendéans and became king of France as Charles X in 1824 on the death of Louis XVIII.

When the French Revolution began in 1789, the power and legitimacy of Louis XVI naturally came under increased

scrutiny. As the Revolutionaries questioned the legitimacy of the Crown in ruling over the French people, Louis sought advice from his advisers as well as from his family. Specifically, in 1789, with more demand for political reform from the lower classes, the king asked his younger brother, the comte d'Artois, whether he should remain as king or flee to a place of safety. The comte advised the king to leave as soon as possible, given the hostilities expressed by the Revolutionaries in the preceding few months. Understanding the grave nature of the situation, Artois gathered his wife, mistress, and children and fled France for England in late 1789. Over the next six years, he watched with trepidation as the monarchy was abolished and, more important, as the Revolutionaries began the wholesale execution of the nobility, including many in the Bourbon family. In 1793, Artois was shocked to hear that his brother, the king, had been guillotined. Thus began in earnest the Reign of Terror.

In 1793 Artois returned to France to participate in the failed Vendean counterrevolution. This royalist resistance, led by aristocratic officers and priests, occurred in the Vendée in western France. Despite the popularity of the revolt, the national government defeated the rebellion, and Artois once again fled the country.

In 1814, after the tumultuous wars of the Napoleonic era, the French monarchy was restored, to much acclaim. With the assumption of Louis XVI's brother, the comte de Provence, as Louis XVIII, the fifty-seven-year-old Artois returned to his homeland. In 1824 Louis suddenly died in Paris. This allowed Artois to become Charles X, king of France. Charles was nothing if not a reactionary monarch. First, he ordered the indemnification of the aristocrats for all their lands seized under the Revolution. He also restored the right of primogeniture. In doing so, he essentially transformed the monarchy into an absolutist regime.

In 1830, when Charles called for national elections, the royalist faction lost many seats in the Chamber of Deputies. On 25 July 1830 Charles issued the Four Ordinances, which restricted freedom of the press, dissolved the Chamber of Deputies, restricted the franchise, and called for new elections. In effect, he was staging a coup d'état. After riots broke out, the king called out the troops, resulting in the deaths of over 1,800 people. On 2 August, Charles abdicated in favor of Louis-Philippe, the duc d'Orléans. Charles fled France with his wife, a new mistress, and the Polignac family. Six years later, Charles, the last Bourbon monarch of France, died in exile.

### Aspern-Essling, Battle of (21–22 May 1809)

The Battle of Aspern-Essling (known to the Austrians as Aspern and to the French as Essling) represented the first significant military defeat suffered by Napoleon in battle. The two-day engagement was fought between an Austrian army of 95,000 men under the command of Archduke Charles and a French army, which eventually reached 65,000 men under Emperor Napoleon. Having taken Vienna after defeating the archduke in Bavaria, Napoleon was keen to bring the Austrians to a decisive battle that would end the war. He was concerned about Prussian neutrality, his unreliable Russian ally and the stirrings of popular revolts in the Austrian Tyrol and some minor German states.

On 12 May 1809 Napoleon took possession of Vienna without a fight. In the previous month he had stopped and then driven back an Austrian offensive moving into Bavaria under Charles. Despite the severe check he had inflicted on the archduke, the battles of Abensberg and Eggmühl did not prove decisive. The Austrian army, although beaten and separated into two unequal halves by the Danube, was able to conduct a successful retreat west toward Vienna. The bulk of the Austrian army, under Charles, retreated toward the mountainous safety of Bohemia. What remained, about 25,000 men, under the command of the competent *Feldmarschalleutnant* Johann Freiherr von Hiller, retired directly on the capital. Vienna was not prepared for a siege, and the citizens made it clear that they did not intend to suffer one. Therefore, when the French began to prepare for a bombardment, Hiller evacuated the city, although a considerable quantity of materiel was left behind. Most important, all the bridges across the Danube were destroyed, making a crossing impossible.

Although he possessed the Austrian capital and had inflicted a defeat on its army, Napoleon had not achieved victory. Charles, in command of 120,000 troops, was somewhere north of the Danube and ready for a fight. Charles's brother, Archduke John, was approaching, albeit slowly, from Italy with 50,000 men. Two further concerns weighed on the French Emperor: the uprisings and rumors of uprisings in the Austrian Tyrol and a few of the German states, and the neutrality of both Russia and Prussia. The revolts and Charles's presence required that several divisions be deployed to cover the French line of communications, thus weakening the main army. All these threats meant that Napoleon needed and desired a quick resolution to the war with the Habsburg monarchy; a decisive win would resolve everything.

He therefore immediately pressed his subordinates to bring all possible reinforcements to the main army, now around Vienna, and to locate a tenable crossing. Initially Napoleon looked to cross at Nussdorf, just north of Vienna, but this was too obvious. Rather, he chose to cross at Kaiser-Ebersdorf, 3 miles downstream of the capital. Here the river was wide but shallow, and Lobau Island offered an excellent staging point. Four bridges would be required, the longest being 505 yards, the shortest 83 yards, with the total crossing, including the island, measuring 2 miles. The process of securing the islands and building the bridge began on 18 May, with the Emperor and the marshals present, and the first elements of the army started to cross on the twentieth.

Napoleon ordered the crossing certain that the archduke was not at hand but, rather, several days' march further north. His great success in April had made him contemptuous of the Austrians and willing to risk a crossing of the Danube, which was now flooding. But Charles had decided by 18 May to stand and fight, having everything to gain from the present situation. However, he would not contest the crossing at the river's bank; rather, he planned to allow the French to get across enough strength that he could inflict a costly defeat and perhaps secure a negotiated peace. With this in mind he drew his army together on the great plain north of Vienna, the Marchfeld, observing the French from a high-ground vantage point on the Bisamberg. On the evening of the twentieth, certain the French would now cross at Lobau, Charles brought his several Korps into a general line running from Stammersdorf west through Deutsch-Wagram. When morning dawned on that Whitsunday, 83,600 infantry, 14,250 cavalry, and 292 guns, all drawn up in assault columns, stood ready to move forward to the attack.

Even as the Austrian attack evolved it was clear that the French position was weak. The bridge across the Danube was the army's only link to its base, and it was subject to the furious flow of the river and the numerous boats and other missiles the enemy was sending down river. When the bridge was broken on the nineteenth, Napoleon considered canceling the entire operation, but he was dissuaded by his marshals. Therefore, while troops could be rushed across, artillery, ammunition, and stores in sufficient quantity could not. The villages near the immediate crossing point, Aspern and Essling, with their stone buildings and walls, offered a good defensive position, but the French did not suspect an attack and so gave no orders to fortify them. When the Austrians did attack on the twenty-first, there were only 23,000 French with forty-four guns to hold the bridgehead.

The Austrian attack called for the concentric movement of five Korps columns. The first three columns, VI, I,

and II Korps, were to attack Aspern. The IV Korps, under Prince von Orsini Rosenberg, was divided into two columns. The first, directly under Rosenberg, was to attack Essling, while the second, reinforced, column would sweep wide, take Gross-Enzersdorf, and then proceed into the French rear. The Cavalry Korps covered the broad and open center between III and IV Columns, while the Grenadier Korps sat in reserve 2 miles to the rear. Theoretically sound, the plan required the columns to be in position at the same time, which proved impossible. There was too much distance to be covered, and the French outposts slowed the Austrian deployment from march columns into lines of battle. Instead, the blows failed to hit together, with I Column, under Hiller, attacking at 2:00 P.M. and the last column attacking two hours later, thus dissipating the Austrian numerical superiority, which should have been overwhelming.

The fighting on the afternoon of the twenty-first was to prove relatively indecisive. The Austrian assault on Aspern was met by a stout defense, directed personally by Marshal André Masséna. Stopped cold, the Austrians were forced to reorganize before a second attack. In Essling, Marshal Jean Lannes expertly handled the defense and held the town and right flank despite the loss of Gross-Enzersdorf. At the same time, in the center an advance by the Cavalry Korps, which was poorly coordinated, was shut down by Marshal Jean-Baptiste Bessières's countercharge. Seeing an opportunity to upset the enemy's overall plan, Napoleon ordered his heavy cavalry, the cuirassiers, to smash the center. Perceiving this threat, Charles ordered a portion of the nearby infantry of II Korps to shift left and cover the center. Arriving at the crucial moment and formed in the cavalry-proof "battalion mass," the Austrian troops delivered a crushing volley at fifteen paces and sent the French horsemen flying. Combat continued in Aspern with house-to-house fighting, and the Austrians eventually cleared the town of the enemy. Essling, however, remained firmly in French hands. As darkness fell, the fighting subsided.

By nightfall the situation was tenuous for the French. During the day's intense fighting the bridge over the Danube had been breached several times, with only 8,000 French troops managing to cross. That night Napoleon was able to rush across most of Lannes's II Corps, elements of cavalry, and the Imperial Guard. Marshal Louis Davout was ordered to bring up his III Corps to cross on the following day. As the sun rose on the twenty-second, the French totaled some 50,000 infantry, 12,000 cavalry, and 144 guns, while the Austrians, preparing to resume their offensive, could still call on 80,000 infantry, 14,000 cavalry, and 280 guns. Looking at the situation and confident of the steady arrival of reinforcements, Napoleon perceived

Fighting in the streets of Essling. Beleaguered French infantry exchanges fire with Austrian troops in the distance. (Print after F. de Myrbach from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 3)

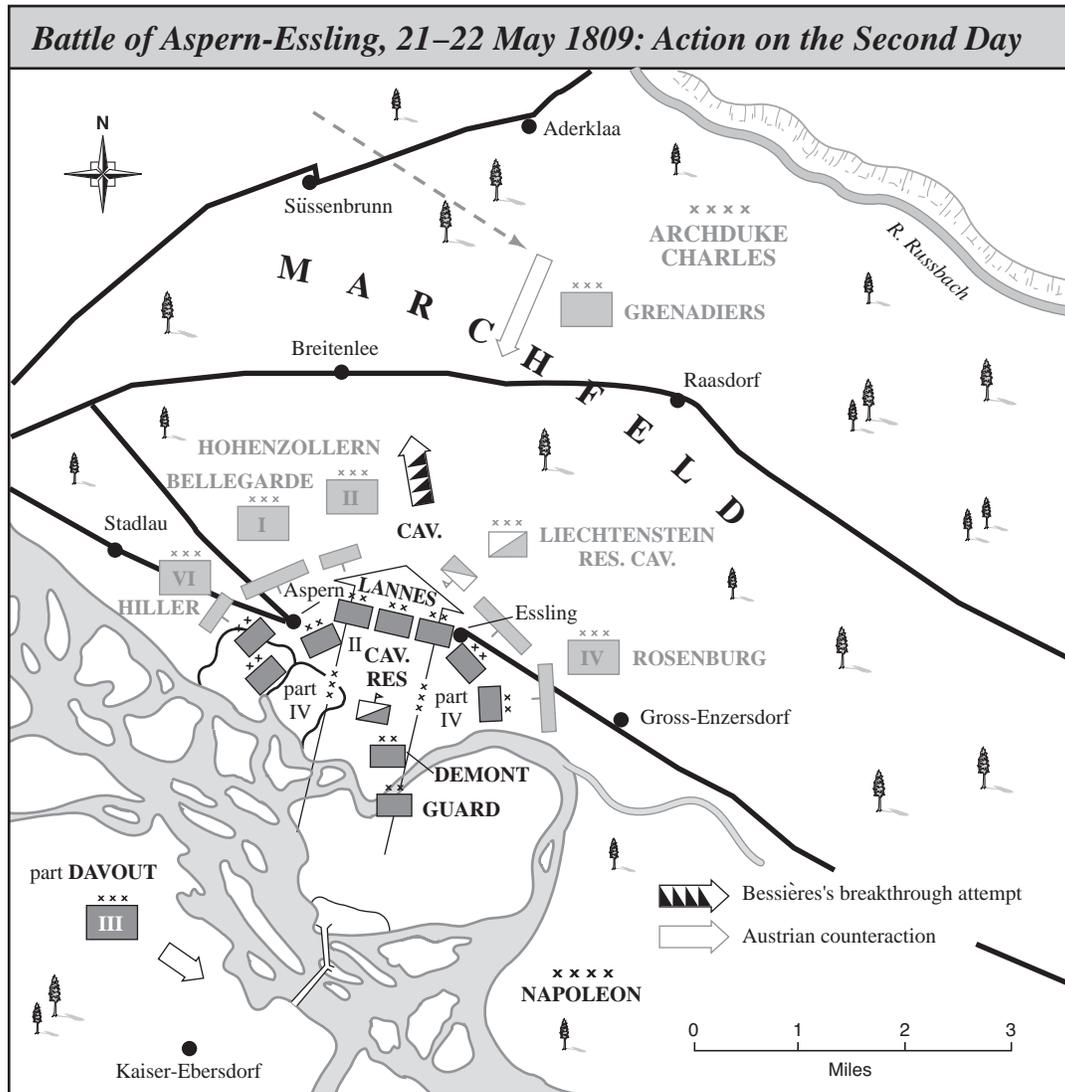

the inherent weakness of the Austrian center. He therefore decided to assume the offensive and attempt to regain the initiative with a blow to the enemy's center. For the French everything now rested on the bridges' remaining intact and the Austrians' will to fight.

The morning of the twenty-second saw the French under Masséna regain all of Aspern because the local Austrian commander had lost his nerve and withdrawn in the night. The Austrians would attack the town throughout the day, consuming the energy of two entire Korps. Essling, under the command of Lannes, remained solidly in French hands throughout the morning. This success allowed Napoleon to deploy the freshly arrived II Corps, three divisions strong and backed by Bessières's cavalry in the center. The French attacked at the juncture of II Corps and the Cavalry Corps, intending to rupture the enemy line and drive them back. The attack moved forward with some initial success, suffering heavy losses from Austrian artillery fire. However, the timely intervention of Charles and his commitment of the Grenadiers stopped the advance. By 9:00 A.M. the crisis had ended, and Lannes's II Corps could not go any further. Worse, at 10:00 A.M. the Austrians managed to inflict serious damage to the bridge, blocking the arrival of Davout's corps and much-needed ammunition.

The Emperor realized now not only that he would have to withdraw to the line of Aspern-Essling but that he would have to retire across the Danube. Such a withdrawal could only be accomplished under the cover of night, which meant that the French must hold their positions for the remainder of the day.

As the French withdrew Charles continued to press his attacks. In the center his efforts were held by repeated French cavalry charges. Unable to break the center, he pulled back his infantry and massed 150 guns to bombard the enemy line. During this intense cannonade Lannes was mortally wounded. Austrian attacks on Essling nearly succeeded and required the commitment of several battalions of the Imperial Guard to repel them. The majority of Aspern had fallen to Hiller by 4:00 P.M., but orders from Charles's chief of staff kept the Austrian commander from rolling up the French line. The battle ended with a whimper, the French quickly withdrawing through the evening and the Austrians making no effort to press their success.

Fighting ceased with the Austrians in command of the field, but they had failed to achieve their objective of beating Napoleon. That said, the battle had been a bloody, embarrassing reverse for the French. Losses were high on both sides. Austrian casualties were probably slightly higher, but

Adapted from Chandler 1966, 705.

both sides suffered some 5,000 dead and 21,000 wounded. Despite a hasty retreat the French only lost three guns, a pair of colors, and several supply wagons. The evacuation to Lobau had gone well, and Napoleon retained the island, which proved essential when he returned to the offensive a month later. Charles made no effort to attack the French position; he had fought a careful battle and did not intend to take risks with the army, as Napoleon so obviously had. Aspern-Essling was therefore a check to the French, not a defeat, with the decisive battle of the war instead occurring a few miles away on 5–6 July, at Wagram.

## Auerstädt, Battle of (14 October 1806)

The Battle of Auerstädt (now Auerstedt) was one of two battles to take place on this day between the French army under Napoleon and its Prussian opponents. While Napoleon himself engaged a force under Friedrich Ludwig Fürst zu Hohenlohe-Ingelfingen (commonly known as Prince Hohenlohe) at Jena, Marshal Davout's III Corps encountered the main body of the Prussian army under the Duke of Brunswick and fought a desperate but ultimately victorious battle at Auerstädt against superior numbers.

Davout's III Corps consisted of the divisions of generals Louis Friant, Charles-Etienne Gudin de la Sablonnière, and Charles Antoine Morand, and numbered 28,000 men with forty-four guns. His objective was to delay any attempt by the Prussians to move further down the road in question, holding up their withdrawal to Magdeburg or Leipzig. Brunswick's force consisted of 48,000 men with 128 artillery pieces (not including battalion guns), organized into five divisions and a force of light troops. The 3rd, or Vanguard Division, was under the command of Graf Schmettau; the 1st under the Prince of Orange, and the 2nd under Graf Wartensleben. A reserve corps under Graf Kalkreuth consisted of two reserve divisions, the 1st under Graf Kunheim and the 2nd under General Alexander Wilhelm von Arnim. General Gebhard von Blücher had his own command of light troops. Brunswick's immediate objective was to reach the Unstrut River at Freyburg, in Saxony, and cross it. The Prusso-Saxon force under Hohenlohe to the south was to cover this movement.

The terrain in the valley of the Saale River, where this battle was fought, was hilly, with deep ravines cutting into the various plateaus. The left bank of the Saale was an escarpment and was wooded in places. The road from Naumburg to Weimar and Erfurt passed through the village of Kösen, where there was a stone bridge over the Saale. On the far side of the river, the road continued uphill and onto the plateau of Hassenhausen and then into a defile at the village of the same name. The valley along this road between Tauchwitz and Hassenhausen had steep sides that hindered the movement of wheeled vehicles. A relatively small force could plug this bottleneck and hold up a considerably larger force. At the far side of the Kösen Defile, the road continued through the villages of Tauchwitz and Poppel and onto a plateau through Gernstedt and Auerstädt, and from there to Erfurt and Weimar. Two streams ran down from the Ranzen hill to the north of the road near Hassenhausen, the Knochelbach and the Lissbach. The villages along them included Spielberg, Bendorf, Poppel, Tauchwitz, and Rehhausen.

Brunswick spent the night before the battle bivouacked around Auerstädt, while Davout had moved

westward, passing Naumburg, crossing and holding the bridge over the Saale to its east, and sending on three regiments of chasseurs, followed by infantry, to the Kösen Defile. Brunswick was aware that his line of movement along the road from Weimar to Naumburg was blocked.

Between 3:00 and 4:00 A.M. Davout received orders to continue his movement via Kösen and Auerstädt toward Apolda. At 4:00 A.M. the 3rd Division moved off from its bivouac at Neu Flemmingen, taking the route to Kösen. At 6:00 A.M. the vanguard of the division, the 25th Line, preceded by a squadron of chasseurs, crossed the bridge at Kösen, with the main body following half an hour later. The 2nd Division left its bivouacs behind Naumburg at 5:00 A.M. and moved to the left of the 3rd Division.

The Prussians marched off at 6:00 A.M. on 14 October from Auerstädt via Gernstedt and toward Poppel, where Prussian dragoons clashed with French chasseurs, chasing the latter off into the thick morning mist. At Hassenhausen, the pursuing Prussians encountered Gudin's division, which was moving up, and they were driven off by canister fire from French artillery.

Blücher had been placed in temporary command of the ten squadrons of cavalry of Schmettau's division, which he led around the north of Poppel onto the Ranzen hill northwest of Hassenhausen. They were accompanied by a battery of horse artillery. As little was now happening there, Blücher continued to Spielberg.

Meanwhile, Davout had Gudin deploy his infantry battalions in squares, mainly to the north of Hassenhausen. Blücher's cavalry made no headway against the solid French veterans, despite launching several attacks against them. Blücher had a horse shot from underneath him. The Prussian troopers eventually broke and could only be rallied at Spielberg.

It was now clear that the French had a substantial force at hand here, although the heavy mist made it impossible to determine their exact numbers. Schmettau quickly deployed his infantry in two lines, intending to seize the crucial village of Hassenhausen rapidly, as this would open the road as far as the Saale. However, after advancing eighty paces, Schmettau halted to allow Wartensleben to deploy his men to the right. The front line of the French fell back into the village, taking up positions in the houses and gardens, ditches, and sunken roads.

About 9:00 A.M. Friant's division came up, and one of its brigades was used to extend the line north of Hassenhausen, to support Gudin. The remainder of the division was sent toward Spielberg to move around the Prussian positions from the north. Of Gudin's division, the 25th Line was north of Hassenhausen, with all his artillery. The 12th and 21st were in reserve, behind the 25th. The 85th engaged a battalion of Prussians, driving them back. The

111th, part of Friant's division, was deployed to the right of the 25th, while the 108th occupied Spielberg. The 48th and 33rd took up positions to the rear of this village. General Jean-Baptiste Viallannes's cavalry brigade moved up to cover the right flank of III Corps. Finally, a battery of 12-pounders was deployed on a ridge a little to the north of Hassenhausen.

A violent firefight opened up around Hassenhausen. Schmettau's 2nd Line deployed to the left in response to the French flanking move. Despite having driven off the Prussian cavalry, the situation on the French right remained precarious. The noise of this firefight reached Brunswick, who was about 600 paces south of Tauchwitz. As he was not sure of the situation, Brunswick sent his chief of staff, General Gerhard von Scharnhorst, to Schmettau to establish what was happening. When Schmettau was wounded, Scharnhorst took command of the Prussian forces in that area.

Brunswick intended to deploy Wartensleben's division to the right of the road to gain the heights south of the village. He directed Hanstein's Grenadier Battalion at this point toward a tree and rode off with its skirmishers. After proceeding only a few hundred paces, a projectile penetrated Brunswick's left eye, leaving him mortally wounded. Although the Prussian king, Frederick William III, was present, he neither took over effective command personally nor delegated that responsibility to a senior general. Scharnhorst, still commanding Schmettau's division, did not hear of this event until later.

Less than half the army had been deployed so far, yet control now broke down. Wartensleben's leading brigade closed in for an attack east of Tauchwitz. The next brigade moved southward toward Rehhausen and deployed without coordination with the leading brigade, climbing the heights and enveloping Hassenhausen from the south. Friedrich von Irwing's Prussian dragoons rode down the French 85th Line, which was falling back to Hassenhausen. The Prussians then cleared the village.

It was now about 10:00 A.M. As the cavalry had opened the way, Wartensleben continued his advance. Davout now committed the last two of Gudin's regiments, the 12th and the 21st. As they closed in on the Prussian troops near Hassenhausen, they started suffering heavy casualties and halted. A critical moment had been reached. General Wicard von Möllendorff ordered Prince Louis Ferdinand's regiment to take the village, while the French 21st Line moved into it. The Prussians opened fire on the village, but the French, under the cover of the buildings, held their positions.

Fresh troops were needed to decide the battle, so the Prince of Orange's division was ordered up. Part of the cavalry was sent on in advance.

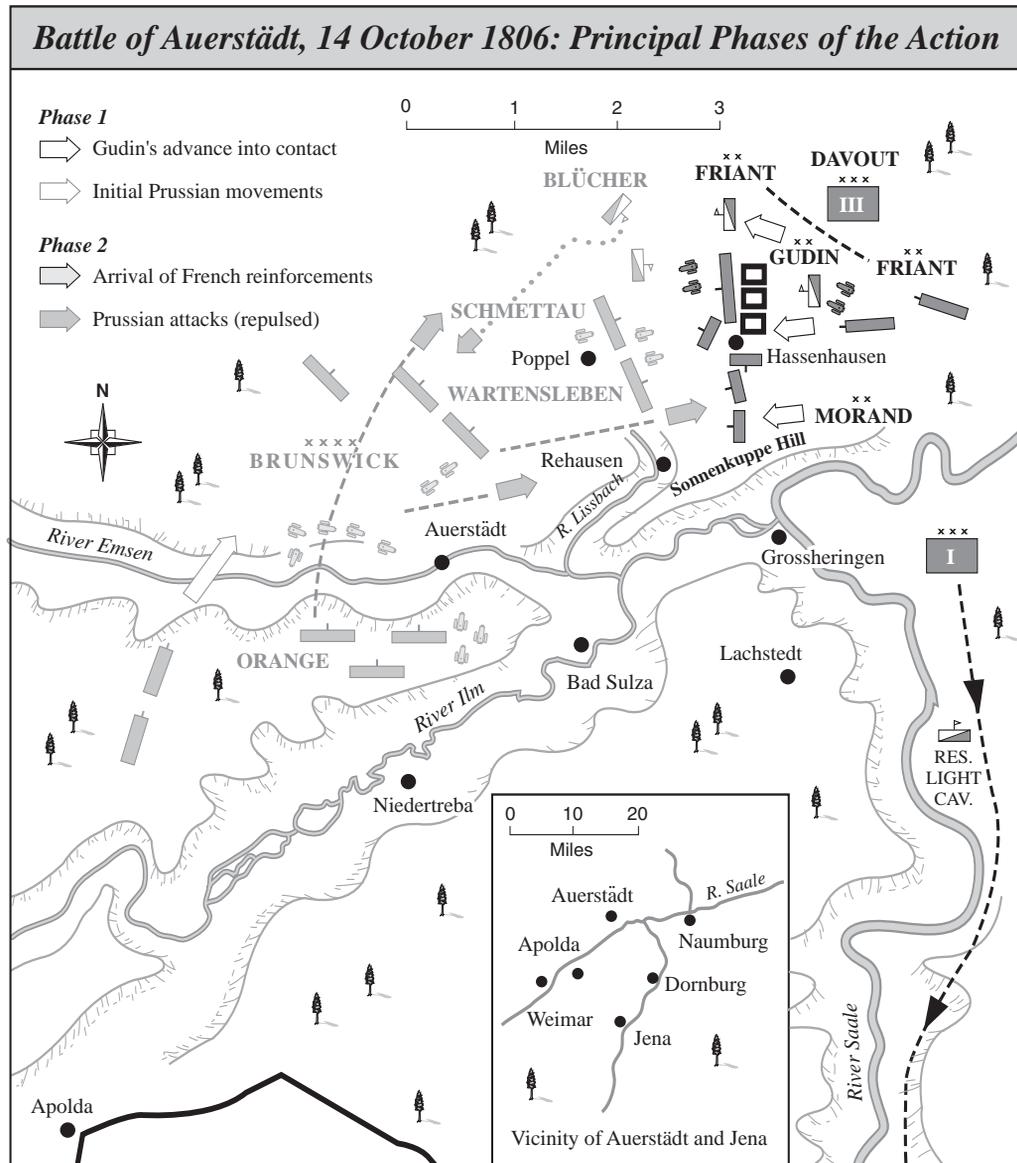

At 10:30 A.M. Morand's division came up and Davout immediately threw one regiment, the 13th, supported by two guns, directly against Hassenhausen, but he had the rest move against the Prussian right. The 13th cleared the village, passing right through it. The remaining regiments were used to extend the French left, and lines of infantry engaged each other with musketry, inflicting heavy casualties. The French infantry here too was subjected to several determined cavalry charges, but control over the Prussian cavalry was also lost, with individual regiments and squadrons making uncoordinated attacks on the French squares. The famed Prussian cavalry was being squandered.

The Prince of Orange's division now arrived, having been delayed en route. The king, in nominal command, had intended to use it on his left, but as Wartensleben's division started to waver, only the leading brigade marched on to Poppel. The remainder wheeled right, moving up via Rehhausen and filling the gaps in the line. At this point, the French enjoyed not only a local superiority in numbers but also a stronger position. Added to that was their greater experience of war. Having fought off the Prussian cavalry, Davout now slowly ground down the Prussian infantry and was gaining the upper hand.

Around midday, the Prussian right started to show signs of breaking. However, the Prussians still had two and a half fresh divisions available, including Kalkreuth's reserve. Kalkreuth's cavalry, lacking any orders, became involved in unnecessary fighting. General Alexander von Arnim's division moved through Auerstädt onto the heights toward Eckartsberga to counter the French moving from Spielberg to Liesdorf. Kunheim's division deployed around Auerstädt. The reserve was fed into the battle piecemeal to plug the gaps, but to little avail. The Prussians were shot to pieces and fell back through Auerstädt. In the middle of this mass of men, Scharnhorst, wounded but carrying a musket, came across the king. Frederick William then ordered the reserve to withdraw.

The Prussians, with one-third of their army not committed to the action, failed to bring their superiority of numbers into play. Blücher pleaded with the king to continue the battle, gathering together a number of cavalry regiments, including the still-fresh Gensdarmes Regiment, but Frederick William called him back. His intention was to move the remnants of his army to link up with Hohenlohe, Ernst von Rüchel, and the Prince of Weimar's detachment and stabilize the situation. From there, he considered withdrawing toward the Elbe River. The reserve retired in relative order, but its left did not do so with sufficient haste and was roughly handled by the pursuing French.

The confusion of the retreat degenerated into chaos in the growing darkness. The disorder increased when the fleeing masses of Brunswick's force crossed paths with

Adapted from Chandler 1966, 491.

parts of Hohenlohe's broken corps, which was falling back toward Weimar from that day's fighting at Jena. It also ran into Friedrich von Holtzendorff's detachment, which had fallen back from Apolda, crossing the Ilm at Ulrichshalben. There was now little chance of reestablishing any order. Companies were separated from their battalions, battalions and squadrons from their regiments, regiments from their brigades. Gunners cut their traces and made a dash for it. Many deserted, particularly from the Polish regiments. The seething mass then separated, with part going on toward Erfurt and the remainder toward Magdeburg. The pursuing French cavalry mopped up isolated units, taking them prisoner. Napoleon concentrated his movement toward Berlin, the Prussian capital. The Saxons ended their alliance with the Prussians.

The confused retreat makes it difficult to be certain of the losses suffered by the Prussians in this battle, but these have been estimated at 15,000 dead and wounded and 3,000 prisoners. The artillery lost fifty-seven field pieces and a large number of battalion guns. Davout lost about one-third of his men, with Gudin's division alone losing 3,500 men—nearly half its strength.

### Augereau, Pierre-François-Charles (1757–1816)

Pierre Augereau rose from the ranks of the Parisian poor to become one of Napoleon's first great lieutenants. A veteran of the pre-1789 French Army, Augereau served in the armed forces of a number of other European powers. Observing how things were done, he consequently brought a broad understanding of tactical skill to the battlefield. Fighting with distinction in the campaign of 1796–1797 in Italy, Augereau established his reputation. Napoleon never forgot the services Augereau rendered at the Battle of Castiglione in holding off one of the most dangerous Austrian offensives in northern Italy.

But the tall, hooked-nose former noncommissioned officer never added substantially to the reputation established during his early years under Napoleon until he performed with great credit at the Battle of Leipzig in 1813. In 1814, Augereau received command of the French army at Lyons with instructions to strike the southern flank of the forces invading France. His failure to do so compromised Napoleon's brilliant defense east of Paris, and Augereau's reputation was permanently sullied by accusations of incompetence or even betrayal of his former commander.

Augereau was born in Paris on 21 October 1757. He came from the lower stratum of the capital's society, with various sources describing him as the son of a grocer, a domestic servant, or a stone mason. For the remainder of his life his speech bore the flavor of the Parisian gutter. Evidently his mother was German. He turned to a military career at an early age, serving first in the French Army. In

1777 he abandoned the French ranks after reportedly killing an officer who had insulted him and then served in the Russian, Prussian, and a number of other armies. The story of these years remains murky, but Augereau almost certainly served in Prussia—as seen by his familiarity with Prussian drill—and just as certainly was a deserter from the Prussian Army. If he had been caught in the act of deserting, he would have suffered the normal penalty of being executed. He had become an expert fencer during his first years of military service, and his years of wandering around the Continent probably included intervals in which he supported himself as a fencing master.

Men with Augereau's military background had extraordinary opportunities as France mobilized its population for war in the early 1790s. After a frustrating period of service in the forces combating insurgents in the Vendée, Augereau arranged for his transfer to more promising duties in the mountainous front against Spain. Here he rose to the rank of major general by the close of 1793. His work included training recruits in the style of discipline and battlefield movements he had experienced in the Prussian Army. His military skills made him popular with his troops, and they were awed as well by his tall, physically imposing figure. To the men under him he was known as the Big Prussian.

Fighting against the Spanish, Augereau proved to be a skilled combat commander as well as a capable trainer of troops. He defeated a powerful Spanish force at San-Lorenzo-de-la-Muga in May 1794. Placing his troops in a centrally located position, Augereau struck in turn at each of the five different Spanish columns advancing against him. In November he played a key role in the decisive French offensive at Figueras, and he remained facing the Spanish until the Madrid government sued for peace in 1795.

Augereau was transferred to the (French) Army of Italy later in 1795, fought successfully at the Battle of Loano in November, and did his best to hold the neglected French forces together during the ensuing winter. He was one of the senior officers in the army when Bonaparte took command in the spring of 1796. Along with General André Masséna, Augereau led a division with conspicuous aggressiveness as the young Bonaparte separated the Sardinians from their Austrian allies in the mountains of northern Italy and then plunged into the Po River valley. Having helped Bonaparte take the rich lands of Lombardy, Augereau led his division in numerous efforts to secure what had been won. This included helping besiege Mantua, the last enemy fortress to hold out against the French, and invading the Papal States to compel the pope to accept French domination.

The peak of Augereau's service in Italy and the unforgettable moment in his entire career came in August 1796.

With Austrian armies under *Feldmarschall* Dagobert Graf Würmser moving down both sides of Lake Garda, Napoleon was hard pressed to mount an effective defense. In later years, Augereau suggested—somewhat implausibly—that he deserved the credit for persuading Bonaparte not to retreat south of the Po River. In any case, Augereau marched his division 50 miles in a day and a half to reach a position in front of the Austrian column east of Lake Garda, then fought like a lion to hold the Austrian advance guard at Castiglione. By stopping the advance of Austria's eastern army, he gave Bonaparte time to defeat the other enemy forces to the west. Bonaparte then linked up with Augereau at Castiglione to defeat the eastern wing of Würmser's offensive. In all, Augereau played the key part in frustrating Austria's most dangerous counteroffensive against the French in northern Italy. By this time, he had also acquired a reputation as one of the most enthusiastic, if indiscriminating, looters of Italian property in Bonaparte's ranks.

The following year saw Augereau back in Paris on a political mission for Bonaparte. Elections to the French representative assemblies were producing a significant number of conservative delegates. The rising influence of royalist factions alarmed the Directory, the five-man governing executive in France. When the Directory expelled conservatives from their stronghold in the Council of Five Hundred, the lower branch of the French legislature, in September 1797, they needed a reliable military man to maintain control over the nation's capital. In command of the 17th Division garrisoning Paris, Augereau occupied the legislative chambers, arrested the apparently dangerous royalists, and made certain no popular uprising occurred to block the Directory's purge. In 1797, in the wake of this success, Augereau developed political ambitions of his own. Although he served in the Council of Five Hundred, his hopes of high office were squashed when he twice failed to obtain one of the newly vacant seats on the Directory.

Subsequently, Augereau held commands in western Germany and on the Spanish frontier. His ties with Bonaparte grew tenuous, perhaps because Bonaparte found other generals, such as Jean Lannes, more talented and more loyal. Thus, Augereau did not join the coterie of generals that Bonaparte took to Egypt in 1798. He played no role in Bonaparte's seizure of power in late 1799, apparently unable to decide whether or not to join in overthrowing the Directory. Nonetheless, in May 1804, when Napoleon honored the most important military commanders in France with the rank of marshal, Augereau found himself within the favored circle. When titles of nobility followed in 1808, the soldier who had once been a poverty-stricken Parisian child was honored as the duc de Castiglione.

In 1804, promoted to command VII Corps for the forthcoming invasion of England, Augereau established his

headquarters at Brest. When Napoleon shifted the newly formed Grande Armée eastward to meet a threat from Austria and Russia, Augereau led his army across the length of France, greatly contributing to Napoleon's triumph by surrounding an entire Austrian army at Ulm. By destroying a complete enemy division near Kempten on the Iller River south of Ulm, Augereau helped close the ring around the Austrian forces under *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich.

The 1806 campaign against Prussia saw Augereau's corps on the left flank of the advancing Grande Armée. After participating in the Battle of Jena, Augereau's forces advanced to Berlin. As the war continued against the remnants of the Prussian army and the large Russian forces that now joined them, Augereau's troops, along with much of the rest of Napoleon's army, entered northern Poland for the frustrating campaign of early 1807. Mud, poor roads, and a harsh climate took their toll on Augereau and his men. Augereau himself was sufficiently ill to request that he be relieved, but he was persuaded to stay on and to lead a crucial assault against the Russian left flank at Eylau. Attacking through a heavy snowstorm, Augereau's corps lost sight of the direction in which they were to advance. Instead, they marched directly into the Russian artillery's line of fire, and their ranks were struck as well by friendly fire from French cannon.

In the aftermath of the disaster at Eylau, Augereau went on sick leave, and the ragged remnants of his VII Corps were disbanded and sent to join other units. Augereau's next command was in Spain, where he was stationed from June 1809 through April of the following year in command of the Army of Catalonia. He served without distinction in Spain, and he was relegated to commanding a rear area in Germany during the invasion of Russia in 1812.

The final years of the Napoleonic Wars saw Augereau's career reach a new height at the Battle of Leipzig in October 1813. Only a few months before, he had gone on sick leave again, and those who saw him at the time had remarked on his aging appearance and wavering concentration. But at Leipzig he fought fiercely in holding the French right flank and extricated the surviving forces of his corps once the field had been lost. In response to this performance, Napoleon reputedly remarked that the old Augereau of Castiglione had reappeared. Such generals were a precious commodity the following year as France faced invasion, and Napoleon awarded Augereau a key role in guarding the nation's eastern frontier. The old soldier was assigned to build an army at Lyons with which he could strike the southern flank of the Austro-Prussian forces crossing the Rhine and moving toward Paris. Napoleon's desperate defense of French soil during the spring of

1814 relied heavily on vigorous action by Augereau, and the veteran warrior failed utterly to provide it.

Either from a lack of energy and determination or possibly from an unwillingness to help Napoleon survive, Augereau remained stuck at Lyons, then retreated southward to Valence; his army never took the field. Napoleon was left to his own devices to hold off the Austrian and Prussian invaders in the river valleys east of Paris. He fought brilliantly, but the absence of any activity on the part of Augereau helped doom his efforts to failure.

The possibility that Augereau had deliberately failed to aid Napoleon was confirmed by his conduct after the Emperor abdicated. He publicly condemned Napoleon and urged that the returning Bourbon king, Louis XVIII, be accepted as the country's legitimate ruler. Louis in turn rewarded Augereau by allowing him to keep the title of marshal in the French Army and by naming him to the Chamber of Peers, the upper house of the new French legislative body.

Augereau could not duplicate his success of 1814 in negotiating further changes of regime when Napoleon returned from Elba in 1815. His former commander rejected Augereau's offer to serve the revived Empire, and Napoleon ordered the veteran soldier's name erased from the list of marshals. But Augereau's failed attempt to change sides made him a marked man after Waterloo and Louis XVIII's return to power. Augereau was stripped of the honors the king had conferred in 1814, and he died at his country estate in Normandy on 12 June 1816.

### Austen, Jane (1775–1817)

The social commentary and deeply satirical depictions of middle-class life found in her novels made Jane Austen one of the most influential novelists of the nineteenth century. Austen's novels focused on middle-class rural life in contemporary England. Although she had brothers in the Royal Navy, Austen largely ignored the political and military events of her lifetime in her writing, instead concentrating on the domestic. Once considered a shortcoming in Austen's work, this introspection is now considered to be one of her greatest strengths.

Jane Austen was the seventh of eight children born to George and Cassandra Austen. The Austen family was a very tight-knit group, and Jane was particularly close to her only sister, Cassandra, who was two years older than she. Education was considered important in the Austen family for both males and females. Cassandra and Jane were sent away to boarding school, while the Austen males were educated at home. Jane began her schooling at the age of six. It is unclear when her formal education ended, but it would seem that by the time she was eleven she had completed her time at boarding school.

In 1791 Austen's cousin, Eliza de Feudillide, to whom she was close, returned to England after living in France with her husband, a royalist named Jean Capot de Feudillide. De Feudillide visited England in 1792 but returned to France after hearing that he would be declared bankrupt if he did not return. He was executed in 1794 and Eliza married Austen's brother Henry in 1797.

Despite the fact that much of Austen's writing was peppered with romance, she never married. Rumors of love affairs that the author supposedly took part in have been hard to prove. It is commonly accepted, though, that she was engaged very briefly to Harris Bigg Wither, the brother of three girls whom both Jane and Cassandra were close to, in 1802.

In November 1797 Austen's father sent a copy of her novel *First Impressions* to the London publisher Cadell.

The novel was immediately rejected. *First Impressions* was an early version of *Pride and Prejudice*, which many consider to be Austen's finest novel. At around the same time, she was also working on *Elinor and Marianne*, which would become known as *Sense and Sensibility*.

In 1803 Austen's father was successful in selling the manuscript of *Susan* to Messrs. Crosby and Cox for £10. Although the book was advertised once, it was not published by Crosby and Cox. In 1809 Austen wrote to the publishers, under an assumed name, stating that she would attempt to have the book published elsewhere if they did not mean to publish it. Crosby and Cox responded by offering her the choice of buying the manuscript back for the original £10 or facing proceedings if she went ahead with publication without paying them back. Austen could not afford the money and did not respond.

In 1811 Austen found publishing success, with *Sense and Sensibility* being accepted for publication. The novel was published in November 1811 by T. Egerton, and she made £140 from the first edition. Of all of her novels, *Sense and Sensibility* was given the most thorough critical reception in Austen's lifetime. Published under the pseudonym "A Lady," a second edition was released at Austen's expense in November 1813.

Egerton offered Austen £110 for the outright copyright to *Pride and Prejudice*, which she accepted. *Pride and Prejudice* was first published in early 1813, a second edition was released in the same year, and a third appeared in 1817.

Austen's next novel, *Mansfield Park*, was completed in mid-1813 and significant in being the first of Austen's novels that was not a revision of one of her pre-1800 works. Begun in 1811 and published in 1814, *Mansfield Park* was not as well received as Austen's previous novels.

*Emma* was begun early in 1814 and completed by March 1815. Published in December 1815, critical response to *Emma* was moderate, but the novel sold well. *Emma* was dedicated to the Prince Regent, who was a fan of Austen's work. Although the feeling was not mutual, Austen did not have any alternative but to dedicate the work to the prince once she was aware that it was his wish. John Murray, who wanted the copyright of *Emma*, *Mansfield Park*, and *Sense and Sensibility*, published *Emma*. Austen would not sell the copyright; instead, the new novel was published under commission.

In 1815 Austen began work on *Persuasion* but put the manuscript aside when her beloved brother Henry became ill. Henry recovered, and in 1816 bought back the manuscript of *Susan* from Crosby and Cox for the same price for which it had originally been sold: £10. During that year Austen's health was waning, but she worked on the *Susan* manuscript, converting it into the novel *Northanger Abbey*. *Persuasion* was finished in spring 1817. Another novel, *San-*

*diton*, was begun in January 1817, but only eleven chapters were written before Austen became too ill to continue.

Austen wrote her will in April 1817. Nursed by her adored sister, Cassandra, Austen died on 17 July. She was buried at Winchester Cathedral on the twenty-fourth. *Persuasion* and *Northanger Abbey* were published posthumously by her brother Henry in December 1817.

Despite the critical and popular following that has grown since Austen's death, she did not reap significant financial rewards for her work during her lifetime. Her entire earnings from her writings during her lifetime did not exceed £700. Considering, though, that neither her mother nor her sister (with whom she lived for most of her life) had any significant income, Austen's modest income reduced the burden on her brothers to support the Austen women.

Cassandra destroyed most of Austen's letters after her death. Henry wrote a biography of a few pages, but this did not add much to what was known of Austen. Nothing more on her life was published for fifty years, when James Edward Austen-Leigh, her nephew, wrote a memoir. It included extracts from *Sanditon*.

## Austerlitz, Battle of (2 December 1805)

Exactly a year to the day after Napoleon's coronation as Emperor of France, the climactic battle of the 1805 campaign took place near Austerlitz in Moravia (now in the Czech Republic). It was the culmination of Napoleon's first campaign as Emperor and saw his army, nurtured in the training camps along the English Channel coast for two years, prove its mastery on the battlefield. Many consider Austerlitz the greatest of Napoleon's victories.

The Battle of Austerlitz, widely regarded as Napoleon's greatest victory. The Austrians withdrew from the Third Coalition, forcing their Russian allies to withdraw into Poland. (Library of Congress)

After the capitulation of Freiherr Mack's Austrian army at Ulm in October 1805, General Mikhail Kutuzov's Russian army turned back from the Austro-Bavarian border, retracing its steps eastward. Kutuzov evaded the French pursuit before joining a concentration of the Allied army at Olmütz, just over 100 miles north of Vienna, late in November. Napoleon ended his pursuit at Brünn.

Napoleon's position appeared weak, with only four formations close to Brünn: the Imperial Guard, Marshal Joachim Murat's Cavalry Reserve, and IV and V Corps of marshals Nicolas Soult and Jean Lannes. However, this was misleading. Both Marshal Jean-Baptiste-Jules Bernadotte's I Corps and Marshal Louis Davout's III Corps were capable of joining Napoleon by forced marches.

On 21 November, Napoleon pushed Soult beyond Austerlitz and, following in his wake, focused on an area dominated by a long plateau above the village of Pratze, about 4 miles west of Austerlitz. This, Napoleon felt, was a battlefield where he could achieve a decisive result.

At Allied headquarters the discussion was on whether to fight or withdraw and await the arrival of reinforcements. Kutuzov advocated withdrawal, but the appearance of Tsar Alexander I at the front reduced his authority. Alexander was convinced this was his chance to personally lead Russia to victory over Napoleon and an apparently weak French army, far from home and at the end of an extended line of communications. Although the Austrian emperor, Francis I, was also present, the Russians had cared little for Austrian opinion since the capitulation at Ulm. On 27 November, the Allied army moved forward.

Napoleon, concerned about his vulnerable communications, needed a decisive victory to bring the campaign to a swift end. Determined to lure the Allies to battle, he encouraged an impression of weakness, sending an aide to Allied headquarters ostensibly to discuss peace. Meanwhile, his advanced troops withdrew westward, giving up the strength of the Pratzen plateau, further adding to Russian confidence. At the same time, orders were issued for Bernadotte and Davout to march.

Napoleon's chosen position extended from a steep fortified hill, known to his men as the Santon, just north of the Brünn-Olmütz road, southward through the villages of Jirzikowitz and Puntowitz, and along the Goldbach stream through Kobelnitz and Sokolnitz to Telnitz, a distance of about 7 miles. Lannes's V Corps formed the left of the army, anchored on the Santon. To his right, two of Soult's infantry divisions, under generals Dominique Vandamme and Louis St. Hilaire, respectively, stood behind Jirzikowitz and Puntowitz, leaving the three brigades of General Claude Legrand's division to cover the remaining 3 miles of the front line. The position suggested an overwhelming weakness on the French right. Bernadotte's I Corps maneuvered into a position in support behind Vandamme who, with St. Hilaire, was to provide the spearhead of the army; Murat's Cavalry Reserve was positioned to operate between Lannes and Soult. An army reserve formed of the Imperial Guard and General Nicolas Oudinot's Reserve Grenadiers stood close to headquarters on Zuran hill. Napoleon's plan was to tempt the Allies to throw their weight against his weak right, then occupy them with Davout's ar-

living III Corps, while his strong left attacked and drove a wedge into the rear of their army.

The task of drawing up the Allied battle plan fell to the one Austrian staff officer still respected by the Russians, Kutuzov's chief of staff, *Generalmajor* Franz Freiherr von Weyrother. Analyzing the limited knowledge he possessed of the French dispositions, Weyrother conceived the idea of a massive sweep by the Allied left and center through the weak right of the French position. As the French fell back before this onslaught, the Allied right would add its weight to the attack. Together, these thrusts would push the French north, away from their line of communications, or back on Brünn. This was exactly what Napoleon hoped for.

The Allies moved into position late on 1 December. Michael Freiherr von Kienmayer's Advance Guard of I Column took up a position close to the village of Augezd on the southern or left flank, with the main body of I Column, commanded by Dmitry Dokhturov, established at the southern end of the Pratzen plateau. Next in line came II Column under Louis Langeron, then III Column with Ignatii Yakovlevich Przhebishevsky at its head. General Fedor Buxhöwden held overall command of the three columns. The IV Column formed in the rear of III Column, directed by Johann Karl Graf Kolowrat-Krakowsky and General Mikhail Miloradovich. The main cavalry force was designated V Column. On the northern flank, Prince Peter Bagration's Army Advance Guard lay across the Brünn-Olmütz road, while the Imperial Guard, the only reserve, occupied high ground not far from Allied headquarters in Krzenowitz. Such was Allied confidence concerning the weakness of the French position that no reserve was allocated to their left. The plan was aggressive, designed to hit the French with as much force as possible, preventing any escape.

The freezing night of 1–2 December passed and, as the Allies struggled to form their columns in the thick mist that shrouded the plateau, Napoleon issued final orders to his corps commanders. They were to wait until the Allies were committed to the attack. Soult remained at headquarters, ensuring Napoleon could directly order his divisions forward.

Kienmayer's Advance Guard of I Column, the Allied extreme left, opened the battle by advancing on the village of Telnitz. The French defenders, from Legrand's division of IV Corps, held the buildings tenaciously, and it was only after the main body of Dokhturov's I Column arrived an hour later and joined the attack that the French infantry fell back on their cavalry and artillery support. With Telnitz captured, Kienmayer's orders were to push on. However, Buxhöwden ordered him to halt. The plan called for the columns to advance together, but there was no sign of II Column, which should have been advancing on Dokhturov's right flank.

Confusion on the plateau delayed the start of II Column, but finally a brigade appeared, marching down the

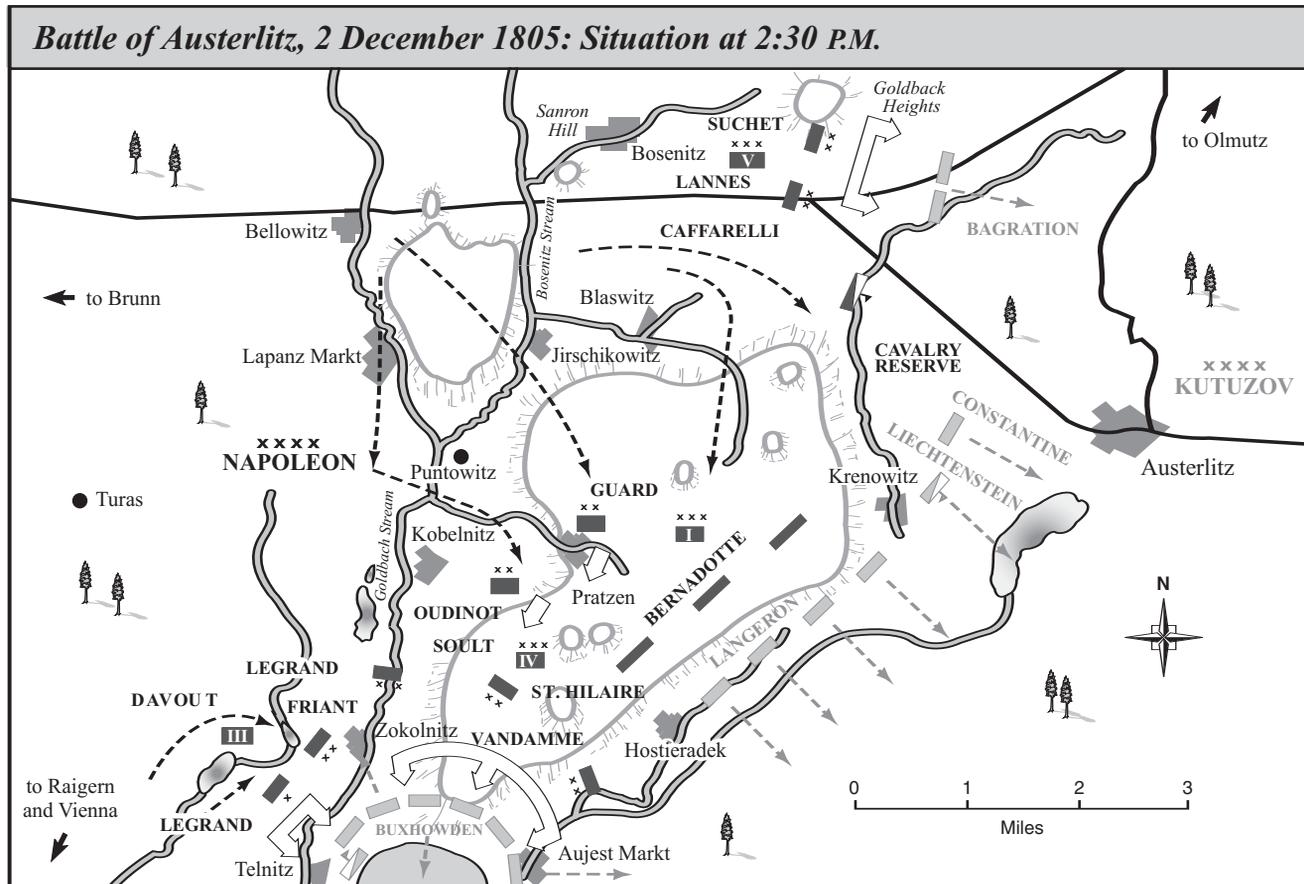

slope toward the Goldbach, although it veered to the right and came up against the village of Sokolnitz. Legrand's men, alerted by the attack on Telnitz, were ready. Langeron halted, ordering his artillery to bombard the village while he waited for his second brigade and the arrival of III Column.

As the bombardment continued, Przhebishevsky's III Column made a belated appearance. Finding Langeron further to the right than expected, III Column drew up opposite Sokolnitz castle, a large country house north of the village, defended by more of Legrand's determined men. Przhebishevsky immediately ordered an attack, and the castle changed hands three times before the French defenders finally fell back. At the same time, Langeron, still missing his second brigade, launched a successful attack against Sokolnitz village. As the Russians consolidated, fighting flared up again at Telnitz.

Following Napoleon's orders to press northward as fast as possible, the leading units of Davout's exhausted III Corps arrived southwest of Telnitz. Responding to a request for help, Davout sent an infantry brigade from Friant's division and a dragoon division toward Telnitz. Friant's remaining two infantry divisions pressed on toward Sokolnitz. The unexpected appearance of this new force before Telnitz caused panic among the defenders until a charge by Austrian hussars sent the French infantry flying, leaving Telnitz once more in Allied hands. Kienmayer again sought permission to continue his advance, but once more Buxhöwden refused, as II and III Columns had still not moved beyond Sokolnitz. Then, as the Russians finally prepared to advance, Davout threw Friant's two divisions forward. Langeron's sole brigade bore the brunt of the initial attack before driving the French back, but not before Przhebishevsky's men also faced a fresh attack. French aggression was proving effective, the main thrust of the Allied plan becoming bogged down on the Goldbach.

The IV Column was scheduled to commence marching an hour later than the first three columns, but it was about 9:00 A.M., two hours after the first move against Telnitz, before it finally got underway. The cause of the delay lay with V Column, the main cavalry force, part of which had bivouacked overnight in the wrong area and impeded other columns as it moved off. Jointly commanded by Miloradovich and Austrian *Feldzeugmeister* Kolowrat, IV Column was numerically strong, with about 12,000 men, but lacked quality. All fourteen Russian battalions had suffered attrition on the long march to the Bavarian border and back, while half the Austrian infantry were raw and inexperienced depot battalions.

At French headquarters Napoleon waited anxiously. The mist that had shrouded the Pratzen plateau cleared at about 8:00 A.M. and then, at last, he saw that the Allies were

Adapted from Chandler 1966, 429.

moving against his right as he had hoped. At about 9:00 A.M., with gunfire to the north confirming that Lannes was in action against Bagration and with continuing gunfire from the south, Napoleon ordered the two divisions of IV Corps, Vandamme and St. Hilaire, to march for the plateau, where he anticipated little resistance. As the leading units of the Allied IV Column approached Pratze, Soult's 16,000 men came into view. The three understrength Russian battalions and two squadrons of Austrian dragoons of the advance guard immediately prepared to defend Pratze. Kolowrat led his two Austrian brigades toward the Pratzeberg, the highest point on the southern end of the plateau, while Miloradovich prepared to defend Pratze and Staré Vinohrady, the high point on the northern end, with the advance guard and his two Russian brigades.

The French, believing there would be little opposition, sent only a battalion to clear Pratze. It was comprehensively repelled, but a second wave of General Paul Thiébault's brigade swept forward, and after a fierce struggle, five Russian battalions turned and fled, their retreat protected by the two squadrons of Austrian dragoons.

While Thiébault was clearing Pratze, the 10<sup>ème</sup> Légère (10th Light Infantry), the leading unit of St. Hilaire's division, bypassed the village heading for the Pratzeberg, intending to secure the high ground. The delayed Russian brigade of Langeron's II Column was finally marching for Sokolnitz when the commander, General Sergey Kamenski, observed this French force. He immediately sent word to Langeron before turning his brigade and heading back toward the plateau. Initially Kamenski's men pushed the outnumbered 10<sup>ème</sup> Légère back, but before they could outflank them, Thiébault rushed forward with the rest of his brigade and artillery support to stabilize the position. As the Russians and French engaged, Franz Freiherr von Jurczik's Austrian brigade of Kolowrat's command, making for the Pratzeberg, joined the attack, with Rottermund's brigade in support. The initial attack failed, and Kamenski and Jurczik fell back. It appears that Rottermund, isolated by this move and with confusion all around, ordered his men back toward the Allied position on Staré Vinohrady. The desperate battle for the Pratzeberg continued as Langeron rode up from Sokolnitz and, realizing the danger, immediately summoned reinforcements.

With ammunition running low, St. Hilaire was close to ordering a retreat, when he decided instead on a desperate bayonet attack against the Russians to ease the pressure on his command. Both sides had suffered heavy casualties, but the ferocity of the French assault proved too much for Kamenski's men, who turned and fled. Jurczik's men attempted to stem the tide, which they did, briefly, before also falling back. Two battalions, sent by Langeron to reinforce the position, arrived just as the Allies abandoned the Pratzeberg and were crushed between St. Hilaire's men and a brigade of Legrand's division that advanced from the Goldbach. The French were in undisputed possession of the Pratzeberg.

At the northern end of the plateau Vandamme brought his division up to Pratze. To the east of the village Miloradovich stood with his remaining five battalions, while Rottermund's Austrian brigade occupied Staré Vinohrady. The heavily outnumbered Russians held their ground for a while, but as the French began to outflank them and artillery fire increased, they gave way. Rottermund made a stubborn resistance, but, outnumbered 2 to 1 and with his flanks threatened, his line finally gave way. It was now about 11:00 A.M. and the French were masters of the Pratzen plateau from north to south. From his headquarters, Napoleon ordered an advance. Bernadotte's corps marched eastward, part of it climbing the plateau, as did the Imperial Guard and the Reserve Grenadiers.

As part of the Allied plan, Bagration, the Russian commander on the northern flank, was not to advance until it was clear the battle was underway in the south. To his left the cavalry of V Column occupied the area between him and the plateau. Opposing Bagration, Lannes's V Corps had similar orders, to delay an advance until the battle was underway. It was probably not until sometime between 9:00 and 10:00 A.M. that Lannes began to move. An attack by the Russian cavalry to arrest this movement brought a temporary halt but then developed into a confused series of cavalry melees. While these ebbed and flowed, a Russian attempt to outflank the French line failed, blocked by a fierce defense of the Santon strongpoint. As the cavalry combat continued, with the Russians facing the full weight of Murat's Cavalry Reserve, the Austrian cavalry faced one of Bernadotte's divisions, advancing north of the Pratzen plateau. The Russian cavalry resistance finally broke under the weight of a charge by General Etienne Nansouty's division, and the Austrians, now threatened in the flank by Vandamme's capture of Staré Vinohrady, also fell back. With the Allied cavalry threat removed, Lannes ordered his infantry forward again.

Bagration's infantry stood firm in the face of repeated French attacks. A forward position on Bagration's left, occupied by elements of the Russian Imperial Guard, finally

gave way under pressure and exposed his flank. Grudgingly, Bagration pulled back until two Austrian batteries arrived to offer much-needed support. Lannes's advance petered out in the face of this concentration of fire.

Back on Staré Vinohrady, Vandamme began to reform his division after the exertions of battle. Observing this, Grand Duke Constantine, commander of the Russian Imperial Guard, determined to prevent him from pushing on. Four battalions of Guard Fusiliers stormed forward, attacking a battalion of 4ème Ligne (4th Line Regiment) at bayonet point, forcing them to break. The Russian Guard infantry rushed on but stalled at a second French line and fell back. As they regrouped, the cavalry of the Russian Imperial Guard moved forward and crashed into the re-forming battalion of 4ème Ligne, capturing their eagle. The cavalry also broke a second French formation, the 24ème Légère (24th Light Infantry). Napoleon, who had now arrived on Staré Vinohrady, immediately ordered his Imperial Guard cavalry to attack. The ensuing melee absorbed the entire cavalry of both Imperial Guards, but the French benefited from the arrival of Drouet's division of Bernadotte's corps, behind which they were able to re-form before returning to the fight. Unable to sustain the action any longer, the Russian Guard fell back toward Krzenowitz, their retreat protected by the Guard Hussars.

With the Allied threat in the north neutralized and with control of the Pratzen plateau secured, Napoleon turned southward with Vandamme's division, followed by the Imperial Guard and the Reserve Grenadiers. He linked with St. Hilaire's division as he progressed, leaving Bernadotte to hold Staré Vinohrady. Down along the Goldbach, Legrand and Davout were still occupying the Allied attack columns when the French appeared on the plateau in the rear of the Allies at about 2:00 P.M. As St. Hilaire's division prepared to move off the plateau, Legrand extended his divisions toward them, and Davout launched fresh attacks to engage the Allies. Langeron and Przhemishevsky realized the battle was lost with the appearance of French troops on the plateau. Langeron extricated five of his nine battalions still fighting on the Goldbach and marched southward. Przhemishevsky attempted to fight his way out to the north but failed, and he surrendered near Kobelnitz.

While the French pushed toward Sokolnitz, Buxhöwden ordered Dokhturov and Kienmayer to retire eastward. As the leading units reached the village of Augezd, Vandamme's men appeared on the plateau above them, cutting this escape route. Veering to the right, the head of the column ventured onto the ice of the vast frozen Satschan pond, where a combination of French artillery fire and the weight of men and equipment caused the ice to break, dumping many into the freezing but shallow water. About

200 Russians died there. Those units following turned back, under the protection of a determined rear guard that held off all French attacks, and escaped across a causeway on the southern side of the pond. At about 4:00 P.M. the last Allied troops left the battlefield.

Austerlitz was a stunning victory for Napoleon, gained, with great dramatic effect, on the first anniversary of his coronation. On 4 December, at a meeting with the Austrian emperor, Francis, the two emperors signed an armistice. Tsar Alexander agreed to the terms and withdrew his army back to Russia. By the end of the month the war had officially ended with the signing of the Treaty of Pressburg. The terms humiliated Austria, forcing it to pay a huge financial indemnity and give up large tracts of land. This further weakened Austria's already-waning influence in the German territories, leading the following year to the dissolution of the Holy Roman Empire and the creation of the French-dominated Confederation of the Rhine. The smoldering resentment caused by the imposition of these terms saw Austria resume hostilities four years later.

## Austerlitz Campaign

*See* Third Coalition, War of the

## Austria

Collective name for the lands under the personal rule of the Habsburg monarchs, formalized as the Austrian Empire in 1804, which fought in most of the French Revolutionary and Napoleonic Wars. After the Holy Roman Empire ended in 1806, the Austrian Empire became more centralized and cohesive and began to create its own identity, but it was still run on a provincial basis. The core of the Empire was its western Hereditary Lands (*Erblande*) and Bohemian lands, balanced by the eastern Hungarian provinces. Additional territories in Italy, Germany, Poland, and the Netherlands, gained and lost across the period, created a multinational empire, which had been consolidating since the mid-eighteenth-century wars with Prussia but which was still economically weak and so needed allies to face the short-term challenge of France and the long-term threat from Russia.

The 1792 population of approximately 24.4 million was steady during the wars but increased rapidly at their end. The western core of the Empire comprised Bohemia (2.5 million people), Moravia (1.25 million), and Austrian Silesia (300,000), together what is now the Czech Republic; Lower Austria (1.6 million), Upper Austria (600,000), Styria (750,000), Tyrol (550,000), Vorarlberg (100,000), Carinthia (270,000), and Carniola (400,000), what is now modern Austria and Slovenia. The small counties of Gorizia-Gradisca and Istria plus the port city of Trieste at the northern end of the Adriatic made up the Littoral, with

a population of 200,000. The 1772 First Partition of Poland added Galicia-Lodermaria, and Turkey ceded the Bukovina in 1775, now southern Poland and western Ukraine, bringing the total population to 2.76 million.

The northern Italian possessions of Lombardy and Mantua, with 1.5 million people, were lost to the French, while Venetia with its population of 2 million, including its Dalmatian possessions, was acquired under the 1797 Treaty of Campo Formio. The Duchy of Tuscany, independent under the rule of the emperor's oldest brother, was lost in 1803, as was Venetia in 1805, but all were recovered in 1814. The wealthy Austrian Netherlands (now Belgium and Luxembourg), with 2 million people, were lost in 1794, and the small enclaves in southern Germany, collectively named the *Vorlande* (250,000), were ceded in 1803, but the territories of Brixen and Trent (enclaves in the southern Tyrol) were acquired in 1803. By the Treaty of Pressburg, Salzburg was acquired in 1805, adding another 200,000; in the same year, Tyrol was lost, not to be regained until 1814. The 1795 Third Partition of Poland added West Galicia (about 600,000), which was lost again in 1809 by the Treaty of Schönbrunn. In the east, Hungary, Croatia, Transylvania, and the Military Frontier (*Militargenze*)—now Hungary, Slovakia, the northern parts of Croatia and Serbia, northwest Romania, and western Ukraine, with a total population of 9.4 million—had been recovered from the Turks a century earlier.

Germans (23 percent of the total population) dominated the Hereditary Lands with scattered populations across the eastern lands, whose main population was Hungarian (14 percent) with Slovaks (5 percent) in the north, Romanians (7 percent) in the east, and Croats and Serbs (3 percent each) in the south. Italians and Flemings/Walloons (Belgians) were predominant in their provinces, while Czechs (11 percent) and Slovenes made up the majority in the Bohemian lands and Carniola, respectively. Galicia's and Bukovina's population was almost all Polish or Ruthene (Ukrainian), with large numbers of Jews and Romanians. Dalmatia's 260,000 people were largely Croatian with Serbian and Italian minorities. Gypsies (120,000), plus groups of Bulgars, Armenians, and Ladins were dispersed across the eastern territories.

The Empire was based on personal rule by the Habsburg monarch, Francis (Franz), who reigned as Holy Roman Emperor Francis II and, after 1804, as Emperor Francis I of Austria. Each province was governed by a governor (or viceroy), together with its own landtag or diet (provincial assembly), although in reality, the western assemblies were not summoned. Consequently, Vienna dealt with provincial administration through the Vereinigte Hofkanzlei (Joint Imperial Chancery) for the western lands, but it worked through the Hungarian and *Sieben-*

*burgen* (medieval German settler colonies) chanceries for the east. The senior administration positions were mostly held by the *Hochadel* (senior nobles), who formed a non-nationalist class owing allegiance to the monarch only, a situation that also encouraged minor German nobles who had joined as Holy Roman Empire officials to remain in Vienna after 1806, notably Grafs Stadion and Metternich.

In Vienna, the emperor was advised by the Staatsrat (Privy Council), whose members sent individual reports to him via his *Kabinett* (personal secretariat), although their personal status depended on their standing with the emperor. However, the heads of the three main departments—foreign affairs, defense, and finance—reported to the emperor directly. In the west, justice was conducted through the Oberste Justizstelle (Justice Ministry) and the police were led from their own *Hofstelle* (an imperial office reporting directly to the emperor) by Anton Pergen and, after 1805, Franz Freiherr Hager. Better coordination was achieved during the existence of the Staats- und Konferenzministerium (State Council) from 1801 to 1807, which enabled the three senior ministers (the foreign, defense, and interior ministers), the emperor, and the head of the *Kabinett*, plus three *Referendars* for specialist issues, to meet for discussion of policy questions. In 1802, the Interior Ministry broke up again into the Finance Ministry and Chancelleries. After 1808, the reconstituted Staatsrat held frequent meetings under Archduke Rainer, meetings also attended by the foreign and defense ministers.

Foreign affairs were directed from the Haus-, Hof- und Staatskanzlei, whose head (the director general) enjoyed considerable influence in key appointments, including those of army chiefs of staff. Wenzel Anton Fürst Prince von Kaunitz had retired as director general in 1792, followed briefly by Philipp Graf Cobenzl until he was sacked and replaced by Johann Freiherr von Thugut in 1793. Johann Ludwig Graf Cobenzl (Philipp's brother) and Franz Graf von Colloredo jointly held the post from 1801 to 1806. It was then held by Stadion until he was replaced by Metternich in late 1809. The imperial policy had initially been to attempt to contain the mayhem of the French Revolution, but after the Napoleonic regime was established, imperial policy gradually shifted toward an accommodation with France, which culminated in the dynastic marriage of Archduchess Maria Ludovika to Napoleon in 1810 and the alliance of 1812. Alliances with Russia in 1799 and 1805 and appeals to German nationalism in 1808 had ended in failure, so that after 1813, Austria aimed to be the balancing force in Europe.

Finance, directed by the Hofkammer (or Camera, that is, the treasury), was always a problem for the Empire, and British war subsidies made little impact. Imperial income

came from extensive Crown lands, supplemented by taxes paid by imperial free cities, mining operations, and the coinage minters, plus customs duties. The Hungarian and Transylvanian cameras were directly controlled by Vienna, but the Netherlands and Milanese cameras were independent, paying a proportion of any local financial surplus. The national debt, which rose from 417 million gulden in 1792 to 739 million in 1816, was administered by the Kreditdeputatio, and the Hofrechnungskammer (Court of Audit) supervised expenditure. The basic unit of Austrian currency was the gulden (or the florin, especially in Hungary), with an exchange rate of 3.2 French livres in 1796 and 14 British pence in 1799. It was divided into 64 kreuzer—in terms of buying power, one kreuzer was approximately equal to one modern U.S. dollar—and a kreuzer was further subdivided into 4 groschen.

With permanent budget deficits, the government resorted to issuing paper money to finance the wars. Known as the *Bankozettel*, 27 million gulden was in circulation by April 1792, rising to 46.8 million in 1796. After the debasement of silver and bronze coinage, the *Bankozettel* rose to 200 million gulden in 1800, so the discount rate (Augsburg quotation) began to move up from par—that is, face value (100)—to 115 in 1800 and 135 in 1804. By 1806, the *Bankozettel* was nearly 450 million gulden, with a discount rate of 175. By 1808, it was 650 million gulden, quoted at 315; aggravated by French counterfeit notes, the circulation was at 846 million, quoted at 469, by 1810. Despite establishing a *Finanzkommission* in 1806, where Archduke Charles (Erzherzog Karl) and Graf Chotek proposed the monetarist approach of withdrawing paper money, Finance Minister Karoly Graf Zichy only implemented a forced loan and an indirect tax surcharge. Inflation roared on, and by early 1811 Austria faced bankruptcy as the discount rose to 1,240 with 1,060 million gulden in circulation.

In February 1811 the new finance minister, Graf Wallis, issued a new *Finanzpatent*, which withdrew all *Bankozettel* and small coinage, replacing it with *Einlösungsscheine* (redemption notes) at a rate of 1 to 5, which cut interest rates from 5 to 2.5 percent. The *Einlösungsscheine* was quoted at 180, but, still unbacked, it continued to fluctuate wildly. By 1812 it had steadied to 139, but when a government pledge not to exceed 212 million gulden in circulation was broken by 45 million in 1813, the discount rate rose to 169 in October 1813, to 238 in April 1814, and to 408 in April 1815. Thereafter it moved between 300 and 360, with over 635 million in circulation. Inflation had been about nil until 1794, but thereafter it rose with the expansion of the *Bankozettel*, so that by 1801, prices had doubled from 1790. Between 1801 and 1804 inflation trebled the cost of living. After the drastic deflation

of the 1811 *Einlösungsscheine* change, inflation picked up again, before falling back in 1812.

The military was administered by the Hofkriegsrat (Imperial War Council), whose presidency was a politically contentious post that was held by Archduke Charles from 1801 to 1804. After the war against Turkey ended in 1791, military expenditure was reduced to 16.4 million gulden but then rose steadily to reach a nominal 87 million in 1801, before falling back sharply to 34.5 million in 1804. The 1809 war took the expenditure to 253.2 million, but it fell to 30.4 million *Einlösungsscheine* in 1811, rising again to 150 million annually for the campaigns of 1813–1814.

Aside from the mercantilist provinces of the Austrian Netherlands and Lombardy, the Habsburg dominions' economy was based on agriculture, which had flourished and modernized in the eighteenth century with state subsidies. Only in Bohemia, Lower Austria, and the mining centers (especially Styria) was there significant industry, mostly primary processing of agricultural and mining output or the production of military materials and Bohemian glass. The Empire was surrounded by a tariff wall on over 200 finished goods, but internal free trade meant that no licenses for factories were granted in Hungary to preserve the western undertakings. From 1809 until 1813 Austria was forced into Napoleon's Continental System, removing its tariffs against France.

Catholicism was the dominant religion, but freedom of worship had been guaranteed since the 1781 Edict of Toleration. Serbs, Romanians, and Ruthenes were Orthodox Christians, while the Protestants were mostly in Bohemia and the *Vorlande*, with outposts in Hungary and the *Siebenburgen* Saxon towns. German was the language of state administration, except in the Austrian Netherlands, Italy, and Hungary (which used Latin); Galicia was bilingual, Polish and Ukrainian.

Emperor Joseph II (reigned 1765–1790) had abolished the death penalty, but it was reintroduced for the most serious offenses when the criminal laws were codified in 1803, although minor penalties were reduced and crimes were separated from civil misdemeanors. The General Civil Code standardized the civil law in 1811. Trained staff in patrimonial courts, based in local manors or towns, administered justice, and above them, the Oberste Justizstelle coordinated the western lands' state courts and the chanceries in the east.

Below the nobles came the town burghers, who practiced trades and participated in local administration. The land was cultivated by peasants. Many peasants were free in the western lands, but most were unfree, which allowed them civil freedom and property rights but with obligations to their landlords. The peasants paid most of the state land taxes, and unfree peasants also paid taxes to their

lords in the form of cash or robot (free labor). Peasants also had to quarter and supply military units, for which they received little recompense. After 1783 every parish had to support its poor. Elementary education was compulsory, but it was based on practical subjects and religious instruction by inadequately paid teachers. Francis expanded secondary education, which was primarily designed for state servants, but only four universities existed, in Vienna, Pest, Prague, and Liège.

## Austrian Army

Taking some part in every major war of the period, aside from the campaigns of 1806 and 1807 and the campaigns in the Iberian Peninsula, the Kaiserlich-königliche Österreichische Armee (Imperial and Royal Austrian Army) was the most determined foe of the French but would fight alongside them in Russia in 1812. Its reputation for its capabilities, leadership, and battlefield performance is as mixed as the nationalities that served under its flags. Victorious at Neerwinden, Würzburg, Stockach, second Caldiero, Aspern-Essling, and Leipzig, it would impress Napoleon in the closely fought defeats of Marengo and Wagram before emerging triumphant in 1815. Although there was organizational and equipment reform throughout the period, the army's fundamental tactical deployment remained largely unchanged as it pursued its role as

the sole force that unified the Habsburg dominions. This position created a defensive outlook and a cautious approach to losses among its generals, many of whom clearly understood the French total war philosophy but knew that their own circumstances meant that they could not take the same risks.

The Austrian military was administered by the bureaucratic Hofkriegsrat (Imperial War Council) in Vienna. A civilian-military body, it also was the center of campaign planning, and so its president (often appointed because he was a supporter of the foreign minister) held considerable power, for the Hofkriegsrat appointed each army's senior command personnel. However, its failure to arrange proper supply systems for the armies greatly limited their operational capabilities. In 1801 as its newly appointed president, Archduke Charles reformed its organization, establishing three departments. The Military Department was responsible for overall management, artillery, engineering, and the Military Frontier; the Political-Administrative Department handled recruitment and remounts, equipment, logistics, salary, and medical services; while the Justice Department dealt with disciplinary matters.

At the start of the French Revolutionary Wars in 1792, the Austrian Army was already in some difficulty after suffering heavy losses in the 1788–1791 war against Turkey. On paper, its strength was almost 300,000 men, formed into seventy-seven infantry regiments (although this included seventeen *Grenzer* regiments and three garrison regiments), thirty-two cavalry regiments, three artillery regiments, and small technical units of pioneers (field laborers who built field fortifications and light bridges, and felled trees and other obstacles), sappers, engineers, and pontooniers. In 1798 the *Grenzer*, who served on the frontier with the Ottoman Empire, were separated into the seventeen National-Grenz regiments, while the fourth battalions of the twelve Hungarian regiments were concentrated into four new regiments and surplus hussar squadrons formed an additional two regiments. After the changes of 1801, necessitated by dramatic cuts in the military budget (expenditures fell from 87 million gulden in 1801 to 35 million in 1804), the organization stabilized at sixty-three infantry regiments (including two garrison regiments), a *Jäger* regiment, eight cuirassier regiments, six regiments each of dragoons and *chevaulégers*, twelve hussar and three uhlan (lancer) regiments, plus four artillery regiments together with the technical units of pioneers, pontooniers, engineers, sappers, and miners. In 1808 the *Jäger* were broken up to form the cadres of nine *Jäger* battalions, and following the 1809 war, eight infantry regiments were disbanded, although four were reraised in 1814 together with an extra uhlan and *chevauléger* regiment. Clear differences remained: Hungarian infantry regiments wore distinctive blue trousers with

In ferocious fighting, Austrian grenadiers attempt to storm the fortified granary in the village of Essling during the campaign of 1809 on the Danube. (Print by Bousson, Valadon, Paris, after F. de Myrbach from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 3)

decoration on the trousers and on their jacket sleeves, while the other regiments, known as German whatever their origin, wore white breeches and black gaiters without the elaborate decoration. The Hungarians formed the hussar regiments, Galicians (mostly Poles) formed the uhlans, and men from the western areas formed the heavier cavalry. Bohemians and Moravians dominated the artillery and technical services.

Drawn from dominions spread from modern Belgium to western Ukraine with large Irish and Alsatian contingents, the army was heterogeneous in character. The troops came from a system of selective conscription and voluntary enlistment. The Hereditary and Bohemian Lands (western territories) and Galicia were subject to conscription, while the eastern Hungarian lands supplied troops on a voluntary quota basis. The Tyrol maintained its own militia, but it also supplied one regiment and men for the Jäger units by voluntary enlistment. Military service remained unpopular across the Empire, so neither the conscription system, with its many exemptions, nor voluntary enlistment, which sometimes included an element of sub-

terfuge, usually involving alcohol, was adequate. However, the title of Holy Roman Emperor held by the Habsburg monarch enabled the Austrians to recruit from many smaller German states, which supplied up to one-third of many regiments' strength until 1806, and this recruitment was a key source of educated men to become noncommissioned officers. Terms of service for conscripts were for twenty-five years (effectively for life for most), but volunteers usually signed up for a term of three or six years.

Much of Austria's light infantry was drawn from the *Militärgrenze* (Military Frontier), which protected the southern flank of the empire. In return for land, its inhabitants—a mix of Croats, Serbs, Germans, Szeckler, and Romanians—guarded the area in peacetime and in wartime provided two battalions for field service from each "Regiment" (an administrative unit, not a tactical formation). These seventeen regiments were augmented by a Tschaikisten Battalion, riverboatmen, who patrolled the Balkan rivers in shallow-draft vessels and supported the pontooniers in wartime. The *Grenzer* were deployed as light troops and, beginning in 1769, were also given basic

training in formal linear warfare, forming a hybrid similar to the French *légère* (light infantry) battalions. Various *Freiwillige* (volunteer) units augmented the *Grenzer* during the 1790s, many being briefly formed into the battalions of the 15th Light Infantry between 1798 and 1801. The shortage of light troops led to the Infantry Régiment 64 being broken up and expanded into the nine Jäger battalions in 1808, with additional *Freiwillige* battalions being formed in 1813.

The officer corps was even more multinational, with many European nationalities being represented. Like modern armies, the Austrian Army drew the bulk of its officers from volunteers and brighter enlisted men, who were appointed as Kadetts, although it was still possible for the wealthier to buy junior commissions. About a hundred officers a year came from the two military academies, the Theresianum at Wiener Neustadt and the Ingenieurschule in Vienna. Junior officers were appointed by the regimental command, nominally in the name of its *Inhaber* (honorary colonel), although *Stabsoffiziere* (senior regimental officers) were appointed through the Hofkriegsrat in the name of the emperor.

The senior command had been radically altered in 1759 with the wide extension of the authority of the chief of staff, whose responsibilities now covered all aspects of operations, notably planning and intelligence gathering. He became the general's chief adviser in planning and operations. The arrangement was designed to give the commander in chief more time to consider the strategic situation. The small peacetime staff comprised thirty officers, and in 1801 the world's first peacetime chief of staff, *Feldmarschalleutnant* Peter Freiherr von Duka, was appointed as planning powers were removed from the Hofkriegsrat. The role of the wartime chief of staff was further reformed until, in 1813, Johann Joseph Graf Radetzky von Radetz took up the modern role of directing the operational heads of department. In wartime the staff was expanded with junior officers, and some would form the staffs of the senior formation commanders to help them understand what headquarters planned.

The bravery of ordinary soldiers was rewarded either by a bounty or, beginning in 1781, gold and silver medals. Following the victory at Kolin in 1757, Empress Maria Theresa instituted the Order of Maria Theresa for bravery by officers (extended to the ordinary ranks from 1799). Twenty years' steady service or additional acts of bravery would also bring ennoblement of officers to the rank of Freiherr (landless nobility), and it was from these men that the bulk of the generals were drawn. The importance of the chief of staff did, however, allow some notional command by several archdukes.

In all the campaigns, the Army was divided up and allocated to the various theaters. Its command would then deploy senior commanders with staff support to each column (of the main army, often called a division) or *korps* (a force operating separately). The component brigades (led by *Generalmajors*) were fairly constant in their organization and would be allocated to the same armies where possible across the period. Just as the politicians directed the campaign goals, so the army headquarters issued multiple full copies of their plans to the commanders in the field. This gave them a grasp of the overall concept of operations but created other problems: such documents could fall into enemy hands (as happened at Rivoli), or the issuance of instructions could be delayed (as happened at Austerlitz). The considerably larger army of 1809 required a planning change, and in his draft organization of 1 March 1809 chief of staff *Generalmajor* Anton Mayer Freiherr von Heldensfeld divided the army up into eleven *korps*, with their commanders and staff. These were then grouped into the three armies. These forces were, however, adjusted as the war began in April to suit operational requirements. In 1813 a similar process occurred, although the forces were called *Armee-Abteilungen* (army subdivisions).

The Austrian Army that took the field in 1792 was a product of the reforms that had followed the Seven Years' War (1756–1763), although the process had already begun after the disastrous defeats of the War of Austrian Succession (1740–1748). Maintenance of the army in peacetime was expensive, taking up fully 45 percent of the Empire's revenues, so it was constantly underfunded and lacked enough trained troops (the infantry regiment's third battalions being maintained only on a cadre basis). Following the Seven Years' War, the Army had been thoroughly overhauled by *Feldmarschall* Franz Moritz Graf Lacy's drill and uniform regulations of 1767–1769. They emphasized precise drill and linear maneuvers while expressing a strategic preference for operating on secure lines of communication from fortress depots.

The line infantry regiments consisted of three battalions (aside from Hungarian regiments, which had four until 1798). Each infantry regiment had two grenadier companies, which were formed into elite battalions. Beginning in 1796, these battalions formed reserves, either for immediate battlefield use or to exploit breakthroughs in the enemy lines. The infantry fought in three ranks, although the 1769 regulations provided for the third rank to form small platoons, which could be employed to extend a two-man-deep line, flank guards, or hit squads, which would be successfully employed against French skirmishers in the 1790s. Archduke Charles's 1796 *Observationspunkte* (military notes for his senior commanders) insisted that "regular, trained and ordered infantry, advancing in closed

ranks at the quick step, supported by guns, cannot be held up by skirmishers. . . . It should close with the enemy as rapidly and orderly as possible to drive them back and decide the action quickly. This is the method that saves lives; firing and skirmishing results in casualties and decides nothing.” No more than a third of the regular infantry were to be employed in broken terrain or clearing villages, so this was usually a task for *Grenzer* and volunteer units.

The cavalry was classified into two main groups: The *Schlachtenkavallerie* (battle cavalry, namely, cuirassiers and dragoons) and the *Leichte Kavallerie* (light cavalry, namely, the German *chevaulegers*, Hungarian hussars, and Galician uhlands). The latter were considered among the best in Europe and were employed mostly in scouting or screening missions, although the mass armies of the later wars increasingly required them to fight as formed battle units.

The artillery, based around the light and standardized system established in 1753 by Fürst Liechtenstein, was overhauled in 1808–1809. Previously, it had deployed its lighter guns as battalion support weapons (usually two 3-pounders per battalion, although a single 6-pounder would sometimes replace them in Germany), and the rest as a reserve, a mix of 6- and 12-pounder guns and 7-pounder howitzers plus the more mobile cavalry pieces: 6-pounder guns and 7-pounder howitzers, whose crews rode on the famous *Würst* seat on the trail. During the early wars and in the campaigns of 1813–1814, 18-pounder guns and 10-pounder howitzers were also deployed in the field. Rockets were added to the inventory in 1810 but only saw action at the siege of Hüningen in 1815. All enlisted men in the artillery were selected by strict standards, which included the ability to read and write. The artillery had regimental schools and also the unique Bombardier Korps school, where the best recruits were trained in advanced technical and military skills. The noncommissioned gun captains and many officers were drawn from their ranks, which formed the quickest route for an enlisted soldier to achieve senior rank.

Reform had been an ongoing process. The war with Turkey had led to the reform proposals by the Nostitz-Rieneck Commission of 1795 (known as the Unterberger commission after 1798). The Commission overhauled and standardized weaponry and equipment, notably in the adoption of the French 1777 musket and the new helmet for infantry and cavalry. Defeat in the War of the Second Coalition brought an incomplete period of change under Archduke Charles. Commissions were established to reform the infantry (under Karl Mack Freiherr von Leiberich) and cavalry (under Phillip Graf Grünne), although their proposals to abandon or simplify some drill would not be formally introduced until 1806–1807. The term of service was reduced in 1802 to prevent potential

conscripts from fleeing their homes: The infantry period was reduced to ten years, the cavalry to twelve, and the artillery to fourteen, although it was 1808 before the change was fully introduced, and in 1814 service in all arms was set at fourteen years.

The second reform period, 1806–1809, consolidated the plans of the first period. The greater density of troops on the battlefield and Austria’s loss of cavalry superiority led to the regulations formalizing the use of the Mass, a battalion in a closed-up column, which could be formed more quickly than a square. However, it was vulnerable to artillery fire, so the more popular formation was the division Mass. Formally a two-company variant of the battalion Mass, it was actually a return to the formations of the Turkish wars of a century earlier, when troops formed six deep (one company behind another) with the three masses placed *en echiquier* (chessboard style). Skirmisher training was also prescribed for the most intelligent men, who formed the third rank of the infantry line. In 1807 Charles issued a new *Dienstreglement* (service regulation), which humanized discipline but had to appeal to the common soldier’s sense of honor, as it was impossible to invoke nationalism within the multiethnic empire. To improve officer education, Charles began publication of the *Beiträge zum praktischen Unterricht im Felde* (Contributions to Practical Training in the Field) booklets and, for the generals, *Grundsätze der höheren Kriegskunst* (Principles of the Higher Art of Warfare).

For home defense, the eastern nobles were obliged to supply the manpower for Hungarian and Croatian *insurrectio* (untrained militia) battalions, which would prove largely ineffectual in combat in 1809. Stirrings of Germanic nationalism did prompt the war party and Archduke John to press for a similar institution in the western areas. In June 1808 the *Landwehr* (home defense militia) was established, intended to relieve regular troops from garrison and communications-protection duties. From these, *Freiwillige* battalions were raised in Vienna, Austria proper, Bohemia, and Moravia from men prepared to join the field armies. While they provided well-motivated and equipped battalions, their counterparts in the *Landwehr*, who wore grey smocks and large-brimmed hats over civilian clothing and were equipped with surplus weapons, performed badly when necessity required them to be drawn upon, notably at Wagram, where 15,000 were engaged. Charles had also planned reserve battalions in the conscription areas, made up of new recruits, who would receive basic training before being sent on furlough until war began—an idea copied by the Prussian *Krümpfer* system. Although nothing was done initially, after the 1809 war the infantry regiments used this system to train men, while standing strength remained at the level agreed at the Treaty of Schönbrunn. In 1813 the

troops were called in and formed a 4th and a few 5th battalions, designated as *Landwehr*, which by late 1813 enabled the Austrians to field the largest Allied contingent, numbering about 550,000 troops.

## Austrian Campaign

*See* Fifth Coalition, War of the

# B

## **Badajoz, First Siege of (26 January–11 March 1811)**

Situated on the southern bank of the river Guadiana, the fortified Spanish border town of Badajoz controlled the main southern route between Spain and Portugal. It was well fortified with the town on one side of the river and the powerful Fort San Cristobal—with eight rectangular bastions, each rising to about 30 feet above the ditch, and strong stone walls—on the other. The defenses were further strengthened by four outlying outworks, including the Picurina lunette and the Pardaleras fort facing the southern part of the city.

Badajoz was the object of two sieges in 1811: by the French under Marshal Nicolas Soult against the Spanish garrison between 26 January and 11 March, and by the British under General Sir William Beresford from 7 May to 12 May—interrupted by the need to drive off a relief force at Albuera—and resumed from 5 May until 19 June.

On 26 January 1811 Soult, with 6,000 men, arrived from Olivença and encircled the town, deploying his cavalry on the north side of the city and his infantry on the south. After French engineers determined that an attack from the south offered the best chance of success, with Pardaleras as the first object, Soult began digging trenches on the night of the twenty-eighth, with the first parallel begun on the night of the thirtieth. General Rafael Menacho, with a total of 5,000 troops at his disposal, launched a sortie on the following day, and although his troops took temporary possession of the French trenches, they failed to disrupt the enemy's operations, and on 2 February the first battery was in position. The Spanish made another sortie on 3 February, which entered the first parallel before being thrown back by the fortuitous arrival of French reinforcements under General Gazán.

Spanish fortunes improved on the fifth by the appearance of 5,000 men under Lieutenant General Gabriel Mendizabal, but Soult defeated them at Gebora before continuing with the siege. On 4 March Menacho sent forth yet

another sortie, which inflicted serious damage on the trenches and equipment but left Menacho dead, to be replaced by Brigadier General José Imaz. The Spanish made no further efforts at disrupting Soult's activity.

By 8 March the French had established a battery 60 yards from the fortress walls, and by the tenth the French had made a breach 70 yards wide. Soult, aware that a relief force was en route, became anxious to complete his work and demanded surrender. Aware that help was on the way in the form of an Anglo-Portuguese force under Beresford, Imaz called a council, the majority of whose members he found to be ill-disposed toward continued resistance. Notwithstanding his personal determination to carry on, Imaz capitulated on the afternoon of the tenth, his nearly 8,000 men marching out the following day. The Spanish had lost almost 2,000 killed and wounded, and another 1,000 sick were left behind in the city's hospitals. Soult had suffered 2,000 casualties, but he discovered rations sufficient to feed 8,000 men for more than a month, 150 pieces of artillery, 80,000 pounds of powder, 300,000 rounds of musket ammunition, and bridging equipment. A garrison of 5,000 troops under General Armand Phillipon was left to defend this vital stronghold.

## **Badajoz, Second Siege of (5 May–19 June 1811)**

In the wake of the French defeat at Barrosa on 5 March, Viscount Wellington sent Sir William Beresford to capture the fortress town of Badajoz, held by General Armand

Phillipon and 5,000 French troops, in order to secure the defense of the northern Portuguese frontier. In light of news of the Allied victory at Barrosa, Marshal Nicolas Soult withdrew to Seville, leaving Marshal Adolphe Mortier with 11,000 troops to occupy Extremadura. By 22 March Beresford, situated about 40 miles from Badajoz, moved against Mortier at Campo Mayor, which he took on the twenty-sixth, before proceeding against Badajoz. By 20 April he had encircled the town and was temporarily joined by Wellington, who had ridden south to supervise operations. After providing Beresford with instructions, Wellington then returned north to join his army.

Beresford, finding he possessed no heavy artillery, took possession of the ordnance from the fortress at nearby Elvas, though many of these pieces were hopelessly obsolete; their brass barrels easily overheated, rapidly rendering them useless for purposes of prolonged firing. Siege works were begun on 5 May, with trenches being opened on the eighth. However, the stony ground in front of San Cristobal refused to yield to picks and shovels, and on the tenth Phillipon sortied from the town in an unsuccessful attempt to disrupt Beresford's operations. When news arrived on the twelfth that Soult was approaching with a relief column, Beresford was forced to abandon the siege in order to drive off the French, which he did at Albuera, 14 miles to the south, on the sixteenth. Meanwhile, Phillipon, in Beresford's absence, had sallied out and destroyed the abandoned siege works.

Following Beresford's victory over Soult at Albuera, the British were able to resume the siege on the nineteenth. Moreover, as a result of the British victory at Fuentes de Oñoro (3–5 May) and the fall of the Portuguese border fortress of Almeida, Wellington was able to reinforce Beresford with two additional divisions, bringing total Allied forces up to 22,000 men, now under Wellington's personal command. Nevertheless, with his operations hampered by insufficient numbers of engineers and guns—and with much of the artillery proving of inadequate caliber—he made but little headway, a circumstance further complicated by the fact that the attack was not concentrated on the weakest point of the enemy's defenses.

Wellington's first object was to capture the fort of San Cristobal, which stood on the opposite side of the river. On 6 June, after the besiegers had made a breach in the walls of the fort, an assault was launched. It failed—at a cost of 92 killed and wounded out of 180 attackers—principally because the breach was too high up the wall for scaling ladders to be used. After further bombardment enlarged the breach, another attempt at escalade was made, with 200 men on 9 June. This assault also failed, leaving most of the officers leading the attack lying dead and wounded among the rubble of the glacis. In all, the British

suffered 140 casualties—about 70 percent of their attacking force.

On 10 June, learning that marshals Marmont and Soult were approaching, Wellington decided to abandon the siege. The guns and ammunition were withdrawn on the twelfth, with the blockade continuing another four days. Soult and Marmont entered Badajoz on the nineteenth. The siege of Badajoz—the first experience of its kind for Wellington—demonstrated his inadequate grasp of this essential element of warfare in the Peninsula. His next attempt to take the city, though successful, would prove even costlier.

### **Badajoz, Third Siege of (16 March–6 April 1812)**

With Ciudad Rodrigo in his hands, the Duke of Wellington moved south to lay siege once more to Badajoz, by far the strongest French-held fortress on the Portuguese border. Once again Wellington deceived the French by leaving a thin screen of cavalry behind while his main army marched south without being detected.

Badajoz, capital of Extremadura, was a much more formidable proposition than Ciudad Rodrigo and had been besieged twice before by the British, in May and June 1811. This time Wellington hoped to be more successful. Its fortifications formed an enclosure of nine bastions connected by walls ranging in height from 20 to 46 feet, and it had a castle that acted as a citadel. The town was also covered by several outworks, the fort of San Cristobal, a smaller fortification called the lunette Werle, and the Tête du Pont, a fortified bridgehead, all on the right bank of the Guadiana and linked to the town by a Roman bridge. On the left bank were the lunettes Picurina, Pardaleras, and San Roque, all strong outworks covering the southern approaches to the town. Inside the town the French garrison consisted of around 5,000 men of all ranks, including a detachment of the crack German Hesse-Darmstadt Regi-

ment. Commanding these troops was the governor of the town, Armand Phillipon, who was to prove a brave and resourceful adversary.

Wellington decided to attack Badajoz by breaching its walls on the southern side at the Santa Maria and Trinidad bastions, and on 16 March 1812, 3,000 British troops broke ground about 1,000 yards from Picurina. The weather was atrocious, with high winds and cold, heavy rain, and for the first week or so the weather was as bad as any of the men digging could remember. Each day saw the unmasking of a new battery, but the French themselves were not idle, constructing all manner of defensive works to make the forthcoming assault all the more dangerous. One of the most effective works constructed by the French was a dam built at the lunette San Roque. This dam across the Rivellas had created a false lake or inundation in front of the British trenches, which meant that their attack would have to be made across the front of the French guns. This would inhibit them in their approach and was to cause the stormers many problems. Attempts were made to blow it up, but none were successful. On the night of 25 March, 500 men of the 3rd and Light Divisions stormed Fort Picurina, and next morning work got underway constructing batteries inside it.

Throughout the rest of March and until 5 April the British guns blasted away attempting to breach the Santa Maria and Trinidad bastions. They were reported practicable at sunset on the fifth, but even as he inspected them through his telescope Wellington was informed that approaching French armies were just a few days away. He knew that to take the fortress by storm would cost him hundreds of casualties, but time was running out so he gave orders that Badajoz was to be stormed on 6 April.

Wellington timed the assault to begin shortly before 10:00 P.M. Thomas Picton's 3rd Division was to cross the Rivellas and take the castle by escalade (scaling); the 4th Division, under Major General Charles Colville, was to storm the breach in the Trinidad bastion; the Light Division was to storm the Santa Maria bastion, and finally, Lieutenant General James Leith's 5th Division was to take Fort Pardaleras and continue on to storm the San Vicente bastion by escalade. A detachment under James Wilson of the 48th Division, meanwhile, was to take the lunette San Roque. It will be noted that the attacks by the 3rd and 5th Divisions were intended to be just diversionary; the breaches were the main points of attack. Yet as we shall see, these two escalades were to prove the decisive factors in the storming of Badajoz.

First into action was the detachment under Wilson attacking the San Roque. After a brief fight the fort was taken with little resistance from the French. Shortly afterward the main attack began. The "Forlorn Hope" (an advance

storming party meant to draw the enemy's first fire ahead of the main assault) went first, followed by the storming parties who dashed forward to the edge of the ditch, placed their ladders in position, and descended. More British troops stormed forward, and soon the ditch was filled with men crowding together. Suddenly a bright flame shot up, exposing the British to the French who had been watching and waiting for the ditch to fill up before lighting the fuses that would explode the mines beneath it.

Some British troops who survived the first rush forward said afterward that it was like a volcano. The columns were blown to pieces by the mines and by the incredible fire of grapeshot and musketry that was poured into the ditch from the ramparts. Hundreds of men were swept away in an instant. By now both the 4th and Light Divisions were mixed together, both divisions desperately trying to fight their way through the breaches.

But in spite of the notably brave attempts by the British to mount the breaches, no impression could be made, and the French, gaining in confidence, came forward, jeering and inviting the British to "come into Badajoz." Not a single British soldier had entered the town even though over forty rushes had been made at the breaches. The situation was critical. The dead lay in ever-increasing heaps, many of them burning, while the wounded crawled and staggered around in the darkness seeking shelter. As the frustrated and despairing troops were driven back, the desperate British attacks began to fade, leaving behind nearly 2,000 of Wellington's best men smashed upon the defenses.

The attack on the castle by Picton's 3rd Division had been raging with equal ferocity. Picton, in fact, had been wounded early in the attack and command passed to Major General James Kempt. The British troops had first to cross the Rivellas, which was done by either wading through the water or by crossing the dam.

When the enraged British troops finally got to the castle walls, they quickly placed the ladders and mounted. At the top they were met by French defenders armed with bayonets, muskets, and pikes; the defenders simply pushed the ladders from the walls to send the British crashing down among the crowds of soldiers waiting below. However, just as the French began to sense victory, Colonel Henry Ridge, of the 5th Regiment, seized one of the ladders and placed it against the castle where the wall was lower and where an embrasure afforded the men some protection. Ridge called out to his men to follow him, and soon the ladder was crowded from top to bottom—so quickly, in fact, that before the French could push it away the weight had become too great and held the ladder firmly in place against the wall. Ridge pressed on with his sword guarding his head and with the bayonets of those behind

him thrust upward to protect him. In spite of the odds, he soon stood on the castle ramparts.

The British troops rushed up the ladders to support him, and at last the tide seemed to turn in their favor. More British troops came up to consolidate the position, and soon the castle was in British hands. Ridge, the first man to enter the town, was shot dead soon afterward as he led his men through the gloom of the castle, which Phillipon had hoped would provide a last place of refuge if the British attacks on the breaches were successful. Now that hope had gone, and with it went all hope of holding the town.

At the San Vicente bastion the 5th Division had also escalated the high walls, the men climbing the walls in the face of stiff opposition. Once inside, they made for the breaches with bugles sounding the advance, and when they were answered by those of the 3rd Division, all French resistance at the breaches collapsed.

It was now about 2:00 A.M. on 7 April, and Badajoz was finally in British hands. Phillipon managed to escape across the Guadiana to the fort of San Cristobal, where he and his staff surrendered a few hours later.

In all, the siege and capture of Badajoz cost Wellington some 5,000 men, of whom 3,000 had become casualties during the assault itself, including five generals: Picton, Kempt, Major General Barnard Ford Bowes, Brigadier General William Maundy Harvey, and Colville, who were wounded. The 4th and Light Divisions suffered 1,000 casualties, all of whom were struck down in a small area just 100 yards long in front of the breaches.

## Bagration, Peter Ivanovich, Prince (1765–1812)

Peter Bagration, a prominent Russian military commander, descended from the Bagration royal dynasty of Georgia. He was raised in the remote town of Kizlyar, in Daghestan, and received a basic education at garrison school. He joined the Russian Army in 1782 and participated in a number of campaigns in the northern Caucasus and in the Crimea in 1782–1791. He served under the famous field marshal Alexander Suvorov at Ochakov in 1788, in Poland in 1793–1794, and in Italy and Switzerland in 1799. Commanding the advance and rear guards of the Russian forces, he distinguished himself at the battles of Tidone, the Trebbia, and Novi in Italy, as well as during the crossing of the St. Gotthard Pass and the storming of the Devil's Bridge in the Alps in September 1799. In 1800–1804, he served as commandant of the imperial residence at Pavlovsk.

In 1805 Bagration commanded the rear guard of the Austro-Russian army and fought with determination at Lambach and Amstetten. At Schöngraben (Hollabrünn) on 16 November 1805, he commanded 7,000 men against 30,000 French under marshals Murat and Lannes. Losing two-thirds of his force, Bagration halted the French for over eighteen hours and let the main Allied forces escape to safety. At the Battle of Austerlitz on 2 December 1805, he commanded the right wing of the Allied army and successfully contained superior French forces. After the battle he covered the Russian army's retreat to Hungary. In 1807 Bagration commanded the Russian advance and rear guard and distinguished himself at the battles of Eylau, Heilsberg, and Friedland. During the Russo-Swedish War of 1808, he commanded the 21st Division and successfully occupied southwestern Finland. In the spring of 1809 he led the famous march across the frozen Gulf of Bothnia and precipitated the coup d'état in Stockholm.

The same year he was appointed commander in chief of the Army of Moldavia against the Turks. He immediately launched an offensive, capturing the fortresses of Macin, Constanta, and Girsov and reaching Cavarna and Bazardjik. On 16 September 1809 he defeated the Turks at Rassevat, and on 22 September he besieged Silistra, forcing the Grand Vizier, Yussuf, to halt his invasion of Serbia and

General Prince Bagration, a distinguished Russian officer, served in the wars against the Swedes and Turks, as well as the French. He died of wounds received at the Battle of Borodino in 1812. (George Dawe [1781–1929]/Hermitage, St. Petersburg, Russia)

Wallachia. Bagration fought to draw a superior Turkish army at Tataritsa on 22 October, repulsed the Turkish advance to Silistra, and succeeded in taking Ismail and Braila. In March 1810 he resigned after a disagreement with the tsar on overall strategy, and for over a year (March 1810–August 1811) he traveled in Europe and Russia arranging his private affairs.

In 1812 Bagration commanded the 2nd Western Army and successfully eluded Napoleon's enveloping maneuvers, achieving victories at Mir and Romanovo. He outmaneuvered Marshal Davout at Mogilev and joined General Barclay de Tolly at Smolensk. On 7 September he commanded troops on the Russian left flank at Borodino, and he fiercely defended the *flèches* (arrow-shaped earthworks or redoubts deliberately left open at the rear) against the main French attacks on that day. However, he was seriously wounded by a shell splinter in his left leg and died of complications on 24 September at Simy in Vladimir *gubernia* (province). He was buried in the local church, but in 1839 his remains were transferred to the Great Redoubt on the Borodino battlefield.

Bagration's character was remarkably complex. On the one hand, he was kind, courteous, taciturn, and restrained. He was idolized by the troops, who called him Bog-rati-on (God of the Army). On the other hand, he was a man of uncontrolled, ambitious, and violent temper who ex-

pressed his feelings in a passionate manner and frequently made unjust and malicious statements. In 1812 he played a controversial role by supporting a group of officers demanding the resignation of the minister of war, Barclay de Tolly, and an immediate offensive against Napoleon. This strategy would have been catastrophic to the Russian armies at the opening stages of the campaign. Bagration was a brilliant tactician and was an extremely effective commander at corps level. However, he lacked military education and often could not comprehend grand strategy.

He was married to Catherine Skavronskaya, but the marriage proved unhappy. Skavronskaya, known also as Princess Bagration, left her husband in 1801 and lived abroad for the rest of her life. Nicknamed "Naked Angel," she was involved with Klemens Graf Metternich and Tsar Alexander I and played an important role at the Congress of Vienna in 1815.

## **Bailén, Battle of and Capitulation at (19 July 1808)**

Bailén was the scene of a major French defeat at the start of the Peninsular War. Sent to occupy Cádiz in May 1808, a French army under General Pierre Dupont advanced as far as Córdoba, but it then heard of the approach of a much larger force of Spanish regulars under General Francisco de Castaños and fell back to Andújar. Unwilling

General Dupont surrenders his army to the Spanish at Bailén, an event that broke the myth of Napoleonic invincibility. (Print after Maurice Orange from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 3)

to mount a frontal attack on Dupont, the Spanish commander then resolved on a risky attempt at encirclement, sending the divisions of General Teodoro Reding and the Marqués de Coupigny eastward along the southern bank of the river Guadalquivir in order to get behind the French at Bailén. There followed a comedy of errors: The Spanish encircling force cut the road to Madrid, only to retreat back across the river, while the division sent to clear the road by Dupont—that of General Dominique Vedel—wrongly assumed they had moved northeast to occupy the passes of the Sierra Morena and set off in hot pursuit, leaving Reding and Coupigny free to reoccupy Bailén. Uncertain as to what was happening in his rear, on the evening of 18 July Dupont decided to evacuate Andújar and join Vedel. Marching through the night, he reached a range of low hills that ran to the west of Bailén near dawn the next day, only to be suddenly fired upon by Spanish pickets. With the way blocked, Dupont could only deploy for battle. Possessed as he was of some 10,000 men, he should easily have been able to break through: The Spanish had themselves been taken by surprise and were deployed in an improvised line that was everywhere over-

looked by the French positions. But in the event he panicked. Brought up piecemeal, his troops, who were in any case mostly of limited quality, were easily repulsed, and by late afternoon the French were in disarray. Dupont himself was wounded, some 2,000 other men were down, and the survivors were exhausted, demoralized, and tortured by heat and thirst. To the west, meanwhile, Castaños's other two divisions had advanced from Andújar and were now closing in for the kill. In consequence, not even the coming of Vedel could save the day; when that general at last came up, having taken twelve hours to cover the 20 miles that separated him from Dupont, his superior had already requested an armistice.

In the negotiations that followed, it was finally agreed that Vedel's column should lay down its arms along with that of Dupont, but that in exchange the 17,000 men involved in the capitulation should all be repatriated to France. (These terms were not honored: Apart from Dupont and a few other officers, the prisoners were eventually sent to the island of Cabrera, where most of them died of starvation.) All this, of course, was a major humiliation for Napoleon, opponents of his rule being every-

where much encouraged. But for the Allies it was a double-edged sword: Much overconfidence was engendered in the Spanish camp, while the exaggerated expectations encouraged in London later created great problems for the Anglo-Spanish alliance.

### Balcombe, Betsy (1802–1871)

Of all the women in Napoleon's life, Betsy Balcombe was surely one of the most interesting. When Napoleon arrived on St. Helena in 1815 to begin his exile, his eventual living quarters, a house known as Longwood, were not ready. Napoleon was lodged in a house in Jamestown, but he immediately grew to dislike being in a crowded town. On the way back from a visit to inspect Longwood on his first full day on the island, he stopped to visit William Balcombe and his family, which included Balcombe's daughter Betsy.

The two men got along well, and Balcombe offered his own home, known as the Briars, to Napoleon. The former Emperor graciously declined the offer but did agree to stay in a summer home on the grounds. It was nicely situated with trees, a fishpond, and walking paths. The British quickly provided additional structures to serve as an eating hall and study, and Napoleon settled in. He spent his days working on his memoirs and getting exercise, and evenings were often spent socializing with the Balcombe family.

Betsy Balcombe was fourteen years old and something of a tomboy. She and Napoleon developed an excellent relationship, with Napoleon serving as something of an uncle to the girl. They would tease each other constantly, and Betsy would ask questions that others might not have dared to ask. Napoleon gave her virtually free access to him, even allowing her to interrupt meetings (much to the annoyance of some of his staff). The two would play games, talk about his career, and generally just enjoy each other's company.

As nice as his stay at the Briars was, it soon came to an end when the British forced Napoleon to move to Longwood on 10 December 1815. Though their parting was sorrowful, Napoleon and Betsy continued their relationship, with Napoleon even escorting her to a ball. During

her visits to Longwood Betsy could observe first hand the petty politics and restrictions enforced by Sir Hudson Lowe. Lowe, the governor of the island, in turn became suspicious of the Balcombes, whom he forced to leave the island in 1818.

In time, Betsy married and became Lucia Elizabeth Abell. She wrote her memoirs of her time with Napoleon, and these memoirs give us one of the most poignant images of Napoleon available. They are certainly among the most important to emerge from Napoleon's exile on St. Helena.

Betsy eventually met Napoleon's brother Joseph and came to the attention of Napoleon III, who gave her land in Algiers. She died in London at the age of sixty-nine. Her memoirs, long out of print, have recently been republished.

### Balloons, Observation

A French technological development used by both the military and civilians. The smaller, hydrogen-filled balloons were used fairly unsuccessfully by French army spotters during the 1790s, while civilians mainly used the larger, hot-air version.

The first balloons were flown in 1783: a hot-air balloon by the brothers Joseph-Michel and Jacques-Etienne Montgolfier and a hydrogen-filled balloon by Jacques Charles. The hydrogen-filled version was developed for military use by General Jean Baptiste Meusnier and then by the chemist Guyton de Morveau, whose first message-carrying balloon was launched during the siege of Condé in 1793. Jean Coutelle and Nicolas Conté developed a way to manufacture hydrogen, separating it from water in a brick oven.

A balloon base was established at Meudon, where experiments continued into 1794 and the *Première Compagnie d'Aerostiers Militaire* (First Military Balloon Company) was created with twenty-seven former artisans. Four balloons were built, each with a 10-meter silk envelope, sealed with varnish, and carrying underneath, in a small wooden gondola, two men who used lights and flags to

relay information or dropped messages. The *Empreuveur* balloon flew in March to an altitude of 450 meters, from where observers could see terrain detail as far away as 10 kilometers and troops as far away as 22 kilometers. However, the round balloons could not be steered and so had to be tethered. Filling the envelope would take up to fifty hours, so balloons had to be transported fully inflated.

The first military observations were made aboard the *Entreprenant* at Mauberge in June 1794, providing information about Austrian deployments from an altitude of 350 meters, and flew during the French victory at Fleurus on 26 June. At Meudon, a second balloon company was formed. Cylindrical balloons with 5-meter-tall envelopes, which were less prone to spin, were developed, and twenty would join the French armies during the War of the First Coalition. A balloon was sent on the Egyptian expedition in 1798, but it was lost at the Battle of the Nile. Asked to report on the balloon service, the French general Jean-Baptiste Jourdan opposed their further use because they were difficult to move and could not be effective in battle, observations being especially poor in turbulent air. The Directory disbanded the companies and closed Meudon in 1799.

One more observation balloon was constructed during Governor Lazare Carnot's defense of Antwerp in 1814, but proposals for free-flying balloons, included in the painting, *The Project for the Invasion of England*, never came to fruition. The first cross-Channel flight was flown in a hydrogen balloon in 1785 by Jean-Pierre Blanchard and John Jefferies. Jordaki Kurapento made the first emergency parachute jump from a balloon in 1807. One balloon with its 1.05-meter-tall gondola (probably the *Entreprenant*), which was captured by the Austrians at Würzburg in 1796, survives in the Vienna Army Museum.

## Bank Crises (1811)

Twenty years of war and the Anglo-French trade war led to financial crises in the United Kingdom, France, and Aus-

tria. Britain was forced to adopt paper money as currency; Austria declared bankruptcy; France's Treasury increasingly relied on short-term loans; and the Continental System collapsed.

The United Kingdom's trade had declined severely since 1806: Exports fell from £61 million in 1810 to £39.5 million in 1811. Gold was flooding out to pay for the Peninsular War, reaching £10 million by 1810, and as the national debt approached £800 million, confidence ebbed. British 3 Percent Consolidated Debt bonds (government bonds), which paid a fixed annual £3 in interest in perpetuity until withdrawn, so the actual value changed to reflect the returns expected by buyers, fell from a steady £68 to £64.2 in 1811, and the income tax rate rose to 19 percent. Despite a credit system and a huge trade-based capacity to borrow, the United Kingdom could not obtain enough gold specie and resorted to making paper banknotes into convertible currency on 10 May 1811, further stoking inflation. As finished goods remained in warehouses, unemployment rose, and September 1810 saw a wave of company bankruptcies. The consequent economic depression, which lasted until 1812, led to the Luddite movement in 1811.

Napoleon's Continental System had broken French commerce by 1811. The franc rose in value, but exports fell from 456 million francs in 1806 to around 350 million in the 1809–1811 period, as raw materials could not be imported and the wars damaged internal and European demand. Widespread bankruptcies brought a costly expansion of the public works program to 154 million francs in 1811, while inflation in foodstuffs raged at 30 percent. Despite a tax on tobacco in 1811, the government deficit rose from 155 million francs in 1810 to 200 million in 1811. In May 1811, the French 5 Percent Rentes (the French equivalent of British Consolidated Debt bonds) were attacked by speculators, forcing them below Napoleon's designated floor of 80. Only expensive market intervention by the financial chief, Nicolas François, comte Mollien, and a new floor of 78 prevented a collapse. Lacking both a sophisticated credit system and the trade to finance it, the Napoleonic government was forced to raise short-term loans from the Bank of France. In 1811 Napoleon told Mollien: "If I am declaring a new war, it is for some great political interest, but also in the interest of my finances, and precisely because they look weak" (Mollien 1898, 3:69). Anglo-French tensions were eased in November 1811 by greatly increased licensed trade, which effectively broke the Continental System, but the 1810–1812 depression damaged Napoleon's support among the middle classes. By 1811 Austria's paper currency was almost worthless, with over 1 billion gulden in circulation and rampant inflation. On 15 March finance minister Joseph

Freiherr Wallis produced the *Finanzpatent* (Finance Order), which withdrew all the *Bankozettel* (paper money issued to help finance the army when the government ran out of coinage) and small coinage, replacing them with *Einlösungsscheine* (redemption bonds) at a rate of one new for five old at the same face value. It was a drastically deflationary measure, but it halved the interest on state loans to 2.5 percent.

### Barclay de Tolly, Mikhail Andreas (1761–1818)

Also known by his Russian name, Mikhail Bogdanovich Barclay de Tolly, governor-general of Finland, Russia's minister of war, field marshal, and prince, led Russian armies against Napoleon, gaining great distinction. He was born of a Scottish immigrant family in Livonia, a historic region of Latvia and Estonia on the eastern coast of the Baltic Sea contested by Poland, Sweden, Denmark, and Russia. Educated in Russian military schools, Barclay rose through the ranks of the Russian Army, fighting against the Turks in 1788–1789 and against the Swedes and Poles in 1790 and 1794, respectively. His distinguished service earned him the ranks of colonel in 1798 and then major general in 1799. During the Napoleonic Wars, Barclay led Russian forces at the Battle of Pultusk in December 1806 and at the Battle of Eylau in February 1807, fighting under General Levin Bennigsen, for which he was promoted to lieutenant general. He campaigned against the Swedes in Finland in 1808 and captured the town of Umea in northern Sweden after marching across the Gulf of Bothnia in 1809.

As a reward for his services he was appointed by Tsar Alexander I to serve as governor-general of Finland from June 1809 to February 1810, and he headed the Senate of the government in the autonomous Grand Duchy of Finland. He represented the tsar in Finland and received his instructions from him, allowing Finland to be controlled by Russian interests. Barclay replaced Georg Magnus Sprengtporten, who had served as governor-general from 1 December 1808 to 17 June 1809, for the tsar believed Barclay de Tolly could successfully defend Finland against other European rivals. His successful political administration in Finland led the tsar to appoint him Russia's

General Mikhail Barclay de Tolly. The large-scale military reforms he introduced in the Russian Army prior to the French invasion of 1812 did much to improve the effectiveness of Tsar Alexander's forces. (George Dawe [1781–1929]/Hermitage, St. Petersburg, Russia)

minister of war in 1810. He was succeeded in Finland as governor-general by Fabian Steinheil, who governed from 1810 to 1824.

Serving as Russia's minister of war, Barclay de Tolly oversaw the defense of Russia against Napoleon's invasion in June 1812, and he continued in this post until the following year. As Napoleon invaded Russia, Barclay de Tolly took to the field once again in command of one of the Russian armies, fighting at Ostrovno and Smolensk. Barclay accepted a military position supporting Field Marshal Mikhail Kutuzov, who commanded the army retreating before Napoleon's advance. He acted under great stress, since the majority of the senior officers opposed his strategy and the public called for his removal. Barclay distinguished himself at the Battle of Borodino on 7 September and aided in the Russian strategic withdrawal to save the remaining forces. However, he was later forced to leave the army in October 1812. Following the Russian withdrawal from the bloodbath at Borodino, Napoleon was allowed to enter Moscow on 14 September, but Kutuzov's forces later

defeated the French at Maloyaroslavets, and the long retreat from Moscow during the winter of 1812 all but destroyed the Grande Armée.

Barclay de Tolly returned to the army and fought in the 1813 campaign in Germany, receiving the post of commander in chief of the Russian forces following the Battle of Bautzen on 21 May. Bautzen had resulted in a French victory over combined Russian and Prussian forces, and the tsar sought a new military leader in Barclay following Kutuzov's death on 28 March. It was a great honor for him to have been chosen, since, owing to his Scottish ancestry, he was viewed as a foreigner. He commanded Russian forces at the battles of Dresden (26–27 August), Kulm (29–30 August), and at Leipzig (16–19 October), where the Allies defeated Napoleon and forced him to retreat back to France. He became a count in the wake of the Battle of Leipzig and pursued Napoleon's army to Paris during the campaign of 1814.

Barclay de Tolly was promoted to the rank of field marshal, and his achievements were publicly acclaimed in Russia. He returned to Russia following the signature of the Treaty of Paris in 1814, but he was called to service once again as commander in chief of Russian forces in 1815 following Napoleon's escape from Elba. The Russian army was not engaged before Waterloo brought the campaign to an end in June of that year. Following the peace, the tsar bestowed the title of prince on Barclay de Tolly, who then retired to Insternburg.

**Barras, Paul Jean François Nicolas,  
vicomte de (1755–1829)**

A Provençal nobleman, Paul Barras rose to become a prominent Revolutionary and one of the most powerful

members of the Directory, contributing to the rise of Napoleon Bonaparte's military career.

Barras was born on 30 June 1755 at Fox Amphoux in Var; his family had an ancient pedigree, tracing its history to the thirteenth century. In 1771 young Barras joined the regiment of Languedoc, and rising to the rank of captain, he transferred to Pondicherry in 1776. After four years in India, Barras participated in colonial expeditions in North America from 1781 to 1784. Returning to Paris, he was unable to find a lucrative position and became disillusioned with the government. Despite his nobility he became a committed republican and joined the Jacobin Club. In July 1789 he took part in the events leading to the fall of the Bastille. Over the next three years, Barras honed his skills in the politics of the new order, was elected deputy from Var to the National Convention in September 1792, and voted for the king's death at the trial of Louis XVI. In 1793–1794 he served as a representative on mission to various regions and with the Army of Italy and distinguished himself at Toulon, where he met young artillery captain Napoleon Bonaparte. Barras ensured that Bonaparte received recognition for his contribution to the fall of Toulon, and he was promoted to the rank of *général de brigade* on 24 December. Barras used high-handed methods to punish the rebels in Toulon and approved summary executions of hundreds of officials and ordinary citizens.

Returning to Paris, Barras opposed the excesses committed by the Revolutionary government of Maximilien Robespierre and played one of the leading roles in the Thermidorian coup d'état of 27 July 1794. After Robespierre and his colleagues in the Committee of Public Safety were executed, Barras served on the Committee of General Security and was elected president of the National Convention in February 1795. In October 1795 he was appointed commander of the Army of the Interior and, together with Bonaparte, he defended the new regime against an attempted royalist insurrection on 13 Vendémiaire (5 October 1795). He helped disband the Convention, helped draft the new constitution, and manipulated the election process in his favor. In November 1795 he became one of the original members of the Directory and served as its president three times (1 November 1796–30 January 1797; 27 November 1797–25 February 1798; 25 February 1799–26 May 1799). Barras emerged as one of the most powerful members of the Directory and became notorious for excessive corruption and luxurious living. He engineered the coup of 18 Fructidor (4 September 1797) that removed his opponents from the Directory and made him the most important figure in the republican government. To secure his positions, he was also elected to the Council of Five Hundred (April 1798) and the Council of Ancients (April 1799).

Throughout his career Barras had many mistresses and female confidants. One of them was the charming and warmhearted Josephine de Beauharnais, who often acted as his hostess and had been his mistress and financial adviser. Their physical relationship soon ended, but they remained solid friends. He helped Josephine marry Bonaparte in March 1796, an event that led to rumors that Bonaparte had received command of the Army of Italy as a wedding present from Barras.

Barras was a second-rate statesman, failing to address the economic and social problems of the fledging Republic. He promoted an aggressive foreign policy that supported establishing sister republics on the French borders and alienated the European monarchies. By 1799 the Directory had become ineffective and corrupt, and its foreign policy resulted in the creation of the Second Coalition. After France survived imminent defeat at the hands of advancing Allied forces, Barras's colleague in the Directory, Abbé Emmanuel Sieyès, conspired with Napoleon to stage the coup of 18–19 Brumaire (9–10 November 1799). Barras was forced to resign and was placed under house arrest at his estate; his political career was in ruins and would never be resurrected. In 1801 Barras was exposed as having been involved in several conspiracies and was exiled to Brussels until 1805. Although he lived in luxurious comfort from the funds he had amassed during the period of the Directory, he resented his forced retirement. Because of his negative reputation, he never again gained favor at court. However, Louis XVIII granted Barras permission to live at his estate at Chaillot. He died there on 29 January 1829 and was buried at the Père Lachaise Cemetery in Paris. His four-volume *Mémoires* were published in 1895–1896.

Barras had a very complex personality. Before he became too deeply involved, he ensured that he would personally profit from the Revolution. He was corrupt, unscrupulous, self-indulgent, and ambitious. He often pursued an excessively ostentatious lifestyle with extravagant entertainment. All the while, he combined brazen and dissolute behavior with an appealing personal charm, which helped him gain his influential positions.

### Barrosa, Battle of (5 March 1811)

In an attempt to relieve the French siege of Cádiz, 14,000 Anglo-Spanish troops met and defeated 7,000 French 20 miles southeast of Cádiz at the Battle of Barrosa (Barosa). The battle took its name from La Torre Barrosa, a watchtower on the seacoast south of the battlefield, and is also known as the Battle of Chiclana by the Spanish. Although it was an Allied victory, it did little to relieve the beleaguered forces in Cádiz.

The French siege of Cádiz had continued since February 1810, but in December of that year, it appeared to the besieged Allies that the French lines were weakening when Marshal Nicolas Soult withdrew one-third of his men from the siege in order to reinforce his attack on Badajoz. In late January 1811 adverse weather frustrated the first Anglo-Spanish plan for a seaborne sortie from Cádiz combined with a Spanish attack on the French rear from Algeciras. Subsequently, the British commander at Cádiz, Lieutenant General Thomas Graham, planned to sail from Cádiz to land a relief force behind the French lines at Tarifa. However, severe weather forced Graham to sail past Tarifa, and on 22 February the British disembarked at the Spanish town of Algeciras, across the bay from Gibraltar.

Graham, strengthened by troops from the garrison at Gibraltar, then marched to Tarifa, where he was joined on the twenty-sixth by 8,000 men under the Spanish general Manuel Lapeña, who had also sailed from Cádiz. The force also included four squadrons of Spanish cavalry under the British colonel Samuel Whittingham and 1,600 Spanish irregulars. The majority of the troops were Spanish, and Lapeña superseded Graham in command. The force of 14,000 men spent the next week marching northwest and arrived at Marshal Claude Victor's rear on the morning of 5 March after a fifteen-hour march. Spanish troops led the approaching column and Graham's force followed in the rear. Aware of their approach, Victor had sent one division under General Eugène Villatte to block the road coming from Cádiz at the Río de San Petri to prevent the Spanish

from breaking through. His two remaining divisions marched from the village of Chiclana, north of the Allied position, to attack the Anglo-Spanish right flank.

The field was dominated by a single piece of key terrain, the Cerro de Puerco, also called Barossa Hill, which rose 160 feet above the pine-forested plain below and was only 3 miles from the Spanish lines outside Cádiz. As day broke, Lapeña found the hill unoccupied and ascended it. Discovering that Villatte's division blocked the road from Cádiz, Lapeña ordered an attack down the hill onto Villatte's rear. The Spanish troops in front of Villatte simultaneously attacked out of Cádiz, forcing the French to withdraw to the north and opening communication with the garrison at Cádiz. Meanwhile, Graham occupied Cerro de Puerco, but Lapeña ordered him to join the victorious Spanish troops in the plain. Unaware of the French approaching from the north, Graham left only five Spanish battalions and one British battalion on the hill and marched to join Lapeña.

Victor then ordered his two divisions in the north to seize the mostly abandoned hill. Learning of the approach of 7,000 Frenchmen, the panicked Spanish fled toward Cádiz. Graham only discovered the French attack as General François Ruffin's division took the hill behind him. Rather than joining the Spanish retreat to Cádiz, Graham ordered an attack to retake the Cerro de Puerco. Before Graham could begin his assault, the French managed to position eight guns in action on the crest of the hill. As the British advanced up the hill, they were exposed to a murderous fire; however, attacking in echelon, Graham managed to turn the French left flank and took the Cerro de Puerco. During the battle, Ruffin was mortally wounded and captured.

While a portion of his force took the hill, the remainder of Graham's men attacked the second French division, under General Anne Gilbert Leval, which was still approaching from the north. Reacting to inaccurate intelligence of approaching British cavalry, Leval's division had formed squares and was caught unprepared for the British artillery that emerged first from the woods. The British guns caused great damage, but the French nevertheless recovered and had some initial success, having 2,700 men to about 700 British. As more of Graham's men advanced out of the woods and organized, they pushed Leval back, defeating his division and causing them to retreat with Ruffin's division. The British were too exhausted from marching and fighting to pursue for very far, allowing Victor to gather his two divisions together and withdraw back to Chiclana. The British action took a total of about ninety minutes and took place without the help of Lapeña, who remained firmly on the plain between the Cerro de Puerco and Cádiz.

Of 7,000 engaged, the French lost 2,062 killed, wounded, and captured. They also lost six cannon and one eagle, taken from the 87th Line. The British lost 1,238 out of 5,200 in the action. Furious at the Spanish conduct, Graham retired on Cádiz and left Lapeña on the plain to make his own way over the Río de San Petri and back to Cádiz. Lapeña was excused by a Spanish court-martial and was decorated by the Regency Council, although he was forced to turn over his command. The council also offered a dukedom to Graham, who refused it and left to join Viscount Wellington in Portugal. The victory was incomplete since Victor's army remained intact while the Allies moved back inside the siege lines. Had Lapeña acted to assist Graham, the Allies might have been able to retake Andalusia. Instead, Soult returned from Badajoz and the siege of Cádiz continued until August 1812.

### Bar-sur-Aube, Battle of (27 February 1814)

The Army of Bohemia, mostly Austrians under the command of Karl Fürst zu Schwarzenberg, defeated the forces of Marshal Nicolas Oudinot at Bar-sur-Aube during the Allied invasion of France in 1814. Napoleon himself, having defeated the Allies at Montereau on 17 February, forcing them to retreat toward Troyes beyond the river Aube, had turned north to the valley of the Marne to try to impede the renewed drive toward Paris by the Army of Silesia (mostly Prussians) under Field Marshal Gebhard von Blücher; the marshals he left behind were ordered to make it appear as though he was still with them. Schwarzenberg tested that assumption by advancing upon Bar-sur-Aube (in part because Alexander I and Frederick William III of Prussia wanted him to do so), and on the twenty-sixth Napoleon ordered Oudinot to follow Schwarzenberg to the town, near Troyes.

When it was learned that Napoleon was preparing to attack the Army of Silesia, Schwarzenberg took the opportunity to strike first at Oudinot with a Russian corps under General Peter Graf zu Wittgenstein and a Bavarian corps under General Karl Freiherr von Wrede. Although

Oudinot enjoyed a measure of numerical superiority at the outset, many of his troops were cut off from the main theater of the battle by their deployment astride the Aube and were therefore unable to participate, much of the French artillery being stuck on the wrong side of the river. Not only was Oudinot forced to retreat over the Aube, but he continued retreating for the next few days, pursued by the Allies and leaving Schwarzenberg in an advantageous position, able to concentrate his forces at Troyes as well as to take possession of the river crossings of the Seine.

### Basle, Treaties of (5 April, 22 July 1795)

The Treaties of Basle (Basel), concluded between France and Prussia (5 April 1795) and between France and Spain (22 July 1795), were crucial diplomatic gains against the First Coalition fighting France during the Revolutionary Wars.

The First Coalition against France was established when Britain, Holland, Piedmont, and Spain joined Austria and Prussia in response to the execution of Louis XVI on 20 January 1793, a Revolutionary decree giving all peoples their liberty, the September Massacres of 1792, and France's contravention of the international Treaty of Westphalia (1648) by opening the Scheldt estuary. France declared war on Prussia and Austria on 20 August 1792, on Holland and Britain on 1 February 1793, and on Spain on 7 March 1793.

The French Revolutionary forces suffered defeats in their initial battles, but their perseverance turned the tide of war by 1794. The levée en masse of August 1793 mobilized France's massive human resources, and the new recruits brought eagerness, fresh tactics, and unabated patriotism that decided the outcome of many battles in 1793–1794.

The first victim of this extraordinary political upheaval was Prussia. After gradually rising to great heights after 1417, Prussia had geographically expanded tenfold by 1795. Despite its eminence following the Seven Years' War,

Prussia had stagnated because of its military absolutism, a government-controlled economy, a highly bureaucratized administration, and economic control of rural areas by the privileged and powerful nobility. Its army was considered the best in Europe, but it suffered several defeats against Revolutionary France. By late 1794 the Prussian king, Frederick William III, realized he could no longer support the war, and he began secret negotiations with the French. The Prussians withdrew from the conflict by signing the Treaty of Basle in Switzerland on 5 April 1795. The treaty included both public and secret articles. The French were obliged to withdraw their troops from Prussian territory on the east side of the Rhine. Although the treaty denied France territory in Belgium, Prussia kept Obergelden and Cleves, and then granted peace to Mainz, Saxony, the Bavarian Palatinate, and the Hessian states. Northern Germany became neutral under Prussia's protection. Britain, which had subsidized Prussia, was obliged to release its Hessian forces or face an attack on Hanover, its possession.

According to the secret articles of the treaty, France would retain the territory it had already conquered. A secret agreement allowed France the west bank of the Rhine in exchange for financial compensation to Prussia for the lost land. These funds would be raised by the secularization of the land belonging to the ecclesiastical German princes, who were not notified of this development. The demarcation line differentiated between those German states at war with France and those that agreed to the treaty, a distinction that would remain in effect until a peace was made with Austria. The other members of the First Coalition were surprised by Prussia's betrayal and thereafter scorned Prussia, whom they considered cowardly. However, the ulterior motive behind Frederick William's signing of the treaty was a desire to concentrate on expanding Prussia's territory through the Second Partition of Poland in 1795.

Another blow to the First Coalition occurred when Spain signed the second Treaty of Basle with France on 22 July 1795. At that time Spain was a very weak imperial power, stretched beyond its capabilities. Spain was ruled by the ineffective King Charles IV, who in 1792 had placed his government in the hands of his corrupt and unpopular chief minister, Manuel de Godoy.

In 1793, as France descended into a period of radicalism that threatened Europe's monarchies, Portugal, Spain, and Britain signed treaties of mutual assistance. Portugal contributed 6,000 troops to Spain's attack on France. However, the French, with reformed and modernized armies, counterattacked in 1794 and took San Sebastian, Bilbao, and Figueras, forcing the Allies to withdraw. French troops then laid siege to Pamplona in the summer of 1795. Consequently, Spain signed the Treaty of Basle

and thereafter allied itself with France. These negotiations were accomplished without any consultation with Portugal or the other members of the coalition; all felt completely betrayed.

The Treaties of Basle stipulated that Spain would cede Santo Domingo (the eastern half of the island of Hispaniola) to France. France, however, was in no position either to send troops or to colonize the territory. Spanish troops had to relinquish control of the ports, towns, and other areas they occupied. One of the chief advantages for France was the acquisition of an ally, for in 1796 Spain signed the Treaty of San Ildefonso, allying itself with its erstwhile enemy against Britain, its former ally.

Ultimately the Treaties of Basle were a diplomatic triumph for Revolutionary France, for in time they allowed it to defeat the weakened coalition and gain Holland, Nice, Savoy, Belgium, and the German territories west of the Rhine.

## Basque Roads, Attack on (11–14 April 1809)

The attack by the Royal Navy on vessels at Basque Roads on the west coast of France in 1809 was a successful attempt to counter French moves against British interests in the West Indies and to prevent the French from reinforcing their colony of Martinique.

In 1808 the French learned of an intended British expedition to the West Indies. To oppose this, Rear Admiral Jean-Baptiste Willaumez was ordered to sail from Brest at the first sign that the British blockade had been relaxed. He

was to relieve the blockade at Lorient, release the fleet of eight ships under Commodore Aimable Gilles Troudes, and sail to Basque Roads, where he was to combine his forces with a further three ships of the line, several frigates, and the troopship *Calcutta*. The fleet was to sail to the West Indies with the purpose of disrupting British trade and supporting the garrison of Martinique.

On 21 February 1809 the blockading ships of Admiral James Gambier were forced by storms to withdraw from their position off Ushant. This gave Willaumez the opportunity to slip out of port and sail south. The maneuver was observed by the *Revenge*, which followed the French south toward Lorient, where Commodore Sir John Beresford lay off the port with three ships. On 23 February, Beresford pursued the French, who discovered they were being driven toward another British force under Rear Admiral Sir Robert Stopford. Faced with this superior force, Willaumez took his fleet into Basque Roads.

Meanwhile, three French 40-gun frigates had left Lorient under Commodore Pierre Roch Jurien and sailed to join Willaumez, anchoring under the shore batteries. Stopford's four ships of the line engaged the enemy frigates and shore batteries, setting two frigates on fire and driving the other aground. All three French ships were wrecked. Meanwhile, Willaumez's force had lost one ship, driven onto a shoal in Basque Roads, but had joined the squadron there of three 74-gun ships of the line and two 40-gun frigates. A heavy boom was placed across the passage into the anchorage. Willaumez was bottled up, but the Admiralty was concerned that the French might yet slip out and reach the West Indies, and so the decision was made to destroy the enemy fleet.

On 19 March, Gambier was told that twelve transports and five bomb vessels (special ships carrying mortars for shore bombardment) were being prepared for what was to be an extremely hazardous operation. Captain Lord Cochrane of the *Impérieuse* was appointed to lead the attack. He had the reputation of being a daring and energetic officer and could conveniently be blamed if the attack proved a disaster. On the French side, however, Willaumez had been removed from command for failing to do battle with Beresford's inferior force off Lorient.

Under Cochrane's supervision, eight of the British transports plus the old frigate *Mediator* were being fitted out as fire ships, with barrels of tar and other combustible materials arranged on their decks, while two further transports and a captured French coaster were converted into explosion vessels, being packed with gunpowder, shells, and grenades. Meanwhile, twelve further fire ships had arrived on 10 April together with the bomb vessel *Aetna*. A number of smaller craft were also fitted out to fire Congreve rockets.

The British force, under Gambier, consisted of the 120-gun *Caledonia*, two 80-gun ships, eight 74-gun ships, one 44-gun heavy frigate, four other frigates, three sloops, seven gun brigs, three smaller craft, twelve fire ships, and the bomb vessel *Aetna*. The French force, under Rear Admiral Zacharie Jacques Allemand, was composed of an inner line made up of the ships *Elbe* (40 guns), *Tourville* (74), *Aquilon* (74), *Jemmappes* (74), *Patriote* (74), and *Tonnère* (74); a center line, of the ships *Calcutta* (troopship), *Cassard* (74), *Regulus* (74), *Océan* (120), *Ville de Varsovie* (80), and *Foudroyant* (80); and an outer line, of the ships *Pallas* (40), *Hortense* (40), and *Indienne* (40). He also had the support of shore batteries manned by 2,000 troops. Allemand anchored his ships in three lines north to south with a 2-mile boom of anchor cables protecting the approach to Basque Roads.

At 8:30 P.M. on the night of 11 April, some British fire ships sailed for the enemy. At 9:30 P.M., Cochrane ordered the fuses lit, and these ships exploded, destroying the boom. Other fire ships were now able to sail through the debris, but now the plan began to go wrong. Several of the fire ships were ignited too soon, many either running aground before reaching the anchorage or sailing harmlessly up the center of the channel. However, the few such ships that reached the French caused much confusion, combined with shells from the *Aetna*, the Congreve rockets, and broadsides from other British vessels. Some of the French ships broke free of the line to escape the fire ships. The *Regulus* got clear of one, only to collide with the *Tourville*. *Hortense* escaped one fire ship and fired upon another, only to hit other French warships. *Océan* ran aground and was then hit by a fire ship that her crew, however, managed to fend off, but she was then rammed by the *Tonnere* and the *Patriote*.

Dawn revealed a scene of devastation within the French fleet. Cochrane asked Gambier for reinforcements to complete the destruction of the enemy, but the latter only ordered the bomb vessels to shell the French, much to Cochrane's frustration. Only the *Foudroyant* and *Cassard* were still afloat—the other vessels were all aground—but even these two ships eventually ran aground. Four of the French ships were eventually refloated, only to run aground again at the entrance to the anchorage. Cochrane took the *Impérieuse* inshore and by 2:00 P.M. on 12 April was engaged with the *Calcutta*, the *Aquilon*, and the *Ville de Varsovie*. This prompted Gambier to send support, forcing the three French vessels to strike. Two other ships, the *Tonnère* and the *Calcutta*, both caught fire and exploded. Cochrane moved closer with the gun brigs, despite repeated orders from Gambier to retire. On 14 April, after a final attack by the *Aetna* and gun brigs, four of the French ships managed to escape

upriver, while two others grounded attempting the same maneuver.

The French government treated this disaster harshly. The French commanders were tried by court-martial; two were imprisoned, and Captain Jean Baptiste Lafon of the *Calcutta* was condemned and shot. On the British side, there was much criticism of Gambier for not having supported Cochrane more vigorously. However, the French plan to attack the West Indies had been thwarted.

## Bassano, Battle of (8 September 1796)

At the Battle of Bassano the main body of General Bonaparte's Armée d'Italie routed two Austrian divisions under *Feldmarschall* Dagobert Graf Würmser, whose defeat forced him to give up his second attempt to relieve Mantua from blockade. The Austrian commander in chief did, however, succeed in escaping the French pursuit and successfully led the remnants of his troops behind the fortress walls.

At the beginning of September 1796 Würmser entrusted *Feldmarschalleutnant* Paul Freiherr Davidovich (with about 14,000 men) with the defense of Trent, the southern door to Tyrol, and left the city with the divisions of *Feldmarschalleutnant* Karl Philipp Freiherr Sebottendorf and *Feldmarschalleutnant* Vitius von Quasdanovich (about 9,500). The former constituted the vanguard; the latter followed at a day's march. Würmser's plan was to move south down the valley of the Brenta River (also called Val Sugana) and—with the support of *Feldmarschalleutnant* Johann Mészáros's division (10,000), already in Bassano—make for Mantua via Bassano, Vicenza, and Legnago. The Austrian commander certainly knew that Bonaparte was on the move up the Adige valley to Tyrol in an attempt to link up with General Jean Moreau in Germany. He believed, however, that Davidovich's force was strong enough to check the

French in the defiles south of Trent. At any rate—so Würmser believed—the threat from Mantua would make Bonaparte desist from his effort.

Bonaparte, however, took an unexpected and unconventional strategic course. Rejecting the obvious choice of retracing his steps down the Adige valley, he decided instead to attack Davidovich before Rovereto on 4 September. On the following day, the French seized Trent. Without allowing his troops any rest, Bonaparte sent General Charles-Henri Vaubois's division northward to watch Davidovich. Meanwhile, he rushed the divisions of generals André Masséna and Pierre Augereau (about 20,000 men) down the Brenta valley in pursuit of Würmser. Marching fast, the French rapidly closed with the tail of the Austrian column. On the morning of the seventh, Augereau's leading troops under General François Lanusse fell on Quosdanovich's rear guard (2,800) in the gorges of Primolano, taking hundreds of prisoners. Though informed that Bonaparte was now on his heels, Würmser did not renounce his original plan. He had already sent Mészáros to Vicenza and Montebello, and he prepared to leave Bassano with his remaining divisions. A rear guard under Quosdanovich and *Generalmajor* Adam Bajalich (3,800) was left to cover the approaches to Bassano on both banks of the Brenta, about a mile upstream.

On 8 September at dawn, Masséna's division, with Lannes's demi-brigade in the lead, advanced down the western bank, pushing the enemy back to the bridge at Bassano. On the opposite bank, Augereau easily drove the defenders from their position and entered the town. Retreating in disorder through the streets, the Austrian infantry ran into their artillery and train. Many units got scattered, producing a large body of stragglers. Würmser, with the remnants of Sebottendorf's division, fled to Vicenza. Quosdanovich, however, was cut off from the main army and retreated to the east. According to their own sources, at very low cost to themselves the French at Bassano took 5,000 prisoners (3,000 being a more likely figure), thirty-five guns, two bridging trains, and hundreds of wagons.

## Bathurst, Henry Bathurst, Third Earl (1762–1834)

The third Earl Bathurst was a member of British governments almost continuously for fifty years, coming into office with William Pitt in 1783 and going out with the Duke of Wellington in 1830. From 1807 to 1827 he played a leading role in the war against Napoleon, in foreign policy, and in the administration of the British Empire.

After holding various minor posts under Pitt, in 1807 he became president of the Board of Trade in the Duke of Portland's cabinet. For the next five years he was responsible for the Orders in Council by which the British countered the Continental System and helped pay for the war. When Napoleon tried to force Britain to accept his domination of Europe by banning British imports and ships that had visited a British port, the British, who commanded the seas after the Battle of Trafalgar, responded by declaring enemy ports under blockade, requiring neutral ships to stop at a British port, pay duty, and buy a license for protection against search by the Royal Navy before proceeding. British trade also continued on ships sailing under flags of convenience with falsified papers and by smuggling.

The U.S. government strongly protested this imposition as a violation of its sovereignty. In the economic downturn after 1810, when Napoleon's Empire was most secure, his prohibitions most enforced, and when the United States retaliated with an embargo on British goods, British merchants also clamored for the repeal of the Orders in Council. Almost simultaneously with the ministry conceding this in June 1812, the United States declared war on Britain and attacked Canada.

Just weeks earlier Bathurst had become secretary of state for war and the colonies in the administration of Lord Liverpool, formed after the assassination of Spencer Perceval. His main occupation was the management of the campaigns in the Iberian Peninsula, in North America, and in Belgium in 1815. He, Liverpool, and foreign secretary Lord Castlereagh between them also practically decided the country's foreign policy during the next ten years, and during Castlereagh's frequent long absences on the Continent in 1814 and 1815, Bathurst ran the Foreign Office. As the civilian war minister he was the frequent brunt of Wellington's criticisms for the shortage of troops, munitions and supplies, and funds. But the duke also showed his gratitude for Bathurst's support for his victories in the

Peninsula and at Waterloo, and the two became close when the duke joined the cabinet at the end of 1818.

After 1815 Bathurst turned his attention more to the colonies. He was practically the founder of the nineteenth-century Colonial Office, serving longer than any other colonial secretary. Many of the young men he appointed in the early 1820s were still there when the War Department was separated from the Colonial Office in 1854.

Bathurst resigned when George Canning succeeded Liverpool as prime minister in 1827 but returned as lord president of the council and general adviser to Wellington between 1828 and 1830, when he retired. He was opposed to the first Reform Act, but as he did with Catholic emancipation and other changes that he had instinctively disliked, he followed Wellington in finally allowing it to pass.

### **Bautzen, Battle of (20–21 May 1813)**

Fought in Saxony on the eastern bank of the Spree River, near the Bohemian border, then in the Austrian Empire. A Prusso-Russian army of 96,000 men under the Russian general Peter Graf Wittgenstein faced 115,000 men under Napoleon on the first day, joined by 84,000 men under Marshal Michel Ney on the second day. The Allies intended to use a prepared position to offset Napoleon's numerical superiority, hoping to fight him to a standstill. Then, by moving up reserves, the Allies hoped to force Napoleon back onto the Bohemian frontier, where he would have to surrender. Napoleon still sought the decisive victory that had eluded him earlier that month at Lützen, hoping that a flanking attack by Ney would achieve victory. After two days of hard fighting, the Allies fell back, beaten but intact.

Napoleon's forces on the first day included the Imperial Guard and the corps of Henri Bertrand, Auguste Marmont, Jacques Macdonald, and Nicolas Oudinot, as well as Marie-Victor Latour-Maubourg's cavalry. The Allied army consisted of the corps of generals Mikhail Miloradovich, Gorchakov, Mikhail Barclay de Tolly, and Grand Duke Constantine (Russians), and generals Friedrich von Kleist, Johann von Yorck, and Gebhard von Blücher (Prussians).

The Allied position was on the eastern bank of the Spree with the town of Bautzen forming the anchor point.

Earthworks had been constructed along much of the front, and a series of lakes secured their right flank.

Anticipating news of Ney's approach, Napoleon waited until noon on 20 May before ordering Oudinot to commence his attack on the heights south of Bautzen. He sent Macdonald and Marmont against Bautzen itself and ordered Bertrand to advance on the heights of Burk. The Imperial Guard remained in reserve. Yorck covered the heights of Burk. Prince Eugen of Württemberg was to his south. Colonel von Wolff's brigade occupied Bautzen. General Engelhardt's brigade was south of the town, with General St. Priest's division covering up to Doberschau. Cavalry covered the Allied left.

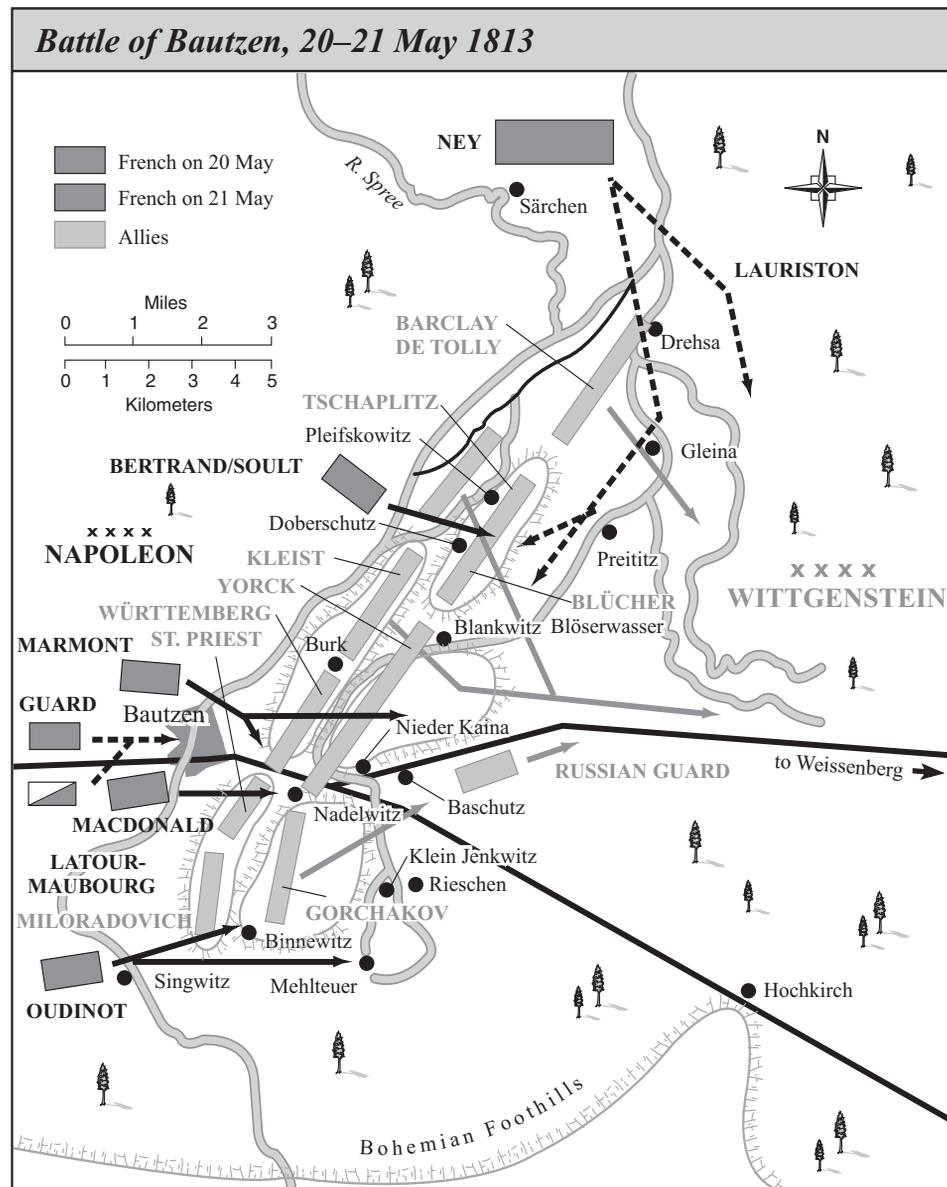

The objective of Napoleon's attack was to draw attention away from Ney's planned flanking move and to tie down the Allied forces to his front while Ney executed this maneuver. Oudinot's attack drew in Allied reserves. Macdonald then commenced his assault on Bautzen, but he became bogged down in the face of strong resistance and only made further progress once Marmont's attack from the north of Bautzen, which started at 1:00 P.M., had cleared the way. By 4:00 P.M., once the French had crossed the Spree in force, using both fords and temporary bridges, the Allies were forced to withdraw, and Eugen retired to the ridge between Auritz and Jenkwitz by 6:00 P.M.

Marshal Nicolas Soult's forces (Bertrand's and Latour-Maubourg's divisions) made little headway against Yorck, despite his superiority in numbers. At 3:00 P.M. he ordered the divisions of General von Franquemont and General Charles Morand to advance against Gottlobsberg, Nieder-Gurig, and Briesing. Gottlobsberg was first to fall, then at 6:00 P.M., Nieder-Gurig fell. The Allies did not contest Briesing, so the French were able to move as far forward as Plieskowitz that afternoon. By 7:00 P.M. the entire Allied front line being in French hands, Kleist fell back.

Most Allied senior commanders considered the advance of General Guillaume de Latrille, comte de Lorencez's division from Oudinot's corps on the far left to be Napoleon's main thrust, so Gorchakov was ordered to counterattack there and did so between 7:00 and 8:00 P.M. Lorencez was forced to retire to Denkwitz. Ney engaged General Tschaplitz's vanguard at Klix, forcing the Russians to retire across the Spree.

By the end of the day, Napoleon had achieved most of his objectives. He had tied down the Allies frontally and drawn in much of their reserves. Although the Allies had made Napoleon pay a price to cross the Spree, they had not been able to launch the planned counterattack.

The next day's fighting commenced at daybreak with a Russian assault along the line from Falkenberg to the Thromberg that drove back Oudinot's vanguard. At 6:00 A.M. Oudinot counterattacked, with Lorencez advancing on

Adapted from Lawford 1977, 43.

the village of Mehltheuer and General Michel-Marie Pacthod on the village of Daranitz, with Lieutenant General von Raglovich's Bavarians in reserve. Macdonald moved up in support. Facing superior numbers, the Russians withdrew, giving Macdonald's artillery the opportunity to deploy on the heights between Daranitz and Rabitz. By 10:00 A.M. the French artillery had gained the upper hand, and their infantry now closed in for the assault. In the next hour, the entire Allied left retired.

Oudinot's determination convinced Tsar Alexander that he was facing the main French assault here, so he ordered in further reinforcements, although this was against Wittgenstein's wishes. This counterattack forced the French back, making Oudinot's position critical. Napoleon ignored

his requests for reinforcements, telling him to hold on until 3:00 P.M., when he was certain of victory. Oudinot did so.

Napoleon's center held its positions against determined Allied support. Marmont deployed his men to the east of Bautzen and awaited events. At 9:00 A.M. he moved to the right to be able to support Soult and Ney.

Hearing the sounds of battle on the morning of 21 May, Ney sought clarification of his orders from Napoleon before continuing his march. This delay cost Napoleon his one chance of a decisive victory in this campaign. Napoleon had failed to inform Ney fully of his intentions. At 6:00 A.M., General Nicolas-Joseph Maison's division of General Jacques Lauriston's corps crossed the Spree at Klix. Tschaplitz did his best to delay the French advance but fell

back when his flanks were threatened. The Allies now became aware of the threat posed to the right and attempted to extricate themselves from the trap, fighting a withdrawal action. Ney waited for reinforcements before pressing on.

Barclay de Tolly abandoned Preititz, thereby endangering Blücher's line of retreat, but a local counterattack gained sufficient time for the Prussians to begin falling back. Ney then sent in fresh troops, regaining Preititz. Once Napoleon heard the sounds of fighting at Preititz, he knew Ney had arrived, so he sent in the Imperial Guard to take the heights west of Kreckwitz. Blücher was attacked from three sides and fell back around 3:00 P.M., as did Yorck. Covered by their cavalry, the Allies then quit the field of battle. Napoleon lost around 25,000 men, and the Allies around 11,000.

## Bavaria

The dynastic lands of the Wittelsbachs became the Kingdom of Bavaria and the nucleus for the Confederation of the Rhine. Bavaria allied with Napoleon and began a series of French-inspired reforms that created a constitutional monarchy that would last until 1918.

Bavaria began the revolutionary period as an electorate of the Holy Roman Empire. It included the Electorate of Bavaria, the Rhineland Palatinate, and the Upper Palatinate as well as the duchies of Berg, Jullich, and Zweibrücken. The traditional friendship of the Wittelsbachs with France left the elector, Charles Theodore, providing only grudging support to the Holy Roman Empire's participation in the War of the First Coalition. Maximilian Joseph I (1756–1825), Duke of Zweibrücken, became elector of Bavaria (as Maximilian

IV Joseph) and elector palatine in 1799. He sympathized with French ideas, as did his newly appointed prime minister, Maximilian Joseph Graf von Montgelas. Both hoped to establish Bavaria as an independent state by consolidating its lands and modernizing its government. The country was not yet strong enough to shift allegiance and thus fought with Austria in the War of the Second Coalition. Shortly after the Treaty of Lunéville, Maximilian signed a separate peace with France (24 August 1801), giving up territory west of the Rhine for the promise of contiguous lands in the south. This allowed Montgelas to begin restructuring the administration and reorganizing the army. Napoleon fulfilled his promise of additional territory with the Imperial Recess (*Reichsdeputationshauptschluss*) of 1803, by which Bavaria gained Würzburg, Bamberg, Freising, Augsburg, Passau, and fifteen other imperial cities. The War of the Third Coalition saw Bavaria fighting on the French side. By the Treaty of Pressburg, Bavaria received the Tyrol, Vorarlberg, and Ansbach, thus becoming the third most powerful German state in Europe.

As a result of the elector's loyalty to the French, Napoleon encouraged him to become King Maximilian I of Bavaria (1 January 1806). In addition, Napoleon's stepson, Eugène de Beauharnais, married Maximilian's eldest daughter, Princess Auguste-Amelie (14 January). In exchange, Napoleon demanded that Bavaria become the central member of his newly formed Confederation of the Rhine (12 July), recognizing France as protector of the south German states while furnishing 30,000 of the 63,000 troops of the confederation. This obligation ended Maximilian's dream of an independent state and brought conscription to Bavaria. True to its obligation, the Bavarian Army fought at the side of the French in the Austerlitz campaign (1805), against Prussia (1806–1807), against Austria (1809), in the invasion of Russia (1812), and in the spring campaign of 1813.

King Maximilian and Montgelas continued their program of reform. In 1804 they dissolved the Bavarian Estates and established a central bureaucracy. They also restricted the powers of the church and began secularizing ecclesiastical states. The king sanctioned new administrative departments (1806) and granted the first written constitution for a German state. It provided for a single-chamber legislature, an end to aristocratic privilege, equality before the law, and abolition of serfdom. In addition, the government promulgated a French-style legal code (1810).

The Treaty of Ried (8 October 1813), concluded shortly before the Battle of Leipzig, brought Bavaria into the camp of the Austrians. The Allies allowed Maximilian to retain his crown, but the Congress of Vienna dispersed his kingdom and forced Bavaria into a German Confederation, thus ending any hopes of independent statehood.

## Bavarian Army

After patterning its army on the French model, Bavaria became an important French ally. Later, as the largest military contingent in the Confederation of the Rhine, the Bavarian Army participated in all of Napoleon's major campaigns, contributing significantly to the victory at Wagram in 1809. Based on its new military power, Bavaria remained a kingdom after Napoleon's abdication.

As part of the Holy Roman Empire, Bavaria fought as a member of the First Coalition. Four regiments of infantry and one of cavalry, serving with the Army of the Upper Rhine, laid siege to Mainz (1793) and shared in the victories at Friedelsheim, Battenberg, Herzheim, Monsheim, and Zell (1794). Later, they garrisoned Mainz until the Treaty of Campo Formio (1797). Maximilian Joseph I, Bavaria's new elector (as Maximilian IV Joseph), reluctantly yielded to Austrian pressure to join the War of the Second Coalition. Bavaria's two brigades, composed of thirteen infantry battalions and one cavalry regiment, suffered defeat with the Austrians at Hohenlinden (13 December 1800) and provided the rear guard that protected the Allied retreat. Maximilian signed a separate peace, allying Bavaria with France (24 August 1801), and began reforming his army along French lines.

Before the Second Coalition, Maximilian abolished the purchasing of commissions and adopted a new Bavarian blue uniform with the distinctive Raupenhelm helmet. From this time on, Napoleon's Bavarian troops would be identified by the tall black leather helmet, named after its high peak crested with a black tuft of wool or bearskin resembling a caterpillar. After the war, the elector introduced general conscription, reduced the number of offenses subject to corporal punishment, and began promoting officers based on merit. General Bernhard Deroy redesigned the army to include smaller battalions and new skirmish units.

In 1805, 25,000 Bavarians, commanded by General Karl Philipp Freiherr von Wrede, served with the corps under Jean-Baptiste-Jules Bernadotte and protected the left flank of Napoleon's army during the Battle of Austerlitz.

Napoleon rewarded their efforts by making Bavaria a kingdom, but he also required Maximilian to provide 30,000 troops to the newly formed Confederation of the Rhine (12 July 1806). During the Prussian campaign (1806–1807), the Bavarians fielded three divisions under generals DeRoy, Wrede, and Ysenberg. Their siege operations captured the towns of Plassenburg, Grossglogau, Breslau, Brieg, Kosel, Glatz, and Neisse.

During the War of the Fifth Coalition against Austria (1809), the Bavarians formed VII Corps of the Grande Armée under Marshal Françoise Lefebvre. Their three divisions, with Napoleon commanding, defeated the Austrians at Abensberg (20 April), and Wrede's division participated in the final attack, which broke the Austrian line and forced Archduke Charles's retreat (6 July). During the campaign, several Bavarian units opposed the uprising of Andreas Hofer in the Tyrol.

For the Russian campaign, VI Corps, commanded by Marshal Laurent Gouvion St. Cyr, comprised two Bavarian divisions, totaling 30,000 infantry and 2,000 cavalry. Guarding the northern flank of the army, they won a minor victory at Polotsk (18 August). General Maximilian von Preysing's cavalry division served with the advance guard under Eugène de Beauharnais and suffered heavy losses at Borodino. Only 20 percent of the Bavarian troops returned from Russia.

A reconstituted Bavarian army fought with the French VI Corps during the Allied invasion of Saxony in 1813. Shortly before the Battle of Leipzig (16–19 October), however, Maximilian joined the Allies in exchange for recognition of his title. Two infantry divisions and three cavalry brigades suffered heavy losses attempting to block Napoleon's retreat at Hanau (29–31 October). During the invasion of France in 1814, the Bavarians besieged several French cities and participated in the battles of Brienne, Bar-sur-Aube, and Arcis-sur-Aube.

### Bayonne, Conference at (16 April–20 July 1808)

The conference—sometimes called the “ambuscade”—at Bayonne marked a crucial moment in Napoleonic diplomacy and led directly to the outbreak of the Peninsular War of 1808–1814. In brief, the first months of 1808 saw Napoleon resolve on the overthrow of the Bourbon dynasty. Ever since the Battle of Trafalgar, the Emperor had been increasingly dissatisfied with the regime of King Charles IV of Spain, for a number of reasons. As an ally Spain was woefully inadequate in both military and naval terms, even though its great American empire suggested that it should in fact have been a very valuable subordinate. Still worse, it was also unreliable: The court—and, indeed, the wider body politic—was split into warring factions centered on the figures of the royal favorite, Manuel de Godoy, and the heir to the throne, Prince Ferdinand, and the former had for some time been showing signs of wanting to throw off the French yoke.

According to some accounts, all this had made Napoleon determine on action as early as the summer of 1807 or even the autumn of 1806, but this is not the case. Although he did resolve to invade Portugal, and on this pretext sent a large army into Spain, at the beginning of 1808 he was still keeping his options open, and that despite the explosion of open warfare in the Spanish court thanks to Charles’s discovery that Ferdinand had been secretly scheming to obtain a Bonaparte bride so as to guard himself against any attempt to exclude him from the succession. At first the Emperor was not averse to this scheme, and he even discussed the possibility with his brother Lucien, whose daughter Charlotte was a potential match for Ferdinand. But Lucien would have none of it, which left Napoleon with only two options if he was to extend French influence in Spain. In brief, either he should overthrow Charles and replace him with Ferdinand, or he should overthrow the entire Bourbon dynasty and replace it by a branch of the Bonaparte family.

Of the two alternatives, there was no doubt which appealed more to Napoleon, but even now he was not fixed in his mind as to which he should do. But one way or another the only way forward was through the use of force, and in

late January the French forces in northern Spain were therefore ordered to seize the Spanish border fortresses. Nor was this the end of the matter: A month later they were marching on Madrid. Knowing that this was the end, Godoy frantically tried to organize resistance, but the supporters of Ferdinand realized that this might mean the overthrow of the entire Bourbon dynasty rather than just—as they fondly imagined—of Charles and Godoy.

In consequence, on 17 March they organized a military coup at the royal residence of Aranjuez in a desperate bid to put Ferdinand on the throne before the French arrived. In this they succeeded—Charles was forced to abdicate and Godoy was imprisoned—but desperate efforts to secure the recognition of the French troops that had now arrived in Madrid under Marshal Joachim Murat drew a blank. Nor was this surprising: The Aranjuez affair seems to have convinced Napoleon that Ferdinand would never be a reliable ally, and on 27 March he wrote to his brother Louis asking him if he would care to accept the throne of Spain.

In the meantime, there still remained the question of how to finalize the overthrow of the Bourbons, and to this end Napoleon set himself up as mediator and invited the entire Spanish royal family to meet with him at the Chateau de Marrac outside Bayonne. There followed a series of unedifying scenes whose chief outcome was that both Charles and Ferdinand—now King Ferdinand VII—abdicated the throne in favor of Napoleon. By 5 May all seemed settled, but news now arrived that Louis Bonaparte would not exchange Holland for Spain, and the Emperor therefore resolved to call on the services of his brother Joseph, who was at that point King of Naples. As Napoleon must have guessed he would, the pliant and easygoing Joseph made no difficulties about the move, and in the meantime preparations were made for his installation in Madrid. Thus, Ferdinand’s abdication was proclaimed (thereby triggering the Spanish insurrection), and large numbers of prominent Spaniards were invited to attend a constitutional assembly at Bayonne, while Napoleon personally promised to right all Spain’s ills and to give her a wise and benevolent ruler.

With Spain in revolt, however, only 100 deputies ever assembled at Bayonne, and they found that they could do little more than accept the *faits accomplis* presented them by Napoleon in the form of Joseph Bonaparte on the one hand and a typically Napoleonic constitution on the other. On 8 June, too, they welcomed the arrival of their new monarch from Naples. For another month king and Emperor lingered in Bayonne, discussing strategy and finalizing the details of French rule, but on 7 July they went their separate ways: Joseph headed for Madrid, and Napoleon set out for Paris. Although they did not yet know it, both were on the road to ruin.

### Beauharnais, Eugène Rose de (1781–1824)

Viceroy of the Kingdom of Italy, French prince, and general, Eugène de Beauharnais was the son of Napoleon's first wife, Josephine, and her first husband, the vicomte Alexandre de Beauharnais, a general in the French Army who was guillotined during the Reign of Terror.

One of the reasons Josephine married Napoleon was to have a male guardian for Eugène. Napoleon was very fond of Eugène and proud of his military record. He tutored him in the military arts from a young age, and they remained very close even after Napoleon divorced Josephine in 1809. Eugène participated in many Napoleonic campaigns and made every effort to emulate him. In 1797, when he was only sixteen years old, Eugène joined Bonaparte in Milan and served as his aide-de-camp for the remainder of the Italian campaign. In 1798 he accompanied Bonaparte on the Egyptian campaign and was wounded during the siege of Acre (1799). He was present at Saint-Cloud during the coup of Brumaire, and in June 1800 he participated in the Battle of Marengo. In 1802 Eugène was promoted to the rank of colonel in the Consular Guard. The Consulate years were probably the happiest period of Eugène's life. He owned a small house near Malmaison, where he entertained friends at bachelor parties. In 1801 his sister Hortense married Louis Bonaparte, who became the king of Holland in 1806.

After Napoleon became Emperor, he named Eugène Prince and Arch-Chancellor of the State and the Empire, which gave him entry to the Grand Council of the Legion of Honor, the Senate, and the Council of State. In March 1805 Napoleon transformed the Republic of Italy into the Kingdom of Italy, himself becoming its king. On 7 June 1805 he appointed Eugène as the viceroy of the new kingdom in Milan. At its peak, the northern Italian state covered an area of 35,000 square miles and possessed 6.7 million inhabitants, about one-third of the peninsula's population.

In 1805 Napoleon faced the Third Coalition. The Kingdom of Italy constituted a secondary military theater in that war. Eugène played a role in organizing the Army of Italy, which was led by Marshal André Masséna. In October

Eugène de Beauharnais, Napoleon's stepson. As well as being a skillful commander, he served from 1805 as viceroy of the new Kingdom of Italy, in which capacity he carried out liberal constitutional reforms. (Drawing by Henri Scheffer from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 4)

the latter faced the Austrian army in an indecisive Battle at Caldiero on the Adige River. In the Peace of Pressburg (December 1805) the Austrians ceded the Veneto to the Kingdom of Italy. In May 1808 the kingdom received the Marche, which had belonged to the Papal States. On 14 January 1806 Eugène married Auguste-Amélie, the seventeen-year-old daughter of the king of Bavaria, Maximilian I. Napoleon arranged that marriage in order to cement his alliance with Bavaria. The Emperor formally adopted Eugène, thereby placing him in line for the Italian throne. Eugène was also endowed with the title Prince of Venice. The couple had five children, four daughters and one son. They preferred to stay in their palace in Monza, outside Milan, rather than their palace in the city itself. Eugène had a good taste for the fine arts. In Milan he did his best to animate the court's life and to patronize the arts. The viceroy's painter-in-chief was Andrea Appiani. The Palazzo of Brera became the Royal Palace of Science and Art, and a new Conservatory of Music was opened in

Milan. Eugène ordered the artist Joseph Bossi to restore Leonardo da Vinci's *Last Supper*.

As viceroy, Eugène was in charge of executing Napoleon's orders and implementing the daily administration of the Kingdom of Italy. Napoleon maintained tight control over his stepson, who was merely twenty-three years old when he rose to power and had no political experience. In July 1810 the Emperor wrote to the viceroy: "Even if Milan is on fire, you must let Milan burn and wait for orders from me" (Beauharnais 1858–1860, 6:368–369). Before leaving Milan, Napoleon provided Eugène with a personal staff and instructed him on how to govern the Italian state. He stressed the need to gain the support of the Italians: "Show respect for them. . . . Learn to speak good Italian. . . . Admire what they admire." "The less you talk [in Council] the better; you are not well educated." "Learn to listen. . . . silence is often as impressive as knowledge." "See your ministers twice a week." "See that your orders are carried out; especially with regard to the army" (Napoléon I 1858–1870, 10:488–489).

Among all Napoleon's relatives who ruled over satellite states, Eugène was the most obedient to the French Emperor and remained faithful to him until the collapse of the Kingdom of Italy in 1814. He worked hard, ran the daily administration, presided over the Council of Ministers, sent frequent reports to Napoleon, and did his best to fulfill imperial orders. His main concern, however, remained the military. In late December 1805 Eugène replaced Masséna as the chief commander of the Army of Italy. The viceroy continued to build the army and assured the smooth operation of annual conscription. He enlarged and improved fortifications and toured his kingdom often to check the troops and the navy in the ports of Venice and Ancona.

The continental blockade weighed heavily on the Kingdom of Italy. A commercial treaty between France and the kingdom favored the former. In August 1810 Napoleon wrote to Eugène, explaining that Italy ought to be grateful to France for the benefits bestowed upon it and not begrudge the commercial advantages accruing to France as a result of the Continental System. Eugène was aware of the adverse effects of Napoleon's economic policies on the kingdom's economy, but unlike Louis Bonaparte in Holland or Joachim Murat in Naples, he never had the courage or the temperament to oppose Napoleon's economic programs. Neither did he resist the heavy taxation and the conscription that added to the resentment many Italians felt toward the French regime.

Eugène played an important role in the 1809 war against Austria. As the commander in chief of the Army of Italy, he served as an independent commander for the first time. His beginning was not auspicious: The Austrian

forces under Archduke John beat Eugène's troops at the Battle of Sacile (16 April). Soon, however, the situation turned around since Austrian forces were forced to retreat from Italian soil after Habsburg defeats on the Danube. Pursuing the retreating army, Eugène, with the help of Marshal Jacques Macdonald, defeated the Austrians on the Piave (8 May). Five weeks later, Eugène beat John again at Raab (14 June) in Hungary, restoring Napoleon's confidence in him. In late June 1809 Napoleon ordered Eugène to join the Grande Armée in Austria. Eugène and his troops played an important role in the victory at Wagram. Soon afterward, Eugène helped suppress the Tyrolean revolt led by Andreas Hofer. Following the war with Austria, the Kingdom of Italy lost Istria to the newly created Illyrian Provinces. In June 1810, however, it reached its largest territorial expansion with the annexation of South Tyrol, which belonged to Bavaria.

In December 1809 Eugène, along with the rest of Napoleon's family, was called to Paris to hear about Napoleon's decision to divorce Josephine. The viceroy also attended the Emperor's marriage to the Austrian archduchess Marie Louise in Paris (1 April 1810) and the birth of Napoleon's son (March 1811).

In the Russian campaign Eugène commanded IV Corps of the Grande Armée, which consisted of French and Italian troops. His men participated in the battles of Smolensk and Borodino. He distinguished himself during the retreat from Moscow, when he won the bloody Battle of Maloyaroslavets (25 October 1812), gaining much praise from Napoleon. The Italian Royal Guard was, however, almost entirely destroyed in that battle. At Smolensk Eugène's troops rescued Marshal Michel Ney and the rear guard. The IV Corps suffered enormous casualties in the Russian campaign. Of the 27,000 troops from the Kingdom of Italy, only 1,000 returned home. After Murat abandoned the remnants of the army and returned to Naples, Eugène assumed command and led the retreat from Posen to the Elbe. He then held the line until Napoleon appeared in April 1813 with a new army.

After the Russian fiasco Eugène returned to Italy, raising a new army. While Napoleon fought in Germany and France, the viceroy was in charge of defending Illyria and the Kingdom of Italy against the Austrians. He failed to do so, however, facing a larger Austrian army. Moreover, unlike in the 1809 campaign, Eugène received no help from Napoleon, who was himself hard-pressed in Germany. By the end of September 1813 the Austrian army under *Feldzeugmeister* Johann Freiherr von Hiller, aided by local uprisings, occupied Illyria. Eugène's position was further weakened by the defection of his father-in-law, Maximilian, to the anti-French coalition (7 October). He withdrew to the Adige River in early November. Maximilian, who

wished to see his daughter as the queen of Italy, urged Eugène to desert Napoleon and receive the crown of Italy from the Allies.

Eugène rejected this advice. His position on the Adige became untenable once Murat, who led a Neapolitan army, defected to the Allies (January 1814). In early February Eugène retreated from the Adige, and on 8 February he won a victory over *Feldmarschall* Heinrich Graf Bellegarde in the Battle of the Mincio River, the largest battle of the 1813–1814 campaign in Italy, but he suffered heavy losses and could not follow up on his victory. Eugène held up against the Austrian and the Neapolitan forces for two more months, until news arrived that Napoleon had abdicated at Fontainebleau (11 April 1814). On 16 April Eugène and Bellegarde signed the armistice of Schiarino-Rizzino. It required French troops to withdraw from Italy to France and allowed Italian forces to continue to occupy positions and fortresses in the Kingdom of Italy not yet occupied by the Allied armies. The cities of Osoppo, Palmanova, Venice, and Legnano and their fortresses were entrusted to the Austrian army.

Eugène, who stayed in Mantua, still hoped to survive the fall of Napoleon and become the ruler of an independent northern Italian state. These hopes were dashed on 20 April when a popular uprising, instigated by Milanese nobles, broke out in Milan, forcing the Senate to dissolve and lynching the unpopular finance minister Giuseppe Prina. Soon the Austrians occupied Milan and restored order. On 26 April Eugène issued a proclamation of farewell from Mantua, conceding control of his army to Bellegarde. The next day he departed for Munich at the invitation of Maximilian. In 1815, during the Hundred Days, Eugène failed to rally to Napoleon since it posed a risk to his family. He lived out his life as Duke of Leuchtenberg, Prince of Eichstädt, titles he received from his father-in-law. He died on 20 February 1824 at the age of forty-two.

## Beethoven, Ludwig van (1770–1827)

Ludwig van Beethoven is regarded as one of the first composers of the Romantic period of the early nineteenth century and as one of the great composers of Western civilization. Beethoven's life reflected his music, for he was a man who challenged the old order of feudalism and aristocracy and wished a new era of freedom to be ushered in. His music, which bridged the Classical style of Wolfgang Amadeus Mozart and the Romanticism of his successors, captured the spirit of the late eighteenth and early nineteenth centuries, a period of revolution and war that defined European history.

Beethoven was born on 16 December 1770 in the city of Bonn, in what is now Germany. His father, Johann van Beethoven, was a court musician to the elector of Cologne. Beethoven was a musical prodigy, and his early training was undertaken by his father. Between 1779 and 1783 Beethoven received further musical training under different teachers. In 1784 he became a court organist for the elector of Cologne. To further sharpen his musical abilities, in 1790 it was arranged that Beethoven was to study in Vienna under Mozart. However, because of Mozart's death in 1791, Beethoven studied under Joseph Haydn and other prominent composers of the day. Beethoven worked under notable patrons from Viennese society, such as Prince Karl Lichnowski and Archduke Rudolph. Despite a degenerative hearing loss, which began around 1797, Beethoven produced hundreds of musical pieces, which include nine symphonies, seven concertos, seventeen string quartets, thirty-two piano sonatas, ten sonatas for violin and piano, five sonatas for cello and piano, one opera, and two masses. When he died on 16 March 1827, thousands throughout Vienna mourned him.

Beethoven's political convictions were highly influenced by the Enlightenment, which taught him to despise tyranny and despotism. Like the philosophers of his day, he was a deist who believed in a supreme being, attesting to the fact that out of his entire musical repertory, he composed only two masses. When the French Revolution broke out, Beethoven was concerned about the growing censorship and repression exercised by the Austrian government.

Despite the fact that they were his only patrons, Beethoven loathed all princes and the aristocracy, particularly because he resented his dependence on them for his livelihood. Because of his talent, however, all Viennese society tolerated his attitudes and eccentricities.

Like many of his generation, Beethoven was caught up in the cult of Napoleon, a man from obscure origins who rose from the position of corporal in the French Army to become the Emperor of France and who dominated Europe for a generation. Much of Beethoven's music reflected the warfare of the early nineteenth century, including his overture "Wellington's Victory." His attitude toward Napoleon ranged from admiration to disgust. Beethoven's Third Symphony, originally dedicated to Napoleon, instead was renamed the *Eroica* after Napoleon crowned himself Emperor. Beethoven was angered at having been betrayed by the man who was to have been the savior of Europe, reputedly exclaiming, "So he is a man after all!"

## Belgium, Campaign in (1792)

The Austrian Netherlands, as Belgium and Luxembourg were known in 1792, had long been a heavily fortified region contested in successive wars between France and its enemies throughout the seventeenth and eighteenth centuries. Soon after the start of the French Revolution in 1789, the Belgian subjects of Holy Roman Emperor Joseph II, angered by a series of imperial reform programs and excited by the Revolution in neighboring France, rebelled against him. The leaders of this revolt declared independence from Austria as the "United States of Belgium" in January 1790, but Austrian troops soon restored order.

Relations between France and Austria deteriorated as the French Revolution progressed and the French monarchy's authority crumbled. Within Revolutionary France, rumors of an Austrian intervention to rescue Marie Antoinette and Louis XVI could seem credible because of the fortifications and garrisons in the Austrian Netherlands, which were within striking distance of Paris. Following the French royal family's bungled flight to Varennes in 1791 and the revelation of secret negotiations between Louis and Joseph, an Austrian invasion from the Belgian border seemed even more likely to many Parisians. Meanwhile groups of émigré nobles were fleeing from France into

Austrian and German territories, militating for armed intervention against the French Revolutionaries. In December 1791 Prince Kaunitz of Austria threatened that imperial troops in Belgium would react immediately should French armies invade to take action against these émigrés.

In this climate of fear of internal plots and foreign invasion, deputies in the French Legislative Assembly debated how best to protect the Revolutionary government, then declared war on 20 April 1792. The Revolutionary government almost immediately launched an invasion of the Austrian Netherlands, and this front quickly became the most important theater of war. The duke of Brunswick assembled an Austro-Prussian army in the Austrian Netherlands for an invasion of France. The Brunswick Manifesto that the duke issued on 25 July made clear his intentions "to put an end to the anarchy in the interior of France" and to restore Louis to power (Mason and Rizzo 1999, 167–170). Brunswick's troops soon advanced from the Austrian Netherlands, seizing Longwy and Verdun. The French forces that faced the Austro-Prussian invasion suffered from problems of morale and disorganization. Yet the French armies under generals François Kellermann and Charles Dumouriez united and stood their ground at Valmy on 20 September, halting Brunswick's invading army and saving the French Revolution.

Dumouriez believed that the Revolutionary war would be won in the Austrian Netherlands, not in France. Following Valmy, a new French army under Dumouriez invaded the Austrian Netherlands and threatened the fortified town of Mons. On 6 November Dumouriez's troops assaulted an entrenched Austrian army under the command of Albert of Saxe-Teschen at the village of Jemappes, near Mons. The French infantry, supported by artillery, successfully stormed the Austrian positions and forced the defenders to retreat. The victory at Jemappes paved the way for French troops to sweep across the Austrian Netherlands, but an Austrian counteroffensive would push French forces out of Belgium again in 1793.

### Belle Isle, Battle of (17 June 1795)

A minor naval encounter in the Bay of Biscay between mismatched British and French squadrons. At the end of May 1795 Vice Admiral William Cornwallis, with a squadron of five line-of-battle ships (one 100 and four 74s), two frigates (32 and 38 guns), and a brig sailed from the Channel Fleet anchorage at Spithead to cruise off Ushant. On 8 June he chased a squadron near Belle Isle, in the Bay of Biscay, under Rear Admiral Jean Gaspar Vence, escorting a large convoy. After capturing several vessels in the convoy, Cornwallis ended his pursuit, leaving the French to seek shelter in Palais Road, which was closely watched by the British squadron. When news of the action reached Brest, the French believed Vence to be under blockade, which he was not, and proceeded on 12 June to rescue him with a squadron under Vice Admiral Louis Villaret de Joyeuse, which linked up with Vence on the fifteenth near Ile Groix. Their combined strength stood at one line-of-battle ship of 120 guns, eleven 74s, two 50s, four 40s, four 36s, and several smaller vessels—a force far superior to Cornwallis's. The French sighted Cornwallis, bound for Belle Isle, on the following day.

Apparently believing himself confronted merely by Vence and the convoy, Cornwallis approached his vastly superior opponent until, around 11:00 A.M., he realized his predicament. He then immediately hauled to windward at full sail while forming in line ahead. The French pursued all day, in two divisions until evening, when they formed into three. Shifting winds favored the French, and although some of the British crews cast overboard a portion of their equipment in order to lighten their respective loads, by dawn on the seventeenth the French were close at hand. One French division, already parallel to Cornwallis's rear, was composed of three ships of the line and five frigates, the center division consisted of five ships of the line and four frigates, and the lee division had four ships of the line, five frigates, and four smaller vessels.

Action commenced around 9:00 A.M. when the leading French line-of-battle ship and a frigate fired on the *Mars* (74), which by 9:30 stood at the rear of Cornwallis's line, preceded by the *Triumph* (74), the *Royal Sovereign* (100), the *Bellerophon* (74), and the *Brunswick* (74). By midday the whole British line was in action, employing its stern guns where possible and making improvised ports for further guns. The second ship in the French van could not engage the rear of the British line until about 1:00 P.M. and after several hours the *Mars* began to lag behind. Cornwallis ordered her to alter course so as to sail clear of the enemy's lee division, while he, in the *Royal Sovereign*, followed by the *Triumph*, came round from the line to rake the bows of the closest pursuing French ships. This action

saved the *Mars* and allowed Cornwallis to re-form his line in order to bring effective fire to bear on the French. The four leading ships of the French van abandoned their attempt to capture the *Mars* and hauled to the wind. Intermittent firing continued until about 6:00 P.M., and half an hour later the French broke off the chase.

“Cornwallis's retreat,” as this action is also known, was skillfully executed, and only two of his ships, the *Mars* and the *Triumph*, received much damage, of which the former had only twelve wounded. In all probability Cornwallis's squadron was saved from capture by a ruse executed by the frigate *Phaeton* (38) on the morning of the battle. Detached well ahead of the squadron, she had hauled up flags to signal an imaginary force that she pretended was composed of line-of-battle ships. This was carried on until around 6:00 P.M. when, by coincidence, several small vessels appeared from the direction the French assumed the British reinforcement would appear. The French then broke off, and thus Cornwallis, with only five line-of-battle ships, intelligent tactics, and an element of trickery, escaped without loss from twelve ships of the line and an even greater number of frigates, reaching Plymouth in safety.

### Bellegarde, Heinrich Graf (1756–1845)

Bellegarde, a Saxon noble, transferred to Austrian service and became a noted cavalry commander. A key military adviser to Austria's foreign minister, Johann Freiherr von Thugut, and an able administrator, he readied Austrian forces for the campaign of 1813. In the field he was a capable and brave commander, albeit cautious and unimaginative, while leading Austrian armies from 1799 until 1815.

Born in Dresden, Bellegarde was a lieutenant in the Saxon infantry before transferring to the Austrian cavalry in 1772. Promoted to *Rittmeister* (captain) with the Zweibrücken Dragoons, he distinguished himself in the War of the Bavarian Succession (1778–1779) before leading cavalry as an *Oberst* (colonel) against Belgian rebels in 1788–1791. In 1792 he was promoted to *Generalmajor*

under *Feldzeugmeister* Fürst Hohenlohe-Kirchberg, leading the attack that cleared the French from the Mormal Forest during the siege of Quesnoi in August 1793 and participating in Fürst Johannes Liechtenstein's famous charge at Avesnes. Distinguished at Wattignies while leading the right wing, in May 1794 he commanded Archduke Charles's advance guard at Tournai, where his courage and tactical skill won him the Knight's Cross of the Order of Maria Theresa. Also an able military theorist, he joined *Feldzeugmeister* Franz de Croix Graf Clerfayt's staff before promotion to *Feldmarschalleutnant* (lieutenant general) took him back to Vienna as a member of Thugut's military advisory staff. He was posted to Archduke Charles's staff in 1796, officially as his *Adlatus* (military adviser) but made responsible for representing Vienna's wishes. His influence waned after he pressured Charles into the costly Battle of Neresheim in early August. In 1799 he devised Vienna's plan for the Second Coalition, fulfilling his own ambition for army command. Leading the Austrian army in the Tyrol, he descended into Italy to defeat General Jean Moreau at Casina Grossa on 20 June 1799, and he fought at Novi in August. After the Russians abandoned the coalition, he returned to the Tyrol until promoted to *General der Kavallerie* when he replaced *Feldmarschalleutnant* Michael Freiherr von Melas after the Battle of Marengo. His courage and determination enabled him to mount a steady but unsuccessful defense against General Guillaume Brune around Valeggio when war resumed in December 1800.

Bellegarde remained in Italy as general commandant in Venetia until Charles took over in September 1805. At the Second Battle of Caldiero (29–31 October), he commanded the center and won the Commander Cross of the Order of Maria Theresa for his determined leadership. As commander of I Korps in 1809, he led the northern Austrian advance into Bavaria, taking Regensburg. Displaying both personal bravery and prudence at Aspern and Wagram, he won promotion to *Feldmarschall* and became president of the Hofkriegsrat (Imperial War Council) in 1810. After forming the Observation Korps in Galicia in 1812, he was widely viewed as having accomplished the impossible to raise Austria's forces to war readiness in 1813. In November he replaced *Feldzeugmeister* Johann Freiherr von Hiller as commander in Italy, although he did not press the French forces hard before the armistice in April 1814.

### Benavente, Action at (29 December 1808)

This minor cavalry action took place during Lieutenant General Sir John Moore's retreat to Corunna during the Peninsular War. French cavalry were following up the British retreat over the river Esla at Benavente. Lord Henry Paget deployed his cavalry to attack. In the ensuing engagement the French cavalry were forced back over the river, and General Charles Lefebvre-Desnouëttes was among those captured. The success at Benavente allowed Moore to continue his retreat toward Astorga.

During the retreat of Moore's British army from Sahagún, the cavalry was very active in protecting the rear guard. On 29 December 1808 the bridge on the Esla had been partially destroyed by troops of the Light Division at Benavente, and Paget was protecting the withdrawal with his cavalry force. The French cavalry, unable to cross the Esla at Benavente, searched for and discovered a ford. This cavalry force was composed of around 600 men from the Chasseurs à Cheval de la Garde Impériale and a small number of Mamelukes led by Lefebvre-Desnouëttes. The initial force of British cavalry facing them amounted to around 100 hussars under the command of Colonel Loftus Otway. This force began a sporadic carbine fire on the enemy. The British were shortly thereafter reinforced by some cavalry from the King's German Legion—Hanoverians serving in the British Army.

Brigadier General Charles Stewart now arrived on the field and took command of all the cavalry engaged. He charged the French and broke through the first line. However, the second line pushed Stewart's force back toward the outskirts of Benavente, where, however, Stewart knew Paget was waiting with further reserves. Paget had placed the 10th Hussars under cover of the town. The French followed up their victory and did not suspect that there were fresh British cavalry in the area. Lefebvre-Desnouëttes was therefore very surprised when his tiring horsemen were assailed by new forces to their front. The chasseurs were unable to withstand the charge and fell back toward the Esla. The 10th Hussars were now supported by the rest of the

British cavalry and pursued the enemy. On the banks of the Esla the French were forced to turn to fight, but they were unable to do so effectively because of a combination of blown horses and disorganization. A furious melee broke out, with both sides losing about fifty men. However, nearly eighty Frenchmen were captured including Lefebvre-Desnouëttes, who had suffered three saber cuts in the fighting.

This defeat was made worse for the French by the fact that it was witnessed by Napoleon, who had positioned himself on heights near to the Esla in order to view the progress of his Guard cavalry. After the engagement, Lefebvre-Desnouëttes was invited to dine with Moore. The British continued their retreat the next day toward Astorga, having blunted the French pursuit for a short time.

**Benckendorf, Alexander Khristoforovich  
(Constantine Alexander Karl Wilhelm) Graf  
(1781–1844)**

General and aide-de-camp to Tsar Alexander I. Benckendorf descended from a Prussian noble family from Brandenburg that settled in Lifland in the late sixteenth century. His father served in the Russian Army, becoming general of infantry and military governor of Riga. His mother, Freiherrin Anna Schilling von Kanschadt, was a close friend of Tsarina Maria Fedorovna, consort of Tsar Paul I. Benckendorf was educated in a Jesuit boarding school and began service in the Life Guard Semeyonovsk Regiment in 1798. He became *flügel-adjutant* to Paul on 11 January 1799. He participated in operations in the Caucasus in 1803–1804 and briefly served on the island of Corfu in 1804.

In 1806–1807 Benckendorf served as a duty officer to General P. A. Tolstoy and received promotion to colonel on 25 February 1807. He distinguished himself at the Battle of Eylau and took part in negotiations at Tilsit. In 1807–1809 he served in the Russian embassy in Paris. In 1809 he volunteered for service in the Danubian Principalities and commanded cavalry detachments against the Turks. Benckendorf fought at Braila and Silistra and distinguished himself at Ruse in 1811, receiving the Order of St.

George. During the 1812 campaign, he commanded the advance guard in the corps of generals Ferdinand Winze-gorode and Paul Golenischev-Kutuzov. He fought at Velizh, Zvenigorod, and Spassk and in other minor actions. He was promoted to major general on 28 September 1812 with seniority dating from 8 August 1812. He briefly served as commandant of Moscow in October 1812.

During the 1813 campaign in Germany, Benckendorf commanded cavalry detachments and fought at Tempel-burg (for which he received the Order of St. George, 3rd class), Furstenwald, Leipzig, and Luttich, receiving a golden sword for courage from the British Prince Regent. In 1814 he distinguished himself at Craonne, Laon, and St. Dizier. He was appointed commander of the 2nd Brigade of the 1st Uhlan Division on 10 September 1814. Two years later, he became commander of the 2nd Dragoon Division (21 April 1816). He was appointed head of the Independent Guard Corps on 30 March 1819 and was promoted to ad-jutant general on 3 August 1819.

Benckendorf became very close to Tsars Alexander I and Nicholas I, who in turn showered him with promotions and awards. In 1821 he was promoted to lieutenant general (2 October) and took command of the 1st Cuirassier Division. On 6 August 1826 he was appointed head of the Gendarmerie Corps and the 3rd Section of His Imperial Majesty's Personal Chancellery. In the same year, he also became a senator in addition to his other duties. Benckendorf was one of the closest associates of Nicholas. He participated in the Russo-Turkish War of 1828–1829 and was promoted to general of cavalry on 3 May 1829. Two years later, he became a member of the State Council and the cabinet. In 1832, he was conferred the title of Count of the Russian Empire. He died aboard the ship *Hercules* returning from Amsterdam to Revel on 23 September 1844.

Benckendorf was one of the most decorated officers in the Russian Army. He received almost every Russian award, including the Orders of St. Andrew with diamonds, of St. Vladimir (1st class), of St. Alexander of Neva with diamonds, of St. Anna with diamonds, of St. George (3rd class), of St. Stanislaus and of Catherine, as well as a medal "For 35 Years of Distinguished Service." He was also awarded nine foreign orders: the Prussian Orders of the Black and Red Eagles with diamonds and the Pour le Mérite, the Swedish Orders of the North Star and of the Sword, the Austrian Order of St. Stephan, the Bavarian Order of Humbert, the Saxon Order of the White Hawk, and the Polish Order of the White Eagle.

### Bennigsen, Levin August, Baron (1745–1826)

A prominent Russian military commander, Bennigsen was born to a Hanoverian noble family in Brunswick, where his father was a colonel in the Imperial Guard. His family also owned estates at Banteln in Hanover. Because of his father's connections at the Hanoverian court, Bennigsen began his service at the age of ten as a page. Four years later he was commissioned as an ensign in the guard and, in 1763, as a captain, he participated in the final campaign of the Seven Years' War (1756–1763). A year later, after the death of his father and his own marriage to the Baroness Steimberg, he retired to his estates at Banteln, disillusioned with military service and widely regarded as an unpromising officer. Bennigsen apparently squandered his inheritance, and after his wife's untimely death, he briefly reentered Hanoverian service before deciding to seek a career in Russia. He was accepted into the Russian service with the rank of premier major and assigned to the Vyatka Musketeer Regiment in 1773.

During the Russo-Turkish War, Bennigsen served in the Narva Musketeer Regiment and was noticed by generals Peter Rumyantsev and Nikolai Saltykov. In January 1779 he became a lieutenant colonel in the Kiev Light Cavalry Regiment. In 1787 he was appointed commander of the Izumsk Light Cavalry Regiment and fought at Ochakov and Bender, receiving promotion to brigadier in 1788. In 1792–1794 Bennigsen took part in the operations against the Polish insurgents, was promoted to major general on 9 July 1794, and was awarded the Order of St. George (3rd class) on 26 September. In 1795 he commanded a brigade at Vasilkov. After returning to St. Petersburg, he formed a close association with Valerian Zubov, the brother of the empress's last favorite. In 1796 he took part in the Persian campaign along the Caspian Sea and fought at Derbent.

After the accession to the throne of Tsar Paul I, Bennigsen was named commander of the Rostov Dragoon Regiment (14 December 1796) and was promoted to lieutenant general (25 February 1798). However, he was dis-

General Levin Bennigsen, a German-born officer in Russian service, held field commands at many prominent battles, including Eylau, Friedland, Borodino, and Leipzig. (George Dawe [1781–1929]/Hermitage, St. Petersburg, Russia)

missed from service on 11 October 1798 during Paul's purge of high-ranking military officers. He participated in the conspiracy to overthrow Paul and, according to the memoirs of the participants, was chosen to lead the coup d'état because of his reputation for audacity and courage. Despite his role in the conspiracy, Bennigsen's career did not suffer under Alexander I. He was appointed military governor of Vilna and inspector of the Lithuanian Inspection on 23 July 1801. Bennigsen was then promoted to general of cavalry on 23 June 1802, with seniority dating from 4 December 1799.

During the War of the Third Coalition Bennigsen commanded a reserve corps of some 48,000 men arranged between Taurrogen and Grodno. In 1806 he was directed to take up quarters in Silesia and assist the Prussians against the French. After the Prussian defeat, Bennigsen withdrew to Poland, where he fought the French army at Golymin and Pultusk. He claimed these battles as decisive Russian victories, received the Order of St. George (2nd class) on 8 January 1807, and was appointed commander in chief of the Russian army on 13 January 1807. He launched an offensive in January 1807 and fought the French army at Eylau (for which he received the Order of St. Andrew the First Called), Guttstadt, Heilsberg, and

Friedland, where his poor tactics resulted in Russian defeats with heavy losses. Displeased with his actions, Alexander discharged Bennigsen on 9 July 1807.

Bennigsen remained in exile until 1812, when he was ordered to join the Imperial Retinue (8 May 1812). He was considered for the post of commander in chief in August 1812 but was rejected in favor of Mikhail Kutuzov. Instead, he was appointed the chief of staff of the united Russian armies and bickered with Kutuzov for command throughout the campaign. After Borodino, he advised against abandoning Moscow to the French. He distinguished himself at Tarutino, where he was wounded in the leg. However, in late 1812, he was finally dismissed because of his ongoing disagreements with Kutuzov.

Bennigsen returned to the army in early 1813 and received command of the (Russian) Army of Poland. He later fought at Lützen, Bautzen, and Leipzig and besieged Torgau and Magdeburg; for his actions, he was conferred the title of Count of the Russian Empire on 10 January 1814. He then commanded the Russian troops besieging Hamburg and was decorated with the Order of St. George (1st class) on 3 August 1814 for his conduct. He commanded the 2nd Army in 1815–1817 but was criticized for poor administration and was forced to retire on 15 May 1818. He spent the next eight years at Hanover. He was awarded almost all the highest Russian awards, including the Orders of St. Andrew with diamonds, of St. Vladimir (1st class), of St. Alexander of Neva, of St. Anna (1st class), of St. George (1st class), and a golden sword with diamonds for courage. In addition, he had six foreign decorations: the Prussian Order of the Black Eagle, the Hanoverian Order of Guelf, the Dutch Order of the Elephant, the French Legion of Honor, the Swedish Order of the Sword, and the Austrian Order of Maria Theresa.

Bennigsen was an overrated general. A brave officer, he showed no tactical or strategic abilities in the 1806–1807 and 1813 campaigns. Despite his claims to victories, the battles of Pultusk and Eylau were draws at best. At Heilsberg he lost consciousness and other senior Russian commanders conducted the battle. At Friedland, he chose disadvantageous positions that led to heavy Russian casualties. Bennigsen was a very ambitious officer and an able courtier, who easily navigated in court politics. His three-volume work *Mémoires du général Bennigsen*, published in Paris in 1907–1908, contains fascinating details on the Russian operations in 1806–1813 but often embellishes the facts.

## Bentham, Jeremy (1748–1832)

Jeremy Bentham was an English philosopher and legal reformer. He is popularly known as the founder of Utilitarianism, a philosophical doctrine based on the principle of “the greatest happiness of the greatest number.” Bentham’s influence during his lifetime was limited, in part by the slow publication of his works, many of which did not circulate in print until after his death. That is especially so for his writings on the French Revolution.

It is generally agreed that Bentham’s thought was influenced by French thinkers, including Jean Le Rond d’Alembert; Voltaire, whose works Bentham read as a youth at the insistence of his French tutor; and, in particular, Claude-Adrien Helvétius. Later, the French Revolution held Bentham’s interest, as it did that of many British thinkers. In it Bentham saw, at first, an opening for legislative and judicial reform based on Utilitarian principles. To effect that impact, Bentham aimed to establish contacts within France, most notably with the comte de Mirabeau and the Abbé Morellet. At one point or another, Bentham was also in contact with Bon Albert Briois de Beaumez, Jacques-Pierre Brissot de Warville, Jean Antoine Gauvain Gallois, Jean Philippe Garran de Coulon, François de La Rochefoucauld, and Charles-Maurice de Talleyrand. That the French Revolution also had an impact upon the direction of Bentham’s thought seems certain, but the extent and nature of that influence is unclear and has been the subject of much scholarly debate.

Bentham had written a good deal before 1789, including *A Fragment on Government* (1776), his critique of Sir William Blackstone’s *Commentaries on the Laws of England*, the standard account of English common law. Bentham published *An Introduction to the Principles of Morals and Legislation* in 1789, the same year in which he defended the French National Assembly.

The French Revolution also spurred Bentham to write about the notion of representation, in a pamphlet written as an open letter to the comte de Mirabeau and in *Considérations d’un Anglois sur la composition des États-Généraux y compris réponses aux questions pro-*

*posées aux Notables &c.* 1788, where he argued for universal manhood suffrage, on the basis of utility. Bentham's manuscripts include "Observations on the Draughts of Declarations-of-Rights Presented to the Committee of the Constitution of the National Assembly of France" and "Project of a Constitutional Code for France." In 1790, Bentham sent to Paris 100 copies of his pamphlet *Draught of a New Plan for the organisation of the Judicial Establishment in France*. In 1791 Bentham published *Panopticon, or The Inspection House*, selections of which he sent to members of the National Assembly; at the same time, he offered to build and manage a prison in Paris. That proposal met with some enthusiasm but little action.

By the time the French National Assembly made Bentham an honorary French citizen, on 26 August 1792, he had come increasingly to distance himself from the Revolution. For instance, in 1793 Bentham printed "Jeremy Bentham to the National Convention of France," an essay that encouraged the French to grant independence to their colonies. In 1795 he composed "Nonsense upon Stilts," his biting critique of the Constitution of Year III and especially its Declaration of the Rights of Man and the Citizen. "Nonsense upon Stilts," like so much else that Bentham wrote on French affairs, was not published until many years after its composition.

Bentham scholars disagree about how best to interpret his writings on the French Revolution. In a now-classic account, Elie Halévy saw them as ad hoc statements. More recently the trend is to see Bentham's French Revolutionary writings as steps in his transformation as a reform thinker.

### **Beresford, Sir William Carr (1768–1854)**

Appointed to reorganize the Portuguese armed forces in 1809, Beresford commanded the Allied forces at the Battle of Albuera in 1811 and remained commander in chief and marshal general of all the Portuguese armies until 1820.

Beresford was born on 2 October 1768, the illegitimate son of the Marquis of Waterford. His younger brother became Rear Admiral Sir John Poo Beresford. He attended a French military academy in Strasbourg and was commissioned into the 6th Foot at the age of seventeen, serving with his regiment in Canada where he lost the use of an eye in a shooting accident in 1786. In 1789 he purchased a lieutenancy in the 16th Foot. He saw active service with Sir John Moore and Admiral Alexander Hood in Italy and at the siege of Toulon, respectively. In 1794 he was made colonel of a regiment newly raised by his father and in 1795, at the age of twenty-seven, he was made colonel of the 88th Foot, the Connaught Rangers. In 1800 he served under Brigadier General Arthur Wellesley (later the Duke of Wellington) in India, whence he accompanied his regiment to Egypt to join Sir Ralph Abercromby's army, which had been sent to expel the remnants of Bonaparte's forces from Egypt. Remaining in Alexandria until 1803, Beresford was promoted to the rank of brigadier. In 1805 he took part in Sir David Baird's capture of the Cape of Good Hope and was appointed to command the expeditionary force that was sent with Commodore Home Riggs Popham to seize Buenos Aires. After capturing the city in June 1806, Beresford acted as governor for two months before surrendering to a superior Spanish force. After escaping from captivity, Beresford returned to London, where he was appointed to command the force being assembled for action against Madeira.

On 24 December 1807 Beresford, in command of an army of 3,500 men, occupied the island of Madeira, which was annexed as a crown colony. As first, and only, British governor of Madeira, Beresford got his first experience of commanding Portuguese troops. He taught himself Portuguese and embarked on an energetic program of reform, which was cut short in March 1808 when the island was handed back to the Portuguese Crown.

Returning to London in August 1808 Beresford was attached to the staff of Sir Harry Burrard and was appointed one of the commissioners to oversee the implementation of the Convention of Cintra. After the departure of the French, Beresford became commandant of Lisbon. After Moore's arrival there, Beresford was sent to negotiate with the bishop of Oporto and then to put the fortress of Almeida into a state of defense. He commanded one brigade of Moore's army in Spain, and it was his troops who covered the embarkation of the army at Corunna after the death of its commander. Beresford emerged from the fiasco of Moore's campaign with a higher reputation, and in March 1809, newly promoted to lieutenant general, he was appointed to take command of the new Portuguese army that was being formed.

Beresford proved to be a highly successful organizer and was a strict disciplinarian. After only three months in command he was able to field an army of 19,000 men for the campaign against Marshal Nicolas Soult in northern Portugal. He eventually commanded a Portuguese army that grew to number 60,000 men, organized along British lines and commanded by a corps of seconded British officers that eventually numbered 100. Portuguese officers were recruited and promoted on merit, and strict military discipline was enforced. Beresford followed the Portuguese practice of dividing the army between front line units and militia, or *segunda linha*, formations. It was the militia that manned the Lines of Torres Vedras. Beresford also made use of the traditional Portuguese light infantry, the *Caçadores*. Beresford was supported in his work both by Wellesley, who became a close friend, and by the secretary to the Portuguese Council of Regency, Dom Miguel Pereira Forjaz, who worked with Beresford to create a centralized commissariat for supplying the army. Beresford became, in effect, Wellesley's second in command and the officer who Wellesley intended should assume command of all the Allied forces should he be killed in action.

Beresford's forces took part in the campaign against Soult in northern Portugal in 1809 and played a major part in the Battle of Busaco, where they fought off the attempt by Marshal André Masséna's army to storm the mountain ridge outside Coimbra. After the battle Beresford was made a Knight of the Bath, and his success in these campaigns was rewarded in 1811 when he was made commander of all the Allied armies in the southern theater. Having laid siege to Badajoz, his main objective was to prevent Soult from raising the siege and invading Portugal. He fought a number of minor actions against the French, the principal being at Campo Mayor (Campo Maior), which culminated in the Battle of Albuera on 16 May 1811. Beresford's handling of the Allied armies at Albuera was later strongly criticized by the Peninsular War historian William Napier and became the subject of a lengthy pamphlet war that lingered on into the 1840s. Beresford was criticized for having dismissed General Robert Long, the commander of his cavalry, on the eve of the battle and for allegedly having issued orders for a retreat at the height of the battle—an accusation that Beresford always vigorously denied. Whatever the truth of these allegations, Beresford never lost the confidence of Wellington or of the Portuguese Prince Regent.

The Portuguese army fought at Salamanca, where Beresford was wounded, and in 1813 at Vitoria, where Portuguese and British troops were equal in number. In the campaign in the Pyrenees Beresford held commands at the battles of Nivelle and Toulouse, and he commanded the Allied forces that received the surrender of Bordeaux.

With the defeat of Napoleon, Beresford was raised to the peerage as Baron Beresford of Albuera and received the Portuguese titles of Conde de Trancoso and Marques de Campo Maior. With his army, he returned to Portugal, where he retained his appointment as commander in chief. In June 1815 Wellington asked for the Portuguese army to be sent to the Low Countries for the Waterloo campaign, and Beresford prepared his forces to go. However, he was refused permission to sail by the Regency Council. This refusal brought into the open a long-festering feud between the commander and the Regents. Beresford now sought the backing of the Prince Regent in Rio de Janeiro, returning to Portugal in 1816 with the new title of marshal general of all the Portuguese armies and with extensive new powers over the armed forces in Portugal. In 1817 he claimed to have uncovered a conspiracy to overthrow the monarchy, and after the execution of the leading conspirator, Gomes Freire de Andrade, in October 1817 Beresford was the most powerful man in Portugal. Units of his army, under General Carlos Lecor, were sent to Brazil for King João (John) VI's ultimately unsuccessful campaigns, and Beresford retained the king's confidence until he was ousted from his command by the outbreak of the Revolution of 1820.

Beresford returned to Portugal in 1824 and helped the king survive the Abrilada coup, after which he pressed without success to be allowed to return to Portugal as commander in chief or as British ambassador. When Wellington became prime minister in 1828, Beresford was appointed to the cabinet as master general of the ordnance and advised Wellington on Portuguese affairs. When Wellington left office in 1830 Beresford's public career was over. He helped the Marquis of Waterford maintain the Waterford influence in northern Ireland's politics, he pursued a vigorous pamphlet war against Napier and the Longs, and he married his first cousin, the Honorable Louisa Hope, in 1832 and settled at Bedgebury in Kent. He was made governor of Jersey, a ceremonial office he held until his death on 8 January 1854, at the age of eighty-six.

Beresford was greatly admired by some of the officers who served under him—notably Sir Benjamin d'Urban, his quartermaster general. He was more grudgingly admired by some Portuguese as an efficient organizer of the armed forces who gave Portugal, for the first and only time in its history, an army that could compete with the best in Europe. He was, moreover, trusted by the Duke of Wellington. However, Beresford was not a very likable man. He was notoriously ill mannered and greedy for titles and wealth. In 1823 he became Viscount Beresford. He acquired estates and pensions in Portugal, which he fought hard to retain. He took as his mistress the wife of the Visconde de Juromenha, who was his private envoy in Rio de Janeiro. He

had three children by her, but when her husband eventually died, she refused to marry the British general. Beresford was prodigiously strong (a popular print showed him lifting a Polish lancer bodily from the saddle at Albuera), but he was also a hypochondriac, habitually taking the waters whether for reasons of ill health or to recover from the breakdown he suffered after the Battle of Albuera.

Although never acquiring the heroic reputation of others of Wellington's general officers, Beresford played a far more important part in the Peninsular War than any other Allied general except Wellington himself. Beresford's role in creating a Portuguese army from nothing cannot be overestimated, while the successful conduct of his troops on every campaign from 1809 to 1814 made him one of the principal architects of Wellington's famous victories.

## **Berezina, Actions and Crossing at the (21–29 November 1812)**

At the Berezina River, the Russians attempted to trap Napoleon's Grande Armée during the retreat from Moscow.

The Russian plan was for General Peter Graf zu Wittgenstein, with 30,000 men, to push the forces covering the French northern flank toward their main body and for General Pavel Chichagov (34,000) to do the same to the forces covering the French southern flank. They were to unite near Borisov on the Berezina, cutting off Napoleon's retreat. General Mikhail Kutuzov (80,000) was to pursue the main French force from the east. After pinning the French, they would all attack.

Wittgenstein succeeded in pushing the corps of marshals Claude Victor and Nicolas Oudinot in the desired direction. General Karl Freiherr von Wrede's corps evaded the net by retiring east. Karl Philipp Fürst zu Schwarzenberg's corps protected the French southern flank but moved southwest to help General Jean, comte Reynier, enabling Chichagov to slip through and capture the important supply depot at Minsk on 16 November.

On hearing this, Napoleon became worried at being cut off at the Berezina. He dispatched messengers to Borisov, ordering the bridgehead to be held at all costs. He ordered Oudinot to counterattack at Borisov, and Victor to hold off Wittgenstein in the north. To expedite the march, he ordered the baggage train to be halved. Among the equipment jettisoned was the pontoon train. It is not clear if this was Napoleon's choice, but he tended to give priority to the preservation of the artillery.

On the twenty-first the French garrison lost control of the bridgehead after a 10-hour fight with Chichagov. Napoleon was now trapped. He ordered that the baggage be halved again and the freed-up horses from the baggage train be given to the artillery. The state papers and the standards were burned. On the twenty-third Oudinot pushed Chichagov out of Borisov but failed in an attempt to take the bridge. Chichagov withdrew to the west bank and destroyed the bridge. He then took up a defensive position extending from Brill opposite Studienka (8 miles upstream, northwest of Borisov), to Usha, 20 miles downstream from Borisov. The river is normally frozen in late November, but a thaw on the twentieth broke up the ice, making the river impossible to cross and bursting its banks. Oudinot sent scouts to find an unguarded crossing below Borisov, but to no avail.

On the twenty-third Brigadier General Jean-Baptiste Corbineau discovered a ford at Studienka, 3.5 feet deep but rising. Napoleon ordered generals François Chasseloup and Jean-Baptiste Eblé of the Engineer corps to build three bridges. Corbineau was to lead a force of 400 cavalry and light infantry to cross the river by raft or horseback to set up a covering position. Victor was ordered to hold off Wittgenstein about 6 miles northeast of Studienka, while Marshal Louis Davout held off Kutuzov coming from the town of Bobr. Eblé had managed to retain two field forges

Crossing of the Berezina. Fugitives of the Grande Armée and camp followers flee across the icy river with the Russians in close pursuit. (Print by F. de Myrbach from *Life of Napoleon Bonaparte* by William M. Sloane, New York: Century, 1906, vol. 4)

and eight wagons of equipment from the pontoon train. On the night of the twenty-fourth the men began tearing down houses to get timber to build trestles and planks. There were only sufficient resources for two bridges, only one of which would be suitable for vehicles.

Napoleon had ordered several diversions to the south. On the twenty-fifth a diversion 6 miles south of Borisov, by a mixed force plus a crowd of refugees, made such a noise as to give the impression of bridging preparations. Chichagov fell for the ruse and abandoned his positions opposite Studienka and Borisov to move south. Corbineau's small force drove off the Cossack patrols that made up Chichagov's rear guard. A battery of forty-four guns, placed on the east bank to cover the bridging site, silenced the two Russian guns left behind.

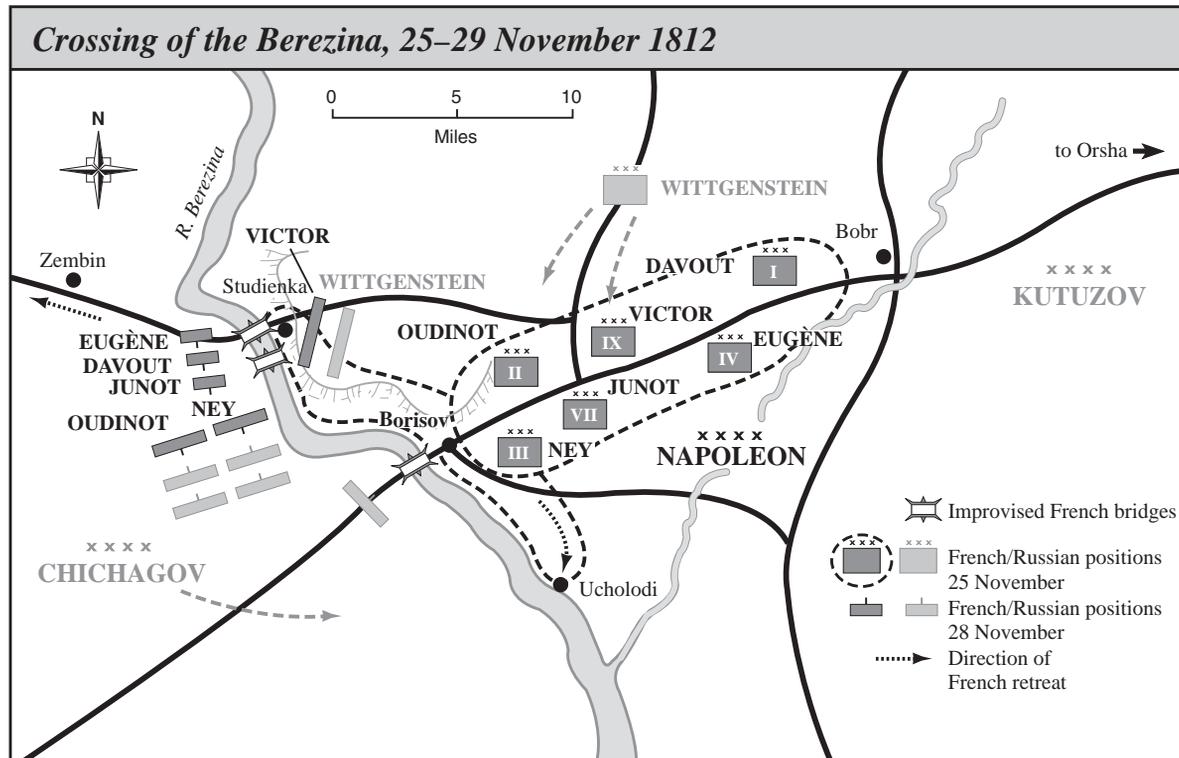

The engineers meanwhile worked throughout the night of 25–26 November to bridge the 80-yard span. Working up to their shoulders in icy water to drive in the trestles, they completed the smaller bridge at 1:00 P.M. on the twenty-sixth. Oudinot's corps crossed first, along with General comte J. P. Dumerç's cuirassier (heavy cavalry) division, followed by Marshal Michel Ney. The artillery followed later once the second bridge was finished at 3:00 P.M. Oudinot moved a few miles southwest to Stachov to cover the left

flank of the army. Ney deployed to his left. Oudinot's cavalry succeeded in seizing the causeway across the marshes near Zemin to the west, the route of the retreat.

The crossing continued on the twenty-seventh. Napoleon's headquarters transferred to the west bank, followed by the Imperial Guard. Meanwhile, Chichagov attacked Oudinot in force. The latter gave ground but stabilized the position. Wittgenstein pushed Victor's IX Corps into a 10-mile perimeter around Studienka and Borisov, but the defenders maintained cohesion, and Napoleon felt able to withdraw the Baden brigade across the river.

At 4:00 P.M., however, part of the vehicle bridge collapsed. The orderly crossing degenerated into a scramble for the remaining bridge, and many died. The bridge was repaired by evening, but its approaches were clogged with abandoned vehicles and corpses. The engineers cleared a passage for IV and I Corps during the evening.

During the night there was a gap in the traffic. Eblé urged the stragglers to cross, but few heeded him. Stupefied by cold and exhaustion, they preferred to stay by their fires. Victor ordered General comte Partonneaux's division to evacuate Borisov during the night of the twenty-seventh–twenty-eighth. After taking a wrong turn, they found themselves cut off, and 4,500 troops were forced to

Adapted from Chandler 1966, 840.

surrender. At dawn on the twenty-eighth Wittgenstein assaulted the weakened IX Corps, which struggled to hold Studienka. Napoleon sent the Baden brigade back to the east bank to stabilize the line.

Chichagov again attacked Oudinot's forces; Oudinot himself had been wounded. Ney took command of both II and III Corps. A charge by Dumerc's cuirassiers saved the day for the French. Nevertheless, Russian artillery fire on the mob at the bridgehead caused renewed panic, and many were pushed into the river. Napoleon formed a massive battery on the west bank, which enfiladed the Russians, forcing them back. Victor withdrew overnight. The last of the rear guard crossed at dawn the next day, after which Eblé fired the bridges. A howl of despair rose from the stranded mob, most of whom were soon to perish.

The French lost 20,000–30,000 combatants and twenty-five guns; 30,000 noncombatants were left behind. The Russians lost 10,000 killed and more wounded. Eblé died shortly after reaching Königsberg in East Prussia.

## Berg, Grand Duchy of

*See* Confederation of the Rhine

## Bergen, Battle of (19 September 1799)

Battle between an Allied army under the Russian general Ivan Ivanovich Hermann and Franco-Batavian troops near Bergen during the Anglo-Russian campaign of 1799 in North Holland. After a British invasion force landed on the coast south of Den Helder, the town (known by the same name) was taken and a defensive line was established at the Zijpe, an easily defensible polder in the north of North Holland. After an awkwardly executed attack from General

Brune's French and Batavians on 11 September and the arrival of Russians on the twelfth, the Duke of York decided to counterattack.

With 35,000 troops, York outnumbered Brune, who had no more than around 25,000 at the ready. As Brune had been a few days before, York was obliged to divide his forces into overextended columns so his forces could negotiate over straight, narrow dykes and roads in swampy polders or, in the case of his right flank, over sandy dunes and coastline. The army was divided into four columns. The column on the right wing, numbering some 9,000 Russians followed by a reserve of 2,500 British, was the strongest and would follow the North Sea coast to attack Bergen. Both center columns, one 5,000 and one 6,500 strong, would aim for minor settlements to pin down the Franco-Batavian forces. Finally, the left column, 9,000 strong and commanded by Lieutenant General Sir Ralph Abercromby, would follow the Zuyder Zee coastline to Hoorn.

Things started to go wrong from the outset. As a result of unclear orders from York, the times of the different attacks were not coordinated. Hermann's first engagement with the French advance guard was successful, and Kamp and Groet were taken, but darkness resulted in disorder in the Russian lines. Still, Schoorl was taken and the troops moved further up to Bergen against continuous French resistance. The French in the town were surprised, but they quickly positioned themselves for defense and Hermann had to wait for supporting artillery before he could attack. After heavy fighting, Bergen was eventually taken.

The Russian troops, however, were in a very bad state of discipline. Many were drunk, as before the battle they had been provided with double rations of spirits, and immediately after taking Bergen they had started pillaging. Hermann attempted to prepare for a French counterattack, but with limited success. A British brigade held in reserve was, moreover, occupied in fighting Batavian troops near Schoorl and was unable to reinforce Hermann.

Brune responded by sending General Vandamme with some 7,500 troops and sixteen guns to attack Bergen. Vandamme ordered some Batavian battalions to march around the village to cut off the Russian line of retreat, and when the village was surrounded, he attacked and defeated the Russians with the rest of his forces, mainly French. Many Russians were taken prisoner, including Hermann himself, who was caught in flight. Only a few Russians escaped, fleeing in disorder to the Zijpe and beyond. The right column having thus been destroyed, the supporting middle columns pulled back as well and the position of Abercromby, who had been successful on the extreme left and had taken Hoorn, became untenable. He abandoned the town and retreated, thereby reducing the net results of

the attack to naught. Total Anglo-Russian losses numbered around 7,000 killed and wounded, while the Franco-Batavians suffered 3,750 casualties.

This debacle did not end the struggle in North Holland, but it may well be contended that this defeat spelled the strategic failure of the campaign, as Brune gained time to reinforce and further prepare the defense of the Batavian Republic, thereby foiling an attempt to turn a modest foothold in North Holland into a genuine northern front.

## Berlin Decrees (21 November 1806)

Napoleon's Berlin Decrees established his Continental System, which was primarily an effort to damage British commerce with the object of bankrupting Britain and forcing it to withdraw from the war with France. The impetus for the decrees came on 16 May 1806, when Britain established a naval blockade of French home ports and those in French-occupied Europe spanning the area from Brest to the Elbe River. On 21 November, the Berlin Decrees were issued in the Prussian capital. Napoleon declared in them that Britain and its imperial possessions were henceforth under a blockade. No ship sailing from Britain with a port of destination in Europe was allowed entry for the purposes of trade. The legislation also stipulated that all British ships and goods were subject to seizure as prizes.

The Berlin Decrees and the subsequent Milan Decrees, issued in late 1807 and expanding the scope of the Berlin Decrees, were an extension of actions against British trade that had been taken by the French Revolutionary government prior to Napoleonic rule. They created in effect a boycott of all British goods in continental Europe, rather than a blockade. The nature of these decrees was the result

of the fact that because of the superiority of the Royal Navy, France did not have a navy capable of effectively blockading Britain.

Napoleon pursued multiple aims through the Berlin Decrees, aims that extended beyond forcing Britain from the war. He believed that because Europe consumed up to one-third of British exports, the economic hardship that the legislation would produce on the Continent would galvanize Europe against Britain. The Emperor also wanted French industry to fill the void in European trade that the Berlin Decrees would create and thereby decrease European dependence on goods from overseas. In addition, he felt that eliminating the need for such foreign goods would isolate Britain from future continental affairs, as in Napoleon's view past British influence rested on trade. Finally, the Emperor believed that the Berlin Decrees, with their emphasis on freedom of the seas as a challenge to the British blockade, could attract the support of neutral powers and thus strengthen his political position in European politics.

The Berlin Decrees were not successful. Britain was not forced to sue for peace, primarily because the continental European powers violated the decrees. European consumers' dependence on British goods, as well as their preference for them, overrode the will of Napoleon. In addition, Europeans were not drawn to the French cause by the argument that Britain stood to blame for any economic problems resulting from the legislation. Rather, they held Napoleon, the originator of the Berlin Decrees, responsible. Ultimately, the hardship produced by the Berlin Decrees and the Continental System in general led Russia to withdraw from the system in 1810. Napoleon's attempt to coerce Russia to return to the stipulations contained in the decrees led to war in 1812 and dire consequences for the French Empire.

### **Bernadotte, Jean-Baptiste-Jules (1763–1844)**

Jean-Baptiste-Jules Bernadotte was a successful soldier in the republican period and was quickly promoted. In 1796 he defeated Archduke Charles of Austria at Ratisbon before being transferred to the French army in Italy. After holding a series of military and diplomatic posts, he was made a

marshal in 1804. He fought at Austerlitz with success, but in the 1806 campaign against Prussia, he was criticized for not appearing at either Jena or Auerstädt. At Wagram, Napoleon was once more unhappy with his conduct. In 1810 he was adopted by the king of Sweden as his heir, and from then on he drifted away from Napoleon. In 1813 he joined the Allies and commanded the Army of the North, fighting at Dennewitz and Leipzig. On the abdication of Napoleon he hoped to be made ruler of France, but he was to be disappointed. He then ruled Sweden until his death in 1844.

Bernadotte was born in Pau in Gascony. He was the son of a lawyer, and his father intended that Jean should follow the same profession. However, on the death of his father in 1780, Bernadotte joined the Régiment de Brassac. Within eight years he had attained the rank of sergeant major. In May 1789 Bernadotte's regiment was sent to Marseilles to help quell civilian unrest. During this posting he was instrumental in saving his commanding officer from a mob. As a reward he received a commission and joined the 36th Regiment, which was posted to the Army of the Rhine. He was made *chef de bataillon* in February 1794 and by April was commanding a brigade under General Kléber. He fought at Fleurus, where his troops carried out a spirited attack on an Austrian-held wood, and as a result he was promoted to the rank of general. By October he was commanding a division. In November he was made governor of Maastricht. In 1795 Bernadotte was constantly engaged in the campaigns along the Rhine. At the Battle of Kreuznach he was involved in some bitter street fighting. In 1796 he occupied Nuremberg and the university town of Altdorf. Here an incident occurred that was to test Bernadotte's temperament. The burghers of Altdorf claimed exemption from having to quarter the French troops. Bernadotte felt that this was a slur on the reputation of his men and threatened to burn down the city if they refused to provide provisions. In August his troops were near the city of Ratisbon (present-day Regensburg), when he was attacked by Archduke Charles. Despite being outnumbered, Bernadotte was able to fight a valiant rearguard action that allowed him to withdraw to Coblenz. It was now reported in Parisian newspapers that Bernadotte had looted Nuremberg. These reports stemmed from the threats that Bernadotte had made at Altdorf. He was furious and traveled to Paris to ask the Directory to take action. Dissatisfied with the actions his government took, Bernadotte threatened to resign.

At this point Bonaparte had requested reinforcements in Italy, and Bernadotte's division was given orders to cross the Alps. Despite the fact that Bernadotte's veteran division was sorely needed, there was tension between them and the rest of the Army of Italy. Bernadotte's men were seen as too close to the traditions of the old royalist army and were

dubbed “Les Messieurs” by the citizen-soldiers of the Army of Italy. Bernadotte himself was drawn into the conflict when the military governor of Milan, Colonel Dominique-Martin Dupuy, refused to obey Bernadotte’s orders. Bernadotte had him arrested, but the colonel was saved by the intervention of General Berthier, who would become Bonaparte’s nominal chief of staff. This clash was to lead to enmity between the future marshals. In March Bonaparte and Bernadotte met near Milan. The meeting was cordial, but there was tension between the two. Bernadotte realized, though, that at the moment Bonaparte had the ear of the Directory and that he had little choice but to obey his instructions.

On 10 March 1797 Napoleon opened a new offensive with Bernadotte leading the advance guard of the right wing. Bernadotte led the crossing of the Tagliamento River and was responsible for saving two men who had been swept away. He was now given the task of blockading or storming Gradisca. Bernadotte was furious with these orders as he suspected that whatever decision he took would be criticized. He carried the city by assault but was still censured by Napoleon for the unnecessary loss of life. Bernadotte was now sent back to Paris with Austrian trophies. This could have been interpreted as an honor, but Bernadotte suspected that it was mainly to get him out of the way.

Early in 1798 Bernadotte was made ambassador to Vienna. It was not a post he wanted, and he was unable to conceal his Republican values. Indeed, Bernadotte is supposed to have had a tattoo declaring “Death to Tyrants.” As a result, the embassy was stormed by a mob and the tricolor was burnt. Bernadotte was incensed by the inactivity of the Austrian government in this matter and left Vienna in April. He was asked to be ambassador to The Hague but he refused. While in Paris Bernadotte married Desirée Clary, who had been betrothed to Bonaparte. This event did little to create harmony between the two. In 1799 Paul Barras asked Bernadotte to take part in a coup against the Directory, but he took no action. In July he was made minister for war, but he was dismissed in September. When Bonaparte returned from Egypt, he asked Bernadotte to take part in the coup of Brumaire. Bernadotte refused but promised not to act against him. After Bonaparte was made First Consul, Bernadotte was made a councilor of state in January 1800 and was then given command of the Army of the West. This force was intended to deal with a threatened invasion by an Allied army. The invasion that actually took place was, however, little more than a raid, consisting of a landing of royalist émigrés in Quiberon Bay.

The Army of the West was now disbanded. Bernadotte angered Napoleon when in his farewell address to his troops he consistently stressed ideas of liberty, which

Bonaparte saw as criticism of his regime. Bonaparte now intended to send Bernadotte to the United States as ambassador. However, with the sale of Louisiana in 1803 and the outbreak of war with Britain in the same year, Bernadotte remained in France. For almost a year he received no official post. In 1804, though, he was made a marshal and governor of Hanover. By August 1805 he was in command of I Corps of the Grande Armée. Bernadotte played his part in the Ulm campaign, and at Austerlitz his corps, with that of Marshal Soult, launched the decisive assault. After the peace Bernadotte was made governor of Ansbach, and in June 1806 he was made prince de Ponte Corvo.

Problems were to follow in the campaign against Prussia, however. At the twin battles of Jena and Auerstädt, Bernadotte did not commit his corps to either engagement. Many reasons have been given for this, varying from his dislike of Napoleon and the hope that he would be defeated and therefore discredited, to faulty staff work and difficult terrain. However, as a result, Bernadotte was severely criticized by Napoleon. Goaded by this criticism, Bernadotte launched a fierce pursuit of the Prussian forces. He stormed Halle and took part in the capitulation of the Prussians at Lübeck, as well as of a division of newly arrived Swedish troops hoping to relieve the city. In January 1807 Bernadotte’s corps was in East Prussia, but his troops were not present at the Battle of Eylau. Once more Napoleon was critical, but his absence could be explained by the fact that orders from Berthier had been intercepted. In June he was wounded at Spanden and obliged to relinquish command. With the onset of peace he was made governor of Lübeck, Hamburg, and Bremen.

When war with Austria broke out in 1809 Bernadotte was given command of the Saxon corps. Many of the Saxon troops at the time were inadequately trained and equipped to fight, and Bernadotte resented being given what he believed was a second-rate formation. Despite this he gained the trust of his troops, and at the start of the campaign they performed well. Wagram proved the decisive battle of the campaign. Once more Bernadotte was a figure of controversy. On the first day of the fighting the Saxons suffered serious losses, and Bernadotte suggested that this was due to the fact that Berthier had not released reserves to support him. Overnight Bernadotte made the decision to withdraw from the village of Aderklaa. Napoleon was furious, as this village now had to be retaken before his main attack could begin. Bernadotte then compounded his error by issuing a proclamation praising the performance of the Saxon troops, as a result of which Napoleon had him removed from command. His next command was the Army of Antwerp, which had been created to ward off the threat of the British invasion of Walcheren Island.

Bernadotte's fortunes now changed dramatically. King Charles XIII of Sweden had no direct heirs, and his adopted son died in June 1810. The king favored a Danish prince, but this was not popular within Sweden. The king therefore asked Napoleon to suggest a member of his family or a marshal as a suitable successor. Bernadotte qualified on both counts. On 21 August, Bernadotte was elected Crown Prince of Sweden and renounced both his Catholic faith and French nationality and took the name Charles John. Napoleon believed that the new Swedish king would bring Sweden fully into the Continental System. This was not to be the case. As one of his first objectives, Bernadotte sought the annexation of Norway—a direct affront to Napoleon, since Norway was part of the kingdom of Denmark, an ally of France. As a consequence Napoleon occupied Swedish Pomerania. Bernadotte now focused his attention on Russia and on 5 April 1812 signed a treaty of alliance at St. Petersburg with Tsar Alexander I. When the invasion of Russia took place, Bernadotte met with Alexander in Finland. Once French defeat in Russia was inevitable Sweden and Britain signed a treaty in which the former agreed to send 30,000 troops to northern Germany, paid for by British subsidies. Bernadotte wrote to Napoleon attributing his actions to the French invasion of Swedish Pomerania.

By May 1813 the Swedish army had landed in Germany. However, Bernadotte was at loggerheads with his allies; he wanted to take immediate action to try and take Norway, but the tsar was still actively trying to persuade the king of Denmark to support the Allies. Bernadotte met the tsar at Trachenberg, where the former recommended a policy of engaging French forces commanded by the marshals, but not engaging Napoleon directly. Rather, Allied forces should withdraw from him. Bernadotte was also given command of the Army of the North. The fighting in early autumn seemed to vindicate this policy with the victory at Dennewitz on 6 September. Bernadotte was nonetheless criticized for his lack of aggression. It seems that he harbored thoughts of replacing Napoleon with himself as emperor and believed any engagement between his own forces and the French reduced the possibility of this taking place. However, he arrived with his forces to assure Allied victory at Leipzig.

After Leipzig the Army of the North marched north to engage Marshal Davout. Lübeck was captured on 5 December and in the Treaty of Kiel on 14 January 1814, Norway was ceded to Sweden. On 10 February the Army of the North reached Cologne. Bernadotte was at Liège when Napoleon abdicated, and despite the fact that he quickly traveled to Paris, he had little chance of securing his goal of becoming ruler of France because many saw him as a traitor to his native land. Bernadotte soon returned to Liège. Norway

declared independence, and he led the Swedish army in a bloodless campaign to overawe the Norwegian forces in May 1814. When Napoleon escaped from Elba, Bernadotte did not join the Allies, as he believed that Sweden had already fulfilled its commitment to the Allied cause. Bernadotte became King Charles XIV John on 7 February 1818. He was to rule until 1844 as a generally popular monarch.

### **Berthier, Louis-Alexandre (1753–1815)**

Born at Versailles, Louis-Alexandre Berthier is best known for his role as one of Napoleon's marshals and as the Emperor's nominal chief of staff. Berthier, however, had a military career spanning over forty years, during which he also served in the comte de Rochambeau's expedition to the United States during the American War of Independence (1775–1783), and as an officer in both the Royal and Revolutionary Armies.

Louis-Alexandre was the son of Jean-Baptiste Berthier and his first wife, Marie-Françoise l’Huillier de la Serre. He was one of four children by his father’s first marriage. There was later a fifth from a second marriage. His father oversaw much of Alexandre’s early military career, much of it spent in his youth at the Hôtel de la Guerre, the French War Ministry, where Alexandre’s father served as a topographical engineer. Jean-Baptiste therefore oversaw much of his son’s attention to detail in drawing maps for the use of the ministry. By 1770, at the age of seventeen, he was a lieutenant. Outside of the young man’s work in the cartographic section at the Hôtel, his father made sure that Alexandre’s military education was rounded out by a number of field assignments. For instance, in 1772 he was attached to the Legion of Flanders. Likewise, he was present in 1775 at the army maneuvers of the Strasbourg garrison. He went on to write reports on these exercises that won him praise from his superiors.

On 2 July 1777, he was promoted to the rank of captain. Meanwhile, he continued gaining field experience by serving in Lambesc’s Lorraine Dragoons. In 1779 he was assigned to the Army of Normandy, then preparing for a planned cross-Channel descent on England. He gave up this opportunity in favor of attempting to gain a post on Rochambeau’s expedition to America. He achieved this transfer, and followed the second division of the expeditionary force. Eventually, he was attached to the Soissonais Regiment along with his brother Charles-Louis.

Berthier served with some distinction during the campaign in America, which culminated in the siege of Yorktown and the surrender of Lord Cornwallis. After leaving America, the force to which Berthier was attached did not return to France; rather, it went first to the Caribbean and eventually to South America in order to aid France’s Spanish allies. During this portion of his American adventures, Berthier experienced a personal tragedy when his brother died in a duel. Berthier left a fairly complete journal of his experiences during this period of his life. Unfortunately, the section dealing with the siege of Yorktown in particular has been lost. He returned to France in 1783.

On his return, Berthier toured both Austria and Prussia. During his stint in Prussia, he met Frederick the Great and seems to have made a positive impression on the aging king, for he was invited to observe the maneuvers of the Prussian army at Breslau in Silesia in August 1783. While on this tour, Berthier also reconnoitered the battlefields of the Seven Years’ War (1756–1763). Next, he journeyed to the court of Emperor Joseph II of Austria.

On his return to France, Berthier resumed his staff work at Versailles. For the remainder of the decade, promotion came slowly to the young officer. In 1787 he received the designation of assistant quartermaster general,

Marshal Berthier, Napoleon’s chief of staff from the start of his first Italian campaign in 1796 until his first abdication in 1814. The operational efficiency of the Grande Armée owed much to his considerable administrative and organizational skills. (Drawing by Antoine Jean Gros from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 2)

but he was only promoted to major on 1 July 1788. During this year he was assigned to the position of chief of staff to the camp at Saint-Omer. At the same time, however, he received the Cross of the Royal Military Order of Saint-Louis. On 11 July 1789 he was promoted to the rank of lieutenant colonel. In the same year, as a mark of gratitude for his service in the American War of Independence, Berthier received from the U.S. government the Eagle of the Society of the Cincinnati. Through 1788–1789 Berthier accompanied General Lambert, the inspector general of the Royal Army, on a tour of Flanders and Hainault. On 1 April 1791, at the age of thirty-seven, he was promoted to the rank of colonel.

Like many other officers of the Royal Army in much the same situation, Berthier is thought to have seen his promotions to this point as coming at an agonizingly slow pace. Still, with the outbreak of the Revolution, he did not immediately join the Revolutionary cause. During the early years of the Revolution, Berthier seemed to approach

the unfolding events with a certain reservation. Some of its reforms he seems to have favored, so much so that he enlisted as a fusilier in the Versailles militia along with his brothers César and Leopold. The Versailles militia was patterned after the same organization in Paris, which was then commanded by the marquis de Lafayette. The Versailles militia fell under the command of the comte d'Estaing, another name more closely connected with the American War of Independence. On the election of d'Estaing to the command of the organization in September 1789, Berthier was promoted to the rank of lieutenant colonel and held the post of chief of staff.

With the removal of the royal family from Versailles (5–6 October 1789), Berthier held responsibility for the protection of the royal properties and commanded the royal garrison stationed there as well. Like many other officers from the old Royal Army still in service, Berthier fell out of favor with the popular faction of the Revolution as politics began to radicalize. In the case of Berthier, the change was due, in particular, to the work of one Laurent Lecointre, who printed a number of attacks on Berthier's loyalty to the Revolution. Matters came to a head during the departure of the Flanders Regiment, now restyled the 19th Line. Soon after this event, Berthier resumed his staff work with the regular army. Through the autumn and winter 1790–1791, Berthier, still a colonel, worked at recruiting volunteers in Loiret and Seine-et-Oise. He likewise served as the chief of staff for the 17th Division, then concentrated around Paris.

With the declaration of war on Austria by the Legislative Assembly on 20 April 1792, Berthier's career turned in a much more active direction. He was again a chief of staff and serving under Rochambeau, now a Marshal of France. During 1792 they both served with the Army of the North on the Dutch border. Berthier continued in this post under the command of General Luckner when the former was made a *maréchal de camp*.

Berthier again ran afoul of the civil authorities at this time. He had written an open letter to the king on 27 June 1792, denouncing the attack on the king's person that had taken place on 20 June at the Tuileries. For this statement, he was relieved of his command after the overthrow of the monarchy on 10 August. The decree was passed on 21 August and went into effect on the very day of the Battle of Valmy—20 September. Berthier did appeal this decision, supported by generals Luckner, Custine, and Kellermann. All of this was to no avail until the spring of 1793.

At that time, the Committee of Public Safety presented Berthier with the chance to serve in the Vendée as a volunteer. He took the opportunity, though he was not formally reinstated in the Army of France. Serving as a volunteer, Berthier took part on 9 June 1793 in the Battle of

Saumur, where he was wounded and had two horses shot from under him. Shortly after these events, he returned to Paris, where he again fell under suspicion and was detained for a period. At this point, he retired to the estate of a brother-in-law at Précly-sur-Oise. In residence here, Berthier escaped the worst ravages of the Terror. The Thermidorian Reaction allowed him to emerge from this semi-retirement.

Berthier was officially reinstated as a *général de brigade* and chief of staff to the Armies of the Alps and Italy on 5 March 1795, again serving under the command of Kellermann. On 13 June of the same year, Berthier was promoted to *général de division*. On 2 March 1796 the Directory made Bonaparte commander of the Army of Italy. Berthier now became his chief of staff. The two met for the first time on 24 March at Antibes. The partnership thus begun would last for the next eighteen years.

During the famed Italian campaign of 1796, Bonaparte wrote reports citing Berthier very highly for his staff work and for his bravery. In the summer of 1797 Berthier's headquarters was set up at Milan. It was at this time that Berthier met Giuseppin Visconti, who became his mistress and remained so for the rest of his life, despite his later marriage. At the end of 1797 Bonaparte named Berthier commander of the Army of Italy while the former traveled on his way to Paris.

In early 1798 Berthier was ordered by Bonaparte to set up the Republic of Rome. Accordingly, Berthier entered the city on 15 February. On 19 May he left the port of Toulon with Bonaparte aboard the *L'Orient* on the expedition to Egypt. Berthier again served as chief of staff through both the Egyptian and the Syrian campaigns, returning to Paris with Bonaparte in October 1799.

With the coup of Brumaire, Bonaparte became First Consul, and at the same time he was preparing to engage Austria again. Berthier's part in this came with his appointment as both minister of war and commander of the Army of Reserve. In the early months of 1800, Berthier marched his forces across the Alps in preparation for this campaign, which culminated at the Battle of Marengo on 14 June 1800.

With the conclusion of the campaign of 1800, Berthier was next sent on a diplomatic mission to Madrid, where, on 1 October, he signed the Treaty of San Ildefonso, in which Spain gave Louisiana to France in return for Parma. Berthier was at Napoleon's side through most of the Emperor's reign. He served in the field with Napoleon at the battles of Austerlitz, Jena, Eylau, Friedland, and Wagram. In most of the aforementioned battles, Berthier's abilities in staff work were a key ingredient to the success of the campaign, though in the campaign of 1809 Berthier was placed in command of the Imperial Guard, his first and

only field command. When the Austrians began an offensive on 9 April, Berthier received orders from the Emperor out of sequence and ordered some poor concentrations, including a countermarch by Marshal Davout's corps from Ingolstadt to Ratisbon. The problem was soon corrected with the arrival of Napoleon in the theater of campaign. Most scholars look to Berthier's mistake at this time as evidence that while he excelled as a chief of staff, he was not a very capable field commander. Through all of his services as chief of staff, and occasionally as a diplomat, Berthier was amply rewarded by the Emperor.

Among his honors was membership in the First Cohort of the Legion of Honor, instituted in 1804. Likewise, he was the first to receive the title of Marshal of the Empire in the same year. Later, Berthier became the first to receive the Grand Cordon of the Legion. Likewise, he was made Grand Master of the Hunt. In addition, he was prince souverain de Neuchâtel. While he never set foot in his Swiss principality, he did dedicate some time to the maintenance and care of his estate and its people as a sort of absentee prince. On the heels of the Austerlitz campaign against Austria and Russia, in 1805 he was made the duc de Valgrin. In spite of his mistakes at the outset of the campaign of 1809, Berthier redeemed himself with his usual excellent staff work, and was named prince de Wagram on 15 August of the same year.

In 1808, at the insistence of Napoleon, he married Marie-Elisabeth-Amélie-Françoise de Bavière, the Princess of Bavaria. Napoleon found Berthier's continuing affair with Visconti an embarrassment and hoped the marriage would make the marshal more mature in this respect. Berthier yielded to the pressure of his master and entered the nuptial compact. While the marriage was certainly coerced, it seems to have been happy, and it produced three children. In 1810 Berthier went to ask for the hand of Marie Louise for Napoleon, a mission at which he succeeded. He went on to represent the Emperor in the proxy marriage that followed in Vienna at the Augustkirche on 11 March 1810.

Returning to his military exploits, Berthier took part in the Russian campaign in 1812. At the outset, he was criticized by Napoleon for warning of the dangers of a campaign conducted over such great distances. Though Bonaparte could sometimes be quite scathing in his treatment of his chief of staff, Berthier never seems to have performed to less than the best of his ability for the Emperor. Thus, he entered Moscow with Napoleon on 14 September and began the retreat with him on 18 October.

Berthier remained with remnants of the Grande Armée after Napoleon abandoned it and set off for Paris. True to form, Berthier kept the Emperor informed as to the weight of the disaster through almost daily reports on the condition of the army. By this time, Berthier was feel-

ing the effects of both age and the rigors of campaign. He thus left the army at Posen on 1 February 1813 and arrived in Paris on the ninth, hoping to regain his health. By the middle of March, having regained his health in some measure, Berthier was at work coordinating the campaign in Germany.

He was very active in the campaign of that year, which included the Battle of Leipzig, as well as in the defense of France the following year. Furthermore, Berthier was among those present when Napoleon abdicated on 6 April 1814. Following the final instructions of the Emperor, on 11 April Berthier transmitted the news that the army would adhere to the new government. On the same day, he gave his personal allegiance to the president of the Senate. With the abdication of Napoleon, Berthier became the interim commander of the army. He left Fontainebleau on 17 April, and by the time Napoleon was departing for Elba, Berthier was already back in Paris, administering to the needs of the troops.

Among the functions he performed in this role was greeting the duc de Berry at the Barrière de Clichy in Paris and promising him the allegiance of the army. On 29 April he was among the dignitaries who met Louis XVIII at Compiègne. Likewise, on 2 May, he rode at the head of the officers who preceded the king into Paris. Thus, Berthier seemed to move from one master to another with great ease, and his capabilities were certainly recognized by the new government.

On 1 June 1814 Berthier was made captain of the 5th, or Wagram, Company of the king's bodyguard. He was also made a peer of France under the new regime. Furthermore, on 14 September he was made commander of the Royal Military Order of Saint-Louis. What seemed to be a comfortable end to the career of the former marshal was interrupted by the return of Napoleon from exile and the Hundred Days.

On the news of Napoleon's return, Berthier sent his family away from Paris to Bamberg. As a member of the king's bodyguard, Berthier was placed in the difficult position of choosing sides. He decided, initially, to follow the duty before him at the moment and went with the king when he abandoned Paris. He proceeded to instruct Marshal Macdonald, however, to tell the people of France that he would resign this post once the king had safely been escorted to Ghent and would then return to France.

The former marshal was as good as his word, for when Louis XVIII reached Ghent, Berthier resigned his post and went on to Bamberg, reaching the Bavarian province on 29 March. There he requested passports for his family to leave Bavaria and return to France. He made two requests of the prime minister on 2 and 5 April. Neither of these was answered. Finally, on the tenth, he and his wife both wrote

the king directly. These inquiries resulted in a reply in the negative on 13 April. Thus, Berthier was a virtual prisoner in Bamberg while the final act in the Napoleonic drama played itself out in Belgium. He was not to see the final end at Waterloo, however, for on 1 June 1815, he fell from a window in his residence at Bamberg.

At the time of his death, there were rumors that Berthier's demise might have been the result of suicide or assassination. The Bavarian government maintained that his death was accidental, though it is worth noting that Berthier was a member of the royal family only through marriage and not by blood and therefore was not immune from foul play. In 1884 his remains and those of his wife were transferred to their final resting place in the royal castle of Tegernsee.

## Bertrand, Henri-Gatien, comte (1773–1844)

Henri-Gatien Bertrand was one of Napoleon's closest, most loyal followers and has even gained a reputation as

one of his key executives. He was present at many of the pivotal moments in the Emperor's life, including his exile to Elba and eventually St Helena.

Originally an engineer, Bertrand also saw action at many of the greatest battles of the Revolutionary and Napoleonic era, including those of the Egyptian campaign, as well as at Ulm, Austerlitz, Jena, and Friedland. After joining the Paris National Guard in 1792, Bertrand went on to enjoy a distinguished military career. He was promoted to *général de brigade* in 1800 and became Napoleon's aide-de-camp in 1804. He was further promoted to *général de division* in 1807.

He constructed the bridges over the Danube for the battles of Aspern-Essling and Wagram and was heavily involved in the 1813 campaign in Germany. Although many sources ignore his contributions to France's war effort, one of his contemporaries, Louis Antoine Fauvelet de Bourrienne, paid tribute to his considerable military and engineering expertise during that year's campaigning. He wrote: “General Bertrand was ordered to construct a bridge which might form a communication between Hamburg and Haaburg, by joining the islands of the Elbe to the continent, along a total distance of about two leagues. In the space of 83 days the bridge was finished. It was a very magnificent structure; its length being 2529 fathoms, exclusive of the lines of junction formed on the two islands” (Bourrienne 1903, 423).

In 1813 he was also appointed grand marshal of the palace to replace Géraud Duroc, who had been killed at Bautzen. Bertrand has, perhaps, become best known for accompanying Napoleon on his ignominious departure to St. Helena. As David Cordingly has made clear, his decision to stay at the Emperor's side could not have been an easy one, for Fanny, his half-English wife, was firmly opposed to the idea and was very vocal in her opposition (Cordingly 2003, 271). Even in death, Bertrand was completely devoted to the Emperor. Bourrienne noted that Bertrand, who was present at Napoleon's postmortem, strongly protested at the British doctors' report, which referred to “General Bonaparte,” a slight on his imperial status (Bourrienne 1903, 517).

In 1840, when Napoleon's body was returned to France, Bertrand went to St. Helena with the prince de Joinville to supervise the exhumation and reburial. Some accounts tend to emphasize Bertrand as merely a prime propagandist for Napoleon and his regime, but this myopic version of history does not do justice to his strong, complex, and undoubtedly warm relationship with the Emperor.

Bertrand was, throughout the period, one of Napoleon's few close friends. His undying affection is clear in the following passage, which describes Bertrand's thoughts

on Napoleon's final journey to France: "The return of Napoleon's body was unlike any other event in history. This was only appropriate, for there has been no person like Napoleon in history" (quoted in Markham 2003, 300).

### Bessières, Jean-Baptiste (1768–1813)

Nicknamed "the Bayard of the Grande Armée," Jean-Baptiste Bessières was a close confidant of Napoleon and was among the eighteen leading generals raised to the rank of marshal on 19 May 1804. Born at Prayssac in Gascony on 6 August 1768, Bessières was the son of a doctor and was a school friend of the future Marshal Joachim Murat. Enlisting in the National Guard in 1792, he secured a place in King Louis XVI's new "constitutional" bodyguard and in this capacity served in the defense of the Tuileries in August 1792. Fleeing Paris in the wake of the massacre that followed, he then enlisted in the Legion of the Pyrenees (later the 22nd Chasseurs à Cheval) and with this unit fought in the campaign against Spain of 1793–1795. In 1795, by now a captain, Bessières was transferred with his regiment to the Army of Italy. This proved a phenomenal stroke of luck: Aside from soon placing him under the command of the up-and-coming Napoleon Bonaparte, it also brought him back into contact with his old friend, Murat, who had secured a place on the new commander's staff.

At all events, the sequel was rapid promotion: When Bonaparte formed a personal bodyguard, it was Bessières who was placed in command. Attached to Bonaparte's staff in Egypt, Bessières, now a colonel, was one of the handful of officers who accompanied the future emperor on his return to France in 1799. Very active in building up support for his patron in the army, he was rewarded for his loyalty by appointment to the post of second in command of the Consular Guard formed after the coup of 18 Brumaire, and in this capacity he distinguished himself at the Battle of Marengo, where he helped cover the retreat of the French right wing and later participated in the last-minute coun-

Marshal Bessières. He commanded the Imperial Guard cavalry at Austerlitz, Jena, Eylau, and Friedland, and later served in the campaigns in Spain, Austria, Russia, and finally Germany, where he was killed in 1813. (Drawing by Edmond Hedouin from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 4)

terattack that finally won the day. Though he had still not led more than a single regiment on the battlefield, his elevation to the marshalate in 1804 surprised no one, for he had by now become a leading figure in the consular court.

Appointed to the command of the entire Imperial Guard in 1805, he again did well at Austerlitz, where he helped beat off the Russian attempts to regain the Pratzen heights, but he saw no action at all in the campaign of 1806, and other than helping rescue Murat after his great charge against the Russian center at Eylau, he proved to be a disappointment as the commander of a cavalry corps in the invasion of East Prussia in 1807. Returned to the command of the still relatively small Imperial Guard, he also derived little profit from the Battle of Eylau, for, as at Jena and Auerstädt, his men were not given the opportunity to go into battle.

In consequence, French intervention in Spain was a moment of considerable importance for him, for the Emperor, possibly moved by growing criticism of Bessières among jealous fellow marshals, appointed him to the command of a corps in the army sent across the Pyrenees in the winter of 1807–1808. Here he did well, winning the one

and only battle in his entire career in which he was in independent command, at Medina de Río Seco on 14 July 1808, but in March 1809 he returned to France to take part in the new war against Austria that was now threatening as commander of the reserve cavalry of the Grande Armée.

What followed was conceivably the high point of his career. Thus, at Aspern-Essling a brilliant cavalry charge held back the Austrian center at a moment of desperate crisis, while at Wagram a similar attack helped cover the gap in the line caused by Napoleon's enforced transfer of Marshal Macdonald's corps to the left flank. Rewarded with the title of duc d'Istrie, Bessières also had the satisfaction of seeing the end of Marshal Lannes: Mortally wounded at Aspern-Essling, Lannes was Bessières's deadliest enemy among the marshalate and had seemingly just accused him of being a cowardly incompetent who owed his rank to little more than toadying to Napoleon. If this last story is true, it is lent an added piquancy by the fact that Bessières's friendship with Josephine led him to oppose the divorce of 1810, which may account for the fact that he was not restored to a field command until January 1811, when he was sent back to Spain as commander of the Army of the North.

In this capacity, he collaborated with Marshal Masséna in the campaign of Fuentes de Oñoro, but Bessières was, with considerable injustice, blamed by his fellow marshal for the Allied victory and in consequence was recalled to Paris. Seemingly distrusted by Napoleon thereafter, in the Russian campaign he was given not a corps but, rather, only the 6,000-strong cavalry of the Imperial Guard, at the head of which force he helped cover the retreat from Moscow. On 25 October, indeed, he actually crossed swords with some Cossacks who attacked Napoleon's personal entourage near Kaluga. By the end of the campaign he had fewer than 800 men left, but the Emperor was pleased enough to give him the whole of the Imperial Guard when hostilities were resumed in Germany in 1813. However, there was to be no chance of further redemption: Struck by a cannon ball while inspecting the enemy line, Bessières was killed instantly near Lützen on 1 May 1813.

### **Biberach, Battle of (2 October 1796)**

Fought during the Rhine campaign of 1796 between French forces under General Jean Moreau and an Austrian army under the command of Graf Baillet de Latour. Strategically Moreau had been on the retreat in Germany, but he seized an opportunity to launch an attack on the pursuing Austrian force. Moreau launched three columns against the Austrians and forced them back across the Riss River.

In the middle of September Moreau, in command of the Army of the Rhine and Moselle, was forced to withdraw from Bavaria because of the defeat of General Jourdan's army in central Germany and the fact that a popular uprising had broken out in Swabia, cutting his lines of communication. During his retreat Moreau was pursued by an Austrian force commanded by Latour. Moreau's force was superior to that of the Austrians, and having crossed the Riss at Biberach he decided to attack. The Austrians crossed the Riss on 29 September and then spread themselves out in a wide arc of about 15 miles to continue their advance. Latour was convinced that the French would not attack him. However, on the morning of 2 October Moreau launched three columns against the Austrians. In the north General Desaix met little resistance and pushed the enemy back about 8 miles toward Biberach. The retreating Austrians took up a position on Galgenberg hill just to the south of Biberach.

The French center was under the command of General Gouvion St. Cyr, whose attack was held up by an Austrian battery until he was able to bring his own twenty-four guns to bear. St. Cyr's men then captured the hills around the village of Steinhausen to the southwest of Biberach. The Austrians retreated on the settlement at Grodt. The French forces to the south, on the other hand, were

unable to make progress against superior enemy forces, though these Austrian troops were forced to withdraw when their flank was exposed by the successful French attack in the center. By late afternoon the Austrians had been forced back into defensive positions mainly to the south and west of Biberach.

Moreau now launched his final attacks on the Austrian positions. Desaix's force assaulted both sides of the Galgenberg hill at once in a pincer movement, and it became clear that the defenders were threatened with encirclement. Latour therefore gave orders for a retreat across the Riss at Biberach. In the process he was able to extract his cavalry and artillery, but four battalions of infantry were captured. At Grodt, too, the Austrians were forced to withdraw on Biberach. The Austrians now tried to retreat over the only bridge in Biberach, and there was wholesale confusion as the French pursued their adversaries.

Only nightfall allowed the majority of the Austrian forces to make good their escape, but not before they had lost 4,000 men taken prisoner by the French with a further 1,000 troops as casualties. Moreau lost fewer than 1,000 men.

### **Bidassoa, Crossing of the (7 October 1813)**

The crossing of the river Bidassoa by the Allied army under the Marquis of Wellington took place during the closing phase of the campaign of 1813 in Spain. Where it ran into the Bay of Biscay, the river formed the frontier between France and Spain. Wellington crossed the estuary at low tide and outflanked the fortifications that Marshal Nicolas Soult had built to defend the river. The French retreated to defend the line of the river Nivelle.

Following the defeat of the French at San Marcial, Soult fell back to the line of the Bidassoa and began to construct a series of fortified positions to defend the river. He believed that Wellington would be unable to cross the Pyrenean passes with the onset of winter and that the lower reaches of the river were too wide to ford. Soult therefore concentrated on defending the central section of the river with six divisions under the command of generals Bertrand Clausel and Jean-Baptiste Drouet, comte d'Erlon. The rest of his forces were spread along a 23-mile-long cordon. However, Wellington had been informed by local fish-

ermen that at low tide it was, in fact, possible to cross the estuary. Soult had only a weak division commanded by General Antoine Maucune in the area. By 7 October Wellington had gathered 24,000 men opposite this sector. Despite the fact that Soult was aware that Wellington was gathering his forces in the west and that there was a larger pontoon train at Oyarzun, he refused to believe that the British were engaged in a serious attempt to cross the river.

At dawn, though, the Anglo-Portuguese army swiftly crossed the mud flats and quickly forced Maucune to withdraw. The attack then continued against the village of Behobie, which was garrisoned by only one French battalion. Resistance was brief, and the remnants of Maucune's force fell back on the village of Croix de Boquets. French reinforcements had been brought up by General Honoré Reille, but they could not halt the British advance. Soult's line of defense had been breached.

At the same time as the attack across the estuary, Wellington launched a holding attack on the village of Vera in the center of Soult's line. Major General Sir Charles von Alten's Light Division, though surprised by the lack of resistance offered by their opponents, exploited their initial advance, supported by Spanish troops. The village of Vera was soon under attack, and despite an increase in casualties the Allied army had command of the most important features in the sector within a few hours. Soult had hurried to the area opposite the initial Allied crossing, but he was unable to rally Reille's troops, and there were more enemy troops crossing every hour. Knowing that he could no longer hold onto his position along the Bidassoa, Soult fell back toward the Nivelle, having suffered around 2,000 casualties. Wellington, who had lost approximately 1,500 men, did not immediately pursue.

### **Bladensburg, Battle of (24 August 1814)**

Fought during the British army's advance on Washington during the War of 1812. Seeking to capture the U.S. capital, Major General Robert Ross approached the town of Bladensburg, 17 miles from Washington, where he planned to ford the eastern branch of the Potomac River. The Americans, under General William Winder, made no effort

to block Ross's advance or to harass him from the woods. Nor did he destroy the bridge, which spanned the Potomac to the west of the town. The Americans had a mixed force of several thousand militia, regulars, sailors, and marines, opposed by 4,500 British. The Americans deployed some of their artillery near the river to protect the approach to the bridge. Riflemen were deployed in support to the left of the guns. The second, main American line, partly militia, partly regulars, was badly placed 500 yards behind these; it neither had cover from the nearby orchard nor was close enough either to support the riflemen or even see the riverbank itself. A third line, too far back to assist the second, was composed of militia, sailors, and marines, plus five large naval guns. Still, the American center and left were protected by the river, while the heavy woods and a deep ravine screened their right. Between these two positions ran the road to the capital, gradually rising to a summit slightly over a mile from the river.

Ross approached sometime after 10:00 A.M. in near-90-degree heat. The Light Brigade passed over the bridge and marched up the road until the militia artillery forced it back across the river. When another brigade arrived, it crossed the river and threatened the flank of the militia, which retreated. Outnumbered and with their left flank vulnerable, the American regulars in the second line also retreated, encouraged by fear of Ross's Congreve rockets. Not until Ross's infantry confronted the third line did they meet serious opposition. There, the militia issued a series of respectable volleys, while the naval guns inflicted serious losses. Nevertheless, when Winder unaccountably ordered the militia to retire, their cohesion broke and a rout ensued, leaving only the sailors and marines to contest the British advance. These were overwhelmed and driven off, while the small body of American cavalry on the hill refused to charge and galloped off with the rest of their army.

The battle ended at around 4:00 P.M. The American showing was poor, though for the fire their green troops had offered, they inflicted losses of 64 killed and 185 wounded on Ross's men, for a cost of only 71 to themselves. Nevertheless, the road was now clear to Washington, which fell shortly thereafter.

### Blake, Joaquín (1759–1827)

A prominent Spanish general in the Peninsular War, Joaquín Blake y Joyes was born in Málaga. The grandson of an Irish Jacobite, in 1808 Blake was a newly promoted brigadier who had shown some interest in military reform. Stationed in Galicia, he took over the army stationed there following the murder of its commander by some mutinous soldiers a few days into the Spanish uprising against Napoleon. Very junior as he was, he owed his promotion to the newly formed Junta of Galicia's desire for a general who would be unlikely to challenge its authority.

In this respect it chose well—unlike some of his fellow commanders, Blake was unwilling to cross the civil authorities—but otherwise the appointment was not a success. Ordered to attack the French in Old Castile, Blake squandered his only hope of success by dividing his forces and failing to strike with sufficient speed and decision. However, the disaster that resulted at Medina de Río Seco did not cost Blake his command, and he was still at the head of the Galician forces when the French counterattacked in November. Caught in the Basque provinces by the French advance, he only narrowly escaped complete destruction, and even as it was his troops suffered heavy casualties at Espinosa de los Monteros. He was replaced by the Marqués de la Romana, and early in 1809 he was sent to Aragón with orders to retake Saragossa (Zaragoza). However, despite an early victory at Alcañiz, Blake's shortcomings led to his numerically superior forces being routed at María and Belchite.

Excused for his failures, he was next sent to Catalonia, but here, too, he enjoyed little success, and he was eventually recalled to the new Spanish capital of Cádiz. Yet he was not out of favor for very long. The liberal faction that dominated the parliament that was assembling in the city wanted the Regency that now ruled Spain to be composed of men who would give them no trouble, and Blake was duly invited to take over its presidency. Conscious of the need for military reform, Blake initiated a number of changes in this capacity, of which the most important was the establishment of a permanent general staff. But he was unable to refrain from the temptation of further military operations: In the spring of 1811, for example, he led an "expeditionary army" to Extremadura, and as its commander he fought at Albuera (an experience that filled him with strong anti-British feelings).

However, in reality Blake still did not have the qualities necessary for independent command. Taking over the defense of Valencia in the face of a major French offensive in the autumn of 1811, he was beaten at Sagunto and the river Turia, forced back inside the city, and finally bombarded into surrender. Imprisoned at Vincennes, he returned to

Spain in 1814 and was showered with honors by King Ferdinand VII, but this did not prevent him from joining the liberals in 1820. With their regime falling apart, in 1823 he reverted to the cause of absolutism, only to be banished to Valladolid, where he died in 1827.

### Blake, William (1757–1827)

British painter, engraver, poet, mystic, and complex and eccentric genius. Blake was born on 28 November 1757 in London into a Dissenting middle-class family. He was the second of five children and started to attend the drawing school of Henry Pars in the Strand at the age of ten. He was self-taught, learning his craft by reading books and studying engravings from the Renaissance masters. Blake claimed to have mystical visions and dialogues with angels, the prophet Ezekiel, and the Virgin Mary. In 1771 Blake was apprenticed to James Basire Sr., who had been appointed an engraver to the Royal Society of Antiquaries in 1761. As a student at the Royal Academy in 1779, Blake became enamored of the Classical style exhibited during the Renaissance by Raphael and Michelangelo.

Blake married the illiterate Catherine Boucher on 18 August 1782, but their marriage did not produce children. Blake made her his artistic partner by teaching her to read and draw. He freelanced as an engraver and entered into a business venture with his brother Robert. However, the business collapsed in 1787 when his brother died. Blake was then employed by Joseph Johnson, who published radical works and influenced Blake's religious philosophies. Blake opened a print shop with his partner James Parke but the venture failed. He returned to Johnson, who introduced him to the radicals Tom Paine, Joseph Priestley, William Godwin, and Mary Wollstonecraft. Elizabeth Montagu and John Flaxman became his patrons.

Blake firmly believed in his own artistic abilities and followed his own path, rebelling against the artistic norms of his day. His poetry was purposely unconventional. Blake also revolutionized the methodology behind engraving. In 1778 he illuminated *Natural Religion* by using an impervious liquid to draw in reverse on copper plates, then allowing the plain part to be destroyed by acid and thereafter

colored by Catherine. He used this expensive and labor-intensive method to illuminate *Songs of Innocence and of Experience*, *The Book of Thel*, and *Jerusalem*, the last taking him sixteen years to complete. His major pieces of prose, *Marriage of Heaven and Hell* and *The Last Judgement*, exhibited his apocalyptic and mythological point of view.

Blake's democratic and individualistic philosophy meshed with French Revolutionary ideals. He published *The French Revolution* anonymously in 1791 and only sold copies to Revolutionary sympathizers; he feared a backlash against his visionary ideas. However, he denounced the Reign of Terror. He wrote *Visions of the Daughters of Albion* and *America: A Prophecy* in 1793; these works reaffirmed his distaste for authoritarian governance.

In 1800 Blake was commissioned by the wealthy William Hayley to engrave the heads of eighteen poets for his library and to create additional engravings. This warranted Blake to move to Felpham, in Sussex, where he commenced his work on *Milton: A Poem* and *Jerusalem*. He used social criticism, prophecy, and biblical legends for nearly all of his works.

A scandal erupted in August 1803 when Blake was accused of using treasonous language while removing an intoxicated soldier from his premises. He was acquitted at his trial in Chichester and moved to London. The next seventeen years of Blake's life were full of hardship and failure. He was unable to get work, and his engravings were often faked by others. In 1809 Blake organized an exhibition of some sixteen of his paintings, but very few attended it. In 1819 Blake's life took a good turn when John Linnell, a prominent painter, introduced him to a group of young artists, members of the Shoreham Ancients, who admired Blake's aesthetic vision. They considered him the grand old man of arts and concurred with Blake's view that a New Age would soon arrive and artistic and spiritual beliefs would override traditional authority.

Blake continued drawing to the last days of his life—often working in his bed—and produced his most beautiful designs and technically masterful works in the 1820s, when he created more than a hundred watercolors for Dante's *Divine Comedy* and twenty-two drawings inspired by the Book of Job. Blake's importance to the art world was largely overlooked during his lifetime; he was much too far ahead of his contemporaries. While his work was misunderstood, his lack of competitiveness ultimately led to his withdrawal from public life. Blake died on 12 August 1827 and was buried in an unmarked grave at Bunhill Fields; a monument was placed there much later.

**Blockade (Naval)**

The practice of naval blockades was well established by the outbreak of the French Revolutionary Wars. A blockade generally entailed the use of warships to patrol the coastline of an enemy and thereby deny the enemy's fleet access to the open sea by trapping it within its harbors. Such an operation was also designed to disrupt maritime commerce, as merchant ships had to contend with blockading forces that sealed off ports to overseas business. By the eighteenth century the primary purpose of naval blockades was to force an enemy battle fleet to sail out to fight the blockading squadron.

Naval blockade had been a key weapon for Britain since the Seven Years' War (1756–1763), when the Royal Navy had sealed major French ports by sailing off France's shores. Beginning in 1793, the British endeavored to establish a blockade similar to that of the past in order to devastate the overseas trade of Revolutionary France, and thereby its economy, as well as to remove the French fleet as a factor in the war by bottling it up in its harbors. By 1798 the strategy employed was that of a close blockade. Fast warships, normally frigates, were positioned within visual range of enemy harbors in order to sight any vessels, both those of war and commerce, and prevent them from leaving or entering enemy ports. Sailing farther offshore were larger vessels, mostly ships of the line that could be called on when the frigates were outgunned by more heavily armed vessels.

This system frequently produced diplomatic tension between Britain and neutral powers that wished to trade with France and other areas of Europe occupied by the forces of Revolutionary and later Napoleonic France. British vessels frequently stopped and searched neutral ships suspected of trading with the enemy or of carrying contraband, which meant goods deemed illegal by the British that were destined for an enemy power. During

these searches, the British maintained their right to seize both the ships and their cargoes as prizes if deemed necessary. Such actions led in 1800 to the establishment by European neutral powers of the League of Armed Neutrality against Britain. More significantly, Britain's blockade led to war with the United States in 1812.

Despite these problems for the British, the naval blockade was a factor in the defeat of Napoleonic France. As the French did not have sufficient naval forces to break the blockade of European ports, the loss of trade resulted in economic hardship in France and elsewhere in Europe. It also led Napoleon to retaliate through the establishment of his Continental System, which was an effort to create a continental blockade of British goods. Napoleon's determination that all Europe participate in the system led to his disastrous invasion of Russia in 1812 when Tsar Alexander I withdrew his country from it.

**Blücher von Wahlstatt, Gebhard Lebrecht Fürst (1742–1819)**

Strong willed and charismatic, the Prussian field commander Gebhard von Blücher provided leadership that was crucial to the resurgence of his nation as a military power and to the defeat of Napoleon in the campaigns of 1813–1814 and again at Waterloo in 1815. As a soldier in the Prussian Army, Blücher served in times of triumph and tumult. His career began at the height of Prussian glory under Frederick the Great and lasted through the humiliating battles of Jena and Auerstädt and on to the era of reform and ultimate success in the later stages of the Napoleonic Wars.

Born at Rostock on 16 December 1742, the future Prussian field marshal began his military career in the Swedish Army. Despite having been sent to lead a pastoral existence with relatives on the island of Rügen, the teenaged Blücher could not be dissuaded from joining the locally billeted Mörner Hussars in 1757. Ironically, with his first military adventures taking place in Sweden's service during the early stages of the Seven Years' War (1756–1763), Blücher first drew his sword in anger against soldiers of the nation he would serve for most of his life. In a manner not unknown in the era of limited war, Blücher's

allegiance changed soon after he was captured by troopers of the Prussian 8th Regiment of Hussars in 1760. Convinced by the regiment's commander, Colonel Wilhelm Sebastian von Belling, that he would be a welcome addition to the regiment, Blücher eventually agreed to switch sides, and thus began one of the most brilliant careers in the history of Prussian arms.

Blücher proved adept in battle as he soldiered on with Belling's hussars through the Seven Years' War. A proud and emotional figure, the future field marshal was not, however, very skillful in attending to the details of his military life off the campaign trail. In 1773 Blücher tendered his resignation in protest over what he saw as the unwarranted promotion of a rival. King Frederick II, not being inclined to indulge the impudence of company-grade officers, granted him his request and made it clear that he was not welcome to return to the army. Blücher would be unable to rejoin the Prussian Army until after Frederick's death. Meanwhile, during his hiatus from military service, Blücher turned his attention to farming and family life. He married Karolina von Mehling in June 1773, and in the years between this union and his return to military service in 1787, Blücher and his wife had seven children, of whom two sons, Gebhard and Franz, and a daughter, Friederika, survived childhood.

Shortly after the ascension to the Prussian throne of King Frederick William II, Blücher was reinstated in the army, and despite his long absence from active service, he was made a major in his old regiment. A hussar again, his personal habits quickly reverted to those he had learned as a youthful light cavalryman. In the days between his return to the 8th Hussars and the outbreak of war with France, Blücher regularly indulged in long rounds of drinking and gambling. The reckless lifestyle of a hussar suited him and does not seem to have handicapped his rise in the Prussian Army. Indeed, after returning to his unit he won promotions quickly, and by 1790 he was a full colonel. Despite the satisfaction he found in a revitalized military career, he was not immune to profound misfortune, most notably the loss of his beloved Karolina in June 1791. Blücher, however, was fortunate in possessing the requisite charm to draw people close to him, and the loss of Karolina was at least in part mitigated by his marriage four years later to Katharina von Colomb.

With Prussia making common cause with Austria in the French Revolutionary Wars, Blücher had ample opportunity to showcase his martial talents. The 8th Hussars were not present in the Prussian Army's first thrust against France. Thus, Blücher had to wait until the Rhine campaigns of 1793–1794 to command in battle. At a time when the Prussian Army and its leaders appeared to suffer from a general lack of resolve, Blücher was an anomaly. He served

Marshal Gebhard von Blücher, the tireless Francophobe commander in chief of Prussian forces in the campaigns of 1813–1815. (Unsigned print from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 4)

with distinction in numerous small actions in the Rhineland, and following the wounding of the 8th Hussars' commander, Colonel Johann Wilhelm Graf von Goltz, in the summer of 1793, he assumed command of the regiment. Habitually opting to attack in the presence of the enemy, his aggressive tactics at Landau on 28 May 1794 resulted in a serious rebuff to the French. His audacity in the field was rewarded shortly after this action with a promotion to major general. Blücher continued to win laurels until hostilities ceased with the Peace of Basle in 1795.

The absence of war never sat well with Blücher. Despite a promotion to lieutenant general in 1801 and the honor of being appointed governor of Münster, he was anxious for Prussia to renew hostilities with France. Unfortunately, neither his nation nor its army were prepared for a recurrence of war. In the time following Prussia's withdrawal from hostilities the armies of France, now led by Napoleon and his able compliment of subordinates, was being honed into the most capable fighting force of the age. By 1806 the soldiers of the Grande Armée had made short work of the Russian and Austrian forces that had opposed them in the War of the Third Coalition of the preceding year. With an army of highly motivated citizen-soldiers, Napoleon broke free

from the constraints attendant upon waging war in the age of Frederick the Great. The speed and alacrity with which the French waged war stood in marked contrast to the methods still favored by the Prussians. When the two powers met on 14 October 1806 on the battlefields of Jena and Auerstädt, the disparity between their two systems of warfare were made painfully obvious.

While Napoleon's victory over the numerically inferior forces of General Friedrich Ludwig Fürst zu Hohenlohe-Ingelfingen (better known simply as Hohenlohe) at Jena was not altogether astounding, Marshal Davout's success against the vastly superior army under the Duke of Brunswick at Auerstädt was profound evidence of the deplorable level of capability to which the Prussian Army had descended. At all levels of war, the Prussians had been found wanting. King Frederick William III was too timid and his senior commanders too old to compete with Napoleon and his retinue. The net result of this uneven combat was a complete rout of Prussian forces. At the outset of the Battle of Auerstädt, Blücher commanded a cavalry contingent with reckless abandon in a series of futile attacks against superior numbers of French infantry. After having his force broken by these repeated assaults, he at last found himself having to screen the retreat of the badly mauled Prussian main force. Yet even in defeat Blücher set himself apart from his contemporaries. As the bulk of what had been the Prussian forces fell into discord, Blücher and the corps then under his command maintained order and sought to stall the rapid pursuit of the French.

The days immediately following the battles of Jena and Auerstädt were in many regards more humiliating than the defeats that put the Prussians to flight. As the French pursued, most of the Prussian forces disintegrated. When confronted by French forces, many Prussian commanders surrendered without a fight. Conditions, however, were different with the forces under Blücher's command. He held his troops together while ably assisted by General Gerhard von Scharnhorst as his chief of staff. Scharnhorst, who had previously occupied the same position for Brunswick, who had been mortally wounded at Auerstädt, offered considerable resistance to the French as they furthered their pursuit. When Blücher finally did surrender at Ratkau, in the vicinity of Lübeck, he made certain that the French formally recognized that this was based upon the total dearth of resources available to him and his troops.

His honor intact, Blücher nonetheless would have to suffer through a long drought of military inactivity. In the years intervening between Prussia's capitulation in 1807 at Tilsit and its resumption of hostilities with France in 1813, Blücher became despondent, and his behavior was somewhat erratic. While he foundered, Scharnhorst and a host

of gifted intellectuals labored to remedy the many defects found in the Prussian Army of 1806–1807. By 1813 the Prussian military had been improved considerably and was in many regards more like the French army that had subjected it to a thorough drubbing in 1806 than the force made famous by Frederick the Great.

In addition to masterminding the Prussian reforms, Scharnhorst was also active as an advocate for Blücher's selection to the most significant post in the new army. In the reformer's eyes, Blücher, despite his peacetime maladies, stood alone as the figure most capable of inspiring Prussia's soldiers to brave the dangers of another war with France. Scharnhorst would also be responsible for establishing a new measure of efficiency in the conduct of Prussian operations by returning to the field as Blücher's chief of staff. Together, not only would Blücher and Scharnhorst hasten the demise of Napoleonic France, but their cooperation as field commander and chief of staff would also create a paradigm for the future conduct of Prussia's military operations.

By 1813 France was in a precarious position, trying desperately to recover from the previous year's Russian campaign and still suffering the ill effects of the Peninsular War. For Prussia the moment was ripe for exploitation and with the assurance of Russian support, the War of Liberation commenced. The combination of Allied improvement and French deterioration was made apparent on 2 May at the Battle of Lützen. When the Allied army of Peter Graf zu Wittgenstein swung into action, it was Blücher who commanded the initial assault at Grossgörschen. For nearly seven hours the Prussians and the French struggled for control of a handful of villages southeast of Lützen. When the issue seemed most in doubt, Blücher took to the field in typical hussar fashion, mounting his horse and personally leading the Prussians in battle. His willingness to expose himself to danger presented the French with a crisis that could only be remedied with a similar effort from Napoleon. The fight was costly. Blücher and Scharnhorst were wounded—Scharnhorst would eventually die from infection—and the Allies relinquished the field. However, unlike at Jena and Auerstädt, the French victory was far from decisive. There was no great disparity in casualties, and the French, suffering from a deficiency of cavalry, were in no position to effectively pursue their retreating foes. Moreover, the Allies maintained order in their retreat, were not demoralized, and within three weeks offered battle in the vicinity of Bautzen. Blücher and the Allies were not as aggressive in this engagement, yet they managed once again to frustrate Napoleon's hopes of winning a decisive battle. More important, Allied troop strength was growing and there was no diminution in the willingness of the Prussians to continue fighting.

Despite a brief armistice, from 4 June to 16 August, the Allies and Napoleon spent the bulk of the summer months preparing for war. When hostilities resumed, Blücher commanded the Prussian Army of Silesia, one of the three principal Allied armies. In this most important assignment he was an unqualified success. With August Graf Neidhardt von Gneisenau as his chief of staff, Blücher once again took to the field as part of an effective partnership in which he provided inspiration and will while the details of operational activity were left to the more gifted intellect.

Blücher, aware that Napoleon was at the head of the Army of the Bober and that the French Emperor intended to start campaigning by advancing against the Army of Silesia, adhered to the Trachenberg Plan, by which the Allies sought to isolate and defeat Napoleon's subordinates, and withdrew out of reach. Napoleon's attention then shifted to the threat to his control of Dresden, posed by the Army of Bohemia led by *Feldmarschall* Karl Philipp Fürst zu Schwarzenberg of Austria, and thus he left Marshal Macdonald to command the army facing Blücher. On 26 August, Blücher's and Macdonald's armies met in the Battle of the Katzbach. Both forces advanced to contact, and once battle was joined it was the characteristic aggressiveness of the Prussian that carried the day. Blücher pressed forward his attacks until Macdonald was thoroughly beaten. The victory, although not sufficient to drive the French out of Germany, was a launching point for a better-coordinated Allied effort that would succeed in accomplishing the greater aim within the year.

With the liberation of Germany and the destruction of Napoleon in his sight, Blücher became the driving force in bringing Napoleon to battle at Leipzig in mid-October. Despite indecision and some reluctance on the part of the Crown Prince of Sweden, the former French marshal Bernadotte, Blücher (now promoted to field marshal) was determined to force an Allied junction with the army of Schwarzenberg. When the three armies combined forces, Napoleon was completely overmatched. For four days starting on 16 October, the Prussians under Blücher helped keep Napoleon under unremitting pressure. The persistence of the Allies successfully overwhelmed the French Emperor's defenses and eventually forced him to retreat to the safety of his own country.

Blücher continued to press forward, crossing the Rhine at Kaub on New Year's Eve and confronting the French in battle with unrelenting frequency from the end of January until Napoleon was forced to abdicate in April. While Napoleon's generalship was admirable throughout the 1814 campaign, his shortened lines of communication and personal skill as a commander were not enough to compensate for superior Allied numbers and Blücher's persistence. Although they suffered a hand-

ful of losses—at Champaubert, Montmirail, Château-Thierry, and Vauchamps—the Prussians under Blücher and Gneisenau regrouped and continued offensive operations until they joined forces with Schwarzenberg before Paris on 28 March. The combined might of the Allied force compelled the defenders of the French capital to surrender three days later. Napoleon had been worn down and had little choice but to go into exile.

After returning from Elba in March 1815, Napoleon sought to secure his crown by eliminating the Allied threat to his continued rule. When he launched his campaign in June, he had only the Anglo-Allied army of the Duke of Wellington and the Prussians under Blücher to confront. If allowed to fight either of these armies alone, Napoleon was confident that rough numerical parity would favor his superior generalship. Therefore, the Emperor would have to isolate each of his opponents and defeat them in turn. Knowing something about his adversaries, Napoleon predicted that Blücher would spare nothing in marching to save Wellington, if the Anglo-Allied should be made the object of his first attack. The British commander, however, was thought to be exceedingly cautious and unwilling to risk his forces in the event of a main thrust against the Prussians. Thus, on 16 June, Napoleon concentrated his first blow against the Prussians at Ligny. The Prussians were unprepared for the storm that was loosed upon them, and Blücher, in desperation, threw himself into the fray in the hopes of reversing the situation. Personally leading a cavalry charge, he failed to stem the tide of battle and ultimately was knocked out of action when he had his horse shot out from under him, pinning him to the ground and nearly leading to his capture by French cavalry.

Blücher's Prussians had been badly mauled at Ligny, but they were not decisively beaten. On 17 June Napoleon detailed Marshal Emmanuel, marquis de Grouchy, with nearly a third of the French force, to pursue Blücher's army and prevent it from linking up with Wellington. Blücher, however, was not retreating along his own lines of communication, as the French had expected. At Gneisenau's direction the army retreated toward Wavre, away from the French and toward Wellington. With encouragement from Blücher, the Prussians regrouped after defeat and marched through the rains of 17 June, to arrive at the battlefield south of Waterloo on the afternoon of 18 June. As the Prussians began to arrive on the scene, Napoleon's hopes of winning the battle were completely frustrated. Blücher unrelentingly pressed his troops into Napoleon's right flank, forcing the Emperor to draw off from his reserve to check the advancing Prussians. Blücher's arrival not only diverted vital reinforcements but also forced Napoleon to accelerate his efforts against Wellington. The tide of battle

had been turned by the hard-driving Blücher. As his Prussians pushed in Napoleon's flank, Wellington was able to shift onto the offensive. With Grouchy engaged miles away at Wavre, fighting against Blücher's rear guard, Napoleon's situation was beyond recovery. The Prussians, after their defeat at Ligny, the long march to Waterloo, and their participation in the battle spent the night of the eighteenth pursuing the remnants of the French forces.

Blücher had infused the Prussian Army with his indomitable spirit. His long service and good work had earned him praise from many quarters, as well as the title of Prince of Wahlstatt from his king. He died 12 September 1819 at home on his Silesian estate.

## Bois-le-Duc, Battle of

*See* Flanders, Campaign in

## Bolívar, Simón (1783–1830)

Known as “the Liberator,” Simón Bolívar led various wars to liberate South America from Spanish colonial rule. Bolívar was born in Caracas, Venezuela, to a rich family of Spanish descent. At fifteen he went to Spain. He married at nineteen, but two months after returning home his wife died. Bolívar then spent the next six years traveling through Europe, furthering his education and indulging his voracious sexual appetite.

Revolution broke out in Venezuela in 1810. South America had been ripe for revolution, but Napoleon's deposition of the Spanish monarchy provided the spark. Bolívar led a delegation to Britain to persuade the exiled General Francisco Miranda to return to Venezuela. The delegation asked Marquis Wellesley, the foreign secretary, for British support. The British were sympathetic, hoping to open up South America to trade and to discomfit the French, but they were reluctant to upset their Spanish allies and remained neutral.

In 1811 Bolívar served under Miranda, commanding the garrison at Puerto Cabello, Venezuela, which he lost to escaping Spanish prisoners. Miranda sued for peace and was later arrested by Bolívar and passed over to the Spanish, who allowed Bolívar to leave the country. Bolívar offered his sword to the patriot army of New Granada (Colombia). He was given a small command and in 1812 initiated a successful campaign. In the face of Spanish atrocities, Bolívar proclaimed a “war to the death.” Any Spaniard not with the patriots would be killed. In 1813 Bolívar crossed into Venezuela. Despite some successes, his forces collapsed under pressure from numerous royalist forces including the “Legion of Hell” (horsemen from the Llanos plain).

When Spain's war with France ended in 1814, Bolívar retired to Jamaica. Spain was now free to send 15,000 veterans under General Pablo Morillo, who had served with Wellington at Vitoria. Morillo pacified Venezuela and retook New Granada. In 1815 Bolívar led an expedition to liberate Venezuela, an attempt that ended in fiasco. In 1816 he landed again and pushed inland to Guyana. He was reinforced by a legion of British volunteers recruited in London, which was awash with demobilized soldiers and materiel. In 1817 he campaigned along the Orinoco River.

After being chosen as president of the Republic of Venezuela in 1818 he set off on an epic march across the Andes and liberated New Granada, joining it to Venezuela

to form Gran Colombia. Owing to political upheaval in Spain, Morillo was authorized to negotiate an armistice in 1820.

Bolívar now set about the liberation of Peru. He had wished to join all of Peru to Gran Colombia but the people of Upper Peru demanded an independent state, which was named Bolivia. In 1828 a convention was convened to write a new constitution. Bolívar's views may be summed up as follows:

- A strong central government—not federalism
- A strong executive
- A parliament elected by the educated and property-owning classes
- A confederation of Latin American states
- Equality of rights between the races
- Antislavery

The convention dissolved in discord, and Bolívar was made dictator of the Republic of Bolivia for two years. He escaped an attempt on his life in 1828 and resigned two years later as planned. A new convention drew up a constitution on federalist lines. Bolívar died on 17 December 1830.

### Bonaparte, Caroline (1782–1839)

Born Maria-Annunziata on 24 March 1782 in Ajaccio, Corsica, Caroline Bonaparte was the youngest of Napoleon's sisters. Caroline had no formal education and as an adult was sent to Madame Campan's boarding school in Paris with Hortense de Beauharnais to become socially acceptable in Paris. Flouting Napoleon's wishes, she married General Joachim Murat on 20 January 1800 and bore the first of their four children, Achille, on 21 January 1801. Caroline was devoted to Murat and campaigned to get him command of the Army of Italy. Deeply jealous of her older siblings, Caroline pushed for a royal title and deeply resented being excluded from the succession to Napoleon's throne. Regarded as a parvenu (as indeed were all the Bonapartes) by the Bavarian royal family and snubbed by Marie Louise, Caroline never cultivated the manners or attitudes of an aristocrat, remaining bawdy and vulgar

throughout her life. She and Murat were made Grand Duke and Duchess of Cleves and Berg in 1805, then succeeded to the throne of Naples in 1808. When Murat was away on campaign, Caroline ruled Naples as his regent.

An inveterate plotter, Caroline acted both in what she perceived to be her brother's interest—as when she instigated Napoleon's affair with Eleonore Denuelle to prove Josephine's infertility—and also, most often, on behalf of Murat. In 1807 she seduced General Jean Andoche Junot in order to be positioned to seize Paris for Murat if Napoleon failed to return from campaign. In January 1813 she carried on an affair with Klemens Graf Metternich, the Austrian foreign minister, who arranged for Murat to keep Naples in exchange for Caroline's betrayal of Napoleon to Austria in January 1814. Against Caroline's advice, Murat tried to rejoin Napoleon during the Hundred Days, while she rallied troops for Napoleon, thus triggering a successful Austrian advance on Naples in May 1815. Murat's later attempted coup led to him being shot by firing squad. Caroline and her children were evacuated under the protection of British marines to Trieste, then to Austrian house arrest at Schloss Frohsdorf.

Eventually, Caroline was allowed to live in Pauline Bonaparte's Florence palace as the Countess di Lipona, where she supported her family from the proceeds of their art collection, sold largely to the Marquis of Londonderry for £250,000. In 1836 Caroline appeared before the Orleanist Chamber of Deputies to successfully demand a grant of 100,000 francs per year from France. During this period, she may havemorganatically married General Francesco Macdonald. Caroline died in Florence 13 May 1839.

### Bonaparte, Elisa (1777–1820)

Napoleon's eldest sister, Elisa Bonaparte, was born Maria-Anna on 13 January 1777 at the family home in Ajaccio, Corsica. From 1785 to 1792, Elisa attended the Royal Academy at St. Cyr as a scholarship student, but the school

Elisa Bonaparte, Napoleon's eldest sister. As Grand Duchess of Tuscany, she supported her brother's desire to unify Italy under Bonapartist rule. (Drawing by Pierre Prudhon from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 1)

closed before she could receive her promised dowry, and she returned to live with the family in Corsica and Marseilles, where she married fellow Corsican Felix Baciocchi on 1 May 1797. The best educated of Napoleon's siblings, Elisa managed her brother Lucien's Paris residence, where she hosted a salon with the vicomte de Chateaubriand and the painter Jacques-Louis David as regular participants. Sent to Rome as her brother's representative, she developed a connoisseur's taste in art and music and impressed Italian intellectuals.

In March 1805, Napoleon made Elisa the Princess of Piombino, to which was later added Lucca and Elba, and in March 1809 she became Grand Duchess of Tuscany. Elisa proved an efficient and well-liked ruler, investing in such local industries as timber, silk, and Carrara marble quarries. She established girls' academies, university chairs in French law, medicine, and music, drained swamps, and prosecuted bandits. She was a great patron of music, and Gaspar Spontini and Giovanni Paisiello dedicated operas to her, and Niccolò Paganini wrote his Sonata for Violin in honor of Baciocchi, to whom he gave violin lessons. Always

supportive of Napoleon, Elisa's Tuscany exceeded the high enlistment quotas and logistical demands of the French army.

In 1814, as the Napoleonic empire was collapsing, Elisa made a secret deal with Murat to surrender Tuscany but to keep Lucca under her rule, a plan that failed, and she was forced to leave for Bologna, then Graz. The Austrians arrested Elisa four days after Napoleon's escape from Elba, and she took no part in the Hundred Days, although her husband had sworn loyalty to Louis XVIII. Using the alias Countess de Compignano, she lived in exile in Trieste on a generous allowance of 300,000 francs a year negotiated with the Austrian government, part of which went to support her brother, Jérôme. Elisa caught a fever while supervising archeological excavations at Aquila and died at Trieste on 7 August 1820. She and Baciocchi had five children, two of whom, Elisa-Napoléon and Frédéric-Napoleon lived to adulthood. Elisa Bonaparte is buried in Bologna Cathedral.

### **Bonaparte, Jérôme (1784–1860)**

Jérôme, Napoleon's youngest brother, was given the kingship of Westphalia under the Empire, a role he fulfilled without great distinction from 1807 to 1813. Born in 1784, he lost his father at an early age and went to France when the family was obliged to depart Corsica in 1793. Initially left to his own devices, he was poorly educated and preferred indolence to application. Yet his elder brother always treated him with indulgence, despite the frequent rebukes he was obliged to administer. It was at Napoleon's behest that Jérôme entered the navy in 1800, where he soon earned a reputation for living beyond his means. An expedition to the Caribbean led to an unauthorized trip to the United States and then marriage to the daughter of a Baltimore millionaire. This profoundly displeased Emperor Napoleon, who had the marriage annulled in 1805 for dynastic reasons, Jérôme proving rather more compliant than Lucien, who had blotted his copy-book in similar fashion.

Having returned to the fleet and having been promoted to rear admiral (as befitted a member of the now-imperial family), Jérôme subsequently served in the continental military campaign of 1806, and the following year, after the defeat of Prussia, he was rewarded with the crown of Westphalia. Napoleon was at the height of his powers, and this satellite state, the largest he created, was assembled from Prussian territory west of the Elbe plus land belonging to its allies (including the Duchy of Brunswick), forming one of the largest states of the Confederation of the Rhine; its capital was located at Kassel. The purpose of founding the kingdom was twofold: to erect a barrier against the resurgence of Prussia and to establish a French-inspired, model state that would serve as an example to other German rulers.

An ambitious series of reforms was launched in Westphalia. The new state was given a constitution drafted by Jean-Jacques Cambacérès, the first to be introduced in Germany. There was provision for an indirectly elected legislature, with 100 deputies, though it met infrequently. Based on the imperial regime, this arrangement represented an experiment in enlightened absolutism, imposing modernizing reforms from above. Three seasoned French administrators were to assist Jérôme, and under their direction, with the cooperation of local bureaucrats, a good deal of reforming legislation was enacted. Seigneurial dues were abolished (though peasants had to compensate their landlords for the loss of income), efforts were made to redistribute taxes, administrative and judicial reorganization was decreed, and the Napoleonic Code was applied. Religious toleration was also implemented, notably for Jews. Yet progress was slow, the result of resistance from an entrenched nobility and the difficulty of integrating heterogeneous territories into a single kingdom. The fiscal and military exactions levied by the Emperor, like the economic disruption brought by the continental blockade, not only produced unrest but suggested that Napoleon's priority was to exploit Westphalian resources. Nonetheless, this short-lived episode bequeathed an important legacy to nineteenth-century Germany.

It is difficult to attribute much of this program personally to Jérôme. Marriage to Princess Catherine of Württemberg did little to curb his wild behavior, and the court at Kassel was memorably described by Goethe as a "Roman Circus." The royal pair excelled in conspicuous consumption, which took its toll on state finances. However, Jérôme did take a particular interest in the army, and from 1809 onward, with the reentry of Austria into the war, military matters predominated. After several enemy incursions into Westphalia, Jérôme was ordered to attack the Duke of Brunswick, who had occupied Dresden. Napoleon was disappointed by his brother's tardy response to

the command and accused him of dishonoring both the imperial army and his own standing. At the end of 1811 Jérôme even threatened to resign, a proposition that cut little ice with the Emperor, who called his bluff. Worse was to come when Jérôme quit the Russian campaign the following year rather than defer to Marshal Davout.

On his return to Westphalia, Jérôme attempted to muster resources for deployment when Germany once again became the major theater of war as Napoleon retreated. Yet these efforts met with little success, for by 1813 many of his Westphalian subjects desired the reinstatement of their former princes. Kassel was briefly occupied in September after a strong Russian offensive, and though the capital was soon retaken, Jérôme now decided to leave his kingdom for good. He traveled to Paris, where he was reunited with his wife, whose earlier departure had already aroused the ire of Napoleon. Catherine was hoping that her father, who had recently joined the anti-French coalition, might save a throne for them, but she refused to abandon her husband as Duke Frederick demanded. During the Hundred Days, when he rallied to Napoleon, Jérôme finally emerged with some credit at Waterloo, where he was lightly wounded.

The former royal couple and their offspring were subsequently given sanctuary in Austria. A nomadic and penurious existence ended when they settled with Jérôme's mother, Letizia (Madame Mère), in Rome, but Bonapartist involvement in Italian insurrectionary movements soon obliged them to move on to Florence. There, after the death of Catherine, Jérôme, ever the gallant, married a wealthy widow, the so-called marchesa Giustina Bartolini. His request to be allowed to return to France was eventually granted when King Louis-Philippe gave him permission to reside in Paris. Shortly afterward, the revolution of 1848 overturned the monarchy and brought Louis-Napoleon to the presidency of the Second Republic. Jérôme was made governor of Les Invalides. Indeed, he lived long enough to serve the Second Empire of Napoleon III as a leading senator, all the while maintaining his renown as a *bon viveur*, suitably ensconced at the Palais Royal. When he died in 1860, he was buried at Les Invalides close to Napoleon, his long-suffering patron. The current Bonapartist pretender is one of his direct descendents.

### Bonaparte, Joseph (1768–1844)

King of Naples and Spain during the Napoleonic era and elder brother of Napoleon Bonaparte, Joseph Bonaparte was born Giuseppe Buonaparte in Corte, Corsica, on 7 January 1768. His parents were Carlo Maria and Letizia Ramolino Buonaparte. His father practiced law in Ajaccio and his maternal grandfather had served as commander of the Ajaccio garrison. Joseph was their eldest son and his siblings were Napoleone, Lucciano (Lucien), Maria Anna (Elisa), Louis, Pauline (Maria Carlotta), Caroline, and Jérôme. His family was of minor nobility from Ajaccio, Corsica, and their coat of arms was a red shield with three bands of silver crossing diagonally with two six-pointed blue stars topped by a coronet. The Buonapartes had become French when Corsica was sold to Louis XV in May 1768, and they were eligible for the privileges of French nobility, including exemption from taxation and the right to sit in Corsica's legislative assembly, the States-General, after 1772. Joseph's father served on the Council of Twelve Nobles that aided French administration of the island, and he mingled with the elite. A branch of the Buonapartes lived in Florence.

Originally Giuseppe, gentle and philosophical, attended with his brothers a day school run by Father Recco in Ajaccio, learning to read and write Italian and imbibing the virtues of courage and honor. He aspired to service in the church and received royal aid to study at the college in Autun, France, from the Corsican civil and military commander, Louis Charles René, comte de Marbeuf. At Autun College he became known as Joseph, and Napoleone, studying for a career in the military at Brienne, became known as Napoleon. Joseph excelled at Autun, winning numerous awards and honors for academics, but he decided against entering the seminary at Aix. He hoped to become a French military officer but later decided to study law at Pisa. Following the death of his father in 1785, Joseph returned to Corsica to care for his mother and there practiced law and by 1791 was serving as a member of the Ajaccio Council.

Napoleon came to Corsica on leave for visits and he enjoyed reading aloud with Joseph the works of Voltaire and Pierre Corneille, for they shared a love of books and

the works of the revolutionary philosophes and supported the French Revolutionary changes in government. Joseph and his brothers inherited considerable sums in the fall of 1791 upon the death of their uncle, Archdeacon Lucciano of Ajaccio, who had named Joseph head of the family. Napoleon and Joseph both financially supported the backers of the new National Assembly's Constitution of 1791, desiring to introduce into France liberty and freedom. Joseph was initiated into the Freemasons with a friend, Antonio Salicetti, one of the National Assembly's commissioners responsible for the campaign in Toulon, and was able to secure a military post for Napoleon to fight the British and Spanish forces there. Napoleon fought with distinction. As Napoleon's military star rose over Paris, Joseph assisted his brother's fortunes and in return was appointed to increasingly important positions in the government that after 1792 became the National Convention, to be replaced in October 1795 by the Directory.

When Napoleon took command of the Army of the Interior under the Directory, he made Joseph consul in Italy. Joseph had married Julie Clary in Cuges-les-Pins, France, in 1794, and they had two children, Zenaide and Charlotte. Following Napoleon's Italian campaign, Joseph was appointed ambassador to Rome at a salary of 60,000 francs a year, and his brothers and sisters received comparable honors and sinecures. Napoleon reorganized northern Italy and sought to give Italians the fruits of the Revolution: liberty and equality. The family wished to emphasize their French noble connection and dropped the *u* from *Buonaparte*, but they nonetheless capitalized on their Italian family links to boost the reputation of the "liberator" Napoleon and to republicanize Italy. Joseph remained Napoleon's important confidant and adviser.

Joseph wrote a political novel, *Moina*, drawing attention to the corruption and weaknesses of the Directory and assisted Napoleon and Lucien in the coup of Brumaire (9–10 November 1799) during which the Directory was overthrown and the French government reorganized to "save the Republic" under Napoleon. Joseph joined Napoleon, France's First Consul, at Malmaison to plan strategy to rebuild France in the wake of the Revolution. Joseph, representing the Consulate, signed the treaty of peace with his country's wartime opponents at Lunéville in February 1801. He was also sent to sign the favorable terms contained in the Treaty of Amiens (25 March 1802) providing peace with Britain, which promised to evacuate Malta in return for the guarantee by the Great Powers of its security.

But war resumed in 1803 after the British, concerned by various French annexations on the Continent during the peace, refused to leave Malta. On the eve of Napoleon's coronation as Emperor of France in early December 1804, Joseph made known his desire to be named Napoleon's

Joseph Bonaparte, Napoleon's older brother. He failed to win popular support as King of Spain and was prevented from exercising any meaningful control over French commanders in the field. (Archivo Iconografico, S.A./Corbis)

heir, but Napoleon decided against him. After his brother became Emperor, Joseph was offered the crown of the Kingdom of Italy (formerly the Cisalpine Republic, to which Venetia had been added) but he declined this offer, accepting instead an appointment as King of Naples, where he reigned from 1806 to 1808.

In Naples, Joseph Bonaparte dispensed the liberal ideals of the French Revolution and of Napoleon's rule. Most notably, he abolished feudalism, codified local laws and introduced the Napoleonic Code, reorganized church offices and monastic orders as his brother had done in France with the Concordat with the pope, promoted internal improvements, and implemented measures for the protection of the southwestern coast of Italy from the British fleet. Efficiency and French legal discipline were introduced, and the area became a vital satellite state of France. Joseph spoke Italian and was well respected by his followers, known as *josefinos*. He ruled wisely and justly, dispensing patronage to loyal supporters, and was called the Philosopher-King. Joseph, who had received some training as a soldier, preferred diplomacy to war and served as Napoleon's skillful diplomat in the Kingdom of Naples, implementing his brother's orders. All feudalistic

remnants were abolished on 2 August 1806 when baronial jurisdictions were relinquished and the government seized the water rights in order to divide them equally. Large feudal landed estates were broken up, and parcels were given or sold to the former serfs who had tilled them. Throughout the region administered by Naples, representative councils were established to secure for the people representative government.

Joseph, like Napoleon, was hailed as a liberator. He reduced the debt of Naples, which totaled 130 million ducats, by selling 213 monastic properties he had seized in the name of the Neapolitans. He carefully placated the church by pensioning the remaining clergymen loyal to himself, utilizing clerical talents in public archives and libraries, and attending prominent Catholic ceremonies. Joseph was seen as introducing a national renaissance in the Kingdom of Naples and established the Royal Order of the Two Sicilies. The public taxes he levied were low in order to encourage loyalty to the French Empire. Throughout Naples the people's living standards were raised and their rights extended by the Napoleonic Code. Joseph, like Napoleon, wished to spread the best achievements of the French Revolution throughout Europe.

So successful was Joseph's reign in Naples that Napoleon appointed him King of Spain in 1808, desiring that Joseph replicate his just administration. Joseph had been preceded by King Charles IV, whom Napoleon had deposed. The throne of Naples was turned over to Marshal Joachim Murat, the husband of Joseph's sister, Caroline, but the Neapolitans regretted Joseph's departure. In Spain, Joseph issued the country's first constitution and ruled with the advice of a legislature composed of a Senate that he appointed and a Chamber of Deputies based on the French model representing three estates—the clergy, the nobility, and the commoners. He made great improvements to the city of Madrid, adorning it with gardens and removing blights on the landscape. As in Naples, he followed numerous local customs, attending bullfights, High Mass, and entertainment including readings of Jean Racine, Voltaire, and Miguel de Cervantes. Once again, the benefits of the French Revolution were to be imported, this time into Spain by Joseph according to Napoleon's directions, including for the abolition of the Inquisition.

But Joseph faced stiff opposition from local independence groups and the Spanish clergy, who resented French occupation. Patriotism in Spain manifested itself as an anti-French movement, and the clergy railed against the liberalism of the Revolution, fearing the confiscation of their church lands. They attempted to smear Joseph's reputation, labeling him a drunkard or "Pepe Botella" (Joe Bottle), even though he drank only water. In May 1808 a church leader, Llano Ponte, issued a call to arms to his countrymen to re-

sist French domination. Following the capture of Valencia by patriots, Napoleon took the field himself against the Spanish, routing them but leaving his brother to wipe out the insurgency, a task that proved impossible for Joseph, who lacked military talent. Furthermore, he proved himself a poor administrator of Spanish affairs, partly as a result of restrictions imposed on him by Paris.

In 1810 the Spanish region north of the Ebro River was re-formed, despite Joseph's opposition, into an autonomous military region answerable only to Napoleon. Joseph attempted to abdicate, but Napoleon convinced him that he was still needed in Spain. The Duke of Wellington led British forces through Portugal into Spain and inflicted successive defeats on French forces including at the Battle of Vitoria, fought on 21 June 1813, as a result of which Joseph was forced to flee to France. Later, when Napoleon told Joseph that he planned to restore the Bourbon dynasty in Spain as a mechanism to halt the British advance, Joseph persisted in his own claims, stating he was the "legitimate" ruler in Spain. Despite Joseph's failure to maintain a hold over Spain, one lasting contribution of his rule remained: the adoption by the succeeding Spanish government of Ferdinand VII of a new constitution modeled on that which Joseph had promulgated during his brief reign. Catholicism was reinstated as the national faith, but the liberties guaranteed under Joseph's constitution remained, and serfdom was not reintroduced.

Owing to Napoleon's losses a new coalition had begun to form against France. Austria, through the diplomacy of Graf Metternich, had signed the Treaty of Reichenbach with Prussia and Russia, requesting Napoleon to submit to their demands and stating that if he did not comply, there would be war. This coalition, which also included Britain, declared war again on France. Following Napoleon's defeat by this coalition at Leipzig in October 1813 and the subsequent Allied invasion of France in 1814, Joseph was placed in charge of the defense of Paris and the safety of Napoleon's wife Marie Louise and their son and heir Napoleon II, named the King of Rome. Joseph was instructed to evacuate Paris should the invading Allies come close and ordered not to negotiate with the enemy under any circumstances. Joseph disregarded his orders from his brother, listened to Parisians who wished for peace at any price, and allowed Talleyrand to remain in Paris to negotiate with France's enemies. Joseph evacuated Marie Louise and the young heir to the throne upon receiving a direct order from Napoleon. The Paris defenses were to be maintained by marshals Marmont and Mortier, but Marmont, upon orders from Joseph, opened peace talks with Tsar Alexander I.

The Allies entered Paris, where Talleyrand negotiated with the coalition leaders and signed an armistice. Paris

had not held under Joseph's direction, and the Allies determined to restore the Bourbon king Louis XVIII, upon Talleyrand's recommendation. Marie Louise wrote to Napoleon from Blois that Joseph and Jérôme were suggesting that she surrender to the Austrians for her own protection. She went to Orléans, where she was placed in custody of the tsar and the French provisional government. Her father had refused, with Metternich's encouragement, to grant her Tuscany, which she wanted so that she could visit Napoleon exiled on Elba. She returned with her father to Austria. During Napoleon's escape from Elba and the Hundred Days campaign, Joseph in Zürich received word from Napoleon that he was to act again in a diplomatic capacity, informing Austrian and Russian ministers in Switzerland of Napoleon's intention to reclaim the boundaries France had enjoyed in 1814. Joseph's peace overtures in Zürich failed, but he returned to Paris to aid his brother once again, raising troops and funds on his behalf. But again an Allied coalition was formed against Napoleon. And after Napoleon's defeat at Waterloo, Joseph sailed for the United States.

The throne of Spain was reaffirmed as belonging to Ferdinand VII by delegates at the Congress of Vienna (1814–1815). After leaving post-Napoleonic France, Joseph became a U.S. citizen and lived for seventeen years with his family in Bordentown, New Jersey. He supported the revolution in France in 1830 and always remained a Bonapartist politically. In 1832 Joseph Bonaparte moved from the United States to Britain and then on to Italy, where he died in Florence on 8 July 1844. His remains were later reburied in Les Invalides in Paris.

### Bonaparte, Louis (1778–1846)

Louis Bonaparte, a brother of Napoleon, was born on 2 September 1778 in Ajaccio, Corsica. In 1791 Napoleon took him to France, where Louis attended military school. In 1796 he accompanied his brother on his Italian campaign, acting bravely but loathing the bloodshed that fighting entailed. When his brother sent him to Paris, he was reluctant to return, but he did and distinguished himself at Arcola. Campaigning in Italy, however, destroyed his health, as the north Italian winter gave him rheumatism and an Italian woman infected him with syphilis.

After the Italian campaign he lived in Paris until he accompanied his brother on his Egyptian campaign, and he was present at the Battle of the Pyramids. Sent back to France to inform the government of his glorious deeds, Louis slipped through the British blockade but went to Corsica, leaving the errand to a subordinate. As Napoleon and Josephine's marriage was proving barren, Napoleon wanted Louis to wed Hortense, Josephine's daughter, to ensure an imperial heir. Louis, not liking Hortense, refused, avoiding the matter by setting off to travel through Europe. Eventually, however, Louis and Hortense reluctantly complied and married in 1802. Their marriage was unhappy, and both were adulterous. They had three sons, the youngest later becoming the Emperor Napoleon III.

In 1806 Napoleon made Louis King of Holland. He was a successful king and cared for the well-being of his people. He won their affection by visiting locations where disaster had struck, notably an explosion of an ammunition boat in Leiden in 1807. He attempted to learn Dutch and extended his general interest in culture to Dutch culture and history. However, by his care for his people he also attracted the anger of his famous brother, for he refused to introduce general conscription and was reluctant to supply troops for the Grande Armée. Moreover, as Louis knew that the Netherlands were very dependent on naval trade, he was lax in maintaining the Continental System. Smuggling was in fact overt and endemic. Eventually, in 1809, Napoleon used the British invasion of Walcheren as a pretext for curtailing Louis's power. Louis did not comply and even considered actual

military resistance to the French, who were already invading Holland. In 1810, however, Louis abdicated and fled to Austria.

When Austria declared war on France, Louis went to Lausanne and later to Rome. He did not return to France during the Hundred Days, instead remaining in Italy for most of his life and keeping himself busy with writing. In 1838, a year after the death of Hortense, he married Julia-Livia Strozzi, a sixteen-year-old of renowned beauty. He died in Livorno, 25 July 1846 of a brain hemorrhage.

Louis Bonaparte was an adequate commander who acted competently though no more. Apart from Italy and Egypt, he took part in the campaigns against Prussia and Russia in 1806–1807, but when the Dutch troops present with the Grande Armée were not allowed to fight as a separate and unified division, he returned home in protest with his regiment of Guards. He commanded the Dutch defense at Walcheren in 1809 until Napoleon replaced him with Marshal Bernadotte. Louis's character was both gloomy and humorous, a fact enhanced by his physical ailments. However, he was also a responsible and honest man, a fact that was reflected not only in his behavior as a king but also in his conduct while campaigning in western France against royalist forces in 1800. When he was ordered to execute some royalist leaders who had been taken prisoner under a flag of truce, he bluntly refused.

### Bonaparte, Lucien (1775–1840)

One of Napoleon's younger brothers, born in 1775, Lucien possessed a fiery temperament that led to some headstrong behavior and frequent disagreements with Napoleon in the course of a checkered but colorful career. When the Bonaparte family was obliged to flee Corsica in 1793, after he had denounced the patriot Pasquale Paoli, Lucien flung himself into French politics and became an uncompromising Jacobin. Under the Directory, though technically too young to serve, he was elected to the Council of Five Hundred as a deputy for Corsica, ideally placed to participate in Napoleon's coup of Brumaire (9–10 November 1799),

since he was at that time president of the council. Indeed, he was to play a decisive role when the plot took an unfortunate turn at Saint-Cloud on 19 Brumaire and a motion to outlaw Napoleon was proposed after the general had entered the assembly in uniform. It was Lucien who sought to reassure the deputies by graphically declaring, dagger aimed at his breast, that he would kill himself if Napoleon violated their liberty. He then rallied the troops outside once it became evident that force was required to overthrow the regime, his elder brother having panicked in the face of unexpected resistance.

When a new constitution was introduced in December 1799, Lucien was appointed minister of the interior. One of his first tasks was to falsify the plebiscite returns on the constitution, a massive fraud that remained undiscovered for almost 200 years. He was also responsible for introducing the prefects, selecting able administrators from a variety of political backgrounds, and defining their tasks in the departments after 1800. Yet his relationship with Napoleon, previously strained when he had married an innkeeper's daughter in 1794, rapidly deteriorated and ended in resignation. He was briefly dispatched as ambassador to Spain, before returning in 1802 to serve in the Tribunate and Senate. A second marriage, this time to the wealthy widow Alexandrine Joubertson, curtailed his political career, for Napoleon had envisaged a royal bride and thoroughly disapproved of Lucien's independent conduct, which he could never succeed in controlling. In 1804 Lucien left for Rome, where the pope rewarded his part in steering through the Concordat with the church by granting him a substantial estate, whose proceeds he used to sustain a cultured and luxurious lifestyle, accompanied by his large family.

Forced to flee by the arrival of French troops, Lucien attempted to escape to America, but he was captured and imprisoned in Britain between 1811 and 1814. The only brother to be awarded neither a kingdom nor a title by Napoleon, he had avoided association with the Empire but reemerged to play a significant role in the Hundred Days, before finding renewed haven in the Papal States. As prince de Canino (an honor bestowed by the pope), this former Jacobin and erstwhile Republican began writing his memoirs and continued to pursue intellectual activities until his death in 1840.

## Bonaparte, Napoleon (1769–1821)

French general who became the leader of France and eventually the Emperor of the French. He lived in an era of enormous change, which spanned the American War of Independence (1775–1783) and the French Revolution (1789–1799). Throughout his career he promoted many of the most important ideas of the time, most notably the concept of equality. A man of enormous intellect and will, he promoted those ideas throughout his Empire. That alarmed the monarchs of Britain and continental Europe, who feared that these ideas might lead to uprisings in their own countries. As Napoleonic France became more powerful, these leaders wanted to reestablish what they saw as the traditional balance of power. They eventually combined to defeat him militarily and send him into exile. His leadership was geared to the needs of the rising middle class, and he provided the stability that allowed France to prosper.

Napoleon's legacy was widespread and progressive. He overcame the objections of many of his supporters and promoted equality for the Jews. At the same time, he reinstated a role for the Catholic Church in French society, while insisting that France maintain religious freedom. He reorganized and reformed education, bringing centralized and secular control to that most important of institutions. His most famous and lasting legacy was his reorganization and rewriting of the chaotic civil code of France into one unified body of law, eventually known as the Napoleonic Code. Napoleon brought these reforms to countries that came under his control. Often considered the father of modern Europe, Napoleon sounded the death knell for the last remnants of feudalism.

### Rise to Power

Napoleon was born Napoleone Buonaparte in the Corsican capital of Ajaccio. His father, Carlo Maria, was a politically active lawyer who had some claims to membership in the minor nobility. His mother, Letizia, was a beautiful young woman who raised Napoleon and his siblings Joseph, Lucien, Elisa, Louis, Pauline, Caroline, and Jérôme. Letizia's perseverance during times of adversity served as an inspiration to her children. Thanks to his noble heritage, Napoleon received a royal scholarship to the military school at Brienne and later in Paris, where he graduated at the age of sixteen as a lieutenant in the artillery, two years before the rest of his class. He was somewhat of a loner but was highly respected by his instructors for his intellect and his understanding and acceptance of new ideas in warfare, including the use of light, mobile artillery. His success was all the more notable given the fact that as a Corsican, whose French was heavily accented, he was looked down

upon by most of his fellow students and probably by some of the instructors as well.

Upon graduation, Napoleon was commissioned a lieutenant in the Royal Artillery. He spent this early part of his career in various assignments and, more often than not, on leave to visit Corsica. There he became involved in the always-dangerous politics of Corsican nationalism. His strong support of the French Revolution eventually got him into serious difficulty, and he and his family had to flee the island. Back in Paris, he witnessed the storming of the Tuileries and the flight of King Louis XVI to the protection of the National Assembly. Later, while stationed in Avignon, Napoleon wrote a short story, “Le souper de Beaucaire” (Supper at Beaucaire [a city in France]), which was a defense of the Revolution. A number of important Revolutionary leaders took note of this work, and these leaders would prove useful in Napoleon’s climb to power.

Napoleon’s first opportunity to enter into the public eye came in 1793 at the French port city of Toulon. Not all regions of France were completely behind the Revolution. Toulon had declared for the king and sought the protection of the British navy until a king was returned to the French throne. This was treason, of course, but the leadership of the troops sent to remove the British was incompetent and unable to restore Toulon to the administration’s control. Napoleon’s political connections and the sheer good fortune of being in the right place at the right time put him in charge of the artillery. His plan of attack was sound, but the commanding general refused to consider it. Undaunted but frustrated, Napoleon wrote to Paris demanding a new general. This was a risky step, as the guillotine was always a possibility for those who fell out of favor. Still, his words in his letter of 25 October 1793 show his willingness to take risks in the name of advancing his ideas:

I have had to struggle against ignorance, and the passions it gives rise to. . . . The first step I will propose to you is to send to command the artillery an artillery general who can, if only by his rank, demand respect and deal with a crowd of fools on the staff with whom one has constantly to argue and lay down the law in order to overcome their prejudices and make them take action which theory and practice alike have shown to be axiomatic to any trained officer of this corps. (Napoleon I 1858–1869, 25 October 1793, no. 1, I, 1–2).

Napoleon’s political connections protected him from any repercussions for this letter. He got his new general, and in due course Napoleon’s plans forced the British and their Spanish allies to leave Toulon. Everyone involved heaped praise on Napoleon, and he was made brigadier general at the age of twenty-four.

At this point, Napoleon’s career began to languish somewhat. The low point came in July 1794, when the Revolutionary leader Maximilien Robespierre and many of his supporters were executed. Robespierre had led France during a year-long period known as the Terror, during which many thousands were executed by the guillotine. He was arrested by those who believed that the bloodshed associated with the Terror had to end. Napoleon was seen by some as part of Robespierre’s group, and he was actually arrested and detained for two weeks in the south of France. He was later released and given an administrative position in Paris.

On 5 October 1795 royalist forces were gaining strength in Paris and making plans to overthrow the government. One of Napoleon’s friends, Paul Barras, suggested placing Napoleon in charge of the defense of the government. The legislative body, known then as the Convention, agreed. Napoleon took charge in a whirlwind of action. He dispatched Captain Joachim Murat (who would later become his brother-in-law and the King of Naples) to secure needed cannon. Napoleon arranged them to control the streets leading to the Convention, fired his famous “whiff of grapeshot,” and dispersed the royalist forces. The government promoted him to *général de division* with command of the French Army of the Interior.

Napoleon’s star had now clearly risen. He was proclaimed a hero, was applauded wherever he went, and was always in demand at the many balls and salons of Paris. It was at one of these affairs that he must have met Josephine de Beauharnais. Josephine was a Creole beauty who had married a French aristocrat, Alexandre de Beauharnais. He was executed during the Terror, but Josephine had escaped that fate and became Barras’s mistress. Napoleon fell deeply in love with her, and though the feeling was not entirely reciprocated, they were married 9 March 1796. Two days later, Napoleon, newly appointed commander of the (French) Army of Italy, left to assume his new command. The world was about to discover a new force in the complicated politics of Europe.

### Early Campaigns

The French Revolution had alarmed the royal powers of Europe, who sought to limit its success and contain France as much as possible. Austria was a leader in this movement, and northern Italy was one of the most important stages for this conflict. It was here that Napoleon truly came into his own. The Army of Italy, some 47,000 men, was demoralized and unsuccessful, lacking adequate supplies and leadership. Senior officers were furious that this young upstart had been given the command, suspecting that it was politically inspired, but they soon felt otherwise. Napoleon had the ability to command the complete loyalty of his sol-

Napoleon surveys the battlefield at Wagram. With the possible exception of Alexander the Great, the French Emperor stands unrivalled as history's greatest commander. (Engraving by M. Haider after Horace Vernet from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 1)

diers. From Italy onward, they would follow him anywhere. In part, this was due to their recognition of his ability, but in part it was because his speeches mesmerized them and inspired them to more success than they had ever thought possible. A French diplomat in Tuscany wrote of the young general: "The campaign was opened, and a series of victories as dazzling as they were unexpected, succeeding each other with surprising quickness, raised the glory of our French soldiers, and that of the great captain who led them daily to fresh triumphs, to the highest" (Miot de Melito 1881, 94–95).

After a relatively minor action at Lodi on 10 May 1796, Napoleon began to suspect that he was capable of great deeds and might be destined for greater things. He later wrote: "It was only on the evening of Lodi that I believed myself a superior man, and that the ambition came to me of executing the great things which so far had been occupying my thoughts only as a fantastic dream" (quoted in Markham 2003b, 52). In a fast-paced campaign he defeated the Austrians, took charge of the negotiation process, and formed the Cisalpine Republic out of part of northern Italy. This was an unusual and risky thing to do:

Mere generals do not create governments, and the political implications were not entirely in France's favor. The government in Paris was unwilling to question his actions, however, and his reputation continued to grow.

Napoleon returned to Paris a hero. This was troublesome to the Directory, a five-member committee that now served as the administrative branch of government. That government was unstable and insecure and was thus suspicious of any strong force in politics that might serve as a threat. They perceived Napoleon as such a threat, and they sought to give him duties outside of Paris. At first they planned to have him lead an invasion of Britain. When this proved impractical, they shifted their focus southward. In 1798 the Directory sent Napoleon to Egypt, where he was to remove Britain's influence and eliminate its shortcut to India. Napoleon saw himself as the successor to Alexander the Great, but he had far less military success there than had Alexander. He was generally successful in his land battles, but Rear Admiral Sir Horatio Nelson was able to surprise and destroy his fleet at the Battle of the Nile, cutting off all but sporadic resupply efforts. The campaign in Egypt produced mixed results, and Napoleon soon became

anxious to return to Europe, where his gains in Italy were in danger of being reversed. His sudden departure was seen by some as abandoning his army, though the Directory had (unbeknownst to Napoleon) ordered his return.

When Napoleon returned to France after a year in Egypt and the Holy Land, he was seen as a great hero. French prospects in Egypt would not last long, but the world learned far more about Egypt than it had learned for a millennium because of the many scholars, artists, and cartographers who accompanied Napoleon. The discovery of the Rosetta Stone laid the foundation for the modern study of Egyptology, one of Napoleon's enduring legacies. In this respect Napoleon was, in fact, similar to Alexander the Great.

### First Consul

When Napoleon returned from Egypt in 1799, he found France's political situation in turmoil. The Directory was seen as corrupt and ineffective, and some top French political leaders were involved in a plot to gain control of the government. Napoleon was a national hero who would bring legitimacy to their coup, and they carefully recruited him into the plot. They expected to control him, but his political skills overmatched those of the other conspirators. In what would become known as the coup of Brumaire (9–10 November 1799), the government was overthrown, and at thirty years of age Napoleon became First Consul (of three), the ruler of France. One of the other consuls, Emmanuel Sieyès, described Napoleon's image by saying: "Gentlemen, you have got a master! This man knows every thing, wants every thing, and can do every thing" (Las Cases 1818, 1:142).

Napoleon was an exceptionally gifted political and military leader. His genius of intellect, his ability to see opportunity and fully exploit it, and his eye for both detail and the larger picture were essential to his success. He also had a unique ability to communicate and soon learned to promote his goals through favorable information and imagery. His military bulletins were carefully written for the consumption of his men, the French public, and his enemies. Like Caesar's *Commentaries*, the bulletins served to inform people of what was happening and acted as propaganda tools to promote his successes.

Had the other European powers allowed Napoleon to peacefully rule France, he would be most noted for his domestic political leadership rather than for his military leadership. He well understood that the nation was turning to him to be a civil leader in a time of peace, not to bring military glory to France. But military glory can help to consolidate civil power, and at any rate peace was not possible. Just after taking power he was faced with another campaign in northern Italy, again against the Austrians. To de-

feat them, he led his army through the Great St. Bernard Pass in the Alps in May 1800, swept to the south, and achieved one of his greatest victories at the Battle of Marengo on 14 June. Other victories followed, and in February 1801 the Treaty of Lunéville was signed.

In March 1802 Britain and France signed the Treaty of Amiens. Peace had come to Europe, but it did not last. While at peace, Napoleon improved the French economy and became extremely popular with the French and even with many intellectuals and politicians in other European countries, including Britain. But the established regimes, especially the government in Britain, would not allow France to exist in peace, fearing that a strong and progressive France was a threat to their own security.

Thus, Napoleon was forced to place military leadership ahead of his domestic agenda. One coalition after another formed against France, each determined either to restore the Bourbons to the throne or to sharply reduce France's power. Napoleon was forced to carry the fight to those coalitions. For most of his career he had great success and left the world an outstanding example of military leadership. When royalists realized they could not defeat him, they turned to other means of achieving their goals. British-sponsored attempts on his life occurred, and Napoleon decided to ensure the continuation of his legacy through the establishment of a hereditary monarchy. This idea was strongly supported by both the Senate and the people, so on 2 December 1804 he became Napoleon I, Emperor of the French.

### Emperor

As Emperor, Napoleon continued to promote domestic reforms. However, the collapse of the Peace of Amiens led to further coalitions against him, and the military components of his career became far more prominent. In 1805 he was poised to invade Britain when he discovered that the Austrians and the Russians were moving against him in central Europe. Without hesitation he moved his troops, now called the Grande Armée, to meet them. He surprised and defeated the Austrian general, Karl Mack, at Ulm, forcing him to surrender his 27,000 troops on 20 October 1805 with hardly a shot fired. Though Napoleon did not know it at the time, the next day the French fleet was badly defeated by Nelson at the Battle of Trafalgar off the coast of Spain. This effectively eliminated the possibility of invading Britain, but on the Continent Napoleon was still unbeatable. He took Vienna without a shot and then moved north. His greatest victory, against the combined armies of the Russians and the Austrians, came at the Battle of Austerlitz on 2 December 1805, the first anniversary of his coronation. Austerlitz was the product of brilliant maneuvers and clever deception, and this, combined with the ac-

tion at Ulm, crushed and humiliated the Third Coalition and should have led to an extended period of peace. Small wonder, then, that Napoleon's Proclamation of 3 December begins: "Soldiers: I am satisfied with you. . . . You have decorated your Eagles with an immortal glory" (Markham 2003a, 55–56). The resulting Treaty of Pressburg and the personal guarantee of Emperor Francis I of Austria was to have removed all future conflict between the two nations. That would prove an illusionary hope.

It did not take long for Britain and Russia, joined now by Prussia, to form a Fourth Coalition against Napoleon. Prussia was not the power it had once been, and it was defeated by the French at the battles of Jena and Auerstädt, both fought on 14 October 1806. Napoleon then turned to halt the Russian advance. He confronted the Russians at the Battle of Eylau on 7–8 February 1807, a bloody but relatively indecisive action fought in a heavy snowstorm. Napoleon then retired into Poland for the winter, which he spent with his Polish mistress, Marie Walewska, with whom he had a son. With warmer weather, Napoleon moved against the Russians once again and soundly defeated them at the Battle of Friedland on 14 June. Napoleon and Tsar Alexander I met on a raft in the Niemen River near Tilsit. There they formed an alliance as well as a personal friendship. Again peace appeared to be at hand, and again it would prove illusionary. Still, there was relative peace, though he had to defeat the Austrians at Wagram in 1809.

Anxious to have a male heir to his throne and unable to have children with Josephine, Napoleon reluctantly divorced her and sought to marry into one of the important royal families of Europe. He felt that this might further ensure continental peace. Rebuffed by the tsar in his efforts to marry into that family, he settled on Marie Louise, the daughter of Francis, the Emperor of Austria. They married in 1810 and had a son in 1811. Napoleon was now tied by marriage to the oldest monarchy in Europe, though that would eventually count for very little.

The height of Napoleon's power was the period 1810 to 1812, but even by then the French Empire was beginning to show cracks. To isolate Britain, Napoleon instituted an economic blockade known as the Continental System. The intent was to destroy Britain's economy by cutting off its trade with the Continent, but the system proved as damaging to continental economies as to Britain's. Several nations were decidedly lax in their enforcement, and British goods could often be found even in France. Even so, the system did put some significant pressure on the British economy and had it remained in place it might have been successful.

Napoleon attempted to control Spain by putting his brother Joseph on the throne. This move was generally

supported by the middle class of Spain, who felt it would lead to a far more enlightened Spanish government. But the Spanish peasant class rebelled, and a war of liberation ensued. When a British expeditionary force, led by Sir Arthur Wellesley, the future Duke of Wellington, arrived in Spain, it had the support of Spanish guerrillas and most of the population, and French forces eventually withdrew toward France.

The final chapter in Napoleon's decline began with his invasion of Russia in 1812. Alexander had withdrawn from the Continental System and demanded that France abandon its commitment to Poland. Napoleon could not and would not tolerate this situation. Russian forces were prepared to invade Napoleon's empire. War was inevitable, and Napoleon decided to take it to the heart of Russia. On 24 June 1812 he led what was then the largest army ever assembled, approximately 600,000 men representing twenty nations, across the Niemen River into Russia. There he won numerous skirmishes and defeated the Russians at the Battle of Borodino on 7 September, though at great cost to himself. Soon thereafter the French captured an abandoned Moscow. Unprepared to spend the winter in a city largely burned by its citizens, Napoleon eventually withdrew from Russia, pursued by the Russian army and Cossacks. The campaign was a disaster, and Napoleon lost 90 percent of his army. The Russians continued their pursuit into Saxony in 1813 and a growing coalition of forces, including the Austria of his father-in-law, defeated Napoleon at the Battle of Leipzig on 16–19 October 1813.

### Final Defeat, Exile, and Death

In 1814 Napoleon was forced to defend France from the invading forces of the Sixth Coalition. It was perhaps his most brilliant campaign. Whenever he led the action he met success, but his marshals were less successful. It eventually came down to a race for Paris, and he arrived late. At that point, some of his marshals refused to fight any more and urged him to abdicate. Final treachery by Marshal Marmont and the foreign minister, Talleyrand, proved impossible to overcome, and Napoleon abdicated on 11 April 1814. He was exiled from France as the Emperor of Elba, a tiny island off the coast of Italy. He was there less than a year, during which time he modernized the island and received many visitors. Louis XVIII was placed on the throne of France and refused to pay Napoleon the pension to which he was entitled by treaty. Bored, running out of money, convinced—with great reason—that his enemies might yet take further action against him, and hearing that the people of France wanted his return, Napoleon went back to France on 1 March 1815 to reclaim his throne. No longer interested in empire but desiring only to govern France as wished by its people, he

pleaded for peace. In letters to European leaders and in statements to his people, he pledged to seek war no more and to be satisfied with being the Emperor of the French. His old enemies, recalling Napoleon's earlier military successes, were unconvinced; they mobilized several armies and began moving on France. Napoleon tried his best to defeat the British and Prussian armies before the Austrian and Russian forces could arrive. After some success at Ligny and Quatre Bras in Belgium, he was decisively defeated at the Battle of Waterloo on 18 June 1815. The period of Napoleon's return, known as the Hundred Days, was over.

Napoleon abdicated a second time and was sent with a small entourage to the remote island of St. Helena. There he spent much of his time dictating his memoirs and feuding with his British captors, most notably Sir Hudson Lowe. On 5 May 1821, Napoleon died. The official cause of death was given as stomach cancer, but many modern historians now suspect he died of poisoning. In 1840 his remains were returned to Paris, and he now lies buried under the dome of Les Invalides, as he requested in his will, "on the banks of the Seine, amongst the French people, whom I have loved so well" (quoted in Markham 2003b, 302).

### Bonaparte, Pauline (1780–1825)

Born in 1780 in Ajaccio, Corsica, Maria-Paolina was the sixth of Carlo Maria and Letizia Ramolino Buonaparte's eight children. Given almost no formal education, Pauline, as she was renamed when the family moved to Toulon in 1793, was beautiful and impulsive, worrying Napoleon that she might elope with someone unsuitable, such as General Andoche Junot or Louis Stanislas Fréron. Instead, Napoleon arranged her marriage to his loyal subordinate Charles-Victor Leclerc, on 12 June 1797 at Momballo. Pauline gave birth to their only child, Dermide, named for Napoleon's favorite poet, Ossian, on 20 April 1798. Pauline also accompanied Leclerc to Haiti in 1801, gaining a reputation for both scandalous behavior and resourceful toughness in the brutal conditions of the island. She returned when Leclerc died of fever in 1802.

Pauline's second marriage, on 28 August 1803, was to Prince Camillo Borghese, a wealthy Italian art patron. Pauline enjoyed his money and cultured background, using his influence to commission Antonio Canova to sculpt a controversial nude of herself, but she preferred to live in Paris in competition with Josephine as first lady of the Napoleonic court. Her Paris house, the Hôtel de Charoset, and her country estate at Neuilly became famous salons through which Pauline dispensed patronage and set imperial fashion. Although her sexual affairs embarrassed Napoleon, she was his favorite sister and he forgave her repeated scandals. The advent of Marie Louise, however, sent Pauline back to Italy until Napoleon's imprisonment on Elba, when she emerged to bankroll both the renovation of his Elba quarters and his escape with her diamond jewelry.

Pauline spent the Hundred Days in Austrian custody at Compignano, but she was released to live in Rome with her mother and uncle, Cardinal Joseph Fesch. Pope Pius VII arranged a generous allowance from the Borghese family despite her legal separation from Camillo. Pauline spent the money living comfortably and supporting Jérôme's and Caroline's children. She sold the Hôtel de Charoset to the Duke of Wellington to be used as the British embassy in Paris. Always in frail health and a devotee of spas, Pauline began to decline in 1824 and was reconciled to her

husband by Pope Leo XII shortly before her death in Florence on 9 June 1825.

### Borghetto, Battle of (30 May 1796)

The French victory at Borghetto permitted Bonaparte to cross the Mincio River, take Verona, and put Mantua under siege. The retreat of *Feldzeugmeister* Jean-Pierre Freiherr Beaulieu's Austrian army back to Tyrol ended the second phase of the 1796 campaign in Italy.

After the Battle of Lodi and the loss of Milan, Beaulieu had withdrawn behind the Mincio and deployed his army on a line stretching 11 miles from Peschiera to the north and Mantua to the south. The steep riverbanks and the fortresses at either end made it a strong defensive position, with only four bridges (at Peschiera, Borghetto, Goito, and Rivalta) and few fords available for crossing. A serious problem for Beaulieu was that his preferred line of retreat to Tyrol along the upper Adige valley was not perpendicular to the Mincio line but instead ran to the north as an extension of his right wing. To avoid being outflanked on his right side, the Austrian commander deployed his main body between Peschiera and Valeggio. Around Peschiera, *Generalmajor* Anton Freiherr Liptay commanded the right wing (3,800 men). In the center, *Feldmarschalleutnant* Michael Freiherr von Melas and *Feldmarschalleutnant* Karl Philipp Freiherr Sebottendorf had their troops (10,200) scattered along the Mincio between Valeggio and Salionze, with outposts on the right bank. To the south, separated from the rest of the army, *Feldmarschalleutnant* Michelangelo Alessandro Freiherr Colli-Marchini held Goito with 3,000 men. Several squadrons of good Neapolitan cavalry were attached to Beaulieu's army.

Being aware of Beaulieu's concern for his line of communication, at the end of May Bonaparte ordered some feints toward Peschiera and along the western shore of Lake Garda. He then selected General Charles Kilmaine's 6,200 elite troops to cross over the bridge at Borghetto, deployed Masséna's division (9,500) behind Kilmaine, and Augereau's division (6,100) to the left, with orders to threaten Peschiera. To the right, Sérurier's division (9,100)

was to advance as far as Guidizzolo. On the early morning of 30 May, after a rapid march from Castiglione under the cover of the hills overlooking the Mincio, Kilmaine pushed the Austrian outposts back across the river, debouching at around 7:00 A.M. before the western end of the bridge. Owing partly to an indisposition of Beaulieu, the Austrian deployment was far from ideal. As a matter of fact, the crucial bridge was defended by only one battalion (Infantry Regiment Strassoldo) with two guns. Nonetheless, the Austrians resisted for a couple of hours until General Gaspard Gardanne's grenadiers found a weakly guarded ford farther downstream and managed to reach the left bank. The defenders then abandoned Borghetto and the bridge, retreating to Valeggio. The French pursued and street fighting ensued.

By noon the French were in control of both banks. Despite his attempts, Colli failed to give Beaulieu any support. Meanwhile, Augereau was pushing toward Paschiera. A few successful Neapolitan cavalry charges and limited counterattacks of the infantry reserve at Oliosi gained time for Beaulieu to rally his army and begin the retreat to the north, via Castelnuovo. According to a late (and unconfirmed) French account, in the aftermath of the battle Bonaparte narrowly escaped capture in Valeggio. It is true, however, that after this engagement he established a headquarters escort, which was later to become the Chasseurs à Cheval of the Imperial Guard.

### **Borodino, Battle of (7 September 1812)**

Borodino, the only major set-piece battle during Napoleon's campaign in Russia, was fought between the Grande Armée and the Russian armies of General Mikhail Kutuzov, around the village of Borodino, a small hamlet on the banks of the Kaluga River near the confluence with the Moskva, about 115 kilometers west of Moscow. The battle is best known for the tenacity with which the two evenly matched opponents fought and for the horrendous carnage

that resulted in this extremely bloody—and yet inconclusive—battle, whose losses exceeded those of every other engagement of the period apart from Leipzig in 1813.

Having defeated the retreating Russians at Smolensk and capturing that city in August, Napoleon closely pursued the 1st and 2nd Armies of the West, under Kutuzov, who succeeded General Barclay de Tolly as commander in chief on 20 August. While Barclay urged immediate confrontation with the French, then steadily advancing east, Kutuzov decided instead to withdraw to Borodino, there to make a stand, a decision made as a result of political pressure urging the defense of Moscow. The main part of the Grande Armée duly followed, with an Austrian auxiliary corps under Karl Philipp Fürst zu Schwarzenberg and French general Jean Reynier observing Alexander Tormasov's 3rd Army of Observation and Pavel Chichagov's Army of the Danube far to the south, while Marshal MacDonald's corps kept watch on the Russians situated far to the north.

Although the French had left the vicinity of Smolensk with 156,000 men as recently as 19 August, by the time they reached the outskirts of Borodino on 5 September they were down to 133,000 fit for action (86,000 infantry, 28,000 cavalry, and 16,000 artilleryists) and 587 guns, all units depleted by disease and generally wearied by the laborious march deep into Russia that had begun on 22 June. The Russians mustered about 155,000 men, of whom 115,000 were regulars (the remainder were Cossacks and militia) plus they were more rested and enjoyed a numerical superiority in artillery, with 640 guns. Nevertheless, the Russian total included a proportion of virtually untrained militia known as *Opelchenie*, about the same number of new recruits in the regular army, and a large body of Cossacks who could not be relied upon to execute orthodox charges against formed troops. Thus, the two armies stood on approximately equal terms.

The French advance guard made contact with the Russians on 5 September when they came in sight of the Shevardino redoubt, a forward earthwork manned by General Dmitry Neverovsky's division, supported by light infantry and cavalry, which the Russians had constructed about 3 miles southwest of Borodino. The French could tolerate no such hindrance to their general advance, so early on the evening of the fifth a division, supported by cavalry, seized the redoubt at bayonet point after an hour's exchange of musketry and artillery fire. Entering the entrenchment, the assailants found it choked with bodies. Driven out again by Russian grenadiers, the French finally took possession when, around midnight, the defenders retired after the place was pronounced untenable.

On the following day, the sixth, the main body of the Grande Armée appeared along the New Post Road and began a reconnaissance of Kutuzov's position. There was to be no fighting on this day; instead, both sides spent the day reorganizing, deploying their infantry and cavalry, siting their artillery, and planning the forthcoming battle. Having established a respectable line of earthwork field fortifications, Kutuzov arranged a religious procession to inspire his very devout troops to fight for "Holy Russia." He then rested his men, satisfied to await the French onslaught.

Russian dispositions were based on a largely static defense, with their right under the command of Barclay de Tolly and their left under General Peter Bagration. Kutuzov established his line on a ridge that looked down on the Semenovskaya creek, with his forces straddling Borodino in his center. His right wing faced north, running parallel to the south bank of the shallow Kalatsha River as far as its confluence with the Moskva; his left, facing west, extended southward from the formidable Rayevsky (or "Great") Redoubt (mounting eighteen pieces of artillery and protected to the front by "wolf pits" dug the previous day) through the ruined village of Semenovskaya, then past three arrow-shaped earthworks known as *flèches* to the village of Utitsa, which sat atop a knoll on the Old Post Road, beside which stood thick woodland. Much of Kutuzov's position was covered by heavy brush and trees, not least the Utitsa woods. Large bodies of Cossacks, unreliable against formed bodies of troops but effective in harassment, scouting, and postbattle pursuit, protected both flanks. Finally, light infantry extended along the entire front. Several brooks intersected the area; these, and the knolls, woods, and ridges at various points along a position measuring only 8 kilometers long, left exceptionally little room for maneuver; conversely, there would be plenty of opportunity for massed artillery to wreak havoc in the tightly packed formations on both sides.

Apart from the strongpoint captured by the French at Shevardino, the field fortifications along the main Russian line, though rapidly constructed, were by no means unimpressive. Earthwork structures manned with artillery stood around Borodino, near Utitsa, and on the right flank to cover the fords of the Kalatsha River. The two most formidable, however, were the Rayevsky Redoubt and the *flèches* built by Bagration. The Russian reserves were kept close to the front line, a great mistake as they were to make an ideal target for massed French artillery.

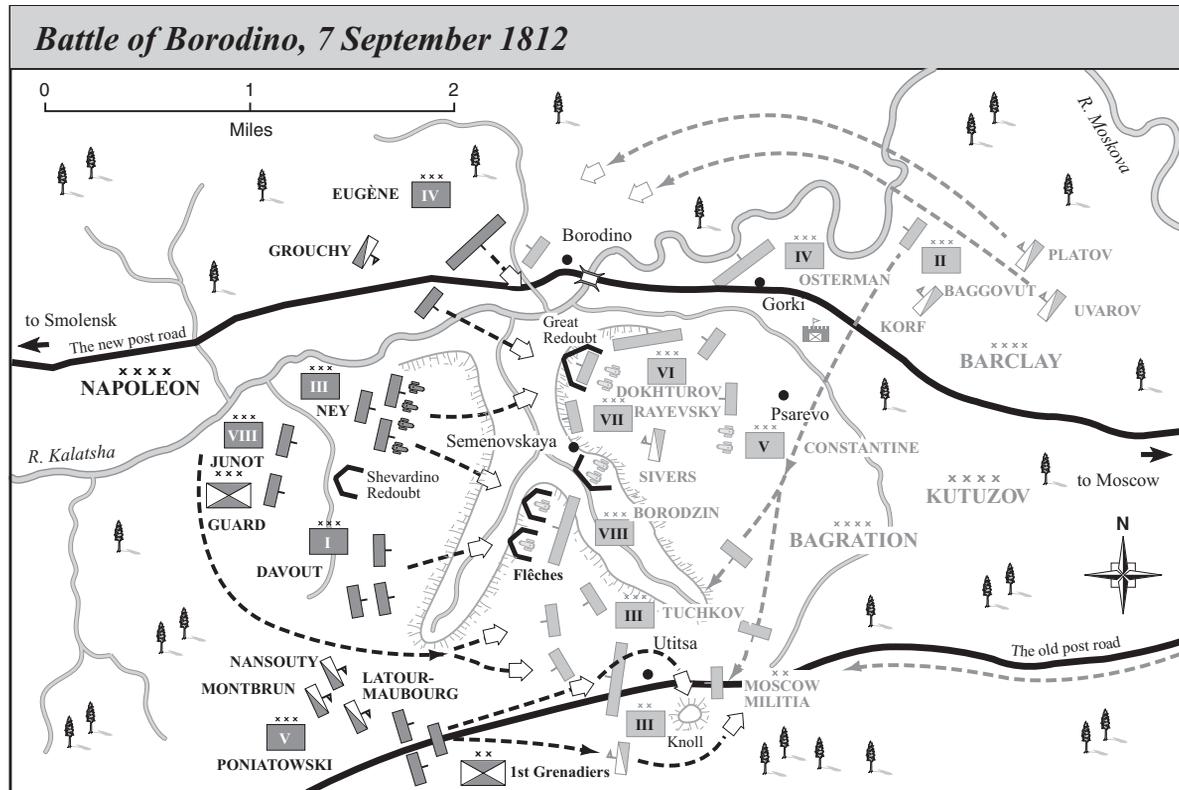

With his left anchored on woods and his center strongly fortified, the Russians probably expected Napoleon to turn their right, and hence the relatively stronger dispositions around Gorki, the site of Kutuzov's headquarters. Napoleon, however, decided against making his main thrust against the Russian right on account of the high

banks of the Kalatsha. He also rejected Marshal Davout's proposal for a wide, sweeping maneuver to the south with 40,000 men, intended to outflank Kutuzov's left—a plan fraught with potential difficulties and yet if successful, possibly decisive. Having insufficient troops to both pin the enemy and execute a wide turn around Kutuzov's flank may have dissuaded Napoleon from adopting the plan. Whatever the reason, the Emperor, suffering from a heavy cold, failed to display his usual energy and opted for a simple strategy: a massive frontal assault on the Russian center and left-center. Specifically, the main thrust would be directed against the area between Borodino to the north and the *flèches* to the south, with Prince Poniatowski's V Corps, on its own, attempting a small flanking movement against the Russian left. This was perhaps the least imaginative and potentially the costliest method of defeating the Russians.

The French were in position by 5:00 A.M. on 7 September, but at sunrise, through some oversight made the previous day, the batteries were found to have been constructed out of range of the Russian line. Once they had been repositioned to within 1,300 yards of the enemy it was precisely 6:00 A.M., at which time 100 guns opened a massive bombardment against Bagration's positions. The French enjoyed some initial success, as IV Corps (mostly Italians) under Prince Eugène de Beauharnais, operating on the left of the attack, captured Borodino in a rapid assault. Barclay de Tolly's counterattack managed to retake the village, but finding the place untenable, the general ordered his troops to withdraw across the Kalatsha and burn the bridge behind them.

Meanwhile, two divisions under Davout reached Semenovskaya further south, while at 6:30 the French made their first assault on the *flèches*, briefly taking one of them. Having lost heavily from artillery fire in the process, however, they soon retreated before a Russian counterattack with bayonets. Davout had his horse shot from under him and was carried off the field semiconscious. On the extreme right, Poniatowski began his efforts at turning the Russian left. He succeeded in capturing Utitsa and part of the woods to the north of the village, aided by the transfer of some of the Russian troops in this sector to the area around the hard-pressed *flèches*. General Alexander Tuchkov was killed in the seesaw battle around Utitsa, where the Poles, despite gallant efforts, found themselves unable to achieve a breakthrough. Kutuzov reacted accordingly, shifting large numbers of reserves from his as-yet unengaged right wing in order to reinforce his center and left.

Back at the *flèches*, a Russian grenadier division struggled against overwhelming numbers of attackers until virtually annihilated; like so many Russian units, especially those regiments within easy range of the enemy's plentiful

Adapted from Chandler 1987, 437.

artillery, they died where they stood, stubbornly refusing to yield ground. The French eventually took two flèches, but before the third could be captured Bagration introduced reinforcements into the fray, which in turn drew in tens of thousands of French troops in a fierce hand-to-hand struggle that involved hundreds of pieces of artillery on both sides. The flèches changed hands several times, and in the course of the fighting Bagration fell wounded, struck in the leg—a wound from which he would die seventeen days later. From Bagration command passed first to General Peter Petrovich Konovnitsyn and then to General Dmitry Dokhturov, and after five hours' savage, fighting the Russians finally withdrew from the flèches, the place littered with the fallen.

Further north, Eugène and his division crossed the Kalatsha in the direction of the Rayevsky Redoubt but were halted with severe losses. Similarly, Davout's I Corps, confronting the corps of generals Nikolay Rayevsky, Borodin, and Karl Fiodorovich Baggovut and supported by part of Marshal Ney's command and all of Marshal Junot's corps, could not make further headway. After four hours' fighting, by 10:00 A.M. the battle had degenerated into a massive contest of attrition, with rapidly growing casualties on both sides. Napoleon had long since committed practically all his formations save for the Imperial Guard and the cav-

alry held in reserve. Subordinates appealed in vain to the Emperor to commit the Imperial Guard to take advantage of the fall of the flèches, but Napoleon refused, perhaps conscious of the fact that it might be needed at a more critical time.

By noon the Russians had partly given way in the center, but they continued to hold the line in other sectors of the field. Kutuzov redeployed General Ivan Osterman-Tolstoy's IV Corps from the right wing in order to bolster the center and left, while 12,000 Cossacks and regular cavalry under generals Matvei Platov and Fedor Uvarov crossed the Kalatsha to counterattack around Borodino, obliging the French to postpone their planned massive onslaught against the Great Redoubt. Meanwhile, by 2:00 P.M. Eugène had recrossed the Kalatsha to the north bank in order to bolster the troops under attack by Russian cavalry and to ready his three divisions for the great assault. An earlier attack on the redoubt had been repulsed, leaving the French 30th Line virtually destroyed and the commander of the Russian reserve artillery, Kutaisov, dead. Grouchy's III Cavalry Corps was sent to cut up the Russian infantry in the area, but when they formed square his enterprise failed. After the cavalry returned to friendly lines the artillery bombardment was redoubled, killing thousands in the tightly packed Rus-

The Battle of Borodino. With both sides evenly matched and Napoleon unimaginatively content to launch his troops straight into the teeth of prepared positions, the battle was destined to be a costly and exhausting stalemate. (Library of Congress)

sian ranks, though the Rayevsky Redoubt remained in Russian possession.

At the same time, on Napoleon's extreme right, Poniatowski had made little further progress around Utitsa. Having the advantage of woods and broken ground, the defenders held their positions tenaciously, despite the appearance of French reinforcements under Junot.

With no possibility of a breakthrough on either wing, the French could only clinch victory in the center. Situated in the Russian line between the Rayevsky Redoubt and the *flèches*, *Semenovskaya*, already burned and virtually demolished, was now utterly destroyed by French artillery fire before two of Ney's cavalry corps swept in to deliver a potentially decisive blow. At the same time, General Marie-Victor Latour-Maubourg's IV Cavalry Corps destroyed a Russian grenadier division before it could deploy in square, only to be driven off by counterattacking Russian cavalry behind them. Further south, General Nansouty's I Cavalry Corps could make no headway against infantry of the Russian Imperial Guard, which had formed squares, while in *Semenovskaya* itself

the grenadiers fought with such tenacity that only Marshal Murat's presence stopped the French from abandoning the place altogether.

Another French advance ejected the Russians from the burning village once again, and for a short time Kutuzov's army was actually split in two. A second appeal to Napoleon to throw in the Imperial Guard was made and declined, and with it probably went the last opportunity for a breakthrough. Nor were Murat's cavalry properly put to use: The bulk of them, having been repulsed from the area around *Semenovskaya*, sat immobile for hours, receiving no orders to exploit the gap in the Russian line and suffering horrendous losses, including General Montbrun, commander of II Cavalry Corps, who was killed by Russian artillery fire. The Russians filled the gap, and despite the loss of *Semenovskaya* and the *flèches*, Kutuzov's line remained intact, albeit battered.

Meanwhile, Eugène, concentrating every available trooper, attempted to advance further after the fall of the Rayevsky Redoubt in order to exploit his success there, but Barclay de Tolly halted this advance by bringing up

two fresh cavalry corps. With no further reserves, the French were simply unable to proceed further.

On the Russian right, Kutuzov now showed some rare initiative, ordering a broad cavalry sweep intended to strike the French rear. Generals Uvarov and Platov, with regular cavalry and Cossacks totaling 8,000 horsemen, advanced with caution, and though they did not attack the French rear, they did manage to cause panic in their ranks and paralyzed thousands of troops who might have been committed to the fight in the center.

The Rayevsky Redoubt, the focus of hours of artillery fire by over 150 guns, remained to be vanquished. Now, at about 3:00 P.M., the French launched a coordinated infantry and cavalry attack against the now-shapeless feature. Napoleon's aide-de-camp, General Caulaincourt, leading II and IV Cavalry Corps, advanced over the breastworks with the Saxon and Polish heavy cavalry, while French cuirassiers stormed in through the back. Caulaincourt was killed in the charge, but the key to Kutuzov's line was taken, secured by infantry that stormed through the embrasures in the wake of the cavalry. There followed a fierce two-hour cavalry engagement as French and Allied regiments galloped on into the main Russian line, where Barclay de Tolly twice narrowly escaped death.

On Napoleon's extreme right, Poniatowski's Polish troops carried on the struggle and at 4:00 P.M. were able to recapture Utitsa and the knoll on which it stood. However, the appearance of Russian reinforcements—unbeknownst to Poniatowski, they were the Moscow militia, a force of very dubious quality—gave the attackers cause for concern, and the offensive ground to a halt. Indeed, by 5:00 P.M., all along the front the fighting gradually petered out, both sides exhausted from the bloodletting. Large gaps had opened in the Russian line, but Napoleon continued to refuse to send in the Imperial Guard in what might have been a decisive turn of affairs. As the fighting abated, the French stood roughly on the site of the original Russian positions. Still, Kutuzov's army, shaken though not broken, retired only a short distance away to the next ridge—hardly the outcome that Napoleon had desired.

Both sides were exhausted. Casualties were horrendous. Exact figures are not known, but approximately 44,000 Russians fell at Borodino, of whom perhaps 25,000 were wounded and left on the field. Bagration lay mortally wounded, Tuchkov was dead, and twenty-one other Russian generals were casualties. Some corps were so depleted as to be mistaken for divisions, and divisions for battalions. The French, for their part, held the field, but at a cost of about 33,000 wounded and killed—roughly 40 percent of their original force. Montbrun and Caulaincourt were among the dead, and Davout was wounded. All told, about a dozen *général de division* and nearly 200 staff and senior

officers were among the fallen. Too weary to pursue, the French withdrew to their original lines and had to content themselves with possession of a battlefield choked with bodies.

Senior commanders on both sides, but particularly the French, had shown little imagination, with massacre the inevitable result of two armies slugging it out on a congested field. Both sides claimed victory, but Borodino may best be described as a draw or, arguably, a technical victory for the French, who, with a clear road ahead of them, staggered into Moscow on 14 September. Nevertheless, Napoleon's losses had been on such a scale as to render Borodino a Pyrrhic victory. While Kutuzov had certainly lost a considerable proportion of his forces, he could expect reinforcements, whereas the French could not rebuild the units that had been thrust into the cauldron of fire with such lavish disregard for the losses they were bound to suffer. Nor could they easily replenish their expended ammunition. Thus, despite their Herculean efforts on 7 September, the French failed to achieve the decisive outcome they desired, marking Borodino as the climax of the campaign and the beginning of the end of the Grande Armée in Russia.

During the night the shattered Russian army, now reduced by more than a third of its strength, began to withdraw further east in case the French sought to renew the attack on the following day. Leaving thousands of stragglers to catch up as best they could, Kutuzov declared on 13 September that he would not fight the French again before Moscow. Instead, he left the city undefended on the basis that its loss would not spell the defeat of his country. He was right: His army remained intact, Napoleon was not in a position to dictate peace, and Tsar Alexander was resolved to continue the war at least until the French had been driven from Russian soil. Although Kutuzov's troops could not inflict a decisive blow on the Grande Armée, the coming winter could.

### Boxtel, Battle of (14–15 September 1794)

This minor action took place near Boxtel on the Dommel River, a few miles from 's-Hertogenbosch (Bois-le-Duc) between French and British troops during General Jean-Charles Pichegru's invasion of Holland. This engagement was fought during the British retreat toward Holland when components of Pichegru's Army of the North of 70,000 troops attacked a British outpost at Boxtel. Although the British had intelligence of an imminent attack, it seems to have been ignored, and the French attacked the stronghold by night, overwhelming the garrison of British, Hanoverian, and Hessian forces. These were but a minor contingent of the Duke of York's army, which probably numbered less

than 40,000. A cavalry unit of French émigrés, Rohan's Hussars, was scattered, and Anglo-Allied troops lost two battalions of Hessians as prisoners. Because these German mercenaries were among the best troops in the army, this was a significant loss.

The following day York sent a force of ten battalions of infantry and ten squadrons of cavalry under Major General Ralph Abercromby to regain the position. The attack was aborted when the British almost ran into the French main force and only narrowly escaped disaster. However, Abercromby judged the situation well and succeeded in escaping extinction with the limited loss of ninety men. During this engagement Colonel Arthur Wellesley, the future Duke of Wellington, saw action for the first time, commanding the 33rd Foot. His regiment covered the retreat of the British Guards by firing disciplined volleys, driving off the attacking French cavalry. Both the 33rd and its commander were commended by York.

Although Boxtel was a significant loss—it commanded the road to 's Hertogenbosch, the British line of retreat—York did not dare to make a further attempt to retake the stronghold. He retreated and crossed the Maas (Meuse) River at Grave, taking up a position at Wychen near Nijmegen.

### Brienne, Battle of (29 January 1814)

The Battle of Brienne marked Napoleon's victorious return to the battlefield in the defense of France, and his intent for the campaign was no less than to keep the two major Allied armies, those of Bohemia and Silesia, separated and defeated in turn. By the end of January, the Allies had pushed the French armies well across the Rhine, and France's defenses were crumbling. Napoleon had hoped that achieving a strong victory in the field would cause the multinational alliance against him to collapse. He sought this victory by chasing the commander of the Army of Silesia, Field Marshal Gebhard von Blücher, from St. Dizier to Brienne from 27–29 January 1814. Blücher had intended to advance to Arcis-sur-Aube without stopping at Brienne, but luckily for the Allies a copy of Napoleon's orders to Marshal Mortier were intercepted, and Blücher stopped to

meet the threat from Napoleon at his rear. Blücher and his advisers were settled at the chateau at Brienne when they were informed that Napoleon, leading his own troops, was advancing.

The engagement began in late morning and continued well into the evening, with the advantage changing several times. The Allied leadership was not terribly worried about the attack; Blücher apparently insisted on sitting down to dinner even as the French artillery bombarded the chateau. A forward French infantry battalion succeeded in taking the chateau late in the evening, and nearly captured Blücher and General Gneisenau, who barely managed to escape. Allied attempts to retake the chateau that night were unsuccessful, and the battle stands as a nominal victory for Napoleon, albeit one that cost him about 3,000 casualties, with a similar number lost for the Allies. It did, however, provide his raw recruits some experience of battle, and gave notice to the Allied armies that the battle for France would not be easy. However, once reinforcements arrived for Blücher from *Feldmarschall* Karl Philipp Fürst zu Schwarzenberg's Army of Bohemia, the renewed Allied forces defeated Napoleon's troops at the Battle of La Rothière on 1 February.

## British Army

As an island nation, Britain naturally devoted a far greater proportion of its resources to the Royal Navy, whose responsibilities extended beyond the defense of the nation to wider strategic interests, than to the army. When war with France began in 1793, the army, which numbered a mere 45,000 men, had not fought in a major conflict in the decade since the end of the American War of Independence (1775–1783), from which it emerged with a respectable battlefield record but a bruised sense of inadequacy as a result of the disasters at Saratoga and Yorktown.

The army's main responsibilities lay in the colonies and in the maintenance of order in restless Ireland. A

massive two-thirds of the nation's troops were serving abroad at the outbreak of war with Revolutionary France, leaving a tiny disposable force available for amphibious operations on the European continent. Even had the bulk of the army remained at home, it would still have paled in comparison with its continental counterparts, which numbered in the hundreds of thousands. The main burden on land for the First Coalition, therefore, stood squarely on the shoulders of Austria and Prussia. This would remain so until 1808, when, with the rising in Spain against French occupation, an expeditionary force sent to Portugal under Lieutenant General Sir John Moore would begin the gradual buildup of British armed forces in the Iberian Peninsula. Under the Duke of Wellington the army would ultimately oust the French from Spain and invade France itself even before Britain's allies crossed the Rhine at the beginning of 1814.

But this is to anticipate events. During the war with Revolutionary France (1793–1802), the quality of British troops was mediocre in general, and many of the amphibious operations conducted in the 1790s were of limited success for this reason, coupled with other factors, including insufficient numbers (very much the result of William Pitt's dispersal of troops around the world). The quality of the troops suffered partly as a consequence of the low position in which soldiers were held within society, for practically everyone from the man in the street to members of Parliament regarded the army with suspicion and sometimes even contempt—a fear harkening back to the days of Oliver Cromwell's usurpation of the power of Parliament, when the army effectively established a dictatorship. Such attitudes were compounded by the fact that without conscription the lower ranks were often society's outcasts, whether through poverty, criminality, or the inability to practice a trade. Such attitudes stood in sharp contrast to prevailing opinions of the Royal Navy, whose virtues had been apparent for centuries. The army, by contrast, could only properly trace its beginnings to the Restoration in 1660. The navy not only defended the nation at sea, it maintained and expanded the British Empire and protected the nation's vital trade routes—while posing no threat to citizens' personal liberty or to the form of constitutional monarchy of which Britons had been proud since 1688.

The record of the British Army during the war with Revolutionary France was mixed: Like his other eighteenth-century predecessors, especially his father, Pitt dispatched numerous minor expeditions—such as to Flanders in 1793–1795 and to North Holland in 1799—in order to divert French attention from the main theater of war, but none of these made much of an impact on the greater strategic aims sought by Allied countries such as

Austria, Prussia, and Russia, who contributed far more substantial numbers of troops. The British Army also had a poor record of cooperation with the navy, on which it obviously depended for its transport and supply, and unlike the continental armies lacked a permanent system for organizing regiments into formations higher than brigades, though a divisional system was later employed during the Peninsular War and in the Waterloo campaign.

Certainly the army enjoyed a number of successes in the West Indies in the 1790s, but this was by no means universal, with setbacks particularly notable on St. Domingue (now Haiti). But far greater enemies awaited the army there: Yellow fever, malaria, and other tropical diseases ravaged the forces sent to that theater, possibly accounting for as many as 100,000 deaths or invalid discharges. The most significant success enjoyed by the army during the 1790s was Sir Ralph Abercromby's expedition to Egypt in 1801, but by then the French army had been isolated for over two years and no longer posed a serious threat to the strategic interests of the Second Coalition (apart from the Ottoman Empire, of course)—and certainly no longer to British interests in India, as had been the case when Bonaparte first arrived in 1798.

By the time the Napoleonic Wars began in 1803, the commander in chief, the Duke of York—an ineffective field commander but a superb administrator—had instituted a number of important reforms, while Sir John Moore had introduced light infantry and new training methods for the infantry as a whole. The government had by then begun to realize the folly of an understrength army and had raised its strength to over 200,000 men, though many of these were still required for home defense and colonial policing; thus, the forces sent to Hanover and Naples in 1805 were again merely diversionary (and not terribly effective at that) and extremely small compared to the massive armies fielded by Austria and Russia in the main theater of campaign. Having said this, from 1808 onward the army's role in Portugal and Spain would grow year by year, so that in the comparatively short space of four years it would become a first-rate fighting force second to none in Europe. The crucial—some would say decisive—role played by British troops at Waterloo, albeit as part of a larger Anglo-Allied and Prussian effort, was proof of the enormous progress made by the army in the preceding decade.

A vast literature exists on the British Army of the period, particularly the forces that served under Wellington in Portugal and Spain. Only the three main arms of the service are covered here, though further branches included the commissariat, the medical services, the Corps of Royal Engineers, the Adjutant General's and Quartermaster-General's departments, and the intelligence service.

## Infantry

Though the infantry of the 1790s were not of impressive material, by the time of the Peninsular War (1808–1814) great improvements had been made in training and morale. Under Wellington's command the British infantry became one of the finest in Europe: extremely reliable, dogged and stalwart in battle, and capable of issuing a disciplined fire that the French were utterly incapable of matching.

The regular infantry regiments were numbered up to 104 by 1815, though there had been more in the 1790s, mostly short-lived units. In addition to these were three regiments of Foot Guards. Most regiments had a title as well as a number, indicating an affiliation with a county or territory from which most of the ranks were recruited, though in many cases these designations did not reflect the true geographical origins of the men at all. From 1805 onward, however, regulations allowed men from the militia to join the regular army, thus raising the local composition of recruits who normally enlisted in their county formation. Regiments from the Highlands and Ireland were drawn from those places for the most part, the former in particular characterized by distinct uniforms including a kilt and feather bonnet. Scottish regiments had proud martial traditions, and most had distinguished themselves in battle.

Theoretically, the basic unit of organization was the regiment, usually consisting of two battalions, but because these rarely served together in the field, it was the battalion that actually functioned as the basic administrative unit. Thus, the two operated independently, with the second battalion frequently serving in a completely different theater, often on another continent. One battalion of a regiment might be serving in the West Indies while the other might be as far away as Gibraltar or India. Sometimes one battalion remained at home, where it served for recruitment purposes and sent out drafts to keep up the strength of its sister battalion on campaign.

In 1808, at the start of the army's campaigning in the Peninsula, there were 103 regiments of the line, 61 of which consisted of the usual two battalions. Thirty-seven regiments had one battalion, one had four, and two regiments had three each. There were also two rifle regiments: The 60th (Royal Americans), which had seven battalions, and the 95th Rifles, which had three battalions. Units designated as "Fuzileers" (fusiliers) were actually no different from the ordinary line regiments except in minor variations in uniform (but particularly in headdress, for they wore fur caps instead of leather shakoes) and the fact that they were descended from regiments that had once carried fusils—a lighter form of musket.

The Foot Guards, together with the Household Cavalry, made up the elite of the army. In the case of the infantry,

their normal established strength was much larger than ordinary regiments of the line, and their conduct and performance in battle was also generally higher. The 1st Foot Guards had three battalions, and the other two Foot Guards regiments had two battalions each. Guardsmen were better paid, and their officers held double rank, which meant that, for instance, a lieutenant in the Foot Guards was the equivalent to a captain in a line regiment.

Officers could rise through the ranks through the normal course of seniority or through distinguished battlefield performance, but the quickest route to promotion was through the purchase of a commission, by which an officer paid for a rank sold to him by another, more senior, officer. On the mere transfer of funds came a transfer in rank, irrespective of other considerations. This, of course, meant that the higher ranks were beyond the reach of any but the most affluent members of society, a fact that preserved the social exclusivity of the officer corps and accounted for the very high proportion of aristocrats and landed gentry in senior command, particularly in the Household regiments, where commissions were more expensive than those in the line.

Each battalion consisted of ten companies, eight of which were “center” companies (so named from the position they held when in line formation); the other two were “flank” companies. The company positioned on the right flank consisted of grenadiers, in theory the biggest men of the battalion, while the left-flank company was made up of light infantry (usually the smallest and quickest men). In the light infantry and the rifle regiments all the companies were identical, with no grenadiers.

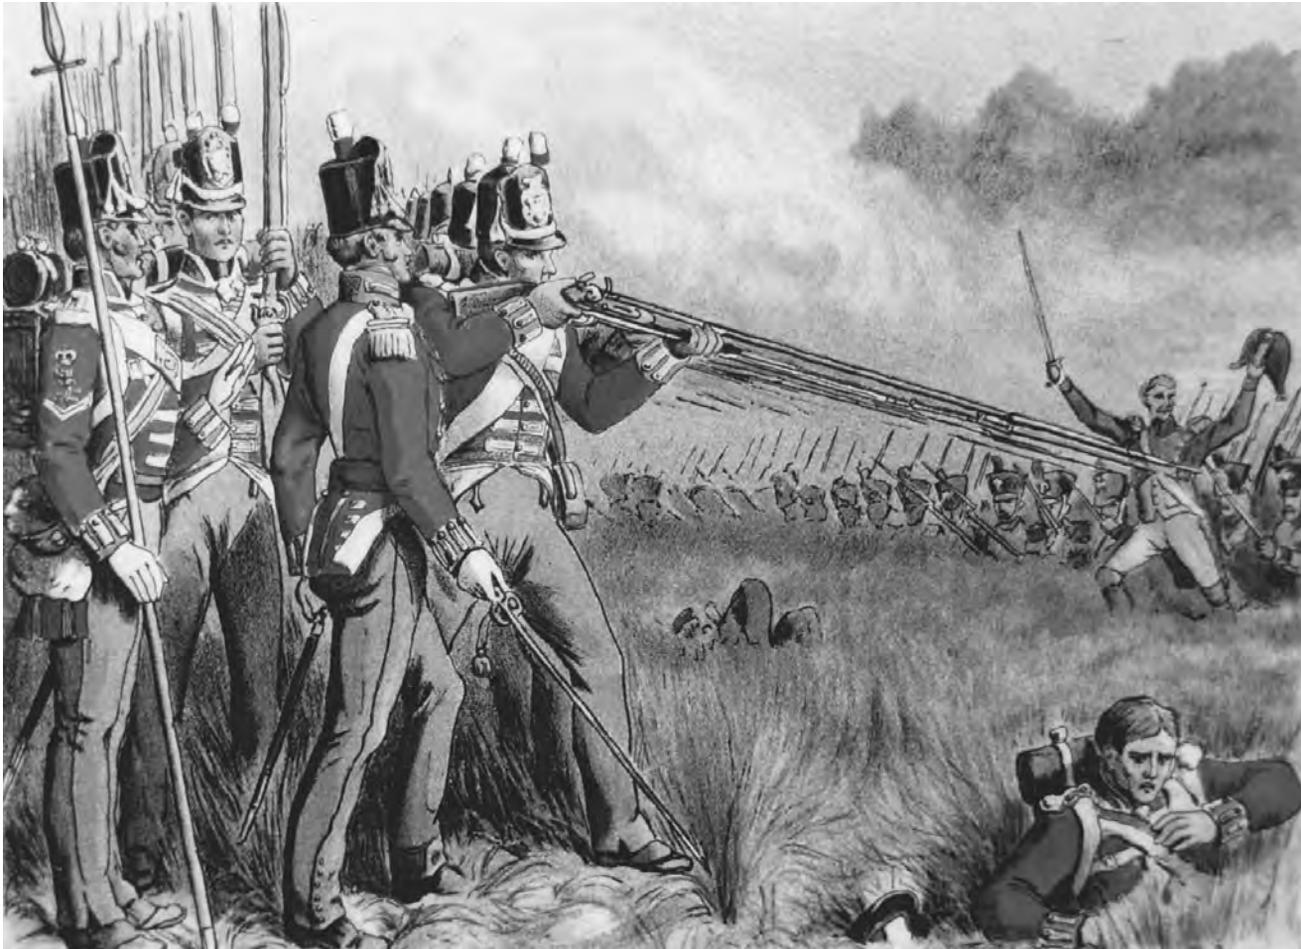

A full-service line regiment theoretically consisted of about 1,000 rank and file, or about ten companies of 100 men each. With officers, noncommissioned officers, and drummers, this would bring the total up to about 1,100 men. However, this figure was very rarely attained on campaign, though numbers in one battalion could be bolstered by drawing men from the second battalion. Indeed, it was not unusual for regiments to fall below 750 effectives (men actually present and fit for action) at the start of a campaign and reach an average of about 550 in the midst of operations. By the summer of 1812, for instance, only one line battalion numbered over 900 men and twelve battalions mustered fewer than 400 men each. If a battalion fell too far below operationally effective strength, it might be temporarily amalgamated with another understrength unit to form a provisional battalion until the two components could be brought back up to strength with reinforcements sent out from their respective recruiting depots back home.

The basic firearm of the infantry was the Brown Bess musket, a smooth-bore flintlock weapon. This fired a

spherical lead ball about an ounce in weight. Its range and accuracy left a great deal to be desired and dictated the shoulder-to-shoulder formations and close-order tactics of the day. Unless faced with a large mass of men, a musket-armed soldier was extremely unlikely to hit his target unless exceedingly proficient. Similarly, unit cohesion could not be maintained except by tightly packing the ranks, so battles almost invariably consisted of large opposing blocks of infantry blazing away at one another at extremely close ranges—with sometimes devastating results. In theory, while a musket ball could strike a man at 200 yards, actual effective range was under 100. Infantry also carried socket bayonets, except for officers, each of whom armed himself with a pistol and a sword. Each soldier carried sixty rounds of ammunition and could fire one round in approximately thirty seconds—perhaps twice as quickly as his French counterpart.

The light infantry regiments were more adept in the use of the musket than were ordinary line regiments, partly as a result of lessons painfully learned during the American War of Independence: Skirmishing, scouting, flank cover, and screening had often been more crucial in the broken ground and forests of North America than they were in the open fields of Flanders and the Rhineland. Light infantry regiments were found to be all the more necessary when ordinary line regiments found themselves confronted by the annoying fire of the French *tirailleurs* who normally screened friendly units moving inexorably forward in column. The British had lost some of these skills by the 1790s, but through the limited efforts of officers such as Sir David Dundas, who reformed methods of infantry maneuver, and above all Sir John Moore, light infantry eventually came into its own and could match their opposite numbers in the field. The conversion of line infantry regiments to light ones took place in 1794, but so rapidly did this branch of the infantry expand in the Iberian Peninsula that several light infantry regiments—initially formed into the Light Brigade—later grew to divisional strength and came to be regarded as an elite formation of Wellington’s army. While light infantry uniforms looked very similar to those of the line, the soldiers’ muskets were slightly shorter (and consequently lighter) and sometimes had backsights to aid in aiming.

Rifle-armed detachments and sometimes whole units had existed for some time on the Continent, particularly in the German states, where the utility of the weapon, first appreciated by hunters and estate managers, was eventually grasped by the more forward-thinking continental tacticians of the era of the Seven Years’ War (1756–1763). The rifle, though slower to load than a musket and requiring more training, proved significantly more accurate, and an adept rifleman, taking advantage of available cover on the

British infantry deployed in line prepare to repulse an advancing French column. Disciplined, short-range musket volleys, followed by a bayonet charge, usually drove off an attacker. (Print after Richard Simkin from *Epochs of the British Army* by Lt. Col. H. S. Spalding, London: W. H. Allen, 1891)

battlefield, could sometimes pick off mounted officers and gunners with impunity. The 95th Foot, which would attain great fame in the Napoleonic Wars, was formed in 1800 and was equipped with the Baker rifle, which could be fired from a prone position (unlike a musket) and whose grooved rifling on the inside of the barrel offered superb accuracy. Whereas a musket-armed soldier would be lucky to hit an individual at 100 yards, a rifleman could do so easily even at twice that distance. With this advantage riflemen could oppose French skirmishers, whose inferior weapons could not reply in kind. The 95th wore a distinctive dark green uniform to aid in camouflage and to render them visibly distinct from the line regiments.

### Cavalry

One of the most notable features of the British cavalry of the French Revolutionary and Napoleonic era was its numerical strength. Unlike the continental powers, Britain possessed a very small mounted corps, for in colonial war-

fare the terrain and climate often did not suit this arm, in amphibious operations the conveyance of cavalry was particularly problematic, and until the middle of the Peninsular War the mounted arm was not required in larger numbers. Once the army grew in order to face the sizable French forces that Napoleon had deployed in the Peninsula, the need for substantial numbers of cavalry naturally arose. In May 1809 there were only just over 3,000 cavalry in Portugal; there were about the same number at the Battle of Talavera in 1810 and fewer than 2,000 at Fuentes de Oñoro in the following year. While the overall strength of the cavalry rose over time, its relative proportion within the army remained about the same—around 10 percent.

British cavalry at the start of the wars were divided into three types: the Household regiments; the dragoons, of which the senior version were the Dragoon Guards, which with the ordinary dragoon regiments were designated as “heavy,” as were the regiments in the Household Brigade; and the light dragoons, the difference being that

the heavy regiments were intended for use on the battlefield to execute the charge, whereas light cavalry, while also able to fight in pitched battles, could also perform duties like scouting, skirmishing, and protecting baggage trains and lines of communication. In 1806, the army converted some light dragoon regiments into hussars, on the pattern of their continental equivalents that had proven themselves so effective in the eighteenth century.

Like the infantry, the basic cavalry unit was the regiment, two or more of which formed a brigade, two or more of which composed a division. A regiment was itself subdivided into squadrons, and then of troops, the number of troops ultimately making up a regiment varying depending on the official establishment at the time. Official strength was over 600 officers and men, though on campaign this often could not be met, and regiments frequently fell below 500.

When the Revolutionary Wars began, the heavy cavalry were armed with a rather unbalanced saber that proved as inadequate for cutting as for thrusting. According to the 1796 manual that set down the principles of cavalry maneuver and the use of weapons, troopers were advised to employ the cut or slash in preference to the thrust used by most continental heavy cavalry. In 1796 the heavy cavalry were issued with a new pattern saber, a heavy, unwieldy, blunt-pointed weapon that was retained through to Waterloo. If it made contact with its target in a downward stroke it caused dreadful injury, though it was less likely to kill an adversary than was a thrust delivered by a French cavalryman.

British cavalry also carried firearms—various types of muskets and carbines—though these were even less effective than their infantry counterparts. Cumbersome and adding unnecessary additional weight to already heavily equipped troops, such weapons seldom benefited the heavy regiments, which rarely performed picket duty or fought as skirmishers as did their compatriots in the light regiments. All officers and troopers also carried a pistol or a pair of pistols, though with such a short range these weapons were practically useless except when nearly within arm's length of an opponent.

### Artillery

Field artillery fell into two categories: “foot” and “horse,” indicating the speed with which a battery was conveyed. As the Royal Artillery was a very small enterprise within the army as a whole, and especially in comparison with its continental counterparts, no British field commander could ever assemble massed batteries in the manner of the French or the Russians. This was a consequence of limited resources and a shortage of trained personnel; the artillery, being a technical arm, required considerably more ad-

vanced training for its officers and gunners and hence the sale of commissions was not permitted, as it was in the infantry and cavalry. Other factors accounted for limitations on the size of the artillery. Whereas militia and yeomanry units could provide ready-trained men for the infantry and the cavalry, no such equivalent existed with respect to artillery, since virtually no formation possessed ordnance. Even for those fit and keen to learn gunnery, places at the instructional college at Woolwich were limited, and thus however many guns the Royal Artillery might procure from government arsenals, there was never a large enough corps of trained officers and men to make use of them all.

In practical terms this all meant that an army in the field possessed relatively few, albeit well-served, guns. In April 1809 Wellington had only about 1,000 artillerymen and support staff and thirty pieces of ordnance—nothing like the number fielded by the French in Spain even when accounting for the small size of Wellington's army at that time. As the army expanded during the Peninsular War, so too did the number of guns that accompanied it; yet proportionally, the artillery continued to remain small and, although of reasonably good quality, it was unable to play a decisive role in battle.

Like all other armies, the Royal Artillery used smooth-bore cannon (properly referred to as guns or field pieces) and howitzers, the latter employed to fire shells over obstacles with a high trajectory in order to bombard the enemy from above, as opposed to ordinary guns that fired on a flat trajectory and therefore had to be in the line of sight of the enemy lest they hit friendly troops. Guns usually consisted of 9-pounders, 6-pounders, or 3-pounders, named for the weight of the projectile. Artillery fired three different types of projectile: round shot, a solid iron sphere and by far the most common form of ammunition; canister, a thin metal tin containing musket shot that broke open on leaving the barrel, creating the effect of a shotgun; and shell, a hollow sphere containing gunpowder and a fuse that exploded after a timed delay. “Shrapnel” or “spherical case” was a form of this ammunition, fired from a howitzer and timed (if the gunner calculated the correct range and elevation) to shower the target with musket balls from above. This form of ordnance was unique to the British Army.

The horse artillery differed from the foot artillery by virtue of its rapidity of movement, as its purpose was to support the cavalry in action or to limber up (that is, to hitch each gun to a wheeled, horse-drawn vehicle known as a limber), move, and unlimber quickly in order to assist the infantry. Speed was facilitated by providing mounts for all the gunners or by seating them on the limbers and battery vehicles, whereas the men of the foot artillery, apart from the officers, had to proceed on foot. The guns them-

selves were always conveyed by teams of horses, but they could be manhandled short distances without them in extreme cases. The horse artillery, being more mobile, naturally employed lighter guns, mostly 6-pounders, though eventually they adopted 9-pounders like their counterparts in the foot artillery.

In addition to shrapnel, the Royal Artillery possessed another innovative weapon peculiar to the British Army: rockets. The Mounted Rocket Corps, associated with the Royal Horse Artillery, fired small tripod-mounted projectiles with an explosive head, invented by Sir William Congreve and first used in action in 1804. Wellington was skeptical of their efficacy, though rockets were employed in the attack on Copenhagen in 1807, in the Peninsula, at New Orleans, and at Waterloo in 1815. The rockets' main disadvantage was obvious for even a lay observer to see: Their flight was exceedingly erratic, it was impossible to predict where they would land, and their explosive effect was minimal. Yet despite all these shortcomings, rockets seriously affected enemy morale, causing otherwise-steady troops to become disordered and sometimes flee. Finally, siege guns were also used, especially in Spain, where Wellington relied on 18- and 24-pounders to reduce the fortresses of Ciudad Rodrigo and Badajoz in 1812.

## British Navy

See Royal Navy

## Brueys d'Aigalliers, François Paul, comte de (1753–1798)

François Paul comte de Brueys, born in Uzès on 11 February 1753, was the ninth child of François Gabriel de Brueys, Baron d'Aigalliers and captain of an infantry regiment from Forez. He studied at Beaucaire and then at Uzès. He went to sea out of Toulon in 1767, at the age of thirteen, as a volunteer. He joined the Guard Marines at Toulon in August 1768 and took part in the bombardment of Tunis in 1770 while aboard the frigate *Atalante*. He joined the frigate *Gracieuse* in Toulon as a naval ensign and from 27 April 1779 to 21 March 1780 served aboard that vessel while it successfully escorted a convoy of merchantmen to Salonika in the Greek archipelago.

Brueys was promoted to lieutenant in April 1780 and joined the *Terrible* (110 guns), which weighed anchor on 20 June and arrived at Cádiz on 12 July. Admiral comte d'Estaing moved his flag to the *Terrible*, which then left for Brest on 7 November and arrived there on 3 January 1781. On 2 March 1781, Brueys sailed from Brest on the *Zélé* (74), which formed part of the squadron destined for America under the comte de Grasse during the American War of Independence (1775–1783). He participated in the fight against Admiral Lord Hood on 29 April 1781 off Fort-de-France, Martinique, at the decisive Battle of the Chesapeake on 5 September 1781, and at St. Kitts on 25–26 January 1782. When peace returned, Brueys found himself on Martinique, but in 1784 he received command of the brig *Chien de Chasse*, then of the cutter *Coureur*, and finally of the artillery-supply ship *Barbeau*. On 25 May 1785 at Fort Royal in Martinique he married Marie Anne Aubin de Bellevue, a friend of Josephine de Beauharnais. Four children resulted from this union.

On his return to France, Brueys commanded the *Poulette* in the Levant and in the Adriatic from 1790 to 1792. Promoted to captain on 1 January 1792, he commanded the *Tricolore* (74) and participated in the operations at Oneglia, Naples, and Cagliari. Being a member of the nobility, he was arrested in 1793 and discharged, but he was reinstated to his post in June 1795. He became *chef de division*, and, on board the *Guillaume Tell* (74), he took command of the squadron in the Adriatic in 1796–1797. In Italy, he met the young General Bonaparte, to whom he pledged his unbounded loyalty.

Brueys was made a rear admiral in 1796, then a vice admiral in April 1798, at which time he received command of the Mediterranean fleet based at Toulon. He conveyed Bonaparte and his army to Egypt, and evaded Rear Admiral Sir Horatio Nelson and took Malta on 10 June along the way, before disembarking the troops at Alexandria. Having received no specific instructions from Bonaparte, Brueys anchored too far from the shore in nearby Aboukir Bay. Being well aware of the inadequate skills of his crews and of the bad condition of his ships, he decided not to withdraw but instead to take the risk of fighting while at anchor, announcing that an admiral must die on his watch. In the event, he was killed by a cannon ball a few minutes before his ship, the *Orient*, blew up at the Battle of the Nile on 1 August 1798.

Although a good seaman, Brueys did not know how to persuade Bonaparte to order the fleet further into port and thus avoid an inevitably disastrous engagement.

## Bruix, Eustache (1759–1805)

A member of a family of the minor nobility, Eustache Bruix distinguished himself during the American War of Independence (1775–1783) through his courage and competence. Later, the French Revolution offered him opportunities for promotion, which he gladly seized. He was a very good seaman, a commander of the Brest fleet, and finally minister of the navy. He could have been a great admiral for Napoleon had he not fallen victim to tuberculosis.

Bruix was born on 17 July 1759 at Fort Dauphin, St. Domingue. His father, Pierre de Bruix, was a captain in the

infantry and a knight of the Royal Military Order of Saint-Louis. Bruix sailed from Brest in November 1778 and then in March 1779 on board the frigate *Concorde*, which captured numerous British privateers in the Channel and off the coast of France. In March 1780 he joined the frigate *Médée*, then the frigate *Boudeuse* and took part in the 1780 campaign in the Antilles conducted by Admiral comte de Guichen. Bruix was made an ensign in 1781 and served aboard the *Auguste* (80) in Louis Antoine de Bougainville's squadron of Admiral de Grasse's fleet. He participated in all major actions in 1781 and 1782: At the Chesapeake, St. Kitts, the Saintes, and elsewhere. In command of the *Pivert*, he was involved in the hydrographic surveys conducted off the coasts of St. Domingue.

Bruix was promoted to lieutenant in 1786 and served on the frigate *Bayonnaise* in 1788. On 13 October 1789, at Brest, he married Marie Gabrielle Sébastienne Richard-Duplessis. They went on to have four children.

In 1790 he sailed aboard the *Superbe* (74) and the following year was elected a member of the Naval Academy. He then commanded the corvette *Fanfaron* in the Channel, followed by the frigate *Sémillante* at Guadeloupe in 1792. He was promoted to captain in 1793 and was in charge of the *Indomptable* (74), based at Brest. Being a member of the nobility, he was then dismissed, but he was recalled in June 1794. He became deputy chief of staff to Admiral Louis Villaret-Joyeuse and participated in the action off the Ile de Groix in June 1795. He was deputy chief of staff at Brest in October and chief of staff to Admiral Justin Morard de Galles on board the *Indomptable* during the expedition to Ireland in 1796.

He was promoted to rear admiral in May 1797, then held the post of minister of the navy and of the colonies from April 1798 to July 1799. During that time he tried to give new impetus to a navy disorganized by nine years of chaos. He was replaced by Pierre Forfait, a civil engineer and the organizer of the expedition to Egypt. Bruix was promoted to vice admiral in March 1799 and received command of the Brest squadron, a force consisting of twenty-five ships charged with the mission of resupplying Malta. On 26 April he was able to break through Admiral Sir Alexander Biddiscombe's blockade, in the course of which he took various prizes notwithstanding being handicapped by the poor state of his ships and the inadequacy of their crews' training. Despite these obstacles, Bruix was able to enter Toulon before proceeding to land troops and supplies at Genoa at the end of May 1799.

After being at sea for more than three months, Bruix finally returned to Brest. Stricken by tuberculosis, he went to Paris where he supported Bonaparte's seizure of power during the coup of Brumaire in November 1799. Bonaparte promoted him to the rank of admiral in March 1801

and entrusted him with command of the Rochefort squadron, which, however, Bruix had again to give up for reasons of health.

In September 1802 he became a senior member in the naval section of the Council of State. Bruix successfully reorganized the Boulogne flotilla, of which he was given command on 15 July 1803. The following year he was named to the post of inspector general of the (Atlantic) ocean coastal areas in 1804. However, overcome by illness, he died in Paris on 18 March 1805 at the age of forty-six. His loss deprived the Empire of one of its better naval commanders.

## Brumaire, Coup of (9–10 November 1799)

With the instability of the French government threatening the success of the Revolution itself, General Napoleon Bonaparte and others seized control on 18–19 Brumaire (in the republican calendar), thus enabling Bonaparte to become the ruler of France.

Emmanuel Joseph Sieyès, a member of the Directory, planned to gain control of the government and bring stability to France. To do this, he needed someone who could assure the support of the army. Bonaparte, just back from what was seen by the French public as a great success in Egypt, arrived on the scene at just the right moment. He was a true hero of the people and just what Sieyès needed. He would add a level of legitimacy and popularity that no one else could approach. Bonaparte also had a reputation as an excellent administrator; he was, in short, the perfect man for the job.

Joseph Fouché, Roger Ducos, and Charles de Talleyrand were brought into the plot. The directors were to resign and be replaced by Bonaparte and two others. Bonaparte's brother Lucien, long active in Jacobin politics, had been installed in October as president of the Council of Five Hundred. The legislature had been convinced to move out of Paris "for its own safety." This isolation from the citizens of Paris made it easier for the leaders of the coup to influence its members.

Bonaparte attempted to appeal to the Council of Elders in person, but he made the mistake of suggesting that if necessary he would resort to the use of force. His normal gift of oratory deserted him, and he left the room in disgrace.

When he later addressed the Council of Five Hundred, he was physically attacked and had to be rescued by several of Joachim Murat's soldiers.

The debacle at the Council of Five Hundred convinced Bonaparte that he must use troops to succeed in his coup. A group of soldiers brought Lucien to address the troops. Lucien spoke of the council's being terrorized and of Bonaparte's having been attacked. Under Bonaparte's command, the soldiers moved on the council, and many of the members departed through the windows. Those who were left installed a provisional executive government of three consuls, including Bonaparte, Sieyès, and Ducos.

Bonaparte was to have been the tool of the coup's instigators, but he quickly moved to consolidate his power. The executive branch was to consist of three consuls, with most of the power residing in the First Consul. Bonaparte became First Consul and personally selected the other two: Jean-Jacques Cambacérès as Second Consul and Charles François Lebrun as Third Consul.

The new constitution was adopted on 14 December 1799. Napoleon was now the new leader of France, having seized power without firing a shot. He was thirty years old.

### **Brune, Guillaume-Marie-Anne (1763–1815)**

The future Marshal Guillaume-Marie-Anne Brune was born on 13 March 1763 in Brive, the son of a judge. After his education he became a self-styled poet and literary, printing revolutionary periodicals. Brune was a friend and adherent of Georges-Jacques Danton and followed his rise to power during the early Revolutionary period, receiving his military commission from this patronage. While acting under the leadership of the Directory, he joined the Army of the North, participating in the defeat of royalist rebels at

Pacy-sur-Eure (1792), and he helped direct a purge of that army's general officers. Following this, Brune was made commandant of Bordeaux and "carried out his task with all the brutal cruelty of the Terror" (Shepperd 1987, 81). Brune was with Bonaparte and Paul Barras during the Paris riots of 1795, which he helped to quell, earning the notice of the future emperor.

In October 1796 Brune joined the Army of Italy commanded by Bonaparte and took an active part in the battles of Arcola and Rivoli, after which he was promoted to command of a division. He was picked to lead the invasion of Switzerland in 1798, and at the head of the Army of Helvetia he fulfilled this task, looting the country of a fortune in gold in the process.

After this success Brune was dispatched to the Batavian Republic to defend Holland from a joint Anglo-Russian invasion force under the command of the incompetent Duke of York, who had landed at the Helder in North Holland. After a number of minor defeats and stalemated engagements, Brune defeated the Allied army at Castricum (near Alkmaar), forcing them to abandon their campaign and withdraw their forces. As a military commander Brune was at his best during this battle, and he holds the distinction of being the first of Napoleon's future marshals to defeat the British. Napoleon later wrote: "Brune was justly named the savior of the Batavian Republic, for by saving Holland he saved France from invasion" (quoted in Shepperd 1987, 90).

After his victory in Holland Brune was transferred back to Italy for a second time; however, his strength as a commander was brought into question by his mismanagement of the passage of the Mincio, during which a division was in danger of being lost. This incident made Bonaparte question Brune's command abilities, and he was therefore relieved of his post. Brune served as ambassador to the Ottoman Empire from 1802 to 1804, but his mission was largely unsuccessful, though he was appointed a Marshal of the Empire. He then was made governor of the Hansa ports, but through corruption and unabashedly republican sentiment, he angered Napoleon and was relieved of command. He remained out of the Emperor's service until the Hundred Days, when, after a reconciliation, he was placed in command of Toulon. After the final defeat of Napoleon, Brune surrendered to the Bourbon authorities, and on his way to Paris he was accosted and murdered by an angry mob in Avignon, who mistakenly believed he was responsible for the executions there during the Terror.

**Brunswick Manifesto (25 July 1792)**

Described as one of the "most notorious documents in modern history" (Price 2002, 296), the Brunswick Manifesto, intended to ensure the safety of King Louis XVI and his family, actually hastened the downfall of the monarchy.

Issued at Coblenz on 25 July 1792, as Allied armies prepared to invade France, the title given to the proclamation is a misnomer, for Charles William Ferdinand, the Duke of Brunswick, merely signed it and was not the author of its bellicose contents. The manifesto worsened the deteriorating situation within France and provided justification for those who believed Louis was betraying his country and working closely with foreign powers to try to retain his power.

Written by émigrés, the document starts innocuously before descending into an overt threat to the people of France, and especially Paris, leading one author to describe it as "[treating] a great nation with a truly extra-ordinary tone of command and contempt, which openly announced to it all the miseries of an invasion, and moreover, vengeance and despotism, [and] excited a national insurrection" (Mignet 1939, 129).

The manifesto laid out the motives of the Allies, claiming that the rights of German princes in Alsace and Lorraine had been violated, that the French king and his family had been brutalized, and that the government of France had declared an unjust war and attacked the Austrian emperor's territories in the Low Countries. According to the manifesto, the Allies wanted to end the anarchy in France, prevent attacks on the Crown and the church, and "restore to the king the security and liberty of which he is now deprived and to place him in a position to exercise once more the legitimate authority which belongs to him." However, it also threatened the inhabitants of towns and villages who obstructed or attacked Allied troops, declaring that they would be severely punished and their property destroyed. If the people of Paris did not immediately submit to royal authority and attacked the Tuileries, the royal residence in Paris, they could expect no mercy, and the invading forces would "inflict an ever memorable vengeance by delivering over the city of Paris to military execution and complete destruction" (in Robinson 1906, 443, 445).

After the publication of the document, many Revolutionaries believed they had nothing to lose. It hastened the growing mood of insurrection when it was disseminated in France in late July, and precipitated, in part, the storming of the Tuileries and the overthrow of the monarchy on 10 August.

It is one of history's ironies that Brunswick, one of Prussia's finest generals, lived to regret the eponymous document and said: "I shall repent it to the last day of my life. What would I not give never to have signed it!" (quoted in Cobb 1988, 151).

**Brunswick, Charles William Ferdinand, Duke of (1735–1806)**

The Prussian field marshal Charles, Duke of Brunswick fought throughout the Seven Years' War (1756–1763) and was commander in chief of the Austro-Prussian armies between 1792 and 1794. He allowed the Brunswick Manifesto to be issued in his name and was then defeated at the Battle of Valmy. He again commanded the Prussian armies in 1806 and was defeated at Auerstädt, where he was blinded and died soon after.

Born in 1735, Brunswick was the nephew of Frederick the Great of Prussia and was destined for a military career. He served throughout the Seven Years' War and was promoted to the rank of general in 1773. He had a reputation for being a particularly effective commander of infantry. He was promoted to field marshal in 1787. In that year he commanded the Prussian forces that invaded the United Provinces to restore the authority of the House of Orange. In 1792 he led the Allied army of the First Coalition in its attempt to destroy the fledgling French Republic. Although it was rumored that he had some sympathy with the ideals of the Revolution, he did not shrink from his responsibilities. He allowed his name to be attached to the Brunswick

Manifesto, which threatened reprisals against the citizens of Paris if King Louis XVI was harmed as a result of the Allied armies' advance. However, Brunswick's army was unprepared for the campaign, and it was late in the year when it finally moved into France.

At Valmy, just over 100 miles from Paris, Brunswick's force met the French Republican army. In what amounted to a large-scale artillery duel, the French succeeded in preventing the further advance of Brunswick's army, and he was forced to withdraw back into Germany. In 1793 Brunswick was on the defensive against a series of French offensives, though he managed to recapture the city of Mainz, before being defeated by General Hoche at Wissembourg. In 1794 Brunswick resigned his command in protest against the continued interference of Frederick William II, the king of Prussia, in the details of the campaign in which Brunswick was engaged. However, in 1806, at the age of seventy-one, he was once more given command of the Prussian armies, despite the fact that he had been seen as the leader of the peace party within Prussia. Owing to divisions in the Prussian high command, mainly involving Friedrich Ludwig Fürst zu Hohenlohe-Ingelgingen, it took time for Brunswick's plan of campaign to be accepted. By the time it was, Napoleon had seized the strategic initiative, and Brunswick was destined to lead a divided army into the separate but simultaneous battles of Jena and Auerstädt. During an attack on Auerstädt at the head of a unit of grenadiers, he was shot through both eyes and died shortly afterward.

### **Brunswick, William Frederick, Duke of (1771–1815)**

William Frederick, Duke of Brunswick, raised a corps to fight against the French in 1809 and fought his way to the coast, where he then took ship to England. He returned to his lands in 1813 and commanded the Brunswick troops at the start of the Waterloo campaign. He was killed at Quatre Bras.

William was the fourth son of Charles, Duke of Brunswick. In 1806 his father was commander in chief of the Prussian army and was killed at the Battle of Auerstädt. As a result of the Treaty of Tilsit, William was formally de-

prived of the territory of Brunswick. The new duke took refuge in Austria, and in 1809 he was given funds to raise a corps of troops to support the Austrians. The duke had become an implacable foe of Napoleon; he clothed his troops in black uniforms and adopted the skull and crossbones as their badge. He therefore became known as the Black Duke, and his corps as the Black Band.

The duke's force was part of a mixed command led by *Generalmajor* Carl Friedrich Freiherr von Am Ende. This force occupied Leipzig and was then entitled IX Korps under the command of Austrian general Michael Freiherr von Keimayer. The IX Korps faced French and allied troops led by Jérôme Bonaparte and Andoche Junot. However, in July an armistice was signed between France and Austria at Znaim. The Black Duke did not consider himself bound by this treaty and resolved to fight his way to the coast and to try to evacuate his troops to England. The Black Band first stormed the town of Halberstadt and then moved on his capital of Brunswick. The duke had now decided that he would embark at Elsfléth on the Weser River. His troops were then transferred to the Isle of Wight, off the south coast of England, where they were reorganized and then sent to Spain to fight with Viscount Wellington.

Brunswick did not take up an active command with his troops but chose to remain in England and Portugal until his return to his dukedom in 1813. He then began to raise a new army, which was able to participate in the final campaign in France in 1814. The veterans of the war in Spain also returned. The duke now reorganized his army, issuing drill regulations based on those of the Prussian Army. On the return of Napoleon from Elba, the duke's forces were placed under Wellington's and formed part of the reserve. On 16 June at Quatre Bras, Brunswick was ordered to commit his troops in support of the Dutch contingent present at the battle. The duke formed his men along the road, where they were exposed to French artillery fire. The duke bolstered the morale of his men by calmly walking in front of the ranks smoking his pipe. He then led a charge of his cavalry, but this was beaten back. In trying to rally his forces, he was shot through the liver and died within a few minutes, the second Duke of Brunswick to be killed in action during the Napoleonic Wars.

### Buenos Aires, Expedition to

The expedition to Buenos Aires by British forces in 1806–1807 was prompted by local commanders who were seeking glory and financial reward. The lack of planning and resources resulted in a British defeat and heavy losses. Actions by local civilians were mostly responsible for the defeat and helped encourage an independence movement in Latin America. Commodore Home Riggs Popham commanded a fleet sent in July 1805 to recapture the Cape of Good Hope from the Dutch in order to secure Britain's route to India. After forces landed by Popham took over the cape on 18 January 1806, the fleet was without a mission. Popham, who had demonstrated an eagerness for prize money and glory, received information that the colonies of Montevideo and Buenos Aires were ready to revolt against the Spanish. Without securing permission from the Admiralty, Popham sailed with his entire fleet and one infantry regiment for the Río de la Plata on 14 April.

After stopping in St. Helena to pick up reinforcements, Popham reached the Río de la Plata on 8 June 1806. The British soon found that the estuary was very shallow in places and that the heavier ships could not get close enough to lend support to land forces in most areas. Without a plan, Popham eventually decided to capture Buenos Aires. The city was poorly fortified, and few regular Spanish troops were nearby. On 26 June, approximately 1,500 men were landed under General William Beresford below Buenos Aires. After defeating a small Spanish force, Beresford captured the city the next day. Popham expected the British to be welcomed as liberators, but the population of 70,000 was angry at the foreign invaders. Popham sent the silver he found in the city to Britain and awaited reinforcements. Over the next two weeks, the people organized an attack on Beresford's men. With a small force of regulars, an uprising took place on 10 August. Outnumbered, Beresford concentrated his men in the city's center, where he counted on using the more open spaces to defeat the irregular attackers. Still, Beresford had to surrender his whole command at noon on 12 August. The fleet was unable to approach close enough to Buenos Aires to affect the fighting.

Popham spent the next few months ineffectually blockading the Río de la Plata and occupying Maldonado. In November 1806 he was replaced by Rear Admiral Charles Stirling, who brought along more troops. On 16 January 1807 a force was landed to capture Montevideo. After a short siege, the city fell on 3 February. The local

population remained hostile, however, and with only 6,000 men, Stirling's control was tenuous. The few shallow-draft vessels available were unable to prevent local troop movements.

Admiral George Murray arrived that spring, along with further reinforcements under Lieutenant General John Whitlocke. Whitlocke was determined to attack Buenos Aires again, since it was the center of resistance. With the fleet's support, he landed an attacking force of 11,000 men near Buenos Aires on 28 June, defeating a 7,000-man Spanish force in the open field before reaching the city. He launched his attack on 5 July, but was bogged down in house-to-house fighting. Nearly 3,000 British troops were killed, wounded, or taken captive, and Whitlocke, recognizing the futility of further fighting, withdrew. A truce was negotiated with local authorities, and the British troops withdrew to their ships. Recognizing that their strength was insufficient to control the estuary, the British set sail that fall. Popham was later court-martialed and censured. Leaders of the local population, however, were encouraged by their ability to defend themselves and began to consider independence as an option.

### Bülow von Dennewitz, Friedrich Wilhelm Graf (1755–1816)

The Prussian general Friedrich Wilhelm Graf Bülow, as commander of III Corps in the battles of Grossbeeren (23 August 1813) and Dennewitz (6 September 1813), saved Berlin twice from the threat of a French attack. He was made Graf Bülow von Dennewitz on 3 June 1814. At the Battle of Waterloo (18 June 1815), IV Corps under his command bore the main burden of the successful attack on the village of Plancenoit.

Bülow entered military service (2 April 1768) as a corporal. On 24 December 1772 he became an ensign, followed by promotion to second lieutenant (1 April 1778), first lieutenant (26 May 1786), captain second class (2

General Friedrich Graf Bülow von Dennewitz, a capable Prussian corps commander who in the campaign of 1813, defeated the French at Grossbeeren and Dennewitz. He also played a prominent part at Waterloo in 1815. (Unsigned print from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 4)

March 1790), captain (10 February 1793), major (3 April 1794), lieutenant colonel (23 June 1803), colonel (23 May 1806), and major general (25 November 1808) (the patent being antedated to 21 November, which made him senior to Major General Friedrich von Kleist). On 14 March 1813 he was promoted to lieutenant general (the patent being post-dated to 21 March, which made him junior to Lieutenant General von Kleist and Princes Heinrich, Wilhelm, and August of Prussia). His final promotion came on 30 May 1814, as a general of infantry (the patent being antedated to 4 April). He served in the campaigns of 1778–1779 in the Bavarian Succession war in 1793–1794 on the Rhine, in 1806–1807 in East Prussia, and in 1813–1815 in Pomerania.

Born 16 February 1755, like many other noblemen destined for military service, Bülow entered the Prussian army at a young age. Intelligent and witty, he used his free time for historical, geographical, and mathematical studies. His regiment being garrisoned in Berlin, his great musical talent, as a composer as well as a player, helped introduce him to the royal court. On 10 February 1793 he was attached as governor to Prince Louis Ferdinand of Prussia,

whom he accompanied in the campaigns of 1793–1794. After the campaigns, keen on active service, he declined the offer to become the adjutant of Prince Heinrich of Prussia and was transferred to a fusilier battalion instead. On 12 September 1797 he became chief of the newly raised Fusilier Battalion no. 16.

With his battalion, Bülow took part in the campaign of 1806–1807 in East Prussia, but he was transferred to the army corps commanded by Gebhard von Blücher, under whom he became a brigadier on 23 May 1807. In the following years, Bülow served as a commander of different brigades. Having become provisional governor-general of East Prussia in place of General Johann von Yorck on 24 March 1812, in the winter of 1812–1813 Bülow showed great skill and diplomatic talent in organizing a Prussian reserve corps under the difficult prevailing political circumstances.

Acting independently in northern Germany in spring 1813, on 12 July his units became III Corps, and on 16 July it was assigned to the Army of the North under the command of the Sweden's Crown Prince Bernadotte. After the Battle of Leipzig (16–19 October 1813), his corps helped drive the French out of northern and western Germany and invaded the Netherlands. On 25 February 1814 Bülow's corps was transferred to (now Field Marshal) Blücher's Army of Silesia, joining it in northern France. After the campaign, on 18 June 1814, he became commander of the Prussian troops in East and West Prussia.

On 1 March 1815 Bülow was appointed commander of IV Corps in the Army of the Lower Rhine under Blücher's command, returning after the Waterloo campaign to his command in East and West Prussia. There he died after a short period of illness on 25 February 1816.

### Burgos, Siege of (19 September–22 October 1812)

The French held the town of Burgos beginning in 1808 when they began their occupation of Spain. In 1812 the Earl of Wellington (created a marquis in October) began a siege to retake it. An initial assault succeeded against an outlying fort, but then the attack faltered when a series of assaults directed against breeches opened by mines failed. Wellington withdrew with significant losses, both in manpower and in materiel. The city was eventually taken in 1813.

Burgos controlled communications between France and Spain. In 1808 Napoleon had ordered that the fortifications should be improved. A battery was built into the base of the keep and was named after Napoleon. To the south of the town a large earthwork, called the Hornwork, was constructed. After Wellington's decisive victory at Salamanca on 22 July 1812, he took the decision to attack Burgos. The fortress was surrounded by 19 September, but owing to his shortage of siege guns, Wellington decided to launch a surprise attack on the Hornwork. Despite heavy losses the attack was a success, and a battery was established in the captured position. Wellington, encouraged by the fact that the Hornwork had been taken by surprise, tried to do the same with the main wall. However, this attack failed because of the lack of aggression shown by some of the Portuguese troops and as a result of the death of the commander of the attack at an early stage. Wellington now ordered that the walls should be mined. A mine was duly detonated on 29 September, but as it was set against the remnants of some old foundations, the damage to the main wall was slight. In consequence, the assault that immediately followed ended in failure. A new mine was begun, and this was exploded five days later. This breach was taken, and Wellington was now lodged within reach of success.

Operations now began to breach the inner wall of the city, but a spirited counterattack by the garrison destroyed much valuable equipment. The French launched a further successful attack a short time later. The weather was also poor, and heavy rain made the entrenching operations difficult. Wellington's artillery was too weak to inflict further significant damage, and he placed his faith in a further mine dug beneath an outlying church. It was hoped that this distraction would allow a successful assault on the inner walls. However, this failed, with the assault forces suffering heavy losses. Informed of the advance of enemy troops under the command of General Joseph Souham from the north, Wellington decided to call off the siege on 22 October, having suffered over 2,000 casualties to a mere 600 for the French. The failure of the siege was com-

pounded by the fact that Wellington had to abandon his heavy ordnance because there were not enough draft animals available. It was intended that the Hornwork should be destroyed, and mines were dug to achieve this. However there was insufficient powder to be used for the detonation, as a result of which the siege of Burgos was to constitute one of Wellington's few failures in the Peninsular War.

In the following year, however, Burgos was finally taken when, as a result of the preliminary moves before the Battle of Vitoria, the French garrison abandoned the city on 12 June.

### Busaco, Battle of (27 September 1810)

After Talavera it was to be well over a year before Viscount Wellington fought another battle, but the intervening months were some of the hardest of the Peninsular War, for Wellington had not only the French to contend with but also his unreliable and fickle Spanish allies. Perhaps a bigger threat, however, came not from the enemy but from the British government. By the summer of 1810 there was tremendous pressure from home for the army to be recalled from the Peninsula while it was still intact. It was the only army available to Britain and as such was seen as a very precious commodity, certainly not to be wasted on what many regarded as a futile campaign. A year had passed since the victory at Talavera and the British public began to despair of there ever being another. Even within Wellington's own army there were clamors for a return home, most of this campaign of dissent being conducted by what Wellington called the "croakers." Nevertheless, Wellington kept his nerve and by his own entreaties managed to convince the government that the struggle in the Peninsula was indeed a worthwhile cause.

Throughout the summer of 1810 there were numerous minor clashes with the French, most of which involved the Light Division under the brilliant but erratic Robert Craufurd. The Light Division, consisting of the 43rd and 52nd Light Infantry Regiments, the 95th Rifles, and two battalions of Portuguese Caçadores, supported by hussars of the King's German Legion, held Wellington's outposts along the Spanish-Portuguese border and fought several small actions, including those at Barba del Puerco, Villar de

Puerco, and, most notably, the infamous encounter along the river Coa, fought on 24 July, during which Craufurd almost lost his division when attacked by Marshal Ney's VI Corps.

When the frontier fortresses of Ciudad Rodrigo and Almeida fell into the hands of Marshal Masséna, commanding the French, Wellington was forced to retreat deeper into Portugal, until on 26 September his army had reached the commanding position upon the great ridge at Busaco, overlooking the Mondego River. The ridge towered some 1,800 feet above sea level and was covered by a vast expanse of gorse and heathland strewn with rocks and boulders.

Wellington's army faced east and held a commanding position some 9 miles long from the north, at the convent of Busaco, to the south where the ridge overlooked the Mondego. At no point could the French climb the ridge without being seen, nor was it possible to climb it easily. The southern end of the ridge, Wellington's right flank, was held by the divisions of Rowland Hill and James Leith, the center by Thomas Picton and Brent Spencer, and the north by Lowry Cole's division, Archibald Campbell's Portuguese, and Siegesmund Lowe's brigade of the King's German Legion. The crucial sector of the line, however, was astride the main road to Coimbra, between Campbell and Spencer. This sector was held by Craufurd's Light Division and Denis Pack's Portuguese brigade supported by Edward Coleman's Portuguese. Altogether, Wellington's army numbered about 50,000 men with sixty guns. Opposed to him were Masséna's three corps—commanded by Ney, Jean Junot, and Jean Reynier—which together numbered 66,000 men with 114 guns.

Wellington employed a thick line of skirmishers below him in order to prevent the French from penetrating too far up the ridge to carry out any reconnaissance, and when Masséna looked up at the British position he had little idea where the center lay. He thought Picton's 3rd Division formed the right flank whereas, in fact, it was almost in the center. Also, when darkness fell on the evening of the twenty-sixth, Wellington gave orders that no fires were to be lit, thereby ensuring that none of his dispositions would be revealed. This was not very welcome news to his men, who would not be able to cook their food, but at least they could take comfort from the fact that they occupied a very strong and commanding position.

The twenty-seventh dawned gray and misty, a thick gray fog completely blanketing the valley below the ridge. It was quite obvious from the noises below, however, that the French were on the move, and at 5:30 A.M. Masséna's *tirailleurs* began to exchange fire with Wellington's skirmishers. The French columns, under Pierre Merle, struggled up through the fog and hit that part of the Allied line

held by Lightburne's brigade, consisting of the 2/5th (second battalion, 5th Foot) and 2/83rd supported by five companies of the 5/60th (Rifles), after being driven there by the accurate artillery fire from two 6-pounder guns. These battalions exchanged musketry with the French from some distance before Merle's columns swerved away, only to meet the 1/88th and 1/45th, who thrust them back down the way they had come after sweeping their columns with musketry.

About fifteen minutes before Merle's attack, another French column, four battalions strong under Etienne Heudelet, attacked a mile to the south. Once again Picton's 3rd Division bore the brunt of the attack and with the same results—complete failure by the attackers. Masséna did not give up, however, and another seven battalions of infantry, under Maximilien Foy, began to make their way up the ridge to try and dislodge the defenders. It was 6:45 A.M., and the fog had completely lifted, exposing the French to both artillery and musket fire. This time the French did achieve a measure of success and five companies of the 1/45th were thrown back in disorder, along with three Portuguese battalions. At this point Leith's 5th Division was thrown into the fray, and forming his men into line he advanced against the French column, his leading battalion, the 1/9th, pouring out a series of rolling volleys against them. The 1/9th was supported by the 2/38th, both battalions from Edward Barnes's brigade, and together they reduced Foy's battalions to a confused mass that was sent rolling and tumbling down the ridge, pursued by British infantry. Foy himself was wounded during the fight and was carried rather uncomfortably down the hillside by his own men.

It was still only midmorning, but Masséna's attacking columns had yet to make any impact at all on Wellington's position. Indeed, all but four of the twenty-seven battalions that had struggled and striven to reach the top of the ridge had been sent reeling to the bottom after having sustained heavy casualties. The battle continued in the form of sporadic musketry between the light troops of both sides until, at about 8:30 A.M., a heavy skirmishing coming from the valley floor heralded the start of yet another French attack.

This time it was Ney's turn to try, and he sent forward Louis Loison's division in two columns, each of six battalions, the right under Edouard François Simon and the left under Claude Ferey. The two columns began the long climb up the ridge toward that part of the line held by Craufurd's Light Division. Craufurd himself had thrown the 1/95th (Rifles) and the 3rd Caçadores into the small village of Sula, below his main position, and these troops exchanged a heavy fire with Loison's own skirmishers. Sula was soon cleared, however, and the two French columns

Busaco was a great victory for Wellington, although Masséna's worshippers have tried to dispute this on the grounds that Wellington was forced to abandon his position the next day after Masséna's cavalry found a way round his left flank. This is an untenable and weak claim, however, for the British commander had already decided upon his next course of action, which involved a withdrawal to the already-prepared Lines of Torres Vedras, a nasty little surprise still waiting to be discovered by Masséna.

### **Buxhöwden, Fedor Fedorovich (Friedrich Wilhelm), Count (1750–1811)**

Russian general and army commander. Buxhöwden descended from a noble family in the Lifland *gubernia* (province) and enrolled in the Artillery and Engineer Cadet Corps in 1764. Six years later, he went with the Russian army to fight the Turks and distinguished himself at Bender, receiving promotion to engineer ensign in 1770. He was seriously wounded during the assault on Braila in 1771

and earned the Order of St. George (4th class) for his valor. In 1772 he became adjutant to General *Felzeugmeister* Prince Orlov and accompanied him in his travels in Germany and Italy. Under Orlov's patronage, Buxhöwden was quickly promoted through the ranks. In 1783, he became a colonel. Four years later, he was appointed a *flügel-adjutant* to Catherine II and took command of the Keksholm (Kexholm) Infantry Regiment. He participated in the Russo-Swedish War in 1788–1790, serving as a brigadier in the galle fleet of Vice Admiral Prince Nassau-Zigen. In 1789 he distinguished himself in the action at Rochensalmi, for which he was promoted to major general and awarded the Order of St. George (3rd class). For his services in the campaign of 1790 he received the Order of St. Anna (1st class).

Buxhöwden then commanded a division in the campaign against the Polish insurgents in 1793–1794, fought at Praga, and was appointed the commandant of Warsaw. He was generously rewarded for his services, receiving the Order of St. Vladimir (2nd class), a medal from the citizens of Warsaw, and a golden sword with diamonds for courage. In December 1795 he was conferred the title of count by the king of Prussia and was awarded the Orders of the White Eagle, of St. Stanislaus (1st class), and of St. John of Jerusalem. Under Tsar Paul I, Buxhöwden became the military governor of St. Petersburg and was decorated with the Order of St. Alexander of Neva. Between 23 November 1796 and 1 September 1798 he served as *chef* (colonel-proprietor) of the Keksholm Musketeer Regiment. On 16 April 1797 he was conferred the title of Count of the Russian Empire. However, in September of the same year, he was discharged from military service. After traveling in Germany, Buxhöwden returned to Russia in early 1802 and returned to duty in 1803 with the rank of general of infantry. The same year, he became head of the Lifland Inspection.

During the campaign of 1805, Buxhöwden brought reinforcements to Olmütz and, at Austerlitz, he commanded one of the Russian columns on the Allied left flank and suffered appalling losses. After the battle, he had only two battalions intact out of the forty-four he had led into action. Despite this catastrophe, he was awarded the Order of St. Vladimir (2nd class). In the campaign of 1806–1807 Buxhöwden commanded one of the Russian corps but had strained relations with General Levin Bennigsen. The two commanders detested each other and refused to cooperate. When Bennigsen became the commander in chief of the Russian Army, Buxhöwden left the army for Riga and complained to Tsar Alexander about his rival. When his appeals were ignored, Buxhöwden challenged Bennigsen to a duel, but the two never fought each other. In 1807 he served as the military governor of Riga and was awarded the Order of St. Andrew the First Called for mobilizing the local militia.

In 1808 Buxhöwden took command of the Russian army to invade Finland and successfully drove Swedish forces out of that possession. For his success, he was awarded the diamond signs of the Order of St. Andrew the First Called and the Order of St. George (2nd class). On 29 September 1808 the Swedes offered a cease-fire, an opportunity that Buxhöwden welcomed, for his army was suffering from lack of supplies, ammunition, and reinforcements. However, Alexander, as he traveled to meet Napoleon at Erfurt, disapproved of the armistice and ordered Buxhöwden to resume the offensive. The armistice ended on 27 October, and by 13 December all of Finland was finally under Russian control. With Buxhöwden opposed to Alexander's aggressive policy in Finland and with the tsar anxious to expand his territory in the north, Buxhöwden was dismissed in early December and was replaced by a new commander in chief, General Bogdan Fedorovich von Knorring. Buxhöwden retired to his estate in Estland, where he died on 4 September 1811.

## Byron, George Noel Gordon, Lord (1788–1824)

The English poet Byron, sixth Baron Byron, is often considered the most influential and perhaps the greatest of the Romantic poets. Generally sympathetic to Napoleon, he wrote some of the most powerful poetry of his age.

Byron was born in London and educated at Harrow School and Cambridge. He adopted the name Noel in 1822, a move that allowed him to receive an inheritance from his mother-in-law and to point out that he had the same initials, N. B., as his hero, Napoleon Bonaparte. Byron became quite wealthy, which allowed him to lead a life dedicated to poetry, politics, and other assorted pursuits of happiness.

Byron was born two decades after fellow Romantic poets William Wordsworth and Samuel Taylor Coleridge and was a child during much of the French Revolution. Even so, he was well aware of the important events that were taking place in France and of the often-contradictory reaction in Britain. He developed his own strong ideas on the subject, even getting into an altercation in 1803 with a fellow student at Harrow over his (Byron's) prized bust of

Napoleon. There was a strong pro-Napoleon cult in England, and Byron became one of its foremost members. His letters and actions bore this out even before it became part of his poetry. He often wrote of his hopes for Napoleon's success and his sadness at Napoleon's failures. He wrote the French author, Stendhal, numerous inquiries on the 1812 campaign and kept up his hopes of French success during 1813 and 1814.

In his poetry Byron created what is often called a Byronic hero, modeled on his own life and that of Napoleon. While his early poetry was less successful, his publication in 1812 of the first two cantos of *Childe Harold's Pilgrimage* was a major step toward his ultimate fame. This tale of a stormy and emotional man who seems to be weighed down by guilt for some past deeds was the first example of the Byronic hero, and the poem was enormously popular. Byron himself had spent years traveling abroad, including several years in Spain, Portugal, the Ottoman Empire, and, most importantly, Greece.

The first poem by Byron on Napoleon was *Ode to Napoleon Buonaparte* (1814), the first of five poems dedicated to the Emperor. In *Ode* Byron explores the concept of the ambiguous position of Napoleon after his abdication and before his exile by referring in the first stanza to Napoleon as a "nameless thing."

Byron's personal life was controversial, to say the least. He was said to have had an overactive sex life, and even an incestuous relationship with his half-sister. In 1816, Byron separated from his wife. British society, once so enamored with Byron, largely turned against him, and so he left England that year, never to return. When he left, he had made for himself a coach that was a replica of Napoleon's at Waterloo. As Napoleon did on St. Helena, Byron was accompanied by a biographer and personal doctor.

His years in exile were very productive. He lived in Geneva, Venice, and Pisa. While there he wrote *The Prisoner of Chillon* (1816), *Manfred* (1817), his epic *Don Juan*, and additional material for *Childe Harold's Pilgrimage*. Byron thought that Napoleon should have died a hero in 1814, and when Napoleon came back for the Hundred Days, Byron expressed his strong displeasure in *Manfred*. By Waterloo, however, Byron is back in Napoleon's camp, blasting the reactionary forces that led to his defeat in his *Ode from the French* (1816). It is in canto 2 of *Childe Harold* that Byron offers his strongest support for Napoleon, and some of his most powerful poetry.

Byron evidently wanted to play the role of hero himself. In 1823 he joined the Greek war of independence against Turkey. He personally recruited soldiers and gave large sums of money to the cause. In 1824 he was made commander in chief of the insurgent forces. Ignoring his own frail health, he insisted on leading the campaign. It

was a fatal mistake, as his health gave out some three months later and he died of rheumatic fever. As he would have had Napoleon do in 1814, Lord Byron died a hero in a lost cause.

## Cabrera

The island of Cabrera (meaning “goat”) was infamous for the squalid conditions in which many thousands of French and Swiss soldiers were held as prisoners of war from May 1809 until May 1814. The island measures 6.5 kilometers by 5 kilometers and is part of the Balearic Islands, situated off the south coast of Mallorca (Majorca). In the early nineteenth century it was desolate, arid, and uninhabited.

On 21 July 1808 the army of General Pierre, comte de Dupont de l’Etang fought an inconclusive battle at Bailén against Spanish forces. Finding himself isolated, Dupont surrendered his army and that of nearby reinforcements; nearly 22,000 French, Swiss, Polish, and Italian troops became prisoners of the Spanish. The terms of the capitulation promised that the French would be repatriated to France. The Junta of Seville, however, refused to ratify the terms, aided by the Royal Navy, which placed diplomatic obstacles in the way of repatriation.

Dupont’s soldiers were taken to the hulks in Cádiz harbor and kept under appalling conditions; many died of disease and neglect. The population of the city grew increasingly hostile to having prisoners of war in their locality, and so in April 1809, 4,500 of these captives were transferred to the island of Cabrera.

Many of the prisoners deposited on the island were in poor health from their confinement on the hulks, and they were to suffer still further. Cabrera’s isolation meant that security could be effectively provided by a single Spanish guard ship offshore; no guards were necessary on the island itself. Food, clothing, and tents were provided by the Spanish authorities on Mallorca only when they were available—which in practice meant only infrequently. Aside from a ruined castle on the island providing accommodation for thirty prisoners and the women who accompanied them, the prisoners had to make shelters from the few trees they found or scrape holes in the rocks in which to sleep. There was only one freshwater spring, which dried up during the summer drought, and sanitation was nonexistent.

The prisoners elected a council that attempted to maintain discipline on the island, and it repeatedly asked the Spanish authorities for more food and better accommodation, but to no avail. Even when a further 5,400 prisoners arrived in June 1809, there was no improvement in the supply situation to the island. Conditions became so bad by 1810 that many prisoners died, despite the council’s encouraging the formation of a market, a school, and a theater to improve morale.

Conditions were so bad that over 1,200 prisoners volunteered for Spanish service. Of the 11,800 prisoners sent to Cabrera between 1809 and 1814, only 3,700 survived to be released in May 1814. After deducting the figure for those men who volunteered for Spanish service, it may be seen that of those captives who remained on the island nearly 60 percent had perished as a result of the appalling conditions in which they had been held.

## Cádiz, Cortes of (1810–1813)

Still revered today, Spain’s first modern parliament, the Cortes of Cádiz sat from 1810 to 1813 and set the scene for much of Spanish history in the nineteenth century. Ever since the uprising of 1808 pressure had been growing in Spain for the convocation of a national assembly that could address the country’s many administrative and military problems, and after holding extensive consultations, the provisional government known as the Junta Central

that had assumed the leadership of the uprising decreed that elections for such a body should be held in 1810. Despite the continuing war, not to mention the occupation of large parts of the country, these were duly held, and a total of over 300 deputies eventually assembled in Cádiz (initially it had been intended that they should meet in Seville, but the fall of that city in January 1810 had resulted in a change of capital).

All male Spaniards over twenty-five had a vote, but the electoral system was indirect, and so most deputies were priests or notables. Represented in the assembly was not just the Spanish homeland but also the American colonies. For provinces that were occupied by the enemy, elections were held among those of their inhabitants who happened to be resident at Cádiz. In the run-up to the new Cortes's first meeting on 24 September 1810, there was much confusion as to what it should do, but a number of factors, not least the decision that it should meet as a single body rather than separate "estates," ensured that it was quickly taken over by a small group of committed reformers (from whose nickname—*los liberales*—is derived the modern word *liberal*).

On the very first day of its existence the Cortes was persuaded to proclaim the principle of the sovereignty of the people, while a series of sweeping reforms were enacted that were eventually embodied in a new constitution. Formally promulgated on 19 March 1812, this constitution remained a key text in Spanish politics until the 1870s. In brief, Spain was transformed into a constitutional monarchy, and all Spaniards were henceforth to enjoy freedom and equality before the law as well as such rights as freedom of speech, property, and occupation. Inherent in this program was the abolition of feudalism and of all forms of provincial privilege. The Cortes also went on to abolish the Spanish Inquisition. (Freedom of worship, however, was not granted; indeed, Spain was formally declared to be a Catholic country.)

Yet in the end the Cortes's record was not a happy one. Few of its reforms aided the common people; furthermore, it did not prove equal to the problems that dogged the Spanish war effort and in some respects made matters much worse. At the same time, too, many of its political solutions were either foolish or unworkable. As so often, in short, the myth of today falls far short of the reality.

## Cádiz, Siege of (5 February 1810–25 August 1812)

The siege of Cádiz, one of many sieges of the Peninsular War, was the longest such event of the Napoleonic Wars. Built on an island off the coast of Andalusia (Andalucía), the city was almost invulnerable to land attack. To reach it, an assailing force would have to get across a marshy creek bridged only by a narrow causeway and then fight its way past the town of San Fernando. Beyond this there came a long spit of land some 4 miles long and only a few hundred yards wide, which was blocked halfway along by a massive fort. To the south of this was the Atlantic Ocean, and to the north the great inlet that formed the harbor. Then, at last, there came the immensely strong walls of the city itself, the latter occupying the seaward end of the isthmus.

Nor was this the end of the matter. In the previous two years, the Spanish had protected San Fernando with numerous entrenchments, while the harbor was full of warships. And, finally, Allied control of the sea meant that the defenders could not be starved out. The only identifiable weakness was the military reliability of the garrison—a posturing civic militia whose noisy patriotism had never been tested in the field. Nevertheless, only days before the French arrived even this defect was remedied, for the Duque de Albuquerque retreated into the city with his 12,000-strong Army of Extremadura (Extremadura).

On his arrival on 5 February 1810, Marshal Claude Victor therefore found he could do little. Nevertheless, he did what he could: While desperate efforts were made to improvise a fleet of gunboats and launches for an amphibious attack, the only spot from which the city could be bombarded from the land—a promontory jutting southward into the harbor—was secured in the face of gallant resistance on the part of a small British garrison that had been thrown into an abandoned fort that stood at its seaward end. As time went on, moreover, Seville's cannon foundry constructed giant mortars designed to terrorize the populace. However, their fire proved ineffective, and the garrison had in any case long since been reinforced by a powerful Anglo-Portuguese division under Sir Thomas Graham. Nor, meanwhile, was Victor able to stop large forces of Allied troops from being shipped from the city and disembarked further along the coast to threaten his own flanks and rear, as occurred at the Battle of Barrosa on 5 March 1811. At times, indeed, it seemed to be Victor who was really under siege, but the French did not retreat until Marquis (later the Duke of) Wellington's capture of Madrid compelled Marshal Soult to evacuate Andalusia at the end of August 1812.

### Cairo, Uprising in (21–22 October 1798)

Although the French dominated Egypt militarily, after the destruction of its fleet and the loss of communications with Europe, Bonaparte needed to win over Muslim allies to cement his gains. Envoys sent to the Turkish sultan were ignored, and war was declared on France (9 September 1798), while overtures to the pashas of Damascus and Acre were equally fruitless. Inside Egypt, Bonaparte attempted to harmonize relations between his army and Muslim civilians. In his meeting with the ulama (religious scholars), Bonaparte

claimed to be a Muslim himself and distanced himself from earlier European crusaders, pointing out his attacks on the Vatican and the Maltese Knights of St. John. He appointed a divan (council) of fourteen compliant sheikhs from Al-Azhar University and had them issue a fatwa (religious edict) stating that the Koran prophesized Bonaparte's arrival. However, the combining of religious and French republican symbolism (for example, placing the Declaration of the Rights of Man and the Citizen alongside the Koran), the mixing of Frenchmen with local women (who began to unveil and adopt European customs), and the introduction of heavy taxation were some of the reasons that led a number of the Al-Azhar sheikhs to declare a jihad against the French.

At morning prayer on 21 October 1798, the call to arms was sounded from minarets across the city. Collaborators, European merchants, and isolated French soldiers found themselves under attack. The rioters smashed much of the expedition's engineering equipment and supplies stored in General Caffarelli's house, assassinating the savants Duval and Thévenot in the process. The

The uprising in Cairo. Napoleon extends amnesty to the leaders of the revolt during his campaign in Egypt in 1798. (Bettmann/Corbis)

French garrison commander, General Dupuy, was also assassinated while summoning help. As news of Dupuy's death spread round the city, General Bon took command and had the alarm guns fired. Placing artillery in the streets, Bon contained the insurgents while Bonaparte raced back from an inspection tour to his Cairo headquarters. Fierce fighting continued through the night, as the French moved artillery and troops up to the Al-Azhar Mosque.

The next day, as French troops approached the Arab barricades, some of Bonaparte's bodyguard and his aide-de-camp, Sulkowski, were killed. Bonaparte ordered General Dommartin to open fire on the mosque and surrounding buildings with the artillery and the guns in the citadel. As the bombardment began, a delegation came out and appealed to Bonaparte for clemency. He refused them, and for two hours the artillery continued to pound the mosque area. Finally at 10:00 P.M., in a gesture of submission, the defenders prostrated themselves before the encircling French troops. Bonaparte ordered a cease-fire and sent troops into the mosque. The revolt cost 300 French lives and around 2,000 Arab lives, with perhaps as many again arrested and interrogated. Many of these were shot in reprisal or, more covertly, beheaded and dumped in the Nile at night. Although the revolt had been suppressed, the event polarized the Arabs, who now considered the French an occupying power.

### Calabria, Uprising in (1806–1814)

The uprising in Calabria constituted the most serious challenge to Napoleon's control of the Italian peninsula. It was encouraged by the British presence in Sicily and helped prevent any serious attempt to invade that island. Sparked by conscription and taxation, the uprising tied down large numbers of troops who could have been used elsewhere.

Calabria is located in the foot of the Italian peninsula. During the late eighteenth and early nineteenth centuries, the region was poor, rural, and lacking in good transportation. It formed a part of the Kingdom of Naples. When French troops occupied the kingdom in 1798, a rebel army formed in Calabria to help drive them out. When King Ferdinand IV joined the Third Coalition in

autumn 1805, Napoleon sent his brother Joseph with 20,000 men to occupy the kingdom. This was accomplished by February 1806, and Joseph was crowned King of Naples on 30 March. Under pressure from Napoleon, Joseph instituted changes in the kingdom intended to modernize its administration.

Two of the most important changes were conscription for Napoleon's armies and efficient taxation to support them. The challenge to the existing order was not well received in Calabria. Many young men deserted or failed to report for conscription. At least some became brigands in the mountains, beyond the easy reach of authorities. Charismatic figures within these groups became leaders of the uprising. During the summer of 1806 the British lent indirect support to the uprising in the form of a small force under General John Stuart, which left Sicily and landed in Calabria. Although a small number of rebels joined him, Stuart did not think highly of their capabilities. In the ensuing Battle of Maida on 6 July, Stuart defeated a larger French force under General Jean Louis Reynier, but lacking cavalry, Stuart did not pursue. His force was soon withdrawn. Reynier, however, was pursued by Calabrian rebels until he reached Cassano.

The *masse*, as the rebels were known, were soon active all across Calabria. The uprising became an extremely bloody class war, with little mercy shown by either side. During his retreat, Reynier burned every village he passed through that might offer assistance to the rebels. Captives were tortured and executed in horrifying ways. Additional French troops were sent to put down the *masse*. Under Marshal André Masséna, a state of siege was declared in Calabria in August 1806. Local municipalities were forced to pay the costs of their French garrisons, monasteries that were suspected of helping the rebels were closed, and flying columns of French troops pursued rebel bands through the mountains.

Many of the leaders of the uprising were forced to flee to Sicily, while others remained in Calabria and were supplied with arms by the British Mediterranean fleet. While most clergymen preached against attacks on property, some of the most effective leaders of the uprising were priests.

By January 1809 the uprising had dwindled and order had been restored. That summer, however, a fresh British landing near Scylla and a threat to Naples forced the French to evacuate part of Calabria. The underlying reasons for the new revolt were poverty, renewed conscription, and taxes levied against the poor. The task of pacifying Calabria was given to General Charles Antoine Manhes. He was ordered by Marshal Joachim Murat, now King of Naples, to show utter ruthlessness in suppressing the rebels. Manhes waited until the winter of 1809 and

then tried to cut the *masse* off from their support in the villages. He stationed garrisons in most villages to prevent food and shelter from being given to rebels. Many villagers were executed unfairly, but the strategy proved effective. The last body of rebels, under Paolo Macuse, known as “Parafante,” disbanded when he was killed in February 1811. The uprising had lasted five years and cost the French 20,000 casualties.

### Caldiero, First Battle of (12 November 1796)

Part of Austrian general Joseph Alvinczy Freiherr von Berberek’s second attempt to break the siege of Mantua. Generals André Masséna and Pierre Augereau were ordered by Bonaparte to prevent the advance of the Austrian army. The Austrian forces were reinforced throughout the day and were able to push the French back on Verona.

In early November 1796 Alvinczy began his second attempt to relieve Mantua. Bonaparte’s forces were thinly stretched to meet this attack and Alvinczy drove back French outposts back onto the river Adige. On 11 October Bonaparte ordered the forces of Masséna and Augereau to attack the Austrian advance guard. Appalling weather forced the French to stop at Caldiero, though the French attack resumed the next day. Augereau was given the task of attacking Caldiero itself. Caldiero was held by Austrian marshal Friedrich Franz Fürst von Hohenzollern with around 4,000 men and sixteen guns. Masséna would attack the village of Colognola to the east of Caldiero. This village was held by a large group of *Grenzer* (border troops) and around ten guns. In total the Austrians had some 8,000 troops, with the French being able to field around 11,000.

Masséna began the attack at dawn in terrible weather. The attackers made good progress, though, and took two villages close to Colognola. Meanwhile, Augereau had also begun his attack on Caldiero. A number of assaults were thrown back from the town, but by noon it seemed that Augereau was nevertheless about to outflank the defend-

ers. The attack failed when the French were surprised to find themselves attacked through a marsh by cavalry. Nevertheless, soon after the town fell to the French. By now Austrian reinforcements were starting to arrive on the field. Alvinczy decided to embark on an ambitious envelopment of the French right wing. Trusting that he would be able to hold the French in their attacks, he sent two divisions through the marshes on his left. It would take around two hours for these troops to arrive on the flank of the French. The assaults on Caldiero and Colognola continued but made little headway, for the French were without artillery support because the poor weather did not allow the guns to be moved forward. By midafternoon Alvinczy’s flanking force began to arrive on the right flank at the village of Gombione. Despite the fact that Augereau deployed troops to meet this threat, he was unable to prevent the advance of the Austrians. Bonaparte saw the danger to his flank, but having no further reserves to commit, he ordered a withdrawal. Poor weather and growing darkness prevented an effective Austrian pursuit. The French had lost around 2,000 men and the Austrians slightly fewer. The effect of the battle was to force Bonaparte to withdraw more troops from the siege of Mantua, notwithstanding that he was to win the crucial Battle of Arcola a short time later.

### Caldiero, Second Battle of (29–31 October 1805)

Indecisive Austrian victory over French forces in northeast Italy during the War of the Third Coalition. Expecting Russian reinforcement in Germany, the Austrians had positioned their main army under Archduke Charles east of the river Adige near Verona, where they faced a French army under Marshal André Masséna. Over the course of three days, the armies fought until the Austrians withdrew after receiving news of *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich’s surrender at Ulm. This strategically important area of the Adige valley was contested four times: at the first Battle of Caldiero in 1796, and again in 1809 and, at Veggio, in 1813 (all Austrian victories).

Unlike Napoleon’s Grande Armée, the (French) Army of Italy had not been trained in camp for two years, so the

French emperor had replaced Marshal Jean-Baptiste Jourdan with Masséna as military adviser to Eugène de Beauharnais, viceroy of Italy. Masséna's army, comprising seven infantry and two cavalry divisions, was to attack the Austrian army under Charles (whose infantry had been reorganized into the new smaller battalions) to prevent it reinforcing the main Allied armies. On 5 October, Charles received orders to remain in position, while his army continued to construct fortifications around the village of Caldiero (16 kilometers east of Verona), which guarded the main road to Venice. Masséna terminated the existing armistice on 17 October, and the next morning, the divisions under General Gaspard-Amédée Gardanne and General Guillaume Philippe Duhesme crossed the Adige from Verona to seize the eastern suburb of Veronetta. A ten-day lull followed as both sides awaited news from Germany. On the twenty-fourth, news of Mack's capitulation at Ulm reached Austrian headquarters, prompting Charles to plan a brief action against Masséna and then to evacuate the area. About 43,000 French troops would face 48,000 Austrians in entrenched fortifications.

During the night of 28–29 October, French feints were launched across the Adige to divert attention from the main assault force (led by generals Gardanne, Gabriel Molitor, and Duhesme), which emerged from Veronetta and pushed *Generalmajor* Johann Freiherr von Frimont's advance guard back on Caldiero. Supported by flank attacks, Gardanne's division took Stra and toward evening reached the main defensive works, where it was repulsed. That night, Charles planned to preempt a further French assault by launching a counterattack early on the following day. *Feldmarschalleutnant* Joseph Freiherr von Simbschen, with twenty battalions, moved up onto the northern hills, and in the south, the left under *Feldmarschalleutnant* Paul Freiherr von Davidovich held the almost-impenetrable marshland east of the Adige with fifteen battalions. In the center, *Feldzeugmeister* Heinrich Graf Bellegarde's thirty battalions occupied Caldiero with grenadiers and cavalry in reserve under *Feldmarschalleutnant* comte Eugene-Guillaume-Alexis Mercy d'Argenteau. Thirty-one guns were in fourteen entrenched positions, with another thirty spread out along the whole position.

The Austrian plan mirrored that of the French, launching flank attacks with the main thrust through the center, joining the right wing on the approach to Veronetta while the left crossed the Adige. As dawn broke on 30 October, the battlefield was shrouded in thick fog, making it difficult to coordinate formations. Simbschen led the Austrian right forward as *Generalmajor* Armand Freiherr von Nordmann moved forward with his advance guard on the left toward Sabionara, but Charles was reluctant to advance his center from Caldiero, and at 10:00 A.M.

the attack was abandoned. An hour later, the fog lifted to reveal the more adventurous French advancing across the plain. Sporadic fighting had started at 7:00 A.M. south of the main road as Duhesme's column tried to outflank the Austrian left. In support, General Jean-Antoine Verdier's division crossed the Adige, reaching as far as the Austrian left-wing artillery positions before being driven back in heavy fighting.

Thinking his right was striking into the Austrian rear, Masséna launched a general attack along the whole front, both sides focusing on the village of Caldiero. General Jean Mathieu Serras took the French 5th Division up on to the Rivoli plateau to sever Austrian links with the Tyrol. Finally advancing at 2:00 P.M., Bellegarde's Austrian center attacked through Stra along the main road in dense formations but was unable to pierce the French center in an hour-long firefight, as cavalry under General Jean-Louis-Brigitte d'Espagne attacked Bellegarde's right flank. Under fire from three sides, Bellegarde's men fell back to the Caldiero entrenchments, pursued by the French. Having issued orders for the Austrian batteries on the high ground to redouble their fire, Charles led his grenadier reserve forward in person and broke the first French battle-line to seize Stra.

Masséna committed his grenadiers to support Gardanne in the center, while Molitor's division renewed the flank attack to the north. Molitor ran into fierce resistance from Simbschen's troops, among whom were the Infantry Regiment no. 7, which took the eagle of the 5th Regiment of Line. To the south, small-scale fighting continued along the causeways, which ran through the marshy fields, until evening without result, for neither side could deploy its cavalry effectively. As darkness fell, the French pierced the Austrian line at the village of Caldiero, prompting Masséna to make one last effort, but it stalled around the fortifications as Charles committed a second grenadier brigade.

Expecting renewed French attacks, the Austrians brought their second reserve up to the center and rotated it with some of their battered battalions. Davidovich was ordered to lead the left in diversionary attacks across the Adige early in the morning. The French launched their next assault at 10:00 A.M. Verdier's division crossed the Adige to attack the southern Austrian positions, but the arrival of Austrian reinforcements drove them back west. During the night of 30–31 October, further news arrived from Vienna of the disaster at Ulm. Charles knew it was essential to break clear of Masséna, and he planned to attack the French the following morning, launching the main attack with his right out of the mountains to force the enemy back across the Adige. However, dawn on 31 October revealed that after losing 8,000 in all, including 1,800 prison-

ers, Masséna had already abandoned his positions. So, after sustaining 5,672 casualties, Charles had won a defensive victory, and at 4:00 P.M., he began his retreat, heading for Hungary, though he would be unable to reach the Allied army before the Battle of Austerlitz.

### Cambacérès, Jean-Jacques-Régis de, duc de Parme (1753–1824)

Jean-Jacques Cambacérès was born on 18 October 1753 to a prominent French family at Montpellier, the son of Jean-Antoine de Cambacérès, adviser at the Court of Auditors, Aides, and Finances of Montpellier. Cambacérès studied at the college of Aix-en-Provence, and in 1772 he began practicing law in Montpellier. Two years later he succeeded his father at the Court of Auditors and remained at this position for fifteen years. The Revolution had interrupted young Cambacérès's life as he took part in the elections of the Estates-General. In 1790 he became one of the founding members of the Société des amis de la Constitution et de l'égalité in Montpellier. In November 1791 he was elected president of the Criminal Court of Montpellier and then became the deputy from Hérault to the National Convention in September 1792. Beginning in October 1792, Cambacérès served on the Committee of Civil and Criminal Legislation, participated in King Louis XVI's trial, and supported the death penalty. He kept clear of factional infighting in the Convention and concerned himself with judicial and legislative matters. He supervised preparations of two successive drafts of the Civil Code in 1793–1794.

In July 1794 he indirectly participated in the events of the Thermidor coup, which led to Robespierre's downfall, and briefly served in the Committee of War, making his first acquaintance with General Napoleon Bonaparte. After the dissolution of the Convention, Cambacérès served on the Council of Five Hundred and prepared his third draft

of the Civil Code in June 1796. Because he was not re-elected in May 1797, Cambacérès returned to private law practice for two years and established a reputation as a skillful lawyer. On 20 July 1799 he was appointed the minister of justice and supported Bonaparte during the coup d'état of 18–19 Brumaire (9–10 November 1799). Cambacérès became the Second Consul in December 1799 and was actively involved in the political life of the Consulate, presiding over the Senate, chairing the meeting of the Council of State, and performing the functions of the First Consul in the latter's absence. He facilitated the signing of the Concordat in 1801, the creation of the Legion of Honor, and the establishing of the Life Consulate in 1802.

In 1800–1804 Cambacérès worked on the monumental task of drafting and adopting the famous Napoleonic Code. He was elected to the French Academy in 1803. He opposed the arrest of the duc d'Enghien in 1804 but was overruled by Napoleon. From March to May 1804 Cambacérès provided his legal expertise to Napoleon to pave the way for the proclamation of Empire and was made archchancellor of the Empire and awarded the Grand Aigle de la Légion d'honneur on 2 February 1805. In April 1808 he was given the title of duc de Parme (Duke of Parma). Presiding over the Senate and the Council of State, he exercised extensive powers during Napoleon's absences on campaign in 1805–1813. Although following the Malet Conspiracy Napoleon established the regency of Marie Louise (February 1813), he left Cambacérès to advise the empress on all issues.

During the First Restoration, Cambacérès was allowed to return to private life. After Napoleon returned from Elba in March 1815, Cambacérès was again appointed archchancellor of the Empire, directed the Ministry of Justice, and presided over the Chamber of Peers. During the Second Restoration he was expelled from the French Academy, denied pensions, and forced into exile in Brussels, where he lived until 1818. He died of apoplexy on 8 March 1824 in Paris and was buried at the Père-Lachaise Cemetery. Cambacérès was truly “the second most important man in Napoleonic France” (Woloch 2002, 120); he acted as intimate adviser to Napoleon, took part in many achievements of the Empire, and exercised extensive powers during Napoleon's absences.

### Cambronne, Pierre Jacques Etienne (1770–1842)

Pierre Jacques Etienne Cambronne, a French general, was born at Nantes on 26 December 1770 and enlisted in the 1st Volunteer Battalion of the Loire-Inférieure in September 1791. Promoted to grenadier in November 1791, he transferred to the 1st Battalion of Mayenne-et-Loire in 1792 and served in the Army of the Ardennes and the Army of the North in 1793. He rose to sergeant major in July 1793 and to lieutenant in September of the same year. In 1794–1795, Cambronne served in the Army of the Cherbourg Coast and took part in the action at Quiberon in July 1795. In 1796 he continued service in the Army of the Ocean Coastline and joined the 46th Line in October 1796. He took part in the abortive expedition to Ireland and, returning to France, he joined the Army of the Rhine and Moselle in 1797, of England in 1798, and of Helvetia in 1799. He distinguished himself leading a bayonet charge in the second Battle of Zürich in September 1799. In 1800–1801 Cambronne served in the Army of the Rhine and fought at Oberhausen on 27 June 1800. Garrisoned at Dunkirk in 1801–1803, he served with the Army of the Ocean Coastline in 1804–1805. He was awarded the Legion of Honor in June 1804 and appointed *chef de battalion* of the 88th Line in August 1805.

He served with distinction in the 1805–1807 campaigns, distinguishing himself at Jena in 1806. In 1808 Cambronne was sent to Spain and then transferred to the Imperial Guard during the campaign against Austria in 1809. He returned to Spain in 1810–1811 and was conferred the title of baron in June 1810. Promoted to colonel major of the 3rd Regiment of the Voltigeurs de la Garde in 1811, he took part in the 1812–1813 campaigns in Russia and Germany. He commanded the 3rd Brigade of General Pierre Dumoustier's division in August 1813, joined the 2nd Regiment of the Chasseurs à Pied de la Garde Impériale in September, and distinguished himself at Hanau in October 1813. The following month, he earned promotion to *général de brigade* and led the 1st Regiment of the chasseurs à pied and the 2nd Brigade of the 1st Division. In 1814 he distinguished himself at Bar-sur-Aube, Craonne, and the battles around Paris. In April 1814 Cambronne fol-

lowed Napoleon to the island of Elba, where he became commandant of Porto Ferrajo and commanded local troops.

In March 1815 he commanded the advance guard of Napoleon's small detachment landing in the Gulf of Juan. He captured Sisteron and was generously rewarded with the grand officer rank of the Legion of Honor (1 April 1815) and the titles of count and peer of France (2 June 1815). Napoleon named him lieutenant general on 20 March 1815, but Cambronne refused the rank. During the Waterloo campaign he served as major colonel of the 1st Regiment of the chasseurs à pied and led the famous charge of the Imperial Guard at Waterloo. Facing superior Allied forces, he nevertheless refused to surrender, and according to a well-known but apocryphal account, he defiantly proclaimed, "The Guard dies but never surrenders," whereas other sources claim that in fact he shouted, "Merde!" (Fremont-Barnes 2002, 80). Cambronne was wounded and captured by the British and remained in captivity until 17 December 1815. On his return to France he was initially sentenced to death, but he was acquitted of treason for supporting Napoleon by the military court. Cambronne was put on half-pay for some period before receiving a command in Lille in 1820. In August 1822 he was conferred the title of viscount, but he retired the following year and spent the rest of his life in his native Nantes, where he died on 29 January 1842. His name is inscribed on the northern side of the Arc de Triomphe in Paris.

### Camp Followers

Camp followers were civilians who traveled with armies throughout the early modern period. Many people associ-

ate the term with prostitutes, but that is misleading. While prostitutes were camp followers, so were civilian wagon drivers, cooks, supply contractors, laundresses, valets, musicians, and family members of soldiers. Camp followers existed because they fulfilled needs or desires that the army could not or would not supply. In some cases these desires were purely for luxuries, but in many areas, such as transport, cooking, and laundry, camp followers provided essential services, without which the army could not function. Camp followers numbered in the thousands behind every army of the period.

Camp followers' status and numbers varied. All armies had some provision for civilian wagon drivers, cooks, and laundresses, though there were always more of these than was officially allowed. Officers of royal and imperial armies often traveled with wives, mistresses, and an array of lackeys. Finally, prostitutes, gamblers, and hustlers followed every army, eager for easy money. The two armies with the most interesting and unique camp follower arrangements were the French and the British: Both included significant numbers of women and children.

The French Army had a long-standing policy of including *vivandières* (sutlers) in its combat units. *Vivandières* were soldiers' wives who served as official unit sutlers; there were four per regiment. They sold supplemental food and drink to the soldiers, cooked meals for a fee, and often did laundry and sewing as well. They received no pay, rations, or uniform, but they did receive an official license called a *patente de vivandière*, which authorized them to travel with their unit. During the Napoleonic period they were subject to a series of administrative attempts to define and regulate their existence. This was because prostitutes as well as illegal wives (women claimed as wives yet with bogus marriage certificates or genuine wives without permission to accompany their husbands), girlfriends, and mistresses traveling with armies consumed rations, slowed movement, and often replaced ammunition and other basic supplies in wagon loads. However, the presence of *vivandières* was deemed essential to the functioning of the army, and the War Ministry never considered abolishing the *vivandières*. They remained a fixture in the French Army until 1906.

A woman became a *vivandière* by marrying a soldier and obtaining a license from the unit's Council of Administration. Bonaparte's decree of 7 Thermidor, Year VIII (1800) ordered units to choose "women of good manners, married to soldiers or noncommissioned officers on active service, recognized as the most active, the most useful to the troops, and whose conduct and morals are the most regular." Once chosen, the women accompanied their units on campaign, supplemented army rations, sewed, cooked, and washed uniforms and provided a social center for their

unit at their tent or wagon. This meeting place was referred to as the *cantine*, so *vivandières* were increasingly known as *cantinières* as the nineteenth century progressed.

*Vivandières* were not combat troops, yet they often fought ferociously in combat. In 1805 a cannon ball killed Madeleine Kintelberger's husband and wounded her right arm. Four of her six children were blinded by an exploding caisson. Surrounded by Russian cavalry, she fought on despite her wound. She received eight saber cuts to the head and neck and was pierced twice with lances. The frustrated Russians finally shot her once in each leg, then took her prisoner along with her children. However, *vivandières*' main role was to obtain supplies and to sell them to the troops when the army logistical system could not keep up, which was most of the time. Prior to the battle, the *vivandières* sold liquor to the troops, though many *vivandières* were patriotic enough to give alcohol away, saying "You can pay me tomorrow." During and after the battle, *vivandières* nursed the wounded.

*Vivandières* and their soldier-husbands also had children, and Bonaparte was quick to capitalize on this manpower pool. Starting in 1800, he authorized two children per regiment to serve as *enfants de troupe*, or "children of the regiment." These were boys only, who had to be sons of a *vivandière* and a soldier, and had to be at least two years of age. Up until age sixteen, these boys received uniforms, half pay, rations, and fuel distributions, and in exchange they served as drummers, buglers, or apprentices to regimental craftsmen. At age sixteen they enlisted as private soldiers. Thus the French army made efficient use of a reliable pool of recruits who were born and raised to military discipline and who made excellent and loyal soldiers. They were often in the thick of combat as young as twelve years old, and many were killed, wounded, or captured.

The British Army adopted a different approach. "Wives on the strength" were wives of private soldiers who exchanged laundry and sewing services for rations, a place to sleep, and a small pittance from the troops for their services. Each regiment could have six wives per hundred men accompany it on campaign. These wives often had children, who lived among the troops but had no official status. Wives were sometimes forbidden from traveling on campaign, but they did so anyway. In the British retreat to Corunna in the winter of 1808–1809, many wives and children died of hunger and exposure, and many were captured, though the French soldiers usually returned them under a flag of truce. Thus, while the British had a system for organizing and regulating camp followers, only the French formally made them part of military units and used them extensively on campaign and in battle.

**Camperdown, Battle of (11 October 1797)**

A major Anglo-Dutch naval encounter fought near the strategic port on the island of Texel, on the coast of Holland, ending in the decisive defeat of the Dutch fleet. In the spring of 1797 Admiral Adam Duncan lay off Texel observing a Dutch fleet of fifteen ships of the line and a number of smaller vessels. With a scratch force of only two ships, the *Venerable* (74 guns) and the *Adamant* (50), he maintained the ruse that support lay in the distance by repeating ghost signals, thus persuading the Dutch to remain in port. In the middle of June Duncan's command increased with the arrival of reinforcements, enabling him then to confront the Dutch whenever they might put to sea. At the beginning of October Duncan entered Yarmouth Road to take on supplies and repair storm damage, leaving five ships to watch the coast of Holland. On 9 October, however, word arrived of the departure of the Dutch from port, and by noon Duncan had left Yarmouth with eleven ships of the line and made for Texel, which he reached on the following day, having been joined by three more ships. At 8:30 A.M. on the eleventh the Dutch fleet was sighted off Camperdown (Kamperduin). It consisted of twenty-six ships in all: four of 68 guns, four 56s, two 64s, three 74s, two 72s, two 44s, one 54, three 18s, one 32, two 24s, one 36, and one 6. The British fleet consisted of seven 74s, seven 64s, two 50s, one 40, one 28, one 16, one 10, two 12s, one 8, and one 6, or twenty-four ships in all.

At dawn the Dutch under Admiral Johan Willem de Winter had been in a loose formation, but on seeing British signals and perceiving that Duncan was nearby, de Winter steered toward land. When he sighted Duncan to the northwest he formed his vessels into a close line extending from the southwest to the northeast and waited for Duncan's approach. On first sighting the Dutch fleet, Duncan's force was badly formed, largely the result of the different sailing abilities of his ships. He therefore shortened sail and just after 11:00 A.M., seeing the Dutch draw in from

the shore, gave the signal for his vessels to engage their opposites in de Winter's line. At 11:30, with the Dutch center about 5 miles to the southeast, Duncan made directly for de Winter, though the British ships remained in some disarray and confusion. Just before noon Duncan signaled that he intended to break through the Dutch line and attack from leeward, but the haze made it virtually impossible for his intentions to be made generally known. A few minutes later he issued the order for close action.

With the signal recognized, at approximately 12:30 P.M. the *Monarch* (74), Vice Admiral Richard Onslow's flagship, at the head of the rear division, penetrated the Dutch line between the *Jupiter* (72) and the *Haarlem* (68), firing into both as she went, and taking up a position along the starboard side of the former. The *Powerful* (74), meanwhile, engaged the *Haarlem*. On the leeward side of the Dutch line stood several frigates and brigs, two of which raked Onslow's ship as it broke through and luffed up to the *Jupiter*. The *Monarch* replied with a devastating fire that caused great damage to these smaller vessels. The British rear, meanwhile, soon engaged the Dutch line on the port side, apart from three of de Winter's ships at the head of the rear division—the *Brutus* (74), *Leijden* (68), and *Mars* (44)—which were largely out of range and thus able to avoid the fate that would befall their consorts later that day.

At about 12:50 the *Venerable* (74), carrying Duncan, sought to pass the stern of the *Vrijheid* (74), carrying de Winter, but she was initially prevented by the *Staten Generaal* (74), carrying Rear Admiral Samuel Storiij, who interposed himself. The fire from the *Venerable*, however, forced Storiij's ship to make way, and Duncan's flagship was able to engage the *Vrijheid* on her lee side, while the *Ardent* (64) attacked the same ship on her starboard side. A short time later the *Triumph* (74) engaged the *Wassenaar* (64) while the *Bedford* (74) fought with the *Admiraal Tjerk Hiddes De Vries* (68) and the *Hercules* (64). The *Hercules* caught fire, and though it was extinguished, the risk of total destruction obliged the crew to throw the entire stock of powder overboard. This, and the loss of her mizzenmast, left the *Hercules* defenseless, and she surrendered. After a short fight the *Wassenaar* surrendered to the *Triumph*, which then carried on to engage the badly damaged *Vrijheid*. This vessel nevertheless continued to fire and, with the help of other ships to her rear, obliged the *Venerable* to maneuver to a new position by wearing on a starboard tack. Finally, after a sustained and heroic effort, in which she was completely dismasted and lost the use of her starboard battery by the collapse of her masts, de Winter's ship struck her colors. Another Dutch flagship, the *Jupiter*, surrendered at about the same time, bringing the battle to a close. Pursuit of the remaining vessels was impossible in such shallow

waters and with a hostile shore only 5 miles away. Duncan therefore sailed for the Nore, in the Thames estuary, which he reached on 16 October.

The British victory at Camperdown was nothing if not fiercely fought. Duncan's force had taken nearly half the opposing fleet: seven line-of-battle ships, two 50s, and two frigates. Though Dutch losses are not known, the *Vrijheid* alone suffered fifty-eight killed and ninety-eight wounded, and losses in officers killed and mortally wounded were particularly high. That, as well as the physical damage to the ships, bore testimony to dogged Dutch resistance. Every captured ship was either dismantled in the action or lost on its journey to England because of high winds and waves. Some of their hulls were so badly damaged that they could not be retained by their captors as anything beyond simple trophies. One of the prizes, the *Embuscade* (36), was driven onto the Dutch coast, recaptured, but taken again in August 1799. Two other captured vessels were lost at sea. Because of the Dutch tactic of concentrating their fire on their opponents' hulls rather than on their rigging, Duncan's fleet had suffered severe damage and relatively high loss of life. Particularly badly hit were the *Ardent*, *Venerable*, *Bedford* (74), *Belliqueux* (64), *Triumph*, and *Monarch*. In all, British losses were 203 killed and 622 wounded.

## Campo Formio, Treaty of (17 October 1797)

The Treaty of Campo Formio resulted from Bonaparte's first Italian campaign and is notable for its display of the French general's political daring as well as for its specific provisions.

Bonaparte's first Italian campaign (1796–1797) was one of his most brilliant. He took a ragtag army and successfully defeated a larger, better-equipped, and better-trained army on several fronts. At the end of the campaign he had pushed Archduke Charles of Austria to within sight of Vienna. Though he had no authority to do so, Napoleon entered into negotiations with the Austrians near the town

of Leoben. The preliminary terms were agreed to on 18 April 1797. Final negotiations were conducted in the town of Campo Formio, resulting in the treaty by that name.

Campo Formio, concluded on 17 October, recognized territorial gains made by other revolutionary armies, most notably Belgium (formerly known as the Austrian Netherlands), which had been annexed by France after the victory over the Austrians at Fleurus in 1794. It also gained for France its so-called natural boundaries on the left (west) bank of the Rhine River, as well as Corfu and the rest of the Ionian Islands. Austria gained some territory as well, receiving Venice, Dalmatia, Istria, and the archbishopric of Salzburg. Bonaparte also secured the release by the Austrians of General the marquis de Lafayette, who had for some five years been imprisoned by the Austrians after he tried to join them in 1792.

These continental gains posed a direct threat to British security, for Britain was fearful of a powerful France that included Belgium and Holland, with their ports just opposite the south coast of England across the Channel. Yet France would be hard-pressed to give them up. They were a long-held dream, and any French leader who relinquished them would do so at the risk of losing his position. This dilemma would prove to be insoluble for both William Pitt, the British prime minister, and, later as First Consul and then Emperor, Napoleon. As a result, war between the two countries was virtually inevitable.

The most notable aspect of the treaty was its establishment of the Cisalpine Republic out of Milan, Bologna, and Modena, areas formally held by Austria. This creation of a new country was far beyond the scope of Bonaparte's orders or authority. His gamble succeeded, however, and he was seen by French citizens as a liberator of the oppressed and a deliverer of the Revolution to Europe. Bonaparte organized the new republic's government, provided a constitution, and nominated the members of its new government.

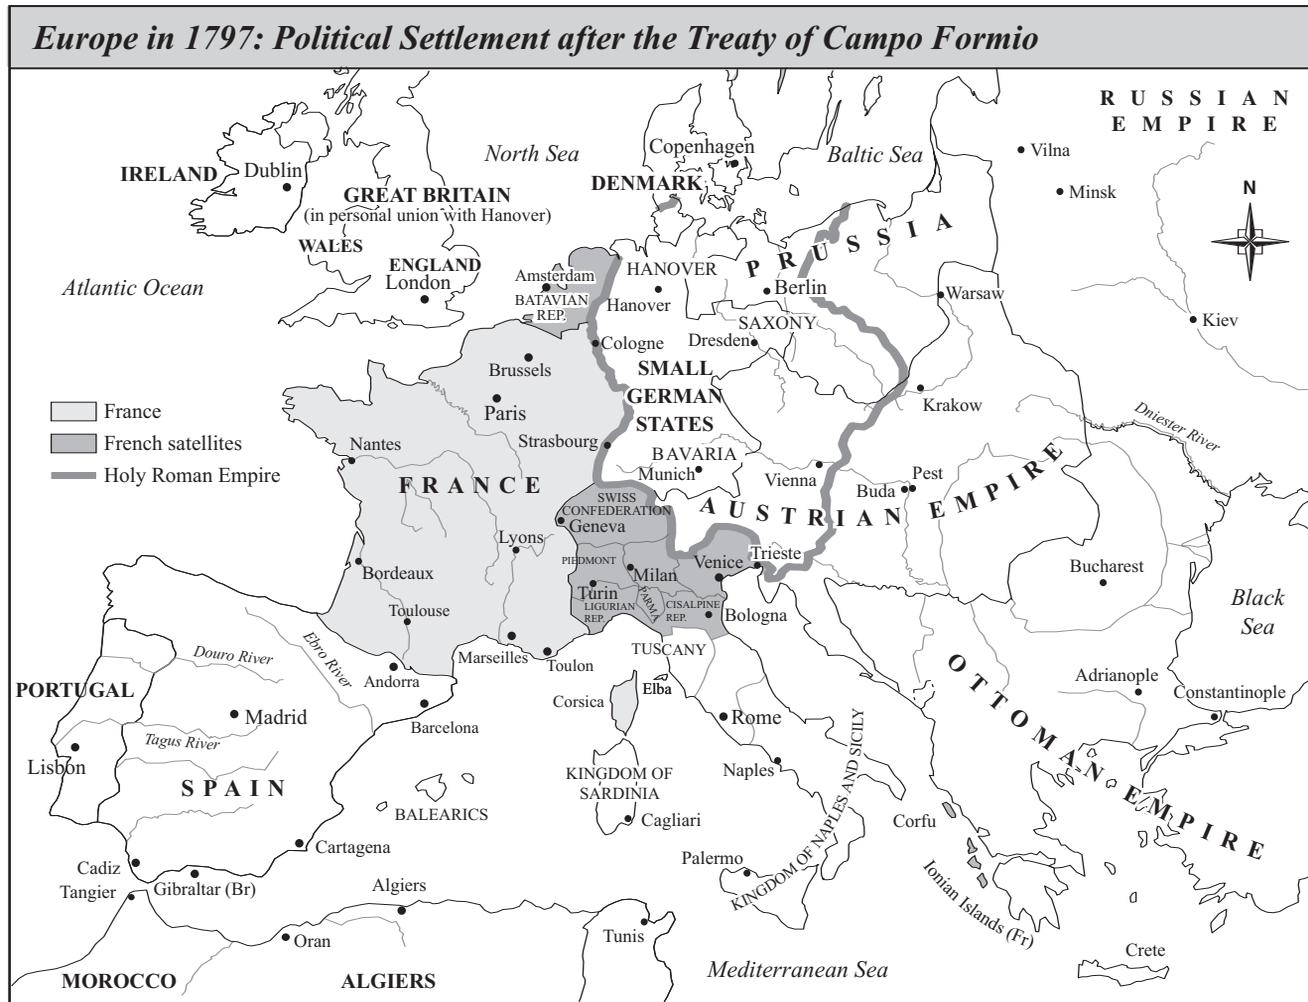

In the space of one year, Bonaparte had completely defeated the Austrian army occupying Italy and had achieved the Peace of Campo Formio, thus establishing himself as a true national hero of France and its greatest soldier. Having met his first military challenge with overwhelming success, and having brought glory and riches to France and great confidence to himself, Bonaparte was hailed in Paris.

### Canning, George (1770–1827)

With the exception of Lord Castlereagh, George Canning was the most important British foreign secretary in the first three decades of the nineteenth century. The most brilliant politician of his generation, a great orator, and a fluent writer, he might have had a leading role in government for far longer had he not antagonized other politicians by his arrogance and sarcasm. In governments that were committed to defending the established order, he was also suspected of always being at heart a radical.

Having been a supporter of the French Revolution in its first, constitutional years, many were surprised when he entered the House of Commons in 1793 as the devoted adherent of the prime minister, William Pitt. He was under-secretary at the Foreign Office under Lord Grenville, Pitt's cousin, from 1796 to 1799, when he became a member of the Board of Control for India. He was also the chief inspiration for and the most notable (though anonymous) con-

tributor of satirical verse and prose to the *Anti-Jacobin*, a weekly publication that combated what were considered subversive ideas in 1797–1798. He supported the union with Ireland in 1801, hoping that it would fulfill his aspiration for Catholic emancipation. When Pitt resigned on the issue, Canning left with him and became the merciless scourge of Henry Addington's administration. From 1804 to 1806 he was treasurer of the Navy in Pitt's last government. Pointedly left out of the so-called Ministry of All the Talents (1806–1807), in 1807 he became foreign secretary in the Duke of Portland's cabinet. Advocating vigorous war against Napoleon, he managed to secure the Danish and Portuguese fleets in 1807 but was furious at the Convention of Cintra, Sir John Moore's retreat to Corunna, and the failure of the Walcheren expedition, all of which he attributed to Lord Castlereagh, the secretary of state for war and the colonies. The two fought a duel when Castlereagh discovered that Canning was plotting to remove him. Canning went out of office after virtually demanding to be

prime minister in place of Spencer Perceval, who succeeded Portland in 1809, and his terms were too high to join Lord Liverpool's government in 1812. In 1814, however, he accepted a special embassy to Portugal, and in 1816 he entered the cabinet as president of the Board of Control for India. Despairing of reaching higher office, he was about to leave as governor-general of India in 1822 when he was appointed foreign secretary and Leader of the House of Commons in place of Castlereagh, who had committed suicide.

Detaching Britain from European engagements more than Castlereagh might have done, he also insisted on the recognition of the independence of Mexico, Buenos Aires, Colombia, and Brazil, formerly colonies of Britain's allies, Spain and Portugal. This, combined with Canning's domineering manner and support for Catholic emancipation and other reforms, divided the cabinet, with the Duke of Wellington leading the opposing faction.

In 1827, following Liverpool's stroke, Canning finally achieved his ambition of becoming prime minister, twenty years later than he had expected. Only four months later he died, but his stance of championing constitutionalism over European autocracy was continued by Lord Palmerston.

### Canova, Antonio (1757–1822)

Despite avoiding explicitly political subject matter, the Italian sculptor Antonio Canova was nevertheless the pre-eminent exponent of the Neoclassical logic of the French Revolutionary and Napoleonic periods. Following apprenticeships in Bassano and Venice, Canova, a native of Possagno, went to Rome in 1780, where he absorbed the Classical models that so influenced his work. During this time Canova's celebrity escalated rapidly, and a young Napoleon Bonaparte, then a general under the Directory, noticed his work during the Italian campaigns of 1796 and 1797. Canova was hostile to the French, especially following the occupation of Rome, and he was unsympathetic to

both their art and their recent political history. Nevertheless, under pressure from the papacy to comply, in 1802 Canova acquiesced to Napoleon's summons to Paris, where he sculpted *Napoleon as Mars the Peacemaker* (marble, 1803–1806, Apsley House, London), a commission that ultimately failed in its propagandistic purpose, since Napoleon aimed to play down the militaristic implications of his allegorical depiction as Mars.

Canova was supported by Antoine Quatremère de Quincy, the supreme advocate of the Classical revival in France, although his popularity in France was relatively slight compared with other European countries, especially Italy and Britain. This lack of popularity was partly due to his perceived friendship with the Emperor, but it was exacerbated in 1815 following a return to Paris as the pope's envoy to negotiate for the return of the Italian art treasures appropriated by Napoleon's armies. Nevertheless, despite Canova's antipathy to France and the French, his association with Napoleon did his reputation little harm, and resulted in numerous commissions.

Although Canova made several funerary reliefs, such as his *Monument to Admiral Angelo Emo* (marble, 1792–1795, Museo Storico Navale, Venice) and *Monument to Admiral Horatio Nelson* (plaster, wax, and terra-cotta, 1806–1807, Gipsoteca Canoviana, Possagno), his forte was free-standing marble figures, which, as was often remarked, gave sculpture an autonomy of form not seen since classical Greece. Canova was especially renowned for the attention he paid to the surfaces of his figures, which were highly polished and were often tinted with colored washes to imitate the texture and appearance of idealized human skin.

Canova's choice of subject matter was largely mythological, ranging from his *Three Graces* (marble, 1815–1817, Victoria and Albert Museum, London; National Galleries of Scotland, Edinburgh) to his *Perseus* (marble, 1797–1801, Vatican, Rome), with its unusual combination of materials (marble with a bronze sword). His political commissions, apart from portrait busts such as *Napoleon as First Consul* (marble, circa 1803, Palazzo Pitti, Florence), mostly adhered to this format. Claiming to esteem truth and beauty above all other values, Canova's political worth as an artist lay in his ability to emulate the artworks celebrating the military and cultural achievements of ancient Greece and Rome, a function he fulfilled for clients irrespective of their political or religious affiliation. Indeed, he performed a similar work on his own reputation by designing a memorial church at Possagno, where he was buried alongside many of his own works.

**Cape Colony, First Expedition against (1795)**

The expedition to the Cape Colony was part of the British government's strategy of taking the war to enemy colonies in order to disrupt enemy trade and safeguard that of Britain. On the formation of the Batavian Republic in 1795, the Dutch were forced into an alliance with France, whereupon Britain considered it vital to secure the Dutch colony of the Cape of Good Hope, at the southern tip of Africa. Securing the cape would safeguard the route to India and the East Indies for the Royal Navy and British trade, would disrupt the French route to Asia, and would counter the potential danger that Mauritius might be used as a base for French privateers.

An expedition was sent from Britain in March 1795 under the command of Vice Admiral Sir George Elphinstone. His fleet consisted of the 74-gun ships *Monarch*, *Victorious*, and *Arrogant*; the 64-gun ships *America* and *Stately*; and the sloops *Echo* and *Rattlesnake*, both 16 guns. The troops embarked for the expedition comprised the 2nd battalion of the 78th Foot under the command of Major General James Craig.

They arrived in Simon's Bay, Cape of Good Hope, on 12 June. Opposing them was a Dutch garrison consisting of 800 regulars and 2,000 militia. The British commanders summoned the Dutch governor, General Abraham Sluysken, and demanded he place the colony under British protection, but he refused. Sluysken evacuated the population of Simonstown, but before the Dutch could fire the buildings, a force of British soldiers and marines took the town on 14 July.

Following this minor success, Craig took a force comprising 1,800 men of the 78th, plus seamen and marines, and advanced on Cape Town. On 7 August a Dutch force blocked their route, whereupon Craig advanced, covered by fire from the *America*, the *Stately*, and the two sloops. The naval gunfire was sufficient to drive the defenders away before Craig's force got to close quarters. A Dutch counterattack the following day was repelled, with the seamen ashore playing a major role as infantry in the action.

The Dutch prepared for a counterattack on 3 September but held back when they learned of the arrival of fourteen East Indiamen bringing reinforcements consisting of the second battalion of the 84th, the 95th, and the 98th Regiments under Major General Alured Clarke. With this increase in strength, the British advanced on Cape Town

on the fourteenth, while the *America*, two sloops, and an East Indiaman sailed to Table Bay as a diversion. The colonists harassed the land advance, but this was not sufficient to stop them, and on 15 September the Dutch commander asked for terms. The governor and garrison were conveyed to Britain as prisoners of war. A Dutch attempt to recapture the colony in August 1796 failed, and the Cape remained in British hands until it was returned to the Batavian Republic under the Treaty of Amiens in 1802.

**Cape Colony, Second Expedition against (1806)**

The Cape of Good Hope at the southern tip of Africa was returned to the Dutch under the Treaty of Amiens. Forces based there, allied to France, could threaten British trade, so in 1805, after the renewal of war, the prime minister, William Pitt, ordered that an expedition be sent to recover the colony.

During the latter part of 1805 a force of 6,000 troops under Sir David Baird was embarked on a fleet of sixty transports and four East Indiamen. Commodore Home Riggs Popham commanded the strong naval force of the *Diadem* (64 guns), *Raisnable* (64), *Belliqueux* (64), *Diomede* (50), *Leda* (38), *Narcissus* (32), *Espoir* (18), *Encounter* (14), and *Protector* (14).

On the evening of 4 January 1806 the fleet dropped anchor to the west of Robben Island in Table Bay. Ships were sent to investigate Blauwberg Bay as a possible landing site, with the *Leda* and the transports of the 24th Regiment approaching Green Island to distract the Dutch garrison. The garrison under General Jan Willem Janssens consisted of a mixed force of 2,200 infantry plus a small contingent of dragoons and artillery. Janssens's force contained many Hessians, Austrians, Hungarians, and Polish recruits among the Dutch units. There was even a contingent of sailors and marines from the French frigate *Ata-*

*lanté* (40 guns), which had been wrecked in Table Bay, plus the crew of the French privateer *Napoléon*.

Some British cavalry and artillery and the 38th Foot, under the command of Brigadier General William Beresford, landed at Saldanha Bay covered by the guns of the *Es-poir* and *Diomedé*, while the main force landed at Blauwberg Bay. The main landing encountered difficulty with the surf, and one boat carrying men of the 93rd Foot was overturned, and thirty-five soldiers drowned. The landing was suspended as evening approached, but it resumed the next morning even though a small force of Dutch arrived on the hills overlooking the bay. However, fire from the ships sent them away, allowing the landing to continue unmolested. On the morning of 8 January two British brigades and the artillery marched off toward Cape Town, driving the Dutch from the hills overlooking Blauwberg. Beyond these heights, Baird's force came up against the main Dutch body, who, after a brief exchange of musketry and artillery fire, were forced to retire by a determined bayonet charge. Dutch losses were 337, while the British lost 15 dead, 189 wounded, and 8 missing.

Janssen's remaining force fell back to Hottentot Holland's Kloof, a ravine east of Cape Town, while Baird bivouacked, intending to continue the advance the next day. However, on the morning of the ninth the Dutch sought terms, and on 12 January Baird took possession of Cape Town. The colony was now in British hands, and as a result of the decision of the Congress of Vienna in 1815 it was to remain so after the Napoleonic Wars.

## Carnot, Lazare Nicolas Marguerite (1753–1823)

Lazare Carnot made his name as a mathematician and artillery officer under the *ancien régime* before turning to politics during the Revolution. A man of strong republican principles, he sat with the Mountain, a group formed by the more radical Revolutionaries, in the National Conven-

tion, becoming a member of the Committee of Public Safety during the Reign of Terror. On the committee he had responsibility for the war effort, and he exercised this with such skill and ingenuity that he turned the war around and was acclaimed with the sobriquet Organizer of Victory. After the fall of Robespierre he continued to serve under the Directory and the Consulate—as one of the five directors after 1795, as minister of war in 1800, and, despite his bitter opposition to the Empire, as an elected member of the Tribunate from 1802 to 1807.

Carnot was a man of true intellectual distinction, a mathematician of some talent who shared the intellectual curiosity of his age. He was born into the provincial bourgeoisie in the small town of Nolay in Burgundy, where his father was a royal notary and an *avocat* in the local *parlement*. He enjoyed a good education, showing a particular talent for mathematics, and—as a nonnoble who enjoyed none of the privileges that came with nobility—he chose to become an army officer in the only arm where he could hope to progress, the artillery. In 1770 he benefited from noble patronage to enter the Ecole de Génie at Mézières in eastern France, where he studied with the distinguished scientist Gaspard Monge before graduating with a commission in 1773. From that point he could make a modest career in the military, though as a commoner he could only be promoted as far as the rank of captain—which, without the advent of the Revolution, is where he would probably have remained. Carnot was far more than a competent artillery officer, however. He was a mathematician of some note who enjoyed the intellectual challenge of finding solutions to algebraic puzzles and who did some notable work solving complex equations. He submitted papers for prize competitions, including prizes offered by the academies in Paris and Berlin, among them a dissertation on the mathematical concept of infinity. And he shared the general enthusiasm of his age for science and the application of science, applying his understanding of mathematics to the science of war, publishing papers on the value of traditional fortifications, on aerostats, and on the theory of machines. He was, in other words, an intellectual before he was an army officer, a son of the Enlightenment, a polymath who read widely in philosophy and literature as well as in the natural sciences, an avid reader who found inspiration in Denis Diderot's *Encyclopédie* and remained a close friend of one of its coauthors, the philosophe Jean d'Alembert.

And with his own ambition thwarted by the demands of noble privilege and the petty rules of precedence, he was exactly the sort of individualist who would throw himself eagerly into revolutionary politics after 1789, recognizing, like many other men of talent, that it was on the political stage that his talents could be best used in the service of the

Lazare Carnot, a feverishly productive member of the Committee of Public Safety during the Terror. His part in raising the *levée en masse* probably saved the French Revolutionary armies from defeat at the hands of their numerically superior opponents. (Engraving by R. G. Tietze after Baron Lejeune from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 1)

nation. In Carnot's case, that conversion did not happen immediately, for though he wrote a thirteen-page address in September 1789 urging the immediate reform of the Royal Corps of Engineers—it appeared under the timely and seemingly revolutionary title *Réclamation contre le régime oppressif sous lequel est gouverné le Corps Royal du Génie, en ce qu'il s'oppose aux progrès de l'art*—that was practically his only foray onto the national political stage under the National Constituent Assembly. If he was involved politically during this early period, it was on the local stage in the town of Saint-Omer. It was in 1791, with the elections to the Legislative Assembly, that he entered national politics, along with his brother as a deputy for the Department of the Pas-de-Calais. In the Legislative Assembly he did not make an immediate impression as an orator, but he quietly served on a number of committees and kept a watching brief on the many military reforms being proposed by the deputies. He sat with the deputies of the Left, showed a healthy suspicion of the motives of the king, and

following the overthrow of the monarchy on 10 August was chosen—as were many of the more radical deputies—to go out on mission to the provinces, in his case to the Army of the Rhine. Thus, when he was elected to the Convention in September he already enjoyed something of a reputation as a critic of the monarchy, a man of generally radical views, and an army officer with a deep commitment to the cause of military reform. His approach and experience would prove invaluable to a country at war.

In the Convention Carnot sat with the Mountain, and though not a member of the Jacobin Club he won the trust of the inner circle of Jacobins by associating himself with many of their more radical policies. In the debate on the fate of Louis XVI he did not hesitate, voting for death and thus condemning himself in the eyes of the Bourbons as an extremist and a regicide. He was also respected by his fellow deputies for his military expertise and for the experience and good judgment he brought to a series of missions, including a vital one to the Army of the North between March and August 1793, which exposed the treason of General Charles Dumouriez and ordered his arrest. By the summer of 1793 France faced a military crisis of huge proportions, defeats and rumors of treason combining to sap confidence and morale. It was in these circumstances that the Committee of Public Safety—a committee composed of civilians and including no one of military experience—turned to Carnot. There were few soldiers among the members of the Convention, few who had the necessary background for the task in hand. That is why the committee asked for the services of Carnot along with another young army captain, Prieur de la Côte d'Or (Claude-Antoine Prieur-Duvernois), like Carnot a military reformer and a staunch Republican. In mid-August Carnot returned from the northern frontier to join the committee, where, along with Prieur and Robert Lindet, he was assigned responsibility for the organization and deployment of the armies.

This was the role in which Carnot would establish his reputation as a great war leader, as the man who turned the war around and imposed himself as the Organizer of Victory. The army he inherited was in a desperate plight, especially along the vital northern frontier against the Austrians: It was poorly trained and equipped and desperately short of horses and munitions; it was threatened with starvation, defeated on the battlefield, and raddled by rumors of treason and allegations of cowardice. It was Carnot's task to resolve personnel problems, to root out inadequate officers, and to establish some sort of strategic overview that could turn the army into an effective military force. The task was a massive one, given the huge size of the army and the troops' lack of battle experience: The *levée en masse* was intended, after all, to enlist three-quarters of a million

young recruits. They had to be armed and clothed, and provisions had to be found and paid for, all at a time when peasants were wary of the government's new paper currency, the assignats, and when the sans-culottes were staking the claims of Paris and the cities above those of the military. Carnot had to organize logistical support for armies that were constantly on the move and that increasingly had to contend with civil as well as foreign emergencies—in 1793 alone troops were being redeployed at home to face the federalist revolt in Lyons and throughout much of the Midi, treason in Toulon, and civil war in the Vendée and the departments of the West.

He also had to deal with politics inside the army, too, as radicals like Louis Lavalette tried to radicalize the military and Maximilien Robespierre sought to purge the officer corps of aristocrats and political moderates. Carnot dealt with political reality as he found it. He was won over to the radical idea of a mass army and to the tactic of the bayonet charge, the benefit of speed that came with use of the bayonet (*arme blanche*). He sought to inspire the troops with news and propaganda, himself publishing a successful newspaper for the armies, *La soirée du camp*, which imitated the tropes and style of Jacques-René Hébert's sans-culotte icon *Le Père Duchesne*. In short, he showed himself to be a skilled communicator, a motivator of men. But he was also careful to hold himself aloof from the more Robespierriest elements on the committee and to root out the more extreme radicals from the offices of the Ministry of War. He distanced himself from Robespierre's more extreme social policies, and he disliked Louis de Saint-Just's terrorist approach to the military. This helped to ensure his survival in 1794 when the more loyal Robespierrists were purged at Thermidor.

Carnot not only survived; he flourished, as a republican who had dissociated himself from the more extreme excesses of the Terror. Eight months later he was returned to the Council of Ancients, where he was chosen as one of the five directors with responsibility for running the war. He presented himself as a champion of the army and of public order, urging the harsh repression of the Babouvistes, the egalitarian radicals who were followers of Gracchus Babeuf, and promoting Napoleon Bonaparte to command the Army of Italy. Carnot's career stumbled with the royalist coup at Fructidor, when the royalists took their revenge on their republican opponents by sentencing fifty-three deputies and two directors—Carnot and François Barthélemy—to be deported to the prison hulks of Cayenne, and Carnot was forced to flee to Geneva for safety. Amnestied by Bonaparte after Brumaire, he returned to government as minister of war from April to October 1800, but his strongly republican ideas and his openly stated belief that the years of war were bankrupting

France did not endear him to the First Consul, who seemed happy to accept his resignation from office. He did not withdraw from politics, but he rapidly became a somewhat peripheral and disgruntled figure. Elected to the Tribunalate in 1802, he showed himself increasingly alienated by Napoleon's personal ambition and voted against both the Consul for Life and the proclamation of the Empire. Unlike many former Revolutionaries, Carnot had little appetite for office under the Empire. When the Tribunalate was dissolved in 1807, he retired into private life with a pension from the government in recognition of past services. He took no part in the Napoleonic Wars until the final months, when, in 1814, as a Frenchman, a patriot, and an officer, he felt duty-bound to offer his services for the defense of the nation. He still proclaimed his republican principles, yet he ended his career as a *général de division* in the armies of the Emperor, directing the defense of Antwerp against the Allied armies in a desperate bid to prevent the fall of France and the reimposition of monarchy. Knowing that by 1814 there was no chance of a republic, Carnot used what influence he had in pursuit of a constitutional settlement. He pleaded with Louis XVIII to establish liberal institutions and a constitutional government, but he then turned back to Napoleon, accepting his assurances of greater liberalization and accepting office as minister of the interior during the Hundred Days.

After the Second Restoration Carnot knew that he could expect no mercy; he stood twice condemned, as a regicide in 1793 and as a traitor to the Bourbon cause. He therefore chose voluntary exile, this time in Germany, where the respect in which he was held as a mathematician and a man of the Enlightenment ensured that he found employment; he ended his long and turbulent career as a professor of mathematics in Magdeburg. Like many of his republican peers, he was never allowed back into France, and he died in Magdeburg in August 1823 at the age of seventy.

### Caro y Sureda, Pedro, Marqués de la Romana (1761–1811)

About the only Spanish general to have received favorable treatment at the hands of British historians of the Peninsular War, La Romana was in reality a difficult individual who inflicted much damage on the Patriot cause. In 1807 he was sent to Denmark with a Spanish division requisitioned by Napoleon for garrison duties, and the outbreak of the Peninsular War saw him win instant renown by declaring for Ferdinand VII and successfully concentrating his troops on the island of Langeland, where they were picked up by the Royal Navy. Whether this renown was deserved is another matter, however: there is some suggestion that he was forced into revolt by pressure from below.

Be this as it may, La Romana was much angered by the situation that he found when he returned to Spain in the autumn of 1808. With the authority of the army overthrown and power in the hands of what he perceived as a revolutionary government, he set his sights on becoming a military dictator who would restore the old order. To add fuel to the fire, meanwhile, his old division was destroyed at Espinosa de los Monteros, while La Romana himself was badly defeated at Mansilla de las Mulas when he was given command of the much-battered Army of the Left in place of Joaquín Blake. Escaping with what was left of his troops in a skillful fighting retreat to southern Galicia, he there earned the nickname “Marqués de las Romerías” (Marquess of the Pilgrimages) on account of his endless evasion of the French.

With northwest Spain completely cut off, the Junta Central now gave La Romana supreme political authority in the provinces of Galicia, León, and Asturias, but this gesture of confidence did not appease the marqués, who persistently defied the authority of the Junta Central and in addition overthrew the Junta of Asturias in a de facto

military coup. In an attempt to defuse the situation, the Junta Central co-opted him to its own ranks as a representative for Valencia, but in September 1809 La Romana issued an extremely provocative proclamation in which he demanded the immediate formation of a regency. When the Junta Central collapsed in January 1810, moreover, he took an active part in the revolution that took place in Seville, but escaped its consequences by reappointing himself to the command of the Army of the Left, which was now based in Badajoz.

At the head of this force he twice attempted to attack the French forces in Andalucía (Andalusia), but in each case was beaten back with some loss. Asked by Wellington to send some troops to reinforce the defense of Lisbon, he traveled there with two divisions, but his presence proved superfluous, and he was soon marching back to Badajoz. On 23 January 1811, however, he suddenly collapsed and died, ostensibly from heart disease (it is also possible that he was a syphilitic).

### Carra St. Cyr, Claude (1760–1834)

A veteran of the pre-1789 army, Claude Carra St. Cyr led a brigade at Marengo and served as a divisional commander in Marshal Masséna's IV Corps at Aspern-Essling and Wagram. His most prominent role during the Napoleonic era, however, was as the ill-fated military commander in Hamburg in the spring of 1813. Carra St. Cyr decided to evacuate the French garrison from the city, a move Napoleon attributed to panic, and it was left to Marshal Davout to restore French control there. Carra St. Cyr's performance brought him lasting disfavor in the eyes of Napoleon. Carra St. Cyr is often confused with a more prominent general and Napoleonic marshal, Laurent Gouvion St. Cyr.

Carra St. Cyr was born at Lyons on 28 July 1760. He entered the army in 1774, served in North America under the marquis de Lafayette, and, as a supply officer, reached the rank of captain. He resumed his military career in 1793 as an aide to General Jean Aubert-Dubayet, and he served a tour of duty in Constantinople when Aubert-Dubayet became France's ambassador there. He saw combat at the Battle of Marengo (14 June 1800), rose to the rank of *général de division* in 1803, and led the 2nd Infantry Division under Masséna at Aspern-Essling and Wagram in 1809. Carra St. Cyr was left to guard French supply lines in

Germany during the 1812 campaign against Russia. He commanded the French garrison and served as military governor of Dresden, in Saxony, then took over the same post at Hamburg.

In the wake of the retreat from Russia in late 1812, Carra St. Cyr's position at Hamburg took on crucial significance, since control of the city was the key to the French position in northern Germany. Carra St. Cyr not only feared a revolt by the local population, but he also believed a large Russian force was approaching the city. The French general decided that his force of some 3,000 men could not hold Hamburg. On 12 March he ordered a withdrawal to Bremen, first seizing 100,000 francs from Hamburg's municipal treasury to pay his forces. In fact, there were only weak bands of German irregulars within striking distance when Carra St. Cyr fled. Hamburg remained in the hands of a locally raised militia and a small force of Cossacks for two and a half months until Davout restored French control there in late May. Outraged at Carra St. Cyr's performance, Napoleon ordered him to be placed in confinement at Osnabrück, and the disgraced general was left without further employment.

Following the fall of Napoleon, Carra St. Cyr entered the service of Louis XVIII and held the post of governor of French Guiana from 1814 to 1819. He died at Vailly sur Aisne on 5 January 1834.

### **Cassano, Battle of (26–28 April 1799)**

A number of separate engagements, known collectively as the Battle of Cassano, took place between 26 and 28 April 1799, as Field Marshall Alexander Suvorov's Austro-Russian army attempted to force the line of the Adda River, watched by General Jean Moreau's Armée d'Italie. Suvorov's victory opened the gates of Milan to him, put an end to the first Cisalpine Republic, and paved the way for the Allied reconquest of Piedmont. The planning and execution of the operations on the Adda brought new evidence of Suvorov's superior strategic and tactical skills.

The Austrian spring offensive in northern Italy had forced the French general Barthélemy Schérer behind the

Adda, where he could cover Milan and wait for expected reinforcements from Switzerland (under André Masséna) and Naples (under Jacques Macdonald). His army, exhausted and reduced from 46,000 to 27,000 men, was strung out across an overextended 70-mile-long defensive line along the western bank of the river, from Lecco to Pizzighettone. The town of Lecco, on the eastern bank, was still in French possession.

Meanwhile, the Allies had been reinforced by the arrival of a Russian contingent of 20,000 men under Suvorov. In compliance with the advice of the Austrian foreign minister, Johann Freiherr von Thugut, the Russian commander had taken command of the whole army, with the Austrian *Generalmajor* Johann Gabriel, marquis Chasteler de Courcelles, as his chief of staff. After detaching Paul Kray Freiherr von Krajova, the former commander in chief, with 23,000 men to blockade Peschiera and Mantua, Suvorov moved west with an army of 50,000 Austro-Russians, including a large body of Cossacks. The citadel of Brescia fell on 21 April, and Bergamo, three days later. By then, Moreau had replaced a tired Schérer. It was too late, however, for Moreau to substantially alter his predecessor's improvident deployment. Allied operations began early in the morning on 26 April. To the north, a Russian column of 3,000 light troops and cavalry under Peter Bagration descended from the heights to take Lecco and the bridgehead nearby. The French garrison under General Louis-Stanislas-Xavier Soyez nevertheless reacted very swiftly and bravely maintained their position for hours. As night fell, the Russians were redirected some miles downstream to Brivio, where *Generalmajor* Philipp Freiherr Vukassovich's column had managed to ford the river without opposition, establish a bridgehead, and send scouting parties toward Milan. Farther south, strong Allied forces (Russians under *Feldmarschalleutnant* Franz Fürst Rosenberg and Austrian divisions under *Feldmarschalleutnants* Zopf and Karl Peter Ott Freiherr von Bartokez) gathered at San Gervasio.

During the night of 26–27 April, engineers succeeded in throwing a pontoon bridge in front of Trezzo. A lively engagement developed at dawn on the western bank between the villages of Trezzano and Vaprio, as Paul Grenier's division, with reinforcements under Claude Victor arriving later, tried against the odds to check the rising tide sweeping down from Trezzo. By late afternoon, however, the French center was forced to retreat toward Milan. Meanwhile, at Cassano d'Adda, 5 miles south of Vaprio, the 106th Demibrigade offered stubborn resistance to Michael Freiherr von Melas's attempt at crossing the river. The arrival of Suvorov on the spot, however, induced two Austrian divisions to launch a decisive and successful assault on the entrenched bridgehead. By evening, the French were in retreat everywhere, with the Allied army holding both

sides of the Adda. Only Jean Sérurier's Franco-Piedmontese division continued to hold its position in the Paderno-Verderio area. On the twenty-eighth, however, Sérurier's troops were entrapped by superior forces under Vukassovich. All lines of retreat being cut, Sérurier was forced to surrender his command.

French losses, including the prisoners taken at Verdorio, ranged between 5,000 and 6,900, while the Allies had 761 killed, 2,913 wounded, and 1,212 taken prisoner. On 29 April Austro-Russian troops entered Milan.

### **Castaños, Francisco Javier de (1758–1852)**

The victor of Bailén, which resulted in the surrender of a French army in Spain, Francisco Javier de Castaños was born in Madrid in 1758. The scion of a noble family that enjoyed much favor at court, he became a cadet at the age of ten and thereafter enjoyed a distinguished military career. Renowned as an avuncular figure who did all he could to provide for the welfare of his men, he saw service against the British, the Moors, and the French alike and eventually became captain general of the military district that encompassed Gibraltar.

Deeply disturbed by the French occupation of Madrid, in April 1808 he opened secret negotiations with the governor of Gibraltar, Sir Hew Dalrymple, in the hope of securing British intervention, and on 30 May he raised his troops in open revolt. Securing command of all the regular forces in Andalucía (Andalusia), he succeeded in engineering (albeit more by luck than by judgment) the victory of Bailén. As such he became the hero of the hour, but as one of the few representatives of the regime of Manuel de Godoy who had managed to retain high office, he had many enemies, and at the same time many of his subordinates in the Army of Andalucía (later the Army of the Center) were disgruntled that he had received the bulk of the credit for Bailén despite not being present on the field.

Chief among his enemies was the aristocratic faction centered on the Palafox brothers, and this group engi-

neered his defeat at Tudela and, with it, his removal from command. For most of the next year, Castaños was confined in a monastery in Seville, but in 1810 he was rehabilitated and made a member of the Council of Regency established to replace the Junta Central.

Freed for command by the formation of a second regency in October 1810, in March 1811 he was appointed to take over the Spanish forces on the frontiers of Extremadura (Estremadura) following the death of the marqués de la Romana. As such, he was present at Albuera, although he took little part in the battle, surrendering the command of his men to Joaquín Blake. (It is, however, possible that he played a major role in persuading Sir William Beresford to stand and fight rather than retreating into Portugal.) Transferred to Galicia in 1812, he collaborated with the Marquis (later the Duke of) Wellington in the campaigns of Salamanca, Burgos, and Vitoria.

Regarded by the liberals who dominated politics in the Spanish capital of Cádiz as a reactionary who was hand in glove with traditionalist opposition to their policies, he was in June 1813 dismissed from his command, the result being a major crisis in Anglo-Spanish relations. Made Duque de Bailén after 1814, he served in a series of high offices both under King Ferdinand VII and during the regency of Maria Christina, and, a veritable grand old man, he ended his career as the tutor of the young Isabel II.

### **Castiglione, Battle of (5 August 1796)**

This engagement was fought between Bonaparte and the Austrian general Dagobert Graf Würmser in northern Italy. The battle took place around the town of Castiglione and involved around 27,000 French and 25,000 Austrians. The battle is seen as one of the classic examples of Bonaparte's concept of the "strategic battle." Bonaparte planned to pin the center of the Austrian line and then strike the flanks of the enemy. In reserve he would have an elite force capable of delivering the decisive blow. Bonaparte's plan

also made use of ordering outlying detachments to march to the scene of the fighting as quickly as possible to surprise and unnerve the enemy. This relied on good staff work and also on Bonaparte's ability to inspire his subordinates to operate independently. The French attacked the center of the Austrian line, and by early afternoon the divisions of generals Pascal-Antoine Fiorella and Hyacinthe-François-Joseph Despinois had arrived to the north and south of the Austrian position. Würmser was forced to withdraw across the Mincio River.

The Battle of Castiglione was the culmination of Würmser's attempt to relieve Mantua, which had been besieged by the French for a number of weeks. Würmser split his army into three parts to force the French away from the city; he commanded the central and largest column. In this he was successful, and he caught the French forces dispersed. Bonaparte responded quickly and defeated the right wing of the Austrian attack led by *Feldmarschalleutnant* Vitus Freiherr von Quosdanovich at Lonato.

Würmser was unaware of the predicament of his subordinate and continued his advance. He managed to relieve Mantua and then marched to join Quosdanovich, not realizing that he was heading toward the main body of the French army, which Bonaparte was concentrating around Castiglione. On 3 August the Austrian *Generalmajor* Anton Freiherr Liptay was forced back by General Pierre Augereau's troops close to Castiglione. Liptay withdrew to the high ground to the east of the town and was only saved by the arrival of *Feldmarschalleutnant* Paul Freiherr von Davidovich with his division. Augereau believed that the French could inflict a decisive defeat on the Austrians at this point and claimed that it was due to his influence that Bonaparte agreed to fight at Castiglione; however, the only evidence we have for this is Augereau's own account.

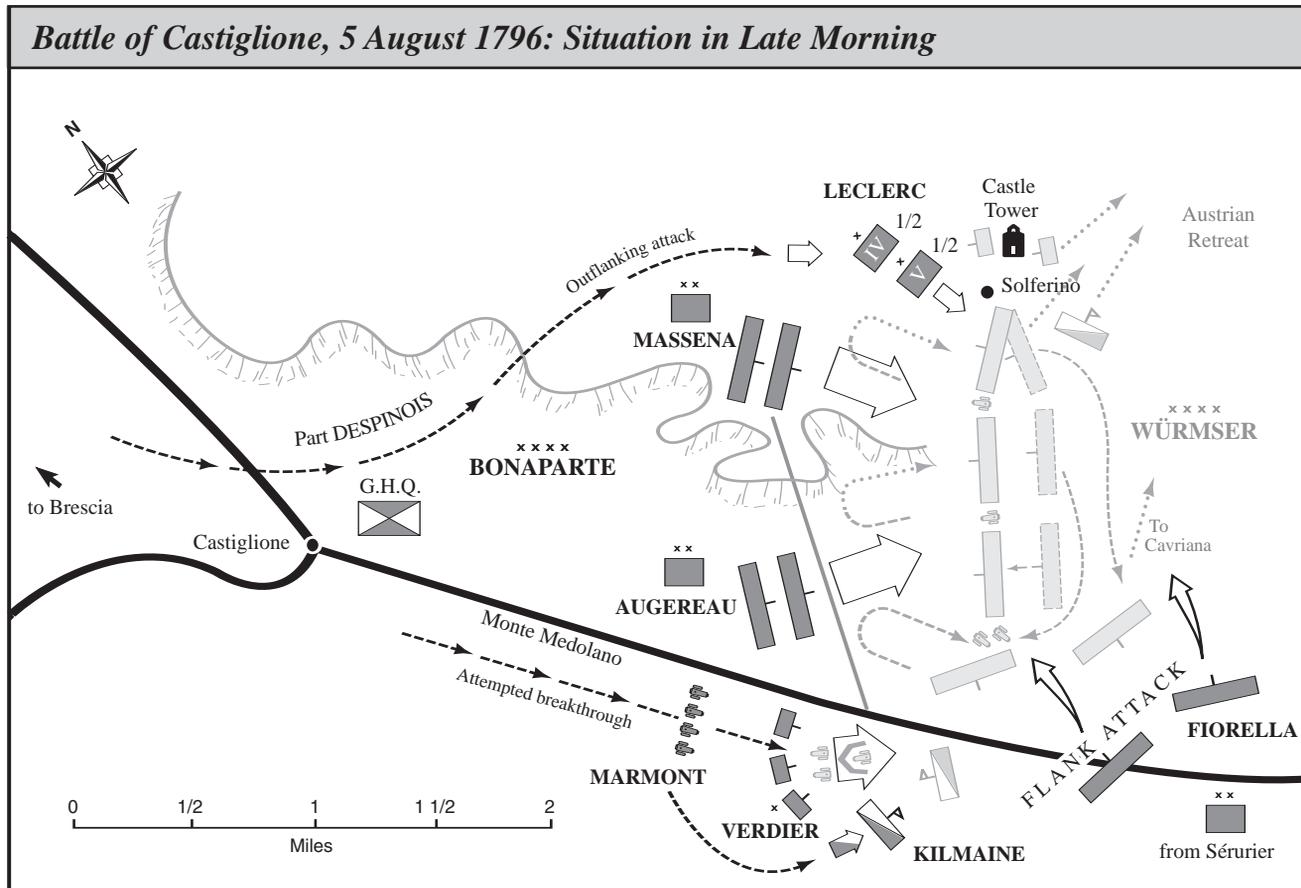

By 4 August Würmser had moved his forces to reinforce Liptay. He decided to occupy the high ground around Solferino, which averaged around 100 feet but at its highest point was over 500 feet above the village. On this position there was a small castle and La Rocca tower. His forces also fortified a small hill to the south of his line at Monte Medolano. This was only a few feet higher than the surrounding ground, but it did have a good field of fire to the west. The Austrians deployed a number of guns in a redoubt on the crest of the hill. Würmser was content at this moment to fight a defensive battle, as he had already achieved his primary goal of relieving Mantua and only had to avoid defeat to maintain the strategic advantage. While Würmser was deploying his forces, Bonaparte was awaiting the arrival of more of his troops. The crucial forces were those of Jean Sérurier's division, which was near the town of Marcaria, about 12 miles to the south of Castiglione. Sérurier himself was no longer in command of

this force, as he was suffering from a bout of malaria and command of his division had passed to Fiorella.

Bonaparte had ordered Fiorella to move to attack the left flank of the Austrian line around Monte Medolano. If this attack could be combined with an assault on the left and center of the Austrian line, then Bonaparte could roll up the Austrian line. Until Fiorella could arrive on the field, Bonaparte intended to launch a series of attacks on Würmser's center designed to lure his forces forward in order to place them in a more advantageous position for his flank attack. Würmser was aware of the location of Fiorella's command and had ordered forces under General Johann Mezaros and parts of the garrison of Mantua to prevent Fiorella from advancing to the battlefield. However, Fiorella moved before Mezaros had put his forces into motion. The commander of the garrison of Mantua was also too concerned with replenishing his supplies and removing equipment from the abandoned French siege lines to prevent the advance of Fiorella.

On the morning of 5 August André Masséna and Augereau were ordered to begin their attacks on the Austrian center. French forces amounted to around 18,000, 10,000 in Masséna's division and 8,000 under the command of Augereau. The French moved to the attack, deploying skirmishers to their front and creating a lot of noise in an attempt to unnerve the Austrian line. Prior to Bonaparte's arrival in Italy the French forces there had operated under the belief that they were inferior to the Austrian troops. Bonaparte, however, had altered this point of view. He merged the republican spirit of his troops with a greater sense of martial pride. After a short time the French withdrew, trying to encourage the Austrians to follow. To a certain extent Würmser was lured forward by Bonaparte, but his forces around Monte Medolano did not move from their strong position, although his right wing did advance for approximately a mile. Würmser also maintained a strong reserve line.

On the right flank of the French line Bonaparte had deployed his reserve forces under the command of General Charles Kilmaine. This force was composed of the cavalry commanded by General Marc-Antoine de la Bonninière, comte de Beaumont, amounting to 900 men, and the grenadier battalions under General Claude Verdier, totaling 800 troops. Bonaparte now decided that it was time to commit the grenadiers to attack Medolano. To reinforce this attack he ordered Auguste Marmont to take command of a twelve-gun battery. Marmont skillfully deployed his guns and was able to bring the Austrian defenders under a very effective fire. Verdier advanced with his grenadiers and in a stiff fight took possession of the hillock. The cavalry also moved to support the French infantry. Masséna and Augereau now renewed their attack on the Austrian

Adapted from Chandler 1966, 197.

line. The fighting was fierce, and the Austrian brigade commander, Liptay, was severely wounded. Liptay's division had suffered casualties in a defeat two days before and had not fully recovered, thus compounding an already-difficult predicament at Castiglione.

Around this time Fiorella had advanced to the town of Guidizzolo, where he found the baggage of the Austrian headquarters. He was initially repulsed by the troops guarding the wagons, but their small number meant that he could only be held up for a short time, and the Austrians were soon pushed aside. Fiorella now moved to Cavriano, which was less than a mile from the main Austrian position. Würmser was able to deploy three battalions from his second line to meet the threat, and for a short time the Austrian line was stabilized.

Bonaparte, confident that his flank attack was about to meet with success, ordered Masséna's troops once more to assault the right of the enemy line. Meanwhile, Augereau maintained pressure on the Austrian center. Würmser was now coming to the conclusion that his position was becoming untenable, and he began to prepare orders for the retreat of his forces. It was at this point that Despinois's division launched an attack on the Austrian right flank.

These troops had been marching from Brescia, which was around 11 miles to the west of the battlefield. Having reached Castiglione by the afternoon, Bonaparte ordered them to move onto the flank of Masséna's division. Despite the fact that these troops were weary from their march, they were more than a match for the Austrians, who had now been fighting for a considerable period of time. In a mixed formation of column and line, Despinois ordered his troops forward. Their advance quickly gained the high ground and then assaulted the castle and La Rocca tower at Solferino. This attack finally unhinged the defensive position of the Austrians, and the French took a large number of prisoners.

Würmser now tried to shore up his line with the remnants of the brigade that had held the castle and tower at Solferino and a further weak brigade under the command of Freiherr Anton Schubirz. However, Masséna's forces were now taking advantage of Despinois's attack and were coming close to splitting the Austrian line in two. Masséna was also threatening the Austrians' main line of retreat toward the Mincio River. Fortune, however, favored Würmser at this point, for he received welcome reinforcements under the command of Colonel Karl Philipp Frei-

herr von Weidenfeld, who had been ordered to march to Solferino the day before. He had been able to hear the sound of the fighting and had encouraged his troops forward as quickly as possible. He attacked elements of Masséna's division and caused enough casualties and disorder among the French to prevent their continued advance. Weidenfeld was in the forefront of the fighting and acted as an inspiration for the Austrians on the right wing. He was decorated for his leadership at this point of the battle.

Weidenfeld's actions allowed the bulk of the Austrian army to withdraw to Borghetto on the Mincio about 4 miles to the east of the original Austrian defensive line. On reaching the river they crossed to Vallegio, on the far bank, under the protection of a number of hussar squadrons. The bridge was only a very narrow wooden construction, and if the French could have brought the crossing under fire, the Austrians' retreat would have been seriously jeopardized. The French, however, were not able to carry out an effective pursuit owing to their lack of cavalry and the fatigue of the troops. Bonaparte himself was exhausted, having been in the saddle constantly for the previous eight days. The bridge was demolished after the Austrian rear guard had crossed.

Austrian losses amounted to around 3,000 casualties, but Würmser was forced to leave his artillery behind, which amounted to twenty guns. The French had lost around 1,500 men. Augereau was, at a later date, to be remembered by Bonaparte for his contribution to the battle with the title of comte de Castiglione. Würmser hoped to be able to hold the line of the Mincio, but owing to the loss of a large proportion of his artillery, this was to prove difficult. Würmser wanted to await the arrival of reinforcements. He also hoped for the rapid arrival of Quosdanovich, who was expected to march around Lake Garda, following his defeat by the French. Bonaparte, however, was not prepared to allow Würmser a chance to reorganize his forces, and he attacked immediately. This assault forced Würmser to withdraw further, and Mantua was once more placed under siege.

Bonaparte had won an important victory at Castiglione. Despite the fact that his concept of a strategic battle had been successful, Bonaparte was not completely satisfied with the result of the engagement, because he had hoped to completely envelop the enemy and destroy him. He was to employ the same basic plan on a number of future occasions. Apart from their losses, the Austrians were able to withdraw intact, and Würmser would soon return to the offensive.

### **Castlereagh, Robert Stewart, Viscount (1769–1822)**

Viscount Castlereagh (as he became in 1796 and then second Marquis of Londonderry, in 1821) was one of three closely connected Irish aristocrats, the others being Richard, Marquis Wellesley, and his brother, Sir Arthur Wellesley, Duke of Wellington, who played leading roles in the age of the French Revolution and Napoleon. Castlereagh was the most important British foreign secretary in the Napoleonic era, a leader in the union of Ireland with Britain in 1801, and the principal minister who mobilized the country after the renewal of war in 1803.

An outstanding student at Cambridge University, Stewart did not take his degree, which was not unusual but which in his case may have been owing to his unwillingness, as an Ulster Presbyterian, to accept the requirement of testifying to the Thirty-Nine Articles of the Church of England. A conventional aristocratic European tour at the beginning of the French Revolution provided useful experience for his future career. A later visit to Paris in 1791, when he observed the National Assembly debating, hardened his hostility to the principles of the French Revolution. He was nevertheless a moderate opponent of the government as a member of Parliament in the Irish House of Commons after 1790. It was here that he became a friend of his contemporary Arthur Wellesley (later Wellington), who as an aide-de-camp to the lord lieutenant of Ireland,

was a more reliable supporter of the administration. In 1794 Stewart was weaned completely from opposition when the prime minister, William Pitt—whom he had admired as a parliamentary speaker and whose government included both Stewart's step-grandfather, the first Earl of Camden, and his heir—presented him with a seat in the British House of Commons. Thereafter, although no great orator, he staunchly supported Pitt and his policies and denounced the French Revolution in both parliaments.

Castlereagh's future nevertheless seemed to lie in Ireland, particularly after his step-uncle, the second Earl of Camden, became lord lieutenant in 1795. In 1796 Castlereagh led the capture of the Belfast leaders of the United Irishmen, a couple of months before a planned insurrection in conjunction with a French army. Part of the expeditionary force reached Bantry Bay in December, though owing to weather and disputes among the commanders it did not land. Despite repression and the decline in Protestant enthusiasm for separation that followed, the governments in Dublin and London remained fearful of another attempt. At the height of this anxiety, in March 1798 Castlereagh was promoted, at first temporarily, from a minor Irish post to chief secretary for Ireland, an office from which Irishmen were conventionally excluded on grounds of partisanship. As second in command to Camden, Castlereagh bore the responsibility and blame for the brutal military campaign against the United Irishmen, which may have saved the capital from capture by the rebels. When disorganized insurrections in both the north and south broke out in June, they were also savagely overpowered.

By the time General Joseph Humbert landed in the west of Ireland with just over 1,000 French troops in August, it was a classic case of too little, too late; despite his military brilliance he was soon defeated, and the peasants who joined him were victims of ruthless reprisals. Another French force of 3,000, accompanied by the United Irish leader Wolfe Tone, was stopped at sea by the Royal Navy in October; Tone committed suicide in jail in Dublin while awaiting execution. Since Bonaparte had taken the army assembled for the invasion of Britain to Egypt in the summer, Ireland was secure for the present, and attention turned to a more permanent solution to the problem of discontent. Castlereagh was joined in this by Lord Cornwallis, the experienced general and Indian administrator, who replaced the overwrought Camden as lord lieutenant (and commander in chief of the army) at the height of the crisis in June. Both favored clemency for and conciliation with the Catholics, who were by no means revolutionary but who were blocked from being members of Parliament and from holding public office by the Protestants in and out of the Irish parliament.

Robert Stewart, Viscount Castlereagh. As British foreign secretary in the closing years of the Napoleonic Wars he played a pivotal role in the diplomacy that led to the formation of the Sixth Coalition (1813–1814) and to the restoration of the balance of power in Europe after Waterloo. (Library of Congress)

Castlereagh's and Cornwallis's answer to the Irish problem, which was strongly supported by Pitt's ministry, was a parliamentary union with Britain. There would then no longer be a separate Irish legislature to challenge the British government, and the more liberal union parliament could safely grant complete Catholic emancipation—including the right to sit in Parliament and hold other offices in addition to the right to vote (which Irish Catholics had had since 1793)—to what would be a minority in the enlarged state. But any open commitment to Catholic relief would have been fatal to the proposal in the Irish Parliament and the British cabinet. The amalgamation was to be a Protestant one, though Castlereagh, Cornwallis, and Pitt made informal promises that emancipation would follow the union.

Even with the lure of greater security against the French Revolution and domestic threats, it was no easy task to get the Irish legislators to vote themselves out of business. In order to carry the bill against stiff opposition, Castlereagh provided £1.26 million in compensation to the patrons of the 200 seats (of 300) in the House of Commons that would be abolished as well as lavishly dispensing offices, pensions, and honors, including promotions within the peerage and British titles. Pitt and his ministers were ap-

palled at the extent of the bribery but acquiesced in it as the price of Castlereagh's success. Castlereagh also bore the blame, then and later, from those who claimed that he had sold out his country. The Parliament of the United Kingdom came into effect on 1 January 1801, with Ireland having 100 members of Parliament (of 658), 28 members of the House of Lords elected for life by Irish peers, and 4 (Anglican) bishops sitting in the Lords by rotation each session. Ireland, however, was still governed by a separate administration headed by the lord lieutenant and chief secretary. And George III, who had been alerted by strong upholders of the Protestant constitution within the cabinet, adamantly refused to consider Catholic emancipation, which he considered a violation of his coronation oath. Pitt, who was not unhappy to be leaving for other reasons, seized on this issue to resign as a matter of honor and was soon followed by Castlereagh (and Cornwallis) on the same grounds. Henry Addington formed a ministry that would maintain Catholic disabilities and seek peace with France.

In July 1803, four months after the Peace of Amiens with France, Castlereagh joined Addington's government as president of the Board of Control for India. He was encouraged in this by Pitt, who was endeavoring to direct the ministry from the sidelines. Pitt particularly wanted Castlereagh to resolve the difference between Lord Wellesley, the imperious governor-general of India, and the East India Company, which wanted more trade and less war and expense. Castlereagh loyally supported Wellesley in Parliament but soon came to the conclusion that he should be replaced by a less bellicose ruler, as he was by Cornwallis in 1805. Castlereagh continued in the same office when Pitt became prime minister again in 1804. In July 1805, when the threat of invasion was lifted as Napoleon marched his army from Boulogne to central Europe, he also became secretary of state for war and the colonies. Castlereagh organized a force for a landing at the mouth of the Elbe, but this depended on Prussia, which vacillated until the project was destroyed by Napoleon's victory at Austerlitz on 2 December.

Castlereagh resigned when Pitt died in January 1806 but returned in 1807 as secretary of state for war and the colonies in the Duke of Portland's administration. In the next two years he improved the militia for home defense and increased the size of the regular army by offering bounties to recruits from the militia. In the summer of 1807 he was responsible, in conjunction with the Royal Navy, for the attack on Copenhagen that seized the fleet Denmark had refused to surrender. The fleet was held for the duration of the war, though at the cost of driving that country into the arms of Napoleon.

The revolt of Spain and Portugal against France in the spring of 1808 raised high hopes of an early victory over Na-

poleon. Castlereagh sent an expeditionary force to Portugal commanded by his former colleague in the Irish parliament and now chief secretary for Ireland, Lieutenant General Sir Arthur Wellesley (later Duke of Wellington), who, on returning from India in 1805, had taken Castlereagh's advice to enter the House of Commons in order to defend his governor-general brother. The high expectations for the campaign were dashed by the Convention of Cintra, by which Wellesley's superiors agreed to the removal of the French army from Portugal in British ships. After the recall of the generals involved for an inquiry, the remaining commander, Sir John Moore, retreated across northern Spain to his own immortal death, but the army at Corunna was also evacuated. Castlereagh, as the minister who had chosen the commanders, was considered to share in their ignominy, not least by his rival George Canning, the foreign secretary. By early 1809 Canning was plotting to remove Castlereagh and replace him by the seemingly more dynamic Lord Wellesley.

Oblivious of this, Castlereagh maintained his confidence in both the Peninsular War and Wellesley, who, after his acquittal by the court of inquiry, was sent back to Portugal in the spring as commander of the British forces, this time resigning his seat in Parliament. The prospects now seemed even better when Austria at the same time rose against Napoleon. To aid the latter Castlereagh organized a strike across the North Sea to seize the island of Walcheren at the mouth of the Scheldt, destroy the French fleet at Antwerp, and encourage the Dutch to fight the French. Unfortunately for the British, the tardy campaign was not launched until the end of July, after Napoleon had defeated the Austrians at Wagram. The failure of the operation, from a combination of poor leadership, French opposition, and malaria, was the last straw for Canning, who insisted that Castlereagh be removed and Wellesley be brought into the ministry. When Castlereagh was finally informed of the first part of this, he immediately resigned and challenged Canning to a duel from which Canning, who had never fired a pistol in his life, was lucky to emerge with a slight thigh wound. Castlereagh refused to return to office with such duplicitous colleagues when Spencer Perceval, under whom Canning also refused to serve, shortly became prime minister.

Two and a half years later, in February 1812, Castlereagh replaced the foreign secretary since 1809, Lord Wellesley, who hoped to form a government of his own when the Prince Regent (George IV after 1820) received the full powers of monarchy a year after George III lost his mental capacity. In the change of effective ruler Castlereagh insisted on the freedom to speak in favor of Catholic emancipation, as he had not for the past decade. Castlereagh continued in the same post and also became leader of the House of Commons under Lord Liverpool, who replaced the assassinated

Perceval as prime minister in June and allowed cabinet members to express their individual views on Catholic disabilities. Being Leader of the House of Commons and chief government spokesman there, since most of the other leading ministers were in the House of Lords, was a heavy increase to Castlereagh's departmental responsibilities. Although he was a poor speaker, he was respected for his courteousness and personal integrity, which let him be effective even when presenting measures to which he was not wholeheartedly committed.

However unpromising the outlook in the summer of 1812, it transpired that Castlereagh had entered his last and most memorable office at the final turning point in the war. By the end of the year Napoleon had retreated from Moscow and was being pursued west by the Russians joined by the Prussians. Wellington had entered Madrid, though his army was not strong enough to hold it, the Americans were being kept at bay in Upper Canada, and even the Luddite agitation declined as manufacturing prosperity returned with the collapse of the Continental System. The possibility of an alliance of the major powers to force France back into its borders had come again.

But the challenge once more was to ensure that the partners stuck together and did not come to separate terms with Napoleon and, in the longer term, that they agreed on a settlement that would prevent a similar war. In March 1813 Sweden promised its army in return for a British subsidy and possession of Norway in compensation for Finland, which it had earlier lost to Russia. In August, encouraged by Wellington's victory at Vitoria close to the French border, Austria also declared war. After their victory at Leipzig in October, Russia, Austria, and Prussia offered Napoleon terms, which he rejected, and at that point Castlereagh decided to go to the Continent at the beginning of 1814 to try to hold the Allies together in person. By the time he arrived Napoleon had defeated his divided opponents at the Battle of La Rothière on 1 February but again refused a proffered settlement. After difficult negotiations and a large British financial contribution, Castlereagh got the three rulers to bind themselves together by the Treaty of Chaumont on 1 March 1814. When Napoleon abdicated a month later, Castlereagh was hailed as one of the architects of victory.

In the summer of 1814 he returned to the Continent for the Congress of Vienna, which would decide the European peace settlement. His main aim was to ensure British security from attack from Belgium (which was joined to Holland), to restrain France by strong neighbors, and to create stability by balancing the interests of the other powers. As disputes over Poland and Saxony led to the brink of war at the beginning of 1815, Castlereagh's hand was strengthened by the success of the negotiations at Ghent

ending the war with the United States on 24 December; this freed the best part of Wellington's Peninsular Army, which had been sent there in the previous spring, to return to Europe. The outlines of the general settlement had been agreed on by the end of January when Castlereagh was recalled to lead the House of Commons, which was demanding government retrenchment, lower taxes, and protectionist corn laws, and replaced at Vienna by Wellington, who was then British ambassador to France.

The return of Napoleon and the support he received in France led to the renewal of the Treaty of Chaumont and his defeat at Waterloo. The renewed danger also concentrated attention wonderfully on building a stable and secure peace when Castlereagh returned to Paris in the summer to participate in the new peace treaty. The victorious Quadruple Alliance (Britain, Austria, Russia, and Prussia) agreed to enforce the arrangement for twenty years, by force if necessary. They also accepted Castlereagh's proposal for periodic congresses to discuss common issues, though the British government refused to accede to or be guided by the vague principles of the Russian emperor's Holy Alliance. Castlereagh attended the first congress at Aix-la-Chapelle in 1818, which finalized French reparations, ended the occupation of that country, and included it in the alliance system, but not the Congress of Troppau (1820) or the Congress of Laibach (1821), which were directed against revolutions in Spain and Italy.

Perhaps influenced in particular by Canning, who had entered the cabinet as president of the Board of Control in 1816, Castlereagh was distancing himself and his country from repression as distinct from preserving the international peace. He did intend to attend what turned out to be the last congress at Verona in October 1822 and drafted instructions refusing to support the other powers (Austria, Russia, and Prussia) in authorizing France to invade Spain in the hope of restoring King Ferdinand VII, who was being held captive by the army, which forced him to accept the liberal constitution of 1812.

At home after 1815 Castlereagh had to defend the ministry's repressive legislation in the Commons and bore the brunt of fierce criticism that should more properly have fallen on the home secretary, Lord Sidmouth. But whatever Castlereagh's reservations, he believed that the measures were constitutional and shared the fears of revolution of most of those who had been in office in the past thirty years. In 1821 he succeeded his father as Marquis of Londonderry, though as an Irish peer he could not continue as a member of the House of Commons. That autumn he accompanied George IV on state visits to Ireland and Hanover. Worn out by his parliamentary, Foreign Office, and other duties, and perhaps being blackmailed for

alleged homosexuality (which was then illegal), he committed suicide on 12 August 1822 by cutting his throat with a penknife. Radicals jeered the hearse as he was carried to be buried in Westminster Abbey next to Pitt.

The more articulate, showier, and verbally more liberal foreign policy of his successor, Canning, which was continued by Lord Palmerston, was for a long time regarded as far more admirable than Castlereagh's cooperation with the crowned absolutists of Europe. But the problems of the twentieth century brought a greater appreciation of the difficulties faced by the moderate Castlereagh and his achievement as one of the chief architects of a lasting peace.

## Cathcart, William Cathcart, First Earl (1755–1843)

British general, best known for his untiring services as a diplomat during the crucial campaigns of 1813–1814. Cathcart went to Eton in 1766 before accompanying his fa-

ther to Russia, where the latter served as British ambassador. He studied law at Dresden and Glasgow and in 1777 became a cornet in the 7th Dragoons. He was made one of Major General Spencer Wilson's aides-de-camp and served with distinction during the American War of Independence at the attacks on forts Clinton and Montgomery in October 1777. He fought at the Schuylkill River in 1778 and at Guilford Courthouse. At the end of 1778 he was given command of a body of loyalist volunteers who served at various outposts. As a major in 1779 he was acting quartermaster general in America while awaiting General William Dalrymple's arrival. He served at Savannah, the siege of Charleston, and the actions at Springfield and Elizabethtown, New Jersey, but he had to return to Britain in October when ill health began to plague him.

He was warmly received by the king, who promoted him to lieutenant colonel of the Coldstream Guards. Cathcart was raised to the Scottish peerage as the tenth Baron Cathcart in 1789, and three years later he received the colonelcy of the Coldstream Guards. In 1793 he served as a brigadier general under the Earl of Moira and was later sent to Holland with reinforcements for the Duke of York. In October 1794 he received a promotion to major general and commanded a brigade in Lieutenant General Sir David Dundas's division. He fought with distinction at Bommel in the winter of that year and in the retreat that followed. He received great acclamation for his defeat of a numerically superior enemy at Buren in January 1795. In 1802, as a lieutenant general, he was given command of the home district and served as commander in chief in Ireland from 1803 to 1805.

Cathcart was to go to Russia as ambassador, but when Napoleon's invasion forces at Boulogne suddenly began their march into Germany, Cathcart was sent to Hanover in command of an expeditionary force to ease the pressure on the Austrians and Russians operating in Moravia, in western Austria. The campaign proved virtually bloodless, and as a result of the death of William Pitt and of the Allied defeat to the south, Cathcart's forces were withdrawn from the Continent. In the spring of 1807 he led an expedition to the Baltic that bombarded and occupied Copenhagen in September. He became Viscount Cathcart in November and received a fortune in prize money as a result of the recent campaign. In 1812 he was appointed ambassador to Russia and British military commissioner to the Russian army. He performed well in securing, in conjunction with his colleagues at Berlin and Vienna, good relations between the Allied sovereigns and their armies in the great campaigns of 1813–1814, and he served as a liaison between the Allied commanders. Cathcart received various decorations for his valuable services, both at home and abroad, including his creation as Earl Cathcart. After the

war he returned to Russia as ambassador and remained at that post until 1820.

## Catherine II “the Great,” Tsarina (1729–1796)

Catherine the Great, Empress of Russia from 1762 until 1796, initially favored the ideas of the Enlightenment that culminated in the French Revolution, but after the regicide of King Louis XVI she reversed her liberal policies and ruled autocratically for the remainder of her reign.

Catherine was born on 2 May 1729 as Sophie Friederike Auguste Prinzessin von Anhalt-Zerbst in Stettin, Prussia (now Szczecin in Poland). Her parents were Prince Christian August von Anhalt-Zerbst and Johanna of Holstein-Gottorp. In 1743 Sophie was chosen by Tsarina Elizabeth of Russia to marry Karl Ulrich, Duke of Holstein-Gottorp, grandson of Peter the Great and heir to the Russian throne as the Grand Duke Peter. She arrived in Russia in 1744, converted to Russian Orthodoxy, assumed the title of Grand Duchess Catherine Alekseyevna, and married Grand Duke Peter in August 1745. However, the marriage was a failure, and the next eighteen years of Catherine’s life were full of humiliation and misery. Nevertheless, a smart and charming woman, Catherine completely immersed herself into all things Russian—as opposed to her husband, who worshiped Frederick II of Prussia—and through her intelligence, personal appeal, and love of Russia she gradually gained considerable support at the imperial court. She gave birth to a son named Paul on 20 September 1754, although it is likely he was the son of one of her lovers. After Tsarina Elizabeth died on 5 January 1762, Peter acceded to the throne of Russia and made the fateful decision to support Frederick II of Prussia, withdrawing Russian troops at a crucial moment during the Seven Years’ War (1756–1763). The new ruler openly professed his loathing for Russia and began introducing Prussian-style reforms, which quickly discredited him and alien-

ated the nobles. On 9 July 1762 Catherine, supported by the Imperial Guard, led a coup d’état against her husband, who was imprisoned and later murdered.

After her coronation in September 1762 Catherine began her reign by reversing many of her husband’s policies. She initiated a promising program of reform that modernized the education system and administration throughout Russia. The political and legal reform policies evolved from Catherine’s embrace of some Enlightenment ideals. She welcomed François-Marie Voltaire and Denis Diderot to her free-thinking court at St. Petersburg, which emulated the brilliance found at Versailles. She even toyed with the idea of emancipating the serfs and drafted a constitution. However, she soon realized the impracticability of introducing liberal reforms in autocratic Russia. Interest in the Enlightenment did not prevent her from exiling Alexander Radischev for his frank description of life in Russia in 1790. Her reign also suffered major hardships, including plague and bad weather that affected western Russia. The Pugachev Revolt of 1773–1774 further exacerbated her underlying autocratic tendencies. Instead of freeing the serfs, she imposed serfdom on the Ukrainians and contributed to a more systematized control over the serfs throughout the empire.

Catherine continued her reforms until the French Revolution attacked the principle of monarchical power. As an absolutist monarch she could not agree to the demands for a constitution that were imposed on Louis XVI. After Louis’s execution, the tsarina’s fear of the radical turn taken by the French Revolution resulted in her rejection and reversal of many of the liberal reforms she had initiated; she perceived that revolutionary ideas would pervade Russia and threaten her power. Domestically Catherine’s reaction was to expel French citizens, recall Russians from France, break off diplomatic relations with France, confiscate French commercial goods, and prohibit French printed materials such as books and newspapers.

During the course of the French Revolution Catherine increased her absolutist tendencies. She made peace with her enemies and shared in the 1793–1794 Partitions of Poland. In the period from 1789 to 1791 Catherine fought two successful wars, against the Ottoman Empire and Sweden, annexing considerable territory along the Baltic and the Black seas. At the time of the Treaty of Basle between France and Prussia (5 April 1795), Prussia left the First Coalition and thus was opened the possibility that Prussia might wage war on Russia and its ally, Austria. Catherine’s strategy of assembling forces on the Prussian and Polish frontiers in June 1795 led to an agreement with Austria. Prussia had no choice but to agree to the Third Partition of Poland. In the same year Catherine received British support in the form of an Anglo-Russian alliance that prom-

ised mutual aid in case of war. She also sent Russian naval squadrons to support the British in the North Sea.

Catherine died on 6 November 1796 at her palace in Tsarsko Selo outside St. Petersburg. Catherine's legacy included the Russian westward and southward expansion that annexed more than 200,000 square miles of new territory. Poland disappeared from the map, the Crimea was annexed, and a Russian presence was established in the Caucasus. She helped found new towns and renovate old ones. Her private life was and remains infamous for her numerous lovers. None of them wielded as much influence, or made such a lasting mark, as Prince Gregory Potemkin. Disliking her son Paul, Catherine sought to have her grandson Alexander placed on the throne, but her last testament was never made public and Paul ascended the throne in late 1796.

## Catholic Emancipation

The major issue dividing British politicians between 1801 and 1812 was not the war against Napoleon but, rather, the admission of Catholics to the political community. Since the Glorious Revolution of 1688, England (Britain after the union with Scotland in 1707) had officially been a Protestant state. Roman Catholics could not vote and were precluded from holding office by the requirement that officeholders accept the declaration against belief in the Catholic doctrine of transubstantiation. Until 1 January 1801 this affected fewer than 100,000 people, most of whom would in any event not have had a vote as being ineligible based on property-holding requirements. But the situation was transformed by the parliamentary union with Ireland since two-thirds of Ireland's population of about 4.5 million was Catholic.

In 1793, at the beginning of the war against Revolutionary France, the British cabinet had practically forced the (Anglican) Irish Parliament to conciliate the Catholics

by granting them the vote. Although no promises were made, the prime minister, William Pitt, clearly stated that it would be safe for Catholics to receive full rights in the larger United Kingdom, a view that was shared by the lord lieutenant, Lord Cornwallis, and the chief secretary for Ireland, Lord Castlereagh. Not all the cabinet ministers agreed, and George III insisted that the concession would violate his coronation oath. Pitt could not fulfill his moral commitment, and he gave this as his official reason for resigning in February 1801. He was replaced by Henry Addington, who formed a ministry that would leave the Protestant constitution alone. When Pitt returned as prime minister in 1804, he had to promise the king that he would not raise the issue of Catholic emancipation. After Pitt's death in 1806, the so-called Ministry of All the Talents, led by Lord Grenville, was pulled down by the king in 1807 over its proposal to open the higher ranks of the army and navy to Catholics. The Duke of Portland then constructed a government that would not touch the Catholic issue, which was continued by the evangelical Spencer Perceval after 1809. Following Perceval's assassination in 1812, Lord Liverpool, himself an opponent of Catholic emancipation, made it easier for colleagues of diverse views to work together by declaring that there would be no official policy on the matter. Members of the administration were free to express their individual opinions, but since the cabinet was carefully balanced between both sides, any change was effectively prevented. By 1825 this arrangement was breaking down within the government, and there was a slight majority in the House of Commons in favor of emancipation, though there would not have been in the country.

The restrictions on Catholics' voting and holding office (with some exceptions relating to the Church of England) were removed in 1829 during the Duke of Wellington's period in office, following the election of the Catholic Daniel O'Connell, who could not take his seat in the Commons. Foreseeing a flood of members who would be similarly disbarred and the prospect of civil war in Ireland, Wellington decided on repeal. Largely owing to his authority the bill passed the House of Lords, but it fatally split his followers, paving the way for Lord Grey's Whig administration in 1830 and the parliamentary reform act of 1832.

### Caulaincourt, Armand-Augustin-Louis de, marquis de, duc de Vicence (1773–1827)

Armand-Augustin-Louis de Caulaincourt, the brother of General Auguste Jean Gabriel de Caulaincourt, was born on 9 December 1773 to a prominent French noble family at the chateau of Caulaincourt near Saint Quentin. He enlisted in the royal cavalry at age fourteen and rose to the rank of *sous-lieutenant* in 1789. He remained in France during the Revolution and served with distinction in the republican armies, first in the Army of the North in 1792–1793, then in the Vendée in 1794–1795, and later in southern Germany, earning promotion to *chef de brigade* of the 2nd Carabinier Regiment on 30 July 1799. In 1801 Charles-Maurice de Talleyrand, a Caulaincourt family friend, suggested to the First Consul, General Napoleon Bonaparte, that he dispatch Caulaincourt on a diplomatic mission to St. Petersburg. Upon returning to France, Caulaincourt became Bonaparte's aide-de-camp in July 1802.

Promoted to *général de brigade* on 29 August 1803, Caulaincourt was involved in the kidnapping of the Bourbon duc d'Enghien—believed to be behind a royalist plot against Bonaparte—for he was instructed to transmit to the Baden authorities Talleyrand's note justifying the passage of French troops across the border, which was a violation of Baden's neutrality. This event came to haunt him later, and Caulaincourt could never escape accusation of involvement in the eventual execution of the duke at Vincennes. In June 1804 he was appointed grand master of horse, responsible for the stables, pages, messenger services, and imperial escorts, and he proved to be one of Napoleon's most loyal servants. Caulaincourt was promoted to *général de division* on 1 February 1805. Serving on Napoleon's staff, Caulaincourt took part in the 1805–1807 campaigns in Moravia, Prussia, and Poland. After the Treaty of Tilsit, he served as the French ambassador to Russia between November 1807 and May 1811, working incessantly on improving relations between the two empires. He was conferred the title of duc de Vicence in June 1808 and was involved in negotiations at Erfurt in October of the same year.

Recalled from Russia in 1811, Caulaincourt counseled against the invasion of Russia but accompanied Napoleon on the campaign. He witnessed the battles at Smolensk, Borodino, and at the Berezina River and accompanied the Emperor on his fourteen-day journey across Europe to Paris, which he described in fascinating detail in his mem-

oirs. He was appointed a senator on 5 April 1813 and took part in the campaign in Germany. In late May he assumed the duties of Grand Marshal Géraud Duroc, who had been mortally wounded on 22 May. During this campaign Caulaincourt was charged with all diplomatic negotiations with the Allies and took part in the summer talks connected with the Pleischwitz armistice and the conference at Prague, where he tried to negotiate peace terms with the Allies but failed to prevent Austria's entrance into the war. After the French defeat at Leipzig, he became the minister of foreign affairs on 20 November and represented Napoleon at the Congress of Châtillon-sur-Seine from 5 February to 19 March 1814, where he tried to secure from the Allies honorable terms of peace for France, the Allies offering to let Napoleon retain his throne and to permit France to retain its boundaries of 1792 in exchange for an end to hostilities. However, following his series of brilliant victories, Napoleon was reluctant to accept the conditions Caulaincourt secured from the Allies.

In April 1814 Caulaincourt stayed with Napoleon at Fontainebleau and delivered the Emperor's notice of abdication to Tsar Alexander I. He attended Napoleon after the latter's attempt to commit suicide with poison on the night of 12 April. Four days later, Caulaincourt took part in the ratification of the Treaty of Fontainebleau, which gave Napoleon full sovereignty over the island of Elba. On Napoleon's return to France in 1815, Caulaincourt was again appointed minister of foreign affairs on 21 March and resumed the hopeless task of negotiating with the Allies. After Waterloo he served in the Provisional Government between 22 June and 9 July. After the Second Restoration, his name appeared on the proscription lists, but it was erased on Alexander's personal intervention with Louis XVIII. Between 1815 and 1827, Caulaincourt lived in retirement in Paris. He left extensive memoirs that provide fascinating and enlightening insight into the last years of the Empire as well as on Napoleon's daily life and thoughts. He died on 19 February 1827.

### Caulaincourt, Auguste Jean Gabriel, comte de (1777–1812)

Born in 1777, Auguste Jean Gabriel de Caulaincourt was the younger brother of Armand-Augustin-Louis de Caulaincourt, who also served in the French Army. Auguste began his service in 1792 in the cavalry. He was wounded at the Battle of Marengo in 1800. In June 1804 he became an aide-de-camp to Louis Bonaparte. He fought at the Battle of Austerlitz in 1805 and in 1806 became King Louis's master of horse while serving him in Holland. Caulaincourt returned to France in 1808 and was promoted to *général de brigade*. He then served in Spain and was promoted to *général de division* in 1809, but he returned to France because of ill health. In 1810 he was created a count. Caulaincourt joined the Grande Armée for the invasion of Russia in 1812. He was in charge of the Imperial Headquarters until, at Borodino, he replaced General Louis-Pierre Montbrun, who had been killed leading II Cavalry Corps. Caulaincourt assumed command of this formation and led it—at the cost of his own life—in the charge that captured the Great Redoubt.

## Cavalry

Cavalry formed part of armies from the earliest period of organized warfare until the early twentieth century. Alexander the Great used heavy cavalry to demoralize and light cavalry to pursue his enemies. Hannibal and Scipio Africanus used cavalry against the flanks and rear of the enemy, using the cavalry's speed of maneuver and power of

shock in the attack to demoralize and defeat. However, as anticavalry missile weapons became more effective (particularly the English longbow), the cavalry needed increased armor, and it lost its advantage of speed. It was not until the seventeenth century—the time of Oliver Cromwell and King Gustavus Adolphus of Sweden—that speed was once more a factor in favor of cavalry operations.

The main element of a cavalry unit was the horse. To mount men on good horses was the intention of every cavalry officer, and the horses had to be able not only to carry the rider and his equipment but also to stand up to the privations often attendant upon military operations. British officers preferred hunters, which were strong and fast, but in Spain heat and lack of a regular water supply took their toll. Napoleon was particularly interested in the horses of the cavalry, and he remounted a number of his cavalry on captured German horses in the campaign of 1806 when he saw that these had made good mounts for the Prussian and Saxon cavalry.

The colonels of the French cavalry were responsible for purchasing or otherwise providing remounts for their regiments, and in the main, they did a good job. Heavy cavalry got heavy, almost draught horses; light cavalry got lightweight hunting-type horses. Perhaps the best-mounted cavalry were the Russians, whose horses were strong, well proportioned to the size of the riders, active, and hardy. The Cossacks, by contrast, were mounted on nondescript, pony-type horses, which could nevertheless maintain 5 miles an hour at the walk for miles and were as fast as any hussar horse in a charge or a chase.

It was always recognized that cavalry could only be used effectively in good open country and against an enemy vulnerable to mounted attack. The cavalry's speed of reaction made it possible to use it when the opportunity presented itself, but in warfare involving siege, cavalry was of little value. The great improvement came with Frederick the Great, whose reforms in the mid-eighteenth century enabled him to use cavalry for annihilation; Frederick, however, saw the value of attaching artillery as part of his cavalry formations because although cavalry had speed and its troopers were well drilled, they needed the extra-long-range cover that artillery could provide.

By the end of the eighteenth century it was quite clear that cavalry attacks against unbroken infantry were almost unfeasible; instead, Napoleon used cavalry to reconnoiter, to screen his flanks and the movements of his main body of troops, and to annihilate a broken enemy. He used a cavalry screen to cover his movements prior to the Battle of Austerlitz and the Battle of Jena, and he used Marshal Joachim Murat's cavalry in an annihilating attack in the pursuit after Jena. He used the younger General François Kellermann's cavalry for demoralization at the Battle of Marengo.

Napoleon was a master in the use of cavalry and said: “The use of cavalry demands boldness and ability, above all it should not be handled with any miserly desire to keep it intact. . . . I do not wish the horses to be spared if they can catch men. . . . Take no heed of the complaints of the cavalry, for if such objects may be obtained as the destruction of a whole hostile army, the state can afford to lose a few hundred horses from exhaustion” (Napoléon I 1858–1870, 6:346). Napoleon hardly ever used cavalry for raiding or for any large-scale operations far from the main body of his army. He kept his heavy cavalry and dragoons in reserve to use them for the coup de grâce upon a demoralized and wavering enemy.

However, Napoleon also used his cavalry as a means of deception. In 1805, en route to Ulm, he sent his cavalry reserve corps ahead of his infantry, creating the impression that he would attack frontally through the Black Forest. Instead, having given this false impression, he then moved the cavalry to the left to cover the right flank of his army as it approached the Danube. He did, however, use cavalry for deep reconnaissance and protection. After the successful completion of the Ulm campaign, dismounted dragoons were sent to scout toward Pilsen, and other divisions were watching the frontier to the southeast. Another division was carrying out a reconnaissance in force toward Vienna, and two cuirassier divisions formed the advance guard to screen the army as it moved forward.

Cavalry in the Napoleonic period were armed with lance and saber and almost always also carried firearms (pistols and cavalry carbines). Napoleon came to rely upon massed cavalry more as the quality of his line infantry began to decline, although in the early part of the Napoleonic Wars there is little doubt that his cavalry was the best on the battlefield. Nevertheless, against well-trained and disciplined infantry deployed in square, cavalry had little chance of success. Horses and riders en masse made a good target for volley fire at short range even by the muskets of the period, not renowned for their accuracy, and once a trooper was dismounted, he was essentially out of the battle.

How the cavalry was used depended upon the size of the army of which it was a part. In many cases there were too few cavalry to form an independent command, but in the Grande Armée Napoleon formed divisions of heavy cavalry for assault, and light cavalry performed other tasks, including support for infantry corps.

The charge with cavalry was predominantly carried out in line, although the column came into use later as it was easier to control. The intention in a charge was to ensure that maximum speed was reached just as the attacking cavalry struck its target. The charge began at a trot, increased speed at a canter (but maintained control), and

only broke into a gallop at the last possible moment commensurate with the need to hit the enemy en masse at high speed. The cavalry also trained to receive charges, and it was considered negligent in the extreme to receive enemy cavalry at the halt. The cavalry always tried to be in motion to receive a charge, the faster the better.

Cavalry have always had a reputation for being eager to charge, and equally to be very difficult to control once galloping. The British were not masters of control, and the Duke of Wellington issued orders that the cavalry should charge in two lines, one of which was in reserve. Further, if necessity demanded that a single line charge, about one-third of the line was to be ordered to pull up as soon as possible and to go into reserve as soon as the enemy was seen to be broken. Essentially Wellington saw that to control cavalry there must always be a reserve. The reserve was to attack 500 yards behind the front line if attacking cavalry, 200 yards behind when attacking infantry (to prevent reloading by the infantry between the two charges). What every cavalry commander was aware of was that a charging line of horses and men would soon develop into a rabble unless closely controlled, and the prospect of a cavalry charge ending in the disappearance of the cavalry in pursuit was not to be countenanced.

The cavalry charged using its edged weapons: saber or lance. Firearms were only used in skirmishing and on outpost duty, where cavalry had the advantage of being able to send reports on the enemy with much greater speed than infantry. The light cavalry carried out most outpost duty, reconnaissance, and raids. On outpost duty its main role was to observe the enemy and to prevent enemy patrols from penetrating the outpost line, a task well performed by the 1st Hussars of the King’s German Legion who, during the Peninsular War, held a 40-mile front against all French patrols from March to May 1811.

All the nations involved in the Napoleonic Wars employed cavalry; some were more successful than others. As noted above, French cavalry, with its particular élan, was superior to that of almost all other nations in the early period and was used later on as a main arm as infantry quality declined. The French cavalry was divided into heavy (for executing charges) and light (mainly for skirmishing, although also able to execute a charge). The heaviest were the cuirassiers, protected by a heavy breastplate and armed with sabers. Due to the weight of the riders and their equipment, these troops were used almost exclusively for the charge. Alongside them were the carabiniers and dragoons, both carrying saber and firearms but also capable of fighting on foot if required.

The most flamboyant cavalry were the hussars, of which there were fourteen regiments in the French Army.

French hussars at the charge. Cavalry performed many functions, including reconnaissance, foraging, and skirmishing, but at its most dramatic, as above, it could sometimes decisively alter the fortunes of battle. (Print by Bousson, Valadon, Paris, after Edouard Detaille from *Epochs of the British Army* by Lt. Col. H. S. Spalding. London: W. H. Allen, 1891)

Theirs was the traditional cavalry role: to protect flanks, to attack a vulnerable enemy, and to attack enemy cavalry. They were often used in combination with *chasseurs à cheval*, similar in organization and role.

In 1811 the first lances were issued to French cavalry, and the *chevau-léger-lanciers* came into being. The “Polish” (nominally Polish, but with other nationalities included) regiments of the French Army had already used lances to good effect, and the lancers were intended to support the heavy cavalry corps. They were only so employed in 1812, otherwise being used as normal cavalry.

British cavalry was divided into the Household Cavalry, the heavy cavalry, and the light cavalry. The Household Cavalry regiments were heavy dragoons, whose moment of fame was at Waterloo, having been little used previously. The heavy cavalry consisted of thirteen regiments of dragoons, and the light cavalry units consisted of

light dragoons, of which four regiments were renamed as hussars in 1806. There was little training for British cavalry, and Wellington observed: “I consider our cavalry so inferior to the French for want of order, that although I considered one of our squadrons a match for the French, yet I did not care to see four British opposed to four French, and still more as their numbers increased. . . . They could gallop but they could not preserve their order” (quoted in Haythornthwaite 1996, 106).

Prussian cavalry before the disaster of Jena in 1806 consisted of the Garde du Corps, twelve cuirassier regiments (later fourteen), and ten hussar regiments, the last including the *Bosniak* (lancer) regiment, raised from Prussia’s territory in Poland. These troops had been employed by Frederick the Great as shock troops, but in the campaign of 1806 they were so dispersed that they were rendered ineffectual. After 1806 the Prussian cavalry was

reduced by Napoleon to four cuirassier, six dragoon, seven hussar, and two uhlan (lancer) regiments.

Russian cavalry in 1803 consisted of six cuirassier regiments, but by 1812 it had increased by four regiments, together with thirty-six dragoon regiments (seven of which were converted from cuirassier regiments in 1803). The dragoons were reduced to a total of eighteen later in 1812. In the reduction, eight mounted *Jäger* regiments were created. There were also seven hussar and twelve uhlan regiments. In addition there was the Chevalier-Garde Regiment, a cuirassier regiment, and the Cossacks, who created their own legend during the French retreat from Moscow in 1812.

One result of Napoleon's disastrous Russian adventure was the loss of much of his cavalry in the retreat, and this loss hampered his ability to plan in 1813. What cavalry he had left was limited in numbers, and the majority of those he did have lacked training. He noted that it was impossible to "carry on anything but a defensive war, covering oneself by entrenchments and natural obstacles, if one has not a cavalry equal in strength to that of the enemy," for "if you lose a battle your army is lost." Furthermore, "an army superior in cavalry will always have the advantage of being able to cover its movements, of being well informed as to the enemy's movements, and giving battle only when it chooses. Its defeats will have few evil consequences and its successes will be decisive" (Napoléon I 1858–1870, 6:346). These words encapsulate not only Napoleon's concept of war but also the important role of the cavalry in all armies of the period.

## Ceva, Battle of (16 April 1796)

On 16 April 1796 the advanced guard of Bonaparte's Armée d'Italie attacked a Piedmontese (Sardinian) entrenched camp at Ceva, a fortified town in the upper Tanaro River valley and one of the southwestern doors to Piedmont and the Po River valley. Though the Piedmontese gained a tactical victory, by the end of the day they were forced by the general strategic situation to withdraw to Mondovi, where a more decisive battle was soon to take place.

At the end of the opening stage of Bonaparte's first Italian campaign, the French had attained their main goal of separating the Austrian army from the Piedmontese. The next objective was now to fall on the latter and force the Court of Turin to ask for an armistice. However, the fresh memory of the unexpected Austrian counterattack at Dego and of the stubborn Piedmontese resistance at the Cosseria Castle made Bonaparte cautious. Thus, he spent most of 16 April in reconnoitering toward Acqui and Sassello to be sure of the Austrians' retreat. Meanwhile, he switched generals Pierre Augereau, Barthélemy Joubert, and Jean-Baptiste-Dominique Rusca and most of the artillery to the west, toward Ceva, so as to make preparations for the offensive against Piedmont. Jean Sérurier's division would continue to descend the upper Tanaro valley.

The entrenched camp at Ceva was an excellent defensive position. At its southern end, a citadel lay on a knoll dominating the walled town and the Tanaro valley. Reporting to the Directory, Bonaparte had often emphasized its key role within the Piedmontese defensive network. From Ceva the camp stretched northward for about 4 miles fol-

lowing a ridge up to La Pedaggera and Bricchi Berico. A number of redoubts and *flèches*, arrow-shaped earthwork defenses, linked together by a number of other earthworks, had been built on the heights all along the line, which to the east was covered by the Bovino stream, vineyards, and thick vegetation.

As the French approached, the Piedmontese commander in chief *Feldmarschalleutnant* Michael Freiherr von Colli started preparations to withdraw his army farther east to another entrenched camp just before Mondovi. He had probably realized that *Feldzeugmeister* Johann Peter Freiherr von Beaulieu was now definitely out of supporting distance and that the camp at Ceva, though almost impregnable, could be easily outflanked to the north. Diplomatic issues were also at play. King Victor Amadeus III was looking for peace and neutrality, and a strategic retreat might serve his goals far better than a dull resistance. As a matter of fact, Colli left at Ceva only 6,000 men under General Giuseppe Felice Count Vitali.

At about noon, the French launched a number of uncoordinated attacks. To the north, Joubert's column, fearing being outflanked from Mombarcaro, soon retreated in disorder. Meanwhile, two attack columns of Augereau's division advanced toward La Pedaggera and Bric Bastia. After an initial failure, the French, with some artillery support, succeeded in taking the latter. Farther south, Rusca advanced to exploit a gap in the Piedmontese deployment, but a counterattack from the Mondon Redoubt pushed him back. Their line restored, the Piedmontese forced the enemy to evacuate Bric Bastia. At this point, Augereau decided to give up.

At the Battle of Ceva the French sustained 600 casualties, the Piedmontese 150. During the night Vitali's rear guard abandoned the camp and joined the rest of the army at Mondovi, leaving a small garrison in the Ceva citadel.

## Champaubert, Battle of (10 February 1814)

The battle of Champaubert was fought approximately 60 miles west of Paris during the campaign in France in 1814

between Napoleon's forces and Field Marshal Gebhard von Blücher's Army of Silesia. Napoleon's victory in this battle ushered in the Six Days campaign, during which his forces delivered several severe blows to the Allies. Napoleon had at first intended to strike at *Feldmarschall* Karl Fürst zu Schwarzenberg's Army of Bohemia before facing Blücher, but once he discovered that Blücher's forces were strung out as they pushed westward toward Paris (and that Schwarzenberg was retreating to Troyes), he changed direction in order to meet the threat from the north where Blücher stood in relative isolation south of the Marne.

Napoleon concentrated his troops at Nogent, where, upon hearing news that General Dmitry Osten-Sacken (not to be confused with his father, General Fabian Osten-Sacken, who was also serving on campaign in France) and more than 15,000 troops were at Montmirail, he led his weary and hungry main force of about 30,000 troops and 120 guns through heavy rain to the village of Champaubert. In the meantime, he left the defense of the Seine to marshals Victor and Oudinot, with orders to protect the bridges across the river in anticipation of future action against Schwarzenberg. Blücher was also in the process of moving his forces: He had intended himself to attack Napoleon at Sézanne and had turned toward Montmirail after receiving information that Napoleon was heading toward Champaubert. Unfortunately for Blücher, his troops were scattered over several villages: Sézanne, Montmirail, and La-Fère-Champenoise, to name a few. Just south of Champaubert, at the village of Baye, the Russian general Zakhar Dmitrievich Olsufiev, with only about 5,000 troops, was isolated from the rest of the Allied forces and nearly unprotected from Napoleon's attack.

On the morning of 10 February Napoleon's cavalry had reached the Allied forces at Champaubert, and though massively outnumbered, Olsufiev chose to hold his ground in the mistaken belief that Blücher might arrive to relieve him. By midafternoon, however, the French corps under Marmont and Ney had nearly completely overrun the Russian positions, and by the time Olsufiev decided to attempt to retreat toward Etoges, it was too late: Enemy cavalry on both flanks rendered all prospect of escape fruitless. Olsufiev, wounded in the fighting, was among those captured in the battle, though 1,000 of his troops managed to escape. Napoleon had not only won the day, inflicting 4,000 casualties on the Russians at a cost of 200 of his own, he had also achieved a central position between elements of the Army of Silesia—a circumstance that Napoleon was to exploit the following day at Montmirail.

Champaubert marks a turning point in the 1814 campaign. Before this battle Napoleon appeared nearly beaten: Prussian troops were gaining ground in the north, allies such as Joachim Murat, the King of Naples,

were deserting him, and Paris was panicking at the prospect of foreign invasion. Napoleon's victory at Champaubert and his subsequent victories at Montmirail, Château-Thierry, and Vauchamps energized the French (and Napoleon himself) and ensured that Allied victory would not be without obstacles.

### Championnet, Jean-Etienne Vachier (1762–1800)

The French general and army commander Jean-Etienne Championnet was born on 13 April 1762 at Valence (Drôme) and would distinguish himself during the siege of Gibraltar in 1782. In July 1789 he joined the National Guard of Valence and quickly rose through the ranks, becoming sergeant in December 1789, lieutenant in March 1790, and premier *adjutant général* in September 1791. In 1792 Championnet rose to *chef* of the 6th Volunteer Battalion of Drôme and took part in operations against insurgents in Jura and other eastern departments. In November 1793 he transferred to the Army of the Moselle and served at Kaiserslautern, Bischwiller, and Haguenau. On 23 December 1793 he took command of a detached corps and fought at Landau and Worms. For his actions, he was promoted to *général de brigade* by the representatives on mission (in French, *représentants en mission*, political commissars or deputies of the Convention sent on specific missions to various regions or armies) to the Army of the Rhine and Moselle on 6 February 1794. Later that year, he commanded divisions on the left flank of the army and was promoted to *général de division* by the representatives on mission on 10 June 1794 (confirmed by the Committee of Public Safety on 2 December 1794). He took part in the Battle of Fleurus on 26 June, and his resolute fighting in the center contributed to the French success.

Over the next three years, Championnet took command of several divisions (4th, 9th, 7th, and 3rd, respectively) in the Army of the Sambre-and-Meuse, and he distinguished himself at Düsseldorf, Königstein, Amberg, and Würzburg. In early 1797 he temporarily commanded the Army of the Sambre-and-Meuse and later was in charge of the advance guard of the Army of Mayence (Mainz). In 1798 he briefly led the right wing of the Army of England, and he later replaced General Laurent Gouvion St. Cyr as the commander in chief of the Army of Rome (18 October 1798). In January 1799 he occupied the Kingdom of Naples and proclaimed the Parthenopean Republic. Appointed commander in chief of the Army of Naples (24 January), he soon quarreled with the Directory and was dismissed and arrested in March. After brief court proceedings, Championnet was acquitted and given command of the Army of the Great Alps (Grandes Alpes) in July 1799. During the 1799 campaign during the War of the Second Coalition, Championnet took command of the Army of the Alps, which constituted the left flank of the Army of Italy. Later that year, he replaced General Jean Moreau in command of the Army of Italy (21 September), but he was defeated at Genola on 4 November and resigned his command the following month. Championnet died of illness at Antibes on 9 January 1800.

### Chappe, Claude (1763–1805)

Claude Chappe was a priest and engineer during the French Revolution. He devised an instrument to enable systematic communications, called the semaphore, that would be utilized by the French Revolutionary armies.

Chappe was born on 25 December 1763 into a prominent French family in Brûlon. He was the grandson of a French baron, thus ensuring noble status in the *ancien*

*régime*. The youthful Chappe had a knack for engineering. However, given his station, he was groomed for ecclesiastical service. With the outbreak of the French Revolution in 1789, Chappe, like his four brothers, lost his sinecure. As a result of this loss of privilege, he opted to pursue scientific endeavors.

Aiding this endeavor was the election of one of his brothers, Ignace Chappe, to the important Legislative Assembly. This paved the way for the Chappe brothers, especially Claude, to actively promote the construction of a 120-mile-long relay line from Paris to Lille. The purpose of this line was to carry messages across military lines. The utility of the device lay in its ability to send messages across longer distances undetected by the enemy. The semaphore, as it came to be known, gave the French a decided advantage over their opponents in their campaigns during the French Revolutionary Wars.

Essentially, Chappe's contraption was a relay tower with two arms and a cross arm. The arms varied in length from 3 to 30 feet long. The relay towers were stationed anywhere from 7 to 15 miles apart. In addition, each tower had a telescope to magnify incoming relayed messages.

In 1792, when the French Revolutionary Wars began, the French opted to employ Chappe's invention. In that year Chappe sent the first messages from Paris to Lille. The semaphore would be employed again in 1794 when it was used to notify Parisians of the successful liberation of the Condé sur l'Escaut from the Austrians. The revolutionary aspect of the semaphore was that the message of the capture of Condé sur l'Escaut reached Paris a mere hour after the occurrence of the event. It was clearly a remarkable moment for Chappe as well as for the future of military communications. Eventually, Napoleon would use the semaphore to signal his military transports and coordinate his massive army and navy. The success of Chappe's invention was widely recognized and led others to copy the machine. In time, many European powers devised their own semaphore systems.

In 1805 Chappe fell down a well at his hotel. Some scholars have claimed that he committed suicide, despite his success, because of depression over an illness as well as over the efforts of other countries to copy his invention. After Chappe's death the era of swift military communication entered a new stage.

## Chaptal, Jean Antoine (1756–1832)

Jean Antoine Chaptal was born in Nogaret, Lozère, France. His parents were small landowners, and Claude Chaptal, his uncle, was a renowned, wealthy, and successful physician at Montpellier. Although his parents were supportive, Chaptal's uncle exercised the greatest influence on his education and career. With his uncle's financial backing, Chaptal studied medicine at the colleges of Mende and Rodez and obtained a medical degree in 1777. Chaptal then persuaded his uncle, who wanted him to go into general medical practice, to allow him to go to Paris to continue his studies. In Paris Chaptal pursued his interests in both medicine and chemistry, but he developed a keener preference for the latter. In fact, his enthusiasm and talent for chemistry were recognized with a professorship at Montpellier University in 1781.

That same year, Chaptal married Anne-Marie Lajard, the daughter of a wealthy cotton merchant, and obtained a large dowry. In addition, after his uncle's death, Chaptal received a large inheritance. He used his wealth to build a chemical plant to manufacture various substances, including the first commercially produced sulfuric acid in France. Chaptal's innovations in chemical science made him internationally famous, and the governments of Spain and the United States made unsuccessful offers of employment. The French government applauded his efforts, presenting him with letters of nobility. During the French Revolution, Chaptal was professor of organic chemistry at the Polytechnic Institute in Paris. He was put in charge of the manufacture of gunpowder, and he began writing books that expounded on applied chemistry. In 1790 he published *Éléments de chimie* (Elements of Chemistry), in which he renamed the element azote as *nitrogen*.

After the Revolution, Napoleon, who recognized Chaptal's talents, appointed him minister of the interior (1801–1804). In this capacity, Chaptal established several vocational schools, reorganized hospitals, and built a chemical factory near Paris. In 1804 Napoleon awarded Chaptal the Grand Cross of the Legion of Honor for his accomplishments. In 1807, Chaptal published *Chimie appliquée aux arts* (Chemistry Applied to the Arts), which was the first book to deal with the field of industrial chemistry. In the years that followed, he made improvements in the manufacture of saltpeter for gunpowder, agricultural techniques, dyeing processes, and wine fermentation. In 1811, as director general of commerce and manufactures, Chaptal introduced the metric system of weights and measures in France. That same year, Napoleon honored Chaptal once again, bestowing on him the title of comte de Chanteloup.

After Napoleon's fall from power, Louis XVIII made Chaptal a member of the Academy of Sciences. Until three years before his death, he continued to expand on his ideas in his various publications. Ultimately, Chaptal's efforts went a considerable way toward bringing about the development of modern industry in France.

## Charles IV, King (1748–1819)

King of Spain from 1788 to 1808, Charles (Carlos) IV is generally portrayed as a half-wit and cuckold who was out of his depth as a statesman and in thrall to his domineering wife, María Luisa of Bourbon-Parma, and to the notorious royal favorite Manuel de Godoy. This picture, however, is unfair. Charles was not especially intelligent, and he was also prone to bouts of indecision. Yet he was in some respects very shrewd. As is well known, in the first years of his reign he first elevated Godoy from the rank of trooper in the royal bodyguard to that of captain general and then made him chief minister. According to popular tradition, the reason was that Godoy had become the lover of the queen, who was in consequence eager to shower favors upon him, but this story is a complete fabrication: Godoy was never María Luisa's lover. Instead, Charles had been alienated by the attempts of rival factions in the Spanish administration to manipulate the king and queen. To avoid this, he settled upon advancing a new man who would be utterly dependent on the throne. Nor was his choice a foolish one: Godoy was not the disaster of legend but a man of some vision and a genuine reformer who believed in pursuing the agenda of "enlightened absolutism" established by Charles's much more dynamic father, King Charles (Carlos) III.

But Charles was terrified of the ever-present specter of the French Revolution, so traditionalists who were opposed to any further reform were frequently able to gain his ear. In consequence, Charles never gave Godoy the support he needed. Many promising initiatives were stifled at birth, while advances in one direction were contradicted by

retreats in another. Even so, his reign saw important changes, most notably the major start made on the expropriation and sale of the lands of the Catholic Church. Coupled with the impact of war with first France and then Britain, however, the effect of these changes was to destabilize the body politic, and the growing tumult gave rise to a series of conspiracies that ultimately caused Napoleon to intervene in Spain and led to the overthrow of Charles himself in a military coup in March 1808. After abdicating all his rights to the throne to Napoleon at Bayonne, Charles lived under the Emperor's protection in France, but in 1814 he moved to Rome, where he died some five years later.

## Charles, Archduke of Austria, Duke of Teschen (1771–1847)

The Erzherzog Carl (Archduke Charles), the victor over Napoleon at Aspern-Essling (1809), is widely regarded as the greatest of Austrian military commanders during the French Revolutionary and Napoleonic Wars. A member of the Habsburg family, he became famous for his military writings and several great battlefield victories. Charles was also the leader of the reformers at the imperial court, seeking to modernize the army and its administration during two separate periods (1801–1804 and 1805–1809). Nevertheless, he remained a conservative figure, uncertain about the radical changes sweeping Europe.

Charles Louis John was born on 5 September 1771 in Tuscany, the third son of Grand Duke Leopold, later Emperor Leopold II, and Maria Ludovica (the daughter of King Charles III of Spain). As a member of the Habsburg imperial family, he was the grandson of Empress Maria Theresa and the nephew of Emperor Joseph II. Charles began his official education under the tutelage of Franz Graf von Colloredo and the Marquis Federigo Manfredini, men who respectively represented two distinct intellectual currents in the monarchy at that time. The "Theresian" baroque recalled the devout sixteenth-century Catholicism of the Counter-Reformation, while the "Josephinian" Enlightenment saw state-oriented utilitarian rationalism. Charles thus became a somewhat awkward mix of the two ideas, both a traditionalist and a reformer.

As the third son of Leopold (his eldest brother being the future Holy Roman Emperor Francis [Franz] II, later Emperor Francis I of Austria after the dissolution of the Holy Roman Empire in 1806) and suffering poor physical health, Charles was originally destined for the church and received religious training. When he was a youth it was realized that he suffered from epilepsy, brought on by bouts of nervous anxiety, which reduced him to near inactivity, although it seems to have vanished by 1804. Nevertheless, Charles was keen to be a soldier and he was allocated as his tutor the Prussian colonel Carl Frederick von Lindenau, a traditional eighteenth-century officer. The two would become lifelong friends, and Lindenau would have a significant influence on Charles's military philosophy.

At his father's coronation in February 1790, Charles met his aunt, the *staathalter* (governor) of the Austrian Netherlands, Archduchess Maria Christina and her husband Duke Albert of Saxe-Teschen. The childless couple arranged to adopt him, making him heir to large estates in Bohemia and Hungary.

War broke out in April 1792 and Charles had his first experience under fire at La Grisuelle, in June. Emperor Francis promptly promoted his brother to *Generalfeldwachmeister* (major general), and he commanded a brigade in the abortive invasion of France. When the army fell back into the Austrian Netherlands, Charles commanded a grenadier brigade at the first major battle of the period, Jemappes. In March of the following year, he led the Austrian advance guard in the victory at Aldenhoven, where he played a critical role, followed by his successful direction of the right wing in the victory at Neerwinden. Rewarded with the Cross of the Order of Maria Theresa, the archduke was appointed *staathalter* of the Austrian Netherlands, although the territory was lost within a year. Promoted to *Feldzeugmeister* in April 1794, Charles twice captured the village of Fleurus in the eponymous defeat (26 June), and the following year he returned to Vienna. There he dedicated himself to studying military science under Carl von Lindenau and *Oberst* (Colonel) Karl Mack Freiherr von Leiberich, while writing his first treatise: *On the War against the New Franks*. In it the archduke blamed Austrian caution and poor leadership for the failure to defeat the poorly trained French troops.

Charles's desire for army command was realized in the spring of 1796, when he took command of the Imperial Army in Germany with the special appointment of *Reichsgeneralfeldmarschall*, the highest-ranking general since Prince Eugene of Savoy nearly a century earlier. In his greatest campaign, largely planned by his senior staff officers, *Oberst* Heinrich Freiherr von Schmitt and Major Anton Mayer Freiherr von Heldensfeld, the archduke initially retired in the face of two superior French armies, be-

fore using interior lines to attack them in detail. After defeating General Jean-Baptiste Jourdan at Amberg and Würzburg and driving him back over the Rhine, he beat Jean Victor Moreau at Emmendingen and Schliengen to clear Germany of French forces. In the meantime, Bonaparte had stormed across northern Italy. Emperor Francis ordered Charles to take command of the demoralized Austrian army there, but after little fighting, he could only urge peace. As a result, the archduke fell from favor with his brother and his hawkish advisers. Sidelined after the war, Charles established his headquarters in Prague as commander of the troops in Germany, but he was excluded from decision making in Vienna.

During the War of the Second Coalition Charles commanded the Army of Germany (80,000 troops), but this time it was a secondary theater. After opening victories at Ostrach and Stockach in March over Jourdan, the archduke was ordered to close down the Congress of Rastatt. The murders of two French diplomats there forced the archduke to abandon plans to advance into Switzerland in defiance of Vienna. Only in June was he permitted to advance on Zürich, where he defeated Masséna at the first Battle of Zürich. In anticipation of an Allied offensive in Germany, Charles was ordered back to the Rhine, but his poor relations with the Russians and their defeat at the second Battle of Zürich led to recrimination and Charles's medical retirement to Vienna. Appointed governor of Bohemia, he was ordered back to the army in Germany after the Austrians were routed at the Battle of Hohenlinden by Moreau in December 1800. The only option open to Charles was to seek an armistice at Steyr on 25 December.

The crushing defeat of 1800 resulted in the permanent removal of Charles's staunchest opponent at court, Johann Freiherr von Thugut, and opened the way for reform. On 9 January 1801 Francis, realizing that Charles was the only man popular and capable enough to enact reform, appointed him president of the Hofkriegsrat. Between 1801 and 1804, known as the first reform period, Charles attempted to rationalize the running of the Austrian administration, although a ten-month ride around Bohemia for his health in 1801–1802 led to the detailed work being done by his civilian adviser, Matthias Fassbender. Taking the new appointment of minister of war and marine within the new Staats und Konferenzministerium (a cabinet chaired by the emperor), he started the process of military reform, while maintaining influence over foreign policy. Charles established a new permanent chief of staff, reporting directly to him, to lead the operational staff, established regulation reform committees, and reduced the periods of enlistment, which had previously been twenty-five years (effectively for life). However, the Ministerium soon collapsed, and the war party regained the upper

hand, influencing the emperor to restore the old organizational arrangements. As war loomed in 1805, Charles attempted to mass the Austrian army in Italy, while seeking to ensure the appointment of Mayer as chief of staff in the smaller army in Germany, but he was outmaneuvered by the war party, who imposed Mack as de facto commander there. Fearing defeat in Germany, Charles stood cautiously in position in Italy and managed to secure a marginal victory over Masséna at the three-day second Battle of Caldiero. Unable to reach the main Allied army, he halted on receiving news of Austerlitz.

After the Treaty of Pressburg, Charles again called for reform of the army. The second reform period, lasting from 1806 to 1809, consolidated the plans of the first period into new regulations. Tactically, these did not represent significant changes, just efforts to make maneuvering easier and to acknowledge the changes brought about by larger armies and the increased power of artillery, while compensating for Austria's loss of cavalry superiority. Plans were also made for increasing the size of the regular army with reserve battalions, although these were not executed at this stage and Charles was reluctantly forced to accept the *Landwehr* (militia) in 1808. Charles was a conservative, and his vision of change remained confined within the limits of his rational, supranational, and dynastic orientation, which required that its sole binding force, the army, had to be preserved. With Chief of Staff Mayer, in 1806 he wrote the *Fundamentals of the Higher Art of War for the Generals of the Austrian Army*, with a particular emphasis on officer training, replacing the 1769 regulations, and began a series of training journals for officers, the *Contributions for the Practical Instruction of Officers of the Austrian Army*. Both characterized war as a science, with specific rules and guidelines laid down for all forms of military activity.

Charles had been an advocate of an accommodation with France, but Napoleon's invasion of Spain in 1808 prompted him to shift his view and he did little to prevent the drift toward renewed war. However, by February 1809 Charles's initial enthusiasm for war waned as he realized that the army was not ready; but he hoped an early move would gain an initial victory. Although he was ready in March, the war party intervened to force a change of chief of staff and a new base along the Danube to protect Vienna. The advance began in April, but failures in the senior command led to defeat at the battles of Abensberg and Eggmühl, followed by retreat toward Vienna. Napoleon, however, had taken Vienna by 12 May, and Charles was forced to reassemble his army north of the Danube and await the French emperor's next move. The French began crossing the Danube on 18 May, but in a surprise advance followed by the Battle of Aspern-Essling, Charles secured

the first defeat suffered by Napoleon. During the fighting, Charles displayed great courage and personally rallied the center of his line when it was threatened with a French assault. Awaiting Napoleon's next move and hoping for peace, Charles was surprised by the second French crossing of the Danube, but on 5 July he managed to halt the advance. Realizing he had no choice, he and his staff planned an offensive for the following day, but late orders prevented its proper coordination and defeat ensued on the second day of fighting at Wagram. An armistice was concluded at Znaim on 12 July, and Charles resigned his last field command on 23 August.

In his last thirty-eight years, Charles was never again involved in a senior role. Emperor Francis and the more conservative elements at court distrusted his popularity and his interest in reform. During the Waterloo campaign of 1815, Charles was appointed military governor of the fortress at Mainz, and it was here he met his future wife, Princess Henrietta von Nassau-Weilburg, whom he married in 1815 and who bore him six children. In 1814 Charles had published his most significant and original work, *Grundsätze der Strategie* (The Principles of Strategy). Well received and widely translated, notably into French by Antoine Jomini, it mixed an account of the 1796 campaign with an attempt to describe it in terms of mathematical principles. In 1822 his adoptive father, Duke Albert, died, leaving Charles a palace in Vienna and substantial holdings in Bohemia, where he later built the Weilburg residence. After Henrietta's devastating death in 1829, Charles dedicated himself to the education of his children and to gardening, until his death at the age of seventy-six in 1847.

### Chateaubriand, François René, vicomte de (1768–1848)

A famous French writer, founder of Romanticism in French literature, and statesman, Chateaubriand was born to a prominent French noble family and grew up at his family castle of Combourg. In April 1791, during the Revolution, he traveled to America but returned to France after hearing about the royal family’s attempt to flee in June 1791. Disillusioned by the Revolutionaries, he briefly served in the émigré Prince Condé’s corps but was wounded at the siege of Thionville and was discharged. He went to Britain in May 1793 and published his first major work, *Essai historique, politique, et moral sur les révolutions* in 1797. After Bonaparte’s takeover of the government in 1799, Chateaubriand returned to France and supported the Consulate. He initially worked as a freelance journalist and continued to write his books. His next work, *The Genius of Christianity* (1802), made Chateaubriand one of the most prominent writers in France. In 1803 Bonaparte appointed Chateaubriand first secretary to the embassy in Rome and then minister to Valaise. However, Chateau-

briand disapproved of the execution of the Bourbon prince, the duc d’ Enghien, in 1804, resigned from his post, and became a bitter anti-Bonapartist.

He spent the next years traveling in Europe and the Middle East, engaged in literary work and in numerous love affairs. In 1811 Chateaubriand was elected to the French Academy. After Napoleon’s fall, he was created a viscount and a member of the House of Peers. He became ambassador to Berlin in 1821 and to London in 1822. He represented France at the Congress of Verona in 1822 and served as minister of foreign affairs to the ultraroyalist premier comte de Villèle in 1823–1824. He actively supported the French intervention to suppress the revolution in Spain. However, this campaign undermined Chateaubriand’s prestige. After serving as an ambassador to Rome in 1828–1829, he left public life in 1830 and spent his final years with Madame Jeanne-Françoise-Julie-Adélaïde Récamier, writing his *Mémoires d’outre-tombe*, his most important and lasting legacy.

### Château-Thierry, Battle of (12 February 1814)

The third action of the Six Days campaign in eastern France, the Battle of Château-Thierry, resulted in a victory for Napoleon’s troops over the Prussians and Russians under generals Johann Graf Yorck von Wartenburg and Dmitry Osten-Sacken, respectively, as well as the continuation of French momentum against the Allied forces. Two days earlier, Yorck had captured Château-Thierry, and after the Allied defeat in the battles of Champaubert (10 February) and Montmirail (11 February), his forces had returned northward to Château-Thierry in their retreat. At the onset of the Six Days campaign, Napoleon had ordered Marshal Macdonald to pursue Yorck and recapture the city (to prevent an Allied retreat across the Marne), but Macdonald was unable to reach Château-Thierry before the Allies could cross the river and fortify themselves, much to Napoleon’s disappointment.

Napoleon himself and the majority of his troops, together with Mortier, pursued the retreating Allied forces from the battlefield at Montmirail to Château-Thierry,

leaving Marshal Marmont in reserve at Vertus. He hoped to knock the forces of Yorck and Sacken out of the campaign before turning to confront Field Marshal Gebhard von Blücher leading the Army of Silesia (Russians and Prussians) and *Feldmarschall* Karl Fürst zu Schwarzenberg of the Army of Bohemia (mostly Austrians).

In the headlong flight to Château-Thierry, a French corps under Marshal Ney caught up with Yorck's rear guard, broke the Allied cavalry line, captured a great deal of baggage, nine pieces of artillery, and two Russian infantry regiments on the Allied right. In the process the French also seized the hills overlooking the Marne. Although the Prussian infantry made a stand at Château-Thierry, it served little purpose save that of protecting their retreat across the Marne. The Allies lost some 3,000 troops (approximately 1,250 Prussians and 1,500 Russians) and the guns and baggage captured at the outset of the action, as well as their strategic position in the village, while the French lost only around 600 men.

Owing to lack of a pontoon train, Napoleon remained in Château-Thierry the evening of the battle while engineers repaired the bridge over the Marne. It was a mixed victory for Napoleon, however. He had won the day, but the surviving Allied troops escaped across the Marne beyond the river Ourcq, destroying the bridge behind them, and were poised to regroup. He left Marshal Mortier to continue the pursuit of Yorck and Osten-Sacken and planned to face the emerging threat from Schwarzenberg near the Seine. First, however, he decided to confront Blücher yet again, at Vauchamps.

The Battle of Château-Thierry highlighted the paradox of Napoleon's efforts: He could win engagements with daring tactics and seasoned troops, but the discrepancy in numbers was beginning to tell, and soon there would be too many Allied forces to face. By the end of March the Allied troops had reached Paris.

## Châtillon, Congress of

*See* Caulaincourt, Armand-Augustin-Louis, marquis de, duc de Vicence; Chaumont, Conference and Treaty of

## Chaumont, Conference and Treaty of (1 March 1814)

An important treaty concluded in 1814 whereby the Allied powers agreed to prosecute the war against France to its conclusion without any seeking to make a separate peace with Napoleon. As the Allied armies entered France in January 1814, Napoleon's armies were no longer stronger than the combined forces of the Sixth Coalition, but the Emperor still believed he could prevail in battle. Allied forces were not fully integrated under a unified command, and a common strategy to defeat Napoleon did not exist. The Allies were split over who would replace a defeated Napoleon. It was possible that French forces might inflict a tactical defeat on the forces of one member of the coalition, which might emerge as a strategic victory for the French if that defeat led that member to withdraw from the coalition and seek a separate peace.

Amid the fluid battlefield situation in the campaign in France, diplomatic discussions between the Allies and Napoleon were conducted. Battlefield successes and failures guided the negotiating tactics of both sides. In the Frankfort Proposals of 9 November 1813, the Allies had offered Napoleon the “natural frontiers” of France as an incentive to end the conflict. Still believing in the inevitability of military success, Napoleon rejected the offer. But by January 1814, French military prospects looked grim. Marshal Joachim Murat had defected to the Allies, and Allied forces were entering France from several directions. Even if Napoleon ever regretted rejecting the offer of the “natural frontiers,” with military fortunes now swinging their way, the Allies never again tendered the offer. Napoleon's withdrawal from La Rothière following Gebhard von Blücher's attack on 1 February reinforced the belief in eventual Allied victory.

But Napoleon reversed his fortunes by achieving several tactical victories in February, notably at Champaubert on 10 February, at Montmirail on 11 February, and at Montereau on 18 February. These successes did not change the strategic situation, but they emboldened Napoleon to order Armand-Augustin-Louis Caulaincourt, his representative at the Châtillon Peace Congress, to accept nothing less than the previously offered and rejected “natural frontiers.” But with Allied forces deep inside France, the Allies were only prepared to offer Napoleon the pre-1792 borders of France, the so-called ancient frontiers. Napoleon's de-

mand for the natural frontiers doomed any hope for a settlement that might have retained a Bonaparte on the French throne.

The ebb and flow of the campaign continued when the Allies resumed their advance on Paris on 1 March. On the ninth, Blücher defeated Napoleon at Laon. The tide swung irrevocably to the Allies, who, prodded by Lord Castlereagh's masterful diplomacy, put aside national interests and agreed to the Treaty of Chaumont, published on 9 March but concluded on 1 March. The coalition agreed that Napoleon could retain his throne only if he were willing to accept the offer of the ancient frontiers, in return for a cease-fire. If the terms were rejected, the Allies agreed to fight the war against France to a successful conclusion, with each of the powers committing 150,000 troops to victory. Britain promised to contribute a subsidy of £5 million to the effort. More importantly, each member of the alliance further agreed that it would not seek a separate accommodation with Napoleon, thus eliminating any possibility of his breaking up the alliance.

Napoleon continued to believe that a military campaign could bring diplomatic success, and he rejected the offer. He still believed he could win a battlefield victory of strategic importance, which would cause the coalition to collapse. Napoleon's rejection created a consensus among the coalition that he had never had any intention of negotiating in good faith. Allied unity ensured that the war would be fought to a final conclusion and that the Bourbons would be restored to France, limited to its pre-1792 borders. Through other provisions in the treaty, the Allies agreed to an enlarged Netherlands that would include Belgium, an independent Switzerland, restitution of the Italian states, some type of confederation of German states, and a Spain under the restored Bourbons. The Allies also agreed to plan for a twenty-year period whereby they would collectively keep the peace, which suggested they believed that France would eventually renew hostilities. Further details of the Treaty of Chaumont were fleshed out at the Congress of Vienna and became the basis of the Quadruple Alliance.

In April 1814 the Emperor abdicated and accepted exile to the island of Elba, while the Allies restored the Bourbons to the French throne. On 7 March 1815, while still in conference at Vienna, the Allies learned that Napoleon had left Elba for France. Declaring Napoleon an outlaw on 13 March, the Allies began preparations to march and destroy him once and for all. Europe found itself at war, not against France but, rather, against Napoleon himself. The return of Napoleon threatened to expose the weakness of the coalition. Though their armies had not been demobilized, it would be some time before the Russians and Austrians could bring their armies to the borders

of France. It thus fell to the British and Prussians to initially deal with Napoleon when he took the field in June.

In an atmosphere characterized by vengeance, Castlereagh arranged a reaffirmation of the Treaty of Chaumont. Drafted 18 March 1815, it was ratified by the four major powers—Britain, Prussia, Austria, and Russia—on 25 March. The other nations represented at Vienna were invited to join the treaty. In the renewed Treaty of Chaumont, all parties agreed that they would take up arms against Napoleon and would not cease until he was finally deposed. Britain agreed to subsidize its allies, for a total of £5 million. The reaffirmation of Chaumont demonstrated the strength and unity of the Allies and hid much of the apprehension that might have found its way into the minds of the individual members of the coalition upon Napoleon's return to Paris.

### **Cherasco, Armistice at (28 April 1796)**

An agreement between France and Piedmont ending the latter's participation in the War of the First Coalition. In April 1796 General Bonaparte launched a successful offensive against Austro-Piedmontese forces in northern Italy, defeating them at Montenotte and Dego. The French then pursued the Piedmontese army of *Feldmarschalleutnant* Michael Freiherr von Colli, who was defeated at Mondovi and asked for an armistice on 23 April. However, Bonaparte ignored the offer until his troops captured the key fortresses of Cherasco and Alba two days later. In the

ensuing negotiations, Bonaparte agreed to halt his advance on the Piedmontese capital, Turin, in return for the right to garrison local fortresses and free passage for his troops. King Victor Amadeus of Sardinia-Piedmont was the first to ratify the treaty, which was later confirmed by the Directory.

### **Chernishev (Chernyshev), Alexander Ivanovich, Prince (1786–1857)**

Russian general and commander. Born to a prominent Russian noble family, Alexander Chernishev was educated at home by a Jesuit priest, Perron, and began service as a junior page at court in 1801. He transferred as a cornet to the Chevalier Guard on 2 October 1802 and served as an adjutant to General Fedor Uvarov. Chernishev participated in the campaigns of 1805–1807 and distinguished himself at Austerlitz and Friedland, for which he received the Order of St. George (4th class), on 1 June 1808. He was dispatched on several diplomatic missions to France in 1808, where he became close to Napoleon. Chernishev served as the Russian observer to the French army during Napoleon's campaign against Austria in 1809, witnessed the battles of Aspern-Essling and Wagram, and was appointed a *flügel-adjutant* to Tsar Alexander I on 18 June 1809.

In 1810–1812 Chernishev served on numerous diplomatic and secret missions to Napoleon and worked as a Russian spymaster in Paris. He successfully infiltrated the French Ministry of War and obtained many secret documents on Napoleon's preparations against Russia. He was promoted to colonel on 18 November 1810 and left France in 1811 after his undercover operations were discovered by the French secret police. During the campaign of 1812 he accompanied Alexander and then served on the staffs of Mikhail Kutuzov and Pavel Chichagov. In November and December 1812 he commanded a cavalry detachment and participated in the pursuit of the French army. He became a major general and adjutant general on 4 December 1812. In

1813 Chernishev distinguished himself at Marienwerder, Berlin (for which he was awarded the Order of St. George [3rd class], on 1 March 1813), Lüneburg, and Kassel and commanded a cavalry detachment during his famous raid into Westphalia. In 1814 he fought at Soissons and was promoted to lieutenant general on 4 March. The following year, Chernishev again commanded a cavalry detachment during the Hundred Days and captured Châlons.

After the war, Chernishev served on the committee to reorganize the Don Cossack Host in 1819–1821. He took command of the Guard Light Cavalry Division on 30 April 1821, served on the commission investigating the Decembrists in 1826, and was conferred the title of Count of the Russian Empire on 3 September 1826. He was appointed to the Senate in 1827, was appointed *chargé d'affaires* of the minister of war on 7 September, and rose to general of cavalry on 14 October of the same year. Chernishev became the deputy chief of the general staff on 15 February 1827 and a member of the State Council in 1828. He served as the minister of war from 13 May 1832 to 7 September 1852. He was appointed *chef* of the St. Petersburg Uhlans Regiment on 14 April 1833, received the title of Prince of the Russian Empire on 28 April 1841, and became *chef* of the Kabarda Jäger Regiment on 23 April 1843. For his services, the St. Petersburg Uhlans and the Kabarda Jägers were renamed the Chernishev Uhlans and Jäger Regiments, respectively, on 6 April 1844.

In 1848 Chernishev became the head of the State Council (15 November), the chairman of the Committee of Ministers, and the president of the Caucasian and Siberian committees. He was conferred the title of His Highness Prince (*svetleishii kniaz*) on 3 September 1849. Chernishev was relieved of all positions because of poor health on 17 April 1856. He traveled to Italy to recuperate but died at Castellamare di Stabia on 20 June 1857. Chernishev was one of the most decorated Russian officers. During his career he received the Russian Orders of St. Andrew the First Called with diamonds, of St. Vladimir (1st class), of St. Alexander of Neva with diamonds, of St. Anna (1st class) with diamonds, and a medal inscribed "For L [50] Years of Distinguished Service"; the Polish Order of the White Eagle, the Prussian Order of the Red Eagle, Order of the Black Eagle, and Pour le Mérite; the Austrian Orders of St. Stephan and of Maria Theresa (3rd class); the Swedish Orders of the Sword and of the Seraphim; the Bavarian Order of Maximilian Joseph (2nd class); the Dutch Order of Wilhelm (2nd class); the French Legion of Honor and Order of St. Louis; the Hessian Orders of the Lion and of Military Merit; the Sardinian Order of Saints Maurice and Lazarus; and the Portuguese Military Order of St. Benedict of Avis (1st class).

## Chichagov, Pavel Vasilievich (1767–1849)

Russian general and army commander. Pavel Chichagov was the son of Admiral Vasily Chichagov and studied in the Naval Corps before starting service as a sergeant in the Life Guard Preobrazhensk Regiment in 1779. In January 1782 he transferred to the 1st Marine Battalion and, in 1782–1784, he took part in the campaign in the Mediterranean Sea as an aide-de-camp to his father. Chichagov became a naval lieutenant on 17 September 1783 and captain lieutenant on 25 April 1787 before serving on the ship of the line *Iezekil* under Rear Admiral Timofei Kozlyaninov in Danish waters in 1788. During the Russo-Swedish War of 1788–1790, he distinguished himself serving on the ship of the line *Rostislav* in the naval engagements at Eland, Vyborg, and Revel. For his services he was promoted to captain 2nd class and awarded the Order of St. George (4th class, 29 May 1790) and a golden sword. He had the honor of delivering news of the victory at Vyborg to Tsarina Catherine II, for which he was promoted to captain (1st class) on 8 July 1790.

After the war Chichagov studied in Britain from 1792–1793. He took command of the captured Swedish ship of the line *Sophia-Magdalena* on 19 July 1793, and in 1794–1796 he commanded the *Retvizan* in the Baltic Sea. Chichagov rose to captain brigadier on 24 November 1796 and took part in the naval maneuvers at Krasnyi Gorky in June 1797, receiving the Order of St. Anna (2nd class). However, he was discharged because of a disagreement with Tsar Paul I in October 1797. Paul pardoned him two years later and promoted him to rear admiral on 20 May 1799. Yet Chichagov was soon thereafter falsely

accused of treason and imprisoned in the Petropavlovsk Fortress on 2 July 1799. After investigating the case, Paul acquitted him and restored his rank on 13 July. Late that year Chichagov participated in the expedition to Holland and fought at the Helder and Texel. For his services he received the Order of St. Anna (1st class) and a golden sword with diamonds (a gift from King George III of Britain).

Returning to Russia, Chichagov became an adjutant general to Alexander I on 24 May 1801, a member of the Committee on Navy Reorganization on 5 September 1802, vice admiral on 25 November, and the deputy minister of the navy on 12 December. Over the next five years, Chichagov introduced a series of reforms to modernize the Russian navy. He was appointed minister of the navy with the rank of admiral on 1 August 1807. He became a member of the State Council on 25 November 1810, though he resigned because of poor health on 10 December 1811 and served as an adjutant general to Alexander. The following year Alexander appointed him the commander in chief of the Army of the Danube and of the Black Sea Fleet and governor-general of Moldavia and Wallachia on 16 July 1812. However, as the Treaty of Bucharest between Russia and the Ottoman Empire was concluded before Chichagov arrived at army headquarters in the Danubian Principalities, he did not participate in military operations against the Turks.

On 30 September 1812 the Army of the Danube merged with the 3rd Reserve Army of Observation, and Chichagov took command of the newly created 3rd Western Army. He drove the Austrian troops to the Bug and advanced to Kamenetz and Visoko-Litovsk. Chichagov attempted to cut Napoleon's line of retreat on the Berezina River on 25–26 November, but he failed and was largely blamed for this fiasco, although generals Kutuzov and Wittgenstein should have shared the responsibility as well. He captured Smorgon on 7 December and pursued the French into Poland in January 1813. In that year he was relieved of command, ostensibly for poor health, but in reality he was harshly criticized and widely blamed for mishandling the operation on the Berezina. Chichagov was offended by such criticism and requested an indefinite furlough in March 1814, settling in France. He was relieved of all positions but remained a member of the State Council for the next twenty years. In 1834 he disregarded Tsar Nicholas I's decree limiting residence abroad to five years and was discharged from the Russian service on 29 October 1834. He was also dismissed from the State Council and his property was requisitioned. Chichagov died on 1 September 1849 in Paris. His interesting memoirs were published posthumously in Paris.

### Chippewa, Battle of (5 July 1814)

One of two principal actions of 1814 fought along the U.S.-Canadian border during the War of 1812. With the end of the war against Napoleon, British reinforcements were sent to America to assist the weak forces operating along the U.S.-Canadian border, whose security depended on British control of the Niagara River valley. Before troops could arrive from Europe, however, the Americans made a push against Niagara, taking Fort Erie on 3 July and crossing into Canada. The opposing forces camped a mile and a half apart on the night of 4 July and the battle took place on a plain, three-quarters of a mile wide, between a creek to the south and the narrow Chippewa River (now the Welland River) to the north. On the west lay heavy woods and to the east flowed the Niagara River, approximately a mile above the falls. The 1,300 Americans under Major General Jacob Brown stood behind the creek, while the 1,500 British, under General Phineas Riall, were deployed just north of them.

The battle opened when Riall's Indian allies began to issue a harassing fire from the woods on the American left. The Americans drove them out with 700 Indians of their own and 300 militia, but in doing so they encountered British regulars. After a stiff fight, Riall's men drove the Americans off. Brown's troops now advanced across the creek into the plain and deployed into line under artillery fire. Riall, believing himself opposed only by militia, was shocked to discover that these were regulars, and when the Americans launched an attack on an exposed flank, Riall's force was driven back across the Chippewa River, promptly destroying the bridge behind them. British losses were 148 killed and 321 wounded. The Americans lost 60 killed and 235 wounded.

### Chouans

The Chouans were counterrevolutionary partisan fighters in the western provinces of France. The word *chouan* literally means “owl” and may derive from the hoot of an owl, which these groups used as a rallying cry. The areas most affected by these insurgents were north of the Loire River, in areas of Maine, Brittany, Normandy, and northern Anjou. The term *chouannerie* described the activities of the insurgents. The regions most affected by *chouannerie* included the modern departments of Maine-et-Loire, Sarthe, Mayenne, Ille-et-Vilaine, and Côtes-du-Nord. The efforts of these different bands reached a peak between the years 1793 and 1796. Many republican commanders saw their reputations shattered in attempting to contend with the Chouans.

Not to be confused with the more organized Royal and Catholic Army of the Vendée, which attempted to fight the Republic as a regular army, the Chouans were true partisan fighters. While the Chouans participated in counterrevolutionary activities from early on, their pervasiveness grew in the provinces listed above as the effective organization of the royalist insurrection faltered, especially in the aftermath of the failed expedition to Quiberon Bay.

Tactically, Chouans were known for classic guerrilla-style methods. They would appear, attack isolated patrols of republican troops, and then melt back into the civilian populace. Thus, while the army columns dispatched into the regions by the republican government killed large numbers of innocent civilians and were responsible for widespread destruction of property, they succeeded more in temporarily dispersing the Chouans than in actually defeating them. Once government troops left an area, the partisans would simply reemerge. Chouan tactics proved so effective that several commanders saw their careers come to an end in contending against them. The young General Napoleon Bonaparte, for instance, refused an offer to command in the region. General Louis Lazare Hoche eventually rose to become the most successful commander at putting down the insurgents, and he wrote a manual based on his experiences.

Socially, Chouans were drawn from the peasants who lived in the hinterlands surrounding the cities of the various regions. As with many guerrilla groups, the motivations of the participants varied. Some members of the Chouans fought in opposition to the taxation imposed by the government, while others did so out of loyalty to Catholicism. Some took up arms in defense of the monarchy, others out of fear of conscription. Finally, mixed in with those fighting against some or all of the changes brought about by the Revolution, there were some who joined the insurrection purely for personal gain and cov-

ered their criminal activities under the veil of fighting for a cause.

### Cintra, Convention of (31 August 1808)

The Convention of Cintra allowed the French army under General Jean Junot to evacuate Portugal and return to France on board British ships. It caused a major political row in Britain and nearly ended the career of the future Duke of Wellington, who signed the cease-fire that preceded the convention.

After the uprisings against the occupying French armies that took place in Spain and Portugal in May and June 1808, British forces were sent under Lieutenant General Sir Arthur Wellesley to aid the Portuguese. Battles were fought against the French at Roliça (17 August) and Vimeiro (21 August), but Junot's army remained intact, in occupation of the Torres Vedras passes, Lisbon, and the Tagus forts while a Russian fleet under Admiral Dmitry Senyavin was anchored in the Tagus River. Wellesley was superseded in command first by Sir Harry Burrard and then Sir Hew Dalrymple, and it was the latter who received General François Etienne Kellermann under a flag of truce. It was Kellermann's suggestion that the French army be allowed to leave Portugal in British ships, which appealed to Dalrymple, who did not believe the British and Portuguese were strong enough to oust the French from Lisbon.

The terms of the cease-fire, signed by Wellesley and Kellermann on 22 August, were that the French would hand over the frontier and the Tagus forts but that they should be allowed to leave with their personal baggage, weapons, and horses. Kellermann also proposed that Senyavin's fleet be allowed to leave on the same terms as would apply if Lisbon were a neutral port. Finally, it was stipulated that no action would be taken against those Portuguese who had collaborated with the French.

Vice Admiral Sir Charles Cotton, in command of the blockading British fleet, refused to accept the terms apply-

ing to Senyavin's fleet, but the convention was eventually signed by Dalrymple on 31 August. It included the added stipulation that the French would be evacuated at British expense. The French interpreted the convention as giving them the right to remove all the plunder they had taken in Lisbon, and the commissioners appointed to oversee the implementation of the convention were only partly successful in preventing the wholesale plunder of Lisbon. The French also removed money from the Portuguese treasury and refused to pay bills owed by them in Lisbon. The French army finally left Portugal on 18 September.

The Portuguese authorities strongly objected to the convention, which had been drawn up without consulting them. Dalrymple and Burrard were recalled on 25 September and the command in Portugal was given to Sir John Moore. A board of inquiry was set up on 1 November, met on 14 November, and reported on 22 December 1808. The three generals were exonerated, but the board was not unanimous in approving the terms of the convention. George III then wrote a formal letter of censure to Dalrymple, who was retired in January 1809. Wellesley returned to politics but got a renewed opportunity for command in the Peninsula after the destruction of Moore's army in the Corunna campaign.

### Cisalpine Republic (1797–1799)

The Cisalpine Republic was created in June 1797 when, following his victories over the Austrians in northern Italy, Bonaparte united Lombardy with Reggio, Modena, Massa, and Carrara. In late July the Cisalpine was enlarged with the addition of the short-lived Cispadane Republic. In the Treaty of Campo Formio, Austria recognized the Cisalpine, which expanded with the annexation of areas that had belonged to the Venetian Republic. The Cisalpine, the most important "sister" republic in the Italian Peninsula, lasted

for twenty-two months and had a population of 3.5 million, a national flag, and an army. Its constitution, modeled on the French constitution of 1795, established a Directory and a bicameral legislature. The authorities divided the state into twenty departments with uniform administration.

The government launched various liberal reforms, including the revocation of feudal privileges, tithes and entails, and the establishment of free internal trade and equality between male and female heirs. The authorities diminished the church's power by abolishing religious orders and confiscating ecclesiastical lands, most of which they sold to wealthy landowners. They also established freedom of religion and required the clergy to swear allegiance to the state. The legislature discussed many other proposals but never enacted them because of lack of time, insufficient resources, or their radical nature. Those issues included a progressive tax, public secular education, judicial reorganization, price controls, and a minimum wage.

The independence of the Cisalpine was largely nominal, however; the French were ultimately in control. Neither Bonaparte nor the Directory wished to see a large, powerful Italian state. They imposed territorial limits that denied the Cisalpine access to the sea as Genoa became a separate Ligurian Republic (June 1797). Bonaparte ignored requests by the new democratic government of Venice to join the Cisalpine and delivered that city to the Austrians. Nor were Piedmont and Ancona added to the Cisalpine.

A treaty with France forced the Cisalpine Republic to maintain a costly army and to pay for the upkeep of 25,000 French troops, thereby causing a huge deficit. A commercial treaty between the two states favored French products. The French constantly intervened in the Cisalpine's internal affairs. Bonaparte had nominated the state's directors and legislators to prevent democrats from gaining power and to ensure the moderates' control. Increasingly, the French established a more authoritarian system. Four coups by the French purged radicals and opponents from the Cisalpinian legislature. In August 1798 the French ambassador, Charles-Joseph Trouvé, removed several directors and legislators and proclaimed a new, less democratic, constitution that increased the Directory's authority. The government suppressed journals and popular societies and arrested several "patriots." Under such precarious fiscal and political conditions, the Cisalpine authorities were unable to consolidate the new state.

Victories by the Second Coalition and the rise of counterrevolutionary forces throughout the Italian Peninsula brought about the demise of the Italian republics. The Cisalpine was the first one to fall. Following the triumph of the Russian field marshal Alexander Suvorov over the

French at Cassano d'Adda (April 1799), the Austrians entered Milan and established a new government.

### Ciudad Rodrigo, First Siege of (15 June–9 July 1810)

A minor Spanish fortress in León, Ciudad Rodrigo was an important Patriot base, and it also blocked the main road into northern Portugal. Thus, in the summer of 1810 the French resolved on its capture as an initial step in Marshal Masséna's advance on Lisbon and attacked it with the corps of Marshal Ney. Led by the tough and determined Andrés Pérez de Herrasti, the 5,000 defenders fought bravely, but they were unable to prevent the French from storming the fortified convents that constituted the city's outer defenses. Matters were not helped by the fact that Ciudad Rodrigo was overlooked by two hills known as the Greater Teson and the Lesser Teson on which siege artillery could be mounted.

With Viscount (later the Duke of) Wellington's army only a few miles away on the Portuguese frontier, the besiegers might have been driven off, but, much to Spanish anger, the British general deemed this to be too risky and refused to move. As a result, Ney was left to carry on unhindered. Despite fierce resistance, the result was never in doubt: By 9 July a very wide breach had been blown in the northern walls, and most of the Spanish artillery had been silenced. All, then, looked set for the city to be stormed, but at the last minute the defenders raised the white flag. Some days earlier, however, the garrison's small cavalry force had managed to break out under the cover of darkness under the command of Julián Sánchez, thereby ensuring that Spanish resistance in the region would continue.

### Ciudad Rodrigo, Second Siege of (8–19 January 1812)

In January 1812 British troops besieged and captured Ciudad Rodrigo, a fortified city in Spain, located near the frontier with Portugal. The city was of strategic importance because of its location at the main crossing site of the Agueda River, the last natural barrier before the Portuguese border. Together with the city of Badajoz, Ciudad Rodrigo guarded the invasion route into Spain. The French had taken the city in the summer of 1810 after a twenty-five-day siege.

In late 1811 a reduction in the numbers of French forces in Spain led Viscount (later the Duke of) Wellington to prepare for attacks on Ciudad Rodrigo and Badajoz. Napoleon began to withdraw troops from the Iberian Peninsula in preparation for the invasion of Russia. In addition, the French removed a significant number of men from the

vicinity of Ciudad Rodrigo and sent them to participate in the attack on Spanish-held Valencia in the east. Wellington hoped to take Ciudad Rodrigo quickly, before the French could reinforce the relatively small garrison that guarded the city.

While the city was well fortified, a major weakness for those defending Ciudad Rodrigo was the presence of two nearby hills, known as the Greater Teson and the Lesser Teson. The location of the two ridges made them perfect for the placement of siege artillery. Indeed, the French had created a breach in the city walls from the hills in 1810. Aware of the strategic importance of the hills, the French had built the Renaud Redoubt to protect the city.

Wellington began his siege on 8 January 1812. British troops launched a surprise attack on the redoubt, capturing it from the French. The next day, they began the construction of siege works. By the thirteenth they had completed the first parallel, or siege trench, and they placed their siege guns there. They also began to build a second parallel on Lesser Teson and ordered an attack on the French outpost at the Convent of Santa Cruz. The French soon launched a counterattack that succeeded in retaking

British infantry storm the fortress at Ciudad Rodrigo during Wellington's campaign in Spain. (Unsigned engraving from *British Battles on Land and Sea* by James Grant. Paris and New York: Cassell, Petter & Galpin, n.d.)

the convent and destroying much of the work on the second parallel. The British responded by taking the Convent of San Francisco. By 18 January, they had erected four batteries and began to use thirty large guns to bombard the city walls. By the next day, the attackers had created two breaches.

The British began their assault on the city on the night of 19 January. The attack started with diversionary maneuvers. These were followed by the main assault on the two breaches. The attack on the main breach met with stiff resistance from French guns and mines. Despite the French resistance, British forces took the breach and entered the town. The attack on the smaller breach was mismanaged and unorganized. However, the attackers at the second breach met with relatively little resistance and also succeeded. The defenders retreated to the town square and surrendered. British troops then looted and pillaged Ciudad Rodrigo until the following day.

The British suffered about 1,100 killed and wounded in the siege and attack on the city. Several high-ranking officers died in the assault. Major General Robert Craufurd, commander of the Light Division, was mortally wounded. So too was Major General Henry MacKinnon, the commander of the main assault, who died in a large mine explosion. The French garrison of 1,900 troops suffered some 600 casualties.

## Civil Code

The Civil Code, first promulgated under Napoleon, was the name for a body of laws covering private relationships. At first it was called the *Code civil des français*, then the *Code Napoléon*, and later the *Code civil*.

The Civil Code was imposed on the areas that Napoleon conquered and governed. It has had a great influence upon the development of the civil law tradition in Europe, Latin America, and elsewhere. Codes, whether civil, crimi-

nal, or some other type, are developed by legal scholars. They are subsequently adopted by legislatures. This was also true of Napoleon's code.

Napoleon's civil code covered private, interpersonal, nonpolitical relations, including areas of contracts, torts, property transactions, family law, inheritance, commerce, corporations, and the procedures in courts that were to be used for trying disputes that arise in civil law cases (civil procedure). There were several factors motivating the development of Napoleon's civil code. The code ultimately reflected these motivations.

A major factor was the demand for reason in organizing life in Enlightenment and French Revolutionary political theory. There was also the confusion of laws existing in the *ancien régime*. The French legal system of the *ancien régime* was hardly worthy of the name. It was a hodgepodge of many kinds of law. In northern France the law was a kind of customary, or common law, tradition. In southern France the old Roman legal tradition was the basic source of law. In addition there were 368 local codes. For practical purposes attorneys could only practice in one locality, because even considerable knowledge of the laws in one locality was useless elsewhere. Furthermore, the Catholic Church exercised enormous power over the laws governing marriage and the family.

Throughout France feudalism had created privileges, monopolies, or other vested interests and had added expenses, fees, or tolls to all manner of commerce or legal business. These vested interests were viewed as unjust and detrimental to the poor and lower middle class. In addition, the aristocracy received preferential treatment under the law, so inequality was a common complaint. Finally, judges were products of the upper classes and were often viewed as biased in their decisions.

The French Revolution sought to sweep away the feudal burden of rights and privileges favoring the aristocracy, the rich, and the powerful. It sought rationality, unity, equality, and justice for all. Napoleon, a product of the Revolution, also shared in this aspiration. However, he had an additional motive. Adopting a single civil code, universal in its claims of social control and its applications to all persons, would strengthen the bonds of nationhood, and it could be easily imposed upon any political unit.

The Revolution had opened the way for a uniform legal system in France. In 1791 the National Assembly had called for a uniform legal system of the laws common to the whole of France. Previous attempts to write a code had been unsuccessful. Napoleon's work of codification of the laws would also solidify the accomplishments of the Revolution.

During the Consulate, Napoleon chose Jean-Jacques Cambacérès, who had worked on earlier attempts at for-

mulating a code, to head the Commission of Legislation of the Council of State, the group made responsible for writing a code. Napoleon also appointed the members of the commission. It included distinguished jurists from all the regions of France. The commission met 102 times to discuss the code. Napoleon presided over fifty-seven of its sessions. He was active in its discussions, most often in support of the rights of women. Whenever the commission failed to make progress, he prodded it to complete its work of producing a finished code.

The commissioners envisaged a uniform set of laws. These were to be the best of the old made into new laws appropriate for a new society founded in a rational vision of the good society as defined by natural law. The code was to possess the virtues of unity, clarity, and simplicity. Most of it extended the aspirations of the Revolution. Equality before the law, freedom of conscience, freedom to work, and a secular state were given legal sanction in the code.

The code was completed by 1801, but it did not go into effect until 21 March 1804. The French legislature rejected part of the code, and under the Tribunate it was rejected as not Revolutionary enough.

Published as the *Code civil des français*, the code was renamed the *Code Napoléon* in 1807. The code consolidated, extended, and modified the changes wrought by the French Revolution. It permanently changed the legal, social, and economic order in France. In areas such as the rights of women, although it gave women more rights than they had had in pre-Revolutionary times, it reduced those rights from those enjoyed by women during the Revolution. In areas such as wills it reversed the Revolutionary ban and allowed for inheritance, but with restrictions.

The Civil Code, as promulgated, was composed of a “Preliminary Title” and three books. The “Preliminary Title” described the promulgation and the application of the code once it took effect.

The books were subdivided into titles covering different topics. Each title was further subdivided into chapters and then into sections. The books each contained laws covering three major topics: persons, property, and actions involving persons and property. The organization of the code into books covering persons, property, and actions followed the organization of Roman law as received through the institutional system devised by the Roman jurist Gaius.

Book I, the law of persons, had eleven titles. Title I of the code covered the topic of the enjoyment and deprivation of civil rights. More specifically, it defined how citizenship was acquired and how it could be lost and recovered, and in the latter case, whether citizenship had been lost by voluntary action or as a consequence of judicial action. Title II covered public acts of interest to the state,

namely, birth, marriage, and death. Official records were to be made of these seminal events in life. Title III covered matters of legal residency (domicile). Title IV covered persons absent for extended lengths of time, especially as absence affected their property. Title V handled marriage, while Title VI covered divorce or legal separation. Titles VII and VIII covered paternity and adoption. Titles IX, X, and XI covered paternal power and guardianships.

Book II had four titles. These described and otherwise defined property. Title I described immovable property while the other titles dealt with usufruct and manorial services.

Book III was the longest part of the code. It covered numerous actions involving persons and property already defined in the previous two books. Its title was “Of the Different Modes of Acquiring Property.” Property was the foremost concern of the 2,228 articles of the code.

Title I of Book III contained four chapters covering the succession of property. The chapters described how the law, in cases where death occurred simultaneously among a group of people, would presume the order of death so that property could be distributed. Title I also excluded from succession those who committed felonious acts such as murder in hopes of inheriting the deceased’s property.

Title II of Book III covered donations of property and wills. Entail was forbidden. This title also forbade professionals such as physicians attending the sick from accepting their property. Nor could ship’s officers inherit from a will made while the deceased sailed with them.

Title III of Book III devoted extensive attention to contracts. The six chapters of Title III on contracts covered the enforceability of contracts in law, the conditions essential to the making of contracts, contractual consent, the capacity of the contracting parties, and the purpose of the contract. Other chapters of the title on contracts covered the obligations created by contracts and the damages due for nonperformance. Other matters covered in the title also treated conditions or factors that could dissolve a contract. Also given extensive treatment was the making of oaths in contracts.

Title IV covered voluntary actions that created a “quasi contract.” These “quasi contracts” included liability for damages caused by one person to another’s property or person.

Title V treated at length the “community” formed by marriage. The code viewed a couple as forming a community by an act of marriage. Thereafter, all their property entered into their common community unless it had been excluded in writing before a notary prior to the marriage. The husband was the legal head of the community. This title put limits on the rights of wives to make contracts without spousal permission.

Title VI decreed the manner for making contracts for sales of real estate or of consumable goods. It specified the obligations of the purchaser and those conditions that would warrant not fulfilling the contract.

Title VII was short and covered barter.

Title VIII covered the renting or hiring of things such as houses or farms. Chapter III of Title VIII extensively covered a variety of labor contracts.

Title IX covered partnerships. It also covered contracts made as part of betting. These were distinguished in different chapters from contracting life annuities.

Titles X–XV covered loans, deposits, securities, and pledging as part of security loans.

Title XVI covered the numerous ways that actions could warrant arrest for financial malfeasance. These included cases of the fraudulent sale of property in which the seller falsely claimed to have title to the property.

Title XVII covered pledging.

Title XVIII dealt with mortgages.

The remaining titles covered suits for “ejectment” (evictions) or other types of suits.

The code mandated that judges were to determine the facts of a case and then to apply the code. Failure to do so was viewed by the code as an act denying justice and warranting prosecution.

The Civil Code was introduced into areas under French control in 1804. These included Belgium, Luxembourg, parts of western Germany, northwestern Italy, Geneva, and Monaco. As Napoleon conquered other territories, the code was introduced there as well. These additional territories included Italy, the Netherlands, the Hanseatic towns, and Switzerland. How lasting an influence the code had in these areas was directly dependant upon how long the code was in effect there.

Other codes besides the Civil Code were also developed during Napoleon’s reign. After the Civil Code was adopted, the next codes to be adopted were the Code of Civil Procedure (1806), the Commercial Code (1807), and the Code of Criminal Procedure (1808). The Penal Code was adopted in 1810. A rural code dealing with agriculture and life in rural areas was formulated but never adopted.

In exile on St. Helena Napoleon said that his fame as a general would fade but that his accomplishments as a law-giver would outlive it. His code has had a global influence, one of the few documents to exercise such influence. In Louisiana and Quebec the Civil Code was adopted in part and is called the Napoleonic Code.

### **Clausewitz, Karl Maria von (1780–1831)**

Regarded as the great military philosopher, not only of this period, but also of history, Karl Maria von Clausewitz was a soldier, a teacher of military theory, and a German patriot who was active in the movement to free Germany from French domination. He enthusiastically supported the military reforms advocated by generals Gerhard von Scharnhorst and August von Gneisenau and fittingly served as a staff officer in Field Marshal Gebhard von Blücher’s army in the Waterloo campaign, seeing out the end of the Napoleonic era first hand.

Clausewitz was born in 1780 in the town of Burg near Magdeburg in Germany into a family of Polish origin, many members of which were priests. Before becoming a low-ranking civil servant, Clausewitz’s father had served as a lieutenant in Frederick the Great’s army. As one of a number of children, Clausewitz lived a modest childhood, for Prussian civil servants did not enjoy the best remuneration. He joined Prince Ferdinand’s Infantry Regiment no. 34 of the Prussian Army as a *Gefreiterkorporal*, as cadets were then designated, in 1792, the year of the start of the French Revolutionary Wars. These events were to have a marked influence throughout Clausewitz’s life. As an ensign, he first saw action the next year in the siege of Mainz, a major fortress on the central Rhine River in Germany. He was promoted to lieutenant in 1795, the year the Prussians opted out of the war with France, and spent 1801–1803 in Berlin, studying at the Military Academy. One of his instructors was Scharn-

horst, who was to become a close friend and mentor in the coming years.

As a young man Clausewitz showed his future potential as a teacher, being appointed personal tutor to Crown Prince August of Prussia on Scharnhorst's recommendation. He was promoted to *Stabskapitain* (junior captain) at the same time. A year later, Clausewitz served as a staff officer at the Battle of Auerstädt and was taken prisoner at the capitulation of the army at Prenzlau under Friedrich Ludwig Fürst zu Hohenlohe-Ingelfingen (Prince Hohenlohe), having fought at the head of his battalion of grenadiers. He spent ten months interned in Nancy in France, accompanying Crown Prince August. The two are known to have discussed military matters, with Clausewitz greatly influencing the prince. The foundation of Clausewitz's later life and achievements had now been laid.

Clausewitz returned to Prussian service in April 1808, going to the royal court then in Königsberg (now Kaliningrad) in East Prussia. Here, with the rank of a full captain, he played an active role in the reform movement led by figures such as Heinrich Freiherr vom und zum Stein, Scharnhorst, Hermann von Boyen, and Karl Wilhelm Georg von Grolman. He held an appointment in the administration of the Prussian War Ministry beginning in 1809, and then was transferred to the General Staff in July 1810, obtaining his majority a month later. Thanks to Scharnhorst's influence, he escaped this tedium the next year, and beginning in October 1810 Clausewitz taught staff duties and the war of outposts at the Military Academy in Berlin. While in Berlin that year, he married Marie von Brühl.

His work was so highly regarded that Scharnhorst recommended him for the post of personal tutor in the science of war to the then-fifteen-year-old Crown Prince August. Clausewitz carried out this appointment from 1810 to 1812. His reputation as a teacher grew, and his teaching plan shows the origins of his later work *Vom Krieg* (On War). During this period in Berlin, Clausewitz took the opportunity of attending Professor Kiesewetter's lectures on philosophy, which taught him dialectical methodology.

When Prussia agreed to an alliance with France early in 1812, Clausewitz was one of a number of officers, including Gneisenau and Boyen, who left the service of Frederick William III in protest. This was one of the most difficult decisions he made in his life, for he had to face the considerable conflict of interests existing between his duties as a Prussian officer and his political sense as a German patriot. Clausewitz felt he had to justify his actions and wrote a memorandum criticizing the effects of the alliance with France and calling for the preparation of a war to overthrow Napoleon. Some were pleased to see this troublemaker go; others saw great wisdom in his words.

Fate now took Clausewitz eastward, to Russia, in whose army he had obtained a commission as lieutenant colonel. His mission was to raise a legion from German prisoners of war from Napoleon's Grande Armée to serve alongside Russian forces in what became known as the Russo-German Legion. This was delayed, and Clausewitz was for a time appointed an aide to General Karl von Pfüel, one of many German officers now advising Tsar Alexander I of Russia. Clausewitz had come across Pfüel, formerly an officer in the service of the German state of Württemberg, when he was on the Prussian General Staff in 1806. Pfüel left the army after a dispute with the tsar, and Clausewitz was then transferred to the headquarters of Count Pahlen, under whose command he fought against Napoleon at the battles of Vitebsk, Smolensk, and Borodino in the fall of 1812. Clausewitz was then appointed chief of staff of the garrison of the Baltic city of Riga, under the command of Graf Essen, but he remained in the headquarters of Peter Graf zu Wittgenstein, which he joined in November 1812.

Once Napoleon's Grande Armée had disintegrated on the retreat from Moscow, the Prussian contingent under General Johann von Yorck, part of the corps under the French marshal Jacques Macdonald, became isolated. Clausewitz was posted to the vanguard of the force pursuing it. The Russians maneuvered between the Prussians and the remainder of Macdonald's men. Clausewitz headed the delegation that negotiated its withdrawal from the war, signing the Convention of Tauroggen on 31 December 1812. This act of rebellion signaled an uprising that spread through northern Germany in the coming months, opening what later became known as the War of Liberation.

The tsar then posted Clausewitz to the Prussian headquarters, where he acted as a liaison officer. His request for an appointment in the Prussian Army was ignored, as Frederick William bore a grudge against those officers who had quit his service in protest in the spring of 1812. Clausewitz remained at Prussian headquarters until after that summer's armistice. The death of Scharnhorst, his friend, mentor, and patron, from of a wound received at the Battle of Lützen in May 1813 greatly affected Clausewitz, who recorded his thoughts in a memorandum published in 1832.

Clausewitz was perturbed by the armistice that commenced on 4 June 1813, after that spring's indecisive campaign. The armies of the two protagonists, Napoleon and a Prusso-Russian force, were exhausted and needed rest, reequipping, and reinforcing. Diplomats vied for an alliance with Austria, whose support would be likely to be decisive in the coming campaign. Clausewitz feared the politicians would come to a compromise, leaving Napoleon able to remain in power.

Clausewitz continued to seek an appointment in the Prussian military, hoping to be posted to the staff of the Army of Silesia, commanded by the old warhorse Blücher with Clausewitz's old friend Gneisenau as chief of staff. However, Clausewitz was not considered the right man for the task in hand. Instead, General Philipp Friedrich von Müffling received the appointment, since, with his caution and reserve, he was seen as a good counterweight to the impulsive Blücher and the ambitious Gneisenau.

During the fall campaign of 1813 and that in France in 1814, Clausewitz continued to serve in the Russo-German Legion, now in British pay. In 1813 the legion was attached to Lieutenant General Graf Wallmoden-Gimborn's corps in the Army of the North under the command of the Crown Prince of Sweden, who had previously served Napoleon as Marshal Bernadotte. Wallmoden's corps consisted of a mixture of local levies, legions, and free corps, with just a smattering of regular troops. It fought in northern Germany, mainly along the upper reaches of the river Elbe, around Hamburg, which was a sideshow to the war going on in and around Saxony. It was under Clausewitz's direction that a French force under General Marc-Nicolas-Louis Pécheux was driven back to Hamburg in an action on the Göhrde on 16 September 1813. After the Battle of Leipzig (16–19 October), the Army of the North moved into the Netherlands, where it saw action. Clausewitz was then transferred to Blücher's headquarters, but he remained in Russian service until after the first Treaty of Paris, concluded at the end of the campaign of 1814.

Clausewitz was eventually again appointed to a post in the Prussian Army, but it took Napoleon's escape from exile on Elba on 1 March 1815 for this to happen. At the end of that month Clausewitz returned to the service of his king as a full colonel on the General Staff. A few weeks later he became chief of staff of III Army Corps under Johann Freiherr von Thielmann. This corps formed part of Blücher's Army of the Lower Rhine and was deployed in the Netherlands. During the Waterloo campaign, Clausewitz fought at the battles of Ligny (16 June) and Wavre (18–19 June). At Wavre, his corps held up the wing of Napoleon's army under Marshal Emmanuel, marquis de Grouchy, preventing it from intervening at Waterloo.

When Thielmann was placed in command of the Military District of the Lower Rhine, a province that had been awarded to Prussia at the Congress of Vienna, Clausewitz continued to serve him as chief of staff. Based in the fortress-city of Coblenz (Koblenz) on the Rhine, Clausewitz held this position from fall 1815 to spring 1818.

In May 1818 Clausewitz was transferred to Berlin, where he held the post of head of administration of the War Academy, which gave him little satisfaction, as the task was too mundane for a man of his intellect. In September

of that year he was promoted to major general. He held his appointment in Berlin until August 1830. Clausewitz then returned to a more active post with the army, becoming inspector of the 2nd Artillery District in Breslau, Silesia. He owed this appointment to the intervention of Prince August, who was now in command of the Prussian artillery. Clausewitz left his incomplete manuscripts in Berlin. They remained there, sealed, until his death.

In March 1831 Clausewitz was appointed chief of staff of an army of observation mobilized along the border with Poland. He had the opportunity of serving under his old friend Gneisenau, who commanded this force, with its headquarters in Posen. Fortunately, hostilities did not break out, so Clausewitz spent his time on administrative matters. He also followed the war between the Russian governors of Poland and the local insurgents, calculating their movements, anticipating their future direction, and speculating on possible clashes. He reported the events to Gneisenau on a daily basis, and the two men continually had detailed discussions on the situation. Although he was one of the greatest military geniuses of history, this was the closest Clausewitz was ever to come to commanding an army in the field. History was not to associate his name with a great battle.

A cholera epidemic broke out in the fall of 1831, and Gneisenau succumbed to it on 23 August. At the end of the insurrection in Poland, this army was disbanded. Deeply shaken by his personal loss, Clausewitz returned to Breslau early in November 1831, where he too caught cholera and died on the sixteenth of that month. An era of Prussian history passed with him. First Scharnhorst, then Gneisenau, and finally Clausewitz passed away, and with them the collective brain that powered the military reform movement. Clausewitz left no children, other than perhaps his manuscripts, and it would be some years before they came to see the light of day.

## Coa, Action at the

See Craufurd, Robert; Ney, Michel

## Cobbett, William (1763–1835)

A journalist in Britain and the United States, William Cobbett was, according to Karl Marx, “the greatest pamphleteer England has ever possessed” (*New York Daily Tribune*, 17 February 1853). Born in 1763 in Surrey, England, Cobbett did not receive much formal education. At age twenty-one he joined the army, but his career in the military came to an abrupt end in 1791 when he fled to France to escape court-martial charges brought against him by a group of corrupt officers. Having read Thomas Paine’s *Rights of Man*, Cobbett was briefly a supporter of republicanism and democracy, but the news that the Tuileries had been attacked and the king deposed made him an opponent of the Revolution. He left for the United States, where he wrote anti-Jacobin tracts. In these pamphlets he referred to an “accursed revolution” where atrocities were performed in the name of liberty. His experience in the United States did not make him any more sympathetic to republicanism,

and in response he set himself up as a pro-British publisher and used his daily paper, *Porcupine’s Gazette* (1797–1799), to attack those who supported warmer relations with the French Revolutionary government. Cobbett risked seeing his business destroyed by a street mob for his support of Jay’s Treaty and his trenchant attacks on individuals such as Thomas Jefferson, who he believed was desirous of pushing the United States in a more radically democratic direction. Writing under the pseudonym Peter Porcupine (Paine thought “Peter Skunk” more appropriate), Cobbett became the most widely read pamphleteer in the United States.

Cobbett returned to Britain in 1800, and over the next several years he underwent a political transformation and abandoned high Tory politics, a change possibly due to his having gained a firsthand knowledge of rural poverty. Although Cobbett is often referred to after this transformation as a radical writer, it is difficult to characterize him as such, since what he wished to see was a Britain returned to an idealized pastoral past. In his *History of the Protestant Reformation* (1823), he traced the problems of his age back to the time of the Tudors, when there was a decline in the traditional paternalistic relationship between farmers and their laborers. In *Rural Rides* (1830), his most famous book, he wrote about his travels throughout southern England and about the passing of small farms, a depopulated countryside, and laborers forced to go to work in impersonal factories.

In 1802 Cobbett unleashed his venomous pen in the pages of his weekly newspaper, the *Political Register*, which he continued to publish for the remainder of his life. He railed against what he called “The Thing,” for Cobbett the corrupt political and economic underpinnings at the heart of British society. Among his targets were high taxation, the national debt, paper money, placemen (political appointees), brokers, officials of the East India Company, and the rural Anglican clergy. A man of many prejudices, Cobbett hated Jews, blacks, and religious nonbelievers. He paid a high price for his journalism. In 1810, after attacking the practice of flogging in the army, he was imprisoned for two years for sedition, and in 1817 he fled to the United States for two years in order to avoid another arrest. He went bankrupt in 1819 after the government passed a series of laws designed to cripple the radical press.

Cobbett never provided a systematic answer for what he perceived to be the problems of the age, but he did become a champion for the reform of Parliament and wrote with contempt about Old Sarum, the worst of the rotten boroughs, since it sent two members to the House of Commons but was completely uninhabited. In his later years he became an advocate for universal male suffrage and was disappointed with the small expansion in the electorate

provided by the Great Reform Bill of 1832. That same year he entered the reformed House of Commons, but he found the life of a legislator less than appealing. An early riser throughout his life, the evening parliamentary sessions were physically taxing, and the strain hastened his death from influenza in 1835.

### Cobenzl, Johann Ludwig Graf (1753–1809)

Austrian politician and foreign minister who facilitated the Austrian alliances with Russia in 1798 and 1804. From a noble family of diplomats, Johann Ludwig Graf Cobenzl spent much of his career in Russia before signing the treaties that concluded the Wars of the First and Second Coalitions. Appointed to the Staats- und Konferenzministerium in 1801, he directed foreign affairs under the supervision of the senior adviser to Emperor Francis II (Holy Roman Emperor, later Francis I of Austria from 1806), Franz Graf von Colloredo, until the end of the War of the Third Coalition in 1805.

Following his father into state service, Cobenzl worked in Galicia for two years before the sponsorship of Fürst (Prince) Kaunitz, the *Kanzler* (foreign minister), brought his brief appointment as ambassador to Denmark in 1774. Transferred to Berlin as ambassador in 1775, he stayed until the outbreak of the War of the Bavarian Succession in 1778. Distrustful of Prussia, he was keen to improve relations with Russia and was appointed ambassador at the Court of St. Petersburg in 1779. His lively spirit and conversation met with Tsarina Catherine II's approval, and he was soon part of her inner circle, where he was able to foil Prussian efforts to break the close relationship between Austria and Russia. He even wrote short pieces for the imperial theater in his free time. But the Second Partition of Poland in 1792 strained Austro-Russian tensions, and he was even accused of pro-French sympathies. Recalled when Catherine died in 1797, he negotiated and signed the Treaty of Campo Formio with Napoleon. After briefly working in the Foreign Ministry in Vienna, Cobenzl returned to St. Petersburg to use established influence to ensure that the Russians joined the al-

liance in the War of the Second Coalition (1799–1802). After the defeat at Hohenlinden (3 December 1800), he signed the Treaty of Lunéville.

Like many senior advisers to the emperor, Cobenzl was in favor of a thorough overhaul of the government to centralize power, and on his appointment to the new council as a *Staats- und Konferenzminister*, he was made *Hof- und Staatskanzler* (foreign minister) in 1801, directing foreign affairs with Colloredo. He was a plump man of medium height with graying red hair and a pale complexion, married to a rich heiress from Moravia. His contemporaries, including Friedrich von Gentz and Archduke Charles, viewed Cobenzl as a skilled courtier but a man who could only work from day to day and who lacked the vision of an able diplomat.

As the foreign minister's policies diverged from those of the military, Cobenzl conspired with Colloredo to subvert Charles's civilian adviser, Matthias Fassbender, and again pressed for an alliance with Russia in 1804 to defeat Napoleonic France. A trusted imperial adviser, Cobenzl gained further control of military policy by ensuring Karl Mack Freiherr von Leiberich's appointment to influential military posts. After the Battle of Austerlitz, Charles successfully demanded that Cobenzl be sacked.

### Coleridge, Samuel Taylor (1772–1834)

An English poet and critic, Samuel Taylor Coleridge took an approach to Romantic poetry that was revolutionary in the sense that it was revelatory. His artistic and philosophical pursuits strove to capture the essence of the Romantic spirit—an intertwining of the intellect and the

emotions leading to heightened awareness of man and nature. The result of mingling thoughts with feelings often plunged Coleridge and other poets of this period into odd patterns of behavior, ranging from artistic enterprise to political activity, which is best understood in the context of the French Revolutionary and Napoleonic Wars. At these times of war, a poet like Coleridge, an individual of intense intellect and emotion, was drawn in two psychological directions. On the one hand, his natural talents and temperament made him loyal to poetry, the analysis of the human imagination, religious speculation, metaphysics, the exploration of esoteric knowledge, and an overall Rousseauian philosophy, grounded in nature, in which life would be led in remote, rural simplicity. On the other hand, Coleridge sought to influence and participate in politics through both literary and physical avenues.

The feeling, or poetical, side of Coleridge appears dominant and was more successful than his efforts in journalism, politics, and military service. In his most notable poems, Coleridge is outstanding for his rapturous imagery, whose elements strike at the very heart of the senses of sight and sound in particular. “Christabel” and *The Rime of the Ancient Mariner* are renowned for their hauntingly dreamlike visionary effects, while “Kubla Kahn,” “Frost at Midnight,” and “The Aeolian Harp” are praised for their elegant displays of the musical and mysterious attributes of the natural world. Many Coleridgean poems demonstrate both the natural and supernatural qualities of the forces within nature as well as descriptions of light and flight. This is to say that the Coleridgean poem often attempts to induce enlightenment through shimmering visions and to free the mind through images of birds.

On enlightenment, Coleridge’s endeavors to awaken the imagination and arouse consciousness extended beyond poetry into verse. In addition to delivering lectures on a variety of topics, he launched a journal, the *Watchman*, as well as a newspaper, the *Friend*. These publications show Coleridge’s adherence to the Christian religion and the British nationalistic stance at a time of rising atheism during the French Revolution and increasing fears of Jacobinism continuing into the Napoleonic Wars. In 1793 he volunteered for the British army as a private in the 15th Light Dragoons despite not being competent on a horse, but a discharge was later negotiated on his behalf. Coleridge was in an unhappy marriage and suffered both emotionally, from melancholy over his love life, and physically, from health problems frequently associated with his opium addiction. These burdens did not, however, prevent him from seeking the Romantic in all. Poetry and literature are not the sole haunts of Romanticism; war and politics are equally in possession of Romantic, hence heroic, ideals and imagery. Napoleon succeeded in what

Coleridge desired to become heroically, a political influence in society. Coleridge succeeded admirably in becoming a hero to poetry.

### Colli, Michael Freiherr von (1738–1808)

In Austrian service for most of his life, in 1796 *Feldmarschalleutnant* Michael Freiherr von Colli-Marchini was the commander in chief of the Sardinian (Piedmontese) army fighting Bonaparte’s Armée d’Italie.

Colli was born in 1738 in Vigevano (Lombardy). His father, Giuseppe Antonio, a state functionary, had been made baron by the Austrian emperor. At eighteen years of age, Colli entered the Infantry Regiment Pallavicini (IR 15). He took part in several battles during the Seven Years’ War (1756–1763) and was wounded at Torgau. Ensign on the general staff at the Battle of Prague in 1757, by the end of the war he had been raised to the rank of captain. Transferred to Infantry Regiment Baden (IR 23) in 1764, four years later Colli became lieutenant colonel in Infantry Regiment Caprara (IR 48) and commanded a battalion in the War of the Bavarian Succession (1778–1779).

Promotion to colonel came in 1779, together with an assignment to the garrison of Milan. In 1787 he distinguished himself under *Feldzeugmeister* Ernst Gideon Freiherr von Loudon in the war against the Turks (1787–1791). The story goes that during the siege of Belgrade, on being informed of a forthcoming inspection by the commander in chief, Colli cunningly mingled with the rank and file in arduous trench work, thus gaining Loudon’s praise. By the end of the year, he was *Generalmajor* in the Imperial Army. After 1792 Colli was on loan to the Sardinian army with the rank of *Feldmarschalleutnant* by an agreement between the emperor and the king of Savoy. A year later Colli brilliantly opposed the French invasion of Nice. In 1795 he unwillingly acted under *Feldzeugmeister* De Vins, the Austrian commander in chief, leading his Sardinian troops in a counteroffensive along the Ligurian shore and through the Maritime Alps.

He commanded the right wing at the unfortunate Battle of Loano on 23 November.

At the beginning of Bonaparte's first Italian campaign in April 1796, the Austrian army under *Feldzeugmeister* Johann Freiherr von Beaulieu was in the mountains behind Savona to watch the road to Acqui, Alessandria, and Milan. Colli had his Sardinian army concentrated farther west around Ceva to block the mountain exits to the Piedmont plain and the road to Turin. The left hook of the French offensive forced him to withdraw from this position. Despite his success against General Jean Sérurier at San Michele on 19 April, two days later Colli was defeated at Mondovi. After the armistice of Cherasco, he rejoined the Austrian army, distinguishing himself in the defense of the line of the Mincio River in summer 1796. Appointed commander in chief of Pope Pius VI's army in late January 1797, he was apparently still in Rome when the main body of his army was crushed by Bonaparte and General Claude Victor at the small action at Faenza on 4 February.

Formally retired from Austrian active service after Campo Formio, in 1798 Colli entered the Neapolitan army staff under Karl Mack Freiherr von Leiberich. After the fall of Naples to the French and the rise of the Parthenopean Republic in January 1799, he moved to Florence. Appointed Austrian ambassador to the court of the Bourbon king of Etruria (Tuscany) in 1803, Colli died in Florence on 22 December 1808.

### Collingwood, Cuthbert, Viscount (1750–1810)

A noted British admiral, Cuthbert Collingwood was born on 23 September 1750 at Newcastle-upon-Tyne to an old Northumberland family in reduced financial circumstances and went to sea as a volunteer at age eleven aboard the frigate *Shannon*, commanded by his uncle. He remained with this ship for the next eleven years and then served on several other ships, most often on home station. In 1774 Collingwood sailed to North America in the *Preston* (4th rate) and fought ashore with a detachment of seaman in the Battle of Bunker Hill in June 1775. For his conduct in the battle, Collingwood was advanced to lieutenant. Ap-

pointed to the sloop *Hornet*, he sailed in her to the West Indies, where he was promoted to commander in June 1779 and to post captain in March 1780. In August 1781 he was in command of the *Pelican* (6th rate) when she was wrecked in a hurricane. He then returned to Britain, where he was appointed to the *Sampson* (64 guns), then to the frigate *Mediator* in the West Indies. It was at this time that he became close friends with Captain Horatio Nelson. Collingwood's ship was paid off in 1786, and Collingwood spent the next three years in Northumberland with his family. He returned to sea during 1790–1791, after which his ship was again paid off.

On the outbreak of war with France in 1793, Collingwood took command of the *Prince* (90) and then *Barfleur* (98). In the latter vessel he participated in the Battle of the Glorious First of June in 1794. He was then transferred first to the *Hector* (74) and then to the *Excellent* (74) in the Mediterranean. During the remainder of 1795 and all of 1796 the *Excellent* was off Corsica, also keeping a watch on Toulon, but it was withdrawn when the French took Italy.

In the *Excellent* Collingwood played a distinguished role in the Battle of St. Vincent (14 February 1797), where his ship took two Spanish ships of the line and helped Nelson's ship, the *Captain* (74), when she was under heavy Spanish fire. Awarded the gold medal for this action, Collingwood refused to accept it until he was granted one for his conduct in the Battle of the Glorious First of June, for which he believed he had been slighted. Several months later, he received both medals.

Collingwood continued in the *Excellent* off Cádiz for the next two years. On his return to Britain early in 1799, his ship was paid off. Collingwood then received promotion to rear admiral and a command in the Channel Fleet in the *Triumph* (74). He remained in the Channel Fleet participating in the blockade of Brest, with one interlude in the Mediterranean, until the Peace of Amiens in 1802.

In 1803, after less than a year at home, Collingwood returned to the Channel Fleet. Promoted to vice admiral in April 1804, he commanded a squadron detached to reinforce Nelson in July 1805. The two squadrons met off Cádiz, where Collingwood commanded the lee line and acted as Nelson's second in command at the Battle of Trafalgar, fought on 21 October. With Nelson's death, he assumed command of the Mediterranean Fleet. Collingwood had his greatest success under Nelson; his actions afterward were less successful. He failed to order the fleet to anchor after the battle, and as a result most of the French and Spanish prizes were lost in the great gale that struck in the days that followed the action. Nonetheless, Collingwood was raised to the peerage for his role in the battle, as Baron Collingwood of Caldburne and Hethpoole.

Collingwood continued in the Mediterranean command, maintaining his ships primarily off Cádiz until 1807, when he proceeded to Sicily. A French fleet sailed from Toulon to reinforce Corfu in 1808, but through missed signals and his own failure to sense the need for prompt action, Collingwood failed to intercept it. In 1809 Collingwood was off Toulon, and that October his ships intercepted a French convoy sailing to Barcelona and drove several of the escorting warships ashore.

The burden of administrative tasks adversely affected Collingwood's health, and in March 1810 doctors pronounced him medically unfit. He sailed for Britain in the *Ville de Paris* (110) but died en route on 7 March. His body was subsequently buried at St. Paul's Cathedral.

## Colloredo, Franz Graf von (1731–1807)

Tutor and later chief adviser to the Holy Roman Emperor, Francis II (later Emperor Francis I of Austria from 1806) for thirty-three years, Franz Graf von Colloredo influenced the emperor with his conservative, anti-intellectual philosophy. A reactionary and the most powerful imperial adviser, he directed foreign affairs with Johann Graf Cobenzl from 1801 until the end of the War of the Third Coalition in 1805.

From one of the richest noble families in Bohemia, Colloredo had been trained for the diplomatic service from a young age, and after being appointed a *Reichshofrat* (imperial adviser) by Francis, he came to general attention when he was in the fortunate position of being the emissary carrying news of several major events to foreign courts. Appointed ambassador to Spain in 1767, he served in Madrid until 1770, when he was made *ajo* (governor and chief tutor) to the children of Archduke Leopold, ruler of Tuscany (Holy Roman Emperor, 1790–1792). His strict approach was based on education in the classics and in the

necessary noble skills. Although widely viewed as being slow-witted (Friedrich von Gentz referred to him in a letter of 1802 as a byword for imbecility), he was a cultured man, noted for supporting art and scientific investigation. When Leopold's eldest son, Francis (Holy Roman Emperor [1792–1806] and then Emperor of Austria [1806–1835]), moved to Vienna in 1784, Colloredo accompanied him and continued as his chief instructor, probably overworking him and instilling his own ponderous and conservative approach. He steered Francis toward his own opposition to intellectual and political liberalism.

After acquiring large estates in Bohemia by marriage to Countess Mansfeld in 1771 (and becoming Colloredo-Mansfeld), he inherited the extensive family possessions and princely title from his father in 1788. When Francis became Holy Roman Emperor in 1792, he made Colloredo his chief adviser in all matters, an arrangement formalized by his appointment as head of the *Kabinet* (personal secretariat) with ministerial status and membership in the Staatsrat (Privy Council), through which Colloredo could also influence military affairs. Colloredo's real power lay in his control of access to the emperor for all except the imperial Habsburg family, which prompted his nickname of "Franz der erster" (Francis the First), and, together with *Hofrat* (imperial adviser) Johann Freiherr von Schloissnigg, he dominated the Staatsrat until 1801. In 1793 it was on Colloredo's advice that Johann Freiherr von Thugut was selected as deputy foreign minister, and the two maintained a close working relationship until 1801.

Appointed to the Staats- und Konferenzministerium, which replaced the Staatsrat in 1801, he supervised Cobenzl in the conduct of foreign affairs, as both pursued policies at odds with those of the war minister, Archduke Charles. They worked to remove *Feldmarschalleutnant* Peter Duka Freiherr von Kadar (the army chief of staff) and Matthias Fassbender (Charles's senior civilian adviser) from their positions, and then Colloredo used his influence to ensure the appointment of Karl Mack Freiherr von Leiberich to key military positions. An advocate of renewed war with France, the early setbacks of the campaign of 1805 brought his dismissal in a curt letter from the emperor on 28 November of that year.

### Combermere, Stapleton Cotton, Viscount (1773–1865)

Sir Stapleton Cotton, Viscount Combermere was a successful British cavalry commander during the Revolutionary period, distinguishing himself in Flanders. He commanded a brigade of cavalry in Spain in 1808 and fought at Fuentes de Oñoro. He was in command of the Marquis of (later the Duke of) Wellington's cavalry for most of 1812 and played an important role in the Battle of Salamanca.

Cotton was born in 1773 and after a military education was commissioned into the Royal Welch Fusiliers in 1790. However, he quickly transferred to the 6th Dragoons and served in Flanders from 1793 to 1794. The following year he was made lieutenant colonel of the 25th Light Dragoons and served in the expedition to the Cape Colony in southern Africa. He was present at the storming of Seringapatam in India, and it was here that he met Arthur Wellesley, the future Duke of Wellington. By 1805 he had been promoted to the rank of major general, and in 1808 he commanded a brigade of cavalry during the Corunna campaign under Sir John Moore. He was present at Talavera and commanded one of the three brigades of cavalry. In 1811 Cotton fought at Fuentes de Oñoro and led his cavalry in a series of attacks to allow the Light Division to conduct a fighting withdrawal. He was then obliged to return home to receive the family title as Viscount Combermere on the death of his elder brother. However, he quickly returned to the Peninsula and covered the retreat of Wellington's forces to the Lines of Torres Vedras.

By 1812 the size of Wellington's cavalry arm had grown, and he was able to deploy them more aggressively. In April Combermere defeated Marshal Soult's cavalry rear guard in a sharp action at Villagarcia. Combermere responded to the initial repulse of one of his brigades by launching a well-executed flank attack, which resulted in the enemy's being pursued for a number of miles. Prior to the Battle of Salamanca, Combermere had command of the rear guard of the army and was able to stall Marshal Marmont in his attempt to deceive Wellington with a sudden change in the direction of his march. At Salamanca Combermere deployed his cavalry effectively and witnessed with Wellington the successful charge of the heavy cavalry. Just after the battle Combermere was wounded by a Portuguese sentry and was forced to return home. He missed the Battle of Vitoria but returned to command to fight in the battles of the Pyrenees and Orthez, and he took part in the invasion of France.

In 1814 he became a peer and was rewarded with a large sum of money by a grateful nation. Despite his success and reputation he was not given a command during the Waterloo campaign, even though Wellington hoped

that he would be. However, he did join the army in Paris after the defeat of Napoleon and took command of the cavalry in the army of occupation. After the Napoleonic Wars Combermere was commander in chief first in Ireland and then in India, and he was made a field marshal in 1855.

### Concordat (16 July 1801)

An agreement between Bonaparte and Pope Pius VII that restored the status of the Roman Catholic Church following the French Revolution. The Concordat was concluded on 16 July 1801, when Bonaparte was First Consul of the French Republic, reestablishing the Catholic Church in France and generating religious peace within the country. Pre-Revolutionary France had had 136 sees, but a number of prelates had died or had fled as émigrés, and Bonaparte desired to redraw ecclesiastical boundaries and appoint his own churchmen. In addition, he wished to restore the Catholic Church to its former prominence—which had been threatened by Revolutionary liberalism and new irreligious sects—thus binding Catholics to his rule.

In 1799 Pope Pius VI had died at Valence, a victim of French Revolutionary captivity. Bonaparte needed an accord and had advanced his ideas to reorganize and support the Catholic Church in France after the Battle of Marengo. In the glow of victory as he traveled through Vercelli, he met with Cardinal Charles de Martiniana on 25 June 1800 and expressed his support for Catholicism. Bonaparte conveyed his plan to reduce the number of French dioceses, induce émigré clergymen to resign their positions so that he could appoint others in their place, and proclaim the pope's spiritual jurisdiction once again in France. The agreement would make Bonaparte supreme in France politically, gain support from Catholics, and win the pope's approval for his leadership, at a time when the pope tended to favor the claims of the Bourbon king Louis XVIII.

Bonaparte wrote the final proposal for the agreement himself and dispatched it to Rome through the courier Palmoni. François Cacault was sent as a minister plenipoten-

tiary from France to the pope in April 1801 to secure the pope's reply. Cacault's secretary, Jean Alexis Artaud de Montor, persuaded Cardinal Ercole Consalvi, secretary of state to Pius VII, to come to Paris to meet Bonaparte directly. An agreement was reached after lengthy negotiations on 16 July, and on 11 August it was approved by the pope following consultation with his cardinals. The Concordat was formally circulated to the French churches and celebrated in Nôtre Dame in Paris on Easter Sunday, 18 April 1802.

Through this accord the French government recognized Roman Catholicism as being the religion of the great majority of the French citizens, and Bonaparte himself professed this faith. The pope granted to Bonaparte police powers to safeguard public worship. Under the Concordat's provisions, the French Catholic archbishops and bishops were to be appointed by the state headed by Bonaparte, so he could select loyal followers. Churchmen were to be confirmed in their ecclesiastical duties by the pope. Priests were ordained within the local sees by bishops after approval by the state. Bonaparte was permitted to reduce the number of sees to sixty. Church property confiscated during the French Revolution would not be restored, but Bonaparte's government offered adequate *sustentationem*, or maintenance, to the clergy. Bonaparte recognized the independence of the Papal States on the Italian peninsula, and the pope acknowledged the legitimacy of Bonaparte's government. Thus, through this agreement Bonaparte was able to placate French Catholics and bind them to his government while at the same time gaining the pope's support for his rule. The Concordat continued in force until its abrogation in 1905.

### Confederation of the Rhine (1806–1813)

The Confederation of the Rhine (Rheinbund) was a conglomeration of German states organized by Napoleon, who hoped that Germany would develop into a unified

state with a central government and administration modeling the political institutions of France. The opportunity for such a grandiose plan emerged after the decisive defeat of Austria during the War of the Third Coalition in 1805, when Napoleon sought to dismantle the thousand-year-old Holy Roman Empire and replace it with a new German political entity that could serve as a buffer against Prussia and Austria, a market for French goods, and a source of military manpower for the Napoleonic empire.

The origins of the Confederation of the Rhine may be traced to the gradual French encroachment into Germany that began with the campaigns conducted by the Revolutionary armies on the Rhine in the 1790s. By 1795 France had full control of the west bank of the Rhine and later compensated various princes for their lost territory according to the decisions reached in the Imperial Recess of 1802–1803. When the Peace of Amiens failed and war on the Continent resumed in May 1803, the French renewed their territorial designs in the region by invading and rapidly occupying the British patrimony of Hanover in north Germany. As war loomed between France and Austria, Napoleon sought allies from among the larger German states, some of which had territory to gain and greater autonomy to acquire by siding against the Habsburgs. Bavaria was the first to throw in its lot with France, signing a treaty of alliance on 23 September 1805, followed by Baden and Württemberg on 1 and 8 October, respectively. In the aftermath of the Battle of Austerlitz (2 December), the Imperial Reichstag was abolished (20 January 1806), enabling Napoleon to create the first of a new set of minor German states to be ruled by members of his family. On 15 March he established the Grand Duchy of Berg, placing his brother-in-law, Marshal Murat, at its head.

The Confederation of the Rhine came into formal being on 17 July 1806 according to the Treaty of Paris, with Karl Theodor von Dalberg as Prince-Primate (*Fürstenprimas*) and with Napoleon maintaining supervisory control in his capacity of “protector” (*Protector*). The original sixteen south- and west-German states of the Confederation consisted of Bavaria, Württemberg, Hesse-Darmstadt, Baden, Berg, and eleven other smaller states, all of which, according to the Rheinbund's constitution, formally withdrew from the Holy Roman Empire, which drew its last breath on 6 August when Francis II foreswore the Habsburgs' ancient imperial dignity and proclaimed himself Francis I, Emperor of Austria in its place. As an inducement to membership in the new Confederation—which, however, was effectively coerced—Napoleon offered an extension of territory and elevation in rank. Thus, he raised the electors of Bavaria (Maximilian Joseph) and of the Grand Duchy of Württemberg (Frederick II) to the status of kings on 1 January 1806, made the electors of Baden (Charles

Frederick and Hesse-Darmstadt) grand dukes on 13 August, and offered similar titles to other minor potentates. The Grand Duchy of Würzburg joined on 23 September.

If Austria's dominance in Germany had all but vanished as a result of Austerlitz, the same may be said to have applied to Prussia after its twin defeats at Jena and Auerstädt on 14 October 1806. Hohenzollern influence, even in north Germany, had never existed on a par with Habsburg influence in south Germany; now the utter defeat of Prussian forces in the autumn of 1806 extinguished its pretensions to occupy Hanover or exercise any vestige of leadership over its other, lesser German neighbors. Napoleon did not wait long before capitalizing on his recent military triumphs: On 11 December, by the Treaty of Posen between France and the Electorate of Saxony (Prussia's erstwhile ally), the latter was converted into a kingdom—enlarged with territory taken from Prussia—with Frederick Augustus III assuming the throne as King Frederick Augustus I. Four days later five small duchies joined the Rheinbund, including Saxe-Weimar, Saxe-Gotha, and Saxe-Coburg. On 11 April 1807 another twelve minor states followed, including Anhalt-Dessau and Waldeck.

The second of the two historic treaties concluded at Tilsit (the first between France and Russia on 7 July; the second between France and Prussia on 9 July), forced Frederick William III of Prussia to recognize the sovereignty of the Confederation, which with Saxony now represented a third major German political entity, deliberately intended to exclude Austria and Prussia. Tilsit paved the way for further admissions to the Rheinbund: The new Kingdom of Westphalia, with Jérôme Bonaparte on the throne, was created in December 1807 out of Prussian lands and territory seized from its former allies, Hesse-Cassel, Brunswick, southern Hanover, and other minor states, while Mecklenburg and several other petty principalities also joined as a result of Tilsit. In 1808, after the admission of Mecklenburg-Strelitz, Mecklenburg-Schwerin, and the Duchy of Oldenburg, the Confederation reached its greatest territorial extent, totaling thirty-nine states.

However high-minded Napoleon may have been with respect to the political future of the Rheinbund, in reality it never properly developed the way the Emperor had envisioned. The diet was convoked in 1806 but never assembled, and the Rheinbund became little more than a set of French satellite states serving as a recruiting ground for soldiers, largely owing to the determination of each ruler—whether king, prince, or duke—to preserve his respective independence. Indeed, so long as each state furnished the contingents required by the various treaties concluded between member states and France, Napoleon was largely content not to interfere in the internal affairs of the Confederation. On the other hand, when he did decree the ces-

sation of all commerce with Britain as part of his Continental System, Napoleon met opposition from German merchants and encountered widespread public discontent. Indeed, trade with the enemy via North Sea German ports became so widespread that on 13 December 1810 France annexed the entire area along the German North Sea coast, including the Duchy of Arenberg, the Principedom of Salm-Kryburg, and the Duchy of Oldenburg. Napoleon's voracious appetite for troops—initially fixed at 63,000—also caused resentment, though not on any serious scale until the Russian campaign. The ever-increasing demands on the Rheinbund to furnish contingents for the imperial French armies resulted in thousands of men serving in Spain between 1808 and 1813, in the campaign against Austria in 1809, in Russia in 1812 (in which perhaps a third—200,000 men—of the Grande Armée consisted of Rheinbund troops), and finally in the campaign in Germany in 1813.

Many Confederation states adopted the Civil Code and other Napoleonic reforms, Hesse-Darmstadt and Anhalt being particularly enthusiastic in this regard. On 15 November 1807 a constitution on the Napoleonic model was promulgated for the nascent Kingdom of Westphalia, abolishing serfdom and establishing equality before the law, equal principles of taxation, and religious freedom. A similar legal framework was introduced in Bavaria on 1 May 1808. Serfdom effectively ended in Bavaria from September of that year, and in the Grand Duchy of Berg, in December. Yet, on the whole, the political and social institutions of the various states did not model themselves on their French counterparts, and thus no uniformity existed within the various German states that would have facilitated their eventual absorption into the French Empire as Napoleon had had in mind. The Napoleonic Code was not widely embraced, and moreover no attempt was made to impose it. What influence the French did exercise in fact proved largely counterproductive, for it fueled a slowly emerging German nationalism that—manifesting itself in a particularly virulent fashion in Prussia—would find expression in 1813 as open opposition to Napoleonic rule.

Following Napoleon's disastrous campaign in Russia, Bavaria was the first of the Confederation states to join the anti-French coalition. By the Treaty of Ried, concluded on 8 October 1813, Bavaria joined the Sixth Coalition, and within a week, at the decisive Battle of Leipzig, the Saxon and Württemberg troops defected to the Allies. The French were swept from Germany, Saxony was occupied and administered first by the Prussians and then by the Russians, and the Confederation was formally dissolved on 4 November. On the fifteenth at Frankfurt, Austria, Prussia, and Russia established a common policy toward the former members of the Confederation, which guaranteed their sovereignty pending the decision of a future postwar con-

ference. This did not apply to states newly created by Napoleon that had not changed sides; as such, on 21 November 1813 Brunswick, Hesse-Cassel, and Hanover were restored as independent states out of the former Kingdom of Westphalia. In 1815 the Congress of Vienna confirmed the survival of many former members of the Rheinbund, albeit in many cases with altered frontiers (particularly Saxony, which was forced to cede a large amount of territory to Prussia), and placed them together in a loose association of states known as the German Confederation.

By establishing the Confederation of the Rhine, Napoleon had unwittingly placed Germany on the road to eventual unification in 1871, for by the end of its existence the Rheinbund consisted of a mere thirty-nine states, in sharp contrast to the approximately 300 duchies, ecclesiastical cities, electorates, principalities, and duchies that had existed less than a decade before. In this respect alone the brief lifespan of the Confederation of the Rhine may be seen as an important period in the development of modern Germany.

## Congreve Rockets

The history of the military rocket may have begun in India, but Sir William Congreve was the inventor and designer of

the first practical British military rocket. His original 1805 design was intended for naval use, and at Boulogne, in October 1806, 200 rockets were fired, setting fire to the town. Again at Copenhagen in 1807 and at Walcheren in 1809 rockets had the same effect. Congreve also designed a rocket for land use and included a shrapnel rocket that was intended to be fired at concentrated troops, especially cavalry, and at trenches. Congreve's rocket differed from the normal "firework" by having the stabilizing stick fitted in the center of the rocket rather than on the side. Vents allowed the propellant gases to exit all round the base of the weapon, which, together with the stick, helped to keep the rocket on line to an extent.

Unfortunately the rockets were still not very accurate, but it is certain that their effect on morale was considerable. The rockets were initially made of paper, but they were soon redesigned to be cast from iron, which had much more value in a military engagement: When the iron rockets burst, the metal fragments could wound or kill; the paper rockets merely frightened the horses. During the Napoleonic Wars rockets were only used by Britain and Austria. In action at Copenhagen, 40,000 rockets were fired, but Brigadier General Sir Arthur Wellesley (later Duke of Wellington) was not particularly impressed, probably because he could see that they were in their infancy as far as weaponry was concerned. Nevertheless, the weapon had a psychological effect on the enemy, and when the French were fired on at the Adour River crossing in 1814, prisoners reported that the rockets, erratic though they were, caused them a great deal of confusion and wounded or killed several men. The Russian general Peter Graf Wittgenstein watched British rockets in use at the Battle of Leipzig and commented that they must be weapons of the Devil.

The inaccuracy of these rockets was partly due to the fact that they were very susceptible to wind and weather, they did not spin in flight, and their center of gravity altered as they traveled along their path to the target. They were launched from loose frames in the general direction of their target, and as they traveled their propellant was consumed, which caused changes in the balance of the rocket. One of the great advantages of the Congreve rocket was its lightness, allowing a few men in a rocket troop to have the firepower of an artillery regiment or a man-of-war. The Congreve rockets in service up to 1864 were the 6-, 12-, and 24-pounder versions. Congreve hoped that he could design and produce a 300-pounder rocket, but this was never achieved. The British Army only officially accepted rocket units into the army in 1813, one troop serving in the Peninsula and one with the Allied army in Germany. A rocket battery also served at the Battle of New Orleans during the War of 1812 and at the Battle of Waterloo.

## Conscription (French)

Form of compulsory military service introduced in the Revolutionary era, which formed the basis of recruitment for 200 years in France. Revolutionary France initially relied on volunteer recruits, but after successful appeals in 1791 and 1792, the volunteers began to run out. The government levied 300,000 men on 24 February 1793, and then, in a mass levy on 23 August, all unmarried males were called up.

In practice these draconian measures proved both unpopular and inefficient. Under the Directory a commission was formed to introduce a fair and sustainable system of recruitment. On 12 January 1798, General Jean-Baptiste Jourdan presented a report in which he proposed a new law governing conscription, which was finally passed on 5 September 1798. This law recognized that all Frenchmen had a duty to protect the fatherland. Men aged eighteen to thirty could volunteer for service (set at four years in peacetime or for the duration in wartime). However, all unmarried males between twenty and twenty-five would be liable for conscription.

Each town hall would publish a list of those eligible for conscription, divided into five annual classes. The candidates would take part in a ballot; anyone drawing a number corresponding to the amount of men required would be taken into service, with a portion of the candidates kept in reserve to replace those who failed a medical exam. The first ballot would be drawn from the youngest class, those aged 20–21. If more men were required, each class would be balloted in turn until the required number was attained. Those selected would then undergo a physical examination performed by a jury of a government commissioner, a medical officer, and five fathers of serving soldiers. On a given day, those who had passed the

medical would assemble in the regional capital and be marched off for training.

There were problems with this system. Many married to avoid the draft; others mutilated themselves in order to fail the medical or, more commonly, especially in rural areas, went into hiding, often with the help of their families and neighbors. More still deserted en route to the depots or after their arrival in garrisons. Napoleon made a number of modifications to the law. On 7 March 1800 he allowed substitutes to be hired to replace those selected in the ballot, but the cost of these was beyond the means of the vast majority of people. To make good the heavy losses after 1807, the need for conscripts increased dramatically. Napoleon began “borrowing” men, calling up future classes early or calling up those who had not been selected in previous years. The most dramatic example of this came on 27 September 1813 when Napoleon called up 160,000 men from the class of 1815, and 120,000 from the previous classes of 1808 to 1814.

## Constable, John (1776–1837)

One of the most renowned English landscape painters of the nineteenth century, John Constable was born at East Bergholt, Suffolk, the fourth child of Golding Constable and Ann Watts. He attended private school in Lavenham, a daily 15-mile round trip during which he observed nature. He attended grammar school in Dedham, where his skills as a draftsman were commended.

Constable was influenced by a number of mentors. A local plumber and amateur painter, John Dunthorne, in his spare time taught Constable how to paint. While staying in Edmonton in 1796, Constable met John Cranch, who for a short time influenced his painting style. He also met John Thomas Smith, with whom he made drawings of cottages. A future patron, art connoisseur Sir George Beaumont, had become acquainted with Constable’s budding genius and advised Constable’s family to have him study art. With a letter of introduction from Joseph Farrington, a distinguished member of the Royal Academy, Constable moved to London, allowing him to move in influential art

circles. He also entered into a lifelong friendship with Archdeacon John Fisher.

On 19 February 1800 he enrolled at the Royal Academy School in London, where the noted American painter Benjamin West became his mentor. After buying a cottage at East Bergholt, he became consumed by the natural state of his native Stour valley. His lifelong proximity to the countryside resulted in his rebellion against the accepted conventions of painting. He sketched the same scene numerous times, to catch the correct light, the right shades of trees, and the exact weather conditions. Natural landscapes fed his soul. Constable revolutionized landscape painting when he discarded preconceived notions and painted nature at its source, with natural light. By painting his idyllic version of England's rural landscape, he created his own unique style. He exhibited his first painting at the Royal Academy in 1802 and declined a position of drawing master at a military academy in order to pursue his art studies. Constable married Maria Bicknell in 1816 despite her grandfather's objections. The happy couple had seven children and resided at Hampstead.

Over the next ten years Constable produced several fine studies in watercolor and graphic media, but his exhibitions in 1807–1808 failed to attract public attention. In 1811 he produced *Dedham Vale: Morning* and began corresponding with John Fisher; these letters remain important sources for an understanding of Constable's art, its inspiration, and its development. In 1814 he completed several easel pictures, including *Boatbuilding* and *The Stour Valley*, and displayed his mastery of drawing. Constable exhibited *The White Horse*, which generated public notice and critical approval and helped his election as Associate of the Royal Academy in 1819. He followed up on this success with a series of popular drawings, including *The Hay Wain*, *Stratford Mill*, *The Lock*, and *The Leaping Horse*. His exhibit at the Paris Salon in 1824, with *The Hay Wain* and other pictures, earned him a gold award from the French royal house. He strongly influenced Eugène Delacroix and the Barbizon school.

Constable traveled through southern England from 1824 to 1835 observing the effects of light upon nature and using the smallest details to perfect his technique. These journeys were funded by a £20,000 inheritance from his father-in-law. Maria died on 23 November 1828. Constable never emotionally recovered from her death; his anguished turmoil was evident in some of his paintings. In 1829 Constable exhibited *Hadleigh Castle* and was finally elected as a full Royal Academician. He published his *English Landscape Scenery* in 1830.

Constable died of a heart attack at his home on 31 March 1837. He was buried beside Maria in the churchyard of St. John's Church, Hampstead.

Constable left a vast amount of work behind. He was practically unknown to the art world and to the public, and none of his works were critically or financially rewarded. During the Victorian era Constable's work was finally appreciated for its genius. Today his paintings adorn major galleries and museums throughout the world.

### Constant de Rebecque, Henri-Benjamin (1767–1830)

Swiss-born French novelist, political philosopher, and politician who was active in numerous endeavors during the French Revolutionary and Napoleonic periods, playing an important role in the development of post-Restoration liberal ideology in France. Benjamin Constant, by which he is best known, was noteworthy for his bohemian lifestyle and his weakness for gambling, alcohol, and women.

Constant's liberalism grew out of his critique of the ideas of Jean-Jacques Rousseau and drew upon ideas of the Scottish Enlightened tradition he had studied while at the University of Edinburgh. Constant was bothered by the Jacobins' use of Rousseau's idea of the "General Will." Constant argued that liberty in the modern world was individualistic in nature and very different from Rousseau's conception, inspired by the ancient republics, of freedom as a collectivist phenomenon. According to Constant, division of labor had destroyed any notion of a "common good" or "General Will." He further believed that the public welfare could only be promoted by protecting the ability of individuals to pursue their own private ends.

In December 1799 Constant was nominated a member of the Tribunate, where his independent nature rankled the First Consul, Napoleon Bonaparte, on numerous occasions. Many attribute Constant's activism and political views to the influence of Madame Germaine de Staël, a well-known anti-Bonaparte agitator and organizer of one of Paris's more liberal salons, with whom Constant had a longtime intimate relationship. Because of his controversial acquaintances and

activities, Bonaparte ended Constant's participation in the Tribunal in 1802, and he accompanied de Staël into exile the following year.

In 1813 Napoleon's reverses of fortune gave Constant, then living in Hanover, the confidence to write a pamphlet very critical of the Emperor. Upon Napoleon's abdication, Constant returned to Paris, where he was well received by the occupying sovereigns and resumed his place at the salon of de Staël. The influence of his most recent infatuation, Madame Jeanne Récamier, led to one of the biggest political blunders of his career. When Napoleon returned to France during the Hundred Days, Constant made it clear he would not associate with the returned Emperor and left Paris. Récamier persuaded him to return, helped arrange an interview with Napoleon, and convinced Constant to become a supporter of the new imperial government. Constant drew up an early draft of the new constitution. The return of King Louis XVIII forced Constant into exile.

His exile was short-lived, and in 1816 he was again in Paris advocating liberal constitutional principles. In 1819 he returned to the Chamber of Deputies and proved to be such a formidable opponent of monarchical principles, and proponent of liberal ideology, that the government made a vain attempt to exclude him from the chamber on the grounds of his Swiss birth. Constant served in the chamber from 1819 to 1822 and again from 1824 to 1830. Throughout this time he continued his political pamphleteering, calling for a constitutional monarchy, civil liberties, and most of all, freedom of the press.

## Constitutions (French)

The French constitutional system is perhaps one of the most important legacies of the Revolutionary period. To date, France has had either sixteen or fourteen constitutions, depending on how various legal issues are counted, but all have been drawn from the basis of the initial 1791 constitution with little variation in major style or structure.

During the Revolutionary period, four constitutions were written, in 1791, 1793, 1795, and 1800. The most important of these was the first, which established a new gov-

ernment. As the new supreme law of the country the Constitution of 1791 had to design policy and law that would encompass the entire changing political environment. The 1,200-man elected National Assembly wrote the first constitution. The National Assembly, which also referred to itself as the National Constituent Assembly, chose to lay out the basis of the new social order in the form of the Declaration of the Rights of Man and the Citizen before proceeding with the drafting of the laws that would support the basic principles that it contained. The National Assembly endorsed the Declaration of the Rights of Man and the Citizen on 26 August 1789. The drafting of the first constitution took a full twenty-seven months thereafter.

Major legal questions were raised early in the process, the most important being questions on the power that would be accorded to the king, on the right to vote, and on the geographical organization of France. Initially a moderate group who called themselves the Monarchiens dominated the assembly's views on sovereign power. They pushed for a large budget for the king and for his right to veto laws he felt were inappropriate. The final decision on monarchical power was much more conservative, leaving the king greatly reduced in authority in favor of a one-house legislature. He was also allowed a suspensive veto that permitted the delay of legislation for a total of six years, or three two-year sessions of the assembly. On the question of voting, the first constitution established for adult males what was for the time a modest requirement of property ownership and tax payment. Others were excluded. The requirements for membership in the legislature were more limiting. Finally, on the question of geographical organization, the National Assembly sought to convey the principle that citizens are first and foremost members of the French nation, and only secondarily subjects of the king. To strengthen national unity, the National Assembly decided early in their work to replace the historical local and provincial divisions of the French kingdom with a more scientific approach using departments. The departments they laid out are virtually the same as those by which France is divided and governed today.

The Constitution of 1791 was adopted and sanctioned by the king in September of that year. When the National Convention came into power on 21 September 1792 it unanimously abolished the monarchy, began Year I of the new Republic, and commenced work on a new constitution. The constitutional committee, consisting of Georges-Jacques Danton, Jérôme Pétion, Jacques-Pierre Brissot, Pierre-Victurnien Vergniaud, Armand Gensonné, the marquis de Condorcet, and Tom Paine, prepared a new constitution for mid-February 1793. This new document was referred to as the Girondin constitution, but it was not put

into effect, as the Girondins lost power in the Convention to the Montagnard faction.

The Montagnard constitution, endorsed in late June 1793, provided for more-democratic functions, including universal manhood suffrage. It also put responsibility on the government to ensure that all citizens had the ability to exercise their rights. As with the Girondin constitution, the Constitution of 1793 was never put into effect, as the Convention voted to postpone its inauguration. The Constitution of 1793, framed by the Jacobins, stood out in the minds of the public as the most democratic and generous of the legal documents of the period and became part of the protest refrain “Bread and the Constitution of 1793” shouted during the riots of 1795. The popular insurrection in support of the Constitution of 1793 merely sealed its reputation as an extremist egalitarian document and guaranteed it would never see implementation.

August 1795 saw the drafting of yet another constitution, this one more conservative than that of its predecessor. The Constitution of 1795 (also known as the Constitution of Year III) reinstated property qualifications for voting rights and largely reinforced the importance of private property and the rule of law over the legitimacy of rebellion. Perhaps the most interesting feature of the new constitution was its explicit limiting of voting rights. While this return to limited suffrage reflected the views of the rest of Europe during this period, it was clearly in opposition to some of the basic tenets of the Revolution. The French public, however, voiced little opposition in this case. The Constitution of 1795 also proposed a two-house legislative system, which included the Council of Ancients and the Council of Five Hundred. The Declaration of the Rights of Man and the Citizen, highlighting the importance of the duties of the people to the nation rather than just the assurance of rights provided, also accompanied the Constitution of 1795.

The Constitution of 1800 (also known as the Constitution of Year VIII) was produced under Bonaparte’s direction following the coup d’état of 18–19 Brumaire (9–10 November 1799). Initially the effort was led by Abbé Emmanuel Sieyès, who supported an elaborate system of checks and balances. However, Bonaparte directed changes, particularly with respect to the power of the executive. By setting the various factions of constitutional groups against one another, Bonaparte was able to reshape that portion of the document concerned with executive power in order to allow for a First Consul who, elected for ten years, would serve with little interference from other parts of the government. The Constitution of 1800 was approved in a plebiscite by a vast majority of the electorate: Over 3 million voters supported it, while fewer than 2,000 rejected it. Bonaparte promulgated the new constitution on Christmas Day 1799.

### Consulate, The (1799–1804)

The Consulate represented the most creative phase of the Bonapartist regime. It was established according to the Constitution of 1800 (formally known as the Constitution of Year VIII), which was implemented in December 1799 and subsequently received popular endorsement in a plebiscite. Instead of the honorific head of state envisaged by Abbé Emmanuel Sieyès, who, along with Roger Ducos, had been part of a three-man provisional consulate following the coup of Brumaire, Bonaparte imposed an all-powerful chief executive. This triumph, sometimes described as “a coup within the coup,” naturally led to his appointment as First Consul, with Jean-Jacques Cambacérès and Charles François Lebrun occupying second and third places in the definitive consular triumvirate. Bonaparte was first among unequals, though his fellow consuls were both gifted administrators who had begun their careers under the *ancien régime* and also served the Revolution.

The consuls promised to end the Revolution, and to a large extent they succeeded in doing so, ably assisted by a talented team drawn from all points of the political compass. Many of the unresolved problems and unfinished projects left over from the Revolutionary decade were tackled effectively between 1800 and 1804. The long-awaited restoration of law and order, for example, began with the creation of the prefects, who took charge of local government in February 1800. They were appointed from the center, and though an electoral system of sorts was retained, most officials were now nominated. The judicial system was also recast, a process that culminated in the promulgation of the Civil Code in 1804. Freedom of expression was rapidly eroded, while widespread brigandage was contained by the implementation of more pervasive police powers. Yet the Consulate was characterized by reconciliation as well as by repression. The lists of émigrés were closed, and most exiles were permitted to return to France. Above all, the Concordat

with the papacy, implemented in 1802, ended the disastrous schism with the Catholic Church that had plagued the Revolution since 1791. Moreover, Bonaparte achieved peace in Europe by the Treaties of Lunéville and Amiens, respectively. The Austrians were defeated once more, and a peace, though amounting to little more than an armistice, was signed with Britain.

At this propitious moment, in 1802, Bonaparte began maneuvering to become Consul for Life. After some resistance in the Senate, a proposal was formulated and put to the people, who massively approved the Life Consulate. This constitutional change also gave Bonaparte the right to nominate his successor, yet it was deemed an insufficient safeguard against the demise of the great man. A mere two years later, Bonaparte became Napoleon I with the creation of the hereditary empire in December 1804. This regime became known as “le Grand Empire,” on account of its vast territorial extent, but the epithet “great” can be justifiably attached to the Consulate too. Though the consular structure was relatively short-lived, many of its monumental administrative, judicial, and religious aspects proved enduring, and some have lasted until the present day.

## Continental System

The Continental System was Napoleon’s vision for achieving an economic counterpart to his military empire. It consisted of two primary parts, a Continent-wide blockade against British imports and a commercial policy that promoted French industrial development within the French Empire. Napoleon revealed his policy in two successive decrees, those of Berlin (1806) and Milan (1807), and amended it with three subsequent ones: Saint-Cloud, Trianon, and Fontainebleau (1810). Considered by many scholars to be one of Napoleon’s biggest mistakes, the Continental System was neither irrational in its implementation nor unrealistic in its aspirations.

In many respects Napoleon’s plan was not, however, very original. The Berlin Decrees asserted simply that “the

British Isles are declared in a state of blockade” and “commerce in English merchandise is forbidden” upon pain of imprisonment or confiscation (quoted in Mowat 1924, 202). For most of the eighteenth century, the British and the French had both employed similar measures—trade restrictions, blockades, and tariffs—against each other. The doctrine of mercantilism held that in order to gain wealth, a country had to take from another, especially by achieving a more favorable balance of trade. Applying these theories, the two rivals worked aggressively to contain the export trade of their rivals and to promote their own. This action against British imports and ships was no more than a continuation of policies that had been in place before Napoleon took power.

The Continental System, however, diverged from previous policies of a similar nature in two major respects. First, Napoleon intended for these restrictions to apply not exclusively to Anglo-French relations but to relations between Britain and the entire European continent. After the Battle of Trafalgar in 1805, Napoleon knew that he would be unable to defeat Britain militarily, so the Continental System was devised in order to attempt to vanquish Britain economically. He wanted to unite all of the countries of Europe behind a barrier past which no British products could pass. The loss of markets would be devastating to the British economy: The industries of the Continent would eventually catch up with their British counterparts, causing, in turn, overwhelming credit problems; Britain would be unable to support its allies on the Continent; and the country was certain to experience domestic political and social unrest as a result of economic hardship. By broadening the scope of the blockade, Napoleon could deal Britain a devastating blow in a relatively short period of time.

At the time, Napoleon did not have the ability to force all of Europe to adhere to his system. First and foremost, he did not control all of the coastlines, a deficiency that he immediately began to address. First, he stipulated compliance with the blockade as part of the treaty he concluded with Tsar Alexander I at Tilsit in July 1807, and he strengthened his control over the trading towns of northern Germany through a treaty with Prussia and by the terms of the constitution of the Confederation of the Rhine. He pressured the rulers of the Netherlands and Spain to enforce the decrees. Next, he moved to increase direct military and political control over the coastlines of Spain, Portugal, and the Italian peninsula, especially the Grand Duchy of Tuscany and the Papal States. If a ruler was not willing to enforce the system, Napoleon did not hesitate to replace him or her, including his own family members. The unwillingness of his brother Louis Bonaparte to destroy the livelihood of his countrymen led to his removal from the throne of Holland, and Pope Pius VII’s

reluctance led to his flight and eventual near imprisonment by French troops.

A second original contribution of the Continental System was its integration into a wider commercial policy. Napoleon did not envision the creation of a customs union with free trade between the different areas of the Empire. On the contrary, faced with a pressing need for increased revenue, the French imperial government often revived old tolls and other obstacles to the free movement of goods (though Napoleon did force most countries to adopt a common decimal system). Instead of creating a united European market, the system was designed to put the interests of France above all others. Accordingly, he protected French markets from the influx of goods, even from Allied countries, through tariffs. In the absence of British competition, Napoleon intended for French industries to rise to the fore and replace the absent British goods with French ones. With this in mind, he promoted the development of French industry and tried to quash industrial growth outside of his carefully demarcated preferred zone.

Napoleon was aware that the system might cause hardship, stating “the blockade will ruin many commercial towns: Lyons, Amsterdam, Rotterdam” (quoted in Broers 1996, 144) and “undoubtedly injure Holland and France” (quoted in Heckscher 1964, 93), but he believed that in the long run the ultimate devastation of the British economy would make it worthwhile. Initially, neutral ships had not been covered by the trading injunctions against Britain, but after the British issued their Orders in Council in 1807, which restricted neutral shipping, Napoleon retaliated with the Milan Decrees, declaring that any ships with British cargoes—sometimes even ships with entirely British crews or possessions—were liable to search and seizure by imperial authorities. When the United States protested and passed its own protectionist laws (against both France and Britain), Napoleon seized over 100 U.S. ships in French-controlled ports. The system would only be effective, he believed, if the Continent stood united against Britain.

Perhaps if Napoleon had been able to implement the entire system consistently, it might have had more chance of success. From the beginning, however, smuggling and corruption were endemic to its operations. When he felt that local administrators could not be trusted to properly enforce the ban, he replaced them with his own men, who often turned out to be just as susceptible to bribery and laxity. Napoleon himself called Marshal Brune, his commander in Hamburg, who replaced customs officials with soldiers in order to facilitate illegal trade, an “undaunted robber” (quoted in Heckscher 1964, 165). Any nearby usable port outside of the blockade saw its customs much increase. In 1807 the British seized the Frisian island of He-

ligoland from Denmark, and it became a popular base for illicit trade in British goods. Between August and November 1808, over 120 ships stopped there. Napoleon directed the Decree of Fontainebleau (October 1810) against smuggling, creating a special court to punish transgressors and calling for all illegal goods to be publicly burned.

The system provoked much hostility and resentment from those who lived under it. The economies of many previously prosperous areas, especially urban centers that depended on trade such as Rotterdam and the Hanseatic ports, suffered heavily under the system. Industries that depended on overseas trade were nearly wiped out in many areas. Bankruptcies of shipping companies, industrial enterprises, and merchants were rampant, especially on the fringes of the Empire. Resentment of the system contributed to outbreaks of unrest and revolts, especially in areas chafing from other aspects of imperial rule, such as taxes or conscription. Napoleon’s harsh treatment of neutral shipping aggravated his relationship with the United States and ended the chances that the Americans might have joined the war against Britain as an ally of France. The Spanish, already incensed over Napoleon’s treatment of the pope for noncompliance, began a guerrilla campaign of resistance to every aspect of Napoleonic rule, which constituted an enormous drain on French resources and left imperial authorities unable to control trade in Spain and Portugal. Napoleon’s seizure of the town of Oldenburg exacerbated an already-declining relationship with Alexander (the Treaty of Tilsit guaranteed that the town would remain under the Duke of Oldenburg, Alexander’s cousin). At the end of 1810, the tsar repudiated the system, refusing to confiscate neutral vessels, especially American ships, and instigating tariffs against French goods.

It might be said that Napoleon participated in smuggling against himself. As the industry and trade of France and its allies suffered, he softened the effects of the Continental System. First, in the Saint-Cloud Decrees, he permitted specially licensed ships to trade with Britain in exchange for the payment of a fee. In 1810–1811 the British suffered from bad harvests and food shortages—perhaps their weakest moment. Ironically, Napoleon’s licenses alleviated the crisis by providing French grain. The Decrees of Trianon permitted the importation of strategic commodities upon payment of tariffs as high as 50 percent. Napoleon argued that both decrees still contributed to British decline because they brought gold from Britain to France (a tenet of mercantilism), but in effect they undermined the system.

Despite the drawbacks, the system was nearly successful. In 1810 the British were facing financial difficulties that were compounded by a series of bad harvests. They had ceased most payments to continental allies and rebels

and had curtailed some military activities due to lack of funds. In the long run, however, the British were saved by their navy. The French Navy was not large enough to enforce a physical blockade capable of excluding British goods from the Continent. As one British minister remarked, “Bonaparte might equally have pretended to blockade the moon as to blockade this country” (quoted in Mowat 1924, 205). The blockade was “little more than a theatrical gesture. . . . It was, and aimed at being, a self-blockade on the part of the Continent” (Heckscher 1964, 93).

The British, on the other hand, possessed a powerful navy, and they used it to impose a true counterblockade on the Continent. The French almost immediately lost access to and eventually lost control over their colonial possessions, especially after the revolution in St. Domingue (modern-day Haiti) in 1791. They also lost access to strategic colonial imports, including popular goods such as sugar and coffee and industrial imports such as cotton. Finally, they even lost markets in Latin America, as governments there expressed support for the Spanish rebellion against French rule. The British were happy to fill the void left by the French. In addition to seizing French islands, Britain (partially) compensated for the loss of continental markets by increasing sales to Latin America.

The system also affected France, of course, though with mixed results. Industries such as iron and sugar refining suffered from a lack of access to critical raw materials, from poor transportation infrastructure, and from the weak demand from their European trading partners, who were suffering from the ill effects of warfare, internal revolts, the economic isolation imposed by the system, or all three. On the other hand, within the preferred trading zone, which included northern France and Belgium, some industries did prosper. Protection from British competition seems to have been a significant factor in inducing the introduction of new technologies to French industry, especially in the textile and chemical industries. Belgium and the Rhineland were especially fortunate, and their experience under the system paved the way for their explosive industrial growth after 1815. French overseas trade, on the other hand, never recovered from the ravages of the Napoleonic period. Overall, after 1815 the continental economy shifted away from an Atlantic-centered orientation to one that focused on national markets and internal development (Crouzet 1964, 586–587).

Finally, it is easy to forget that the Continental System was in effect for only eight years and was not in full force for all of that period. It hardly had time to severely affect the European economy. Napoleon had only intended it to be a short-term solution to a long-term problem: the defeat of Britain and the creation of a united French empire

in Europe. Enforcement of the system depended on his continued military success; when his military aspirations failed to materialize, so too did his economic ones.

## Convention, The (1792–1795)

The National Convention was a constituent assembly that sat for three years between September 1792 and October 1795. Two constitutions were produced, in 1793 and 1795. The former, though endorsed in a plebiscite, was immediately suspended because of the severe crisis facing the Republic, and the Reign of Terror ensued. After the coup of Thermidor and the gradual repeal of emergency legislation, the innovative prescriptions of 1793 were no longer acceptable, and a less radical document emerged in 1795. The Convention thus presided over a momentous phase in the Revolution, marked by both violence and democratic experimentation. Following the overthrow of the monarchy in August 1792, the newly elected Convention enshrined both executive and legislative functions. Indeed, it would also assume judicial responsibilities with the trial of

Louis XVI, who was executed after a close-run parliamentary vote in January 1793.

The 749 deputies, or *conventionnels*, cannot have anticipated so long or arduous a task when they first met on 20 September 1792 and promptly declared France a republic. Circumstances of war and insurrection, combined with deep internal divisions (the celebrated conflict between Jacobins and Girondins) dictated otherwise. Yet the *conventionnels* were a remarkably homogeneous group in terms of age, experience, and occupational background: mostly in their thirties, having held office, and mostly with professional qualifications; there were some priests but very few former nobles. What principally divided them, apart from personality and power, was their relationship with the sans-culottes of Paris, who overawed the Convention. It was “the mob” who ensured a purge of the Convention on 2 June 1793, leading to the expulsion of twenty-nine deputies (some of whom were later killed). This violation of parliamentary sovereignty provoked uproar in the provinces and exacerbated the crisis facing the Republic. Unrest was assuaged by the completion of a constitution and by increasingly repressive measures from the now-dominant Jacobins, who took concerted action with the tacit support of uncommitted deputies.

Executive authority was vested in a Committee of Public Safety, subject to monthly renewal by the Convention, whose membership under Maximilien Robespierre was unchanged from the summer of 1793. If the first year of the Convention was characterized by division, the next twelve months were stamped with the “single will” that brought the Terror but also produced victory on the battlefield and a range of social and cultural reforms (equal inheritance and the Republican calendar, for example). As the Convention entered its third and final period, when the Terror was gradually dismantled after Thermidor, there was something of a return to normality. Even so, there was no wholesale retreat from radicalism in the Constitution of 1795, for France remained a secular Republic, in which virtually all adult males could vote. Establishing the Directory, as the new regime became known, would prove equally problematic, and the memory of the Convention continued to inspire fear as much as respect for dramatic policies that were both radical and extremely violent.

### Copenhagen, Attack on (2–5 September 1807)

On 7 July 1807, following Napoleon’s defeat of Prussia, France and Russia concluded peace at Tilsit. Its terms reduced Prussia to a secondary power, and France and Russia agreed in secret provisions to coerce Denmark and Sweden to expel the British navy from the Baltic. Aware of the terms and fearful that Denmark’s fleet would now be added to those of France and Russia, London decided on immediate action in the form of a preemptive strike to repeat its first attack on Copenhagen in 1801. On 26 July, Admiral James Gambier sailed from Yarmouth Road for Copenhagen in command of a powerful fleet of twenty-five ships of the line and forty frigates, sloops, bomb vessels (special ships carrying mortars for shore bombardment), and gun brigs. Lieutenant General Lord Cathcart commanded a land contingent of about 27,000 men in 377 transports.

Arriving off Vinga, Gambier detached four of his ships of the line, three frigates, and ten brigs into the Great Belt to ensure that no reinforcements reached Copenhagen from the mainland, where the majority of Danish troops were located. On 3 August the main body of ships anchored off Helsingør, where the transports joined them.

The Danes had twenty ships of the line, twenty-seven frigates, and sixty smaller vessels. An additional three ships of the line were under construction and almost complete. The British had achieved surprise, however, and when they arrived none of the Danish ships were ready for combat.

The Danes rejected the British demand that they hand over their entire fleet as well as all cannon in the arsenal, so on 15 August Gambier moved his ships off Skövshoved, 4 miles north of Copenhagen. The next day he sent the British troops ashore there and 5 miles to the north. Hostilities began on the seventeenth. Following an armistice during 28–30 August, the fighting resumed.

On 2 September the British ships commenced a bombardment of Copenhagen. The British had learned from their first attack on Copenhagen in 1801 and did not use ships of the line in the bombardment. Instead, they employed shore artillery and Congreve rockets fired from special ships. The rockets proved highly effective in a circumstance where accuracy was not a requirement, and parts of the city were soon in flames. On 6 September the Danes surrendered, agreeing to the British demands.

During the next six weeks the British removed the spoils of war and destroyed what they did not take, including the three ships of the line and four other vessels under

construction. Some other vessels were also burned and sunk. On 21 October the British sailed away with sixteen ships of the line, twenty frigates, and forty-three other vessels. The military booty the British carried off in the transports was estimated to be worth some 3 million thalers. Unfortunately for the Royal Navy, severe storms on the return trip to Britain led to the loss of twenty-five vessels. Only four of the Danish ships of the line were taken into the Royal Navy.

Ironically, London had moved too quickly, for Gambier had presented his ultimatum to the Danish government before Napoleon had been able to present his own. A delay of several weeks might have induced the Danes to come over to the British side. In any case, the British achieved their goal of preventing any augmentation to Napoleon's naval strength.

## Copenhagen, Battle of (2 April 1801)

Trade with the Baltic had long been important to Britain. It included grain imports, but the Royal Navy also relied on the Baltic for timber and naval supplies, especially flax, which was used in the production of both sails and rope. Thus, in 1800, when Tsar Paul of Russia abandoned the war against France and moved to create a pro-French "Armed Neutrality of the North," the British government was greatly alarmed. London regarded the matter as sufficiently important to warrant military action.

The immediate problem arose with Denmark and its claimed right to convoy its merchant shipping through the British blockade without being subject to search. On 25 July 1800 a small British squadron brought a Danish convoy into port to search it for contraband. Pressured by the presence of a British squadron off Copenhagen, the Danes agreed to allow their convoys to be searched. Although

both the British and Danish governments declared themselves satisfied, the event pushed Denmark closer to Russia.

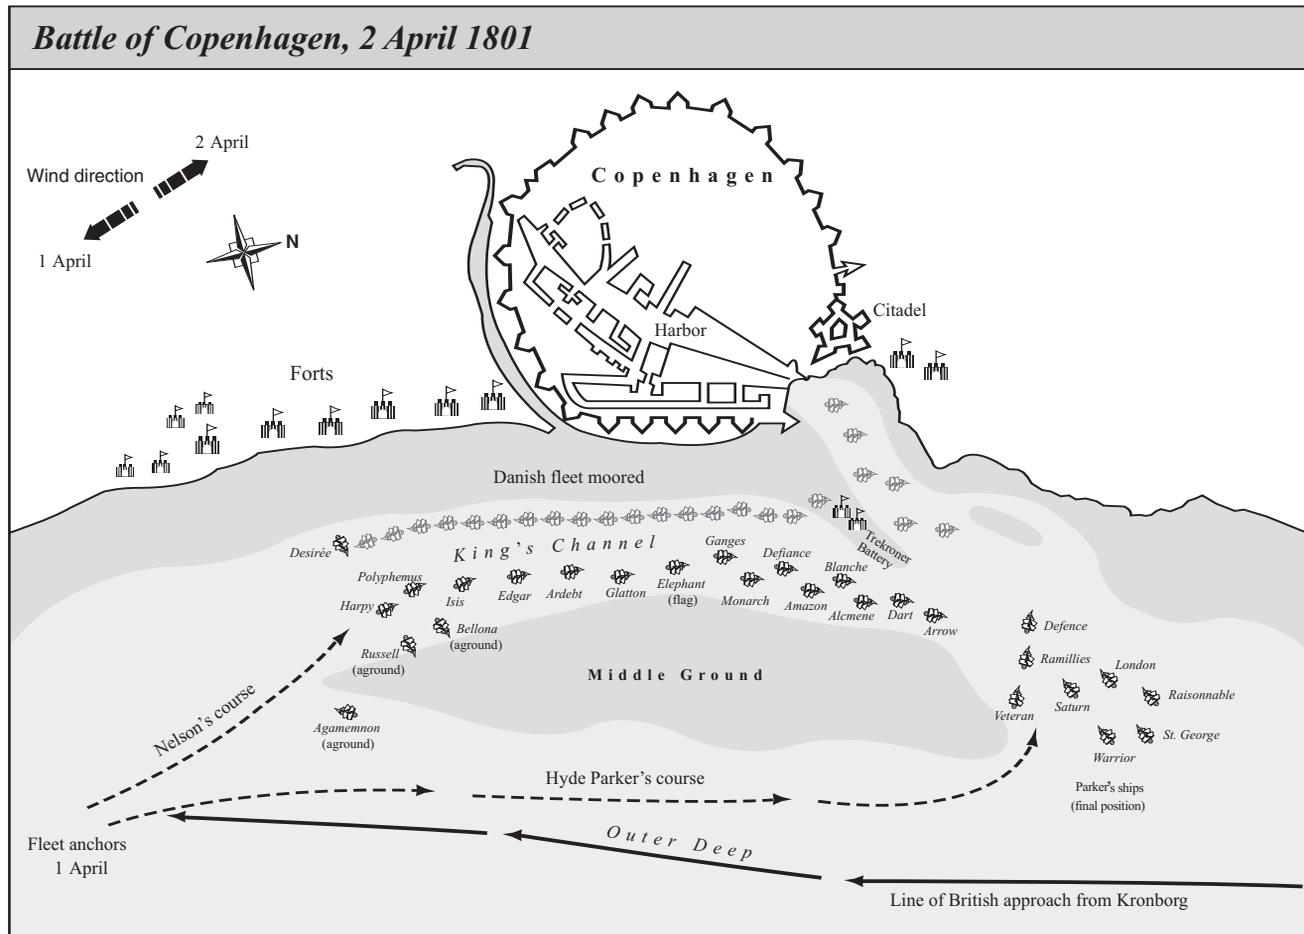

In December 1800, having learned of the British seizure of Malta, to which Paul had pretensions, Russia embargoed all British ships and signed a naval convention with Sweden in which the two powers revived the Armed Neutrality of 1780, which would have allowed noncontraband goods, including timber and flax, to pass to France. In February 1801, after Bonaparte had forced Austria to sue for peace in the Treaty of Lunéville, Russia expanded the Armed Neutrality to include Prussia and Denmark, whereupon the British government decided on a show of force and, if necessary, a preemptive strike to break up the league.

Admiral Sir Hyde Parker received command of the Baltic expedition. Vice Admiral Horatio Nelson, recently returned from the Mediterranean, was made second in command. In March Denmark embargoed British shipping, and its forces occupied both Hamburg and Lübeck. The only question for the British now was whether to descend on Denmark or to move up the Baltic against the source of the problem and attack the Russian fleet at Revel (now Tallinn) while the remainder of Russian ships were icebound at Kronstadt. This would have been the boldest, most certain course, but the cautious Parker rejected it in favor of a descent on Denmark.

Parker sailed from Yarmouth on 12 March with fifty-three ships, twenty of them ships of the line, and nearly two regiments of infantry. The British had sent a diplomatic mission ahead, so the Danes had time to prepare. Even on his arrival, Parker delayed for a week. Nelson asked to lead an assault on Copenhagen, and on 1 April Parker agreed, giving him thirty ships, including ten smaller ships of the line, a 54-gun ship and a 50-gun ship, and seven bomb vessels (special ships carrying mortars for shore bombardment). Parker would remain well offshore with eight ships of the line, including the 98-gun ships *London* and *St. George*.

At dawn on 2 April, taking advantage of a favorable southerly wind, Nelson's ships weighed anchor to attack. Noting that the Danish line was strongest in the north, close to a large land battery, Nelson decided on an attack from the south. It began at 9:30 A.M. Danish commodore Johan Fischer commanded eighteen warships, armed hulks, and floating batteries moored north and south parallel with the shore for about a mile and a half, all supported by several shore batteries.

From the start, things went badly for the British. Lacking adequate charts or pilots, one ship of the line grounded before the action began. Two other ships of the line grounded on the other side of the channel at extreme range. The other nine capital ships then closed to relatively

Adapted from Warner 1965, 114–115.

long range of about a cable length (240 yards) and engaged the Danish ships and shore batteries. Subsequently the British learned that they might have improved their gunnery effectiveness by bringing their vessels in much closer and even engaging the Danish ships on both sides simultaneously, as at the Nile.

Clearly, Nelson underestimated the Danish defenses, which were fought with great gallantry and effectiveness. The result was a long, slow slugging match, but after three hours of combat that included even Nelson's frigates, superior British gunnery began to tell. At this point, Parker, about 4 miles away with his larger ships of the line and very slow to engage, signaled a recall to all ships. Nelson ignored the order. Had it been carried out, it would have turned victory into disaster, for the only way for Nelson's ships to withdraw was up the channel and across the undefeated northern Danish defenses (two British ships of the line grounded there after the cease-fire). An angry Nelson reportedly turned to his flag captain and remarked, "You know, Foley, I have only one eye,—I have a right to be blind sometimes." Placing the telescope to that blind eye,

he remarked, "I really do not see the signal." Nelson's captains copied their commander and also refused to disengage (Fremont-Barnes 2001, 84).

By 1:30 P.M., although several British ships were flying distress signals, Nelson had disabled a dozen Danish ships, including Fischer's flagship, and overwhelmed the southern shore defenses of Copenhagen. He was then in position to bring up his bomb vessels to shell the city. The Danes agreed to a cease-fire an hour later. Casualties were heavy and approximately equal; of Nelson's battles, only Trafalgar was fought at greater human cost. It was also Nelson's most difficult battle, the one in which he came closest to defeat; but it stands as one of the three most remarkable of his victories at sea, along with the Nile (1798) and Trafalgar (1805).

Nelson then negotiated directly with Crown Prince Frederick. On 9 April, faced with a British threat to bombard Copenhagen, the Danes agreed to a truce of fourteen weeks. Nelson had demanded sixteen weeks, sufficient time for the British fleet to deal with the Russians. The battle had been unnecessary. Nelson understood from the start

that Russia was the real enemy. He had wanted to descend on the Russians at Kronstadt, leaving only a squadron to keep the Danes in check. Had this course of action been followed the British would have discovered that Paul had been assassinated on 24 March and that his successor, Alexander I, had changed policies. Indeed, news of this event, received at Copenhagen by the Danes in the course of the negotiations, enabled them to conclude an agreement more satisfactory to their position. The Armed Neutrality now broke up, and by June 1801 British trade in the Baltic was again moving without threat of hindrance.

## Corn Laws

The Corn Laws were enacted in 1815 by the British Parliament in order to protect agriculture, which had invested heavily to increase the domestic food supply during the wars against Revolutionary and Napoleonic France. It was also argued that they would safeguard tenant farmers and laborers and shield the country from dependence on food imports in wartime. The importation of corn (wheat) was prohibited until the domestic price, which was determined by taking the average price in several market towns, reached 40 shillings (£4) a quarter (8 bushels); lower levels were set for other cereals, such as oats and barley.

From the beginning this high floor price and the principle of protecting agriculture and aristocracy in contrast to leaving industrial workers to their own fate in economic turbulence was a major grievance for those to whom bread was the staff of life. Urban workers, unlike those who controlled both houses of Parliament, received no protection during the difficult transition to peace after twenty years of wartime prosperity and bitterly resented being forced to pay artificially high prices for food. There

were riots in London and other towns while the measure was being debated in Parliament at the time of the Waterloo campaign, though they had no effect on the passage of the legislation. The agriculturalists for their part were disappointed that protection did not produce high grain prices. In 1822 Lord Liverpool's government, which was reducing other tariff barriers to stimulate trade, lowered the duty on grain, but since the domestic price never reached the level at which it would come into effect, the legislation remained a dead letter. The ministry was divided on taking further, more effective action. Not until 1828 was the matter resolved by the Duke of Wellington's administration, which reduced the level of protection and tried to make imports more orderly by a sliding scale of tariffs. When the domestic price reached 66 shillings a quarter, corn would be admitted on paying a duty of 20 shillings, falling to 1 shilling when the price rose to 73 shillings a quarter. An unanticipated consequence was that speculators, by raising the price slightly in the towns where the averages were taken, could considerably reduce the duty on grain stored in bonded warehouses.

In 1838 Manchester cotton manufacturers formed the Anti-Corn Law League to bring pressure on Parliament by means of speakers and publications denouncing grain protection as an immoral tax on the poor, a burden to industrialists, and unwarranted security for the aristocracy. The prime minister, Sir Robert Peel, whose instincts were for free trade, alarmed his agricultural followers in 1842 by including grain in a general tariff reduction. In 1846, on the justification of the Irish famine, and with the league having changed public opinion so that the laws could not be reimposed if they were suspended to deal with the Irish crisis, he completely abolished the Corn Laws over the next three years. The bill was supported in the House of Commons by the opposition Whigs, and in the House of Lords it passed as a result of Wellington's influence. The move fatally split the Conservative Party, but in the era of free trade Peel was hailed as a statesman who put country before party.

## Cornwallis, William (1744–1819)

Sir William Cornwallis was a British admiral active during the French Revolutionary and Napoleonic Wars. Born in London on 20 February 1744, his father was the first Earl of Cornwallis. His brother, Charles (later first Marquis) Cornwallis, was the general who surrendered the British army at Yorktown in 1781, later negotiated the terms of the Treaty of Amiens with France in 1801–1802, and became governor-general of India in 1805. William too saw service in North America. He had entered the navy in 1755, at age eleven, and by 1766 had risen to the rank of captain. During the American War of Independence (1775–1783), Cornwallis fought in Vice Admiral John Byron's fleet at the Battle of Grenada (July 1779), commanding the *Lion* (64 guns), which, damaged in the battle, sought refuge in Jamaica. Cornwallis also saw action at Monte Christi (March 1780), St. Kitts (January 1782), Dominica (April 1782), and many other places. His reputation rose with men such as Horatio Nelson, with whom he was well acquainted. From 1788 until 1793 Cornwallis served primarily in the East Indies, rising from rear admiral to vice admiral.

After Britain declared war on France in 1793, Cornwallis was most active in the English Channel. On 17 June 1795 he and his fleet encountered a sizable French fleet under Admiral Louis Villaret-Joyeuse off Belle Isle, near Brest. Heavily outgunned, Cornwallis ordered a retreat. But seeing one of his ships falling behind, he returned to assist it. The French interpreted Cornwallis's actions to mean that more British ships must be nearby, and they hastily called off their pursuit, allowing Cornwallis to escape to Plymouth. This event became known as "Cornwallis's retreat" and gained him a reputation for valor. In 1796 a misunderstanding with the Admiralty led to a court-martial, at which Cornwallis was later acquitted. In 1799 he was promoted to full admiral.

Cornwallis was commander of the Channel Fleet in 1801 and again from 1803 until March 1806, when his command passed to Lord St. Vincent. His blockade of French ports during the naval campaign of 1805 played a vital part in Nelson's success by bottling up enemy vessels that might have bolstered the strength of the Franco-Spanish fleet at the Battle of Trafalgar.

Cornwallis's various nicknames attest to the fact that his men regarded him with admiration, mixed at times with resentment. He was variously known as "Billy go tight," "Mr. Whip," and "Coachee," but most often as "Billy Blue," a nickname that referred to his practice of anchoring and immediately hoisting a flag known as a Blue Peter, which indicated that the fleet needed to be ready to sail at a moment's notice. He died on 5 July 1819, with his impor-

tant contribution to British naval success in 1805 still largely unacknowledged.

## Corps System

The corps system reorganized the French Army into a stronger and faster military force and contributed greatly to French victory after 1804. The reorganization transformed the French Army into a collection of smaller units known as corps, each containing infantry, cavalry, and artillery and thus capable of fighting independently. Their smaller size also enabled them to move faster than an entire army. These enhanced capabilities influenced the future tactics of the French Army and gave it a decided advantage until France's enemies adopted the system themselves.

The concept was not a new one. Units of combined arms, designed for specific missions, had been used by the French marshals Maurice, comte de Saxe and Charles Louis, duc de Belle-Isle during the War of the Austrian Succession (1740–1748). More recently, Lazare Carnot had created all-arms divisions in his reorganization of French forces in 1794. By 1800 Jean Moreau had instituted a corps system in the Army of the Rhine, and Guillaume Brune used the same structure in Italy. Napoleon's achievement, then, was not to have invented the corps but to have implemented it as the standard structural unit for the French Army. He did this during the reorganization of the Grande Armée between 1802 and 1804.

The new corps contained two to four infantry divisions, a brigade of light cavalry, and several companies of artillery attached to the corps headquarters. The combat units had their own companies of lighter-caliber artillery. In addition, corps had staff and support services. The strength of a corps varied widely, being based on its intended purpose. At the Battle of Wagram in 1809, Marshal Davout's III Corps was made up of four divisions of infantry (31,600), one light cavalry division, and one

dragoon division (6,200), and 120 guns. Marshal Bernadotte's IX Corps (Saxon troops), at the same battle, contained three divisions of infantry (15,500), two brigades of cavalry, all light except for one regiment of cuirassiers (2,500), and 38 guns.

The major advantages of the corps were mobility and adaptability. Being smaller than a full army, a corps could travel faster and forage more easily. This allowed the French forces to disperse on the march but reunite for battle. Containing infantry, cavalry, and artillery, a corps could temporarily engage an enemy force two to three times its size and hold it in place until reinforcements arrived. This procedure eventually became standard practice, employing a formation known as the *bataillon carré* (battalion square). It allowed for a roughly square formation of four corps forming an advance guard, a rear reserve, and a right and left flank. The adaptability of the battalion square relied heavily on the quality of the officer corps as well as on the superior French command and staff system. It also relied on commanders' marching to the sound of the guns to reinforce the first corps to engage the enemy. The efficacy of the system declined as the number of veterans declined in later years. Nonetheless, the success of the corps system convinced other European armies to adopt it. Austria began reorganizing after 1805, while Prussia and Russia attempted to adopt the new system after 1806. No other contemporary army, however, employed it as efficiently as the French.

## Corsica

Located at a strategic position between France and Italy in the western Mediterranean Sea, Corsica is the fourth-largest island (after Sicily, Sardinia, and Cyprus) in the Mediterranean. It lies 105 miles (170 kilometers) from southern France and 56 miles (90 kilometers) from northwestern Italy, and is separated by the narrow Strait of Boni-

facio from Sardinia. The island has an area of 3,352 square miles (8,681 square kilometers). It has been repeatedly invaded and colonized throughout the centuries. In the mid-sixteenth century the island came under control of the Italian city-state of Genoa, but it continuously rebelled and fought for independence. In 1729 a Corsican rebellion evolved into a revolution that eventually succeeded under the leadership of charismatic Pasquale Paoli in 1755. Paoli, whom the Corsicans affectionately called Babbu (meaning father in Corsican), ruled Corsica for the next fourteen years, establishing one of the more original governments in Europe and opening the first printing press, newspaper, and university at Corte. Paoli even invited the famous philosopher Jean-Jacques Rousseau to write a constitution for Corsica, about which Rousseau later famously proclaimed, "I have the feeling this little island will one day astonish Europe" (Rousseau 1999, section x).

In 1768, however, Genoa, still nominally in control of the island, ceded Corsica to France to help pay off a debt. French forces conquered the island in the spring of 1769, defeating the feeble Corsican troops at Ponte Nuovo on 9 May and forcing Paoli and his supporters to flee to Britain. Three months after the French victory, Napoleon Bonaparte was born at Ajaccio on 15 August 1769. Corsica became a province of France that same year and was reorganized into a department during the French Revolution. Exiled for twenty-one years in England, Paoli initially accepted French sovereignty, but he later began moving the island toward greater independence. His appeals for foreign aid led to British intervention. In 1794, Vice Admiral Sir Alexander Hood, commander of the British Mediterranean Fleet, selected Corsica as a base for the Royal Navy. In February he dispatched some 1,500 men to Corsica, where they faced numerically superior French troops garrisoned at Bastia and Calvi. In the ensuing fighting, Captain Horatio Nelson led the crew of the *Agamemnon* (64 guns) to besiege Bastia and lost an eye during the fighting. Following the French surrender in early August, the British established Anglo-Corsican rule, which lasted only two years (1794–1796). After Napoleon's triumph in Italy in 1796, the British considered the island a defensive liability and had withdrawn their forces from Corsica by October 1796. In November French troops landed from Tuscany to reestablish French control for the rest of the Napoleonic period.

### Corunna, Battle of (16 January 1809)

In January 1809 Lieutenant General Sir John Moore's British army battled the elements and the pursuing army of Marshal Nicolas Soult as it retreated across northern Spain toward the port town of Corunna (La Coruña), where the Royal Navy intended to embark them to safety. However, as the British force prepared for its evacuation from Corunna, Soult's men arrived and attempted to prevent as many as possible from reaching the ships. After boarding some of his army, Moore turned to counter Soult's offensive drive toward Corunna. Moore deployed his 15,000 men, with only twelve guns, on the Monte Moro ridge approximately 2 miles south of the town.

Soult advanced cautiously, attempting to consolidate his force of 24,200 men before striking the British defenses. His first move, on 15 January, was to drive off the British pickets and seize the Palavea and Penasquedo ridges, located to the south of Moore's position. The key to these ridges lay in the fact that French artillery could bombard the enemy. A British counterattack against the French guns ended in failure and the death of Colonel John McKenzie, commander of the 5th Foot. Moore's troops stood fast on their ridge while the British commander placed a reserve force under Major General Edward Paget out of sight behind his men as a reserve in case the French attempted to turn his right flank—perhaps the weakest point of his line. Soult prepared to assault the British right flank the next day at the village of Elvina. The British realized they were vulnerable at this point and expected an attack to be focused on this area. A French success there could cut off a British retreat to the town of Corunna. During the night Soult ordered artillery manhandled up the steep slopes of the Palavea and Penasquedo ridges in order to prepare for an assault on the British lines the next day.

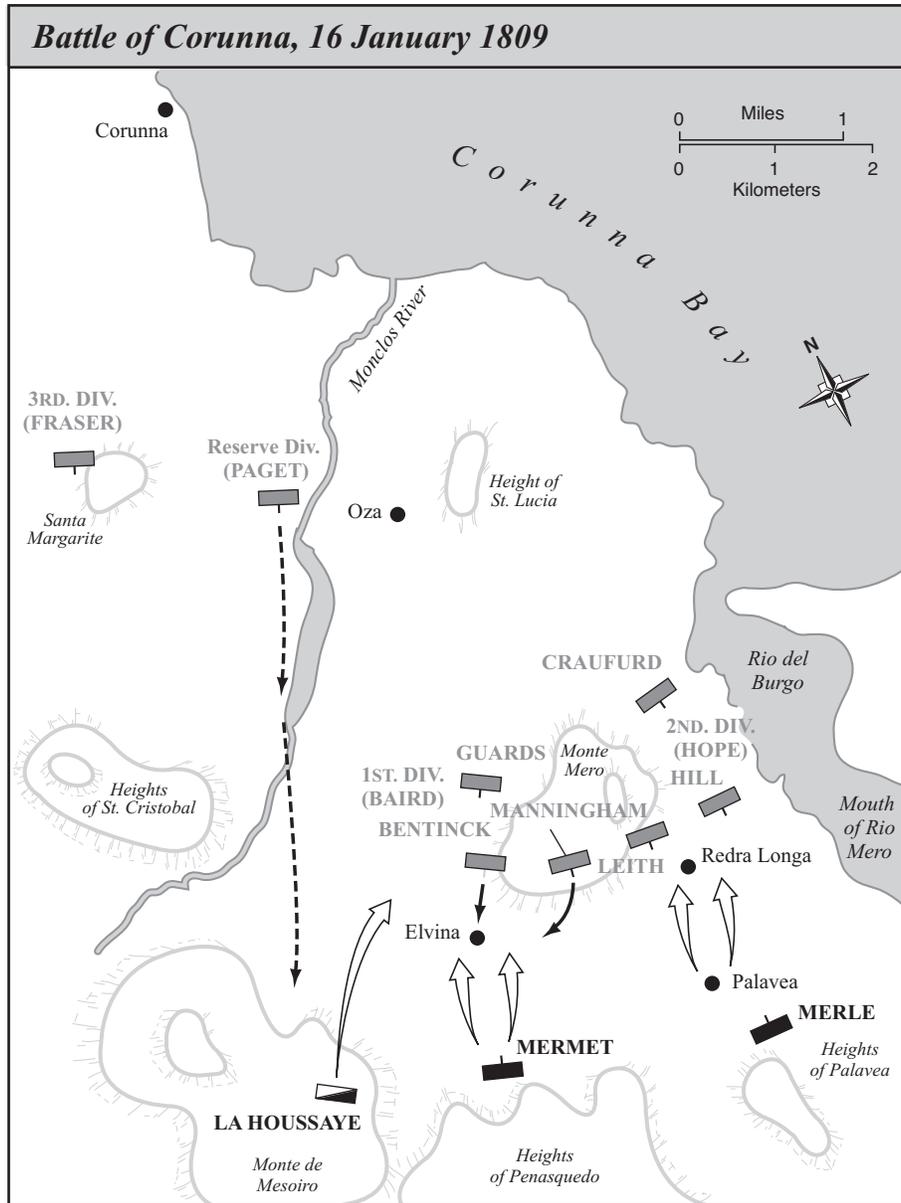

Maneuvering the French forces onto the two ridges proved to be more difficult than anticipated, and it was past noon on the sixteenth before they were in position. The French delay lulled Moore into thinking that Soult would not attack, so he ordered Paget to move his troops back to Corunna and prepare for embarkation. The main

British force would withdraw and board the vessels that evening. However, just before 2:00 P.M., the French launched their assault. French artillery fired upon the British troops in Elvina as infantry streamed toward the village and the hills above it. Initially, the French paid little attention to the British left and center, concentrating their effort on the vulnerable right flank.

Moore ordered Paget to watch for a French attempt to turn the British right flank and sent word for reinforcements in Corunna to move forward. Meanwhile, the French assault forced the British from Elvina and back to their main line above the village. Moore ordered a counterattack, and the British then rushed down the hill and drove the French back from Elvina. Far from defeated, the French launched a second assault and pushed the British defenders of Elvina back out of the village again. British reserves arrived to bolster the main British line, which held against the renewed attack from Elvina despite a determined French effort combined with continuous artillery support. During this phase of the action, Moore received a mortal wound from a round shot (cannon ball) that tore through his left shoulder, nearly severing his arm from his body. After a message was sent transferring command of the army to Lieutenant General John Hope, soldiers carried him from the field.

Paget's men and those of the reserve rushed forward from Corunna and established themselves in positions to oppose the French attempt to turn the British right flank. The terrain in the area consisted of fields containing many stone walls, making it difficult for French dragoons to advance quickly. They made up to three attempts to charge Paget's men, but each assault was easily defeated. The dragoons dismounted, but accurate fire from the British took a heavy toll on their ranks, forcing them to withdraw. Paget continued to advance and overwhelmed the French units to his front. By evening Paget's position lay just opposite the French guns on the Penasquedo ridge. At Elvina the British launched a second attack upon the French forces in the village, and after a long, tough engagement, Soult's troops pulled back. Late in the afternoon, the French right flank moved against the village of Piedralonga, where they encountered stiff resistance. By dusk each opposing force held part of the village.

Both sides opted not to renew the battle the next morning. Hope felt secure in his positions and satisfied with the performance of his army the previous day. Soult had suffered an unexpected reversal and chose not to make another attempt at his opponent's well-defended positions. The British forces completed their embarkation that evening and the next morning. Casualties sustained at the battle are not well documented, not least because many British commanders reported losses from the battle and the retreat to Corunna as one figure. Hope reported 700–800 British casualties at the battle, although some historians believe this

Adapted from Paget 1997, 80.

number is too high. French casualty estimates vary greatly, and historians have placed the figure at approximately 1,500 men.

### Corunna, Retreat to (December 1808–January 1809)

Lieutenant General Sir John Moore assumed command of the British army on the Iberian Peninsula on 6 October

*Adapted from Fremont-Barnes 2002A, 38.*

1808. In the middle of October, Moore ordered approximately 23,000 men to advance toward Spain from Lisbon, where he left a garrison force of 10,000 men. Lieutenant General Sir David Baird would disembark 12,000 troops at Corunna (La Coruña) and advance into northern Spain to cooperate with Moore. The advance of Moore's troops proved to be slower than anticipated owing to poor roads and nearly useless intelligence. By early December Moore's force had finally reached Salamanca, but the defeat of Spanish troops by Napoleon persuaded Moore to withdraw his force back to Lisbon. The army in the Iberian Peninsula represented practically the only offensive land force available to Britain at this time, and Moore did not want to see it crushed needlessly by Napoleon's far larger army in Spain.

However, while withdrawing, Moore learned that Marshal Nicolas Soult's corps lay isolated north of Madrid and might be a ripe target for a quick strike. Moore's men approached Soult's position undetected until they surprised and defeated a small force of French pickets. Learning of Moore's maneuver, Napoleon turned to catch the British general between his force and that of Soult. Moore, however,

realizing he was in a potential trap, immediately turned his army toward the relative safety of Corunna, where he could rendezvous with Baird and have the navy extricate his troops.

Napoleon relinquished direct command of his army and returned to France after learning of Moore's withdrawal toward Corunna. Some scholars believe that Napoleon did not want to be directly associated with a military action that would not end in a clear, decisive victory, while others have countered this argument by declaring that Napoleon had received dispatches indicating possible political trouble in Paris. Whatever the explanation, Napoleon departed after ordering Soult to pursue the British to Corunna and destroy as much of the force as possible. Moore ordered his men and a small Spanish force to move quickly through the desolate mountainous region of Galicia despite the appalling winter weather. The British rear guard under Major General Edward Paget destroyed bridges and fought off the French cavalry riding ahead of Soult's main body.

The British retreat turned into a disaster as thousands of soldiers and camp followers dropped from exhaustion and died where they lay. As the animals pulling the carts of

wounded and sick men became too weak to continue, the soldiers were often left to fend for themselves in the bitterly cold weather. Many accounts of the retreat graphically illustrate the misery of the common soldier in the retreat as well as of the many women and children who accompanied them. At Villafranca, British troops forced open a wine shop, and many of these drunken men were slaughtered when the French cavalry rode into the town.

Moore's men finally reached Betanzos, located 12 miles east of Corunna, on 11 January 1809. The weather grew milder, and the soldiers feasted on the supplies stockpiled in Corunna. Moore prepared for his departure from the town by destroying approximately 4,000 barrels of British gunpowder intended for the Spanish. A Royal Navy squadron and transports arrived on 14 January to evacuate the survivors of Moore's expedition. Over 5,000 men had died during the retreat and 300 were too ill even to embark. Approximately 2,000 overworked horses were slaughtered before the boarding process began. Even then, before completing the evacuation, Moore had to defeat a French assault on Corunna, during which he was killed. Although Moore has been highly criticized for the disasters of the retreat, it should be noted that his force was considerably smaller than the French army in Spain and that therefore it is doubtful that he could have done more than merely harass Napoleon's army. On the other hand, Moore's maneuver in western Spain and subsequent withdrawal did divide and divert the French army, delaying its offensive operations for the 1809 campaign.

## Cossacks

The Cossacks were arguably among the best irregular cavalry of the Napoleonic Wars, and they played an important

role in the destruction of Napoleon's Grande Armée during the Russian campaign of 1812. The Cossacks and their best-known ataman (or leader), Matvei Ivanovich Platov, played an intrinsic part of every Russian campaign, and on two occasions these intrepid horsemen nearly seized Napoleon himself.

For centuries the Cossacks had been seen as wild horsemen of the steppes; some of them were descendants of the Mongol armies that had conquered much of Europe and central Asia. However, during the French Revolutionary and Napoleonic periods, the various Cossack hosts, or tribes, became ever more assimilated into the tsar's empire. There were a number of hosts, including the Ural, Black Sea, Orenburg, Caucasus, and Asiatic Russian Cossacks, but the largest tribe was the Don Cossacks, whose territory stretched for some 2,600 miles.

Cossacks were used for reconnaissance and as messengers, raiders, and skirmishers and occasionally in a policing role. During Napoleon's retreat from Moscow their skill as guerrillas came to the fore. Their relentless hit-and-run tactics caused panic among the Emperor's troops, and one Russian officer praised the Cossacks for their "qualities of mobility, enterprise and ingenuity that characterize a martial nation not yet crippled by the uniformity of methods and regulations typical of European states" (Davidov 1999, 169).

The horse-riding skills of the Cossacks were second to none, and one contemporary observer noted that "children are able to ride on horseback at three or four years of age, and the habits which they generally acquire in infancy are those of the Cossack soldier to subsist on the coarsest of fare, and to endure being mounted all day and even all night if requisite" (quoted in Spring 2003, 27). Their arsenal of weaponry included a knout (a form of knotted whip), a lance, pistols, and carbines, although some Cossacks used a lasso to capture their foe, including the French general Philippe Paul Ségur.

Cossacks acquired a reputation for cowardice for their occasional reluctance to engage directly with opposing troops, but this may be seen as a consequence of their highly mobile style of warfare. Their bravery must be beyond reproach, as they saved the day during numerous battles including Bergen in 1799, Eylau in 1807, Borodino in 1812, and Leipzig in 1813. Cossacks were also depicted by their opponents as marauding bandits, but this is rather disingenuous, as all armies of the period carried out requisitioning in one form or another.

### **Council of Ancients (1795–1799)**

The Directory was established during the turbulent times of the ongoing French Revolution and maintained control over the country from August 1795 to November 1799. It was composed of five directors, who held executive powers, and two legislative bodies, the Council of Five Hundred and the Council of Ancients.

Long before the establishment of the Directory, a National Convention was held, attended by representatives elected by universal male suffrage. The Convention was

modeled after constitutional conventions in the United States, and it lasted from 21 September 1792 until a constitution was agreed upon in June 1793. That constitution was never promulgated, however, due to political purges within the assembly, followed by the establishment of the Reign of Terror.

The notorious Reign of Terror lasted over fourteen months. Finally, French victories on the battlefield, together with increasing public aversion to the guillotine killing spree initiated by leaders of the Terror, led to the end of this period of tyranny. In what became known as the Thermidorian Reaction, former allies of Maximilien Robespierre, leader of the Terror, led a coup against him, executing him along with some of his followers on 28 July 1794.

The remaining political forces moved to consolidate their powers after the coup d'état of Thermidor, with the new government, known as the Directory, eventually established in late 1795. The constitution adopted earlier that year (known as the Constitution of Year III) had created a two-chamber legislative assembly made up of the Council of Five Hundred and the Council of Ancients. Members of these two assemblies were chosen by electors.

From a list submitted by the Council of Five Hundred, the Council of Ancients selected five directors. As evidenced by the “election” format for the directors, the Directory was not particularly democratic. Indeed, throughout France, the right to vote was only given to wealthy property-owning males, which resulted in an electorate of about 30,000.

The Council of Ancients, part of the Directory’s legislative branch, had 250 members, who had to be at least forty years of age. Annually, one-third of the council would be replaced through the electoral process. In addition to the Ancients’ power to select the directors from the Five Hundred’s list, the Ancients approved or rejected legislation created by the Council of Five Hundred. In addition, legislation that was rejected could not be presented to the Council of Ancients again for at least one year. The Ancients, however, were not given the authority to draft legislation.

The Council of Ancients was a short-lived body, as indeed was the entire Directory. From the beginning, government officials were unable to effectively handle royalist uprisings in the Vendée region of France, to deal with financial difficulties, or to prevent a rising young general, Napoleon Bonaparte, from seizing power. The end for the Directory came on 9–10 November 1799, when Napoleon and his co-conspirators carried out the coup of 18–19 Brumaire, leading shortly thereafter to the establishment of the Consulate.

### Council of Five Hundred (1795–1799)

The Council of Five Hundred was part of the legislative branch of the Directory government of France, along with the Council of Ancients. The Directory, which had a five-member executive branch in addition to the two legislative bodies, was established in 1795 and maintained control over France until 1799.

Before the establishment of the Directory the French public had endured the horrific Reign of Terror, which was

filled with bloody executions by the guillotine and political schemes and corruption. The Terror came about because of the void of power created by the failure of the Constitution of 1793. The constitution had been formulated by representatives elected by universal male suffrage through a series of electors, but it was never effectively put into force.

Following the failure of the Constitution of 1793, Maximilien Robespierre and his associates asserted authority over the chaotic government and established the Terror. After over fourteen months of repression, there was a coup against Robespierre, known as the Thermidorian Reaction. The dissidents quickly executed Robespierre and some of his supporters on 28 July 1794 and moved to establish the Directory. It came into full operation in late 1795. Wealthy property-owning males were given the right to vote for the Council of Ancients and the Council of Five Hundred, resulting in about 30,000 eligible electors. Next, the five directors of the government executive had to be “elected.” The Council of Five Hundred was empowered to create a list of candidates from whom the Council of Ancients chose the directors.

In order to be considered for office, members of the Council of Five Hundred had to be over thirty years old and had to possess significant amounts of property. In addition to the power to create the list of possible director candidates, the council had the power to draft new legislation, although it had to receive the approval of the Council of Ancients before the legislation could be presented to the directors. In addition, the members of the council were given the power to declare war against countries considered enemies of France and the Revolution. Legislation passed by the Council of Five Hundred signified the victory of the bourgeois and wealthy classes over the common people, known as the sans-culottes, as exemplified by the Directory’s success in removing price ceilings on such staple foods as bread.

Ironically, the man who saved the Directory from a major royalist uprising also later overthrew the Directory on his rise to power. This man was the young General Napoleon Bonaparte. Seizing upon the Directory’s inability to deal with domestic crises and corruption, Napoleon initiated the coup of 18–19 Brumaire (9–10 November 1799). Significantly, the president of the Council of Five Hundred was Napoleon’s brother, Lucien Bonaparte, who offered considerable assistance to his brother as he struggled to seize power. Failing to win the approval of the Council of Five Hundred during his speech to them on the day of the coup, Napoleon only elicited insults and criticisms. Consequently, the Council of Five Hundred was forced into compliance at the point of the bayonet, when Napoleon’s grenadiers stormed the council’s cham-

bers. Soon after, Napoleon disbanded the Directory and established the Consulate.

### Courtrai, Battle of (11 May 1794)

The Battle of Courtrai was fought as part of a French campaign to seize western Flanders in 1794. General Jean-Charles Pichegru, commander of the French Armée du Nord at this point, had directed his troops to advance into western Flanders during the spring. Pichegru sent two of his divisions to seize Courtrai and Menin in April 1794. After fighting against the Austrians at Mouscron on 28 April, General Joseph Souham's division quickly seized Courtrai. Meanwhile, General Jean Victor Moreau's troops invested Menin, and its garrison surrendered on the twenty-ninth.

Austrian forces and their allies were already in the field, besieging the town of Landrecies as of 19 April. The town capitulated on the thirtieth, allowing the Austrians to respond to the French advances. While Souham's division maneuvered west of Courtrai on 10 May, Austrian general Charles de Croix, Graf von Clairfayt, led an Austro-Dutch column to attempt to retake Courtrai. Clairfayt's troops attacked General Dominique Vandamme's brigade, forcing it to withdraw and seek the support of Moreau's men. By the end of the day, the Austrian and Dutch troops had seized Courtrai and the village of Wevelghem. Clairfayt's forces established a strong defensive line to protect their gains and positioned artillery batteries to support the infantry.

Souham, aware of the Austrians' bold move, maneuvered his division to force Clairfayt's troops back. On 11 May Souham's division attacked Clairfayt's force in the midafternoon, while two brigades under generals Malbrancq and Macdonald, respectively, threatened the Austrian flanks. Austrian artillery sustained a heavy fire against French attacks. Souham's infantry advanced twice into the teeth of Austrian artillery, only to be repulsed with heavy losses. A third French attack forced the Austrian left back and succeeded in threatening Clairfayt's line. As night fell,

Clairfayt accepted that his entire position was compromised and ordered a retreat toward Thielt. Each side had lost around 700 to 800 men.

The Austrian, Dutch, and Prussian forces continued to concentrate near Courtrai, however. On 15 May, Austrian general Karl Mack Freiherr von Leiberich formulated a plan for a complex envelopment of all French forces around Courtrai using six independent columns. The Allies began their enveloping attacks on the eighteenth, leading to a series of engagements, collectively known as Tourcoing. On that day, Souham and his men would again face Austrian assaults around Courtrai.

The Battle of Courtrai on 11 May 1794, then, was merely one in a series of relatively small combats leading up to the more significant Battle of Tourcoing.

### Craig, Sir James (1748–1812)

British general, noted for leading expeditions to Cape Colony and southern Italy. Sir James Craig, a Scotsman, was the son of the judge advocate general of British troops at Gibraltar. He joined the 30th Foot as an ensign at the age of fifteen in 1763. His regiment was based at Gibraltar, where he became aide-de-camp to General Sir Robert Boyd, lieutenant governor of the fortress. He fought in the American War of Independence (1775–1783), where he was severely wounded at Bunker Hill. He later served in Canada and was again wounded in Major General John Burgoyne's advance into New York. He distinguished himself on several occasions during the war, at the close of which he had reached the rank of lieutenant colonel. In 1790–1791 he went to the Continent to study the tactics of the Prussian Army and provided valuable information to General David Dundas, who used Craig's regiment, the 16th, for the new system of infantry exercises that would soon be introduced into the British Army.

During the French Revolutionary Wars Craig, as adjutant general, was placed on the staff of the Duke of York,

then operating in Holland in 1794. Despite concerted efforts Craig found it impossible to rectify much of the disorganization then plaguing the army on campaign, but his efforts toward this end were rewarded by promotion to major general in October 1794. Following the campaign in Holland, he commanded the troops sent to the Cape of Good Hope in 1795, which were to cooperate with forces to be sent from India. Those troops were not present when Craig reached southern Africa, but his advance toward Cape Town ended in success just as the hoped-for reinforcements arrived under General Alured Clarke. After the Dutch relinquished control, Craig assumed command of the civil and military administration of the colony until 1797.

Craig was knighted for his work and thereafter held command of a division in Bengal. There he faced serious problems owing to the disaffection of many East India Company officers, who were nearing the point of mutiny. Craig acted with firmness and managed to avert violence. He saw no action in India but was appointed to command an expedition to capture (Spanish) Manila, an operation that was eventually canceled. He was promoted to lieutenant general in 1801 and returned to Britain to command the troops in the eastern district until 1805.

In March of that year, despite poor health, Craig was sent with the local rank of general on an expedition to the Mediterranean, there to cooperate with a Russian army in Italy to act as a diversion to Allied operations against the French in the north. Napoleon's victories at Ulm and Austerlitz at the end of the year rendered his presence futile, and Craig withdrew to Sicily, which he correctly recognized as a vital base for future British operations in the Mediterranean. His health, however, had been rapidly on the decline, and in March 1806 he left Sicily and passed command to Major General John Stuart.

Craig's health improved sufficiently to allow him further opportunities for command, which he held in Canada with the local rank of general from August 1807. The same month he was made governor-general. In Canada, as elsewhere, he faced a difficult task, as relations with the United States over British naval policy soured to the point of complete breakdown and finally war, in 1812. Nevertheless, French Canadians, not normally enamored of British government, grew fond of Craig, who proved himself an effective administrator. He resigned his post in October 1811 and died in January of the following year, with the rank of full general.

### **Craonne, Battle of (7 March 1814)**

The Battle of Craonne was fought during the Allied campaign in France as Field Marshal Gebhard von Blücher with his Army of Silesia advanced along the river Marne, with the ultimate objective of taking Paris. Blücher intended to mass his army around Craonne but was surprised by Napoleon, who, despite being badly outnumbered, nearly inflicted a defeat on the Allies, owing to a lack of coordination in their movements (see map, p. 553).

Blücher was shadowing the French army and looking for an opportunity to attack with his superior numbers. He hoped to trap Napoleon against the river Aisne, but his plan was foiled by the failure of the Russian general Ferdinand Winzregorode to guard all the bridges over the river. This allowed Napoleon to occupy Craonne. Blücher decided against a frontal assault on the French position and was certain that the French would advance to the west toward his forces. Blücher therefore deployed General Mikhail Semenovitch Woronzoff and his Russian infantry onto the plateau west of Craonne, where it narrowed at the farm of Heurtebrise. Prussian troops under General Dmitry Osten-Sacken were positioned to support Woronzoff. Further to the west Blücher intended that Winzregorode and General Friedrich Graf Kleist von Nollendorf should move to the northeast and then sweep down on the flank of any French attack on the farm of Heurtebrise.

During the evening of 6 March there were limited attacks on the farm. However, at 10:00 A.M. the next morning Marshal Ney ordered a concerted attack on the Russian position led by the Young Guard. The French broke onto the plateau but were then pushed back. Napoleon was able to deploy his Guard cavalry on the flank of the Russian position, which forced them to withdraw. Blücher was now concerned that he had not received any indication that Kleist and Winzregorode were advancing on the flank of the enemy. Blücher rode to the north and found that they had advanced only about half the distance needed to close with the French. Despite the fact that he was not well, Blücher tried to lead the cavalry forward himself. He realized, however, that he would be unable to bring these forces into action quickly enough to have an impact, and therefore he ordered the Russians to withdraw to the north toward Laon.

Many of the Russian officers were surprised by this order and questioned why more Prussian troops had not been brought into action. However, by this time Marshal Mortier had managed to deploy his artillery around Heurtebise. The fire of almost seventy guns made the retreat of the Russians inevitable under the cover of darkness. During the battle Blücher had been unable to make use of his numerical superiority, and Napoleon had achieved localized parity of numbers. Blücher now gathered all his troops around Laon to await the next move of the French. Both sides had lost around 5,000 men.

## Craufurd, Robert (1764–1812)

Major General Robert Craufurd was one of Viscount (later the Duke of) Wellington's best subordinates in the Peninsular War, commander first of the Light Brigade and then the Light Division before his death at the assault on Ciudad Rodrigo in 1812. "Black Bob" Craufurd was one of the finest commanders of light troops in the British Army, perhaps in any army in the Napoleonic period.

Craufurd was born into an aristocratic but not prominent Scottish family in 1764 and joined the British Army in 1779, rising to the rank of captain. Serving initially in Ireland, following the American War of Independence he was put on half pay (reduced pay for officers not on active service) from 1783 until 1787, when he was recalled to the army, serving in the 75th Regiment of Foot in India. While he was on half pay, Craufurd traveled extensively throughout much of Europe, visiting and observing the training of other armies, a rather unusual pastime for a British officer on half pay.

Craufurd saw active service in the campaigns in India against Tipu Sultan, where he first came to the attention of Sir Arthur Wellesley. His regiment, however, did not see fit to promote him to major. Always somewhat hot tempered and cognizant of his own abilities, Craufurd resigned his commission and returned to Europe. He served as a liaison officer with the Austrian armies in both the Netherlands and Italy. This afforded him close observation of the

French forces and their tactics, which he would later use to his advantage in Spain.

Craufurd returned to British service in 1798, serving with the 60th Foot, which would soon be transformed into one of the new light regiments, through its training at Shornecliffe Camp, in Kent, along with the 43rd and 52nd Regiments of Foot, and the 95th Foot (later known as the Rifle Brigade). Craufurd trained with Lieutenant General Sir John Moore, developing not only tactical methods but also a new style of leadership that emphasized the individuality of the light infantryman. This, in addition to his observation of European methods and service as a liaison officer, provided Craufurd with a foundation in the use of light infantry troops far in excess of what most British officers possessed.

In 1807 Craufurd led the Light Brigade, which consisted of the 43rd and 52nd Regiments of Foot and five companies of the 95th Rifles, as part of the expedition to Buenos Aires. The campaign was a disastrous failure, but Craufurd, being relatively junior among the officers involved, emerged from the fiasco with his reputation intact, and he was selected the next year to lead the Light Brigade once more into combat—this time in the Peninsula.

Joining Moore's army in Spain, Craufurd's Light Brigade led the advance toward Madrid and served most effectively as the rear guard of the army as it withdrew to Corunna. Upon the withdrawal from Corunna, Craufurd reconstituted the much-weakened Light Brigade before returning to Spain in 1809 to serve under Wellington. On the eve of Talavera, Craufurd led the Light Brigade on a 250-mile forced march from Lisbon to the battlefield, covering the last 43 miles in twenty-six hours, to arrive in time to perform critical skirmishing duty that covered Wellington's front.

The Light Brigade under Black Bob Craufurd was Wellington's most effective tactical unit. Craufurd could be trusted to push the light troops out to provide both reconnaissance and security for Wellington. The spring and summer of 1810 saw Craufurd commanding the screening forces in Portugal in front of the Lines of Torres Vedras, a mission that he performed exceedingly well. In action, however, Craufurd was often overly aggressive, most particularly on the occasion of his sole major action in independent command, at the Coa against Marshal Ney, where he attempted to defend the crossings of the Coa from the wrong side of the river and nearly suffered a major defeat.

In 1810 the Light Brigade was expanded to divisional status, and Craufurd was promoted to major general. He led the Light Division in several major battles, most notably at Fuentes de Oñoro, where he redeployed his division to save the retreating 7th Division from probable annihilation and then led his own division 2 miles across an

open plain in the face of massed French cavalry. He continued his successful command until he was wounded in the lesser breach during the hurried siege and assault at Ciudad Rodrigo on 19 January 1812. He died of his wounds five days later.

## Czartoryski, Adam Jerzy, Prince (1770–1861)

Adam Jerzy Czartoryski was a descendant of a noble, patriotic Polish family. The political views of his family led him to Russia, where he became a hostage of the court of Tsarina Catherine II as a consequence of his family's part in the Polish revolt of 1794. When the French Revolutionary Wars began, Czartoryski had but one option, to campaign for Poland's independence within the context of some form of cooperation or union with Russia, a policy he pursued while serving as the foreign minister to Tsar Alexander I from 1804 to 1806. Frustrated in his hopes after the Congress of Vienna in 1815, Czartoryski resigned from politics until the uprising of November 1830.

Czartoryski was born in Warsaw on 14 January 1770 to Prince Adam Kazimierz Czartoryski and Izabela (née Fleming). Czartoryski's family originated from among the oldest and most powerful Lithuanian families. In the eighteenth century they became one of the most influential families in the Polish-Lithuanian Commonwealth, heading the Familia political camp. As the oldest son and future head of the family, Czartoryski received a thor-

ough education at home under the best tutors, an education later supplemented by travel to western Europe. During a stay in Paris in 1787 he prepared his first (though utopian) political treatise on the reform of the commonwealth. Over the next few years he observed the work of the Four-Year Diet in Warsaw and traveled to Britain, studying parliamentary government and institutions. In 1792, when the Russo-Polish War broke out, he joined the Lithuanian troops and was rewarded with the Order Virtuti Military for bravery. Following the capitulation of Polish forces, like many other young patriots he left the army and set out on another journey. During the uprising led by Tadeusz Kościuszko against Russian interference in Polish affairs (1794), Czartoryski was in Belgium and Vienna.

Although Czartoryski was not involved in the struggle against the Russian Empire, his family was regarded as antisarist, and as a result Catherine sequestered all the estates of the Czartoryski family in Russian-controlled Polish territory. After receiving secret advice from the former Russian ambassador to Poland, Nikolai Repnin, the Czartoryski family decided to send their two sons, Adam Jerzy and his younger brother Konstanty, to the Russian court. In theory they were to volunteer for service in the Russian Army; in reality they were to be hostages for the family's sequestered goods and property.

The brothers left in January 1795, and in May they arrived in St. Petersburg. The stay at the Russian court must have been humiliating, but on 31 August 1795 Catherine returned to the Czartoryski family almost all its sequestered estates. In September both brothers became lieutenants in the Guards, and in January 1796 they became Gentlemen of the Chamber at the court.

Czartoryski was not happy as a courtier until, in the spring of 1796, he became a dear friend of Grand Duke Alexander, Catherine's oldest grandson, and fell in love with Alexander's wife. Oddly, the young Russian grand duke had nothing against the affair. Yet Alexander's father, Tsar Paul I, on discovering the affair, sent Czartoryski on a pointless and boring mission to Italy to the court of King Charles Emmanuel of Piedmont. On Paul's death in 1801, Czartoryski was summoned back to Russia on the order of the new tsar, Alexander I, his close friend. Returning in July, Czartoryski instantly began work as part of an unofficial committee organized by Alexander to modernize Russia. In particular, Czartoryski was involved in the drafting of educational reforms to be implemented in February 1803.

Yet it was foreign policy that was to occupy young Czartoryski in the years that followed. On 20 September 1802 he was nominated to the post of deputy minister of foreign affairs. It was at this time that Czartoryski pre-

Prince Adam Czartoryski, who as foreign minister under Tsar Alexander played a key role in the formation of the Third Coalition against France. (George Dawe [1781–1929]/Hermitage, St. Petersburg, Russia)

sented a memorandum on the foreign policy principles that he believed should guide Russia. The memorandum, written in French, stated that politics should be based on justice and morality. He also suggested ways that international relations in Europe should be changed. In particular, he proposed that the balance of power could be maintained through the organization of four federations: one composed “of the French race” (France, Belgium, and Spain); another of Slavic peoples headed by the Russian tsar; a third based on states of Germanic stock, including Holland and Switzerland, though not including Austria or Prussia; and, finally, a federation composed of Italian states.

On 7 February 1804 Czartoryski became Russia’s acting minister of foreign affairs. He tried to steer Russia’s foreign policy more toward Asia and the Balkans, but without lasting effect. Czartoryski’s attempts to build an anti-Napoleonic coalition became reality when on 11 April 1805 Russia concluded an offensive alliance with Britain, to which Austria adhered in July, thus forming the Third Coalition. Prussia also signed a treaty with Russia, at Pots-

dam, on 3 November. Yet the defeat of Austro-Russian troops by Napoleon at Austerlitz on 2 December brought the Third Coalition to an end. It also ended Czartoryski’s political visions and resulted in his resignation, which was accepted in June 1806.

The following year Czartoryski was involved in preparing a project according to which Alexander was to reestablish the Polish kingdom under his own rule, Poland having been divided up between Russia, Prussia, and Austria in three partitions (1772, 1793, and 1795). These plans proved impossible to implement when the Duchy of Warsaw was created by Napoleon. Czartoryski watched, from a position of neutrality, the birth of the duchy and its expansion after Napoleon’s war with Austria in 1809. Only when Franco-Russian relations began to worsen did Czartoryski once more return to the idea of a Polish kingdom in some confederation with the Russian Empire.

In June 1812, when Napoleon entered Russian territory, a Polish General National Confederation was created in Warsaw. It was headed by Adam Kazimierz Czartoryski, Adam Jerzy’s father. Even though the aim of the confederation was an independent Poland, Adam Jerzy decided to remain neutral and not join it. Thus, in December 1812, after Napoleon’s army had retreated from Moscow, he could once more appeal to Alexander to create a Polish kingdom with connections to or as an integral part of the Russian Empire. He laid down his ideas before Alexander at the beginning of 1814, after the invasion of France. Czartoryski’s proposal was adopted by the Congress of Vienna after the treaty was signed on 9 June 1815. The territory of the Congress Kingdom of Poland, established under the rule of Alexander, was smaller than that of the Grand Duchy of Warsaw and was the object of severe criticism from various Polish politicians.

Czartoryski was not offered any significant office in the new Congress Kingdom of Poland, and as a result he withdrew from politics until the death of Alexander in 1825. Owing to his involvement in various proscribed activities during the 1830–1831 uprising against Russia, he was forced to emigrate to western Europe, where he was active in Polish political activities in Paris and London.

## **Dardanelles, Expedition to the (1807)**

Unsuccessful British attempt in February 1807 to force the Ottoman Empire (Turkey) to abandon its war with Russia by threatening Constantinople with the Royal Navy.

In late 1806 Britain found itself in the uncomfortable position of having two allies drifting toward war with one another. One of these was Russia, whose massive armies served as the only remaining counterweight to Napoleon's ambitions to continental dominance after the French victories over Austria in 1805 and Prussia in 1806. The other was the Ottoman Empire, which Britain had traditionally supported in order to prevent any other power from gaining control of the Black Sea Straits (the Bosphorus and the Dardanelles), which provided access between the Black Sea and the Mediterranean Sea.

Despite British opposition, French influence in the Ottoman Empire grew through the efforts of their ambassador, General Horace François Sébastiani, as a result of which Sultan Selim III declared war on Russia on 27 December 1806 as the final culmination of a series of moves between the rivals in the Balkans. The presence off Constantinople—located directly on the Bosphorus—of HMS *Canopus*, an 80-gun ship of the line, failed to deter the declaration, and a frigate evacuated British civilians.

The British naval commander in the Mediterranean, Vice Admiral Sir Cuthbert Collingwood, had anticipated trouble and begun to assemble forces. A small squadron of

three ships of the line, one frigate, and one sloop, followed later by another five line-of-battle ships and smaller vessels, was placed under the command of Vice Admiral Sir John Duckworth. This show of force, however, did no more than had the *Canopus* to deter Selim, and Duckworth resolved to execute his instructions and deliver the British government's ultimatum to the sultan to end the war with Russia.

Duckworth's squadron forced the Dardanelles on 19 February 1807 after defeating the Ottoman defenses, both afloat and ashore. Safe in the Sea of Marmora, the British admiral demanded that the sultan expel Sébastiani and declare his intention to make peace with Russia within twenty-four hours, or else face the bombardment of his largely defenseless capital.

The British effort had achieved surprise, and Selim initially seemed inclined to accept the ultimatum, but foul weather forced the British squadron to shelter away from the city. This delay gave the sultan and his government time to find their resolve and resist British demands. The population of the city, ably guided by Sébastiani and a small staff of French engineers, assembled over 1,000 guns on the shores to defend the capital.

Unable to overcome the Turks with his small squadron, Duckworth took advantage of favorable winds and currents to retreat back through the Dardanelles into the Mediterranean. The return passage was to prove more costly than the initial forcing of the straits, however, as Duckworth suffered damage to his ships as well as casualties among their crews. This experience in mind, Duckworth refused to make a second effort against Constantinople without the reinforcement of troops on land, even with assistance from Russian naval forces.

This failure at Constantinople, in spite of the difficulties Duckworth faced, ruined his reputation at home. The Russo-Turkish War continued without much enthusiasm on either side until 1812, and despite Britain's aggressive action and the losses suffered and inflicted by the Royal Navy, no official Anglo-Turkish War resulted, though an

expedition was dispatched to Egypt the following year, with disastrous consequences for British forces there.

### David, Jacques-Louis (1748–1825)

One of the greatest French painters and central figures of Neoclassical art. Born into a middle-class Parisian family, Jacques-Louis David was trained by Joseph-Marie Vien and followed him to Rome in 1776, where he won the Prix de Rome for his art. Influenced by Classical artworks, he developed a unique Neoclassical style, drawing his subject matter from Roman sculpture. He returned to Paris in 1780 and soon firmly established himself as one of the leading painters of Neoclassicism. His paintings reflected the new ideals of the civic virtues, and among his famous works of this period were *The Oath of the Horatii* (1784), *The Death of Socrates* (1787), and *Brutus and His Dead Sons* (1789). The French Revolution had a great impact on David's career as he became actively involved in Revolutionary activity. He was elected to the Convention, where he sided with radical Montagnards, voted for the execution of King Louis XVI, and later became a member of the powerful Committee of Public Safety.

During this period his paintings went through a change, becoming more realistic in order to accurately depict scenes of the Revolution. His greatest paintings of this period are the famous *The Death of Marat* (1793) and *The Oath of the Tennis Court* (1791), but he also made interesting sketches of various personalities, including those of Queen Marie Antoinette and Georges Danton on their way to the guillotine. After the coup of Thermidor in 1794, David was imprisoned for his support of Maximilien Robespierre, but he was later released. Under the Directory, he completed *The Intervention of the Sabine Women* (1799) before the rise of Napoleon Bonaparte in the coup d'état of November of that year changed his fortunes. He became official painter of the First Consul and later of the Emperor and was commissioned to paint many works of art that often served as propaganda tools in the hands of Napoleon. Among his greatest works of this period were *Bonaparte Crossing the Alps* (1800), *Coronation of Napoleon* (1805–1807), and *Napoleon in*

*His Study* (1812). David also produced numerous portraits, including portraits of Pope Pius VII (1805) and Madame Jeanne Récamier (1800).

With the fall of Napoleon, David was persecuted by the Bourbon dynasty and went into exile in Brussels, where he remained for the rest of his life. His influence over French art diminished over time, although he trained several distinguished painters, among them François Gérard, Antoine Gros, and Jean-August Ingres. He died on 29 December 1825 and was buried at the Evère Cemetery in Brussels. His heart was interred separately at the famous Père-Lachaise Cemetery in Paris.

### Davout, Louis Nicolas (1770–1823)

Louis Nicolas Davout, Marshal of the Empire, duc d'Auerstädt, prince d'Eckmühl, was born 10 May 1770 at Annoux and died 1 June 1823 at Savigny. He served in the French Army from 1788 to 1815, and took part in the many of the campaigns of the 1790s, including Bonaparte's expedition to Egypt. In command of III Corps of the Grande Armée, he fought at Austerlitz, defeated a Prussian army at Auerstädt, and served at Eylau, Eggmühl (Eckmühl), and Wagram. In 1812 he was wounded at the Battle of Borodino in Russia, and he commanded the besieged city of Hamburg in 1813–1814. During the Hundred Days, Davout was minister of war.

His father, Jean-François d'Avout, was of the cadet branch of the noble d'Avout family that traced its origins back to the Middle Ages. His mother, Catherine de Somme, was also of a Burgundian noble family. At the age of nine years he was enrolled in the Ecole royale militaire (Royal Military Academy) at Auxerre. Upon completion of the course of study at Auxerre in September 1785, Louis d'Avout received an appointment to the Ecole militaire (Military Academy) in Paris. After two and a half years as a "gentleman cadet," he was commissioned a second lieutenant in the Royal Champagne Cavalry Regiment.

When the French Revolution began in 1789, d'Avout supported the Revolutionary movement. This led to a brief confinement in the citadel d'Arras for his political activism, followed by his dismissal from the army (15 September 1791). He arrived home in the department of Yonne when a volunteer battalion was being formed. D'Avout enlisted as a common soldier, and because of his military experience he was elected lieutenant colonel, second in command. Designated the 3rd Volunteer Battalion of the Yonne, it joined the Army of the North. The colonel of the battalion was a politician with no military experience; thus it was the twenty-one-year-old d'Avout who actually organized and trained the men. When war broke out with Austria and Prussia in April 1792, d'Avout led the battalion into battle. It was also at this time that Louis Nicolas changed the spelling of his name to "Davout" in keeping with the egalitarian spirit of the French Revolution.

The Revolution moved into its republican phase in September 1792. The deposed king was tried in December as citizen Louis Capet and executed on 21 January 1793. The extreme political left, the Jacobins, gradually gained control of the government in Paris. Loyalty to the government became the first priority for an officer in the army. Aristocrats either left the army or were purged. As a supporter of the government, Davout was promoted to the rank of colonel on 1 May 1793 and to *général de brigade* on 3 July 1793. As the Reign of Terror intensified, he realized that owing to his noble birth he would not be allowed to remain in the army. Before he was discharged, therefore, he resigned his commission (29 August 1793) and retired to his mother's home at Ravières.

For fourteen months Davout lived quietly in the Burgundian countryside while the Terror took its toll on civilians and soldiers alike. Then Jacobin control of the government came to an abrupt end on 27 July 1794. The pendulum began slowly to swing back toward the political center, and Davout requested to be reinstated in the army. On 11 October he was commissioned *général de brigade* and given command of a cavalry brigade with the Army of the Moselle. During the next three years he served with various armies on the northern front and on the Rhine. When Bonaparte's successful campaign in northern Italy resulted in a general armistice concluded at Leoben in April 1797, the five years of continental conflict came to an end.

Britain alone remained at war with France. Unable to cross the English Channel, the French decided to strike east in the direction of British-controlled India. To this end, in May 1798 Bonaparte with some 35,000 men sailed to Egypt to establish a French colony as a possible stepping-stone to India. Davout was invited to accompany the expedition. Landing near Alexandria, the army marched south

to Cairo. Within sight of the Pyramids at Giza, a major battle was fought in which the army of the Mamelukes was defeated and driven south up the Nile valley. General Louis-Charles Desaix was assigned the task of following the enemy and securing Middle and Upper Egypt. Davout was given command of the cavalry attached to Desaix's division. During the winter and spring of 1798–1799 he marched and fought from Cairo to Aswan. By the summer of 1799, Davout was back in the vicinity of Cairo in command of cavalry.

During Bonaparte's absence from Europe, a second coalition was formed against France that included the Ottoman Empire. Hoping to regain control of Egypt, a Turkish army landed at Aboukir in July 1799. Davout commanded a part of Bonaparte's army that drove the enemy back into the sea. Bonaparte then turned over command to General Jean-Baptiste Kléber and sailed back to France. When Kléber, realizing the hopelessness of the army's position in Egypt, signed a peace treaty with the British and Turks at El Arish, Davout received permission to return to France, where he arrived at Toulon on 6 May 1800. In a show of gratitude for his service in Egypt, Bonaparte, who had become First Consul of the Republic following the coup of Brumaire in November 1799, promoted Davout to the rank of *général de division* (3 July 1800) and gave him command of the cavalry in the (French) Army of Italy. Davout commanded the cavalry under General Guillaume Brune at Monzambano (25–26 December), where he broke the Austrian center and secured a French victory. But it was General Jean Victor Moreau's victory at Hohenlinden, north of the Alps, that brought the Austrians to the peace table, putting an end to the Second Coalition with the Treaty of Lunéville (8 February 1801).

The Second Coalition having been destroyed, the First Consul was able to settle affairs with Britain in the Treaty of Amiens, concluded in March 1802, which brought general peace to Europe. Davout was employed first as inspector general of cavalry, then as commander of the foot grenadiers of the Consular Guard (the forerunner of the Imperial Guard), and finally, on 29 August 1803, as commander of the camp at Bruges. It was during these years of peace that Davout found the time to court and marry Louise-Aimée-Julie Leclerc (9 November 1801). She was the pretty, eighteen-year-old sister of General Charles-Victor Emmanuel Leclerc, who was married to Bonaparte's sister Pauline. Thus, Davout became a part of the extended Bonaparte family and the beneficiary of a dowry of 15,000 francs that came with the hand of Mademoiselle Leclerc.

The Peace of Amiens was in fact only a truce on the part of two war-weary nations. By May 1803 France and Britain were again at war. Bonaparte realized that only a military solution would settle affairs between the two

nations. Therefore, he began to prepare for an invasion of the island kingdom, amassing an army along the English Channel. Davout's command at Bruges was designated III Corps of the Grande Armée. Then, on 18 May 1804, the French Empire was proclaimed, and Napoleon Bonaparte, general and First Consul, became Napoleon I, Emperor of the French. The following day, he promoted eighteen *général de division* to the rank of Marshal of the Empire. Davout was among those who received a marshal's baton.

When Austria and Russia joined Britain to form the Third Coalition in the summer of 1805, Napoleon ordered the Grande Armée to turn its back on the English Channel and to march across the Rhine into southern Germany. Destroying an Austrian army at Ulm under *Feldmarschalleutnant* Freiherr Karl Mack, he marched down the Danube to Vienna. The Russian army reached central Austria too late to save Mack's army, which surrendered at Ulm, and retreated before the French, back into Moravia.

By the end of November, Davout's III Corps had occupied Vienna and a section of the middle Danube east to Pressburg. When Napoleon realized that a major battle was imminent, he concentrated his army at the critical point. To this end, he ordered Davout to join him as quickly as possible. The marshal marched north from Vienna, covering the 70 miles to Austerlitz in forty-six hours. Tsar Alexander I and the Austrian emperor, Francis II, were present with the Allied army. As they enjoyed a numerical superiority over the French (85,000 Russians and Austrians to 73,000 French), they decided to attack. Davout held the French right wing against the main Russian advance, while Marshal Nicolas Soult's IV Corps broke the Russian center. So successful were Napoleon's tactics that the Russian center and left wing were shattered and fled from the field of battle in great confusion. This was the first time that Davout had played a major role in a Napoleonic battle, and he performed superbly. Had he been driven from his position, the battle would have been lost for the French.

The Treaty of Pressburg (26 December 1805) brought an end to the Third Coalition, although Russia and Britain were not signatories to the treaty. Alexander took his battered and defeated army back to Russia, and Napoleon established his army's winter quarters in southern Germany. Prussia had remained neutral in 1805, but in the summer of 1806 King Frederick William III was ready to drive the French out of Germany. Napoleon gathered his forces in northern Bavaria to meet the advancing Prussians. The clash took place on 14 October, when Napoleon with 90,000 men defeated 40,000 Prussians at Jena under Friedrich Ludwig Fürst zu Hohenlohe-Ingelfingen (Prince Hohenlohe), and Davout's III Corps of 28,000 defeated the Duke of Brunswick's 63,000 men at Auerstädt. It was

Davout's finest hour, and the basis upon which his reputation as a great commander rests. The Prussian army was destroyed, and its remnants retreated in great disorder to the north and into East Prussia. Two years later, Napoleon, as a token acknowledgment of Davout's victory, bestowed upon the marshal the title of duc d'Auerstädt.

Although the Prussian army was no longer able to take the field, the Russian army had not yet been engaged. As Russia was still at war with France, Napoleon continued his march east into Poland. On 7 February 1807, the Russian army under the command of General Levin Bennigsen gave battle at Eylau in northeastern Poland. Davout's III Corps once again formed Napoleon's right wing; and although it was able to drive the enemy back, the Russians held their line intact until darkness brought an end to the fighting. During the night, Bennigsen led his weary men east into winter quarters. The exhausted French also returned to winter quarters, around Güttsstadt, Osteröde, and elsewhere. Napoleon claimed victory as he occupied the field of battle, but in fact Eylau was a draw. After the campaign resumed in the spring, Napoleon was able to decisively defeat the Russian army at Friedland on 14 June; the Treaty of Tilsit followed, bringing peace to the Continent.

By the terms of Tilsit, Alexander reluctantly agreed to the creation of the Duchy of Warsaw. This reestablished Polish state was not independent but, rather, under the nominal rule of the king of Saxony. In fact, it was Napoleon who controlled the duchy through his governor-general, Davout. With his headquarters in Warsaw, Davout commanded all troops, both French and Polish, in the duchy. For the next two years he served as an administrator, a diplomat, and the eyes and ears of the Emperor.

Frustrated by the treaties imposed on it by Napoleon and heartened by resistance in Spain, Austria decided once again upon war with France in the spring of 1809. With 200,000 French troops tied down in the Iberian Peninsula, Davout's III Corps was the cornerstone upon which Napoleon built his army to meet the Austrian challenge. Davout played a crucial role in the Battle of Eggmühl. His III Corps held the Austrian army at bay while Napoleon arrived with reinforcements on the enemy's left flank. In recognition of his role in defeating the Austrians, Napoleon gave Davout the title of prince d'Eckmühl on 15 August. However, the Battle of Eggmühl had not ended the campaign of 1809. The Austrians retired to the left bank of the Danube, leaving Vienna in the hands of the French. After a serious setback at Aspern-Essling (21–22 May), Napoleon defeated the Austrians at Wagram on 6 July. Once again Davout formed the army's right flank and steadily pushed the enemy back. However, it was General (soon Marshal) Nicolas Charles Oudinot who broke the Austrian center, causing the Archduke Charles to retreat to the

north. When the French again caught up with him, Charles asked for an armistice, which, in turn, led to the Treaty of Schönbrunn (14 October).

There followed nearly three years of peace in central Europe. The war in Spain and Portugal continued to drain the resources of France, but for Davout in Germany it was again a time of administration and organization, not fighting. However, by the beginning of 1811, Napoleon was preparing for war with Russia. The army was reorganized, and Davout was given command of 70,000 men designated I Corps of the Grande Armée. When his corps crossed the Niemen River into Russia on the night of 23–24 June 1812, it was the best trained and best equipped of all of the corps of the army except for the Imperial Guard. The Russians retreated east through Smolensk, where Davout took part in the fighting before the city. General Mikhail Kutuzov, who commanded the Russian army, was pressured into giving battle in defense of Moscow, taking up a strong position at Borodino on 7 September. Davout's corps formed the right center of the Grande Armée, and together with Marshal Michel Ney's IV Corps attacked and captured the redoubts that were the key to the Russian position. Davout was twice wounded during the battle, but, although in great pain, he refused to relinquish command. The Russian army held a continuous line until darkness brought an end to the struggle. During the night Kutuzov led his battered army east through Moscow to a position southeast of the city. Napoleon occupied the city, and following the great fire Davout took to his bed to recover from his wounds.

When Alexander refused even to discuss terms of a treaty, Napoleon realized that he could not winter in a burned-out city 500 miles deep in enemy territory. On 18 October the French army began its ill-fated retreat from Moscow. Davout's troops formed the rear guard of the army in the first weeks of the westward march. But when he proved too slow, Ney replaced him. From Smolensk the withdrawal turned into a retreat; and after crossing the Berezina River, the retreat became a disaster as the French army continued to disintegrate. Davout, although recovered from his wounds during the five weeks the army had remained in Moscow, suffered greatly, as did the remnants of the once-mighty army.

Napoleon returned to Paris early in December to raise and organize a new army in order to continue the struggle in central Europe. As part of this new organization, Davout was given command of the troops on the lower Elbe and the task of recapturing Hamburg, which had rebelled against the French. When the campaign of 1813 began late in the spring, Davout established his headquarters in Hamburg, now retaken, and commanded XIII Corps of the new army. Napoleon won battles at Lützen, Bautzen, and Dres-

den but was defeated at the Battle of Leipzig on 16–19 October. As the French army retreated back across the Rhine, Davout and XIII Corps were cut off from France, encircled, and besieged in Hamburg. The marshal had had time to prepare for a prolonged siege, and the Allies were more interested in invading France proper than in compelling Davout to surrender the city. Napoleon was forced to abdicate on 6 April 1814 and was exiled to Elba. However, it was not until 11 May when General Maurice Etienne Gérard arrived in Hamburg with orders from the new (Bourbon) minister of war that Davout handed over command of the city and retired to his home at Savigny-sur-Orge.

Davout found himself clearly out of favor with the new Bourbon court in Paris. Louis XVIII would not receive him, and he was forbidden to come to Paris. He was living quietly at Savigny just south of the capital when news arrived in March 1815 that Napoleon had returned, the king had fled, and the Empire was restored. Davout immediately went to Paris in support of Napoleon, who persuaded him to accept the position of minister of war. The Battle of Waterloo put a permanent end to Napoleonic rule, and Davout once again retired to Savigny. But his support of Napoleon during the Hundred Days and his defense of Ney at the latter's trial led to Davout being banished to Louviers in central France (27 December 1815) and placed under police surveillance. Deprived of his military pay and the revenue of his estates outside of France, the marshal lived a meager life until he was allowed to return home on 21 June 1816. He made his peace with the Bourbons and was restored to his military rank and pay in August 1817. The king even named him to the House of Peers. Davout lived quietly at Savigny until his death on 1 June 1823.

**Davy, Sir Humphry (1778–1829)**

Humphry Davy, the founder of electrochemistry, was born to a poor but respectable Cornish family. He received a grammar school education but little formal training in chemistry or other sciences. His independent chemical studies began in 1797. The radical physician and chemist Thomas Beddoes, impressed with the young man's experiments on light and heat, recruited him for his Pneumatic Institute to investigate the medical effects of breathing different gases. Davy was now able to devote most of his time to science and scientific research. He experimented with nitrous oxide, "laughing gas," and other gases, including carbon monoxide, experiments that may have shortened his life.

Alessandro Volta's discovery of the "voltaic pile," or battery, in 1799 revolutionized Davy's science. Davy's analysis of the pile, which demonstrated that electrical current was generated not by mere contact but by the oxidation of zinc, was first published in 1800 and led to his elec-

tion as a Fellow of the Royal Society in 1803. Even more important, in 1801 he left Bristol and moved to London, to the newly formed Royal Institution. Davy shone at the institution, where his spectacular lecturing style assured that his demonstrations were always crowded. His most important scientific work was devoted to the electric decomposition of chemical compounds. The use of electricity to decompose water into oxygen and hydrogen was already known, but Davy broadened electrochemistry immensely. He discovered, named, and classified as metals potassium and sodium, producing these "new elements" by the electrical decomposition of potash and soda in 1807. He also isolated and named chlorine as an element.

Davy's move from Bristol and the radical Beddoes to the Royal Institution was accompanied by a growing political conservatism. Davy wanted the prizes British society offered, and he gained many of them. He was knighted and married an eligible London heiress, Jane Apreece. Davy and his wife toured France and Italy, rather difficult as France and Britain were at war. Despite the conflict, Davy received a prize in electrical research endowed by Napoleon.

On his return, he invented a safety lamp for coal miners. The candles and lamps used by coal miners were setting off explosions of methane, making an already-dangerous job even more so. Davy's laboratory experiments with samples of the gas revealed that a lamp could be made safe by using very narrow metal ventilation tubes, later changed to metallic gauzes. The lamp, which Davy refused to patent, thereby forfeiting hundreds of thousands of pounds, did not end explosions in coal mines but was successful in bringing Davy even more fame and honors—a hereditary baronetcy, the highest honor the British Crown had ever bestowed on a scientist, and the presidency of the Royal Society in 1820. His declining health forced him to resign the position, and he moved to the Continent, dying in Geneva in 1829.

**Davydov (Davidov), Denis Vasilievich (1784–1839)**

Russian cavalry commander and guerrilla leader. Denis Vasilievich Davydov was born to a prominent Russian

noble family and enlisted as an *estandard junker* (officer candidate or cadet) in the Chevalier Guard Regiment on 10 October 1801, rising to cornet on 21 September 1802 and to lieutenant on 14 November 1803. For writing satires about his superiors, Davydov was transferred to the Byelorussia Hussar Regiment on 25 September 1804, and then, on 16 July 1806, he joined the Leib Hussar (Life Guard Hussar) Regiment with the rank of lieutenant. On 15 January 1807 he was appointed an adjutant to Prince Peter Bagration and rose to staff *rotmistr* (a rank in the Guards, equivalent to major in the regular forces of the Army) on 26 January 1807. During the campaign in Poland, he served in Bagration's detachment, participating in numerous rearguard actions as well as in the major battles of Eylau (for which he garnered a golden cross), Güttsstadt, Heilsberg, and Friedland. For his actions he was decorated with the Order of St. Anna (2nd class) and the Prussian Pour le Mérite.

From February to April 1808, during the Russo-Swedish War, Davydov again served under Bagration in Finland and then joined General Jacob Kulnev's advance guard, fighting at Sikaioki, Karloe, Lappo, Perho, Kuhalambi, Kuortain, Salmi, Oravais, and Gamle-Kamlebi. In April 1809 he took part in Bagration's expedition to the Åland Islands. In July 1809 he followed Bagration to the Danubian Principalities, where Davydov fought against the Turks at Macin, Girsov, Rassevat, Silistra, Tataritsa, and Shumla (for which he received the Order of St. Anna [2nd class]). Promoted to *rotmistr* of the Leib Hussar Regiment on 16 March 1810, he transferred as a lieutenant colonel to the Akhtyrsk Hussar Regiment on 20 April 1812.

During the 1812 campaign, Davydov served in the 14th Brigade of the 4th Cavalry Division in the 7th Corps of the 2nd Western Army and participated in the battles at Romanovo, Saltanovka (Mogilev), and Smolensk. Following the battle at Smolensk, Davydov organized, with Bagration's consent, a guerrilla detachment to harass the French communication and supply lines. He distinguished himself at Lyakhov, where his troops captured an entire French brigade from General Pierre-François-Charles Augereau's corps. He then fought at Vyazma, Krasnyi, Kopys (for which he received the Order of St. George [4th class]), Shklov, Starosel, and Grodno. For his actions in 1812 Davydov was promoted to colonel and awarded the Order of St. Vladimir (3rd class).

In 1813 Davydov commanded a detachment in General Ferdinand Winzgorode's forces at Kalisch and later made a daring raid on Dresden, capturing Neustadt in March. However, he acted without orders during this operation, for which he was relieved of command and transferred to Major General Sergey Lanskoj's detachment. He then took part in the actions at Predel, Ezdorf, Ubigau,

Bautzen, Dresden, Reichenbach, Zeitz, Altenburg, Chemnitz, Naumburg, and Leipzig, as well as in the pursuit of the French army to the Rhine. For his actions in 1813 he received an imperial letter of gratitude. The following year Davydov commanded the Akhtyrsk Hussar Regiment in France, distinguishing himself at Brienne, La Rothière (where he was promoted to a major general on 2 January 1816 with seniority dating from 1 February 1814), Montmirail, Château-Thierry, Laon, La-Fère-Champenoise, Craonne, and Paris.

Returning to Russia, Davydov served as an assistant to the commander of the 1st Dragoon Division (2 January 1815) and then in the same capacity in the 2nd Horse Jäger Division (26 March 1816) and the 2nd Hussar Division (3 June 1816). On 19 November 1817 he took command of the 1st Brigade of the 2nd Hussar Division. On 3 March 1818, he became the chief of staff for the 7th Infantry Corps and, on 6 March 1819, for the 3rd Infantry Corps. He was relieved of command on 29 March 1820 and retired because of illness on 26 November 1823, but he returned to the army on 4 April 1826. Davydov participated in the Russo-Persian War in 1826, fighting at Amymly and Alagez, and he constructed the fortress of Djelal-Oghlu. However, his health quickly deteriorated, and he had to take an extended furlough to recuperate in 1827. Four years later, he returned to the army during the Polish uprising, taking command of a cavalry detachment of one dragoon and three Cossack regiments. He captured the town of Vladimir (Volhynia) on 18 April 1831. He then commanded the advance guard in General Fedor Ridiger's corps, earning his promotion to lieutenant general on 18 October 1831 and the Orders of St. Anna (1st class) and of St. Vladimir (2nd class).

After the campaign Davydov returned to his estate of Verkhnyaya Maza in the Simbirsk *gubernia* (province), where he died on 4 May 1839. Before his death, he organized the transfer of Bagration's remains from the village of Simy for reinterment on the Borodino battlefield, where he had received his mortal wound.

Davydov left a diverse literary legacy. In addition to numerous poems and lyrics, he wrote articles and memoirs that remain important sources for the study of the Napoleonic Wars. They contain vivid and insightful accounts of the military actions and interesting characterizations of the prominent Russian commanders.

### Dego, Battle of (14–15 April 1796)

The favorable outcome of the fiercely contested combats of 14 and 15 April 1796 at Dego, a small village and a key point in the upper Bormida River valley, allowed Bonaparte to consolidate the strategic advantage gained in the opening stage of his first Italian campaign. After Dego, the Austrian *Feldzeugmeister* Johann Peter Freiherr von Beaulieu decided definitively to retreat from Liguria toward the plain of Alessandria, thus abandoning the Piedmontese (Sardinian) army to its fate.

Following the Battle of Montenotte and its general advance from the Ligurian coast on 12 April, Bonaparte's Army of Italy had reached the Altare-Cairo-Carcare salient in the upper Bormida valley, thereby driving a wedge between Michael Freiherr von Colli's Piedmontese around Ceva in southwestern Piedmont and Beaulieu's Austrians on the Apennines behind Savona. Bonaparte spent the following day in consolidating his position and dispatching scouts to discover Colli's whereabouts and prevent any Austrian counterattack. While marching westward to take Montezemolo and establish a junction with General Jean Sérurier's division in the upper Tanaro River valley, General Pierre-François-Charles Augereau ran into *Generalmajor* Giovanni, Marquis Provera's Austro-Piedmontese Auxiliary Corps. Hopelessly outnumbered, 900 Sardinian grenadiers and Croats gallantly resisted in the ruined castle of Cosseria, between Carcare and Millesimo, up to the morning of the fourteenth, inflicting appalling losses on the enemy.

At this stage, Beaulieu still had a chance to reverse the situation. By using Dego as a strongpoint, he could have rallied his scattered troops and struck at the enemy's right flank. With Colli's support from the west, he might have succeeded in driving the French back to the coast. At first, the Austrian commander considered this option, but later he changed his mind and remained around Acqui.

On 14 April Bonaparte, with a substantial part of his army, made for Dego, which was held by a force of about

3,000 Austrians and Piedmontese with sixteen to eighteen guns. The road approaching the village from the south ran along the eastern bank of the Bormida through open countryside. At Dego the valley narrowed, and a chain of steep knolls covered with entrenchments lay behind the village and its castle. General André Masséna's division advanced forward in two columns along the eastern bank. General Amédée-Emmanuel-François Laharpe followed on the far bank. By dusk the French had expelled the enemy from all defensive positions, taking sixteen guns. The Austrians lost 350 killed and wounded, and 1,500–2,500 men were taken prisoners. The French lost 200 men.

Tired and hungry, Masséna's men settled down in Dego and began pillaging, many units becoming scattered. French disorder, pouring rain, and thick fog favored an unexpected Austrian counterattack. With about 3,000 men, *Generalmajor* Philipp Freiherr Vukassovich advanced from Sassello during the night and fell on the enemy at dawn on the fifteenth. Surprised and disorganized, the French were soon in full rout, leaving hundreds of prisoners behind. Masséna, who had apparently spent the night elsewhere—the received view contending that he was either with a woman or collecting loot—arrived late on the spot. By noon, however, he managed to rally about 3,000 of his men, Laharpe and Claude Perrin Victor also coming up with reinforcements. A new attack on Dego began in the afternoon, with the French adopting the same tactical approach as they had the day before. Hard fighting continued for hours. In the end, Vukassovich was forced to give up and withdrew to Spigno. On the second day of the battle the Austrians had 650 killed and wounded, and about 1,000 were taken prisoner; the French lost 600 killed and wounded, and 300 were taken captive.

### Denmark

Denmark, a small Scandinavian country, located just to the north of the central German plain, is predominantly a low-lying peninsula with a cluster of neighboring islands. The capital and major city, Copenhagen, is located on the island of Bornholm. At the time of the French Revolutionary and

Napoleonic Wars, Denmark also included Norway, the Duchy of Schleswig (the northernmost province of Germany), the Faroe Islands, Iceland, and Greenland. It controlled the strategically important sea passages between the North Sea and the Baltic Sea, the Skagerrak and the Kattegat.

The intellectual currents of the Enlightenment and the Romantic movement reached Denmark prior to the outbreak of the French Revolution, which resulted in both an increasing sense of national consciousness and a desire for a more responsive “liberal” regime in place of the absolute monarchy of Christian VII (reigned 1766–1808) and later Frederik VI (reigned 1806–1839). Serfdom had initially been eliminated in 1702 but had been restored by 1733. It was finally eliminated in 1800.

Denmark’s importance in European affairs ebbed and flowed primarily with two factors: first, the strength of its neighbor Sweden, and second, its own economic vitality. Toward the end of the eighteenth century, Denmark was enjoying a period of economic growth in contrast to Sweden’s weakness after the losses of the Great Northern War (1700–1721). Agricultural growth also stimulated maritime growth as one of the bases of Danish wealth and power. It was this maritime growth that embroiled Denmark in the Napoleonic Wars.

Britain was naturally concerned with maintaining trade and naval access to the Baltic region as well as with the size and power of the Danish fleet. Should the Danes ally with Napoleon, trade and access would be imperiled because of the closure of the Skagerrak and the Kattegat to British shipping. In addition, the union of the skillful and rather large Danish Navy with the growing combination of the naval forces of Napoleon and his Dutch and Spanish allies would have serious consequences for British control of the North Sea and the English Channel.

Tension began to rise in 1798 when the Danes allowed their navy to escort allegedly neutral shipping under the Danish flag. Many of the vessels involved were actively engaged in supporting French forces. In 1801, after Denmark refused to withdraw from an armed alliance of neutrals including Russia and Sweden (the League of Armed Neutrality) and fearing open French intervention in Denmark, the Royal Navy under the overall command of Admiral Sir Hyde Parker but led into battle by Vice Admiral Viscount Horatio Nelson undertook to destroy the Danish fleet in the roadstead of Copenhagen harbor on 2 April 1801. Subsequently Denmark drew closer to France, and in 1807 the British returned, disembarking a landing force with one brigade under the command of Sir Arthur Wellesley, who, in recognition of his services, was promoted to lieutenant general in May 1808, becoming the youngest lieutenant general in British service and thus assisting his rise to senior command in the Peninsular War. During 1807 Copen-

hagen was blockaded for approximately two weeks, from mid-August to 2 September. After a short but effective bombardment the Danish capital surrendered, and the fleet was seized and taken to Britain.

From 1807 to 1814 the Danes were actively allied with Napoleon. The Danes engaged in a “gunboat” war, involving minor operations with shallow draft vessels along the North Sea and Baltic coasts, with the Royal Navy unsuccessfully contesting control of the Skagerrak and the Kattegat. In 1808, a Spanish corps of 13,000 under the Marqués de la Romana, garrisoning Denmark for Napoleon, was withdrawn by a Royal Navy squadron and returned to Spain to fight against the French in the Peninsular War. Subsequently, during the Russian campaign in 1812, Danish troops occupied lines of communication in Germany and in 1813 were heavily engaged on the French side at the Battle of Leipzig. Danish involvement in the Napoleonic Wars ended with the Treaty of Kiel, concluded on 14 January 1814. Under the terms of that treaty the Kingdom of Denmark ceded control of Norway to the Kingdom of Sweden and the island of Heligoland to Britain.

### **Dennewitz, Battle of (6 September 1813)**

The Battle of Dennewitz, fought during the 1813 campaign in Germany, took place just south of Berlin, between the (French) Army of Berlin, under Marshal Michel Ney, and the (Allied) Army of the North, under the Crown Prince of Sweden, formerly one of Napoleon’s marshals, Jean-Baptiste-Jules Bernadotte. It was Napoleon’s second attempt to seize Berlin during this campaign and was as unsuccessful as Marshal Nicolas Oudinot’s first attempt, which ended at the Battle of Grossbeeren.

The Army of Berlin consisted of IV (under General Henri-Gatien Bertrand), VII (under General Jean Reynier), XII (Oudinot) Corps, and the III Cavalry Corps (under General Jean-Toussaint Arrighi de Casanova), about 58,000 men with 199 guns. The Army of the North consisted of III (Friedrich Graf Bülow) and IV (Friedrich Bogislav Graf Tauentzien) Prussian Army Corps, General Ferdinand Winzgorode's Russian corps, and Baron Stedingk's Swedish corps, around 120,000 men. Of these, around 43,000 Prussians were involved in the battle, although reinforcements were close to hand, some of which were committed at the end of the battle.

The terrain consisted mainly of open fields covering gently undulating hills with some small woods. The banks of the Ahe brook that ran through both Dennewitz and Jüterbog were marshy and could only be crossed at the bridges at Dennewitz, Rohrbeck, and Jüterbog.

On 5 September, Ney's army commenced its march on Berlin, moving toward Zahna and Jüterbog. Oudinot made contact with the Allied outposts almost immediately and brushed them aside. Tauentzien fell back to Jüterbog. Receiving news of the French movement, Bülow marched off to support Tauentzien.

The next morning Bertrand clashed with Tauentzien's shaky militia at Dennewitz, gaining the crossing there. The Prussian militia delayed Bertrand long enough for Bülow to arrive. Tauentzien's cavalry covered the withdrawal of his infantry.

That afternoon, Bülow engaged Bertrand, who had now crossed the Ahe and deployed, and Reynier, who had drawn up to the south of the brook. Attack was followed by counterattack in what constituted some of the bitterest fighting of the fall campaign. Charles Antoine Morand's artillery of Bertrand's corps threw back the first Prussian assault made by General Heinrich von Thümen's brigade. A brigade under Ludwig, Prince of Hessen-Homburg then forced Morand to retire. Reynier's Saxons then came into action along a line from Göhlsdorf to Dennewitz.

Knowing that the Swedes and Russians were moving to assist him, Bülow decided to make a further determined effort before any more French reinforcements arrived, sending in General Karl von Borstell's brigade. He captured Göhlsdorf, but could not make any further headway against Reynier.

About 3:30 P.M., Oudinot arrived. He immediately attacked Göhlsdorf and recaptured it. Bülow's men were exhausted, the reinforcements were still some way off, and his artillery failed to silence Ney's. Victory was at hand when Ney ordered Oudinot from his left to his right, which Oudinot did despite remonstrations from Reynier. This gave Bülow the opportunity to counterattack and regain Göhlsdorf.

The Prussian assaults on Bertrand ended when they ran out of ammunition, but just after 5:00 P.M. fresh Russian artillery broke him with salvos of canister fire. Finally, Russian and Swedish troops then threw back Reynier. Ney's army was devastated, losing 22,000 men, 53 guns, 412 wagons, and four standards. The Prussians lost around 10,000 men.

### **Desaix, Louis-Charles-Antoine, chevalier de Veygoux (1768–1800)**

After rising to prominence with the Army of the Rhine, Louis-Charles-Antoine Desaix became one of Bonaparte's most trusted lieutenants, playing a leading part in the campaign in Egypt and most notably at Marengo, the battle that cemented Bonaparte's political future but that cost Desaix his life. In death he achieved an iconic status among the pantheon of heroes of the Revolutionary era—selfless, incorruptible, virtuous, living only for the pursuit of glory and service to the state.

Born to a noble family in the Auvergne on 17 August 1768, Desaix entered the Bretagne infantry regiment (20 October 1783) with the rank of *sous-lieutenant* third class. In 1790 he became an aide-de-camp to General Mathieu Dumas. In 1791 two of Desaix's brothers emigrated and joined the Royalist Army of Condé, in which they served until 1801. Desaix refused his mother's pleas that he follow them, claiming that he would never serve against France. Promoted to lieutenant (24 November 1791), Desaix sought to avoid the political turmoil plaguing the army by moving to the War Commissary (20 December 1791). This move was short-lived, as Desaix had lied about his age by two years in order to fulfill the entry requirements. A few weeks after he took the oath of office (9 January 1792) his deception was noticed and the appointment annulled. Returning to his regiment, he became aide-de-camp to General Victor de Broglie, the Army of the Rhine's chief of staff (20 May 1792) and was promoted to captain (23 May).

After the fall of the monarchy on 10 August 1792, Broglie refused to take an oath supporting the new government and was suspended. Desaix remained loyal to his superior and so was subsequently arrested (8 September 1792) and imprisoned. After the intervention of his cousin, General Beaufranchet d'Ayat, Lazare Carnot ordered his release (25 October 1792). Returning to duty, Desaix was appointed to the staff of the Army of the Rhine on the recommendation of General Adam de Custine.

Throughout 1793 Desaix proved both his bravery and his competence in a series of actions with the Army of the Rhine. The representatives on mission (political commissars) with the army provisionally appointed him *adjutant général* with the rank of battalion commander (20 May). His appointment to *général de brigade* followed a fierce action in the forest of Bienwald. Desaix was shot through the mouth but carried on fighting and encouraging his troops. The representatives on mission gave him a field promotion the same day (20 August), confirmed on 11 September.

On 20 October 1793 he was provisionally promoted to *général de division* and offered command of the army's right wing, which he declined, claiming he was too young and inexperienced. He was suspended on 13 November for being the brother of émigrés, but when the commissars came to arrest him, they were driven off by his soldiers and the charges were quashed by Minister Bouchette. His mother and sister were less lucky: They were denounced by local Jacobins and incarcerated for a year. On 2 December he was wounded at Bertsheim and had a horse killed under him.

Desaix was confirmed a full general on 2 September 1794. He commanded the left wing of the Army of the Rhine and the Moselle, which blockaded Mainz throughout the winter, and then a corps of observation in Upper Alsace through the spring of 1795. Desaix had developed into one of France's best generals, with a particular aptitude for intelligence gathering. His appearance was characteristically unorthodox: Rarely seen in uniform, Desaix habitually wore an ill-fitting, dark blue coat. He was dark skinned, tall, with loosely tied, long black hair and a moustache he had grown to conceal the scars around his mouth. He developed a strong bond with his subordinates, making it a point to share their privations and never to profit from their successes.

After the commander of the Army of the Rhine, General Jean-Charles Pichegru, first captured Mainz but subsequently failed to stop the Austrians from retaking it, he resigned his command and was replaced by General Jean Moreau. Despite Desaix's preference to remain with the light troops, Moreau had him command the army's center. In 1797 Desaix commanded the Army of the Rhine in Moreau's absence from 31 January to 19 April, during

which time he ably prepared it for the spring offensive. On 20 April he took the initiative, crossing the Rhine under fire near Diersheim. During fierce fighting Desaix was wounded in the thigh, but the rest of the French army crossed the river the following day. On 23 April the Austrians announced the peace negotiations initiated by Bonaparte at Leoben.

Desaix remained in Strasbourg until July 1797 recovering from his wound. Instead of returning to active duty, Desaix avoided a new spate of political infighting by going to represent the Army of the Rhine in the peace negotiations. He traveled to Italy, where he met General Bonaparte for the first time. The two men formed an enthusiastic friendship, with Bonaparte confiding his many plans to Desaix, including an expedition to Egypt. While Bonaparte lobbied for this expedition, on 26 October 1797 Desaix was given interim command of the Army of England. For several months Desaix inspected the ports and arsenals in preparation for the invasion across the Channel. However, Bonaparte's lobbying succeeded, and the government instead secretly decreed an expedition to Egypt on 16 March 1798.

With his chief of staff, General François-Xavier Donzelot, and his aides-de-camp, generals Anne Jean Savary and Jean Rapp, Desaix arrived in Rome on 2 April 1798. On 26 May he departed Civita-Vecchia onboard the *Courageuse* with a convoy of sixty ships, disembarking to attack Malta on 10 June. After leaving Malta (19 June) Desaix's division landed in Egypt (1 July) and formed the advance guard on the desert march to Cairo. He encountered resistance at Rahmaniya (12 July) and Shubra Khit (13 July) before commanding one of the five squares at the Battle of the Pyramids (21 July) against the Mamelukes. On 25 August he set off to conquer Upper Egypt, repulsing the forces under Murad Bey at Sediman (7 October). Desaix returned briefly to Cairo before resuming his march down the Nile. With 6,000 men under generals Louis Friant, Augustin-Daniel Belliard, and Louis Davout, Desaix prevented the Mamelukes from regrouping. He explored the ruins of Denderah and Thebes before reaching Aswan on 1 February 1799. It was while governing Upper Egypt that the local population famously dubbed Desaix "the Just Sultan."

Desaix did not learn of Bonaparte's departure for France (23 August 1799) and his invitation to join him until 3 September. After fighting a second battle at Sediman (9 October), Desaix was recalled by Bonaparte's successor, General Jean-Baptiste Kléber, arriving in Cairo on 16 October. Although Desaix had been instructed to return to France by Bonaparte, he was at odds with Kléber over the decision to evacuate the army from Egypt. However, Kléber obliged him to negotiate such a move and sign the

Convention of El Arish (24 January 1800) with Sir Sidney Smith. Desaix left for France with Davout, his aides-de-camp, passports, and a British officer to vouch for them, but when the convention was not ratified by London, Desaix's ship was captured and taken to Leghorn (Livorno), where Desaix was imprisoned by Vice Admiral Lord Keith.

The British belatedly honored Desaix's passports and released him on 29 April. He arrived in Toulon on 5 May, narrowly avoiding capture by Barbary pirates. Desaix endured a thirty-day quarantine during which he received an invitation from Bonaparte to join him in Italy. Taking a route through Grenoble and the Little St. Bernard Pass, he was attacked by bandits on 7 June, before finally being reunited with Bonaparte at Stradella on 11 June. After a night-long meeting, Bonaparte gave him command of two infantry divisions. On 13 June Desaix was sent with General Jean Boudet's division to block the Austrians' escape route to Genoa via Novi. Bypassing Tortona, Desaix arrived at the Scrivia torrent around 5:00 P.M., but heavy flooding prevented the division from crossing. After they set up post in Rivalta, a local priest assisted the French in finding a boat to ferry the infantry across. Meanwhile Desaix ordered cavalry patrols to Novi and then informed headquarters that they had found no Austrians present there.

The next morning (14 June) Desaix heard the artillery open fire at Marengo (at approximately 9:00 A.M.). It has passed into legend that, without waiting for orders, Desaix marched to "the sound of the guns" and arrived to save the day, a service Marshal Emmanuel, marquis de Grouchy failed to perform at Waterloo fifteen years later; in truth, however, Desaix was more cautious.

Believing the gunfire to be a feint, at 9:00 A.M. Bonaparte sent an order for Desaix to march south to intercept the Alessandria-Genoa road at Pozzollo-Formigaro. Meanwhile, Desaix had ordered Savary back to Novi on a reconnaissance, and when Savary returned, he was sent to inform Bonaparte that the Austrians were still not there. Bonaparte's first message arrived and with Boudet's division assembled by noon, Desaix began the march as ordered. They had not reached a mile beyond Rivalta when a second message from Bonaparte arrived, urgently requesting Desaix to return if it were still possible. Desaix turned the division around, to march on San Giuliano, then Marengo.

Approaching San Giuliano, Desaix's march was hindered by masses of retreating fugitives and wounded soldiers. The division quit the road and accelerated its march, reaching a position north of Cassina Grossa around 5:00 P.M. As Boudet led the 9<sup>ième</sup> Légère (9th Light Infantry) forward to attack the lead Austrian column, Desaix went to meet Bonaparte. A council was held under fire, in which Desaix urged General Auguste Marmont to concentrate all the available artillery.

In Desaix's absence the Austrians had begun deploying to meet Boudet. Marmont's battery opened up, causing the Wallis regiment to break and fall back through *Generalmajor* Christoph Freiherr von Latterman's grenadier brigade. As the grenadiers began their advance, Desaix ordered Boudet to pull back into line with the rest of the army. Desaix then sent Savary to ask Bonaparte for cavalry support, while he led the infantry charge.

When Desaix reached Boudet, he ordered him to take command of his second brigade on the right of the road. With everything in place, Desaix ordered the charge from the head of the 9<sup>e</sup> Légère. Desaix was struck by a fierce volley delivered by the grenadiers at just ten paces and killed instantly; a ball had passed diagonally over the heart and exited through the right shoulder blade. General Charles Lefebvre-Desnouëttes was the first to the body and confirmed him dead. The last words attributed to him in the army *Bulletin*, "Go tell the First Consul that I die regretting not having done enough to live in posterity," were composed by Bonaparte. General Jacques Lauriston claimed Desaix said only "Dead," but doctors examining the body thought it was unlikely he could have uttered a word. A moment after his fall, when the troops crossed bayonets, General François Kellermann (the younger) crowned the attack with a devastating cavalry charge, after which the whole army retook the offensive.

Desaix's body was collected by Savary and taken to Milan, where it was embalmed on 16 June. Struck with genuine grief, Bonaparte ordered that Desaix be entombed in the monastery in the Great St. Bernard Pass. It was not until 1805 that Desaix was permanently laid to rest, in a marble mausoleum constructed the following year.

## Desertion

Desertion was a major problem for the French Revolutionary and Napoleonic armies, cutting their fighting strength and threatening military morale. It was also, along with the associated problems of evasion and draft dodging by young men before they could be incorporated into the regiments, seen as a scourge by departmental administrations, by prefects, and by the men charged with policing French towns and villages. Over nearly a quarter of a century of war, desertion lay at the root of widespread crime, occasional rioting, and mutual distrust between locals and the state, especially in country areas with little tradition of military service. And since the Revolutionaries defined military service as an obligation, a duty enshrined in citizenship, desertion could acquire ideological significance in the eyes of the authorities.

It is not easy to estimate the scale of desertion, since accurate figures are hard to find. In the early years of the Revolution there was still something rather casual about the process of recruitment, which made desertion easy and rather tempting. Men were called to a nearby town to sign on and were then left to walk for days or even weeks to join their units; not surprisingly, some of them chose to spend the money they were given for the journey in a wayside inn before creeping back home, they hoped undetected. Hence, the figures supplied by civilian authorities seldom tallied with those held by the army. Besides, for much of the period the overall picture was complicated by exemptions and by the fact that a man could buy himself out of personal service by providing a substitute. Police and local administrators did not always find it easy to establish who should be in the army and who had the right to remain in the community.

After conscription was introduced under the Loi Jourdan in 1799, the men of each age group—each *classe*—were called in turn to present themselves for a cursory medical examination, and this made official estimates more reliable. The best figures that were available at the time were those that Antoine-Audet Hargenvilliers sup-

plied to the Ministry of War in 1808, which showed that between 1800 and 1806 around a quarter of a million men had safely evaded capture. But he admitted that this number was almost certainly an underestimate, since it included only those men for whom the government had records. Napoleon used a variety of contrasting measures, from harsh policing to periodic offers of amnesty, to try to bring the recalcitrant to heel. But he never succeeded in rooting out the problem. Even in 1813, after an entire generation had been called before the recruiting sergeant and conscription had begun to appear as something of a rite of passage for adolescent males, disillusionment and despair still led many thousands of young Frenchmen to take the risk of evasion every year. The numbers listed as deserters, or *insoumis*, remained stubbornly high.

These numbers were also very uneven between region and region, department and department. Even in 1813 there were departments where the prefect could claim to have fewer than 100 deserters on their territory, while others admitted to in excess of 2,000. Here the young men took to the woods or sought protection from their families rather than submit to the draft, and where the law was finally imposed on an unwilling community, it was done by compulsion, by threats of retribution, and the use of terror. So what defined the regions that defied the government over service in the armies, the one issue that Napoleon saw as the key to public order? There was no clear link between areas of defiance and areas with a history of counterrevolution, especially since Napoleon specifically reduced the demands made in the west, where the bitter conflict in the Vendée had stripped the countryside of many of its young men and left agriculture dangerously short of labor. Rather, the desertion rates reflected opportunity and the presence or absence of military tradition in the community. Heavily wooded regions, or mountainous areas such as the Pyrenees and the Massif Central, provided deserters and draft dodgers with cover and obstructed the searches of the police. Local history also played its part. Those regions that for centuries had been forced to defend themselves against invasion—from across the Rhine, for instance—were eager to provide soldiers for these wars too, whereas isolated villages and remote areas of mountain pasture, which were themselves safe from the threat of invasion and where news traveled slowly, tended to figure among the most refractory areas of the country. Resistance was a predominantly rural problem: The cities and larger towns—notably Paris and Lyons—had little problem with desertion.

Desertion was taken very seriously by the government, since it undermined the effectiveness of the armies and deprived the generals of much-needed manpower. Napoleon, especially, sought to counter it by repression, especially

where bands of deserters formed in the countryside and turned to crime and banditry. Policing was stepped up in an attempt to deter both the soldiers from deserting and their families from welcoming them back. Gendarmes were ordered to hunt down those on the run, soldiers' families were required to provide evidence that their sons had joined up, and troops were billeted in the homes both of parents and of village notables in a bid to drive a wedge between different interests in the local community. These measures, seen by many as harsh and brutal, risked alienating whole communities. Heavy fines were imposed on those sheltering or employing deserters, and those who conspired to engage in fraud to save friends and relatives from conscription or who made fortunes by forging birth and marriage registers faced severe punishment. Desertion itself was made punishable by death. In practice, however, the death penalty was seldom imposed, except for those who were found behind enemy lines, since its use would have been counterproductive. The army needed live soldiers, not dead ones, and those convicted were usually dispatched back to the front line, where many of them are known to have fought bravely in the later campaigns of the Empire.

### Díaz Porlier, Juan (1788–1815)

Known as the *marquesito* on account of the fact that he was the illegitimate son of the Marqués de Bajamar, Juan Díaz Porlier was a well-known leader of the Spanish guerrillas. Born in Cartagena de Indias in 1788, in 1802 he enlisted as a midshipman aboard the 80-gun *Argonauta* commanded by his uncle, Don Rosendo Porlier. By 1805 he was serving aboard the 112-gun *Príncipe de Asturias* on the staff of Admiral Don Federico Gravina, and in this capacity he fought against the British at Trafalgar. After this action Porlier transferred to the army, and when war broke out against France in 1808, he was a captain in the Mallorca (Majorca)

infantry regiment. Stationed in Badajoz, he was promoted to the rank of lieutenant colonel in the 1st Regiment of Provincial Grenadiers and along with his new unit was incorporated into the 1st Division of the Army of Extremadura (Extremadura).

In consequence, he first came face-to-face with the French on the battlefield of Gamonal on 10 November 1808. The resultant action was a disaster—the Spanish army was overwhelmed and suffered heavy losses—but Porlier happened to be stationed on the extreme left wing on the edge of a range of hills. As the Spanish line collapsed, he was therefore able to lead a few men to safety and put together a small guerrilla band.

At the head of these men, he launched a series of attacks on the invaders in the provinces of Palencia and Santander. Pleased with his courage, the Patriot authorities promoted him to the rank of brigadier and recognized his command as the so-called Cantabrian Division. To all this, Porlier responded by militarizing his forces, which were transformed into four regiments of infantry and one of cavalry. After fighting in the various petty campaigns that surged to and fro in the provinces of Asturias and Santander in the period 1810–1812, in 1812 he cooperated with the naval operations of Sir Home Popham and occupied the region in the wake of the definitive retreat of the French.

At this point, however, Porlier's character began to show itself to disadvantage. Always a difficult subordinate who was noted for his overweening ambition, he objected to orders that would have taken his division out of its home territory and incorporated it into the main Spanish armies. In consequence, his division was broken up, and Porlier sent in disgrace to Oviedo. Rehabilitated the following year, he commanded a division at the Battle of San Marcial on 31 August 1813. Promoted to the rank of major general, he then took part in the Battle of the Nive, after which he and his men were sent back to Bilbao. The following year, however, came disaster: In 1812 Porlier had married Josefa Queipo de Llano, the sister of the liberal leader the Conde de Toreno, and the coup that restored Ferdinand VII as absolute ruler of Spain therefore led to Porlier's arrest as a suspect. Imprisoned in La Coruña (Corunna), Porlier managed to win the sympathy of part of the garrison, and in July 1815 he persuaded his adherents to join him in a revolt. This proved short-lived, however. Porlier and his followers were quickly overcome, and on 3 October he was executed by firing squad.

**Directory, The (1795–1799)**

The Directory, an executive body that ruled France for four years after 1795 and lent its name to the later phase of the Revolution, was overturned when Bonaparte came to power in 1799. It was in Bonaparte’s interests to blacken the regime that preceded him, and the coup of Brumaire was justified by the alleged failure of the Directory to restore law and order. Crime and violence were certainly rife in some regions, and in the summer of 1799 France once more risked invasion. The Directory also acquired a reputation for corruption, incarnated in the dissipated person of Paul Barras, the single director who served throughout this period. Maximilien Robespierre’s Republic of Virtue seemed long gone; the rich flaunted their wealth while the poor starved. Yet current historians stress the achievements of the Directory, on which Bonaparte was to build.

The Directory faced a massive task. The polity had been torn apart by civil war, leaving opposing factions with scores to settle; inflation was rampant and conflict abroad unrelenting; reconciliation would prove extremely difficult. The architects of the new Constitution of 1795 sought to found their regime on the wealthy notables, those individuals whom Bonaparte would call “blocks of granite.” As François-Antoine Boissy d’Anglas suggested, only the best qualified candidates would exercise authority in future. Yet the attempt to steer a course between anarchy and tyranny was flawed by an insistence on annual elections, not only for the bicameral parliament and local authorities but also for the Directory itself, one of whose five members would be replaced each year. This safeguard against dictatorship became a recipe for instability as a deeply divided, albeit restricted, electorate returned first royalist and then Jacobin majorities that threatened the very basis of the system.

The Directory’s response was to annul election results, violating its own principles. Hence Bonaparte’s assertion

in 1799 that the directors had already overthrown the constitution. Political impasse notwithstanding, the Directory did make significant progress in financial and administrative terms. The disastrous experiment with paper money was ended and the currency restored, while *commissaires* attached to each department were forerunners of the famous prefects, instituted by Bonaparte in 1800. The Directory remained an innovatory regime, striving to create a republican culture, albeit at the expense of alienating Catholics with a series of anticlerical measures. Religious as well as political divisions thus persisted, but what sealed the Directory’s fate was the turning tide of war. Territory had been gained and favorable terms negotiated with the continental powers, but Bonaparte’s Egyptian campaign produced a fresh coalition against France, and desperate action to defend the territory revived fears of a fresh Terror. Emmanuel Sieyès, an opponent of the constitution, was elected to the executive in 1799, and when Bonaparte returned, a coup was imminent. Yet the Directory had survived for four years, longer than any regime since 1789.

**Division**

*Division* is a term referring to one of two distinct concepts. The first and of lesser importance is the use of the term *division* as a tactical concept involving the forming of a battalion into column with a front of two companies. In this instance the formation was referred to as a “column of divisions.” In the second usage, a division is a subordinate permanent or semipermanent combined arms formation typically under the command of a general officer, consisting of varying numbers of infantry battalions (from six to twelve), artillery batteries, and on occasion cavalry squadrons or regiments. By the end of the Napoleonic period all major armies had adopted the divisional concept, although the Prussians, for instance, grouped numbers of large brigades directly within a corps.

The limited tactical definition involving the column of divisions originated in the seventeenth century and died out with the demise of formal linear formations in World

War I, although it is still referred to in some formal drill manuals and is sometimes utilized as a parade formation. The second and broader definition began to be used during the War of the Austrian Succession (1740–1748) and was formalized in various pre-Revolutionary French regulations, most notably the *Ordonnance* of March 1788. Originally the idea of forming divisions was to assist an army moving through broken and restrictive terrain, such as in mountains. The Regulations of 1793 established the concept in the Revolutionary and, later, Napoleonic armies. At that time the division was to consist of twelve battalions, two squadrons of cavalry, and a variable number of artillery batteries. While the concept remained, the static organization did not. Napoleon intentionally varied the strength of divisions and corps in order to aid in deceiving his enemies.

The utility of the division lay in the fact that an army could be divided and could follow several different routes in its advance or retreat with all forces being capable of conducting combat operations for at least a limited period of time. The French utilized the division to gain an advantage in mobility over their enemies. As the Revolutionary Wars continued, the French and later Napoleon began to form larger combined-arms units known as corps, which were capable of sustained fighting for a day or two in the face of the enemy's army. As Napoleon's enemies reorganized and reformed their armies to meet the challenge of his forces, they too adopted the divisional and, in some cases, the corps concept. In the Peninsular War, great distances, difficult terrain, and the relative scarcity of troops restricted the use of the corps, and the forces were generally organized into and fought as divisions. Normally, divisions in the Napoleonic Wars would number between 4,000 and 10,000 troops.

The concept of the division continued to evolve throughout the nineteenth and twentieth centuries and remains today the organizational structure of larger armies in both peace and war. Today, the U.S. Army maintains ten active-duty divisions of various types, with a mix of combat, combat-support, and service-support elements in each, numbering between 12,000 and 20,000 troops. Each is led by a major general and can constitute a joint task force headquarters in conjunction with air and naval forces.

## Divorce

With the victory of the peasantry and the proletariat in the French Revolution, the notion of divorce was radically transformed. After the Revolution, social and religious acceptance of legalized divorce became widespread until the Napoleonic era.

In 1789 a social revolution started in France that not only would transform the political and economic system but also would change the moral and social system. Specifically, the process of divorce and, by fiat, marriage, would undergo change by the Revolutionaries. As the National Assembly passed laws to reform the social, economic, and political system, it also passed legislation to change the institution of divorce. Under the *ancien régime*, which to a large degree was a patriarchal system, divorce was illegal: Marriage was indissoluble under the law.

On 20 September 1792, however, the National Assembly passed the Law of Divorce. Under this law the government acknowledged the principle of marital failure, in which neither the wife nor the husband was held responsible for the divorce. A divorce could occur under mutual consent. Indeed, in a truly revolutionary notion, one party could sue for divorce based on the modern idea of incompatibility. The law specified the exact reasons for a possible divorce, including immorality, cruelty, insanity, and desertion. The law dictated a compulsory resting period of six months in case either side believed that the marriage was salvageable. In the end, the number of divorces in the pre-Napoleonic era increased because of the law's far-reaching grasp as well as its simple affordability for the ordinary citizen. In addition, the concept of divorce reaffirmed the Revolutionary ideal of individual liberty, especially within the institution of marriage.

With the advent of the Napoleonic era, the institution of divorce again underwent a similar phase of transition, becoming more difficult to attain. According to the Napoleonic (Civil) Code of 1803, the grounds for divorce were narrowed significantly. These grounds included adultery and maltreatment, among others. Essentially, the code eliminated a substantial number of grounds for divorce. In addition, divorce was permitted by mutual consent. Unlike the law of 1792, however, the new law allowed divorce only if both families gave their consent. The Napoleonic divorce laws created a double standard for women. For example, whereas husbands could divorce their wives for adultery, women could only sue for the same infraction. Napoleonic laws strengthened the patriarchal system while reducing the number of divorces to 10 percent of those allowed by the 1792 law. Women continued to outnumber men in seeking divorces in the early nineteenth century.

## Dokhturov, Dmitry Sergeyeovich (1759–1816)

Dmitry Sergeyeovich Dokhturov, a prominent Russian military commander, was born on 12 September 1759 to a Russian noble family from the Tula *gubernia* (province). He began service at the imperial court, becoming a page in 1771 and a *kamer* page in 1775. Dokhturov enlisted as a lieutenant in the Life Guard Preobrazhensky Regiment on 17 April 1781, becoming lieutenant captain in 1784 and captain in 1788. He participated in the Russo-Swedish War of 1788–1790, fighting at Rochensalmi (where he was wounded in the right shoulder), near the estuary of the Kumen River, at Hervanland (for which he received a golden sword), and Vyborg (where he was wounded). Dokhturov became a colonel and commander of the Yeletsk Infantry Regiment on 12 January 1795. Two years later, he rose to major general and *chef* of the Sofia Musketeer Regiment on 13 November 1797. Between 11 November 1798 and 3 August 1800, this unit was named Dokhturov's Musketeer Regiment. Dokhturov was promoted to lieutenant general on 5 November 1799.

After brief retirement from July to November 1800, Dokhturov became *chef* of the Olonets Musketeer Regiment on 11 August 1801 and *chef* of the Moscow Musketeer Regiment and infantry inspector of the Kiev Inspection on 7 February 1803. During the 1805 campaign he commanded one of the columns in the Russian army, distinguishing himself at Krems (Dürnstein, for which he received the Order of St. George [3rd class], on 24 January 1806) and Austerlitz (for which he received the Order of St. Vladimir [2nd class]). In 1806–1807, he led the 7th Division in Poland, fighting at Golymin (for which he received the Order of St. Anna [1st class]), Eylau (where he was wounded in the right leg and earned a golden sword with diamonds), Lomitten (for which he received the Prussian Order of the Red Eagle [1st class]), Heilsberg (for which he received the Order of St. Alexander of Neva), and Fried-

land. In 1809 he took part in the operations against the Austrian army in Galicia, for which he received the Order of St. Catherine. Promoted to general of infantry on 1 May 1810, he took command of Fourth Corps that November and of Sixth Corps of the 1st Western Army in early 1812.

During the 1812 campaign Dokhturov defended Smolensk, for which he later received 25,000 rubles, and distinguished himself at Borodino, where he took command of the 2nd Western Army after Prince Peter Bagration was injured. For his actions in this battle Dokhturov was decorated with the diamond signs of the Order of St. Alexander of Neva. At the council of war at Fili he recommended engaging Napoleon in the vicinity of Moscow. In October and November he fought at Aristovo, Maloyaroslavets (for which he received the Order of St. George [2nd class]) and Krasnyi. In 1813 he commanded the right flank of the (Russian) Army of Poland, fighting at Berggieshubel, Dohna, Dresden, Leipzig (for which he received the Order of St. Vladimir [1st class]), Magdeburg, and Hamburg, where he remained until the end of the war. In late 1814 Dokhturov took a furlough to recuperate and nominally commanded Third Corps. During the Hundred Days, he returned to the army, commanding the right flank of the Russian army. Returning to Russia, he took a discharge because of poor health on 13 January 1816 and died on 26 November of the same year in Moscow.

## Donegal, Battle of (12 October 1798)

Minor Anglo-French naval action connected with French attempts to land an expeditionary force in Ireland. When rebellion erupted in Ireland in 1798, the French government naturally wished to support it as a means of diverting British attention from the main theaters of war on the Continent and at sea. As such, the French sent two expeditions

to Ireland, originally intended to be embarked simultaneously. Lack of funds for the troops, however, obliged them to split the expedition into two, with the first force of 1,200 men dispatched under General Jean Humbert, aboard four vessels, none of which carried more than forty guns. The expedition, being woefully understrength, ended in total failure with Humbert's surrender at Ballinamuck on 8 September.

The second expedition was rather stronger: 3,000 men with a respectable complement of artillery and immense quantities of supplies. These were carried aboard a force under Commodore Jean Baptiste Bompert, sailing from Brest on the night of 16 September on the *Hoche* (74 guns) with Bompert aboard, *Romaine* (40), *Loire* (40), *Immortalité* (40), *Coquille* (36), *Bellone* (36), *Résolue* (36), *Embuscade* (36), *Sémillante* (36), and *Biche* (36). Royal Navy vessels of the Channel Fleet spotted the French on the following morning. After failing over the course of several days to shake off British cruisers assigned to watch his movements, Bompert steered west-north-west. This course suggested the destination was Ireland, and the commander in chief of that station was consequently alerted. Three British frigates continued to observe the French for several days before finally joining the squadron off Donegal under Commodore Sir John Warren.

Warren had left Cawsand Bay on 23 September on learning that Bompert's force had left port, and he had made for a point on the Irish coast close to where Humbert had disembarked his men not long before. By 11 October, having recently received reinforcements, Warren's squadron was composed of the *Foudroyant* (80), Warren's flagship the *Canada* (74), the *Robust* (74), *Magnanime* (44), *Anson* (44), *Amelia* (44), *Ethalion* (38), and *Melampus* (36). At midday on the eleventh, while off Tory Island and bound for Lough Swilly, where Bompert intended to land his troops, the French sighted Warren's squadron, and consequently altered course for the southwest with the object of disembarking their troops whenever an opportunity arose. On himself sighting the French, Warren signaled for a general chase and for his ships to form in succession as they reached the opposing squadron. Heavy winds on the night of the eleventh caused serious damage to the *Anson*, *Hoche*, and *Résolue*. Nevertheless, at dawn on the twelfth, when sight was restored to the rival squadrons, the French were so positioned as to have no path of escape, apart from the southwest, to which they were already proceeding.

With his own flagship damaged and another ship leaking, Bompert had little choice but to accept battle, and by 7:00 A.M. his force had established itself in a loose line ahead, with the *Résolue*, supported by the *Biche*, detached inshore in consequence of her disability. Warren enjoyed every advantage over his adversary, but rather than contin-

uing the pursuit he formed line of battle, a formation that enabled the *Robust* and *Magnanime* to be just in range of the *Embuscade* and *Coquille* shortly after 7:00 A.M. Fire was exchanged, and after fifteen minutes, having increased sail, the *Robust* was close upon the *Hoche*, with which she began to exchange broadsides. Meanwhile, the *Magnanime* fought with the *Embuscade* and the *Coquille*, but she also took some raking fire from the *Loire*, *Immortalité*, and *Bellone* as she passed to leeward of the *Robust*. Some of Warren's other ships then came up, including the *Foudroyant*, *Amelia*, *Ethalion*, *Melampus*, and *Canada*, all of which assisted in various ways to compel the *Hoche*, after a stoic resistance, to haul down her colors just before 11:00 A.M. Half an hour later the *Embuscade*, having suffered injury inflicted by both the *Magnanime* and later the *Foudroyant*, surrendered to the former ship. The remainder of Warren's force, apart from the heavily damaged *Robust* and the still-distant *Anson*, aggressively pursued, as a result of which the *Coquille* surrendered around 1:00 P.M., followed by the *Bellone*, which had resisted brilliantly for almost two hours against the *Foudroyant* and *Melampus*. The *Ethalion* accepted the surrender. The remaining French ships made off, inflicting heavy damage on the *Anson* as they effected their escape.

Warren lost 13 killed and 75 wounded, a small number considering his opponent's determination. French losses are not known, but the *Hoche* alone lost 270 killed and wounded, and therefore total losses must have been several hundred. The heavily damaged *Robust* took the completely disabled *Hoche* into harbor, but only after the latter had been saved from foundering by the efforts of her own crew and from recapture by the efforts of the *Doris* (36). Five French frigates were able to escape to leeward, pursued by the *Canada*, *Foudroyant*, and *Melampus*, the last of which captured the *Résolue*, in a sinking state and after brief resistance, on the following day. Other vessels fled successfully or were engaged before breaking off and escaping. The *Hoche*, *Bellone*, and *Embuscade* were renamed and added to British service. The *Coquille* was accidentally destroyed by fire at Plymouth two months after the action. On balance, then, the engagement off Donegal was a marked success, though not an overwhelming victory.

## Dresden, Battle of (26–27 August 1813)

In the fall of 1813 Napoleon resumed his campaign in Germany against the Sixth Coalition, which consisted of all the great powers of Europe: Austria, Britain, Prussia, and Russia, as well as Sweden. The Allies formulated a strategy agreed to by a convention signed at Trachenberg during the summer armistice. The strategy specified that no one army would fight the forces led by Napoleon in person; only a combination of armies would seek to confront him. The plan thus relied mainly on avoiding forces commanded by Napoleon while aggressively attacking his lieutenants and his lines of communications.

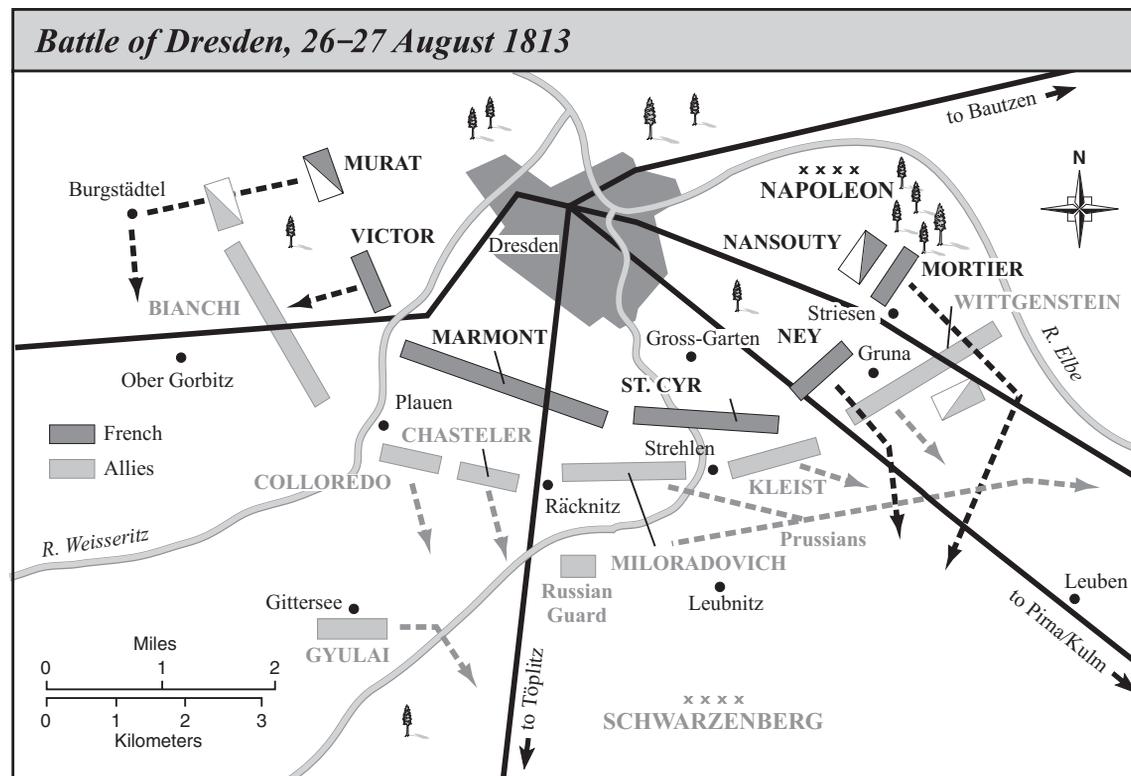

At the outset of the campaign three large armies were poised around Napoleon's defensive salient in Saxony. In the north was former French marshal Bernadotte's army protecting Berlin. In the east was General Gebhard von Blücher's Army of Silesia. The largest army of all was in the south in Bohemia, under the command of Karl Philipp Fürst zu Schwarzenberg, who also served as the nominal commander in chief but really was only responsible for coordinating the movements of the other armies. On the French side Napoleon was in overall command of the central reserves in Saxony with subordinate armies under Marshal Nicolas Oudinot in the north facing Bernadotte, and Marshal Jacques Macdonald in the east facing Blücher.

Unity of command was the key French advantage in the forthcoming battle. From the beginning Tsar Alexander I had been unhappy about an Austrian exercising overall command. Alexander now felt he had sufficient resources of military talent—the turncoat French generals Jean Moreau and Antoine Jomini—to reassert his claim to supreme command in the field. Alexander's failure to recognize the distaste an Austrian would have for a partnership with Moreau and Jomini developed into a dispute over strategy. Napoleon's apparent inaction since the end of the armistice caused the Allies to reconsider the wisdom of the Trachenberg Plan. Trachenberg had not allowed for an inert French defense but, rather, had anticipated a move on Napoleon's part. The Allies therefore sought to react to Napoleon's movements. A "general offensive" movement, contrary to the desires of Schwarzenberg and *Feldmarschalleutnant* Johann Joseph Graf Radetzky

von Radetzky was agreed to at a council of war shortly after the campaign began. Schwarzenberg had organized the logistics for the Austrian army to support an eventual advance on Leipzig, and now that an offensive was to be conducted, he naturally recommended Leipzig as the objective. Orders were sent and the huge Army of Bohemia (over 200,000 men) began to advance.

Once again the tsar, advised by Moreau, interfered. Alexander and Moreau felt that a move closer to Blücher in Silesia was warranted; indeed, that was where Napoleon had gone in response to an advance by the Prussian commander in chief. The tsar's view prevailed, despite Schwarzenberg's opposition, and Dresden was chosen as the new objective. Schwarzenberg had considered moving on Dresden as well but had wanted to take advantage of his logistical preparations and to wheel to the east toward the city after advancing through the Bohemian mountains. The crisis of command translated itself to the tactical level. Logistical support, established for a move on Leipzig, soon broke down during the advance to Dresden. The effects of countermarching and the wet, rainy weather further fatigued and slowed the advance of the Allies. The lead elements of the Army of Bohemia arrived cold, tired, wet, and hungry south of Dresden on 25 August. Napoleon was not yet there. Another council of war was held instead of attacking while Napoleon was still absent. Schwarzenberg and Jomini supported the tsar's desire for an immediate assault, but Moreau and General Karl Freiherr Toll (a Prussian in Russian service) advised against it. The attack was eventually postponed until the next day (26 August), when discussion resumed while the troops formed up for battle.

Marshal Laurent Gouvion St. Cyr's corps opposed the Allies at Dresden. He had earned his marshal's baton in Russia at Polotsk fighting just the type of battle the Allies now contemplated—a battle in urban terrain naturally suited to fortification and defense. The Allied skirmishers had already found Dresden's walled houses and gardens well fortified in response to their threatened assault. It was at this point that, at about 9:00 A.M. on the morning of 26 August, Napoleon dramatically arrived. Once Napoleon's presence became known, the mood at Allied headquarters changed, and Alexander now favored a withdrawal. The Prussian king, Frederick William III, for the first time, asserted himself and called for the attack to continue—in contravention of the Trachenberg Plan. Moreover, the Allies had not consolidated major formations of their army to include both the Russian Imperial Guard and the corps of General Prince Eugen of Württemberg. They had about 150,000 men initially on hand. However, St. Cyr had only about 30,000 troops. While the Allied supreme command bickered, the assault

Adapted from Lawford 1977, 49.

began on the basis of the orders already issued. This decided the issue, and the battle now commenced in earnest.

The critical action on the battlefield took place south of the river Elbe in the old city of Dresden and was characterized by desperate house-to-house fighting. Walls held up many of the Austrian columns of assault because they had not brought assault ladders. Meanwhile, more French troops arrived by the hour—many after forced marches. Napoleon rapidly reinforced St. Cyr's excellent defenses with portions of the Young Guard. By the end of the day Napoleon had stabilized his position, repulsed the Allied attacks all along the line, and assembled more than 70,000 men. On the same day General Dominique Vandamme, commanding the French I Corps, engaged Eugen's corps, thus effectively preventing it from reinforcing the Allies. Meanwhile Napoleon himself continued to be reinforced and would have almost 120,000 troops for the second day of battle. With Vandamme threatening the Allied line of communication, the Allies diverted another corps to help contain him near Pirna further up the Elbe.

On the second day, 27 August, Napoleon once again displayed his tactical genius for terrain and weather (as he had at Austerlitz in 1805), while his troops exhibited their former élan in executing their emperor's plans. During a furious rainstorm and using a rain-swollen stream that bifurcated the Allied line, Napoleon launched Marshal

Joachim Murat and the cavalry against the Allied left, which annihilated *Feldmarschalleutnant* Frederick Freiherr Bianchi's Austrian Korps. On the far right Marshal Adolphe Mortier had roughly handled the Russian corps under General Peter Graf Wittgenstein. In the center the Allies had massed what they hoped was overwhelming strength, but as news of trouble on the flanks became known a spirit of defeat settled in. Allied headquarters also nearly suffered a serious loss when a round shot (cannonball) narrowly missed the tsar, killing Moreau instead. The Allies had had enough and late in the day ordered a retreat. Napoleon had already retired from the field convinced he would need a third day of battle to complete the victory.

Half-beaten once Napoleon's presence was known, the Allies had compounded their initial mistakes in deviating from the Trachenberg Plan and accepting battle against a strong defensive position. Their losses were heavy even by Napoleonic standards: Some 38,000 Austrians, Prussians, and Russians were casualties, including many prisoners. French losses were approximately 10,000. Dresden was the exception that proved the rule: The Trachenberg Plan had never intended that an offensive battle be fought against Napoleon and his main army by a single Allied army—even the huge Army of Bohemia. The fact that Napoleon occupied such a strong defensive position as Dresden had only made things worse. For Napoleon this battle could

have been a harbinger of one of his most successful campaigns. Dresden seemed to justify the improvements Napoleon had made during the summer armistice. His Young Guard had resolutely defended the city on the first day of action, and his cavalry and horse artillery had been critical in the counteroffensive that forced the Allied withdrawal the following day. However, Marshal Auguste Marmont had expressed to Napoleon his concern about fighting on such a widely extended front with the prophetic words “[I] greatly fear lest on the day on which Your Majesty gains a great victory, and believes you have won a decisive battle, you may learn you have lost two” (Chandler 1966, 903).

Marmont's concerns literally came true. At Kulm, Vandamme was fortuitously cut off from the main French army while leading the pursuit of the dispirited Army of Bohemia. He himself was captured, and his 30,000-man corps was reduced to fewer than 10,000 effective troops. Not long after that, Napoleon learned that General Friedrich von Bülow's Prussian corps had repulsed Marshal Michel Ney's drive on Berlin at Dennewitz. Worse still, at about the same time as the fighting was going on at Dresden, Macdonald had been badly defeated by Blücher along the Katzbach in Silesia and was in headlong retreat.

Thus the fruits of the Battle of Dresden were temporary, and circumstances relegated it to the status of a mere tactical victory. Despite this unfortunate confluence of events, the battle highlights once again the high degree of skill and leadership of which Napoleon was still capable. For the Allies, despite their defeat, the Trachenberg Plan had yielded considerable fruit, and for the remainder of the campaign the initiative remained with them until Napoleon's ultimate and catastrophic defeat at Leipzig that October.

## Drouet, Jean-Baptiste, comte d'Erlon (1765–1844)

Serving in both military and political capacities under Louis XVI, the Revolutionary republic, Napoleon, and Louis-Philippe, Jean-Baptiste Drouet fought in a great number of battles in the period from 1792 to 1815.

Drouet enrolled in the army in 1782. After being dismissed five years later, he returned in 1792, responding to the call of “La patrie en danger!” He climbed quickly in the military hierarchy under generals François Lefebvre and Louis Hoche and later became an important figure in the Grande Armée. He took part in numerous actions, fighting at Zürich (1799), Hohenlinden (1800), and in the occupation of Hanover (1803), where he was promoted to *général de division*. Drouet also played a major role at Ulm (1805), Austerlitz (1805), Jena (1806), and at the siege of Danzig (1807). Danzig and the Battle of Friedland, where he was wounded, together constituted the high points of his career. As a consequence Drouet received two distinctions: the Legion of Honor (1807) and the title of comte d'Erlon (1809). Thereafter, he served in the campaign against Austria (1809) and in Spain (1810–1814).

The First Restoration was a difficult time for him because of his close connection with Napoleon. He finally joined the Bourbons and was made commander of the 16th Military Division (the Bourbons having returned to the pre-Revolutionary system of stationing troops in particular areas of the country, known as military divisions).

This reconciliation was challenged when Drouot was thought to be part of a plot laid by General Charles, comte Lefebvre-Desnouëttes. He was placed under arrest but managed to escape until Napoleon's return. Nominated a peer of France, Drouot enthusiastically joined the Emperor during the Hundred Days as commander of I Corps. His role in the Waterloo campaign is controversial, with some scholars claiming that Drouot received contradictory orders from both Marshal Michel Ney and Napoleon. As a result, his troops wandered from Quatre Bras to Ligny, thereby preventing them from taking an active role in either of the two battles. His corps took a prominent part at Waterloo, where it was badly mauled by a spirited British cavalry charge and later in the day engaged forces resolutely defending the farm of La Haye Sainte.

At the beginning of the Second Restoration Drouot took refuge in Germany, but he was finally granted amnesty by Charles X in 1825. He returned to France as commander of the 12th Military Division in Nantes. In November 1832 he ordered the arrest of the Duchess of Berry on her attempt to raise rebellion in the Vendée. Louis Philippe, toward whom Drouot had always shown loyalty, nominated him as governor-general of the French colonies in North Africa (1834–1835). He received the title of marshal of France in 1843 and died in Paris the following year.

## Drouot, Antoine, comte (1774–1847)

Antoine Drouot was born the son of a baker in Nancy in 1774. He was commissioned in the artillery at the age of nineteen. He took part in the French Revolutionary Wars, serving in Holland and Germany. He also held the odd distinction of being one of only a handful of officers who took part in both the greatest sea battle and arguably the greatest if not most decisive land battle of the Napoleonic Wars: He served as one of a few army artilleryists attached to Admiral Pierre de Villeneuve's fleet during the Battle of

Trafalgar on board a ship of the line, and he was also in command of troops at Waterloo.

A major turning point in Drouot's career occurred in 1808 when he transferred to the Imperial Guard. He fought in the Peninsula and followed Napoleon on his highly successful campaign along the Danube against the Austrians in 1809. During the Battle of Wagram, Drouot was severely wounded in the right foot by grapeshot. He slowly recovered from his wound, which left him with a permanent limp.

Drouot was promoted to colonel in time to direct the Imperial Guard during the invasion of Russia in 1812. He fought with distinction during that disastrous campaign, notably at Borodino. Drouot was again promoted, to *général de brigade*, in January 1813 and served as an aide-de-camp to the Emperor. Napoleon, also an artilleryist by training, was known to like Drouot's style of leadership and his tactical and moral qualities, calling him "the sage of the Grande Armée" (Elting 1988, 249) for his studious demeanor. A pious man, Drouot carried his Bible into battle and read profusely. Although he sometimes disapproved of his Emperor's actions, he remained unfalteringly loyal to Napoleon.

Drouot led the Imperial Guard with distinction during the 1813 campaign in Germany. During the Battle of Lützen he maneuvered seventy cannon forward and inflicted serious casualties on the enemy, an action that is considered one of the most notable deployments of artillery in the Napoleonic Wars. In September 1813 Drouot was made a count of the Empire and continued to serve with distinction throughout the campaign of 1814.

After Napoleon's forced abdication Drouot followed the Emperor into exile on Elba, receiving the title of governor of the tiny island. The exile, however, was short-lived. During Napoleon's return to France, Drouot served his emperor throughout the Waterloo Campaign, fighting well at the head of the Imperial Guard.

After the defeat at Waterloo the Bourbon government charged Drouot with treason. Rather than flee the country, Drouot remained to face the charges. He received an acquittal from his court-martial and went into retirement, refusing a pension until well after the death of Napoleon. He died in 1847, having performed loyal and diligent service to Napoleon and the French Empire.

### Du Pont de Nemours, Pierre Samuel (1739–1817)

Pierre du Pont was born in Paris in 1739, the son of the watchmaker Samuel du Pont and Anne de Montchanin. Though Pierre was early apprenticed to follow in the footsteps of his father, his mother made sure that he received an education in the humanities as well. This education laid the groundwork for his later exploits both in the service of the government of Louis XVI and in the early phases of the Revolution. His activities during the Revolution eventually made it unsafe for du Pont to remain in France, so he emigrated to the United States, where he founded a gunpowder mill.

Early on, as a result of his humanist education, du Pont took an interest in the then-nascent field of economics. In the 1760s he wrote several tracts on the national economy. The government of Louis XV suppressed these works for the ideas they advocated, which were clearly physiocratic. Still, du Pont's publications did earn him the notice of such influential figures as Voltaire and Anne-Robert-Jacques Turgot. Likewise, he may even have influenced Adam Smith.

The controversy generated by du Pont's writings forced him to leave France. He traveled to Poland in 1773, where he served as tutor to the prince royal. His exile did not last long, however, as he returned to France to serve the new king, Louis XVI. Among the projects he undertook for the monarch were negotiations that led to the Treaty of Paris, ending the American War of Independence (1775–1783). His efforts on this project earned him a title of nobility from the king, as well as the friendship of Thomas Jefferson.

Du Pont continued to serve the finance ministers of the king, first Anne Robert Turgot and later Charles Alexandre de Calonne. Even when the Revolution broke out, he remained involved during the legislative phase, submitting proposals for moderate economic reforms that would have led to a mixture of free enterprise and state paternalism. His ideas were popular enough to win him election to the National Assembly in 1790. Later his moderate stance became more of a burden than an asset.

As the Revolution became more radical, du Pont fell into enmity with the leadership. He was arrested and jailed several times and barely escaped execution during the Terror. In 1799 he left France for the United States. He settled in Delaware, where he founded a gunpowder mill, the basis for the DuPont chemical company.

In 1802 du Pont returned to France, hoping to restart his political career in the more conservative climate of the Consulate. He was instrumental in negotiating the Louisiana Purchase, but he returned to America shortly thereafter. He died on 17 August 1817 from exhaustion after fighting a fire in his gunpowder mill.

### Düben, Battle of (16 October 1813)

The German town of Düben is located on the main road between Dresden and Leipzig in Mark Brandenburg along the river Elbe. The town is a historical site, and many of the buildings date from the Middle Ages, including what many have described as a “dreary palace.” It was at this palace that Napoleon set up his provisional headquarters between 10 and 13 October while he pondered what to do as General Gebhard von Blücher and *Feldmarschall* Karl Philipp Fürst zu Schwarzenberg closed in on him from different directions. The year 1813 was pivotal in the War of the Sixth Coalition. The action at Düben would be a minor part of the larger Battle of Leipzig, also known as the Battle of the Nations.

Napoleon had left Düben at the head of his forces to meet Blücher near Leipzig on 13 October. Napoleon's forces were strung out along the road to Leipzig and on both sides of the Elbe when they were attacked on the sixteenth. A French rear guard was located in Düben consisting of the understrength 9th Division commanded by General Antoine-Guillaume Muraillhac d'Elmas de La Costa (known as Delmas).

His forces consisted of elements of the 29th Provisional Regiment, 29th Light Regiment, 136th, 138th, and 145th Line Regiments, and two batteries of foot artillery, totaling some 4,235 men.

To the north of Delmas were the 1,300 men of the Polish 27th Infantry Division commanded by General Edward Żołtowski, part of Prince Józef Poniatowski's Polish forces. Żołtowski's men held the twin villages of Gross Wiederitzsch and Klein Wiederitzsch, partially covering Napoleon's rear. Austrian and Hungarian grenadiers supported by Russian infantry fiercely attacked the Poles across the Elbe, and Żołtowski was hard-pressed, losing control of

Gross Wiederitzsch to the Russians. French forces across the Elbe could do nothing to aid Zołtowski, but Delmas was in position to do so.

Delmas led his troops out of Düben, launching an attack into the flank and rear of the Russians relieving the beleaguered Poles. Delmas and Zołtowski then regrouped and assaulted the woods near Klein Wiederitzsch, putting the Allied troops to flight. Delmas, with the assistance of the Poles including 700 recently arrived Polish uhlans (lancers) commanded by General Jan Dabrowski, recaptured Gross Wiederitzsch that afternoon after a sharp engagement.

Ultimately the battle swung against Napoleon when increasing pressure from Austrian, Russian, and arriving Prussian troops rendered the positions near Düben untenable. After strong resistance, both the Polish and French troops were forced to give way before their formations were shattered by repeated Allied assaults. Düben was only a small part of much larger events, but the Poles that fought there highly distinguished themselves, as did their French comrades.

### **Dumouriez, Charles François Dupérier (1739–1823)**

Born in Cambrai, Flanders, on 26 January 1739, Charles François Dupérier Dumouriez was the son of a poet and war commissioner, Anne-François Dupérier Dumouriez. After receiving a preliminary education from his father, Dumouriez spent three years in attendance at the college of Louis-le-Grand, where he studied classics. At the age of eighteen, Dumouriez entered the army and served as a war commissioner in Hanover. His bravery led him to be promoted to the rank of captain in 1761. Dumouriez fought against the Prussians in the Seven Years' War, in which he was injured and taken prisoner. He was awarded the Cross of St. Louis in 1763 at the end of the war and retired with a pension.

During the pre-Revolutionary years, Dumouriez served on a number of secret diplomatic missions for the

Crown. One of these was the post of minister of information in Corsica from 1768–1769. The duc de Choiseul, the minister for foreign affairs, sent him to Madrid, Lisbon, and later to Poland during the early 1770s in an effort to defend the Poles against Russian aggression. While in Poland, he established a Polish militia. Upon his return to Paris, he was sent clandestinely to Hamburg to raise an army for the purpose of intervening in Sweden.

Dumouriez was imprisoned in the Bastille for six months, charged with embezzling funds during these secret missions. He spent his time in prison writing. With the accession of Louis XVI to the throne in 1774, he was released from prison. He married his cousin, Mademoiselle Marguerite de Broissy in the same year, but the marriage proved to be unsuccessful because of his infidelities. His wife sought refuge by entering a convent.

During the decade from 1778 to 1788, he served as commandant of Cherbourg. By the eve of the Revolution he had reached the rank of major general. The Revolution offered the ambitious and adventuresome soldier a world of new opportunities. Dumouriez used the Revolution to further his own aspirations rather than to promote its principles of liberty, equality, and fraternity. On the surface, he appeared to be a supporter of the new regime, joining the Jacobin Club of Paris in 1790. Initially, he attached himself to the more moderate Revolutionaries, the Monarchiens, led by the comte de Mirabeau, a prominent Third Estate deputy from Aix-en-Provence who favored a constitutional monarchy in which the king would possess an absolute veto. With the death of Mirabeau in April 1791 and the radicalization of the Revolution with the king's flight and capture at Varennes, Dumouriez began to associate with a more radical group, the deputies from the Gironde region of France, who would later become known as the political faction of the Girondins.

In common with the Girondins, Dumouriez supported war against Austria; however, whereas the Girondins were in favor of war to consolidate the Revolution, Dumouriez wanted war to strengthen the monarchy. The Girondin faction, led by the deputy Jacques-Pierre Brissot, was the dominant faction during the winter of 1791 to 1792, and through their support Dumouriez was appointed minister of foreign affairs on 15 March 1792. This portfolio lasted for three months. With the demise of the Girondin ministry in June 1792—the king dismissed the ministers because he did not support their policies concerning the émigrés and refractory priests—Dumouriez replaced Joseph Servan de Gerbey as minister of war. He remained in this post only for a few days and then resigned to join the Army of the North led by Nicolas, baron Luckner. At this time, the war was not going well for the French. The invading Allies had captured Longwy and

marched on to Verdun, and the Duke of Brunswick, leading the Prussian forces, now began his march on Paris. The monarchy had fallen on 10 August 1792, and the marquis de Lafayette, one of the leading generals, had defected to the Austrians. At this time, Dumouriez was appointed commander of the Army of the North. He joined François Kellermann (the Elder), commander of the Army of the Center and forced the Prussians to retreat at Valmy on 20 September. This battle marked a turning point for the French Army and was its first victory since war had been declared on 20 April.

On 6 November, Dumouriez led the Revolutionary forces to another victory at Jemappes, the Austrians' winter quarters, located in the Austrian Netherlands (Belgium). Dumouriez's intention was to invade Belgium and create a separate state with himself at its head. With the victory at Jemappes, most of the province had been conquered. The Austrians retreated, leaving some 4,500 men killed or wounded. The French took 1,500 prisoners but lost some 2,000 men. Dumouriez received a hero's welcome from the people when he returned to Paris. However, he was not so popular with the Jacobins, who were now in power, their government being known as the Convention.

He then invaded Holland on 26 February 1793, but the French were forced to retreat into Belgium, where they were defeated by the Austrians at the battles of Neerwinden (18 March) and Louvain (21 March). Dumouriez entered into secret negotiations with the Austrians, who agreed not to pursue his army as long as he would march on Paris, overthrow the government, and restore the monarchy. He would become regent for Louis XVII, the dauphin. Unfortunately for Dumouriez, the Convention became suspicious of his plans and sent the minister of war, Pierre de Riel Beurnonville, and four deputies to his headquarters. Dumouriez arrested the minister and his aides, but his army rebelled, and on 5 April he defected to the Austrians. His treason helped precipitate the purge of the Girondin faction and their allies from the Convention throughout the summer of 1793.

Dumouriez wandered throughout Europe during the next few years. Eventually he settled in England, where he worked for a time as an adviser to the British government and received a small pension for his work. However, no one would take him seriously. With the Restoration of the monarchy in France in 1814, Louis XVIII proscribed his return to native soil. He died at Turville Park, Buckinghamshire, on 4 March 1823. In addition to his memoirs in three volumes, Dumouriez authored many political pamphlets.

*See* Flanders, Campaigns in

## Dupont de l'Étang, Pierre-Antoine, comte (1765–1840)

French general who served in a number of campaigns but whose performance in Spain caused him to fall out of favor until the Restoration in 1814.

Originally an officer in the Dutch Army, Pierre Dupont joined the French Army in 1791, having received an appointment as a first lieutenant from the comte de Rochambeau. By 1793 he was a *général de brigade*, and in 1797 he rose to *général de division* and was made director of the War Depot. In the Italian campaign of 1800, Dupont served as General Louis-Alexandre Berthier's chief of staff, fighting at the Battle of Marengo and participating in the occupation of Tuscany. It was Dupont who signed the Convention of Alessandria with the Austrian general Michael Freiherr von Melas.

During the War of the Third Coalition in 1805, Dupont served in Marshal Michel Ney's corps, defeating Archduke Ferdinand at Haslach, came to the aid of General Honoré Gazan's division at Dürnstein, and served under marshals Adolphe Mortier and Jean-Baptiste-Jules Bernadotte in the campaign of 1806. In June 1807 Dupont served competently at Friedland, for which he was well rewarded, including receiving the honor of the Grand Eagle of the Legion of Honor.

Dupont's career then took him to Portugal, where in 1808 he was given the title Count of the Empire. After that, however, Dupont's fortunes turned sour. He was entrusted

with the job of gaining control of the province of Andalusia in southern Spain. Dupont soon found himself under heavy attack from a popular uprising and a large Spanish army. He fought bravely and was wounded, but his decision to fight rather than make a quick strategic withdrawal led to disaster, and he was forced to surrender his army at Bailén. This made Napoleon livid, and also convinced him that only his imperial presence would lead to victory in the Iberian Peninsula.

Dupont was sent back to France on parole but for his actions at Bailén he was almost immediately imprisoned and held until Napoleon's fall in 1814. During the First Restoration, Louis XVIII appointed him minister of war (replacing Henri Clarke) among other posts, but with Napoleon's return Dupont was forced to flee France. After Napoleon's final defeat at Waterloo, Dupont returned and was appointed minister of state and a member of the Privy Council. He pursued an active political career until his death.

### **Duroc, Géraud Christophe Michel, duc de Frioul (1772–1813)**

Géraud Christophe Michel Duroc was born on 25 October 1772 to the family of Claude de Michel, chevalier du Roc. Duroc studied at the military school at Pont-à-Mousson between 1789 and 1792 before enrolling as an artillery *sous-lieutenant* in the military school at Châlons in March 1792. As the Revolution became more radical, Duroc emigrated in the summer of 1792, but he soon changed his mind and returned to France. In June 1793 he became a *sous-lieutenant* of the 4th Artillery Regiment and served in the Army of Italy for the next five years, earning promotions to lieutenant on 18 November 1793 and to second captain on 21 November 1794. In late 1794 he took part in the siege of Toulon, where he met the young Napoleon Bonaparte, then a mere captain of artillery. Two years later Duroc became an aide-de-camp to (now General) Bonaparte on 26 October 1796 and distinguished himself at Isonzo, Brenta, and Gradisca during the Italian campaigns

of 1796–1797. Promoted to captain on 2 June 1797, he transferred to the Army of the East and took part in the expeditions to Egypt and Palestine, where he commanded a battalion (November 1798) and a brigade (March 1799). However, he was seriously wounded at the Battle of Aboukir on 25 July 1799. His devotion to Bonaparte earned him a place on the frigate when the latter fled Egypt, and, returning to France, Duroc actively supported Bonaparte in the events of the coup of Brumaire.

During the Consulate, Duroc became the first aide-de-camp to Bonaparte in October 1799 and carried out a series of secret missions in 1799–1800. Appointed *chef de brigade* of the 3rd Artillery Regiment on 14 March 1800, he took part in the second Italian campaign in 1800 and fought at Marengo on 14 June. Over the next two years, he served on diplomatic missions to Berlin, Vienna, St. Petersburg, and Copenhagen. He was promoted to *général de brigade* on 13 October 1801 and to *général de division* on 27 October 1803.

In 1803–1805 Duroc served with the main French army at the Boulogne camp awaiting the invasion of England. Appointed *grand maréchal du palais* (1804) of the Tuileries palace, Duroc was responsible for Napoleon's personal safety and supervised the imperial household, managing it very efficiently and economically. He accompanied Napoleon during the 1805–1807 campaigns in Austria, Prussia, and Poland and temporarily commanded General (later Marshal) Nicolas Oudinot's grenadier division at Austerlitz on 2 December 1805. Duroc was actively involved in diplomatic negotiations with King Frederick William III of Prussia in 1805, with the elector of Saxony in December 1806, and with Tsar Alexander I of Russia in 1807. Following the Treaty of Tilsit with Russia, Duroc was sent on a mission to Spain, where he negotiated the Treaty of Fontainebleau (27 October 1807) and the agreement at Bayonne (5 May 1808), the first intended to effect the dismemberment of Portugal, and the second to remove the Spanish Bourbon monarchy from power. Both of these diplomatic maneuvers formed part of French machinations for military and political intervention in Spain. In late 1808 Duroc accompanied Napoleon to Erfurt, where he was again involved in discussions with Alexander. For his dedicated service, Napoleon conferred on Duroc the title of duc de Frioul in 1808.

During the 1809 campaign against Austria, Duroc accompanied Napoleon at the battles of Aspern-Essling and Wagram and concluded the armistice of Znaim on 12 July. Three years later he followed Napoleon into Russia and tried in vain to persuade Napoleon not to pursue the Russian armies deep into Russian territory. He witnessed the battles of Borodino and Maloyaroslavets and departed the retreating French army in December 1812. Returning to

Paris, he was appointed a senator on 5 April 1813, actively participated in the organization of the new French army, and followed Napoleon back to Germany. He took part in the battles of Lützen and Bautzen in May and was mortally wounded by a cannonball in the action at Würtzen on 22 May, dying the following morning in a farmhouse at Markersdorf, near Görlitz. Duroc's death was a considerable personal blow to Napoleon, who lost a dear friend and trusted confidant. Duroc was later interned in the Invalides in 1847, and his name was inscribed on the eastern side of the Arc de Triomphe in Paris.

### Dürnstein, Battle of (11 November 1805)

A rearguard action fought between Russian and French forces on 11 November 1805. As the Russian army quickly retreated to the east, Napoleon pursued it with his main forces. To prevent General Mikhail Kutuzov from crossing the Danube, he ordered Marshal Adolphe Mortier to operate along the northern bank of the river. Mortier crossed the Danube with his newly created VIII Corps on 6 November and hurried General Honoré Gazan's division (6,255 men) to Dürnstein, while the remaining divisions of generals Pierre-Antoine Dupont (6,203 men) and Jean-Baptiste Dumonceau were moving behind along the north bank. At the same time, Marshal Joachim Murat lost contact with the Russians and, after some hesitation, decided to move toward Vienna, which was undefended. By moving his forces eastward, Murat left Mortier isolated and exposed to attack by the entire Austro-Russian army.

Kutuzov immediately took advantage of the situation and decided to destroy the French divisions piecemeal as they marched along the riverbank. Gazan's division bore

the brunt of attack. Advised by the Austrian general Schmidt, Kutuzov divided his troops into five sections in order to attack the French division from the front, the flank, and the rear in a narrow defile near Dürnstein. In total, over 35,000 Russian troops converged on some 6,000 French under Gazan, attacking them early on 11 November. Despite their disadvantage in numbers, the French fought with remarkable tenacity and élan and managed to repulse Russian attacks for several hours before Dupont arrived in time to rescue Gazan and drive the Russians back.

The French suffered very heavily: Gazan's division lost almost half of its men, with 1,700 killed and wounded and 1,300 captured. The Allied losses are less accurately known since Kutuzov did not include them in reports, but most scholars acknowledge around 3,000–4,000 killed and wounded.

### Dutch Forces

When in 1789 the French Revolution broke out, the Dutch republic (United Provinces) was militarily unprepared for the onslaught to come. Dutch land forces were known as the State Army, the name emphasizing the sovereignty of the States-General and its control over the armed forces. The States-General were dominated by the notoriously anti-Orangist tradesmen of Holland, and since both the army and navy traditionally supported the Prince of Orange in his capacity as the *stadtholder* and captain general, the States-General were loath to invest in the armed forces.

Moreover, the tradesmen in the States-General considered any investment in the armed forces rather wasteful,

and the provinces were divided as well: The powerful merchant provinces in the west relied on overseas trade and felt relatively well protected behind the Water Line, a stretch of polders that could be inundated if the country was invaded. The “land provinces,” on the other hand, were both far more rural and vulnerable to invasion. Thus, the “sea provinces” wanted—if anything—to invest in the navy, while the “land provinces” preferred investment in land forces and fortifications. As a result, nothing was done to benefit either branch of the armed forces. Thus, when Revolutionary France proved to be a threat, the State Army was understrength, inefficient, and ill equipped.

Early in 1793 the French invaded the Netherlands (not to be confused with the Austrian Netherlands, present-day Belgium) for the first time. Dutch Brabant was occupied, but the (French) *Armée du Nord* (Army of the North) under General Charles François Dumouriez met significant resistance and was prevented from crossing the *Hollandsch Diep*. Dumouriez was defeated at Neerwinden, and the Netherlands were evacuated, but the next year the French returned, now under the command of General Jean-Charles Pichegru. Often in conjunction with Allied troops, Dutch forces were heavily involved in the contest for the Austrian Netherlands, capturing Landrecies and Charleroi and pushing the *Armée de Sambre-et-Meuse* (Army of the Sambre and Meuse), under General Jean-Baptiste Jourdan, behind the river Sambre. However, Pichegru’s army marched north again, and, notwithstanding fierce resistance, notably at Grave and Sluis, and several unsuccessful attempts to cross the Maas (Meuse), Waal, and Rhine rivers, the French eventually succeeded on Christmas Day 1794, for an extraordinarily severe winter cold had frozen solid the rivers and inundated polders, rendering Dutch defenses effectively useless.

The French soon renamed seven provinces of the Netherlands as the Batavian Republic, and the army was reformed on the French model, effectively transforming an old-fashioned, burdensome force into an effective fighting force. Numbers were almost halved, however, largely because the Batavian Republic was obliged by treaty to admit a force of 25,000 French troops upon its territory and to pay for their maintenance, a severe burden on the defense budget. Although a national guard was created, general conscription was avoided.

During the following years the Batavian army would take part in several campaigns, both within and without the borders of the Dutch republic. In 1796 a division was sent to fight in the campaign along the Rhine, but although the Batavians did not see action, desertion was endemic, probably as a result of poor conditions and supply. In 1797 Batavian forces prepared to invade Ireland but never sailed. However, the army would soon be called to defend its own

soil, as an Anglo-Russian army invaded North Holland in August 1799. Batavian troops fought several engagements, notably at Castricum, Bergen, and Alkmaar.

In 1800 a Batavian division took part in the Rhine campaign and fought at Aschaffenburg and at Würzburg, the latter of which they were involved in particularly heavy fighting at the fortress of Marienberg. Between 1803 and 1805 a Batavian division was maintained for service in Napoleon’s planned invasion of Britain, but when that expedition was abandoned in August 1805 the division was instead ordered to march into Germany, where it served with the French in the War of the Third Coalition. The Batavian division saw action at Passau, Augsburg, and Krems but suffered from desertion and straggling, probably because the Batavians were not prepared for the relentless marching speed expected of them by the French.

In 1806 the Batavian Republic became the Kingdom of Holland. The army was again reformed, now after the French imperial example, which resulted in the introduction of cuirassiers (heavy cavalry wearing steel breastplates and helmets) and a rather substantial Royal Guard. The King of Holland, Napoleon’s brother Louis Bonaparte, considered the army his personal toy, resulting in a flood of decrees and subsequent chaos. However, whether by accident or design, this seems to have assisted Louis in resisting his brother’s exorbitant demands on manpower. Under Louis’s rule general conscription was held at bay, thus preventing the kingdom from being bled white, but in doing so the king greatly angered Napoleon.

During Louis’s reign the Dutch army served on several fronts. During the 1806–1807 campaign in Germany, two divisions and the Royal Guard marched into Hanover and Westphalia, but when Napoleon would not allow the Dutch divisions to serve as separate and undivided units, Louis angrily marched back to Holland with his Royal Guard. The remaining troops were divided between other commands, with some Dutch units involved in the capture of Hameln and Nieburg. In 1807–1808 a Dutch corps took part in the capture of Stralsund in Swedish Pomerania, and from 1808 to 1810 a Dutch brigade served in Spain, where it was present at Durango, Mesa de Ibor, Talavera, Almonaci, and Ocaña. In 1809 two Dutch brigades served in Mecklenburg and Pomerania, taking Dönitz and (again) Stralsund.

In 1809 a British force invaded the Dutch island of Walcheren. King Louis immediately assumed command but was overruled by his brother, who relieved him from command and put Marshal Jean-Baptiste Bernadotte in his place. Franco-Dutch forces—and the outbreak of a deadly fever—eventually succeeded in forcing the extremely ill-prepared British to evacuate the island. Dutch troops distinguished themselves during the capture of the fortress of

Bath, yet Napoleon ostracized Louis and used this incident as an excuse to force his brother to abdicate—an excuse, for Louis was not an incompetent commander and had responded adequately to the invasion. On 13 July 1810 Holland was annexed by imperial France, and the army was subsequently incorporated into the French Army. However, by order of the Emperor, some regiments remained homogenous, that is, both the officer corps and new recruits remained overwhelmingly Dutch. Two regiments deserve special mention: the Royal Guard Grenadiers and the Royal Horse Guard, which were incorporated into Napoleon's Imperial Guard as the 2nd (later 3rd) Guard Grenadiers (“Dutch Grenadiers”) and the 2nd Guard Lancers (“Red Lancers”), respectively.

The Dutch departments of the French Empire now became subject to general conscription. As part of the French Army, Dutch troops served in the Russian campaign and took part in many actions, in some cases with distinction. In particular, Dutch troops fought at Borodino and Polotsk, the Dutch Grenadiers were almost eradicated during the second Battle of Krasnyi, and the *pontonnières* who built the two bridges over the Berezina were largely Dutchmen. During the following year, further troops were recruited in the Dutch departments, and they fought in Germany in 1813, being present at several battles, including Lützen, Bautzen, and Leipzig.

When Napoleon abdicated, the territory of the former Dutch republic and the Austrian Netherlands was merged into the Kingdom of the Netherlands to provide a buffer against future French territorial ambitions. The new army drew heavily upon the experience of the recent past, relying on a professional core of troops bolstered by a national militia. About one third of the Duke of Wellington's troops at Waterloo were Dutch, and on several occasions Dutch participation was decisive, most notably at Quatre Bras—where Karl Bernhardt of Saxe-Weimar-Eisenach and Baron Jean-Victor Constant de Rebecque chose to hold their positions, in defiance of Wellington's orders—and two days later at Waterloo, where General David Hendrik Chassé launched a decisive bayonet charge. On the other hand, a significant proportion of Dutch forces were composed of raw militia, and their commander, the Prince of Orange, though courageous, was inexperienced and cocky, making a series of blunders at Waterloo. On balance, however, the Dutch troops themselves performed reasonably well.

## Dutch Navy

The story of the Dutch Navy during the Revolutionary and Napoleonic Wars is a tragic record of pride, effort, and failure. When war broke out in 1793, the Dutch Navy was in a bad state of repair, largely due to poor funding typical of the Dutch republic (United Provinces) in times of peace. However, it succeeded in fending off attempted French landings, notably at Willemstad when it prevented General Jean-Baptiste Dumonceau from crossing the Hollandsch Diep. When in 1795 the Dutch Republic was overrun by the French—rivers and inundated areas defending the north of the republic were frozen over because of an extraordinarily cold winter—the fleet was taken over by the Batavian Republic, a French satellite created out of seven provinces of the Netherlands. Most notably, a major part of the Dutch fleet off Texel was taken by cavalry crossing the ice—perhaps the only instance in history of such a feat.

In 1795, because the navy was in bad condition due to the aforementioned low funding and action against the French, measures were taken to render it ready for action. However, the fleet almost immediately suffered severe setbacks; for example, in June 1796 a squadron under Captain

Engelbertus Lucas, sailing for the Cape of Good Hope and the East Indies, was cornered by a superior British force in Saldanha Bay and forced to surrender by Orangist mutineers. This was an unnecessary loss, for promised French naval assistance evaporated when the fleet simply never sailed out of port, leaving the Dutch squadron at the mercy of British numerical superiority. Another squadron, sailing for the West Indies, suffered from dwindling supplies and French privateers, who attacked notwithstanding a Franco-Dutch accord. Upon returning home the squadron was bottled up by the British in Norwegian harbors. Because the ships were unable to sail, they were sold off. Meanwhile, the remaining vessels of the fleet in the Netherlands were also unable to leave port because of a British blockade.

The French failed to send a fleet to support Lucas because they had reallocated the funding to prepare for an invasion of Ireland at Bantry Bay. In December 1796 the invasion failed due to bad weather and inadequate generalship, but France continued to pursue the ambition to bring Britain to its knees by invading Ireland, which was notoriously rebellious. Shortly thereafter a new landing was planned in which the Batavians, in Dutch ships, would play a major part. However, lack of wind held up operations, and the British were alerted providing them sufficient time to quell the mutinies of their own fleets at Spithead and the Nore before the Dutch fleet appeared in British home waters. Then, on 11 October 1797, Admiral Adam Duncan decisively defeated the Dutch at Camperdown (Kamperduin), where a major part of the Dutch fleet was lost. The defeat was largely due to bad judgment on the part of the central command, which ordered the fleet to sail despite the objections of the acting commander, Admiral Johan Willem de Winter, thereby putting it at great risk without any set goal in mind.

The Dutch fleet could not prevent an Anglo-Russian army from landing during the invasion of North Holland in 1799, for the fleet was simply too small to protect the long western Dutch coastline. Instead, it remained at the Marsdiep between Texel and Den Helder, so when the British fleet finally sailed into the Zuiderzee, the Dutch allowed themselves to be cornered. It is not known exactly why the fleet did not sail out to battle, but the commander's indecision probably played a role, in conjunction with a mutiny

among the crew precipitated by the appearance of Orangist banners flown from the mastheads of the British vessels. In any case, the Dutch fleet surrendered, and the ships were taken, largely with the collusion of the crews. The vessels sailed under the British flag for the remainder of the Napoleonic Wars, manned with Dutch crews and officers.

After 1799 the Dutch/Batavian fleet played an increasingly defensive role, although the republic did provide ships to assist in Napoleon's preparations for invasion of Britain, a plan that was frustrated by the Franco-Spanish defeat at Trafalgar in 1805. In spite of this, Napoleon continued to entertain ambitions of attaining a powerful fleet. The British invasion of Walcheren Island in 1809 was partially intended to neutralize a renewed Franco-Dutch effort to rebuild the fleet. The limited Dutch fleet did what it could, but it was unable to prevent the invasion. When in 1810 Holland was annexed by France, what remained of the Dutch fleet was incorporated into its French counterpart. Only after the defeat of Napoleon and the creation of the Kingdom of the Netherlands in 1814 was the Dutch Navy able to rebuild a significant force, its first feat being the Anglo-Dutch bombardment of Algiers—one of the Barbary States that preyed on European shipping in the Mediterranean—on 27 August 1816.

## Ebersberg, Battle of (3 May 1809)

Also known as Ebelsberg, a minor French victory over the left wing of the Austrian army during its withdrawal through western Austria during the campaign of 1809. Separated from the main Austrian army in Bavaria, *Feldmarschalleutnant* Johann Hiller had retreated to Linz by 2 May with three corps. Followed by Marshal André Masséna with IV Corps, Hiller fought a defensive action at Ebersberg, which was the main crossing over the river Traun, on 3 May. After fierce fighting on the 550-meter-long bridge and in the town, Hiller continued his retreat to Vienna.

After a brief counterattack around Riedau, Hiller had to defend the Traun crossing on 3 May to allow the brigade under *Generalmajor* Emmanuel Freiherr von Schustekh-Herve to catch up, and he was unable to burn the only wooden bridge. At 8:00 A.M., the main Austrian column crossed leaving *Feldmarschalleutnant* Karl Freiherr von Vincent's rear guard on the left bank. As the Austrians prepared breakfast, the first skirmishing began around 9:30 A.M. The town was garrisoned by three battalions, with the rest of the Austrian force on the hills behind. Leading the French advance guard, General Jacob François Marulaz engaged Vincent with eighteen squadrons of light cavalry, while four attacked the approaching Schustekh. At 11:00 A.M., as the Austrians retreated to the bridge, Marulaz pressed forward, reinforced by General Louis-Jacques, Baron de Coëhorn's brigade from General Michel-Marie Clarepède's division, turning the bridge into a scene of disorder. In the confusion, the French reached the far end of the bridge by 11:30 A.M. Coëhorn massed his troops for an assault on the southern part of Ebersberg but came under heavy Austrian artillery fire from the castle to the north. Clarepède added his two other brigades (under generals Joseph Lesuire and Florentin Ficatier) to the battle, and his eighteen guns opened fire. An Austrian counterattack from the north threatened the French in the town, but by 1:00 P.M., Lesuire's brigade had taken the marketplace and

was trying to outflank the enemy near the castle. As Lesuire's brigade faltered, Ficatier assaulted the castle in three columns but was repelled.

The main Austrian force was surprised to find Clarepède's skirmishers on the hills. Three battalions of Vienna Volunteers charged into the burning town and, reinforced by four infantry battalions, drove the French from the marketplace. Outflanking attacks came from the castle and from the south, threatening to cut the French off from the bridge. By 2:00 P.M. Hiller was preparing to retreat as General Claude Legrand's division arrived to reinforce Clarepède. Within half an hour, Legrand had secured the bridge and town gate; Masséna directed his men in the marketplace as fires consumed the whole town. The French could not advance further, but by 3:00 P.M. the Austrians were pulling out. André-Jean, baron Ledru's brigade quickly took control of the castle as the Austrians evacuated it, and by 4:00 P.M. the fighting was over. This bloody battle had cost the Austrians 8,340 men, and the French about 12,000.

## Education (French)

While Napoleon is often seen in terms of his military image, he was also one of history's great administrators. Education was high on his list of priorities, which were in large part the priorities of the middle class. Napoleon believed in a system of merit, and for such a system to be ef-

fective there must be some form of widespread education, especially at the secondary level. His statement “The real conquests, the only ones that do not cause regret, are those that are won over ignorance” (Napoléon 1858–1869, 3: no. 2392) expresses his intense interest in the educational system in France.

The French Revolution had given some emphasis to education, a subject that formed a part of its numerous constitutions. Perhaps the most dramatic change brought by the Revolution was the removal of religious influence from all educational institutions. The Paris Normal School was created with a curriculum that included indoctrination in republican values as well as more traditional subjects, and schools were to use books to be published and prescribed by the Convention. The Revolution continued the French tradition of extreme centralization of educational policy. Also instituted at this time was the policy of establishing a public secondary school for every 300,000 people. The curriculum for these *écoles centrales* (central schools) consisted of literature, languages, science, and the arts.

These efforts notwithstanding, when Bonaparte came to power in 1799 the position of public education in France was not good. Numerous problems existed, including a shortage of qualified teachers and, more important, a shortage of qualified students. Schools in Paris and several other major population centers did well, but in the rest of the country the story was not always as positive. One problem had to do with the organization and curriculum of the schools. There was no continuity in the curriculum and very little in the way of required courses. Thus, a “graduate” from a central school might or might not have met some reasonable standards, either academic or curricular. In short, the system of central schools had not lived up to its promise.

The Revolution had removed most religious influence from the public schools, a move that was not universally popular with the French people. This issue was partially resolved by the 1801 Concordat between the pope and Bonaparte, which allowed some of the religious elementary schools to be reestablished. These schools again provided most of the education available to girls, a fact that reflected Bonaparte’s attitudes toward female education. He felt that education was important for girls but did not generally expect them to receive the same sort of education provided for boys. Bonaparte believed that religion and assorted domestic skills necessary to attract husbands should be stressed for girls. While Bonaparte’s attitudes regarding women and education may seem less than progressive by modern standards, he at least called for them to learn numbers, writing, and the principles of their language, as well as history, geography, physics, and botany. This made him relatively progressive by the standards of his day.

Secondary education was extremely important to Bonaparte. He wanted to divide education into two parts: for those under age twelve and for those over. The first four grades would teach general topics such as reading, writing, history, and the use of arms. The later grades would be divided into those boys who were destined for a civil career and those destined for a career in the military. Civil careers would stress languages, rhetoric, and philosophy; military education would stress mathematics, physics, chemistry, and military matters. Both civil and military graduates would be guaranteed employment in their chosen career. On 1 May 1802 a decree established what was to be a new system of education in France, which continues to serve as the foundation of French education today.

Under the new system, elementary schools (*écoles populaires*) were to be the responsibility of the local municipalities. Bonaparte had relatively little interest in this level of education and was not firmly committed to the mass education that would result from a statewide elementary education system. Consequently, religious schools were to share a significant amount of the responsibility for elementary education.

Secondary education, however, was the base education for the future leaders of the nation, as well as for members of the bureaucracy and the military—hence Bonaparte’s greater interest. The state had a strong interest in the curriculum being presented, and control would be easier with a system of secondary schools under the direction of a central authority. Many of these schools, including clerical ones, would be established by private initiative, but all such institutions were controlled by the state. Covering students roughly from ages ten to sixteen, these schools would provide a level of education designed to develop students who could go on to higher levels of education. Indeed, some bonus plans were established for teachers who had large numbers of students qualifying for advancement.

The heart of the new system was the establishment of thirty *lycées*. Every appeal court district was to have a *lycée*, and they were to be completely supported and controlled by the state. Scholarships were provided, with about one-third going to sons of those in the military and the government and the rest being for the best pupils from the secondary schools.

The *lycées* had a six-year term of study, building on the work of the secondary schools. The curriculum included languages, modern literature, science, and all other studies necessary for a “liberal” education. Each *lycée* was to have at least eight teachers, as well as three masters (a headmaster, an academic dean, and a bursar). In a reflection of modern debate on the subject, the government provided a fixed salary for teachers but also paid bonuses to successful teachers. They were also provided a pension. Teachers were

chosen by Bonaparte from a list of recommendations provided by inspectors and the National Institute.

It is clear that the new system of education introduced by Bonaparte had more than one purpose. It was intended, of course, to provide an educated elite that could help run the country and the military. It was also designed to provide for an increased middle class—a middle class that would be successful and hence nonrevolutionary. Moreover, there was a great emphasis on patriotism in the schools, an emphasis that was to increase during the years of the Empire.

When Bonaparte became the Emperor Napoleon in December 1804, he became even more interested in centralized control of the educational system. He saw education as a tool through which each generation could be taught the values of society. He also believed education was of critical importance in developing greater unity among the French people. To fulfill those goals, Napoleon wanted increased control over the curriculum.

Financial constraints had limited the number of *lycées* that had actually opened, and competition with private schools had limited their enrollment, a situation that rendered control of the curriculum of all French students impossible. This was unacceptable to Napoleon, and his solution was to create the ultimate in centralized control of the French educational system: the establishment of the Imperial University in 1808. This body had complete control of public education in the Empire. All schools were part of the Imperial University, and none could be established outside its control. Every teacher had to be a graduate of one of its member schools.

The Imperial University was actually something of a compromise with those who wanted to eliminate private education altogether. Private schools were allowed to exist, but they were put under strict public control and various taxes were demanded from them, designed to reduce the educational outlay of the central government. The quality of instruction in private schools was controlled, however, in part by a requirement that teachers must have degrees. Later revisions to the law reduced the number and enrollment of private schools, especially those administered by the Catholic Church.

Perhaps the most important element in the development of the Imperial University was that for the first time the state took responsibility and control of the elementary education of its citizens. Teachers were placed under stricter controls, including on dress, discipline, and salary.

Napoleon had long been concerned about the teaching profession, recognizing the central importance of teachers to the educational system. He had at times suggested that the teaching profession should take on some of the characteristics of an order, or corporation, with very

specific expectations, privileges, and rewards, even proposing at one point that newly trained teachers might be forbidden to marry. On the other hand, a teacher, by the end of his career, was to see himself as among the highest ranks of state officials, having been placed under the protection of the Emperor himself.

As is the case with French schools today, inculcating patriotism and loyalty to the state played a major part of the function of educational institutions; for instance, the law establishing the Imperial University called for the teaching of the Catholic religion and of fidelity to the Emperor and his dynasty, among other things.

The system of education under the Imperial University was as follows: First came elementary education. This was, as before, of the lowest priority for Napoleon. Following that came secondary education for the middle class. Napoleon placed the greatest emphasis on this level of education. Beyond that, the *lycées* were mainly boarding schools supported by the state and providing a six-year course heavy on classics and mathematics. In addition to the *lycées* were the *collèges*, which were municipal or communal secondary schools, a bit lower than the *lycées*. These schools stressed French, Latin, geography, history, and mathematics. There were also some independent schools known as *instituts*, which were more or less the equivalent of the *collèges*. This system was not, of course, uniquely Napoleonic; it mirrored ideas of earlier systems as well as of other contemporaneous systems in Europe. Not surprisingly, Napoleon stressed various military aspects in his schools, including uniforms, formations, music, and discipline.

The real value of an institution may be in its ability to survive the ravages of time. On this basis, one must evaluate the Napoleonic educational system largely favorably. After Napoleon's downfall, it might have been expected that his system would be abolished or greatly modified. There has certainly been some turmoil in French education over the years, especially as regards the role of the Catholic Church. During the Third Republic, the separation of church and state was made complete, and the teaching of religion no longer formed a part of the public school curriculum. Thus, the curriculum of the Revolution replaced the curriculum of Napoleon. The Imperial University has, of course, disappeared, but centralized control lives on in the Ministry of Public Instruction. The *lycée* continues and, indeed, plays an even more important role. It is a virtually self-contained unit, and graduation from a *lycée* is adequate for many careers (unlike, for instance, the U.S. high school). As in Napoleonic times, French education is somewhat stratified and elitist in nature; success and progression are based on examination results rather than on a belief in universal education.

### Eggmühl, Battle of (21–22 April 1809)

The French victory at the Bavarian village of Eggmühl (also referred to as Eckmühl) ended the Austrian offensive phase of the 1809 campaign.

While Archduke Charles pulled back, having failed to destroy Marshal Louis Davout's III Corps during the action at Teugn-Hausen on 19 April, Napoleon launched his counteroffensive on the following day, splitting the Austrian army in two. Napoleon pursued what he erroneously believed was the main force southward toward Landshut, leaving Davout and Marshal François Lefebvre to deal with what he perceived as an Austrian rear guard. However, on 21 April, as Davout closed in on the village of Eggmühl, he realized that he faced a much stronger force. Despite this Davout attacked, but a tenacious Austrian defense held firm.

That evening Charles repositioned his army and prepared to attack a French concentration, which information incorrectly led him to believe was about 6 miles northwest of the Eggmühl line. Four Korps (II, III, IV, I Reserve) formed for the assault, and the attack was delayed until early afternoon to allow II Korps to get into position. The IV Korps (*Feldmarschalleutnant* Franz Fürst von Rosenberg-

Orsini) was to maintain the position at Eggmühl until the attack gained momentum.

Davout sent Napoleon a number of messages during the day expressing his concerns, but it was only in the early hours of 22 April that Napoleon finally recognized his error. Immediately he redirected the axis of his advance northward toward Eggmühl. Davout, having benefited from the Austrian delay, recommenced his attack as the leading elements of Napoleon's force appeared south of Eggmühl. With his plans now in disarray, Charles ordered the assault columns to withdraw toward Regensburg. Meanwhile, Rosenberg at Eggmühl, commanding 18,000 men, received orders to pull out as best he could as about 69,000 men under Davout, Lefebvre, and Marshal Jean Lannes converged on his position, with another 30,000 under Marshal André Masséna close behind.

Having overcome stubborn resistance at the village of Eggmühl, Napoleon ordered forward his overwhelming mass of cavalry. Davout's attack against the village of Unterlaiching proved successful too, but in the woods behind it the Austrian defenders put up ferocious resistance as the first of many cavalry clashes swirled between Unterlaiching and Eggmühl. Heavy fighting also took place in the woods to the north. After about two hours a brief lull in the battle allowed Rosenberg to pull his hard-pressed men back, a determined rearguard defense by the Austrian cavalry and artillery allowing the infantry to break contact. A final cavalry action at Alteglofsheim halted any further French pursuit that day.

Retreating across the Danube at Regensburg, the Austrian army marched through Bohemia to link up with the left wing of the army arriving from Landshut. The French advanced and occupied Vienna on 13 May. Eight days later the reunited Austrian army engaged Napoleon once more at the Battle of Aspern-Essling.

## Egypt

Egypt proved a difficult province for the Ottomans to control. During the period of Ottoman rule in Egypt (1517–1805), it remained dominated by the Mamelukes (originally slaves from the Ottoman Empire) until it was conquered by the French in 1798. Egypt was divided into twenty-four districts. Each one had its own Mameluke bey (provincial governor), who received orders directly from a pasha named by the sultan in Constantinople each year. Besides the beys, the pasha had five cavalry and two infantry units under his direct orders. He was responsible for keeping order in the country and collecting taxes. The pasha had to pay tribute to the sultan in Constantinople, but over time the Mamelukes grew tired of this practice and decided to govern Egypt by themselves. After the death of Mohamed Bey in 1778, a ten-year war took place between the beys and their Ottoman overlords for control of Egypt. Eventually Ibrahim Bey and Murad Bey emerged triumphant and ruled Egypt jointly. The last attempt of the Ottomans to maintain direct control of Egypt took place in 1786 with the dispatch of an expedition to the province. Murad Bey attempted to resist but was easily defeated, and together with Ibrahim Bey decided to settle in Upper Egypt. The Turkish commander entered Cairo and instituted violent measures to restore order in the country. Ismail Bey was made a sheikh again, and a new pasha was installed as governor. In 1791 an epidemic broke out in Egypt, Ismail Bey becoming one of its victims. Owing to the need for competent rulers, Ibrahim Bey and Murad Bey were reinstated in order to resume their dual government. They were still in office in 1798 when Bonaparte conquered Egypt.

After the French invasion, the Ottoman army remained in Egypt, hoping to continue in power and to replace Mameluke rule after the expulsion of the occupiers. The Ottomans appointed Khusraw Pasha as viceroy. An internal struggle for power between the two parties (the Ottomans and the Mamelukes) took place in the absence of the French, and by 1803 a third party in Egyptian politics had come to the fore: the Albanian contingent of the Ottoman forces. From their ranks emerged Muhammad Ali, who had arrived in Egypt in 1801 to fight the French. Initially a junior commander, after two years he became a commandant, and by 1805 had become the Ottoman viceroy. By 1811 he exercised complete power in Egypt after having defeated the Mamelukes and their beys in Upper Egypt.

## El Arish, Convention of (24 January 1800)

On 24 August 1799 Bonaparte departed from Egypt and returned to France leaving General Jean-Baptiste Kléber in command of the 10,000 French forces in the Ottoman province. Kléber faced a difficult position. The French army was restless and near mutiny, a Turkish force under Grand Vizier Yussef was approaching from Syria, and Kléber believed that Bonaparte and France had abandoned the army in Egypt. Kléber approached Sir Sidney Smith, a temporary commodore in the Royal Navy, to serve as a mediator between himself and Yussef. Many scholars have questioned whether either man had the political authority to negotiate a treaty. However, considering the distance from Europe and the fact that instructions could take up to two months to reach Kléber from Paris or Smith from London, one can understand why the men would enter political negotiations without authorization from their respective home governments.

Kléber had a number of conditions he wished to see fulfilled: He insisted his men should be allowed to depart Egypt with honor, carrying their weapons and baggage with them and without molestation from Turkish forces. He also demanded that Turkish vessels carry French troops home to France, that the British and Russians guarantee their safe conduct during the passage, that Turkey should end its alliance with Britain and Russia, and, finally, that the Turks should pay the costs of maintaining the French army in Egypt as it awaited transport. Yussef refused to honor the request for a halt in his advance as the negotiations were being conducted. As Yussef's men approached the 250-man French garrison at El Arish on the northern coast of the Sinai Peninsula, the French troops mutinied against their commanders, raided the town's liquor supply, and actually helped the Turkish force enter the town. The Turkish army immediately began to massacre the French, an atrocity only halted at the insistence of a British officer serving as an adviser to the force.

Smith and two French negotiators arrived at Yussef's headquarters in El Arish on 13 January 1800 in order to open direct negotiations. Yussef agreed to Kléber's request for the safe departure of French troops aboard Turkish vessels, but he proved reluctant to accept the other points. Kléber's counteroffer conceded to Yussef's demands that the Turkish army enter Egypt prior to the French departure and that the alliance with Britain and Russia be maintained until after a peace agreement was achieved with France. However, Kléber insisted on Turkish financial support for the French troops awaiting departure.

The parties signed the Convention of El Arish on 24 January, Kléber ratified his copy on the twenty-eighth, and the two parties exchanged ratifications on the thirtieth. In accordance with this agreement, French forces evacuated Katia, Es Saliya, Bilbeis, and Cairo and moved to Alexandria, Aboukir, and Rosetta to await Turkish transport vessels. In the meantime, Smith received a message from Vice Admiral Lord Keith, written prior to the signing of the convention, directing that British military and naval commanders should ignore any agreement reached separately between the French and Turkish forces. Keith added that the Royal Navy would intercept any enemy troops trying to reach France. Meanwhile, in London, the British government repudiated the terms of the convention, though word did not reach Keith, who acted unilaterally.

On 18 March Kléber received a letter from Keith stating in strong terms that the British would accept nothing less than unconditional surrender of the French forces in Egypt. By this time Yussef had arrived at Cairo with 40,000 troops. An angry Kléber terminated the armistice, marched from Cairo, and defeated the numerically superior Turkish army at the Battle of Heliopolis.

### El Bodón, Action at (25 September 1811)

This small engagement took place during the Peninsular War in Spain between the British infantry of Lieutenant General Sir Thomas Picton's division, supported by a small detachment of cavalry, and French cavalry under General

Louis-Pierre Montbrun. The British infantry were caught dispersed along a series of ridges near the village of El Bodón and were charged repeatedly by the enemy cavalry. However, the British were able to hold their ground and then conduct an orderly withdrawal. At one point the infantry actually countercharged their mounted opponents, disregarding all the rules of infantry tactics that strongly advocated against this extremely dangerous course.

In the autumn of 1811 Viscount Wellington was planning to lay siege to Ciudad Rodrigo. Marshal Auguste de Marmont, commanding the French army in the area, decided to reinforce the garrison and moved with his main force of over 50,000 toward the city. He hoped to ascertain whether the enemy was just trying to blockade the fortress or to conduct a formal siege, and he sent his cavalry forward to search for the location of the enemy siege train. Montbrun led a body of French cavalry to El Bodón, 10 miles south of Ciudad Rodrigo, on 25 September. He quickly found himself among the dispersed units of the British division under Picton's command. In fact, the elements of the two brigades of the division were separated by at least 5 miles. Montbrun, realizing there was an opportunity to destroy an entire division of the opposing force, called on Marmont to support his attack with infantry. No support, however, was forthcoming. Marmont was as yet unsure of the location of the main part of Wellington's force and would not commit himself to a general engagement.

The cavalry then launched repeated attacks upon the infantry along the summit of the hills above the village. Picton's division was supported by a small detachment of cavalry composed of dragoons and troopers from the King's German Legion, the whole time enjoying the advantage of being able to charge downhill. The charges conducted by these squadrons broke the impetus of many of the French attacks. At one point Picton lost four of his guns that belonged to a Portuguese battery. However, these were recovered when Major Henry Ridge brought up the 5th Foot in line and advanced toward the French—in breach of tactical doctrine that forbade infantry to advance on cavalry except in square formation. Disciplined volley fire from these troops was enough to drive the cavalry off long enough for the guns to be recovered. Picton now sought to withdraw his division from its precarious position and was able to do so with the loss of only 80 casualties. Picton's division withdrew toward Fuenteguinaldo, 25 miles southwest of Ciudad Rodrigo. During the cavalry melees the British lost around 70 casualties while Montbrun lost around 200.

**Elba**

A small island off the northern coast of Italy close to the island of Corsica, Elba was of little consequence historically until it became forever connected to Napoleon as the place of his first exile.

When Napoleon abdicated in 1814, the Allies were faced with the question of where to send him. At the suggestion of Tsar Alexander I of Russia they chose the island of Elba. Alexander saw this as quite fair to Napoleon, for it had a pleasant climate and its population of more than 100,000 spoke his native Italian. However, the Allies refused to reunite him with his wife and son, a decision that was hardly designed to make Napoleon content to live on the island forever.

By the provisions of the first Treaty of Paris, Napoleon's family kept their titles and Napoleon was granted a pension of 2 million francs per year. Napoleon became the emperor of Elba with a guard of 400 soldiers (actually closer to 1,000). The treaty did not require him to remain on Elba, nor did it forbid him from ever returning to France. On 20 April, in a scene that ranks among the most poignant in history, Napoleon bade farewell to the soldiers of his Old Guard in the courtyard of Fontainebleau, near Paris.

While on Elba, Napoleon spent much of his time in a serious effort to improve conditions there. He revised the laws, improved the collection of taxes, and initiated a number of physical improvements. What few roads there were, he extended. Fearful of attack, he improved the defenses; when he was done, he was in a position to fend off all but the most massive assault on his fortified island empire. Providing for the cultural life of his subjects, he even started a theater. He was joined by his mother and his sister Pauline and was visited by many people, including his former Polish mistress, Marie Walewska. Sadly, he learned of Josephine's death shortly after he arrived at Elba.

Napoleon soon began to hear of plots to assassinate him or to remove him to a prison island or the remote island of St. Helena. He also began to hear that the people of France, and especially his veterans, wanted him to return. Louis XVIII was trying to return France to its pre-Revolutionary days, and many felt that only Napoleon could save the great principles of the Revolution. In a move of monumental stupidity, and over the objections of the Allies, Louis refused to pay Napoleon his pension, rendering

Napoleon in danger of exhausting his funds. He decided to risk everything by returning to France and reclaiming power. Napoleon left Elba on Sunday, 25 February 1815, and arrived in France on 1 March. There he began the amazing period of his career known as the Hundred Days.

**Elchingen, Battle of (14 October 1805)**

French victory during the War of the Third Coalition that led to the Austrian surrender at nearby Ulm.

Napoleon's objective was to capture Ulm, and he wished to do so before the Russians could bring their forces to bear. The Austrians were commanded by *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich, the Russians by the underestimated, one-eyed General Mikhail Kutuzov, who was approaching from the east.

Unknown to the Allied generals, Napoleon's Grande Armée had already crossed the Rhine and the Danube and made a wide encirclement with troops commanded by marshals Jean-Baptiste Bernadotte, Auguste de Marmont, Louis Davout, and Jean Lannes. Meanwhile, marshals Nicolas Soult and Michel Ney were to create a smaller encircling movement around Ulm meant to cut off Mack's line of supply. Mack was unaware of having been surrounded.

Ney had been repulsed by the Austrians on 13 October because his men had marched 15 miles from Stuttgart in cold, wet, snowy weather and were exhausted. In the early morning of 14 October Ney received orders from Napoleon that he was to prevent Austrian and Russian forces from meeting. However, later in the morning Marshal Joachim Murat, Napoleon's brother-in-law, ordered Ney to take the bridge at Elchingen, a small village 5 miles north-east of Ulm. Ney, who had a reputation for breaking into a rage, was dismayed because he realized that his men would be decimated by the numerically superior Austrian forces. However, he obeyed orders. Elchingen was fought between

*Feldmarschalleutnant* Graf von Riesch, who led 15,000 men, and Ney, who committed only 7,500 of his infantry and artillery to the fighting.

The first confrontation began at 8:20 A.M. The Austrians initially fought off the French 39th Line, which suffered 300 casualties. Ney's VI Corps then outflanked the Austrians causing a retreat by the Infantry Regiments (IR) nos. 16 and 35. The 8th Kurassier Regiment attempted to halt the French but was fired upon, suffered 130 casualties, and, together with the infantry, retreated to Ober-Elchingen to gather strength and regroup. The VI Corps and the 69th Line proceeded to attack Ober-Elchingen, which was covered by grenadiers belonging to IR nos. 3 and 4. The French infantry retreated as soon as they faced heavy volley fire. While covering the French rear guard, the Austrian 5th and 2nd Kurassier Regiments charged, only to be annihilated and lose one of their colonels as a prisoner.

Around 10:00 A.M. some French dragoons were met by the 8th Kurassiers and a grenadier battalion. This resulted in 400 French casualties. The Austrians pushed their troops forward an hour later, but they fell back once Ney thrust their division into Ober-Elchingen using the 25e Légère (light infantry) and the 27e de Ligne (line infantry). All the Austrian troops retreated except for the elite IR no. 3, which served as a rear guard.

In order for Ney's troops to cross the Danube they needed to cross the partially destroyed bridge at Elchingen. Believing they were setting a trap for the French, the Austrians allowed some of Ney's troops to cross before the bridge deteriorated even more. Ney's men were halfway across the bridge at Elchingen when the Austrians charged and inflicted heavy French casualties. Ney, a father figure to the men he had personally trained, was furious, took the matter into his own hands, and supervised the bridge repairs. He ordered planks placed across the bridge and crossed on his horse as they were being laid. Then, rallying his cavalry and artillery and quickly capturing the two Austrian regiments while he was facing heavy fire, he stormed Elchingen.

The Battle of Elchingen was a spectacular victory for the French. It cost the Austrians 4,000 casualties and around 2,500 captured. Ney lost 1,589 men and suffered 1,400 wounded. Once Ney crossed the bridge he decided to rest in the monastery at Elchingen. Mack, realizing that he was completely surrounded, formally surrendered to Napoleon at Ulm on the twentieth. In 1808 Ney would receive the title duc d'Elchingen from Napoleon, who had been present at the battle.

### Emancipation Edict (9 October 1807)

The Emancipation Edict replaced the feudal societal and economic structure of Prussia and transformed it into a modern state during the French occupation of 1806 to 1813.

After Prussia rose to great heights under successively strong eighteenth-century monarchs, most notably Frederick the Great, it began a downhill slide into a caste-ridden society indirectly controlled by the interests of the nobility. During the French Revolutionary and Napoleonic eras Prussia was ineptly ruled by the indecisive, feeble King Frederick William III, whose lack of foresight and reasoned judgment demonstrated that he was unfit to rule.

The Prussian state completely collapsed after Napoleon's crushing victories at the battles of Jena and Auerstädt on 14 October 1806. The French rapidly occupied Prussia and gained total control over the stagnant kingdom, which became a vassal state utterly dependent on France. A huge indemnity issued by Napoleon wreaked havoc on the economy and caused a series of recessions. The humiliating Treaty of Tilsit concluded on 9 July 1807 between Napoleon and Frederick William (separate from that signed two days earlier between Napoleon and Tsar Alexander of Russia), and imposed appalling terms on Prussia, including the surrender of half of its far-flung territories to Jérôme Bonaparte, who would rule the new Kingdom of Westphalia.

Napoleon forced Frederick William to reappoint Heinrich Freiherr vom und zum Stein, who had promoted domestic administrative reform before the campaign of 1806. Stein had been dismissed by the king because he had insisted on creating ministerial departments. Napoleon entrusted Stein with dictatorial powers to enable Prussia to enter the modern era. Stein was neither liberal nor revolutionary, but he adopted a cogent, pragmatic approach and realized that reforms could form the basis for ultimate victory over Napoleonic supremacy. He aimed to inspire his dejected fellow subjects by comprehensive reforms that would ensure Prussia's survival.

With this view, an exceptionally large number of reforms were instituted in Prussia from October 1807 to December 1808. The result was the Emancipation Edict of 9 October 1807, the first peaceful and legal societal reform that offered a semblance of equality and led to the modernization of Prussia. The edict consisted of two provisions: that of 9 October 1807, and the Edict of the Municipal Statutes that became law on 19 November 1808. The October edict abolished the prohibitive hereditary social estates, and peasants, merchants, artisans and bourgeoisie were made equal citizens. Serfs would be liberated as of 11 November 1810. Although bondage was eradicated, peasants were not granted their personal freedom; that remained under the auspices of the Statute of Servants. Stein had hoped to create yeoman farmers on the British model, but this was thwarted by more conservative elements. Peasants were still obliged to fulfill their ancient legal responsibilities, and ultimately they became workers in a capitalist system controlled by the nobility. The Jews, constituting only 1 percent of the population, had been exploited and persecuted for centuries. Stein accorded them full citizenship status.

Stein's wide-ranging municipal statutes gave towns, cities, and provinces the right of self-governance. Urban and provincial officials would be elected rather than appointed. Representative assemblies were established. Ministries were created to control finance, foreign affairs, education, and the army. The ministers gained personal access to the king, and they could not be overruled by the king's personal advisers. Administrative centralization eliminated the possibility that the personal whims of the king or his court advisers would have any effect on Prussian affairs. On 24 November 1808 these reforms came into effect.

The reforms were not on the magnitude of those carried out in France or elsewhere on the Continent, and thus complete modernization was not achieved. Nevertheless, they constituted a huge step for Prussia. Reform was not universally popular: Some peasants, artisans, and members of the nobility feared such far-reaching reforms, some of which they did not fully understand. The nobility in particular were very disgruntled by the loss of their power. They detested the edict, and Stein even more. They deviously sent a letter to Napoleon, written by Stein, that indicated his involvement in a military conspiracy against France. Napoleon thereupon immediately forced the king to dismiss Stein once again.

The reform program was continued by Karl August von Hardenberg, who had signed the Treaty of Basle in 1795 and had been chief minister before Stein's reappointment in 1807. The slow disintegration of the Prussian Army, once the greatest in Europe, also warranted reform. Military reorganization was led by the Hanoverian Ger-

hard von Scharnhorst. Maintaining that everyone should be liable to serve and defend the country, he established a system of universal military service, eliminated the use of mercenaries, and opened up the officer corps to all competent men, regardless of their background. Education and ability became the criteria for acceptance, and promotion would arise from merit.

Wilhelm Freiherr von Humboldt reformed the education system in 1809. Arguing that the state was morally obliged to educate its citizens, Humboldt helped found the University of Berlin in 1810, opened preparatory and grammar schools, and established the *Abitur*, a school exit exam. The high educational standards that Humboldt implemented would prove their worth during the rapid period of industrialization that followed the Napoleonic Wars.

## Emigrés

The Revolutionary and Napoleonic era was a time of massive personal displacement when, as a result of war and upheaval, soldiers marched toward and civilians fled from zones of conflict. Many individuals left France altogether during the 1790s, in successive waves that became a tide of emigration. The émigrés, as they were known, probably numbered some 100,000 in total, though precise figures are difficult to obtain since the official records both omitted genuine cases and included those who had left their homes but remained in the country. Unlike loyalists fleeing the earlier American Revolution, for instance, most émigrés would eventually return to France within a decade, but their departure and subsequent fate was a significant factor in French politics for far longer.

The first émigrés were aristocrats, notably members of the royal household such as the comte de Provence and the

comte d'Artois (the future kings Louis XVIII and Charles X), who quit France in disgust as early as 1789 and were the last to return. Military officers left in droves in 1791 and 1792, as the monarchy was menaced and radical change threatened their livelihoods. Such émigrés stripped the army and navy of their leadership and posed a counter-revolutionary threat to the new order, since many of them plotted its overthrow from abroad. Thousands of priests were also leaving France, as a consequence of reform and schism in the Catholic Church. Their opposition to the Revolution fanned the flames of anticlericalism and brought deportation in its wake. War and civil war in 1793 produced a fresh exodus of involuntary émigrés. Emigration was a matter of necessity rather than choice for the 20,000 inhabitants who escaped, in order to avoid arrest for collaboration, after an Austrian army of occupation evacuated Alsace. Likewise in rebel areas of the west and the Midi: Thousands fled from Toulon after the collapse of revolt rather than endure republican reprisals. The frontier areas of France were most deeply affected by this huge surge of fugitives, both on account of turbulence and on account of their proximity to foreign havens. There was a final flurry of departures under the Directory, when priests and moderates fled a renewed government crackdown in 1797, but the émigrés had begun to return.

Although the Terror claimed the majority of its victims among ordinary people, the emigration involved peasants and artisans as well as the privileged classes. Yet nobles and priests were significantly overrepresented: Roughly 17 percent of recorded émigrés were aristocratic, while an even greater percentage, 25 percent, were clergy (Greer 1951, 127). These categories accounted for almost half the émigrés who have been identified. They left earlier and spent longer in exile than their lower-class counterparts. The aristocratic experience, often vividly conveyed in colorful memoirs such as those of the marquise de la Tour du Pin, has inevitably influenced perceptions of the emigration, painting a picture of genteel poverty and efforts to re-create a courtly life abroad. Many nobles gathered in the Rhineland around Coblenz (Koblenz) or in Baden, forming armies that participated in the invasion of France in 1792. Following the French victory at Valmy, the émigrés' main force was disbanded, but Louis-Joseph de Bourbon, prince de Condé continued the struggle. The gradual expansion of the French Republic and later the Empire into the German and Italian territories where they had first sought refuge dispersed these émigrés more widely, with Britain a popular and secure destination (as it always had been for Breton and Norman refugees). Provence and Artois arrived there after a continental odyssey, while others traveled to Russia or the United States (where they encountered émigrés of another sort,

those who were fleeing slave rebellion in the French colony of St. Domingue (later established as Haiti).

The penalties imposed on emigrants had become increasingly severe as the Revolution progressed. In December 1790 the loss of public office was the price to be paid for continued absence, but a year later the Legislative Assembly ordered capital punishment in the event of unauthorized return. After the outbreak of war in 1792 émigré property was seized by the local authorities and it was later put up for sale as national property (*biens nationaux*). The end of the Terror brought little respite, and émigrés arrested on French soil still faced punishment, while the relatives of émigrés were barred from holding public office. The 700 émigrés comprising the ill-fated invasion force that landed at Quiberon Bay in July 1795 were simply shot, while priests and other returning exiles were executed following the purge of parliament in 1797. Yet steps to address the problem of reintegrating the émigrés had been taken, albeit in a halting fashion. Recognizing that in 1793 many people took flight because of fear of repression rather than because of opposition to the Revolution, a partial amnesty was offered (of which others took advantage).

When Bonaparte came to power in 1799, he initially forbade the return of returning émigrés because they had abandoned their country and did not deserve to be allowed back. Yet from 1800 onward exceptions multiplied, and by 1802 only those who had led military operations against the Republic, served in princely households, or committed treason remained proscribed. Like the royalist vicomte François-René de Chateaubriand, émigrés banned from France for a decade rushed to make their declarations of loyalty to the Consulate. Many recovered property that was unsold or had been acquired by agents; the loss to the nobility in general was not as severe as once thought. Only a small, hard-core group of émigrés, some 1,000 in number, were excluded from the general amnesty and stayed abroad until the reestablishment of the Bourbon monarchy in 1814. Yet they were to play a notorious role in souring the Restoration, demanding compensation that climaxed in the infamous *milliard des émigrés* of 1825, which indemnified those expropriated during the Revolution to the tune of more than 600 million francs. Napoleon may have virtually closed the circle of emigration, but its psychological legacy, like that of the Terror, far outlived its more immediate consequences.

### Emmendingen, Battle of (19–20 October 1796)

In the Rhine valley, 15 kilometers north of Freiburg im Breisgau in the Elz valley, Emmendingen was the site of the main Austrian victory over General Jean Moreau's retreating French army, which forced the French to withdraw across the Rhine. It was the culmination of the Austrian plan devised in mid-July to gain local numerical superiority and defeat the two French armies individually to win the 1796 campaign in southern Germany.

News of Archduke Charles's victory over General Jean-Baptiste Jourdan at Würzburg on 3 September had prompted Moreau to abandon his offensive in southern Germany against the Austrian *Feldmarschalleutnant* Maximilian Graf Baillet von Latour and retreat back up the Danube valley to the Rhine bridges. He defeated Latour at Biberach on 2 October and withdrew down the Höllental between the Black Forest and the Swiss border over 13–15 October, while General Laurent Gouvion St. Cyr's troops on his left secured Freiburg. After his victory at Altenkirchen on 19 September, Charles had marched south up the Rhine valley with 16,000 troops to join Latour and attempt to defeat Moreau. Charles had committed 8,000 troops to besieging the Kehl Rhine bridgehead opposite Strasbourg, so Moreau, with 16,000 troops massed at Freiburg with his advance guard holding Waldkirch (just southeast of Emmendingen), decided to reopen his communications with Kehl. On 17 October Charles secured Kintzingen, while from the east *Feldmarschalleutnant* Friedrich Graf Nauendorff (Latour's advance guard) had reached Schweighausen, but there was little fighting the next day, while Latour joined the archduke.

Both commanders decided to attack on 19 October, but Charles struck first: *Feldmarschalleutnant* Karl Alois Fürst von Fürstenburg held Kintzingen in the northwest with 4,000 men; Nauendorff with 6,000 troops headed for Waldkirch from the northeast; *Feldzeugmeister* Wilhelm Graf Wartensleben with 8,500 marched from the north on the Elz bridge at Emmendingen, alongside Latour with

6,000 men. To the southeast, *Generalmajor* Franz Freiherr von Fröhlich and Louis-Joseph de Bourbon, Prince de Condé pinned down Moreau's right wing under General Pietro Maria Ferino in the Stieg valley. St. Cyr's French division made the main attack on Nauendorff around Bleibach, but the Austrian commander used his hidden detachment at Sieglau to assail St. Cyr's left and forced the French back through Waldkirch. Wartensleben fought his way into Emmendingen and by nightfall had reached the Elz bridge, which had been broken by the retreating French. In the meantime, Latour crossed the Elz and reached Denzlingen village. As night fell, Moreau withdrew to a position north of Minburg between Riegel and the Gundelfingen forest to the southeast. Charles renewed the general assault the next day: Wartensleben's and Nauendorff's columns drove the French from Langendenzlingen and the Gundelfingen forest, while after four attacks, Latour crossed the Resiam, and Fürstenburg took Riegel.

Moreau's left wing under General Louis Desaix crossed the Rhine at Breisach the next day, and after a further clash at Schliengen on 24 October, the main French army fell back across the Hüningen bridge near Basle two days later.

### Enclosure Act (1801)

Officially known as the General Enclosure Act of 1801 (41 Geo III c.1 09), a change in British agricultural practice that reallocated land, stripped subjects of common rights to grazing land, and allowed landowners to use the land as they pleased. It was passed in 1801 during a time of social upheaval, fluctuating currency, and war with France.

Enclosure, a change from the open-field system of farming to individual ownership, had been used for centuries and dated from statutes of 1235 and 1285. The Board of Agriculture and its secretary, Arthur Young, had been lobbying for years to improve the procedure for enclosures.

By confining itself to model clauses and suggesting reduced costs, the act easily passed in Parliament. The Enclosure Act of 1801 efficiently organized the enclosure procedure and standardized the previous enclosure acts; it was meant to save Parliament time. Acts of Parliament introduced privately had significantly increased in the latter half of the eighteenth century despite the £6,000 fee. The former tenants were displaced, vagrancy increased, and social unrest occurred, forcing many of the dispossessed to seek work in urban areas.

Some 5,000 individual enclosures had been passed involving 21 percent of the land, or almost 7 million acres (28,000 square kilometers). About two-thirds of the land was arable, while one-third was either common land or wasteland. The enclosures resulted in more agricultural output, which was necessary to feed the ever-increasing population. The Enclosure Act would also later prove useful in blocking the negative effects of Napoleon's continental system by encouraging increased agricultural production and partially compensating for the reduced volume of imported foodstuffs.

## Enghien, Louis Antoine Henri de Bourbon-Condé, duc d' (1772–1804)

Louis Antoine Henri de Bourbon-Condé, duc d'Enghien, a member of the house of Condé, a junior branch of the royal house of Bourbon, was arrested on Bonaparte's orders and executed after a staged military trial.

D'Enghien was born on 2 August 1772 in Chantilly, France, as the only son of Louis Henri-Joseph, duc de

Bourbon, and Louise Marie Thérèse Mathilde d'Orléans. The intelligent boy was privately tutored and grew up with a strong, noble character and an astonishing command of French and European affairs. He joined the army in 1788 but left France, along with his parents, in 1792. He served in his grandfather's émigré army until 1801, when it was dissolved by the Treaty of Lunéville. He married Princess Charlotte de Rohan-Rochefort and the couple lived at the hunting lodge of Ettenheim in the Duchy of Baden.

In 1803–1804, in response to plots to assassinate him, Bonaparte ordered his police to put an end to royalist plotters in France. Of the royalist leaders, Georges Cadoudal was captured and executed, General Jean-Charles Pichegru died in suspicious circumstances in prison, and General Jean Moreau, despite his probable innocence, was exiled from France. During the investigation, one of Cadoudal's lieutenants confessed about the participation of "a prince of the house of Bourbon." Wishing to send a forceful warning to the émigrés and the Bourbons to refrain from future plots, Bonaparte accepted the insinuations of Charles-Maurice de Talleyrand and Joseph Fouché against d'Enghien.

On the night of 14–15 March 1804, d'Enghien was abducted from his house in Baden, in violation of that principality's neutrality, and brought to Vincennes, where he was tried for treason before a military tribunal. Despite the lack of evidence or of any witnesses and despite the absence of a lawyer, d'Enghien was found guilty and executed at 2:00 A.M. on 21 March. He was buried in a grave that had been dug that evening in the moat of the fortress.

Rulers throughout Europe were outraged at Bonaparte's role in the murder of the last prince of the house of Condé. Any hope of renewed relations between Bonaparte and the exiled royal family was destroyed. Bonaparte later admitted responsibility for the duke's execution but declared it necessary for the security of the French people and the government. At the same time, the d'Enghien affair was used to prove that the life of the First Consul was in danger and to pave the way for hereditary rule under the house of Bonaparte.

In 1816 Louis XVIII had d'Enghien's body exhumed and moved to a chapel in Vincennes, securing a fitting monument to honor the duke's memory.

## Engineering

The relation of engineers and the military intensified during the French Revolutionary and Napoleonic Wars. Revolutionary France, the country with the most developed and sophisticated engineering tradition, built on the achievements of the *ancien régime*. The most famous example is Lazare Carnot, an engineer and mathematician known as the “Organizer of Victory.” Carnot, like his fellow member of the Committee of Public Safety Claude-Antoine Prieur (usually referred to as “Prieur de la Côte d’Or”), was a graduate of the French school of military engineering at Mézières and a member of the army’s Corps of Engineers. Carnot and Prieur led in the establishment of the Manufacture of Paris, a workshop that attempted to rationalize weapons production on an unprecedented scale. The original goal of the manufacture, which employed over 5,000 workers under the day-to-day headship of Prieur, was to produce 1,000 muskets per day, a goal never attained. The government even set up an experimental workshop for producing firearms with interchangeable parts, another goal never achieved. The Manufacture of Paris, which had produced well over 100,000 weapons despite poor labor relations, was disbanded with the demise of the Reign of Terror at the end of 1794.

The Revolutionaries also founded new institutions to teach technical knowledge. The most famous was the Ecole Polytechnique founded in Paris in 1794 and led by the mathematician Gaspard Monge. Monge, a Jacobin who became an ardent Bonapartist and an imperial senator, was also the author of *Description de l’art de fabriquer les canons* (1794) and *Gomtrie descriptive* (1795), which established the practices of engineering drawing in France and continental Europe. The Ecole Polytechnique moved from an emphasis on technical drawing and wide dissemination of engineering knowledge to an elitist emphasis on mathematical theory and serving the military’s needs. This culminated in Napoleon’s militarization of the school in 1804. The Ecole Nationale des Arts et Métiers at Châlons supported the Ecole Polytechnique’s mission by training skilled draftsmen to mediate between theoretically trained engineers and ordinary workers. Institutions modeled on the Ecole Polytechnique were founded in Berlin in 1799, Prague in 1805, and Vienna in 1815. Its curriculum and

textbooks also profoundly influenced the new U.S. military academy at West Point, America’s leading source of technically trained engineers in the early nineteenth century.

Britain’s engineering culture was strikingly different. British engineers were trained in an apprenticeship system rather than in state schools (with the exception of the Royal Military Academy at Woolwich) and were much more closely attached to businesses than to the state or the military. Civil rather than military engineers had the most prestige. One curious result was that a technology in which Britain led the world, the steam engine, found no direct military or naval applications. Among the few British engineering innovations of direct military application were the Congreve rocket and machinery for the mass production of uniform wooden pulley blocks for the Royal Navy.

## England, French Plans for the Invasion of (1797–1805)

One of the greatest threats to Britain in the French Revolutionary and Napoleonic Wars was invasion. The Royal Navy guarded against this possibility, which became a serious threat with the French occupation of Belgium and Holland by the end of 1795. These areas lay near Britain’s southern coast and could be used as staging points for armies to attempt a landing in the British Isles. The French did not ignore the prospect of invading Britain. The first plans for such an operation were laid by the Directory in late October 1797 in the wake of the Treaty of Campo Formio, which had left Britain as the only belligerent power opposing Revolutionary France. These plans resulted in the creation of the Army of England under Bonaparte’s command. Transport was to be provided by an armada of flat-bottomed craft that were constructed at various points on the southern coast of the English Channel. French doubts about the operation surfaced, however, in early 1798 when these craft failed in operations to seize the Saint Marcouf Islands in the Channel. The scheme was ultimately aborted the same year when the Directory gave approval for Bonaparte’s campaign in Egypt, which diverted manpower resources away from designs against Britain.

Plans for an invasion of Britain did not resurface until the Peace of Amiens between France and Britain collapsed

in May 1803. Bonaparte, who was now governing France as First Consul, was convinced that such an endeavor was necessary to ensure French domination of the Continent. Britain served as a source of supply and financial aid to Bonaparte's continental enemies. The country also represented a threat as a potential staging point for forces to attack French-occupied territory in mainland Europe. In 1803 Bonaparte began to assemble a new Army of England at the channel ports of Boulogne, Ambleteuse, Wimereux, and Etaples. By August 1805, now Emperor, Napoleon had enough landing craft to transport 167,000 troops across the Channel to various points in southern England. Even so, the feasibility of an invasion appeared doubtful for several reasons. In July 1804 some 2,000 men had drowned during a test of the craft built to carry the invasion force. Aside from technical problems that were evident from the failure of this test was the reaction of the British to intelligence concerning French preparations. Recruiting for local militias in southern England increased greatly while new defensive works were hurriedly constructed in the region. These measures greatly reduced the possibility of success for a French invasion force.

Aside from these considerations, the most fundamental problem for France in any plans to invade England was the protection afforded by the Royal Navy in the face of a numerically weaker French Navy. Numerous schemes—some utterly unfeasible—had been hatched to obviate this British strength, including building a tunnel under the English Channel and using balloons to transport troops to England. These were eclipsed by more conventional plans to surmount the problem. Napoleon ordered Admiral Pierre de Villeneuve, in command of the French fleet at Toulon, to sail for the West Indies and thereby draw the British Mediterranean Fleet, under the command of Vice Admiral Viscount Horatio Nelson, away from Europe in pursuit. Villeneuve was supposed to elude Nelson, sail back to Europe, and rendezvous with French fleets in Brest and Rochefort and Spanish ships from the ports of Cádiz and Ferrol. This combined force would then sail into the English Channel in early August in order to escort the invasion force and protect it against the skeleton force that the Royal Navy would have in place while Nelson was diverted elsewhere. Villeneuve set sail on 30 March 1805, bound for the West Indies. On 3 August, in expectation of Villeneuve's arrival in the Channel, Napoleon took personal command of French forces in Boulogne.

Although this plan enjoyed success in its initial stages insofar as Nelson was decoyed to the West Indies, the situation deteriorated for the French. Nelson soon realized the deception and went in pursuit while sending a fast dispatch vessel to inform the Admiralty in London that Villeneuve was returning to European waters. This ship happened to sight Villeneuve's force heading for the Spanish

port of Ferrol to rendezvous with the squadron stationed there. This information led to orders for British squadron commanders to increase the vigilance of the blockades of French harbors. As a result, the French fleet at Brest failed to break through the cordon of enemy vessels. This blow to the operation was compounded when Villeneuve failed to rendezvous with the French fleet from Rochefort, which had managed to put to sea. Villeneuve's force was subsequently engaged by a British squadron and forced into the port of Cádiz, where it was blockaded in September 1805 by Admiral William Cornwallis.

Napoleon had decided in late August, before Villeneuve was bottled up in Cádiz, to cancel his plans for invasion. Without naval support to protect his Army of England, the Emperor had little choice. He also needed to divert resources to confront the Austrians and Russians, who with the British had combined to form the Third Coalition. Subsequent plans for an invasion never materialized, in part because of the destruction of a large portion of the Franco-Spanish fleet at the Battle of Trafalgar, fought on 21 October 1805 by a fleet under Nelson. New schemes to conquer Britain were also scrapped in favor of Napoleon's Continental System, which was instituted in November 1806 with the issuance of the Berlin Decrees. The decrees were designed to force Britain to withdraw from the war with France by crippling it economically.

### Erfurt, Congress of (27 September–14 October 1808)

Napoleon faced a dilemma during the summer of 1808. The French suffered a series of reversals in Spain during early summer followed in July by the defeat and capitulation of an army under General Pierre Dupont in the wake of the Battle of Bailén. The outcome of this battle stirred many European states to consider redressing their differences with France. Austria began to rearm, forcing France to consider the prospect of fighting a two-front war. Napoleon needed to transfer troops from occupied Prussia to Spain while maintaining sufficient forces to keep Austria at bay. In order to secure the cooperation of Tsar Alexander I of Russia at a time when war with Austria seemed imminent, Napoleon proposed a conference. The two emperors met at Erfurt from 27 September to 14 October 1808.

The Congress of Erfurt centered on four main issues. The first involved Napoleon's reversals in Spain. The French emperor needed to reinforce his army in the Iberian Peninsula while keeping an eye on Austria. Second, Napoleon wanted Alexander to exert pressure on Austria to prevent it from rearming and attacking France. Third, Russia desired the evacuation of French forces from Prussia. These troops secured the French position in Prussia and sat poised to oppose an Austrian offensive. On the other hand, they were also too close to the Russian frontier for Alexander's comfort. Fourth, an internal rebellion in Turkey was attracting the interest of the European states.

Alexander approached the congress from a position of strength since Napoleon required Russian cooperation. Alexander's interest centered on the Russian absorption of the Danubian principalities of Moldavia and Wallachia (now Romania), both belonging to the Ottoman Empire, with whom Russia was then at war. Russia also wished to annex Finland, which belonged to Sweden, with whom Russia would go to war the following year. Napoleon wanted to pursue the issue concerning Austria and persuaded Alexander to postpone discussion on Moldavia and Wallachia while giving a vague promise to acknowledge the incorporation of the two principalities into Russia, pending approval by Turkish authorities. Napoleon conceded to Alexander's demands that France should remove its forces from the Duchy of Warsaw, though in the end he failed to comply. Alexander also asked Napoleon to remove French troops from Prussia. This, however, Napoleon declined to promise, successfully arguing that such troops were needed to watch Austria's northern flank and would be called upon in the event of an Austrian attack on France.

The Austrian issue proved to be the most important and controversial topic during the Congress of Erfurt. Napoleon demanded that Austria disarm and recognize Joseph

Bonaparte as King of Spain. Failing this, Napoleon wanted a Russian commitment to a joint offensive against Austria. Alexander stubbornly resisted Napoleon's position on Austria, and Napoleon reportedly lost his temper at least once while debating this point with the tsar. While Napoleon expected Alexander to concede in the face of confrontation, the latter informed the French emperor that he must regain his composure and negotiate sensibly or the tsar would leave the meeting. After more than a week of intense negotiations, the two compromised: Alexander would not join Napoleon in an attack on Austria, but he did pledge that Russia would aid France if it were attacked by Austria.

On 12 October 1808 the two leaders signed the convention resulting from their discussions. The Congress of Erfurt proved to be the last face-to-face meeting between Napoleon and Alexander and produced an agreement of little substance. Thus, during the congress, Russia assured Austria that the agreement to aid France in the event of war was simply a theoretical declaration. It is also interesting to note that while some scholars ignore or minimize the role of Charles-Maurice de Talleyrand, the French foreign minister, during the congress, others maintain strongly that he worked against Napoleon's interests at the meeting.

### Erlon, comte d'

*See* Drouet, Jean-Baptiste, comte d'Erlon

### Ermolov (Yermolov), Aleksey Petrovich (1772–1861)

Russian general and army commander. Aleksey Ermolov was born to a Russian noble family from the Orlov *gubernia*

(province). After graduating from the boarding school of Moscow University, he enlisted in the Life Guard Preobrazhensk Regiment on 16 January 1787. Four years later, he was promoted to lieutenant and transferred to the Nizhegorod Dragoon Regiment with the rank of captain. He briefly taught at the Artillery and Engineer Cadet Corps in 1793 before being sent to fight the Polish insurgents in 1794. He participated in the assault on Praga and in the following year took part in the Persian campaign along the Caspian Sea. However, he was arrested on 7 January 1799 for alleged participation in a conspiracy against Tsar Paul I and spent two years in exile. He was restored under Alexander I and appointed to the 8th Artillery Regiment on 13 May 1801. He then transferred to the horse artillery on 21 June.

During the 1805 campaign Ermolov served in the rear and advance guard and distinguished himself at Amstetten and Austerlitz. For his services he was promoted to colonel on 16 July 1806. The following year he participated in the campaign in Poland, serving in Prince Peter Bagration's advance guard. He distinguished himself commanding an artillery company in numerous rearguard actions during the retreat to Landsberg as well as in the Battle of Eylau. In June 1807 Ermolov commanded a horse artillery company in the actions at Guttstädt, Deppen, Heilsberg, and Friedland, receiving the Order of St. George (3rd class) on 7 September 1807. He was promoted to major general on 28 March 1808 and was appointed inspector of horse artillery companies. In early 1809 he inspected artillery companies of the Army of the Danube. Although his division took part in the 1809 campaign against Austria, Ermolov himself commanded the reserves in the Volhynia and Podolsk *gubernias*, where he remained for the next two years. In 1811 he took command of the (Russian) Imperial Guard artillery company, and in 1812 he became the chief of staff of the 1st Western Army.

During the 1812 campaign, Ermolov took part in the retreat to Smolensk and played an important role in the quarrel between General Mikhail Barclay de Tolly and Bagration. He opposed Barclay's strategy and appealed to Tsar Alexander to replace him with Bagration. After the Russian armies united on 2 August, Ermolov fought at Smolensk and Lubino (Valutina Gora), for which he was promoted to lieutenant general on 12 November 1812 with seniority dating from 16 August. He distinguished himself at Borodino on 7 September, where he was lightly wounded leading a counterattack that recaptured the Great Redoubt. During the rest of the campaign, he served as a duty officer in the headquarters of the main Russian army and fought at Maloyaroslavets on 24 October.

In October and November 1812, Ermolov served in the advance guard under General Mikhail Miloradovich

and fought at Vyazma and the second Battle of Krasnyi. In late November he commanded one of the detachments in the advance guard under General Fedor Rosen, taking part in the actions on the Berezina. On 3 December he was recalled to the main headquarters, where he became the chief of staff of the Russian Army. Three weeks later he was appointed commander of the artillery of the Russian Army.

During the campaign of 1813 in Germany Ermolov fought at Lützen, where he was accused of insubordination and transferred to command of the 2nd Guard Division. He then fought at Bautzen, commanding the Russian rear guard during the retreat, and at Kulm, where he was decorated with the Prussian Iron Cross. In 1814 he distinguished himself in the fighting around Paris and was awarded the Order of St. George on 7 April. Two years later he was appointed commander in chief of the Russian forces in Georgia and commander of the Independent Georgian Corps on 21 April 1816. He proved himself an able administrator and successfully negotiated with Persia in 1818, receiving promotion to general of infantry on 4 March 1818 (Ermolov was in retirement in 1827–1831, so his seniority was changed to 1 February 1822).

Ermolov served in Georgia for nine years but was dismissed on 9 April 1827 because of an argument with General Ivan Paskevich, who was patronized by Tsar Nicholas I. Ermolov was discharged on 7 December 1827 with a full pension. However, four years later, Nicholas restored his rank in the army (6 November 1831) and appointed him to the State Council. Ermolov's rank of general of infantry was confirmed in 1833. During the Crimean War Ermolov was elected the head of the Moscow *opolchenye* (crudely armed, virtually untrained citizenry) on 10 March 1855. He died on 23 April 1861 in Moscow and was buried at the Trinity Church in Orel. Ermolov was one of the best artillery officers in the Russian Army. He proved his abilities throughout the Napoleonic Wars and later in the Caucasus. However, he was also a shrewd and cunning courtier, who often intrigued against his superiors. Because of his enigmatic character, he was often called the "Modern Sphinx." He proved himself a ruthless ruler in the Caucasus and brutally suppressed the Chechen uprisings. Ermolov left interesting and valuable memoirs, his "Zapiski," of his service from 1796 to 1816, covering his early career, the Napoleonic Wars, and his rule in the Caucasus.

### Espinosa de los Monteros, Battle of (10–11 November 1808)

A serious Spanish defeat, the Battle of Espinosa de los Monteros marked an important moment in the counteroffensive Napoleon launched in Spain in November 1808. Following the Battle of Bailén and the subsequent evacuation of Madrid, Joaquín Blake's Army of Galicia occupied Bilbao, where it was joined by the division commanded by the Marqués de la Romana that had just been repatriated from Denmark by the Royal Navy, and a division from Asturias commanded by General Vicente María de Acevedo. A substantial force, Blake's command was renamed the Army of the Left, and it was agreed that it should advance eastward along the Cantabrian coast in an attempt to outflank the French, whose main body was massed around Vitoria and Pamplona. Little progress was made in this endeavor, however: Dogged by inclement weather and lack of supplies, by late October Blake's men were still at Bilbao, and it was in consequence the French who took the initiative.

On 29 October, then, the Army of the Left's advance guard was attacked at the village of Zornoza (today Amorebieta) by the corps of Marshal François Lefebvre. Much alarmed, Blake pulled back southwestward and took up a strong defensive position at the town of Espinosa de los Monteros. Well placed though the Spanish were, they were in no fit state to fight. Many men had fled, fallen sick, or been cut off; there was no cavalry; most of the artillery had been sent to the rear; the weather was appalling; and the troops had neither food nor shelter. To Blake's immediate front was Marshal Claude Victor, while Marshal Lefebvre was swinging round his right flank and Nicolas Soult was heading north from Burgos to cut his communications at Reinosa. Aware only of the 21,000 men to his immediate front, however, Blake resolved to stand and fight.

Attacked on 10 November by Victor, his 23,000 men initially did well: In a day of furious fighting every French assault was beaten off. Thus, had he retreated immediately, Blake might still have escaped, but he was apparently still unaware of the threat to his flank and rear and in consequence decided it was safer to stand firm. On 11 November the battle was resumed. The French, however, had learned their lesson, and their attacks were much better coordinated than on the previous day. In consequence, Blake's line was soon broken. Streaming westward toward Reinosa, however, the fugitives found their path blocked by Soult.

Desperate to escape, Blake now led his remaining troops northward across the Cantabrian Mountains before turning southwestward for León, which he finally reached in mid-December. Carried out in the depth of winter in the midst of some of the highest mountains in Spain, these forced marches saved what remained of the Army of the Left, but the survivors were in terrible condition, and the campaign still cost the Spanish at least 20,000 men. As for Blake, he was stripped of his command, being replaced by Romana.

### Espionage

Espionage, the use of spies to gather information, was prevalent throughout the Napoleonic period because of the almost-constant state of war. Military intelligence operations played an important role in all of Napoleon's campaigns and contributed significantly to his victories in 1805 and to French defeat in Spain after 1812. International relations were also shaped by espionage. Embassy officials were routinely used to gather intelligence and often passed secret information to their own or other countries. Rival political factions and royalist intrigues made France a fertile field for clandestine operations, as the many attempts on Napoleon's life demonstrate. Finally, there existed the networks for police spying on citizens of their own countries. Joseph Fouché, Napoleon's police minister, was the best-known master of police spies, but each country, including Britain, practiced a similar policy.

The French were famous for gathering military intelligence. Early on, the Emperor ordered the construction of a

card catalog that allowed him to file information, sent from his embassies, on troop movements all over Europe. This informed him of the locations and strength of all his enemies' units before a campaign began. Shortly before the army marched, Napoleon sent senior officers, in civilian clothes, to reconnoiter enemy territory and fortifications. Before the Austerlitz campaign, Marshal Joachim Murat, General Anne Jean Marie René Savary, and General Henri-Gatien Bertrand traveled through Bavaria in disguise to collect information on Austrian troop movements and geography. Once on the march, cavalry patrols preceded the army and collected information by reconnaissance or by kidnapping local officials and bringing them back to camp for interrogation. In addition, spies infiltrated enemy camps and reported on battle plans and troop movements. Karl Ludwig Schulmeister was probably the most famous of Napoleon's military spies. His activities as a smuggler in Strasbourg provided him with many contacts, and during the Austerlitz campaign he spied for Savary, head of military police operations. Posing as an Austrian spy, Schulmeister informed *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich of a British invasion of France and of Napoleon's plans to return to Paris. This misinformation convinced the Austrian general to remain in Ulm and ultimately led to his defeat in October 1805. Schulmeister then disguised himself as an Austrian officer and roamed freely through the Austrian and Russian armies. Eventually arrested and imprisoned in Vienna, he was rescued when the French captured the city later that year. Savary had enough confidence in Schulmeister to appoint him commissioner general of police for Vienna. This was only the beginning of an illustrious career, which included supervising police activities at the Congress of Erfurt and returning to Vienna in 1809 as commissioner general of police.

Another important part of espionage was encryption. The French had two official codes, known as the Grand Cipher and the Little Cipher. Handed down from the court of Louis XIV, the Grand Cipher was used primarily for diplomatic messages until 1811, when it was adapted for military use. It used a system of substituting words, syllables, and single letters for numbers and contained over 1,000 predetermined substitutions. There were also personal codes used by individual commanding officers. They could be as simple as basic letter substitution. Some were more complicated, such as one by which two officers would have a copy of the same book and then cite the page number, line number, and numerical position in the line for each word they used. This system was used by the Duke of Wellington in the Iberian Peninsula. George Scovell, a British officer, decoded the Grand Cipher in 1812, a success that played a large part in Wellington's victory at Salamanca.

The focal point for international espionage was France itself. The royalists set up the first spy networks in Paris. The comte d'Artois ran the English Committee, which controlled Normandy, Brittany, and the Vendée. The comte de Provence headed the Swabian Agency, formerly the Philanthropic Institute. It was organized along Masonic lines and reached into eastern and southern France. In 1799 these agencies notified British secret services that the time was ripe for a coup. Based on this intelligence, Sir Sidney Smith negotiated with Napoleon in Egypt, temporarily lifting the British naval blockade, and inadvertently allowing him to escape back to France. Implicit in this negotiation was Napoleon's agreement to participate in a royalist coup—a promise that was never fulfilled. After Napoleon's seizure of power in 1799, the royalists hatched a new plot. Their intention was to recruit important legislators to their cause, vote out the current government, and establish a royalist council until a member of the royal family could arrive to take charge. Simultaneously, the Chouans would rise up in the west, which, it was hoped, would spark a general rebellion. Hyde de Neuville went to London and convinced the British government to finance the scheme. Planned by Nicholas-François Duthiel, head of royalist intelligence in London, the plot was abandoned when the plebiscite affirming Napoleon's coup made a general uprising seem improbable. Still, the precedent for British funding had been established, and "perfidious Albion" would contribute to royalist schemes thereafter. Not content merely to fund royalist plots, though, the British began setting up their own network of spies in France.

Faced with British-funded, royalist coup attempts, Napoleon built an extensive intelligence network of his own. To his chagrin, it was not entirely under his control. Both Fouché, the minister of police, and Charles-Maurice de Talleyrand, the minister of foreign affairs, operated spy networks. Interior ministers had their own spies. Savary had his military spies. To keep track of all these, Napoleon had his own spy network. Fouché and Talleyrand were notorious for using their information for personal gain. Fouché took the newly reinstated Ministry of Police in 1798 and built it to serve his own needs. Perpetually underfunded by the government, he found his own sources of financing by taking protection money from illicit businesses in Paris. He was also presented with an unprecedented opportunity to recruit informers from the ranks of political prisoners serving long sentences or condemned to death. He gave them freedom in exchange for future services as information gatherers. Thus, he very quickly had an independently funded agency served by the largest number of informers in the history of France. Headed by Pierre-Marie Desmarest, this secret branch gathered information from all walks of life, distilled it, and presented the Emperor with a daily re-

port. In addition, Fouché arranged for a royalist counterpolice operation to flourish within his own organization. This protected certain royalist agents from arrest, but it also allowed the police minister to track many of their plots. Talleyrand also rebuilt his ministry to suit his own needs. Becoming foreign minister in 1797, he staffed the organization with trusted friends who served him rather than the government. His office maintained a workshop for forging documents, which included a file of signed letters written by important people and copies of official seals. He used these forged letters when dealing with other nations, but he also used them to influence Napoleon. His duplicity is legendary, and he is known to have been supplying the British with information as early as 1806. After Napoleon removed him from office, he continued working against the Emperor. He counseled Tsar Alexander against negotiating with Napoleon at Erfurt in 1808 and sold information on French military plans to Klemens Graf Metternich in 1809. Napoleon also made use of the *cabinet noir*, an agency run by the Minister of Post, the comte de Lavalette, for opening, reading, and resealing letters.

In spite of this abundance of information, Napoleon was not well informed. There is no better evidence for this than the many assassination attempts on his life. The best known of these are the Infernal Machine Plot (1800) and the Cadoudal Conspiracy (1804), which illustrate British involvement, Fouché's double-dealing, and the influence of espionage on international affairs. After Marengo (1800), Napoleon felt secure enough to reject Louis XVIII's proposal for a restoration. With no other options, the royalists turned to assassination. Georges Cadoudal, a Chouan leader exiled in London, kept the British apprised of royalist plans. Their own agent in Paris, Antoine Talon, did the same. Alexandre Chevalier, an explosives expert, had been hired with British secret service money. He was arrested before completion of the project, but another expert was employed to take his place. Cadoudal returned to France in September to assist in the assassination preparations. However, in November Napoleon's police foiled another assassination plot and in so doing captured the plotters' papers, which revealed the presence of 5,000 royalist troops in Paris. Napoleon demanded that Fouché arrest their leader. Fouché did so, but this ended the liaison between Fouché and the royalists' leader in Paris, the comte de Ghaisne de Bourmont. Thus, when Cadoudal and his associates went into action, Fouché had lost his primary source of intelligence. Joseph Picot de Limoelan came from London to position the bomb, which was disguised as a water wagon, and to light the fuse on Christmas Eve. Napoleon, riding to the opera in his carriage, barely escaped death. This most dangerous in a series of over ten assassination attempts led Napoleon to purge Jacobins and royal-

ists alike. Fouché performed some impressive detective work. He reconstructed the horse and wagon, located the blacksmith who had recently shod the horse, and from him obtained a description of Limoelan. This did not, however, hide Fouché's collusion with the royalists, which came to light during the many arrests that followed and no doubt played a part in his dismissal in 1802.

Hardly dissuaded from his project of assassination, Cadoudal escaped to London and, with British assistance, began building a nucleus of leaders for a new conspiracy that he called the "coup essentiel." It differed little from the plan of 1800. A group of chosen men would neutralize Napoleon, either by abduction or murder. They would then establish a royalist council, supported by anti-Bonapartist generals and senators. The council would rule until the comte d'Artois arrived. General Jean-Charles Pichegru, who was in exile in London, hoped to rally dissident generals. Napoleon found out about the plotting generals as early as October 1802 when police captured incriminating letters being carried to England. A new liaison, Louis Fauche-Borel, was appointed by the British secret service, and after meeting with generals Jacques Macdonald and Jean Moreau, he was also captured. In desperation, an Englishman went to Paris to negotiate with Moreau, proposing that Moreau lead troops to Saint-Cloud to capture Napoleon. The general remained noncommittal.

It was not until February 1803 that General Bon Adrien de Moncey, inspector general of gendarmerie, captured two plotters who implicated Desmarest, head of the Bureau Secrète, and revealed the seriousness of the plot. One month later Moncey gave Napoleon details of the plot. Moreau was to be named head of the Republic, while Pierre Augereau and André Masséna were to take command of French troops in Paris. A long list of senators and generals would support the change of government. Unbeknownst to Moncey and Napoleon, Fouché, no longer minister of police, was one of the plot's Paris leaders. Barricades and police checkpoints soon surrounded Paris but provided no new information. In July the defection of a British agent in Boulogne revealed that a large part of the departmental administration was in British pay and assisting royalists with secret entry into France.

Finally, in January 1804, Jean Pierre Querelle, in order to avoid his own death sentence, revealed the complete plot. He informed the police of the chain of safe houses leading to Paris, the intended roles of Pichegru and Moreau, and of a prince waiting just outside France to take charge of the new government. In addition, he told them that Cadoudal had been in Paris for the last four months. It was not long before Paris police had tracked down Moreau (13 February), Pichegru (26 February), and Cadoudal (9 March). Moreau, it seems, had reneged on his promise to

help the royalists and demanded control of the government for himself. The awaited prince never arrived, and so the plot went nowhere. The police arrested 356 conspirators, and Talleyrand exposed the British attempt at assassination to all the embassies in Paris. The number of plotters and the participation of the British government shocked Napoleon. No doubt having been the target of assassins for four years influenced his decision to execute the duc d'Enghien and to have himself declared Emperor. Both actions strongly influenced European diplomacy during the Napoleonic period; both were the result of espionage and clandestine operations in France.

## Espoz Ilundaín, Francisco (1781–1836)

A peasant from Idocín in northern Navarre, Francisco Espoz Ilundaín was beyond doubt the most successful of the Spanish guerrillas. As is the case with many of his counterparts, the early part of his story is shrouded in legend, and our knowledge of him is not helped by his memoirs, which are a farrago of lies and half-truths. At some point in the autumn of 1808, however, he fled Navarre, which was occupied by the French, and enlisted in a new volunteer regiment that formed part of the garrison of the Aragonese town of Jaca. Why he did so is unclear—it is possible that he may have killed a French soldier in a brawl. All that is certain is that when Jaca was summoned to surrender by the French in February 1809, he slipped back to his home province, where he enlisted in the guerrilla band of his distant kinsman, Martín Javier Mina y Larrea. In March 1810, however, this commander was captured by the French, whereupon Espoz—the correct short form of his name—set himself up as Mina's successor and proceeded to unite the scattered guerrilla bands that were then roaming Navarre into a single force under his own leadership.

So much for historical fact. But underlying this story there is almost certainly a much darker tale. As is shown by his later career, the new leader was both utterly ruthless and intensely ambitious, and there is little doubt that his chief motive for taking up arms was to make his fortune. At the very least, the methods he used to impose his authority in Navarre were unscrupulous in the extreme: Rival leaders who failed to submit to his authority were executed on the grounds—essentially true, be it said—that they were mere bandits. At the same time, to legitimate his position, Espoz claimed that he was Mina's uncle rather than his very distant cousin and began to call himself “Francisco Espoz y Mina” (which in practice was often shortened simply to “Mina”). All this can be justified, perhaps, by exigency, but there is also very strong circumstantial evidence to suggest that Espoz betrayed Mina to the French in order to clear the way for his own rise to power. Just as damaging, meanwhile, was the new commander's consistent reluctance to subordinate himself to any sort of political or military control, the fact being that he was at heart an adventurer who had little interest in anything other than his own reputation and advantage.

That said, however, he, like the somewhat similar Juan Martín Díez (often referred to by his nickname, “El Empecinado”), was also a realist, as well as a man of very real military talent. Exactly as was the case with El Empecinado, then, he saw that to succeed he had to secure a genuine military reputation, to gain the recognition of the Patriot authorities, and, more fundamentally still, to avoid

elimination at the hands of the invaders. Faced by this situation, there was only one way forward, namely, the creation of a disciplined force that could carry the war to the enemy and withstand all attempts at its suppression. In all this Espoz was remarkably successful. Aided by divisions in the French command structure that made effective operations against his forces very difficult, the rugged nature of the terrain, the availability of isolated mountain strongholds that could serve as safe havens for his forces, and the fact that his heartland of northern Navarre was for a variety of reasons far more committed to the struggle against Napoleon than almost anywhere else in Spain, he was able to build up a private army that in the end amounted to nine regiments of infantry and one of cavalry.

At the head of these troops—a disciplined fighting force arrayed in proper uniforms and trained in the use of formal military tactics—he waged a relentless war against the French, gaining particular fame by his capture of two major French convoys on the highroad from Vitoria to the French frontier. It is important not to exaggerate these achievements—given sufficient troops and unity of command, the French might easily have crushed his forces, as was proved by the massive offensive launched against him by the enemy in the early part of 1813—but there is no doubt, first, that the guerrilla struggle in Navarre was far more developed than anything the rest of Spain could produce, and, second, that by diverting large numbers of French troops, Espoz made an immense contribution to the campaigns of the Duke of Wellington.

Unfortunately, however, his later history is not as happy. Confirmed as commandant general of Navarre and northern Aragón with the rank of major general (not, as is often claimed, field marshal) by the Spanish Council of Regency in the wake of the Battle of Vitoria, he played little part in the rest of the war, behaved in the most despotic fashion in his dominions, and engaged in a series of disputes with the liberal authorities. Increasingly embittered, moreover, when Ferdinand VII returned to Spain in 1814 he immediately rallied to the cause of absolutism. To his dismay, however, the king would no more tolerate his pretensions than had the regency, and Ferdinand not only ordered the demobilization of his forces but also stripped him of his position as commandant general of Navarre. In a desperate bid to force Madrid to change its mind, in September 1814 Espoz therefore instigated a rebellion in Navarre whose aim seems to have been to show that he was so powerful that Ferdinand could not afford to do without him. The revolt, however, was a complete failure, and Espoz was left with no option but to flee into exile and affect the guise of an ardent liberal.

Returning to Spain in 1820, he played a leading role in the war of 1821–1823, and on the defeat of the liberal

cause he once again fled into exile in England, where he made his home at Sevenoaks, in Kent, and spent the rest of the reign of Ferdinand VII playing a less than creditable role in the long series of plots that were hatched to rid Spain of absolutism by means of military rebellion. Increasingly unpopular with his fellow exiles, who justly regarded him as a pompous and unprincipled braggart, in 1833 he returned to Spain and was given command first of the Army of Navarre and then of the Army of Catalonia by the loyalist *crístinos* in the struggle against the Carlists. Following the revolution of 1836 he was elected as a deputy to the constituent Cortes, but he was now a sick man, and on 24 December of that year he died of stomach cancer.

## Eylau, Battle of (7–8 February 1807)

Eylau has the dubious distinction of being one of the bloodiest and most futile battles of the Napoleonic Wars. Some 200 years after the inconclusive event, it is difficult for historians to calculate the true scale of the losses incurred by the participants. One thing remains clear: The figures involved would not look out of place in the attrition rates for the soldiers of World War I. Modern scholars put a figure of 25,000 men on French casualties, approximately one man in three. The opposing Russians lost some 15,000 men, including a number of Prussians. One officer described it as “the bloodiest day, the most horrible butchery of men that had taken place since the beginning of the Revolutionary wars” (quoted in Haythornthwaite 2001, 56). The grueling combat, which saw the forces

under Napoleon pitted against Russian troops under General Levin Bennigsen, is also noteworthy for a number of other reasons. It gave rise to one of the greatest cavalry charges in history (spearheaded by Marshal Joachim Murat); it was fought in some of the most atrocious weather conditions; and was one of the few occasions when the Emperor himself almost fell into the hands of his enemies.

Following an indecisive action at Jankovo, Napoleon, on 7 February 1807, with 30,000 men under his corps commanders Murat and Marshal Nicolas Soult, met the Russian army of 67,000 near the small village of Preussisch Eylau in Poland. The Russians drew up in a line running roughly from the north to the east behind the town. The French were drawn up from just northwest of the town

down to the southeast. Hostilities began when, probably ignorant of the enemy's presence, Napoleon's own baggage train entered Eylau in search of cover for the night. Bitter street fighting ensued, accompanied by intense combat in the town graveyard. Eylau changed hands several times until Bennigsen conceded the place to the French and pulled back to a ridge behind the town, leaving around 4,000 casualties on each side. With French supply wagons lagging behind the army and the Russian supply system on the verge of collapse, both sides suffered from severe shortages of food. Worse still for Bennigsen, loss of the village forced his men to spend the night in subzero temperatures. During the evening 15,000 French reinforcements arrived, with an equal number again expected on the following day under Marshal Louis Davout. To the northwest stood a

Adapted from Chandler 1966, 539.

corps under Marshal Michel Ney, operating independently to keep the 9,000 Prussians under General Anton Wilhelm Lestocq from uniting with the Russians, but with orders to join the main body on the eighth.

The size of the respective armies during the second day's fighting remains unknown, but it is estimated that though Napoleon was clearly outnumbered in the morning, the successive appearance of troops over the course of the day increased the strength of each side until they stood about equal—perhaps 75,000 men, but with Bennigsen enjoying a clear superiority in artillery: 460 guns to about 200 for Napoleon.

The French, occupying heights slightly north of the town and only 1,200 yards from the Russian positions, stood in expectation of a frontal attack. At about 8:00 A.M. the massed artillery of the Russians opened the battle with a bombardment that left the village of Eylau ablaze, but in concentrating their guns at relatively short range they exposed themselves to counterbattery fire from the French, whose accuracy soon began to tell. Amid a shrieking blizzard, Soult, supported by cavalry under General Antoine Lasalle, carried out a diversionary attack against the Russian right to deflect attention from the arrival of Davout from the southwest, where Napoleon hoped the decisive blow would be delivered. At about 9:00 A.M., however, Soult was beaten off by the stoic Russians, and General Louis Friant's division (the advance guard of Davout's corps) was effectively stalled by an attack at about the same time by a large body of Russian cavalry.

The stage was set for even more carnage. With both his flanks seriously threatened, Napoleon ordered the 9,000 men under Marshal Pierre Augereau, on the French right, to counterattack the Russian center, with a division under General Louis St. Hilaire in support. Augereau's ill health and the atrocious weather conditions ensured that the attack ended in grisly chaos. The columns became separated, and Augereau's men—advancing blindly and losing their way—ended up walking directly into the mouths of seventy massed Russian guns. A withering bombardment ensued, while the beleaguered French troops were also subjected to fire from their own artillery, whose gunners could not make out anything through the swirling snow. By 10:30—in under an hour—Augereau's corps had all but been destroyed, with over 5,000 killed and wounded, Augereau included among the latter, and St. Hilaire's men had been halted in their tracks.

Napoleon's fortunes were taking a turn for the worse as General Dmitry Dokhturov's reserve infantry corps pushed into Eylau on the heels of Augereau's reeling formations. With the appearance of something on the order of 6,000 Russians in the town, the Emperor himself only narrowly avoided capture, thanks to the self-sacrifice of his

escort, who lost heavily until relieved by the arrival of Imperial Guard infantry. Characteristic of the carnage of the day's fighting was the fate of the French 14th Regiment of the Line: Finding itself completely encircled by the enemy, it refused to surrender and was consequently annihilated near the cemetery.

With the battle reaching a critical phase and with only one major formation still uncommitted, Napoleon ordered the 10,500 men of his reserve cavalry into the fray. Around noon, Murat deployed his eighty squadrons into two vast columns before launching them against the Russian center in a maneuver that has become almost legendary. It gave rise to the oft-quoted vignette in which General Louis Lepic exhorted his men as they waited for the charge with the rejoinder: "Heads up, by God! Those are bullets, not turds!" (quoted in Lachouque and Brown 1997, 88). With inexorable momentum, Murat's massed horsemen smashed through Bennigsen's infantry and rode over a seventy-gun battery before reforming, facing about, and returning to friendly lines as a single column through the wreckage left by their initial advance. The charge cost the French 1,500 men, but it brought the relief Napoleon's infantry desperately needed, allowing him to restore order among his hard-pressed formations. Historians have pointed out that Murat's feat validated the cavalry as an independent (and

The Battle of Eylau. Napoleon inspects the field after a tremendous bloodletting that left both sides shocked and exhausted by the carnage. (The Art Archive/Musée du Louvre Paris/Dagli Orti)

useful) fighting force in its own right rather than as a mere adjunct to the artillery or infantry.

While Lestocq's Prussians had meanwhile arrived around 11:00 A.M. to bolster their beleaguered Russian allies, Davout's corps was not far behind and by 1:00 P.M. was applying pressure against Bennigsen's left, which had to shift its position by 45 degrees to maintain a solid front against ever-increasing numbers of French troops. Nevertheless, so determined was Russian resistance that despite the continuous increase of French troops on the field as the day wore on, they still found themselves unable to wrest ground from dogged Russian infantry who preferred to die where they stood.

Ney's corps did not arrive until dusk, by which time the bulk of the fighting had ended. That night Bennigsen withdrew from the field, leaving Napoleon in possession of Eylau. Despite Napoleon's subsequent claims in *Le Moniteur*, the government's official newspaper, the battle was far from a great victory and is now generally viewed by historians as a costly draw at best, with losses estimated at 15,000 Russian casualties and as many as 25,000 French, whose exhausted state rendered pursuit impossible. Both sides, severely mauled, went back into winter quarters to recover from the bloodletting, but with the certain expectation of renewed fighting in the spring. Eylau's signifi-

cance cannot be underestimated because, as David Chandler points out (Chandler 1966, 551), it was one of the first occasions when the chinks in Napoleon's considerable armor were exposed for all his contemporaries to see.

## Fédérés

The term *fédérés* can apply to either of two very different groups who participated in various stages of the French Revolution. Both groups played significant roles at pivotal points in the progress of events. The parts each group played were profoundly different, as the first furthered the political changes wrought by the Revolutionaries, while the second assumed more of the demeanor of a conservative backlash.

The first fédérés were composed of the volunteers of the National Guard who marched from the various provincial towns in order to take part in the Fête de Fédération celebrated in Paris on 14 July (Bastille Day) of each year after 1789. Many of the men who composed these units hailed from the regions of France where the Revolutionaries encountered the greatest resistance in enacting reforms. These included regions such as Brittany, the Midi, and eastern France. By the same token, these men represented the more radical elements of the population of their respective areas. Those who came to Paris to celebrate the fete in 1792 were thus in favor of replacing the monarchy with a republic. They stayed on after the celebration of 14 July and took part in the uprising of 10 August. The uprising culminated in the storming of the Tuileries, in which many of these fédérés took part. This action precipitated the fall of the monarchy and the creation of the Republic.

The second group of fédérés constituted those who opposed the growing centralization of the Revolutionary government that took place during the Terror. The exclusion of the Girondins from the Convention in 1793 launched these men into action. It is important to keep in mind regarding this group that they were neither royalists nor Chouans; they simply disagreed with the path taken by the government in Paris. In a number of areas of France, including the cities of Caen, Lyons, Marseilles, and Toulon, royalist revolts broke out against the government in Paris. In Lyons the fédérés attempted to drive out

the Jacobins, and in Toulon the rebels welcomed the presence of Anglo-Spanish troops and a British fleet. Maximilien Robespierre had not trusted the earlier fédérés who had participated in deposing the monarchy. Now, as a key member of the Committee of Public Safety, he unleashed the full repressive power of the Revolutionary government on this second group. The suppression of the fédérés revolts thus became intimately linked to the wider Reign of Terror. The forces of the central government besieged both Lyons and Toulon in 1793. Joseph Fouché, minister of police, ordered the repression of the fédérés in Lyon, an event often considered one of the most brutal of the Terror.

## Ferdinand IV, King (1751–1825)

The third son of Charles (Carlos) III of Spain (VII of Naples) and Maria Amalia of Saxony, Ferdinand was born in Naples on 12 January 1751. When Carlos inherited the Spanish throne in 1759, he and his eldest son relocated to Madrid, leaving Ferdinand and a mentally handicapped brother behind in Naples under the regent, Bernardo Tanucci. Tanucci deliberately neglected Ferdinand's education and encouraged

him to spend his time hunting or among Naples's lower classes. This changed in 1768, when the now-adult Ferdinand married Maria Carolina of Austria, a daughter of the empress Maria Theresa. By the terms of her marriage contract, Maria Carolina joined the royal council after the birth of her first son. She dismissed Tanucci in favor of Sir John Acton, a British adventurer and the Neapolitan minister of marine. The queen also favored the British envoy Sir William Hamilton and his wife, Emma.

In 1793 Ferdinand joined the First Coalition against France, but in December 1798 he was forced by invading French troops to flee to Palermo, Sicily, on board Rear Admiral Sir Horatio Nelson's ship. In 1799 he launched troops under Cardinal Fabrizio Ruffo against the French-backed Parthenopean Republic, and when that collapsed, he convinced Nelson to take part in savage reprisals against the revolutionaries. In 1805 Ferdinand joined Austria in the war of the Third Coalition, but after the Battle of Austerlitz he again fled to Sicily, while Napoleon placed his brother Joseph on the Neapolitan throne. Under British protection in Sicily, Ferdinand was convinced by Lord William Bentinck, the British minister to Naples, to adopt parliamentary reforms (including exiling the much-disliked Maria Carolina to Austria, where she died in 1814) and to leave ruling to Francis, the crown prince. Unfortunately, upon his restoration on 23 May 1815, Ferdinand abandoned the British-style constitution, declared the Kingdom of the Two Sicilies, and proclaimed himself head of a new government as King Ferdinand I.

Hated by his subjects and despised by his Austrian relatives, Ferdinand ruled as a tyrant until 1820, when a revolution by General Guiguelmo Pepe forced him to sign a new constitution. Ferdinand wasted no time in appealing to the Holy Alliance for aid. The alliance grudgingly sent assistance in 1821 in the form of Austrian troops, who were sent to stabilize Italy rather than Ferdinand's own rule. Austria attempted, without success, to restrain Ferdinand's vicious oppressions and hold him to reforms until his death on 4 January 1825.

## Ferdinand VII, King (1784–1833)

King of Spain from 1808 to 1833, Ferdinand (Fernando) VII has the reputation of being the worst monarch in Spanish history. In some respects this is unfair. So formidable were the problems faced by Spain during his reign that even the greatest of rulers would have been hard put to cope with them. That said, however, Ferdinand was hardly an admirable figure. Deeply hurt by the hold that the favorite, Manuel de Godoy, possessed over his parents, Charles IV and María Luisa, he emerged as a cowardly, narrow-minded, unintelligent, suspicious, and highly vindictive young man whose chief characteristic was a violent hatred for king, queen, and favorite alike.

Extremely foolish and easily malleable, in the years leading up to 1808 Ferdinand fell prey to the machinations of an aristocratic faction that was eager to reverse the inroads that a century of Bourbon enlightened absolutism had made on the privileges of the nobility and that saw him as a puppet whom they would be able to manipulate at will once the aging Charles IV had died. Terrified of retribution from Charles, these conspirators encouraged Ferdinand to seek Napoleon's protection. At the same time, they also popularized Ferdinand as a "prince charming" who would initiate a new golden age. The result was a serious crisis at court, considerable popular agitation, and in the end, French intervention in Spain and the overthrow of the Bourbon monarchy.

Exiled in France following the Conference of Bayonne, Ferdinand spent most of the war that followed in comfortable imprisonment at Valençay in the company of his younger brother, Prince Charles. Back in Spain, patriot propaganda conjured up visions of Ferdinand bravely defying Napoleon, but in reality, the exiled monarch not only made no attempt at resistance but wrote frequent letters to Napoleon congratulating him on his victories.

Released by the Emperor in 1814 in Napoleon's desperate bid to end the Peninsular War, Ferdinand then overthrew the constitution of 1812. Forced to accept this document by the Revolution of 1820, he was restored to full power by the French in 1823 and continued to block political change until his death ten years later. Yet Ferdinand was not quite the disaster of legend. Although he was ferocious in his persecution of the liberals, he did not quite turn the clock back in 1814. Several of the reforms of the war years were retained—the feudal system was never reestablished, for example—although the king refused point-blank to abandon the gains made in royal power by his predecessors in the course of the eighteenth century. By the end of his reign Ferdinand had also rehabilitated many of the reformist thinkers and bureaucrats who had backed the French in the Peninsular War. If he did not advance the

cause of modernization in Spain, he nevertheless did not set it back as much as has often been suggested.

### **Ferdinand of Habsburg, Archduke of Austria, Grand Duke Ferdinand III of Tuscany (1769–1824)**

The second son of Holy Roman Emperor Leopold II and brother of Holy Roman Emperor Francis II (later Francis I of Austria), Ferdinand was a peripatetic ruler, starting as Grand Duke of Tuscany before becoming Grand Duke of Salzburg and then Grand Duke of Würzburg before returning to Tuscany at the end of the Napoleonic Wars. Pursuing a policy independent from that of his older brother, Ferdinand was sympathetic to France and in 1806 joined Würzburg to the Confederation of the Rhine.

Ferdinand was born in Florence and with his oldest brothers, Francis (Franz) and Charles (Karl), he was given a well-rounded education by his tutor, Marquis Federigo Manfredini, although it excluded military subjects. In 1790, at age twenty-one, Ferdinand had both inherited the Habsburg Grand Duchy of Tuscany from his father, Leopold I (Holy Roman Emperor Leopold II), and married his first wife, Ludovika, daughter of Ferdinand IV of the Kingdom of the Two Sicilies, with whom he had five children. Influenced by his father's policies, Ferdinand was a liberal Enlightenment personality, supporting independent justice and proper state finances to contribute to economic and cultural advancement. He supported the principles of the French Revolution and declared Tuscany neutral when war began in 1792. Under British and popular pressure, he was forced to expel the French ambassador in 1793, but he continued to protect French citizens in Tuscany. Neutrality was restored when French armies invaded Italy in 1795, and relations with Paris remained good. When Britain tried to evict the French from Leghorn (present-day Livorno), neutrality was compromised, and Bonaparte occupied the port in 1796 before stripping Tuscany of 2 million francs. The Treaty of Campo Formio of 1797 restored Tuscan neutrality, but renewed French advances into southern Italy in late 1798 forced Ferdinand to seek Vienna's help. Florence was occupied by the French in March 1799, so after issuing a proclamation to his people to remain calm, Ferdinand fled to Austria.

By the terms of the Treaty of Lunéville (8 February 1801) and the rearrangements within the Holy Roman Empire known as the Imperial Recess (1803), Ferdinand was compensated with the new Grand Duchy and Electorate of Salzburg. He was then moved to the new Grand Duchy of Würzburg in 1806, although he was unable to develop good relations with his people, as unfamiliar with them as they were with him. His relationship with Napoleon improved in September 1806, when Würzburg joined the Confederation of the Rhine and Ferdinand became a welcome regular guest at Napoleon's court. He was the only Habsburg to attend Napoleon's wedding to Marie Louise in Paris in 1810, and his reliable friendship prompted the French emperor to announce in 1812 that Ferdinand would be the next king of Poland. However, he actually returned to Tuscany in 1814, where he continued his enlightened policies and built the foundations of a peaceful state. He married his second wife, Maria of Saxony, in 1821.

### **Ferdinand d'Este, Archduke (1781–1854)**

A member of the ruling d'Este family of Modena, who were also governors of Lombardy and closely linked to the Habsburgs by marriage (Ferdinand was a brother of Empress Maria Ludovika of Austria and a grandson of Empress Maria Theresa). An intelligent and energetic soldier, Ferdinand was a graduate of the Wiener Neustadt Military Academy. He was appointed Austrian army commander in Germany in 1805 and commanded VII Korps in Poland in 1809.

Born in Milan, Ferdinand was appointed *Inhaber* (honorary colonel) of the Austrian 3rd Hussars in 1793. When his family was exiled to Austria in 1796 by Bonaparte's advance through Italy, he studied at the Wiener Neustadt Academy. Promoted to *Oberst*, he led his regiment in Germany in the 1799 campaign, distinguishing himself by his personal bravery and military leadership at the first Battle of Stockach and at the capture of Mannheim, for which he was rewarded with the Order of Maria Theresa and promotion to *Generalmajor*.

In 1800 he was promoted to *Feldmarschalleutnant* and commanded a mixed light brigade in *Feldmarschalleutnant* Friedrich Graf Nauendorff's advance guard of the Austrian army in Germany (under Paul Kray Freiherr von Krajova) during the battles of Engen and second Stockach in early May against General Jean Moreau's (French) Army of the Rhine. Marching southeast of Donauechingen with *Generalmajor* Ignaz Gyulai's troops, his force was overwhelmed by General Laurent Gouvion St. Cyr's corps around Engen on 2 May. Kray withdrew on Ulm, but counterattacked against the French wing on 16 May around Erbach. Ferdinand commanded the cavalry and led the initially successful assault until French reinforcements under St. Cyr sealed the Austrian defeat. When the fighting resumed in November, Ferdinand commanded a division under *Feldmarschalleutnant* Johann Michael Freiherr von Kienmayer. At Hohenlinden on 3 December, this division fought on the Austrian right wing, engaging General Paul Grenier at Buch until, toward nightfall, the division was ordered to retreat.

Having commanded a cavalry division in Hungary in the 1801–1805 peacetime, Ferdinand was appointed to command the Austrian army in Germany in 1805 and advised against a rash advance deep into Bavaria. Unable to overcome the political support enjoyed in Vienna by the chief of staff, *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich, Ferdinand nevertheless escaped Napoleon's trap at Ulm on 14 October with Karl Philipp Fürst zu Schwarzenberg and twelve cavalry squadrons, forcing his way through French outposts and evading Marshal Joachim Murat's cavalry to reach Bohemia. There he expanded his force to 10,000 troops and defeated the Bavarian general, Karl Freiherr von Wrede, at Stecken on 5 December. After raising the *Landwehr* (militia) in Bohemia in 1808, Ferdinand was appointed commander of VII Korps in 1809, which fought in Poland and defeated Prince Józef Poniatowski's Polish-Saxon army at Raszyn on 19 April to take Warsaw. Repulsed at Thorn on 19 June, Ferdinand had to retreat as the Russians entered the war on the enemy side.

After commanding the Austrian Reserve Army in France in 1815, Ferdinand was *General Kommandant* (a peacetime military post with responsibility for a province of the empire) of Hungary from 1816 until he became governor of Galicia in 1832. During that period, he spent four years as imperial commissar reorganizing Siebenbürgen.

### Fichte, Johann Gottlieb (1762–1814)

Philosopher and early supporter of Immanuel Kant and the French Revolution, who later became a proponent of German nationalism. Johann Gottlieb Fichte was born on 19 May 1762 to an artisan family in Rammenau near Bischoffswerda in Upper Lusatia in the Duchy of Saxony. Precocious as a child, he attended school in Leipzig and in 1780 entered the University of Jena as a theology student. In 1791 Fichte attended lectures given by Immanuel Kant. In 1792 Fichte's *Critique of All Revelation* was published by Kant's printer, a circumstance that accidentally led many people to think that it was a new work of Kant's. The book was very successful among German intellectuals and earned Fichte a professorship at the University of Jena (1793). In the *Critique* he argued that the Bible does not reveal an objective divine authority but, rather, reveals a moral principle within each person.

Starting in 1794 Fichte gave lectures at the University of Jena that were later published as *The Vocation of the Scholar*. The French Revolution attracted Fichte's attention along with that of numerous students at the University of Jena. Most of the students and Fichte himself supported the Revolution and were supporters of the French anti-monarchists. He also met with students for private study of French political ideas.

As excesses occurred in France, the Revolution was condemned by some. Fichte, however, defended it in the philosophical work "Contributions to the Rectification of Public Opinion Concerning the French Revolution." The work's aim was to defend liberty as an inherent part of the human condition and to hold up the French Revolution as a movement of progress. Between 1796 and 1798 Fichte published his legal and ethical ideas in *Basis of Natural Right* and *System of Ethics*. His assertion that within a few years monarchy would disappear and be replaced by democratic governments, along with his Jacobinism and his atheistic reputation, led to his dismissal from his teaching position in 1799.

At first Fichte considered going to French-governed territory; however, in the spring of 1799 he moved to Berlin, where he began to develop a feeling of German patriotism. His philosophy began to move in a Romantic direction. In 1799 he published the *Vocation of Man* and in

1800 *The Closed Commercial State*, which presented a theory of economic autarchy.

After Prussia was defeated by Napoleon in the 1806–1807 campaign, Fichte followed Frederick William III and the army to Königsberg. Even while Napoleon's troops occupied Berlin, Fichte returned to the capital to deliver his "Addresses to the German Nation." His speeches represent one of the key features in the genesis of German nationalism. In them Fichte called for a national educational system for teaching patriotism. In 1810 he was appointed professor of philosophy at the University of Berlin. In 1814 a typhus epidemic broke out in Berlin. Fichte and his wife volunteered for hospital work, in the course of which they contracted the disease, which resulted in Fichte's death on 27 January 1814.

### Fiedovoisky, Battle of (3 November 1812)

During the retreat of the Grande Armée from Russia, Marshal Louis Davout's I Corps formed the rear guard of the army. At Fiedovoisky the Russian general Mikhail Miloradovich attacked with his corps and supporting Cossacks. Davout was heavily outnumbered and would have suffered a major defeat, but his force was reinforced by the troops of the Viceroy of Italy Eugène de Beauharnais and Marshal Michel Ney. Davout escaped, though losing almost 5,000 men, and Ney's corps became the rear guard.

On 3 November Davout's corps was at Fiedovoisky, 50 miles to the west of Borodino. Davout was forming the rear guard of the Grande Armée in the retreat from Moscow. Davout officially had almost 20,000 men in his corps, although the morale and fighting ability of some of these troops was suspect. It was at this point that Miloradovich chose to attack. He had around 30,000 infantry in Eugen of Württemberg's corps supported by cavalry under the command of generals Fedor Korf and Illarion Wasiltschkov and large numbers of Cossacks. Davout's corps was surrounded within a short space of time, and it seemed poised to be overwhelmed. However, at this point Eugène recognized Davout's perilous situation and sent two divisions of his command, led by General Jean-Baptiste Broussier, to try and break through to Davout. In this they were partially successful, and Davout was able to

begin withdrawing his troops from the Russian vise. However, further Russian pressure threatened to engulf the French, and after five hours of fighting the situation still remained very serious, not least because Miloradovich was able to deploy most of his artillery and kept the French under constant bombardment. Further French reinforcements now arrived in the form of General Jean Nicolas Razout's division from Ney's corps. These troops had been sent from Viasma, about 5 miles distant.

Miloradovich observed the arrival of these fresh troops and decided to cease his attack, though he refused to relinquish any of the gains he had made, and as a result Davout was only able to escape through a narrow corridor to Viasma. Nevertheless, he was forced to abandon all his guns and much of his baggage, as a consequence of which Davout's corps ceased to exist as an effective fighting unit. His losses amounted to approximately 5,000, but the damage to the morale of his troops was more serious. Nightfall was also approaching, and the Russian army was spread over quite a wide area, requiring Miloradovich to spend time reorganizing his troops. However, the large body of Cossacks in the area maintained contact with the French and attacked them the following day. Ney was now given instructions to assume command of the rear guard, in which capacity he served for the remainder of the retreat with exceptional bravery, earning for himself an almost legendary status among his countrymen.

### Fifth Coalition, War of the (1809)

The War of the Fourth Coalition (1806–1807) had left only Britain and Austria capable of contesting Napoleon's control of Europe and willing to do it. Britain had begun somewhat earlier and very inauspiciously. In December 1807 Napoleon sent an army through Spain to Portugal in an effort to tighten his continental blockade against Britain. Britain replied by sending an army in the summer of 1808 to help Portugal. Thus began the long Peninsular War, or what Napoleon termed his Spanish ulcer.

During this conflict, lasting until Napoleon's abdication in 1814, the British army and Portuguese and Spanish

regular and irregular forces inflicted a heavy cost on the occupying French army, whose losses numbered in the hundreds of thousands in the course of this six-year conflict. Lieutenant General Sir Arthur Wellesley, later the Duke of Wellington, led the first army and defeated the French at Vimeiro in August 1808. In early December Sir John Moore, who replaced Wellesley, was forced to retreat from Spain before Napoleon himself, and Napoleon returned to France thinking he had triumphed.

Austria thought the time for renewing war with France was auspicious, not least owing to the surrender of a French army under General Pierre Dupont at Bailén—the first capitulation of a major French force since 1801, when the French had laid down their arms to the British in Egypt. Not only was Napoleon at least momentarily preoccupied with the Iberian Peninsula, but he seemed to be losing his energy and fighting ability. The French victories over Prussia at Jena and Auerstädt in the War of the Fourth Coalition, highlighted by speed and maneuver, were characteristic of Napoleon at the height of his abilities. On the other hand, the subsequent battles against the Russians at Eylau and Friedland were bloody and unimaginative; Napoleon relied on massive frontal attacks and suffered great and—as would be proven later—irreparable losses. Meanwhile, Austria wanted to avenge its terrible defeat of eighteen months earlier at Austerlitz, though the Habsburg government was utterly unable to renew hostilities.

In 1809, however, Austria decided to act, in alliance with Britain, in what has come to be called the War of the Fifth Coalition, although, with only two main participants, each operating independently on fronts separated by great distances from one another, the Fifth “Coalition” is hardly worthy of the name. The emperor, Francis I, would use his three brothers, all archdukes, to lead armies against France. A small Austrian army operating from Galicia would threaten the French-created Duchy of Warsaw from the south, and another army would seek to retake the north Italian plain and reestablish Austria’s position there, lost after the Battle of Marengo in 1800. Finally, the main Austrian attack would be directed against Bavaria, a French ally and the principal member of the French-controlled Confederation of the Rhine. Thus, the decisive theater of operations would be along the Danube River in Bavaria and Austria.

The fighting began on the Italian front in northeastern Italy near the Adriatic Sea. The French general, Eugène de Beauharnais, who was Napoleon’s stepson, commanded a combined army of nearly 40,000 men; they confronted a similar-sized Austrian army commanded by Archduke John. The two armies fought a disorganized battle on 16 April at Sacile, where the Austrians were able to mount a flank attack that threatened to turn the French position and cut their line

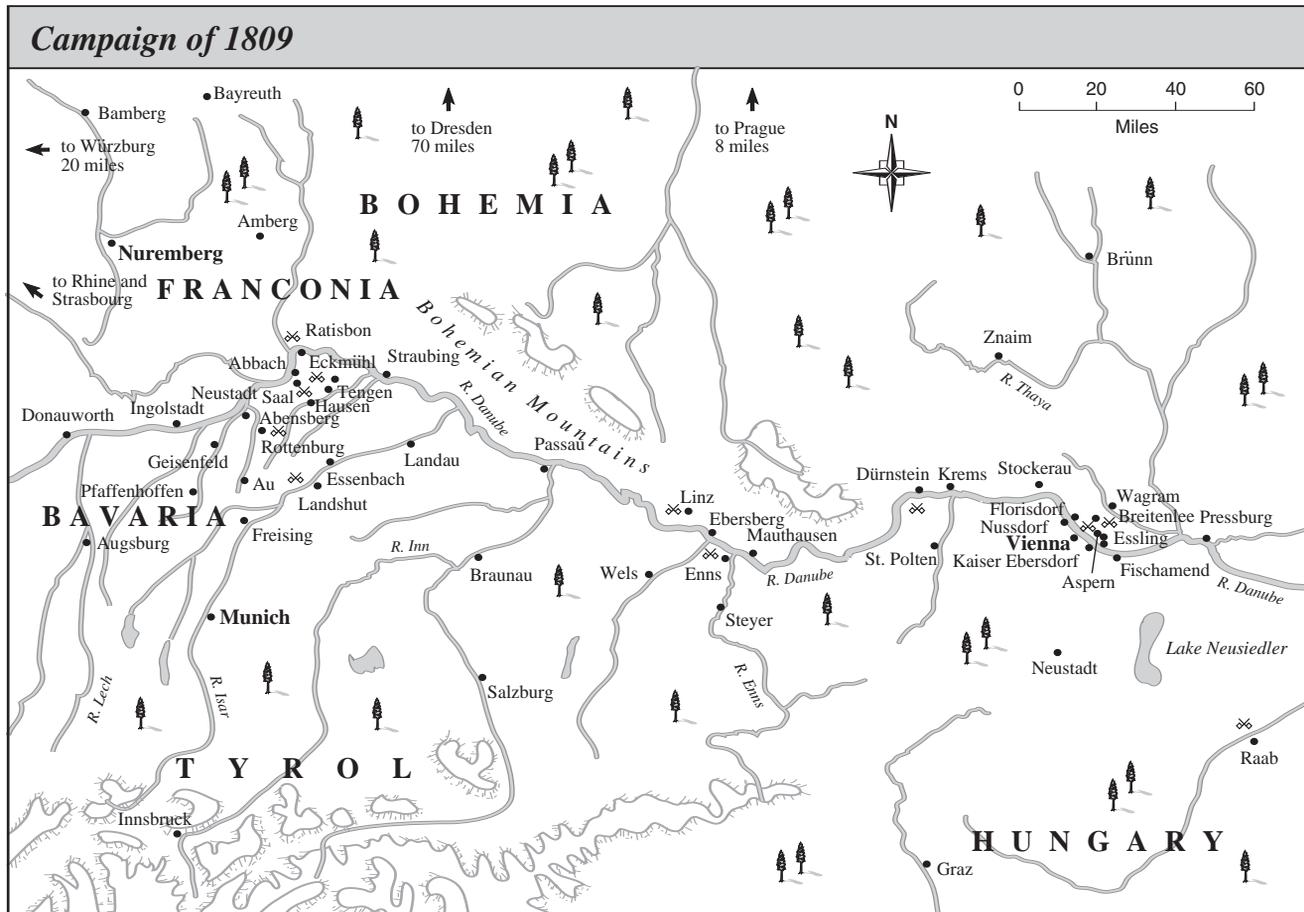

of communication and retreat. Eugène ordered a retreat, first to the Piave River and later to the Adige, largely conceding northeastern Italy. After this initial Austrian victory, however, the focus of war turned elsewhere.

Another brother of Francis I, Archduke Charles, a *Feldmarchall*, commanded the main army, some 200,000 men, and on 10 April, several days before the Battle of Sacile, he began marching into Bavaria, south of the Danube. Charles was seeking to trap French troops commanded by Marshal Louis Davout, whom he greatly outnumbered. The Austrians advanced in a pincer movement, with the goal of trapping Davout’s corps in the middle.

Recognizing the danger to this central front, Napoleon reacted quickly. Arriving at the threatened front, he sent a corps commanded by Marshal Jean Lannes south of Abensberg against the comparatively weak Austrian center, judging that sector to be the critical hinge or joint of the Austrian advance. The French drove back the center, and largely split Charles’s army in two. The right wing retreated to Eggmühl, the left to Landshut, toward the south. Napoleon had gained an easy victory, with few casualties, but there would be hard fighting ahead.

Napoleon believed the larger wing of the now-divided Austrian army was the left, which was retreating toward Landshut. He committed the bulk of his army against 36,000 men commanded by *Feldmarschalleutnant* Johann Hiller. The French drove into Hiller’s position along the Isar River and even fought their way across a burning bridge, eventually driving the Austrian left out of town and further south, away from the Austrian right. While Hiller lost a quarter of his men and most of his artillery and baggage wagons, Napoleon had left Davout with only a small force with which to face the bulk of the Austrian army, the right wing, commanded by Charles.

As Napoleon was winning at Landshut, Davout was in a precarious position at Eggmühl. Charles wanted to turn the French left along the Danube. He did not pursue the attack vigorously on 22 April, and it took until early afternoon for the Austrian attack to put pressure on the French. This gave time for Lannes to rush north to Eggmühl from Landshut with badly needed reinforcements. Another French force under the command of Marshal François Lefebvre joined Lannes in a crushing attack against the Austrian left, pushing it back and capturing Eggmühl. The Austrians retreated, having suffered twice as many casualties as the French. Charles decided to withdraw north of the Danube and then eastward along the north bank as the French seized Ratisbon (now Regensburg). Hiller rejoined Charles, and the Austrians retreated toward Vienna. Napoleon’s army beat the Austrians to their capital and took it on 13 May, while Charles took a defensive position on the far side of the Danube to the north and east of Vienna.

Adapted from Chandler 1966, 674–675.

This somewhat unusual situation would lead to the two great battles of the campaign. The Austrians did not seek peace when they lost their capital; rather, Charles rebuilt his army to about 95,000 men. Napoleon believed that he had to find, fix, and assault Charles's position rather than remain in Vienna. Napoleon tried to cross the Danube, which was flooding from melted snow and spring rains, below Vienna, and he had his engineers construct a pontoon bridge to Lobau Island. He then began sending men across to Lobau, which was close to the far bank of the Danube.

The French vanguard crossed the river and occupied the small villages of Aspern and Essling. It seems there were no Austrians in sight, and so the risky crossing over a single bridge appeared justified. Napoleon had the bulk of his army on the Vienna side of the Danube, and a smaller force, about 23,000 men, on the far side—tempting targets for the Austrians who were situated entirely on the far side of the Danube.

Charles attacked on the afternoon of 21 May, the day after the French moved into Aspern and Essling. His troops had a marked superiority in infantry, cavalry, and artillery,

and they pursued the attack against Marshal André Masséna's men in Aspern and Lannes's men in Essling. The French held on, but it was a grim scene as the Austrians pounded them with shot and shell from several hundred guns throughout the afternoon and evening until nightfall brought a temporary halt to the fighting.

During that night Napoleon moved reinforcements across the bridge and tried to seize the initiative. On 22 May the French attacked the Austrian center, and there was fighting all along the front lines. Each side held, and the Austrians were as unable to drive the French into the Danube as the French were to break out in strength on the Austrian side of the river. Charles realized that between the flooding Danube, the deliberate floating of heavy debris down the river, and his own artillery, the bridge had been destroyed. He also recognized that the French had difficulties moving supplies and reinforcements onto the bridgehead. Charles therefore decided to rely on his artillery to pound the French. When nightfall brought an end to the bombardment, the French retreated to Lobau Island leaving nearly 20,000 of their compatriots as casualties, including Lannes, one of their

best senior commanders and consequently a great loss to the army. For weeks thereafter, Napoleon continued to strengthen his position on Lobau Island, biding his time for a renewed effort to cross the river and renew the fight against Charles.

To the south, the quiet Italian front came to life as Napoleon confronted Charles across the Danube. Eugène had rebuilt his army after the defeat at Sacile and once again faced John, Emperor Francis's youngest brother. Eugène attacked to drive John back and away from the Danube, and thus to cut him off from his brother Charles. John retreated across the Isonzo River in May and into Hungary. When John heard of Charles's fight at Aspern-Essling, he felt somewhat emboldened, taking up a position at Raab, about 70 miles southeast of Vienna. On 14 June, Eugène pressed the attack at Raab. John held all day and then retreated that night, crossing the Danube in an attempt to unite with his brother. French forces, however, cut him off at Pressburg, and Eugène meanwhile took Raab on 25 June, thereafter marching to Vienna to join Napoleon.

The final battle of this brief conflict took place at Wagram. Napoleon had not given up on crossing the Danube in great strength near Vienna, and he continued to concentrate his forces on Lobau Island. By early July he had most of his nearly 200,000 men on the island, and on the night of 4–5 July he ordered his men to begin landing on the east bank, having constructed many bridges across the river, and to drive off the weak Austrian screening force.

In the early afternoon of 5 July Napoleon had most of his army on the east side and began to press the Austrian defenders. Charles conceded the plain, but, as the French moved to attack on the Wagram plateau, Charles's troops held their position. The second day's fighting was also heavy. Charles sought to turn the French left and cut off Napoleon from his bridges across the river. Napoleon responded by sending General (shortly to be Marshal) Jacques Macdonald's corps against the Austrian center, and the French drove through taking heavy casualties. Charles had to retreat, but the French were too exhausted to pursue that night. John finally arrived from Pressburg, but he could not fight his way past the French. Napoleon had 34,000 casualties, and Charles suffered about 43,000.

Charles retreated for four days, and after further brief resistance at Znaim asked for an armistice on 10 July. Napoleon granted it, and several months later Emperor Francis, realizing that he was unable to rebuild and field a new army, agreed to the Treaty of Schönbrunn on 14 October. Austria ceded territory and agreed to join Napoleon's Continental System, intended to ban trade between Britain and the European continent. Napoleon now faced only Britain in the Iberian Peninsula. There Napoleon would continue to suffer great losses, and he personally would never return

to Spain, where the costly conflict occupied 200,000 French troops. Equally important, the 1809 campaign against Austria revealed that the aura of Napoleonic invincibility was weakening, and the high tide of the French Empire in a greater sense had begun to ebb.

### Figueras, Battles of (17–26 November 1794)

The battles of Figueras were the decisive actions on the western Pyrenean front during the fall of 1794. They decisively shifted the fighting on this front to Spain and opened the northeast of the country to invasion by French forces.

Following their defeat at St. Laurent, the Spanish forces in the eastern Pyrenees began building a series of field fortifications, known as the Lines of Figueras. Their commander, Conde de la Union, received reinforcements to increase his army to nearly 50,000. On the opposing side, General Jacques Dugommier commanded the (French) Army of the Eastern Pyrenees. His army continued to receive additional troops because of the mobilization overseen by Lazare Carnot. Although his forces totaled only 40,000, Dugommier believed he could dislodge the Spanish from their fortifications. The key was the Spanish center around Figueras. Dugommier reinforced his right flank under General Pierre-François-Charles Augereau. Augereau was known as an aggressive commander and was willing to take his men through the mountainous terrain to get into the rear of Figueras. The French left flank, although reduced in size, would launch a diversionary attack to tie down the Spanish reinforcements.

Dugommier opened his offensive on the morning of 17 November. Augereau's attack was successful and drove the Spanish left back from St. Laurent, despite stubborn resistance. On the brink of total victory, Augereau halted his assault, seeing that the rest of the French army had not moved forward. He did not know until later that Dugommier had been killed. After watching Augereau's attack open, Dugommier had retired behind the French center for breakfast. While he was eating, a Spanish mortar shell landed near by, exploded, and killed him instantly. No clear succession to command had been prepared, and for a time the French army in the Pyrenees remained leaderless.

The fighting straggled to an end on 17 November. A representative assigned to the army from the Committee of Public Safety decided that General Catherine Dominique Pérignon would succeed Dugommier. He and Augereau were rivals and their working relationship was sometimes rocky. Pérignon took two days to reconnoiter the situation and to determine his next step, eventually deciding to continue the attack that Dugommier had planned. Augereau was again reinforced from the center and left. He opened the second offensive on 20 November. The Spanish left wing wavered under the blow. De la Union led a counterattack to drive the French back but was killed before the issue

was decided. The Spanish left fled in disorder, abandoning most of their equipment. The French assault on the Spanish right was also successful, although the attackers were outnumbered.

Spanish casualties totaled approximately 10,000 men and 200 guns lost. They established a new line around Gerona, leaving the roads into central Spain open to the French. Pérignon failed to follow up on his victory, however. The fortress of Figueras remained in Spanish hands, and he was determined to capture it to clear his lines of supply. Citizens of the city opened the gates for the French, and the garrison was penned in the citadel. On 26 November the discouraged commander surrendered to Pérignon. Over 9,000 more Spanish troops went into captivity, along with another 171 pieces of artillery and large amounts of supplies.

## Finland

Under Swedish dominance since the early Middle Ages, the Finnish gradually developed a sense of unity with Sweden. In 1581 King John III of Sweden raised Finland to a grand duchy, which sparked a conflict with Tsar Ivan IV “the Terrible.” After the administrative reforms of King Gustavus Adolphus (reigned 1611–1632), Finland became an integral part of the Swedish kingdom. Starting in the late sixteenth century, the main threat to Finland came from the rising Russian principality. Sweden was initially successful in containing Russian expansion in the Treaties of Täysinä (1595) and of Stolbova (1617). However, with the ascendancy of a strong, centralized Russian state in the early eighteenth century, the two powers were on a collision course. Russia had no coastline, was deprived of maritime trade, and considered the Baltic Sea of strategic importance to its interests.

Therefore, Tsar Peter I “the Great” (reigned 1682–1725) concentrated most of his resources on “cutting the window into Europe” through the Baltic. He faced King Charles XII, who had turned Sweden into a formidable power. The Great Northern War between Russia and Sweden continued for twenty-one years (1700–1721) and resulted in the Treaty of Nystadt on 30 August 1721. Russia annexed the territory along the southern Baltic coastline (Livonia, Estonia, Ingermanland) and part of Finland. Thus, Peter the Great achieved his major goal of ensuring Russia’s access to the sea. A new capital of the empire, St. Petersburg, was built on the eastern coast of the Gulf of Finland, and the political center of the Russian Empire was shifted northwest.

However, the struggle between Sweden and Russia over Finland continued. Sweden, supported by France and Turkey, declared war in 1741, but within two years its armies were defeated and a new peace was concluded at Åbo (Turku). Russia received new territories in Finland, including the towns of Fredrikshamn, Villmanstrand (Lappeenranta), and Neschlodt (Savonlinna). During the war Russia pledged to the Finnish people that it would establish Finland as separate state under Russian suzerainty; some Finns favored this idea. Some forty-five years later, Sweden tried to recover these Finnish lands and, in 1788–1790 the two powers clashed in another campaign. Although the war ended in a draw, Sweden signed a treaty of peace at Wereloe that confirmed Russia’s previous territorial acquisitions. During the following decade, Russia secured its positions along the Baltic coastline, despite increasing tension with Sweden. Russian rulers wanted to establish their dominance on the Baltic Sea in order to secure free navigation, provide for commercial routes into western Europe, and protect the capital of the empire, St. Petersburg.

To achieve these goals, Tsar Alexander wanted to annex the rest of Finland. In the course of the next Russo-Swedish War (1808–1809), the Russian army defeated the Swedes throughout the region and occupied all of Finland. Alexander treated the Finns very compassionately and offered them autonomy within the empire. The political framework of Finnish annexation was provided for by the Porvoo (Borgå) Diet in 1809. Summoned by Alexander, the diet was composed of four estates (nobility, clergy, burghers, and peasantry) and swore its allegiance to the tsar. In return, Russia promised to govern Finland in accordance with its laws and to respect the religion, privileges, and rights of the inhabitants. The Russo-Swedish peace treaty of Hamina (Fredrikshamn) of 17 September 1809 confirmed the Russian acquisition of Finland. Finland was transformed into a grand duchy with the Russian tsar as the grand duke and represented by a governor-general.

Russian governance brought growing prosperity and favorable economic conditions to the region, but it also suppressed the Finnish language and culture.

### First Coalition, War of the (1792–1797)

The War of the First Coalition began after the governments of Austria and Prussia issued the Declaration of Pillnitz in August 1791 proclaiming their commitment to restore Louis XVI and the Bourbon monarchy in France if the other powerful monarchical rulers in Europe would support them. The French Revolutionaries responded with a declaration of war against Austria on 20 April 1792.

A combined Austro-Prussian army commanded by the Duke of Brunswick crossed the border to invade France, and such prominent French military officers as the comte de Rochambeau and the marquis de Lafayette resigned their commands given the violent turn the Revolution was taking. Despite the absence of many veteran generals, French forces—which combined some traditionally organized and led regular units with new units consisting of raw recruits fueled by Revolutionary fervor—met Brunswick’s army at Valmy on 20 September. The Prussians had advanced slowly and ponderously, as was the custom of eighteenth-century warfare, and many men were detached to guard the ever-lengthening line of communications. The two forces were approximately equal in number; when they came together, a grand artillery exchange raged for several hours in a thick fog. The Prussians

advanced and then, after a brief exchange of musket and artillery fire, retreated before either side had suffered many casualties and before the abilities and steadfastness of the recently recruited and only partially trained French volunteers could be tested.

Maintaining the initiative, the French government, the Convention, ordered advances into the Austrian Netherlands (modern-day Belgium) and the Rhineland. General Charles Dumouriez, the victor of Valmy, advanced to Jemappes in the Austrian Netherlands, and on 6 November 1792 his larger but less-well-trained French troops (perhaps 40,000 men) overwhelmed the smaller but veteran Austrian defending force (about 13,000 men). French Revolutionary forces then moved to secure all of Belgium. Previously, other French forces had invaded Piedmont, taking Savoy and Nice.

France sought to build on these initial military successes. It offered support to other peoples willing to overthrow their royal rulers; the French executed their king and Marie Antoinette on 21 January and 16 October 1793, respectively, and they threatened the independence of Holland. In response, Britain, Holland, Spain, and Sardinia (which was responding to France's occupation of Savoy and Nice the previous September) joined Austria and Prussia in the First Coalition. Concern about the Revolutionary tide in France combined with the view that opportunities would arise in which to pursue more traditional territorial goals on the Continent—for example, for Russia in Poland and for Prussia in northwestern Germany—helped unite several European monarchies into the First Coalition. France responded by declaring war against Britain and Holland on 1 February and against Spain on 7 March 1793.

Initially, the expanded conflict went badly for France. Dumouriez advanced from Belgium into Holland, and on 18 March he arrived at Neerwinden. While the French outnumbered the defenders, the Austrians, commanded by Archduke Charles, easily defeated the invaders, whose plan of attack was too complicated for the officers and troops to carry out, and Dumouriez, fearing Revolutionary justice, defected to the Austrians. Meanwhile, the Austrians retook Brussels.

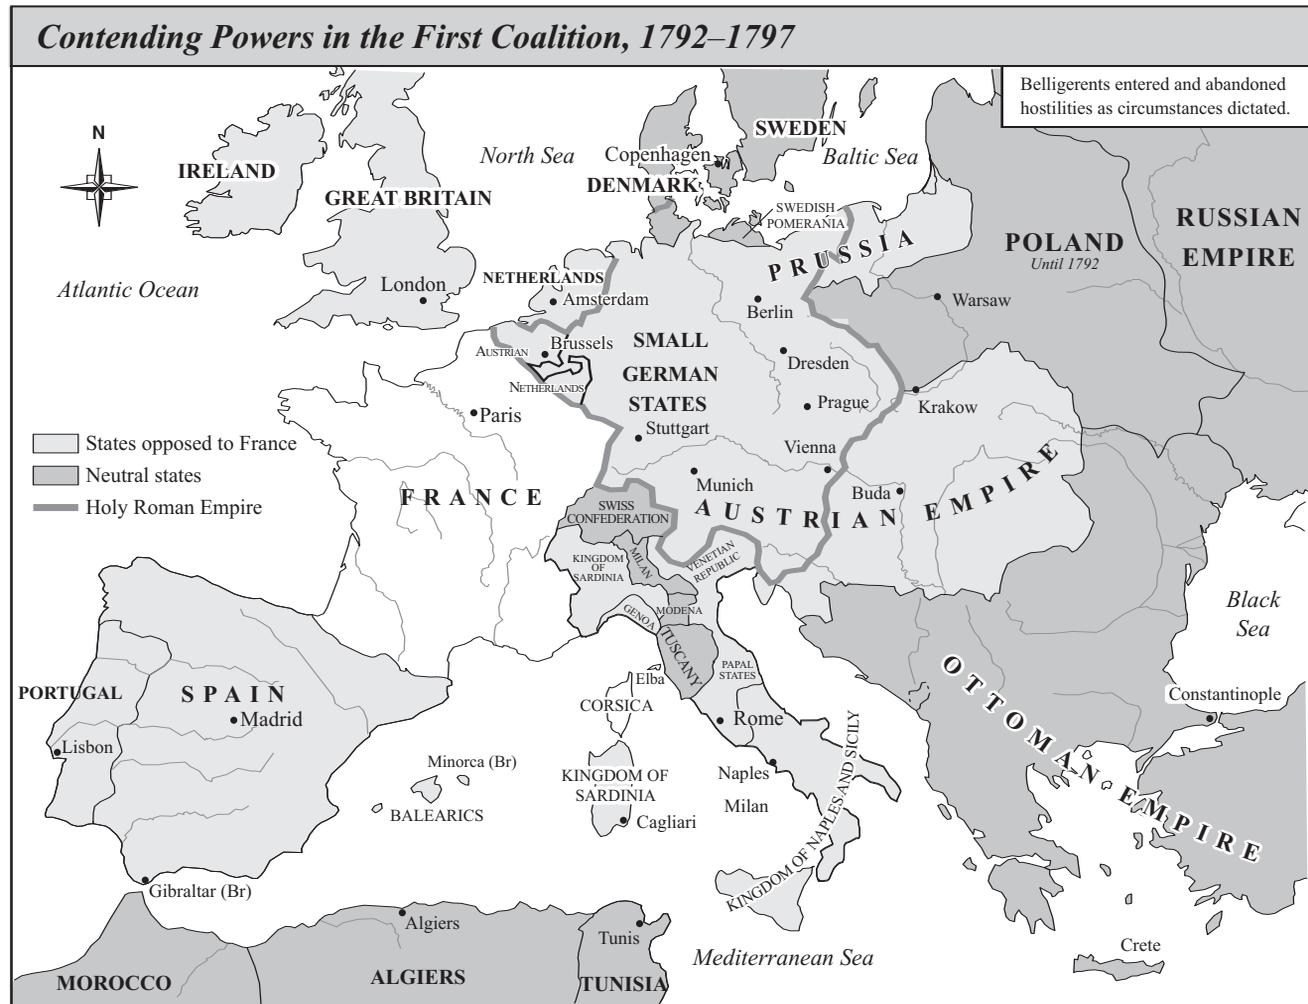

France responded, and the Revolutionaries instituted some far-reaching reforms that were to radically transform warfare. First, the newly formed Committee of Public Safety announced a *levée en masse*, the first genuine draft of all able-bodied young men, by which large armies of relatively undertrained men caught up with Revolutionary fervor would be pitted against the traditionally smaller, superbly trained armies of the monarchical powers. In addition, the committee executed defeated generals as much to encourage their audacity in combat as to discourage any possible inclination to retreat. Thus, Dumouriez defected

after being accused of betrayal for losing Brussels to the Austrians, and General Adam de Custine died on the guillotine for failing to hold onto territory along the Rhine that he had earlier seized, as well as for the defeat he suffered at Valenciennes.

This new fighting led to resounding French victories by the end of 1793. General Jean Houchard restored France's gains in the Austrian Netherlands when, using troops raised from the *levée en masse*, he defeated the British at Hondschoote on 8 September. Some 24,000 ill-trained French troops charged 16,000 disciplined British and German infantry, and their numbers carried the day. The Duke of York was fortunate to survive, although the British had to abandon their artillery. Fate was not so kind for Houchard, who was guillotined after an indifferent result at Menin and his failure to drive the Austrians from France. He was succeeded by General Jean-Baptiste Jourdan, who won at Wattignies in mid-October: Although the first day favored the Austrians, Jourdan surrounded the Austrian right wing on 16 October and forced it backward, gaining the town.

In southern France, at the great port of Toulon, French royalists turned the town and port over to British and Spanish forces. A French army besieged the defenders and initially could not make any headway. However, by 18 December Revolutionary forces had returned to the attack, regaining control of the port. A young artillery captain, Napoleon Bonaparte, received credit for his placement of the artillery, his vigor in pressing the attack, and his ability to energize his troops. Proposing a plan that led to the seizure of a key fort, he then deployed his artillery so as to drive off the Anglo-Spanish fleet. His plan allowed French forces to overwhelm the remaining defenders, now cut off from any prospect of retreat. In return for this great victory, Bonaparte was promoted to *général de brigade*—an extraordinary rise through the ranks.

French armies in the field moved to the offensive in 1794. On 18 May General Jean-Charles Pichegru won at Tourcoing, in Holland, which, transformed by its occupiers into the Batavian Republic, made peace with France. Pichegru's army proceeded to defeat a somewhat larger British-Hanoverian-Austrian army, which was poorly led. On 26 June, at Fleurus, Jourdan defeated the Austrians, who had pressed him all along the line early in the battle, and moved into the Rhineland to Mannheim, so forcing the Austrians out of their Belgian possessions. Later, Pichegru invaded the United Provinces (modern-day Holland) and gained control in a brief winter campaign when ice trapped the Dutch fleet in the harbor at Texel. Prussia signed a separate peace, the Treaty of Basle, on 5 April, ceding the left bank of the Rhine to France, and Spain (and some minor German states) soon followed on 22 July.

Adapted from Fremont-Barnes 2001, 31.

In 1795 French armies fought along the Rhine and in Italy, though the campaign would prove less vigorous than in the years to follow. Jourdan advanced toward Frankfurt in September but was outmaneuvered soon thereafter and forced to retreat. In Italy General Barthélemy Schérer led an army that was slowly advancing along the Mediterranean coast. Soon only Austria and Sardinia remained in the coalition against France. The new Directory, which had succeeded the Committee of Public Safety, wanted a broad advance from the Low Countries into southern Germany and across Italy, with all forces to confront Austria. The two main theaters of campaign would therefore be in Germany and Italy, in the latter of which the campaign would reach its climax on 23 November at the Battle of Loano.

In 1796 Archduke Charles was able to turn the tide against the French, who conceived a strategy whereby Jourdan would occupy the archduke's army along the northern Rhine while General Jean Moreau would lead

his army further south across the Rhine, invade Bavaria, and perhaps maneuver around the Austrians and trap them. However, the two French armies were too far apart to cooperate, and Charles defeated Jourdan at Wetzlar on 16 June, forcing him across the Rhine and further from Moreau. Charles then caught up with Moreau's army and fought an inconclusive battle at Ettlingen (Malsch) on 9 July. Moreau had pushed Charles across the Danube by mid-August, but after receiving reinforcements, Charles, possessing great energy, returned to confront Jourdan and on 24 August, with some 46,000 troops, overwhelmed that general's 34,000 troops at Amberg. On 3 September at Würzburg he again defeated Jourdan, outflanking the outnumbered French and driving them backward under pressure. Jourdan signed an armistice, and Moreau wisely retreated across the Rhine in late October. By the autumn of 1796 Charles had driven the two French armies across the Rhine and appeared capable of pursuing them into France itself.

Just as it appeared that Austria was on the verge of defeating France, Bonaparte, still a young officer, assumed command in Italy. Born in Corsica, he had attended French military schools and had begun his career as an artillery officer. Early success at Toulon, referred to earlier, had led to his becoming a general in his twenties. Now, more than two years later, he was given control of an ill-fed, ill-supplied, discouraged French army seemingly trapped along the coast; yet he soon transformed it into an effective fighting machine.

Bonaparte opened a startlingly successful campaign in 1796. He brought with him useful experience in the deployment and handling of artillery, an innate grasp of key principles of war, and an appreciation of how to move his troops quickly. He understood the value of speed; he continued the development of the divisional structure in the army that other French officers had begun and that gave greater flexibility during both the approach to battle as well as in combat itself; he recognized the advances recently achieved in the use of artillery, particularly in making guns more mobile; and he realized that cavalry had a greater role to play in battle than had previously been accorded it. As a result, he employed mass and speed to attack at critical points; he outmaneuvered his opponents and consequently achieved great victories on the battlefield.

Bonaparte soon drove Sardinia from the war. Leaving Nice, he began his offensive on 10 April and moved into Lombardy, Italy. Although nominally Bonaparte commanded 45,000 men, he actually had about 34,000 fit and ready for duty. He found himself between the Piedmont-Sardinian army of 25,000 men, under *Feldmarschalleutnant* Michael Freiherr von Colli, somewhat forward of his left, and an Austrian army of 35,000 commanded by *Feldzeugmeister* Johann Peter Freiherr von Beaulieu to his right. These Allied armies had divided themselves to block all the valley routes leading north. Bonaparte nevertheless understood how to achieve mass to overwhelm these partly isolated units, and he was to provide a demonstration over the next two weeks.

Bonaparte first attacked the Austrians, at Montenotte, on 12 April, where he bent the Austrian right and moved it further away from the Piedmontese army. Two days later, the French, initially under Masséna and then Bonaparte, fought a two-day see-saw engagement at Dego, in which they finally ejected the Austrians from the village. Bonaparte then quickly shifted the focus of his offensive to the northwest and moved against the now-isolated Piedmontese army at Mondovi. Although the Piedmontese resisted the first attack on 21 April, Bonaparte continued the battle on the second day. It was clear that Colli feared being isolated, and Piedmont-Sardinia signed an armistice on the

twenty-eighth. The king of Piedmont-Sardinia formally concluded peace the following month. Bonaparte had just demonstrated the value of attacking the vulnerable hinge, or joint, of an enemy.

Thereafter Bonaparte planned to move around Austrian forces seeking to retain control over key cities on the northern Italian plain; he would threaten Mantua in northeastern Italy, which he judged to be the center of gravity of the Austrian effort there; and he would then defeat Austrian relief efforts. Finally, he would move out from Mantua, threaten Vienna, and force Charles to make peace on terms that would deny him the fruits of his victories over Jourdan and Moreau.

As the Austrian commander, Beaulieu, divided his 20,000 men to defend three approaches to Milan, Bonaparte went south, violating the neutrality of an Italian state, and maneuvered around the defenders. He attacked in column formation at Lodi on 10 May, and although the attack was not necessary, he hailed the action as a great victory. Beaulieu retreated eastward, abandoning Milan, which Bonaparte entered on 14 May. He again moved against Beaulieu, whom he defeated at Borghetto on 30 May, before proceeding to lay siege to Mantua, where Beaulieu had left 15,000.

Maintaining his central position, Bonaparte was able to defeat piecemeal Austrian efforts to relieve Mantua. He faced a difficult challenge, having to lay siege to that key fortress, keep control over the civilian population, and defend various valleys leading out of the Tyrolean Alps. The Austrians gathered forces under *Feldmarschall* Dagobert Graf Würmser, and they moved piecemeal through the valleys of the Alps to Mantua. Bonaparte in turn established his men in good defensive positions in such a way that his smaller force was able to successively defeat many of the Austrian efforts to break the siege and relieve the fortress garrison.

Several battles took place as the struggle for Mantua continued. In July Würmser sought to advance in several parallel columns, and Bonaparte, using interior lines of communication, defeated them twice at Lonato (31 July and 3 August) and at Castiglione (5 August) as they advanced down both sides of Lake Garda and the Brenta valley. In September Würmser tried again, proceeding down the Brenta valley and using action around Lake Garda as a diversion. Once again Bonaparte was able to attack the advancing columns, first at Rovereto on the fourth, and four days later at Bassano, before they could clear the mountain valleys and gain room to maneuver on the northern Italian plain.

The greatest of these victories occurred at Arcola (15–17 November) and at Rivoli on 14–15 January 1797. In November 1796, by which time French forces had been

reduced by illness, the Austrians advanced and were able to gain entry onto the plain, and Bonaparte recognized the threat they posed. Before the Austrians could move on his rear, he moved to attack their rear in a three-day battle at Arcola amid marshes, dikes, and small streams. He forced an Austrian retreat, but they continued to hold onto Mantua, and Bonaparte remained stymied. In January the Austrians tried again, advancing in three columns, the strongest being at Rivoli. Bonaparte ordered Joubert to hold at all costs and ordered a concentration at Rivoli. On 14 January Bonaparte had 23,000 men and forty guns to face 28,000 Austrians with ninety pieces of artillery. He attacked—indeed, so furiously that he routed them—while his subordinates were able to badly maul the other two prongs of the Austrian advance. In Mantua, the garrison and many of the townspeople were starving for lack of supplies, and the Austrian commander thereupon surrendered the fortress and city on 2 February.

Having taken Mantua, Bonaparte could now move confidently out of the river valleys and threaten to advance through the Tyrolean Alps and then northeast the 100 miles toward Vienna. By mid-March he had crossed the Alps, and Austrian resistance had collapsed. Charles returned home from Germany but was unable to rally the troops. Although he held a difficult position, Bonaparte had psychologically defeated his enemy, and after two delays, they agreed to an armistice at Leoben on 18 April and later agreed to conclude formal peace with the Treaty of Campo Formio on 17 October 1797.

## Flanders, Campaigns in (1793–1795)

The campaigns in Flanders—technically speaking only a region of the Austrian Netherlands (Belgium and Luxembourg) but more broadly applied here to include operations in the whole of the Austrian Netherlands and Holland—formed a crucial part of the War of the First Coalition. Following its success over the invading Prussian army at Valmy on 20 September 1792, which occurred on the same day as the foundation of the Republic, France assumed the offensive. Under the direction of Lazare Carnot, the minister of war, the resources were assembled for this alteration in strategy, as France sought to secure its borders along the “natural frontiers,” namely the Rhine in the north (together with the Alps and Pyrenees), by incorporating the Austrian Netherlands and southern Holland. Although the fortunes of the protagonists in the campaign in Flanders ebbed and flowed for the following two years amid regular changes of commanders on both sides, the eventual result favored the French Republic, and all of Belgium was in French hands by January 1795.

The initial incursion in the summer failed miserably after being beaten back from Mons. However, a renewed advance into Flanders (already referred to as Belgium by the French) in the closing months of 1792 by the *Armée du Nord* (Army of the North) under General Charles François Dumouriez led to a decisive victory over Austrian forces under *Feldmarschall* Herzog (Duke) Albert von Saxe-Teschen at Jemappes on 6 November, so enabling the French to occupy Brussels on the fifteenth and to complete their conquest of Belgium by 2 December.

In the spring of 1793 as Dumouriez marched on Holland, Allied forces, comprising Austrians under *Feldmarschall* Frederich Josias Graf Saxe-Coburg-Saalfeld (generally known as Saxe-Coburg) and a composite force of British, Hessian, and Hanoverian troops under the command of the Duke of York, counterattacked from east and west, respectively. Saxe-Coburg was placed in overall command of the Allied force. Initially, these forces were successful. The Austrians defeated the French under Dumouriez at Aldenhoven and Neerwinden in March to retake Brussels. Following victory at the Battle of Valenciennes (21–23 May) over the French under General Adam Philippe de Custine, the eponymous fortress was besieged until early August, and York attempted to lay siege to Dunkirk. However, the delays resulting from this ponderous style of siege campaigning allowed the French to recover and counterattack. General Jean-Nicholas Houchard advanced with the *Armée du Nord* in the west, leading to French victories on 6–8 September at Hondshoote over York and on 13 September at Menin over Dutch forces under the Prince of Or-

ange. However, the losses of the fortresses at Cambrai and Le Quesnoi to Allied besiegers led to Houchard’s execution. Command of the army then passed to General Jean-Baptiste Jourdan, who defeated Saxe-Coburg at Wattignies on 15–16 October, so ending the campaign season with the French holding the initiative.

The year 1794 continued to see Flanders as the main theater, as the Austrians fought to retain their possessions in the Low Countries. In a bid to improve flagging morale, Holy Roman Emperor Francis II (later known as Francis I of Austria) arrived in Brussels on 9 April to assume overall command of Allied forces in the Low Countries. The French strategy for 1794 was for the *Armée du Nord*, now under the command of General Jean-Charles Pichegru, to advance west and take Ypres, Tournai, and the line of the river Scheldt. Initially, the Austrians moved against a weakly held sector of the French lines and were victorious at Landrecies on 26 April. The French attacked *Feldzeugmeister* Franz de Croix Graf von Clerfayt on 11 May at Courtrai, obliging him to retreat to Thielt and to abandon Menin, while, in the decisive Battle of Tourcoing on 17–18 May, the French defeated a complex five-column attack devised by Allied chief of staff, *Generalmajor* Karl Mack Freiherr von Leiberich. Despite Saxe-Coburg’s victory at Tournai over Pichegru on 22 May, Austrian foreign policy had always aimed to exchange Flanders for territory closer to the main Habsburg domains, and anxious about events unfolding in Poland, Emperor Francis with his senior commanders decided to abandon Flanders. Command reverted to Saxe-Coburg, who, along with York, was heavily defeated again by the French at the Battle of Fleurus on 26 June. After Fleurus, the Allied effort began to collapse. The Austrians retreated eastward, separating themselves from the British contingent under York, who pulled back to the northeast. Resuming the offensive, Pichegru and the *Armée du Nord* pursued York across the Dutch border in September and then to Bremen on the German North Sea coast, from where the remnants of his force were evacuated by the Royal Navy in March 1795. York’s withdrawal from Holland opened the way for one of the most peculiar feats of the French Revolutionary Wars, when on 23 January 1795 French cavalry crossed the frozen ice, which temporarily linked the mainland with the island of Texel, and captured the Dutch fleet.

Jourdan kept pressuring Saxe-Coburg, who, under strict orders to husband his troops as best he could, had no other option but to retreat. In August, Clerfayt replaced Saxe-Coburg in command of the Austrian troops. Clerfayt continued the Austrian retreat, first to the river Roer (Ruhr), and then across the Rhine. Thus, by the end of 1794, the French had effectively ejected the Austrians from Belgian soil.

In the greater context of the French Revolutionary Wars, the campaigns in Flanders are significant for two reasons. First and foremost, they witnessed the transformation of the volunteers of the French Army into a highly motivated and effective fighting force. Secondly, the fighting in Flanders resulted in the acquisition by France of both Belgium and Holland. These areas provided important sources of wealth and supplies for the French Republic and, later, the Empire, and they were to remain under French control until 1814.

## Fleurus, Battle of (26 June 1794)

The Battle of Fleurus was a major confrontation fought in the Austrian Netherlands (modern-day Belgium) on 26 June 1794, when an Austro-Dutch army attempted to halt a French offensive around Charleroi. In 1792 the French Revolutionary government, known as the Convention, had declared that the Republic lay at risk of invasion—*la patrie en danger!*—and throughout 1793 the Revolution had indeed seemed imperiled. In 1794, however, the Republic's armies began to strengthen France's border defenses and to overcome internal counterrevolutionary forces. During the summer of 1794 the French government focused on the threat from the Austrian Netherlands represented by the formidable Austro-British-Dutch army under the overall command of *Feldmarschall* Friedrich Josias Graf Saxe-Coburg-Saalfeld (generally known as Saxe-Coburg). Fol-

lowing the French victories around Tourcoing on 17–18 May 1794, the French forces along the border with the Austrian Netherlands attempted several successive crossings of the river Sambre in May and June in order to threaten the town of Charleroi, a strategically important fortified town on the river. French troops managed to invest Charleroi between 29 May and 2 June, but Austrian troops arrived in numbers and forced them to withdraw.

Earlier, in March 1794, the Committee of Public Safety had given General Jean-Baptiste Jourdan command of the substantial French forces fighting along the French border with the Austrian Netherlands. Jourdan marched his *Armée de la Moselle* north to join the portions of the *Armée du Nord* and the *Armée des Ardennes* in early June. He gradually took control of an impressive composite army, soon to be known as the *Armée de Sambre-et-Meuse*, with a strength of approximately 80,000 men and already engaged in operations around Charleroi.

On 12 June French troops again crossed the Sambre and besieged the fortified town, establishing siege batteries and opening approach trenches to advance against its defenses. Saxe-Coburg responded by concentrating his Austrian forces north of Charleroi and attacking on 16 June. The French lost over 2,000 men, and Jourdan was forced to order his troops to abandon their siege and retreat southward across the Sambre. Each time Charleroi had been seriously endangered, Austrian troops had effectively reacted and forced the French back.

French troops crossed the Sambre and besieged Charleroi once again on 18 June. The town had a garrison of about 2,800 men. A detachment of 2,500 men from Jourdan's force was sent to observe the Austrians at Namur while French siege artillery, which had been gathered from fortresses, battered the bastions protecting Charleroi's northern defenses. As the siege works advanced, Jourdan had the rest of his army begin to construct defensive earthworks and redoubts north of Charleroi to protect against any relief attempt the Austrians might attempt. Meanwhile, Representative on Mission Antoine-Louis Saint-Just summoned Charleroi to surrender, pressuring the Austrian governor of the town to agree to a capitulation. Surprisingly, the governor agreed, and Charleroi's garrison laid down their arms on 25 July. About 2,000 men from General Jacques Maurice Hatry's division entered the town to hold its defenses.

Unaware that the town had already fallen, Saxe-Coburg led an Austro-Dutch army of about 103,000 men to relieve the siege of Charleroi. Saxe-Coburg organized his troops into five massive columns in an attempt to envelop the French army. William (Willem), Prince of Orange-Nassau led the first column, which was composed of 40,000 Dutch troops. *Feldmarschalleutnant* Vitius von

Quosdanovich led 12,500 Austrians of the second column. Prince Wenzel Anton Fürst von Kaunitz commanded the third column, with 14,000 men. Archduke Charles directed the fourth column's 14,000 men, and Johann Peter Freiherr von Beaulieu led the 23,000 men of the fifth column. The Austrian and Dutch columns advanced before dawn on 26 June, aiming to force the French to withdraw once more across the Sambre.

Jourdan had decided to rely on his concentrated position and his troops' entrenchments to fight a defensive battle around the village of Fleurus. General François-Séverin Marceau's division of 8,000 men took up a position on the French extreme right near some woods. General François Joseph Lefebvre's division, with 8,800 men, held a series of redoubts and the village of Lambusart on the right. General Jean-Etienne Championnet's division, with 9,000 men, was posted in the center, defending the villages of Heppignies and Wagnée. The 8,500 troops of General Antoine Morlot's division held redoubts extending westward from Championnet's line to the village of Gosselies. General Montaigu's division of 8,000 men was detached and positioned near Courcelles to hold the French left. Jourdan posted General Jean-Baptiste Kléber's troops somewhat to the rear, supporting both Morlot's and Montaigu's divisions. Hatry's division of about 11,000 men and Dubois's cavalry were held slightly in reserve to support Championnet and Lefebvre. Above the French line floated an observation balloon, one of the latest French engineering developments. French commanders would later ridicule the balloon, condemning it as a useless invention.

Early in the morning of 26 June, the Austro-Dutch columns crashed into the French outer defenses. The general attack by these columns led to a series of separate engagements over an 18-mile front. The Austrians deployed light artillery and pounded French positions around Fleurus. Kaunitz's column attacked the redoubts in the French center, forcing Championnet's division back. But Championnet's men fought tenaciously and managed to hold the villages of Heppignies and Wagnée. Quosdanovich's column advanced more slowly against Morlot's infantry.

The French right came under attack as Beaulieu's troops maneuvered east of Fleurus and smashed Marceau's division. Archduke Charles led the Austrian attacks through Fleurus and against the redoubts protecting the village of Lambusart. Lefebvre organized a tenacious defense of the village, and his men repulsed the Austrians at least three times. Austrian artillery battered the village and some of its buildings began to burn. One of the French soldiers defending Lambusart later remembered that "it seemed that we were fighting in a plain of fire" (Bernède 1994, 150). Jourdan fed in Hatry's division, which he had held in reserve, to assist Lefebvre's beleaguered men.

Meanwhile, a separate battle developed on the French left. The Prince of Orange advanced against Montaigu's division, aiming to seize the Sambre River crossing near Marchienne-au-Pont. Throughout the morning Montaigu's men retired in the face of overwhelming numbers of Dutch troops. Then, in the early afternoon, Kléber's troops counterattacked, forcing the Dutch column back. Almost 40,000 Dutch troops thus never really participated in the decisive engagement that developed on the French right.

Late in the afternoon, Marceau and Lefebvre massed artillery on the French right to force back the Austrian attacks. French infantry holding the remaining redoubts continually fired into the Austrian ranks, and Lefebvre reported that their musketry fire "was a volcano" (Bernède 1994, 154). In the center, Dubois's cavalry and horse artillery came to the aid of Championnet's infantry, which was still defending Heppignies and Wagnée. Marceau's men eventually rallied and were able to retake the woods around Lépinoy and Copiaux. Saxe-Coburg, having viewed the desperate defense conducted by Championnet's and Lefebvre's divisions, now called off the Austrian attacks and ordered his army to withdraw.

Throughout a desperate battle of more than twelve hours, the French had held firm against the determined Austrian attacks. The Austrian army had lost about 2,200 men in the fighting, while the French lost some 2,000 men. French cavalry captured about 3,000 isolated Austrians following the battle, but Jourdan's exhausted army was unable to closely pursue the defeated Austrians.

The Convention acted quickly to commemorate Fleurus with medals and prints celebrating the battle as a glorious confirmation of republican policies. Just days after the battle, the government baptized Jourdan's victorious composite army the *Armée de Sambre-et-Meuse* in recognition of its victory at Fleurus. The battle confirmed the effectiveness of French citizen-soldiers, the systems in place to encourage revolutionary zeal, and the system of army organization. General Louis Henri Loison, one of the officers in Jourdan's army, understood the symbolic significance of the battle, recording that "numerous royal battalions attacked . . . our armies reunited on the Sambre; victory remained faithful to the Republicans and the slaves were repulsed with losses" (Bernède 1994, 195).

The French victory at Fleurus also represented a crushing blow to Habsburg control over the Austrian Netherlands. Following Fleurus, French forces swept through Belgian towns and seized Brussels on 10 July. By the end of 1794 victorious French troops had seized the entire Austrian Netherlands, beginning a long series of conquests that would continue well into Napoleon's reign. Fleurus signaled that *la patrie* was no longer in danger and

that foreign invaders could no longer seriously threaten the French Republic.

## Fluvia, Battles of the (April–May 1795)

The battles of the Fluvia made up the opening offensive in the 1795 French campaign in the eastern Pyrenees. They constituted the last major attempt by the French to invade Spain before peace was signed between the two countries during the summer.

Following the battles of Figueras in November 1794, General Dominique-Catherine Pérignon and his Army of the Eastern Pyrenees had the opportunity to push farther into northeastern Spain. The opposing Spanish forces were disorganized and short of equipment. Their commander had been killed at Figueras, and a new general had assumed command. However, instead of pushing on to Gerona and Barcelona, Pérignon allowed himself to become involved in a siege of the small fortress at Rosas. The siege dragged on until 3 February 1795. Most of the garrison managed to escape, thanks to Spanish command of the sea. The delay allowed the Spanish to rebuild their army, call up militia units, and transfer regular units from other fronts. The spring of 1795 also saw the formation of volunteer units whose members fought out of patriotic and religious motives.

Disease and desertion had reduced the French Army of the Eastern Pyrenees. Animosity between Pérignon and General Pierre-François-Charles Augereau, his most suc-

cessful commander, also hampered operations. The French government decided to replace Pérignon with a commander unacquainted with French forces in Spain. General Barthélemy Louis Joseph Schérer was thus transferred from command of the (French) Army of Italy to Spain during the spring of 1795. He was ordered not to take the offensive unless he believed he would achieve victory in any ensuing battles. Admonished by these orders, Schérer nevertheless decided to open an offensive at the end of April.

On 25 April Schérer launched his army against Spanish lines along the Fluvia River. One French column moved against the Spanish left to attract its attention and tie down the Spanish reserves. Schérer, personally leading the main body in two columns against the Spanish center, ran into two Spanish divisions conducting a reconnaissance in force north of the Fluvia. Fighting was heavy; the Spanish fought bravely and with some skill. Schérer managed to push them back but failed to force his way across the Fluvia that night. He resumed the attack the following morning, when his men managed to cross the Fluvia under fire before clearing both the northern and southern banks of the river during the morning. The Spanish responded with a heavy counterattack led by their cavalry against the French left. The French were particularly weak in that arm and were badly shaken. A follow-up attack by a Spanish division stopped any further advance by the French left. By the middle of the afternoon Augereau, on the right, had been halted by the Spanish reserves. During the evening, seeing no prospect of further progress, Schérer ordered his army to retire north of the Fluvia to his new base of operations at Rosas.

Final operations took place at the end of May, when Schérer decided to undertake a reconnaissance against the Spanish positions. The Spanish concentrated against the weak French center and nearly broke through, with only the arrival of reinforcements from the right under Augereau saving the day. Further operations by the French were hampered by the outbreak of malaria in the sickly atmosphere of the region. Both sides settled down to await the outcome of peace negotiations at Basle.

### Fontainebleau, Treaty of (13 April 1814)

Treaty negotiated by the Allied coalition that allowed Napoleon to go into exile at Elba as emperor. By the end of March 1814 Napoleon's military options were quickly disappearing. He faced massive defections to the Allies, including Marshal Auguste de Marmont's entire command. Paris had capitulated, and Allied forces had entered the capital. Facing total collapse, Napoleon and his remaining supporters retired to his Fontainebleau palace, hoping to rally the Bonapartist faithful.

Napoleon finally accepted the reality that the Allies would never allow him to remain as French emperor. On 6 April 1814 he tendered a conditional abdication, in favor of his son, the King of Rome. The Allies, who had already committed themselves to the Bourbon restoration when Napoleon refused Allied terms that would have allowed him to remain on the French throne, rejected the offer and instead demanded a full abdication. General Armand de Caulaincourt, the French foreign minister, brought the treaty from Allied headquarters to Napoleon on 11 April. In return for a full abdication, Tsar Alexander I offered a rather generous and unexpected deal to Napoleon, considering the tsar's long-standing desire for revenge. This offer evolved into the Treaty of Fontainebleau. The treaty's provisions included a renunciation of the French and Italian thrones by Napoleon for himself and his family members. Napoleon would be allowed to keep his imperial title; he agreed to be sent in exile to Elba, a small island off the Italian coast; and, oddly, he would be allowed to reign there as emperor. Alexander agreed that Napoleon would receive an annual stipend of 2 million francs from the new French government. Napoleon was authorized to take with him 600 men from his Imperial Guard. He was also given a ship to travel to Elba, which would be transferred to his ownership. Napoleon's wife, Marie Louise, was named Duchess of Parma in Italy, as a regent for Napoleon's son. Other immediate members of the Bonaparte family could also retain their titles and also receive annuities.

Napoleon withdrew his conditional abdication offer and, instead, chose to take poison. The episode left him violently ill but, he survived and on 13 April signed the full, unconditional abdication and accepted the Treaty of Fontainebleau. The somewhat reluctant Allies ratified the treaty on 16 April. Napoleon bade his Imperial Guard a formal farewell at Fontainebleau on the twentieth. He sailed for Elba on 28 April, arriving there on 5 May to begin his tenure as emperor of the small island.

Not all of the Allies were satisfied with the treaty's provisions and consideration of other options had been urged, such as Napoleon's retirement to England or even exile to the United States. Lord Castlereagh, the British foreign sec-

retary, feared the proximity of Elba to the Continent and knew full well that Britain, with its control of the seas, would probably be held responsible if Napoleon should return to France, for the treaty did not stipulate his confinement on the island. Klemens Fürst Metternich believed that another European war was certain within two years. Both of their prophecies proved correct within the year, for in February 1815 Napoleon left Elba aboard his one-ship navy, returned to Paris, and began his ill-fated Hundred Days.

### Forcheim, Battle of

*See* Rhine Campaigns (1792–1797)

### Fouché, Joseph, duc d'Otrante (1758–1820)

French statesman and minister of police. Born in Nantes on 21 May 1758, Joseph Fouché was educated by the Oratorians and later taught at their school, but he was never ordained as a priest as is popularly believed. He taught physics and mathematics at Oratorian schools and, while living in Arras, he met young Maximilien Robespierre. After 1789 he became active with the Society of Friends of the Constitution and became the president of their club. In late 1792 he was elected as a deputy from the Loire-Inférieure to the National Convention. Although he initially sided with the Girondins, Fouché's radical views soon placed him among the Montagnard deputies, and he voted for the execution of Louis XVI in 1793. Later that year Fouché was sent as a representative on mission from the Convention to ensure the loyalty of the provinces and won notoriety for ruthlessly suppressing the Vendée revolts and the rebellion in Lyons, where he executed rebels by mass shootings and earned the nickname "*le mitrailleur de Lyon*" (the Gunner of Lyons).

Fouché supported the redistribution of wealth and pursued policies of de-Christianization and the destruction and looting of church properties. He opposed the Cult of the Supreme Being advocated by Robespierre, and after the execution of radical Hébertists with whom he was associated at one time, he was recalled to the Convention in April 1794. He managed to become president of the Jacobin society in June but abandoned it after Robespierre's attacks. In July Fouché played an important role in the coup of 9 Thermidor and the execution of Robespierre. Under the new government, Fouché was haunted by his past connection with the Terror and was briefly imprisoned in 1795. Over the next two years, he was involved in various businesses before procuring the post of military supplier. In September 1797 he helped Paul Barras and the Directory suppress the coup of Fructidor and was rewarded with the post of envoy to Milan; later, in 1799, he briefly served at The Hague.

On 20 July 1799 Fouché became minister of police and proved himself an effective but unscrupulous minister. He closed the Jacobin Club in August 1799 and ruthlessly persecuted his former comrades, the Jacobins as well as the royalists. He was among the first to support Bonaparte on his return from Egypt in late 1799. During the coup of Brumaire (9–10 November 1799), Fouché used his increasingly powerful network of agents to support Bonaparte and remained in Paris, keeping the capital under control. As First Consul, Bonaparte kept Fouché as the minister of police, and he spent the next two years organizing a secret police. When the Ministry of Police was merged with the Ministry of Justice, Fouché was relieved of duty and appointed a senator in August 1802. In 1804 Bonaparte reappointed him minister of police, a position Fouché retained for the next five years. During this period, Fouché created an effective secret police with a widespread spy network, an eerie precursor of the secret police of later authoritarian regimes. With his dead-white countenance and lackluster expression, he inspired fear in many and gained numerous enemies; François René, vicomte de Chateaubriand, an author and diplomat, acidly called him "the Crime." For his service, Fouché was made a Count of the Empire in 1808 and duc d'Otrante in 1809. In June of that year he became minister of the interior as well as of the police.

Continuous wars and growing troubles in Spain made Fouché doubt the solidity of the Empire, and he began intriguing against Napoleon. He maintained contact with the royalists and Britain and established close relations with another conniver, former foreign minister Charles-Maurice de Talleyrand. During the 1809 campaign Fouché, at his own discretion, ordered a levy of the National Guard and gave its command to Marshal Jean-Baptiste-Jules Bernadotte, whom Napoleon distrusted following his conduct in the

campaign of 1806. In addition, Fouché made secret peace overtures to the British. Returning to France from the war against Austria, Napoleon dismissed Fouché in June 1810; he never fully trusted him and later regretted not having executed him. However, the Emperor valued Fouché's skills and continued to employ him as the governor of Rome in 1810 and of the Illyrian provinces two years later.

After Napoleon's first abdication, Fouché returned to Paris in April 1814, but he failed to procure any position under the Bourbon monarchy. During the Hundred Days, he again became minister of police, but, following Napoleon's final defeat, Fouché was instrumental in organizing the provisional government, briefly serving as its president in the summer of 1815. The restored King Louis XVIII made him minister of police, but the ultraroyalists soon forced his resignation and he became French ambassador to Saxony. He was proscribed as a regicide in 1816 and lived in exile in Prague and Trieste, where he died on 25 December 1820.

Fouché the man still remains an enigma. He was one of the most powerful and feared men in France for almost two decades. By all accounts he was unprincipled and ruthless, occasionally brilliant, and universally disliked. Yet the fact that he survived and prospered under a succession of governments attests to his incredible political acumen and abilities.

### Fourth Coalition, War of the (1806–1807)

Prussia could have had a decisive effect on the outcome of the War of the Third Coalition in 1805, but the king of Prussia, Frederick William III, had dithered about declaring war, so that by the time he decided to intervene in the fighting, the war was over, decisively in Napoleon's favor.

In 1806, however, French influence was growing within the German states, largely as a result of the formation of the Confederation of the Rhine, and rumors were circulating that Napoleon was to offer Hanover—which had also been offered to Prussia in 1805 in return for its neutrality—to Britain in return for peace. This was too much for the Prussian war party, led by Queen Louise, whom Napoleon described as the “only man in Prussia” (quoted in Fremont-Barnes 2002, 16). Strongly influenced by the queen, Frederick William finally declared war on France on 7 August 1806, and the following month, without waiting for Russian support, Prussian troops occupied Saxony. The elector of Saxony, Frederick Augustus, was forced to join a new coalition of Britain, Prussia, Sweden, and Russia. Frederick William would have overall com-

mand of the Prussian Army, but he had inherited none of the military genius of his uncle, Frederick II “the Great.” Moreover, the commander of the main Prussian force, Charles William Ferdinand, Duke of Brunswick, possessed few talents as a general.

On hearing of this new coalition forming against him, Napoleon knew he had to defeat the Prussians before the Russians could mobilize their forces again. On 6 October he invaded Saxony, and he defeated a Prussian army at Saalfeld on the tenth. Four days later Napoleon and Marshal Louis Nicolas Davout, fighting separate engagements at Jena and Auerstädt (14 October) destroyed a large contingent of the Prussian army, commanded by Frederick Louis, Prince of Hohenlohe-Ingelfingen (at Jena), and the main body under Brunswick (at Auerstädt), respectively. Brunswick was killed at Auerstädt, and Hohenlohe led the remnants of the Prussian army into Pomerania.

On 25 October, because of its performance at Auerstädt, Davout's corps was given the honor of being the first to enter the Prussian capital, Berlin, followed two days later by Napoleon. A week later Frederick William sued for peace at Custrin. Napoleon's terms were severe:

Officers of the élite Prussian Garde du Corps, wishing to provoke war, sharpen their swords on the steps of the French embassy in Berlin in the autumn of 1806. (Print after F. de Myrbach from *Life of Napoleon Bonaparte* by William M. Sloane, New York: Century, 1906, vol. 2)

All Prussian territory on the left bank of the Elbe was to be surrendered, except for Magdeburg and Altmark; Prussia could make no alliances with any other German states; and Prussia had to pay 100 million francs as a war indemnity. The king had a week to comply, but as more and more Prussian towns and cities surrendered, including Magdeburg and Lübeck, Napoleon revised his demands, adding the requirement that Prussia surrender all its territory up to the Vistula. Despite the harshness of the conditions, Frederick William and his senior generals were willing to make peace. Queen Louise, however, forced the king to reject these demands.

Meanwhile, detachments of Prussian forces held out for another month, surrendering one by one. Hohenlohe's 14,000 men surrendered to Marshal Joachim Murat at Prenzlau on 28 October. Murat then joined marshals Nicolas Soult and Jean-Baptiste-Jules Bernadotte, who were pursuing 12,000 Prussians under General Gebhard von Blücher. Blücher was retreating to the Hanseatic port of Lübeck, hoping to unite with a Swedish army that was reported to be there, but on arriving on 5 November he found the Swedes had already withdrawn. On 6 November Bernadotte's forces stormed and sacked Lübeck. In just one month, Prussia had effectively been knocked out of the war, apart from a force under General Anton William Lestocq, which moved east to link up with the Russians, and another under General Friedrich Adolf Graf von Kalkreuth, which was besieged in Danzig.

Napoleon, who was now joined by Saxony (by the Treaty of Posen, 11 December 1806), was now free to take on the Russians, who under the command of Field Marshal Mikhail Fedorovich Kamenski were marching to support their Prussian allies. In worsening weather, which turned the roads into mud, the Grande Armée marched into Poland, the Russians retiring over the Vistula. Murat's cavalry occupied Warsaw on 28 November. However, Napoleon still had to watch his southern flank in case the Austrians launched an attack to avenge their defeats at Ulm (October 1805) and Austerlitz (December 1805). A second Russian army, under General Fedor Fedorovich Buxhöwden, was also marching to confront Napoleon, arriving in the theater of war on 26 December. This second army was the remnants of the army General Mikhail Kutuzov had commanded at Austerlitz, and there had been no time to bring the regiments up to strength.

On 26 December, at Golymin, the French caught up with the Russian rear guard, under General Prince Dmitry Vladimirovich Golitsyn, whose troops were too exhausted to march further. Golitsyn also had to hold the town and await General Fabian Osten-Sacken's troops, who were in danger of being cut off. With a total of about 16,000–18,000 men facing the corps of 38,000 men under marshals

Pierre-François-Charles Augereau and Murat, the Russians held out until nightfall and then withdrew.

On the same day, 12 miles away, against Kamenski's orders, General Count Levin Bennigsen decided to attack Marshal Jean Lannes's corps of 20,000 men with his 40,000–45,000 men at Pultusk. Bennigsen, however, deployed his men so that his numerical superiority was negated. A snowstorm forced both sides to fight with little or no visibility. Bennigsen, moreover, fought a defensive battle, thus allowing General d'Aultanne's division time to march to Lannes's aid. Both sides claimed a victory, but Bennigsen, who would later claim that he had been faced by Napoleon with 60,000 men, left the field to Lannes.

At the end of December both sides settled down into winter quarters. Napoleon needed the time to put his army, which had now been campaigning for over a year, into order. The Russians settled into winter quarters around Königsberg, and Kamenski took this opportunity to retire from the campaign because of ill health. Buxhöwden was also recalled, leaving Bennigsen in command.

Bennigsen, who had been encouraged by the successes at Pultusk and Golymin, was eager to renew the campaign. In mid-January 1807 he decided to strike at Marshal Michel Ney, who, against Napoleon's orders, had scattered his corps over a large area in search of better quarters closer to Königsberg. However, the Russians clashed with an outpost of Ney's corps, which was able to warn Ney and Napoleon in time. Ney's corps was forced to give ground, but Napoleon saw a chance to encircle the Russians. However, a dispatch sent to Bernadotte detailing the Emperor's plans was captured by a Cossack patrol, and Bennigsen, who realized he was marching into a trap, ordered his army to withdraw. On 3 February the French caught up with the Russians at Jankovo, but the engagement that followed was inconclusive, and Bennigsen withdrew during the night. Ney was given the task of pursuing Lestocq and preventing him from joining Bennigsen.

The French pursued Bennigsen's army through driving snow, and on 6 February they clashed with the Russian rear guard at Hof. Once more, after heavy fighting, the Russians retreated. The French again caught up with Bennigsen on the evening of 7 February near the town of Eylau. Bennigsen decided to make a stand the following day, which again resulted in a bloody, savage, seesaw battle. Meanwhile, Lestocq had outmaneuvered Ney and arrived just in time to prevent the Russians from being routed. On the evening of the eighth, Bennigsen, with his army low on ammunition and provisions, decided to withdraw, despite protests from the Russian generals. The Russo-Prussian army retired to Königsberg, leaving Napoleon to claim another victory, but a Pyrrhic one at best.

Despite his claims to victory, Napoleon remained in the vicinity of Eylau just long enough to make it appear that he had won the battle before retiring over the Passarge again to lick his wounds. He decided to increase the size of his army so that by the time spring came the outcome of the campaign would not be in doubt. Napoleon decided to offer Prussia better terms in the hope that it would make peace, but the conditions were rejected. He was also worried that, encouraged by the costly stalemate at Eylau, the Austrians would once again declare war.

Napoleon's army returned to winter quarters, except for Marshal François Lefebvre, commander of X Corps, which was ordered to capture the port city of Danzig, on the Prussian Baltic coast. On 18 March Lefebvre laid siege to the city, which was defended by Kalkreuth and 16,000 Prussians. The siege dragged on through April, and on 10 May Russian and British naval squadrons were able to land 8,000 reinforcements under General Nikolay Mikhailovich Kamenski, the son of the field marshal, but he was unable to break through to the town because Lefebvre had been reinforced by Lannes's corps. Further reinforcements under Marshal Adolphe Mortier arrived on 21 May, and, seeing the situation was hopeless, on the following day Kalkreuth began negotiations. On 25 May Kamenski evacuated his men, and two days later the Prussian garrison marched out with full military honors and rejoined what was left of their army at Pillau. Kalkreuth promised that his men would take no further part in the war.

On 5 June Bennigsen quickly mustered his army, hoping to surprise the French who were quartered around Spandau and Lomitten. Napoleon, however, counterattacked and forced the Russians to retreat to Heilsberg, where on 10 June another bloody yet indecisive battle was fought. Bennigsen continued his retreat. Napoleon believed that Bennigsen would retreat toward Königsberg, and it was on the evening of 13 June that the Emperor was informed that the Russians were concentrating at Friedland. The following day (the fourteenth) the two sides met in battle, but this time the outcome was decisive, Napoleon crushing the Russian army.

After the battle the Russians retired to Tilsit. On 19 June Murat arrived there, where he found a Russian delegation requesting an armistice. On the twenty-fifth, Tsar Alexander met Napoleon on a raft in the middle of the Niemen River to discuss peace. On 7 July, the two emperors concluded a peace treaty, which was ratified two days later. Russia agreed to join the Continental System and to give up the Ionian Islands and some other Mediterranean islands in its possession. In return, France agreed to support Russia in its war against Turkey if the sultan did not make peace within three months. In addition, with French support, Russia was free to invade Finland, which was then

a province of Sweden. (In the end, however, French aid for Russia's wars with Sweden and Turkey did not materialize.) Alexander also agreed to mediate between France and Britain, and Danzig became a free city.

Russia had gotten off lightly by the Treaty of Tilsit, but Prussia was not so lucky: Frederick William had been practically ignored by Napoleon, and when the French emperor did speak to him it was usually to ridicule him. Even the efforts of Queen Louise could not obtain better terms for her country, Napoleon informing Alexander that he was too old to be entranced by the queen's universally acknowledged beauty. On 9 July Prussia also made peace, agreeing to give up all its territories west of the Elbe, as well as its Polish territories. East Frisia was absorbed into Holland, and the Kingdom of Westphalia was formed from Prussian territory and was to be ruled by Jérôme Bonaparte. Prussia's armed forces were to be greatly reduced in size. Finally, a substantial war indemnity was imposed on Prussia, barring the payment of which French troops would remain on what little remained of Prussia's truncated soil.

The signing of the Treaty of Tilsit marked the height of Napoleon's power. In just eighteen months he had defeated Austria, Prussia, and Russia and had set in motion measures to prevent trade between Britain and much of the European continent. At the beginning of the war Prussia had been a great power; now it was little more than a vassal to Napoleon.

### Fox, Charles James (1749–1806)

Charles James Fox was a celebrated British statesman and renowned orator. He led the main Whig faction in Parliament, in opposition, from 1784 to 1797. Fox supported some aspects of the French Revolution and was a vocal critic of Britain's war with France.

Born in Westminster, in London, on 24 January 1749, Fox was raised with many advantages for his later career in politics. His first private tutor was Rev. Philip Francis, a translator of Demosthenes, the famous Greek orator with whom Fox's speaking abilities would later be compared. Fox's formal education was at the academy at Wandsworth, which was headed by a French refugee; Eton, a school famous for its parliamentary tradition; and Oxford, where he attended Hertford College. Less formal learning shaped his thoughts about the French, too, some acquired by his grand tour and during other trips abroad, several to France. In 1769, at the young age of twenty, Fox took a seat in Parliament as member for Midhurst.

At the beginning of his political career, Fox was a court supporter. But by 1772 he had come increasingly to oppose the policies of King George III. Fox came to support the grievances of the American colonies against the administration of Lord North. Fox's speeches to Parliament on that subject gained him a reputation for oratory and quickened his friendship with Edmund Burke. Unlike Burke, Fox was also sympathetic toward the Revolution in France. For Fox, the American Revolution and the French Revolution were both best understood as extensions of England's Glorious Revolution of 1688.

From 1789 to 1791 Fox aimed to keep the Whigs united. As political tensions in Britain became heightened

over events in France, the Whigs split into a liberal and a conservative branch. Fox's preference for reconciliation was increasingly untenable and also unpopular. While he condemned the execution of Louis XVI, Fox maintained that Britain was not justified in going to war against France, a stance that led to opposition with William Pitt. When "Pitt's war" was declared in 1793, Fox fought against the counterrevolutionary spirit that in Britain saw the Habeas Corpus Act suspended. Fox wanted to end the war. After pleading his case for many years to no avail, in 1797 Fox withdrew from Parliament. Research for a history of King James II took Fox to France in the summer of 1802, where he met and dined with Bonaparte, whom he did not much like. With Pitt's death in 1806, Fox was appointed secretary of state for foreign affairs. He aimed to negotiate peace with France, but he found that to be impossible given Napoleon's designs. In the summer of 1806, his health failing, Fox was forced to give up attendance at Parliament. He died on 13 September of that year.

### Foy, Maximilien Sebastien, comte (1775–1825)

Maximilien Foy was one of the ablest divisional commanders in the French Army. He fought in the republican period but was better known for his part in the battles in the Peninsula. He fought at Waterloo, where he was wounded.

Foy began his military career in the artillery in 1792. In this early period he fell afoul of the political changes in France and lost his rank. However, in the Thermidor coup of July 1794 he was reinstated in the army. He fought in the Army of the Rhine in 1796, receiving a wound at an action at Kehl. In 1799 at the battles of Zürich he commanded part of the artillery, and in 1800 he was present at Engen and Biberach. In 1803 he commanded the coastal defenses at Boulogne and the mobile artillery protecting the flotilla that was preparing for the invasion of England. In 1805 he

served in General (later Marshal) Auguste de Marmont's corps and for a short time was in Constantinople on diplomatic duties. In 1807 he was under the command of General Jean Andoche Junot and fought against the British at Vimeiro (21 August 1808). He was promoted to *général de brigade* and was involved in the pursuit of the British under Sir John Moore, culminating in the Battle of Corunna (16 January 1809). He was captured by the Portuguese after the Battle of Oporto (12 May 1809) but was released soon afterward. In 1810 he was made a baron and was badly wounded at Busaco (27 September). He returned to France to take news of the campaign in Spain to Napoleon and was promoted to *général de division*.

He returned to Spain and was given the command of a division in VI Corps. He fought with great distinction at Salamanca (22 July 1812). His division allowed the defeated French to retreat across the river Tormes by fighting a rearguard action in the gloom of the close of the day. Following this defeat Foy's troops were badly mauled when they were attacked at García Hernandez (23 July 1812) by the Earl of Wellington's heavy cavalry. One of the French squares was broken in this action. In 1813 he defended Tolosa and took part in the engagement at Maya (25 July 1813), where the French were successful, though they were later defeated at the Battle of the Nive (9–12 December 1813). As the war in Spain drew to a close, Foy was once more wounded, at Orthez (27 February 1814).

Upon Napoleon's abdication Foy was allowed to retain his commission by the restored Bourbon government. However, he rallied to Napoleon in 1815 and was given a divisional command in General Honoré, comte Reille's corps during the Waterloo campaign. His forces were engaged at Quatre Bras (16 June), where he occupied a position in the French center. Two days later, at Waterloo, he was wounded in the shoulder while his men were engaged in the assault against Hougoumont, which they had endeavored to take for most of the day. He retired from service in August 1815 and entered political life, writing at the same time a detailed history of his military exploits.

## France

France was the prime mover in the series of revolutionary wars that rocked Europe and other parts of the world from 1792 to 1815. At the same time, the country was undergoing profound internal changes, which affected and were affected by its military struggles.

### The Revolution Begins

The era of the French Revolution began with the summoning of the Estates-General in 1789, a desperate move by a French regime facing a fiscal crisis. The Estates-General had not met since 1614. It was composed of representatives of the “three estates”—the First Estate (clergy), the Second Estate (nobility), and the Third Estate (all others)—a manner of categorizing society that had originated in the Middle Ages and was increasingly incompatible with the changing society of eighteenth-century France. Dissatisfied leaders of the Third Estate adopted the title “National Assembly” and allied themselves with dissident members of the first two estates and the people of Paris, who stormed the royal prison of the Bastille on 14 July, thus inaugurating what for most historians signifies the beginning of the Revolution. In the following months the assembly gravitated toward an evermore-radical approach in its attack on existing society.

Pre-Revolutionary France—the *ancien régime*—was an aristocratic society in which the nobility enjoyed legal privileges, including exemption from some taxes, and a monopoly on certain offices of state and the Church, particularly in the military realm. Members of the Third Estate resented aristocratic privilege. Very early in the Revolution, the National Assembly abolished the feudal privileges of aristocrats in a wave of enthusiasm shared by many aristocrats themselves. The abolition of the legal privileges of classes (gender was a different matter) was made explicit in the Declaration of the Rights of Man and the Citizen, adopted by the Constituent Assembly in August 1789. The declaration announced that all citizens were equal in rights and that distinctions could only be made for pragmatic reasons—an assertion that destroyed the traditional position of the nobility. In July 1790 many of the remaining marks of nobility were banned, including titles, coats of arms, and liveried servants. Nobles were not recognized as differing from the rest of the population in any way. Although many French nobles supported the Revolution, particularly in its

early stages, the term *aristocrat* came to be used to denounce the enemies of the Revolution, even where technically the term was applied inaccurately.

The aspect of the Revolution that most shocked contemporary Europeans was the overthrow of the monarchy and the subsequent execution of the king, Louis XVI, and his queen, Marie Antoinette. Although at the beginning of the Revolution, the Revolutionaries had proudly proclaimed their loyalty to the king, the subsequent months and years saw a growing alienation between the government in Paris and the court and royal family. This alienation culminated in the flight to Varennes in June 1791, as the royal family unsuccessfully attempted to escape from the Revolutionary government. After their capture, the king and his family became prisoners, although the monarchy itself was not formally abolished until 22 September 1792. Louis was executed on 21 January 1793, and Marie Antoinette on 16 October.

The aristocracy and the monarchy were not merely political institutions but also cultural formations. The Revolutionary attempt to purify French culture of its aristocratic and monarchical elements extended deep into the fabric of society. The old forms of formal address, *monsieur* (my lord) and *madame* (my lady), were replaced with *citoyen* and *citoyenne*. Even new playing card decks omitting the kings and queens were introduced.

One of the most formidable challenges the Revolutionaries faced was the Catholic Church. The French church, whose leadership was drawn almost entirely from the nobility, had been a buttress of the pre-Revolutionary order. It was also one of the biggest landowners in France. The loyalty of French Catholics, and particularly French Catholic priests, to a non-French authority, the pope, also challenged the Revolutionaries. The secularization of church lands, in which Revolutionary France followed the precedent of Europe's Protestant regimes, was one of the earliest attempts of the Constituent Assembly to deal with France's fiscal crisis. The Revolutionary government also took over the papal enclaves within France, Avignon and the Comtat-Venaissin.

Revolutionary opposition to the church was not merely based on the church's institutional status; the Revolutionaries also opposed the Church's ideology. Many of the French Revolutionaries were influenced by the Enlightenment, with its aggressive assertion of religious tolerance and its distrust of clerical power. French Revolutionaries dissolved the bonds between church and government that had made France a Catholic state. Freedom of religion was one of the principal guarantees in the Declaration of the Rights of Man, and Revolutionary France was the first European country to grant full civic rights to Jews.

The earliest attempt to secure the loyalty of the church to the Revolutionary state was the Civil Constitution of the

Clergy, dating from 1790. This constitution required members of the clergy to take an oath of loyalty to the constitution, dissolved religious orders, and made the posts of bishops and parish priests elected positions. It created a division between those clergy who swore the oath—the “Constitutional Church”—and the “nonjurors,” those who refused or withdrew their oaths, following the instructions given, after some delay, by the pope.

One of the most important changes to occur in France during the Revolutionary and Napoleonic periods was the rise of centralization. Although France had been evolving as a more centralized country under the *ancien régime*, the Revolution saw the pace of this process radically increase. In territorial administration, the old France of overlapping jurisdictions and large provinces with separate historical origins, administrations, privileges, and institutions was replaced by a new France composed of small departments (*départements*), as alike as the administration could make them, all with the same legal status and all increasingly run from Paris. Internal tariff barriers were also abolished, although those between France and foreign countries remained.

The drive toward standardization extended to culture. The National Assembly sought to create a uniform system of measurements to replace the chaotic system of different measurements prevailing in different parts of France. Their efforts culminated years later with the creation of a simple and easy method of weights and measures—the metric system—which, however, still faced fierce resistance.

European powers initially saw the French Revolution as increasing French vulnerability. The major continental powers, however, were too busy with affairs in Poland and elsewhere in the east to immediately concern themselves with developments in France, despite their rhetorical denunciations of the Revolutionaries. The threat to the royal family, which was related to other European royal houses, and the increasingly bellicose rhetoric of French politicians caused the German powers, under Austrian leadership, to adopt a harsher tone with France, though they still hoped to avoid war. However, the dominant faction in the assembly early in 1792, a loosely knit group under Jacques-Pierre Brissot known as the Girondins, hoped that war would unify the country behind their leadership. France therefore declared war on Austria on 20 April.

War presented the new French government with difficult challenges. Like other European powers, pre-Revolutionary France had an army dominated by the aristocracy that furnished the vast majority of the officer corps. (The least aristocratic segment of the officer corps, the artillery, was, unsurprisingly, also the most loyal to the Revolution.) As the Revolution grew more radical, more officers

emigrated, and the loyalty of those who remained grew less reliable. The spread of Revolutionary ideals among ordinary French soldiers and sailors undermined military discipline. The earliest battles between France and the First Coalition led by Austria and Prussia constituted serious setbacks for France. The tide of war, however, began to turn with the French victory at Valmy on 20 September.

War contributed to the universalization of the principles of the Revolution. Both sides cast the war not merely as a struggle between states but as a conflict between conservative and monarchical ideologies, on the one hand, and those of the radical, republican, and anti-Christian French Revolution, on the other. The presence of exiles, both French émigrés at foreign courts and foreign exiles in Paris, encouraged the tendency to see the wars as ideologically based. Revolutionary universalism had, after all, been implicit from the beginning, and the Declaration of the Rights of Man had spoken of Man in the abstract, not of Frenchmen. Most shocking of all for the monarchies of Europe, however, was the French government's willingness to help all peoples struggling for liberty, a position publicly enunciated on 19 November.

### The Jacobins and the Terror

The Revolutionary project of refashioning French culture and society was at its height in the period known as the Terror. The Terror saw the domination of French politics by Jacobins, members of the Jacobin Club, a political association that had originated in Paris and attracted emulators throughout France. The Jacobins began to take power from the Girondins in the summer and fall of 1792, forming a government known as the Convention. The next year the Jacobins eliminated their rivals and established the most effective governing body seen in France since the Revolution began, the Committee of Public Safety, a group of twelve men whose leading politician was Maximilien Robespierre.

Although the Jacobins continued to proclaim the principle of religious toleration, among them were Revolutionaries who hoped to carry forward the principles of radical Enlightenment anticlericalism to the destruction of Christianity itself. These “de-Christianizers” hoped to establish a new religious calendar and set of rituals to reinforce the principles of republicanism. (Most Revolutionaries opposed atheism, which they viewed as “aristocratic.”) The high point of the effort to create a republican religion was the Feast of the Supreme Being on 8 June 1794, a deistic rite. The Jacobin regime also continued the struggle for rationalization and standardization. The months of the year were renamed in a systematic way relating to the agricultural calendar. The boldest attempt to remake standards was the replacement of the week with a ten-day period

known as the *décade*. The *décade* also contributed to de-Christianization by abolishing Sunday, as well as giving French workers one day off in ten rather than one in seven—two reasons it failed.

The Jacobins also believed strongly in a centralized government situated in Paris, the focus of their political base. The term *fédéraliste* became an insult directed at their opponents. The Convention was marked by vigorous action against the enemies of the Republic (real and imagined), both foreign and domestic. The Terror, a judicial purge of those “aristocrats” and “traitors” whom the Revolutionary government saw as a threat, claimed thousands of victims, many of whom were politically harmless. The Jacobins saw all other organized political factions, whether of the “Left” or the “Right,” (these terms deriving from the respective seating arrangements of liberal and conservative political groups in the chamber holding the National Constituent Assembly between July 1789 and September 1791) to be not truly loyal to the Republic. The intensity of the Terror, vigorously promulgated both by local Jacobins and by emissaries sent out from Paris, varied greatly across France.

The military challenges facing France were made even greater with the addition of Great Britain, ultimately Revolutionary France's most persistent opponent, to its list of enemies early in 1793. Another front, against Spain, opened shortly thereafter. The response of the Revolutionaries to the military challenges facing France was the *levée en masse*, which called for a total mobilization of the resources of the country for war, with the eventual aim of building a massive army of over a million men through conscription. The Committee of Public Safety and its servants performed prodigies of energy and organization to raise, equip, and support its military forces. The creation of the new French military also constituted a social revolution. As the old military leadership was alienated by the Revolution, careers for officers were opened for very young men of nonaristocratic backgrounds. The foremost among these was Napoleon Bonaparte, but there were many others. Despite the success of the conscript army, however, conscription created another domestic problem: the revolts in the Vendée in western France, touched off by conscription but grounded in the loyalty of the inhabitants toward the monarchy and Church over the Revolution.

### The Thermidorian Reaction and the Directory

The Terror ended in 1794 with a coup that brought together extreme leftists and moderate republicans against the Jacobins, specifically Robespierre, who was executed along with several of his followers on 27 July. Known as the Thermidorian (or Thermidorean) reaction after the republican month of Thermidor in which it took place, it marked the

end of the Revolution as a project for transforming society and the beginning of a series of regimes focused on defending the Revolution's gains from domestic enemies of the Right and the Left as well as from foreign armies.

After the Thermidorian reaction, the Constitution of 1795 established a group of five directors: the Directory. The directors were to be chosen by a bicameral legislature elected by men who met certain property qualifications. The ministers, the executive administrators of the country, were responsible to the directors rather than to the legislature. This separation of powers was a response to the fear of a repetition of the unrestricted terror that had been inflicted on the country by the Committee of Public Safety, which had combined executive and legislative power. The Directory also moderated the anti-Christian policies of the religious extremists. France was now ruled by the middle classes and by the profiteers of war and revolution—financiers and military contractors. Unlike many of the early Revolutionary politicians, the directors were not remarkable personalities, although some, notably the former leader of the Committee of Public Safety, Lazare Carnot, were excellent administrators.

Although most of the powers at war with Revolutionary France, including Spain and Prussia, made peace in 1795, war continued with Austria and Britain. The war with Austria was mostly fought in Italy, under the leadership of the charismatic young general, Napoleon Bonaparte. The Treaty of Campo Formio in 1797 confirmed French conquests in Italy and Belgium. Peace talks with Britain, however, were unsuccessful, and the Directory and its generals made several attempts to attack Britain where it was vulnerable, including an unsuccessful invasion of Ireland in 1798. Loot from the wars helped the Directory stabilize the French currency.

Internally, the Directory faced challenges from the Right and the Left. In 1796 a left-wing conspiracy led by Gracchus Babeuf was defeated with little difficulty. In 1797 a number of monarchists in the legislature attempted to return France to its political past. This movement was crushed by the directors and the army, whose leaders feared that a return to monarchy would lead to peace and an end to the perceived benefits of the Revolution. The regime's dependence on the army, however, ultimately proved fatal. Bonaparte overthrew the Directory in the famous coup of Brumaire in November 1799.

Bonaparte's coup d'état was the culmination of a process by which the military had acquired a stronger political role in society at the expense of civilian rule. This problem was particularly pressing in light of Bonaparte's military success and ambition. His popularity remained undimmed either by the recent failure in the Middle East and his return to France virtually alone on 9 October or by

his having deserted his army. In Paris he began sounding out politicians interested in carrying out yet another of the coups that had marked the Directory's career. On 18–19 Brumaire (9–10 November) three directors complicit in the plot resigned, and the other two were arrested. When the legislative councils met, Bonaparte presented himself before them as the savior of the nation. A group of followers of the conspirators shortly after appointed Bonaparte along with two others as consuls, or heads of government, but there was no question that Bonaparte was more than the first among equals. Thus was born the Consulate, which lasted from 1799 until 1804.

### The First Empire

Napoleonic France was a curious mixture of the traditions of the Revolution and those of the *ancien régime*. The most striking example of the return of the old is that of hereditary monarchy. After a plebiscite, Bonaparte was crowned Emperor Napoleon I by the pope on 2 December 1804. Legislative institutions continued to exist, but exercised little power. Real power was held by the appointed Council of State. Napoleon also re-created a hereditary nobility and increasingly turned to administrators with a royalist background. Following an explicitly dynastic policy, he also lavishly distributed European thrones to members of his incompetent family.

Napoleon attempted to settle the Revolutionary quarrel with the Catholic Church with the Concordat of 1802, which ended the separate existence of the Constitutional Church and recognized Catholicism's privileged position in France, much to the disgust of some old Revolutionaries. However, it was the church that made the greatest concessions, recognizing the alienation of the bulk of church lands and the loss of papal territories as permanent and accepting French government control over papal activities in France. Like French Protestant ministers, Catholic priests became salaried government employees. Despite this agreement, Napoleon soon fell out again with the pope, and many French Catholic clergy quietly opposed his government.

However, Napoleon also built on the Revolutionary legacy. He continued the process of standardization with the creation of a single, uniform code of law for the entire country, thus ending the centuries-old practice by which the north and south of France had been subject to different legal regimes. The new, standard legal code, known as the Code Civile des Français (promulgated on 21 March 1804, proclaimed on 18 May of the same year, and known as the Code Napoléon from September 1807), would be imposed on or adopted by many countries apart from France as well. Napoleon also centralized and created nationwide standards for higher education with the founding of the Imperial University. Napoleon's military continued to em-

phasize the possibility of career advancement for talented soldiers regardless of social background. The Emperor also continued the Revolutionary policy of religious toleration.

Napoleon's military genius and the mass armies and efficient administration developed by the Revolution were a devastatingly effective combination, leading to victory after victory and eventually to French hegemony over continental Europe west of Russia. A problem Napoleon was unable to solve was France's naval inferiority to Britain. After defeat at the Battle of Trafalgar, France had lost the ability it had under the Directory and the Consulate to dispatch significant forces by sea. Indeed, the Revolutionary and Napoleonic Wars completed the process by which France lost nearly all of its overseas colonies. French resources also eventually proved inadequate to the task of maintaining military control over continental Europe, the high point reached with the Treaty of Tilsit in 1807. The French also failed to choke off trade between Britain and mainland Europe as intended through Napoleon's Continental System. Thus, in spite of massive loss of life between 1792 and 1815, Revolutionary and Napoleonic France did not make significant permanent territorial gains in Europe.

## France, Campaign in (1814)

After the disastrous invasion of Russia in 1812, Napoleon still retained some of his mystique, but gradually his long-time enemies realized he was vulnerable, and a new coalition came into being. In October 1813 the French emperor suffered a decisive defeat at the Battle of Leipzig, in Saxony, and thereafter the armies of the Sixth Coalition advanced from Germany for the climactic battles in France in 1814.

While Revolutionary fervor had helped French armies achieve victories years earlier, the weight of French imperialism had caused an upsurge of nationalism in Europe. As Russian armies advanced into Europe, Prussia joined with Russia, and later, in August 1813, Austria joined the coalition, fearing the spread of Russian power into central Europe. In addition, as the power facing Napoleon increased, the German states in the Confederation of the Rhine began to desert this French-controlled union, and when the Battle of Leipzig was over Napoleon had lost all his confederation allies.

Napoleon could not bring himself to accept the Allied peace terms, offered on 8 November 1813, which would

have reduced France to its so-called natural frontiers: the Rhine River, the Alps, and the Pyrenees. The Allies did not want to pay the high cost in men and materiel to invade France, and they still had great respect for Napoleon's military talents. Notwithstanding these reservations, the Allies nevertheless wanted France contained and its forces ousted from Italy, Switzerland, Germany proper, and the Low Countries. Napoleon feared that a much-reduced France would expose his regime to the threats of domestic opponents willing to rise against him, and so on 1 December he rejected the peace offer.

Napoleon felt he could defeat his opponents, in part because he would have a central position against the Allies moving from many fronts in Spain, Italy, Germany, and the Low Countries. He retained great faith in his strategic and tactical abilities, and he also underestimated his adversaries. Moreover, he was unable to see the real weaknesses in his own forces. He had lost a great many veteran troops—including several very distinguished senior commanders—through his many campaigns, and the invasion of Russia had cost him a vast number of horses, vital for moving supplies and artillery as well as for mounts for the cavalry. As Russian armies advanced into central Germany, Napoleon lost access first to German horses and then horses from the Low Countries, which had proven to be great assets in earlier campaigns. Worse still, when he issued a call for nearly a million men in the hopes that such a large force, even if composed of indifferent troops, would cause his opponents to hesitate, a great many Frenchmen did not respond. Indeed, it appears that perhaps only one in seven heeded the call to serve their Emperor.

As Napoleon moved to confront the threat to his home soil, he needed fresh forces, since French armies were still committed elsewhere. He left most of the 100,000 men still in Spain to contain the British and their Portuguese and Spanish allies and thus to protect France's Pyrenean frontier. He also left 50,000 troops in northern Italy under Eugène de Beauharnais to face an equal number of Austrians, so defending, albeit weakly, France's southwestern and Alpine borders. Having overstretched his resources and manpower, Napoleon faced a severe challenge that certainly would have shaken the composure of a less self-confident leader.

However, despite the great odds, Napoleon seemed to shake off the lethargy that had characterized his leadership in recent years. The earlier Napoleon had been more active, and his great victories had relied as much on strategic maneuvers and an indirect approach to battle as on mass and the tactical power of concentrated artillery working in conjunction with cavalry and infantry attacking in columns. In later years Napoleon seemed lazier and more content simply to mass his forces and to bludgeon his ene-

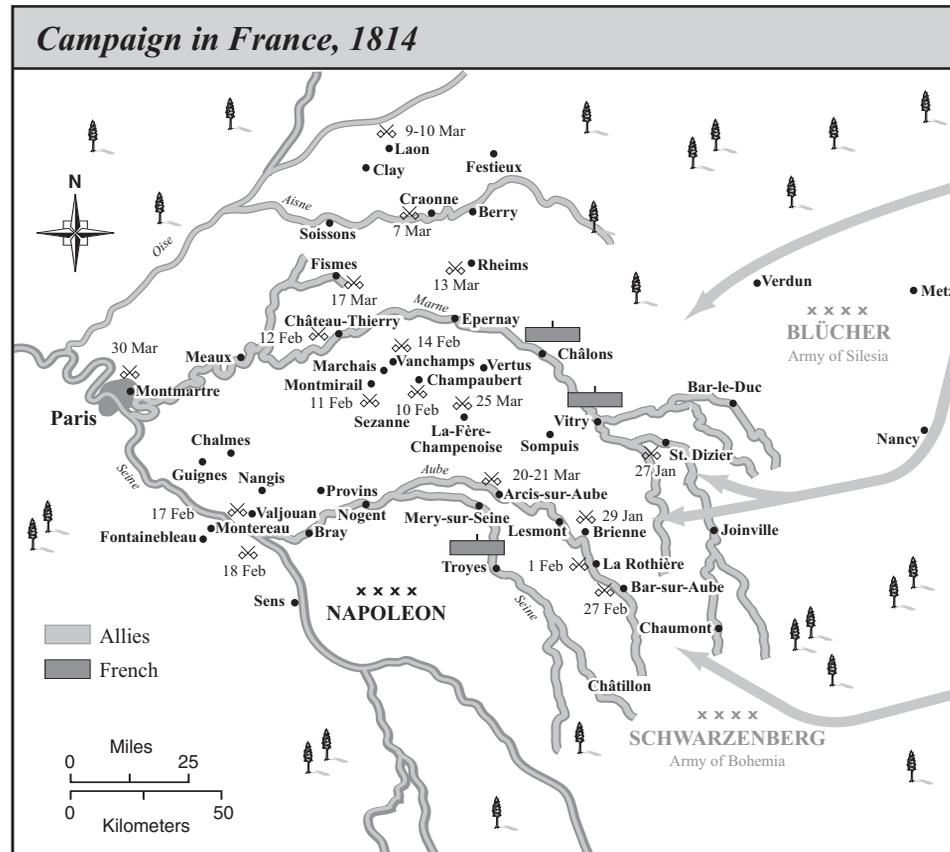

mies, at great cost to his own armies. These great battles, notably Eylau, Wagram, and Borodino, cost him precious men, horses, and materiel that he eventually found himself unable to replace.

In the opening phase of the campaign of 1814, Napoleon was able to defeat his enemies as well as to regain the respect that once made him the most feared commander in Europe. Even though he stationed most of the newly raised army in and around Paris and fought with perhaps 40,000 men at most, he won initial victories against his various opponents at Brienne, La Rothière, Champaubert, Montmirail, Château-Thierry, Vauchamps, Montereau, Craonne, and Rheims. He used the advantage of his interior position to attack the different Allied armies in turn and push them back. For the most part, he inflicted greater casualties than he suffered, although Allied manpower reserves greatly exceeded the human and material resources of a defending nation that had already sacrificed so much of its youth to the dreams of its Emperor.

After retreating from Germany, Napoleon had nearly 120,000 troops along France's northeastern border to face his major opponents. Three armies—*Feldmarschall* Karl Fürst zu Schwarzenberg's Army of Bohemia advancing from Switzerland, Field Marshal Gebhard von Blücher's Army of Silesia moving from Germany toward Metz, and former French marshal Bernadotte's Army of the North advancing into Belgium—intended to execute a classic strategy of maneuver in which, if Napoleon stopped to contest one advance, the others would seek to move around his position and threaten his line of communications and contact with Paris. The goal, ultimately, was to avoid bloody battles, limit Napoleon's freedom of action, and force him back upon his rear, resulting in surrender. Since the Austrian foreign minister, Klemens Fürst Metternich, still hoped negotiations would succeed, he exercised a kind of brake on the pace of advance, which aided Napoleon.

Showing great energy, Napoleon decided to attack the armies in succession before they could combine and perhaps overwhelm his green troops. He chose to attack Blücher's units, which were more scattered, after the Prussian commander crossed the Rhine, to ignore the army moving into Belgium, and to concentrate afterward against the army moving from Switzerland, which could outflank him as he faced Blücher and thereby threaten his communications.

At St. Dizier on 27 January, with 34,000 men Napoleon sought to isolate and engage a portion of Blücher's army but failed to reach it before most of the enemy had crossed the Marne in the direction of Brienne. Napoleon duly retook St. Dizier, drove off Blücher's rear guard, and pursued the Prussians to Brienne where, on the twenty-ninth, the Emperor fought on familiar ground, having at-

tended the military academy there. He slightly outnumbered Blücher's Prussians, but most of his troops had just completed their basic training and had little if any battle-field experience. He sought to pin the Prussians and then move to turn their hanging flank, a typical Napoleonic tactic. The fighting was difficult, and at one point Cossacks nearly captured Napoleon, while Blücher also narrowly evaded capture by the French. Blücher chose to withdraw rather than risk having his flank turned, suffering 4,000 casualties to Napoleon's 3,000. As Blücher withdrew, Napoleon advanced to La Rothière.

Three days later, on 1 February, Blücher, bolstered by reinforcements and by other troops following him, moved to reengage Napoleon at La Rothière. The French had only 40,000 men, while Blücher had some 53,000, with at least that many more Allied troops moving into the general theater of operations. Napoleon did not want to risk fighting the combined armies, but his order to withdraw came late, and the fierce fighting raged throughout the day. Then the French skillfully disengaged and withdrew that evening after darkness fell. Both sides suffered about 6,000 casualties.

Napoleon had to continue the quick pace of battle before his opponents could gather to overwhelm him, and

between 10 and 14 February fought a brilliant series of engagements (Champaubert, Montmirail, Château-Thierry, and Vauchamps) known collectively as the Six Days Campaign. On 10 February, at Champaubert, Blücher's army advanced in several columns too separated to provide support for one another. Napoleon moved quickly to concentrate against the more vulnerable of these dangerously dispersed units. He managed to engage 5,000 Russian troops, who were isolated from the larger Prussian army that Blücher commanded. Believing that reinforcements were en route, the Russian commander held his ground against assailants who outnumbered his forces by more than 6 to 1. Napoleon's troops, gaining experience with every battle, fought for five hours against the Russians, who, completely surrounded, finally surrendered. Their total losses reached 4,000—or 80 percent of their initial strength.

The next day Napoleon decided to renew the attack on the isolated detachments of the larger Prussian army. He developed a complicated plan for the coming battle at Montmirail. His 10,000 men faced 18,000 troops under the Russian general Fabien Osten-Sacken and the Prussian general Johann Graf Yorck von Wartenburg. But Napoleon believed his reinforcements would soon arrive, giving him a numerical advantage, and he was certain he could keep

Napoleon and his weary marshals during the campaign of 1814 in France. Despite a series of spectacular initial successes, the Emperor simply could not match the numerical superiority of the Allies. (Print by Bousson, Valadon, Paris, after E. Boutigny from *Life of Napoleon Bonaparte* by William M. Sloane, New York: Century, 1906, vol. 4)

the two armies separated, holding off one while defeating the other and then turning to defeat the first. With this in mind, Napoleon detached some forces to engage General Johann von Yorck's Prussians while himself concentrating on Osten-Sacken's Russians, whom he quickly defeated. As French reinforcements arrived, Napoleon turned to confront the Prussians, who were forced to retreat. Overall, the Allies lost 4,000 men to Napoleon's 2,000.

Having defeated contingents of Blücher's army, Napoleon moved on 12 February to continue the body blows at Château-Thierry. He caught the Prussian rear guard under Yorck along the Marne River and badly mauled the tired troops, inflicting 3,000 casualties while losing only 600 killed and wounded from his own force.

Two days later, the series of running battles began again at Vauchamps. Once again, Napoleon moved to attack Blücher, who had some 20,000 troops with him. The French drove the Prussians from the field, but wet, boggy ground slowed the French cavalry pursuit, enabling most of the Prussians to escape, though they lost vast quantities of supplies and suffered some 7,000 casualties to about 600 for the French. It was a remarkable campaign for Napo-

leon, but even this series of successes could do little to affect the balance of forces moving against France.

On 18 February, four days later, Napoleon changed targets. He had pummeled and pushed Blücher and his Prussians in the series of battles in the Marne River valley; in the meantime, an Austrian army commanded by Schwarzenberg had crossed the Seine, and Napoleon needed to counterattack before the Austrians advanced too far into France. Napoleon drove his men, and they moved some 60 miles very quickly to close on the enemy. Buoyed by the idea of defending their homes and families, the French troops, no longer raw recruits, would attack with great passion. Meanwhile, when Schwarzenberg learned of Blücher's defeat, he left a rear guard at Montereau and retreated. Preceded by a massive artillery bombardment, the French attacked the Austrian rear guard in Montereau on the eighteenth, causing some 6,000 casualties to 2,500 of their own. On 22 February Schwarzenberg and Blücher linked up near Troyes, where an Allied council determined, against the wishes of Tsar Alexander of Russia and King Frederick William III of Prussia, that the Allies should withdraw, Blücher to the Marne, and the

other Allied armies to the river Aube. On the twenty-seventh, at Bar-sur-Aube, Schwarzenberg attacked French forces under Marshal Nicolas Oudinot. The French had deployed in a poor position, and the Austrians forced them back to Troyes, from which the Austrians themselves had recently advanced.

There followed a pause in the fighting for about ten days, before hostilities resumed at Craonne on 7 March. Blücher had time to regain his courage and to renew his advance on Paris through the valley of the Marne. Napoleon moved quickly to attack him, and the smaller French army pushed Blücher's larger force across the Aube. As Blücher prepared his counterattack, Napoleon intended to hold the center of his enemy, who outnumbered him more than 2 to 1, and then with a mixed force of cavalry, infantry, and artillery attack the always-vulnerable hanging flank to turn the Allied position and destroy the Army of Silesia. The attack did not go as planned, the troops assaulting the enemy flank suffered heavy casualties, and the Allied army was able to retreat in good order.

The ratio of forces, moreover, continued to turn against Napoleon, and he continued to seek the ever-more-elusive decisive victory through attack against the array of forces attempting to defeat him. At Laon on 9 and 10 March, Napoleon once again sought to turn the left flank of Blücher's army, which outnumbered his own force of 47,000 men by nearly 2 to 1. But the flank attack proceeded too slowly, and by the time Napoleon withdrew he had suffered 6,000 casualties to Blücher's 4,000. Three days later, at Rheims, Napoleon scored a minor though remarkable victory over a Russian corps when he surprised the town's garrison and drove it off in headlong retreat. The Emperor's continuing series of victories appeared to justify his contemptuous rejection of Allied terms made at Chaumont at this time, whereby Napoleon was offered peace on the basis of the 1791 French frontiers and the retention of his throne. There would be no further Allied peace proposals, and all were committed by Chaumont to wage war without concluding a unilateral peace with Napoleon.

The ordinarily cautious Schwarzenberg made a spirited attempt to ambush the French as they proceeded east to cross the River Aube at the town of Arcis on 20–21 March. Napoleon assumed other French forces could defend the Aisne River, freeing his main but shrinking army of 28,000 to confront 80,000 troops under Schwarzenberg. A daylong cavalry battle at Arcis-sur-Aube on 20 March should have led to an all-out Austrian attack on the twenty-first, but Schwarzenberg so feared walking into another trap set by Napoleon that he moved cautiously, and the Emperor was able to withdraw after losing 3,000 men.

More important, Napoleon was now cut off from Paris, with Allied armies between him and the French cap-

ital. The end was nearing. The Emperor sought to distract the Allies by striking at their lines of communication, an old and usually successful tactic of his, but this time Schwarzenberg showed uncharacteristic energy, and four Allied columns, perhaps 200,000 men, converged on Paris, where Napoleon's brother, Joseph Bonaparte, led the defenders. In the last major action of the campaign, Schwarzenberg's massive army forced back a numerically inferior French force under marshals Adolphe Mortier and Auguste Marmont at La-Fère-Champenoise on 25 March, enabling the Army of Bohemia to proceed to Meaux, where it linked up with the Army of Silesia on the twenty-eighth. The Allies attacked Montmartre before dawn on 30 March, Joseph fled the capital, and other French forces, badly outnumbered, could not withstand the assault and abandoned Paris in the predawn hours of the thirty-first.

At first, Napoleon tried to rally troops to regain Paris. But while some of his troops may have been willing to continue the hopeless struggle, his generals and marshals had tired of the constant fighting, and his foreign minister, Charles-Maurice de Talleyrand, had opened negotiations with the Allies, including discussions on the restoration of the Bourbon monarchy. When the generals confronted the Emperor with their refusal to fight, Napoleon sought, on 6 April, to abdicate and turn power over to his infant son. The Allies were determined to rid themselves of the Bonapartes, and they were firm. After Marshal Nicolas Soult lost the last battle of the war at Toulouse, in the south of France, on 10 April, Napoleon accepted the Allies' insistence on his exile on the thirteenth by the terms of the Treaty of Fontainebleau. In the Treaty of Paris signed on 30 May, Louis XVIII, brother of the executed Louis XVI, was restored to the throne of France, whose borders were reduced to pre-November 1792 limits, so reversing nearly all of the territorial gains achieved during the French Revolutionary and Napoleonic Wars, save for substantial German territory west of the Rhine. Napoleon himself went into exile on Elba, a small Mediterranean island off Sardinia.

Restless and still full of energy, Napoleon would return from Elba the following spring for one short and final campaign, which was to end in the climactic Battle of Waterloo and definitive exile to the remote South Atlantic island of St. Helena.

## Francis I, Emperor (1768–1835)

Initially, Francis reigned as Francis II, the last Holy Roman Emperor, but later as Francis I, the first emperor of Austria. Reigning throughout the entire French Revolutionary and Napoleonic period, he remained a staunch opponent of republican and imperial France. Francis displayed a great capacity to work and was popular among his subjects, earning him the title “Francis the Good.” An unwavering conservative with a Beamter (minor administrative official) mentality, his priority was to maintain the power of his dynasty.

Francis was the eldest son of Grand Duke Leopold of Tuscany (later Holy Roman Emperor Leopold II), and his

wife Maria Louisa (daughter of King Charles III of Spain). Although born in Florence on 12 February 1768, he was brought to Vienna by his childless uncle, Holy Roman Emperor Joseph II, in 1784 at the age of sixteen to be trained as the presumed successor. Although Joseph initially found the young man timid, their relationship improved with Francis's marriage to Elizabeth of Württemberg in 1788. Francis's first real military experience came when he accompanied his uncle on campaign during the mishandled, dismal Turkish war in 1788, about which he kept a diary. Despite the overall failure of the effort, Francis never lost his willingness to use war as a political tool.

On 18 February 1790 Francis's wife died, followed two days later by his uncle, Emperor Joseph. Thus, his father, Leopold II assumed the imperial throne. In the following September Francis married his second wife (and first cousin), Maria Theresa, the daughter of the king of Naples, who would bear Maria Louisa (Marie Louise), future wife of Napoleon. After his second wife's death in 1807, Francis married Maria Ludovica, Beatrix d'Este, the following year; when she died, he married his fourth wife, Carolina Augusta of Bavaria, in 1816.

Emperor Leopold only ruled for two years, and Francis became emperor on 1 March 1792. The internal and external position inherited by the twenty-four-year-old Francis was fraught with difficulty. The various Habsburg dominions scattered from the Low Countries (Austrian Netherlands), through Germany and northern Italy, into eastern Europe (Bohemia, Hungary, and Croatia), were exposed to the ambitions of the French in the west, the Russians and Prussians in Poland, and the Ottomans in the east. Francis now had to face the new dangers posed by the French Revolution, although Napoleon's assumption of an imperial title in 1804 was a concept he would accommodate. In all matters of foreign and military policy, therefore, Francis would maintain a cautious approach, accepting short-term losses in the hope of ultimate success but changing his advisers with each major defeat. His most senior and powerful advisers were the ministers responsible for foreign affairs. Initially, these were the hawks, Prince Wenzel Fürst Kaunitz and then Johann Freiherr von Thugut, who both opposed the disorder created by the French Revolution. Defeats up to 1800 and the Habsburg influence on Germany led to Thugut's dismissal, which was followed by an attempt to reorganize political government into a cabinet system, whereby Francis was only required to decide the issues affecting more than one department. This failed in 1804 with the collapse of the Interior Ministry, and Francis reverted to personal rule, albeit his attitudes being shaped by favored advisers, notably the foreign minister, Johann Philipp Graf von Colloredo. Realizing that the old Holy Roman Empire was

Francis I, emperor of Austria, whose persistent opposition to Napoleonic France cost him extensive territory and the loss of Habsburg influence in Germany. (Engraving by Meyer after A. Dumont from *History of the Wars of the French Revolution* by Edward Baines. London: Longman, Hurst, Rees, Orme, Brown & Harper, 1817)

obsolete, Francis adopted the hereditary title of emperor of Austria. In doing so he avoided a loss of rank and gave the Habsburg Empire's complex association of dominions a better central focus. Francis's fears of French influence and power were proved correct when Napoleon created the Confederation of the Rhine and pressured Francis into abdicating as Holy Roman Emperor, thus dissolving the empire completely.

After the defeat in 1809 he handed foreign policy to Klemens Graf Metternich, who famously claimed that while he sometimes had Europe in the palm of his hand, he never ran Austria. On Metternich's advice Francis gained time for the empire with the marriage of his daughter Maria Louisa to Napoleon in 1810. Again taking his cue from Metternich, he waited for the right opportunity to renew the war against the French at a time favorable to Austria. This came in late 1813, and by the spring of 1814 Napoleon had been removed from power. The settlement at the Congress of Vienna made Austria stronger and more compact than it had been in 1792 and renewed its power in

Germany by granting it the presidency of the German Confederation.

In the period between the end of the Napoleonic Wars and his death in 1835, Francis worked to oppose the influence of revolutionary thought in Europe. Paying lip service to the somewhat fanciful ideals contained in the Holy Alliance with Russia, which he signed only in deference to Tsar Alexander I, Francis adhered to the policy of repression that Metternich pursued. Consequently, Francis was denounced by European liberals and revolutionaries as a tyrant. He continued to try to avoid the mayhem caused by war and revolution by opposing reform and preferring traditional methods.

Francis did, however, remain popular with his subjects, as the *Landesvater* (father of the country) who cared for but when necessary punished his disobedient children. Seen as a well-meaning ruler and moral man, Francis remained loyal to his subjects in return, although he clearly believed that sovereign authority resided in him, placed there by God. By the time of his death on 2 March 1835, the Austrian government had been rendered almost arthritic by a system that was utterly reliant on the indefatigable industry of one man, a system ill-suited to the increasing complexity of modern methods of government.

### Frederick William II, King (1744–1797)

King of Prussia from the death of Frederick the Great to the French Revolution, Frederick William II introduced a number of important reforms but left his kingdom with a heavy burden of debt. The son of Prince August Wilhelm and nephew of the childless Frederick II “the Great,”

Frederick William became heir to the throne on his father's death in 1758.

Frederick William experienced the outbreak of the Seven Years' War (1756–1763) as a teenager and held his first senior command in the War of the Bavarian Succession (1778–1779). This was one of the few occasions on which his uncle gave him any praise. More often, Frederick had expressed concerns about the crown prince.

It is always difficult to fill the shoes of a great man. On ascending to the throne in 1786, Frederick William initiated the program of reforms, in both the government and the army, that characterized his reign. Most of these were welcomed, and a breath of fresh air passed through a Prussia that had stagnated somewhat in the last years of the great king. These reforms streamlined the administration and improved the soldiers' lot. Frederick William continued the work of codifying Prussia's legal system that his uncle had begun. Officers' pay was improved, and a proper pension system was introduced. Plans were made to improve the army's uniforms and equipment, and conscription regulations were improved. The light infantry introduced by Frederick was expanded. The education of soldiers' children was given more attention. Although much was started, more still needed to be done.

The reforms were interrupted by the outbreak of the French Revolutionary Wars in 1792. Frederick William collaborated with the Austrians in intervening in France, sending an invading force under the Duke of Brunswick. Checked by the cannonade of Valmy on 20 September 1792, this force fell back into Germany. The war continued in the Palatinate and the Rhineland until Frederick William signed a separate treaty with France, the Peace of Basle, in 1795. Although this treaty secured the neutrality of northern Germany, Prussia's policy of participating in the defense of the Holy Roman Empire had now, in effect, ceased. Frederick William's attention was now on Poland.

Under Frederick, Prussia had been elevated from a medium-sized German state to a European great power. What his uncle had achieved mainly by military conquest, Frederick William augmented largely without conflict. The massive territorial gains made in the Second and Third Partitions of Poland (1793 and 1795), however, brought Prussia more problems than benefits, with the vast swaths of underdeveloped countryside swallowing up more resources than they produced.

Frederick William enjoyed life to the full. Very much a womanizer, he divorced his first wife, Princess Elisabeth Christiane Ulrike of Brunswick, in 1769 and married Princess Frederike Luise of Brunswick shortly afterward. Known as "Fat William," he had numerous mistresses and affairs, which did little to improve the image of the monarchy. His first marriage produced his successor, also named

Frederick William. Frederick William II died in 1797, leaving his son with severe financial problems to solve.

### Frederick William III, King (1770–1840)

King of Prussia in the most difficult part of its history, Frederick William III is often characterized as a weak ruler. Despite the collapse of the army and state in 1806, he led Prussia through this difficult period, ending his reign with a state and army stronger than when he began.

As the only son of Frederick William II's first marriage, Frederick William III was brought up knowing he was destined to be king. His first taste of what was to come was in 1792 when he commanded a brigade of the army under the Duke of Brunswick sent to put an end to the French Revolution. The invading force was checked at Valmy on 20 September 1792, and the Prussians withdrew into Germany. Although this was not evident at the time, this action was one of history's turning points. Not only had the French Revolution been saved, it was now going to engulf Germany as well, and Europe was to be at war for a generation.

The crown prince inherited his political legacy of neutrality with France when he ascended the throne in 1797, as well as the debts incurred by his spendthrift father. These problems were to characterize his reign. The reform program begun by Frederick the Great and continued by Frederick William II was not interrupted. Efforts were made to stabilize the country's finances, but it was often the case that the cash was simply not there to pay for necessary changes and for overdue investment. Reformers of the state such as Heinrich Freiherr vom und zum Stein and Karl von Hardenberg pressed for more change, while reformers of the army such as Gerhard von Scharnhorst and August Graf Neidhardt von Gneisenau cried out for more resources. These needs could not be properly satisfied.

Frederick William III pursued his father's policy of neutrality in the wars with France. Not a match for Napoleon's cunning, he allowed Prussia to become isolated. In late 1805 he almost came to the support of Austria and Russia by offering, according to the terms of the Treaty of Potsdam (3 November), his armed mediation between the

King Frederick William III of Prussia. Docile and slow to recognize the growing French threat, his decision for war in 1806 ended in national humiliation. (Unsigned print from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 3)

two sides, but rapid military events, particularly the French occupation of Vienna, made him balk at the prospect of war. With the defeat of the Third Coalition at Austerlitz in December 1805, Napoleon now provoked Prussia into war. Frederick William did not have a firm control over his generals. His army was crushed in two catastrophic defeats, at Jena and Auerstädt, in one day, the remnants were scattered on the retreat, and many fortresses capitulated without firing a shot. Napoleon dictated a peace that plundered and dismembered an already-impooverished Prussia. Left with only half his territory, Frederick William also had to support an army of occupation. Times were hard for all.

He did not support Austria in 1809 despite intensive pressure from his advisers. He walked a thin line between placating Napoleon and preparing for hostilities, and he provided a contingent for the Grande Armée during the invasion of Russia in 1812. Only when he was convinced of Russian support did he declare war against France in March 1813. The mobilization of forces and resources that then took place was unprecedented. In 1815 the Congress of Vienna divested Prussia of much of its Polish territories but compensated with gains in Saxony and western Ger-

many, thereby refocusing future Prussian policy on German affairs.

Frederick William never implemented his promise of transforming Prussia into a constitutional monarchy, but his economic reforms did much to secure a prosperous future.

## French Army

The army that Napoleon inherited from Louis XVI of France and from the early Revolutionary councils was ready-made and had battle experience. What he did with that army was truly remarkable, even more so when it is acknowledged that Napoleon himself was no great innovator. He applied already-established concepts and, by the strength of his own personality, his brilliant leadership, and his understanding of the men he commanded, transformed the defeated army of the Seven Years' War (1756–1763) into an almost invincible force.

Napoleon took command of the (French) Army of Italy on 27 March 1796. He had some 58,000 men who were short of food and clothing and strung out along the coast from Marseilles to near Genoa. His success in this campaign was due to the characteristics mentioned above and to his strategy of hitting at enemy weak points and attacking where he was sure of victory. By 25 April he had defeated Johann Peter Freiherr von Beaulieu's right wing at Dego and Michael Freiherr von Colli's at Mondovi. His campaign continued with the brilliant coup at the Lodi bridge, showing how much he believed in a commander's power to inspire men. His subsequent campaigns all demonstrated the validity of this concept.

One Napoleonic Order of the Day (bulletin to the troops) stated clearly how he thought the French soldier ought to respond to his particular call to arms; he posed it as an individual challenge to each of them: "All men who value life more than the glory of the nation and the esteem of their comrades should not be members of the French Army" (Chandler 1998, 149). His personal appearance at the crucial moment of a battle was profound: the famous
