be some of the most effective of the war. The *Wahoo* was soon the navy's most effective submarine, sinking 16 Japanese vessels totaling 45,000 tons between May and July 1943.

In July 1943, O'Kane was ordered to fit out and take command of the new submarine *Tang*. He commanded the *Tang* throughout her career, implementing and improving on the tactics that he and Morton had previously developed. On 24 October 1944, during her fifth war patrol, while between Taiwan and the Philippines in an attack on a Japanese convoy, one of the *Tang*'s own Mark XVIII torpedoes malfunctioned, circled back, and sank her. Only O'Kane and eight of his crew survived the sinking; they were picked up by Japanese ships. The *Tang* was credited with sinking 24 Japanese ships totaling 93,285 tons.

O'Kane spent the duration of the war in a Japanese prisoner-of-war camp. For the *Tang*'s final patrol, O'Kane was awarded the Medal of Honor. O'Kane remains the highest-scoring submarine commander in U.S. naval history.

In 1949, O'Kane commanded Submarine Division 32. Promoted to captain in 1953, he attended the Naval War College and then commanded Submarine Division 7 at Pearl Harbor. O'Kane held various commands after the war, including the Navy Submarine School at New London and Submarine Squadron 7. O'Kane retired from active duty in 1957 as a rear admiral. He died at Petaluma, California, on 16 February 1994.

O'Kane, Richard Hetherington (1911–1994)

U.S. Navy officer. Born in Dover, New Hampshire, on 2 February 1911, Richard O'Kane graduated from the U.S. Naval Academy in 1934 and began a series of tours aboard cruisers and destroyers. He entered the submarine service in 1938. After duty aboard the minelaying submarine *Argonaut*, O'Kane reported to the submarine *Wahoo* in early 1942. When Lieutenant Commander Dudley W. Morton took command of the *Wahoo* after her second war patrol, O'Kane became her executive officer. Morton and O'Kane then worked closely to develop more aggressive submarine tactics, which proved to

Okinawa, Invasion of (Operation ICEBERG, March–June 1945)

Last major battle of World War II in the Pacific and the largest and most complicated amphibious operation in the theater. Okinawa, the largest of the Ryukyu Islands and only 350 miles from the Japanese home island of Kyushu, had long been regarded as the last stepping-stone before a direct Allied attack on Japan. The island is 60 miles long and at most 18 miles wide. Japan had gained possession of the island in 1875. Japanese leaders considered the defense of Okinawa as their last chance to hold off an invasion of the homeland, and they

A marine of the 1st Marine Division fires on a Japanese sniper with his tommy-gun as a companion ducks for cover. The division was working to take Wand Ridge before the town of Shuri on Okinawa. (Corbis)

were prepared for their forces to battle to the death. Allied strategists decided that a major amphibious operation, code-named *ICEBERG*, would be mounted to take the island to secure harbor and air-base facilities for the projected attack on the Japanese home islands. Taking the island would also sever Japanese communications with south China.

Admiral Raymond Spruance, commander of Fifth Fleet, had overall charge of the invasion operation. The covering force included 18 battleships and 40 carriers in Vice Admiral Marc A. Mitscher's Fast Carrier Force (TF-58) and the British component commanded by Vice Admiral H. B. Rawlings (TF-57, a battleship and four carriers, plus supporting ships, 22 in all). The lifting force of Vice Admiral Richmond K. Turner's Joint Expeditionary Force, TF-51, comprised some 1,300 ships. Operation *ICEBERG* included the largest number of ships involved in a single operation during the entire Pacific war.

The land assault force consisted of U.S. Army Lieutenant General Simon Bolivar Buckner's Tenth Army of some 180,000 men. Tenth Army included Major General Roy S. Geiger's III Marine Amphibious Corps (1st, 2nd, and 6th Divisions) and Army Major General John R. Hodge's XXIV Army Corps (7th, 27th, 77th, and 96th Divisions). The Japanese defenders were formed into the Thirty-Second Army (Ryukus). It comprised four divisions (9th, 24th, 62nd, and the 28th on Sakishima) plus additional units. Lieutenant General Mitsuru Ushijima commanded about 130,000 men, including the 20,000-man Okinawan Home Guard. The Japanese constructed a formidable defensive system, particularly on the southern part of the island.

The invasion was originally scheduled for 1 March 1945, but delays in the Philippines Campaign and at Iwo Jima caused *ICEBERG* to be delayed for several weeks. The operation began with the occupation of the Kerama Islets, 15 miles west of Okinawa,

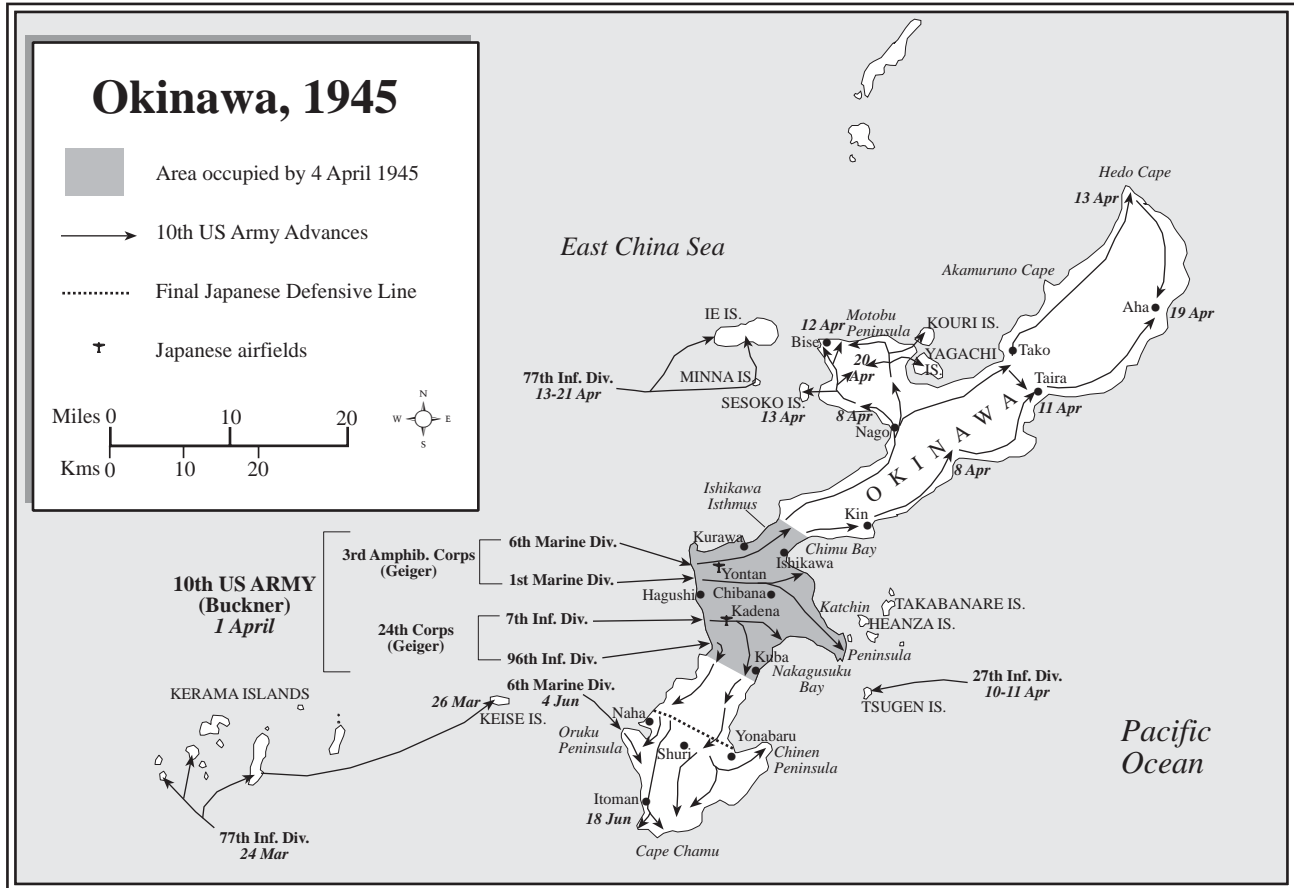

on 16 March 1945. Five days later, a landing was made on Keise-Jima, from which point artillery fire could be brought to bear on Okinawa itself. Then on 1 April, Easter Sunday, the landing began with a feint toward the southeastern shore of the island. The real assault was made by 60,000 U.S. troops landing on the central stretch of Okinawa's west coast. They quickly seized two nearby airfields and advanced east to cut the island's narrow waist. The Marines and Army troops attained most of their initial objectives within four days.

Ushijima had concentrated the bulk of his defenders out of range of Allied naval guns off the beaches and behind the strong Shuri line at the southern end of the island. There, the Japanese planned to inflict as much damage as possible on the invaders, supported by the last units of the Imperial Fleet and kamikaze raids. U.S. forces encountered the Shuri line for the first time on 4 April. They fought for eight days to take a ridge and clear the Japanese from numerous caves. Fighting was intense as the Japanese defended every inch of ground. The 1st Marine Division finally took Shuri Castle on 29 May. The Japanese then withdrew to the south to establish another defensive line at Yaeju Dake and Yazu Dake. Fierce fighting continued until most Japanese resistance had been eliminated by 21 June. During the battle for Okinawa, both com-

manders died within five days of each other; General Buckner died of shrapnel wounds inflicted by Japanese artillery at a forward observation post on 18 June, and General Ushijima committed suicide on 23 June.

While the battle had raged ashore, fighting in the waters around the island was just as intense. Japanese kamikaze attacks reached their highest level of the war as the suicide pilots flung themselves against the Allied fleet. Several thousand pilots immolated themselves against U.S. and British ships, sinking 36 and damaging another 368. The largest kamikaze was the giant battleship *Yamato*, dispatched to Okinawa with sufficient fuel for only a one-way trip. She was to inflict as much damage as possible before being destroyed; the Japanese hoped the *Yamato* might finish off the Allied fleet after the latter had been weakened by kamikaze attacks, then beach her-

The land assault of the U.S. Tenth Army consisted of some 180,000 men against the Japanese Thirty-Second Army of about 130,000 men.

self as a stationary battery. This mission came to naught on 7 April when the *Yamato* was attacked by U.S. carrier aircraft. Hit repeatedly by bombs and torpedoes, she sank long before reaching the invasion site.

Okinawa was officially declared secure on 2 July. Both sides had suffered horrendous casualties. More than 107,000 Japanese and Okinawan military and civilian personnel died. On the U.S. side, the army lost 12,520 dead and 36,631 wounded. The Marines suffered 2,938 dead and 13,708 wounded. The navy lost 4,907 men killed and 4,874 wounded, primarily from kamikaze attacks. The navy was the only service in the battle in which the dead exceeded the wounded. This figure was greater than the navy's casualties in all U.S. wars to that date. The Battle of Okinawa was the costliest battle for the Americans of the Pacific war; this was used to support the case for bringing the war to an end by means other than the invasion of Japan itself and certainly influenced the decision by the United States to use atomic bombs.

Oldendorf, Jesse Bartlett (1887–1974)

U.S. Navy admiral. Born in Riverside, California, on 16 February 1887, Jesse Oldendorf graduated from the U.S. Naval Academy in 1909 as a passed midshipman and was commissioned an ensign two years later. During World War I, Lieutenant Oldendorf served on North Atlantic convoy duty. He next served as engineering officer on a cruiser and aboard a former German transport. A series of shore billets followed. From 1924 to 1927, Oldendorf commanded the destroyer *Decatur*. He then attended both the Army and Navy War Colleges (1928–1930). Following service on the battleship *New York*, Oldendorf served as an instructor at the Naval Academy (1932–1935). He then was executive officer on the battleship *West Virginia*. Promoted to captain in March 1938, he

took command of the heavy cruiser *Houston* the next year. In 1941, he was assigned to the staff of the Naval War College.

Promoted to rear admiral in January 1942, Oldendorf held a series of commands in the Aruba-Curacao and Trinidad sectors of the Caribbean and then commanded a task force in the Atlantic Fleet. In January 1944, Oldendorf was transferred to the Pacific and assumed command of Cruiser Division 4, which supported U.S. operations in the Marshall Islands, against Truk, and in the Mariana Islands and Peleliu. In October 1944, Oldendorf commanded Seventh Fleet's Fire Support Force of six prewar battleships (five of which had been rebuilt following the Japanese attack at Pearl Harbor), four heavy cruisers, four light cruisers, and numerous destroyers and patrol-torpedo (PT) boats, all supporting the U.S. amphibious landing on Leyte Island in the Philippines.

On the night of 24–25 October, Oldendorf positioned his forces in Surigao Strait between Leyte and Mindanao to meet Vice Admiral Nishimura Shoji's Japanese Southern Force, part of the SHO-1 plan to destroy U.S. forces off the landing site. In a classic "crossing the T," Oldendorf placed his battleships across the mouth of the strait to rain shells on Nishimura's ships, which were proceeding in single-file line. At the same time, Oldendorf's destroyers and PT boats lining the strait launched torpedoes from the flanks. Oldendorf's ships also engaged a trailing Japanese force, the Second Diversion Attack Force, which was commanded by Vice Admiral Shima Kiyohide. Oldendorf's ships scored one of the most complete American naval victories of the war—sinking both Japanese battleships, two of four cruisers, and four of eight destroyers without U.S. loss.

Promoted to vice admiral in December 1944, Oldendorf ended the war in command of Battleship Squadron 1 and Battleship Division 4 in support of landings in the Lingayen Gulf, Luzon. After recovering from an injury, he commanded Task Force 95 at Okinawa from June to November 1945.

In November 1945, Oldendorf took charge of the 11th Naval District and San Diego Naval Base. He ended his career in command of the Western Sea Frontier and the "moth-ball" fleet at San Francisco (1947–1948). Oldendorf received promotion to admiral on his retirement from the navy in September 1948. He died at Portsmouth, Virginia, on 27 April 1974.

Ōnishi Takijirō (1891–1945)

Japanese navy admiral. Born in Hyōgo on 2 June 1891, Ōnishi Takijirō graduated from the Naval Academy in 1912. Promoted to ensign in 1913, he studied at the Gunnery School in 1914 and 1915 and was assigned to Yokosuka Naval Station from 1916 to 1918. One of the pioneers of Japanese naval air forces, Ōnishi learned to fly in 1915. He served as Japanese naval attaché in Britain and traveled in Britain and France from 1918 to 1922 to study naval aviation.

In the mid-1920s, Ōnishi served as an instructor in the Kasumigaura Air Training Corps under Captain Yamamoto Isoroku. In the 1930s, he served in various staff and line positions in naval aviation, including heading the Training Section of the Naval Aviation Department. Promoted to rear admiral in 1939, Ōnishi took command of the 2nd Combined Air Corps, which flew shore-based, long-range Mitsubishi G3M ("Nell" in the Allied code system) bombers. Based in Hankow, he commanded strategic bombing operations in the Sino-Japanese War. In early 1941, Ōnishi was appointed chief of staff to Vice Admiral Tsukahara Nishizo, commander of Eleventh Air Fleet, the first entirely shore-based air fleet of this kind.

In January 1941, commander of the Combined Fleet Admiral Yamamoto Isoroku ordered Ōnishi, then regarded as Japan's foremost expert on naval aviation, and Genda Minoru, commander of the naval air group at Yokosuka, to plan an attack by carrierborne aircraft against the U.S. Pacific Fleet base at Pearl Harbor in the Hawaiian Islands. At the outbreak of the Pacific war, the Eleventh Air Fleet based in Taiwan made a decisive contribution to the Japanese military effort by destroying U.S. air power in the Philippines.

Ōnishi then held important administrative posts, including chief of the Naval Aviation Department and deputy chief of the Aerial Weapons Department of the Ministry of Ammunition. In the latter capacity, he had the unenviable task of trying to reconcile navy-army demands for resources in aircraft production.

In October 1944, Ōnishi was appointed commander of the First Air Fleet in the Philippines. Facing a desperate situation, Ōnishi adopted the tactic of suicide air attacks against U.S. warships. On his order, the first kamikaze operation was implemented. Thereafter, Ōnishi commanded kamikaze attacks from the Philippines and then from Taiwan until he was called back to become vice chief of the Navy General Staff in May 1945.

At the end of the war, Ōnishi strongly opposed Japanese acceptance of the Potsdam Declaration. On learning of the sur-

render, he committed ritual suicide in Tokyo on 16 August, leaving behind a statement expressing deep gratitude to those who had sacrificed themselves in kamikaze missions.

Oppenheimer, Julius Robert (1904–1967)

U.S. scientist who helped develop the atomic bomb. Born in New York City on 22 April 1904, Robert Oppenheimer was a gifted and precocious child. Graduating summa cum laude in three years from Harvard University, he did his graduate work at the Cavendish Laboratory in Cambridge and at Göttingen under Max Born. A brilliant dissertation on quantum theory confirmed a vocation and his status as a leading theoretical physicist. In 1929, he accepted joint appointments in physics at the University of California, Berkeley and at Caltech.

Ambitious and possessing an incredibly quick and agile mind, Oppenheimer attracted a coterie of stellar students at Berkeley. A chain smoker with a penchant for martinis, he stood six feet and weighed 125 pounds. Economic depression and the rise of fascism piqued his interest in the Communist Party, and he later married a former party member. Yet his left-leaning political stance failed to deter Brigadier General Leslie R. Groves from recruiting him to lead a centralized laboratory for the construction of atomic bombs. Groves recognized Oppenheimer's genius for science, his extensive connections and ability to recruit talent, and, most important, his improvisational and organizational skills and his determination to prove his patriotism. Overriding objections from army counterintelligence, Groves appointed Oppenheimer in October 1942 to lead the laboratory.

Oppenheimer assembled his initial team of approximately 30 scientists at Los Alamos in April 1943. Because Oppenheimer encouraged a sense of community and open communication, the team overcame seemingly intractable difficulties to produce a working nuclear device in just over

American physicist Julius Robert Oppenheimer, ca. 1940s. (Corbis)

two years. Despite intellectual assertiveness that bordered on arrogance, Oppenheimer proved to be the indispensable man of the MANHATTAN Project. His unqualified success earned him the Presidential Medal of Merit in 1946.

In 1947, Oppenheimer became director of the Institute for Advanced Study at Princeton and chairman of the General Advisory Committee of the Atomic Energy Commission. Initially entranced by the “technically sweet” challenge of building atomic bombs, he later remarked that, with Hiroshima, physicists “have known sin.” His opposition to the hydrogen bomb within the febrile climate of McCarthyism led to hearings in 1954 that stripped him of his security clearance. Rehabilitated by 1963, he received the Enrico Fermi Award. Oppenheimer died at Princeton on 18 February 1967.

Oradour-sur-Glane Massacre (10 June 1944)

German atrocity against French civilians. During World War II, German armed forces—both Wehrmacht and Waffen-Schutzstaffel (Waffen-SS)—committed an untold number of atrocities. Although the vast majority occurred in eastern Europe and the Soviet Union, western Europe witnessed several notorious German war crimes, including the massacre of innocent men, women, and children at Oradour-sur-Glane.

Located 15 miles northwest of Limoges in central France, the small village of Oradour, although it lay within the German zone of occupation from June 1940, managed to escape the horrors of World War II for the better part of four years. This all changed, however, on 10 June 1944, when *Sturmbannführer* Otto Dickmann and troops from the 1st Battalion of the 2nd SS Panzer Division (Das Reich) entered the village, slaughtered its inhabitants, and looted and burned its houses and buildings.

Commanded by *Obersturmbannführer* Heinz Lammerding, Das Reich, one of the original Waffen-SS divisions, had been transferred from the Eastern Front to Montauban in southern France in early 1944. In the immediate aftermath of the Allied Normandy Invasion of 6 June, Das Reich received orders to redeploy to the Normandy Front. As it made its way north, the division came under attack from French Resistance forces and engaged in several firefights. On 9 June, the Resistance captured one of the division’s officers, the popular *Sturmbannführer* Helmut Kampfe. Possibly, the massacre at Oradour was in reprisal for this act.

On entering the village, the panzergrenadiers who made up Das Reich’s 1st Battalion forced the startled residents to assemble in the central square. Separating the men from the women and children, the Germans herded the former into barns and the latter into the village church. They then burned both barns and church, tossing in grenades for good measure and gunning down those who tried to flee. After plundering and setting fire to other buildings, the 1st Battalion withdrew. A total of 642 victims, including 207 children, lay dead. Only 7 villagers (5 men, 1 woman, and a child) managed to escape. Das Reich proceeded to the Normandy Front without encountering further Resistance activity.

At war’s end, French authorities decided to maintain Oradour-sur-Glane as it had been left by the Das Reich Division, transforming the remnants of the village into a national monument. As for the perpetrators, 7 Germans and 14 Alsations were tried by a French military court at Bordeaux in

Burnt corpses of some of the victims of the massacre by the German SS Das Reich Division in Oradour-sur-Glâne. (Hulton-Deutsch Collection/Corbis)

1953. The court found 20 of the defendants guilty and sentenced 2 to death and 18 to imprisonment at hard labor for terms ranging from 5 to 20 years. Amnesties and pardons, however, led to all 20 being freed within 5 years.

ther punishment, it also removed their families from ration lists. Many Red Army soldiers were captured through no fault of their own for lack of ammunition or because they had been surrounded. Leading figures such as General Georgii Zhukov pointed out the negative effect this would have on morale, but Stalin insisted on carrying out Order 270. It was first employed against Lieutenant General A. I. Eremenko, who retreated with his men east from the Bryansk Front in late August 1941. This order was followed by Order 0064, which ordered execution for those “who did not do their duty” (i.e., retreat, surrender) and Order 227, which insisted that the Red Army take “not one step further back.”

Read to every Soviet soldier, since many were illiterate, these measures were bitterly resented by leaders such as Zhukov, who not only realized the real situations in which Soviet soldiers had been forced to surrender, but who also believed that both Stalin and Foreign Minister Vyacheslav Molotov had collaborated with the Germans themselves in the 23 August 1939 nonaggression pact with Germany. Despite wide knowledge of these orders within the Soviet Union, the documents concerning them were not made public officially until Soviet leader Mikhail Gorbachev was in power, nearly 50 years after the war.

Ōshima Hiroshi (1886–1975)

Japanese soldier and diplomat who unknowingly served the western allies in World War II as a chief source of intelligence. Born in Gifu Prefecture, Japan, on 19 April 1886, Ōshima Hiroshi came from a prominent family well known for its distinguished service to the Japanese emperor and its admiration of Germany. Following graduation from the Military Academy in 1905, Ōshima rose steadily in rank and assignment. As a major in the early 1920s, he served as an attaché in the Japanese legations in Germany, Austria, and Hungary. He was singularly unimpressed by these war-torn European societies and, in particular, detested the struggling democratic Weimar Republic.

The 1930s provided unique opportunities for Ōshima. Not long after the National Socialists and Adolf Hitler came to power in Germany, Colonel Ōshima, largely through the influence of militarists and pro-Axis elements in the Japanese government, was appointed senior military attaché in the Imperial Japanese Embassy in Berlin. Ōshima was at once both comfortable and effective in his new post. Speaking nearly flawless German, he wholeheartedly approved of the Nationalist Socialist movement. Thus, with the aid of political and military contacts in both Tokyo and Berlin, Ōshima soon gained direct access to the upper echelons of the government and met privately with Hitler for the first time in the autumn of 1935. Through a great deal of intrigue and maneuvering, Ōshima progressed from the rank of colonel and position of attaché in 1934 to lieutenant general and ambassador in 1938.

The rabidly anticommunist Ōshima worked hard to conclude the 1936 Anti-Comintern Pact, which would culminate in the Tripartite Pact of Germany, Italy, and Japan in 1940. However, Hitler's rush to war in September 1939 weakened and temporarily discredited Ōshima's plans, thus triggering his recall by the Tokyo government not long after the German invasion of Poland.

The Japanese government was impressed by the successes of German armed forces, first in Poland and then the next year in Denmark, Norway, the Benelux countries, and France. As a result, Ōshima was reappointed ambassador to Germany. Hitler was delighted to receive Ōshima in February 1941. Certainly Ōshima was excited by the exuberance of a victorious Nazi Germany. He and Hitler widely agreed on political and military matters in their numerous meetings, and Ōshima became something of a Hitler confidante.

By this time, however, the U.S. Army Signal Intelligence Service (SIS) had solved the most sophisticated of Japanese diplomatic ciphers, known to it as Purple. The circle was complete: Hitler and his senior assistants confided their

Adolf Hitler receives Ambassador Ōshima's credentials in the Berghof while Joachim von Ribbentrop looks on, 27 February 1941. (Photo courtesy of Carl Boyd/National Archives)

strategic intentions and military thinking to Ōshima, who reported to Tokyo by the supposedly secret high-grade Japanese diplomatic cipher, but his reports (more than 2,000 of them) were quietly intercepted, deciphered, and translated. Soon these reports were on the desks of President Franklin D. Roosevelt and Prime Minister Winston L. S. Churchill and their senior intelligence staffs. U.S. Army Chief of Staff General George C. Marshall regarded Ōshima's reports as his main basis of information for unmasking Hitler's intentions in Europe.

Ōshima escaped from Berlin in April 1945, soon to surrender in the Alps to U.S. forces. In July, he was interned in the United States until the Japanese government surrendered. Afterward, he was taken to Japan, where he was indicted and tried as a war criminal at the International Military Tribunal for the Far East. Found guilty of overall conspiracy against peace on 12 November 1948, he was sentenced to life imprisonment. However, in December 1955, Ōshima was paroled from prison. He was granted clemency in April 1958.

Hiroshi Ōshima died in Chigasaki, Japan, on 6 June 1975, shortly before SIS successes in solving Japanese World War II ciphers were declassified and the reports made available to archival researchers. Thus, Ōshima died still unaware that, throughout his wartime assignment, his Berlin mail and Tokyo replies were read in Washington and London.

OVERLORD, Operation (Planning)

Operation OVERLORD, the invasion of Normandy, France, on 6 June 1944, was the Western Allies' greatest operation of World War II and the finest hour of Anglo-American cooperation. Only the United States and the British Empire could have successfully undertaken the largest and most dangerous amphibious assault in history. The operation was so complicated that U.S. Army Chief of Staff General George C. Marshall said it "almost defies description." The Allies assembled 2 million troops of numerous nationalities, nearly 5,000 ships, and 11,000 aircraft without the Germans knowing where or when the invasion would take place.

British Prime Minister Winston L. S. Churchill, already thinking offensively shortly after the evacuation of the British Expeditionary Force from Dunkerque in May–June 1940, established the Office of Combined Operations to plan raids on

Nazi-occupied Europe. A cross-Channel invasion became likely after the December 1941–January 1942 ARCADIA Conference in Washington, which reaffirmed British-U.S. determination to defeat Germany first. General Marshall flew to Britain in April to propose an early opening of the second front (code-named SLEDGEHAMMER), and although he returned to Washington in the belief that an invasion of the Continent would take place within a year, the British sent Vice Admiral Lord Louis Mountbatten, head of Combined Operations, to Washington in June to tell the Americans that a cross-Channel invasion was not possible in 1942. This was confirmed in the disastrous Allied Dieppe raid of 19 August 1942.

At the January 1943 Casablanca Conference, where U.S. President Franklin D. Roosevelt and Churchill agreed to exploit Allied success in North Africa, they also stipulated that preparations for a cross-Channel attack should continue. Shortly after Casablanca, General Frederick E. Morgan was appointed chief of staff to the Supreme Allied Commander (designated COSSAC), and a small Anglo-American planning group began work in Norfolk House, St. James's Square, London, on what would become the greatest military operation in history. Its objective was to mount an invasion with a target date of 1 May 1944 "to secure a lodgment on the Continent from which further offensive operations can be carried out."

By the end of July 1943, the Anglo-American COS-SAC staff had produced a 113-page plan for OVERLORD. Limited by a lack of amphibious landing craft, the initial plan called for a three-division assault along a 30-mile front. After a weekend conference at Largs in Scotland, planners selected the Normandy coast as offering the best chance for success. An invasion there would be most likely to surprise the Germans, who would expect the invasion to occur in the closed point to Britain, the Pas de Calais, and who concentrated their defenses on that stretch of the French coast. Normandy was within the maximum range of Allied air cover. The Allies hoped that it would result in early capture of the port of Cherbourg. The disastrous failure of the Dieppe raid, in which the attacking Canadians suffered 60 percent casualties, appeared to rule out a direct attempt to seize a major port. The Allied answer was to build, to tow across the Channel, and to assemble their own artificial harbors, known as Mulberries.

The Allies assembled 2 million troops of numerous nationalities for OPERATION OVERLORD without the Germans knowing where or when the invasion would take place.

U.S. soldiers reach the shore during D day on the Normandy coast, 6 June 1944. (Bettmann/Corbis)

COSSAC planners examined meticulously the requirements necessary for successful invasion. These included such variables as weather, tide and moon conditions, and sand on the landing-site beaches. All were designed to produce a solution to the ultimate question of where and how a cross-Channel invasion could be launched.

An essential part of planning for OVERLORD included an elaborate deception plan, the largest of the war by either side. Originally the brainchild of COSSAC staff, the operation, code-named FORTITUDE, involved a massive effort to deceive Germany about the date and place of the invasion. It saw the “creation” of a nonexistent U.S. army to mislead the Germans into believing that the Normandy landings were merely a feint and that the main landing would be under the command of Lieutenant General George S. Patton in the Pas de Calais. The ruse reinforced the already existing German conviction that the main landing would indeed take place in that part of France closest to Britain. Another part of FORTITUDE was to draw off resources from France by convincing the Germans

that the Allies also intended to invade Norway. Both aspects of FORTITUDE worked to perfection.

On 6 December 1943, Roosevelt named General Dwight D. Eisenhower as Commander of Supreme Headquarters, Allied Expeditionary Forces (SHAEF), which replaced COSSAC. Morgan continued on as deputy chief of staff, SHAEF. Both Eisenhower and British General Bernard L. Montgomery, who was designated ground forces commander for D day, argued for a month’s delay of the invasion until June in order to obtain another month’s production of the critically important landing craft. Acquisition of these was necessary to increase from three to five the number of divisions in the initial assault. The delay would also allow increasing the number of airborne divisions to protect the flanks of the 50-mile beachhead from two to three. Churchill opined that the invasion “seemed to be tied up in some god-damned things called LSTs [landing ship tank].”

The scale of preparations for OVERLORD was staggering. In the four months before D day, plans poured forth from

SHAEF and Allied armies. The First U.S. Army, in association with the Western Naval Task Force and the Ninth Tactical Air Force, planned the landings on Omaha and Utah Beaches. The Second British Army, in association with the Eastern Naval Task Force and the British Second Tactical Air Force, planned the landings on Sword, Juno, and Gold Beaches. The Ninth Air Force's plan for the invasion alone ran 847,500 words in 1,376 pages and weighed more than 10 pounds.

By June 1944, there were 1,536,965 U.S. troops in Britain. Stockpiles of equipment for the invasion came to 2.5 tons and included everything from artillery and bulldozers to dental chairs and tanks. Wags remarked that only the barrage balloons overhead kept the British Isles from sinking under the weight of men and equipment. Administrators required each unit landing in France to carry a 30-day supply of blank forms and stationery. Approximately 7 million tons of oil were stored in the United Kingdom.

On the eve of D day, 2,700 vessels (not counting the 1,897 smaller landing craft carried in the landing ships) were steaming toward Normandy. No fewer than 195,000 sailors manned the invasion fleet, carrying 130,000 troops, 12,000 vehicles, 2,000 tanks, and nearly 10,000 tons of stores. Overhead, thousands of Allied fighters provided a protective umbrella for the invasion force.

Fortunately, OVERLORD planners had the invasions of North Africa, Sicily, and Italy, as well as amphibious operations in the Pacific, as guides for their D day planning. Allied planning for OVERLORD, based on honest debate, cooperation, and teamwork, laid the groundwork for the massive defeat of the German army in the Battle of Normandy.

Ozawa Jisaburo (1886–1966)

Japanese navy admiral. Born in Miyazaki Prefecture on 2 October 1886, Ozawa Jisaburo graduated from the Naval Academy in 1909. While he was young officer, Ozawa served as a torpedo officer on several ships and as instructor at the Torpedo School. He served in destroyers from 1918 to 1921. Promoted to lieutenant commander in 1921, he graduated from the Naval War College the same year. He commanded destroyers in 1924 and 1925 and then was assigned to the staff of the Grand Fleet as a specialist in torpedo tactics. Promoted to commander in 1926, he was an instructor at the Torpedo School and also traveled in Europe and the United States for nine months.

Promoted to captain in 1930, Ozawa commanded a destroyer division in 1930 and 1931, and next he was an instructor of tactics at the Naval War College. In 1934 and 1935 he commanded first the cruiser *Maya* and then the battleship *Haruna*. He was promoted to rear admiral in 1936, and in 1937 Ozawa was assigned as chief of staff of the Combined Fleet. He next commanded the 8th Cruiser Squadron and the 3rd Battleship Squadron, served as superintendent of the Torpedo School (1938), and commanded the 1st Fleet Air Group (1939).

Overview of World War II

See page 15.

Despite his lack of expertise in this area, Ozawa was a forceful advocate for naval aviation. Promoted to vice admiral in 1940, Ozawa was appointed superintendent of the Naval War College in September 1941. In 1941, he assumed command of the Southern Expeditionary Fleet. On the outbreak of the Pacific war, from December 1941 to March 1942 his fleet supported the Japanese invasions of Malaya and the Netherlands East Indies. He also conducted a successful commerce raiding operation into the Indian Ocean during March and April 1942.

In November 1942, Ozawa took command of the Third Fleet, and in March 1944 he commanded the 1st Mobile Force (Carrier Force), which incorporated all remaining Japanese aircraft carriers. Ozawa suffered disastrous defeats in the June 1944 Battle of the Philippine Sea (Operation A-GO) and in the October 1944 Battle of Leyte Gulf (Operation SHO-1). In the latter, Ozawa's mission was to serve as bait, his carriers luring Admiral William F. Halsey's Third Fleet north in order to leave the U.S. landing site in Leyte Gulf undefended. In the battle, Ozawa's force suffered heavy losses, although he himself is remembered in Japanese naval history as a brave and

capable commander and one of the leading exponents of naval aviation.

From November 1944, Ozawa was simultaneously vice chief of the Naval General Staff and president of the Naval Staff College. In May 1945, when Toyoda Soemu assumed the office of chief of staff of the navy, Ozawa became the last commander of the Combined Fleet. Ozawa died in Tokyo on 9 November 1966.

Palatinate Campaign (March 1945)

Defeat by the western Allies of German forces west of the Rhine River. When German forces retreated from the West Wall (known to the Allies as the Siegfried Line) in February and March 1945, there were insufficient fortified positions between them and the Rhine. In spite of this fact, German commander in chief West Field Marshal Albert Kesselring insisted on the principle of no retreat unless absolutely necessary. Thus, the Germans were driven back to the river by the advancing Allied armies at a considerable cost to both the attacking and defending forces in terms of men and matériel.

In early March, Allied commanders carefully studied the area then known as the Palatinate (Pfalz) as they consolidated their victories in the adjoining Rhineland and pummeled the West Wall in and around the Saarland. On 17 March, Supreme Allied Commander General Dwight D. Eisenhower decided to permit Lieutenant General George S. Patton's Third U.S. Army to attack southeastward toward Kaiserslautern and the Rhine from the direction of Trier. Simultaneously, Lieutenant General Courtney Hodges's First U.S. Army, on Patton's left (northern) flank in the Rhineland, was spreading out from the initial bridgehead at Remagen. Patton's line of advance was to go deep and cut across the axis of attack by Lieutenant General Alexander Patch's Seventh U.S.

Army, which was on Patton's right and was still slugging its way through the West Wall but was headed northeastward, also toward Kaiserslautern. Patton was to cut off the Germans being driven backward by Patch before they could flee across the Rhine. The First French Army, under General Jean de Lattre de Tassigny, yet farther south, was on Patch's right flank and likewise was attacking northeastward toward Speyer and the Rhine from the Saar and Strasbourg regions.

From 17 March to 24 March, the Germans fought a desperate delaying action while the western Allies marched inexorably onward. General Herman Foertsch's First German Army, along with portions of General Erich Brandenburger's Seventh German Army, bore the brunt of the Allied two-pronged attack. The Third U.S. Army cut a swath of territory several miles wide across the northern half of the Palatinate and the southern Rhineland all the way to the Rhine. At the same time, the Seventh U.S. Army and the First French Army pushed through the West Wall and then chased the shattered defenders from their improvised fallback positions.

In these circumstances, large numbers of German soldiers discarded their uniforms and donned whatever civilian clothing they could find in an effort to escape. German officials directed the evacuation of the civilian population to the degree possible. Policemen and firemen disappeared too, as did the civilian officials themselves along with their incriminating Nazi files. German cities fell in rapid succession. Bad Kreuznach and Bingen capitulated on 18 March. Worms fell into American hands on 19 March, and the same fate befell Zweibrücken, Mainz, Idar-Oberstein, and Kaiserslautern on 20 March.

As the situation developed, the only possible escape route for the Germans was through the heavily forested Haardt

Allied forces crossing the Rhine River at Remagen, March 1945. (Corbis)

Mountains (Pfaelzer Forest) south of Kaiserslautern. However, that route had limited roads and trails, which soon were either blocked or covered by the pursuing American ground and air forces. Landau, Neustadt, Germersheim, and Doerrenbach surrendered on 22 March. Bergzabern surrendered on 23 March and Speyer and Leimersheim did likewise on 24 March.

Only mopping-up operations remained by 25 March. Many German cities were badly damaged in the fighting. Bad Kreuznach, Kaiserslautern, and Ludwigshafen were more than 25 percent destroyed. Pirmasens and Worms lost at least 50 percent of their structures, and in Mainz and Zweibrücken more than 75 percent of the buildings were reduced to rubble.

The Palatinate Campaign featured elaborate, well-coordinated offensive maneuvers by the various U.S. land and air forces and the First French Army. German forces, on the other hand, managed an improvised, stubborn delaying action until the very end in the face of overwhelming odds. Because military operations did not follow Germany's internal political boundaries, it is difficult to assign casualties on either side to spe-

cific geographic areas. However, in the combined Rhineland-Palatinate Campaign, there were 20,000 American and 60,000 German military dead and wounded. Additionally, the Americans captured 250,000 German prisoners of war. By the end of March, the victorious combat forces were headed eastward at high speed, and U.S. Military Government detachments were left in charge throughout the Palatinate.

Papagos, Alexandros (1883–1955)

Greek army general and political leader. Born on 9 December 1883 in Athens, Alexandros Papagos attended military academies in Athens and Brussels, Belgium, and was commissioned in the army in 1906. He fought in the 1912–1913 Balkan Wars and served in Anatolia in the 1919–1922 Greco-Turkish War, commanding first a battalion and then a regiment. Promoted to major general in 1927 and to lieutenant general in 1934, in 1935 Papagos became minister of war. The next year, he became army chief of staff under General Ioannis Metaxas when the latter seized power and became dictator.

Papagos took command of the Greek army in September 1940 and prepared Greek forces for the anticipated Italian invasion of Greece, which began on 28 October 1940. Under the leadership of Papagos, Greek forces halted the Italian invasion and then assumed the offensive. Papagos adroitly confined Greek military operations to the mountain areas, where the Italians could not exploit their technological advantage. Papagos's forces defeated the Italian Ninth Army and then invaded Italian-held Albania. He halted another Italian offensive in March 1941. Following the German invasion beginning on 6 April 1941, Greek forces fought bravely, but Papagos was slow to withdraw them to the Aliakmon Line; he could not halt Field Marshal Wilhelm List's Twelfth Army, even with British assistance. Taken prisoner, Papagos was sent to Germany and imprisoned at Dachau.

Papagos was released by U.S. troops in 1945 and returned to Greece. Recalled to active duty in 1947, he was promoted to the rank of general and reappointed commander in chief of the army in January 1948. Papagos used American aid to defeat communist insurgents in the ensuing civil war. Hailed as the savior of democratic Greece, Papagos was advanced to the rank of field marshal in October 1949.

Papagos resigned his military posts in May 1951. He then formed the conservative Greek Rally Party, which he led to victory in the November 1952 elections. As prime minister, Papagos strengthened ties with the West, improved the Greek economy, and signed an alliance with Yugoslavia and Turkey in August 1954. Greece's greatest soldier of modern times and one of its most adroit political leaders died in office in Athens on 4 October 1955.

Papuan Campaign (July 1942–January 1943)

Important Pacific Theater land campaign and U.S. General Douglas MacArthur's first victory. Papua was Australian-controlled territory in the southeastern corner of the island of New Guinea. On 8 March 1942, the Japanese moved into New Guinea, occupying Lae and Salamaua. Engaged in their Philippines and Burma Campaigns, the Japanese did not advance on Papua. Instead they subjected its capital, Port Moresby, to air attack. Having lost their 8th Division defending Singapore and the Netherlands East Indies, the Australians were alarmed by these events. While veteran Australian troops were fighting in Egypt, their homeland was being defended only by militia, obsolete planes, and a few ships.

On 17 March 1942, General MacArthur reached Australia from the Philippines. He found he had insufficient forces to

Troop Casualties, Papuan Campaign

defend his new command and none to spare for the relief of the Philippines. MacArthur's appointment as Southwest Pacific Area commander reassured the Australian government that U.S. aid would be forthcoming. Australia was already withdrawing two divisions from the Middle East. The 6th Division arrived during March, and the 7th Division returned in April. On 6 April, the U.S. 41st Division reached Australia, followed by the U.S. 32nd Division by 14 May. The Royal Australian Air Force reequipped while the U.S. Fifth Air Force formed in Australia. The U.S. Navy could spare few ships for MacArthur, however.

To isolate Australia from further reinforcements, the Japanese navy tried to seize Port Moresby. But during the 4–8 May 1942 Battle of the Coral Sea, the Japanese suffered their first major naval defeat. The loss of four of their aircraft carriers in the next large naval engagement, the 4–6 June Battle of Midway, prevented the Japanese navy from attacking Port Moresby again. Subsequently, the Japanese initiated plans for an overland strike against the port.

Anticipating this Japanese move, MacArthur sent U.S. engineers and Australian troops to Milne Bay to construct a strategic airfield on Papua's eastern tip. He also ordered two Australian militia battalions, code-named Maroubra Force, to Buna, a possible north-coast landing site. Commanded by Colonel Bill Owen, Maroubra Force began its march on 7 July 1942 along the narrow track called the Kokoda Trail across the formidable Owen Stanley Mountain Range separating Port Moresby from Buna.

Maroubra Force was spread along the track when Colonel Yokoyama Yosuke's 2,000 Japanese troops of the 144th Regiment invaded Buna and Gona on 21 July. Two days later, Yokoyama attacked Owen's vanguard at Awala. A Papuan battalion fled into the jungle. B Company of the 39th Battalion

retreated to Oivi. Encircled on 27 July, the Australians withdrew through the jungle around Kokoda Airfield, regrouping at Deniki.

Between 28 July and 10 August, the Australians fought desperately. Kokoda was retaken twice, but Owen was among those killed. The Japanese had superior numbers and drove the Australians back to Deniki. They lost that place on 14 August and retreated to Isurava. On 29 July, Allied aircraft damaged the Japanese transport *Ayatozan Maru*, but Major General Horii Tomitoro and 11,450 reinforcements reached Buna by 21 August. American landings at Guadalcanal on 7 August, however, increasingly diverted Japanese resources there.

Concerned over the Japanese progress, MacArthur ordered the 7th Australian Division to Papua on 3 August. Its 18th Brigade went to Milne Bay, and the 21st Brigade started up the Kokoda Track on 18 August. As few transport planes were available, Papuan carriers delivered supplies.

On 25 August, the Japanese invaded Milne Bay as a flanking move against Port Moresby. Allied aircraft sank some barges at Goodenough Island, stranding some Japanese. Their main force landed at Ahioma, however; spearheaded by two tanks, it drove the Australian forward units back toward the vital airfield. Japanese reinforcements arrived on 29 August. On 31 August, the Australians defeated the Japanese attacks across the airfield. By 7 September, the Japanese had evacuated 1,300 survivors. It was their first land defeat of the war.

At Isurava, the exhausted 39th Australian Battalion was joined on 25 August by the 21st Brigade's lead battalion. Fresh Japanese troops supported by artillery attacked the next day. For four days, a crucial battle raged. Outflanked and then pursued by the Japanese, the Australians destroyed Myola supply dump and prepared to defend Efogi. Delivering reinforcements to Gona on 2 September, the Japanese attacked with 5,000 troops on 8 September. The exhausted, hungry, and malarial Australians retreated to Ioribaiwa Ridge on 11 September.

Reinforced by two battalions of the 25th Brigade, the Australians counterattacked. Defeated, they withdrew to Imita, the last ridge before Port Moresby, on 17 September. Horii's troops, suffering from disease and starvation, were preparing to attack Imita when, on 25 September, the Japanese High Command made Guadalcanal its priority and ordered Horii to retreat. Two days later, Australian patrols found Ioribaiwa abandoned. The Australians then began the pursuit.

Horii's fighting withdrawal held the Australians for a week at Eora. On 2 November, Australian troops entered Kokoda. At Oivi on 10 November, the Australians drove the Japanese from the track, and Horii drowned crossing the Kumusi River. Few of his soldiers reached Buna, which was garrisoned by Japanese marines and base troops.

In late September, MacArthur ordered Major General Edwin Harding's 32nd Division to Papua. MacArthur wanted

Belts of ammunition hang over branches in the jungle of New Guinea as American soldiers carry cases of cartridges up to the front line for offensive operations against Japanese in the Buna area, ca. 1942. (Hulton-Deutsch Collection/Corbis)

his Americans to use the Kapa Kapa Track to take Buna from the rear. From 6 October their vanguard Mendendorp Force spent two harrowing weeks crossing the mountains. Luckily, airfield sites were discovered on the north coast that enabled an airlift in of the remaining Americans.

On 17 November, the Japanese landed 1,000 reinforcements, who moved into the formidable Buna and Gona defenses. These comprised a system of concealed log bunkers with cleared fields of fire covered by artillery and machine guns. Commencing on 19 November, Allied attacks on Buna and Gona stalled before these bunkers. Dissatisfied, MacArthur replaced Harding with Lieutenant General Robert Eichelberger, who was told to “take Buna or die.” Allied aircraft stopped four Japanese supply convoys reaching Buna, but 500 reinforcements landed on 2 December and another 800 arrived on 14 December.

Misunderstanding the terrible conditions in Papua, MacArthur decided not to bypass the starving Japanese. A bloody battle of attrition followed. Artillery and aircraft could

not neutralize the bunkers, so tanks were used instead. The Australians finally took Gona on 9 December. The American Warren and Urbana Forces next invested Buna, which fell on 2 January. Japanese resistance continued at Sanadanda until 18 January.

In the Papuan Campaign, the Australians lost 2,165 dead and 3,533 wounded; the Americans sustained 930 American dead and 1,918 wounded; and the Japanese suffered 12,000 dead and 2,000 wounded.

Parachute Infantry

Development of troop-carrying aircraft before and during the war allowed for the deployment of parachute infantry in cohesive units behind enemy lines to secure key objectives or to act in a reinforcing role. Noting that artillery observers used parachutes to escape from damaged balloons in World War I, American Colonel Billy Mitchell envisaged parachuting infantry as an airborne assault force to break the stalemate of trench warfare. Mitchell suggested assigning the 1st Infantry Division in an air assault role to be carried to drop zones behind enemy lines by aircraft. Friendly aircraft would then provide subsequent air support. The war ended before the plan could be implemented.

The Soviet Union was the first to carry out extensive experiments with parachute troops. Beginning in 1922, Soviet troops were dropped successfully from aircraft. The Soviet Union made extensive progress by encouraging parachuting and gliding as national sports. Paratroopers captured a corps commander during a 1930 training exercise. By 1936, there were 115 parachute training schools in the Soviet Union at which civilians made 1.6 million jumps from towers and 30,000 jumps from aircraft. During a 1936 exercise, a group of 1,500 infantrymen parachuted onto an “enemy-held” airport, securing it before being reinforced by air-landed, then armored, forces. Although foreign military observers were greatly impressed, apathy on the part of western governments precluded an equivalent effort in these states.

In 1927, Italy adopted the Salvator parachute. Unlike aircraft seat-mounted, ripcord-operated parachutes, the Salvator was carried on the individual’s back and connected to the aircraft by a static line. Beginning in 1938, Italy trained two battalions in military parachuting. This force was expanded during the war and made several operational drops. The Italians adopted the German parachute as their standard because the Salvator led to too many injuries.

Germany was the first to effectively use airborne troops in battle. Through its secret military agreements with the Soviets, German advisers attached to the Red Army took note of Red Army experiments, although the concept of parachute troops lagged until Adolf Hitler came to power. Large numbers of highly trained paratroops deploying rapidly behind enemy lines, or smaller groups seizing key objectives, proved

ideal for the new practice of blitzkrieg. Because Germany was surrounded by numerous linear defensive works, such as the Maginot Line, it encouraged the evolution of the concept of vertical envelopment. To that end, a Major Immanns, with 15 officers and 70 soldiers, established a parachute training school in Stendal, Bavaria, in 1936. Political infighting dogged early training. The army wanted a battalion for rapid reinforcement; the air force desired troops for demolition tasks where air defense was too hazardous for bombers; and the Schutzstaffel (SS) sent a platoon to be trained without any specific rationale. Even the Nazi political arm, the Sturmabteilung (SA), wanted two battalions: one parachute and one that would be air-landed.

On 4 July 1938, Colonel (soon Generalmajor [U.S. equiv. brigadier general]) Kurt Student was ordered to fuse this disparate group into an airborne division by 1 September. Student subsequently created the 7th Flieger Division of nine battalions: two parachute and seven air-landed. In all, there were 9,000 troops (minus aircrew). Despite having components stripped away that winter, by September 1939 Student rebuilt an airborne force of one parachute division (the Luftwaffe’s 7th Flieger Division) and one air-landing division (the German Army’s 22nd Infantry Division).

The effectiveness of this new form of waging war was demonstrated with the invasion of both Norway and Denmark on 9 April 1940. Incredibly, four objectives in two separate countries were assigned to only the 1st Parachute Battalion. Despite high winds, low cloud, and confusing orders, paratroopers of this single battalion occupied Norway’s Forneblu Airfield (Oslo) and Sola Airfield (Stavanger), Denmark’s Aalborg Airfield, and the Vordingborg Bridge to Copenhagen. German airborne forces subsequently secured bridges and routes across the Netherlands and the Belgian frontier in May 1940 on the occasion of Germany’s invasion of France and the Low Countries. Although the Scandinavian operations had alerted the west to German capabilities, innovative techniques carried the day. These included attacking Eben Emael fortress by glider troops and securing a Rotterdam bridge by landing at its abutments in seaplanes.

That winter, the airborne army expanded into XI Flieger Corps, adding supporting elements such as signals, medical and supply battalions, an assault engineer regiment, and a squadron of reconnaissance aircraft. In April 1941, the paratroopers headed south, where they contributed to victory in Greece by blocking the British retreat across the Corinth Canal.

In late May 1941, German forces carried out an airborne invasion of Crete. It was a close-fought battle, and many of the air-landing troops were killed when their gliders broke up on the rocky objectives. Through ULTRA intercepts, the Allied defenders were aware of the German landing sites and planned accordingly. Although British and Commonwealth

German parachute troops dropping on the island of Crete, June 1941. (Bettmann/Corbis)

troops were defeated and driven from Crete, the operation cost the paratroopers some 5,000 dead and 2,500 wounded of an attacking force of 22,000. Adolf Hitler then decided that the days of paratroopers were over, and the German units became elite infantry during the rest of the war.

Early discussions between the Japanese and the Germans ensured that Japan was also aware of the potential of airborne troops. Japanese parachute training extended over a 6-month period and produced very few graduates. With the arrival of German instructors, the courses were shortened to approximately 8 weeks, with slight variations between the army and navy schools. By late 1941, 100 German instructors were guiding the instruction of more than 14,000 men in 9 training centers. The army's airborne forces were contained in a 5,575-member all-ranks Raiding Group, consisting of a Raiding Flying Brigade with directly assigned aircraft and a Raiding Brigade of 2 parachute battalions, support elements, and 2 never-manned glider battalions. Assigning the aircraft directly avoided the problems experienced by some other

armies, in which the airborne forces were members of the army and the aircraft belonged to the air force. This Raiding Group spent most of the war held on home-islands reserve. A second, smaller Raiding Brigade was established to provide troops for operations in China.

The Japanese navy created two special naval landing forces, each with a strength of 844 officers and men. Early naval paratroop operations all met with success, but at varying costs. The 1st Yokosuka Special Naval Landing Force secured Menado Airfield on the Celebes on 11 January 1942. The paratroopers were scattered, suffered losses, and required reinforcements. Fortunately for them, the Japanese had air superiority. Three days later, however, because of the distance to the targeted oil fields at Palembang (Sumatra), there was inadequate air support, and the daytime preparatory bombing served merely to alert the defenders. With the Japanese approach route directly over several anti-aircraft units, the drop was scattered. The oil fields were captured the next day with the aid of a reinforcing parachute drop.

Having learned Japanese operating procedures, the Allies began countering the weaker airborne forces. Thus, the Japanese airborne assault on Timor on 21 February 1942 commenced with a feint assault by paratroops several miles from the actual objective's drop zones. With the Dutch defenders reacting to the deceptive attack, the main body of paratroops easily secured and held the Allied communications lines until follow-on amphibious forces overran the island. Although the Japanese did conduct several additional parachute operations during the war, these tended to be smaller-scale missions. The initiative passed to the Allied forces.

The Allied response to early parachute experiments was varied, although the underlying theme was usually neglect or hostility. The French, for example, began training airborne troops in 1937, but France's army was defeated before the troops could be used. On 21 June 1940, the British established the Central Landing School in Ringway to develop expertise in glider and parachute operations the day before Prime Minister Winston L. S. Churchill made his noteworthy call for the formation of a corps of at least 5,000 parachute troops. Not until October 1941, however, was Major General Frederick Browning ordered to form the 1st Airborne Division; a second, the 6th Airborne Division, was authorized in April 1943.

A common problem for fledgling paratroopers was a lack of support in the form of aircraft and doctrine. British airborne forces, however, faced special impediments, given the concentration of resources in home defense. At first, the British used obsolete bombers; the paratroopers jumped either from a platform where the tail turret was previously or through a hole cut in the aircraft's floor. The arrival of American Dakota aircraft by 1942 led to changes in many of the British techniques. By 1945, Britain fielded two airborne divisions, each consisting of two parachute brigades and an air-landing (glider) brigade.

As noted, the Soviet Union had been a leader in parachute operations, but during the war Soviet airborne forces usually dropped onto territory they already held or into partisan-prepared drop zones. Such missions stiffened partisan morale and reinforced ground troops already in location. This policy seems to have resulted from a disastrous three-brigade paratroop operation in June 1942 wherein the Germans eliminated the Soviet force.

The United States experimented with military parachuting on a small scale in the late 1920s, but the army largely ignored military parachuting until the German successes early in World War II. In August 1940, a test platoon of volunteers made a mass jump, and the next month the chief of infantry authorized the establishment of the 501st Parachute Battalion. Army chief of staff General George C. Marshall was profoundly impressed by the German success in Crete. Convinced that the concept of "vertical envelopment" was here to stay, he then initiated plans to field substantial American airborne forces.

With the subsequent expansion of airborne forces, the four American battalions established by February 1942 (501st, 502nd, 503rd, 504th) each became Parachute Infantry Regiments (PIRs) comprising three subordinate battalions.

The expansion also reinforced the requirement for higher command elements. The 82nd Infantry Division divided, becoming the 82nd Airborne Division and the 101st Airborne Division, each equipped with two parachute regiments and one glider regiment of 13,000 personnel. Further expansion provided for the 17th (December 1942) and 13th Airborne Divisions (August 1943), both destined for the European Theater, and the Pacific Theater's 11th Airborne Division (February 1943). In all, between 1941 and 1945 American airborne forces increased from 600 to more than 65,000 men.

The 503rd PIR made the first U.S. combat jumps into Algeria and Tunisia on 8 and 15 November 1942. Almost a year later, on 5 September 1943, the 503rd PIR also conducted the first U.S. Pacific Theater airborne assault at Markham Valley, New Guinea. For this operation, it was augmented by an Australian artillery troop, which underwent a one-jump parachute qualification mere days before the combat jump. The 503rd PIR also carried out an airborne drop on Corregidor Island in the Philippines on 16 February. The 503rd PIR was atypical of U.S. parachute organizations in that it operated independently of a higher airborne formation, although the Panama-based 550th and 551st PIRs were initially independent before being absorbed into the 82nd Airborne Division. They saw action in Italy, southern France, and during the Battle of the Bulge. On 24 February, a parachute company from the 11th Airborne Division's 511th PIR jumped at Los Baños Prison in the Philippines in a coordinated operation to release 2,147 internees there.

As the war progressed, Allied airborne formations were used on large-scale multinational operations. The Normandy Invasion, for example, used American, British, and Canadian paratroopers; operations in the Netherlands used American, British, and Polish troops. The parachute operations supporting the Sicily invasion (September 1943) convinced the U.S. Army of the requirement for integral combat support, such as artillery and engineers. This necessitated larger gliders, since parachuting artillery and jeeps in adequate quantities was not feasible until after the war.

Haphazard parachute drops often marked operations. During the Sicily invasion, for example, the 505th PIR was scattered over 65 square miles. Many of the planes bearing the 504th PIR were shot down by mistake by U.S. Navy and ground troops, which believed they were German aircraft. The Normandy drops 11 months later proved no better organized, but this worked in their favor. German efforts to reinforce the beaches were hampered because they could not determine the extent of the threat since the paratroopers were so widely scattered, thus allowing the amphibious foothold.

Paratroopers and gliders taking part in Operation MARKET-GARDEN, during which the Allies dropped more than 20,000 paratroopers and landed more than 13,500 glidermen behind German lines, 1944. Allied airborne casualties numbered some 10,700 men. (Corbis)

The most memorable parachute campaign was Operation MARKET-GARDEN, the planned effort to sweep across the Netherlands, outflank the Siegfried Line, and secure a Rhine River crossing at Arnhem. The U.S. 101st and 82nd Divisions eventually secured bridges in the Eindhoven and Nijmegen areas, respectively, and the British 1st Airborne Division and the Polish Parachute Brigade were virtually annihilated attempting to seize the Arnhem Bridge. The plan was flawed from the start, given inadequate airlift, drop zones too distant from objectives, leadership's refusal to listen to intelligence reports about German strength, a narrow route susceptible to counterattacks, and inflexibility worsened by inefficient communications.

As part of their Rhine crossing operations, on 24 March 1945 the western Allies mounted Operation VARSITY in the Wesel area east of the river. It involved 21,692 Allied para-

troopers and glidermen of the British 6th Airborne and U.S. 17th Airborne Divisions of Major General Matthew B. Ridgway's XVIII Airborne Corps along with 614 jeeps, 286 artillery pieces and mortars, and hundreds of tons of supplies, ammunition, food, and fuel. A total of 1,696 transports and 1,348 gliders participated in the operations, and some 240 B-24 bombers were specially rigged to drop supplies and equipment. The airborne forces quickly secured most of their objectives, virtually wiping out the defending German 84th Division, with 3,500 Germans taken prisoner. Although VARSITY was a success, the airborne forces sustained higher casualties than did the Allied ground units in their Rhine crossings.

Airborne forces played important roles in the war. They would continue to be used by all the world's major militaries in the postwar period.

Paris, Liberation of (19–26 August 1944)

The Allied plan for the liberation of France called for the destruction of occupying German armed forces and rapid movement toward Germany to end the war in Europe as quickly as possible. The Allies planned to bypass the French capital of Paris on the assumption that once German forces had been isolated there, they would soon surrender. Supreme Allied Commander General Dwight D. Eisenhower issued orders to commander of French Forces of the Interior General Pierre Joseph Koenig that there be no uprising in the city with consequent diversion of Allied troops there, but political events dictated otherwise.

Beginning with a strike by French gendarmes, the civilian police, on 15 August 1944, two factions of the French Resistance movement vied for the credit of liberating the French capital. The well-organized and more numerous Communist wing of the Resistance advocated a complete uprising in Paris, hoping that with popular credit for liberation of Paris they would have a significant advantage in taking power in France after the war. Gaullist Free French Resistance leaders in Paris were well aware of this plan, and although they feared destruction of the city by the Germans in any uprising, they grew increasingly concerned that an Allied failure to act would jeopardize future Gaullist control of the French government.

German general of infantry General Dietrich von Choltitz had taken command of the greater Paris area on 7 August 1944. Choltitz had established his military credentials on the Eastern Front, especially in heavy fighting that led to the capture of Sevastopol in July 1942. Choltitz had the reputation of following his orders to the letter, and these, delivered to him in a personal meeting with German leader Adolf Hitler, called for the destruction of Paris before allowing it to fall into Allied hands. Hitler instructed Choltitz to begin preparations for the destruction of the city.

On 19 August, when Allied forces were still more than 50 miles from the city to the north and south, Gaullist elements

in Paris preempted their Communist rivals by seizing the Paris prefecture of police. On learning of this action, the larger Communist organization sprang into action and initiated a general uprising within the city. Choltitz immediately deployed infantry backed by tanks around the city, and the fighting spread. German tanks opened fire on the prefecture of police. The citizens of Paris were no longer intimidated by the Germans, and Resistance fighters fought the Germans with what weapons they possessed, mostly small arms and homemade gasoline bombs that they used against German vehicles. By 23 August, more than 400 street barricades were in place, and localized intense fighting was occurring in many areas of the city.

Both Hitler and Eisenhower were soon aware of the fighting in the city. As the number of German casualties steadily mounted, Choltitz was faced with a dilemma. Plans were in place for the destruction not only of public works and buildings, but also monuments and museums in Paris. Swedish consul general in Paris Raoul Nordling pleaded with Choltitz to save the city and attempted on his own initiative to arrange a cease-fire in Paris. However, commander of Communist forces Henri Tanguy (alias Colonel Rol) refused.

Choltitz had his orders; he also had serious doubts about Hitler's mental condition and he did not wish to become notorious for all time as the destroyer of one of the most beautiful cities in the world. Choltitz could not cede the city to the insurgent civilians without resistance, because his family members were in Germany; his not-unreasonable fear of reprisals against them apparently had some bearing on his decisions. Choltitz, however, minimized the combat in various ways, especially by his decision to move the bulk of German combat forces outside the city and into formal tactical defensive positions oriented toward the approaching Allied armies in areas beyond the city limits. During the fighting, he also withheld the use of heavy artillery.

On 21 August, Major General Philippe Leclerc, against Allied orders, turned his 2nd Free French Armored Division north toward Paris. Meanwhile, within the city, Resistance leaders met and decided to continue fighting. Choltitz, now determined to spare the city, sent Nordling to the Allies to ask that they enter Paris. Choltitz pledged to hold off destroying the city until they arrived. Eisenhower then agreed that Leclerc's division should move into Paris. At the same time, Choltitz rejected repeated orders from Berlin to begin the destruction of the French capital.

By 23 August, fighting in parts of Paris was intense. That day, Nordling conferred with commander of U.S. 12th Army Group Lieutenant General Omar N. Bradley. Impressed by what Nordling told him, Bradley ordered the U.S. 4th Infantry Division to move into Paris before Choltitz could change his mind.

By early 24 August, Leclerc's tanks had reached Rambouillet 20 miles south of Paris. De Gaulle arrived at the

Crowds of French citizens line the Champs Élysées to view Allied tanks and half-tracks pass through the Arc de Triomphe, on the liberation of Paris, 25 August 1944. (Library of Congress)

Chateau of Rambouillet that same day. Fighting was now raging in virtually every section of the city. Late on 24 August, Leclerc's tanks arrived in Paris. Part of his division moved through the Porte d'Orleans, and the rest entered by the Porte de Vanves. By 11:30 P.M., Leclerc's tanks were in front of the Hôtel de Ville (city hall) in the center of Paris, and the bells of Notre Dame pealed out the good news to the populace.

On 25 August, French and U.S. forces eliminated pockets of German resistance, and at 3:00 P.M. Choltitz and his staff surrendered to French officers. Many of the German troops, unaware of the surrender, continued to fight. De Gaulle arrived in the city that evening, and the next day he and the Resistance moved on foot from the Arc de Triomphe to Notre Dame Cathedral for a celebratory mass. Although there was sniper fire, both events proceeded.

It is impossible accurately to assess casualties in the liberation of Paris. Although the cost in casualties to Allied forces

was slight, the liberation of Paris and the need to feed the city were heavy loads on an already overburdened Allied supply system. But the cost of a destroyed Paris would have been far higher, and the liberation of the French capital was a great psychological boost to the Allies in their effort to defeat the Third Reich.

Paris Peace Treaties (10 February 1947)

Following preliminary draft treaties prepared by the deputy foreign ministers of the major Allied powers, the Council of Foreign Ministers met in the faded glory of the Luxembourg Palace in Paris in two sessions of several weeks each from July to October 1946. There were sharp exchanges and disagreements among the former allies but, after further discussions in New York City in November 1946, the peace treaties were signed at the Quai d'Orsay in Paris on 10 February 1947. The main provisions of the five peace treaties with Italy, Finland, Hungary, Romania, and Bulgaria are as follows:

Italy

The most difficult of the territorial discussions centered on Italy. At the end of the war, Yugoslavia had attempted to secure land at the expense of Austria and Italy, and the conferees spent much time discussing the Italo-Yugoslav frontier. Ultimately, they adopted the compromise put forth by the French. The port city of Trieste, which was 80 percent Italian, became a Free Territory under the authority of the United Nations Security Council. Fiume (Rijeka), Istria (to include the Italian city and naval base at Pola), and most of the Julian March were awarded to Yugoslavia, as was Zadar, a partly Italian city in Dalmatia. Yugoslavia and Albania also secured from Italy some islands in the Adriatic. The status of Trieste was not finally resolved until 1954, when improved relations between the two states led to Italy receiving the city and Yugoslavia the area around it.

France secured some strategic territory from Italy along their common frontier in the Tenda-Briga sector, and Greece obtained the Greek-inhabited Dodecanese Islands off southwestern Turkey, which the Italians had gained from Turkey after World War I. Italy did retain control of the Tyrol south of Brenner Pass, claimed by Austria. Ethiopia was recognized as independent, and Italy lost its overseas colonies of Libya, Eritrea, and Somaliland, which were now under British control. There was no immediate agreement on their disposition, with the conferees agreeing that, should there be no resolution within one year, their future fate would be decided by the United Nations. This is indeed what happened, with all three states moving toward independence. Italian reparations were set at \$360 million, and the Italian army was limited to 250,000 men.

Finland

Finland was reduced to its 1940 borders following the Finnish-Soviet War of 1939–1940, thereby losing the Karelian isthmus and Vyborg as well as land north and east of Lake Ladoga and some land in Lapland. In addition, Finland was now forced to yield Petsamo, its only Arctic port. The Soviet Union also secured a lease on the Porkkala Peninsula on the Gulf of Finland near Helsinki as a naval base in exchange for the return of Hango.

Hungary

Hungary was obliged to return to Romania that portion of Transylvania that it had occupied. Hungary was again reduced to the post-World War I borders of the 1919 Treaty of Trianon, with the exception that it was also forced to yield a small amount of territory to Czechoslovakia at Bratislava. Czechoslovakia, in turn, had to relinquish to the Soviet Union a portion of sub-Carpathian Ruthenia, which now gave the Soviet Union a direct border with both Hungary and Czechoslovakia. Hungary's reparations were set at \$300 million.

Romania

Romania was obliged to recognize as final its 1940 loss of Bessarabia and northern Bukovina to the Soviet Union. It was also forced to cede the southern Dobruja to Bulgaria, but it regained the portion of Transylvania that Germany had forced it to cede to Hungary. Romania also had to pay reparations in the sum of \$300 million.

Bulgaria

Bulgaria received the southern Dobruja, which Germany and Italy had insisted it give to Romania in 1940. Bulgaria was assessed \$70 million in reparations.

All five states also agreed to restore the legal and property rights of the victorious powers, to dissolve fascist organizations, and to guarantee human rights and fundamental freedoms. All treaties, save that with Finland, contained provisions that the occupying Allied nations would withdraw their troops, although the Soviet Union retained the right to maintain forces in both Hungary and Romania to safeguard its lines of communication to Austria until it concluded a peace treaty with that nation in 1955.

Because of sharp disagreements between the western Allied powers and the Soviet Union and the coming of the Cold War, no formal peace treaties were agreed to by the former Allies with either Germany or Japan.

Park, Sir Keith Rodney (1892–1975)

British air force air chief marshal. Born at Thames near Auckland, New Zealand, on 15 June 1892, Keith Park joined the New Zealand artillery during World War I and earned a commission during the 1915 Gallipoli Campaign. Park transferred to the Royal Flying Corps in 1916 and, flying Bristol fighters, scored an estimated 20 victories by war's end. Remaining with the new Royal Air Force after the war, Park joined Headquarters, Fighter Command in 1938 as senior air staff officer under Air Chief Marshal Hugh Dowding.

In April 1940, Dowding named Park commander of Number 11 Fighter Group, which defended London and southeast England. After providing vital fighter coverage for the Dunkerque evacuation, Number 11 Group faced the onslaught of the Luftwaffe during the Battle of Britain. Park clashed with his counterpart at Number 12 Fighter Group, Air Vice Marshal Trafford Leigh-Mallory, over fighter tactics. Park believed in radar early warning and single-squadron intercepts of the German bombers before they could reach their intended targets, whereas Leigh-Mallory favored the slower-reacting, multiple-squadron Big Wing tactics. When the Air Ministry backed Leigh-Mallory, Park was relieved in December 1940 after the Battle of Britain had essentially been won.

Following assignments with Training Command and in Egypt, Park was ordered to Malta in July 1942 to organize air defenses on that crucial island. Park used the same fighter tactics at Malta that he had used with Number 11 Fighter Group. His air defenses caused the Luftwaffe to expend precious resources needed in North Africa. Park also counterattacked, hitting German supply convoys as they left Italy and striking Axis positions throughout the theater.

In January 1944, Park became an air officer commanding in the Middle East, and in February 1945 he transferred to South-East Asia Command as head of all Allied Air Forces there. Park was promoted to air chief marshal in August 1945 and played a key role in the Allied reconquest of Burma.

Over Park's objections, the Air Ministry retired him from active service in 1946. Entering private business with Hawker

Sidley Aircraft, Park returned home to his native New Zealand in 1948. He died in Auckland on 6 February 1975.

Partisans/Guerrillas

Indigenous combatants operating in enemy-held territory and conducting military and paramilitary operations. During World War II, numerous Allied partisan or guerrilla units operated in Axis-controlled areas, carrying out intelligence-gathering, sabotage, pilot-rescue, and harassment operations. Partisans worked together in organized units.

Motivations for joining partisan movements varied widely. Many became members as an act of survival; others joined from ideological motivations or to protect their families. Some groups were made up of escaped prisoners of war and political prisoners. Regardless of why they joined, partisans assumed an incredible burden as well as the risk of being shot out of hand if they were apprehended.

Early on, partisans spent much of their efforts merely establishing their organizations and working to sustain them by securing food, supplies, weapons, and ammunition. Late in 1942, as Axis battlefield fortunes turned, the partisans began conducting raids against railways and supply depots. Some even participated in assassinations of Axis officials.

Life for the partisans was difficult. For their own security, they tended to live in, and operate from, inhospitable terrain such as mountains, swamps, and deep forests. Partisans had to endure primitive living conditions, malnutrition, lack of medical assistance, and enemy patrols. They took inspiration from successful operations of this type in the past, such as the guerrillas of Spain against the French army during the Napoleonic Wars.

The British Special Operations Executive (SOE) and the U.S. Office of Strategic Services (OSS) established contact with many partisan units, helping to coordinate their activities and to supply them with weapons and matériel. In return, the partisans provided intelligence, assisted Allied operatives and

downed airmen, and conducted limited sabotage and assassination operations. In some cases, partisans found themselves pawns in the geopolitical contest by the various Allied powers during the war, as was the case in Yugoslavia and Greece.

Partisan units varied in strength and tactics from country to country. Space does not allow discussion of even a majority of such movements, but some of the most famous of partisans were the Polish Home Army; the French maquis; the Greek ELAS (National People's Liberation Army); the Yugoslavia Partisans; and fighters in the Soviet Union. Numerous other partisan groups also operated in Europe and in the Pacific. As a rule, the more crucial the role that partisan groups played in liberating their country from occupation, the more likely there were to have a major part in establishing and running its postwar government.

Poland

Although Poland was defeated by Germany in September 1939, many Poles continued the fight. Resistance groups coalesced into the Polish Home Army, which sought to combat the occupation of the country by both German and Soviet troops. With nearly a fifth of the country in forests, the Poles had a natural base for unconventional warfare. The Polish Home Army did provide useful intelligence to the western powers and, once the tide of war had turned, began to attack German supply trains and tie down German forces that might otherwise have been at the front. Their most spectacular action by far, however, was the Warsaw Rising of August–October 1944. When Soviet forces arrived at the city limits of the Polish capital, the Home Army came out in the open and battled the Germans for control. The Soviets refused for more than two months to move to assist the Poles. The Home Army fought on virtually alone until it was defeated. Warsaw was largely destroyed in the fighting. Some accurately viewed the Soviet refusal to act as a deliberate decision to effect the destruction of the natural Polish leadership and thus help ensure Soviet control of Poland in the postwar period.

France

Probably the best known partisan efforts in the west were those in France, particularly the guerrilla units known as the maquis. The French Resistance as a whole included everything from underground opposition newspapers to organized combat units; the maquis carried out sabotage and harassment operations. Originally operating in southern France, the maquis spread throughout the country. The maquis provided immense assistance to the western Allies in the June 1944 Normandy invasion when it conducted wide-scale sabotage operations against German lines of communication and helped isolate the battlefield from German reinforcement. The maquis also harassed small German units.

Yugoslavia

Following their conquest by the German army, the Yugoslavs formed Resistance movements. The two chief groups were bitter rivals: the Četniks (named after the Serbian guerrillas who had fought the Turks), who were loyal to the monarchy and were led by General Dragoljub "Draza" Mihajlović, and the Partisan movement led by veteran Communist Josip Broz (Tito). These two organizations, often at odds with each other, fought the occupying Axis powers and the fascist Ustaše movement in Croatia. Partisan activities here were among the most effective in Axis-occupied Europe and tied down a great many Axis troops, but they also exacted a high cost in the form of reprisals and casualties to the civilian population. During the course of the fighting, the British government, which was supplying aid to the Yugoslav Resistance, decided to back the Partisans exclusively because, unlike the Četniks, they did not hesitate to engage the Germans. At the end of the war, the Partisans were the dominant force in Yugoslavia and, in consequence, liberated much of the country themselves.

Greece

In Greece, resistance to the Axis occupiers began almost immediately. The largest group was the leftist National Liberation Front (EAM), with the National People's Liberation Army as its military wing. It had poor relations with the more conservative National Republican Greek League, and the two groups fought each other during the winter of 1943–1944, although a truce was arranged in February 1944. When the Germans pulled out of Greece, EAM held the vast majority of the country.

Italy

Following the 8 September 1943 armistice, Italian Resistance began against the Germans and Benito Mussolini's subsequent Italian Social Republic (RSI) in the northern part of the country. Early groups sprang up around former military units and were centered in the Alpine valleys and the Piedmont. The partisan groups varied ideologically, but those in the cities tended to be largely socialist or communist. In turn, the RSI fielded groups to fight the partisans. Captain Junio Valerio Borghese headed an independent unit allied to the Germans. It numbered 10,000 men and fought against partisans in both Italy and the Yugoslav border area. The Italian Resistance claimed that in fighting from September 1943 to May 1945, it sustained 36,000 killed out of 250,000 participants. Some 10,000 civilians also died in reprisals.

Soviet Union

The rapid German advance through the Ukraine and White Russia led many Red Army stragglers and those opposed to the Nazis to find refuge in the forests. Only 11 days into the war, Soviet leader Josef Stalin called for a partisan uprising to

Yugoslav partisans, ca. 1942. (Library of Congress)

harass the Germans. Nazi occupation policies played a key role, driving many who had initially greeted the Germans as liberators over into the partisan camp.

Partisans operated extensively in the region of the Pripet Marshes south of Minsk. They formed around smaller cells known as *Orgtroikas*, consisting of officers and operatives from state, party, and *Narodnyy Kommissariat Vnutrennikh Del* (NKVD, People's Commissariat for Internal Affairs) sources. By the summer of 1943, about 17,000 partisans were conducting sabotage and harassment operations in the Pripet Marshes; at the time of Operation *BAGRATION* in 1944, these numbers reached 140,000 people. Despite the efforts of special German antipartisan units, Soviet partisans carried out some 40,000 railway demolitions alone, greatly aiding the Red Army offensive.

In the Ukraine, nationalist movements such as the *Ukrainska Povstanska Armiya* (UPA, Ukrainian Insurgent Army) formed, bent on driving out both the Germans and the Soviets. Roman Shukhevich, leader of the UPA, controlled a wide swath of territory. Although conflicts between pro-Soviet partisans and nationalist partisans reduced the effectiveness of the movement, such activities forced the Germans

to divert significant military resources to maintaining lines of communication. German General Heinz Guderian later wrote that this was one of the prime factors in the defeat of the German Army in the east.

Jews able to escape the German grasp also sought to organize. The Bielski Partisans were the most famous of the Jewish Resistance groups. The movement began as an act of simple self-preservation and the rescue of other Jews fleeing the Nazis, and eventually it grew to more than 1,000 people, including children and the elderly. Jewish partisans lived in constant danger because of rampant anti-Semitism among others apart from the Nazis.

The Germans did their best to put down the partisan movements. Their tactics included reprisals against villages aiding partisans and the taking and execution of hostages, often at the rate of 20 or more executed for every German killed. However, regardless of the tactics used, and probably because of the Germans' ruthlessness, the partisan numbers continued to grow.

In the Pacific, partisan movements were found in many locations, most notably in the Philippines. Following the Japanese victory at Corregidor in 1942, some 260,000 Filipinos

and Americans organized to oppose the Japanese occupiers. Most notable among these groups was the Huks (Hukbalahap), or the People's Anti-Japanese Army. Communist Luis Taruc organized a Huk army of 30,000 men that ultimately controlled much of Luzon. U.S. forces not captured by the Japanese attached themselves to Filipino partisan groups.

Groups in China, Southeast Asia, the Philippines, and some Pacific islands initiated intelligence-gathering and sabotage operations against the Japanese. One of the better known of the partisan groups was the Viet Minh, led by Vietnamese nationalist Ho Chi Minh. The Viet Minh conducted guerrilla operations against both the French and the Japanese.

Patch, Alexander McCarrell, Jr. (1889–1945)

U.S. Army general. Born at Fort Huachuca, Arizona, on 23 November 1889, Alexander Patch Jr. was the son of an army officer. Graduating from the U.S. Military Academy in 1913, Patch was commissioned in the infantry. He served in the Punitive Expedition into northern Mexico in 1916 and 1917 with the 18th Infantry Regiment in 1916 and deployed with his unit to France during World War I. There he commanded the U.S. 1st Division's machine-gun battalion, and he then served as director of the Machine Gun School. He ended the war as temporary lieutenant colonel.

Following occupation duty in Germany, Patch returned to the United States in 1919 and reverted to his permanent rank of captain. Patch graduated at the top of his class from the Command and General Staff College, Fort Leavenworth, Kansas, in 1925. He next served as an instructor at the Staunton (Virginia) Military Academy (1925–1928 and 1932–1936). Patch then commanded the 3rd Battalion of the 12th Infantry Regiment at

U.S. Army Lieutenant General Alexander Patch, 1944. (Corbis)

Fort Washington, Maryland, from 1928 to 1931. Patch graduated from the Army War College in 1932.

Appointed to the Infantry Board at Fort Benning, Georgia, in 1936, Patch helped develop and test the three-regiment “triangular” division. Between March 1939 and August 1941, Patch held several assignments, including command of the 47th Infantry Regiment. He was promoted to colonel in August 1939. Promoted to temporary brigadier general in August 1941, Patch took command of the Infantry Replacement Training Center, Camp Croft, South Carolina.

In March 1942, Patch, promoted to major general, commanded Task Force 6814, which was sent to New Caledonia. The unit consisted primarily of men made surplus when two National Guard divisions were triangularized. The task force was soon organized into the Americal Division, and it relieved the Marines on Guadalcanal in December 1942. From January to April 1943, Patch commanded XIV Corps, including troops on Guadalcanal and the neighboring islands.

Returning to the United States, Patch took command of IV Corps at Fort Lewis, Washington. In March 1944, he was sent to Sicily to command the Seventh Army as a lieutenant general. On 15 August 1944, the Seventh Army invaded southern France in Operation DRAGOON. The Seventh Army, part of the 6th Army Group, was the first army to cross the Rhine, fighting in the Colmar pocket and meeting up

with General Mark Clark's Fifth Army at the Brenner Pass on 4 May 1945.

In July 1945, Patch took command of the Fourth Army, Fort Sam Houston, Texas, and in October he headed a group assembled to make recommendations about the army's postwar organization and strength. Patch contracted pneumonia and died at Fort Sam Houston in San Antonio, Texas, on 21 November 1945. He was posthumously promoted to general in 1954.

Pathfinders

Elite U.S. Army paratroopers who facilitated airborne operations. Developed in the European Theater of Operations during World War II, pathfinders would jump ahead of the main assault and direct following planes to their specific drop zones. Their efforts increased accuracy of placement of airborne forces and hence the effectiveness of such operations.

Pathfinders were developed following the Allied invasion of Sicily in 1943. After the widespread airborne drops there, commanders sought a way to organize and deliver airborne troops more accurately. The job fell to Colonel Joel Crouch of the Army Air Forces and Captain John Norton of the 82nd Airborne Division. Based at Biscari Airfield in Sicily, these men originated pathfinder tactics.

In the first drops in the invasion of Italy, pathfinders used colored lights, smoke pots, and vision panels to designate drop zones. These teams also used radio communication and a simple radar homing system consisting of two components, "Eureka" and "Rebecca," to aid in aircraft navigation. Once a ground team was positioned, it would set up radios and activate the radar transmitter, the Eureka set. The Rebecca device in the planes would home in on the signal produced by the ground team and use it to pinpoint the exact location for the drop. Pathfinder units were composed of a large squad of 9–14 men for signaling with 2 Eureka sets and 9 Halifane (illuminating) lights and a 5-man security team. Squad mem-

bers were volunteers from airborne units such as the 82nd and 101st Airborne Divisions. Pathfinders jumped in such missions as Operations OVERLORD, MARKETGARDEN, and VARSITY. After World War II, pathfinder techniques continued to undergo refinement.

The term *pathfinder* was also applied in strategic bombing. After the Luftwaffe employed a specially trained force to mark and illuminate targets during the Battle of Britain, the Royal Air Force formed a similar group for the strategic bombing of Germany. Special squadrons of highly trained crews flying Wellington and Stirling bombers (later mostly Mosquito bombers) flew in advance of the main bomber stream to mark targets for the less-experienced bombers crews following them. Pathfinders were also used to mark the route to the target, and a senior pathfinder known as the master bomber or master of ceremonies would fly above the target and provide advice to the main bomber force by radio.

Patrol-Torpedo Boats

Known popularly as PT boats, World War II-era patrol-torpedo boats were the American equivalent of German E boats and British motor torpedo boats. They were small, fast, wooden-hulled, shallow-draft vessels that depended on surprise, speed, and maneuverability and thus did their best work in coastal waters.

During World War I, the Italian navy built and used some 299 torpedo-armed motorboats against the Austro-Hungarian navy in the Adriatic. From 1916, the British navy used coastal motor boats in home waters and in the raids against Ostend and Zeebrugge, Belgium, in April 1918. Although the United States did not use such craft in World War I, the Electric Boat Company's Elco Division in Bayonne, New Jersey, constructed several hundred power boats for Britain and Italy and gained expertise in designing and manufacturing that type of vessel.

In the late 1930s, the U.S. Navy was pushed toward the development of gasoline-powered motor boats by President Franklin D. Roosevelt and Assistant Secretary of the Navy

Charles Edison, both of whom were concerned about European interest in these craft. They secured a 1938 appropriation of \$5 million for the construction of ships of fewer than 3,000 tons displacement. In June, the navy staged an American design competition, selecting seven winners for further testing, but Edison decided instead to put into limited production at Elco a 70 ft craft, with a crew of 10 men, from the British designer Hubert Scott-Paine. Elco's boat substituted Packard engines for

those of Rolls-Royce. By 1941, Elco had progressed to a 77 ft version that demonstrated an average speed of 27.5 knots in

rough waters and mounted 2 × 21-in. torpedo tubes and 2 × 50-caliber machine guns in twin turrets. The boats also had the ability to lay smokescreens. Andrew Jackson Higgins, a Louisiana shipbuilder, developed a similar 78 ft vessel. At 80 ft or less, the boats could be carried on long voyages by larger ships.

During World War II, the United States deployed in the Pacific 350 PT boats, mostly of the Elco and Higgins types, along with 42 in the Mediterranean and 33 in the English Channel. Together, they launched in combat a total of only 697 torpedoes, usually with minimal success. All too often, American torpedoes were defective, and firing them accurately from fast-moving vessels was problematic in any case. Nor were PT boats fortunate at antisubmarine warfare, being much too noisy to make effective use of sonar equipment. The most memorable action in European waters by this type of craft came from the Germans when they sent their E boats in an attack on an American landing exercise at Slapton Sands, England, on 18 April 1944. The Germans sank two LSTs

The U.S. deployed 350 PT boats in the Pacific, 42 in the Mediterranean, and 33 in the English Channel. They launched only 697 torpedoes.

(landing ships, tank), damaged a third, and killed more than 700 Americans.

In the South and Southwest Pacific Theaters, the most profitable service of American PT boats was in coastal work. Their speed made them difficult targets for shore batteries. With a 40 mm gun and, perhaps, 4.5-inch barrage rockets or mortars replacing their torpedoes, they could attack Japanese landing barges (*daihatsus*), which, as the war progressed, were typically used to deliver reinforcements to forward positions. In one five-month period off New Guinea, PT boats claimed some 115 barges sunk with minimal losses of their own.

Two PT boat events, because of the personalities involved, overshadowed all others in the war. The first, in the Philippines in the early weeks of the conflict, involved Motor Torpedo Boat Squadron 3 under Lieutenant John D. Bulkeley. He and his men displayed great gallantry in various actions but achieved limited success against Japanese invading forces. Then, in March 1942, theater commander General Douglas MacArthur, under orders to leave the Philippines for Australia, selected Bulkeley and his four available boats to convey his party of 22 persons—including his wife, young son, housekeeper, and key staff members—more than 500 miles from Corregidor Island in Manila Bay through the Japanese blockade southward to Mindanao, from where MacArthur could complete the trip by air. At great risk, the journey was completed between 11 and 13 March. MacArthur could have traveled much more easily and safely in a submarine but seemed to have been unwilling to be confined beneath the waves at such close quarters. As it was, his escape from Corregidor—and the PT boats' role in it—proved to be the stuff of legend and were recounted in W. H. White's 1942 book *They Were Expendable* and John Ford's 1945 film of the same name.

The second incident involved a confused night action. In Blackett Strait off Kolombangara in the Solomon Islands on 1 August 1943, Lieutenant John F. Kennedy's *PT-109* was struck and sunk by the Japanese destroyer *Amagiri*. Kennedy and other survivors then swam to a nearby Japanese-held island, from which they were rescued after several days. Although written up in the *New Yorker* magazine by John Hersey during the war, the incident became widely known only after Kennedy launched his successful run for the presidency in 1960. By 1963, Kennedy's experiences had inspired several books, the film *PT 109*, and (at least indirectly) the television comedy series "McHale's Navy."

Overall, the PT boat proved a serviceable but not decisive weapon. The successors of such craft were later employed in riverine operations during the Vietnam War.

Patton, George Smith, Jr. (1885–1945)

U.S. Army general and commander of the Third Army in the European Theater of Operations. Born on 11 November 1885 in San Gabriel, California, George Patton Jr. attended the Virginia Military Institute for a year before graduating from the U.S. Military Academy in 1909. An accomplished horseman, he competed in the 1912 Stockholm Olympic Games. He also participated in the 1916–1917 Punitive Expedition into Mexico.

General George S. Patton Jr. at his headquarters at the last press conference he held for war correspondents on completion of the fighting in Europe, 1945. (Corbis)

On U.S. entry into World War I, Patton deployed to France as an aide to American Expeditionary Forces (AEF) commander General John J. Pershing, but he transferred to the Tank Corps and, as a temporary major, commanded the first U.S. Army tank school at Langres, France. He then commanded the 304th Tank Brigade as a temporary lieutenant colonel. Wounded in the Saint-Mihiel Offensive, he was promoted to temporary colonel and took part in the Meuse-Argonne Offensive.

After the war, Patton remained an ardent champion of tank warfare. He graduated from the Cavalry School in 1923, the Command and General Staff School in 1924, and the Army War College in 1932. Returning to armor, Patton was promoted to temporary brigadier general in October 1940 and to temporary major general in April 1941, when he took command of the newly formed 2nd Armored Division. Popularly known as “Old Blood and Guts” for his colorful speeches to inspire the men, Patton commanded I Corps and the Desert Training Center, where he prepared U.S. forces for the invasion of North Africa.

In November 1942, Patton commanded the Western Task Force in the landing at Casablanca, Morocco, part of Operation TORCH. Following the U.S. defeat in the Battle of the Kasserine Pass, in March 1943 he won promotion to lieutenant general and assumed command of II Corps. He quickly

restored order and morale and took the offensive against the Axis forces.

In April, Patton received command of the Seventh Army for the invasion of Sicily in July 1943. He used a series of costly flanking maneuvers along the northern coast of the island to reach Messina ahead of the British Eighth Army on the eastern side. Patton, however, ran afoul of the press and his superiors when he struck two soldiers who suffered from battle fatigue.

Relieved of his command, Patton was then used as a Trojan horse to disguise the location of the attack of Operation OVERLORD, the cross-Channel invasion of France. The Germans assumed that Patton would command any such invasion, but he actually remained in Britain in command of Third Army, the fictional 1st U.S. Army Group, in a successful ruse to trick the Germans into believing the invasion would occur in the Pas de Calais area.

Following the Normandy Invasion, Patton was at last unleashed in August when his Third Army arrived in France

and spearheaded a breakout at Saint-Lô and campaigned brilliantly across northern France. Moving swiftly, his forces swung wide and then headed east, although he was frustrated by the refusal of General Omar Bradley and Supreme Commander General Dwight D. Eisenhower to recognize the importance of sealing the Falaise-Argentan gap. Patton's forces crossed the Meuse River in late August to confront German defenses at Metz, where the Germans held the Americans until December. During the German Ardennes Offensive (Battle of the Bulge), Patton executed a brilliant repositioning movement and came to the relief of the hard-pressed American forces at Bastogne.

By the end of January, Patton began another offensive, piercing the Siegfried Line between Saarlautern and Saint Vith. On 22 March, the Third Army crossed the Rhine at Oppenheim. Patton continued his drive into Germany and eventually crossed into Czechoslovakia. By the end of the war, his men had covered more ground (600 miles) and liberated more territory (nearly 82,000 square miles) than any other Allied force.

Promoted to temporary general, Patton became military governor of Bavaria. He soon found himself again in trouble for remarks in which he criticized denazification and argued that the Soviet Union was the real enemy. Relieved of his post, he assumed command of the Fifteenth Army, slated to write the official U.S. Army history of the war. Patton suffered a broken neck in an automobile accident near Mannheim and died at Heidelberg on 21 December 1945.

Paul, Prince Regent of Yugoslavia (1893–1976)

Prince regent of Yugoslavia. Born on 27 April 1893 in Saint Petersburg, Russia, to Arsen Karadjordjevic and Avrora Pavlovna Demidova, Paul was by nature sensitive and with-

By the end of the war, Patton's men had covered 600 miles and liberated nearly 82,000 square miles, more than any other Allied force.

drawn. He attended boarding school in Lausanne and was also educated by tutors in the royal palace in Belgrade and at Oxford. He spoke six languages. In 1923, he married Princess Olga of Greece.

On 9 October 1934, King Alexander of Yugoslavia was assassinated at Marseille, France, by Croatian terrorists. Alexander's son Peter was only a child, so Peter's great-uncle Paul became the principal regent. The problems then facing the country were virtually unsolvable. The deeply entrenched nationalistic, political, and ethnic rivalries of Yugoslavia meant that it entered the war sharply divided.

Although Paul declared Yugoslavia neutral at the beginning of World War II, this did not spare the country from involvement in the war, given its geographical position and German and Italian expansionist plans. Paul's anglophilia and overwhelmingly pro-Allied sentiment among the Serb population reinforced the belief that sooner or later Yugoslavia would enter the war on the Allied side. Adolf Hitler, meanwhile, insisted that Yugoslavia declare for the Axis side. Paul sought to delay that decision. Finally, in early March, under a verbal onslaught from Hitler at Berchtesgaden, he concluded that not joining the Axis side would bring about the end of his country. On 25 March 1941, Yugoslavian ministers traveled to Vienna to sign the Tripartite Pact. Anti-German Serbs believed Paul to be a traitor who delivered Yugoslavia to Hitler on a silver platter.

After this event, anti-German demonstrations occurred in Serbia and Slovenia. Early on 27 March 1941, Yugoslavian senior army officers, who were Serbs, responded with a coup d'état, deposing Paul. The underage Peter was declared of age as King Peter II. This action infuriated Hitler, who took the coup as a personal insult. Beginning on 6 April 1941, German, Italian, Romanian, and Hungarian forces invaded Yugoslavia and occupied the country. Paul, who had been en route to Zagreb at the time of the army coup against him, escaped via Greece to London. In 1943, he moved to South Africa. Paul's efforts to clear his name and reputation occupied much of his time until his death in Paris on 14 September 1976.

Paulus, Friedrich (1890–1957)

German army field marshal. Born on 23 September 1890 in Breitenau, Friedrich Paulus joined the German army in 1910 and was commissioned a second lieutenant the following year. He served on both fronts during World War I. Paulus ended the war a captain in the Alpenkorps on the Italian Front, winning the Iron Cross, both First and Second Class. Paulus continued in the Reichswehr after the war and was promoted to lieutenant colonel in 1934. He succeeded Colonel Heinz Guderian as chief of staff of Germany's mechanized forces in 1935. Contemporaries noted him as stiff, methodical, and occasionally indecisive.

Paulus was nonetheless promoted to Generalmajor (U.S. equiv. brigadier general) in 1939 and was appointed chief of staff of General Walther von Reichenau's Tenth Army. He participated in the conquest of Poland and the 1940 offensive into Belgium and France. When Operation SEA LION was canceled, Paulus became deputy chief of staff for the Supreme Army Command and helped plan Operation BARBAROSSA, the invasion of the Soviet Union.

In January 1942, at Field Marshal Reichenau's request, Paulus was promoted to general of panzer troops and assigned command of the Sixth Army (formerly Tenth Army), which was part of Army Group South. After an initial success at Dnepropetrovsk, Paulus was forced to retreat to better defensive positions before counterattacking. The Sixth Army then advanced slowly on Stalingrad over the summer, reaching the Volga River north of the city on 23 August 1942. From 24 August, a great battle raged over the city. Fighting was fierce, but Adolf Hitler ordered Paulus to take Stalin's namesake city at any cost. In the end, the Sixth Army was trapped there.

Paulus has been much blamed for refusing to disobey Hitler and withdraw before it was too late, but his and Hitler's greatest failure lay in not anticipating the Soviet encirclement, Operation URANUS, begun on 19 November. Although relief efforts failed, Hitler refused Paulus permission to try to break out, ordering him instead to hold all ground taken. On 24 January 1943, Hitler denied Paulus's request for permission to surrender and promoted him to field marshal. Paulus surrendered nonetheless on 31 January, claiming he was "taken by surprise" but refusing his men the same option. Paulus was the first German field marshal to be captured in battle.

In the aftermath of the failed July 1944 Bomb Plot intended to kill Hitler, Paulus made anti-Nazi broadcasts for the Soviets. Hitler ordered Paulus's entire family jailed. Paulus appeared as a witness for the prosecution at the Nuremberg Trials, but he remained in a Soviet prison until 1953. On his

German Field Marshal Friedrich Paulus at Red Army headquarters in Stalingrad after the German Sixth Army surrendered to Soviet troops. (Bettman/Corbis)

release, he became an inspector in the East German Volkspolizei in Dresden. He died in that city on 1 February 1957.

Pavlov, Dimitri Grigorevich (1897–1941)

Soviet army general. Born in the village of Vonyukh, Kostroma region, on 4 November 1897, Dimitri Pavlov fought in

World War I and was taken prisoner by the Germans. He joined the Red Army and Communist Party after the war. Commissioned in the cavalry, Pavlov graduated from the Frunze Military Academy in 1928 and the Military-Technical Academy in 1931. He then commanded the 4th Mechanized Brigade, one of the Red Army's first mechanized units. He next headed the Armored Directorate in 1937 and was chief of the Soviet tank advisers sent to assist the Republican side in the 1936–1939 Spanish Civil War. Pavlov erroneously concluded as a result of that experience that there was no future for large armor formations. Although this decision was shared, such thinking helped bring the disbandment of the Soviet mechanized corps and at least until the death of Josef Stalin, Pavlov was blamed for it. In 1939, Pavlov became head of the Armed Tank Directorate.

As a general colonel, Pavlov was appointed to the Main Military Council in July 1940. Promoted to general of the army in February 1941, he received command of the Western Front on 6 June just prior to the German invasion of 22 June. Facing German Army Group Center, Pavlov positioned three of his armies well forward and only one in reserve.

A week after the German invasion of the Soviet Union and the collapse of his sector of the front, Pavlov and his chief of staff General Major V. Y. Klimovskikh and several others were ordered to Moscow. Pavlov was made the scapegoat for Soviet military failures, accused of collaboration with the Germans, tried, found guilty, and shot on 22 July 1941. Also executed were Klimovskikh, Fourth Army commander General A. A. Korobkov, and several divisional commanders and commissars.

Pearl Harbor, Attack on (7 December 1941)

Japanese military action against the U.S. naval base at Pearl Harbor, the Hawaiian Islands, that caused America to enter the war. By early 1941, tensions between Japan and the United States had reached the breaking point. Japan's invasion of China beginning in 1937 and its occupation of French Indochina in 1940 and 1941 had led President Franklin D. Roosevelt to embargo scrap metal and oil and to freeze Japanese assets in the United States. The Japanese particularly resented the embargo on oil, characterizing it as "an unfriendly act." Japan had no oil of its own and had limited stockpiles. Without oil, the Japanese would have to withdraw from China. An army-dominated government in Tokyo now sought to take advantage of British, French, and Dutch weakness in Asia to push its own plans to secure hegemony and resources. Japan was determined to seize this opportunity, even if that meant war with the United States. The United States misread Tokyo's resolve, believing that it could force Japan to back down.

Both sides visualized the same scenario for war in the Pacific. The Japanese would seize U.S. and European possessions in the Far East, forcing the U.S. Navy to fight its way

HISTORIOGRAPHICAL CONTROVERSY

Hitler's Declaration of War on the United States (11 December 1941)

On 11 December 1941, Adolf Hitler announced before a cheering Reichstag that Germany had declared war on the United States. The reasons for Hitler's decision, sometimes accorded the status of a major "Hitler mistake," remain obscure; Hitler never really spelled out his reasoning. Throughout 1940 and 1941, Hitler had sought to avoid war with the United States—indeed, he had restricted U-boat activities to prevent an incident that might lead to war in the fashion of World War I.

On 27 September 1940, Hitler had signed the Tripartite Pact, creating the Rome-Berlin-Tokyo Axis. The pact required all parties to declare war on any country that attacked any of them, but Japan's decision to declare war on the United States clearly did not obligate Germany and Italy to go to war against the United States. Following his invasion of the Soviet Union, however, Hitler was eager for Japan to join the war. Fearful that Japan and the United States might

come to some kind of agreement, Berlin promised Tokyo to sign an agreement that in case either Germany or Japan became involved in war with the United States, whatever the reason, the other power would not conclude a separate peace or armistice. Tokyo then asked Berlin if it would consider itself also at war with the United States if Japan and the U.S. went to war, regardless of the reason. On 28 November 1941, German Foreign

Hitler's Declaration of War on the United States (11 December 1941) (continued)

Minister Joachim von Ribbentrop extended such assurances to Japanese Ambassador Ōshima Hiroshi. The news must have been especially welcome in Tokyo, as the Japanese strike force against Pearl Harbor had sailed two days before. Then, on 5 December, Ribbentrop sent the Italians a draft treaty that obligated both Italy and Germany to declare war on the United States should that country and Japan go to war. It also called on the Axis states not to conclude a separate armistice or peace with either Britain or the United States.

On 7 December 1941, the Japanese attacked Pearl Harbor. The next day, the U.S. Congress declared war on Japan. Three days later, on 11 December, Germany and Italy declared war on the United States. To be more specific, Hitler declared war.

Historian Norman Rich, who devotes considerable attention to the German declaration of war in his book *Hitler's War Aims*, makes it clear that Hitler welcomed news of the Japanese attack on Pearl Harbor with a great sense of relief and took the step of a declaration of war against the United States enthusiastically. The Japanese blow was for Hitler a great "deliverance" that promised him a "a new lease on life."

There are several reasons Hitler was prepared to join the Japanese in a declaration of war against the United States. He hated President Franklin D. Roosevelt and the United States, which he regarded as virtually already in the war by virtue of its substantial material aid to the British. A declaration would thus clarify things. Hitler still counted on a short war. If Japan could hold the United States in check for a year, it would assist Germany in helping to secure victory against the Soviet Union. Hitler also believed that by immediately ordering full-scale submarine attacks on Allied shipping, he could inflict maximum damage on his opponents. In addition, if

Germany failed to join Japan, it would damage relations with that country and end the chance of Japanese assistance against the Soviet Union. At long last, he could tell the world what he really thought of Roosevelt and the United States; that, by itself, was worth a declaration of war. Hitler viewed the United States as militarily weak (he thought the Japanese fleet was superior to that of the United States), racially corrupt, and "Jew-ridden."

Historian Alan Bullock claims that the declaration merely recognized the de facto state of war created by Roosevelt's Lend-Lease program. For Ronald Lewin, it was simply another of Hitler's mistakes. Some historians see a psychological motivation of lunacy or hubris in Hitler's action. Joachim C. Fest saw it as an expression of Hitler's strategic impotence.

Bullock pointed out that Hitler badly underestimated the war-making potential of the United States. John Toland argued that by declaring war, Hitler gained material support from the Japanese and propaganda fodder to hide his military failures in the campaign in the Soviet Union. He could at last engage in a historic struggle of annihilation against both international communism and capitalism, both of which he believed to be controlled by international Jewry.

Others see Hitler as a victim of his racist ideology. Hitler viewed the United States as weak, racially "mongrelized," a country that had declined because of social crises and "degenerate" materialism. Revisionists have claimed that Roosevelt tricked Hitler into giving him a backdoor declaration of war to overcome opposition from isolationists.

Because Hitler never stated his exact motives, his reasoning behind the declaration of war remains a subject for argument. Gerhard Weinberg posits that the declaration had the enthusiastic support of the German people. One thing is clear:

Hitler completely underestimated the United States and the role it might play militarily. Hitler's declaration of war did solve a major problem for Roosevelt, who hesitated to ask Congress to declare war on Germany because of opposition from isolationists and America First supporters. Now Roosevelt had a free hand to prosecute the war on a global basis. If Germany had not declared war on the United States, Roosevelt would have been under great pressure from U.S. public opinion to fight Japan only.

HISTORIOGRAPHICAL CONTROVERSY

Pearl Harbor, a Conspiracy?

Even today, there are many who believe that U.S. President Franklin D. Roosevelt deliberately used Pearl Harbor as bait to lure the Japanese into attacking the United States, enabling him to bring his reluctant nation into World War II. Many isolationists and those with a strong dislike of Roosevelt believed in December 1941 and thereafter that he had used an economic blockade, including an oil embargo and freezing Japanese assets in America, to manipulate Japan into attacking the United States. Roosevelt had begun an undeclared war against German submarines in the North Atlantic in September 1941, yet isolationist sentiment in the United States continued strong, and the country remained officially neutral in the war. Japan's attack finally led to massive public support for hostilities against Japan, and German dictator Adolf Hitler resolved the problem that Roosevelt might have had of fighting only against Japan when on 11 December, four days after the Pearl Harbor attack, Hitler declared war against the United States, although he was not obligated to do so under the terms of the Tripartite Pact. Retired General Robert E. Wood, chairman of Sears, Roebuck, spoke for many U.S. isolationists when he stated that Roosevelt finally "got us in [to the war against Germany] through the back door" of Japan.

President Roosevelt was first publicly named as the central figure in this controversy in the fall of 1945, less than five months after his death on 12 April. On 3 September 1945, the conservative *Chicago Tribune* ran an editorial called "The Indictment" that accused the Roosevelt administration of negligence and culpability in the Pearl Harbor disaster and called for further disclosure. The editorial was based on John T. Flynn's pamphlet *The Final Secret of Pearl Harbor*, and it precipitated another congressional investigation.

Colonel Robert McCormick, owner of the *Chicago Tribune*, then commissioned

employee George Morgenstern to write the first full-scale revisionist book on the subject, *Pearl Harbor: The Story of the Secret War* (1947). Although the book was briefly a best-seller, it was historian Charles A. Beard's *President Roosevelt and the Coming of the War, 1941* that really fueled the debate. It was published in 1948 and went through several printings.

Both of these books quoted from the 40-volume records of the *Report of the Joint Congressional Committee* of 1946 that printed the verbatim testimony and findings of all eight prior investigations into the matter. Although this massive collection contains much opinion, it renders no judgment as to where responsibility lay for U.S. forces having been caught unaware by the Japanese attack.

Defenders of President Roosevelt included Samuel Eliot Morison, the U.S. Navy's official historian of World War II. Other Navy officers became vociferous detractors of the president. Most important among them was Rear Admiral Robert A. Theobald, who wrote *The Final Secret of Pearl Harbor: The Washington Contribution to the Japanese Attack* (1954). Theobald's book included "corroborative" forewords by Rear Admiral Husband E. Kimmel, discredited commander of the naval forces at Pearl Harbor during the attack, and Fleet Admiral William F. "Bull" Halsey. This book presented the idea that Roosevelt had personally "set up" the fleet at Pearl Harbor. The book sold well and was reprinted almost in toto in two issues of *U.S. News and World Report* that same year.

Gordon W. Prange's *At Dawn We Slept: The Untold Story of Pearl Harbor* (1981), finished after his death by his assistants, Donald M. Goldstein and Katherine V. Dillon, was the strongest counterargument to the revisionists. This massive study included an appendix that summarized the anti-Roosevelt theories and questioned some revisionists' notion that the United States could have simply stood by and

watched Hitler and Japan conquer the British Empire and Soviet Union. Goldstein and Dillon also argued convincingly that there is no proof to substantiate the conspiracy theories espoused by the more extreme writers.

Prange's book did not end the controversy, however. Forty years after the event, declassified documents showed that the president had access to the secret Japanese diplomatic code messages and he was therefore aware of how the Japanese were reacting to American diplomacy and economic sanctions. The Japanese attack could not therefore have been a total surprise to Roosevelt and his top advisers. Indeed, American military bases in the Pacific, particularly the Philippines, had been steadily reinforced due to the possibility of hostilities.

John Toland laid out a strong case against Roosevelt in his *Infamy: Pearl Harbor and Its Aftermath* (1982), but his case is weakened by some unsubstantiated speculation. British Prime Minister Winston L. S. Churchill became the villain of the Pearl Harbor tragedy in James Rusbridger's *Betrayal at Pearl Harbor: How Churchill Lured Roosevelt into World War II* (1991). This book posits that Churchill withheld intelligence from Roosevelt that indicated an attack force was under way so that the Japanese air assault would not be thwarted by forewarned defenders. The ulterior motive was to use the surprise attack to neutralize opposition to Roosevelt's desire to enter the war in Europe.

Robert B. Stinnett's *Day of Deceit: The Truth About FDR and Pearl Harbor* (2000) is one of the recent studies that contradicts and questions much of what has been written. Stinnett and other writers basically believe that the end justified the means: the United States would not enter a necessary war against Nazi Germany unless it was forced into armed conflict. The Roosevelt administration therefore promoted actions, such as the undeclared war

(continues)

HISTORIOGRAPHICAL CONTROVERSY

Pearl Harbor, a Conspiracy? (continued)

against the U-boats and a virtual economic war against Japan, that would inevitably lead to war.

The most recent development in the controversy, Philip Jacobsen's article in *Naval History*, "Pearl Harbor: Who Deceived Whom?" (December 2003), reviews recently declassified U.S. naval communications intelligence records to refute the claims by revisionist conspiracy theorists. Jacobsen points out that evidence now corroborates that Japanese radio deception masked movement of their carriers to Pearl Harbor, effectively ensuring a surprise attack.

Before the war, western military analysts underrated Japanese capabilities. Few believed that Japan could make so many concurrent strikes and operate at such long distance, or that its military could perform as well as it did. Placed in context, the well-executed Japanese air assault on Pearl Harbor was just one of several unpleasant surprises for the Americans.

There is no evidence that implicates President Roosevelt in instigating a war with Japan in the hope that it would lead to hostilities between the United States and Germany. Roosevelt loved the navy, and the idea that he would deliberately set

up a sizable portion of it for destruction is quite hard to believe; this also presupposed knowledge by other leading U.S. military figures including General George C. Marshall, making it even harder to believe. The proposition that Roosevelt deliberately "set up" American forces at Pearl Harbor, as argued by Theobald and others, is based more on emotion than logic. War between the United States and Japan seemed increasingly likely by late 1941, but the precise timing and location of a Japanese attack remained a mystery to the Roosevelt administration.

across the Pacific to relieve them. Somewhere in the Far East, a great naval battle would occur to decide Pacific hegemony. In March 1940, commander of the Combined Fleet Admiral Yamamoto Isoroku scrapped the original plan—which called for using submarines and cruisers and destroyers with the Long Lance torpedo and savaging the U.S. battle fleet as it worked its way west—in favor of a preemptive strike against the U.S. fleet, which Roosevelt had shifted from San Diego to Pearl Harbor on the island of Oahu. Yamamoto believed that such an attack, destroying the U.S. carriers and battleships, would buy time for Japan to build its defensive ring. Yamamoto also misread American psychology when he believed that such an attack might demoralize the American people and force Washington to negotiate a settlement that would give Japan hegemony in the western Pacific. With both sides edging toward war, U.S. Pacific Fleet commander Admiral Husband E. Kimmel and army Lieutenant General

Walter C. Short made their dispositions for the defense of Oahu. Both men requested additional resources from Washington, but the United States was only then rearming, and little additional assistance was forthcoming.

The Japanese, meanwhile, trained extensively for the Pearl Harbor attack. They fitted their torpedoes with fins so that they could be dropped from aircraft in the shallow water of Pearl Harbor, and they also planned to use large armor-piercing shells to be dropped as bombs from high-flying aircraft. No deck armor would be able to withstand them.

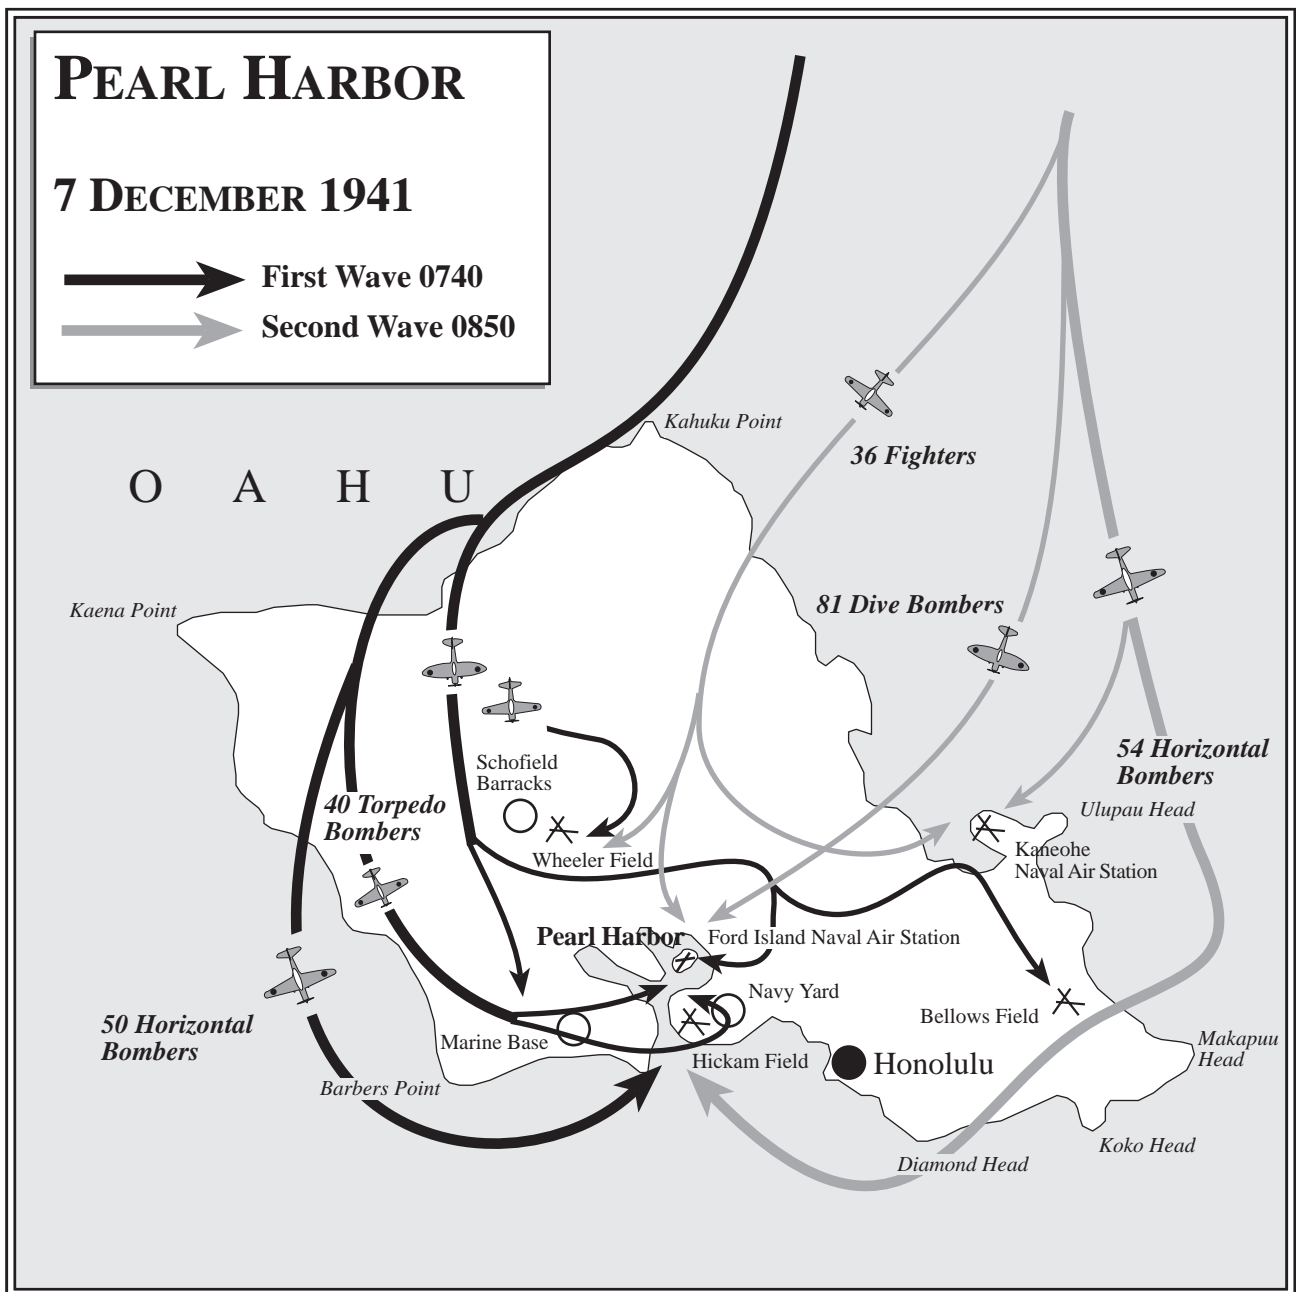

Following the expiration of a self-imposed deadline for securing an agreement with the United States, Tokyo ordered the attack to go forward. On 16 November 1941, Japanese submarines departed for Pearl Harbor, and 10 days later the First Air Fleet, commanded by Vice Admiral Nagumo Chūichi, sortied. This attack force was centered on six aircraft carriers: the *Akagi*, *Hiryu*, *Kaga*, *Shokaku*, *Soryu*, and *Zuikaku*. They car-

ried 423 aircraft, 360 of which were to participate in the attack. Accompanying the carriers were 2 battleships, 3 cruisers, 9 destroyers, and 2 tankers.

Surprise was essential if the attack was to be successful. The Japanese maintained radio silence, and Washington knew only that the fleet had sailed. A "war warning" had been issued to military commanders in the Pacific, but few American leaders thought the Japanese would dare attack Pearl Harbor. Nagumo planned to approach from the northwest and move in as close as possible before launching his aircraft, and then recover them farther out, forcing any U.S. air reaction force to fly two long legs.

Nagumo ordered the planes to launch beginning at 6:00 A.M. at a point about 275 miles from Pearl Harbor. Two events should have made a difference to the Americans but did not. Before the launch, American picket ships off the harbor entrance detected one Japanese midget submarine. Then they sank another. There were five Japanese midget submarines in the operation. Carried to the area by mother submarines, they were to enter the harbor and then wait for the air attack. Probably only one succeeded.

At 7:50 A.M., the first wave of Japanese aircraft began its attack on the ships at Pearl Harbor and air stations at Ewa, Ford Island, Hickam, Kaneohe, and Wheeler. Most U.S.

HISTORIOGRAPHICAL CONTROVERSY

Pearl Harbor, Feasibility of a Third Strike

Of all the decisions made by Japanese commanders during World War II, few have generated more debate than Vice Admiral Nagumo Chūichi's order to withdraw his First Air Fleet following the 7 December 1941 attacks on Pearl Harbor. Afterward, U.S. officials agreed that Nagumo's failure to launch a third, follow-on attack that targeted the U.S. oil depot, machine shops, docks, and power station at Pearl Harbor was a critical error. This was the position taken in the third volume of the official U.S. Navy history by Samuel E. Morison.

Historian Gordon Prange, who wrote the most exhaustive history of the Pearl Harbor attack, has Commander Fuchida Mitsuo, who commanded the Japanese strike aircraft, reporting to Nagumo that his planes had sunk four U.S. battleships and badly damaged four others, but arguing that a third strike be launched that afternoon against the oil tank farms, repair and maintenance facilities, and remaining ships. Prange claimed that Commander Genda Minoru, chief air officer of First Air Fleet, who had helped develop the attack plan, joined Fuchida in pointing out to Nagumo that the Japanese controlled the air over Oahu and the sea. But with the U.S. carriers undetected and now certainly alerted, Nagumo refused. Genda is said to have wanted Nagumo to remain in the area for several days and try to destroy the U.S. carriers.

Historian H. P. Willmott has noted in *Pearl Harbor* (2001) that Genda, who was indeed on the bridge of flagship *Akagi* during the operation, claimed that no proposal for a subsequent attack was ever made. Prange's statement was evidently based solely on his postwar interview with Fuchida. Genda did, however, note that he had told Nagumo be-

fore the attack that another strike might indeed be necessary. No attacks on port facilities were ever mentioned, but had the Japanese mounted an additional strike and destroyed the oil tanks and facilities, the Pacific Fleet would have been forced to relocate to San Diego. Nagumo had achieved his objectives at virtually no cost, and he did not want to risk his own ships. Moreover, as chief of staff of the First Air Fleet Rear Admiral Kusaka Ryūnosuke pointed out in *Rengo Kantai*, the Pearl Harbor attack was of secondary importance to overall Japanese operations in the Pacific. He therefore strongly counseled a withdrawal that would ensure a great victory and preserve the fleet to fight another day. Nagumo agreed, and the fleet returned home.

Virtually all American authors have castigated the decision. Led by Gordon W. Prange in *At Dawn We Slept*, they point out that 4.5 million barrels of fuel oil, the submarine base, and the dockyard facilities at Pearl Harbor were left untouched by Japanese attacks, and that Nagumo's scout planes would almost certainly have found the American aircraft carriers (which were at sea during the attack on Pearl Harbor) as they returned to port. The destruction of all or even part of these forces, they argue, would have paralyzed the U.S. fleet and justified whatever additional losses the Japanese incurred. The staff of Combined Fleet commander in chief Admiral Yamamoto Isoroku, author of the Pearl Harbor attack plan, pushed Yamamoto to order Nagumo to strike again rather than withdraw. Yamamoto agreed, but he was unwilling to issue what would have been a humiliating countermand to his commander in the field.

Given the material and psychological advantage held by the Japanese on 7 December, the vulnerability of U.S. forces, and the importance of the American carriers and Pearl Harbor to the outcome of the war, Nagumo let a golden opportunity slip away. He, however, shares the blame for this with Yamamoto, who should have prioritized the fuel tanks and repair facilities and included provisions for subsequent strikes in the original attack plan. By late 1942, Yamamoto regretted these oversights for, as Gordon W. Prange concluded, the Japanese failure to launch more attacks represented their "greatest strategic error of the war."

planes were destroyed on the ground. They were easy targets as Short, to avoid sabotage by the many Japanese on the island, had ordered the planes bunched together and ammunition stored separately. The attack achieved great success. Over some 140 minutes, the Japanese sank 4 of the 8 U.S. battleships in the Pacific and badly damaged the rest. Seven smaller ships were also sunk, and 4 were badly damaged. A total of 188 U.S. aircraft were destroyed, and 63 were badly damaged. The attack also killed 2,280 people and wounded 1,109. The attack cost the Japanese only 29 aircraft and fewer than 100 aircrew dead.

The chief drawbacks in the attack from the Japanese point of view were that the U.S. carriers were away from Pearl Harbor on maneuvers and could not be struck. The Japanese failed to hit the oil tank storage areas, without which the fleet could not remain at Pearl. Nor had they targeted the dockyard repair facilities. Nagumo had won a smashing victory but was unwilling to risk his ships. The task force recovered its aircraft and departed.

Yamamoto's preemptive strike was a brilliant tactical success. The Japanese could carry out their plans in the South Pacific without fear of significant U.S. naval intervention. However, the Pearl Harbor attack also solidly united American opinion behind a war that ultimately led to Japan's defeat.

PEDESTAL, Operation (3–15 August 1942)

The last contested Royal Navy operation to resupply Malta. Maintaining the effectiveness of the island's aircraft and warship strike forces against the very long and vulnerable Axis supply routes to North Africa was crucial, especially as the Allies prepared for a new offensive in the Western Desert and the invasion of Vichy French North Africa. Three of five freighters and the tanker *Kentucky* all had been lost from the Harpoon convoy in June, and Malta faced a growing shortage of supplies, particularly of fuel. Therefore, despite the very real risks of heavy losses among the merchant vessels and their escorting warships, the Allies decided to mount another convoy operation.

Axis control of the North African coast ruled out a westbound convoy. An eastbound convoy would be vulnerable to attack from Sardinian and Sicilian bases for some 400 miles, requiring moonless nights, fast merchantmen, and a heavy escort for passage. The convoy itself numbered 14 ships, including the tanker *Ohio*, carrying 85,000 tons of supplies and 12,000 tons of fuel. Close escort to Malta was provided by the British navy in the form of Force X of 4 cruisers and 11 destroyers. Additional cover as far as the Skerki Channel would come from Force Z of 2 battleships, 3 carriers with 100 aircraft, 3 cruisers, and 13 destroyers. Two oilers and a tug, escorted by 4 corvettes, accompanied the armada. The carrier *Furious*, escorted by 8 destroyers, used this opportunity to fly off 40 Spitfires to reinforce Malta before returning to Gibraltar. Nine submarines were deployed to counter possible movements by Italian surface forces.

On 10 August 1942, Axis forces received immediate confirmation that the convoy had passed through the Straits of Gibraltar. Twenty submarines (18 Italian and 2 German) were deployed to intercept, and the convoy was shadowed from the air. At 1:15 P.M. on 11 August, German submarine *U-73* torpedoed and sank the carrier *Eagle* and escaped. Two hours later, the first Axis air attack in the form of 30 aircraft from Sardinia arrived. It caused no damage to the convoy at the cost of 2 aircraft shot down.

Major air attacks from Sardinia commenced the next morning. Between 9:00 A.M. and 4:30 P.M., 134 Italian and 77 German aircraft made 3 attacks in 5 waves, slightly damaging the carrier *Victorious* and slowing the merchantman *Decaulion*, forcing it to proceed independently. The Axis forces lost 12 aircraft. Aircraft flying from Sicily entered the fray at 6:35 P.M., when 95 aircraft attacked in 6 waves. They made a glancing hit on the battleship *Nelson*, torpedoed the

destroyer *Foresight*, and bombed the carrier *Indomitable*, putting the last 2 out of action.

Force Z turned back to Gibraltar at 6:55 P.M., 20 minutes earlier than planned, but its carrier losses reduced the convoy's air cover to 6 Beaufighters from Malta. At nightfall, as the convoy entered the Skerki Channel, Italian submarines struck, torpedoing the cruisers *Cairo* and *Nigeria* and the tanker *Ohio*. The *Ohio* continued, but the *Cairo* was scuttled and the *Nigeria* turned back to Gibraltar. A cruiser and 2 destroyers were detached from Force Z as reinforcements, but before they arrived a German night air attack by 37 aircraft caused the loss of 3 freighters (including the *Decaulion*) and seriously damaged a fourth.

Axis motor torpedo boats attacked in the early hours of 13 August, devastating the convoy. By dawn it was scattered and reduced to seven merchantmen (three damaged) escorted by two cruisers and 16 destroyers. An attempted interception by Italian surface ships was foiled when the submarine *Unbroken* torpedoed 2 of 4 cruisers off Cape Milazzo. Air attacks from Sicily recommenced at 9:15 A.M., sinking 2 merchantmen and further damaging the *Ohio*. By 11:00, however, Spitfire fighter cover from Malta effectively prevented further successful attacks. Four merchantmen (1 damaged) and the *Ohio*, barely afloat, entered Valetta's Grand Harbor, bringing 32,000 tons of supplies and 11,500 tons of fuel to the garrison, sufficient for 2 months of operations. Force X successfully returned to Gibraltar through the gauntlet of Axis air, submarine, and motor torpedo boat attacks, losing only the damaged *Foresight*.

Operation PEDESTAL was at best an Axis tactical victory. The British lost 8 freighters, a carrier, 2 cruisers, and a destroyer. A carrier, a cruiser, and a destroyer also suffered heavy damage. The Italians lost 2 submarines and several light craft, and 2 cruisers, 2 submarines, and other light craft were heavily damaged. Aircraft losses on all sides were modest, considering the numbers engaged. Most significantly, however, the British, despite heavy merchant ship losses, had succeeded in resupplying Malta, which had an immediate serious impact on the Axis supply lines to North Africa at a critical moment.

Peenemünde Raid (17–18 August 1943)

Information about German operations to build the V-2, a single-stage rocket, at Peenemünde first reached the British in November 1939. In 1943, further information came to light, and reconnaissance missions were flown that produced photographic evidence of a rocket on a trailer. The Allies decided that Peenemünde had to be destroyed, and the task was assigned to the Royal Air Force (RAF) Bomber Command. The raid was launched on the night of 17–18 August 1943 and occurred only a few hours after the U.S. Army Air Forces had begun raids against Regensburg and Schweinfurt. There was also a diversionary raid against Berlin.

The British hoped as a result of the raid to delay German rocket research by many months. This would entail destroying the facility and killing as many people working there as possible, especially the scientists. Head of Bomber Command Air Chief Marshal Arthur Harris decided on a mix of precision and area bombing, and to achieve the maximum results he decided to employ the entire strength of Bomber Command. He would also use Pathfinder aircraft.

Peenemünde was 500 miles from the British bases, and the British would come under full German attack. The RAF strike on the night of 17–18 August used 596 bombers (324 Lancasters, 218 Halifaxes, and 54 Stirlings), of which 560 reached the target area. British losses were heavy, with 40 bombers shot down. The Germans lost 12 fighters.

The raid destroyed several facilities and killed between 120 and 178 people working in the facility, along with 600 inmates of a nearby forced-labor camp. Although it is impossible to judge this with any certainty, the raid probably retarded German V-2 production by up to six months. The first V-2s did not fall on London until 8 September 1944, three months after the Allied invasion of Normandy. The raid is also notable as the first time the Germans used their Schräge Musik cannon, upward-firing 20 mm guns that were mounted on Me-110 aircraft and that claimed six British bombers. Peenemünde would continue to take a heavy toll of Allied bombers the remainder of the war.

The U.S. Army Air Forces also raided Peenemünde later, and the Germans moved much of their development work elsewhere. At the end of the war, the Americans secured most of the German rocket scientists as well as Peenemünde itself, from which they gathered V-2s and related equipment, filling 300 railroad cars before destroying the site.

Peiper, Joachim (1915–1976)

German Waffen-Schutzstaffel (Waffen-SS) officer. Born in Berlin on 30 January 1915, Joachim Peiper came from a military family. He was well educated and was fluent in both

German SS Colonel Jochen Peiper, who led the combat group that killed 83 unarmed US war prisoners near Malmédy, Belgium, on 17 December 1944. (Corbis)

English and French. Peiper joined first the Hitler Youth, then the SS. Commissioned in the SS in 1936, he served on Heinrich Himmler's personal staff but sought a combat command. He was a company commander in the elite SS Liebestandarte Adolf Hitler (LAH) in the invasion of the France and the Low Countries in May 1940 and led an abortive effort to seize bridges over the Meuse. He served in the LAH in the invasion of the Soviet Union in June 1941. There his unit was noted for its military efficiency and for its extreme brutality; it was involved in massacring the inhabitants of several villages. Transferred to Italy, in September 1943 Peiper's troops destroyed the town of Boves and murdered its inhabitants.

After the LAH transferred to France, Peiper studied techniques for night movements that were later used effectively in the Ardennes Offensive (the Battle of the Bulge) in December 1944. In that offensive, SS-Obersturmbannführer Peiper headed Kampfgruppe (battle group) Peiper, which was the lead element for the 1st SS Panzer Division, itself the weighted thrust (*Schwerpunkt*) for the entire Sixth Panzer Army.

Peiper's mission was to race ahead of the main body of the division, bypass all determined resistance, and capture the bridges across the Meuse River at the small Belgian village of Huy. This would allow following forces to cross this major water obstacle en route to their planned envelopment of the Allied armies to the north.

Despite its experience and the initial disordered nature of the U.S. defenses, Kampfgruppe Peiper never achieved its objective, being thwarted in Huy on 20 December by a determined defense by U.S. Army combat engineers. After several determined efforts to break through failed, on 23 December Peiper and his 800 remaining men abandoned their equipment and retreated on foot under cover of darkness. Before then, Peiper's unit had already committed one of the most infamous massacres of the war, at Malmédy.

On 17 December, Peiper's lead elements had overrun a U.S. unit, Battery B of the 285th Field Artillery Observation Battalion. The lead element (with Peiper present) rapidly disarmed the hapless Americans and passed them along to following forces. The soldiers of these trailing units within Peiper's Kampfgruppe herded the roughly 150 prisoners into a field and then opened fire on them with machine guns and small arms, killing 83 and wounding others.

For this atrocity at Malmédy, Peiper and 69 others were tried before a U.S. military court at Dachau in the spring of 1946. On 16 July 1946, the tribunal condemned Peiper and 43 others to death, although the sentences were subsequently reduced to life in prison. Peiper was later released. On 14 July 1976, Peiper's house in the small village of Traves, France, burned in mysterious circumstances, reputedly firebombed. Although Peiper's body was never recovered, he was declared dead.

Peleliu, Battle of (15 September–27 November 1944)

Pacific island battle, one of the bloodiest of the war. Peleliu had been taken by Japan from Germany during World War I. Located about 2,400 miles south of Tokyo and having a land area of only about 7 square miles, Peleliu island was largely blanketed by a tropical forest. Before General Douglas

Marine Private First Class Douglas Lighthheart (*right*) cradles his 30-caliber machine gun in his lap, while he and his buddy, Private First Class Gerald Churchby, take time out for a cigarette, during mopping up Japanese forces on Peleliu, 14 July 1944. (National Archives)

MacArthur's forces could retake the Philippines, he would have to neutralize the Palau Islands, and Peleliu specifically, to protect his right flank. Admiral Chester Nimitz also believed that Peleliu was needed as a staging area for the invasion of Leyte. Securing the island would ensure domination of all the Palaus and neutralize Japanese submarine facilities.

Beginning on 12 September 1944, the U.S. Navy began a three-day naval and air bombardment. The naval fire-support group included 5 battleships, 5 heavy and 3 light cruisers, and 14 destroyers. Between 7 and 11 escort carriers provided combat air and antisubmarine patrol. Beginning at 8:32 A.M. on 15 September, the ground force went ashore. It consisted of the 1st, 5th, and 7th Regimental Combat Teams of Major General William H. Rupertus's 1st Marine Division. The assault was made in amphibious tractors (amphtracs and landing vehicles, tracked [LVTs]) across 600–800 yards of coral reef on the southwest corner of the island. Rupertus predicted victory in 4 days.

Colonel Nakagawa Kunio, commanding some 5,000 Japanese troops, had adopted new tactics. The Japanese did not defend at the beaches, but they were well dug in inland to make the attackers pay the highest possible price. The Japanese only had 13–15 light tanks. On the first afternoon, these were destroyed when they tried to break through the attackers's line. The Marine objective on the first day was to secure the high ground, soon known as "Bloody Nose Ridge," but that effort was only partly successful. On 16 September, the advance resumed. On 17 September, led by 1st Regimental Combat Team commander Colonel Lewis B. "Chesty" Puller, the Marines attacked the ridges and destroyed many Japanese strong points.

On 22 September, the Marines were reinforced by the U.S. Army 321st Regimental Combat Team of the U.S. Army's 81st Division, which was the floating reserve. The next day, the Americans secured the airstrip, but the Japanese then retreated to prepared positions in caves on Umurbrogol

Ridge. On 26 September, the 5th Marines seized Radar Hill, the easternmost and highest terrain on the island and site of a Japanese radar installation. By the end of September, the Japanese soldiers were compressed into a pocket only 90 yards long and 400 yards wide. In mid-October, the U.S. Army 81st Infantry Division replaced the Marines on Peleliu, but the island was not declared secure until 27 November, although some Japanese did not surrender until February 1945.

Even with total U.S. air and naval superiority, lavish naval gunfire and air support, and a 4:1 ground manpower superiority, American forces paid a heavy price for the seizure of Peleliu. U.S. casualties totaled some 9,615, with 1,656 of them killed in action. Of the 6,000 Japanese defenders, only 33 surrendered or were captured. The same Japanese tactics were replicated, more spectacularly, in their defense of Iwo Jima. The seizure of Peleliu, while costly, did neutralize some 25,000 Japanese troops on Babelthuap, the largest island of the Palaus.

Peng Dehuai (P'eng Te-huai) (1898–1974)

Chinese Communist general, later marshal. Born a peasant in Xiangtan (Hsinangt'an) in the southern province of Hunan on 24 October 1898, Peng Dehuai (P'eng Te-huai) endured poverty and hardship before enlisting in a warlord army in 1916. Military talent and an expanding social conscience inclined him first toward the Guomindang (GMD [Kuomintang, KMT], Nationalist) military, but ultimately he joined the Communist Party in 1928. Peng fought in early battles against GMD forces and survived the Long March (1934–1935).

In 1937, Peng was appointed second in command of the new Eighth Route Army, which although ostensibly under GMD control within the “United Front” was actually under

Communist General Zhu De (Chu Teh). More conventional than Mao Zedong (Mao Tse-tung), Peng favored professional soldiers over guerrillas or commissars, as well as larger, more aggressive assaults against the Japanese. Initially, he also favored more genuine cooperation with the GMD against their common foe.

In August 1940, Zhu ordered Peng to attack the Japanese in Shanxi (Shansi) and Hebei (Juprh) Provinces southwest of Beijing (Peking). In the largest Chinese offensive of the war, Peng amassed some 104 regiments, comprising 200,000 regulars and 200,000 guerrillas, who successfully destroyed blockhouses and rail lines. In October, strong Japanese counterattacks drove Peng westward into mountain retreats. Although successful in its initial phase and in countering claims that Communists were avoiding the Japanese, this “100 Regiments Campaign” cost at least 22,000 Chinese lives, compared with about 5,000 Japanese killed (although Peng put Japanese losses at 30,000). In retaliation, the invaders accelerated their “burn all, kill all, destroy all” campaign in north China, killing tens of thousands more Chinese. By late 1941, Peng had returned to Yan'an (Yenan), Shaanxi (Shensi) Province. He spent more time on political work than military campaigning for the rest of the war, gravitating more toward Mao's ideas on politics and conservation of forces. Peng mounted no more offensives against the Japanese.

Peng led the Northwest Field Army during the subsequent Civil War and led all Chinese forces in the 1950–1953 Korean War. Promoted to army marshal and minister of defense in 1955, Peng was purged in 1959 for criticizing Mao's Great Leap Forward program. During the Cultural Revolution, he was vilified, jailed, interrogated, and tortured. He died, probably from tuberculosis or thrombosis, in a military prison outside of Beijing on 29 November 1974.

Aerial view of the Pentagon, Washington, D.C., ca. 1944. (Bettmann/Corbis)

Pentagon

U.S. military headquarters located just outside Washington, D.C., in Arlington, Virginia. Constructed between 11 September 1941 and 15 January 1943 at an approximate cost of \$83 million, the massive five-sided office building consolidated the 17 separate buildings of the War Department under one roof.

The U.S. Army grew from a force of approximately 190,000 men in the fall of 1939 to more than 1.4 million by the summer of 1941. Responding to international crisis and the outbreak of war in Europe, the War Department was growing exponentially to keep up with increasing responsibilities. There would be a critical need for more space for war planning if the U.S. did indeed enter the war.

Brigadier General Brehon Burke Somervell was chief of construction for the War Department in 1941. He proposed that a single building should house the entire War Department, uniting all the military decision-makers under one roof. Somervell's personal determination, his access to President Franklin D. Roosevelt, and his highly competent engineers

and architects, who developed the original Pentagon plans in one harried weekend, all contributed to the ultimate success of the project that some referred to as "Somervell's folly."

When Somervell took his plan to Congress for the necessary appropriations, many objected to the estimated cost of \$35 million. Others objected to locating the building outside of Washington, D.C., and some believed the building would be useless once the current war crisis passed. Even Roosevelt thought the Pentagon would only temporarily house the War Department and would later be used mainly as a storage facility. Some in Congress observed that construction of such a massive building would use too many scarce materials, especially steel. Engineers replaced steel frames with reinforced concrete made from sand and gravel dredged from the bottom of the nearby Potomac River. They saved steel by constructing ramps instead of elevators from level to level within the building. Constant design changes and use of substitute materials such as fiber and wood saved large quantities of other metals during construction.

Construction got off to a slow start but speeded up considerably after the Japanese attack on Pearl Harbor created a

new urgency to occupy the building. Somervell brought in Colonel Leslie R. Groves, who would later head the MANHATTAN Project, to oversee construction. Two of the five building sections were completed by the following spring, and the first War Department employees, 300 Ordnance Department workers, moved into the first section at the end of April 1942.

In 1989, the Pentagon was placed on the National Register of Historic Places. Renovation and restoration, partly because of age and partly because of the terrorist attack of 11 September 2001, continues on the 60-year old building, still a symbol of U.S. military power.

Percival, Arthur Ernest (1887–1966)

British army general who commanded in Malaya in 1941 and 1942. Born at Aspenden, Herts, on 26 December 1887, Arthur Percival was educated at Rugby School. He was in business in London from 1907 to 1914 and joined the British army as a private at the beginning of World War I, progressing through the ranks in the course of his career to general. He fought in France in 1915, was wounded in 1916, and won two Distinguished Service Orders and the French Croix de Guerre. He was also promoted to captain.

After the war, Percival served in north Russia and in Ireland (1920–1922), where he was mentioned in dispatches twice and received an Order of the British Empire award. He attended Staff College at Camberley and served in Nigeria. He also attended the Imperial Defence College course in 1935. Percival won promotion to lieutenant colonel in 1932 and to colonel in 1936. Percival then served two years (1936–1938) in Malaya as a staff officer. He returned to Britain to take charge of Aldershot in 1938 and 1939. Promoted to brigadier general in 1939, Percival assumed command of the 43rd Division of the British Expeditionary Force in France. Following the Dunkerque evacuation (May–June 1940), he had charge of the 44th Division in Britain.

Largely because of his previous service there, Lieutenant General Percival took command of British forces in Malaya in July 1941. British defenses in the area depended on controlling the sea and air. His defenses inadequate, Percival requested six additional divisions and extra air support. Although he only received two and a half poorly trained divi-

sions, Percival did little to prepare for an invasion, especially in training his men.

Japanese forces commanded by Yamashita Tomoyuki invaded Malaya in early December 1941, and on 27 January 1942 Percival ordered a general withdrawal from the Malay Peninsula to Singapore Island. Percival rejected suggestions that the British construct defensive positions on the northern side of the island because he feared this would adversely affect the morale of his troops and civilians. The Japanese invaded Singapore proper in early February 1942 and drove back the unprepared British forces. British Prime Minister Winston L. S. Churchill demanded Percival hold the island to the last, but the water supply was dangerously low and the defenses inadequate. Although British troops outnumbered the Japanese forces, who were also racked by disease, on 15 February 1942, Percival was bluffed into surrendering, in large part to spare civilian casualties. In Britain's most humiliating defeat of the war—some would argue in its history—130,000 British, Australian, Indian, Malay, and local troops became prisoners of the Japanese.

Percival spent the next four years as a prisoner of war. On the defeat of Japan, he was released from captivity in Malaya and brought to Tokyo to witness the formal Japanese surrender on board the battleship *Missouri* on 2 September 1945. Percival retired from the army in 1946. He published *The War in Malaya* in 1949. He died in London on 31 January 1966, a broken man.

Pétain, Henri Philippe (1856–1951)

French army general and chief of state of the Vichy government of France during the German occupation. Born on 24 April 1856 in Cauchy-à-la-Tour, Henri Pétain graduated from Saint Cyr in 1878 and was commissioned in the army. He served as an officer in a line regiment and then on the staff at the École de la Guerre. His career was less than distinguished, and Colonel Pétain was nearing retirement age at the beginning of World War I.

Vichy chief of state Henri Philippe Pétain. (Library of Congress)

One of the few experts in the French army in defensive warfare, Pétain then advanced quickly in rank. His leadership in the 1916 Battle of Verdun won him a corps command and hero status in France. In May 1917, he was elevated to command of the French army. Named a marshal of France in 1918, Pétain remained in charge of the army until his retirement in 1931. He was briefly minister of war in 1934.

In 1939 and 1940, Pétain was French ambassador to Spain. In the desperate circumstances of the Battle of France in May–June 1940, Pétain was recalled to serve as vice premier to Paul Reynaud to lend his personal popularity to the war effort. He ended up moving the government in another direction. Believing the situation was hopeless, he took over as the last premier of the Third Republic, determined to end the fighting on the best terms possible.

On the conclusion of an armistice with the Germans, Pétain became chief of state of the unoccupied part of the country with its capital at Vichy. Pétain, who at first enjoyed virtually unanimous French support, established a frankly authoritarian government that accepted the principle of collaboration with the Germans. In October 1940, Pétain met with Adolf Hitler at Montoire-sur-Loire. Pétain consistently made concessions to Germany in the form of cooperation, workers, and matériel to protect France and its colonies. This included lim-

ited cooperation with the Germans in the deportation of Jews and hunting down anti-Nazi operatives in unoccupied France.

Following the Allied invasion of North Africa in Operation TORCH, German forces occupied the remainder of France, and Pétain's government lost what little authority it had once enjoyed. He continued to urge his countrymen to follow a neutral course, even insisting that they not aid the Allies following the Normandy Invasion of June 1944.

Removed to Germany in August 1944, Pétain voluntarily returned to France in April 1945 to defend his policies. He claimed he had been trying to dupe the Germans and buy time for France to recover. Put on trial for treason, Pétain was convicted in August and sentenced to death. Head of the Provisional Government General Charles de Gaulle commuted the sentence to life imprisonment because of Pétain's contributions in World War I and the fact that Vichy had at least kept alive some French independence. Pétain died a prisoner on the Isle d'Yeu on 23 July 1951. There have been several attempts by French rightists to remove his remains from that place and rebury them at Verdun.

Philippine Sea, Battle of the (19–21 June 1944)

Fought between the Japanese and U.S. navies and the largest aircraft carrier engagement in history. The Battle of the Philippine Sea virtually destroyed what remained of the Japanese naval aviation capability. In June 1944, U.S. forces launched Operation FORAGER to capture the Mariana Islands for use as bases for Boeing B-29 strategic bombing raids on Japan. On 15 June, U.S. Marines invaded Saipan, northernmost of the principal Marianas. Admiral Raymond A. Spruance had overall command. His Fifth Fleet and its main strike force, Vice Admiral Marc A. Mitscher's Task Force 58, provided support and protection. Task Force 58's assets included 7 fleet carriers, 8 light carriers, 7 battleships, 8 heavy cruisers, 13 light cruisers, 69 destroyers, and 956 aircraft.

Also on 15 June, the Japanese First Mobile Fleet under Vice Admiral Ozawa Jisaburo emerged from the Philippines

A Japanese heavy cruiser under attack by U.S. Navy carrier-based aircraft. The Japanese ship was sunk. (Corbis)

through the San Bernardino Strait and headed northeast in Operation A-gō, which was intended to draw the U.S. fleet into a decisive battle that would reverse the course of the war in the Central Pacific. Assembled over the preceding month, Ozawa's force comprised 90 percent of Japan's surface naval strength and consisted of 5 fleet carriers, 4 light carriers, 5 battleships, 11 heavy cruisers, 2 light cruisers, 28 destroyers, and 473 aircraft. Ozawa believed his inferior aircraft numbers would be offset by the greater range of his planes and by the presence of 90 to 100 land-based aircraft on the islands of Guam, Yap, and Rota, with which he planned to attack the U.S. carriers to initiate the battle. As Ozawa's own carriers came into range, his planes would launch a second strike, refuel and rearm on the islands, and then attack the Americans a third time while returning to the Japanese fleet.

The U.S. submarine *Flying Fish* reported the Japanese sortie from the Philippines. Leaving his older battleships and

several cruisers and destroyers to protect the Saipan beach-head, Spruance joined Mitscher's Task Force 58 on 18 June to search for Ozawa. Misled by the commander of the Japanese land planes and unaware that most of them had been destroyed by attacks from Mitscher's undamaged carriers, Ozawa launched four attack waves on the morning of 19 June, only to lose 346 planes in what the victors called the "Great Marianas Turkey Shoot." That same day, the U.S. submarine *Albacore* sank the *Taiho*, Japan's newest and largest carrier and Ozawa's flagship; another submarine, the *Cavalla*, sank the Japanese fleet carrier *Shokaku*.

Spruance still did not know Ozawa's precise location, and he rejected Mitscher's urging that he move offensively toward the west for fear that the Japanese might flank him and get between him and the Saipan landing sites. Aerial night searches were deemed impractical because aircrews were exhausted and the moon was new. Although Mitscher

dispatched extensive search missions through the morning and early afternoon of 20 June, not until 4:00 P.M. were Ozawa's ships finally sighted, at the extreme range of the U.S. aircraft. Despite his realization that his planes would return to their carriers in darkness and that many of them would probably exhaust their fuel beforehand, Mitscher ordered a massive strike. It found Ozawa's ships shortly before dark and sank another fleet carrier, the *Hiyo*, and 2 oilers; severely damaged 3 other carriers, a battleship, a heavy cruiser, and a destroyer; and eliminated all but 35 of the remaining Japanese aircraft.

The return flight of the U.S. aircraft became one of the most dramatic episodes of the Pacific war. Only 20 of the 216 aircraft sent out earlier had been lost in action, but 80 were lost in ditchings or crash landings. Ignoring the risk of Japanese submarines, Mitscher ordered his carriers to turn on all their lights to guide his fliers, and efficient search-and-rescue work recovered all but 49 airmen. Spruance pursued the retreating Japanese from midnight to the early evening of 21 June, but he was slowed by his destroyers' need to conserve fuel, whereas Ozawa accelerated the withdrawal begun after his losses on 19 June.

Although it effectively destroyed Japanese naval air power, the Battle of the Philippine Sea quickly became controversial; members of Mitscher's staff condemned Spruance for not steaming farther westward on the night of 18–19 June to give Mitscher a more favorable launch position. Mitscher, for his part, was criticized for not sending out night searches on 19–20 June that might have found Ozawa sooner and allowed the Americans more daylight for their air attack on the Japanese fleet, perhaps even creating conditions for a surface engagement. Such a scenario, however, might have resulted in much greater losses for the U.S. side with no more strategic benefits than were actually gained.

John A. Hutcheson Jr.

Philippines, Japanese Capture of (8 December 1941–9 June 1942)

At the beginning of the Pacific war, Japanese leaders sought to capture the Philippine Islands to control the islands' resources and to protect the Japanese supply route to the Netherlands East Indies (Indonesia). In early December 1941, U.S. forces in the Philippines numbered 19,116 U.S. regulars, the excellent 12,000-man Philippine Scouts, a 3,000-man Philippine Constabulary, and 107,000 poorly trained and poorly equipped recently drafted Philippine army troops.

Much of Admiral Thomas C. Hart's U.S. Asiatic Fleet, already weak, had been withdrawn from the Philippines. Only 4 destroyers, 28 submarines, small vessels, and some torpedo boats remained. U.S. air assets and air warning capability in the islands were woefully inadequate. The Far East Air Force in the islands numbered about 277 aircraft, about half of which were obsolete. There were 35 B-17s and more

Japanese troops celebrate the capture of Bataan, Philippine Islands, 1942. (Captured Japanese photograph; U.S. Army; Library of Congress)

than 100 modern P-40 fighters. U.S. commander in the Philippines General Douglas MacArthur hoped to use his limited air and naval assets to savage any Japanese seaborne attack and was confident that he could defeat any actual landing force, should the Japanese get ashore.

The original U.S. plan for the defense of the Philippines was based on the premise that troops there could hold out against the Japanese until the Pacific Fleet could force its way across the ocean to their relief. U.S. ground troops were to withdraw into the Bataan Peninsula and fortified island of Corregidor until the fleet could arrive. The plan called for prepositioned depots on the Bataan Peninsula and Corregidor sufficient for 43,000 men on Bataan and 7,000 on Corregidor for 180 days.

MacArthur, convinced that he could defeat any Japanese invasion, scrapped this plan in favor of a forward defense, but resources scattered in this effort were insufficient to defend the entire islands. Most significant was Washington's realization that no relief expedition could be sent out immediately after the start of hostilities. The result was a great deal of confusion.

When word was received in the Philippines of the Japanese attack on Pearl Harbor, MacArthur's air force commander, Major General Lewis H. Brereton, sought permission for a strike on Formosa. Brereton was refused permission to see MacArthur, but he received a message from MacArthur's chief of staff, Brigadier General Richard Sutherland, that he was to wait for an overt act by the Japanese. Brereton suggested that the Japanese attack on Pearl Harbor was such an act. Although MacArthur eventually granted his permission for a strike on Formosa, it came too late. At 12:30 P.M. on 8 December 1941, Japanese aircraft from Formosa struck Clark and Iba Airfields. Without an effective air warning system in the Philippines, many U.S. aircraft, including about half of the B-17s and a third of the fighters, were destroyed, most of them on the ground, at a cost of only 7 Japanese aircraft. Unlike the Japanese attack on Pearl Harbor, there never was an investigation into the attacks on Clark and Iba Airfields, despite a loss of life comparable to that at Pearl Harbor.

Tokyo assigned the task of conquering the Philippines to Lieutenant General Homma Masaharu's Fourteenth Army based on Formosa. Many of Homma's 43,100 men had fought in China, and Tokyo was optimistic that victory in the Philippines would be quick. The timetable for conquest of the islands was only 50 days. MacArthur's prewar goal, to be reached by April 1942, was 200,000 men under arms, but on 15 December 1941, he had some 120,000 Philippine army troops in *all* the Philippines and roughly 31,000 U.S. troops and Philippine Scouts. MacArthur had claimed that he could defend the entire Philippines against Japanese invasion. But most of the regulars were kept back near Manila, with the result that likely landing sites along the extensive coastline

were covered only by poorly trained Filipino troops. This meant that the Japanese would encounter little resistance in getting ashore.

On 8 December 1941, the first Japanese troops landed on Bataan Island. On 10 December, Japanese forces invaded Aparri and Viecan on northern Luzon. Two days later, they came ashore at Legaspi in southern Luzon. The bulk of Homma's forces landed at Lingayen Gulf beginning on 22 December. Homma commanded in the Philippines a force, at peak strength, of some 65,000 men.

With the Japanese troops ashore and moving on Manila, on 23 December MacArthur reverted to the original Bataan defense plan, without, however, adequate preparation for its implementation, especially in prepositioning of supplies and food. MacArthur directed his North Luzon Force field commander, Major General Jonathan Wainwright, to stage a fighting withdrawal along five preplanned defensive lines into the Bataan Peninsula. On 26 December, Manila was declared an open city. Japanese forces entered it on 2 January 1942.

MacArthur's troops executed an effective withdrawal and were established on the Bataan Peninsula by 6 January. Japanese strength on Bataan was only about 30 percent of their own (some 23,200 Japanese to 80,000 defenders). The Bataan Peninsula is only about 20 by 25 miles in size. MacArthur was handicapped by having to feed more than 110,000 people there and on Corregidor, including civilians, rather than the 43,000 in the original plan. Supplies were totally inadequate, many dumps having been lost in the hasty withdrawal, so that the defenders in the peninsula immediately went on half rations. Moreover, the peninsula was extremely malarial. By late March, barely a quarter of the defenders were able to fight.

Washington decided against attempting to relieve the position. Rather than yield a tremendous propaganda advantage to the Japanese with the capture of the U.S. commander in the Far East, on 22 February President Franklin D. Roosevelt ordered MacArthur to Australia. He departed Corregidor on 11 March. Derisively referred to by many of the defenders as "Dugout Doug" for his failure to leave Malinta Tunnel on Corregidor (he visited Bataan but once), MacArthur later received the Medal of Honor. Wainwright assumed the Philippines command.

By early April, conditions in the Bataan Peninsula for the defenders were desperate, prompting the commander on Bataan, Major General Edward P. King, to surrender the Filipino and American forces there against direct orders from Wainwright. After a major Japanese offensive that shattered his army—and facing widespread starvation, disease, and no hope for victory—King surrendered his 70,000 men on 9 April.

The Japanese forced the weakened survivors of Bataan to march 55 to 60 miles to prisoner-of-war camps. Most of the

prisoners were sick and hungry, and there was little food. In fairness to the Japanese, they were unprepared for the large influx of prisoners, but it is also true that they behaved with a shocking disregard of the norms of warfare and even denied the prisoners water. Up to 650 Americans and 5,000–10,000 Filipinos died in the Bataan Death March to Camp O'Donnell. Another 1,600 Americans and 16,000 Filipino prisoners died in the camp in the first 6 to 7 weeks of their imprisonment.

The fight then shifted to Corregidor with its fewer than 15,000 defenders. Only 2 miles separate the island from the Bataan Peninsula, enabling the Japanese to bombard it with artillery and attack it from the air. On the night of 5–6 May, the Japanese staged a successful amphibious assault accompanied by tanks. On 6 May, Wainwright, his resources exhausted and with less than 3 days of water remaining, ordered all U.S. forces throughout the Philippines to surrender to avoid unnecessary casualties. Formal resistance ended on 9 June.

The Japanese conquest of the Philippines was a major blow to American morale and assisted the Japanese in their effort to dominate the southwest Pacific and control that region's resources. What was remarkable about the Philippine Campaign was not its conclusion but the skill and determination of the defenders, who held out for six months. General Homma was called home to Japan in disgrace. Perhaps the greatest surprise was the loyalty of the Filipinos to the United States. The Japanese expected the Filipinos to rally to them, leaving the Americans to fight alone. But after its first hasty retreats, the poorly trained and inadequately equipped Philippine army settled down and fought well. That army and the vast majority of the Filipino people remained loyal to the United States during the campaign and the long Japanese occupation that followed.

Philippines, Role in War

The Philippines are strategically located between Formosa (Taiwan) and the Netherlands East Indies. In 1941, the nearly 7,100 islands that comprise the Philippines had a population of some 17 million people of many different languages. There were also many religions, although Catholicism predominated. The United States had acquired the Philippine Islands as a consequence of the 1898 Spanish-American War.

The United States decided to grant independence to the Philippines in 1946 after an interim period, and under the Tydings-McDuffie Independence Act of 1934, the government of the islands was changed in 1935. In March 1935, President Franklin D. Roosevelt approved a new constitution for the islands, which the Filipinos accepted in May. In September, Manuel Quezon was elected president, and in November, when he was inaugurated, the Commonwealth of the Philippines was formally established. Quezon was reelected president in November 1941.

Quezon wished to strengthen the defenses of the Philippines against a possible attack by Japan. In 1935, he invited General Douglas MacArthur to the islands as his military adviser, and the following year, Quezon appointed MacArthur field marshal of the Commonwealth forces. Although U.S. war plans called for defense of the Philippines, the U.S. Congress had done little to provide funding. In 1941, the Philippine army numbered only about 90,000 men, four-fifths of them Filipinos and the rest U.S. troops. The Philippine navy consisted of 2 torpedo boats, and the air force had 40 aircraft. With war threatening, in July 1941 these forces were integrated into the new U.S. Army Forces in the Far East, commanded by Lieutenant General MacArthur. The principal ground element of this force was Major General Jonathan Wainwright's Philippine Division, consisting of 8,000 Philippine Scouts commanded by U.S. officers, a U.S. infantry regiment of 2,000 men, and an artillery regiment. In August 1941, MacArthur began to mobilize and train the Philippine army's reserve forces of 10 lightly armed infantry divisions.

The Japanese attacked the Philippine Islands, beginning with air raids on Clark and Iba Airfields, on 8 December 1941. Japanese forces then landed and drove on Manila, forcing MacArthur to withdraw into the Bataan Peninsula. U.S. and Filipino forces fought surprisingly well and delayed the Japanese timetable. Cut off from the outside and starved of resources, even food, the Americans were forced to surrender on 9 April 1942. The fortified island of Corregidor fell on 6 May. President Roosevelt had already ordered MacArthur to Australia. President Quezon established a government-in-exile in Washington.

Artillerymen of Battery C, 90th Artillery, lay down a barrage on Japanese positions in Balete Pass, Luzon, Philippine Islands, 19 April 1945. (National Archives)

Japanese claims of Asian solidarity rang hollow with their practice of treating the Filipinos with contempt and brutality. The Japanese were surprised to discover that most Filipinos remained loyal to the United States. As early as 1943, Tokyo announced its plans to grant independence to the Philippines. Japanese leaders hoped that this would diminish anti-Japanese sentiment and allow some Japanese troops to be shifted elsewhere, but the Japanese also insisted that any grant of independence be accompanied by a declaration of war by the Philippines against the United States. Under Japanese pressure, in September 1944 the puppet Philippine government headed by Jose Laurel, former minister of the interior, declared war on the United States.

As elsewhere, there were collaborationist elements, but resistance activities also occurred. Resistance on the big island of Luzon was led by the Filipinos, Americans, and Hukbalahap (“Huks,” People’s Anti-Japanese Army) guerrillas. Although they did not seriously disrupt the Japanese occupation, they proved an irritant to the Japanese, provided intelligence information, and greatly assisted in the reconquest of the islands by U.S. troops.

Following U.S. landings in the Philippines in October 1944, the Philippine government was reestablished in the islands at

Tacloban, Leyte, on 23 October. U.S. forces then invaded Luzon, and following two weeks of heavy fighting that devastated the city, retook Manila in February. Laurel and some other collaborators fled to Japan, where they eventually surrendered to U.S. authorities. On 5 July 1945, MacArthur announced that the Philippines had been liberated. The Philippine Congress met on 9 June for the first time since 1941, and in September it ratified the United Nations charter.

Following the liberation, MacArthur, much to the surprise of many, adopted a lenient attitude toward the collaborators and personally pardoned Manuel Roxas, a prominent collaborator who won election to the presidency in 1946. Sporadic violence continued in the Philippines after the war, fed by serious economic problems and separatism. Some guerrilla warfare occurred, led by the Huks. Independence came to the islands on schedule on 4 July 1946. The Philippines then concluded free trade agreements with the United States, secured significant funding for reconstruction, and granted long-term leases on military and naval bases to the United States.

Philippines, U.S. Recapture of (20 October 1944–15 August 1945)

In July 1944, U.S. President Franklin D. Roosevelt met at Pearl Harbor with his two Pacific Theater commanders, General Douglas MacArthur and Admiral Chester W. Nimitz. MacArthur insisted that the next U.S. move in the Pacific be the liberation of the Philippine Islands. The islands were, he

argued, U.S. territory, and he had vowed, "I shall return." Nimitz, supported by chief of naval operations Admiral Ernest P. King, argued in favor of an assault farther north, on Formosa. The former made political sense, the latter military sense. Either move would, however, have the same advantage of cutting off the Japanese home islands from the oil of the Netherlands East Indies (Indonesia). Roosevelt decided to approve two operations: the first would be against the Philippines; it would shift the second—Nimitz's invasion—farther north, to Okinawa.

Recapture of the Philippines would allow the United States to cut Japanese access to oil from the Netherlands East Indies. It also would provide vital strategic bases for further Allied operations against Japanese forces to the north. The plan as approved called for MacArthur's forces to attack Mindanao, and those under Nimitz struck Yap. The two would then combine for an assault on Leyte. MacArthur's forces would next invade the big Philippine island of Luzon, after which Nimitz's forces would move against Iwo Jima and Okinawa. Unfortunately, there was no unity of command for the U.S.

invasion of Leyte. Japanese commanders recognized the vital importance of the Philippines, and they were prepared to commit the bulk of their remaining naval assets to thwart a U.S. effort to recapture the islands. The U.S. invasion of Leyte in fact prompted the Battle of Leyte Gulf (23–26 October 1944), the largest naval battle in history.

The landings on Leyte began on 20 October; 132,000 men of Lieutenant General Walter Krueger's Sixth Army put ashore the first day. MacArthur landed with the third wave, accompanied by members of the Philippine government and press. Capable Japanese General Yamashita Tomoyuki, the conqueror of Malaya, had overall command of the defenders. Although some 350,000 Japanese army troops garrisoned the Philippine islands, only the 16th Division of 16,000 men was on Leyte. The invaders had an accurate picture of Japanese strength and dispositions, thanks to Filipino guerrillas. Filipino support was a morale-booster for U.S. forces.

The Japanese did not fight for the beaches. They chose instead to contest the advance inland and away from naval gunfire. The U.S. drive was slowed by heavy rains, skillful

Japanese delaying actions, and rugged terrain. Yamashita also reinforced Leyte with some 45,000 additional troops sent from Luzon and the Visayas. U.S. aircraft and ships gradually severed this supply line, and the U.S. 77th Infantry Division also went ashore on the west coast of Leyte. Organized Japanese resistance ended on 25 December. The United States had suffered 15,584 casualties; Japan's losses were more than 70,000. There were no survivors from the Japanese 16th Division, which had conducted the infamous Bataan Death March. On 15 December, the Americans seized the island of Mindoro in the northern Visayas, just south of Luzon, for use as an advance air base for the strike against Luzon.

Yamashita had 250,000 troops on Luzon, but an Allied deception caused him to withdraw most of them south toward Manila. Meanwhile, kamikaze pilots took a heavy toll on Rear Admiral Jesse B. Oldendorf's gunfire-support group in Lingayen Gulf, sinking an escort carrier and damaging a battleship, an escort carrier, one heavy and four light cruisers, and other vessels. Nonetheless, on January 9, 1945, Krueger landed 68,000 men of his Sixth Army almost unopposed at Lingayen Gulf in northern Luzon. Then, when Yamashita had committed his forces to the northern threat, Lieutenant General Robert E. Eichelberger's Eighth Army landed in southern Luzon and struck north. Handicapped by shortages of equipment, transport, and air support, Yamashita organized his forces on Luzon into three main groups and settled in for a static defense.

Japanese Rear Admiral Iwabuchi Sanji received Yamashita's order too late to withdraw from Manila and ordered his 17,000-man Manila Naval Defense Force to hold the capital to the last. The Battle for Manila lasted from 3 February to 4 March 1945 and saw the destruction of much of the city and an estimated 100,000 civilian casualties. Afterward, the United States held Yamashita responsible for Japanese atrocities committed in Manila and executed him as a war criminal. At least 16,655 Japanese were killed in the battle. Most of Luzon was secured by July.

With no hope of victory or rescue, most Japanese stoically fought on. With his force down to 50,000 men, Yamashita surrendered on 15 August. The U.S. campaign for the Philippines was skillfully fought with proportionally few U.S. casualties, an exception to the general rule in warfare that attackers generally suffer higher losses than defenders. The Battle for Luzon cost Japan some 205,535 killed and 9,050 captured. U.S. losses were 8,310 killed and 29,560 wounded.

Meanwhile, from February to August, Eichelberger's Eighth Army liberated the Visayas and southern Philippine Islands. Simultaneously, Australian troops took the remaining Japanese strongholds on New Guinea and in the Bismarcks and Solomon Islands.

Phillips, Sir Tom Spencer Vaughan (1888–1941)

British navy admiral. Born on 19 February 1888 in Falmouth, England, Tom Phillips became a naval cadet in 1903. He joined the navigation branch of the service and served on the cruiser *Bacchante* during the 1915 Dardanelles Campaign, but he spent much of the rest of World War I in the Far East.

Phillips attended the Naval Staff College (1919–1920); served on the Permanent Advisory Commission for Naval, Military and Air Questions of the League of Nations (1920–1922); and was promoted to captain in June 1927. He ended a three-year tour on the operational staff of the Royal Navy Mediterranean command in May 1928. Phillips was assistant director of plans at the Admiralty from 1930 to 1932, served with the East Indies squadron from 1932 to 1935, and was director of plans at the Admiralty from 1935 to 1938. In April 1938, Phillips commanded the Home Fleet destroyer flotillas. He was promoted to rear admiral in January 1939 and served as deputy chief of the Naval Staff during 1939–1941.

First sea lord and chief of the Naval Staff Sir Dudley Pound selected Phillips as deputy chief over several more senior officers. At first, Phillips had the confidence of Prime Minister Winston L. S. Churchill, who recommended him for the rank of acting vice admiral in February 1940. The rapport between the two men gradually eroded, however. Phillips opposed Churchill's proposal in September 1940 for retaliatory bombings of German cities. He also opposed Churchill's preference in March 1941 to divert scarce forces from North Africa to bolster Greece. His personal contact with the prime minister practically ceased thereafter. An intelligent, hardworking officer, Phillips was also self-assured, lacked combat experience, and did not appreciate the need for air cover. He was a short man, nicknamed "Tom Thumb" by some.

Phillips was appointed commander in chief of the Eastern Fleet in May 1941, but he retained his duties as vice chief of the naval staff until October, when he took up his new command with the acting rank of admiral. He sailed for the Far East on 25 October in the new battleship *Prince of Wales*, which was joined en route by the old battle cruiser *Repulse*. Phillips arrived in Singapore on 2 December, only to face the Japanese attacks on Malaya on 8 December.

Phillips had a difficult choice. He could attempt to oppose the Japanese amphibious landings in Malaya, or he could remain in Singapore. Phillips gambled on the offensive, and his Force Z—the *Prince of Wales*, *Repulse*, and four old destroyers—sailed on 8 December with the hope that radio silence, bad weather, and the element of surprise might enable him to catch the Japanese transports. His plan had some merit, as the *Prince of Wales* was stronger than any Japanese ship. Phillips also knew that the Japanese had no aircraft carriers, and he observed that the Japanese were taking risks in pushing their troopships forward. An unknown factor remained the strength of Japanese land-based aircraft, their range from their recently captured airfields, and the availability of British air cover. On 9 December, Phillips was advised he would have no friendly air cover, but he elected to press on. Phillips had great faith in the antiaircraft armament of the *Prince of Wales* and did not believe land-based air power could sink underway capital ships. No capital ship had yet been sunk at sea by aircraft.

Discovered by reconnaissance aircraft on 9 December, Phillips finally opted to turn around, but his Force Z was attacked by a large formation of Japanese land-based naval aircraft on the morning of 10 December. Within two hours, both capital ships were sunk in what was Britain's worst single naval defeat of the war. Phillips went down with his ship. His decisions of 9–10 December to maintain radio silence and not to request air cover remain open to criticism and debate.

Pick, Lewis Andrew (1890–1956)

U.S. Army general. Born at Brookneal, Virginia, on 18 November 1890, Lewis Pick graduated from the Virginia Polytechnic Institute in 1914 with a degree in civil engineering. Pick served with the U.S. Army 23rd Engineers in France during World War I. Commissioned into the U.S. Corps of Engineers in 1917, Pick was stationed in the Philippines from 1921 through 1923, where he established a Filipino engineer regiment.

When he returned to the United States, Pick assisted with flood control work and the construction of dams. He was in the New Orleans office as district engineer when catastrophic floodwaters surged down the Mississippi River in 1927. From 1928 to 1932, Pick was on Reserve Officers' Training Corps duty at Texas A&M University. He graduated from the Command and General Staff School in 1934 and taught tactics there until 1938. In 1939, he graduated from the Army War College and was assigned to the Corps of Engineers' Ohio River Division. In December 1941, Pick was promoted to temporary colonel. Pick became the Missouri River Division engineer in April 1942. Working with W. Glenn Sloan of the Bureau of Reclamation, Pick sought ways to prevent the Missouri River from overflowing its basin. The Pick-Sloan plan that incorporated several of his ideas for the Missouri River basin went into effect in 1944.

In October 1943, Pick was deployed to the China-Burma-India Theater, where he replaced Brigadier Raymond A. Wheeler in directing engineers who were building the Ledo Road, which came to be known as "Pick's Pike." This crucial land supply route extended from northern India through Burma to China and tied in with the old Burma Road to supplement the Himalayan air routes. The difficult jungle terrain seemed almost impossible for road construction, but Pick persevered. Although he and the majority of his workers were sickened by malaria, Pick pushed the main road ahead while also providing for construction of side roads for combat troops to pursue the Japanese. It took slightly more than two years to complete the route. Pick, promoted to brigadier general in February 1944, led the first convoy into Kuming on 4 February 1945.

Theater commander General Joseph Stilwell praised Pick's devotion to his troops and said that he "covered the road by foot, jeep, and liaison plane twenty-four hours a day. He knew every rock quarry, every mudhole and slide, every curve, every cutback and bridge." Pick's men also built an airfield for Merrill's Marauders during the Battle of Myitkyina. Pick was promoted to major general in March 1945.

Following the war, Pick resumed his peacetime position as division engineer in Missouri until March 1949, when

U.S. Army Major General Lewis A. Pick, 1947. (Photo by Jerry Cooke/Time Life Pictures/Getty Images)

President Harry S Truman named him chief of the Army Corps of Engineers. Promoted to lieutenant general in 1951, Pick headed the Corps of Engineers until his retirement in November 1952. Pick moved to Auburn, Alabama, and died in Washington, D.C., on 2 December 1956.

Pistols and Revolvers

Modern pistols are magazine-fed hand weapons that fire semiautomatically each time the trigger is pulled. Most pis-

tols have a minimum capacity of at least eight rounds, although there are variations. A revolver has a rotating set of chambers (normally six), which are each loaded with one cartridge. The action is fired by pulling on the trigger, which cocks the weapon and rotates the chamber to the next live round (single-action), or by cocking first and then firing (double-action).

The pistol or revolver is a single-handed weapon with a short barrel firing a low-energy cartridge. This means it is largely useless at ranges in excess of about 30 yards, and very few soldiers can use it effectively except at the closest belt-buckle range. In the period prior to World War II, the pistol or revolver was the side arm of officers and cavalrymen and was regarded as a weapon of last resort.

Pistols have been used by soldiers since firearms were first invented, but the ineffectiveness of the weapon at any but the shortest range has always been its drawback. Long-barreled weapons of the nineteenth century suffered from loss of penetration power as the cartridge was low-powered. Attempts have been made to increase accuracy by firing "super" or magnum cartridges, but the short barrel makes accuracy questionable.

In World War II, a development in firearms design reduced the importance of the pistol still further; this was the submachine gun, which fired the same cartridge as the pistol but from a heavier, longer-barreled weapon, increasing accuracy to about 100 yards. As with the long-barreled weapons mentioned, killing power with standard pistol cartridges was limited. The Soviets adopted the submachine gun to good effect, arguing that a heavy weight of fire at short range was far more effective than single rifle shots at longer ranges.

Nevertheless, the pistol was still issued. The U.S. Army used the Colt M1911 .45 caliber (inch) pistol, which was carried by officers, noncommissioned officers, and enlisted men. The pistol was intended to be a personal side arm that was easy to carry and use and that was with the owner at all times, being in a holster on his belt. The .45 ACP cartridge had significant power, capable with one shot of disabling or killing the targeted individual. Lieutenant General George S. Patton's famed six-shooters were certainly never used in anger, but they perpetuated the American myth the spirit of the frontier was alive and well and perhaps enshrined within the general himself. The Americans also used the Smith and Wesson M1917 revolver, derived from the British .38/200 revolver.

Europe was still married firmly to the 9 mm Parabellum cartridge, invented in Germany, which was fired by a variety of weapons, including the famous Luger Pistole '08 and the Walther P38. Most nations in Europe used this caliber and cartridge for the simple reason that it was effective and was a disabling cartridge if not a true killer. The standard Italian-issue side arm was the well-made 9 mm Beretta Model 1934 with seven rounds. The French used the old (1892) revolver, the so-

A soldier holding a U.S. Army Colt automatic .45-caliber pistol. (Photo by William Vandivert/Time Life Pictures/Getty Images)

called “Lebel” of 8 mm, but in the 1930s they introduced two new 7.65 mm pistols: the M1935A and M1935S each carried eight rounds. The British, idiosyncratic to the last, persisted in issuing a rimmed .38 caliber cartridge-firing revolver to their officers and mechanized troops, although many were rearmed with the Sten (9 mm) or the Thompson (.45) submachine gun.

On the Eastern Front, troops on both sides were armed with pistols as well as rifles or submachine guns, particularly when engaged in house-clearing or close-terrain operations, because of the close-quarters element of such fighting. German medical troops (banned from carrying weapons by the Geneva Convention of 1929) carried pistols for close protection when it was found that Soviet troops did not always respect the Red Cross.

The principal Japanese side arm was the Taisho 04 (or 1915), known as the Nambu for its designer, Colonel Nambu Kirijo. An 8 mm, it held eight rounds. The follow-on was the Taisho 14 (1925) Nambu. Nambus were never considered reliable firearms, especially those produced late in the war.

The reason for arming mechanized troops and officers with pistols was to ensure that they had some protection. This

was despite the fact that officers had many other tasks to perform, among which fighting was less important; mechanized troops operated in confined spaces, into which a full-length rifle or even a submachine gun was difficult to fit. U.S. forces used the M1 carbine in preference to the pistol, but the weapon was not popular as it lacked killing power.

Pistols were also carried by police units within armies as well as by secret police units, and they were issued to individuals in the secret services. Some of these latter were designed for concealment or to be one-shot weapons, for use only in emergency situations.

The demise of the pistol as a frontline weapon began with the introduction of the submachine gun and was completed with the invention of the short-cartridge assault rifle. The pistol is now limited to issue as a self-protection weapon to certain rear-echelon troops and to special forces who can get within pistol range of their target.

Pius XII, Pope (1876–1958)

Roman Catholic pope. Born in Rome on 2 March 1876, Eugenio Pacelli was ordained to the priesthood in 1899 and accepted appointment to the Secretariat of State for the Vatican in 1901. Pacelli served as papal nuncio to Germany from 1917 to 1929 and observed firsthand the early manifestations of Nazi ideology. He was probably the Vatican official most familiar with the goals of Adolf Hitler. Pacelli was made a cardinal in 1929 and became secretary of state at the Vatican in 1930.

During Pacelli's tenure, the Vatican negotiated a concordat with Germany that formally separated religion and politics. Pacelli encouraged the German Catholic hierarchy and individual clerics to abide by the terms of the agreement and to seek accommodation with the National Socialist regime. In an effort to keep favorable diplomatic relations with the German government, the Vatican never publicly challenged the ideology of the Nazi Party, and it punished clerics who spoke against some of the overt racist policies that emerged in Germany during the 1930s.

On 2 March 1939, Eugenio Pacelli was elected pope as Pius XII. He was soon confronted with the horrors of World War II, which began that September. Pius XII's challenges during the war included maintaining civil relations with extremist governments, responding to the pastoral needs of Catholic peoples facing the horrors of war, and managing a worldwide enterprise divided by civil loyalties. His skills as a lifelong diplomat and his understanding of the ideas of *realpolitik* characterized his papacy during the war.

Using a quill pen, Pope Pius XII signs the Bull (Papal Message) of the Proclamation of the Dogma of the Assumption of the Virgin Mary in his private study at St. Peter's, November 1950. (Bettmann/Corbis)

Clearly, Pius XII preferred fascism and Nazism, which at least tolerated the Christian churches, to godless communism. Pius attracted considerable criticism, both during and after the war, for his lack of response to the anti-Semitic policies of the Third Reich, especially the Holocaust. Although Pius XII made several oblique condemnations of deportations, racial laws, and the plight of Roman Jews, he never exposed Nazi policies or condemned them outright. Recent investigations reveal that he was aware of the extent of the Holocaust. Pius XII understood the dangers that condemnation of Nazi policies would bring, and although he apparently agonized long and hard over the matter, he came to the conclusion that strong condemnation would be counterproductive.

Pius XII was also later criticized because the Vatican issued passports to many suspected war criminals, allowing them to seek safe haven in other parts of the world. Pope Pius XII died in Rome on 9 October 1958.

Placentia Bay (9–12 August 1941)

Site off Argentia, Nova Scotia, of the first wartime meeting between British Prime Minister Winston L. S. Churchill and U.S. President Franklin D. Roosevelt. The conference at Placentia Bay evolved from the correspondence between the two leaders and a growing desire to meet face to face. The idea for a meeting was first raised in 1940, but the meeting was delayed repeatedly by political and war events. Argentia was chosen as a rough midway point for the two leaders. A new U.S. base that could provide cover was located there, and the location was remote, ensuring secrecy.

Roosevelt left Washington on 3 August 1941 under the guise of a vacation fishing trip, but instead he secretly boarded the heavy cruiser *Augusta* off Martha's Vineyard and steamed north. Likewise, Churchill had quietly sailed the North Atlantic aboard the new battleship *Prince of Wales*. Each leader traveled with a substantial entourage of senior military and political advisers.

On Saturday, 9 August, both parties arrived, and Churchill boarded the *Augusta* for the first meeting of the two leaders. Churchill presented Roosevelt with a brief note from King George VI and then took a tour of the U.S. ship. Respective staffs had the opportunity to know one another. On Sunday, 10 August, a shared religious service was held on the sunlit quarterdeck of the *Prince of Wales*, where the mingled British and American crews and leadership sang familiar hymns. All was filmed for later release.

On Monday, 11 August, the real work of the conference began with three parallel meetings: Churchill and Roosevelt, their diplomatic assistants, and the military chiefs of staff. As a result, the United States agreed to accelerate aid to both Britain and the Soviet Union and to increase naval patrols in the Atlantic. The two countries also agreed to a protective takeover of the Canary Islands (by Britain) and Azores (by the U.S.) if Germany invaded the Iberian Peninsula. But the Americans made it clear that they did not intend to intervene beyond these actions because of domestic isolationist political pressure and their military unpreparedness. Among the controversies that arose, however, was one over the British plan to rely for victory on heavy bombing, whereas the Americans argued that an invasion by ground forces would be needed to overcome Germany.

Tuesday, 12 August, was dominated by discussion of the forthcoming Anglo-American mission to Moscow (to be headed by Lord Beaverbrook and W. Averell Harriman), and final amendments to the joint eight-point statement of goals and aims, which became known shortly thereafter as the Atlantic Charter. Both leaders then departed Argentia.

Roosevelt and Churchill discussed the meeting and the Atlantic Charter with journalists in the days that followed. Disagreement resulted from the softening by Secretary of State Sumner Welles of a statement to which Churchill and Roosevelt had agreed concerning further Japanese intentions in the Pacific. Welles believed American political opinion was not ready for too firm a stand against the Japanese, and Roosevelt agreed with the new version as opposed to the near-ultimatum that had been penned in Argentia. Principles expressed in the Atlantic Charter lasted far longer.

Plata, Río de la, Battle of (13 December 1939)

Naval battle in the South Atlantic; first major surface engagement of World War II. Grossadmiral (Grand Admiral) Erich Raeder, commander of the German navy, envisioned using his capital ships as commerce raiders and ordered his captains to avoid engaging enemy warships, even inferior forces, because even light damage could be fatal given Germany's lack of foreign bases. On 1 September 1939, the German pocket battleship *Graf Spee* was already at sea. Commanded by Captain Hans Langsdorff, she cruised in company with the supply vessel *Altmark* to begin the war in the South Atlantic.

The *Graf Spee* was one of the three-ship Deutschland-class. The others were the *Deutschland* and the *Admiral Scheer*. These capital ships represented the design compromises faced by Germany as a consequence of the Versailles Treaty ending World War I. Because of caliber and weight restrictions, the ships nominally displaced 10,000 tons and boasted a main battery of 6 × 11-inch guns. Armor was equivalent to that of a typical light cruiser, but these ships were also slower than most in that class. In short, the Deutschland-class vessels were heavily armed, lightly protected warships designed primarily for commerce raiding.

Over the course of three months, the *Graf Spee* sank 10 British merchantmen totaling 50,000 gross tons. To combat the German surface raiders, the Royal Navy positioned hunting groups in areas where German cruisers would likely search for prey. One such was Force G, commanded by Commodore Henry Harwood, operating in the South Atlantic. Harwood's squadron included the heavy cruisers HMS *Exeter* (6 × 8-inch guns) and *Cumberland* (8 × 8-inch guns) and the light cruisers HMS *Ajax* and HMNZS *Achilles*, each armed with 8 × 6-inch guns. By early December, Langsdorff decided to return to Germany after one final victory. Intelligence indicated a valuable convoy sailing from the River Plate (Río de la Plata) under escort. Despite standing orders, he decided to engage such an enemy force.

On 13 December 1939, lookouts aboard the *Graf Spee* spotted masts on the horizon. They were three of Harwood's

cruisers (the *Cumberland* had remained in the Falkland Islands to undergo repairs). Langsdorff ordered his ship to close with the British ships and fired the first salvo at 6:17 A.M. Harwood divided his force into two sections, with the light cruisers cooperating and *Exeter* operating from a different quarter to complicate his enemy's targeting. *Exeter* bore the brunt of the battle, as Langsdorff considered her to be the greatest threat. Langsdorff initially engaged the light cruisers with his 5.9-inch secondary armament, but throughout the battle he switched the main battery's targets, complicating the *Graf Spee*'s fire control.

In the exchange of fire, the *Exeter* absorbed several 11-inch hits that eventually disabled her main armament. The *Ajax* and *Achilles* also sustained damage, the former losing use of her aft turrets. Gunnery on both sides was not especially accurate, but the British in particular suffered spotting problems. Nonetheless, the *Graf Spee* took its share of punishment. At least 18 shells caused damage that included a large hole in the ship's bow as well as destruction of the ship's galley and freshwater plant. At 7:40 A.M., Langsdorff disengaged and made for the neutral port of Montevideo, Uruguay.

Langsdorff hoped to make repairs at Montevideo, but Uruguayan officials only allowed the belligerent 72 hours in port. Ironically, the British also wanted to keep *Graf Spee* there longer, to allow time for reinforcements to arrive. Langsdorff despaired that he could not return to Germany, given the condition of the ship. His own expectations, along with British disinformation, led him to believe the battle cruiser *Renown* and aircraft carrier *Ark Royal* awaited him outside the harbor. Both were en route, but neither would arrive for several days. After discussions with Berlin, on 17 December 1939 Langsdorff had the *Graf Spee* weigh anchor and sailed to just beyond Uruguay's territorial limit. There, in the Río de la Plata estuary, Langsdorff scuttled his ship rather than waste the lives of his crew. Tugs transported the Germans to Argentina, where most spent the war in internment.

Total human casualties in the Battle of the Río de la Plata were 37 German and 73 British dead. There was another casualty of the battle. On 20 December, Captain Langsdorff took a hotel room in Buenos Aires. There he wrapped himself in his ship's ensign and committed suicide with a pistol. The *Graf Spee* remains buried in the mud of the Río de la Plata. The battle was the first important victory won by the British in World War II.

Ploesti, Raids on (1 August 1943–18 August 1944)

Major and costly U.S. air raids. The refineries of Ploesti, Romania, supplied almost one-third of Germany's oil requirements before and during World War II. A land invasion of Romania to seize the Ploesti refineries being impractical, on 1 August 1943 the United States launched a yearlong air campaign to destroy them.

The first air raid on Ploesti was conducted on 1 June 1942 by 13 B-24 bombers of Halverson Detachment, led by Colonel Harry A. "Hurry-Up" Halverson. The mission originated at Fayid, Africa. Twelve planes reached the target and bombed it from high altitude, escaping without loss. Damage to Ploesti was negligible. Three times during that first week in June, the Soviet air force sent small numbers of bombers against Ploesti. The last inflicted some damage but at the cost of several Soviet planes and airmen. That ended Soviet interest in the refineries. At the Casablanca Conference in January 1943, President Franklin D. Roosevelt and Prime Minister L. S. Winston Churchill endorsed a plan to bomb Ploesti from North Africa. Planners decided a low-level attack would be safer and more productive than one from the traditional high level. Three U.S. B-24 bomb groups from England were added to the two in Brigadier General Uzal G. Ent's IX Bomber Command, which was already in North Africa.

After studying the plan (code-named TIDAL WAVE) with his commanders and staff, General Ent wrote a note to his superior officer, Major General Lewis H. Brereton, recommending against a low-level mission. Ent did not know that this had already been decided at the highest level. Once informed of this, he began intensive training of the five groups.

On 1 August 1943, 178 B-24s departed for Ploesti. Eleven bombers either aborted or were lost en route to the target. Unknown to the Allies at the time, the Germans detected and traced the air armada from takeoff all the way to the target. As a result, German air defense fighter squadrons and anti-aircraft defenses were fully alerted, the German fighters being particularly effective against the bombers during the return from the mission.

Because of a navigational error, the bomb runs could not all be made as planned. Nonetheless, substantial damage was

Oil storage tanks at the Columbia Aquila refinery in Ploesti, Romania burning after the raid of U.S. Army Air Forces B-24 Liberator bombers. Some of the structures had been camouflaged, 1 August 1943. (Library of Congress)

inflicted on several refineries. Oil production was reduced only in the short term, however. The bombing results did prove that the low-level attack destroyed more of the target area than raids made from high altitudes. However, at this point in the war, the 2,700-mile round-trip raid by unescorted bombers was an epic. Losses, although heavy, were less than General Ent had anticipated. He had told his men that returning from the mission was "secondary." American losses included 310 men killed and some 130 wounded (including those who crashed or landed in neutral territory). Eighty-eight aircraft returned to base, but only 33 were fit to fly, and Ent had just over half his original complement of airmen. For this raid, five men were awarded the Medal of Honor, three of them posthumously. Ent and several others were awarded the Distinguished Service Cross, America's second-highest award for heroism.

Ploesti had an impressive and deadly array of anti-aircraft guns and fighter planes to defend the area during that 1 August 1943 raid. But following the raid, German General Alfred Gerstenberg, who commanded Ploesti's defenses during the entire campaign, improved the defenses with additional guns and planes and, as a final touch, smoke pots. These pots were scattered throughout the refinery area and could be lit to cover the targets with smoke, no matter which way the wind was blowing. Gerstenberg was resourceful. He also installed an oil pipeline system, linking all the refineries, so that oil could be diverted from more damaged refineries to those less damaged or undamaged, maintaining optimal output.

Between 5 April and 19 August 1944, the U. S. Fifteenth Air Force made 5,479 high-level sorties in 19 raids against Ploesti, with a loss of 223 aircraft, representing 4.1 percent of the aircraft employed. On 10 June 1944, 46 P-38 fighters made a low-level attack, and 24 were lost. Some 2,829 American airmen were killed or captured during the entire campaign. During the summer of 1944, Britain's Royal Air Force (RAF) flew 924 high-level sorties against Ploesti, in which 38 planes (4.1 percent) were lost.

In the raids, the Fifteenth Air Force and the RAF destroyed nearly 1.2 million tons of Ploesti oil production, amounting to 84 tons of oil lost for each ton of bombs dropped. When Soviet troops entered Ploesti on 30 August 1944, they found five refineries producing about 20 percent of normal production.

Poland, Air Force

There were three separate incarnations of the Polish air force (PAF) in World War II: the force that fought the campaign in Poland in 1939; the reconstituted force that fought under Allied control in the west; and the Polish air units that fought under Soviet control on the Eastern Front. Nonetheless, the small Polish air force played a disproportionately significant role in World War II.

Poland produced some fine aircraft in the 1930s. The P7 parasol-winged fighter, which entered service in 1931, was built entirely of metal and covered with stressed skin. The follow-on, version P-11 Jedenastka (Eleventh), entered service in 1935. Ruggedly built, it was fast and maneuverable. As with many other countries, in the mid-1930s Poland shifted development priority to bombers. Poland had two primary bombers, the P.23 Karas single-engine light bomber and the P.37 twin-engine medium bomber. The latter, which entered service in 1938, was a world-class aircraft, but Poland had only about 75 of them when the war began, and only half were fully equipped.

At the start of the war on 1 September 1939, the PAF contained a total of 397 combat aircraft, including 159 fighters, 154 bombers, and 84 reconnaissance craft. Prior to the German attack, almost all the operational aircraft were dispersed

to outlying airfields in accordance with established plans. Despite the enduring but false myth of the PAF being destroyed on the ground on the first day of the war, most of the aircraft hit by the Luftwaffe were nonoperational aircraft used for spare parts. Even though the PAF was outnumbered more than four to one, it still inflicted surprisingly heavy losses on the Luftwaffe. During the monthlong campaign, the Germans lost 564 aircraft in Poland, at least 121 in air-to-air combat. The Poles lost almost all of their aircraft, 70 of them in aerial combat.

After the Soviets invaded Poland on 17 September, the remainder of the PAF withdrew into Romania and Hungary. Many Polish pilots and ground crew made their way to France and reconstituted the PAF under the Polish government-in-exile. During the France Campaign in 1940, the PAF had almost 7,000 men, but they were equipped with only obsolete aircraft. Nonetheless, the PAF scored 56 aerial victories in May and June before withdrawing to Britain and reconstituting again.

Flying under the control of the Royal Air Force (RAF), the PAF finally came into its own, especially during the pivotal Battle of Britain. During the two and one-half short months of history's first decisive air campaign, the control of British airspace was stoutly defended by a razor-thin line of only 2,363 pilots—446 of whom were killed in action. Almost forgotten today is the fact that 487 of those pilots—some 21 percent of the total—were not British at all. They were a mixed assortment of volunteers from many nations, including contingents of various European air forces in exile. By far, the largest group of the non-British pilots flying under RAF operational control were the 146 pilots of the PAF.

On 11 September 1940, one of the pivotal days of the battle, the Poles accounted for 18 percent of the Luftwaffe aircraft destroyed. On 15 September, they accounted for 14 percent. On 19 September, they shot down 25 percent, and on 26 September, they shot down a staggering 48 percent. The PAF's Number 303 "Kosciuszko" Squadron was the top-scoring squadron in the entire Battle of Britain. Number 303 Squadron downed three times the average RAF score, while incurring only one-third the average casualties. The RAF as a whole lost 1 pilot for every 4.9 enemy kills. The Polish squadrons shot down 10.5 German aircraft for each of their own pilots lost.

The PAF in Britain eventually numbered 20,000 airmen organized in 14 squadrons, including 3 bomber squadrons. By the end of the war, they had flown almost 90,000 combat sorties, had destroyed more than 500 Axis aircraft and some 200 V-1 flying bombs, and had flown 16,000 transport sorties.

The final Polish air element of the war was fighting on the Eastern Front. In the summer of 1943, the Soviets established Polish air units to support the Polish ground units then fighting under Soviet control. They began flying combat missions

on 23 April 1944. By the end of the war, the Polish 1st Composite Air Division had flown almost 19,000 combat sorties, downing 20 German aircraft.

Poland, Army

Faced with growing German aggression in eastern Europe, the Polish army introduced a new mobilization plan on 30 April 1938. Plan W called for drafting 1.3 million new troops and raising a total of 39 infantry divisions, 9 reserve infantry divisions, 11 cavalry brigades, 2 armored brigades, and 3 separate tank battalions. In the event of a national emergency, the Poles planned to mobilize 28 of the divisions, with the remaining 11 called up only after the declaration of a general mobilization. By September 1939, the Polish army had some 500,000 men, 41,000 machine guns, 3,500 antitank rifles, 1,200 mortars, 1,200 antitank guns, 462 antiaircraft guns, and 3,388 artillery pieces of various sizes. The Poles, however, were poorly motorized, having fewer than 6,000 motor vehicles. Traditionally considered among the best military horsemen in Europe, the Poles continued to rely heavily on horses for economic reasons more than anything else.

The Poles had 887 tanks, but 550 of these were small two-man TK and TKS tankettes, mounting little more than machine guns. The Poles had only 170 larger tanks mounting guns up to 47 mm in size, and they also had 102 obsolete French tanks of World War I vintage. Although this force was less than one-third of the nearly 2,500 tanks the Germans could field, the Polish armored force was larger than that of the contemporary U.S. Army. The Poles, however, made the mistake of adopting the flawed British and French armored doctrine, which regarded tanks as infantry-support weapons.

Under French and British pressure, the Poles delayed declaring a general mobilization until 30 August. The Germans attacked two days later, and many of the Polish units never had the chance to reach their authorized strength. According to British and French assurances, the Poles were

only supposed to fight a delaying defense for two weeks, until their allies could attack Germany from the west. That never happened, and when the Soviet Union invaded Poland from the east on 17 September, all hope of Polish survival disappeared. The last major Polish forces surrendered on 5 October 1939, having suffered 210,000 killed or wounded and 580,000 captured by the Germans and another 200,000 captured by the Soviets.

Some 100,000 Polish soldiers managed to evade capture and escaped through Romania, Hungary, and the Baltic states. Many eventually made their way to France and joined the Polish government-in-exile, which was headed by General Władysław Sikorski. Meanwhile, as early as May 1939, Polish and French officials had discussed the feasibility of forming military units manned by some of the half million Polish immigrants then living in France. By May 1940, the reconstituted Polish army in France had some 84,500 troops organized into two infantry divisions and a mechanized brigade. In addition, the Podhale Rifle Brigade fought in Norway and at Narvik, and the independent Carpathian Rifle Brigade was formed in the Middle East.

During the 1940 France Campaign, the Polish 1st Grenadier Division was destroyed fighting in Lorraine. The 2nd Rifle Division escaped into Switzerland, and its soldiers were interned there for the remainder of the war. Only some 30 percent of the Polish army managed to escape to Britain, where it again reconstituted and formed the Polish I Corps. That unit eventually consisted of the 1st Armored Division, the 4th Infantry Division, and the 1st Independent Parachute Brigade. The parachute brigade's most celebrated battle was its doomed jump into Arnhem to support the British there in Operation MARKET-GARDEN in September 1944.

Sikorski, meanwhile, had been negotiating with the Soviets to form another Polish unit from the prisoners of war (POWs) who had been imprisoned in the Siberian labor camps in late 1939. In August 1941, a Polish force of 96,000 men was formed under Soviet control to fight against the Germans on the Eastern Front. But there were conflicts and tensions between the Soviets and Poles right from the start, and the British pressured Soviet leader Josef Stalin to release the force to fight under their control in the Middle East.

In August 1942, General Władysław Anders led 74,000 Polish troops and many accompanying civilians from the Soviet Union through Iran to Palestine. After merging with the Carpathian Rifle Brigade already there, the newly established Polish II Corps moved to Libya. By the end of 1943, the force moved to Italy, where it continued to fight under British control. The II Corps eventually consisted of the 3rd Carpathian Rifle Division, the 5th Kresowa Infantry Division, the 2nd Armored Brigade, and an artillery group. The II Corps suffered 17,000 casualties during the Italian Campaign and distinguished itself during the fighting for Monte Cassino.

Warsaw, Poland: A fanfare of trumpets salutes Polish army tanks as they move through Warsaw streets during a military parade on 11 May 1939. (Bettmann/Corbis)

Thousands of Poles still remained in Soviet captivity, even after Anders moved his corps to the Middle East. Soviet-Polish tensions reached a new high in May 1943 after the Germans discovered the mass graves of thousands of murdered Polish POW officers in the Katyń Forest. The Soviets used the rising tensions as a pretext to sever relations with the Polish government-in-exile in London and to establish their own government-in-exile composed of Polish Communists. The Moscow-based Union of Polish Patriots raised the first units of what would become the Polish People's Forces (PPF), fighting under Soviet control.

The initial PPF unit, the 1st Infantry Division, was named after Polish national hero Tadeusz Kosciuszko, who ironically had led the Polish revolt against the Russians in the 1790s. The division first went into action at Lenino in October 1943. In 1944, the Polish force had grown to the size of a field army. Designated the First Polish People's Army, it was under the command of General Zygmunt Berling. It had some 107,000 troops and consisted of five infantry divisions, a tank brigade, and supporting artillery units.

After the Red Army entered Poland and began to push the Germans back to the west, the Soviets installed a Communist provisional government at Lublin, the Polish Committee of National Liberation, also known as the "Lublin government" to distinguish it from the Polish government-in-exile in London, the "London government." That government expanded the PPF by adding another field army. By March 1945, the PPF numbered some 400,000 troops, which were under the com-

mand of Marshal Michal Rola-Zymierski. The order of battle included 14 infantry divisions, an armored corps, and 16 artillery brigades. The Second Polish People's Army took part in the capture of Dresden, and the First Polish People's Army participated in the April 1945 Battle for Berlin. The Poles suffered 30,500 casualties in that fighting.

The Poles were the first to fight the Germans; they fought them the longest; and they fought them on every major front: Norway, North Africa, Italy, Western Europe, and Eastern Europe. At the end of World War II, more than 620,000 Poles were under arms in both the west and east. The Polish armed forces in the west numbered close to 200,000 men, including 14,000 in the air force and 4,000 in the navy. Between 1940 and 1945, the exile force in the west sustained 43,500 casualties, including 7,600 dead. When the force in the west demobilized in 1946, only a small number returned to Communist-dominated Poland.

Poland, Navy

Although one of the smallest in Europe, the Polish navy was the first Allied force to see combat in World War II. The commander of the Polish navy, Vice Admiral Jozef Unrug, had charge of only 34 vessels, including 4 destroyers and 5 submarines.

The Polish navy was unprepared for the scale of the German air and naval attacks launched on it beginning on 1 September 1939. Unrug, a former U-boat captain in the German

Imperial Navy, foresaw the impending invasion and sent his three newest destroyers to Britain in late August. Unrug knew that the lack of Polish anti-aircraft defenses and concentration of much more powerful German naval units in the southern Baltic made defeat inevitable. Those ships that remained behind at Gdynia and Gdansk endured two days of constant German air and naval attacks that damaged or sank all of them save submarines *Orzel* and *Wilk*, which managed to escape. Unrug and his staff withdrew to the naval base on the Hel peninsula after the invasion and were the last of the Polish military to surrender, on 2 October 1939. During the campaign, the Polish navy lost 26 vessels. Personnel casualties amounted to 1,500–2,000 men killed and perhaps 3,500 wounded.

Several naval personnel escaped to Britain to serve with the remnants of their navy reorganized under Royal Navy command. The Poles received two new destroyers from the British through an Anglo-Polish Naval Accord of 18 November 1939. The destroyer *Grom* and submarine *Orzel* were sunk during

the German invasion of Norway, and the destroyer *Burza* was heavily damaged during the Dunkerque evacuation.

The Polish government-in-exile's navy remained active in the Allied war effort, thanks to a steady flow of recruits from Polish refugees in Britain and the addition of new British destroyers and gunboats. The Polish navy participated in a wide range of actions, including the sinking of the German battleship *Bismarck*, protection of trans-Atlantic convoys, and the amphibious assaults on Sicily and Normandy. The 4,000 Polish navy officers and sailors operating in conjunction with the British manned 47 warships (including 2 cruisers, 10 destroyers, and 5 submarines). They sank 9 enemy warships and 39 transport vessels. The Polish navy lost 3 destroyers and 2 submarines, and it suffered 404 dead and 191 wounded.

Poland, Role in the War

Poland was the first nation to fight the Germans in World War II. The Poles would fight the Germans longer than anyone else, and they fought them on all fronts. On 1 September 1939, 1.8 million German troops moved into Poland from three directions. The Germans had more than 2,600 tanks to only 180 for the Poles and more than 2,000 combat aircraft for only 420 Polish planes. Furthermore, the Polish armed forces were only about one-third mobilized by the time the attack came. Britain and France had pressured Poland not to mobilize earlier to avoid presenting Germany with the provocation of aggressive behavior.

Britain and France declared war on Germany on 3 September. Under the security guarantees that had been given to Poland, that nation was supposed to fight a defensive campaign for only two weeks, at which time the Allies would counterattack from the west. That Allied offensive never occurred. By 14 September, the Germans had surrounded Warsaw. Three days later, Soviet forces invaded Poland from the east. The last Polish forces surrendered on 5 October.

There are many myths about Germany's so-called blitzkrieg campaign against Poland. The Polish air force was not destroyed on the ground on the first day of the war, and Polish horse cavalry units never mounted wave after wave of

suicidal attacks against the German panzers. Nor was the campaign a walkover. The Poles held out for twice as long as they were expected to. In six weeks of fighting, the Germans suffered 50,000 casualties and lost 697 aircraft and 993 armored vehicles.

Under a secret clause of the German-Soviet Non-aggression Pact of August 1939, Germany and the Soviet Union participated in a fourth modern partition of Poland. The Soviets absorbed the eastern part of the country, including the great cultural centers of Lwow and Wilno. In the Soviet zone, 1.5 million Poles were deported to labor camps in Siberia. In a deliberate effort to exterminate the Polish intelligentsia and leadership classes, Soviets authorities transported thousands of captured Polish officers, including many reservists from universities and industry, to the Katyń Forest of eastern Poland and other locations, where they were executed and buried in anonymous mass graves.

Of the territory they occupied, the Germans annexed Pomerania, Posnania, and Silesia in the west. What was left became the General Government, under the harsh rule of Hans Frank. The Germans then began a campaign to liquidate the Jews of Poland and grind down the rest of the Poles. The Polish Jews were first herded into ghettos while the Germans built more than 2,000 concentration camps in Poland, including the industrial-scale death centers at Auschwitz, Birkenau, and Treblinka.

Several Poles, including many in the armed forces, managed to escape from the country before the Germans and Soviets tightened their viselike grip on it. Poles who escaped established a government-in-exile in London, with Władysław Raczkiewicz as president and General Władysław Sikorski as prime minister. In Poland, meanwhile, the Polish Resistance established the Armia Krajowa (AK, Home Army), which became the largest underground movement in Europe with 400,000 fighters.

Outside of Poland, the Polish army, air force, and navy reorganized themselves in Britain and continued the war. The Britain-based Polish army eventually fielded a corps in western Europe. After Germany attacked the Soviet Union in June 1941, the Soviets released several thousand Polish prisoners of war to establish another corps under General Władysław Anders. The Polish II Corps was allowed to leave the Soviet Union by way of Persia and Egypt, and it eventually fought with distinction in North Africa and Italy.

Prior to the start of the war, Polish intelligence had managed to duplicate a German Enigma cipher machine. They turned over copies to both the French and British in July 1939, which was the starting point of the Allies' spectacular success with radio-derived communications intelligence. Later in the war, the intelligence service of the AK recovered a German V-2 rocket that had crashed in the Bug River after a test flight and sent the key components to London.

German troops parade in front of Adolf Hitler and German generals after entry into Warsaw, 5 October 1939. (Photo by Keystone/Getty Images)

In 1943, the Soviets formed their own division of Polish troops to fight on the Eastern Front. That unit would eventually grow to field-army strength. But when the Germans later that year discovered the bodies of the Polish officers executed at the Katyn Forest and broadcast this news to the world, it opened a rift in Polish-Soviet relations that remained until the end of the Cold War.

As the Red Army slowly pushed the Germans from the Soviet Union and back to the west, the USSR's postwar intentions for Eastern Europe began to unfold. At the Allied Tehran Conference, British and U.S. leaders agreed to Soviet leader Josef Stalin's demands that the Soviet Union be allowed to keep the Polish territory taken in September 1939—in effect, the old Curzon Line established by the Allied governments in the peace settlement following World War I. After the war, Poland was partly compensated for its territorial losses in the east with a strip of German land in the west to the line of the Oder and Neisse Rivers. In July 1944, after the city of Lublin was liberated, the Soviets established their own Polish government, a direct rival to the one in London, which was now led by Stanisław Mikołajczyk.

By 1 August 1944, the Red Army reached the right bank of the Vistula River opposite Warsaw. Armia Krajowa units in the city rose up against the Germans, anticipating Soviet support against the common enemy. The Soviets did nothing. Not only did they not help the AK, they refused landing rights on Soviet-controlled airfields for any Allied aircraft that might attempt aerial supply missions. The Poles fought on alone, street by street and house by house for 63 days, and in the end the Wehrmacht and the Waffen-Schutzstaffel (Waffen-SS) destroyed virtually the entire city. When the Germans finally withdrew from what was left of Warsaw, the Soviets moved across the river. The destruction of Warsaw eliminated the remaining political and military institutions in Poland still loyal to the London government and paved the way for a complete Soviet takeover. The final blows to a free Poland were delivered by the victorious Allies at the Yalta Conference. World War II ended, but Poland remained under the Soviet yoke until the very end of the Cold War more than 40 years later.

Poland suffered as heavily as any nation in the war, losing an estimated 38 percent of its national assets. The country

lost 22 percent of its population—some 500,000 military personnel and 6 million civilians. Roughly half the Poles who died between 1939 and 1945 were Jews. Most of the approximately 5.4 million victims died in concentration camps and ghettos or by starvation, epidemic, or other causes resulting from the brutal occupation. One million of the survivors were war orphans, and another half million were invalids.

Poland Campaign (1939)

World War II began with the German invasion of Poland on 1 September 1939. The subsequent 36-day campaign triggered a global war that lasted six years. The Poland Campaign was soon overshadowed by the campaigns and battles that followed. As a result, it is best remembered today by series of myths and legends, almost all of them untrue. Contrary to the most popularly cherished beliefs about World War II, Polish horse cavalry units never mounted suicidal charges against

German panzers; the Polish air force was not destroyed on the ground on the first day of the war; and the Polish army was far from being a pushover for the German army.

Under the command of Marshal Edward Rydz-Śmigły, the Polish army in the summer of 1939 had roughly 500,000 men, organized into 30 regular and 9 reserve infantry divisions, 11 cavalry brigades, and 2 mechanized brigades. The Polish army had 887 tanks, less than a third of the almost 2,500 tanks fielded by the Germans. When it became obvious they would be attacked by Germany, the Poles opted for a forward defense, which was designed to withdraw slowly to the east to buy more time for mobilization. Plan ZACHOD (West),

issued on 23 March 1939, correctly assumed that the German main attack would come from Silesia in the direction of Warsaw, with supporting attacks from German Pomerania and East Prussia. The Poles therefore positioned four armies along Poland's western border. In north-central Poland, one army was positioned to defend Warsaw from a German thrust south from East Prussia. After the Germans moved into Slova-

kia, the Poles also established a weak army in the south to defend the passes through the Carpathian Mountains.

The concept of Plan ZACHOD was based on a fighting withdrawal, with Armies Pomorze, Poznan, and Lodz all falling back to the west, while pivoting on the strong Army Krakow, the southern anchor of the Polish line. Many military historians have been highly critical of the Polish plan, positing that Poland's armies were deployed too far forward and spread far too thin. But the Polish army by itself could have never beaten the Germans, regardless of its strategic plan. The Polish-German border was 1,250 miles long, and the German extension into Bohemia and Moravia and Slovakia added another 500 miles. Plan ZACHOD was based on the assumption of a strong attack by Britain and France against Germany in the west. Unfortunately for the Poles, that promised attack never came.

In August 1939, the Wehrmacht had 51 active divisions, 51 reserve divisions, and 1 active cavalry brigade. All the reserve divisions were infantry units, and the active force included 6 panzer and 4 motorized divisions. The average panzer division had 310 tanks, most of which were the lightly armed PzKpfw-I and PzKpfw-II models. The Germans had a total of about 500 of the heavier PzKpfw-III and PzKpfw-IV tanks. They also made use of PzKpfw 35(t) and PzKpfw 38(t)

tanks, redesignated Czech machines acquired in the March 1939 takeover of Bohemia and Moravia. The Wehrmacht's active strength was roughly 730,000 men, and its reserve strength was about 1.1 million men.

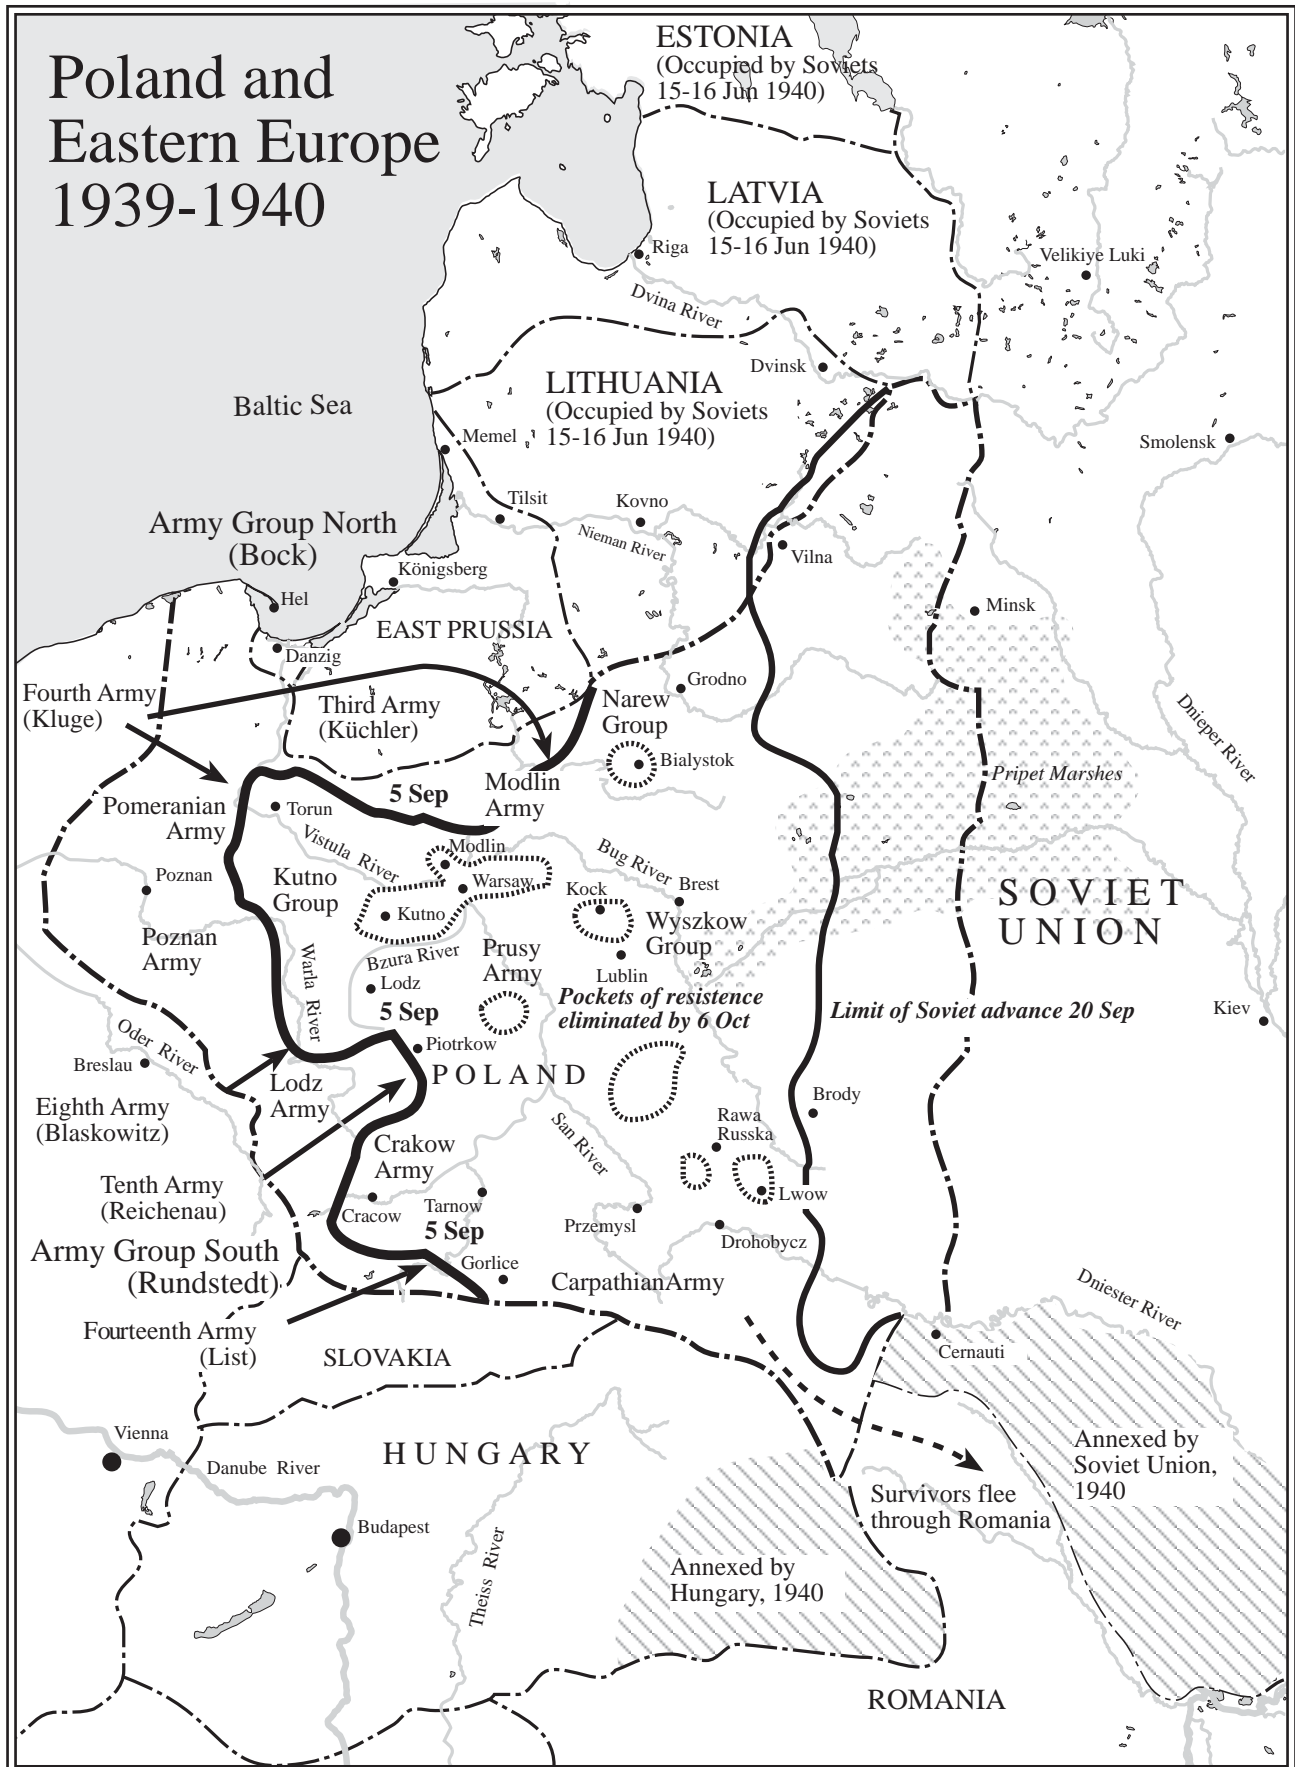

On 3 April 1939, Adolf Hitler's headquarters responded to British Prime Minister Neville Chamberlain's declaration of support for Poland by issuing Fall WEISS (Case WHITE), the plan for the invasion. The success of Fall WEISS hinged on a calculated political risk that made most of Hitler's generals nervous. The Germans had to secure a quick victory in Poland in order to shift their forces rapidly back to the west to fend off any attack from the French and British. The Wehrmacht of 1939 was neither large nor strong enough to mount simultaneously a massive attack in the east and a strong defense in the west. Thus, the attack in the east could only be strengthened at the risk of weakening the defense in the west. Willing to gamble that the French and British would not act in time to save Poland, Hitler took that risk. Fall WEISS then called for Germany's border with France to be guarded by the relatively weak Army Group C, which consisted of 21 active and 14 reserve divisions.

A total of 52 divisions, including all of the panzer and motorized divisions, were allocated for the attack on Poland. They were organized into Army Group North and Army Group South under Colonel Generals Fedor von Bock and Gerd von Rundstedt, respectively. The original plan did not include military operations east of the Vistula, on the assumption that Soviet forces would move rapidly into that area. The campaign would end with the Tenth Army linking up with Army Group North at Warsaw, sealing off the Polish units in western Poland and preventing them from escaping east to the Narew–Vistula–San River line.

Beginning in July, 386,000 army and 55,000 Luftwaffe reservists were called to active duty under the guise of training maneuvers. By the end of August, Army Group North had a strength of 630,000 men, and Army Group South had 886,000. Hitler initially set 26 August as Y-Day, the start of the attack. But then Hitler himself blinked when Britain and France on 24 August responded to the German-Soviet Non-aggression Pact of the day before by giving Poland written guarantees of military support and when Benito Mussolini backed off bringing Italy into the war on Germany's side. Late on 25 August, Hitler canceled the attack orders, but several small German units still crossed the frontier and clashed with Polish border guards before they could be recalled.

After a few more days of diplomatic cat-and-mouse games, Hitler on 31 August signed "Führer Directive No. 1 for the Conduct of the War." On 30 August, Rydz-Śmigły decided to order a general mobilization. That move brought an immediate and sharp reaction from Poland's erstwhile allies, Britain and France, which were afraid of provoking Germany and which remembered only too well the spiral of mobilizations that triggered World War I. Within three hours, the

World War II began with the German invasion of Poland on 1 September 1939. This 36-day campaign led to a global war that lasted six years.

French government had pressured Rydz-Śmigły into revoking the mobilization order.

With the German forces in position and ready to move, Hitler needed only an incident of provocation to provide him with a fig leaf of respectability. Leaving nothing to chance, the German Sicherheitsdienst (SD), dressed in Polish uniforms, “raided” the German Silesian town of Gleiwitz on the night of 31 August. They seized the local radio station and played a prerecorded anti-German message in Polish. After firing off a few rounds for effect, the SD unit withdrew, leaving behind several “Polish casualties” as evidence. The bodies were actually prisoners from the Sachsenhausen concentration camp dressed in Polish uniforms and murdered specially for Hitler’s little charade.

According to the Fall WEISS plans, the invasion was to commence at 4:45 A.M. on 1 September. The first shots of World War II were fired 15 minutes early, however, when three dive-bombers of the 3/1st Stuka Geschwader hit a Poznan air base, which turned out to be deserted. The Luftwaffe immediately followed through with attacks on Polish airfields and rail centers. For the most part, the attacks on the Polish airfields were failures. Anticipating the strikes against the bases, the Polish

air force on 31 August dispersed its frontline aircraft to secret secondary bases to avoid having them caught and destroyed on the ground.

The Luftwaffe dwarfed the Polish air force, which had only 392 first-line combat aircraft. The Luftwaffe in March 1939 had a strength of 4,303 aircraft, including 1,180 bombers, 336 dive-bombers, and 1,179 fighters. In support of the German invasion, Army Group North was allocated Luftflotte 1 under General Albert Kesselring; Army Group South was supported by General Alexander Löhr’s Luftflotte 4. The combined force totaled 36 groups and included all of Germany’s dive-bombers, 70 percent of its bombers, and 50 percent of its fighters.

Vastly outnumbered and technically outclassed, the Polish pilots put up a stiff resistance. The law of numbers, however, dictated that the Polish air force would play only a marginal role in the overall outcome of the campaign. By 6 September, Polish fighter units were down to 50 percent of their original strength. A few days later, the surviving fighters began withdrawing toward Romania with the rest of the Polish army.

In the end, the Poles lost almost 300 of their combat aircraft, and they evacuated 98 to Romania. But the Germans

suffered heavy losses as well, with 285 aircraft destroyed and another 279 severely damaged. Despite the great technological disparity in aircraft, Polish fighter pilots scored at least 121 confirmed air-to-air kills for the campaign. German records indicate that the true number may have been closer to 160.

The Poles had no illusions about their strategic situation. On 30 August, Vice Admiral Jozef Unrug, commander of the Polish navy, initiated Operation PEKING, ordering Poland's three modern destroyers to leave immediately for British ports. At 4:43 A.M. on 1 September, the old German battleship *Schleswig-Holstein* opened fire on the Polish military supply base on Westerplatte island in Danzig harbor.

The ground war started within minutes of the *Schlewsig-Holstein* opening fire. In the north, visibility was limited by heavy ground fog as von Bock's units jumped off. The Third Army, under General Georg von K uchler, attacked south toward Warsaw, and General G unther von Kluge's Fourth Army sliced into the Polish Corridor, which divided East Prussia from the rest of Germany. The Fourth Army's objective was to clear a path for the one panzer and two motorized divisions of General Heinz Guderian's XIX Corps to drive a pincer arm southwest toward Warsaw.

The weather in the south, meanwhile, was clear as Army Group South crossed into Poland. General Johannes Blaskowitz's Eighth Army drove toward the Polish industrial city of Lodz. In von Rundstedt's center, his Tenth Army, under General Walther von Reichenau, struck from Oppeln toward Czestochowa, Piotrkow, and Tomaszow to encircle Warsaw from the south. The Fourteenth Army, under Colonel General Wilhelm List, attacked from German Silesia and Slovakia to cut off Krakow.

By 4 September, the Germans had managed to drive a deep wedge between Army Lodz and Army Krakow. On 5 September, the first major clash between German and Polish tanks occurred at Piotrkow. At the end of the day, the Germans penetrated Polish defenses and secured the key road links to Warsaw. The breakthrough at Piotrkow marked the end of the first phase of the Poland Campaign. By the evening of 5 September, the Polish armies were retreating all along the line. With his thin defensive shell cracked, no reserves to commit, and much of his army still mobilizing, Rydz-Śmigły believed he had no alternative but to order a withdrawal to the line of the Vistula. Simultaneously, German field commanders such as Guderian were smelling victory and pushing the German High Command to authorize operations beyond the Vistula.

Warsaw was now directly threatened. On 7 September, Rydz-Śmigły compounded the Polish command-and-control problems by ordering the withdrawal of the High Command eastward to Brzesc (Brest). The Polish command-and-control infrastructure was primitive to begin with, but the

move from Warsaw to Brzesc virtually guaranteed that the Polish High Command would no longer play any significant role in managing the campaign. In the north, meanwhile, the Fourth Army pushed Army Pomorze out of the Polish Corridor, bypassed Army Poznan, and was approaching Warsaw. On 8 September, the 4th Panzer Division attempted to take the Polish capital by storm, but it was driven back and lost 60 armored vehicles after heavy street fighting.

In their rush to reach Warsaw, the Germans lost track of General Tadeusz Kutrzeba's bypassed Army Poznan. They assumed that it had been pushed back as well and was now incorporated into the Warsaw garrison. Kutrzeba's force, in fact, was entrenched behind a bend in the Bzura River about 30 miles west of Warsaw. Locally, Kutrzeba held a 3:1 superiority in infantry, and he decided to attack. The Bzura River Offensive was the only major Polish counterattack of the campaign. On 9 September, the Poles caught the German 24th and 30th Infantry Divisions by surprise, capturing more than 1,500 prisoners from the 30th Division alone. But the Germans, with their far greater mobility and firepower, were able to shift other forces rapidly to contain this Polish offensive. Army Poznan finally surrendered on 21 September, with the Germans capturing more than 100,000 Poles.

With the Buzra Offensive under control, the Germans were then able to turn their attention back to Warsaw to conduct a set-piece siege. On 15 September, the German Third Army forced its way into Warsaw's Praga district on the east side of the Vistula. By 23 September, Warsaw's food and water were running out and the city was completely ringed by 13 German divisions and more than 1,000 guns. On 25 September, a day the Poles still call "Black Monday," Hitler personally ordered an armada of 420 German bombers to savage the capital with repeated sorties. Warsaw finally surrendered on 27 September, after suffering some 2,000 military and 40,000 civilian dead.

It quickly became obvious to Rydz-Śmigły that his order to withdraw to the rivers had come too late. With their vastly superior mobility, the Germans were able to reach the river lines before the Poles could man them. Given approval by the High Command, German field commanders now advanced their forces east of the Vistula. On 9 September, the Fourth Army initiated a drive toward Brzesc that was spearheaded by Guderian's XIX Corps. Two days later, Rydz-Śmigły ordered the surviving Polish units to withdraw toward the southeast, to the so-called "Romanian Bridgehead."

Plan ZACHOD had been based on holding until the French and British could attack Germany from the west. The Poles were promised that attack no later than 16 September. It did not occur. On 17 September, Soviet leader Josef Stalin drove the final nail into the Polish coffin by invading Poland from the east. Hiding behind the excuse of occupying eastern Poland "to protect its fraternal Byelorussian and Ukrainian populations," the Soviets marched in with two fronts (army

groups). The Byelorussian Front, under General M. P. Kovalev, and the Ukrainian Front, under General Semen Timoshenko, had a combined strength of 24 infantry divisions, 15 cavalry divisions, and 2 tank corps.

The Soviet invasion caused immediate problems for the German field commanders, who already were operating well to the east of the demarcation line agreed to in the German-Soviet Non-aggression Pact. On 20 September, Hitler ordered a withdrawal to the designated line, with movement to start the next day. The Soviets reached the Bug River on 23 September. On the diplomatic level, meanwhile, the Soviet government initiated negotiations to shift the line to the east in exchange for Lithuania. The Germans agreed, and on 1 October the new demarcation line was established along the general line of the Bug River. The result was to extend the German zone to the east by as much as 100 miles in some places.

Poland suffered staggering losses in the campaign, amounting to 66,300 killed, 133,700 wounded, 587,000 taken prisoner by the Germans, and another 200,000 taken prisoner by the Soviets. Polish civilian deaths were close to 100,000. Virtually all of Poland's military hardware was destroyed or captured, with the exception of the handful of obsolete fighters that escaped to Romania.

Despite the claims of German Minister of Propaganda Josef Goebbels, the Germans paid a high price for such a short campaign. The Wehrmacht suffered 16,000 dead and 32,000 wounded. It lost 217 tanks totally destroyed and another 457 so heavily damaged that most never returned to service. Thus, the Germans lost one-quarter of the tanks as well as one-fifth of the combat aircraft they committed to the campaign. On top of that, they expended eight months' worth of fuel, ammunition, and repair parts in an operation that lasted little more than one month.

The performance of the Polish military can perhaps be put into proper perspective by comparing it with that of the western Allies in the spring of 1940. Only partly mobilized, vastly outnumbered, with obsolete weapons, and attacked from all sides, the Poles held out for 36 days and inflicted heavy losses on the Germans. The British, French, Belgians, and Dutch had almost nine months to mobilize and prepare. When war did come in the west, the Allies had near parity in ground and air forces, actual superiority in tanks, and outright supremacy at sea. Yet, in a 39-day campaign, they inflicted fewer losses on the Germans than had the Poles.

The Anglo-French failure to deliver their promised attack on Germany in September 1939 remains one of the great "what-ifs" of the twentieth century. Strong Allied intervention in the west might not have saved Poland in the end. On the other hand, it certainly would have forced Germany into a two-front war two years earlier than the German invasion of the Soviet Union. The German war machine of 1939 was

Soldiers of the SS-Leibstandarte Adolf Hitler Division, resting in a ditch alongside road on the way to Pabjanice, during the campaign in Poland, September 1939. (Library of Congress)

nowhere near as large and strong as it would be by June 1941. In September 1939, French and British forces were capable of throwing 98 divisions and some 3,500 combat aircraft against Army Group C's 35 infantry divisions supported by about 1,000 aircraft. Behind them lay the vulnerable industrial base of the Rhineland. But in the end, the French made only a feeble effort into the Saarland; the British record was worse and largely confined to debate over the legality of using the Royal Air Force to bomb private property in Germany.

World War II started over Polish independence. Yet in one of the greatest ironies of history, that very independence was bargained away in the deals between the victorious powers at the war's end. The Yalta and Potsdam agreements left Poland on the wrong side of the Iron Curtain, and despite a deep historical antipathy toward the Russians, the Polish people had to endure more than four decades of Soviet domination during the long winter of the Cold War.

Poland–East Prussia Campaign (July 1944–April 1945)

Important Eastern Front campaign. On 22 June 1944, the third anniversary of the German invasion of the Soviet Union, the Red Army launched Operation BAGRATION, a massive offensive to drive German forces from western Belorussia. By mid-1944, the German army was only a shell of what it had been in 1941, whereas the Soviets had superior numbers of artillery pieces, tanks, trucks, and aircraft as well as a four-to-one manpower advantage on the Eastern Front. The Soviets had also developed new tactical doctrines that took advantage of their greatly improved mobility.

The great Soviet offensive involved 11 fronts (army groups) and stretched from the Baltic in the north to the Black Sea in the south. Within two months, the Red Army had liberated Byelorussia and destroyed German Army Group Center, but even before the conclusion of BAGRATION, Soviet leader Josef Stalin issued new orders through Stavka for the liberation of the Baltic states and Poland and a drive on Berlin. From north to south, this effort involved the 1st Baltic and 3rd, 2nd, and 1st Byelorussian Fronts.

On 20 July 1944, units of the 1st Byelorussian Front crossed the Bug River in three places and captured Lublin. There the Soviets established their own Polish government and army and declared open season on the London government's anti-Communist Polish Home Army. On July 25, the Red Army reached the Vistula. The great city of Brest, encircled, fell on 28 July after a single day of fighting. Meanwhile, Lvov, capital of Galicia, capitulated on 27 July as the other fronts, north and south, achieved their objectives against varying degrees of resistance. Some German army units, cut off and isolated

against the Baltic, did not surrender until the end of the war. German Colonel General Joseph Harpe, commander of Army Group A (the redesignated Army Group North), could do little more than delay the inevitable. Indeed, Hitler's call for "no retreat," when obeyed, resulted in the destruction of many German units in untenable positions, and static defense also brought the destruction of the few remaining German maneuver elements. Adding to Harpe's difficulties later was Hitler's decision to withdraw units to prepare for the Ardennes Offensive (the Battle of the Bulge) in the west.

At the end of July, Stavka ordered the 1st and 2nd Byelorussian Fronts to drive to the Narew River and Warsaw. The 2nd Byelorussian Front was to advance to Ostrołę and Łomża. The 1st Byelorussian Front drove on the Warsaw suburb of Praga, along the way seizing crossing points over the Narew and Vistula Rivers. Although these objectives were secured, the Red Army offensive had lost momentum. In the drive, the Soviets destroyed 28 German divisions, inflicting 350,000 casualties, but logistical problems, in consequence of the rapid advance and two months of solid fighting, forced a pause.

On 29 August, Stalin ordered that all Red Army fronts were to dig in generally along the line of the Vistula and Narew Rivers. Although the 1st and 2nd Byelorussian Fronts continued limited attacks to strengthen their hold across the Narew, Soviet forces made no effort to cross the Vistula River and move into Warsaw. This decision produced one of the most controversial episodes of the entire war, the Warsaw Rising of 1 August to 2 October 1944.

With the rapid Soviet advance, Polish Home Army commander General Tadeusz Bór-Komorowski ordered a general uprising in Warsaw, which brought quick German army reaction. The Soviets made only halfhearted efforts to assist the Home Army in the form of air-dropped supplies. Although it is true that the Red Army suffered from genuine logistical problems, it is also quite true that Stalin was delighted to see the Germans eliminate the anti-Communist Home Army forces, whose existence he correctly believed would hinder his own postwar control of Poland. The Soviets not only refused to help the Poles in any meaningful way, but they also obstructed efforts by the western Allies to air-drop supplies to the Polish fighters. The fighting brought the destruction of 90 percent of the buildings of Warsaw, but it also claimed 10,000 Germans casualties—tribute to the ferocity of the two-month-long Home Army resistance.

Stavka, meanwhile, laid plans for the final control of Poland in an offensive that would carry from the Vistula to the Oder. The massive offensive involved Marshal Georgii Zhukov's 1st Byelorussian Front, Marshal Konstantin Rokossovsky's 2nd Byelorussian Front, General of the Armies Ivan Chernyakovsky's 3rd Byelorussian Front, and

Marshal Ivan S. Konev's 1st Ukrainian Front, all of which were on the Narew-Vistula Line. Meanwhile, General Ivan Petrov's 4th Ukrainian Front occupied positions along the San River line in southern Poland and Galicia.

Stalin's orders were to destroy Army Group A, with the secondary objective of drawing off German reserves in response to western appeals during the German Ardennes Offensive (Battle of the Bulge). Under Stavka's plan, the 1st Byelorussian Front was to take Poznan and destroy forces cut off in the Warsaw area. The 2nd Byelorussian Front would assist in surrounding Warsaw and also take Marienburg. The 1st Ukrainian Front, with five combined-arms armies, two tank armies, and four tank/mechanized corps, would carry the brunt of the offensive, breaking out of the Sandomierz bridgehead and driving to Breslau. The 4th Ukrainian Front would drive on Kraków. The Soviet offensive was massive. The 1st Ukrainian and 1st Byelorussian Fronts together contained 2.2 million ground troops (a six-to-one advantage over the defending Germans) in 163 divisions supported by more than 32,000 artillery pieces and almost 4,800 aircraft.

The second half of the offensive to clear Poland began on 12 January 1945. Radom fell on 16 January. By 17 January, Zhukov's 1st Byelorussian Front and the Soviet-controlled Polish First Army had liberated Warsaw. Within the next week, the 1st Byelorussian and 1st Ukrainian Fronts had punched a 310-mile hole in the German lines and driven 100 miles. There was little Harpe and the German forces could do to arrest the Soviet advance. Kraków and Poznan were taken in late January, and on 22 January, Konev's 1st Ukrainian Front bridged the Oder. Zhukov also reached the river and got his troops across, although it took three weeks to close the 70-mile gap separating these two Red Army fronts. On 28 January, forces of the 1st Byelorussian Front entered German Pomerania, where they were met by the hastily formed Army Group Vistula, commanded by the inept Heinrich Himmler. Königsberg was surrounded and taken on 9 April. Meanwhile, the 1st Ukrainian Front eliminated pockets of German forces in southwestern Poland.

Soviet forces had once again outrun their logistical support and were forced to halt. Nevertheless, the Red Army was now poised to begin its final offensive: the drive on Berlin to end the war.

Portal, Sir Charles Frederick Algernon (First Viscount Portal of Hungerford) (1893–1971)

Royal Air Force (RAF) marshal, chief of the RAF Air Staff from 1940 to 1945, and member of the Combined Chiefs of Staff. Born 21 May 1893 in Hungerford, England, Charles Portal joined the Royal Engineers as a dispatch rider during World War I. In 1915, he was commissioned in the Royal Flying Corps, qualifying as an observer and then a pilot. He shot down several German aircraft in some 900 sorties that primarily included reconnaissance and artillery fire direction and won the Distinguished Flying Cross. Between the wars, his posts in the RAF included commander of British forces at Aden (1934–1935) and the Imperial Defence College (July 1937). Promoted to air vice marshal in July 1937, he became director of organization and was responsible for developing 30 new RAF bases around Britain. He also served as air member for personnel at the Air Ministry.

Portal became chief of Bomber Command in April 1940, initiating the first RAF raids against Germany. He was knighted that July. On 25 October 1940, Portal was named chief of the air staff and air chief marshal (the highest RAF post; he was the youngest staff chief). In addition to his Air Ministry duties directing the policy and operations of the RAF, Portal participated in all the summit conferences as a member of the Chiefs of Staff Committee. Portal supported Sir Arthur Harris's controversial stewardship of Bomber Command and the policy of area bombing (until it was halted by Prime Minister Winston L. S. Churchill in March 1945). A strong believer in air power, he saw the role of the RAF and its American Army Air Forces allies as destroying Germany's ability to resist invasion. Portal was made a baron (Lord Portal of Hungerford) in August and served as RAF chief until 31 December 1945. Churchill's verdict on Portal was that he was the "accepted star of the air force."

From 1946 (when he was raised to Viscount) to 1951, Lord Portal was responsible for administering the atomic research facilities at Harwell. He served as chairman of the British Aircraft Corporation from 1960 to 1968. He died 23 April 1971 in Chichester, England. He was one of the few senior wartime leaders to leave no memoirs.

Portugal

Portugal, located in the western Iberian Peninsula, was dwarfed by its overseas empire, which was chiefly in Africa. Portugal itself comprises only about 35,500 square miles and had a population in 1939 of 7.7 million people.

A republic had been proclaimed in 1910, but the years that followed were turbulent; there were 40 cabinets in the first 14 years of the republic. Finally, in 1926, the military seized power and subsequently summoned a university economics professor, Antonio Salazar, as minister of finance to restore economic order. For the next forty years, until 1968, Salazar completely dominated Portugal. In 1932 he became premier as head of an authoritarian government, and under a constitution in 1933, Portugal became a corporative republic. A national assembly elected by the heads of families served as the legislative body. A corporative chamber advised the assembly on social and economic matters; it represented syndicates of various corporations. The Catholic Church also maintained considerable influence. Salazar's National Union party was the political voice of the so-called *estado novo* (new state). This system came to be known as clerical fascism.

Salazar avoided Portuguese entanglement in the Spanish Civil War, and on 31 March 1939, he and Spanish dictator Generalissimo Francisco Franco signed a friendship and nonaggression treaty. Known as the *Pacto Ibérico* (Iberian Pact) it pledged both countries to mutual aid if either was attacked. Portugal was a long-standing ally of Great Britain and had entered World War I in 1916 as a result of British ties, but when World War II began, Salazar proclaimed Portuguese neutrality. He was convinced that, although the war would be long, the Allies would eventually win. During the conflict, Salazar's policy of collaborative neutrality or "juridical neutrality" helped keep German troops out of the Iberian Peninsula.

Several consequences flowed from Portugal's neutral stance. From the beginning of the war, refugees flooded in and were given sanctuary in Portugal or allowed to transit the country. The wealthy political opponents of the Nazis, English and American expatriates, the homeless and displaced, and desperate Jews all found in Lisbon a travel terminus to North Africa or the Americas. Portuguese neutrality also provided a place for the transit of goods bound for Axis powers.

At first, the Salazar government ignored the Jews, but it then issued an order (Circular 14) to forbid them visas. Portuguese consul general in Bordeaux, France, Aristides de Sousa Mendes not only ignored this order, but over a six-month period in 1940, he issued more than 30,000 visas to Jews and others, allowing them to escape the Nazis. Mendes was dismissed, disgraced, and eventually died in poverty. Not until 1987 did the Portuguese government honor his deed.

To meet the refugee problem, various charities operated in Portugal. The Red Cross headquarters for relief operations, prisoner-of-war packages, and the like in Europe during the war was centered in Portugal. Others also came to neutral Portugal to operate. Spies from both sides made Lisbon a hotbed of intrigue and espionage during the war. Businessmen from both sides in the war sought Portuguese goods. The Axis side sought Portuguese tin, cork, wool, fish, and especially wolfram (tungsten) for use in hardening steel.

Portugal in fact supplied wolfram to both sides. When the Germans insisted on increased deliveries, Salazar resisted, and on 12 October 1941, 80 miles from Lisbon, the crew of the German submarine *U-83* searched and then sank the Portuguese merchant ship *Corte Real* on the grounds that she was carrying contraband. Many believed that this was intended to intimidate the Portuguese. Salazar nonetheless refused to change his policy of evenhanded neutrality. Salazar attempted to regulate the sale of wolfram; however, the Germans increased their share by smuggling it from private mines. Finally, in June 1944, Salazar agreed to impose an embargo on the sale of wolfram to the Axis side.

The Portuguese Azores in the Atlantic were islands of great strategic importance and figured in German invasion plans for the Iberian Peninsula (Operation *FELIX*), which were never implemented. To prevent these islands from falling into Axis hands, in June 1943 the British invoked the Anglo-Portuguese Alliance of 1373 and requested the use of bases on the Azores. Salazar, well aware of the change in Germany's military fortunes, complied, and on 8 October 1943 Britain landed troops in the Azores to establish bases there. U.S. troops and bases followed. Lajes Field on Terceira became an important transit point for aircraft, and other Azores bases figured prominently in anti-U-boat activity in the Atlantic.

Politically, there were those in Portugal who supported the Allies and others who favored the Nazis. As the war continued, shortages developed and unemployment rose. The government ruthlessly crushed all strikes.

Portugal maintained its overseas colonies during the war. The one exception was the island of Timor in the Indonesian archipelago. In late 1941, fearing a Japanese attack there, a combined Australian and Dutch force took control. In early 1942, the Japanese drove them from Timor.

Salazar's policy of "juridical neutrality" kept one of Europe's poorer countries out of the conflict. Certainly Salazar

emerged from the war in a much better position than Franco. Portugal was readily admitted to the United Nations and was invited to join the North Atlantic Treaty Organization.

Potsdam Conference (17 July–2 August 1945)

Final wartime conference involving the leaders of the major Allied powers. The conference was held in 1945 from 17 July to 2 August in the Cecilienhof Palace at Potsdam, near Berlin. Its code name, *TERMINAL*, signaled both the end of the war and the wartime alliance. U.S. President Franklin D. Roosevelt had died in April 1945; President Harry S. Truman represented the United States, assisted by Secretary of State James F. Byrnes and chairman of the Joint Chiefs of Staff Admiral William Leahy. Truman traveled to and from Europe on the cruiser *Augusta*.

The results of British elections were announced in the midst of the conference, and in one of the most stunning upsets in British electoral history, the Conservatives were ousted. Prime Minister Winston L. S. Churchill resigned, replaced by leader of the British Labour Party Clement Attlee with Foreign Secretary Ernest Bevin. No elections disturbed the Soviet delegation, headed by Josef Stalin, assisted by Foreign Minister Vyacheslav Molotov. Despite French leader Charles de Gaulle's appeals to Washington, France was not represented at Potsdam. The day before the conference formally opened, Truman received word of the successful explosion of an atomic bomb at Alamogordo, New Mexico.

Among issues discussed at the conference were the future of Germany and eastern Europe and involving the Soviet

Union in the war against Japan. On 26 July, U.S. and British leaders issued a surrender ultimatum to Japan. Designed to weaken Japanese resistance to surrender, the Potsdam Declaration held out some hope to the Japanese for the future. Although their country would be disarmed, occupied, and shorn of its conquests, Japan would be allowed access to raw materials after the war and would have the opportunity for democratic development. If, however, Japanese leaders refused to surrender, the nation would be destroyed. The Soviet Union, several weeks away from a declaration of war against Japan, was not a party to this proclamation.

Stalin demanded heavy reparations from Germany for the vast damage suffered by the Soviet Union in the war. He held out for a firm figure, whereas Truman would agree only to the Soviet Union receiving a set percentage of a whole to be determined on the German capacity to pay. The U.S. delegation also disagreed with the Soviets over their very loose interpretation of "war booty"—goods that could be confiscated without reference to reparations. Agreement was reached at Potsdam, however, that the Russians would receive 25 percent of plants and industrial equipment removed from the western zones. In return, the Soviets were to repay 15 of the total 25 percent in food and raw materials from their zone. The Soviets also received permission to seize German assets in Bulgaria, Hungary, Finland, Romania, and their zone of Austria. No agreement on reparations was ever reached, but it is estimated that the Russians probably took about \$20 billion (the total sum discussed at the Yalta Conference) from their zone of Germany alone.

The Allies also reached agreement on the "three Ds"—democratization, denazification, and demilitarization. German leaders were also to be punished as war criminals, and Germany's resources were to be used to repair the damages that had been inflicted in the war on its neighbors. German industrial production was set at a level no higher than the average for Europe as a whole.

No peace treaty was signed between the Allies and Germany, and so further "temporary" arrangements sanctioned by Potsdam became permanent. Following the war, East Prussia was divided according to agreements made at the Tehran Conference. Königsberg, Memel, and northern East Prussia were appropriated by the Soviet Union, and the remainder of East Prussia went to Poland. The conferees at Potsdam agreed on an "orderly and humane" transfer of the German population from this region. This did not occur. Perhaps 2 million Germans lost their lives in the forced reparations and exodus that followed.

Agreement was reached over the surrender of Japanese forces in Korea and Indochina. In the case of Korea, the Soviets were to be responsible for their surrender north of the 38th parallel, and American forces were to be responsible south of that line. In Indochina, Chinese forces would take the Japa-

British Prime Minister Winston Churchill, U.S. President Harry Truman, and Soviet Premier Josef Stalin shake hands in celebration at the Potsdam Conference of July–August 1945. The leaders of the “Big Three” met at the conference to discuss the postwar fate of Germany and to plan the end of the war against Japan. (Corbis)

nese surrender north of the 16th parallel and British forces south of it. Never intended as political boundaries, these too became part of the Cold War.

The leaders at Potsdam also established a Council of Foreign Ministers to plan the preparation of peace treaties. Their discussions produced increasingly bitter exchanges that reflected the start of the Cold War.

Pound, Sir Alfred Dudley Pickman Rogers (1877–1943)

British admiral, first sea lord, and chief of the Naval Staff. Born on 29 August 1877 near Ventnor, Isle of Wight, Alfred Pound entered the Royal Navy in 1891 and became a torpedo lieutenant in 1902. Promoted to captain in 1914, he was second naval assistant to First Sea Lord John Fisher (December 1914–May 1915). Pound fought in World War I as flag captain of the battleship *Colossus* (1915–1917), including service at the Battle of Jutland.

After the war, Pound served on the Admiralty Staff (1917–1919), was head of the Royal Navy Plans Division (1922), and commanded the battle cruiser squadron (1929–1932). He was knighted in 1933 and served as second sea lord (1933–1935). Pound returned to sea and became commander in chief of the Mediterranean Fleet (1936–1939), training its personnel for the impending war.

On the eve of war, Pound was promoted to admiral of the fleet; he was named first sea lord (the highest Royal Navy post) in June 1939. He was already a tired man who consistently worked too hard and for long hours, and he had few

Prime Minister Winston Churchill walking with First Sea Lord of the Royal Navy, Admiral Sir Alfred Dudley Pound. (Corbis)

hobbies with which to break the pressure. Yet under him, the navy planned and saw through the initial stages of the successful war at sea, although not without setbacks. Pound blamed himself for the loss of the *Prince of Wales* and *Repulse* to Japanese air attack in December 1941. In July 1942, wanting to clear convoy escorts for expected German surface attack, Pound ordered the Russia-bound convoy (PQ-17) merchant ships to scatter, and 22 of 35 ships were subsequently lost to U-boat attack.

In an effort to lighten his load, Pound handed over chairmanship of the Chiefs of Staff to Alanbrook (9 March 1942), and a deputy first sea lord was appointed to assist him two months later. He declined a peerage, but he was awarded the Order of Merit in 1943. Following the death of his wife in July 1943, his own health failed. Although the cause was not realized at the time, he was suffering from a brain tumor that had made him increasingly sleepy in meetings. Pound eventually suffered a stroke while accompanying Prime Minister Winston L. S. Churchill to the Quebec Conference. He died on 21 October (Trafalgar Day) 1943 in London.

POWs

See Prisoners of War.

Prien, Günther (1908–1941)

German naval officer and U-boat captain. Born on 16 January 1908 in Lübeck on the Baltic coast, Günther Prien joined

the merchant marines at age 15 to aid his divorced mother and two siblings. He impressed his superiors with his acumen and skill. He graduated from captain's school in 1932 and, in 1933, entered the German navy. Commissioned an ensign, he volunteered for submarine school in 1935. During the Spanish Civil War, he served on *U-26* off the coast of Spain.

Prien's skill won him command in 1938 of *U-47*, one of Germany's new Type VIIB submarines. From the start of World War II, Prien's submarine patrolled the Atlantic shipping lanes. He logged his first kill, a merchantman, on 5 September 1939. The next month, commander of German submarines Admiral Karl Dönitz picked Prien for a daring mission to penetrate the principal anchorage of the British Home Fleet at Scapa Flow in the Orkney Islands. On 13 October, Prien was able to pass *U-47* between sunken blockships in Kirk Sound and maneuvered into the harbor. At about 1 A.M. on 14 October, Prien fired four torpedoes at the battleship *Royal Oak*, sinking her. Three torpedoes fired at what Prien mistakenly believed to be the battle cruiser *Repulse*

Adolf Hitler, accompanied by Admiral Erich Raeder (left edge) and Captain Günther Prien, decorates Prien's U-boat crew after they sank the British battleship *Royal Oak* at Scapa Flow, with the loss of 833 British sailors, Berlin, 1939. (Corbis)

(actually the transport, later seaplane-tender, *Pegasus*) missed. Prien then departed the harbor, managing to avoid detection. This accomplishment was a major propaganda coup for the German navy, and Adolf Hitler awarded Prien the Knight's Cross of the Iron Cross for this deed. Prien was also promoted to Kapitänleutnant.

Prien went on to sink 31 Allied ships and assisted in sinking 4 others, for a total of 213,283 tons. On 8 March 1941, British destroyers *Verity* and *Wolverine* surprised Prien's *U-47* and *U-99* on the surface. *U-99* reported a 9-hour attack with more than 50 depth charges. It is possible that Prien's *U-47* succumbed to this assault, although another theory suggests that Prien counterattacked and his submarine was struck by one of his own circling torpedoes. In any case, all contact with *U-47* was lost.

Prince of Wales and Repulse **(10 December 1941)**

Following World War I, British authorities decided to develop Singapore as the most important naval base in the Far East to concentrate British forces to protect the vast British imperial and commercial interests in the region. During the interwar period, a major base was created somewhat haphazardly, including land defenses and provisions for air support. Part of the plan involved deploying a large naval force to Singapore, a force as large as or larger than the Japanese battle fleet. The doctrine was called "Main Fleet to Singapore." However, by the late 1930s, naval commitments in home waters and in the Mediterranean Sea reflected increased threats from Germany and Italy, so that at the beginning of World War II, the Royal Navy battle fleet was spread thinly. Finally, in October 1941, Prime Minister Winston L. S. Churchill decided to deploy a squadron of capital ships to Singapore under new Eastern Fleet commander Admiral Sir Tom Phillips. Some viewed this as the Main Fleet to Singapore force designed to overawe the Japanese from the seemingly impregnable base at Singapore.

Phillips flew his flag in the *Prince of Wales*, a George V-class battleship that was completed in March 1941. Britain's newest capital ship, she had fought the German bat-

tle ship *Bismarck* and carried Churchill to meet with U.S. President Franklin D. Roosevelt at Placentia Bay, Newfoundland. She mounted a main armament of 10 × 14-inch guns in two quadruple and one double turret, along with 16 × 5.25-inch quick-firing guns. She also was armed with 64 × 2-pounder pompoms, 8 × 40-mm Bofors, and 25 × 20-mm Oerlikon anti-aircraft guns. The battle cruiser *Repulse*, completed in 1916 during World War I, accompanied her. She mounted 6 × 15-inch and 15 × 4-inch guns plus 4 × 4-inch quick-firing anti-aircraft guns. The aircraft carrier *Indomitable*, which was to have accompanied these two capital ships, had been run aground off Jamaica and was undergoing repairs. The decision to send the two capital ships to the Far East without air cover was fateful, as it deprived the squadron of the means to defend against Japanese air attack. Land-based air forces at Singapore were also inadequate. Churchill, however, believed that capital ships could not be sunk by aircraft while the ships were under way and defending themselves with anti-aircraft guns.

The *Prince of Wales* and *Repulse* arrived at Singapore on 2 December. Following the Japanese attack on Pearl Harbor, the two were the only Allied capital ships on station between Hawaii and the Mediterranean. On 8 December, the Japanese invaded Malaya, and Phillips immediately took his ships to sea to intercept a Japanese convoy off of the Kra Isthmus of Malaya. His Force Z consisted of the two capital ships and the destroyers *Vampire*, *Tenedos*, *Electra*, and *Express*.

With no British air cover available and all hope lost of surprising the Japanese naval units, Phillips ordered his ships to return to Singapore. At this point, Phillips received a report of another Japanese landing at Kuantan, closer to his position. He headed there but maintained radio silence so as to not alert the Japanese. This prevented the dispatch of British land-based aviation, which Phillips assumed would be forthcoming.

The British ships had been sighted by a Japanese submarine, and on the morning of 10 December, the Japanese launched massive air attacks against the British ships. The Japanese force consisted of 86 twin-engine bombers, 18 high-level bombers, and 25 torpedo bombers of the First Air Fleet at land bases in Indochina. The attacks began at 11:15 A.M. Force Z was then about 50 miles off the east coast of Malaya. The *Repulse* was sunk first, then the *Prince of Wales*. Both ships were victims of air-launched torpedoes. The *Repulse* went down with 327 of her crew of 960; the *Prince of Wales* was struck by one or two 1,100-pound bombs and as many as 6 torpedoes. Of her 1,612 crew members, the destroyers rescued 1,285. Neither Admiral Phillips nor Captain J. Leach, captain of the *Prince of Wales*, were among the survivors. The Japanese lost only 3 aircraft in the battle.

The destruction of Force Z came as a great shock to the Royal Navy and British government and public. It has been charac-

terized as a sign of the end of the battleship era. No longer could capital ships operate alone without air and subsurface protection. The associated surrender of Singapore to inferior numbers of Japanese forces in February 1942, the greatest defeat suffered by Britain in its modern history, was seen as the end of British, even western, dominance in East Asia.

Prisoners of War (POWs)

In 1929, the Geneva Convention Relative to the Treatment of Prisoners of War (POWs) replaced the Hague Convention of 1907 regarding protection of POWs. The Hague Convention had dealt primarily with the means of war (for example, it prohibited the use of exploding bullets), whereas the Geneva Convention dealt exclusively with the protection of victims of war. It held that POWs should be considered on a par with the detaining power's garrison troops as far as rations, living space, clothing, and access to medical care were concerned. It also addressed such issues as permissible work and punishment and access to letters and packages. Forty powers signed the convention, but the Soviet Union did not, meaning that prisoners taken by its forces were not subject to Geneva Convention protection. Although the Japanese delegates at Geneva signed the POW convention, the Tokyo government never ratified it. Its military leaders assumed no Japanese would be taken prisoner and that the convention would thus be applied unilaterally. Cultural attitudes also played an important role, and authorized punishments for POWs were much milder than those the Japanese meted out to their own soldiers. Although in 1942 the Japanese government pledged to live up to the spirit of the convention, its treatment of Allied POWs during the war clearly ran counter to its assurance.

Europe, Eastern Front

On 1 September 1939, German forces invaded Poland; two days later Britain and France declared war on Germany, igniting World War II. Two weeks later, Soviet forces invaded Eastern Poland in accordance with the secret provisions of the August 1939 German-Soviet Non-aggression Pact. In 1940, Soviet authorities executed perhaps 15,000 Polish officers in the Katyń Forest of eastern Poland. Prisoners taken by the Germans were sent to slave-labor camps. The Poles thus did not benefit from the Geneva Convention.

In June 1941, German forces invaded the Soviet Union. In response to inquiries by the U.S. government, Moscow had stated that the Soviet Union would observe the Hague Convention of 1907 regarding land warfare, the Geneva Protocol of 1925 regarding chemical and bacteriological warfare, and the Geneva Convention of 1929 regarding care for the wounded and sick of warring armies. However, the Soviets said they would observe the agreements on POWs only as "they were observed by the Germans."

The German government was as obstinate on the issue as the Soviets, and the cost was ultimately very high for the POWs captured in the fighting. Both German and Soviet POWs suffered conditions that were approached only by treatment accorded prisoners of the Japanese. Of some 5.7 million Soviet soldiers taken prisoner by the Germans, at least 3.3 million died in captivity, a mortality rate of 57 percent. This compares with a mortality rate of only 3.5 to 5.1 percent for British and American POWs in German hands.

Many Soviet prisoners taken early in the fighting were simply starved to death. According to Adolf Hitler's notorious Commissar Order, political officers were to be shot on capture. Jewish soldiers taken prisoner were handed over the Schutzstaffel (SS) to be executed. Conditions were horrendous for the others. The Germans marched the prisoners long distances to the rear, and there were no prepared lodging or sanitary facilities and little food for them when they reached the camp locations. As a result, POWs died by the hundreds of thousands. The leaders of the Reich regarded the prisoners as subhuman and treated them accordingly. Of 3.2 million Soviet soldiers taken prisoner by December 1941, 2 million were dead by February 1942.

As the German advance came to a halt and it became impossible to demobilize German soldiers, the Reich's leaders sought to make more effective use of the Soviet POWs by putting them to work in difficult conditions in road building, mining, and agriculture. Not until mid-1944, however, did food rations for Soviet POWs approach those of other Allied POWs in German captivity. So difficult was it for Soviet prisoners of war that at least a quarter million volunteered to serve as auxiliaries to the German army, working as cooks, drivers, and the like, in an effort simply to stay alive. Tens of thousands of others also agreed to serve in a German-

sponsored Russian Liberation Army led by former Soviet Lieutenant General Andrei A. Vlasov. Hitler, however, refused it any combat role and it became simply a means to encourage desertions.

The plight of Soviet POWs in German hands did not end with the defeat of Germany. Soviet leader Josef Stalin's infamous Order 270 of August 1941 had branded as traitors all Red Army personnel who allowed themselves to be taken prisoner, regardless of circumstances. It also ordered rations cut off to their families. Of some 1.8 million Soviet POWs repatriated at the end of the war, at least 150,000 were sentenced to long prison terms of forced labor for having "aided the enemy."

On the other side, about a third of the nearly 3 million German and Austrian soldiers taken by the Soviets in the war died in captivity. Of some 91,000 Germans taken prisoner in the Battle of Stalingrad, fewer than 5,000 survived Soviet captivity. Death rates were comparable for the 2 million Axis soldiers taken prisoner by the Soviets.

The only difference in German and Soviet treatment of POWs was that, for the Germans, it was systematic government policy to work the prisoners to death, whereas POWs in Soviet hands fell victim to the general inefficiency and indifference of the Soviet POW camp system (GUPVI), lack of resources in a country ravaged by war, and individual acts of reprisal. Rising numbers of German POWs after 1942 simply overwhelmed available Soviet means to care for them. The Soviets did not begin major repatriation of its POWs until 1947, and the last were not released until 1956.

Western Europe

During World War II in Europe and North Africa, the Axis powers captured some 8.5 to 9 million enemy soldiers, of whom 6 million—the vast majority—were Soviets. In turn, the Allies took some 8.25 million Axis soldiers captive, 3.4 million of whom surrendered with the end of hostilities on the Western Front.

Few problems were reported for prisoners held by the Italian government. Experiences for POWs held by the Germans varied according to their citizenship. Treatment was decidedly better for western Europeans and North Americans than for those from eastern or southern Europe. The Germans did not expend scarce resources on the prisoners, however. Thus, in consequence of the high number of parcels sent to western Allied POWs, the German government decided to cut food rations to U.S. and British Commonwealth POWs by one-third, forcing these Allied governments to subsidize German Geneva Convention obligations. The Germans did, however, employ many of its French and Belgian POWs in labor activities (such as the armaments industry) that directly benefited the German war effort.

The Germans organized their POW camps quite methodically. Internally, the camps were run by the prisoners. Gen-

erally there was an SAO—Senior Allied Officer or Senior American Officer, depending on the mix of prisoners. Officers were segregated from enlisted men. *Stalags* were camps that held enlisted personnel as well as noncommissioned officers. *Oflags* were camps with only officers and some noncommissioned officers. In stalags, there was generally a "man of confidence" who was usually elected by his fellow POWs, although on occasion he was appointed by the Germans.

Camps usually contained more than one compound, and prisoners were segregated among the compounds by uniform, not by claimed citizenship. Hence, U.S. personnel who flew with the RAF and were captured in RAF uniform were considered to be British and housed with British flyers. Compounds held French, Russians, British, Commonwealth, and various other nationalities. Some camps held only one nationality; some held many different nationalities.

There were also prisoner-of-war camps located in areas that held concentration camps. Auschwitz, which is known for being an extermination center, was actually a complex of camps comprising more than just the extermination center. French, Soviet, and other nationalities of POWs were held there. Two exceptions to the generally satisfactory German treatment of western POWs came in Hitler's Commando Order of October 1942, which allowed the killing out-of-hand of Allied commandoes, and Berga, a Buchenwald subcamp that held 352 U.S. "Jewish" POWs. Of that number, only 70 were actually Jewish, but the others were chosen by the Germans because they "appeared" Jewish. Prisoners were regularly beaten and starved, and several were murdered.

There have been unsubstantiated charges in recent years of British and U.S. mistreatment of German POWs in the months immediately following the end of the war in Europe. There is, however, no proof of this nor of any widespread mistreatment of Axis prisoners of war by British and U.S. authorities during the war itself.

Far East

Japanese cultural attitudes played an overwhelming role in Japanese treatment of its POWs. The Japanese believed that soldiers should die in battle rather than surrender and that those who allowed themselves to be taken prisoner had dishonored themselves. Japanese treatment of POWs was atrocious. Prisoners were subject to torture, starvation, beatings, and denial of medical care. Most were required to perform slave labor, from building railroads to working in coal mines and factories, all of which were forbidden by the Geneva Convention. Mistreatment was rampant, as were disease and starvation, not only among military prisoners but with civilian internees. Nor would the Japanese allow humanitarian aid to reach the prisoners.

The generally accepted figure for Allied POWs in Japanese hands is 320,000: 140,000 Europeans and North Americans and 180,000 Chinese, Filipino, Indian, and other Asian

German prisoners captured at the beachhead of Anzio, south of Rome, leave a LST on their way to a prison camp, 1 January 1944. (Photo by Hulton Archive/Getty Images)

troops. Most of Japan's prisoners were taken in the Japanese successes of late 1941 and early 1942, especially in the Netherlands East Indies. Although the Japanese soon released many of the nonwhite prisoners, they held their white captives until the surrender in 1945.

The Japanese captured some 25,600 U.S. prisoners. Of these, 8,288 died, a rate of 35.6 percent. This was appreciably higher than the rate for all prisoners who died in Japanese hands: 37,800 or 26.9 percent. Part of this disparity was the result of the many American and Filipino POWs who died in the Bataan Death March. Prisoners of the Japanese received no medical care and little food, and they were seldom allowed to contact their families. Many of the prisoners were transferred from the Philippines and other places to Japan or Manchuria to prison camps. Sent by ship, the prisoners were

entombed below decks with little or no access to fresh air or water. Many hundreds of men died in these "Hell Ships" of the conditions, but the exact total is unknown. Several of the ships, unmarked by the Japanese as transporting POWs, were sunk by Allied planes or submarines. In addition, many POWs who ended up in Manchuria were subjected to the horrors of biological warfare and vivisection experiments carried out by the infamous Japanese Unit 731.

Japanese military codes forbade surrender, and in consequence, the western Allies took very few Japanese prisoners. On Iwo Jima, U.S. Marines took fewer than 300 prisoners from the 21,000-man Japanese garrison, and only about 7,400 of nearly 115,000 Japanese soldiers on Okinawa surrendered. It is also true that once Allied soldiers learned of the barbaric treatment accorded by the Japanese to their pris-

oners, there was a tendency to decline to take prisoners, although this was never official policy.

Some 633,000 Japanese personnel were taken prisoner in Southeast Asia, and most of them surrendered to the British at the end of the war. Many of these were held well after the war and worked as laborers without pay. Only in October 1947 were Japanese released from Singapore. Some Japanese POWs were also rearmed and forced to serve with Dutch forces in the Netherlands East Indies in violation of international law, and nearly 1,000 died.

It is unclear how many Japanese were taken prisoner by the Soviet Union, which entered the war in the Pacific on 9 August 1945. The Soviets claimed to have captured 594,000 Japanese and claimed that upward of 71,000 of these were immediately freed. Japanese scholars, however, insist that the number was much higher. Sent to Siberia, the Japanese worked there for several years before they were released. Because of the dishonor associated with being captured, few Japanese ex-POWs have left memoirs of their experiences. The record of Americans and Europeans held by the Japanese is, however, well documented.

North America

When the United States entered World War II, little thought had been given to the establishment of POW facilities. In March 1942, President Franklin D. Roosevelt authorized the evacuation of Japanese Americans from “military areas,” especially on the West Coast of the United States. Ultimately some 120,000 Japanese Americans were affected. Although they were not called prisoners of war, they were interned in camps in Wyoming, California, Colorado, Arizona, Idaho, and Arkansas.

Following the Axis defeat in North Africa, large numbers of German and Italian POWs were brought to camps in the United States. Ultimately, some 425,000 Axis prisoners of war were held in the United States. By the end of the war, the United States had established 141 permanent base camps and 319 branch camps, each holding an average of about 2,500 prisoners. Given the labor shortage in the United States because of the demands of the war, many of the POWs went to work, but they were paid for their labor according to rank. Officers were not required to work, although several did accept supervisory positions. Contractors who hired the POWs paid the U.S. government some \$22 million for their services, so that the program was nearly self-sufficient. By the end of the war, of 370,000 POWs in the United States, nearly 200,000 were employed in nonmilitary jobs, most of them in agriculture. Conditions in the U.S. camps were generally excellent. The major problem came from die-hard Nazi fellow prisoners, who had to be segregated in special camps.

Following the war, several U.S.-held POWs were turned over to France and Britain to work in mines and help clear

bombed roads and cities. Most of these POWs were repatriated to Germany in late 1947 and early 1948, embittered over their postwar treatment.

Propaganda

Organized and usually emotional government campaigns employing print, film, and especially radio designed to persuade audiences of nefarious enemy actions while supporting one’s own war effort. Propaganda as a modern psychological weapon of war was first systematically applied by all major combatants in World War I. With more modern media available—and a far clearer ideological conflict between democracy and fascism—propaganda became much more pervasive in World War II. Some was aimed domestically to encourage support for the war; the best-known efforts were directed at opponents.

The Axis Powers: Germany, Italy, and Japan

Germany’s stellar propaganda efforts drew on Hitler’s own experience of Allied propaganda during World War I. Recognizing the importance of a clear effort, Germany developed

centralized control of all media from the beginning of the Nazi regime with the March 1933 creation of the Ministry of Public Enlightenment and Propaganda, which was headed by Joseph Goebbels. Initial efforts were largely domestic and soon included a steady beat of anti-Semitic and anti-Communist content. Another theme was how World War I had been lost not on the battlefield but thanks to subversion and internal collapse. By the late 1930s, propaganda focused on how others (such as Poland) had attacked Germany and on the “decadent” Slav people. There was also a steady building of the Hitler personality cult.

Two media were especially valuable to Goebbels—radio and dramatic films and newsreels. Epitomized by *The Triumph of the Will* (1935), Leni Riefenstahl’s heroic film portrayal of the Nazi Party’s 1934 Nuremberg rally, sound, Wagnerian music, and dramatic photography combined to illustrate Germany’s growing might. Likewise, shortwave radio, including the use of turncoat broadcasters such as “Lord Haw Haw” and “Axis Sally,” was invaluable in attempts to weaken enemy morale and soften up target countries before and during attacks. Film and radio helped promote the power of German arms on land, on the sea, and in the air, as did bright poster art and printed media. Germany’s propaganda was clearly the most effective and cohesive of any belligerent in the war.

Italian efforts were more for internal consumption and dated to the beginning of Benito Mussolini’s regime in 1922. Marshaling all media, the fascist movement was pictured as reviving the glorious days of Imperial Rome. Central to that message was (as in Germany) building a cult around the maximum leader, Mussolini.

Japan’s approach to propaganda, or what its leadership termed “thought war,” centered on the conception of the Greater East Asia Co-prosperity Sphere. This economic empire backed by Japanese arms was described as liberating Asia for Asians as old colonial powers (Britain, France, the Netherlands) were beaten back. The glory of empire was personified again, this time in the role of the virtually godlike emperor.

Given the distances covered by Japan’s conquests, at their height stretching from the borders of India to the mid-Pacific, Japan relied on extensive use of shortwave radio, and “Tokyo Rose” and others broadcasted directly to American troops. Internal propaganda emphasized Japanese victories and expansion even when that was no longer true. Japanese listeners were thus stunned when they first heard Emperor Hirohito call for an end to hostilities in August 1945, having had no idea of the true direction of the war for the previous two years.

The Allies: Britain, United States, and Soviet Union

Allied propaganda efforts began as a response to Axis messages. The British drew lessons from their World War I experience and again divided internal and external propaganda operations. The former involved considerable reliance on

Poster produced by U.S. Office of War Information, ca. 1941–1945. (Swim Ink/Jack Betts/Corbis)

media cooperation with authorities rather than government orders. Prime Minister Neville Chamberlain’s government established a Ministry of Information (January 1940) under former British Broadcasting Corporation (BBC) director general Sir John Reith. Prime Minister Winston L. S. Churchill appointed Duff Cooper in May 1940 and then Brendan Bracken, a journalist and close political associate, in July 1941. Although there was some clumsy initial censorship, the ministry found its feet as the war took hold. Churchill also established a Political Warfare Executive (September 1941) to direct propaganda aimed at enemy countries. These efforts included massive leaflet drops from bombers and effective use of BBC news and other broadcasts.

Themes evident in print, film, and radio propaganda emphasized that all Britons were in the war together. “We” might be “standing alone” but “London can take it.” These and similar themes helped to rally domestic support even at the height of the Blitz. In its 4,000 theaters, Britain made excellent use of hundreds of motion pictures, including both features and short news items. Some were screened in the United States to encourage U.S. support of Britain’s fight. The BBC played a central role, including broadcasting Churchill’s persuasive and gripping speeches. Churchill and others made

use of the “V for Victory” appeals from early 1941 to mid-1942 and succeeded in covering Europe with the painted sign or Morse Code signal (. . . -).

Through 1941, the United States remained heavily isolationist and wary of foreign propaganda, given the World War I campaign that had helped lure the nation into the war. After the Japanese attack on Pearl Harbor and several initial organizational attempts, President Franklin D. Roosevelt formed the Office of War Information (OWI) in June 1942 under respected radio news commentator Elmer Davis. OWI established domestic and overseas sections, the latter eventually becoming the Voice of America.

American propaganda themes emphasized Roosevelt’s Four Freedoms (of speech and worship, and from fear or want). Messages promoted military victories combined with some censorship. That the efforts of women were needed to back the fighting men was evident in posters featuring “Rosie the Riveter” and in Hollywood films that presented a positive view of the war. Frank Capra’s seven-film “Why We Fight” series comprised some of the best wartime documentaries made. Films by John Ford and John Huston, among others, and wartime application of famous cartoon characters and comic book heroes all contributed to the effort. Commercial radio broadcasts incorporated the war effort in nearly all drama, variety, and music programs.

Soviet Russia remained largely neutral in the propaganda wars until the German invasion on 22 June 1941. Then messages focused on the Russian “motherland” and traditional values, historical victories (as over Napoleon), and the once-vilified Russian Orthodox Church. All were combined in propaganda depicting Stalin as architect of victory in the “Great Patriotic War.” Soviet authorities made good use of documentary and news film in major cities but relied on posters in rural regions.

Psychological Warfare

Operations crafted to undermine an enemy force or to propagate a message to a civil population. The main objective of such activities is not necessarily to garner enemy defectors but to lower morale, military or civilian. World War II saw the most extensive use of psychological warfare in history.

The Germans entered World War II with a reputation for propaganda success, orchestrated by Joseph Goebbels, the Reich’s minister of propaganda. German propaganda was aided immeasurably by the Third Reich’s early military victories and throughout the war by technically excellent radio broadcasts and an impressive documentary film legacy going back to the 1930s. Of course, much German propaganda on the Eastern Front was quickly vitiated by the Germans’ brutality toward their prisoners.

Undoubtedly Germany’s best “psywar” was to be found in its English-language radio broadcasts, the producers of which had the good sense to use up-to-date American and British popular music and to go lightly on the overt propaganda message. In the field, though, German psychological warfare leaflets tended toward “We Will Crush You” themes or heavy-handed humor with out-of-date English slang that never came off.

Soviet propaganda used such common themes as “Save Your Lives” and “Why Die in a Lost War?” but such leaflets were effectively countered by German propaganda that proclaimed, realistically enough, “*Sieg Oder Siberia*” (victory or Siberia). One useful Soviet tool for undermining German troop morale was simply the broadcasting of a metronome’s ticking and the lugubrious occasional voice-over: “Every 10 seconds, a German soldier dies in Russia.”

U.S. and British psywar was by far the most effective of World War II. Allied psywarriors eschewed political themes (“Hitler Is the Ruin of Germany!”) or making impossible demands on their enemies (“Refuse to Fight in This Impossible War”). The best leaflets instructed German or Japanese soldiers how to get out alive, literally, from a very bad situation. The most successful such leaflet, in this or any other previous war, was the well-known U.S. Army *passierschein*, an effort that resembled an international treaty, with a multilin-

gual text and a display of the Allied flags. The leaflet was represented as an order to American soldiers to receive the bearer as an honorable prisoner of war; it concluded with the signature of General Dwight D. Eisenhower.

In the Pacific Theater, American “psywarriors” learned the hard way that Japanese soldiers do not “surrender,” but that a few (as well as many more who were likely to be Taiwanese or Korean) might be persuaded to “cease resistance” or “take the honorable path.” The most successful U.S. propaganda of the Pacific war was directed toward the civilian population—the justly famous “city leaflets” listing the Japanese cities to be bombed and the dates of the bombings. The fact that U.S. Army Air Forces B-29 bombers duly appeared on the dates given and that the “ever-victorious” Japanese air force could do little to prevent these publicly scheduled mass incendiary raids had a devastating effect on Japanese morale, judging by postwar interrogations, whose subjects included Emperor Hirohito himself.

Japanese radio propagandists, like their German allies, did garner a wide Allied listenership simply by playing popular music. But Japanese leaflets were an art form in themselves. They featured hard-core pornography (much appreciated by Allied troops) or hilariously mangled English, and sometimes both.

By the close of World War II, British and U.S. military propagandists arrived at several battle-tested psywar truths: (1) Know your enemy or target audience; know their language and culture as much as possible. (2) Tell no lies. (3) Never denigrate or caricature the enemy. (4) Steer clear of politics in favor of simple how-to-save-your-life suggestions. Germany and Japan, more often than not, and to their loss, violated every one of these maxims.

Puyi, Henry

See Aixinjueluo Puyi.

Pyle, Ernest Taylor “Ernie” (1900–1945)

Arguably the most beloved American journalist of World War II. Born on 3 August 1900 near Dana, Indiana, Ernie Pyle attended Indiana University from 1919 to 1923, leaving just short of securing a degree in journalism to accept a job with a local newspaper, the *LaPorte Herald*. A few months later, he

Ernie Pyle, 19 September 1944. A journalist and correspondent who reported from Latin America and accompanied the Allied forces in World War II during invasions of North Africa, Italy, and Normandy. (Bettmann/Corbis)

went to work for the *Washington Daily News*, a Scripps-Howard paper. During two stints with the paper, he wrote the first daily column about aviation news, and he later became managing editor.

Pyle found the lives of ordinary people fascinating and full of rich lessons. In 1935, he began a syndicated column for Scripps-Howard recounting his experiences as he drove across America. During the next four years, Pyle crossed the United States 35 times, chronicling the lives of everyday people doing sometimes extraordinary things.

In 1940, Pyle went to Britain to cover the Battle of Britain for Scripps-Howard. Like radio commentator Edward R. Murrow, Pyle became the eyes and ears of America in London. His description of the hardships and courage of the average Briton tugged at the conscience of a nation not yet at war. When the United States did go to war, Pyle joined American troops as they landed in North Africa. Later he followed them through Sicily, Italy, and even to Normandy on D day. Always near the front, Pyle gained a reputation for understanding the drudgery and fear that the average GI had to endure. He focused his stories and reports on combat infantrymen and soon became loved by the regular soldier and the public back home.

By 1944, Pyle's columns were carried by more than 400 daily and 300 weekly newspapers. That same year, he won the Pulitzer Prize for Journalism and was featured on the cover

of *Time* magazine. Pyle's wartime books, *Here Is Your War* (1943) and *Brave Men* (1944), both compilations of his wartime experiences, became best-sellers many times over.

In early 1945, at the request of the U.S. Navy, Pyle deployed to the Pacific Theater to cover Navy and Marine operations. Pyle accompanied a Marine rifle company. During the Okinawa Campaign on 18 April 1945, Pyle was preparing a story on the island of Ie Shima, not far from Okinawa, when he was killed by Japanese machine-gun fire. Later in 1945, famed director William Wellman released a film about Pyle titled *The Story of GI Joe* and starring Burgess Meredith as Ernie Pyle.

Q

QUADRANT

See Quebec Conference (14–24 August 1943).

Quebec Conference (14–24 August 1943)

Allied conference held in Quebec, Canada, from 14 to 24 August 1943. Code-named *QUADRANT*, this meeting included U.S. President Franklin D. Roosevelt, British Prime Minister Winston L. S. Churchill, Canadian Prime Minister W. L. Mackenzie King, and Chinese Foreign Minister T. V. Soong, as well as their staffs and military advisers.

Regarding military strategy in Europe, Churchill continued to argue for concentration on the Balkans. The U.S. military chiefs were strongly opposed to this; they reminded their ally that the invasions of Sicily and Italy had been carried out on the promise that the next objective would be the cross-Channel invasion. The conferees then approved tentative plans for the cross-Channel invasion of Europe, now code-named Operation *OVERLORD*, and fixed 1 May 1944 as the target date for its execution. Churchill had argued that the commander of *OVERLORD* should be British, and he initially proposed General Sir Alan F. Brooke, chairman of the Imperial General Staff. By the time of the Quebec meeting, however, Churchill realized that the United States would have the preponderance of troops employed after the initial landing, and he had therefore concluded that the commander should be an American. At Quebec, therefore, he proposed and it was agreed that an American general would command *OVERLORD*

and a British general would have charge of the Mediterranean Theater.

The Allies also agreed to accelerate the strategic bombing offensive against Germany from bases in the United Kingdom and Italy. The objectives of the bombing campaign would be to destroy German air combat strength; to dislocate the German military, industrial, and economic systems; and to prepare the way for a cross-Channel invasion. The United States agreed to a large-scale buildup of its forces in the United Kingdom prior to the invasion of France. The Allies also agreed to press vigorously the war in the Mediterranean. The objective here was to drive Italy from the war and secure air bases for operations against Germany in Italy and in Sardinia and Corsica. The Allies discussed a second landing in France, code-named Operation *ANVIL*, on the Mediterranean coast. Allied operations in the Balkans would be limited to the supply of Balkan guerrillas by air and sea, minor commando raids, and strategic bombing. The Allies then agreed to intensify the war against German submarines and to make greater use of the Azores as an Allied naval and air base.

In the Pacific Theater, the Allies decided to establish a separate South-East Asia Command with Lord Louis Mountbatten as its commander. They also agreed to accelerate operations against Japan. The goals in the Pacific were to exhaust Japan's air, naval, and shipping resources; to cut its communications; and to secure bases from which to conduct strategic bombing of the Japanese home islands. There was some disagreement on the last point about whether to set up air bases in China or from the Japanese barrier islands in the Central Pacific. This effort would be borne principally by

expanding U.S. naval power, with large armies required only at the end to invade Japan. The British promised to participate fully in this effort once Germany was defeated. Finally, the United States, although it was opposed to formal “recognition” of General Charles de Gaulle’s French Committee of National Liberation as the French government-in-exile, did issue a statement extending limited recognition to de Gaulle’s government.

Quebec Conference (12–16 September 1944)

Allied summit meeting in Quebec, Canada. The conference between U.S. President Franklin D. Roosevelt and British Prime Minister Winston L. S. Churchill and their staffs was held in the city of Quebec at the Citadel and Chateau Frontenac. The two leaders met in private conference and in plenary sessions with the Combined Chiefs of Staff to shape

plans for the conclusion of the war in Europe, the defeat of Japan, and the governance of Germany following the establishment of peace.

The list of leading figures at the meeting is noteworthy. Longtime Roosevelt confidant Harry Hopkins was not present, having temporarily fallen from favor; neither was Secretary of State Cordell Hull, who was generally excluded from such conferences. On 12 September, the president met with a close friend, Secretary of the Treasury Henry Morgenthau Jr. A plan for the administration of Germany drafted for Morgenthau by his assistant, Harry Dexter White, became a topic of discussion at the conference and a source of continuing study and controversy.

The Morgenthau Plan declared that Germany should be rendered an agrarian, pastoral economy and society following the war. All heavy industry would be stripped from the country. Secretary of War Henry Stimson strongly opposed the approach, as did Hull. A memorandum from the former to the latter, which was passed on to the White House, argued strongly that the Morgenthau approach lacked economic sense and promised political difficulties. Rich coal and ore deposits in the Saar and Ruhr regions of Germany pointed to an industrial economy. Since the 1870s, Europe had depended on these resources as well as the economic production of German firms and workers. Apart from these considerations, the argument was made that trying to keep Germans limited to a "subsistence level" was unwise and wrong as well as impractical.

Roosevelt initially pretended that he knew nothing of the Morgenthau Plan; then he raised objections. On 20 October, he sent a memorandum to Hull questioning the idea of "making detailed plans for a country we do not yet occupy," and after that he let the initiative wither. Churchill initially supported the Morgenthau approach. Informed speculation concluded that the British leader doubtless was mindful of the importance of American economic assistance after the war and wanted the support of the U.S. secretary of the treasury on the matter. In any case, Churchill knew the War Department in Washington ultimately would veto the Morgenthau Plan if necessary. The Quebec Conference also revealed Roosevelt to be in failing health, which in turn fueled speculation about his capacity to continue to lead the war effort.

Quesada, Elwood Richard "Pete" (1904–1993)

U.S. Army Air Forces general and innovator of tactical air support. Born in Washington, D.C., on 13 April 1904, Elwood Richard "Pete" Quesada earned his wings and a commission in the Air Reserve in 1925. He briefly played professional baseball before going on active duty in September 1927. He flew as a crew member of the "Question Mark," a modified Fokker C-2A trimotor monoplane that set a world record for airborne endurance in 1929. Quesada served in the 1930s as assistant military attaché to Cuba, personal pilot to the assistant secretary of war for air during an expedition to collect African wildlife, and technical adviser to the Argentine air force. Stints at the Air Corps Tactical School and the Army's Command and General Staff College led him to consider the problem of air-to-ground coordination.

After commanding the 33rd Pursuit Group at Mitchel Field, New York, in 1941, Quesada was promoted to brigadier general in December 1942 and deployed to North Africa. Taking charge of 12th Fighter Command, he served as deputy commanding general of the Northwest African Coastal Air Force. Here he learned the tactical air doctrine developed by British air marshal Sir Arthur Coningham. It featured air liaison officers (ALOs) to coordinate air-to-ground operations, co-located air and army command centers, and streamlined command-and-control procedures between ground units and supporting tactical air. All of these Quesada adopted and enhanced in 1944.

Promoted to major general, Quesada commanded the Ninth Tactical Air Command in Europe for Operation OVERLORD. His support of Major General J. Lawton Collins's VII Corps demonstrated brilliant innovative skills. Recognizing that close air support (CAS) was a key Allied force multiplier, Quesada installed very-high-frequency (VHF) radios in tanks to enable ALOs in armored assaults to talk directly to pilots overhead. Deviating from accepted doctrine that air units sacrificed effectiveness if distributed in "penny packets," he allocated fighter-bombers in four-ship formations to provide constant reconnaissance and CAS to Collins's armored columns. German panzer commanders learned that to concentrate in daylight meant death from the sky. Yet in dis-

U.S. Air Force Lieutenant General Elwood R. Quesada, 1948. (Photo by W. Eugene Smith/Time Life Pictures/Getty Images)

persing to survive, the Germans sacrificed much of their combat power. Quesada's tactics proved crucial to the success of COBRA and the Allied breakout in July.

Throughout 1944, Quesada continued to innovate. At the Battle of the Ardennes (Bulge), he used radar to provide CAS in poor weather. Using modified Norden bombsights combined with radar, he enhanced navigation and bombing accuracy.

During 1946–1947, Quesada commanded the Third Air Force, and in 1947–1948 he commanded the Tactical Air Command. However, Quesada was marginalized within the newly independent Air Force, which stressed strategic nuclear bombing. After commanding Joint Task Force Three at Eniwetok (1948–1951), Quesada retired from the air force as a lieutenant general. He then entered private industry and later became first head of the Federal Aviation Agency from 1958 to 1961. Quesada died in Washington, D.C., on 9 February 1993.

Quezon, Manuel Luis (1878–1944)

Chief architect of Philippine independence and first president of the Commonwealth of the Philippines. Born at Baler in Tayabas (now Quezon) Province on 19 August 1878, Manuel Quezon studied law at the University of Santo Tomas in Manila. He interrupted his education in 1899 to join the forces of Emilio Aguinaldo in rebellion against rule of the islands by the United States. After U.S. forces crushed the insurrection in 1901, Quezon was imprisoned for six months. Following his release, he resumed his legal studies and passed the bar in 1903.

Quezon started his political career in 1905 when he ran successfully for governor of Tayabas. In 1907, he was elected to the Philippine Assembly, where he became floor leader of the majority Nacionalista Party. In 1909, Quezon was appointed resident commissioner for the Philippines in the U.S. House of Representatives. During his years in Washington, he vigorously lobbied to secure passage of the Jones Act (1916), which pledged future independence of the Philippines. On this success, Quezon returned home a hero and became the first president of the new Philippine Senate.

In 1934, at Quezon's urging, the U.S. Congress passed the Tydings-McDuffie Act, which provided for independence 10 years after the adoption of a constitution and inauguration of a new government. On 17 September 1935, Quezon was elected president of the pre-independence Philippine Commonwealth. Alarmed by the advance of Japan into Southeast Asia, Quezon took several emergency steps in 1941 that vested him with dictatorial powers. He was reelected president that November.

In December 1941, when Japanese forces invaded the Philippines and occupied Manila, Quezon went with General Douglas MacArthur to the fortified island of Corregidor in Manila Bay. He departed the islands by submarine on 20 February 1942 and formed a government-in-exile in Washington, D.C., in May. There he served as a member of the Pacific War Council and signed the United Nations Declaration. In November 1943, President Franklin D. Roosevelt signed into law a bill that extended Quezon's term in office until the end of the Japanese occupation of his country. Quezon died in Saranac Lake, New York, on 1 August 1944, only months before his country's liberation. Sergio Osmeña followed him in office.

Quisling, Vidkun Abraham Lauritz Jonsson (1887–1945)

Norwegian collaborationist leader with Nazi Germany. Born in Fyresdal, Norway, on 18 July 1887, Vidkun Quisling

entered the army in 1911. By 1918, he was Norwegian military attaché in Petrograd, Russia. After holding several administrative posts, in 1931 Quisling became minister of defense. Known as a capable army officer and government official, Quisling became controversial through his support of the German National Socialist Party. In 1933, he helped found the Nasjonal Samling Party, a Norwegian fascist organization. In 1939, on the failure of this party, Quisling met German leader Adolf Hitler and argued for a German occupation of Norway with the object of placing the Nasjonal Samling in power. During the German invasion of Norway in April 1940, Quisling founded a government in which he was minister president.

Quisling's government lasted only one week; the Germans crafted a new ruling body, in which Josef Terboven was Reich commissioner. On 1 February 1942, Quisling managed to attain greater political power as Norway's minister president in a Nasjonal Samling government. He subsequently embarked on a program of Nazification for his country. His policies, which included efforts to convert churches and schools to the principles of National Socialism, met opposition from most of the Norwegian population. Quisling's government was also responsible for transporting more than 1,000 Jews to German concentration camps.

Quisling's government was impeded both by interference from Berlin and by Norwegian partisan resistance. Following the liberation of Norway in May 1945, Quisling was imprisoned in Norway to await trial for war crimes. After maintaining in court proceedings that he had acted for the greater good of Norway, Quisling was found guilty of high treason. He was executed at Akershus Castle in Oslo, Norway, on 24 October 1945. His name has subsequently become synonymous with that of traitor.

R

Rabaul

The principal Japanese naval and air base in the southeast Pacific during World War II. The port of Rabaul, with its superb natural harbor, was located in the Bismarck Archipelago at the eastern end of New Britain Island, one of the islands mandated to Australia as a consequence of World War I.

On 24 January 1942, the Japanese overwhelmed the Australian garrison of 1,500 men at Rabaul and soon began construction of a large naval support facility, protected by five airstrips and two air armies with more than 600 aircraft. Rabaul became the base of the Eighth Fleet, and from the port, the Japanese could defend the approaches to New Guinea and the Solomon Islands and strengthen the southern flank of the region covered by their Central Pacific base at Truk in the Caroline Islands.

General Douglas MacArthur, Allied supreme commander in the Southwest Pacific Area, made the reduction of Rabaul a major objective. However, the position's strength persuaded Allied leaders at the August 1943 Quadrant Conference in Quebec to cancel MacArthur's plans for a direct assault in favor of a strategy of circumvention. "Island-hopping" was replaced by

"leapfrogging." Preparations began on 12 October 1943 with massive air attacks by the U.S. Fifth Army Air Force operating from New Guinea, followed on 5 November by carrier

Crewmen on board the USS *Saratoga* at dawn as the carrier moves in for a strike against Rabaul, November 1943. (Wayne Miller/Corbis)

raids mounted by the *Saratoga* and *Princeton*. These U.S. attacks forced the troops stationed at the Japanese garrison into a network of tunnels and caves and effectively ended Rabaul's usefulness as a naval base. Under MacArthur's command, Operation CARTWHEEL continued the strike on Rabaul from the air, and eventually, 29,000 Allied sorties dropped more than 20,500 tons of bombs on the base. At the same time, the Allies seized positions to the southeast on the island of Bougainville, at Cape Gloucester on the western end of New Britain, and to the north in the Admiralty and Saint Matthias Islands.

By March 1944, the Japanese had withdrawn their major naval and air units, first to Truk and later to Palau, but 100,000 military and civilian personnel remained at Rabaul. Cut off from air or sea resupply, the Japanese garrison there suffered increasing deprivation until its surrender in August 1945.

Radar

System or technique used to detect the position, movement, and nature of distant objects. The term *radar* is an acronym that references the operating principles and function of this technology: *radio detection and ranging*. Radar systems transmit radio waves with the aid of a directional antenna, and they receive and process the radio emissions that reflect off distant objects. The range of target objects is determined by measuring the time it takes for the electromagnetic emission transmitted from the radar antenna to reach the object and return. The theoretical foundation of radar was established through the work of nineteenth-century scientists James Clerk Maxwell and Heinrich Hertz. Maxwell developed equations governing the behavior of electromagnetic waves in 1864. Inherent in his equations are the laws of radio-wave reflection, which were demonstrated by Hertz between 1886 and 1888.

A number of early-twentieth-century scientists and engineers recognized the potential for radio-based detection systems. Radio direction-finding and distance-measuring

experiments were conducted during World War I and in the 1920s. From these early efforts, several theoretical radar systems were proposed before World War II. Between 1934 and 1940, practical radar systems were developed independently in several countries as military instruments for detecting aircraft and ships. One of the first practical radar systems was devised in 1935 by Scottish physicist Sir Robert Watson-Watt. His success with this early system can be attributed to the fact that a number of critical technical components became available during the 1930s; it was Watson-Watt who integrated transmitters and receivers, modulators capable of generating microsecond pulses, and high-speed cathode-ray tubes to display search results. Much of this equipment was the by-product of civilian work on broadcast television. By the late 1930s, laboratories in Britain, the United States, Germany, France, Italy, and the Soviet Union had all begun radar experiments on a modest scale. Japan did not take notice until 1941 but then hurried to catch up. Thus, all of the principal belligerents in World War II entered the conflict with some radar technology.

At the insistence of Air Vice Marshal Hugh Dowding, Great Britain adopted radar in the late 1930s to augment the defenses of the home islands. Before the start of the war, Great Britain began construction of the Chain Home (CH) radar network, which was enhanced in 1939 with a number of Chain Home Low (CHL) stations, capable of detecting low-flying aircraft approaching the English coast. The CH and CHL stations were the first integrated radar defense system, staffed by crews who were trained to track incoming aircraft and relay tactical information to air defense control centers and air bases. The CH/CHL system played an important role during the Battle of Britain in 1940, giving British defenders valuable advance warning of the relentless attacks launched by the German Luftwaffe.

In September 1940, Britain provided the United States with examples of key radar components, including a magnetron, with the understanding that cooperation would lead to the further development of radar technology. The Americans moved quickly. The Radiation Laboratory was established in 1940 at the Massachusetts Institute of Technology under the leadership of Lee DuBridge. Other emergency radar research programs were created in 1940 and 1941, and the close cooperation of Bell Laboratories, the Army Signal Corps, and the Naval Research Laboratory led to substantial improvements in the accuracy and range of radar equipment. High-power microwave radar systems were among the important advances made by the United States.

Although Germany had the opportunity to exploit radar technology before World War II began, the indifference of the country's political leadership hindered the development of the technology. Before the war, Adolf Hitler and Hermann

Radar in operation in Italy, 1944. (Library of Congress)

Göring, chief of the Luftwaffe, were reportedly suspicious of radar's utility and antagonistic to the idea of adopting the technology as a defensive weapon. Later, interservice rivalries within Germany slowed the development of radar even further as resources for research and development became scarce. Germany did finally put into operation the Kammhuber Line, an interlocking system of radar, aircraft, and ground controllers that ran from the North Sea to southern France and went into full operation in September 1942. It was similar to the Chain Home system in scale and purpose, but the Allied use of long-range fighter escorts for bombers limited its value. Italy had a limited radar capability on land and at sea by the middle of 1942. It utilized its own equipment and that of Germany.

The Japanese were late in developing and adopting radar technology, a fact that greatly advantaged the Allies in the Pacific Theater fighting. However, though U.S. radar identi-

fied the Japanese aircraft approaching Pearl Harbor on 7 December 1941, the information was not utilized. Radar provided early warning of subsequent Japanese air strikes as well—for example, during the decisive Battle of Midway in June 1942, where the Japanese lost four aircraft carriers. Throughout World War II, continuous improvements to radar technology increased the accuracy of the U.S. Navy's tracking and intercept capabilities.

By 1943, thanks to aggressive research and development, the Allies had a wide variety of radar systems at their disposal. The technology evolved rapidly during the war, and specialized radar units were developed for early warning, battle management, airborne search, night interception, bombing, and gun aiming. Experiments with terrain-following radar for aircraft presaged the enhanced electronic avionics developed for jets and helicopters after the war. Air defense radar systems, which came to include gun-direction devices, proximity fuses,

and increasingly accurate direction-finding and ranging capabilities, had greatly enhanced the accuracy of anti-aircraft fire by the end of the war.

In the postwar years, as missiles replaced artillery as the backbone of air defense, radar technology improved still further, and radar systems were adapted for a number of useful purposes. As the systems became even more powerful and sensitive, radar was used in navigation, meteorology, and astronomy (the first radar emissions were reflected back from the moon in 1946).

Raeder, Erich (1876–1960)

German navy grand admiral and commander in chief until his resignation in 1943. Born in Wandsbek, Germany, on 24 April 1876, Erich Raeder joined the Imperial Navy in 1894, where his abilities and ambition brought him into close contact with State Secretary of the Imperial Naval Office Admiral Alfred von Tirpitz and Kaiser Wilhelm II and the unique ideology that characterized German navalism. As Admiral Franz von Hipper's chief of staff, Raeder participated with the German battle cruisers in the major operations of the High Seas Fleet during World War I, including the Battle of Jutland.

In 1918, Raeder experienced the trauma of the naval mutinies and revolution, and he resolved never to see such events repeated. His role in the naval command's support of the abortive, right-wing Kapp Putsch in 1920 threatened the future of the navy and his own career. Assigned to the naval archives, he wrote a two-volume study of Germany's cruiser warfare in World War I, which defined his conception of naval strategy.

Grand Admiral Erich Raeder visiting the crew of the battle cruiser *Scharnhorst* in April 1942 to express his appreciation after its escape from Brest through the English Channel. (Library of Congress)

In 1925, Raeder was promoted to vice admiral and appointed chief of the Baltic Naval Station in Kiel. He attempted to keep the navy “above politics” despite charges that he and the navy were engaged in antirepublican activities. In 1928, he was promoted to admiral and appointed chief of the naval command. In 1935, he became commander in chief of the Kriegsmarine (German navy) and a full admiral. Three years later, Adolf Hitler raised him to the rank of grand admiral.

To ensure support for the navy’s rebuilding, Raeder established a firm, autocratic administration, demanding obedience and discipline. Initially skeptical about Hitler’s support for an expanded navy, he found the Führer receptive to building a fleet as an instrument of power for a “greater Germany,” which reflected the legacy of the Tirpitz era. Given Hitler’s support for a powerful navy, Raeder was willing to accept the criminal excesses of the Führer and his regime. He pressed hard for a greater share of resources in building a navy that was directed at Britain after 1938, but he soon found an impatient Hitler was unwilling to delay the building of battleships rather than U-boats and other ships more suited for a war against merchant shipping.

Although unprepared for war in 1939 (Hitler had assured him that there would be no war before 1944), Raeder was determined to “die gallantly” for the future existence of the fleet. He called for a concentration of forces against Britain as the primary enemy and advocated a massive build up of U-boat forces and intensification of the naval war, even if this meant fighting the United States. Raeder opposed the invasion of the Soviet Union until Britain was defeated and argued vigorously for an alternative Mediterranean strategy. Following the loss of the battleship *Bismarck* in May 1941 and the failure of the German army in the USSR, Raeder and the fate of his capital ships became increasingly irrelevant to Hitler. Raeder resigned in January 1943, to be replaced by the commander of U-boats, Admiral Karl Dönitz.

Arrested at the end of the war, Raeder was sentenced to life imprisonment at the Nuremberg trials as a war criminal, but he was released on 26 September 1955. He spent his remaining years crafting his memoirs and attempting to justify his own actions and those of the navy in serving the Third Reich. Raeder died in Lippstadt on 6 November 1960.

See Great Britain, Air Force.

Ramsay, Sir Bertram Home (1883–1945)

British navy admiral who was naval commander in chief for the Normandy Invasion. Born at Hampton Court Palace in England on 20 January 1883, Bertram Ramsay joined HMS *Britannia* in 1898 and served on the North American and Red Sea stations (including a 1903–1904 landing in British Somaliland) and on Home Fleet destroyers before World War I. During the war, he held commands with the Grand Fleet and Dover Patrol. Following World War I, Ramsay commanded cruisers and a battleship, and as a rear admiral, he was naval aide to King George V and Home Fleet chief of staff. He retired in December 1938 at the age of 55, his career apparently over.

When World War II began, Ramsay returned to active duty and received command of the port of Dover. Following the German invasion of France in May 1940, he organized and executed Operation DYNAMO, the successful evacuation of the British Expeditionary Force from Dunkerque between 29 May and 5 June 1940, for which he was knighted. Ramsay, now with the rank of acting admiral, was assigned to planning for Operation TORCH, the Allied invasion of North Africa, and he directed the landings at Algiers and Oran on 8 November 1942. After the Axis collapse in North Africa, he planned the invasion of Sicily and commanded the eastern task force for the landings that began on 10 July 1943. Reinstated on the active list, he was appointed commander of British naval forces in the Mediterranean.

On 29 December 1943, Ramsay was appointed Allied naval commander in chief for the upcoming Allied invasion of Normandy. He planned and executed this huge operation, which involved more than 2,700 warships and well over 4,000 minor vessels supporting the initial landing of troops on five beaches, plus subsequent landings of troops and armor. He was criticized on occasion for his insistence on detailed planning, but he contended it was necessary given the complexity of the task, and the outcome certainly justified this assessment. For his efforts, he was promoted to full admiral on the active list in June 1944.

British Admiral Sir Bertram Ramsay. (Bettmann/Corbis)

Ramsay turned over control of the French ports from Le Havre southward, as they were captured, to the U.S. Navy, while retaining responsibility for those to the north and east. He later directed amphibious operations to clear the South Beveland Peninsula and Walcheren Island in October and November 1944, which opened the port of Antwerp. Ramsay died on 2 January 1945 when his plane crashed on takeoff from the airfield at Toussus-le-Noble near his headquarters at Saint-Germain-en-Laye, France.

Randolph, Asa Philip (1889–1979)

U.S. labor and civil rights leader who worked to end racial discrimination in the defense industry during the war years. Born in Crescent City, Florida, on 15 April 1889, A. Philip Randolph was raised in Jacksonville. After graduating from Cookman Institute in Jacksonville, he moved to Harlem, where he continued his studies at the City College of New York. Following the U.S. entry into World War I, he and a partner founded a magazine, *The Messenger*, that demanded more positions in the war industry and armed forces for African Americans. He ran unsuccessfully for offices on the Socialist ticket in the 1920s.

In 1925, Randolph began organizing the Pullman porters in the railroad industry into the Brotherhood of Sleeping Car Porters and succeeded in gaining that union's admission into the American Federation of Labor (AFL). Later, to protest the AFL's racially discriminatory policies, he withdrew the brotherhood from the AFL and took it into the Congress of Industrial Organizations (CIO).

U.S. labor and civil rights leader A. Philip Randolph. (Bettmann/Corbis)

With the tremendous increase in defense contracts just prior to the U.S. involvement in World War II, Randolph protested racial discrimination in the defense industry's hiring practices, and he warned President Franklin D. Roosevelt that he was prepared to lead thousands of African Americans on a march to Washington, D.C. In response, the president issued Executive Order #8802, which barred racial discrimination in the defense industry and created the Fair Employment Practices Committee to ensure compliance with the law. Approximately 2 million African Americans obtained work in the war industries.

After World War II, Randolph founded the League for Nonviolent Civil Disobedience against Military Segregation. The organization successfully pressured President Harry S. Truman to issue Executive Order #9981, which ended segregation in the U.S. military. Randolph spent the remainder of his life fighting workplace discrimination, and he was a director of the August 1963 March on Washington for Jobs and Freedom. Randolph died in New York City on 16 May 1979.

Rankin, Jeannette Pickering (1880–1973)

U.S. politician and peace activist. Born near Missoula, Montana, on 11 June 1880, Jeannette Rankin attended Montana's public schools and graduated from the University of Montana in 1902. She became a social worker and was active in the women's suffrage movement. In 1914, Montana enfranchised women, and two years later, Rankin ran for Congress as a Republican, becoming the first woman representative. Her platform called for a constitutional amendment for women's suffrage, Prohibition, and welfare legislation. She also opposed U.S. intervention in World War I. On 6 April 1917, she joined 56 other members of congress in voting against the U.S. declaration of war against Germany. She failed to win reelection in 1919 and spent the years between the wars participating in organizations for consumers, women, children, and peace.

In 1940, Rankin returned to the House of Representatives, where she opposed the military draft and spending on armaments. On 8 December 1941, immediately following the Japanese attack on Pearl Harbor, President Franklin D. Roosevelt asked Congress for a declaration of war against Japan. Rankin

U.S. Representative Jeannette Pickering Rankin of Montana, December 1941. (Hulton-Deutsch Collection/Corbis)

was the only dissenter, preventing a unanimous vote. This stance was extremely unpopular and ended her political career.

A lifelong pacifist, Rankin led several thousand women, known as the Jeannette Rankin Brigade, to protest the Vietnam War in 1968. She died in Carmel, California, on 18 May 1973.

Raskova, Marina Mikhailovna (1912–1943)

Soviet air force officer who commanded a regiment of dive-bombers in World War II. Born in Moscow on 12 March 1912, Marina Raskova (née Malinina) mastered air navigation as a

Marina Raskova, ca. 1936. (Library of Congress)

laboratory employee at the N. E. Zhukovskii Air Force Engineering Academy and was the first Soviet woman to qualify for a navigation diploma. She then taught navigation at the academy while training to fly at the academy's expense and studying mechanical engineering at the Aviation Institute in Leningrad as an extramural student.

On 24–25 September 1938, Raskova, with pilot Valentina Grizodubova and copilot Polina Osipenko, took part in a non-stop pioneer flight from Moscow to the Pacific in an ANT-37 aircraft named *Rodina* (*Homeland*). The three aviators became the first women to receive the Hero of the Soviet Union, the highest Soviet military decoration. As a major in the Soviet air force, Raskova persuaded Soviet dictator Josef Stalin to form three women's combat wings at a time when there was no shortage of male aircrews. She then trained her new 122nd Air Group at Engels, near Stalingrad, in 1941 and 1942. In late 1942, she received command of the 587th Dive Bomber Regiment (which was renamed the 125th M. M. Raskova Borisov Guards Dive Bomber Regiment after her death).

On 4 January 1943, Raskova died in a plane crash at an undetermined location while making her way to the Stalingrad Front during a heavy snowstorm. Members of her unit pledged to make it worthy of bearing her name and qualify for the honorific "Guards" designation, attaining both in 1943. The tactics of this wing's 2nd Squadron, applied in the air battle of 4 June 1943 (during which the unit shot down sev-

eral German fighters), became a model for Soviet bomber aviation. Raskova's ashes are immured in the Kremlin Wall beside those of fighter pilot Polina Osipenko, who was killed in a training accident in 1939.

Red Ball Express (24 August–16 November 1944)

U.S. Army Quartermaster Corps operation following the Allied breakout in Normandy. Commencing on 24 August 1944, the Red Ball Express was a massive truck operation to resupply Allied forces advancing across France. Supplies carried by the Red Ball Express were essential to the continued movement of U.S. units.

After the Allied breakout at Saint-Lô, U.S. forces pushed across the Seine River. The original plan envisioned the supply of 12 U.S. divisions at the Seine by 4 September, but by that date, 16 divisions were already some 120 miles beyond the Seine. The pace of these operations presented a severe logistics challenge. The ruined French port facilities were inadequate to support the Allied advance, and most supplies had to be transported over the beaches. The main problem lay in getting the supplies forward to the advancing forces. The Allies had also counted on utilizing the French railroad system, but it had been severely damaged by Allied bombing, and parts of it remained under German control. Most supplies thus had to come by vehicle from the beachheads at Normandy. The Red Ball Express was the truck supply line organized by the army's Quartermaster Corps to address the logistical shortfall.

At its peak, the Red Ball Express involved 132 truck companies, composed of some 23,000 men operating 5,958 vehi-

Corporal Charles H. Johnson of the 783rd Military Police Battalion waves on a "Red Ball Express" motor convoy rushing priority matériel to the forward areas, near Alençon, France, 5 September 1944. (National Archives)

cles. The most common vehicle employed was the six-by-six, 2.5 ton General Motors truck known as the “deuce and a half” or “Jimmy.” Trucks transported matériel to the front along French roads paralleling the French rail lines. They ran 20 hours out of 24 and operated at night without blackout lights.

U.S. forces moved so quickly that only the most important supplies, such as ammunition, rations, medical supplies, and

gasoline, were carried forward: without these supplies, the Allied advance could not continue. Most truck runs were overnight operations that allowed the drivers little sleep. To ensure safety, rules mandated 60-yard intervals between trucks, 10-minute breaks at the top of the hour, and bivouac sites for long trips. Nonetheless, the strain of the operation took

a heavy toll on drivers and their vehicles. Supplies were also diverted by other U.S. units on the way to the front, and a portion ended up on the French black market. African Americans, who constituted only about 10 percent of the U.S. Army, made up three-quarters of the drivers on the Red Ball Express.

The Red Ball Express officially lasted for 81 days, until 16 November 1944, and in this time span, it transported 412,193 tons of matériel from Normandy to the front. It also met the gasoline demands of the First and Third Armies, a total of 800,000 gallons a day. The Red Ball Express was the lifeline of the most mobile and highly mechanized army the world had ever seen.

Reichenau, Walther von (1884–1942)

German army field marshal who led Sixth Army in the invasion of the Soviet Union before becoming the commander of Army Group South. Born in Karlsruhe, Germany, on 8 October 1884, Walther von Reichenau joined the 1st Guards Artillery Regiment as a cadet in 1903 and became an officer in 1904. During World War I, he served as adjutant to the 1st Guards Reserve Artillery Regiment and then joined the General Staff.

Reichenau continued in the German army after the war and worked in the General Staff. Promoted to colonel in 1929, he was chief of staff of the East Prussia Military District. After rising to Generalleutnant (U.S. equiv. major general) in 1933, he headed the Reichswehr Chancellery. He was one of the few aristocratic officers to support Adolf Hitler actively and was partly responsible for the Führer's selection of General Werner von Blomberg as minister of war. In 1935, he took command of VII Corps at Munich, and he played an important role in the staging of the 1936 Olympic Games. Promoted to General der Artillerie (U.S. equiv. lieutenant general) in 1938, he took command of 4th Army Group at Leipzig.

Reichenau commanded Tenth Army in the invasion of Poland in September 1939, where he enveloped the Polish Krakow Army in Germany's first major encirclement battle of the war. Tenth Army was then redesignated Sixth Army, and Reichenau was raised to Generaloberst (U.S. equiv. full general). He led Sixth Army in the invasion of France and the Low Countries, although his vocal protests over German atrocities in Poland and his opposition to the violation of the neutrality of Belgian and the Netherlands permanently alienated him from Hitler. In the invasion of the west, Reichenau again demonstrated his effectiveness as a field commander. He was known for leading from the front and for his rapport with his men in operations in the Netherlands and northern Belgium. His troops took Paris in mid-June, and he was promoted to field marshal in July 1940.

Reichenau next led Sixth Army in Operation BARBAROSSA, the invasion of the Soviet Union, operating in Ukraine and taking Kiev, Belgorod, Kharkov, and Kursk. He proved a master of armored warfare, and he supported both the execution of Red Army commissars and the killing of Jews. His name surfaced as a possible replacement for the commander in chief of the army, Field Marshal Walther von Brauchitsch, whom Hitler fired, but instead, he replaced Field Marshal Karl Gerd von Rundstedt as commander of Army Group South in early December 1941. On 15 January 1942, Reichenau collapsed from a cerebral hemorrhage. Hitler ordered him transported to a clinic in Leipzig, but he died of heart failure during the flight two days later.

Reichswald, Battle of the (8–22 February 1945)

Important western European Theater battle, marking the opening phase of Operation VERITABLE, the advance of Lieutenant General Henry Crerar's Canadian First Army to the Rhine River. The offensive had First Army pushing across the German-Dutch border, securing Cleve, and then turning south between the Rhine and the Maas Rivers to meet Lieutenant General William H. Simpson's U.S. Ninth Army as it

was driving northeast across the Roer River and toward the Rhine in Operation GRENADE. The Allies hoped to surround and destroy defending German units and secure crossing points over the Rhine. To accomplish this, Canadian forces, reinforced by the British army's XXX Corps, would have to cross the heavily wooded Reichswald State Forest and eliminate the German pillboxes and bunkers of the West Wall (known to the Allies as the Siegfried Line). The Allied force committed to this effort eventually numbered 200,000 men. General Alfred Schlemm's First Parachute Army of Army Group H defended the area. Schlemm sought to prevent the Allies from breaking through and seizing the bridgeheads over the lower Rhine.

The Allied attack was hindered to some extent by the terrain—there were only two roads through the Reichswald Forest—and by the weather. A thaw just before the attack turned the ground into mud, and the Germans opened floodgates on the Maas, overflowing the river and flooding the countryside. As a consequence, the battle, planned to last only a few days, dragged on for several weeks.

The assault began on 8 February 1945 with a five-hour artillery barrage by 1,000 Allied guns. British Lieutenant General Sir Brian Horrocks's XXX Corps led the attack, which consisted of (from north to south) the 3rd and 2nd Canadian, the 15th Scottish, the 53rd Welsh, and the 51st Highland Divisions. Delays in the advance, however, enabled Schlemm to bring up reserves, as well as Mark IV tanks and assault guns of the Panzer Lehr Division.

By opening the gates of the Roer River dams, the Germans forced Simpson to postpone Ninth Army's attack for almost two weeks. By the time the Ninth Army launched what was to have been a supporting attack on 23 February, the Canadian and British troops had already achieved almost all their objectives. Supported by massive artillery barrages and air support, the Canadian and British infantry troops slowly forced the German defenders from their defensive positions. The Germans fought particularly hard in and around the critical towns of Cleve, Goch, and Calcar. The Canadian II Corps suffered heavy losses advancing east of Cleve, and the British XXX Corps sustained considerable casualties near Goch.

British and Canadian forces took 15,634 casualties, nearly two-thirds of which were in XXX Corps. General Horrocks later wrote that the brutal Reichswald fighting reminded him of the carnage in World War I. The operation had cost the German army as well. Losses sustained by the 11 German divisions involved have been estimated from as low as 22,000 to as high as 75,000 men; some 16,000 Germans were taken prisoner. The commitment of so many German reserves to the fighting in the Reichswald helped to open the way for U.S. advances farther south.

Reitsch, Hanna (1912–1979)

German test pilot who worked with the Luftwaffe during World War II. Born in Hirschberg, Silesia, on 29 March 1912, Hanna Reitsch mastered glider aviation skills as a young woman. She was one of the earliest pilots to soar over the Alps, and she flew a glider for 11.5 consecutive hours, setting a world record. In 1934, she piloted a glider to an altitude of 9,186 feet, the highest any woman had glided.

Reitsch also mastered powered aircraft and became a valued test pilot, with the rank of Flugkapitän (U.S. equiv. flight

captain), testing experimental aircraft for the Luftwaffe. In 1937, she became the first woman to pilot a helicopter. During World War II, Reitsch tested a variety of aircraft, including fighter planes, dive-bombers, and the Messerschmitt Me-163 rocket aircraft. She also tested aerial methods to cut barrage balloon tethers. Reitsch was one of just two women to be awarded the Iron Cross First Class and the only civilian so honored.

A fervent supporter of German leader Adolf Hitler, Reitsch proposed establishing a women's pilot squadron, an idea that German military leaders rejected. Her suggestion of a suicide squadron that would attack British industrial sites never was put into effect. The incredibly brave Reitsch piloted the final German flight into Berlin, carrying Luftwaffe General Robert von Greim to a meeting with Hitler and landing on a shell-pocked Berlin avenue on 26 April 1945. Reitsch offered to stay with Hitler and share his fate, but she was ordered to fly Greim from the city several days later.

Arrested after the war, Reitsch was held by U.S. authorities for 18 months. When freed, she went first to India and then to Ghana, where she opened an aviation school to teach gliding.

Adolf Hitler shaking hands with aviator Hanna Reitsch, recipient of the Iron Cross, as Hermann Göring and others look on, 28 March 1941. (Library of Congress)

She became the first female winner of the World Helicopter Championships in 1971. Many aviation historians consider her to have been the twentieth century's outstanding female pilot. Reitsch died at Frankfurt, Germany, on 24 August 1979.

Religion and the War

With World War II's casualty toll measured in scores of millions, one might initially imagine that the war brought a total eclipse of religious sentiment. Certainly, partial eclipses occurred in both Europe and Asia, as war's barbarity ran to extremes in such atrocities as the systematic destruction of Jews in the Holocaust or the Nanjing (Nanking) Massacre. Yet at both institutional and personal levels, religion continued to shine forth—sometimes erratically or unpredictably or fleetingly and not always for good but also not always for evil.

Both good and evil characterized the record of the Roman Catholic Church. Priests in Poland heroically resisted Nazi oppression and served with distinction as chaplains at the front, often ministering to both Protestants and Catholics, and churches, monasteries, and individual Catholics helped to shelter Jews from the Holocaust. Yet nationalistic Catholic priests in Slovakia and Croatia sanctioned or participated in ruthless persecutions of non-Catholics, especially Jews and Orthodox Serbians. Meanwhile, Pope Pius XII, elected to the papacy in March 1939, refused to condemn publicly Nazi atrocities against Poles, Jews, and other peoples. One might say charitably that Pius XII took the long view of the war, putting the survival of the apostolic episcopate and the Vatican ahead of the uncertain efficacy of protesting war crimes.

Certainly, the Catholic Church in Germany expressed nearly unqualified support for Adolf Hitler and the war, although these expressions mainly called for German men to serve the Fatherland at the front. Most Catholics agreed with the rhetoric of "crusade" that the Nazis employed against Bolshevism. Open opposition to Nazi policy, such as that in sermons delivered by Archbishop Galen of Münster in 1941

condemning Germany's euthanasia program, was decidedly uncommon. Those few Catholics who dared speak out sometimes paid with their lives, among them the Jesuit Alfred Delp, who, as a member of the Kreisau Circle, sought to define a new Germany after the Third Reich's anticipated demise.

Protestant opposition to the Nazi war effort was equally rare and could prove just as deadly. Ludwig Müller, a devotee of Adolf Hitler, became Reich bishop of the German Lutheran Church. His plan to meld the church and National Socialism was supported by the *Deutsche Christen* (German Christians) but rejected by Hitler, who instead sought to curtail Christianity's influence throughout the Reich.

The less numerous "Confessionals" within the church were more critical of Nazi policy. Among their members were Martin Niemöller and Dietrich Bonhoeffer, who founded the Pastors' Emergency League to resist Nazi interference in church activities, the subjugation of faith to Fatherland, and the unbending and unreflective obedience to duty. Arrested in 1943 by the Gestapo, Bonhoeffer penned his famous *Letters and Papers from Prison*, calling for a "religionless" Christianity in which believers could profess the faith as a matter of individual conscience. They could thereby avoid religious institutions that had been irredeemably compromised by Nazism. Bonhoeffer paid for his elevation of individual conscience and his involvement in the plot against Hitler with his life in April 1945.

The de facto policy of Nazi Germany was essentially non-interference with organized Christianity as long as religionists supported or acquiesced in the activities of the regime. Those who refused to take oaths of loyalty, such as the Jehovah's Witnesses, were sent to concentration camps, and many perished. (The U.S. also imprisoned Jehovah's Witnesses for refusing to register for the draft.) The Nazis themselves attempted to undermine Christianity with neopagan rituals and hypernationalism. Among more fanatical Nazis, the Führer became a new messiah, *Mein Kampf* a new bible, and iron crosses and swastikas the new crucifixes. Yet most Christians in Germany experienced little distress in preserving traditional Christian symbols and beliefs while professing allegiance to Hitler and the Nazi Party. Opposition to the war became a force in Germany only after major military setbacks, notably the defeat at Stalingrad in early 1943.

In countries occupied by Germany, religion sometimes served to unify resisters to Nazi rule, as it did in Poland, Holland, Norway, Belgium, Denmark, and other nations. Yet the opposite could be true as well, at least initially. In France, the Catholic Church supported head of state Henri Philippe Pétain and the Vichy government, since the latter drew its strength from conservatives sympathetic to Catholicism, a contrast to their Republican or Socialist counterparts in the interwar period. As Nazi occupation policy grew more oppressive, French Catholics such as Jacques Maritain began calling for

Men of the 50th CB Battalion (Seabees), sitting on sandbags in a canvas chapel, bow their heads in prayer during candlelight Holy Communion service, at Tinian, Mariana Islands, 24 December 1944. (National Archives)

heartfelt examinations of individual conscience and resistance to totalitarian forms of government. Maritain's *Christianity and Democracy* (1943) pointed the way toward the Christian Democratic parties of the postwar period.

Where religious identity mattered in deadly earnest, of course, was among Jewish communities scattered throughout Europe. Widespread European anti-Semitism, internecine struggles over the desirability and practicality of Zionism, and debates over orthodoxy and proper observance of Jewish law further fractured an already fragmented Jewish community, which was then systematically annihilated by the Nazis. Yet Judaism persisted. The Nazis could destroy the Jews' synagogues, cut off their beards, and even murder them, but they could not annihilate their faith. Despite Nazi prohibitions, many Jews practiced their faith surreptitiously in the ghettos, demonstrating fortitude and fidelity to their forefathers and precipitating acts of moral and violent resistance against their nominally Christian German persecutors. The Holocaust led some Jews to reject God, whereas others embraced him more closely. Few Jews were left unchanged.

Jewish emigration to Palestine in the 1930s and Zionist ambitions had provoked Arab revolts against British rule from 1936 to 1939. In 1939, attempting to appease Arab demands, the British limited Jewish immigration to Palestine to 75,000 for the next five years. By quelling Arab dissent, the British were able to redeploy two divisions from Palestine to the home islands to resist the anticipated Nazi assault on Europe. Dissatisfied with the British response, the grand mufti of Jerusalem approached the Nazis, a move that compromised his moral authority and the political credibility of the Palestinian Arab cause.

Yet the Muslim-Jewish split in Palestine was arguably less significant during the war than the shared goal of checking Nazi aggression. Thus it was that the British Eighth Army, which included thousands of Indian Muslim troops, thwarted Nazi ambitions to conquer Palestine, thereby saving the tens of thousands of Jews residing there. After the war, Britain relinquished its mandate over Palestine to the United Nations, whose support of a Jewish state led to Israel's creation but also to inflammatory disputes over

Jerusalem and other territories—disputes that are unresolved to this day.

In Britain and the United States, organized religion lent its moral authority to the holy crusade against Nazi Germany. The Nazi combination of megalomaniac territorial ambition suffused with genocidal racial ideology was so transparently evil that few people in the West objected to combating Germany after 1941. Such was not the case earlier in the war, when some viewed fascism as a dangerous but nevertheless more congenial alternative than communism. In his Four Freedoms, however, President Franklin D. Roosevelt made it clear that democracy best preserved people's freedom to worship. The four chaplains—Catholic, Protestant, and Jewish—who together lost their lives when the U.S. Army transport *Dorchester* sank in 1943 set a powerful example of ecumenism and religious unity that served the Western democracies well in prosecuting the war.

Josef Stalin also recognized the importance of religion to fighting spirit. Soon after the German invasion in June 1941, he suppressed the League of Militant Atheists (an organization founded in 1917). He then permitted the reappointment of a patriarch (Sergius) for the Russian Orthodox Church (Peter the Great had eliminated the post in 1721). Orthodox priests—now freed from prison, with their rights to preach guaranteed and their churches reopened to the faithful—rewarded Stalin with calls for a holy war to defend the homeland against bloodthirsty and barbarous Nazi “jackals,” a call that was answered with considerable enthusiasm by many Soviet citizens.

The Pacific Theater witnessed even more intense expressions of religiously inspired nationalism. In Japan, the state Shinto religion merged with militant and nationalistic expressions of the Bushido warrior code to elevate emperor veneration and expansionist rhetoric to unprecedented heights. In such a setting, battle became a Shinto purification rite to cleanse Asia of corrupt, materialistic Westerners. Japan planned to incorporate Asia and the Pacific Basin into a “co-prosperity sphere” ruled by its army and navy, agents of the divine emperor. Militarism extended even to Japanese Buddhist sects, such as the Nichiren, which aggressively sought to provoke incidents in China to justify Japanese expansionism and imperial exploitation.

Meanwhile, Western missionaries in China played pivotal roles as witnesses to Japanese war crimes, most notably the infamous Nanjing (Nanking) Massacre (1937). Faced with the fanaticism of Japanese soldiers, sailors, and aviators, the West responded with its own “war without mercy,” in John W. Dower's memorable phrase, that caricatured the Japanese as irredeemable, inhuman vermin. With Shintoism viewed in the West as a debased form of primitive nature and ancestor worship, there was little room for Christian accommodation.

Whether it was Japan's divine sense of mission against Western domination or Nazi crusades against godless Bol-

shevism or Allied efforts against degenerate and murderous Nazism, World War II often became a moral and religious crusade with little tolerance for pacifists or conscientious objectors. Nevertheless, avoiding military service on religious grounds was possible, if suspect—a fact that cast a shadow over even long-term pacifists such as the Society of Friends (Quakers). Conscientious objectors were tolerated most in countries whose existence was threatened least, such as the United States and Canada.

Here, one must note the success of Mohandas Gandhi in pursuing a nonviolent protest against British rule in India. Its tragic denouement in Hindu-Muslim violence that led to Gandhi's assassination and the India-Pakistan split in 1947 should not obscure the spiritual power of Gandhi's war of ideas.

Religion was perhaps most crucial in the postwar world in helping to restore morality and human decency after the genocidal catastrophes and horrific casualties of the war. Ecumenism was plainly more evident; the World Council of Churches, founded in 1948, brought together 147 different churches from 44 countries. Evangelism within Christianity also increased as resistance to communism became the new *raison d'être* of many European and American Christians. Meanwhile, Jews attempted to recover from the enormity of the crimes against them while simultaneously defending the state of Israel.

Many people, Jews and Christians alike, were left to ponder the question raised and the confession made by Christians such as Emmi Bonhoeffer, who asked how a German population consisting of 95 percent baptized Christians could have supported or acquiesced in Nazi war crimes. Many believers confronted (or sometimes actively avoided) this and similar questions of conscience after 1945.

Remagen Bridge, Capture of (7 March 1945)

As the Germans retreated across the Rhine, they destroyed bridges over the river. Not expecting to find a bridge intact, American forces planned to pause along the Rhine while to the north, Field Marshal Bernard L. Montgomery's 21st Army Group drove between Düsseldorf and the Dutch frontier to secure the Ruhr. Such a delay was unacceptable to U.S. Generals Omar N. Bradley and George S. Patton, who wanted to cross the Rhine as soon as possible and maintain pres-

sure on the German army. American forces narrowly missed capturing several bridges over the Rhine.

At noon on 7 March 1945, Task Force Englemann (commanded by Lieutenant Colonel Leonard Englemann), consisting of the U.S. 14th Tank and 27th Armored Infantry Battalions of Combat Command B of the 9th Armored Division, reached the Ludendorff Railroad Bridge at Remagen, 20 miles upriver from Bonn. The bridge, the last one still intact over the Rhine, had two rail tracks and a pedestrian walkway. When the French had occupied the region following World War I, they had poured large quantities of cement into the demolition chambers under the bridge, which made it difficult to destroy. Indeed, the Germans had failed to blow it twice before the Americans arrived. The bridge was held by an inadequate force of only a platoon of German soldiers.

At 4:30 P.M. on 7 March, the lead U.S. units received orders to take the bridge at all costs. The Germans detonated charges that cratered the approach to the bridge, but a U.S. tank round had severed the power cables between the electrical source and the main charge on the bridge itself. As the Americans dashed forward, the Germans did detonate a low-quality backup charge, but the explosion only shook the bridge.

Between 7 March and 17 March 1945, 50,000 U.S. troops and dozens of vehicles crossed the Remagen Bridge.

Task Force Englemann captures the Ludendorff Bridge spanning the Rhine at Remagen, the only bridge left standing across the Rhine, March 1945. (Corbis)

Over the next 10 days, the United States rushed nearly 50,000 troops and dozens of vehicles across the bridge into Germany. Almost from the moment the bridge was captured, engineers began constructing supplementary crossings, including a large Treadway pontoon bridge. Begun on 9 March, the auxiliary bridge was completed 80 hours later.

The Germans tried to destroy the Remagen Bridge with aerial bombing, V-2 rockets, jet aircraft, and even an assault by frogmen. On 17 March 1945, the bridge collapsed with little prior warning, killing 28 Americans. Studies revealed that it had given way due to overuse, especially by heavy vehicles.

The dramatic capture of the Remagen Bridge facilitated the infusion of Allied forces into Germany and likely shortened the war in Europe. Later, General Dwight D. Eisenhower declared that the bridge was “worth its weight in gold.”

Resistance

Defined here as the act of opposing a foreign occupying power, resistance has existed since the beginning of warfare and conquest. There have always been citizens of an occupied nation who refused to accept the military verdict and attempted to continue the fight against the victor, sometimes with success. During World War II, there was some degree of resistance in every Axis-occupied country, not only to the military conquest but also to Axis ideology. The degree varied sharply, depending on the nation and circumstances.

The word *resistance*, in the sense of actions taken, encompasses everything from noncooperation to civil disobedience, conducting intelligence activities, committing sabotage and assassinations, running escape lines, and even carrying out hit-and-run raids against small enemy units. *Resistance* can also mean an organization or a particular movement, such as the maquis in France. Resistance may be undertaken by individuals or by groups of people organized to work clandestinely against an oppressor. To the occupied people, those who engage in such activities are resisters and are often held up as heroes. To the occupying power, they are considered bandits, criminals, and even terrorists.

To exacerbate the confusion, most nations have created myths concerning their resistance activities. As a consequence, we will never know, even approximately, the numbers of people actually involved in such activities. After the war, for quite understandable reasons, the governments of many countries, including France, sought to magnify the numbers of citizens involved in resistance work and their contribution to victory.

Resistance movements during World War II were sharply fragmented along national lines, and there were even bitter rivalries within groups of resisters in individual nations that often led to bloodshed. These rivalries were the result of deep ideological and religious differences, long-standing ethnic feuds, fiefdoms, and petty jealousies among the leaders themselves. In Czechoslovakia, Defense of the Nation and the Falcon Organization vied with one another. In the Netherlands, various religious and political groups emerged, but they did not work together until September 1944. In France, resisters were markedly divided at first: not until May 1943 was the National Council of the Resistance (CNR) formed, uniting all major French Resistance groups. In Greece, infighting among the National Popular Liberation Army (ELAS), the National Republican Greek League (EDES), and the Communist National Liberation Front (EAM) led to a civil war after World War II had ended. In Albania, royalist Zogists fought a prorepublican group of resisters. The Yugoslavia Resistance was polarized between the royalist Četniks under the leadership of Dragoljub “Draza” Mihajlović and Communist Partisans led by Josip Broz (better known as Tito). The Četniks were promonarchy and conservative, whereas the Partisans were antimonarchy and sought a postwar communist state. The Četniks were also reluctant to embark on the types of operations that would bring reprisals against the civilian population, such as direct attacks on German troops. The Partisans felt no such compunction. Inside the Soviet Union, many resisters sought not only freedom from the Germans but also freedom from Soviet control as well.

Often, Allied agents who parachuted into an occupied state had difficulty sorting out all these rivalries and making the appropriate determinations as to where Allied financial and military assistance should be directed. Throughout the occupied countries, the communist resistance groups, although they were late to take the field (until the German invasion of the Soviet Union in June 1941, Josef Stalin advocated close ties with Nazi Germany), tended to be highly effective because they were better trained and organized; with strong ideological motivation, they had no reservations about the use of force.

Geography impacted resistance activities and determined the levels of action and participation. Mountainous, forested, or swampy terrain favored the guerrilla. It was thus easier to conduct resistance activities in Norway, Yugoslavia, Albania, and Greece, all countries with many hills, forests, and caves.

In Asia, jungles often worked to the advantage of the resistance forces as well.

Resistance took many forms and was both passive and active. Passive resistance was generally nonconfrontational and a method of coping and asserting one's patriotism. Passive resistance involved many people in occupied Europe and in Asia. It encompassed a wide range of activities and might include nothing more than reading an illegal newspaper, selling or buying goods on the black market, or not handing in materials decreed necessary for the Axis war machine. It might also mean secretly listening to church sermons, praying for a royal family or leaders in exile, listening to broadcasts from the British Broadcasting Corporation (BBC), leaving a public place when a German entered it, or other such actions. At the highest levels, passive resistance might include balking at anti-Jewish legislation or not handing over individuals sought by the occupier and seeking to evade the occupying power's exactions.

Active resistance included intelligence gathering; acting as couriers or radio operators; disseminating information or

Allied propaganda, through such means as underground newspapers; printing false identification papers and ration cards; rescuing downed Allied pilots and assisting them to neutral nations; committing acts of sabotage; freeing prisoners; hiding Jews; and even carrying out assassinations of individuals and conducting military actions against small numbers of occupying troops. Active resistance was far more dangerous and often life-threatening, both to the individual involved and to his or her family. For that reason, those who engaged in it were always a minority. Considerable courage as well as clairvoyance were required for a Frenchman to see, in 1940, that Germany might indeed lose the war, let alone for him to be willing to risk all toward that end.

The British Special Operations Executive (SOE), established by Prime Minister Winston L. S. Churchill in 1940, helped finance and train agents from the nations of Axis-occupied countries to carry out active resistance activities. Its U.S. counterpart, the Office of Strategic Services (OSS), conducted similar activities. The SOE and OSS enjoyed some suc-

cesses, but they also experienced a number of failures leading to the deaths of agents. The most dramatic failure resulted from ENGLANDSPIEL, an elaborate German counterintelligence operation in the Netherlands that ended in the deaths of many Allied agents. Resisters had to exercise constant vigilance—and not only against the occupying forces. The governments of their own countries, working with the occupiers, often sent out forces (such as the Milice in France) to hunt them down.

One notable resistance success was the February 1943 strike executed by British-trained Norwegian resisters against the hydroelectric plant at Vermork, Norway. This raid and the subsequent sinking of a ferry delayed German production of the heavy water essential for the production of an atomic bomb.

The Poles, who suffered terribly at the hands of their German and Soviet occupiers during the war, immediately established active resistance operations. They provided immensely useful intelligence on the German development of V weapons, and they created the secret Home Army. Jews in the Warsaw ghetto employed active resistance as well, rising up against the Germans and providing a heroic example of courage against impossible odds.

The French maquis also fought the Germans. Resistance activities mounted from the Vercors Plateau in the Alps of eastern France provoked a strong reaction in the form of 20,000 German troops who, in June 1944, decimated the Vercors maquis and mounted savage reprisals against the civilian population. The Germans carried out ferocious reprisals elsewhere as well. Often, they executed innocent civilian villagers or hostages at the rate of 20 or more for each of their own slain. Reprisals were especially fierce after British-trained Czech commandos assassinated the Reich protector of Bohemia and Moravia, Reinhard Heydrich. His death led the Germans to kill most of the inhabitants of Lidice and level the town. Communities in other parts of Europe suffered a similar fate.

Resistance activities sharply increased as the Axis powers suffered military reversals, especially when it became clear that they would lose the war. Resisters had to be constantly on guard and regularly change their modus operandi. They also had to contend with double agents, of whom there were a substantial number. French Resistance leader Jean Moulin, the head of the National Resistance Council (CNR), for example, was betrayed to the Gestapo by an informant.

The effectiveness of resistance activities during the war is difficult to gauge. Such activities may not have greatly sped up the end of the war, but they did affect events in that the occupiers were forced to divert many troops from the fighting fronts to occupation duties and to hunting down the resistance forces. Resistance in all its forms was a vindication of national identity and pride and a statement for freedom. Unfortunately for resistance leaders in many countries, their bright and idealistic hopes that the war would bring new

political structures were, for the most part, left unfulfilled. In most nations, these individuals were thanked politely and then shown the door, as the old elites soon reestablished themselves in power.

Some resistance groups, of course, fought not only against the Axis powers but also against colonial forces. Thus, in Vietnam, the Vietminh led by Ho Chi Minh fought both the Japanese and the French. As a consequence, the resistance continued in a number of countries after World War II ended, utilizing the methods and weapons supplied to fight the Japanese. Such was the case in Vietnam, in the Philippines, and even in the Soviet Union.

Reuben James, Sinking of (31 October 1941)

The loss of the U.S. Navy destroyer *Reuben James* (DD 245) to the German submarine *U-552* on 31 October 1941 helped move the United States closer to entering World War II. The *Reuben James* was a Clemson-class “Four Piper” destroyer, named for the U.S. sailor who, interposing his own body, had saved the life of Lieutenant Stephen Decatur during the Barbary Wars. Commissioned in 1920, “the Rube,” as the destroyer came to be known, displaced 1,200 tons, was capable of speeds in excess

U.S. Navy destroyer *Reuben James*. (Photo by Hulton Archive/Getty Images)

of 30 knots, and was armed with 4 × 4-inch guns and 21-inch torpedoes.

On the outbreak of the war in Europe in 1939, the *Reuben James* was assigned to patrol duty off the East Coast of the United States. In March 1941, the Rube joined Squadron 31 in the Atlantic, where it was part of the Northeastern Escort Force assigned to escort convoys as far east as Iceland and as far west as the United States.

On 31 October 1941, the *Reuben James* (under Lieutenant Commander H. L. "Tex" Edwards) was some 600 miles west of Iceland, with 4 other destroyers escorting 44 merchantmen in the eastbound convoy HX.156. She was steaming on the port beam of the convoy abreast of the last ship in the column that morning when she was hit without warning on the port side by a torpedo fired by the German *U-552*. Evidently, the torpedo explosion touched off ammunition in the destroyer's forward magazine and split the ship in two. The stern remained afloat for about five minutes, and then it, too, sank. Only 45 men, including a chief petty officer, survived; 115 others, including Edwards and all the other officers, went down with the ship.

Within days, U.S. President Franklin D. Roosevelt had transferred the Coast Guard to the U.S. Navy. The next week, Congress amended the Neutrality Act by authorizing the arming of American merchantmen and removing restrictions that denied European waters to U.S. shipping. The U.S. Navy could now convoy Lend-Lease goods all the way to British ports. The *Reuben James* was the only U.S. Navy ship lost to the German navy before the United States entered World War II.

Reynaud, Paul (1878–1966)

French premier who was arrested by the Vichy government and turned over to the Germans. Born on 15 October 1878 in Barcelonnettes (Basses-Alpes), France, Paul Reynaud earned a doctor of law degree at the Faculté de Droit at the Sorbonne. He joined the bar and built a practice in civil and commercial law. During World War I, he served in the medical corps, winning the Croix de Guerre and Legion of Honor. Reynaud won election to the Chamber of Deputies in 1919 from Basses-Alpes. He failed to win reelection in 1924 but was again elected to the chamber four years later, this time from the Seine. He held this seat until the end of the republic in 1940.

Reynaud was soon a major political figure in the Third French Republic. Beginning in the 1930s, he was named to the cabinet eight times, three of them in the Ministry of Finance. A maverick on many issues, as early as 1935 he supported the reformist ideas of the army's Lieutenant Colonel Charles de Gaulle for the organization of a powerful armored force to confront the Germans.

As minister of justice from April 1938 in the government of Édouard Daladier, Reynaud opposed the Munich Agreement but then accepted the post of minister of finance. When Daladier was forced to resign as premier for failing to prosecute the war vigorously, Reynaud became the premier on 20 March 1940. He was saddled with having his political rival Daladier as

French politician Paul Reynaud, 1948. (Photo by Kurt Hutton/Picture Post/Getty Images)

his defense minister, but he proposed aggressive action against the Germans, including plans to intervene in Norway. He and British Prime Minister Neville Chamberlain also discussed means of aiding the Finns in their war against the Soviet Union.

Following the German invasion of France and the Low Countries on 10 May 1940, Reynaud tried to rally the French nation, announcing in a radio address, “The situation is grave; it is not desperate. The Maginot Line is there . . . intact, robust, unbreakable.” He also sought to strengthen the government by bringing into it Marshal Henri Philippe Pétain and General Maxime Weygand. Reynaud pledged to continue the fight, but by the end of May, with the military situation fast deteriorating, he met with British Prime Minister Winston L. S. Churchill and warned that he might be unable to keep his pledge not to negotiate a separate armistice. The government fled to Bordeaux in southwest France, and defeatists in the cabinet gained strength. Reynaud favored continuing the fight, if necessary overseas. When Churchill proposed a merger of France and Britain, he agreed, but this union was disavowed by a majority of the cabinet. On 16 June 1940, Reynaud resigned. Arrested by the Vichy government in August, he was held until November 1942, when he was handed over to the Germans. He was taken to Germany and remained a prisoner until he was liberated at the end of the war.

Reynaud returned to France and became a leading politician in the Fourth Republic from 1946. He headed the committee drafting the French constitution that ended the Fourth Republic and began the Fifth. Reynaud supported Charles de Gaulle until 1962. He was also an early advocate of the unification of Europe. He died in Neuilly-sur-Seine, France, on 21 September 1966.

Rhine Crossings (7–24 March 1945)

The Rhine River presented the greatest natural obstacle in the path of the advancing Western Allies after their crossing of the English Channel. Ranging in width from 700 to 1,200 feet and at no point fordable, the river was at flood levels in early March 1945—the result of spring rains and melting snow. The Rhine was also in German territory and would be defended at great cost. Allied plans called for Field Marshal Bernard Montgomery’s 21st Army Group to cross the Rhine in the north, while General Omar N. Bradley’s 12th Army Group would cross in the south. The majority of resources were to be assigned to Montgomery, whose forces were then to secure Germany’s industrial heartland of the Ruhr Valley.

The Germans had already blown most of the bridges across the Rhine accessible to the advancing Allies when, on the afternoon of 7 March, lead elements of Combat Command B of the 9th Armored Division of Bradley’s army group were able to secure the Ludendorff Railroad Bridge at Remagen. Troops and vehicles were rushed across as combat engineers hurried to construct other bridges. Meanwhile, amphibian trucks and engineer ferries supplemented the bridge.

Not to be outdone, Lieutenant General George S. Patton sought to secure a crossing for his Third Army. He planned to make a feint at Mainz and then cross at Oppenheim. The task of making the initial crossing fell to the 5th Infantry Division. The operation began late on the night of 21 March. Thirteen artillery battalions and 7,500 engineers stood by to support the crossing, but to secure surprise, there was no preliminary fire.

Two assault companies of the 5th Division, assisted by the 204th Engineer Combat Battalion, crossed the river at Oppenheim without resistance. South of the city, another assault company got across but then met heavy German resistance on the other bank. Not until 12:30 A.M. on 22 March did the Germans begin to fire artillery, and even then, it was only sporadic. Patton's sneak crossing had worked well indeed.

As the bridgehead expanded, ferries, DUKWs amphibious trucks, and landing craft known as LCVPs (landing craft, vehicle or personnel) of the U.S. Navy's Naval Unit 2 ferried men and equipment to the other side. By midafternoon, three infantry regiments and hundreds of support troops were across. By evening, the bridgehead was 5 miles deep. Patton's army made two other assault crossings of the Rhine. Lead elements of the 87th Division crossed in the early morning hours of 25 March at Boppard, and the following morning, the 89th Division crossed at Saint Goar.

Despite the good fortune of the Remagen crossing and Patton's crossing to the south, the Allied plan still called for the northern crossings, code-named Operation *PLUNDER*, to be the main attack. Montgomery massed nearly 1 million men along the lower Rhine: 21st Army Group units in the crossing included the 9 divisions of the British Second Army and the 12 divisions of the U.S. Ninth Army. The U.S. Navy's Naval Unit 3 supported 21st Army Group and was the largest of three such supporting units for the Rhine crossing. It was reinforced by a Transportation Corps harbor company and elements of the Royal Navy. Defending in this area, the Germans had only 85,000 men and 35 tanks. Operation *PLUNDER* began late on 23 March, with units of the 21st Army Group getting across the Rhine between Wesel and Emmerich.

To support Operation *PLUNDER* at Wesel and impede any German reinforcement, the Allies planned a massive airborne assault. Operation *VARSAITY*, carried out on 24 March, involved 21,692 Allied paratroopers and glidermen of the British 6th Airborne and U.S. 17th Airborne Divisions of Major General Matthew B. Ridgway's XVIII Airborne Corps, with 614 jeeps, 286 artillery pieces and mortars, and hundreds of tons of supplies, ammunition, food, and fuel. A total of 1,696 transports and 1,348 gliders participated. More than 2,000 Allied fighter aircraft provided support, and 240 B-24 bombers were specially rigged to drop supplies and equipment. The drop zones for *VARSAITY* were east of the Rhine in the Wesel area, close enough to the advancing ground forces to provide for a quick linkup but not deep enough to give any real additional depth to the operation. By the end of 24 March, the airborne forces had secured most of their objectives. The defending German 84th Division was virtually destroyed, with 3,500 Germans taken prisoner. Although *VARSAITY* was a success, it was a costly one; casualties were higher for the airborne forces in this operation than for the Allied ground units in their crossings.

Meanwhile, the Ninth Army's 90th Infantry Division crossed all three of its regiments near Wallach shortly after midnight on 24 March. The Scottish 15th Division of Lieutenant General Neil Ritchie's British XII Corps got across the river west of Xanten, opposed only by sporadic artillery, mortar, and machine-gun fire. Then, at 3:00 A.M. on 24 March, the 79th Division conducted the last amphibious crossing of the river, at points east and southeast of Rheinberg.

The initial assault crossings completed, engineers followed with additional bridging. Allied headquarters had estimated that sustaining military operations across the Rhine would require 540 tons of supplies per day. Allied engineers had, in short order, constructed a variety of foot, vehicle, railway, and pipeline bridges. For generations, the Germans had considered the Rhine as a natural barrier that would protect them from invasion, but superior resources at the points of attack and military engineering gave the Allies access to the German heartland.

Rhineland, Remilitarization of (7 March 1936)

Probably the seminal event on the road to World War II in Europe. The 1919 Treaty of Versailles, imposed on Germany by the victorious Allies after World War I, demilitarized the entire Rhineland (the German territory west of the Rhine River) as well as a belt 30 miles east of the Rhine. Then, in 1925, the German government voluntarily negotiated and signed the Locarno Pacts. Among their provisions was one guaranteeing continuation of the Rhineland demilitarization.

German Chancellor Adolf Hitler chose to violate these treaties. Timed to occur in the midst of France's most bitterly contested election campaign after World War I, his move to do so was hastily mounted with the preliminary directive issued on 2 March 1936. On 7 March, in Operation *WINTER EXERCISE*, Hitler sent across the Rhine bridges into the Rhineland just 19 battalions of infantry and 13 artillery

groups plus 2 antiaircraft battalions and 2 squadrons of 27 single-seater fighter planes without reserves, a total strength of 22,000 men, as well as 14,000 local police. The troops were armed with little more than rifles and machine guns.

To its credit, the weak French government was more inclined to fight than were its generals. Astonishingly, France had no contingency plans for such an eventuality. Army Chief of Staff General Maurice Gamelin informed the cabinet that the choices were to do nothing or to totally mobilize. The French intelligence services grossly overestimated the size of the German forces inside the Rhineland at 265,000 troops. The British more realistically believed Hitler had sent in 35,000 men, but they erroneously accepted his boast that the Luftwaffe had achieved air parity with the Royal Air Force. In reality, the two squadrons of obsolete biplane Arado Ar-65 and Ar-68 and Heinkel He-51 fighter aircraft that Germany put aloft lacked guns or synchronization gear to enable them to fire through their propeller arcs. Had French aircraft appeared, the only German recourse would have been to ram! The sole Luftwaffe aircraft capable of reaching London, the Junkers Ju-52, could not have flown there carrying bombs and returned. But even this prospect was not a realistic one, as the Luftwaffe had few bombs available—a total of perhaps several hundred.

The most that France did was to mobilize 13 divisions and reinforce the Maginot Line. In a vain cover for its own inaction, Paris appealed to Britain for support, but Foreign Secretary Anthony Eden made it clear that Britain would not fight for the Rhineland, which was, after all, German territory. Speaking for the cabinet, Eden announced in the House of Commons that, although Germany's action was "inexcusable" as a breach of a freely signed international treaty, it in no way implied a hostile threat to France!

Had the French acted by themselves, their forces would have defeated the Germans. Hitler later recalled, "We had no army worth mentioning. . . . If the French had taken any action, we would have been defeated; our resistance would have been over in a few days. And what air force we had then was ridiculous. A few Junker 52s from Lufthansa, and not even enough bombs for them." A French military move would probably have been the end of the Nazi regime. As Hitler noted, "retreat on our part would have spelled collapse."

Acquisition of the Rhineland fortified Hitler's popularity in Germany. It also assured his ascendancy over his generals, who had opposed the move as likely to lead to a war with France for which Germany was not prepared. Strategically, the remilitarization of the Rhineland provided both a buffer for the Ruhr and a springboard for invading France and Belgium. It also shook France's allies in eastern Europe, who now believed that country would not fight to maintain the security system it had created against German aggression. The action

had another important negative consequence for France as well, for on 14 October 1936, Belgian leaders denounced their treaty of mutual assistance with France and again sought security in neutrality. Germany promptly guaranteed the inviolability and integrity of Belgium so long as it abstained from military action against Germany. By his action, Hitler had effectively destroyed the post-World War I security system.

Rhineland Offensive (February–March 1945)

Allied eastward campaign to reach and cross the Rhine River. Actually a series of offensives—Operations VERITABLE, GRENADE, LUMBERJACK, and UNDERTONE—the Rhineland Offensive was designed to drive the German army from the area north of the Mosel River in preparation for the main Allied invasion of Germany by Field Marshal Bernard L. Montgomery's 21st Army Group in the north, across the Rhine north of the Ruhr. The supreme Allied commander in the west, General Dwight D. Eisenhower, also wanted to occupy the Rhineland (the area of Germany west of the Rhine River) south of the Mosel River in order to protect Montgomery's right flank and to provide territory for a secondary invasion of Germany through the Kassel-Frankfurt corridor.

Eisenhower had pledged to Montgomery that his forces would make the primary thrust to the Rhine, and he left Lieutenant General William H. Simpson's Ninth Army under Montgomery's command. He also allowed Lieutenant General George S. Patton Jr.'s Third Army to continue its drive toward the city of Trier and the Saar River basin. Ordering elements of Lieutenant General Courtney H. Hodges's First Army to seize the Roer River dams in support of Montgomery's northern thrust, he also let Lieutenant General Omar N. Bradley make an additional strike northeast from Saint Vith toward the Rhine. This latter attack began on 28 January, but the troops bogged down when confronted with poor weather and stiff German resistance.

American soldiers surveying the wreckage of the Ludendorff Bridge at Remagen, Germany, 24 March 1945. (Bettmann/Corbis)

Montgomery's attack in the north, Operation *VERITABLE*, began on 8 February. Infantry and tanks of the Canadian I and II Corps, reinforced by the British XXX Corps, assaulted the German West Wall (known to the Allies as the Siegfried Line)—entrenchments in and around the Reichswald State Forest. Despite the attackers' greater numbers and air superiority, stubborn German resistance and poor weather slowed the advance. When the Germans breached the Roer River dams before the Allies could seize them, the flooding of that river postponed Operation *GRENADE*, a supporting attack by the U.S. Ninth Army, and allowed the Germans to concentrate their reserves against the British and Canadians.

However, having committed almost all their reserves against *VERITABLE*, the Germans could not hold back the Americans as the First and Third Armies involved in Operation *LUMBERJACK* began to penetrate the West Wall defenses. Patton, ignoring orders to halt his offensive, sent Major General Manton Eddy's XII Corps toward Bitburg and Major General Troy H. Middleton's VIII Corps on to the Prum River.

Steadily advancing through a heavily fortified German belt, the weary troops reached both objectives by the end of February. The U.S. First Army north of Patton likewise pressed the defenders ever closer to the Rhine. Launching Operation *GRENADE* on 23 February, after the Roer River flooding had receded, the U.S. Ninth Army broke through the thinned defenses and advanced toward the Rhine. Operation *UNDERTONE* was the final stage of clearing the Rhineland, with the goal of removing German forces from the Saar and Palatinate. Mounted by Lieutenant General Alexander M. Patch's Seventh Army, it began on 13 March. Adolf Hitler's stubborn refusal to permit his armies to retreat or even maneuver contributed greatly to the subsequent German debacle. Standing in place, the German defenders were destroyed in detail or cut off and forced to surrender. Only a relative handful escaped east across the river. By 24 March, German forces had been forced back across the Rhine.

The U.S. First Army secured the biggest prize of the campaign. No American commander had really expected to cap-

ture an intact Rhine bridge, but on 7 March, a unit from the U.S. 9th Armored Division took advantage of a confusion in the German defense to seize the Ludendorff Railroad Bridge at Remagen. General Hodges reinforced the coup by rushing divisions of his III Corps under Major General John Millikin over the river. The First Army's bridgehead over the Rhine, reinforced on 22–23 March by Patton's surprise crossing near Oppenheim and Montgomery's set-piece crossing on 23 March, wrapped up the campaign.

British and Canadian casualties in these battles approached 16,000 men, and U.S. losses among all the armies engaged were almost twice that number. The collapse of the German defenses west of the Rhine began when pressure was applied at several points simultaneously. Lacking the reserves to meet so many attacks and forbidden by Hitler to fall back, the German armies suffered severely. In the Rhineland Campaign, the Allies took more than 200,000 German prisoners.

Ribbentrop, Ulrich Friedrich Willy Joachim von (1893–1946)

German diplomat who became foreign minister in 1938. Born in Wesel, Westphalia, Germany, on 30 April 1893, Joachim von Ribbentrop ended his education in Germany without taking the *Abitur* (a national exam to qualify for university study). He and his brother Lothar then studied at a boarding school in Switzerland, where they acquired an international outlook and interest in languages. Ribbentrop next traveled in England and worked for a time as a clerk in a German import firm in London. Between 1910 and 1913, he and his brother were in Canada, where they held a variety of jobs. In 1914, Ribbentrop underwent surgery to remove a tubercular kidney and returned to Germany to recuperate. When he recrossed the Atlantic afterward, he visited the United

German Foreign Minister Joachim von Ribbentrop in SS (Schutzstaffel) uniform in January 1940. (Photo by Hulton Archive/Getty Images)

States before joining Lothar in Ottawa, where they ran a wine import-export business.

When World War I began in 1914, Ribbentrop managed to return to Germany, where he joined the army and fought as a lieutenant until he was wounded in action. Invalided from line service, he was awarded the Iron Cross. Later, he served on the staff of German military attaché Colonel Franz von Papen in the United States, and he followed the latter when he was posted to Turkey.

After the war, Ribbentrop married into the family of a prosperous champagne producer. Always a social climber, he purchased the aristocrat *von* in his name from a maiden aunt who adopted him in return for a cash settlement in 1925. A handsome man of considerable charm, he was also a parvenu and dilettante.

In January 1933, Ribbentrop helped arrange meetings at his villa in Dahlem between Adolf Hitler and Franz von Papen. He joined the Nazi Party relatively late, in May 1932. Though he paid lip service to the movement, he was actually a royalist and a conservative and seemed not to have realized Hitler's true aims. The urbane, internationalist Ribbentrop never did fit in with old-guard Nazi leaders, who referred to him as "the champagne salesman." From 1934 to 1938, he

advised Hitler on relations with Britain. He played a key role in negotiating the 1935 naval accord with that country, and he served briefly as the German ambassador in London (from 1936 to 1938) before succeeding Konstantin von Neurath as foreign minister on 4 February 1938. His great triumph was the German-Soviet Non-aggression Pact of 23 August 1939. On the outbreak of World War II, Ribbentrop and diplomacy faded into the background. Hitler called him “the New Bismarck” but conducted his own foreign policy.

Ribbentrop held the third-highest Schutzstaffel (SS) rank during the war, and in a vain effort to regain influence, he adopted a rigorous anti-Semitic posture, ordering the Foreign Office to expedite deportations of Jews and others. He remained loyal to Hitler to the end, testifying at the Nuremberg trials: “I could never repudiate him now or renounce him. I don’t know why.” Found guilty by the International Tribunal on four counts of war crimes, most notably for his involvement in the German-Soviet Non-aggression Pact of 1939 and instigating anti-Jewish measures, he was sentenced to death. Ribbentrop was hanged on 16 October 1946.

Richthofen, Wolfram von (Baron) (1895–1945)

German air force field marshal who assumed command of Luftflotte 2 in 1943. Born in Barzdorf, Germany, on 10 October 1895, Wolfram von Richthofen was the cousin of Manfred von Richthofen, the “Red Baron” of World War I. He joined the army in 1913 as a lieutenant in the 4th Hussars Regiment. During World War I, he saw action on both fronts before transferring to the Military Aviation Service. He was posted to his cousin’s command, Jagdgeschwader 1 (fighter wing 1, or JG 1) in March 1918 and scored eight aerial victories before the end of the war.

Following the war, Richthofen studied engineering at the Hanover Technical Institute. He joined the Reichswehr in 1923 and proved a capable, intelligent staff officer. Within two years of Adolf Hitler’s rise to power, he had transferred to the

Luftwaffe and been promoted to lieutenant colonel. In 1936, Richthofen went to Spain as chief of the Development and Testing Branch to observe firsthand the performance of Luftwaffe equipment. Hugo Sperrle, commander of the Kondor Legion, asked Richthofen to remain in Spain, and he eventually became commander of the Kondor Legion as a brigadier general. In Spain, he developed such close-air support techniques as having air force officers serve with ground troops.

Richthofen departed Spain convinced that ground support should be the primary Luftwaffe role. He became the leading advocate in the Luftwaffe for air-ground cooperation. He commanded VIII Air Corps in the invasion of Poland in September 1939, and he directed the aerial destruction of Warsaw. During the invasion of France and the Low Countries in 1940, Richthofen commanded three squadrons of Ju-87 Stuka dive-bombers that provided effective flying artillery support to the advancing German Sixth Army.

Promoted to lieutenant general in May 1940, Richthofen directed VIII Air Corps in the Battle of Britain and in the German invasions of Greece and Crete. In 1942, he assumed command of Luftflotte 4 (Fourth Air Fleet), supporting German forces in the southern Soviet Union and at Stalingrad. Promoted to field marshal in February 1943 (the youngest in the German military), he took command of Luftflotte 2 in Italy in hopes that he could stem the Allied tide on that front.

In November 1944, Richthofen was diagnosed with a brain tumor and medically retired. After Germany surrendered, he was held by the Americans in Austria. He died of his brain tumor on 12 July 1945 in Ischl, Austria.

Ridgway, Matthew Bunker (1895–1993)

U.S. Army general and commander of the 82nd Infantry Division from 1942 to 1944. Born on 3 March 1895 in Fort Monroe, Virginia, Matthew Ridgway graduated from the U.S. Military Academy in 1917 and was commissioned in the infantry. He was sent to a border post at Eagle Pass, Texas, and rose to captain. Ridgway returned to West Point and

U.S. Army General Matthew B. Ridgway. (Corbis)

served as an instructor there from 1918 to 1924. In 1925, he graduated from the Infantry School, Fort Benning, Georgia. He then held a variety of overseas assignments in China, Nicaragua, the Panama Canal Zone, and the Philippines. In 1932, he was promoted to major.

Ridgway graduated from the Command and General Staff School, Fort Leavenworth, Kansas, in 1935 and from the Army War College in 1937. Between 1939 and 1942, he was in the War Plans Division of the War Department's General Staff. A protégé of Army Chief of Staff General George C. Marshall, he was promoted to lieutenant colonel in July 1940, colonel in December 1941, and temporary brigadier general in January 1942. He was then assigned as assistant division commander of the 82nd Infantry Division assembling at Camp Claiborne, Louisiana, under Major General Omar N. Bradley. In June 1942, he assumed command of the 82nd, reorganizing it in August into an airborne division when he was promoted to temporary major general.

Ridgway commanded the 82nd in Sicily in July and August 1943 and in Italy from September to November 1943, during which the unit captured Naples and fought in the drive to the Volturno River before returning to England to prepare for the Normandy Invasion. He made his only combat jump with his division on 6 June 1944, and he fought with it throughout the Normandy Campaign. In August 1944, he turned over com-

mand of the 82nd to James Gavin and subsequently took charge of the newly formed XVIII Airborne Corps, directing it in Operation MARKET-GARDEN, during the Battle of the Bulge, and throughout the drive into Germany.

Promoted to lieutenant general in June 1945, Ridgway briefly commanded the Mediterranean Theater. From 1946 to 1948, he was U.S. representative to the UN Military Staff Committee, and from 1948 to 1949, he headed the Caribbean Defense Command. Appointed deputy chief of staff of the army in August 1949, Ridgway took command of Eighth Army in Korea on the death of Lieutenant General Walton Walker. In that post, he stopped its retreat before Chinese forces, restored its morale, and returned it to the offensive. Ridgway subsequently succeeded General of the Army Douglas MacArthur as supreme Allied commander, in April 1951. Appointed supreme Allied commander, Europe in May 1952, he was promoted to full general. In August 1953, he was appointed army chief of staff. Declining to serve his full four-year term because of his disagreement with President Dwight D. Eisenhower's defense policies that placed reliance on nuclear weapons, Ridgway retired in June 1955. He then wrote his memoirs and served on various corporate boards. He died in Fox Chapel, Pennsylvania, on 26 July 1993.

Riefenstahl, Leni (1902–2003)

German film director and actress who made movies for the Nazi regime. Born in Berlin on 22 August 1902, Leni Riefenstahl trained as a dancer, and her performances in Berlin, beginning in 1923, made her a star. Hired by Max Reinhardt, director of the Deutsches Theater, she performed throughout Europe. After sustaining a knee injury, Riefenstahl became the foremost actress in the troupe of Arnold Fanck, founder of the Freiburg Mountain and Sport Company. The film *Holy Mountain* launched her acting career in 1926, and she would thereafter appear in *The Big Jump* (1927) and *White Hell of Pitz Palü* (1929). She mastered the transition

The German actress, director, and photographer Leni Riefenstahl, 1935. Riefenstahl won the German film prize in 1934–1935 for *Triumph of the Will*, her film of the 1934 Nuremberg Nazi Party rally. (Austrian Archives/Corbis)

from silent films to sound, as evidenced in *Storms over Mount Blanc* (1930).

In 1931, Riefenstahl founded a film production company and began directing her own projects. *Blue Light: A Mountain Legend from the Dolomites*, the first film she directed, won a silver medal in Venice in 1932 and ran for over a year in Paris and London. She also produced and acted in *SOS Iceberg* in 1932, a film shot in Greenland.

In June 1933, Riefenstahl concluded an agreement to make films for the Nazi Party. Her first commission, *Victory of Faith*, dealt with the Fifth Party Congress. Renaming her company Reich Party Congress Film, she was assigned the following year to capture on film the Nuremberg party rally. *Triumph of the Will*, made in the style of a newsreel to enliven the endless columns of marching participants, displayed numerous artistic and technical innovations and became one of the most famous documentaries of the century.

In 1935, Riefenstahl produced a film about the German army, called *Day of Freedom*. Consisting largely of scenes of military exercises, its first public showing was held in the

Berlin Chancellery and was attended by Adolf Hitler and more than 200 high-ranking guests. The next year, on the occasion of the Olympic Games held in Berlin in August, she directed a film about conceptions of the Olympic ideal, *Olympia*, released in 1938. Her second great documentary, it was intended to be a bridge from antiquity to the present but was largely boycotted abroad as Nazi anti-Semitic policies became widely publicized.

During the war, Riefenstahl was expected to contribute to the propaganda offensive. Although she and her cameramen underwent training as frontline correspondents, she showed little enthusiasm for the war effort. Widely denounced as a faithful servant of Nazism with a gift for glorifying the wrong cause, Riefenstahl is cinema's principal figure in the discord between morality and art.

After the war, Riefenstahl traveled frequently to Africa and lived for extended periods in the Sudan with primitive tribes. She attracted worldwide attention with her photography of the Nuba. At 71, she learned to dive and thereafter became a renowned undersea photographer. Riefenstahl died on 10 September 2003 in Pocking, near Munich.

Rifles

The nations that went to war in 1939 were all armed with rifles from World War I, although some modifications had been made during the 1919–1939 period. Germany went into battle with a shortened, lightened version of the Gewehr 98, which had become the Kar(abine) 98k(urz). The cartridge it fired was virtually the same, the 7.92 mm s.S.Patron (*schweres Spitzgeschoss*, heavy-pointed bullet).

Great Britain also went to war with a World War I rifle, the modified Rifle No. 1, Short, Magazine, Lee Enfield in Marks III to V. The Mark VI had also appeared, which was the forerunner of the weapon introduced after the outbreak of war, the Rifle No. 4, Mark I, and its subsequent derivatives. This weapon fired the .303 (inch) Mark VI, Mark VII, and Mark VIII cartridges. Wartime shortages caused Great Britain to import many rifles from Canada and the United States, but

these were issued to the Home Guard, not to regular troops. The British experimented with semiautomatic and self-loading rifles, but they did not bring any into service.

The French had changed their rifle design and were issuing the Fusil 34 and the Fusil 36. These rifles fired a 7.5 mm rimless cartridge developed in 1929 for light machine guns. The weapon was bolt-operated and had a five-round magazine. Despite the development of the *Fusil semiautomatique* in 1918, the French army had not made the change to this weapon by the end of operations in June 1940. The Italian army chose rifles based on their 1891 design, often called the Carcano. The rifles were redesignated Model 38 and fired either 6.5 mm or 7.35 mm cartridges. These weapons were characterized by design flaws, and they bear no comparison with later Italian designs.

Japan went to war in 1941 with the type-38 Arisaka 6.5 mm rifle. This old design was soon superseded by the type-99 (1939) 7.7 mm rifle, which was put into service to overcome the weakness of the 6.5 mm cartridge. Although it had strange appendages (to Western eyes), such as anti-aircraft sights and a wire monopod, it was nevertheless a well made and effective weapon, although not up to British and U.S. standards. The Arisaka was also too large for the average Japanese soldier to use effectively.

On the German invasion of the Soviet Union in June 1941, Soviet troops were armed with their M-1891/30 rifle, in 7.62 mm. Various versions were available, including a special sniper version, but the Soviets soon realized that their massive conscript army needed firepower (rather than accuracy, the product of long periods of training), and the submachine gun rapidly overtook the rifle in both numbers and popularity. Nevertheless, research into automatic weapons produced the Tokarev M-1940 as well as its predecessors from 1936 onward. All were in the Soviet 7.62 mm caliber and were well regarded by the Germans, who used the design principles in their own semiautomatic rifles later in the war.

The U.S. Army was still employing the Springfield Cal .30-06 M-1903 rifle. In 1936, the army adopted John Garand's new rifle as the Rifle, Semi-Automatic, M1. The United States became the only country in World War II to have a semiautomatic rifle as a standard infantry weapon. The rugged Garand weighed 9 lbs, 8 oz (unloaded) and was a gas-operated, clipped, air-cooled, semiautomatic shoulder weapon that fired .30 caliber ammunition from an 8-round clip. It had an effective range of 440 yds and a maximum range of 3,200 yds. The M1 was the standard U.S. infantry firearm from 1936 to 1957. The one problem with this weapon was that it had an unpleasant recoil because it fired the same cartridge as the Springfield.

During the war, while the Soviets placed increased emphasis on the submachine gun, the Germans also made great strides in developing their own semiautomatic assault rifles. This new genre in the rifle world was intended to provide

increased firepower without sacrificing range. Submachine guns are excellent weapons at short (pistol) ranges of up to 50 yds, but beyond that, there is a need for accurate and effective fire out to 300 yds. Machine guns were the mainstay of the German army's infantry tactics, but the sheer weight of numbers in Soviet attacks made it imperative that every infantryman be able to put down effective defensive fire.

Mauser (the main German small-arms manufacturer) had been looking into semiautomatic rifles since the nineteenth century, but technical problems had ruled out its designs until the German army began to collect Tokarev semiautomatic rifles on the battlefield. The Germans then went ahead wholeheartedly, seeing their previous mistakes and how the Soviets had avoided them. The first rifle in the new range was the Gewehr 41 W, a weapon with a gas blast cone at the muzzle. The gases trapped at the muzzle operated the action by means of a rod that extended to the rear to the breech mechanism. At the same time, the German "borrowed" the Degtyarev machine-gun locking system to close the bolt firmly for firing.

The U.S. Garand system worked by means of a gas port tapped into the barrel that allowed gases in the barrel to operate a rod, which in turn forced the breechblock back against a spring. The first German system was much less sophisticated. The next German design was similar to the Garand but imported from the Soviets. Now there was a gas port some 12 inches along the barrel, allowing gas energy to operate the reloading mechanism of the rifle. This system was seen in the Gewehr 43.

The Germans also fielded a revolutionary weapon, the Fallschirmjäger Gewehr 42. This paratroop weapon had a folding bipod, and it was gas-operated and fired from a closed bolt when in single-round mode, which increased accuracy. In automatic mode (for it really was a light machine gun), it fired from an open bolt, allowing better cooling. This system was first seen in the U.S. Johnson light machine gun.

The modern assault rifle had its genesis in the German development of the Sturmgewehr rifles from 1943 onward. In 1938, development of the short, 7.92 mm cartridge began, and by 1942, both the Haenel and Walther companies were producing test weapons. In 1943, the first weapons were submitted for troop testing, and in 1944, the Sturmgewehr 44 was on limited issue to troops. This weapon was the first true assault rifle, and it eventually led to the design of the Soviet AK-47 and the Czech Model 58.

Demands from the field led to the adaptation of many standard service rifles for sniping use. The No. 4 British rifle became the No. 4 Mark I(T) and was equipped with a No. 32 telescope. The German Kar 98k was also fitted with a telescopic sight, as was the Soviet M-1891/30. The United States issued the M-1903 in an A4 version, made by Remington, but did not adapt the .30 Garand due to the problems caused by

Soviet soldier firing an antitank rifle at close range, January 1944. Toward the end of the war, these weapons were frequently used against enemy emplacements, especially in brick houses. (Photo by Alexander Ustinov/Slava Katamidze Collection/Getty Images)

the clip-loading system, which would have caused the sight mount to be fitted to the side of the loading port.

The Soviets adapted their semiautomatic Tokarev M-1938 and M-1940 rifles for sniping purposes. The weapons were sighted to 1,430 yds and weighed just over 9 lbs each. These were standard rifles, however, for weapons were not specifically designed for sniping until after the war.

The United States also produced the only true carbine of the war, the U.S. Carbine Cal .30 M1. This weapon fired a shortened .30 caliber cartridge, which was designed by Winchester and adopted in October 1941. The weapon was seen as a medium-range, medium-velocity arm, designed for use by junior officers and men who had heavy loads to carry. More accurate than the M-1911 pistol, it nevertheless did not receive unconditional approval from the troops, being considered too light in firepower. However, it was used widely

and was even equipped with the first infrared sighting equipment to be fitted to a weapon (the M3). The Carbine was also issued in a fully automatic version (the M2), which was not widely used, and it had a paratroop version with a folding stock. Basically, the weapon did not have the killing power needed in a military weapon, and although it was a good design, it was not as valuable as a good submachine gun.

Rifles were also adapted to fire rifle grenades. The Germans developed their grenade attachment to fit the Kar 98k and fired high-explosive and smoke grenades, as well as indicator bombs. The Americans fitted the Garand with the Grenade Launcher M-7, used with a blank cartridge, which was loaded with black powder (the M3 cartridge).

World War II saw a number of extremely effective designs in service, but the days of the bolt action were ending, and the influence of the *Sturmgewehr* range of rifles in par-

ticular caused all nations to look to semiautomatic and assault rifle design. Since 1945, the gas-operated semiautomatic (and even fully automatic) rifle has taken over on the battlefield.

Ritchie, Sir Neil Methuen (1897–1983)

British army general in command of XII Corps in Normandy. Born on 29 July 1897 in Georgetown, British Guyana, and educated at Lancing College and Royal Military College, Sandhurst, Neil Ritchie was commissioned in the Black Watch in December 1914. During World War I, he served in France, Mesopotamia, and Palestine. He was wounded at the Battle of Loos and was awarded the Distinguished Service Order in 1917 and the Military Cross in 1918.

Ritchie held several staff appointments during the inter-war period. In 1939 and 1940, he was a brigadier general and chief of staff of Lieutenant General Alan Brooke's II Corps with the British Expeditionary Force (BEF) in France. Following the BEF evacuation from Dunkerque, Ritchie held the same post under Major General Claude Auchinleck in Southern Command. Promoted to major general, he then served as deputy to Auchinleck when the latter took over the Middle East Command. Ritchie was the only feasible replacement for Lieutenant General Alan Cunningham when Auchinleck relieved Cunningham from command of the Eighth Army.

Ritchie was an able, vigorous, and cool-headed staff officer, but he was rather slow and unimaginative. His personality and appearance made him the very image of a British general. He was also much junior to his corps commanders, Lieutenant Generals Charles Willoughby Norrie and Alfred Godwen-Austin, and he had had no experience in field command since leading a battalion in World War I. Auchinleck intended his appointment as commander of Eighth Army to be temporary, but Ritchie was fortunate to reap the triumph of victory by relieving the siege of Tobruk and chasing Gen-

British Lieutenant General Sir Neil Methuen Ritchie, 1947. (Photo by Hulton Archive/Getty Images)

eral Erwin Rommel from Cyrenaica. With these two successes, his appointment became permanent.

An unshakable optimist, Ritchie prepared to advance and neglected the defenses at Gazala and Tobruk. When Rommel attacked again in May 1942, Ritchie lost most of Eighth Army's armor as well as control of the battle. Auchinleck belatedly relieved him from his command on 25 June, four days after the fall of Tobruk.

The inexperienced Ritchie was unfortunate to be assigned a command at a desperate moment, but he retained his personal stature and surprisingly survived this debacle. He was given another chance as commander of 52nd Division in the United Kingdom, and he led XII Corps under Field Marshal Sir Bernard L. Montgomery in Normandy and northwest Europe with some success. Ritchie was promoted to full general in April 1947 and was appointed commander in chief, Far East Land Forces and then commander, British Army Staff in Washington. He retired in 1951 to become an insurance executive in Canada. He served as both president and director of the Mercantile and General Reinsurance Company and as director of Tanqueray Gordon and Company. Ritchie died on 11 December 1983 in Toronto, Canada.

Rokossovsky, Konstantin Konstantinovich (1896–1968)

Marshal of the Soviet Union who was in command of the 2nd Belorussian Front in 1945. Born to a Polish railway worker and his Russian wife in Velikiye Luki, Poland, on 21 December 1896, Konstantin Rokossovsky moved with his family to Warsaw in 1900. In 1914, he was drafted into the Russian army, where he served with the 5th Kargopol Dragoon Regiment and rose to sergeant. He joined the Red Army in 1918 and fought in the Russian Civil War in Siberian Mongolia.

Rokossovsky completed the cavalry short courses in 1923 and the Frunze Military Academy in 1929. He commanded the 5th Kuban Cavalry Brigade (1929–1930) and then the 7th Samara Cavalry Division (1930), which included his friend Georgii Zhukov. Rokossovsky next commanded the 15th Cavalry in the Far East until 1935. In 1936 and 1937, he commanded the V Cavalry Corps. In August 1937, during the purge of the Soviet officer corps, Rokossovsky was arrested on a false charge of having spied for Poland and Japan. He was subsequently tortured and twice taken into the woods to be shot. After being imprisoned near Leningrad, he was freed on 22 March 1940. Rokossovsky again commanded the V Cavalry Corps and took part in the “liberation” of Bessarabia in the summer of 1940. He then received command of the newly formed IX Mechanized Corps in the Ukraine.

Following the German invasion of the Soviet Union in June 1941, Rokossovsky commanded Sixteenth Army in the defense of Moscow. The next year, he organized the reduction of the encircled German Sixth Army at Stalingrad with his Don Front. As a result of his success, he was promoted to colonel general in January 1943 and to full general that April. After a successful defense of the north side of the salient during the Battle of Kursk, his Central Front (later redesignated the 1st Belorussian Front) drove across the Dnieper River.

In Operation BAGRATION, Rokossovsky, promoted to marshal of the Soviet Union in June 1944, led forces that defeated German Army Group Center in Belorussia. His troops captured Minsk (3 July) and Lublin (23 July) before halting on the Vistula River opposite Warsaw (1 August). He next commanded the 2nd Belorussian Front and conducted an effective cam-

Marshal of the Soviet Union Konstantin Rokossovsky. (Photo by Hulton Archive/Getty Images)

paign in East Prussia and Pomerania in 1945, aiding in the Berlin Campaign.

After the war, Rokossovsky commanded Soviet forces in Poland from 1945 to 1949, and in November 1949, he was appointed commander in chief of the Polish army and minister of defense. He remained in these posts until returning to the Soviet Union in 1956. From 1956 to 1962, he was deputy minister of defense of the Soviet Union, save for a one-year break to command the Transcaucasus Military District between 1957 and 1958. Rokossovsky died in Moscow on 3 August 1968.

Romania, Air Service

The Forțele Aeriene Regale ale României (FARR, Royal Romanian Air Force; also known as Aeronautică Regală Română, Royal Romanian Aeronautics) was still rebuilding when war began. Outnumbered and inadequately equipped, its pilots fought for Pyrrhic victories, and its anti-aircraft ground crews inflicted most of the damage incurred by enemy aircraft. Approximately 500 Romanian flyers died in the war, a proportionally heavy total. The Industria Aeronautică Română (Romanian Aeronautical Industry) works at Brasov produced several serviceable aircraft, notably the IAR-80 and IAR-80A. Based, in part, on the Polish PZL-24, the IAR-80 was among the best European fighters when it entered service in 1939, but it soon lagged behind newer designs.

A reluctant Romania officially joined the Axis powers on 23 November 1940, and German Luftwaffe advisers trained and reorganized the FARR along German lines. Romania participated in Operation BARBAROSSA, the invasion of the Soviet Union, and in the August–October 1941 Odessa Campaign, fighter strength dropped by a fourth as spare parts for older British, French, and Polish aircraft were depleted. Planes of German or Romanian manufacture replaced them. FARR fighters and bombers aided the Romanian army's victories against the Soviets in Bessarabia and at Odessa in 1941, losing 862 men in less than 10 months, including ground-support and anti-aircraft crews. Romanian pilots flew some 4,000 sorties in the Battle of Stalingrad from October 1942 to January 1943. The FARR lost 79 planes, most of them abandoned when airfields were overrun, while destroying 61 Soviet aircraft. Romanian women pilots of the Escadrilla Aviatie Sanitare won Red Cross medals for braving Soviet fighters and intense flak to airlift out casualties during these campaigns.

FARR pilots blunted the Soviet bombing of Romania, but a stronger enemy appeared beginning on 12 June 1942, when, in Operation HALPRO, U.S. bombers made Romania's Ploesti (Ploiesti) oil fields their target. When 178 unescorted American B-24 heavy bombers swept over Ploesti at low level on 1 August 1943 in Operation TIDAL WAVE, FAAR pilots claimed 20 of the 54 raiders shot down and lost just 2 fighters. Defending Romania's oil fields and cities then became the FARR's top priority. After Romania changed sides in September 1944, FARR pilots flew 4,300 missions for the Allies and dropped over 1,000 tons of bombs on its erstwhile Axis partners.

Romania's top-scoring ace of the war was Căpitan Aviator de Rezervă Constantin Cantacuzino, with 43 confirmed and 11 probable victories; FARR's practice of awarding additional points for shooting down bombers raised his total to 69. Despite limitations in both the quality and the quantity of its aircraft, the FARR had been one of the most powerful eastern European air forces. By August 1947, however, Soviet-imposed restrictions reduced its postwar strength to fewer than 75 aircraft.

Romania, Army

Romania provided more troops to the German cause than all other Axis satellites combined, and more than 1.2 million Romanian men served under arms by mid-1944. The Armata Română (Romanian army) fought first for the Axis powers and then for the Allies. Most senior officers were political appointees who relied on outmoded tactics of massed frontal assaults—an approach that was reinforced both by the paucity of modern communications equipment and by the fact that the army was composed primarily of uneducated peasants. Strict boundaries existed between officers and enlisted ranks, and punishments were brutal. Campaigns on foreign soil for dubious benefits diminished morale and efficiency, but the soldiers were tenacious when they believed they were fighting in the interest of Romania instead of for Germany.

The Frontier and Mountain units were the elite troops, composed of experienced professional border guards. The Cavalry Corps also performed with skill and élan. In fact, Romania fielded the largest horse-mounted cavalry contingent in Europe, and half of the 8-million-head national herd was lost in the war.

Equipment was a hodgepodge, much of it of World War I vintage. Some 1,000 Romanian artillery pieces were fitted with barrel sleeves to standardize on 75 mm ammunition. The front-line Romanian infantry was armed with Czechoslovakian ZB30

Romanian forces advance towards the battle front, utilizing German SDKFZ 251 armored personnel carriers, June 1944. (Photo by Keystone/Getty Images)

light machine guns and ZB24 rifles, the Czech version of the German Mauser, and Romania produced many weapons of its own, including the respectable Orita submachine gun. Although the Germans promised modern equipment, they generally delivered only older weapons.

On 2–3 July 1941, following the start of the invasion of the Soviet Union, Romanian and German troops crossed the flooded Prut River to reclaim lands seized from Romania by the Soviet Union the previous year. The Soviet Ninth, Twelfth, and Eighteenth Armies opposed them. In northern Bukovina, elements of Third Army encountered weak opposition, and by 9 July, they secured that province, which had also been seized by the Soviet Union in 1940. To their southeast, the Romanian Fourth Army lost 9,000 men vainly trying to enlarge a bridgehead at Falcui, but it successfully crossed into Bessarabia near Iasy (Jassy) and advanced on the capital of Kishinev (Chisinau to Romanians).

The Soviet II Cavalry Corps, led by tanks, counterattacked savagely in the Cornesti Massif highlands on 10 July, smashing Romania's 35th Reserve Division. Crack troops of the Frontier Division halted the breakthrough, and the 1st Armored Division turned the Soviet flank. By 26 July, Romania again possessed Bessarabia and northern Bukovina, at a cost of 22,000 casualties. Most Romanians believed their war was over.

Instead, the Romanian government dispatched 18 divisions to capture the Soviet Black Sea port of Odessa. The siege of Odessa, from early August to mid-October, cost 70,000 to 100,000 Romanian casualties, but it was the most significant victory ever achieved independently by an Axis satellite. Romanian soldiers fought in the Crimea, the Caucasus, and the southern USSR. The Germans sometimes had to rescue their allies, but on other occasions, Romanians saved German troops, as at the Kuban bridgehead on 7 April 1943.

Romanian engineers helped build the bridge over the Dnieper at Berislav, the longest bridge ever constructed under fire. On 1 September 1942, the Romanian 3rd Mountain Division and the German 46th Infantry Division captured beachheads on the Kerch (Kersch) Peninsula in the largest amphibious assault undertaken by the European Axis powers during the war. Romanian Brigadier General Ion Dumitrache won Germany's Knight's Cross for capturing Nalchik on 2 November 1942, the farthest point of Axis advance in the Caucasus. At least 16 Romanian officers received the Knight's Cross, more than were awarded to any other non-German Axis power. Additionally, 25 soldiers won the Order of Michael the Brave, Romania's highest award for valor.

Performance declined as disgruntled soldiers increasingly believed they were fighting Adolf Hitler's war. They failed to construct adequate defenses at Stalingrad, and the So-

viet armored counteroffensives tore through their lines. Although they then repeatedly blunted the Soviet advance, they lacked the means to halt it. Flaws in the army had become glaringly apparent after Odessa. Its 75 mm artillery and 37 mm antitank guns lacked sufficient range and firepower. The infantry had not been trained to cooperate with the tanks, and it did not have motorized transport to keep up with them. The lack of a mobile reserve remained one of Romania's greatest military deficiencies throughout the war, and supplies and equipment were often carried by horses. Although obsolete Czech R-2 and French R-35 tanks were gradually replaced with upgraded German PzKpfw IIIs and a few PzKpfw IVs, plus captured U.S. Lend-Lease M-3 tanks and Soviet T-60s, virtually all were inadequate against Soviet heavy tanks.

Two-thirds of Romania's field army was lost at Stalingrad. Demoralized replacements, many recruited from prisons, were pushed steadily back toward the Prut. On 23 August 1944, Romania renounced its membership in the Axis pact. Soon, more than a half million Romanian soldiers were fighting against their former allies.

Using outdated tactics and weapons against powerful, modern enemies cost Romania approximately 410,000 casualties, 120,000 of them during the war's final eight months. Another 130,000 troops disappeared into Soviet prison camps, where many died.

Romania, Navy

When Romania began rearmament in the 1930s, Hungary was seen as the nation's most likely opponent in war. Accordingly, Romanian land and air services were built up at the expense of the navy. In 1939, the Marina Regală Română (RRN, Royal Romanian Navy) consisted of 7 destroyers, 3 motor torpedo boats (MTB), 4 escort and patrol craft, 1 minesweeper, 1 submarine, 7 river craft, and 35 merchantmen. Few were of recent construction. Seven Savoia-Marchetti

S-55 single-wing and 11 S-62 biplanes comprised the sea-plane fleet.

Germany and Italy provided additional craft, including submarine hunters and 5 Italian Costiero B-class midget submarines. Romania also built 6 Dutch-designed torpedo boats and assembled 2 German-manufactured U-boats (the *Rechinul* and *Marsuinul*) at Galati during the war. By June 1941, the RRN had 40 military vessels. Its air support had similarly increased.

Opposing the Romanian navy was the Soviet Black Sea Fleet. It boasted 1 battleship, 7 cruisers, 10 destroyers, 84 MTBs, and 47 submarines, plus 626 naval aircraft. Outnumbered, outclassed, and outgunned at sea, Romania fought no major naval battles; most actions involved MTBs escorting convoys. Naval planners opted for a defensive strategy. Romania laid thick minefields around the ports of Sulina and Constanta. In the process, the 406-ton Romanian gunboat *Locotenent Lepri Remus* hit a stray mine and sank on 11 January 1940, the largest RRN ship sunk in the war.

The Sea Division guarded the coastline, supported by coastal artillery and 20 aircraft of the 102nd Sea Plane Flotilla. The Sea Division had 2 destroyers, the *Marasesti* and *Marasti*, built by Italy in 1918 and 1919, respectively, each with a main armament of 4 × 4.7-inch guns. Its gunboats, the *Locotenent-Comandor Stihi Eugen* and *Sublocotenent Ghiculescu*, both of French origin, dated to 1916 and mounted 2 × 3.9-inch main guns each. The Romanian Danube Division consisted of two sections. The River Naval Force had 3 monitors, 2 MTBs, a landing company, an underwater defense group, and a service group. The Tulcea Tactical Group had 2 monitors and 4 MTBs, an underwater defense group, and a supply convoy. The Sulina Naval Detachment protected the Danube Delta, and the Upper Danube Sector guarded the river from Cazane to Portile-de-Fier. Both depended on 7 pre-World War I river monitors and a handful of smaller craft.

On 1 September 1942 on the Kerch (Kersch) Peninsula, RRN and German vessels successfully conducted the largest European Axis amphibious assault of the war. Romania's Dunkerque—the evacuation of German, Romanian, and auxiliary troops from the Crimea during April and May 1944—earned a German Knight's Cross for the commander of the Black Sea Division, Contraamiral (U.S. equiv. rear admiral) Horia Marcellariu. Estimates of the number of soldiers saved in this operation vary from 25,000 to over 118,000.

On the eve of the Soviet invasion of Romania in 1944, the RRN had 54 warships and auxiliaries on the Black Sea. An additional 37 warships and 100 auxiliary craft were on the Danube. On 5 September, all ships were handed over to the Soviets. Most of the Sea Division was bottled up in port, but the river flotilla fought for the USSR until the war's end.

Romania, Role in War

Romania played an important role in World War II. A major producer of both oil and grain, it had the third-largest military establishment of the European Axis powers, and after it switched sides in August 1944, it became the fourth-largest Allied military presence. Romania entered the war for nationalistic reasons—to maintain its independence and reclaim territories lost in 1940.

Following the Balkan Wars and World War I, Romania (also spelled Rumania and, archaically, Roumania) secured territories from Hungary and Russia that united most Romanian peoples into a single country for the first time in centuries, a source of great national pride. In the acquisition of Transylvania from Hungary, it also secured a restive Hungarian population. Hungary was bent on the return of that territory. The Soviet Union also sought the return of Bessarabia. To shore up his southern flank, Adolf Hitler put heavy pressure on Hungary, Romania, and Bulgaria to join the Axis powers. On 29 May 1940, the Romanian government announced its acceptance of Hitler's plan for "a new European order." Bereft of French and British support, it had no alternative. Under the terms of the German-Soviet Non-aggression Pact of 23 August 1939, the Soviet Union had been awarded Bessarabia. In the wake of the defeat of France, Soviet leader Josef Stalin cashed in his remaining chips. Both Germany and Italy pressured Romania to accede to the Soviet demands of 28 June 1940 to give the Soviet Union Bessarabia and also northern Bukovina, which had not been Soviet territory before.

Hungary also secured German and Italian support for the return of territory lost to Romania following World War I. Under terms of the Second Vienna Award of 30 August 1940, dictated by Germany and Italy to stabilize the political situation between Romania and Hungary, Romania ceded to Hungary north-central Transylvania and other Romanian territory north of Oradea. Also under German pressure, Romania ceded to Bulgaria the southern Dobruja in the 7 September 1940 Treaty of Craiova, thereby restoring the pre-World War

I boundary between those two states. Almost overnight, Romania had lost half of its territory and population, greatly reducing its ability to defend itself.

Romania's King Carol II never had popular support. Married to a Greek princess, he flaunted his longtime love affair with his mistress, Elena "Magda" Lupescu. His government was further destabilized by frequent cabinet turnovers and widespread corruption. National outrage over the loss of Romanian territories to the Soviet Union, Hungary, and Bulgaria allowed the pro-Fascist, anti-Semitic Iron Guard to force Carol's abdication on 6 September 1940. He fled Bucharest with his mistress and nine train cars loaded with royal booty.

Carol's 19-year old son, Michael (Mihai), replaced him but was an impotent figurehead. Real power rested in the recently appointed prime minister and World War I military hero General Ion Antonescu, who proclaimed himself *conductător* (leader). Intensely nationalistic, Antonescu managed to maintain significant independence within the Nazi sphere. In October 1940, the first of 500,000 German "advisers" arrived in Romania, ostensibly to protect Ploesti (Ploiesti), the site of Europe's second-largest oil fields. Romania proved an important source of natural (nonsynthetic) oil for Germany; it also supplied virtually all of Fascist Italy's oil during the war.

On 23 November, Romania officially joined the Axis powers. Antonescu declined to participate in the subjugation of Yugoslavia in April 1941, but he readily assisted with the invasion of the Soviet Union in order to reclaim Romania's lost territories to the east. When the invasion began on 22 June 1941, he called for a "holy war" against Bolshevism. On 2–3 July, Army Group Antonescu, composed of Romanian and German troops, crossed the Prut River. By midmonth, Romania again owned Bessarabia and northern Bukovina. Most Romanians, including frontline troops, believed their war was over.

It was not to be. Antonescu agreed to send Romanian troops to capture the Soviet Black Sea port of Odessa. In return, Hitler granted Romania all the territory between Bessarabia and the Black Sea, including Odessa, the "Russian Marseille." After taking Odessa at horrendous cost, increasingly demoralized Romanian soldiers fought in the Crimea, the Caucasus, and the southern USSR; their country furnished more troops to the war against the Soviet Union than all other German satellites combined. Antonescu vainly hoped this effort would be rewarded with the return of Transylvania, since Hungary provided far less support for Hitler's war. On 12 June 1942, American bombers based in North Africa struck Ploesti. Over the next two years, no single raid did exceptional damage, but the cumulative effect significantly diminished the flow of oil to Germany.

The wartime anti-Semitic government sanctioned the killing of Jews. More than 40,000 Soviet Jews reportedly were

Marshal Ion Antonescu of Romania meets with German Führer Adolf Hitler in November 1940 to sign the Tripartite Pact, which allied Romania with Germany, Japan, and Italy. Antonescu, backed by the Germans, was the fascist dictator of what was left of Romania until being deposed in 1944. (Corbis)

killed near Odessa alone, yet about half of Romania's Jews survived the war. Antonescu protected many to utilize their experience in industrial and economic management. Additionally, a long-standing tradition of corruption among Romanian officials made buying fake identity papers and passports relatively simple.

Throughout 1942, Antonescu was under considerable pressure from other Romanian political leaders to withdraw the nation's troops from the Soviet Union, but he refused to do so. He pointed out that the army was more than 900 miles deep inside Soviet territory and that the Germans controlled the lines of communication and would surely wreak vengeance on Romania and occupy the country. As the military situation deteriorated in 1943 following the Soviet victory in the Battle of Stalingrad, Antonescu authorized peace feelers, but these foundered on the Anglo-American insistence on unconditional surrender. On 23 August 1944, with Soviet forces having crossed the eastern border, young King Michael ordered the arrest of Antonescu and announced that Romania was withdrawing from the Axis alliance. Even Romanians were caught by surprise.

Antonescu was later tried by the Soviets and was executed in June 1945.

Romania turned on its former allies in hopes of securing *cobelligerent* status, as Italy had been accorded, and maintaining its independence after the war. But such hopes proved illusory. On 9 October 1944, British Prime Minister Winston L. S. Churchill and Soviet Premier Josef Stalin agreed that the USSR would have 90 percent "predominance" in postwar Romania.

In February 1945, surrounded by Soviet tanks, King Michael had little choice but to create an essentially Communist government. That government forced him to abdicate in December 1947, although Stalin and U.S. President Harry S. Truman both decorated him for personal courage in overthrowing Antonescu. Trapped between major powers, Romania had tried to hold on to its land, people, and independence by allying itself first with one side and then with the other. Instead, it became a Communist puppet state. Of all its lost territories, only Transylvania was returned to Romania after the war.

Romania Campaign (August–September 1944)

With 1.2 million men under arms in 1944, Romania was the third-largest Axis military force in Europe. An impending Soviet invasion led to the overthrow of Romania's Fascist government, but the restored monarchy was soon replaced by a Communist state.

By mid-August 1944, Romania's battered troops held the Traian defensive line from the headwaters of the Sereth to the Dniester. Fourth Army guarded the northern approaches to Bessarabia, and Third Army defended the lower Dniester. On 20 August, a 10-hour artillery barrage from 11,000 Soviet guns opened the Battle of Iasy-Kishinev (Jassy-Chisinau). The Romanian 5th Infantry Division, pulverized by the bombardment, was quickly finished off by the Soviet Twenty-Seventh Army. Soviet tanks of the Fifty-Second Army annihilated the Romanian 7th Infantry Division and took Iasy. Romanian aircraft flew 161 sorties as ground troops counterattacked in futile efforts to stem the tide. Meanwhile, the German 20th Panzer Division fled, taking with it every Romanian tank it could locate.

On 20 August, waves of Soviet planes broke through heavy anti-aircraft defenses protecting Romania's harbor at Constanta, sinking the torpedo boat *Naluca* and damaging three other ships, including the destroyer *Marasesti*. Romania capitulated three days later, and by 5 September, the entire

Romanian fleet was in Soviet hands. In an attempt to maintain Romania's independence, its figurehead monarch, young King Michael (Mihai)—aided by several army officers and armed, Communist-led civilians—had staged a coup on 23 August, arresting the premier, General Ion Antonescu. That same night, Michael announced by radio that Romania was withdrawing from the Axis alliance.

German troops then tried to restore control by seizing the capital of Bucharest, but they were repulsed by the Royal Bodyguard supported by an armored platoon. Ninth Army enveloped the remaining Germans outside Bucharest on 27 August, taking 7,000 prisoners. An outraged Adolf Hitler ordered his top commando, Otto Skorzeny, to lead a parachute battalion in a rescue of Antonescu. The plan was foiled when Antonescu was handed over to the Red Army and hurriedly spirited off to Moscow. Twenty thousand Germans fought to hold the Ploesti (Ploiesti) oil fields, but Soviet armor and Romania's 4th Parachute Battalion secured the area. Romanian pilots also shot down 24 German planes.

The Red Army entered Bucharest on 31 August. On 12 September, Michael signed a formal armistice in which he agreed to wage war on Germany and Hungary, to repeal anti-Jewish laws, to ban Fascist groups, and to pay \$300 million in goods and raw materials to the Soviet Union. Moscow calculated those goods at reduced 1938 prices, making the actual reparations closer to \$2 billion.

On 28 August, Romania's 1st Armored Division fought its way through the Ghimes Pass, eliminated a German penetration, and seized a bridgehead for the Soviet XXIV Guards Corps near Reghin (Szászrégen). Romanian troops then blocked a Hungarian attempt to seize the Carpathian passes on 7 September. A few days later, First Army helped stop a German-Hungarian thrust out of Yugoslavia, but on 26 October, the Soviets reduced the size of the Romanian army and ordered most of its divisions to be kept at the front outside the country, clearing the way for a Communist takeover.

Soviet troops with captured prisoners, Romania, August 1944. (Yevgeny Khaldei/Corbis)

Rome, Advance on and Capture of (May–June 1944)

The Allies had launched their invasion of Italy in September 1943 with high hopes for the speedy capture of Rome. These hopes were quickly dashed by Italy's poorly handled switch from the Axis side, fierce German resistance, harsh mountainous terrain, and terrible weather. A renewed offensive in January 1944 to breach the Gustav Line by the British Eighth Army under Lieutenant General Oliver Leese and the U.S. Fifth Army under Lieutenant General Mark Clark, accompanied by a simultaneous amphibious landing at Anzio by the U.S. VI Corps, also met with stubborn resistance from Field Marshal Albert Kesselring's German Tenth Army, especially at the Benedictine abbey at Monte Cassino.

After three failed attempts to break through and the near annihilation of the Anzio landing, the last opportunity for a decisive victory in Italy was embodied in Operation DIADEM. On the Gustav Line, 16 Allied divisions faced 6 weakened German divisions. At Anzio, 6 Allied divisions faced 5 German ones with 4 more in reserve, and the Allies were supported by

more than 2,000 guns and overwhelming air superiority. For the first time, the Allied forces were used as a combined army group, rather than discrete corps, with the aim of destroying the German army south of Rome. The plan entailed Eighth Army striking the main effort at Cassino and thrusting through the Liri Valley, supported by Fifth Army, including the French Expeditionary Corps (CEF), attacking across the Garigliano and the Anzio bridgehead to join with the other Allied forces.

The offensive opened on 11 May 1944 with a massive air and artillery bombardment, but initially, the Allies failed to make any headway. The CEF, which lay between the two fronts, was able to fight its way into the mountainous country behind the Garigliano, enabling the U.S. II Corps to push up the coastal road. In a set-piece attack, XIII Corps ruptured the German line, culminated by the extraordinary efforts of the II Polish Corps, which eventually captured Monte Cassino on 18 May, and the French Moroccan Goums, who crossed the mountains to pierce the Hitler Line, in front of Rome, from the rear before it could be properly manned. Moreover, Kesselring, who had been duped into expecting another amphibious landing farther north, was slow to send reinforcements southward to the Liri Valley.

Italians watch Allied tanks move through the streets, following the liberation of Rome, 12 June 1944. (Photo by R. Gates/Hulton Archive/Getty Images)

General Harold Alexander, commander of 15th Army Group, was alerted to German movements through ULTRA intelligence, and when victory seemed complete, he ordered the Anzio breakout on 23 May. Alexander planned for the U.S. VI Corps to strike directly at Valmontone and cut Route 6, the main inland road, and thus trap the German Tenth Army holding the Gustav Line. Rome would thus be ripe for the taking, but more important, the Germans would be unable to form further organized defenses, enabling the rapid occupation of Italy up to the Alps.

Fifth Army linked up with VI Corps on 25 May, but General Clark, perhaps the most egocentric Allied commander in the war, was enticed by the glory of capturing Rome. He was determined that Americans should be the first to enter the city and that this should be accomplished before the Allied landings in France dominated the headlines. He swung his drive directly to Rome, leaving a gap between the Allied

armies through which the Germans escaped. Clark triumphantly entered Rome on 4 June, but the spectacle of the first capture of an Axis capital was eclipsed by the Allied invasion of France two days later. Clark's impetuous failure enabled Kesselring to withdraw to the Gothic Line, but thereafter, the campaign in Italy assumed a secondary status to the campaign in France.

Rommel, Erwin Johannes Eugen (1891–1944)

German army general and commander of the Afrika Korps (Africa Corps). Born in Heidenheim, Württemberg, Germany, on 15 November 1891, Erwin Johannes Eugen Rommel joined the German army in 1910 with the 124th (6th Württemberg) Infantry Regiment as an officer cadet. He then attended the officers' training school at Danzig (present-day Gdansk, Poland) and was commissioned in January 1912.

During World War I, Rommel was wounded while fighting in France in September 1914. On his recovery, he won renown in service on the Italian and Romanian fronts. He fought at Mount Cosna and at Caporetto. In the latter battle,

he and his men took 9,000 Italian troops as prisoners and captured 81 guns. Promoted to captain, he was also awarded the Pour le Mérite.

Rommel remained in the Reichswehr after the war and took charge of security at Friedrichshaven in 1919. In January 1921, he was posted to Stuttgart, where he commanded an infantry regiment, and then he was assigned to Dresden in 1929, where he was an instructor at the Infantry School until 1933. There, he wrote *Infantry Attacks*, a textbook on infantry tactics. In 1935, Rommel received command of a battalion of the 17th Infantry Regiment. He taught briefly at the War Academy (in 1938) and then had charge of Adolf Hitler's army security detachment.

In 1940, Rommel assumed command of the 7th Panzer Division and led it in spectacular fashion in the invasion of France. Promoted to Generalleutnant (U.S. equiv. major general) in February 1941, he received command of German forces in Libya (the Afrika Korps). An aggressive, bold commander who led from the front, he employed daring attacks and was tenacious in battle. His skill as a field commander earned him the sobriquet "Desert Fox." Promoted to General

General Erwin Rommel with the 15th Panzer Division between Tobruk and Sidi Omar, 1941. (National Archives)

der Panzertruppen (U.S. equiv. lieutenant general) in July 1941 and colonel general in January 1942, he was elevated to field marshal in June 1942.

Denied sufficient resources to achieve victory, Rommel was defeated in the October 1942 Battle of El Alamein, but he conducted a skillful withdrawal west into Tunisia. After returning to Germany for reasons of health and recuperating, he was assigned as commander of Army Group B with responsibility for northern Italy. In November 1943, he became inspector general of coastal defense in France and worked to strengthen the so-called Atlantic Wall.

On 1 January 1944, Rommel became head of Army Group B in France, subordinate to the German commander in chief, West Field Marshal Karl Rudolf Gerd von Rundstedt. Based on his experiences in North Africa, Rommel believed that if an Allied invasion was to be stopped, it would have to be at the beaches. Rundstedt and Hitler, however, envisioned a cordon on the shoreline and large, mobile German forces inland that would destroy the Allies once they landed. Rommel correctly believed that Allied air and naval supremacy would render that outcome impossible.

Rommel did what he could to improve the coastal defense against an Allied invasion. When the invasion occurred, he was in Germany trying to secure two more panzer divisions and additional artillery. In meetings with Hitler, he went so far as to ask the German dictator why he thought the war could still be won. On 17 July 1944, he was badly wounded in an air attack by three Royal Air Force (RAF) fighters that caught his staff car on the road.

Rommel, not a fanatic Nazi, grew despondent over Hitler's estrangement from reality but failed in his efforts to convince the German leader that the war was lost. When he was approached about participating in a plot to overthrow the Führer, he refused to join in, but he also failed to inform the authorities. In the aftermath of the unsuccessful attempt on Hitler's life, he was given the choice of a trial for treason or suicide. He chose the latter. Rommel died on 14 October 1944, near Ulm, and was accorded a full military funeral.

Romulo, Carlos Peña (1899–1985)

Philippine journalist and nationalist who worked with General Douglas MacArthur during the war years. Born in Manila on 14 January 1899, Carlos Romulo graduated from Columbia University in New York City in 1921. A brilliant, articulate reporter, he rose to be editor in chief of the Philippine DMHM chain of newspapers. He also became a leading citizen of Manila and an unfailing supporter of Philippine President Manuel Quezon. He championed Filipino autonomy and freedom, and in 1941, he won a Pulitzer Prize for newspaper articles that warned of the Japanese threat. He stated that the peoples of Southeast Asia, other than the Filipinos, would not fight the Japanese; in fact, he said, they would welcome them.

Following the U.S. entry into World War II, General MacArthur placed the then mobilized Major Romulo in charge of the Philippine press and radio. In this capacity, Romulo issued press releases and helped editors select headlines that would simultaneously soothe and inform Filipinos, and he established a radio station on Corregidor called the Voice of Freedom. He defined the war not as a fight for America but a fight with America for freedom.

MacArthur sent Romulo to the United States to tell the Philippine story. There, Romulo spoke to factory workers and to Congress, bringing the story of the Philippine resisters to life for his American audience. He told them of the small bands of poorly armed Filipino guerrillas who were keeping the faith with the United States. Romulo, who was promoted to colonel in August 1942, embodied Filipino resistance and loyalty. One month after becoming a brigadier general in September 1944, he landed with MacArthur on Leyte. His stay in the Philippines was short, however, for he was ordered back to Washington, D.C., to tell Congress about MacArthur's return to Leyte and about Filipino loyalty to the United States.

In April 1945, Romulo went to San Francisco as chairman of the Filipino delegation to the United Nations. There, he became an impassioned champion of the small nations of Asia, especially those still striving for independence. He remained in the United States for 17 years. Between 1945 and 1954, he was the Philippine ambassador to the United Nations, and he was also ambassador to the United States from 1952 to 1953 and again from 1955 to 1962. Romulo was elected president of the Fourth General Assembly of the United Nations in 1949. He served as president of the Uni-

versity of the Philippines from 1962 to 1968 and was his country's foreign minister from 1950 to 1952 and from 1968 to 1984. He also wrote numerous books. Romulo died in Manila on 15 December 1985.

Roosevelt, Anna Eleanor (1884–1962)

U.S. first lady from 1933 to 1945 and statesperson before, during, and after World War II. Born on 11 October 1884 in New York City, a niece of U.S. President Theodore Roosevelt, Eleanor Roosevelt was orphaned at 10 and was raised by her maternal grandmother. Privately educated until age 15, she later studied at Allenswood, a British school. She taught at the Rivington Street Settlement House and later at Todhunter School, both in New York. In 1905, she married her fifth cousin, Franklin D. Roosevelt. They had six children.

After nursing her husband through poliomyelitis in 1921, Eleanor encouraged Franklin to continue his political career. When he was elected governor of New York, she made suggestions for female appointees. An indefatigable volunteer, she was

Eleanor Roosevelt, wife of President Franklin D. Roosevelt, accompanied by Dillon S. Meyer, director of the War Relocation Authority, at the Gila River Relocation Center, Rivers, Arizona, 23 April 1943. (Bettmann/Corbis)

active in many organizations, including the League of Women Voters and the Democratic National Committee. The political environment of the late 1920s and 1930s constantly encouraged her to question gender, racial, and social inequality.

Once Franklin became president in 1933, Eleanor traveled extensively representing the White House. She tirelessly championed the cause of the underprivileged, children, women, and minorities. Her interventions led to a number of social improvements. An inexhaustible writer, she authored several books and articles, including the syndicated column "My Day." In 1940, she also developed the United States Committee for the Care of European Children.

During World War II, Eleanor visited Allied troops worldwide, and her steadfastness brought a level of comfort to many. Throughout the war, numerous social agencies sought her advice and intervention. After the president's death in April 1945, she remained politically active and continued her battle for human rights, especially for war refugees. In response to her universal recognition of human rights, President Harry S. Truman appointed her to the U.S. delegation to the UN General Assembly, a position she held from 1945 to 1953. She also served as chairman of the Human Rights Commission and was instrumental in the passage of the Declaration of Human Rights. Additionally, she was actively involved with the Peace Corps under President John F. Kennedy. Eleanor Roosevelt died in New York City on 7 November 1962.

County, New York, Franklin Delano Roosevelt was educated at home until age 14. He then attended Groton Preparatory School, Harvard University, and Columbia University Law School. In 1905, Roosevelt married his distant cousin Eleanor Roosevelt, President Theodore Roosevelt's niece.

After passing the bar examination, Roosevelt joined the law firm of Carter, Ledyard and Milburn. In 1910, he won a seat in the New York Senate, where he served two terms and was a strong advocate of progressive reform. In 1913, he was appointed assistant secretary of the navy, and he worked diligently and effectively in that post. A strong advocate of intervention of the Allied side and military preparedness, he helped prepare the navy for its role in World War I.

In 1920, Roosevelt ran unsuccessfully as the vice presidential candidate of the Democratic Party on the ticket headed by James M. Cox. During the campaign, he advocated U.S. entry into the League of Nations. In 1921, Roosevelt was stricken with polio. Although his suffering was acute and left him permanently disabled, he remained intensely interested in politics. In 1924, he attended the Democratic Convention and nominated Alfred E. Smith, governor of New York, for president. Four years later, Roosevelt was elected governor of New York. His efforts in seeking relief for suffering New Yorkers following the stock market crash in 1929 led to his reelection in 1930.

In November 1932, Roosevelt was elected president of the United States on the Democratic ticket, triumphing over incumbent President Herbert Hoover. He promised the American people a "New Deal," and he told Americans that "the only thing we have to fear is fear itself." He also began regular radio broadcasts to the American people, the first U.S. president to do so. Known as "fireside chats," these addresses were designed to restore morale. Legislative products of his first hundred days in office included banking reform, the Agricultural Adjustment Act (AAA), and the National Industrial Recovery Act (NIRA). Congress allocated more than \$3 billion under the NIRA for the Public Works Administration (PWA). The National Recovery Administration (NRA) set minimum wages and limited hours for employees. The Federal Emergency Relief Administration provided funds to relief agencies run by the state, and the new Civilian Conservation Corps (CCC) employed thousands of men to replant forests and work on flood-control projects. During this time, Roosevelt also established the Securities and Exchange Commission (SEC) to oversee stock trading.

In the second phase of the New Deal, the Works Progress Administration (WPA) was established, extending employment to more than 2 million workers to construct bridges, roads, and buildings. Another measure, the Social Security Act, provided disability insurance as well as pensions for the aged. The American people welcomed Roosevelt's programs, and in 1936, they overwhelmingly reelected him to office.

Roosevelt, Franklin D. (1882–1945)

U.S. politician and president from 1933 to 1945. Born on 30 January 1882 at his family's Hyde Park estate in Dutchess

President Franklin D. Roosevelt signing the declaration of war against Japan, 8 December 1941. (National Archives)

With the beginning of World War II in Europe in September 1939, Roosevelt increasingly turned his attention to foreign affairs and military preparedness. On 8 September 1939, he proclaimed a limited national emergency, which allowed expansion of the army from 135,000 men to 227,000. Believing that the security of the United States demanded the defeat of the Axis powers and sensing that Adolf Hitler was a mortal threat to the world, Roosevelt gradually moved the United States from its isolationist stance. Later in September, he called on Congress to amend the Neutrality Act, which it did the next month, allowing the Allies to purchase arms in the United States on a cash-and-carry basis. Following the defeat of France in 1940, Roosevelt pledged to support Britain in every manner short of declaring war. In September, he concluded an agreement with Britain whereby that country would receive 50 World War I–vintage destroyers in return for granting the United States rights to bases located in British territory in the Western Hemisphere. He also initiated a major rearmament program in the United States and secured passage of the Selective Service Act, the first peacetime draft in the nation's history.

Known as “fireside chats,” Roosevelt held regular radio addresses to restore morale during the Great Depression.

By early 1941, Roosevelt and British Prime Minister Winston L. S. Churchill were coordinating their nations' policies toward the Axis powers. In the spring of 1941, Roosevelt ordered U.S. destroyers to provide protection as far as Iceland for the North Atlantic convoys bound for Britain. In March 1941, on his urging, Congress passed the Lend-Lease Act that extended U.S. aid to countries fighting the Axis powers.

Roosevelt also began pressuring Japan to leave China, which the Japanese had invaded in 1937. When Japanese troops occupied southern Indochina in the spring of 1941, he embargoed scrap metal and oil shipments to Japan. Roosevelt also ordered the Pacific Fleet from San Diego to Honolulu, Hawaii, in order to intimidate Japan, but the embargo caused Japanese leaders to opt for war with the United States. On 7 December 1941, Japanese aircraft attacked the U.S. Pacific Fleet at Pearl Harbor, Hawaii. The following day, Roosevelt called for a declaration of war on Japan, referring to the Japanese attack as “a day that will live in infamy.” No solid evidence exists to substantiate persistent allegations that the president set up the fleet at Pearl Harbor in order to bring about the U.S. entry in the war.

From 1941 to 1945, Roosevelt skillfully guided the United States through the war and worked to ensure a secure post-war world. During the course of the war, the United States fielded not only a navy larger than all the other navies of the

world combined but also the largest air force and the most mobile, most heavily mechanized, and best-armed army in world history. It also provided the machines of war, raw materials, and food that enabled other nations to continue fighting the Axis powers. In these circumstances, full economic recovery occurred in the United States.

In 1944, Roosevelt ran successfully for an unprecedented fourth presidential term against Republican candidate Thomas Dewey. In February 1945, he met Churchill and Soviet dictator Josef Stalin at Yalta in the Crimea. The Yalta Conference built on decisions already reached at the prior Tehran Conference and was an effort to secure a stable post-war world. Roosevelt gambled that, with his considerable charm, he could convince Stalin that he had nothing to fear from the United States and that Britain, the Soviet Union, China, and the United States could cooperate to secure a peaceful postwar world. Although accused of making unnecessary concessions to the Soviet Union at Yalta, Roosevelt really had little choice but to do so, as the Red Army already occupied much of eastern Europe and the U.S. military wished to induce the Soviets to enter the war against Japan.

At Yalta, Roosevelt was already ill, and shortly afterward, he sought rest at his summer home in Warm Springs, Georgia. He died there of a massive cerebral hemorrhage on 12 April 1945. Vice President Harry S. Truman succeeded him as president. Franklin Roosevelt, one of the best-loved presidents in U.S. history, had successfully led the nation through two of its greatest trials—the Great Depression and World War II.

Rosenberg, Alfred (1893–1946)

German National Socialist Party publicist and leading Nazi racial theorist and “philosopher” of National Socialism. Born in Reval, Russia (today’s Tallinn, Estonia), on 12 January 1893, Alfred Rosenberg came from a family that spoke German but may have been of Estonian extraction. He studied architecture at Riga Technical University, which moved to Moscow with the approach of German forces in World War I. He graduated in Moscow in 1918 and witnessed the early days of the Bolshevik Revolution. He soon emigrated to Paris, and at the end of the year, he settled in Munich. There, he joined the German Worker’s Party, which became the National Socialist Party. Rosenberg became a German citizen in 1920 and gradually assumed the position of the party’s chief ideologist. In 1923, he was the sole editor of the party daily, the *Völkischer Beobachter* (National Observer). He participated in the unsuccessful November 1923 Beer Hall Putsch and was Adolf Hitler’s personal choice to serve as interim party leader while Hitler was in prison.

Rosenberg headed the new National Socialist Society for Culture and Learning (the Militant League for German Culture) from 1929 and was elected to the Reichstag (the national parliament) as a Nazi Party deputy from Hesse-Darmstadt in 1930. In that year, he also published his major work, *The Myth of the Twentieth Century*, which became the most popular party work after Hitler’s *Mein Kampf*. A turgid, racial, pseudoscientific study, it claimed that the Germans represented a pure Nordic race destined to rule Europe. It also attacked Jews, Free Masons, the Catholic Church, and others.

Rosenberg held numerous party posts. After Hitler rose to power, he headed the foreign policy office of the National Socialist Party and was made Hitler’s deputy for supervising the spiritual and ideological training of the Nazi Party. In January 1940, he was tasked with founding the so-called High School, which was to evolve into the postwar Central National Socialist University. One of the institutes within the High School was the Institute for Research of the Jewish Question, the libraries of which were filled with looted Jewish art. The Einsatzstab Rosenberg (Special Staff Rosenberg) and Rosenberg’s special “furniture action” confiscated art, furniture, rugs, and even appliances from the homes of Jews and Free Masons.

The peak of Rosenberg’s career came in 1941 when he was designated Reichsminister for the Occupied Eastern Territories. In this position, he opposed genocide of the Jews and

German National Socialist racial theorist Alfred Rosenberg, shown here in September 1937. (Bettmann/Corbis)

expulsion of populations, believing it made more sense to utilize their support against the Soviet Union. Despite his party positions, Rosenberg never achieved the influence or recognition he believed he merited. He was disappointed when Joachim von Ribbentrop became foreign minister in 1938 and was upset with the August 1939 German-Soviet Non-aggression Pact, which he believed sacrificed ideology to political motives. He was an inept administrator: Joseph Goebbels referred to Rosenberg as “a monarch with neither country nor subjects” and spoke of his “ministry of chaos.”

Frustrated by his lack of influence, Rosenberg attempted to resign in October 1944, but Hitler never answered his letter. Arrested at the end of the war, he at last achieved the notoriety to which he believed he was entitled when he was tried among the principal Nazi leaders at the Nuremberg proceedings. He remained unrepentant in his support of Hitler and a true believer in National Socialism, but he argued that some of Hitler’s intentions had been subverted by more devious and bloodthirsty officials. Convicted on all four counts of war crimes, he was hanged at Nuremberg on 16 October 1946. His body was cremated and his ashes scattered in the Isar River.

Rostov, Battle for (17–30 November 1941)

Important Eastern Front battle in 1941. On clearing the Ukraine, German Field Marshal Karl Gerd von Rundstedt's Army Group South continued its advance east and south. Barring its way was the Soviet city of Rostov on the Sea of Azov at the mouth of the Don River. Rostov was the gateway to the Caucasus Mountains, the Soviet oil fields to the south, and the road to Persia, through which Britain and the United States were to supply the Red Army.

Between 29 September and 13 October 1941, Rundstedt's armies overran the coal- and iron-rich Donets Basin region, where 20 percent of Soviet steel was produced. They also forced the Mius River and captured Taganrog on the Sea of Azov. Meanwhile, General Friedrich Paulus's Sixth Army captured Kharkov on 24 October. Rain and mud slowed the German movement, however. The Soviets were then able to evacuate Rostelmash, a large agricultural machinery plant at Rostov, despite German bombing.

To counter the German advance, the Soviet Southern Front (army group) under Commander Marshal Semen Timoshenko had recently been reinforced, and Timoshenko had at his disposal the Thirty-Seventh Army and the Fifty-Sixth Independent Army. On 9 November, he submitted a plan to Stavka (the Soviet High Command) for an attack against the concentration of German forces in the Rostov area to take place on 17 November. Josef Stalin approved the plan but refused to reinforce Timoshenko.

On 17 November, Timoshenko's forces struck Rundstedt's spearhead, Colonel General Ewald von Kleist's First Panzer Army, some 40 miles north of Rostov. Timoshenko had hoped to create a diversion and draw the Germans away from Rostov, but this effort failed, and Colonel General Eber-

hard von Mackensen's III Panzer Corps drove on Rostov, entering the city's northern suburbs on 19 November. On 21 November, the 1st SS Panzer Division captured Rostov. But a gap had opened between the German forces. Realizing that he was overextended, Kleist withdrew from Rostov on 22 November, only to see his order to construct positions behind the Mius River, 45 miles west, countermanded by Commander of the German Army Field Marshal Walther von Brauchitsch, who insisted that Rostov be held.

On 28 November, Colonel General Yakov T. Cherevichenko's Southern Front forces composed of 21 divisions of the Thirty-Seventh and Ninth Armies drove into the rear of III Panzer Corps, which was exhausted and seriously short of supplies, manpower, and equipment. Later that same day, Kleist ordered that Mackensen give up the city. The Soviets then succeeded at getting a bridgehead across the iced-over Don on the southern outskirts of Rostov. Night crossings reinforced the Soviet bridgehead, despite German opposition. By 29 November, Soviet units had cleared Rostov, which was heavily damaged and burning as a result of German demolitions.

On 30 November, Kleist again ordered a withdrawal behind the Mius River, but this move was more than Adolf Hitler would tolerate, and he ordered Brauchitsch to have Rundstedt countermand the order. Rundstedt refused and offered his resignation. On 1 December, Hitler replaced him with Field Marshal Walther von Reichenau, who was unable to influence events. The withdrawal, certainly the correct decision in the circumstances, was completed that night.

The battle marked the first serious setback for the Germans since the start of Operation BARBAROSSA. It also began the departure of all four of the German army's top commanders. In December, both Brauchitsch and Army Group Center commander Field Marshal Fedor von Bock also resigned, and the commander of Army Group North, Field Marshal Wilhelm von Leeb, followed suit in January. Hitler did not replace Brauchitsch, choosing to take command of the German army himself.

Rote Kappelle

German Resistance organization. A group of loosely affiliated intellectuals and civil servants united only by their opposition to Nazism, the Rote Kappelle (Red Orchestra) became a Soviet espionage tool. Many of the members, such as Adam Kuckhoff, were longtime Communists or Communist sympathizers. Some, such as Arvid Harnack and his American wife, Mildred Fish, had previously been Soviet agents. Others, such as Harro Schulze-Boysen, merely opposed Nazism.

Schulze-Boysen's opposition to the Nazis dated from late 1932, and he was sent to a concentration camp in April 1933. Influential family contacts not only arranged his release but also secured him a position on the intelligence staff in the Air Force Ministry. In 1936, Schulze-Boysen passed information about Luftwaffe activities in Spain to the Soviet Embassy. Though the intermediary was arrested, the Gestapo found no evidence of the spy ring Schulze-Boysen had created, and the group resumed copying and disseminating anti-Nazi leaflets in Germany. The group dissolved in 1938.

Harnack, who had spied for the Soviet Union from his post in the Economics Ministry since August 1935, broke contact during the Great Purges. In September 1940, however, he sent a message warning that an attack on the Soviet Union was imminent, and he established a network of some 60 agents. Harnack had also been in touch with U.S. intelligence since 1938. He insisted that resistance to Adolf Hitler had to take priority over ideology. His contacts included not only industrial leaders but also several military and political figures later involved in the July 1944 bomb plot against Hitler. In early 1941, Harnack persuaded Schulze-Boysen to cooperate in passing information to the USSR. Schulze-Boysen was then employed on the Luftwaffe operational staff engaged in planning Operation BARBAROSSA, the German attack on the Soviet Union. This recruitment completed the organizational triad that became the Red Orchestra.

Each man headed a separate network. Kuckhoff, an author, wrote pamphlets and served as liaison for the three groups. Most information gleaned concerned the impending attack on the Soviet Union. But as with the numerous other warnings that reached Soviet dictator Josef Stalin, this vital intelligence was ignored.

Operation BARBAROSSA forced the group to rely on wireless transmissions. None of the members had been properly trained in wireless techniques, however, so Moscow sent an agent to rectify the situation. The German Sicherheitsdienst (SD, Security Service) intercepted his orders, and in June 1942, it broke the group's code. The Schulze-Boysen group, as it was also known, continued to send reports and also wrote and distributed anti-Nazi pamphlets. In August 1942, when it became

apparent that Schulze-Boysen knew the codes were compromised, the SD arrested 119 persons connected with the Red Orchestra. Fifty-five of them, including Mildred Fish-Harnack and 18 other women, were executed for their activities.

Although the Red Orchestra had little immediate impact, it did prove that opposition to Hitler had existed in Germany. Fish-Harnack, though little known in the United States, became a heroine in the Communist pantheon, and the Red Orchestra was a staple in the founding myth of the German Democratic Republic.

Rotmistrov, Pavel Aleksevich (1901–1982)

Soviet army marshal and commander of Fifth Guards Tank Army. Born at Skovorovo in the Kalinin Oblast, Russia, on 6 July 1901, Pavel Rotmistrov was too young to participate in World War I. He joined the Red Army in 1919, fought in the Russian Civil War, and graduated from the Frunze Military Academy in 1931. Promoted to major general in June 1940, Rotmistrov was chief of staff of III Motorized Corps in the Baltic Military District when the German army invaded the Soviet Union in June 1941. In September 1941, he took command of VII Tank Corps, attached to the Northwest Front, and participated in the defense of Moscow in October.

Rotmistrov was then transferred with his corps to the Leningrad area. As a result of its exemplary performance there, VII Tank Corps was renamed the III Guards Corps in January 1942. Promoted to lieutenant general, Rotmistrov commanded a tank corps in the Battle of Stalingrad, and in December 1942, he halted German Generalmajor (U.S. equiv. brigadier general) Erhard Raus's attempt to reach the trapped German Sixth Army. In the subsequent Soviet counteroffensive, Rotmistrov had charge of a mechanized group that outfought German General Hermann Hoth's Fourth Panzer Army.

In February 1943, Rotmistrov assumed command of the newly formed Fifth Guards Tank Army. When Stavka (the Soviet High Command) assembled a strategic reserve in April

1943, Marshal Ivan Konev's Steppe Military Front (army group), Rotmistrov's army was included. Thereafter, Stavka would utilize this force in crisis situations or as needed in preparation for Soviet offensives. Rotmistrov was a keen student of armored warfare tactics, and he also took on the responsibility of training all armored forces of this reserve.

Rotmistrov's Fifth Guards Tank Army was part of Marshal Nikolai Vatutin's Voronezh Front. He then took part in the largest tank battle of the war, at Prokhorovka near Kursk. From 10 to 12 July, Rotmistrov's 850 tanks successfully held off attacks by German Lieutenant General Paul Hausser's II SS Panzer Corps of three divisions. Although many of his own tanks were outgunned by German armor with 88 mm guns, Konev was able to offset this disadvantage by ordering that his crews close as far as possible before engaging the Germans.

In August 1943, Fifth Guards Tank Army was redeployed to Marshal Konev's 2nd Ukrainian Front to take part in the Belgorod-Kharkov operation. Rotmistrov was promoted to colonel general in October 1943. Then, at the beginning of 1944, the Fifth Guards Tank Army was transferred to the Soviet 2nd Belorussian Front, where it participated in the Kirovograd (8 January), Korsun-Shevchenkivskyi (24 January–17 February), and Uman (5 March) operations.

In February 1944, Rotmistrov was promoted to the newly created rank of marshal of armored forces. Stavka placed his army at the disposal of Marshal Ivan Chernyakhovskiy's 3rd Belorussian Front to take part in Operation BAGRATION. So vital was Rotmistrov to the successful outcome of this Soviet plan to destroy German Army Group Center that Josef Stalin personally urged Lazar Kaganovich, head of railways, and General of the Army Andrei Vasilevich Khrulev, head of home front services, to guarantee that Fifth Guards Tank Army would be in position for the start date of 22 June 1944. At the end of the war, Rotmistrov's forces took part in the drive on Berlin from the south.

In 1953, Rotmistrov resigned from the General Staff, but he remained within that institution as a professor of war sciences and theory. Between 1954 and 1964, he was chief of the Military Academy for Armored Forces, and in April 1962, he was named the first chief marshal of Soviet Armored Forces. From 1964 to 1968, he was deputy minister of defense, and he was appointed inspector general for the Ministry of Defense in June 1968. He also wrote a number of studies on armored warfare. During ceremonies marking the twentieth anniversary of the end of war, Rotmistrov was awarded his second decoration as Hero of the Soviet Union. He retired to his birthplace, where he died on 16 April 1982.

Rotterdam, Destruction of (14 May 1940)

German air force attack and one of the most controversial actions of the war, undertaken to pressure the Dutch to conclude a peace. The Dutch military's resistance to the German invasion of 10 May 1940 surprised the Germans, who had expected little fighting. By 13 May, Dutch resistance was almost at an end, but the defenders still held Rotterdam. With German forces in the Netherlands ordered to end the resistance quickly to allow ground troops there to join those fighting in France, Luftwaffe commander Hermann Göring decided to employ the Ju-87 Stuka dive-bombers of Fliegerkorps IV to destroy the Dutch strong points guarding the approaches to Rotterdam. On the evening of 13 May, Queen Wilhelmina and the Dutch government departed The Hague aboard two British destroyers, beginning their exile in Britain.

The next morning, a German staff officer entered Rotterdam under a flag of truce to demand that the city surrender. Göring then decided against using the dive-bombers and instructed the Luftflotte 2 commander, General Alfred Kesselring, to carry out a saturation bombing of the city. At noon, the Dutch commander in chief, General Henri Winkelman, entered into negotiations through an emissary with the German military to prevent such an attack, but due to faulty communications, the air strike took place just as the Dutch were preparing to surrender.

Some 100 Heinkel He-111 medium bombers appeared over central Rotterdam at 2:00 P.M. on 14 May. The Germans on the ground tried to signal the aircraft to abort the attack, and 43 of the bombers turned away and attacked other targets; the remainder, however, had already released their loads over Rotterdam. Their high-explosive bombs demolished the entire center of the city and touched off fires that created additional damage. Some 24,000 houses were destroyed, rendering 78,000 people homeless. In addition, the bombing resulted in the destruction of more than 2,500 shops, 1,200 workshops and small factories, 500 pubs, 70 schools, 21 churches, 20 banks, 12 cinemas, 4 hospitals, and 2 theaters. Some 900 civilians were killed, and thousands of others were wounded; many were children trapped in their schools. In the bombed area, little save the city hall and Laurens Church remained standing.

On 14 May 1940, German bombers attacked Rotterdam, killing a large number of its inhabitants. (Corbis)

Early on the morning of 15 May, with the Germans announcing they would next bomb Utrecht, Winkelman issued an order for all Dutch soldiers to lay down their arms. He announced that he had taken the decision to prevent civilian casualties. A partial surrender that excluded the navy was signed that day.

At the Nuremberg war crimes trials, both Göring and Kesselring denied knowledge of the surrender negotiations, but it seems clear that the bombing was undertaken as a deliberate act of force to hasten the surrender, as had happened with the destruction of Warsaw in September 1939. And in this, it succeeded.

ROYAL MARINE, Operation (May 1940)

British plan to mine the Rhine River. On 17 November 1939, First Lord of the Admiralty Winston L. S. Churchill proposed mining Germany's inland waterways. He suggested introducing mines into the Rhine from French tributaries and between Strasbourg and Lauter, where the left bank was French territory, while Royal Air Force (RAF) bombers dropped additional mines into Germany's other rivers and canals at the same time. Churchill hoped that thousands of small, 20-pound mines might overwhelm German countermeasures and completely halt traffic on Germany's waterways. Such mines would be more than sufficient to damage

or sink river barges. To avoid causing problems with the neutral Kingdom of the Netherlands, the mines would deactivate after several days, hopefully before they drifted across the Dutch frontier.

Prime Minister Neville Chamberlain and the War Cabinet approved the plan, and Churchill began assembling the mines. The French government and military, however, remained cool to the idea, especially Premier Édouard Daladier. By March 1940, Britain had assembled more than 6,000 mines, and Churchill wanted to begin deploying them in the Rhine.

The Allied Supreme War Council then endorsed plans to lay mines along the Norwegian coast and bomb the Ruhr in combination with Operation ROYAL MARINE in an effort to shut down German industry. However, newly appointed French Premier Paul Reynaud, fearing German retaliation with a possible strike on Paris, rejected ROYAL MARINE and any bombing or mining of German industry, so only the mining of the Norwegian coast went forward in April. Reynaud insisted on a three-month delay before launching ROYAL MARINE in order to give the French air force time to prepare for German retaliation. He later agreed that Britain could launch the operation should German forces invade France or Belgium.

Royal Marines hastily implemented the plan after German troops opened their offensive into France on 10 May 1940. In

Between 1940 and 1942, the British placed almost 16,000 mines, which sank some 369 German vessels at an estimated 361,821 tons.

the first week of fighting, they placed more than 1,700 mines into the Rhine. These effectively halted river traffic between Karlsruhe and Mainz and damaged several pontoon bridges. By 24 May, British Marines had placed more than 2,300 mines, and these drifted into the Rhine, Moselle, and Meuse Rivers. In the closing days of the campaign, the Royal Air Force dropped some additional mines in

night sorties. As Churchill later wrote, Operation ROYAL MARINE's limited success was "swept away in the general collapse of French resistance." The operation did, however, lay the groundwork for later minelaying efforts by both the RAF Bomber Command and the RAF Coastal Command. Over the next two years, the British placed almost 16,000 mines, which sank some 369 German vessels for an estimated total of 361,821 tons.

Royal Oak, Sinking of (14 October 1939)

Incident in which a British battleship was lost to a German submarine attack within the Home Fleet anchorage at Scapa Flow in the Orkney Islands. Built as one of five superdreadnoughts of the Revenge-class, the *Royal Oak* was launched in November 1914. On 31 May 1916, two weeks after commissioning, she fought at Jutland. She stayed with the Grand Fleet for the rest of the war and served in the Atlantic and Mediterranean until 1937, when she joined the Home Fleet. The *Royal Oak* and her sisters were 624 feet long, displaced 28,000 tons, and carried a main battery of 8 × 15-inch guns, with a secondary armament of 14 × 6-inch guns.

When World War II began in September 1939, the *Royal Oak* was based at Scapa Flow, which, as in World War I, was Britain's main fleet anchorage in a war with Germany. Nonetheless, substantial weaknesses in Scapa Flow's defenses led the commander of German submarines, Rear Admiral Karl Dönitz, to conceive an attack within the harbor that might destroy British faith in its security and usefulness. To carry out the mission, he chose Lieutenant Commander Günther Prien of *U-47*, who sailed his Type VII-B vessel from Kiel on 8 October.

German aerial surveys on 11 and 12 October showed 5 battleships and battle cruisers, 1 aircraft carrier, and 10 cruisers at anchor in Scapa Flow, but this low-level reconnaissance, along with an uncoordinated sortie by the battleship *Gneisenau* and other German surface units, persuaded the Admiralty that an attack was imminent. The British dispatched their large ships into the North Sea and then moved almost all of them to Loch Ewe in northwest Scotland. Only the *Royal Oak*, which until then had been used as a convoy escort, returned to Scapa Flow.

On the moonless night of 13 October, the *U-47* began a surface approach to Scapa Flow through a gap in the sunken blockship barriers revealed by aerial photography. During

British battleship *Royal Oak*, later sunk by a German U-boat on 14 October 1939. (Bettmann/Corbis)

the four-hour passage, Prien submerged once to avoid detection by a passing merchant ship and learned that, even with illumination from the northern lights, targets were not visible through his periscope. Back on the surface, he narrowly escaped entanglement in a blockship's mooring cable but emerged into the main anchorage shortly after midnight.

Prien identified the only suitable targets as the *Royal Oak* and the battle cruiser *Repulse* (he had misidentified the latter vessel, for it was actually the seaplane carrier *Pegasus*). The *U-47* fired four torpedoes, scoring only one hit. The torpedo struck the *Royal Oak* on the starboard bow, causing her crew to believe a small internal explosion had occurred. After a shot from his stern tube also missed, Prien fired three more reload torpedoes from his bow tubes. All struck the *Royal Oak* amidships, exploding a main magazine. Thirteen minutes later, the battleship capsized. Of her crew, 833 were lost and only 424 survived.

Believing that destroyers had seen him, Prien retired quickly, reaching open water unmolested more than two hours later after another difficult passage by a slightly different route. The British Admiralty grimly announced the sinking of *Royal Oak* on 15 October, ironically on the same day an

additional blockship ordered weeks earlier arrived at Scapa Flow to close the gap by which Prien had entered. On 17 October, Prien returned in the *U-47* to Wilhelmshaven and a national celebration.

Rudel, Hans-Ulrich (1916–1982)

German air force officer and the most decorated German soldier of World War II. Born at Seiferdaj, Silesia, Germany, on 2 July 1916, Hans-Ulrich Rudel joined the Luftwaffe in 1936 and was originally commissioned as a reconnaissance pilot. After the start of World War II, he was accepted into dive-bomber pilot training in May 1940 and was posted to Staffel 1, Sturmkampf Geschwader 2 (1.StG-2, or Squadron 1, Dive-Bomber Wing 2) a year later.

Following the German invasion of the Soviet Union in June 1941, Rudel participated in the strike against the Soviet fleet at Kronstadt and was credited with having sunk the battleship *Marat* on 23 September 1941. Between May 1941 and January 1942, he flew over 500 sorties and was awarded the Knight's Cross. By February 1943, he had flown 1,000 missions and was a national hero. Rudel fitted a 37 mm gun to his Junkers Ju-87G Stuka and used it for "tank busting." His success in this regard led to his assignment in developing tactics for such weapons on Stuka aircraft. His unit was attached to the 3rd SS Panzer Division for Operation CITADEL, and at the end of the first day of fighting, Rudel had destroyed 12 Soviet tanks. In October 1943, he was promoted to major and awarded the Knight's Cross with Swords. Throughout 1944, he continued to add to his score, and he was awarded the Diamonds to his Knight's Cross in March for his efforts to save a downed crew behind enemy lines. Shot down himself that same month, he made it to friendly lines.

On 9 February 1945, after destroying a Soviet tank, his Ju-87 was hit by antiaircraft fire. Badly wounded, Rudel was nonetheless able to land the aircraft with instructions shouted to him over the intercom by his radio operator. A man of great determination, he returned to action six weeks

later, despite the amputation of his right leg and orders that he not fly.

Rudel ended the war commanding Schlachtgeschwader 2 (Ground-Attack Wing 2). His final tally was 2,530 sorties. He was credited with the destruction of the *Marat*, 1 cruiser, 1 destroyer, 70 landing craft, 150 gun emplacements, 519 tanks and 800 other combat vehicles, and 7 aircraft. For his exceptional service, Adolf Hitler instituted the Gold Oak Leaves to the Knight's Cross. Rudel was the only recipient of this award.

On 8 May 1945, Rudel led the remaining aircraft from his unit to land at a U.S. airfield and surrender. U.S. authorities rejected demands from the Soviets that he be turned over to them. Held as a prisoner of war, he was released in March 1946. Rudel then emigrated to Argentina to work for its air force. An unrepentant Nazi, he wrote several books supporting the regime and condemning the German General Staff for failing Hitler. In the early 1960s, he returned to Germany, but his extreme right-wing views made him unwelcome in the Federal Republic's armed forces and aviation industry. On several occasions, he ran unsuccessfully for political office as an ultraconservative and ultimately became a ski instructor, despite his artificial leg. Rudel died in Rosenheim, Germany, on 18 December 1982.

Ruge, Otto (1882–1961)

Norwegian army general who became the army's commander in chief in 1940. Born on 1 September 1882 in Kristiania, Norway, Otto Ruge joined the Norwegian army and was an instructor at the Military Academy from 1923. In 1930, he headed the Communications Section of the General Staff, and between 1933 and 1938, he was chief of staff of the General Staff. From 1938 to 1940, he was inspector general of infantry. A colonel at the time of the German invasion of his country on 9 April 1940, Ruge rallied Norwegian forces and halted a German advance at Midtskogen. Whereas Norwegian army commander General Kristian Laake lacked confidence in continued resistance, Ruge expressed a determination to fight on. Appointed commander in chief of the Norwegian army on 10 April and promoted to brigadier gen-

eral, he hoped to contain the German invasion along the southern Norwegian coast and then slowly withdraw northwest to allow time for mobilization of the rest of the country and British and French military intervention.

Ruge skillfully directed the Norwegian defense in a series of delaying positions. Not having been informed in advance of the British evacuation and with a German victory in sight, he steadfastly refused to abandon his men and capitulated only when King Haakon and the government had departed for London. He disbanded the 6th Division on 9 June, and the next day, a member of his staff signed an armistice with the Germans. Ruge then became a German prisoner of war and was only released at the end of the war.

From 1945 to 1946, Ruge was once again commander in chief of the Norwegian army, and he served as commander in chief of the armed forces from 1946 to 1948. He died in Mysen, Norway, on 15 August 1961.

Ruhr Campaign (25 March–18 April 1945)

By March 1945, the Western Allies had defeated all German opposition west of the Rhine River and had crossed Germany's last defensive stronghold at several points. British Field Marshal Sir Bernard Montgomery, commander of 21st Army Group, advocated that the next Allied advance should take place in his own northern zone, where the Allies could push through the north German plain and begin the final assault on Berlin. This route, however, was heavily defended, and the supreme commander of the Allied Expeditionary Forces, General of the Army Dwight D. Eisenhower, favored a broad-front approach in which his main thrust would be concentrated in the center, against the Ruhr River valley.

The Ruhr industrial complex was Germany's industrial heartland and the most important Allied military objective after Berlin. Concentrated within a 2,000-square-mile area were 18 manufacturing cities and coal deposits supplying 69 percent of Germany's requirements. Between 1942 and 1945, the Allied air campaign had diminished the Ruhr's productive capacity and forced a 25 to 30 percent drop in steel production. Allied air forces also enforced some measure of

The partially cleared site of ruins of the Krupp factories near Essen, Germany, after the war (ca. 1945). Hundreds of acres of Krupp factories and other places in the Ruhr were in similar condition. (Bettmann/Corbis)

isolation on the Ruhr by crippling 11 of 17 critical rail centers that connected it with the rest of Germany. Still, the Allies recognized that the only way to eliminate totally the Ruhr's contribution to the German war effort was to occupy it.

Sixty-five German divisions defended the Ruhr. These units were largely concentrated in the west to defend against a direct assault from the Rhine. Although understrength, these divisions presented a formidable obstacle to any direct American offensive. General Omar N. Bradley, the commander of the 12th Army Group, chose to envelop the Ruhr in a classic pincer movement. Lieutenant General Courtney H. Hodges's First Army would advance along the Ruhr's southern boundary while Lieutenant General William H. Simpson's Ninth Army enveloped the Ruhr from the north. The two armies planned to link up at Paderborn.

The Ruhr Campaign began on 25 March when the First Army broke out of the Remagen bridgehead over the Rhine and advanced eastward. The forward armored elements moved rapidly through the Germans' thinly dispersed flank defenses. The 3rd Armored Division reached Marburg and turned north on 28 March, the same day that the Ninth Army, led by its 2nd Armored Division, moved out from its bridgehead. The 3rd Armored Division encountered stiff German resistance on the approach to the Paderborn rendezvous. Students and instructors from a local Waffen-SS panzer training camp blocked the U.S. advance with their Tiger and Panther tanks. The 2nd and 3rd Armored Divisions then bypassed this resistance. At noon on Easter Sunday, 1 April, forward armored elements of the First and Ninth Armies linked up in the Lippstadt area west of Paderborn, completing the Ruhr envelopment.

The Ruhr pocket (*Ruhr Kessel*) measured some 30 by 80 miles. Trapped within were Field Marshal Walther Model's Army Group B headquarters, Generaloberst (U.S. equiv. full general) Josef Harpe's Fifth Panzer Army, most of General der Infanterie (U.S. equiv. lieutenant general) Gustav von Zangen's Fifteenth Army, and two corps of the First Parachute Army. In all, German forces caught in the pocket included remnants of 18 divisions and 7 corps commands. The encircled German forces were unable to muster sufficient strength to break through the U.S. perimeter and could not count on a rescue from outside the pocket. Characteristically, Adolf Hitler ordered Model to defend "Fortress Ruhr" to the last man.

Initially, the Americans deployed 13 divisions for the Ruhr battle. Later, with progress slower than expected, 4 additional divisions were committed. Major General John B. Anderson's XVI Corps of Ninth Army cleared the densely populated industrial area north of the Ruhr River. To the south, Major General James A. Van Fleet's III Corps, Major General J. Lawton Collins's VII Corps, and Major General Clarence R. Huebner's V Corps of First Army cleared the rugged and forested Sauerland. Meanwhile, three divisions of Lieutenant General Leonard T. Gerow's Fifteenth Army were to keep the Germans occupied along the Rhine River.

German resistance proved spotty and unpredictable. The Americans adopted an effective technique for clearing the pocket. Once a town was captured, they would call ahead by telephone to inform the next town that they were coming soon and demand its surrender.

American forces reduced the Ruhr pocket quickly. Essen, home of the Krupp industrial combine, was taken on 11 April, and by 14 April, they had effectively cut the area in two when troops from the First and Ninth Armies met up along the Ruhr River. Major General Matthew B. Ridgway, XVIII Airborne Corps commander, wrote Model and demanded his surrender, but the German general refused to disobey Hitler's order. Instead, he disbanded his army, and on 21 April, he committed suicide. All organized resistance in the Ruhr pocket ceased on 18 April. During the two-week campaign, the Americans captured 317,000 German soldiers, including 30 generals and an admiral—more than the Allies had captured at Tunisia or the Soviets had at Stalingrad. The Western Allies also liberated 200,000 forced laborers and 5,639 prisoners of war.

Rundstedt, Karl Rudolf Gerd von (1875–1953)

German field marshal and commander of the German Western Theater from 1942 to 1945. Born at Aschersleben, Germany, on 12 December 1875, Karl Gerd von Rundstedt joined the army in 1893 and served throughout World War I. Following the war, he rose steadily in the new Reichswehr. He was promoted to lieutenant colonel in October 1920 and colonel in February 1923. Rundstedt was then chief of staff of the 2nd Infantry Division. In March 1925, he assumed command of the 18th Infantry Regiment. In November 1927, he was promoted to Generalmajor (U.S. equiv. brigadier general), and a year later, he commanded the 2nd Cavalry Division. Promoted to Generalleutnant (U.S. equiv. major general) in March 1929, he took command of the 3rd Infantry Division and then Group Command I. Rundstedt was promoted to General der Infanterie (U.S. equiv. lieutenant general) in October 1932 and to Generaloberst (U.S. equiv. full general) in March 1938. Unhappy with Adolf Hitler's growing power, he retired on 31 October 1938. He was recalled to duty at the age of 64, and in September 1939, he led Army Group South into Poland.

In spring 1940, Rundstedt favored the plan devised by General Erich von Manstein to invade France. He commanded Army Group A, composed of 45 divisions. By 14 May 1940, his tanks had opened up a broad gap in the Allied front. Rundstedt argued that his tanks should halt until infantry divisions could catch up. Hitler agreed and made the order a fast one, stopping General Heinz Guderian's panzer thrust that could have cut off the British escape from Dunkerque. Hitler promoted Rundstedt to field marshal on 19 July 1940. Later, Rundstedt took control of occupation forces and was given responsibility for coastal defenses in Holland, Belgium, and France.

In June 1941, Rundstedt participated in the invasion of the Soviet Union, Operation BARBAROSSA, as commander of Army Group South. His forces made slow progress during the first weeks, but in September 1941, he took part in the capture of Kiev and 665,000 Soviet troops. Rundstedt strongly opposed continuing the advance into the USSR during the winter and advised Hitler to call a halt, but his views were rejected.

He continued the advance and reached Rostov on 21 November, but a Soviet counterattack forced his troops back.

German Field Marshal Gerd von Rundstedt, shown here on an inspection of the Atlantic Wall in early 1944. (Library of Congress)

When Rundstedt called for withdrawal, Hitler replaced him with General Walther von Reichenau. After the Führer recalled him to duty in March 1942, sending him to France as commander in chief, West, Rundstedt organized the building of the fortifications known as the Atlantic Wall along 1,700 miles of coastline. After the Normandy landings, he urged Hitler to make peace. The Führer responded by replacing him with Field Marshal Günther von Kluge, but in September, Rundstedt returned to his former post. Having been in charge for the last major German offensive in the Ardennes in December 1944, he was sacked as supreme commander, West in March 1945.

Rundstedt was the prototype, if not the caricature, of the old-style Prussian officer, deeply attached to Germany's imperial traditions. He never failed to contradict Hitler with respect to military matters when he felt it necessary to do so, but he also never questioned his regime. Captured by the Western Allies on 1 May 1945, Rundstedt was released in May 1949 and lived in Hannover, Germany, until his death on 24 February 1953.

Ruweisat Ridge, Battles of (1–27 July 1942)

Crucial battles in determining the outcome of fighting in North Africa and the Middle East. In May and June 1942, German Field Marshal Erwin Rommel and his Axis forces had won spectacular victories at Gazala and in the capture of

Tobruk, costing the British some 80,000 men and 1,000 tanks. Driving his troops hard, Rommel hoped to rout the retreating imperial forces. His goals were to capture Cairo and seize the Suez Canal. The British defeat at Mersa Matrûh in late June appeared to confirm this course of action.

After months of heavy fighting, however, Axis forces were exhausted and much understrength. At the end of June, the three German divisions of 2,000 infantrymen possessed 55 tanks, 77 field pieces, and 63 antitank guns. Italian forces included 8,000 infantrymen, 70 tanks, and 200 field pieces. Axis forces were at the end of a rapidly lengthening supply and reinforcement line. Rommel had also outrun his air support, with the Axis air forces struggling to establish new forward bases.

On 25 June, General Sir Claude Auchinleck, British commander in the Middle East, took personal control of Eighth Army. Its defensive positions were almost 100 miles west of Alexandria, Egypt, and ran south for 38 miles from the coastal town of El Alamein to the impassable salt marshes of the Qattara Depression. These positions formed a natural choke point, as they could be penetrated but not outflanked. The terrain was largely flat except for two low, east-west ridges—Miteiriya in the north and Ruweisat in the center.

The 1st South African Division occupied the northern positions, the 18th Indian Brigade held the center, and the 2nd New Zealand Division deployed in the south. Rommel's attack plan had his 90th Light Division attacking in the north. It would drive east and then swing left to the sea, encircling the South Africans. The 21st and 15th Panzer Divisions were to move east in the center and then strike right, striking the New Zealanders in the rear.

Confident of victory, Rommel unleashed the Afrika Korps (Africa Corps) on 1 July. The panzers found their path blocked by the 18th Indian Brigade. The Indian defenses were incomplete, and the troops were short of ammunition and even water. Luckily, the day before the German attack, artillery units had arrived with some 40 guns. The defenders fought tenaciously until overrun that evening. They had, however, destroyed 18 German tanks and stopped the German advance. To the north, 90th Light encountered heavy fire from the South Africans and an artillery reinforcement. Panic erupted among the long-suffering German soldiers, and the officers were fully occupied restoring control.

On 2 July, Rommel attempted to use his panzers to renew the attack in the north. Auchinleck now inserted the 1st Armoured Division, consisting of the 2nd, 4th, and 22nd Armoured Brigades. The 4th and 22nd Brigades, with 38 Grant medium tanks, thrust into the open southern German flank and fought the panzers until nightfall. Rommel resumed the offensive on 3 July, sending his tanks forward along both sides of Ruweisat Ridge. The Italian Ariete and Trieste Divisions, which had excellent fighting records, were instructed to attack south.

But the 4th and 22nd Armoured Brigades barred the panzers' path. In the south, the Trieste Division failed to move and the Ariete was split, its tanks entangled in the armor battle. The remaining units were struck by the New Zealanders, and the Ariete Division fled, with the loss of 531 men and 44 guns.

Auchinleck now unleashed a series of counterstrokes, relying heavily on information garnered through ULTRA intercepts. Reinforcements from the 9th Australian Division came into play. The 2nd Armoured Brigade replaced the 4th Armoured Brigade, decimated in the fighting. In the north, on 10 July, the 2nd South African and 26th Australian Brigades attacked positions west of El Alamein held by Italian infantry. This assault overran the Italian lines and netted 1,500 prisoners and 30 guns. Only the newly arrived 382nd German Infantry Regiment, a battalion of elite Bersaglieri Italian troops, and additional Italian guns halted the attack.

Auchinleck then mounted an assault in the center of the line, sending his 4th and 5th New Zealand Brigades and 5th Indian Brigade against some 4,000 Italian troops on Ruweisat Ridge. Between 14 and 15 July, they seized the ridge, but it was impossible to dig into the rock terrain, and no tanks came forward to help the New Zealanders. In addition, corps commander Lieutenant General William H. Gott failed to coordinate his infantry and armor. In a devastating counterattack, German armor recovered the ridge, and 1,405 New Zealanders were lost.

On 17 July, two Australian battalions attacked south against Italian positions on Miteiriya Ridge. The Australians captured 700 prisoners, but they came under fire by Italian guns and were halted by a German task force. Rommel now reluctantly concluded that Axis forces had to go on the defensive. German engineers utilized power drills to lay extensive minefields. They also erected strong points, where troops were armed with automatic weapons and antitank guns.

In his report of 21 July, Rommel exaggerated his losses in order to accelerate reinforcement. This report, decoded by ULTRA, strengthened Auchinleck's resolve to crush Rommel and the Afrika Korps. Strong pressure also came from Prime Minister Winston L. S. Churchill, whose government was under parliamentary attack occasioned by a series of military defeats.

Auchinleck planned a three-pronged assault for the night of 21–22 July. The 161st Indian Brigade was to seize the western end of Ruweisat Ridge, while the newly arrived 23rd Armoured Brigade (less one regiment in support of the Australians) was entrusted with the major objective of attacking the center and overrunning Rommel's headquarters. The 6th New Zealand Brigade was to attack from the south in a north-west direction. The 2nd and 22nd Armoured Brigades were to join the New Zealanders by daybreak.

The Indians met stiff resistance from German and Italian infantry and failed, incurring substantial losses. In the south,

the New Zealanders secured their objective, but the 2nd and 22nd Armour failed to link up with the New Zealanders. On the morning of 22 July, the 15th and 21st Panzers destroyed the 6th Brigade, inflicting 904 casualties. That same morning, the 23rd Armoured Brigade unleashed two regiments of Valentine infantry tanks in a determined assault. Running into vicious antitank gunfire and blundering into uncleared minefields, the British had 40 tanks destroyed and another 40 damaged, but 7 were still intact. This attack did cause serious concern for the defenders, as it had penetrated German defenses and overrun a key strong point.

Auchinleck's last effort came in the northern sector, in an attack against Miteiriya Ridge on 26–27 July. One battalion from the 24th Australian Brigade and two battalions from the British 69th Brigade were to seize the ridge. The 2nd Armoured Brigade would move through gaps cleared in the minefields to support the infantry. The infantry troops gained their objectives and overran two Axis battalions. But the mine clearing went awry, and the Australians and British fell victim to swift German armored counterattacks, losing 1,000 men.

Commonwealth infantrymen, particularly the New Zealanders, emerged from these battles bitter about the lack of British armor support and what they regarded as incompetent British commanders. Although 7,000 Axis prisoners were captured in the Ruweisat battles, British/Commonwealth casualties totaled 13,250. On 8 August, Churchill removed Auchinleck from command.

Rydz-Śmigły, Edward (1886–1941)

Marshal of Poland and commander in chief of the Polish armed forces at the beginning of World War II. Born on 11 March 1886 at Brzeóany in Austrian Galicia, Edward Rydz-Śmigły joined a Polish paramilitary organization in 1907 and graduated from its officer school in 1912. In August 1914, he joined the First Legion organized by Józef Piłsudski and

Polish armed forces commander, Marshal Edward Rydz-Śmigły, ca. 1940. (Hulton-Deutsch Collection/Corbis)

fought in it alongside the Austrians against the Russians until July 1917. Rydz-Śmigły advanced quickly thanks to his leadership abilities, and by 1917, he had reached the rank of colonel and had command of a regiment.

When Piłsudski discovered that the Central Powers did not intend to grant Poland its independence, he and his First Legion refused to swear allegiance to Austria and Germany and went underground. Rydz-Śmigły followed Piłsudski and was appointed commander of the clandestine Polish Military Organization (Polska Organizacja Wojskowa). Following the declaration of Poland's independence in November 1918, Rydz-Śmigły became one of Piłsudski's closest associates and was promoted to the rank of brigadier general. In 1920, during the Russo-Polish War, he commanded the Third Army that spearheaded the Polish-Ukrainian offensive that occupied Kiev. After the peace treaty of Riga in March 1921, he became one of the inspectors of the Polish army, with the rank of lieutenant general.

Rydz-Śmigły supported Piłsudski in his 1926 coup d'état. In May 1935, when Marshal Piłsudski died, Rydz-Śmigły took power, assuming both Piłsudski's rank and his place as head of the Polish armed forces. Thereafter, he made a considerable

but belated effort to modernize Poland's defenses. Such efforts were halted by the September 1939 invasion of Poland, first by Germany and then by the Soviet Union.

Rydz-Śmigły next turned to Poland's ally Romania. Promised the right of free passage to France for himself and the remnants of his military forces, he sought shelter on Romanian territory. Under pressure from Berlin, the Bucharest government decided to intern him as well as other members of the Polish government. Rydz-Śmigły escaped internment, however, and returned secretly to Poland via Hungary. He died at Warsaw from heart failure on 28 November 1941 while trying to organize Polish underground resistance against German occupation.

S

Saar, French Invasion of the (September 1939)

Ineffectual French offensive at the beginning of World War II. On 19 May 1939, French and Polish military officials agreed that their armies would attack Germany if Germany moved against either state. Supreme commander of French land forces General Maurice Gamelin pledged that he would invade Germany with the majority of his troops no more than 15 days after mobilization began. Britain and France also promised that in the event of a German attack, they would move against Germany immediately from the air.

Despite the Allied pledge, the French military strategy for war with Germany was to remain on the defensive, wearing down the enemy until France's own army was strong enough to seize the initiative. During World War I, 1.5 million Frenchmen had perished, and it was unacceptable that such a military holocaust be repeated. Gamelin declared he would not open this war with a new Battle of Verdun, a costly, all-out assault on fortified positions. His deputy, General Alphonse Georges, vowed to resign if ordered to lead an invasion. The French military philosophy was summed up in the phrase "Stingy with blood; extravagant with steel." Given this mindset, any French military operations on behalf of the Poles were destined to be extremely cautious.

On 1 September, Germany invaded Poland. Six days later, the Polish General Staff radioed an appeal for Gamelin to act quickly, in hopes that Germany would divert units from the invasion to the west. The French mobilization had just begun, and most heavy artillery was still in storage. The army's 85 divisions were dispersed to guard against possible attacks from fascist Spain and Italy while also defending the long bor-

der with Germany. Regardless, honor demanded some action on behalf of the Poles.

If France's troops could pass through Belgium, they might outflank Germany's West Wall defenses (known as the Siegfried Line by the French). Belgium, however, insisted on remaining neutral. With the northern route thus closed, Gamelin had little choice but to attack within a 90-mile-wide sector between the Rhine and Moselle Rivers in the Saar, directly into the teeth of what he believed to be strong fortifications. The invasion force was designated 2nd Army Group. General André Prételat was its commander. Chief of staff of the Fourth Army in 1918, Prételat had since 1934 been a member of the Supreme War Council, a group wedded to defensive strategy.

On the night of 7–8 September, a few light French units entered German territory along a 15-mile front southeast of Saarbrücken. On 9 September, stronger forces from the Fourth and Fifth Armies followed, while the Third Army advanced into the Wendt Forest slightly to the west. Despite Gamelin's earlier pledge to use the majority of his troops, no more than 15 divisions crossed the frontier; most French authorities believe only 9 of the 85 divisions on the northeast front were used.

The French advanced against a pitifully inadequate German force in the west. Adolf Hitler had gambled on a Schlieffen Plan in reverse, throwing the bulk of his resources against Poland while leaving only weak covering forces in the west on the correct assumption that the French would be slow to move. The German army had a maximum of 25 divisions in the west, the bulk of which were inadequately trained and poorly equipped reserves. The mechanized and motorized troops had all been committed to the fighting in Poland, and artillery

had been stripped from the West Wall. German forces in the west had no tanks, little artillery, and virtually no aircraft.

In the west, only light skirmishing occurred. So cautious was the French advance that a single automatic weapon halted an entire platoon. Artillery of both sides lobbed shells in the general direction of the enemy. Modern Char B heavy tanks supported French infantry, but the French government, fearful of retaliation against Paris, refused to authorize bombing, and the Royal Air Force readily complied with French requests to follow the same policy.

While Polish cities shuddered under German bombs, the 2nd Army Group inched forward. It advanced a mere five miles by 12 September, capturing 20 deserted German villages. Gamelin then ordered Prételat to halt short of the Siegfried Line and prepare for retreat should the Germans counterattack through Belgium. Five days later, as it was clear the Poles were collapsing under the German hammer blows, Soviet troops invaded eastern Poland. By the end of the month, the Poles were finished.

Not a single Stuka or panzer had been diverted from the invasion of Poland by Gamelin's timid "invasion." On 30 September, Prételat was ordered to withdraw his troops secretly at night. By mid-October, Germany had 70 divisions in the west. On 16 October, a handful of infantry attacked the remaining French troops, and in two days Germany reoccupied all the territory the 2nd Army Group had required two weeks to capture. Casualties on both sides in the ineffectual campaign were light. Most French losses resulted from a thick belt of German mines and booby traps.

The French High Command lamented that Poland had not been able to hold out until spring when a proper offensive might have been undertaken. Gamelin later justified the feeble effort by saying the governments of France and Poland had not ratified a parallel political treaty to complete their mutual support agreement, although France had signed the political agreement on 4 September.

Given France's reliance on large numbers of reservists, its troop dispersions, and its defensive mentality, a stronger offensive may not have been a realistic option, but German observers believed that a more determined French effort would have carried to the Rhine and changed the course of the war. It is worth noting that Britain, which also had a solemn obligation to defend Poland, did nothing to assist Poland beyond the dropping of propaganda leaflets. By the time of the French offensive, the British Expeditionary Force had not even completed its assembly. Both states would pay a heavy price for their lack of military preparedness.

Saint-Lô, Battle of (11–19 July 1944)

Key battle following the 6 June 1944 Normandy Invasion. Saint-Lô was the hub of an extensive road net that allowed the Germans to rapidly shift men and weapons east and west to meet American attacks. Lieutenant General Omar N. Bradley, commanding the U.S. First Army, needed the road from Saint-Lô west to Périers as a line of departure for an offensive (code-named COBRA) to break out of the Normandy bocage of hedgerow country. The bocage consisted of small fields and orchards surrounded by underbrush-covered earthen dikes from 3 to 5 ft thick and from 6 to 9 ft high, with numerous narrow sunken lanes. These brush-crowned embankments walled in the fields and provided excellent positions for the German defenders.

On 11 July, Major General Charles H. Gerhardt's 29th Infantry Division began the attack to take Saint-Lô and the Martinsville Ridge to its east. The 35th Infantry Division attacked on its right, and the 2nd Infantry Division (V Corps) on its left. Defending was General der Fallschirmtruppen (U.S. equiv. lieutenant general) Eugen Meindl's II Parachute Corps of the 3rd Parachute Division and badly battered Kampfgruppen: battle groups of varying sizes from the 266th, 352nd, and 353rd Infantry Divisions under command of the 353rd.

The 116th Infantry attacked on the left and the 115th Infantry on the right in the 29th Division's zone, using assault groups composed of infantry, tanks, and engineers method-

Ruins of St.-Lô, France, site of a fierce battle between Allies and the Germans. (Photo by Frank Scherschel//Time Life Pictures/Getty Images)

ically to attack and seize each field. Many tanks were now equipped with steel prongs hastily welded to the fronts of their hulls to help them through hedgerows and to punch holes in which to place explosives. By the end of the day, the 116th decisively penetrated German defenses, but heavier resistance stopped the 115th. However, the 2nd Division seized Hill 192, which overlooked the Saint-Lô area.

Attacking U.S. forces made little headway between 12 and 14 July. On 15 July, the Germans stopped both regiments. Starting at 7:30 P.M., however, the 116th again began making headway, but it was halted for the night by higher headquarters. The 2nd Battalion failed to receive the order, and although it was cut off, it was not attacked. Meanwhile, that same day, the 35th Division seized the north slope of Hill 122 about a mile north of Saint-Lô.

On 16 July, the 115th was again thwarted, and the 116th defeated two German counterattacks. On 17 July, the 115th continued attacking the high ground on the Martinville Ridge, commanding the German rear area. Major Thomas D. Howie's 3rd Battalion, 116th Infantry, attacked southwest, and by 6:00 A.M. it had taken the village of La Madeleine without opposition, relieving the regiment's 2nd Battalion. La Madeleine was about 500 yards from Saint-Lô itself.

The 2nd Battalion was supposed to attack into Saint-Lô, but it had suffered too many casualties to do this. Howie then took the mission. Shortly after he issued his orders, he was killed, and his executive officer, Captain William H. Puntenney, assumed command. Severe German artillery and mortar fire followed by a counterattack thwarted the attack plan. U.S. artillery and mortar fire and air strikes then defeated the German counterattack. However, both the 2nd and 3rd Battalions of the 116th were now isolated from the remainder of the division. By the end of the day of 17 July, however, the 29th Division was on the inner slopes of hills that led directly into Saint-Lô. On the morning of 18 July, the 35th Division reported that the Germans had pulled out everywhere in its sector.

Task Force C—commanded by Brigadier General Norman D. Cota, assistant division commander of the 29th Infantry Division, and composed of reconnaissance, tank, tank destroyer, and engineer units—was tapped to seize the town. Cota was to obtain infantry support from the nearest available infantry unit just before entering the town. That was 1st Battalion, 115th Infantry (less one platoon designated to contain a small number of German holdouts). By 7:00 P.M., Saint-Lô had been secured. Major Howie's men carried his body into the town and placed it on the rubble surrounding what had been the Cathedral of Notre Dame.

Pockets of resistance still remained, and the Germans poured in mortar and artillery fire. Cota was wounded, and some 200 of the 600-man task force became casualties, but the capture of Saint-Lô and the adjacent high ground solidly protected the U.S. First Army's left flank as it penetrated the German lines and prepared the way for Operation COBRA.

Saint-Nazaire, Raid on (28 March 1942)

British commando raid on the French port of Saint-Nazaire on the Bay of Biscay. The port of Saint-Nazaire had one of the few dock facilities capable of accommodating the German battleship *Tirpitz* and was the only such facility on the French coast. The plan to raid the port was developed by Captain J. Hughes-Hallet of British Combined Operations. Known as Operation CHARIOT, it called for commandos to ram a ship

loaded with explosives into the dock itself to demolish it while other forces landed to destroy additional port facilities. Wrecking the dry dock might prevent the Germans from sending the *Tirpitz* from Norway on a sortie against the Atlantic convoys because she would lack repair facilities in France.

On the afternoon of 26 March 1942, the British strike force sailed from Falmouth. Commander R. E. D. Ryder had charge of the naval forces, and Lieutenant Colonel A. C. Newman commanded the landing party. The naval force centered on the destroyer *Campbeltown* (the obsolete former U.S. Navy *Buchanan* acquired under the Destroyer-Bases Deal) and naval launches. The *Campbeltown* was packed with four tons of timed explosives. Destroyers *Tynedale* and *Atherstone* provided escort. The flotilla, flying the German naval ensign and flashing German recognition signals, entered Saint-Nazaire harbor early on 28 March. At 1:30 A.M., the Germans, although initially fooled, opened fire with shore artillery, but the darkness hampered the accuracy of their fire.

At 1:34 A.M., the *Campbeltown* slammed into the dry dock's outer caisson at 18 knots. The force of the impact crushed the bow for 36 ft and drove the ship onto the caisson a full 12 inches into the steel gate, while some 260 commandos poured off the *Campbeltown* and launches to destroy machinery, several buildings, bridges, and smaller vessels. German reinforcements arrived, and the firing soon became intense. Although 3 motor launches and the 2 escorting destroyers escaped to Britain under air cover, most of the commandos were left behind.

At 10:30 A.M., high-ranking German officers and engineers were at the dry dock to inspect the damage when the explosives in the destroyer's bow detonated. Another charge aboard a motor torpedo boat destroyed the lock gates of the Saint-Nazaire basin. Some 400 Germans were killed in the raid, most of them in the explosion aboard the *Campbeltown*. Among the dead were 2 of the commando officers, who had refused to reveal the presence of the explosives. The British lost 2 motor torpedo boats and 14 motor launches. Of 621 raiders who participated, 169 were killed and 200 captured; 5 escaped to Spain. The British had achieved their primary objective, as the Germans were unable to use the dry dock for the remainder of the war. Operation CHARIOT has been dubbed the "greatest raid of all."

Saint-Pierre and Miquelon, Seizure of (24 December 1941)

Saint-Pierre and Miquelon, island territories of France off the coast of Newfoundland having fewer than 4,500 people, became a cause célèbre in the winter of 1941–1942. Following the German defeat of France in June 1940, the government of the Saint-Pierre and Miquelon territory recognized the French government of Marshal Henri Philippe Pétain in Vichy. Although there was some Free French agitation, threats to bring in Vichy forces kept most such sentiments under control. At the same time, control over the islands was a minor issue for the governments of Canada, Britain, and the United States. Britain advocated Free French control over the territory, whereas the United States vehemently opposed any change, and Canada attempted to hold a middle ground.

In 1941, increased U-boat activity in the North Atlantic added greater weight to the matter, as it was feared that the territory's radio station was broadcasting information detrimental to Allied interests. Proposals were circulated among Ottawa, London, and Washington for pressure to be brought to bear on the territorial government to transfer authority over the station, proposals that received further impetus after the December attack on Pearl Harbor.

Learning of the possibility that authority would be transferred, head of Free French forces in London Charles de Gaulle decided to forestall any Anglo-British action. On 22 December 1941, Vice Admiral Émile Henri Muselier, commander of the Free French Navy, departed Halifax with three corvettes and the *Surcouf*, then the world's largest submarine. Ostensibly leaving on a training exercise, Muselier instead sailed for Saint-Pierre, some 365 miles to the northeast. Arriving there on the morning of 24 December, the Free French forces easily seized the islands. Muselier arrested the leaders of the Vichy government and held a plebiscite on 25 December to demonstrate the wishes of the majority of the people to support the Free French.

In Washington, Secretary of State Cordell Hull was enraged, as he believed that de Gaulle had acted with British approval and support. Although Hull was under attack from American media, which was increasingly critical of what it regarded as his appeasement policies toward Vichy, Hull released an inflammatory statement calling for a return to the status quo in Saint-Pierre and Miquelon and insisting that Canada enforce the return of the territory to Vichy control.

The governments of Canada, Britain, and the Free French all refused to follow the American dictates. Although various plans and projects were suggested, the islands remained in Free French hands. The end result for de Gaulle, however, was

less than he had hoped. He had managed to secure one of France's territories for his cause, but, contrary to his ambitions, it did not lead to any other territories opting to follow his flag. In addition, this event exacerbated de Gaulle's poor relations with Franklin D. Roosevelt, who was already suspicious of his motives, and hampered de Gaulle's later activities.

Saipan, Battle of (15 June–9 July 1944)

Important battle in the Pacific Theater. Saipan, part of the Mariana Islands chain that includes Guam and Tinian, had become Japanese territory in 1920 as a consequence of World War I and was considered a part of Japan itself. Following the successful U.S. invasions in the Gilbert and Marshall Islands, U.S. Chief of Naval Operations Admiral Ernest J. King pushed for an assault on the Marianas. Despite opposition from General Douglas MacArthur, King's view prevailed.

The invasion force for Saipan included the 2nd and 4th Marine Divisions; the 27th Army Infantry Division was in reserve. Admiral Raymond Spruance commanded the Fifth Fleet, while Rear Admiral Richmond Kelly Turner had charge of planning and executing the landing. Marine Major General Holland ("Howlin' Mad") Smith commanded V Amphibious Corps and would be in charge of the troops once they disembarked at Saipan.

The attack plan, code-named Operation FORAGER, called for the Marines to land along a strip of beach on the western side of the island. American estimates placed up to 15,000 Japanese soldiers on Saipan, but the actual number was about 30,000 Japanese army and naval personnel. There were also many civilians. Vice Admiral Nagumo Chūichi, victor at Pearl Harbor and loser at Midway, commanded the Fourth Fleet, a small area fleet charged with defending the Marianas. He established his headquarters on Saipan, which was also headquarters for the Japanese Twenty-First Army, commanded by Lieutenant General Hideyoshi Obata. Lieutenant General

Saitō Yoshitsugu had actual ground command on Saipan. His men were well entrenched in caves and other natural fortifications on the island, and they were well supplied with defensive firepower.

More than 800 ships transported the U.S. invasion force from Eniwetok to the Marianas. Bombardment vessels pounded Saipan for three days before the landing, but this bombardment was insufficient, as many Japanese defensive positions had not been identified. Early on the morning of 15 June, the Marines went ashore. Contrary tides and Japanese fire prevented the 2nd Marine Division, aiming for the north end of the target beaches, from landing in the preferred location. The 4th Marines landed with greater accuracy, but the Japanese mounted an excellent defense and subjected the invaders to withering artillery and mortar fire. Both the Marines and the Japanese suffered heavy casualties in the first days of the battle.

Despite stubborn Japanese opposition, the Marines slowly advanced. The 2nd Marines swung north along the western coast of Saipan, while the 4th Marines pushed across to the eastern coast of the island before they turned northward as well. On 16 and 17 June, Holland Smith committed his reserve, the 27th Infantry Division, to the battle. He deployed it between the two Marine divisions and ordered it to drive northward up the center of the island.

While the Marines and infantry were struggling to gain control of Saipan, Admiral Spruance learned that the Japanese fleet had sailed from the Philippines for the Marianas. Spruance then departed with most of his ships to engage the Japanese fleet. Vice Admiral Marc Mitscher, who commanded Task Group 58 of the American carriers, successfully defeated the Japanese threat in the 19–21 July Battle of the Philippine Sea. Known to the Americans as the "Great Marianas Turkey Shoot," this battle destroyed Japanese naval airpower, but it also deprived the Americans on Saipan of much-needed naval gunfire and air support.

In the meantime, Marines and army troops on Saipan continued to drive north. In a controversial decision, General Smith, dissatisfied with army progress, relieved Major General Ralph C. Smith from command of the 27th Infantry Division. This matter, largely the result of different tactical doctrines, led to an interservice dispute that raged well after the end of the war.

On 7 July, the Japanese mounted the largest banzai attack of the war, but that desperation charge by 3,000 Japanese soldiers was the last major effort in a lost battle. Most Japanese fought to the death rather than surrender, and their commanders committed suicide. Hundreds of Japanese civilians also leaped to their deaths from cliffs at the northern end of Saipan rather than surrender. Organized resistance on the island ended on 9 July, and Saipan was declared secure on 13 July. United States forces suffered 3,126 killed, 13,160

Army reinforcements disembarking from LSTs proceed across coral reef toward the beach, Saipan, June–July 1944. (Laudansky [Army], National Archives)

wounded, and 326 missing. Japanese losses were approximately 27,000 killed. Only 2,000 were taken prisoner. Nagumo and Saitō were among those who committed suicide.

The fall of Saipan brought the resignation of Japanese Premier General Tōjō Hideki. Guam and Tinian in the Marianas were also secured by early August. Even as fighting for the three islands was going forward, Seabees were clearing runways for B-29 bombers to strike Japan.

Saitō Yoshitsugu (1890–1944)

Japanese army general. Born in Miyagi Prefecture on 28 November 1890, Saitō Yoshitsugu graduated from the Military Academy in 1912 and from the War College in 1924. He was promoted to lieutenant colonel in 1932. A cavalry officer, Saitō was a member of the Inspectorate General for Cavalry during 1932–1933. He then held cavalry commands. Promoted to colonel in 1936, he was next chief of staff of a division.

In 1939, Saitō was promoted to major general and appointed chief of the Military Remount Depot of the Guangdong (Kwantung) Army. In 1941, he became chief of Military Remount Department of the War Ministry. Promoted to lieutenant general in 1942, Saitō was appointed commander of the 43rd Division and given charge of the Northern Marianas District of Saipan and Tinian islands in April 1944.

The convoy carrying 7,000 men of the 43rd Division to the Marianas came under U.S. Navy submarine attack, and five of seven transports were sunk. Although most of the men were saved, they arrived at Saipan without their equipment. Saitō also had little time to prepare for a U.S. invasion of the island. The main body arrived on 5 May and the remainder on 7 June, and U.S. forces invaded on 15 June. Saitō had only his 43rd Infantry Division and the 27th Independent Brigade, in addition to naval personnel. Saitō was junior to both Admirals Nagumo Chūichi and Takagi Takeo, who had their headquarters on the island, but few resources.

Saitō's tactic of trying to defend at the water's edge was not successful, nor were the banzai night attacks against the U.S. beachhead. Overwhelming U.S. ground strength and naval and air support steadily reduced the defenders, who were driven into the northern part of the island. On 6–7 July, some 3,000 Japanese survivors mounted the war's largest banzai attack, which failed, and Saitō committed suicide. That same day, U.S. Marine Major General Holland M. Smith declared the island secure.

Salazar, António de Oliveira (1889–1970)

Portuguese political leader and dictator. Born on 28 April 1889 in the village of Vimieiro near the town of Santa Comba Dão, Portugal, António Salazar grew up a conservative Catholic. Educated at the University of Coimbra, he became a respected professor of political economy there. Salazar was elected to the Portuguese Chamber of Deputies, but he soon withdrew because he considered it to be a futile exercise.

In 1926, to end chronic political instability in Portugal (there had been 40 cabinets since the overthrow of the monarchy in 1910), the Portuguese military seized power. Salazar was then briefly minister of finance. Recalled to the same post in 1928, he received the full financial authority he demanded, and in short order he placed Portuguese finances on a firm foun-

ation. Over the next few years, Salazar gradually increased his power until, in 1932, he became premier of an authoritarian government. From that point until 1968, Salazar dominated Portuguese affairs.

Under a new constitution ratified in a 1933 referendum, Salazar reorganized Portugal as a corporative unitary republic rather than pluralist state. A national assembly elected by heads of families served as the legislative body. A corporative chamber advised the assembly about social and economic matters and represented syndicates of various corporations. The Catholic Church also had widespread influence. Salazar's National Union Party was the political voice of the so-called *Estado Novo* (new state), which combined eighteenth-century enlightened despotism with Christian morality but also had fascist and democratic trappings. This system came to be known as clerical fascism; it was subsequently a model for the Nationalists in Spain and for Austria.

Profoundly religious, Salazar was also an ascetic and bachelor. Unlike most dictators, he lived frugally on a modest salary and was utterly uninterested in the accumulation of personal wealth. Salazar also remained virtually unknown to his people. Although he admired fascism and supported the Nationalist side in the Spanish Civil War, he also intensely disliked Adolf Hitler and the Nazis, and he maintained diplomatic relations with Portugal's longstanding ally, Great Britain. Unlike Francisco Franco in Spain, Salazar kept his country strictly neutral during World War II, until, under British and U.S. pressure, he agreed in October 1943 to lease bases in the Azores. These proved vital to the Allied cause in the Battle of the Atlantic. Nonetheless, Salazar maintained that the nation was neutral, and Portugal profited from selling goods to both sides. Portugal emerged from the war in a much better position than Spain, and it was readily admitted to the United Nations and invited to join the North Atlantic Treaty Organization.

Although Portugal was a police state, Salazar always tried to preserve some of the elements of a democratic facade. Increasingly, in his last years in power, Salazar was forced to devote substantial financial and military resources to maintaining Portuguese control over its overseas empire. A disabling stroke in 1968 finally forced him to give up power. His successor, Marcelo Caetano, introduced some reforms. Salazar died in Lisbon on 27 July 1970.

Salerno Invasion (Operation AVALANCHE, 9 September 1943)

Allied invasion of southern Italy. The Allied plan for the invasion of the Italian mainland called for a three-pronged effort. In Operation BAYTOWN, General Bernard L. Montgomery's Eighth Army would cross the Strait of Messina and land at Calabria on 3 September; then it would work its way north. The following day, in Operation SLAPSTICK, 3,600 soldiers of the British 1st Paratroop Division would drop on the Italian port of Taranto. The third part of the invasion, Operation AVALANCHE, was the largest. It involved the landing of two corps, the British X and the U.S. VI, at Salerno on 9 September. The goal was to then secure the port of Naples 30 miles to the northwest.

U.S. Navy Vice Admiral H. Kent Hewitt had overall command of the operation. U.S. Rear Admiral John L. Hall had charge of the mainly American Southern Attack Force, and Royal Navy Commodore G. N. Oliver commanded the largely British Northern Attack Force. British Navy Rear Admiral Philip Vian commanded one fleet carrier and four escort carriers assisting with air cover. In all, 627 vessels participated in the operation.

Lieutenant General Mark Clark commanded the Fifth Army, the ground force for AVALANCHE. The Fifth Army consisted of the British X Corps of the 46th and 56th Divisions and the U.S. VI Corps of the 36th and 45th Divisions. Two battalions of U.S. Rangers and two of British commandos were included to secure key passes northwest of Salerno.

The Allies expected no opposition. On 8 September 1943, hours before the assault forces landed, General Dwight D. Eisenhower broadcast that Italy had signed an armistice with the Allies. Clark fully expected to be able to secure Naples quickly and then throw a line across Italy, trapping German units between his own army and the British Eighth Army to the south. Clark decided to forego a preliminary bombardment, which meant German forces that had occupied the Italian positions were virtually undisturbed. As it evolved for the Allies, the battle was confusing and hard to control, developing its own momentum.

At 3:10 A.M. on 9 September, the Rangers began going ashore to secure the Allied northern flank. They were followed 20 minutes later by men of the U.S. 36th Infantry Division, who secured the southern flank. The British X Corps then landed between the Rangers and the 36th Infantry Division. The 56th Infantry Division secured the southern sector of the British corps area, and the 46th Infantry Division

secured the north sector. With the support of the Rangers and X Corps, British commandos were able to land at the town of Salerno itself.

On the first day, the Germans mounted only sporadic, small-scale counterattacks. German Theater commander Field Marshal Albert Kesselring immediately ordered his forces south of Salerno to withdraw from southern Italy to prevent them being cut off. The German 16th Panzer Division was to oppose the Salerno landings and prevent any Allied deep penetration there until German troops from the south became available. The Germans concentrated the limited forces initially available against the British X Corps.

On the morning of 10 September, General Clark visited both corps zones. Because VI Corps was making better progress, Clark assigned it 4 miles of the X Corps' area. This, however, stretched the Americans thin. Meanwhile, more men and equipment came ashore, although a shortage of landing craft hampered operations. Naval gunfire, however, strongly supported the troops ashore. During the Salerno operation, Allied warships fired more than 11,000 tons of shell to assist shore operations. On 11 September, German aircraft launched glide bombs at the Allied ships, damaging 2 cruisers, and other attacks followed. On 16 September, 2 glide bombs badly damaged the British battleship *Warspite*.

On 13 September, the Germans launched their first major counterattack, overrunning a battalion of the 36th Infantry Division, but they then encountered stiff resistance along the banks of the Calore River. Tank, tank-destroyer, and artillery units poured fire into the ranks of the attacking Germans, and accurate naval gunfire played an important role. With the beachhead seemingly in jeopardy, on the night of 13 September two battalions (1,300 men) of the 82nd Airborne Division were air-dropped into the 36th Infantry Division sector and quickly thrown into the line.

Throughout 14 September, German units attacked all along the line, probing for weak spots. Meanwhile, Allied aircraft pounded German lines of communication and frontline positions. Elements of the British 7th Armored Division now landed to reinforce X Corps, and the 180th Infantry Regiment landed in VI Corps' sector. That night, another 2,100 paratroopers of the 82nd Airborne Division arrived, further reinforcing the line.

Another airborne operation occurred on the night of 14 September to insert the 2nd Battalion of the 509th Parachute Infantry Regiment 20 miles north of the X Corps zone. Its assignment was to harass German lines of communications for 5 days, then either infiltrate back into the beachhead or link up with advancing units. Only 15 of the 40 transport aircraft involved dropped their men near the target area; most of the paratroopers landed far from their intended drop zones. Although the men of the battalion caused some dis-

U.S. Coast Guardsmen and men of the Navy Beach Battalion hug the beach at Paesternum, just south of Salerno, during a German bombing raid, October 1943. (Library of Congress)

ruption in the German rear areas, they paid a heavy price; of the 600 men who participated in the jump, only 400 gained friendly lines.

On 15 September, Kesselring ordered another counterattack, which failed in the teeth of the Allied reinforcement. Clark now had more than 150,000 men ashore. Meanwhile, Montgomery's Eighth Army was still 50 miles to the south, making slow progress against only light German resistance. Kesselring knew he could no longer hope to defeat the Allies at Salerno, and on 16 September the Germans began a deliberate, well-executed withdrawal northward. The Eighth and Fifth Armies finally linked up on 19 September. The Allies first entered Naples on 1 October.

The Salerno battle had been costly for both sides. The British had suffered 5,259 casualties and the Americans 1,649. German killed, wounded, and missing were 3,472. The

next target was to secure Naples. Salerno was a clear indication that much hard fighting lay ahead.

Santa Cruz Islands, Battle of the (26–27 October 1942)

Important carrier battle off the Santa Cruz Islands between the United States and Japan. The Battle of the Santa Cruz Islands was actually the fourth in a series of sea battles for control of the Solomon Islands. Japanese land forces on Guadalcanal were fighting to regain Henderson Field, and Japanese naval forces sought to establish air supremacy there. The battle occurred off the Santa Cruz Islands some 250 miles east of the Solomons. Vice Admiral William F. Halsey commanded U.S. South Pacific Forces; Rear Admiral Thomas C. Kincaid had operational command of the *Hornet* and *Enterprise*, the only two U.S. aircraft carriers left in the Pacific Theater. Vice Admiral Kondō Nobutake's task force, centered on carriers *Shokaku*, *Zuiho*, *Junyo*, and *Zuikaku*, sought to gain air superiority over Guadalcanal, assisting Japanese land forces in retaking Henderson Field.

On 26 October, Halsey moved to block the Japanese advance. He initiated the battle when he ordered U.S. naval

units to search for the Japanese. U.S. reconnaissance aircraft spotted the Japanese first, and at 7:40 A.M. dive-bombers from the *Enterprise* damaged the light Japanese carrier *Zuiho*. Japan countered with 62 Kate torpedo planes from *Shokaku* and 21 Zero fighters from *Zuikaku* and *Zuiho*. At 7:45 A.M., Kincaid sent out another force of 19 Wildcat fighters, 29 SBD dive-bombers, and 25 TBF torpedo planes.

The two strike forces spotted one another while heading toward their respective targets. Zeros attacked the *Enterprise* strike force and destroyed 8 U.S. planes without loss. After this brief fight, the Japanese aircraft continued toward the American carriers. Unfortunately for the Americans, the *Hornet*'s combat air patrol had been vectored to the wrong location. Japanese torpedo planes and dive-bombers attacked *Hornet* simultaneously. The carrier absorbed 4 bombs, 2 torpedoes, and a Japanese plane that crashed through the flight deck, whereon 2 of its bombs detonated. The *Hornet* was left dead in the water. Thirty-eight of 53 Japanese aircraft were shot down. On the other hand, U.S. aircraft hit *Shokaku*, forcing her out of the fight, and nearly hit *Zuikaku*. The American planes also damaged the heavy cruiser *Tone*.

Puffs of flak fill the sky as a Japanese bomb splashes astern of a U.S. carrier and the enemy plane pulls out of its dive above the carrier during the battle of Santa Cruz, 26 October 1942. (National Archives)

The *Hornet's* second wave of aircraft attacked the heavy cruiser *Chikuma* and killed many of her crew at their antiaircraft stations. The second Japanese strike from *Zuikaku*, divided because the Kate torpedo planes had to rearm, attacked the destroyer *Porter* at 10:00 A.M., leaving her dead in the water. They then struck the carrier *Enterprise*, which had escaped the first attack. At 10:17 A.M., 4 Japanese bombs hit the *Enterprise's* port bow and forward elevator. Thirty minutes later, the second part of the strike force struck the *Enterprise* again, with minimal success because of deadly antiaircraft fire, much of it from the battleship *South Dakota*. Japanese planes also struck the *San Juan*, but the U.S. cruiser sustained little damage. Twenty-four of 44 aircraft in the 2 Japanese strike units were shot down.

By the end of the day, the *Hornet* lay dead in the water and the *Enterprise* was out of action. Halsey now ordered a withdrawal to preserve the *Enterprise*, and Kondō pursued. The *Hornet* was under tow at 2:55 P.M. when *Junyo's* second strike wave of Kates attacked and severely damaged her. Kincaid ordered the ship scuttled. Despite 8 American torpedo hits, the carrier was still afloat when 2 Japanese destroyers finally sank her with Long Lance torpedoes at 1:35 A.M. on 27 October. Kondō then called off the pursuit.

During the withdrawal, U.S. planes hit both the Japanese destroyer *Teruzuki* and the carrier *Junyo*. The destroyer *Mahan* was another casualty of the battle. She collided with the battleship *South Dakota* and had to go to a dockyard. Kondō might have achieved a more decisive victory had he continued the pursuit, as Halsey probably would have been forced to stand and fight to protect the damaged *Enterprise*.

During the Battle of Santa Cruz, the Japanese lost 99 aircraft. Sixty-eight pilots and 77 crewmen were killed. Aircrew losses continued to affect Japan, which, unlike the United States, had no effective pilot replacement system. *Zuikaku*, *Zuiho*, and *Chikuma* were all out of action for many weeks. On the other hand, the United States lost the *Hornet* and the destroyer *Porter* (torpedoed by a Japanese submarine, probably the *I-21*), and the *Enterprise* was damaged, although she continued limited service off Guadalcanal while undergoing repairs. Eighty U.S. aircraft, 18 pilots, and 8 crewmen were lost. Although on paper the Battle of Santa Cruz was a defeat for the United States, it prevented the Japanese from disrupting U.S. land operations on Guadalcanal.

Sasaki Toichi (1886–1955)

Japanese army general. Born in Ehime Prefecture on 27 January 1886, Sasaki Toichi graduated from the Military Academy in 1905 and the War College in 1917. From 1919 to 1921, he served on the staff of the Siberian Expeditionary Army. From 1922 to 1924, he was assigned as resident officer in Guandong (Kwantung), where he developed a close relationship with Sun Yat Sen (Sun Wen) and Jiang Jieshi (Chiang Kai-shek). In 1926, Sasaki was appointed assistant military attaché in China, and in 1927, he was assigned as resident officer in Nanjing (Nanking). That same year, he took part in an operation that overthrew the military government in Beijing (Peking) that was carried out by the revolutionary government at Guandong. Sasaki had hoped the Nationalist Party would be able to achieve national reunification and sovereignty of China, establishing a cooperative relationship with Japan, but he became disillusioned when Nationalist forces massacred Japanese citizens and ransacked their residences in Nanjing in 1927 and in Jinan (Tsinan) in 1928.

In 1930, Sasaki was promoted to colonel and assigned to command the 18th Infantry Regiment. Following the Second Shanghai Incident, he was assigned to the staff of the Shanghai Expeditionary Army. In 1932, he was appointed military adviser to the Japanese puppet government of Manchouguo (Manchukuo). He next became chief adviser in 1934 and contributed to improvements in the puppet government's armed forces. Promoted to major general in 1935, Sasaki took command of the 30th Infantry Brigade in 1937. In 1938, he was promoted to lieutenant general and commanded the Military Police Corps in China. The next year, he took command of the Japanese 10th Division. In April 1941, he went on the reserve list. Recalled in July 1945, he was appointed commander of the 149th Division in China. After the war, he was arrested on charges of war crimes. Sasaki was tried and convicted and died in prison in Fushun, China, on 30 May 1955.

Saukel, Fritz (1894–1946)

German plenipotentiary for labor. Born on 27 October 1894 in Hassfurt, Bavaria, Fritz Saukel had only a secondary education before working in the merchant marine. Taken prisoner by the French in 1914 during World War I, he was not released until November 1919. Saukel joined the Nazi Party in 1923 and became Gauleiter (district leader) of Thuringia in 1927, Reich governor in 1933, and Reich defense commissioner for the Kassel Military District in 1940. He also was a Schutzstaffel (SS)-Obergruppenführer without function.

Hitler recognized Saukel's blind obedience and fanaticism and rewarded him with the position of plenipotentiary general for labor mobilization in March 1942. Saukel overhauled the erratic administration and applied an efficient system based on the forced deportation of workers from the occupied territories to Germany to work in the war machine. Saukel boasted openly that of 5 million foreign workers he had secured for the Reich, only 200,000 had come voluntarily. He fully supported the brutal methods by which they were relocated and the terrible conditions in which they lived and worked.

Arrested at the end of the war, Saukel was brought to trial at the International Military Tribunal at Nuremberg on charges of war crimes and crimes against humanity. Found guilty on 1 October 1946, he was hanged at Nuremberg on 16 October.

Savo Island, Battle of (9 August 1942)

Naval battle in the long struggle between the Japanese and the Americans for control of the Solomon Islands. On 7 August 1942, to protect the lines of communication between the United States and Australia, U.S. Marines landed on Guadalcanal and captured a nearly complete Japanese airfield. U.S.

Vice Admiral Frank Jack Fletcher commanded the landing support force. It included the aircraft carriers *Saratoga*, *Wasp*, and *Enterprise*, the battleship *North Carolina*, 5 heavy cruisers, 1 light cruiser, 16 destroyers, and 3 oilers. Rear Admiral Richmond Kelly Turner had command of the amphibious force of some 75 transports and support vessels. On the evening of 8 August, claiming inadequate fuel, Fletcher withdrew his carriers. Two days of air operations had also reduced his air strength by 21 percent, but the principal reason for the decision was that Fletcher feared the loss of his carriers in the restricted waters surrounding Guadalcanal.

British Rear Admiral Victor Crutchley commanded the screening force of cruisers and destroyers. Crutchley deployed his ships in four main groups on the night of 8–9 August to protect the transports. The U.S. cruiser *Chicago* and destroyers *Bagley* and *Patterson*, along with the Australian cruisers *Australia* and *Canberra*, patrolled the area south of Savo Island. The U.S. cruisers *Vincennes*, *Astoria*, and *Quincy* and the destroyers *Helm* and *Wilson* patrolled east of Savo Island. The U.S. cruiser *San Juan*, destroyers *Monssen* and *Buchanan*, and the Australian cruiser *Hobart* patrolled between Guadalcanal and Florida Island. A final group, mostly destroyers, remained near the transports. Finally, the American destroyers *Blue* and *Ralph Talbot* individually acted as pickets seaward of Savo Island. Within hours of the U.S. landings on 7 August, Japanese Vice Admiral Mikawa Gunichi sailed from Rabaul with the heavy cruisers *Chokai*, *Aoba*, *Furutaka*, *Kako*, and *Kinugasa* along with the light cruisers *Yubari* and *Tenryu* and the destroyer *Yunagi* to contest the Allies and attempt to destroy the transports at the landing site.

At 10:45 P.M. on 8 August, Turner called a meeting to discuss the withdrawal of Fletcher's carriers. Crutchley sailed to the meeting in the *Australia*, signaling Captain Howard D. Bode of the *Chicago* that he had tactical command. Bode never received the message. Shortly after midnight, the Japanese superior ability in night operations was confirmed when Mikawa's force slipped past the U.S. destroyer pickets undetected. The Japanese then attacked at high speed and in column. At 1:40 A.M., the *Patterson* was struck by a shell, opening the battle. Over the course of 3 minutes, the *Canberra* absorbed 24 large-caliber shells and 2 torpedo hits and was put out of the action without firing a shot. The ship sank the next day. The *Chicago* was next. A torpedo struck her bow, and a shell hit the foremast. Confused as to his position, Bode ordered the *Chicago* away from the Japanese.

Unintentionally, the Japanese then divided into 2 nearly equally strong formations. Both attacked the *Vincennes* group. In 22 minutes, all 3 U.S. cruisers were out of action, and by the next day all had sunk. Over the course of the battle, the Japanese also damaged the destroyer *Ralph Talbot*. The destroyer *Jarvis*, which had been damaged the preceding day in an air attack, sustained further punishment during the

battle. Japanese planes sank her on 9 August as she limped to Australia. At 2:40 A.M., Mikawa withdrew without attacking the transports at the landing site, which would have had a much more decisive impact on the battle for Guadalcanal. Mikawa feared reprisals from Allied aircraft, not knowing that Fletcher had already departed. In only half an hour, the Allies lost 4 heavy cruisers and 1 destroyer. Three other ships were heavily damaged; 1,023 men were dead and another 709 wounded. In return, the Japanese ships suffered some 10 shell hits, 38 dead, and 33 wounded. The only major Japanese loss came on the return, when the U.S. submarine S-38 torpedoed and sank the *Kako* as she was about to enter Kavieng harbor.

Several causes led to the Allied disaster in the Battle of Savo Island. First, the Allies ignored reports from an Australian patrol plane that had spotted Mikawa's group on 8 August and other intelligence indicating a Japanese response to the landings. Furthermore, Crutchley issued patrol plans leaving great gaps that radar could not cover in the restricted waters around Savo Island. Additionally, there was a lack of communication among the Allied ships. Each group was unaware of the location of the others. Allied sailors were also exhausted after two days at general quarters. In contrast, Mikawa concentrated his forces. Japanese sailors were fresh and superbly trained in night-fighting techniques.

There were multiple inquiries into the disaster, but none laid the blame on any one individual. Scrutiny fell on Bode, but he was not punished. Nevertheless, he committed suicide in 1943. The Battle of Savo Island was, arguably, the worst defeat ever inflicted on the U.S. Navy in a fair fight.

of Antwerp. On 4 September, after the German Fifteenth Army escaped from the Breskens pocket (formed on the mainland north of the Leopold Canal and west of Antwerp), it was disposed to hold the Scheldt estuary and prevent the Allies from opening Antwerp. German commander General Gustav von Zagen left only a rearguard on the mainland and concentrated his strength on the South Beveland and Walcheren Island, both of which formed the northern boundary of the estuary. In late September, Montgomery assigned clearing the Scheldt to the First Canadian Army, which was already engaged in taking the Channel ports, including Boulogne and Calais.

The British attacks to clear the Scheldt began in October. Canadian Lieutenant General Guy Simonds, commanding the First Canadian Army, designed the plan. Simonds had been temporarily elevated from command of the II Canadian Corps because of the illness of lieutenant general (promoted to general on 14 November) Henry Crerar. A key element in Simonds's plan was the destruction of dikes that protected Walcheren from the North Sea. This action flooded most of the island and restricted German movement and communications. Also important to the plan was the use of special equipment, including flamethrower "wasps" (converted universal carriers) and "buffaloes" (amphibious vehicles).

Simonds's plan had three phases. The first called for the 2nd Canadian Infantry Division to seal off South Beveland while the I British Corps drove northeast to cover the flanks of the II Canadian Corps and the Second British Army. The 3rd Canadian Infantry Division cleared the Breskens pocket in nearly a month of tough fighting. In the second phase, the 2nd Canadian Division and the Scottish 52nd Lowland Division took South Beveland, reaching the causeway to Walcheren at the end of October. Three attempts by the Canadians to cross the causeway ended in failure, although one did gain the other side. The Scottish Division then relieved the exhausted Canadians. In the final phase that began on 1 November, commandos amphibiously assaulted the south and west ends of Walcheren, supported by the 52nd Division in the south, which also attacked from the east. It took a week to clear all pockets of German resistance, but the parts of the island that commanded the Scheldt were taken on 3 November. Throughout the campaign, the Germans were both ably led and entrenched, providing a tough fight for the Canadians and British.

The battles to clear the Scheldt estuary cost the Allies 13,000 casualties. The first oceangoing ships arrived on 29 November. Denying the Allies use of the port for nearly three months delayed the defeat of Germany considerably. The Germans also harassed Antwerp with V-1 buzz bombs and V-2 rockets, which, however, had little effect on port operations beyond the decision to transfer ammunition resupply to other ports. The terror weapons killed many civil-

Schmid, Anton (1900–1942)

German army sergeant who was executed for assisting Jews during the Holocaust. Born in Vienna in 1900, Anton Schmid enlisted in the German army in 1938. Following the German invasion of the Soviet Union, he was assigned to the Vilnius ghetto in Lithuania in the autumn of 1941. In Vilnius, Schmid met many Jewish workers who were assigned to perform various tasks in and around his office. Shocked when he witnessed the execution of Jews a few miles from Vilnius in Ponary, Schmid resolved from that point to assist the Jews in any way possible.

Schmid hid Jews in three houses of which he had charge. He also did everything in his power to free people from the Lakishki jail. In addition, Schmid was involved with the Jewish underground, transporting members of the Resistance in his truck and supplying them with identity papers.

In January 1942, Schmid was arrested for assisting the Jews. On 25 February, he was brought before a military tribunal for his actions. Found guilty, Schmid was shot by a firing squad on 13 April 1942. Schmid is credited with saving the lives of more than 250 people. On 16 May 1967, the Israeli government posthumously awarded Schmid the "Righteous among the Nations" medal.

Scholl, Hans (1918–1944); Scholl, Sophie (1921–1944)

German resisters to the Third Reich. Hans Scholl was born on 28 September 1918. His sister, Sophie Scholl, was born on 9 May 1921 when their father, Robert Scholl, was mayor of Forchtenberg am Kocher. In late 1933, Hans Scholl joined the Hitler Youth, but he soon became disillusioned by the reality of National Socialism. In 1937, he and some of his friends were briefly jailed for "subversive activities" in the Jugendbewegung (Youth Movement).

Although Sophie joined the Bund deutscher Mädel (BdM, League of German Girls) at the age of 12, her initial enthusiasm gradually gave way to criticism. She was aware of the dissenting political views of her father, of friends, and also of some teachers. The arrest of her brother and his friends in 1937 left a strong impression on her.

In March 1937, Hans graduated from secondary school and was drafted into the Reichsarbeitsdienst (RAD, National Labor Service). Two years of military service with a cavalry unit in Bad Cannstatt followed. As a member of the armed forces, Hans began studying medicine at the University of Munich in 1939.

In the spring of 1940, Sophie Scholl became a kindergarten teacher at the Fröbel Institute in Ulm-Söflingen. She had chosen this profession hoping it would be recognized as alternate service to the RAD, membership in which was a prerequisite for university admission. However, from the spring of 1941, she served six months of auxiliary war service as a nursery teacher, and the militaristic regimen of the Labor Service convinced her to practice passive resistance.

In the summer of 1940, Hans was sent as a member of the student medical corps with the German army when it invaded France. Later that year, he returned to Munich, where he joined with Christoph Probst, Kurt Huber, Alexander Schmorell, Willi Graf, and Jürgen Wittenstein to form the "White Rose," a resistance group. These friends, later joined by popular philosophy professor Kurt Huber, formed the heart of the group. From the end of July to October 1940, Hans Scholl served as a medic on the Eastern Front.

In May 1942, Sophie joined Hans at the University of Munich as a student of biology and philosophy, and she insisted on being included in the White Rose. The group's activities included publishing leaflets calling for the restoration of democracy and social justice. During the summer of 1942, the Scholls' father was imprisoned for making a critical remark about Hitler to an employee.

Hans Scholl and Alex Schmorell wrote and duplicated "Leaflets of the White Rose," which were scathing in their criticism of Germans who did nothing to oppose the Third Reich. Three more leaflets headed "Leaflets of the Resistance" were issued, each more hard-hitting than the last. The initial two called for passive resistance in a largely abstract and philosophical way. The third essay advocated specific measures such as sabotage of armament plants, obstruction of scientific research benefiting the war effort, and boycotts of cultural institutions that enhanced the Nazi image.

After publication of the fourth pamphlet, the White Rose suspended activities because Hans Scholl, Schmorell, Graf, and Wittenstein were sent as part of a student medical unit to the Eastern Front. Their experiences in this campaign only hardened their resolve, and when they returned to Munich, they expanded the activities of the White Rose to other German universities. The leaflets were at first sent anonymously to people all over Germany. Two final leaflets appeared, one in January and the last in mid-February 1943.

All of these activities attracted the attention of the Gestapo, which found it relatively easy to track down the perpetrators. Sophie was arrested on 18 February 1943 while distributing the sixth leaflet at the University of Munich. On 22 February, Sophie, Hans, and their friend Christoph Probst were condemned to death and executed by guillotine a few hours later. Both Scholls were later hailed as martyrs by the Federal Republic of Germany and the German Democratic Republic.

Schörner, Ferdinand (1892–1973)

German field marshal. Born in Munich on 12 May 1892, Ferdinand Schörner served in the Bavarian army before attending the universities of Munich, Lausanne, and Grenoble.

Commissioned an officer in October 1914, Schörner specialized in mountain warfare. He served on both the Italian and Western Fronts in World War I and was wounded. Following the war, he fought with the Freikorps before joining the Reichswehr. Although Schörner served on the General Staff, he much preferred line service.

Lieutenant Colonel Schörner took command of the 98th Mountain Regiment in 1937. Promoted to the rank of colonel in 1939, he led his unit in the invasion of Poland in September 1939. He then commanded the 6th Mountain Division in the invasion of France and the Low Countries in May 1940. Promoted to Generalmajor (U.S. equiv. brigadier general) in August, he led the same unit in the April 1941 German invasion of Greece. Schörner's division was then transferred to the Arctic in 1941 and 1942. There he took command of Mountain Corps Norway in January 1942 as a Generalleutnant (U.S. equiv. major general). He was promoted to the rank of general of mountain troops, and his force was reorganized as the XIX Mountain Corps in June 1942. Transferred to south Russia in October 1943, Schörner took charge of Army Detachment Nikopol. Following a brief period in staff work with the High Command in March 1944, Schörner was promoted to full general. He commanded Army Group South Ukraine from March to July 1944 and Army Group North from July 1944 to January 1945.

Schörner commanded Army Group Center from January to May 1945, which he managed to keep largely intact until Germany's surrender. Promoted to field marshal in April 1945 and named in Adolf Hitler's testament to succeed Hitler as head of the Wehrmacht, Schörner caused several of his own men to be executed for cowardice. He was one of the most brutal of German army generals.

Held prisoner by the Soviets after the war, Schörner was sentenced to 25 years in prison as a war criminal, but he was released in January 1955. He returned to the Federal Republic of Germany, where he found himself accused by the Association of Returned Prisoners of War and his former chief of staff, Generalleutnant Oldwig von Narzmer, with ordering the execution of thousands of German soldiers in drumhead court-martial. In 1957, a Munich court found him guilty and sentenced him to four and a half years in prison and loss of his military pension for executing without trial a soldier found drunk at the wheel of an army truck. Veterans of the 6th Mountain Division raised the sum lost in the pension and more to give to their former commander. Following his release, Schörner lived in Munich, where he died on 2 July 1973.

Schuschnigg, Kurt von (1897–1977)

Austrian chancellor. Born in Riva (Lake Garda, today Italy) on 14 December 1897, Kurt von Schuschnigg fought in the Austro-Hungarian army during World War I. After the war, he studied law at the University of Innsbruck and became a lawyer. Schuschnigg joined the Christian Social Party and was elected to the legislature in 1927.

In 1932, Schuschnigg was appointed minister of justice. The following year, he also became minister of education in Chancellor Engelbert Dollfuss's cabinet. When Dollfuss was assassinated in July 1934, Schuschnigg became his successor. He attempted to eliminate the threat from the Heimwehr, a paramilitary rightist defense force, by disbanding it. But it was the illegal Austrian Nazi Party that represented the real danger for his government and Austria's independence. Continuing the authoritarian course of his predecessor, Schuschnigg

rejected any reconciliation with the Social Democrats to establish a common defense against German aspirations for Anschluss (union with Austria). Furthermore, Schuschnigg's sympathies with the Habsburg dynasty isolated his country among the European democracies. The situation turned hopeless when Benito Mussolini, Austria's former protector, aligned himself with Germany in the Axis alliance.

Schuschnigg capitulated to Adolf Hitler during a meeting at Berchtesgaden in February 1938. He had to promise to allow the Austrian Nazi Party a legal existence. In addition, he was forced to incorporate Nazis into his government, among them Arthur Seyss-Inquart as minister of the interior. A few days later, the Nazis began a seizure of power in the provinces. On 9 March 1938, Schuschnigg attempted to regain control by arranging for a plebiscite on Austrian independence to be held on 13 March. The German Wehrmacht invaded two days before the scheduled plebiscite, and under heavy German pressure, Schuschnigg was forced to resign and to call publicly for no resistance to the invasion.

Schuschnigg was subsequently arrested and sent to Sachsenhausen concentration camp, where he and his family received unusually comfortable treatment until they were liberated in May 1945. Both the Allies and the new Austrian government prohibited his return to Austria. Schuschnigg was a

Austrian Chancellor Kurt von Schuschnigg addresses a delegation of Boy Scouts in front of the Chancellery in Vienna. An opponent of Hitler's regime, he was imprisoned by the Nazis for the duration of the war. (Photo by Three Lions/Getty Images)

professor of international law at Saint Louis University in the United States from 1948 to 1967. He died in Mutters, Austria, on 18 November 1977.

Schweinfurt and Regensburg Raids (1943)

The attack by the U.S. Eighth Air Force on Schweinfurt and Regensburg on 17 August 1943 and the follow-up mission against Schweinfurt on 14 October 1943 were designed to halt the German war economy and vindicate U.S. commitment to unescorted daylight precision bombing. Instead, German recovery efforts and dispersal negated the impact of the attacks on the important ball-bearing plants in Schweinfurt, and Eighth Air Force aircraft losses were so high that deep-penetration missions were suspended until the bomber force could be reconstituted and long-range escort fighters could be obtained.

Lieutenant General Ira Eaker's Eighth Air Force celebrated the first anniversary of American heavy bomber operations from England in August by striking the two most critical targets on their objective list, the anti-friction-bearing

U.S. Army Air Forces B-17 bomber over Regensburg, Germany, 17 August 1943. (Bettmann/Corbis)

plants at Schweinfurt and the large Messerschmitt aircraft factory complex at Regensburg. This was the deepest penetration into Germany flown to date by U.S. bombers. The attack plan was designed to force the German fighters to meet nearly simultaneous attacks. The 3rd Bombardment Division, commanded by Brigadier General Curtis LeMay, was supposed to take off first, hit Regensburg, and then proceed to landing fields in North Africa. The 1st Bombardment Division, commanded by Brigadier General Bob Williams, was to follow about 30 minutes later; the hope was it would find its route to Schweinfurt unobstructed by enemy fighters lured away by LeMay's force.

Heavy fog ruined the well-laid plans. Because of special training and innovative assembly techniques, the 3rd Division took off in the thick cloud cover, but the 1st Division did not. LeMay's bombers could not wait around and were sent off to Regensburg. The other force did not get airborne for more than 3 hours, giving defending German fighters a chance to refuel and rearm. Escorting P-47s did not have the range to protect the bombers past Aachen on the German border, and the B-17s suffered terribly. Of the 376 that began the raid, 60 were shot down; 24 of those belonged to LeMay. Of the 146 aircraft LeMay took to Regensburg, only about half were able to fly back from North Africa. But the feisty air leader did attack Bordeaux on the way home. Bombing at Regensburg had inflicted some damage on most key buildings, but results at Schweinfurt were not as satisfactory, although some essential machinery was destroyed.

Plans for the return to Schweinfurt on 14 October were just as complicated and also were foiled by weather. A total of 149 B-17s from the 1st Division and 142 from the 3rd Division would cross enemy defenses about 30 miles apart while a third force of B-24s attacked from the south. The B-24s could not assemble properly because of bad weather and flew an uneventful feint instead. The B-17s met an unusually well-coordinated fighter defense using rockets, cannons, and bombs. The attacking force lost 59 bombers over Germany. Another bomber ditched in the English Channel, and 5 others were abandoned over England or crashed on landing. Of the 257 B-17s that made it into Germany, only 50 were not damaged by flak or fighters.

The 14 October attack caused the most damage to the ball-bearing plants of any of the 16 such U.S. Army Air Forces missions during the war. Although Allied leaders exaggerated their success, the 10 percent damage inflicted on the factories inspired the Germans to diversify and disperse their ball-bearing facilities. More important was the effect of the raid on the American bomber force. Leaders realized they could not sustain such heavy losses, and deep-penetration raids were suspended while force strength was rebuilt and long-range fighter escorts were developed. By the time the Eighth Air Force returned to Schweinfurt four months later, its

efforts to destroy the dispersed and reorganized industry were doomed to failure.

SEA LION, Operation (Planning, 1940)

German preparations for an invasion of Britain. As early as November 1939, the commander of the German navy, Grand Admiral Erich Raeder, had ordered a study of the feasibility of a landing in Britain. The study was to detail the problems the small German navy would confront in conducting an invasion in the face of the overwhelming superiority of the Royal Navy. Following the successful German occupation of Norway and the progress of the German army against France, Raeder ordered a second study and presented the results to a surprised Adolf Hitler on 4 June 1940. The Führer had not yet considered the invasion of England as a possibility.

Raeder's purpose in this case, unlike his energetic promotion of the occupation of Norway (Operation WESER), was to forestall any attempt by others to influence Hitler for a rash descent on Britain. The Naval Command still had reservations against an invasion, especially after heavy losses in the Norwegian Campaign, and Raeder continued to argue that the primary focus should remain on the surface, air, and U-boat campaign against Britain's maritime supply lines. Even with Germany's improved geographic position as a consequence of its acquisition of the French Atlantic and Channel ports, available sealift transport and landing craft were both lacking.

With the defeat of France, Hitler still held to his idea that the British would see reason and be forced to the peace table. He also feared that a total defeat of England would benefit the United States and Japan. The failure of London to respond to Hitler's peace feelers, however, led him to issue a directive on 2 July to initiate immediate preparations for an invasion. On 16 July, Hitler issued Directive 16, "On Preparation for a Landing Operation against England," which placed the navy primarily in a transport role. The key precondition for Operation SEA LION, as the invasion of Britain was to be known, projected for 15 September 1940, was German air superiority.

The German army's demand for a broad-front landing caused an intense debate with naval leaders, who preferred a narrow-front approach. Both services vigorously sought to

persuade Hitler to support their proposal. Initially, the army won support for its plans, but a compromise was eventually reached on 26 August. The army also had no real enthusiasm for an enterprise that, as Raeder lectured them, was not another river crossing. In its planning, the navy estimated that convoying 13 divisions in the initial assault wave against Britain would require 155 transports and more than 3,000 smaller craft: 1,720 barges, 470 tugs, and 1,160 motorboats. Conflicting interests and rivalries prevented any real collaboration among the army, navy, and air force.

The massive preparations undertaken by the navy to assemble the necessary landing craft have been well documented and indicate that the navy did its best to comply with the Führer's decision. However, the debate still lingers as to whether *SEA LION* was simply a propaganda ploy and a diversion for other military operations, especially as Hitler was already contemplating an invasion of the Soviet Union. Certainly, Raeder was sceptical, and he persistently pointed out the impact of the invasion preparations on the navy and maritime transportation, as well as the risks of mounting an operation and supplying an invasion force of at least 40 divisions in waters controlled by the enemy. For Raeder, *SEA LION* remained a last resort, but he loyally continued preparations. Even as he began to sense Hitler's equivocation over *SEA LION*, Raeder spoke positively of the chances for a successful landing.

On 1 August 1940, a Hitler directive ordered the Luftwaffe to switch its preinvasion tactics to a strategic air offensive and to be prepared to switch targets at any time if a new invasion date was set. The failure of the Luftwaffe to control the skies over Britain and the approach of bad weather resulted in the decision to indefinitely postpone the invasion. On 12 October, *SEA LION* was definitively deferred until the spring of 1941. Until 1942, it continued to serve as a deception.

For Hitler, *SEA LION* became a means of psychological warfare. Raeder continued to report on the navy's ongoing planning efforts (e.g., the development of new landing craft), but, as he later reflected, these had been to no effect and had needlessly tied up resources. Yet *SEA LION* had allowed Raeder to keep the navy and its needs in front of the Führer. If the navy's grand building plans in the aftermath of a defeat of the Soviet Union had been successful, no direct attack on Britain would have been necessary.

Seabees

U.S. Navy Construction Battalions. Organized during the opening days of U.S. involvement in the war, the Seabees built the infrastructure that enabled the navy to extend its operations globally during World War II. Seabees turned the jungles of the Pacific islands into the docks and air bases that allowed the United States to carry out its island-hopping and leapfrogging strategies and to conduct the strategic bombing of Japan.

As U.S. involvement in the war approached in 1941, Rear Admiral Ben Moreell saw that the continued construction of overseas bases, which would be essential to the United States in the event of war with Japan, would be in jeopardy because the civilian crews, which were prohibited from carrying weapons by international law, were at risk from enemy attack. As a solution, he advocated institution of an organization composed of skilled construction laborers who were naval personnel. After the labor unions protested that these battalions would take work away from civilian construction workers, Moreell agreed that his units would only serve overseas, leaving stateside construction for civilian contractors.

On 2 January 1942, Congress authorized the organization of Naval Construction Battalions, the nickname "Seabee" being derived from the initials. The Seabee symbol was a flying fighting bee wearing a sailor cap and carrying a machine gun, wrench, and hammer. The slogan of the Seabees was *Construimus, Batiumus* (we build, we fight).

In a change from other navy units, Seabees were commanded by officers of the Civil Engineering Corps (CEC) who were trained for construction work. The 250,000 men and 8,000 officers who became Seabees were the men who had built American subways and skyscrapers. Seabees were recruited based on their civilian skills and experience in more than 60 skilled trades. Because experience was the key factor, normal physical standards applied to fighting men were relaxed. Seabees ranged in age from 18 to 50, with the average being 37. There were reports that some Seabees were as old as 60. Seabees also received higher pay than the average enlisted man; their pay was equivalent at least to that of petty officers. Because their primary mission was to build, not fight, the Seabees spent only three weeks at boot camp and received only basic small-arms training.

Seabees served in all the war theaters and took part in most of the major operations, but the majority of them served in the South Pacific Theater. They built new naval bases and additions to existing ones, docks, staging facilities, warehouses, hospitals, roads, and airstrips. Aided by such innovations as Marston mats, Quonset huts, and prefabricated buildings, Seabee units were able to construct large air bases

The Black Seabees, members of Naval Construction Battalions, whose training centers were at Camp Allen and Camp Bradford, near Norfolk, Virginia, ca. 1942. Training included landing tactics as well as general military drills. (National Archives)

in a matter of days. Special battalions were also organized, known as Seabee Special Battalions. The first Seabee Special Battalion was composed of enlisted men trained as stevedores and longshoremen to unload the ships in combat zones. Among other units were those that maintained the bases, repaired tires, built pontoon bridges, drove trucks, and handled the transportation and storage of fuel. Although they were not organized as a fighting unit, individual Seabees received 33 Silver Stars and 5 Navy Crosses during the war.

Sedan, Battle of (14 May 1940)

Site of the German army breakthrough during the Battle for France on 14 May 1940. Located north of the Maginot Line and astride the Meuse River, the city of Sedan was in a poorly defended sector. It served as the pivot point for the German envelopment of Allied forces in the Low Countries under the German operations plan *SICHELSCHNITT* (CUT OF THE SICKLE).

While the German attack into the Low Countries drew the British Expeditionary Force (BEF) and principal French armies into Belgium, Panzer Group Paul von Kleist quietly moved through the Ardennes with the first units of general of panzer troops Heinz Guderian's XIX Panzer Corps arriving opposite at Sedan on the evening of 12 May. General Charles Huntziger's French Second Army defended the Sedan vicinity, but it was not unduly alarmed by the German arrival.

Preceded by a very accurate and demoralizing five-hour bombing attack of French defensive positions conducted principally by Ju-87 Stuka dive-bombers, on 13 May German infantry and motorcyclists succeeded in crossing the Meuse east and west of Sedan. The French defenders, consisting

mostly of new reservists, were surprised by the rapid German river crossing. Despite the lack of reserves and insufficient artillery and air support, the French resisted fiercely, but they were gradually driven back. By the end of 13 May, the Germans had secured a bridgehead 3 miles wide and 6 miles deep. German military engineers worked feverishly to construct pontoon bridges and tank ferries.

The commander of the French 55th Infantry Division at Sedan, Général de Division Henri Jean Lafontaine, remained calm and prepared to continue the fight. Unfortunately, others were not so determined. To the north, General André Georges Corap's French Ninth Army had already retreated, leaving the Second Army's flank exposed. Within the French Second Army, some commanders, believing that the Germans had already penetrated the French positions, ordered their units to retreat. The retreat of these units started a panic within the French forces. Despite this, the French sent two tank battalions and two infantry regiments to counterattack the bridgehead. The French attempted a two-pronged counterattack on 14 May with their 1st, 2nd, and 3rd Armored Divisions, but only the 3rd was able to reach a part of Guderian's forces. The French armored unit lacked the tactical flexibility to mount an effective attack and suffered heavy casualties, not to German armor but to the antitank guns of the German assault engineers. After losing half of their tanks, the French withdrew. Repeated air attacks by French and British bombers throughout the day achieved little and brought heavy air losses for the attackers.

By the end of 14 May, the French defenders were in complete disarray. The French 55th and 71st Infantry Divisions sustained heavy casualties and fled the battlefield, causing panic in the neighboring French X Corps. The German bridgehead was 30 miles wide and 15 miles deep. The Germans also held the key terrain, which denied the French the ability to mount an effective counterattack.

During the course of the battle, the realistic training and combat experience of the German forces proved decisive. German commanders were aggressive and rapidly pursued any advantage they discovered. Their use of combined arms gave them an unmatched tactical flexibility and agility and allowed them to constantly outmaneuver and destroy the French forces piecemeal. By 15 May, Guderian's forces were across the Meuse River in strength and ready to exploit the opening they had punched in the French defenses.

Selective Service Act (Burke-Wadsworth Act, September 1940)

U.S. conscription legislation passed more than a year before American intervention in World War II. In mid-July 1940, German troops had overrun France and the Low Countries. During a speech accepting the Democratic nomination for a third term, U.S. President Franklin D. Roosevelt expressed support for a draft bill that would make all young American men liable for military service. This action took some political courage, as Roosevelt was running for reelection in a campaign that would be dominated by the issue of peace. Although most Americans supported the Allies, they also feared intervention in the war and hoped that aid to Britain would suffice to check Germany. At this time, Roosevelt himself publicly argued that substantial increases in U.S. military forces were necessary primarily to defend U.S. interests in the Western Hemisphere and deter outside aggressors.

President Franklin D. Roosevelt signing the Burke-Wadsworth Selective Service Act into law, 1 January 1940. (Photo by Thomas D. Mcavoy/Time Life Pictures/Getty Images)

The eventual legislation's drafting and passage relied heavily on lobbying and publicity by a small group of dedicated pro-Allied eastern patricians who consciously looked back to the comparable efforts they had undertaken for World War I mobilization. They worked closely with sympathetic politicians, notably Senator Edward R. Burke and Congressman James W. Wadsworth, who sponsored the bill that eventually emerged, and consulted incessantly with military leaders, including army chief of staff General George C. Marshall. After considerable debate, Congress passed a Selective Service Act in September 1940, the first peacetime draft in U.S. history, to raise an army of no more than 900,000 men. Initially, the draft was restricted to men between the ages of 21 and 35. Terms of service were to be 12 months rather than the 18 months the army originally sought, and deployment was to be limited to the Western Hemisphere.

As the international situation deteriorated, in August 1941 Congress, by a one-vote margin, removed these restrictions. Between Pearl Harbor and 1945 almost 10 million Americans were inducted into the military under this legislation. The original Selective Service Act expired in 1947, although Cold War tensions caused the passage of replacement legislation in 1948.

Sevastopol, Battle for (30 October 1941–4 July 1942)

One of the great battles on the Eastern Front. Sevastopol is located on the southwestern tip of the Crimean Peninsula. In 1941, it was one of the world's most powerful fortresses and home to the Soviet Black Sea Fleet. Its location made any approach to the city difficult, and it was strongly defended by large concrete bunkers, minefields, and a dozen naval gun batteries containing 42 heavy guns ranging from 152 mm to 304 mm in caliber.

Securing Sevastopol was a major German military objective. By taking the entire Crimean Peninsula with Sevastopol,

Hitler sought to deny the Red Air Force the ability to strike the Ploesti oil fields, which were vital to the German war effort. He also hoped that destruction of the Soviet Black Sea Fleet might bring neutral Turkey into the war against the Soviet Union. Hitler was determined to have Sevastopol, but Stalin was just as determined to hold it. In Soviet hands, it could threaten any further German advance into the southern Soviet Union.

Sevastopol came under air attack in the first hours of the German invasion of 22 June 1941. From late September to mid-November, Lieutenant General Erich von Manstein's Eleventh Army overran the entire Crimean Peninsula save for Sevastopol. Meanwhile, during the last two weeks of October, the Soviets reinforced the base, sending to Sevastopol by sea from Odessa the remains of Major General I. Y. Petrov's Independent Maritime Army, some 32,000 men. Petrov, who took command of all ground forces at Sevastopol, immediately set his men to work building three defensive lines, the most northerly of which was 10 miles from the fortress. Vice Admiral F. S. Oktyabrsky had overall command of Sevastopol and used his cruisers and destroyers to bring in supplies from Novorossisk, which they could reach overnight. In all, Oktyabrsky commanded about 102,000 men. Manstein had the smallest German army on the Eastern Front—seven divisions comprising about 100,000 troops—but with more guns and many more aircraft. There were few tanks on either side.

The siege itself began on 30 October, when Manstein mounted the first effort to break through the well-fortified Soviet lines. After three weeks, the attack had barely penetrated the Soviet defenses and was halted. On 17 December, the Germans launched a second and more intense attack that breached the three defensive lines and pushed to within five miles of the city. The Soviets, however, fought for every inch of ground. The rainy and cold weather became a serious problem for the Germans, who were ill-prepared in summer uniforms.

The fighting was bitter, and tunnels deep below ground helped the Soviets survive. On 26 December, Soviet forces landed on the Kerch Peninsula to the east, diverting German troops. By mid-January, the Germans were again forced to discontinue the attack. For a few months that winter, the population of Sevastopol believed they had won the battle, and life in the city even began to return to some semblance of normalcy.

It was not to be. Stavka, the Soviet High Command, activated the Crimea Front under Major General D. T. Kozlov and ordered him to deploy three armies on the Kerch Peninsula, which was possible in winter when the Kerch Strait was frozen solid. When good weather returned in the spring, Manstein dealt with Kozlov, committing 5 German and 2 Romanian infantry divisions and a German panzer division against Kozlov's 21 infantry divisions and 4 tank brigades. A

A group of Soviet soldiers rests on a pile of rubble in the ruined streets of Sevastopol during the hard-fought battles there in 1942. (Hulton-Deutsch Collection/Corbis)

German amphibious landing unhinged Kozlov's defenders and led to the surrender of more than 170,000 Red Army troops. Manstein now returned to the conquest of Sevastopol, which Hitler insisted be taken.

On 2 June, the Germans used 700 guns to begin the systematic reduction of the massive Soviet forts. The German artillery included some three dozen very heavy siege guns that had been specially developed to reduce the French Maginot Line, ranging in size from 280 mm to 800 mm (10.9 inches to 31 inches). The largest of these, the "Dora" Gustav Gun, was in fact the largest artillery piece of all time.

Manstein opened a third assault by four divisions from the north on 7 June, but it failed to break through the defenders, who from tunnels and caves continued an effective resistance with small arms. On 11 June, three German divisions attacked on the southeast but also made little headway. After two weeks of fighting, the Germans were on the shore of Severnaya Bay north of Sevastopol and at the Sapun Heights to the southeast. The last Soviet reinforcements arrived between 22 and 26 June. Thereafter, the only links between Sevastopol and the outside world were by submarine and air. Waves of German bombers leveled the city and naval base, in a week dropping some 50,000 bombs.

A surprise German assault by boat across the bay on 28 June shattered the defenders, and beginning on the night of 30 June, Admiral Oktyabrsky, Petrov, and a few hundred top Soviet military, party, and government personnel were evacuated by air. Fighting ended on 4 July 1942. The Germans claimed 92,000 Soviet prisoners taken, along with 460 guns, but they suffered 24,000 casualties of their own in the June and July fighting alone. An overjoyed Hitler promoted Manstein to field marshal. Manstein had indeed achieved much, given the difficult terrain and weather and the defenders' determination. Hitler then transferred Eleventh Army north to Leningrad, a decision that adversely affected the German army in its drive on Stalingrad later that year.

The Soviets retook Sevastopol in May 1944. Then the situation was reversed, with the German Seventeenth Army defending the city and the Soviets attacking. Although the Germans evacuated 38,000 troops by sea, the Soviets claimed 100,000 others killed and captured. After the long siege and this battle, little was left of Sevastopol itself.

Shanghai, Battle of (13 August–9 November 1937)

First major battle of the Sino-Japanese War of 1937–1945. Formal war between Japan and China developed rather unexpectedly from a clash on 7 July 1937 between Japanese and Chinese troops near the historic Lugouqiao (Lukouch'iao) Marco Polo Bridge, a major railroad artery 10 miles from Beijing (Peking) in Hebei (Hopeh) Province. Chinese and Japanese officials deadlocked when they tried to reach an appropriate settlement that would cover not just this particular incident, but govern overall Sino-Japanese relations.

As the situation deteriorated, Japanese troops seized control of the Beijing-Tianjin (Tientsin) area. On 7 August, Jiang Jieshi (Chiang Kai-shek), the Guomindang (GMD [Kuomintang, KMT], Nationalist) president of China, decided to retaliate by attacking Japanese forces stationed at the Japanese settlement in Shanghai in Jiangsu (Kiangsu), China's leading port and major international commercial center. Japan and several prominent western powers each administered part of an area of the city called the International Settlement, where their nationals enjoyed special extraterritorial privileges. To protect these rights, the Japanese government had installed its own garrison, a force expanded after the Lugouqiao/Marco Polo Bridge clash. Meanwhile, top Japanese naval officials urged forceful action in the Shanghai area, a hotbed of Chinese nationalist sentiment. At this sensitive time, moreover, several Japanese warships—together with naval vessels of other foreign nations—were moored in Shanghai harbor. The situation in Shanghai grew increasingly explosive, and on 9 August, Chinese soldiers killed two Japanese marines.

Jiang believed that the constricted conditions of street fighting in Shanghai would minimize Japanese superiority in logistics, tanks, and artillery and that the urban location

would prove more advantageous to his own forces than the northern Chinese plains, the focus to date of Sino-Japanese military confrontation. By diverting Japanese attention to central China, he also hoped to allow beleaguered northern Chinese military units to regroup. On 11 August, Jiang ordered his troops to positions within the greater Shanghai area, carefully avoiding the foreign sections of the city. Japanese commanders rushed reinforcements to Shanghai, but when battle began on 13 August, a mere 12,000 Japanese soldiers faced 80,000 Chinese. For a week, the battle hung in the balance, as Chinese units came close to driving their enemy into the Huangpu (Whampoa) River.

From 20 August, Japanese reinforcements arrived en masse by sea, landing on the banks of the Changjiang (Yangzi) River and mounting what quickly became a siege of Shanghai. The Chinese government likewise poured men into Shanghai, where heavy fighting continued for almost three months, as both sides struggled for control of the city. Combat was brutal. On 14 August, Chinese warplanes tried to bomb Japanese naval vessels in Shanghai harbor, but they only succeeded in hitting civilian areas of the city. Japanese warships in the Changjiang and Huangpu Rivers responded with heavy point-blank fire against Nationalist positions, which continued throughout the battle. During the siege, a stray shell hit the U.S. cruiser *Augusta*, killing a crewman and wounding 18 others.

Hoping that the influential foreign residents of the city's International Settlement might conceivably serve as mediators and perhaps win overseas support for China, Jiang ordered Shanghai's defenders to hold out to the end, and for several weeks of bitter house-to-house fighting they did so. Between August and November 1937, 270,000 Chinese troops—constituting 60 percent of the city's Nationalist garrison and the core of Jiang's newly modernized Chinese army—were killed or wounded in the fighting, along with many thousands of civilians. Japanese casualties totaled some 40,000. Much of Shanghai was devastated, although both sides left the foreign settlements undisturbed.

At the beginning of November, a Japanese amphibious force landed at Hangzhou (Hangchow) Bay 50 miles from Shanghai, threatening the city's rear. In what swiftly became a disorganized rout, Chinese forces evacuated Shanghai. Instead of retreating to newly built fortifications along the Shanghai-Nanjing (Nanking) railway line, they fell back further on Nanjing, the Nationalist capital, which became the next Japanese target.

Jiang's decision to launch the battle of Shanghai marked a deliberate extension to central China of Sino-Japanese conflict. It was a major strategic shift reflecting Jiang's new determination, after the Xi'an (Sian) Incident in Shaanxi (Shensi) and his rapprochement with the Communists, to move to outright opposition toward further Japanese incursions. It

Japanese troops fight from behind barricades in Shanghai, 1937. (Corbis)

also constituted the real beginning of the Sino-Japanese War, which would last a further eight years.

Shaposhnikov, Boris Mikhailovich (1882–1945)

Marshal of the Soviet Union. Born in Zlatoust in the southern Urals on 2 October 1882, Boris Shaposhnikov began his military career in the Russian Imperial Army as a private in 1901. He became an officer two years later on graduation from the Moscow Military College. In 1910, after graduation from the General Staff Academy, he served in the Tashkent Military District and in Russian Poland. During World War I, he

served in Galicia, and in 1917, he was promoted to colonel and given command of a grenadier regiment.

Shaposhnikov joined the Red Army in 1918 after the Bolshevik Revolution and served on its field staff during the Russian Civil War. In 1923, he published his first book, *The Cavalry*; shortly thereafter, he published *The Vistula: The History of the 1920 Campaign*. He was an assistant to chief of staff M. V. Frunze by April 1924. In 1926, Shaposhnikov took command of the Leningrad Military District. He became known internationally for his three-volume study *The Brain of the Army* (1927–1929), in which he argued that the General Staff should be the sole agency directing the Red Army.

Long considered politically suspect, Shaposhnikov was admitted to Communist Party membership in 1930; the usual probationary period was waived. From 1928 to 1931, he was head of the Red Army staff. He was demoted in 1931, allegedly because he published an account of the Civil War that gave Leon Trotsky more credit than Josef Stalin could abide. From 1931 to 1937, Shaposhnikov was successively commander of the Volga Military District, chief of the Frunze Military Academy, and commander of the Leningrad Military District. Shaposhnikov then served on the board that helped purge the Red Army in 1937. One of those purged was his successor as chief of the General Staff, Marshal Mikhail Tukhachevsky.

Appointed chief of staff of the army and deputy commissar of defense in May 1937, Shaposhnikov did what he could to modernize and improve the Red Army, although much of his work in this regard was blocked by the opposition of Stalin and others. He also was unable to prevent the disbanding of seven mechanized corps in November 1939, despite Colonel General Georgii Zhukov's success with armor in the Battle of Khalkin-Gol in Manchuria.

Shaposhnikov drew up the plans for the Soviet occupation of eastern Poland at the beginning of World War II and the belated successful offensive in the Soviet-Finnish War (Stalin at first ignored his counsel). Promoted to marshal of the Soviet Union in May 1940, Shaposhnikov relinquished the post of chief of staff because of poor health, although he retained the position as deputy defense commissar.

On the eve of the German attack, Shaposhnikov urged Stalin to abandon forward positions in Poland in favor of the Stalin Line along the Soviet Union's former border. Stalin dismissed Shaposhnikov from his posts for this advice. With the German invasion, Stalin reinstated Shaposhnikov as chief of the General Staff on 29 July 1941 in a reorganized Stavka that apparently followed the form suggested by Shaposhnikov in his study *The Brain of the Army*. Although ill, Shaposhnikov nonetheless played an important role in planning the Soviet defense of Moscow and the subsequent Soviet counterattack. In June 1942, he advised against an attack on Kharkov as being premature. He left his post as chief of the General Staff for reasons of health on 26 June 1942. Although still ill, he

remained on the Stavka and as deputy commissar of defense. In June 1943, he became commandant of the Voroshilov Military Academy. He continued to hold this post and serve on the Stavka until his death in Moscow on 26 March 1945.

Shepherd, Lemuel C., Jr. (1896–1990)

U.S. Marine Corps general. Born on 10 February 1896 in Norfolk, Virginia, Lemuel Shepherd graduated from the Virginia Military Institute and was commissioned a second lieutenant in the Marine Corps in April 1917. As a member of the 5th Marine Regiment during World War I, Shepherd participated in all the major U.S. actions and was wounded three times.

After the war, Shepherd served in Brazil, China, and Haiti. In 1937, he graduated from the Naval War College and then commanded the 2nd Battalion, 5th Marine Regiment, which developed amphibious tactics and techniques. In June 1939, Shepherd served on the staff of the Marine Corps Schools. In March 1942, he assumed command of the 9th Marine Regiment. After organizing and training the regiment, he deployed with it to the Pacific as part of the 3rd Marine Division. In July 1943, while serving on Guadalcanal, Shepherd was promoted to brigadier general and was assigned as assistant commander of the 1st Marine Division. From December 1943 through March 1944, he participated in the Cape Gloucester operation on New Britain. Shepherd assumed command of the 1st Provisional Marine Brigade in May 1944 and led it in the recapture of Guam in July and August 1944. Following this operation, Shepherd was promoted to major general and charged with expanding the brigade into the 6th Marine Division, which he led in the assault and occupation of Okinawa from April to June 1945. He next took his division to Tsingtao, China, where he received the surrender of Japanese forces in that area on 25 October 1945.

In 1946, Shepherd was appointed assistant commandant of the Marine Corps. He headed the 1946 board that recom-

U.S. Marine Major General Lemuel Shepherd, commanding general of the 6th Marine Division, on Okinawa in June 1945. (Corbis)

mended the helicopter as the future Marine Corps amphibious assault vehicle. From 1948 to 1950, Shepherd was commandant of the Marine Corps Schools. In 1950, he took command of Fleet Marine Forces in the Pacific and participated in the Inchon landing during the Korean War. In January 1952, Shepherd became the commandant of the Marine Corps, a position he held until his retirement in January 1956. Two months after his retirement, he was recalled to active duty and appointed chairman of the Inter-American Defense Board, a position he held until September 1959. Shepherd died at La Jolla, California, on 6 August 1990.

Sherman, Forrest Percival (1896–1951)

Admiral in the U.S. Navy. Born in Merrimack, New Hampshire, on 30 October 1896, Forrest Sherman graduated second in his class in 1917 from the U.S. Naval Academy. From then onward he won a reputation as a brilliant, cerebral tactician and skilled mediator. In 1922, he became a naval aviator, and his subsequent career assignments focused heavily on aviation. In 1932, he commanded Fighting Squadron 1 aboard the *Saratoga*. From 1933 to 1936, he was director of the Board of Ordnance's Aviation Ordnance Section, and from 1937 to 1940 he was aviation officer of the U.S. Fleet.

In 1940, Sherman joined the War Plans Division, drafting plans for hemispheric defense, serving on the U.S.-Canadian Permanent Joint Board of Defense, and attending the August 1941 Atlantic Charter conference. Promoted to captain, in May 1942 Sherman assumed command of the aircraft carrier *Wasp*, but he lost his ship to the Japanese submarine *I-19* on 15 September 1942 during the Battle of Guadalcanal, winning the Navy Cross for “extraordinary heroism.”

Sherman then spent a year at Pearl Harbor as chief of staff to Vice Admiral John H. Towers, commander of the Pacific

Admiral Forrest Sherman, chief of naval operations, November 1949. (Bettmann/Corbis)

Fleet's air elements. His talent for staff work, including operational planning, force deployment, and logistical support, caused Admiral Chester W. Nimitz, commander U.S. Forces, Pacific Ocean Area, to appoint Sherman his planning officer as a rear admiral. As deputy chief of staff (plans), Sherman devised and implemented much of Nimitz's strategy in the Pacific Theater, including which specific islands would be attacked or bypassed. He also sometimes represented Nimitz, always ably, before the Joint Chiefs of Staff in Washington. He stood beside Nimitz and Admiral William Halsey at the Japanese surrender ceremonies of September 1945.

Returning to Washington, Sherman was promoted to vice admiral in December 1945. As deputy chief of naval operations, he became heavily involved in formulating both unification of the armed forces and Cold War strategy. After emphasizing to President Harry S Truman the potential Soviet threat in the Mediterranean, an important influence in the formulation of the Truman Doctrine of February 1947, Sherman became the first commander of the new U.S. Naval Forces, Mediterranean. In November 1949, Sherman became chief of naval operations as a full admiral. He supported U.S. intervention in the Korean War and proposed the successful naval blockade of North Korea. He also gave cautious approval to the September 1950 Inchon landing and backed Truman in his relief of general of the army Douglas MacArthur and the primacy of Europe in U.S. defense planning. While on a diplomatic assignment to Naples, Italy, Sherman suffered a fatal heart attack on 22 July 1951.

Shimada, Shigetaro (1883–1976)

Japanese navy admiral, minister of the navy, and chief of the navy General Staff. Born in Tokyo on 24 September 1883, Shimada Shigetaro graduated from the Naval Academy in 1904 and participated in the 1904–1905 Russo-Japanese War. Fol-

Japanese Admiral Shimada Shigetaro. (Photo by Carl Mydans/Time Life Pictures/Getty Images)

lowing the war, he entered the Gunnery School and became a gunnery officer. From 1916 to 1919, Shimada was in Italy first as a resident officer, then as assistant attaché, and later as attaché.

In 1904, Shimada joined the navy General Staff and became an instructor at the Naval War College. Promoted to captain in 1928, he commanded first the cruiser *Tama* and then the battleship *Hiei* (1928). Following promotion to rear admiral in 1929, Shimada became chief of staff of the Second Fleet and then chief of staff of the Grand Fleet in 1930. In 1931, he became the director of the Submarine School, and in 1932, he was chief of staff of the Third Fleet. He next held various posts on the navy General Staff. Promoted to vice admiral in 1934, Shimada became the deputy chief of the Naval Staff until he was assigned as commander of the Second Fleet in 1937. Promoted to admiral in 1940, Shimada became the commander in chief of the China Fleet, and later he served as the commander in chief of the Kure and Yokosuka Naval Districts.

In October 1941, Shimada became minister of the navy in the cabinet of Prime Minister Tōjō Hideki, who had rejected the first candidate, Admiral Toyoda Soemu, who was known to be "anti-army." Shimada owed his appointment to his ability to get along with those around him. Although he shared the

navy's reluctance to go to war against the United States, he found that it was impossible to swim against the tide and followed Tōjō's policies. In February 1944, Shimada assumed the office of chief of the navy General Staff, tasked with Tōjō's demand to conduct the war at sea more effectively. From that date, Shimada concurrently held the offices of minister of the navy and chief of the navy General Staff. Navy and intellectual circles denigrated him, whispering that "Shimada is Tōjō's puppet." Following the loss of Saipan, in July 1944 Tōjō reluctantly ordered Shimada to resign before resigning himself.

In January 1945, Shimada went on the reserve list. After the war, Shimada was arrested by Allied authorities as a Class A war criminal. Tried and convicted by the International Military Tribunal for the Far East, he was sentenced to life in prison, but he was released in 1956. Shimada died in Tokyo on 7 June 1976.

U.S. Lieutenant General Walter C. Short, military governor of Hawaii, 5 January 1941. (Bettmann/Corbis)

Short, Walter Campbell (1880–1949)

U.S. Army general. Born in Fillmore, Illinois, on 30 March 1880, Walter Short graduated from the University of Illinois in 1901 and was commissioned a second lieutenant in the U.S. Army in 1902. He served in the Philippines and participated in the 1916–1917 Punitive Expedition into Mexico. He went to France following U.S. entry into World War I and served in staff positions, rising to the rank of temporary colonel.

After the war, Short reverted to his permanent rank of captain. He then served with the Far Eastern Section of the Military Intelligence Division. Short was an instructor at the Command and General Staff College (1919–1922 and 1929–1930) and graduated from the Army War College in 1925. He was promoted to colonel in 1934 and commanded the 6th Infantry Regiment. In 1936, he became the assistant commandant of the Infantry School at Fort Benning, Georgia. Promoted to brigadier general in 1937, he commanded a brigade of the 1st Division and then commanded that division (1938–1940). Promoted to major general in 1940, he commanded I Corps.

Widely respected in the army as an expert trainer, in January 1941 Short was appointed to head the Hawaiian Department, and the next month he was promoted to temporary lieutenant general. As relations between the United States and Japan deteriorated in 1941, Short worked feverishly to strengthen Hawaii's defenses, focusing on accelerated train-

ing of his units and antisabotage measures. Despite warnings from Washington that war with Japan was possible, he was caught off guard by the attack against Pearl Harbor on 7 December 1941, apparently because he believed that if war came it would break out first in Southeast Asia.

Both Short and Admiral Husband E. Kimmel, commander of the U.S. Pacific Fleet, were blamed for the poor state of U.S. preparedness to meet the Japanese attack, and both men were relieved of their commands shortly after the attack. Short was reduced to major general, and in February 1942, under pressure, he retired from the army. A special investigating committee that year blamed both Short and Kimmel for failing to defend the Hawaiian Islands adequately from attack despite repeated warnings from the War and Navy Departments. Although there were some calls for courts-martial, the secretaries of war and the navy both decided there was no evidence to justify such a trial.

Congressional hearings into the Pearl Harbor attack continued after the war. In 1947, Short accused the War Department of making him a scapegoat for the attack. He admitted to underestimating the possibility of a Japanese strike, but he blamed officials in Washington for withholding critical intelligence about Japanese intentions. Short went to work for Ford Motor Company and died in Dallas, Texas, on 3 September

1949. There are ongoing efforts to restore Short posthumously to the rank of lieutenant general.

**Shtemenko, Sergei Matveevich
(1907–1976)**

Marshal of the Soviet Union. Born into a peasant family in Volgograd Oblast on 20 February 1907, Sergei Shtemenko joined the Red Army in 1926 and became a member of the Communist Party in 1930. Graduating from the Academy of Motorization and Mechanization, he commanded an independent heavy-tank training battalion near Zhitomir. He went to the General Staff Academy in September 1938. Before graduation

Marshal of the Soviet Union Sergei Shtemenko, shown here in 1956. (Yevgeny Khaldei/Corbis)

in 1940, Shtemenko's class was assigned in August 1939 to the Operations Department of the General Staff to prepare for the Soviet occupation of eastern Poland and, later, to work on preparations for the Soviet invasion of Finland.

On graduation, Shtemenko was reassigned to the General Staff, despite his request to command a mechanized unit. Shtemenko then worked in the Office of Operations as a senior assistant to the section chief in 1940, moving up to deputy chief by August 1941. When the Germans invaded the Soviet Union on 22 June 1941, he was appointed a section chief. General Alexi Antonov made Shtemenko his deputy in April 1941. He succeeded Antonov as chief of the Operations Directorate in May 1943, a post he held until April 1946.

Shtemenko successfully organized the operations of the Transcaucasus Front (army group) in 1942 and subsequently for the Black Sea and Northern Fronts. As chief, he was involved in planning for all fronts, and he played a key role in the planning for Operation BAGRATION against German Army Group Center and in the campaign against Berlin. By war's end, he was a colonel general.

In his subsequent two-volume work *The Soviet General Staff at War*, Shtemenko stressed the need for creativity in the direction of war. A genuine admirer of Josef Stalin, Shtemenko frequently praised the Soviet leader's role in the war. In November 1948, Shtemenko was promoted to general of the army. He then served as Soviet deputy prime minister, and in September 1952, he became a candidate member of the Central Committee. Two months later, however, he was replaced by General Vasily Sokolovsky and assigned to Germany as chief of staff of the occupation forces. Shtemenko was demoted in 1953 after Stalin's death but promoted again in 1956 after three years of obscurity when Marshal Georgii Zhukov, who refers to Shtemenko in his reminiscences as an "outstanding strategist," returned to prominence. Shtemenko was demoted again in 1957 and then was again promoted to general of the army in February 1968. Within six months of that promotion, he was appointed chief of staff of Warsaw Pact forces. He planned the Soviet bloc invasion of Czechoslovakia that year. Shtemenko retired in 1975 and died in Moscow on 23 April 1976.

Shuttle Bombing, Soviet Union (June–August 1944)

U.S.-Soviet collaboration designed to allow American bombers to hit German targets too deep to be attacked from normal operating bases. The concept of shuttle bombing was tested in 1943 in flights between bases in Britain and North Africa, including the Schweinfurt-Regensburg mission on 17 August 1943. Code-named Operation FRANTIC, the shuttle-bombing operation allowed U.S. bombers to fly missions from bases in Britain and Italy and land at bases in the Soviet Union. The planes could then fly missions from Soviet bases and also carry out missions during their return flights to U.S. air bases in Britain and Italy.

Senior U.S. commanders hoped that these missions would force the Germans to disperse their air defense forces, lead to a better Soviet understanding of the value of strategic bombing, and establish a more collaborative relationship between the U.S. and Soviet militaries. Leaders of the U.S. Army Air Forces (USAAF) also hoped that an improved relationship with the Soviets might lead to U.S. use of airfields in the Soviet Far East for shuttle attacks against Japan. Following extended negotiations, including approval from Soviet leader Josef Stalin at the Tehran Conference in December 1943, the Soviets committed themselves to support the plan by making available airfields at Poltava, Mirgorod, and Piryatin. USAAF personnel worked hard to make the concept of shuttle operations succeed despite considerable restrictions placed by Soviet authorities on support personnel, logistical operations, and communications support.

On 2 June 1944, the Fifteenth Air Force in Italy flew Operation FRANTIC's first mission. It involved 130 B-17 bombers and 70 P-51 escort fighters, with a successful strike on rail yards at Debrecen, Hungary, en route to the Soviet bases. A strike from these bases inflicted damage on an airfield at Galatz, Romania, on 6 June. During the return flight to Italy on 11 June, the bombers successfully attacked an airfield at Foscani, Romania.

The first Eighth Air Force mission from Britain was held on 21 June 1944. It hit its designated target, a synthetic-oil plant near Berlin, but German aircraft shadowed the bombers to Poltava and conducted an air raid on the base that night, destroying 43 B-17s and damaging another 26. The surviving and repaired bombers attacked a synthetic-oil plant near Drohabyz, Poland, on their flight to Fifteenth Air Force bases in Italy on 26 June. These aircraft flew a combined mission with Fifteenth Air Force units and then returned to their bases in Britain.

The Eighth Air Force then performed shuttle-bombing missions on 6–8 August and on 11–13 September. The August mis-

Bombs being loaded into a U.S. B-24 Liberator bomber for a strike against the Axis Powers. (Hulton-Deutsch Collection/Corbis)

sion attacked an aircraft plant at Gdynia, Poland, en route to the Soviet bases; successfully hit oil refineries at Trzebinia, Poland, the following day; and then bombed airfields in Romania en route to bases in Italy, followed by return flights to Britain. The September mission involved an attack on an armaments factory at Chemnitz during the flight to Russia and a strike on steel works at Diosgyor, Hungary, on the leg out to Italy. The only other Fifteenth Air Force shuttle operations were fighter-bomber sweeps in late July (P-38 and P-51 raids on Romanian airfields) and in early August (P-38 raids on Romanian airfields and railroads in support of Soviet operations). Also, 117 F-5 (camera-equipped P-38) photoreconnaissance missions were flown to or from Soviet bases between 2 June and 19 September 1944. The last shuttle operation of *FRANTIC* was a resupply effort on 18 September to support the Polish Home Army uprising in Warsaw by 107 B-17s with P-51 fighter escorts.

Because of Soviet resistance to continuing the shuttle missions, by late October 1944 U.S. personnel supporting *FRANTIC* in the Soviet Union were reduced to a small caretaker

contingent. Overall, the shuttle operations had little operational effect, and the targets that were struck could have been hit from the home bases in Britain and Italy. Operation *FRANTIC* did generate increased contacts between the U.S. and Soviet militaries, but it had limited substantive effect on relations between the two states. The operation did not lead to any significant collaboration in the Far East.

SICHELSCHNITT, Operation (1940)

German military plan for the invasion of the west in 1940. Following the German invasions of Denmark and Norway, Adolf Hitler's next strike was against France and the Low Countries (the Netherlands, Belgium, and Luxembourg). Hitler believed that defeating France offered the best chance of forcing Britain to the peace table. The balance of forces appeared to be somewhat equal. By the time of the invasion in May 1940, Germany had assembled in the west 2.5 million men in 136 divisions. The German force was matched on the ground by a combined Allied force of more than 2 million men in 3 army groups of 138 divisions. The Allies actually outnumbered the Germans in tanks, and the French tanks were generally heavier and better armed than those of the Germans. The most glaring Allied weaknesses were in aircraft and anti-aircraft artillery.

The German invasion, originally set for 12 November 1939, was repeatedly postponed because of bitterly cold weather and pleas from Hitler's generals for additional time to prepare. Then, on 10 January 1940, an event occurred that may have changed history. On that date, the pilot of a German military aircraft flying from Munster to Köln became lost in dense fog and was forced to land near Mechelen-sur-Meuse, Belgium. The passenger, Major Helmut Reinberger, was a staff officer of the 7th Airborne Division and was carrying top-secret operational plans for the German attack in the west. Reinberger was to have traveled by train, but delays led him to fly. Although the two Germans tried to burn the papers, the Belgian police secured the bulk of them. That discovery was only one of several indications of a German plan to strike west that caused neutral Belgium to open military talks with France and Britain. In any case, when Hitler learned that the invasion plan had been compromised, he abandoned it.

The need to recast the plan now caused the German invasion to be delayed until May. Generalmajor Erich von Manstein, assisted by Generalmajors Heinz Guderian and Walther Model, drew up the new plan. Known as SICHELSCHNITT (THE CUT OF THE SICKLE), the plan was agreed on in a meeting

German Field Marshal Erich von Manstein, key figure in drawing up plans for Operation SICHELSCHNITT. (Photo by Hulton Archive/Getty Images)

between Hitler and Manstein on 17 February 1940 and became the basis for German planning of the assault in the west (CASE YELLOW). It shifted the major effort from central Belgium to just north of the French defensive system known as the Maginot Line. The northern effort would occur first, drawing the Allies into Belgium. Then the major blow would fall to the south, in the hilly and wooded Ardennes—country reputedly impassable for tanks. The plan called for the invading Germans to cross the Meuse River and crack the French lines at Sedan, then swing northwest to the Channel and cut off the best British and French divisions, which would in the meantime have moved into Belgium.

Colonel General Fedor von Bock's Army Group B, charged with invading Belgium and Holland, was downgraded from 37 divisions in the original plan to only 28 in the Manstein plan, and 3 rather than 8 panzer divisions. Colonel General Gerd von Rundstedt's Army Group A, which was to move through the Ardennes, was upgraded from 17 to 44 divisions, including 7 armor divisions rather than a single armor division. At the point of the breakthrough, the Germans would thus outnumber the defending French 44 divisions to 9.

The original German plan was somewhat similar to the Schlieffen Plan of 1914 and would have followed Allied staff

predictions. Its axis of advance would have encountered the best Franco-British forces and might thus have ended in failure. Still, Manstein's plan appeared risky, and although he had Hitler's firm backing, many senior military leaders opposed the plan. Apart from the plan, factors working in Germany's favor were the experiences it had gained in Poland regarding the movement of massed armor and supply columns, its clear superiority in numbers of combat aircraft and antiaircraft guns, and the fact that a single national command system faced four disparate national armies.

Sicily, Invasion of (Operation HUSKY, 9 July–22 August 1943)

Allied invasion of Sicily, to that point the largest amphibious landing in history. At the January 1943 Casablanca Conference, U.S. President Franklin D. Roosevelt and British Prime Minister Winston L. S. Churchill and their staffs discussed the next military objective to follow the final defeat of Axis forces in North Africa. The British favored a strike against the Axis southern flank that would avoid the strong German defenses in northern France, whereas U.S. Army Chief of Staff General George C. Marshall and the Americans advocated a cross-Channel invasion of France as the shorter road to victory. Ultimately, Roosevelt agreed with the British view that a southern advance would secure Allied Mediterranean shipping lanes, provide bombers bases from which to strike Axis southern Europe, and perhaps drive Italy from the war. Thus the next big offensive of the western Allies was the invasion of Sicily, code-named HUSKY.

U.S. General Dwight D. Eisenhower had overall command of Allied forces in the Mediterranean. His ground commander for HUSKY was British General Sir Harold Alexander, commander of Fifteenth Army Group. British Admiral Andrew B. Cunningham commanded the naval forces, and

Air Chief Marshal Sir Arthur Tedder commanded the supporting Allied air forces. British and American forces would participate in HUSKY in almost equal numbers. The Eastern Task Force would put ashore General Bernard Montgomery's British Eighth Army in southeastern Sicily from just south of Syracuse to the end of the southeastern peninsula. The Eighth Army was then to advance along the coast, its final objective the port of Messina on the northeastern tip of the island. The Western Task Force would land Lieutenant General George S. Patton's U.S. Seventh Army in southeastern Sicily between Licata and Scoglitti. On securing the beachhead, Patton was to move inland to conduct supporting attacks and protect Montgomery's left flank. The newly formed Seventh Army had the supporting role, because Alexander believed that Montgomery's veteran troops were better suited for the chief offensive role. The Allies enjoyed air superiority; they had some 3,700 aircraft as opposed to 1,600 for the Axis forces.

Sicily was defended by Italian General Alfredo Guzzoni's Sixth Army (consisting of seven static coastal divisions and four maneuver divisions) and German Lieutenant General Hans Hube's XIV Panzer Corps of the 15th Panzergrenadier Division and the Hermann Göring Division. On 10 July, the Germans reinforced with the 1st Parachute Division and the 29th Panzergrenadier Division. Axis strength totaled between 300,000 and 365,000 men.

The Allied invasion was preceded by an elaborate British deception, Operation MINCEMEAT. This was designed to convince the Germans that the Allies planned to invade Sardinia and islands in the eastern Mediterranean. The deception worked, causing Adolf Hitler to shift some resources to those locations.

The invasion of Sicily, preceded by naval and air bombardment, began with airborne landings on 9 July 1943, the first large use by the Allies of such troops in the war. Few of the 144 gliders landed on their targets, and many crashed into the sea. The paratroopers were also widely dispersed. Worse, the invasion fleet fired on the second wave of transport aircraft in the mistaken belief they were German aircraft and shot down 23 C-47s. Nonetheless, the widely dispersed airborne soldiers created confusion among the Axis defenders, disrupted communications, and, despite their light weapons, prevented some German armor units from reaching the invasion beaches.

The seaborne invasion began early on 10 July in bad weather. The second-largest landing undertaken by the Allies in the European Theater after OVERLORD, it involved two large task forces and 2,590 vessels. Operation HUSKY was the first Allied invasion of the war in which specially designed landing craft, including the DUKW truck, were employed.

Resistance from the Italian coastal defenses was weak, and by nightfall the Allies had secured the beachheads. At Gela, the Hermann Göring Division attacked the U.S. 1st Infantry

LSTs lined up and waiting for tanks to come aboard at the French naval base of La Pecherie, Tunisia, two days before invasion of Sicily, July 1943. (National Archives)

Division but was driven off by naval gunfire. Inland, the rugged terrain and Axis resistance slowed the Allied advance, although Patton's forces reached the capital of Palermo on 22 July and, several days later, cut the island in two. The British occupied Syracuse with little resistance.

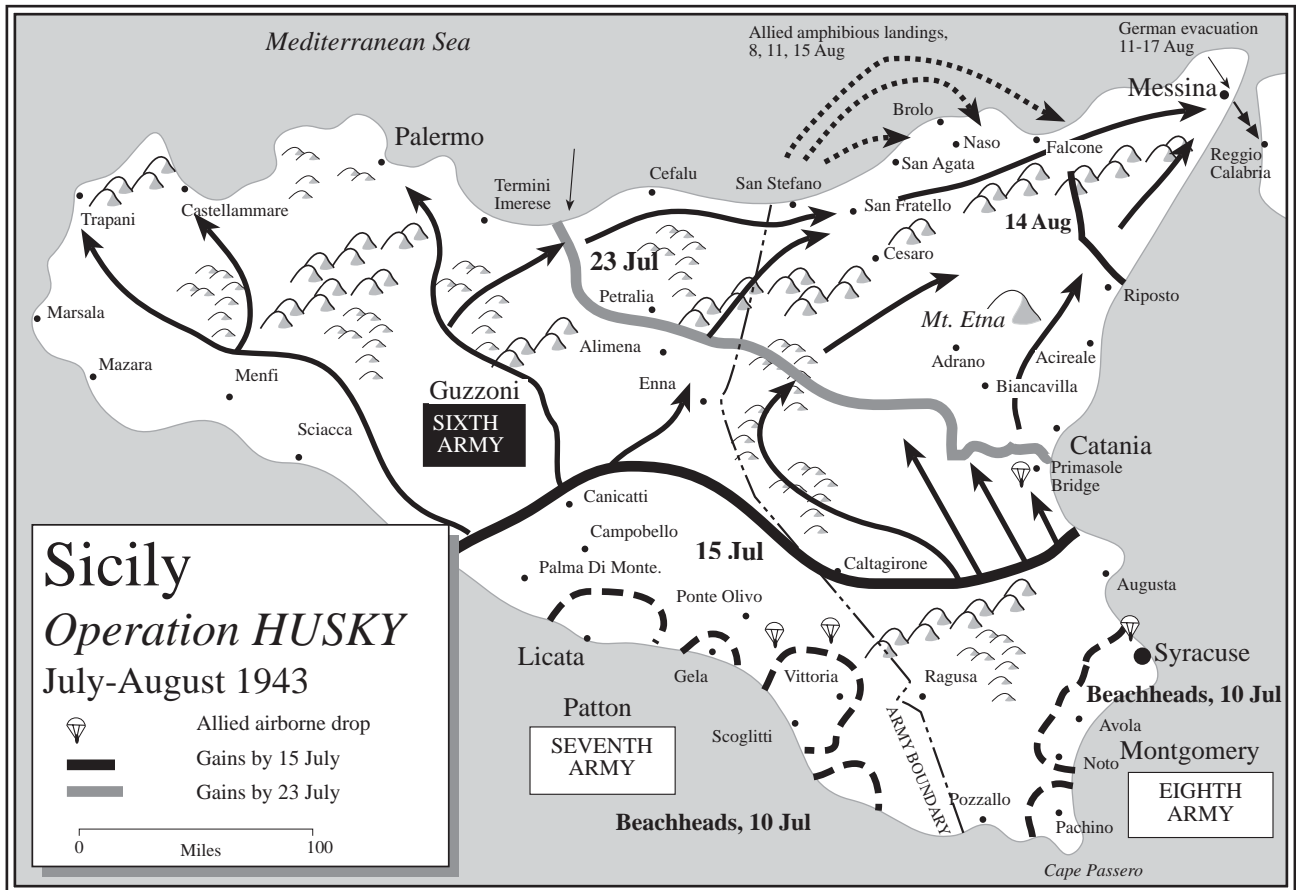

British and American forces were soon in competition to see which would be first to Messina, and a major controversy erupted when Montgomery expropriated an inland road that had been assigned to the Americans. This shift delayed the advance for two days and prolonged the campaign. Meanwhile, on 25 July, Benito Mussolini fell from power in Italy as that government moved toward leaving the war. In Sicily, Axis forces continued a tenacious defense. Allied forces pressed forward, aided by a series of small, skillfully executed amphibious operations on the north coast east of San Stefano.

On 11 August, German Field Marshal Albert Kesselring ordered the evacuation of Axis forces, the Italians having already begun their exodus across the narrow Straits of

Messina to Italy. The Italians brought out 62,000 personnel and 227 vehicles; the Germans evacuated 39,569 troops and 9,605 vehicles. It was thus something of a hollow victory when, on 17 August, Patton's forces reached Messina just hours after the last Germans had evacuated to Italy. Later that day, elements of the British Eighth Army also entered the city.

The conquest of Sicily claimed 11,843 British and 8,781 Americans killed, wounded, missing, or captured. The Germans suffered some 29,000 casualties, including 4,325 killed, 6,663

Sicily's defenders included 1,600 aircraft and between 300,000 and 350,000 men. As many as 170,000 of these men were killed, wounded or captured.

captured, and an estimated 18,000 wounded. Italian losses are estimated at 2,000 killed and 137,000 captured, most of the latter taken by the Seventh Army. The Axis side also lost up to 1,850 aircraft against only 375 for the Allies.

The invasion of Sicily was one of the most important Anglo-American campaigns of the war. It was the first assault by the western Allies on Fortress Europe and another important experience in coalition planning. As such, it set important precedents. It also achieved its goal of driving Italy from the war. On 3 September, a new Italian government signed a secret armistice with the Allied powers.

Siegfried Line, Breaking the (October–December 1944)

Allied penetration of the western defenses of Germany. The Siegfried Line—an Allied label based on German World War I defenses, known to the Germans as the West Wall—was a system of defensive positions in western Germany. The Siegfried Line ran south to north from the Swiss border along the Rhine River to the area of Karlsruhe and then northwest to Saarbrücken; it followed the Saar River to Trier and then paralleled the German border with Luxembourg, Belgium, and the Netherlands. The West Wall did not rely on large fortifications but used terrain features and several belts of mutually supporting bunkers, pillboxes, and firing positions. These defenses, combined with minefields and antitank barriers such as “dragons’ teeth” and deep ditches, protected the German border region. The forward defenses were backed by hardened bunkers for troops, supplies, and command-and-control facilities. The operational concept was to slow attacking forces and create opportunities for counterattacks by mobile reserve forces.

The defensive system was initially developed following the German remilitarization of the Rhineland in 1936, and extensive work on it was carried out in 1938 under the direction of

Fritz Todt. All construction work stopped in 1940 after the conquest of France, and the line was stripped of its armaments. Many guns were shifted to the new defenses on the French coast. In August 1944, German leader Adolf Hitler directed that an accelerated program begin to strengthen the West Wall in response to Allied advances in France, but the defenses were limited by shortages of troops, artillery, and ammunition. Nonetheless, the West Wall provided an important shield for reconstituting forces that had retreated from France, and it became the focal point for the defense of the German homeland in the west under Field Marshal Gerd von Rundstedt.

The Siegfried Line was a major concern of Allied planning and operations after the breakout from Normandy. German defenses combined with Allied logistical constraints were the major considerations in the debate within the senior Allied leadership over a broad-front or narrow-front strategy. By 11 September 1944, the Allied forces were advancing on the German frontier in a relatively continuous front from

Switzerland to Antwerp, with Field Marshal Bernard Montgomery's 21st Army Group in the north, General Omar N. Bradley's 12th Army Group in the center, and Lieutenant General Jacob L. Devers's U.S. 6th Army Group in the south. After extensive high-level debate, Allied theater commander General Dwight D. Eisenhower shifted logistical priority to the 21st Army Group and authorized Montgomery to conduct Operation MARKET-GARDEN, an effort to flank the German northern defenses, cross the Rhine River at Arnhem, and rapidly penetrate and capture the industrial heart of Germany. When the MARKET-GARDEN operation, which began on 17 September, failed to achieve the final objective of crossing the Rhine at Arnhem, Eisenhower returned to the broad-advance concept to maintain pressure on the German forces and penetrate the Siegfried Line defenses.

Initial contact with the West Wall was made by elements of Lieutenant General Courtney H. Hodges's First Army as it advanced to the German frontier in early September in the area north of Luxemburg. Hodges began a reconnaissance in

American soldiers look down on the German Siegfried Line, 1944. (Hulton-Deutsch Collection/Corbis)

force into the Eifel region of Germany on 14 September in an effort to sustain momentum and rapidly breach the fixed defenses. Although the defensive positions were not fully manned, initial U.S. penetrations of the Siegfried Line were blunted by German counterattacks, and the American forces paused to replenish logistical stocks. On 29 September, the First Army began a major offensive against West Wall positions around Aachen, a key defensive stronghold in the Siegfried Line, with the objective of opening a route to the Rhine River. After a vicious urban battle, the Aachen garrison surrendered on 21 October. In October and again in early November, the First Army also attempted to clear the Hürtgen Forest in an effort to open a route to the Rhine and secure the Roer River dams, which potentially allowed the German military to flood crossing areas downstream in the Roer River valley. After initial successes, aggressive German counterattacks pushed back the attackers, and the battle for the Hürtgen Forest became a bloody contest that held up the First Army. At the same time, the Ninth Army cleared the German defenses to the north and secured the west bank of the Roer River by 9 December, but it did not attempt to cross the river due to the flooding threat posed by the dams.

During September, Lieutenant General George S. Patton's Third Army fought through the Lorraine border region south of Luxembourg toward the West Wall, battling German forces that used old French defensive positions of the Maginot Line and pre-World War I fortifications (especially those around Metz) to strengthen resistance to the American advance. Patton's offensive then bogged down from a combination of the German defensive effort and logistical shortages. After resupplying and refitting in late October, the Third Army reinitiated the assault on Metz on 8 November, and the city's garrison finally surrendered on 22 November. After cleaning out the remaining German positions in Lorraine, the Third Army reached the Siegfried Line on 15 December and quickly seized several river crossings. Patton then paused the advance to resupply his forces before pushing through the West Wall and breaking out toward the Rhine in an attack planned for 19 December.

In the south, Devers's 6th Army Group fought to the upper Rhine, capturing Strasbourg on 23 November. However, the Germans continued to hold the West Wall defenses and a pocket in rough terrain around the city of Colmar. Although Devers was prepared to force the Rhine, Eisenhower ordered him to consolidate along that river and reduce the Colmar pocket.

The multiple Allied advances on the West Wall were halted on 16 December when the Germans launched an offensive in the Ardennes that became known as the Battle of the Bulge. As the Allies responded to the German drive in the Ardennes, the Germans launched a second attack out of the Colmar

pocket, threatening to retake Strasbourg. Both offensives fit into the operational concept for the West Wall and provided strength for defensive operations and a base for counteroffensives against the attacking force. Although surprised, the Allies were able to counter the German attacks, and the planned Allied assaults on the Siegfried Line were only delayed.

The final series of advances through the Siegfried Line and into Germany began on 8 February 1945 with an attack from the northern flank of Montgomery's 21st Army Group by the Canadian First Army, with the mission of clearing the west bank of the lower Rhine. This attack was complemented by U.S. attacks into the Roer River valley and the Hürtgen Forest. The Roer River dams were seized on 10 February, and the west bank of the lower Rhine was cleared by 5 March. In February, after repositioning following its counterattack in the Battle of the Bulge, the Third Army began a series of attacks that penetrated the Siegfried Line and allowed an advance toward the Rhine through the Eifel region. In the 6th Army Group area, the Colmar pocket was eliminated by 9 February, and the U.S. Seventh Army captured Saarbrücken on 19 March and broke through the final West Wall defenses on 20 March. The Siegfried Line held up the Allied offensive and allowed the German army to attempt counterattacks, but once the Allied logistical system provided adequate support to the combat forces, the strength of the Allies overwhelmed the German defensive structure.

SIGINT

See Signals Intelligence.

Signals Intelligence (SIGINT)

The collection and analysis of electromagnetic emissions that provide insight into an enemy's technological capabilities. The broader category of signals intelligence (known today as SIGINT) includes both communications intelligence (COMINT) and electronic intelligence (ELINT). COMINT includes the monitoring of radio and telephone traffic, the decryption of coded messages, and analysis of message content. ELINT is the collection and analysis of electromagnetic emissions such as telemetry and radar signals. This essay deals with COMINT.

SIGINT played a key role in World War II. In the 1920s, the knowledge that cryptanalysis had achieved important results in several countries during World War I led to the development of new and improved cipher methods and especially new cipher machines. These were produced not only for diplomatic and military communications, but for use in business. American Edward Hugh Hebern had been working since 1917 to develop a rotor-driven machine, but he secured a U.S. patent only in 1924.

Also in 1917, German Arthur Scherbius experimented with a similar machine; he secured a German patent on 23 February 1918. He was followed in October 1919 by Dutch inventor Hugo Alexander Koch and Swede Arvid Gerhard Damm. In 1923, Scherbius purchased the Koch patents and produced a new rotor-driven cipher machine known as "Enigma." Scherbius demonstrated the Enigma machine in 1923 at Bern and in 1924 at the World Postal Congress at Stockholm. He developed several versions of the Enigma; the commercial version, Enigma-D, was purchased by several countries, including the Netherlands, Sweden, Switzerland, Czechoslovakia, the United States, Great Britain, and Japan.

The Enigma influenced production of cipher machines in other countries for military uses. In Sweden, engineer Boris Hagelin began his improved machine series; in Great Britain, "Type X" was an improved Enigma. In Japan, a special version was constructed, and experiments led to the "97-shiki-O-bun In-ji-ki" for high-level diplomatic communications (later identified by the Americans with the code name "Purple"). During the Spanish Civil War, the Nationalist side and their allied Italians employed Enigma-D machines, and the Italians also used their Enigma version known as "Alfa." The Poles developed their own cipher machine, "Lacida," and the Czechs experimented with a version driven by compressed air rather than electricity. Boris Hagelin successfully marketed his machines in Sweden and France, later with the Italian navy, and finally in the United States, where 140,000 copies of his M-209 machine were built.

The Germans relied heavily on the Enigma machine for military communications during the war. Only in 1975, with the publication of Frederick Winterbotham's book *The Ultra Secret*, did it become generally known that Allied cryptanalysts had unlocked the secrets of the Enigma machine and that Allied intelligence had been able to read the most secret German military and diplomatic communications, although not in real time. Winterbotham's book was only the first in a flood of publications about Allied code-breaking. These included work published by the Poles, who in 1932 and 1933 had been the first to crack the secrets of the Enigma; the French, who had delivered to the Poles cipher materials secured from a German agent; the British, who established at Bletchley Park a decryption center; and the Americans, who also came into this operation and worked to break the Japanese codes.

The concentration on Enigma obscured the fact that there was not one Enigma machine, but rather several versions. Moreover, Bletchley Park could break only some of the cipher key nets of Enigma, depending on the number of signals sent in the daily settings of the various key nets. Concentration on Enigma also led to neglect of the many other machine- or hand-cipher systems of other nations, which were tackled by the cryptanalysts of many countries with mixed success.

The German defeat of Poland in September 1939 came so rapidly that Polish cryptanalysts had virtually no impact on that campaign. Evacuated by way of Romania to France, however, they joined the French Deuxième Bureau (intelligence service), which was operating in close conjunction with the British. But Allied efforts against the German Enigma key nets only had limited success at first and did not greatly influence Allied operations until mid-1940. With the defeat of France, that nation's cryptanalysts went to the unoccupied southern zone. From there, some Poles went on to Algeria and then joined the British at Bletchley Park.

On the Axis side, the German naval decryption service, the xB-Dienst, enjoyed considerable success in breaking the hand-cipher systems of the Royal Navy, which at this time did not use machines but rather super-enciphered codebooks. This fact enabled German warships in most cases to evade superior British forces. It also provided the Germans with information about Allied convoys.

In May 1940, Bletchley Park at last was able, with only short delays, to decrypt the main operational Enigma key net of the German Luftwaffe. This was aided by the introduction of the first "bombes"—devices developed by mathematicians Alan Turing and Gordon Welchman to determine the daily settings of the German machines. These intercepts, now known by the intelligence code name of *ULTRA*, influenced the Battle of Britain, as daily reports by the German air groups revealed their strengths and intended operations. Using this

information, Britain's "home chain" radar, and a system of coast watchers, the British could use fewer fighter aircraft with maximum efficiency, sending fighters aloft at the right time to intercept incoming German bombers.

But Bletchley Park could not then break the Enigma key nets of the German army. Of special importance at the time was breaking the German navy key nets, especially those used by the U-boats. The German Enigma machine was known to the British from a replica the Poles had constructed and delivered to France and Britain in August 1939, but the problem was the wiring of the cipher-rotors. Only five of these were known; but the German navy used eight, and these had to be identified, together with information about the cipher settings, which changed daily. This was only accomplished in May and June 1941.

Despite decoding delays, the Allies were able to read German radio signals and thus had the means to destroy their surface supply organization in the Atlantic. This in turn forced the Germans to cancel commerce raiding operations by their large surface combatants. Also, from early August

The decryption of German U-boat radio signals prevented the sinking of perhaps 300 merchant ships in late 1941.

1941, it became possible to decrypt U-boat radio traffic, which made it possible for the Allies to reroute their Atlantic convoys around the German U-boat dispositions. This prevented the sinking of perhaps 300 merchant ships in the second half of 1941.

Not all German officials had confidence in the security of the ciphers. Admiral

Karl Dönitz tried several times after mid-1941 to improve the system. He introduced a code for the grid map positions and a separate cipher key net for the Atlantic U-boats. Then, on 1 February 1942, Dönitz ordered the introduction of an improved cipher machine known as "M-4" that had a divided "Umkehrwalze B" reflective rotor and an additional, fourth, rotor, the so-called "Greek Beta." This change produced an 11-month blackout at Bletchley Park in reading German U-boat traffic. At the same time, xB-Dienst was able—partially in 1942 and more so in 1943—to decrypt the Anglo-American super-enciphered codebook "Naval Cipher No. 3" used for communication with the convoys. Although there were decoding delays, the decryption led to excellent results for the U-boats in the North Atlantic until early spring 1943.

On 30 October 1942 in the Mediterranean, a German U-boat was forced to surface, and a specially trained British boarding party was able to salvage important cipher materials, especially the "weather short signal book." This was used to find "cribs," the cipher/clear text compromises that aided

in determining daily settings of the MC4 machine. Thus, from mid-December 1942, Bletchley Park could once again send to the submarine tracking room of the Admiralty the dispositions of the German U-boat Wolf Packs in order to reroute convoys. But there were now so many Wolf Packs that new tactics had to be found to avoid repetition of the heavy losses incurred in mid-March, when the Germans introduced a new weather short signal book, producing a new blackout. By concentrating the available bombes to U-boat traffic, Bletchley Park was again able after only 10 days to break the U-boat cipher. Coupled with this, the Allies committed additional antisubmarine forces, very-long-range aircraft, hunter-killer groups of destroyers and the first escort carriers, radar in escort ships and light-weight radar in aircraft, high-frequency direction finders, and Leigh lights. The turning point came in late May 1943, when Dönitz redeployed his submarines from the North Atlantic convoy routes to the Central Atlantic and to distant operational areas. At the same time, Bletchley Park decrypted the orders, enabling the British to relocate their air groups from the convoy routes to Britain over to a strong offensive against U-boat routes in and out of the Bay of Biscay.

In June 1943, the British realized that the Germans had decrypted their signals, and the Admiralty changed to a new super-enciphered code, Naval Cipher No. 5, which led to a blackout for xB-Dienst. On 1 July, the Germans introduced a new "Greek rotor C/Gamma," but this led to only a short interruption in decryption at Bletchley Park because of the introduction of a new high-speed bombe. Development in the United States of high-speed bombes led to the transfer in November 1943 of decryption work on the U-boat cipher to the U.S. decryption organization Op-20G, while Bletchley Park concentrated on the German Enigma ciphers of the German air force and the army, both of which had substantially increased the number of their key nets.

Bletchley Park's first break into the German army ciphers had come as the Germans prepared to invade the Soviet Union in June 1941. This provided information about German deployment of forces to Poland and preparation of trains specifically to transport prisoners of war, clear proof that the deployments were not simply an effort to blackmail the Soviet Union. During the invasion itself, Bletchley Park was able to intercept and read a great many German signals. Because the British did not trust the security of the Soviet code and cipher systems, decryptions from the German forces on the Eastern Front were transmitted to Moscow in a special secure cipher and only under cover stories. It is as yet unknown if the Soviets were aware from their spies in Britain, including Kim Philby and especially John Cairncross at Bletchley Park, of the source of the information and, if so, whether Soviet leader Josef Stalin trusted it. Also, while the German army, navy, and air force decryption services were able to read Soviet codes

Cryptologist Major William F. Friedman, Signal Intelligence Chief at the War Department, explains the principles of a ciphering machine. (Corbis)

and some ciphers and use the information thus obtained in operations, we do also not know how extensively and when the Soviets could decrypt German signals.

Signals intelligence was of great importance in the Mediterranean Theater. When Italy entered the war on 10 June 1940, the Allies could read many of the Italian codes and ciphers. In addition, some ciphers were captured from Italian submarines forced to surface. But the Italians soon changed many of their systems, and decryption fell off sharply as a result. Then, in February 1941, Bletchley Park cracked the German air force cipher "Light Blue" and the Italian version of the Enigma known as "Alfa," used for radio communication between Rome and the Dodecanese Islands. These successes had important consequences, most notably in defeating the Italian navy at the Battle of Cape Matapan in March 1941.

In May 1941, decryption of the German signals provided excellent intelligence concerning German plans to invade Crete, but the British defense of the island failed because the German air force controlled the skies and because the

intercepts included misleading information about a German seaborne invasion. As it transpired, this was not a significant German effort, but it led the British to shift defensive assets to the north away from the airfields, where the main German assault occurred. The Battle of Crete revealed both the advantages and disadvantages of SIGINT regarding enemy intentions.

From June 1941, Bletchley Park's decryption of the Italian Hagelin naval cipher machine "C-38m" used in communications between Supermarina in Rome and Tripoli had important consequences for Axis resupply of Axis forces in the western desert. Axis shipping losses increased dramatically in the second half of 1941 and 1942, when it became possible to vector Allied submarines and surface warship strike groups from Malta to intercept Italian convoys between Sicily and the Tunisian coast and Tripoli. The British always tried first to send reconnaissance aircraft to report the target so the signals they sent prevented the Italians from recognizing the true source of the information.

Decrypted signals had to be used judiciously. Thus Afrika Korps commander General Erwin Rommel exaggerated the evils of his supply situation in order to gain additional support, causing British Prime Minister Winston L. S. Churchill twice to order his commanders in the field to begin offensives that then failed in Rommel's counterattacks. Rommel also learned much about British force strengths in Egypt because the U.S. military attaché in Cairo used a code broken by the Italians for his reports. Allied commanders also made different use of SIGINT results in operations extending from El Alamein to Tunisia and during the landing operations at Sicily, Salerno, and Anzio. Revelations of the ULTRA secret in 1975 did force a reconsideration of the military reputations of several Allied commanders, including Field Marshal Bernard Montgomery.

In connection with the preparation of the Normandy Invasion, the Allies in Operation FORTITUDE successfully used radio deception to convince the Germans of the presence in south-east England of a U.S. Army group commanded by Lieutenant General George S. Patton, a force that in fact did not exist. This false information led Adolf Hitler to believe that the Normandy Invasion was a feint and that the Allies planned to make their major cross-Channel attack in the Pas de Calais area. Hitler thus held back his panzer divisions of the Fifteenth Army from Normandy until too late and then sent them piecemeal into action.

The western Allies also succeeded in the decryption of the German army teleprinter cipher machine used for communications between the highest levels from the army High Command and field armies. This was made possible by development of the first electronic precursor of the later computers, the "Colossus" machine, which became operational in spring 1944. It proved important in halting the German counterattack against the breakthrough at Argentan and led to the encirclement of strong German forces at Falaise. But Allied reliance on ULTRA intelligence, as the German decryptations were known, meant the German Ardennes Offensive (Battle of the Bulge) of late December 1944 took the Allies unawares, as the Germans had observed strict radio silence and used only secure land lines for communication.

Other belligerents and also neutral powers employed SIGINT during the war. The Finns cracked many Soviet codes, and the Swedish mathematician Arne Beurling broke into the German naval teleprinter Siemens T-52 cipher machine. German teleprinter lines running through Swedish territory were tapped there. Swedish intelligence officers, who favored the Allied side, delivered information to the British naval attaché at Stockholm. Thus the Admiralty learned of the German plan to attack convoy PQ 17 in July 1942 with large surface ships, destroyers, submarines, and aircraft, whereon British First Sea Lord Admiral of the Fleet Sir Dudley Pound ordered the convoy to scatter without waiting for the report of the departure of the German Task Forces. This led to catastrophe for

the convoy, as German aircraft and U-boats sank two-thirds of its merchant ships. The rising number of cipher key nets employed by the Germans also overstretched Bletchley Park capacities. Thus even by mid-1942, of about 50 key nets then in use, Bletchley Park could only decrypt about 30, and these with varying time delays and gaps.

SIGINT also had great influence in the Far East Theater. In September 1940, American cryptanalysts under the leadership of William Friedman broke the Japanese diplomatic Purple cipher. (Recently it has been revealed that both the Germans and Soviets were also able to break Purple.) Thus, during negotiations with Japanese in 1941, the U.S. State Department not only knew the documents the Japanese diplomats would present but also their specific negotiating instructions. Purple intercepts provided clear evidence in late 1941 that the Japanese had decided to break off negotiations. But the diplomatic communications gave no hints of Japanese military plans, and the Japanese army codes were still difficult to decrypt. The Japanese navy's super-enciphered codes, especially JN.25—an earlier version of which had been broken—could not be read after changes in the codebooks and super-enciphering tables. Thus U.S. military and naval leaders had to depend on traffic analysis and direction finding, which did provide clear evidence, supported by optical observations, of the deployment of Japanese forces for attacks against the Philippines, Malaya, and the Netherlands East Indies. There was, however, no direct indication of an attack against Pearl Harbor, which thus came as a great surprise.

Breaking the new version of JN.25 and other Japanese codes took time, because reconstructing the tables and codebook was always difficult after changes. In 1942, by clever evaluation of vague indications, Commander Joseph J. Rochefort concluded that the Japanese planned first to invade New Guinea and then to strike at Midway. This conclusion enabled Pacific Fleet Commander Admiral Chester Nimitz to counter the Japanese moves, leading to the Battles of the Coral Sea and Midway.

During the struggle for the Solomon Islands in late 1942 and 1943, U.S. cryptanalysts learned to decrypt the Japanese codes more quickly, and by 1944 they could in most cases provide timely decryptations of Japanese signals in support of strategic operations. Of special importance was the success in breaking the so-called "Maru" cipher for Japanese logistical support to the islands they held in the Pacific. This allowed U.S. submarines to be directed with considerable accuracy to intercept positions, which in turn produced rising losses in the already thinly stretched Japanese merchant ship capacity and in Japanese warships. SIGINT closely supported General Douglas MacArthur's Southwest Pacific Forces from New Guinea to the Philippines and the Central Pacific Forces under Admiral Nimitz against the Marshall, Caroline, and Mariana Islands and finally against Iwo Jima and Okinawa.

In the Indian Ocean area, British cryptanalysts were able to break Japanese army and air force codes. On the other side,

the Japanese had only limited success in decryption operations. In consequence, they employed mainly traffic analysis and direction finding for their military and naval operations.

There is no doubt that SIGINT was of great importance to all belligerents in the war. It is also true that the Allies were much more effective in its use. SIGINT alone did not win the war for the Allies, but undoubtedly it significantly shortened the length of the conflict.

Prime Minister of the Polish-government-in-exile General Władysław Sikorski, 1940. (Corbis)

neering in Lemberg and served in the Austrian army in 1904 and 1905. Sikorski became chief of the Polish Supreme National Committee's Military Department during World War I and commanded the Polish Fifth Army during the 1919–1920 Polish-Soviet War. Chief of the Polish general staff in 1921 and 1922, he became prime minister in 1922 and minister for military affairs in 1924 and 1925. A rival of Józef Piłsudski, Sikorski was relieved of his command after 1926. He then gained considerable reputation as a military writer, stressing the importance to Poland of the alliance with France.

When the Germans attacked Poland, Sikorski was still without assignment. With the military defeat of his country and internment of the Polish government in Romania, Sikorski arrived in Paris on 24 September. There he became prime minister and minister for military affairs of the newly formed government-in-exile. As supreme commander of the Polish armed forces, Sikorski reorganized those men who reached France. When France was defeated in June 1940, Sikorski convinced British Prime Minister Winston L. S. Churchill to evacuate the Polish troops and the government-in-exile to Great Britain.

Sikorski pushed for the reestablishment after the war of the Polish state in its pre-September 1939 frontiers, and he

Sikorski, Władysław Eugeniusz (1881–1943)

Polish general and politician, prime minister of the Polish government-in-exile and commander of the Polish armed forces. Born in Tuszów Narodowy near Mielec (then Austrian Poland) on 20 May 1881, Władysław Sikorski studied engi-

outlined plans for a Polish-Czech federation. This position was compromised by the fact that Sikorski represented a defeated country, depending on the goodwill of its western allies. Under these circumstances, Sikorski's attempts to normalize Polish-Soviet relations met with difficulties that were only partly resolved following Germany's invasion of the Soviet Union. Relations between the government-in-exile and Moscow then became impossible with the revelation of the Soviet massacre of Polish army officers in the Katyń Forest.

In the midst of this crisis, Sikorski was killed in a plane crash at Gibraltar on 4 July 1943; he had been returning to Britain from an inspection of Polish troops in the Middle East. He was succeeded in authority by much less able men, but in any case the situation for Poland would have been impossible, given the decision by Britain and the United States to maintain harmonious relations with the Soviet Union.

Simonds, Guy Granville (1903–1974)

Canadian army general, arguably the best Canadian general of the war. Born on 23 April 1903 at Bury Saint Edmunds, England, Guy Simonds graduated from the Royal Military College, Kingston, in 1925 and then served with the artillery in the small interwar Canadian army, where he quickly emerged as a rising star. A brilliant performance at Camberley Staff College in 1936–1937 seemed to confirm this promise. During World War II, Simonds rose from major to brigadier general in September 1942 and to major general in April 1943.

Unlike most of his Canadian peers, Simonds was naturally aggressive with an intuitive grasp of mobile, armored warfare. Field Marshal Sir Bernard Montgomery considered him a protégé and far superior to the plodding General Henry Crerar. Simonds cut his teeth in Italy, commanding the 1st Canadian Division in Sicily with great success and then briefly the 5th Armoured Division in Italy. All this was grooming for Normandy, where he led II Canadian Corps.

Simonds's battle plans in the assaults around Caen and particularly in the bloody, attritional fighting to close the Falaise gap from the north in August 1944 (Operations TOTAL-

IZE and TRACTABLE) were operational masterpieces, but so complex that they often overmatched the abilities of his inexperienced army. Simonds's performance at Falaise remains controversial. Although he sacked subordinates with abandon and relentlessly pressed his exhausted soldiers forward, many historians since have criticized him for showing insufficient "resolution." In fact, the task given to Simonds's army was beyond its capacity—at least in the time allotted—not least because most units were well understrength.

The greatest achievement of Simonds and First Canadian Army (he assumed command from an ailing Crerar in September 1944) was undoubtedly the clearance of the Scheldt estuary in the fall of 1944, which opened Antwerp to shipping and resolved the supply problem that had threatened to strangle Allied mobility. Fighting under the most appalling conditions and despite Montgomery's inexplicable refusal to allocate sufficient troops, at least until General Dwight D. Eisenhower finally intervened, the Canadians prevailed. Simonds displayed more innovation and flexibility, and both commander and men proved they had absorbed the summer's hard lessons.

Simonds's career went into eclipse after the war. He lost out to the more politically astute Lieutenant General Charles Foulkes in running the postwar army and left little mark, save as a critic of Canada's drift into the American military orbit. Simonds died on 15 May 1974 at Toronto, Ontario.

Simpson, William Hood (1888–1980)

U.S. Army general. Born in Weatherford, Texas, on 19 May 1888, William Simpson graduated from the U.S. Military Academy in 1909. He then served in the Philippines and in the 1916–1917 Punitive Expedition into Mexico. During World War I, he deployed to France with the American Expeditionary Forces and saw action in the Saint-Mihiel and Meuse-Argonne Offensives, ending the war as a temporary lieutenant colonel.

U.S. Army Lieutenant General William H. Simpson, January 1945. (Photo by William Vandivert/Time Life Pictures/Getty Images)

Reverting to captain after the war, Simpson attended the Infantry School (1924), the Command and General Staff School (1925), and the Army War College (1927–1928). Promoted to colonel in 1938, he took charge of an infantry regiment. He was promoted to brigadier general in October 1940 and became assistant division commander of the 2nd Infantry Division. In September 1941, he was promoted to major general and assumed command of the 35th Infantry Division.

Simpson next commanded XII Corps in September 1942 and was promoted to lieutenant general the next month. He then commanded the Fourth Army in California. Assigned to Europe in May 1944, Simpson organized the new Ninth Army headquarters staff in England. The Ninth Army became operational in France as a single-corps army under 12th Army Group in September 1944.

Simpson's army cleared Brittany and captured the port of Brest. It then occupied a quiet frontline sector in the vicinity of Luxembourg between the First and Third Armies. In the reorganization of army commands in October 1944, Ninth Army Headquarters moved to Maastricht. Simpson had his first major combat test in the November offensive designed to reach the Rhine. The undersized Ninth Army spent nearly four weeks against stiff German resistance reaching the Roer River. The offensive ended when the Germans launched their Ardennes counteroffensive, and the Ninth Army was transferred under British Field Marshal Bernard Montgomery.

The Ninth Army, finally up to strength, got across the Roer River in February 1945. It then crossed the Rhine, linking up with the First Army to encircle the Ruhr. In April, back under

Lieutenant General Omar Bradley's control, the Ninth Army reached the Elbe River, where it met up with Soviet forces. Simpson later claimed his forces could have reached Berlin within 24 hours had Supreme Allied Commander General Dwight D. Eisenhower given the order.

After the war, Simpson commanded the Second Army and headed the board that reorganized the army. Retiring in November 1946, Simpson was promoted to general on the retired list in 1954. He died in San Antonio, Texas, on 15 August 1980.

Singapore, Battle for (8–15 February 1942)

Capture of the great British base of Singapore was essential to Japanese success in the Far East. Throughout the 1930s, British governments neglected Pacific defenses, as budgetary constraints forced retrenchment. From 1939 onward, moreover, fighting in Europe and North Africa was Britain's priority, diverting additional men and resources from the Far East, where Singapore was complacently considered impregnable.

The Japanese plan called for an approach to Singapore from the north by land. The British had designed Singapore's defenses primarily to meet a seaborne attack. Although some of the big guns were capable of firing against land targets, they lacked the high-explosive shells for use against attacking troops.

The drive on Singapore began with the Japanese invasion of northern Malaya on 8 December 1941. By 15 January 1942, the British III Corps of the 8th and 11th Indian Divisions had been forced back to the defensive line in Johore, which was held by the 8th Australian Division. By the end of January, the Japanese had driven British forces back across the Straits of Johore into a defensive position on Singapore Island.

The Straits of Johore protected the northern and western shores of Singapore Island. The straits varied in width from 600 to 2,000 yards and were crossed only by a 70-foot-wide causeway that the British cut but could not destroy. Singapore island was largely covered by jungle growth and plantations

that sharply limited observation and fields of fire. Save for several towns, the population was concentrated on the south-east coast in Singapore Town, a city of 1 million. The key location around Bukit Timah village in the center of the island contained a large depot of military stores and the three reservoirs for the island's water supply.

Lieutenant General Arthur E. Percival commanded 85,000 defending troops. Japanese commander Lieutenant General Yamashita Tomoyuki had only 30,000 men of the Twenty-Fifth Army. Although the attackers were short of ammunition and other supplies, their aircraft dominated the skies. Percival deployed the bulk of his troops too far forward, defending 30 miles of front to make his stand on the island's beaches. Most of the men were poorly trained. In any case they were exhausted and dispirited after weeks of battle and defeat. Moreover, they had been outfought by a battle-hardened enemy skilled in infiltration and tactics suitable for the jungle terrain. The defending force of Indians (now consolidated into the 11th Division) and the 8th Australian Division had been reinforced on 29 January by the 11th British Division and, a few days earlier, by the partially trained 44th Indian Brigade. The only other troops were fortress troops, with two Malayan brigades and volunteers. All but one of the island airfields were

within reach of Japanese artillery fire, and the few remaining fighter aircraft were thus redeployed to Sumatra, from which they could provide only limited air support. Yamashita planned to throw the British off balance by feinting east of the causeway and making his major attack to the west of it.

On the morning of 8 February, the Japanese attacked. Two divisions crossed in landing craft against the Australian 22nd Brigade west of the Kranji River. Although the Australians sank many landing craft, they were too thin on the ground to hold the line. By the next morning, the Japanese had taken Ama Keng and were attacking Tengah Airfield. The defenders then withdrew to establish a line on the narrow neck of land between the Kranji and Jurong Rivers. Meanwhile, on the evening of 9 February, the Japanese successfully attacked the 27th Australian Brigade, creating a gap between the brigade and the Kranji-Jurong line. The Japanese soon bypassed that line, which was never properly prepared or occupied by the defenders. A British counterattack attempt to restore the position failed.

By 11 February, the Japanese had seized and repaired the causeway, allowing them to send additional resources, including tanks, onto the island and advance toward Nee Soon village. On 12 February, Percival ordered a withdrawal to a

perimeter marked by Bukit Timah road, MacRitchie and Pierce reservoirs, and Paya Lebar-Kallang. Heavy fighting began south of Bukit Timah road on 13 February, where for 48 hours the Australians held, and along Pasir Pajang ridge, where Malayan forces stubbornly repulsed the Japanese. On 14 February, however, the defenders were forced back to what proved to be their final line.

London had ordered Percival to continue the fight and not surrender. However, conditions in the city were shocking, with dead and dying in the streets and loss of the water supply imminent. Reserves of food and ammunition for the troops had been seriously depleted by loss of the depots. Meanwhile, the British evacuated certain key personnel by sea who were essential to the later war effort, and demolitions destroyed heavy guns, aviation fuel, bombs, and other equipment. Many of Percival's troops simply deserted, including the engineers who were to destroy the naval dockyard.

When it was clear that nothing was to be gained by further resistance, on 14 February Prime Minister Winston L. S. Churchill instructed Field Marshal Archibald P. Wavell, Allied theater commander, to authorize Percival to surrender. Percival also had the welfare of civilians to consider when on 15 February he surrendered his 70,000 troops unconditionally to Yamashita. The Japanese had taken Malaya and Singapore in only 70 days. The loss of Singapore was the greatest defeat of British forces since the 1781 Battle of Yorktown, and it had immense repercussions for British prestige in Asia.

Sino-Japanese War (1937–1945)

Struggle between Japan and China that was fought for control of China. The Sino-Japanese War was sometimes known as the Second Sino-Japanese War to distinguish it from the war between these two states in 1894 and 1895. It began against

the backdrop of repeated efforts of Guomindang (GMD [Kuomintang, KMT], Nationalist) Party leader Jiang Jieshi (Chiang Kai-shek) to crush Chinese Communist forces led by Mao Zedong (Mao Tse-tung). Japanese efforts to control China flared into all-out war in 1937. Previously, an uneasy truce had held, despite Japanese encroachments into Manchuria, Inner Mongolia, and the Chinese provinces outside the Great Wall. As Japanese forces moved onto the north China plain, the situation became more volatile, however, and a confusing three-sided conflict emerged until the Japanese surrender of August 1945.

Scholars of the conflict delineate up to four broad phases of the war. The first began with the September 1931 Mukden (Shenyang) Incident, in which intelligence officers of the elite Japanese Guandong (Kwantung) Army in south Manchuria blew up a portion of track on the rail line at Mukden. They blamed it on the Chinese and used it as an excuse to occupy all of Manchuria, an area roughly the size of Texas and a major resource base. In succeeding years, the Japanese occupied more territory in north China outside the Great Wall as Jiang concentrated on “extermination campaigns” against Mao's Chinese Soviet Republic in Ruijin (Juichin) of Jiangxi (Kiangsi) Province in southeastern China. From October 1934 to October 1935, Jiang pursued Communist forces through China's hinterlands to Yan'an (Yenan) in what became known as the Long March. When Mao's forces reached the relative safety of Yan'an in northeastern Shaanxi (Shensi) Province, Jiang ordered local warlords, nominally loyal to him, to continue the campaign against the Communists instead of concentrating on resisting Japanese expansion. The Xi'an (Sian) Incident in December 1936, a coup staged by two Nationalist generals, forced Jiang to accept a United Front against Japan and helped focus Chinese nationalist fervor against the Japanese.

The Lugouqiao (Lukou-ch'iao) or Marco Polo Bridge Incident began the second phase and marked the start of the larger conflict. On 7 July 1937, Japanese army troops demanded entry into the town of Wanping (Wan-p'ing) about 10 miles west of Beijing (Peking) in Hebei (Hupeh) Province. The town was held by forces loyal to Jiang's Nationalist government. When the GMD troops denied entry to the Japanese, who were supposedly looking for a lost soldier, the Japanese threatened the use of force at Lugouqiao (the Marco Polo Bridge), where the opposing sides met.

In the aftermath of the Japanese demand for entry into the town and the Chinese refusal, Japanese forces began shelling Wanping and attacking the bridge. Larger Chinese units held their positions and even drove the Japanese back. Negotiations then began, used by both sides to concentrate additional forces in the north China plain. On 28 July, the Japanese attacked and seized control of the bridge; shortly thereafter the Japanese captured both Beijing and Tianjin (Tientsin),

Chinese soldiers raise their hands in surrender to Japanese soldiers in September 1938. Japanese forces drove deep into China between 1937 and 1939, despite stubborn Chinese resistance. (Hulton-Deutsch Collection/Corbis)

local Chinese commanders having decided to abandon these cities rather than risk their destruction. On 31 July, Jiang informed the Chinese people that “the hope for peace has been shattered” and that the Chinese people had to fight the Japanese “to the bitter end” in order to expel the “invader.”

From July to December, Japanese forces seized most of the territory north of the Huanghe (Hwang Ho, known to westerners as Yellow) River. The fighting was not confined to north China, for in August 1937 the Japanese attacked the great commercial city of Shanghai in Jiangsu (Kiangsu). Not until November, after three months of hard fighting involving the best Nationalist troops, did Shanghai fall. Japanese forces then advanced up the Changjiang (Yangtse) River, and in December they took Nanjing (Nanking), also in Jiangsu Province, where they committed wide-scale atrocities. Nationalist forces withdrew deep into the Chinese interior to Chongqing (Chungking), in Sichuan (Szechwan), where Jiang established his new capital.

Over the next several years, Japanese forces conquered much of northern and east-central China. The Japanese moved somewhat predictably along railroad lines and major

waterways in order to facilitate troop transport and resupply. In theory, this should have aided the Chinese defenders, since it reduced the element of surprise. China, however, did not present a truly unified front because it was more unified in theory than in fact. Although Jiang possessed the most modern Chinese military force, his armies were less powerful than those of the Japanese. Other Chinese commanders were really regional military leaders, warlords unwilling to risk their troops and thereby weaken their position relative to other Chinese warlords. All too frequently, poorly led Chinese troops fought well for a brief time, but then they fled with escaping civilians.

By 1940, the Japanese controlled northern and eastern China, and the Chinese Communists dominated northwestern China. Late that year, the Communists launched the “Hundred Regiments” Offensive against Japan, but they were defeated by the better-equipped Japanese. The Communists then switched to guerrilla warfare against Japanese positions in northern and central China. This policy led to Japanese reprisals against both the Communists and the civilian population. Guerrilla warfare did not drive out the Japanese, but

it did help disrupt their control and served to establish the Communists as dedicated opponents of Japanese rule, enhancing their postwar political position.

By 1940, the situation had stabilized and a third, somewhat quieter, phase began. Although few major battles occurred, there were regular skirmishes in the three-sided conflict that had emerged after 1937. The Japanese occupied most of the eastern third of China, its major ports, and the bulk of its industrial areas. The Japanese-controlled territory included the majority of Han ethnic Chinese people. The Japanese established a puppet regime under Wang Jingwei (Wang Ching-wei), a left-wing member of the Guomindang who had been forced from power in December 1935. With Nationalist forces, Communist guerrillas, and an uncooperative Chinese population, the Japanese military sought to wear down Chinese resistance and cut off China from outside assistance, chiefly from the United States.

None of the three main contending armies could afford a major and costly campaign. Mao's Communist forces carried out a social revolution in the areas under their control, introducing land reform and seeking to improve the lot of the peasantry in health care and education. They also sought to identify landowners and other members of the Chinese upper classes with the hated Japanese occupiers. Mao remained vigilant against Jiang's armies, since the Chinese president continued to keep many of his best military units in a blockade of the Communist base area around Yan'an. Typically, Communist forces attacked troops and sought to convert the peasants to their cause in areas only weakly held by the Japanese.

Jiang also proceeded cautiously, for he intended to conserve Nationalist military strength to continue the civil war and crush the Communists once Japan had been defeated. For a time, the Soviet Union and the western powers provided aid to Jiang, despite logistical challenges. The Soviets sought to keep Japan occupied in China to forestall any invasion of Siberia, but a Japanese-Soviet Neutrality Pact signed in April 1941 eased Moscow's fears of Japanese expansion and enabled Soviet leader Josef Stalin to concentrate on the greater threat posed by Germany, which invaded in June. Britain, France, and the United States also provided assistance, but the German conquest of France reduced that aid to a trickle as Great Britain fought Germany alone while the United States gave highest priority to assisting Britain in its time of greatest peril.

The civil war, however, was never far from the surface, as evidenced in the so-called New Fourth Army "Anhui (Anhui) Incident" of January 1941. As part of the United Front against Japan, Jiang permitted Mao to reorganize his armed units into the Eighth Route Army and later authorized formation of the New Fourth Army. There was disagreement about its area of operations; Jiang expected the force to operate north of the Huanghe, but the New Fourth Army instead moved south into Shandong (Shantung). Consequently,

GMD armies surrounded and attacked the New Fourth Army on 6 January 1941, badly mauling that smaller force and compelling the surrender of 2,000 of its troops.

In September 1940, meanwhile, Japanese forces moved into northern Indochina, and in July 1941 they move into southern Indochina. These steps, an effort to cut the Chinese off from U.S. aid flowing from India, brought U.S. retaliation against Japan in the form of an economic embargo on certain critical war materials, especially oil. In turn, this triggered Japan's decision to go to war against the United States. Japan's December 1941 attack on Pearl Harbor and its war with Britain and the Netherlands broadened the conflict into a general Pacific war and severely strained its capability to conduct offensive operations in China.

Japanese military leaders were forced to reassign divisions from China to carry out the invasions of Hong Kong, the Philippines, Malaya, and Burma. In consequence, Japanese operations in China subsided. Jiang, confident of ultimate Allied victory, continued his policy of largely avoiding pitched battle with major Japanese military units, although he reluctantly agreed to commit some divisions to assist in operations against Japanese forces in Burma. Meanwhile, Chinese Communist forces continued their pattern of securing the loyalty of the peasants in areas they controlled while engaging in small-unit attacks against the Japanese. The general Nationalist military inactivity against the Japanese aided the Chinese Communists in that it helped them secure the mantle of Chinese nationalism. The Japanese "three-alls" reprisal policy also assisted the Communists. Following a guerrilla attack, Japanese forces would move into a nearby populated area and "kill all, loot all, burn all." Their policy turned many of the survivors into new recruits for the Communists.

U.S. aid to the Nationalists increased after December 1941, but China was a distant part of the China-Burma-India Theater. In April 1942, Japanese forces in Burma took Lashio and cut the Burma Road, Nationalist China's only land route to the outside world. Thereafter, American aid had to be flown over "the Hump" of the Himalayas to reach Chongqing. Jiang's U.S. military adviser, Lieutenant General Joseph Stilwell, tried to train and organize new Chinese divisions equipped by the United States, but he became increasingly frustrated with Jiang's refusal to commit them to fight the Japanese in Burma or in southeastern China. There was also disagreement among U.S. generals about aid to China. Major General Claire Chennault wanted to build on the success of the Flying Tigers and their high kill ratio against Japanese pilots to commit most aid to the new U.S. Fourteenth Air Force in China.

In October 1944, Stilwell was recalled at Jiang's request, and the China-Burma-India Theater was separated into the China Theater and the Burma-India Theater. This final phase of the Sino-Japanese War (late 1944 to August 1945) highlighted the corruption and inefficiency of Nationalist forces.

The United States had provided sufficient aid to build a modern army of 30 divisions and had also created the Fourteenth Air Force. Further, the United States began strategic bombing of Japanese air bases on Formosa some 100 miles from the Chinese mainland. Throughout 1943, American planners had contemplated using either eastern China or Formosa as a staging point for the men and supplies necessary to launch an invasion of the Japanese home islands. Early planning assumed that the new Chinese Nationalist divisions would reopen the Burma Road and contain Japanese forces in China proper. It also assumed that the Fourteenth Air Force would be able to subject Japanese coastal defenses to attack.

The successes of the U.S. amphibious forces in the southwest and central Pacific and the success of U.S. submarines in cutting the flow of food and raw materials, especially oil, from the Japanese-conquered territories to the home islands somewhat reduced the importance of China as a staging area against Japan. At the same time, Japanese forces in China launched a two-pronged offensive that demonstrated continued Chinese military weakness. Operation ICHI-GŌ, which Japan conducted from April to December 1944, aimed to cross the Burma-India border through south China to seize Allied airfields at the western side of the Hump air-transport route, to capture key north-south railroads in China, and to seize Fourteenth Air Force airfields used to stage attacks on Japanese forces. The attack on Assam failed, as Allied forces in Burma under Lieutenant General Sir William Slim broke the siege of Imphal and then went on the offensive. But the Japanese attack in China succeeded. The Japanese first won control of the key north-south railroad between the Huang and Chenjiang Rivers; they then seized the airfields used by the Fourteenth Air Force, and later in 1944 they secured Guilin (Kweilin), Nanning, and Liuzhou (Liuchow) in Guangxi (Kwangsi) Province. Chinese Nationalist forces not only fought poorly, but peasants attacked them as they retreated, demonstrating the huge divide between the Chinese masses and the government. Interestingly, the Japanese did not attack Communist base areas in northern and north-central China, causing some observers to speculate about a de facto Japanese-Chinese Communist truce that benefited both sides.

The ICHI-GŌ operation was the high point of Japanese military operations in China. Thereafter, Tokyo began transferring its best divisions from China and Manchuria to meet the U.S. drive across the Pacific into the Philippines and later the Bonin Islands and the Ryukyus. Remaining Japanese forces in China were badly overextended, and Japanese commanders sought to consolidate, especially by summer 1945, to face a possible Soviet attack. Meanwhile, the weight of corruption and inefficiency was beginning to sink Jiang's Nationalist regime. The Chinese government had limited financial resources because Japanese troops occupied the populous and most productive part of China. Corruption and inefficiency

also hurt the government. Jiang's regime responded by printing more and more paper money, driving down the value of paper and leading to dramatic inflation that wiped out much of the middle class. By contrast, Mao's Communist forces emerged from the war in a much stronger position because of their apparent honesty and commitment to the welfare of the peasants and their resistance to the Japanese.

By the summer of 1945, the war was drawing to a close. In early August 1945, Red Army troops—honoring Soviet leader Josef Stalin's pledge at the February 1945 Yalta Conference that the Soviet Union would enter the war against Japan "two or three months" after the defeat of Germany—invaded Manchuria in overwhelming force and quickly occupied that Chinese province. On 14 August 1945, Japan surrendered. The fighting in China had tied down some 1.2 million Japanese troops, with some 396,000 killed. China had sustained military casualties alone of more than 3.2 million, with more than 1.3 million dead. The number of civilian dead is unknown.

Unfortunately for the Chinese, the end of the long Sino-Japanese War did not bring peace to China. Ignoring American advice, Jiang moved troops to Manchuria to secure that key province before the Communists in north China could do so. Fighting broke out between the Nationalists and the Communists that led to a Communist victory in September 1949, bringing the long years of civil war and international war to an end.

Sirte, First Battle of (17 December 1941)

The First Battle of Sirte, an important Mediterranean air and naval battle between the British and Italians, occurred because both navies were conducting simultaneous convoy operations at sea. The British were trying to get a tanker, the *Breconshire*, to a fuel-starved Malta. Rear Admiral Sir Philip Vian departed Alexandria on 16 December 1941 with the *Breconshire* (disguised as a battleship), three light cruisers, and eight destroyers. Meanwhile, British Force K of three light cruisers and six destroyers sortied from Malta to meet it.

Simultaneously, the Italians dispatched supply ships to North Africa. This effort was particularly important, given heavy Italian shipping losses over the previous months. Seven destroyers and a torpedo boat provided close escort for 2 small convoys totaling 4 merchant ships and carrying 400 vehicles, 17 tanks, 10 artillery pieces, and other supplies. Their close escort, commanded by Vice Admiral Carlo Bergamini, consisted of the battleship *Duilio*, 2 light cruisers, and 3 destroyers. Italian Vice Admiral Angelo Iachino's covering force was also at sea. It consisted of the battleships *Littorio*, *Cesare*, and *Doria* as well as 2 heavy cruisers and 10 destroyers. Bergamini had developed the so-called "battleship convoy," with which he had enjoyed success following earlier Italian convoy disasters. The battleship escort operated near the slow-moving convoys and maneuvered in such a way as to remain close to them. At the same time, Iachino's heavier force was steaming between Vian's force and the main Italian convoy east of Malta.

The Italians learned through radio intercepts that British cruisers had departed Alexandria, and on 16 December their reconnaissance aircraft and German Ju-52s flying troops from Greece to North Africa sighted the disguised *Breconshire* and reported her as a battleship. Later that day, the British ships came under ineffective Italian air attack. Iachino assumed that British battleships were at sea hunting for his convoys, although in reality the lack of escorts and the threat of German submarines prevented the commander of British forces in the Mediterranean, Admiral Andrew B. Cunningham, from dispatching battleships from Alexandria.

Iachino then increased speed to 24 knots, the fastest *Doria* could manage, and steamed to engage. Vian had been joined by Force K and was aware of Iachino's approach from aerial reconnaissance early in the afternoon. He turned to the south, away from Iachino, in order to protect the *Breconshire*. Vian was also aware that additional Italian forces were at sea.

On 17 December, Vian's ships had again been subjected to Italian air attack, and the British antiaircraft fire had been observed by Iachino's fleet, which then closed. Sunset was approaching when contact was made, the Italians opening fire at extreme range of 35,000 yards dropping to 24,000 yards.

Vian detached the two destroyers, and later all of Force K, to protect the *Breconshire*, which then steamed south to escape.

Italian fire for this range was quite accurate, and their shells straddled several British ships. The British destroyers made smoke and advanced on the Italians, who countered by ordering their destroyers forward. The British destroyers boldly moved forward, but Vian almost immediately ordered them to retire on the main force.

With night coming on, Iachino ordered a withdrawal. Vian, under orders from Admiral Cunningham, did not try to force a night engagement. One British destroyer suffered one dead and sustained very minor damage. In the morning, Vian ordered Force K to escort the *Breconshire* into Valetta, Malta, while he retired on Alexandria.

Meanwhile, the two Italian convoys arrived safely at Tripoli and Benghazi. In an ancillary development on 19 December, Force K, trying to intercept the Axis convoys, ran into an Italian minefield near Tripoli. One cruiser and a destroyer were lost and two cruisers were damaged at a cost of more than 600 dead.

Sirte, Second Battle of (22 March 1942)

Mediterranean air and naval battle fought between the British and Italians as a consequence of British efforts to resupply Malta. Conditions on the British island were dire in 1942, with the Royal Navy able to sail only a few ships through the gauntlet of Axis air and naval forces dominating the Mediterranean. Admiral Sir Andrew B. Cunningham, Britain's commander in the Mediterranean, was determined that the next effort to resupply Malta would be successful.

On 20 March 1942, British convoy MW.10 of 4 merchant ships, including tanker *Breconshire*, departed Alexandria for Malta with fuel and provisions. Vice Admiral Sir Philip Vian commanded an escort force of 4 light cruisers, 9 large destroyers, and 7 small Hunt-class destroyers. A light cruiser and a destroyer were ordered from Malta to join it. Five British submarines were also on patrol.

German reconnaissance aircraft located the British convoy on the evening of 21 March, and the next morning, a British submarine off the port of Taranto reported an Italian naval force headed south. Vice Admiral Angelo Iachino commanded the battleship *Littorio*, 2 heavy cruisers, 1 light cruiser, and 8 destroyers. Two other Italian destroyers ordered to sea failed to arrive in time to participate in the battle. The Axis powers also had 6 submarines on patrol in the eastern Mediterranean. The Italian ships lacked radar (the first effective set would not be installed until May), but they did have command of the air, and Iachino knew the British lacked battleships.

By 22 March, Vian was nearing Malta and had lost one Hunt-class destroyer, which was torpedoed by a U-boat. At 2:10 P.M. on 22 March, the British sighted the 3 Italian cruisers and 4 destroyers. Vian now carried out the procedures decided on earlier. Five destroyers continued on with the convoy while Vian's remaining cruisers and destroyers made smoke and launched torpedo attacks against the Italian ships. The Italian ships then drew off.

Vian's detached forces had barely regained the convoy when at 4:37 P.M. the Italian fleet again came in sight. Iachino's intention was to steam to the southwest and cut off Vian from Malta, at the same time positioning himself downwind of the immense smoke screens being laid down by the British ships. Vian's force consistently charged and fell back, feinting and threatening the remainder of the afternoon, as the range slowly closed. With the approach of darkness, Iachino closed to within 5,000 yards. Fire from the *Littorio* damaged 2 British destroyers; 2 other British warships suffered minor shell damage. But with nightfall and lacking radar, Iachino decided to withdraw, despite having suffered only 1 British shell hit on the *Littorio*. During Iachino's return to Taranto, however, 2 Italian destroyers foundered in a storm with heavy loss of life.

The Luftwaffe sank 2 of the British transports short of Malta. The other 2 reached Malta, but they had been only partly offloaded before they, too, were sunk by air attack. One of the British destroyers damaged in the battle on 22 March was later sunk at Malta, again from the air, while undergoing repairs. The success of the Axis blockade of Malta led to another failed attempt to resupply the island in June.

Sitzkrieg (4 October 1939–10 May 1940)

Period of apparent inactivity in ground or aerial combat between Germany and the Allies following the fall of Poland. Although Adolf Hitler hoped to launch an offensive against France in 1939 before winter began, the Wehrmacht required more time to redeploy its forces before such an undertaking. German generals begged for additional time, and terrible winter weather led Hitler reluctantly to agree to delays that ultimately postponed the invasion until the spring of 1940.

In the interim, France remained committed to the strategy of passive defense it had adopted from the war's outset. The French army had completed its mobilization along the German frontier while Hitler's forces seized Poland. Although France had an overwhelming advantage in numbers and equipment, French army commander General Maurice Gamelin failed to seize the opportunity and invade Germany in strength from the west. On 30 September, Gamelin ordered an end to the small foray he had authorized into the Rhineland and a withdrawal to the French frontier. The French also manned the Maginot Line and settled into garrison duty by 4 October.

Belgium and the Netherlands maintained their neutrality, and the British—who were slow to commit resources to France and to understand the gravity of the situation—believed the economic pressure of the Royal Navy's blockade could force a negotiated settlement. As a result, an illusion of peace called the *Sitzkrieg* (stationary war)—an ironic reference to the German blitzkrieg (lightning war) campaign in Poland—settled over the opposing forces. It was also known as the Phony War or *drôle de guerre* and the Bore War. Both sides were reluctant to unleash premature air action that might bring about the bombing of cities, and the British limited their early bombing activity largely to dropping of leaflets (critics called it the “Confetti War”).

Civilian trains continued to run along tracks between the German and French lines. Children and soldiers alike played in the open fields separating the combatants. The surreal atmosphere at the front began to take a toll on the morale of the French army, as defeatism and apathy spread through the French government.

Meanwhile, preparations for further hostilities continued. The British Expeditionary Force (BEF) gradually grew in strength along the Belgian border, but the Allies failed to take advantage of lessons learned in Poland regarding the use of tanks in divisions. The army largely ignored Colonel Charles de Gaulle's pleas to reform French armor doctrine to reflect Germany's successful demonstration of blitzkrieg warfare in Poland.

As the bitterly cold winter of 1940 gave way to spring, illusions regarding the war continued. Even an American intel-

ligence assessment, correctly noting that Germany would complete its buildup along the French border in May 1940, concluded that no attack would follow. The Norway Campaign of April 1940 did little to weaken that common perception, which lingered in many minds until 10 May, when the Germans launched their invasion of France and the Low Countries.

Skorzeny, Otto (1908–1975)

German Schutzstaffel (SS) commando officer. Born in Vienna, Austria, on 12 June 1908, Otto Skorzeny studied engineering at Vienna Technical College. His involvement there in a dueling society led to his nickname “Scarface.” Upon graduation, Skorzeny worked as an engineer. After the 1938 Anschluss (union) of Austria with Germany, Skorzeny volunteered as a pilot for the German air force. Rejected because of his age, he joined the SS Leibstandarte Adolf Hitler Division (later the 1st SS Panzer Division). Transferring to the SS Das Reich Division, he fought in the invasion of France and the Low Countries in 1940 and as a lieutenant in the invasions of the Balkans (April to May 1941) and the Soviet Union (June 1941). He was badly wounded in fighting on the Eastern Front and was evacuated. On his recovery, he was assigned to a desk job in a supply depot.

In April 1943, Skorzeny was promoted to captain in the SS and placed in charge of German Special Troops. He studied British commando operations and set up a facility at a hunting lodge at Friedenthal (Valley of Peace) near Berlin, where his volunteers were trained in special operations techniques. On 9 September 1943, Skorzeny and his commandos gained international attention when they rescued former Italian dictator Benito Mussolini in a daring assault on Gran Sasso, a mountain resort where Mussolini was being held, freeing him within five minutes without firing a shot. On 15 October 1944, with Hungarian leaders trying to leave the war, Hitler sent Major Skorzeny and his commandoes into that country. There they seized Milos Horthy, son of the regent of Hungary Miklós Horthy, and the next day they seized the regent himself. A pro-Nazi government then took power in Hungary.

In late October, Hitler personally promoted Skorzeny to lieutenant colonel in the Waffen-SS and charged him

Waffen SS Lieutenant Colonel Otto Skorzeny in prison in Nurmberg, December 1945. (Bettmann/Corbis)

with responsibility for covert operations for the upcoming Ardennes Offensive. Skorzeny took command of the 10th Panzer Brigade, a collection of 2,500 men from different units, some speaking English and dressed in American uniforms to commit sabotage and create havoc behind Allied lines. In Operation GRIEF during the offensive, the brigade had limited success creating confusion among U.S. troops. With the defeat of the Ardennes Offensive, the brigade was disbanded. Skorzeny then fought briefly on the Eastern Front before he was transferred back to the west, where he tried and failed to destroy the bridge captured by U.S. forces over the Rhine at Remagen.

Arrested after the German surrender and charged with war crimes, Skorzeny was acquitted for lack of evidence, but he was not released. He escaped from prison in July 1948 and made his way to Spain, where he married an heiress and established a prosperous engineering business. In 1952, the Federal Republic of Germany government cleared Skorzeny of any wrongdoing in the war. Skorzeny raised funds to enable ex-SS men to find refuge in Latin America. He died in Madrid on 7 July 1975.

Slim, Sir William Joseph (First Viscount Slim) (1891–1970)

British army general and commander of the Fourteenth Army in India and Burma. Born on 6 August 1891 in Bristol, Slim came from humble stock. He joined the Officer Training Corps, and in August 1914, he was commissioned a second lieutenant. At Gallipoli in 1915, he received a serious wound, but he made a full recovery. He deployed to Mesopotamia in 1916, earning the Military Cross for valor before being wounded again and sent to India to convalesce.

Between the wars, Slim served with the Indian army, honed his writing doing part-time journalism, and distinguished himself as an instructor at the Staff College at Camberley and as a student at the Imperial Defence College. By 1940, he was a brigadier general commanding the 10th Indian Infantry Brigade. At Gallabat in the Sudan, his brigade retreated in the face of inferior Italian forces. After this error in judgment, he adopted a marked preference for offensive boldness. The next year, he rose to major general and command of the 10th Indian Division in Iraq and Syria.

With the Japanese invasion of Burma, Slim returned to the China-Burma-India Theater in March 1942 to command the Burma Corps. Overwhelmed by the superior skill and mobility of attacking Japanese forces, Slim oversaw a 1,000-mile retreat, the longest in British army history. Throughout, he kept his demoralized and seriously outclassed corps together, preserving 12,000 men to fight another day.

Promoted to lieutenant general and given command of XV Corps in April 1942, Slim worked to instill in his soldiers resilience and an aggressive attitude. By emphasizing fitness, night and jungle training, small-unit tactics, and self-reliance, he restored the confidence of a badly shaken army. As with the more famous Bernard Montgomery, Slim had the advantage of being not quite a gentleman. He spoke to his troops using their language (he knew Urdu and Gurkhali), and he shared their sacrifices. A solid physique and strong, lantern-jawed mien lent authority to his tough talk. As he mingled with his men, he transmitted the forcefulness of his

General William Slim, chief of the Imperial General Staff, 10 August 1948. (Bettmann/Corbis)

own personality to the units under his command. Slim continued his personalized brand of leadership when he assumed command of the Fourteenth Army in May 1943.

Slim's Fourteenth Army faced its sternest challenge with the Japanese HA-GŌ and U-GŌ offensives in March 1944, the latter aiming for Imphal and Kohima. Initially caught off balance, Slim's army fought doggedly, forcing the Japanese to expend their momentum and limited supplies in costly attacks. Counterattacking, Fourteenth Army pursued the Japanese across the malarial mountains of Burma during the monsoon season. In its headlong retreat, the Japanese Fifteenth Army lost nearly half of its initial force of 150,000 men. Fighting a unified Japanese army with an aura of invincibility about it, Slim's multiethnic and religiously diverse army inflicted the largest land defeat on Japan up to that time. Slim then led the reconquest of Burma until war's end.

After the war, Slim served as chief of the Imperial General Staff, and in 1949 he earned promotion to field marshal. From 1953 to 1960, he was governor-general of Australia, becoming in 1960 the First Viscount Slim. His memoir, *Defeat into Victory* (1956), is regarded as a classic. Slim died in London on 14 December 1970.

Slovik, Edward D. (1920–1945)

U.S. Army private, the only U.S. serviceman to be executed for desertion during World War II. Born on 18 February 1920 near Detroit, Michigan, Edward Slovik was classified 4F because of his criminal record but was reclassified as draft-eligible in 1943 because of a manpower shortage. In August 1944, Slovik was sent to France to join the 28th Infantry Division as a replacement.

On 25 August, Slovik and another soldier became separated from their unit and fell in with a Canadian patrol. They spent six weeks with the Canadians before U.S. military police returned Slovik to his original company on 5 October. Slovik told an officer that he was frightened of combat and that he would run away again. Believing his punishment would be the stockade, Slovik deserted the next day. Returning to his unit, he signed a confession of desertion. He was given a chance to clear himself of the charges, but he refused. He was court-martialed on 11 November and sentenced to be executed by firing squad. Supreme Allied Commander General Dwight D. Eisenhower, believing it was necessary for morale, upheld the sentence, and the execution proceeded on 31 January 1945 near Saint-Marie aux Mines, France. Years later, U.S. President Jimmy Carter officially pardoned Slovik.

Smith, Holland McTyeire (1882–1967)

U.S. Marine Corps general. Born at Hatchachubbee, Alabama, on 20 April 1882, Holland Smith graduated from the Alabama Polytechnic Institute (today Auburn University) in 1901 and then earned a law degree at the University of Alabama in 1903. More interested in military service than

U.S. Marine Corps Lieutenant General Holland M. "Howlin' Mad" Smith at base on Saipan, 1944. From there he helped plan the Allied attack on Guam. (Corbis)

law, Smith received a commission as a second lieutenant in the Marine Corps in 1905.

Over the next decade, Smith held a variety of land and sea assignments. He also earned the nickname "Howlin' Mad" for his frequent explosions of temper. In Santo Domingo in 1916, Smith undertook experiments with amphibious landings. Following U.S. entry into World War I, Smith fought in France with the 5th Marine Regiment and then served as adjutant to the 4th Marine Brigade. Following postwar occupation duty in Germany, he returned to the United States in 1919.

Smith graduated from the Naval War College in 1921. An enthusiastic advocate and pioneer of amphibious warfare, in 1937 Colonel Smith became director of operations and training at Marine Corps headquarters in Washington, D.C. Here he worked to develop new tactics, landing craft, and amphibious tractors. Smith believed that amphibious warfare would be an essential element of any U.S. Pacific military operation. Smith was especially concerned about developing efficient amphibian landing craft, and he worked closely with Andrew J. Higgins on new designs. In September 1939, Smith took command of the 1st Marine Brigade. He was promoted to major general and deployed his brigade to Cuba to practice amphibious techniques. Doubled in size, his brigade became the 1st Marine Division. In June 1941, Smith assumed command of what became the Amphibious Force, Atlantic Fleet.

Smith then headed Marine amphibious training on the west coast of the United States until June 1943, when he com-

manded the joint Army-Marine V Amphibious Corps in the Central Pacific. Smith's troops implemented his amphibious strategies while seizing Japanese-held islands. In November 1943, Smith's forces took the Gilbert Island atolls of Makin and Tarawa. Based on lessons learned at Tarawa, Smith urged the deployment of additional amphibious tractors and the institution of more effective landing-support techniques.

In 1944, Smith's forces seized the Marshall Islands and Mariana Islands, capturing Kwajalein and Eniwetok in the Marshalls in January and Saipan, Tinian, and Guam between June and August. On Saipan, however, Smith relieved 27th Division commander Army Major General Ralph K. Smith for not being sufficiently aggressive. This action led to sharp Marine-Army recriminations but did not prevent Smith's promotion to lieutenant general that August, when he took command of the new Fleet Marine Force, Pacific. In 1945, Smith directed the assault on Iwo Jima, the penultimate amphibious assault of the war.

In July 1945, Smith assumed command of the Marine Training and Replacement Command at Camp Pendleton, California. Smith retired from the Marines in July 1946 with promotion to full general, only the third Marine in history to reach that rank. He died in San Diego, California, on 12 January 1967.

Smith, Julian Constable (1885–1975)

U.S. Marine Corps general. Born in Elkton, Maryland, on 11 September 1885, Julian Smith graduated from the University of Delaware in 1907 and was commissioned in the Marine Corps in 1909. He participated in several U.S. operations in Latin America and the Caribbean, including the occupation of Veracruz, Mexico, in 1914. A 1928 graduate of the Army Command and General Staff School, Smith was an instructor

at the Marine Corps Schools. He served in Nicaragua (1930–1933) and was operations officer with the 7th Marine Regiments (1933–1934), and he then became director of operations and training at Marine Corps Headquarters (1935–1938). From 1938 to 1940, Colonel Smith was chief of staff of the 1st Marine Brigade. Promoted to brigadier general in March 1941, Smith served as naval observer in London.

On his return to the United States, Smith was promoted to major general in October 1942, and he assumed command of Marine Training Schools, Camp Lejeune, North Carolina. In May 1943, Smith commanded the 2nd Marine Division, leading it in the invasion of Tarawa in the Gilbert Islands during 20–23 November 1943. In some of the war's heaviest fighting, Smith's Marines defeated the tenacious Japanese defenders at Betio Atoll. In April 1944, Smith became commanding general, Expeditionary Troops, Third Fleet. Smith's forces then captured the southern Palau Islands, and in September 1944, they occupied Ulithi, which became the hub of U.S. naval operations in the western Pacific. In December 1944, Smith assumed command of the Pacific Department, Fleet Marine Force, Pacific, a post he held until the end of the war.

In February 1946, Smith assumed command of the Parris Island Marine Base in South Carolina. He retired from the Marines as a lieutenant general that December. Smith died at Fort Belvoir, Virginia, on 5 November 1975.

Smith, Walter Bedell (1895–1961)

U.S. Army general. Born in Indianapolis, Indiana, on 5 October 1895, Walter Bedell Smith was nicknamed "Beetle." He joined the Indiana National Guard in 1910 and briefly attended Butler University. Smith earned a commission in the National Guard and served with the 39th Infantry in France during World War I. He was wounded in the Aisne-Marne Offensive in August 1918 and invalided home.

Smith remained in the U.S. Army after the war and proved himself a capable administrator. Assignments included the Bureau of Military Intelligence, the Bureau of the Budget, and the Federal Liquidation Board. He also served as a student or instructor at the Infantry School at Fort Benning, Georgia; the

Marine Major General Julian Smith (foreground) and Rear Admiral Harry Hill observe the action on Tarawa Island from the bridge of the U.S. Navy battleship *Maryland*. (Corbis)

Command and General Staff School at Fort Leavenworth, Kansas; and the Army War College. His abilities were noted by General George C. Marshall, who became army chief of staff in September 1939. The following month Marshall named Smith assistant secretary of the General Staff and, in August 1941, secretary of the General Staff.

After the United States entered the war, Smith became the U.S. secretary to the Combined Chiefs of Staff in February 1942. Following heavy lobbying from European Theater commander Lieutenant General Dwight D. Eisenhower, Marshall reluctantly ordered Smith to Europe in September 1942 to assume his most recognizable role as Eisenhower's chief of staff. Smith earned Eisenhower's trust to handle staff planning and administration, thus allowing his commander to spend more time on operational matters. In a post far less glamorous than battle command, Smith made decisions beyond staff direction, often issuing orders to field commanders in Eisenhower's name.

Eisenhower rejected any notion that Smith should be assigned anywhere but as his chief of staff. Entrusted by

Eisenhower with the job of negotiating with Italian emissaries, Smith, through a combination of bluster and intimidation, accepted the Italian surrender on 3 September 1943. As planning for Operation OVERLORD began in earnest, Smith became chief of staff, Supreme Headquarters, Allied Expeditionary Forces. His staff direction built the core of Operation OVERLORD. On 5 June 1944, when Eisenhower turned to Smith for advice on whether he should launch the Normandy landings, Smith urged that the attack proceed, calling it, "the best possible gamble." When the Third Reich collapsed, Eisenhower authorized Smith to accept the German surrender at Rheims on 7 May 1945.

In January 1946, Smith returned to Washington to be chief of the Operations and Planning Division of the Joint Chiefs of Staff. In March, President Harry S. Truman appointed him ambassador to the Soviet Union, where he remained until 1949. Smith was convinced that the United States should take a strong stand against Soviet expansion and that the Soviet Union would back down if confronted by American power.

U.S. Army Lieutenant General Walter Bedell Smith, 1945. (Corbis)

From 1950 to 1953, Smith served as the second director of the Central Intelligence Agency. He was advanced to full general in July 1951. Smith also served as undersecretary of state in the Eisenhower administration.

Smith retired from government service in October 1954. He was embittered that he never received either the fifth star or promotion to chief of staff of the army, which he believed he deserved. He then entered private business. Smith died in Washington, D.C., on 9 August 1961.

Smolensk, Battle of (10 July–5 August 1941)

Crucial battle at the beginning of the German invasion of the Soviet Union. Smolensk was an important rail and communications center 200 miles from Moscow. The historic gateway to Moscow, Smolensk is located at the western exit from the 50-mile-wide gap between the Dnieper and Dvina Rivers. Soviet Marshal Semen Timoshenko took command of the West Front comprising seven armies with weak infantry divisions and virtually no mobile reserves to stem further German advances. He organized his forces on the Dnieper River line anchored by Vitebsk and Mogilev as the first-echelon defense of the heart of the Soviet Union.

The large concentration of Soviet troops served as a magnet for German commanders who sought to encircle their enemy in a decisive battle. The armored spearheads of Colonel General Heinz Guderian's Panzer Group 2 and General Hermann Hoth's Panzer Group 3 were to cross the Dvina and Dnieper Rivers, advance on a parallel axis along the Minsk-Moscow highway, and link behind Smolensk to trap the Soviets. General Alexander Löhr's Fourth Air Fleet provided aerial support. The plan was risky, as the speed it required of the mechanized elements would preclude use of the slower infantry armies needed to secure the vulnerable flanks of the panzer groups.

On 10 July, Panzer Group 2 crossed the Dnieper and bypassed Soviet troop concentrations without concern for flank security, heavy rains, or determined Soviet resistance. Guderian drove his forces deep toward Smolensk. At the same time, Panzer Group 3 captured Vitebsk and forced the Soviet defense toward Veliki Luki. By 13 July, three Soviet armies were withdrawing toward Smolensk to establish a defense of the city. To buy time, Timoshenko ordered counterattacks with his remaining armies into the exposed flanks of Panzer Group 2, which led to bitter fighting and slowed the German mechanized elements.

On 16 July, Guderian's Panzer Group 2 captured Smolensk, and Panzer Group 3 captured Yartsevo to form an elongated pocket around three Russian armies trapped north of the Dnieper. However, instead of trying to close the pocket, Guderian sent his panzers toward Yelnya, forfeiting a *Kesselschlact* (cauldron, or encircling battle) and offering a salient for the Soviets to attack. On 20 July, Timoshenko formed new armies to counterattack and pin down German forces, especially

Two German soldiers watch burning buildings in the city of Smolensk, 12 August 1941. The Germans used this photo to back up their persistent claims that Smolensk had fallen. (Photo by Keystone/Getty Images)

those in the Yelnya salient. As 60-mile-long columns of Soviet infantry moved forward and hundreds of trains appeared loaded with vehicles and tanks, the Germans realized that the Red Army had not yet been beaten.

Furious battles raged around Smolensk as the Soviets counterattacked to hold open a corridor for more than 100,000 men to escape. The Soviets lost the battle for Smolensk, although fighting continued there until 5 August. In the Smolensk pocket, the Germans captured more than 300,000 prisoners, 3,000 guns, and 3,200 tanks. However, the victory strained the German forces at all levels, forcing a pause of several weeks. As Adolf Hitler and the German army High Command debated whether the next objective should be Moscow or Ukraine, the Soviets reorganized and prepared their defenses that would halt the Germans at the gates of Moscow.

Smuts, Jan Christian (1870–1950)

South African politician, prime minister, and British field marshal. Born to Afrikaner parents on a farm near Riebeck West, Cape Colony, on 24 May 1870, Jan Smuts won highest honors at Christ's College, Cambridge. He then practiced law in Capetown. During the 1899–1902 Boer War, Smuts fought against the British, leading Boer commandos as a general. Following the war, Smuts, who was a close ally of Louis Botha, helped draft the constitution of the Union of South Africa and sought accommodation with the British.

General Jan Christian Smuts, 1941. (Bettmann/Corbis)

When World War I began, Smuts was defense minister under Prime Minister Botha and headed the southern offensive that took control of German Southwest Africa (the future Namibia) from the Germans. Made a British army general, Smuts then commanded British operations in East Africa. By the time World War I ended, he had joined the British Imperial War Cabinet as minister of air and helped to organize the Royal Air Force, the world's first independent air force. Smuts represented South Africa during the Paris Peace Conference, where he supported the League of Nations and helped to develop the mandate system.

On the death of Botha, Smuts became prime minister of South Africa in August 1919. He remained in that post until the Nationalists attained power in 1924. In 1933, he formed a coalition with Nationalist Party leader (James) Barry Hertzog and was deputy prime minister. On the outbreak of war with Germany, Hertzog favored South African neutrality. Smuts, who advocated war with Germany, narrowly defeated Hertzog in Parliament and became prime minister again on 6 September 1939. He was also minister of defense, and from June 1940, he commanded South African armed forces in the war. During the conflict, despite his unprecedented power, Smuts overcame significant opposition to his policies from Nazi sympathizers, although he refused to suppress his fascist opponents completely.

His longtime friend British Prime Minister Winston L. S. Churchill frequently consulted Smuts on strategic matters. Smuts was a strong advocate of holding onto Egypt, no matter the cost; thus, South African forces, following their participation in the East Africa campaign, deployed to Egypt in late 1941. The next year, they helped to take the island of Madagascar. In 1941, Smuts was made an honorary British field marshal.

Smuts was also a staunch advocate of the formation of the United Nations (UN). He wrote its preamble and helped draft its charter. In April 1945, Smuts attended the San Francisco conference and was thus one of the UN's official founders. His internationalist outlook undoubtedly cost him political support at home, and in 1946 Smuts retired following his defeat in the general elections. Smuts died at his home near Pretoria on 11 September 1950.

Snipers

Individuals firing at long range from concealment against an enemy force. Sniping was a phenomenon of World War I that did not seem likely to occur in the World War II because of the initial rapid advances of invading German and Japanese troops. However, when military operations began to take on a more static aspect, it was realized that sniping could be of great value, especially in affecting morale. The ability of a seemingly invisible sniper to kill individuals at a range of 400 or even 600 yards could have a significant effect on the attacked unit. Snipers generally worked in pairs, one acting as a spotter while the other shot.

Heinrich Himmler can be considered the instigator of German sniper training. He began a Waffen-Schutzstaffel (Waffen-SS) sniper training program. The Germans had sold off many of their sniper rifles and had not reordered any telescopic sights, but Himmler reversed this situation. At first, the Germans used any rifle to which a telescopic sight could be fitted, but later they concentrated on the standard infantry rifle, the Kar 98k, fitted with turret-mount telescopic sights.

When the German army invaded the Soviet Union in June 1941, it encountered many Soviet snipers and needed to neu-

Sergeant P. Dorzhiev, a Soviet sniper credited with killing 181 German soldiers on the Leningrad front, looking through binoculars and holding rifle, 1942. (Library of Congress)

tralize them. The Soviet snipers were at first more numerous than skilled, but they improved with training and experience. Stories abound of Russian snipers' effectiveness. One sniper killed 75 German soldiers and wounded another 25 from the German 465th Infantry Regiment in September 1941. Russian snipers were armed chiefly with the Moisin-Nagant 91/30 rifle, which was fitted with a variety of telescopic sights.

As the war progressed, snipers appeared in increasing numbers on both sides on the Eastern Front. The Soviets had snipers who recorded tallies of 400 or even 500 dead. The leading German sniper managed about 300 kills. The movie "Enemy at the Gates" (2001) celebrates the success of Soviet sniper Vassily Zaitsev in the Battle of Stalingrad.

In the Pacific Theater, U.S. snipers were equipped with the Springfield .30 caliber M1903 A-3 and A-4 rifles, with a commercial 2.5 magnification telescopic sight. The sight was fragile, having been designed for deer hunting. Because the rifle had no iron sights fitted, if the telescope was damaged the rifle was rendered useless for sniping. In all, the U.S. Army issued some 28,000 Springfield sniper rifles. The M-1 Garand serv-

ice rifle was also fitted with a telescopic sight, but this came too late in the war to have great effect on sniping techniques and practice.

The U.S. Marine Corps has always had a great interest in sniping, and it parted from the commercial telescopic sight to fit a Unertl scope, which had military durability. One marine sniper, Private David Cass, shot down a Japanese machine-gun crew at a range of 1,200 yds. Japanese snipers often, to their own danger, were roped into trees from which they could fire on advancing Allied troops. Many were killed by machine-gun fire, and on one celebrated occasion a Japanese sniper was comprehensively dispatched by a round from a Boyes .50 caliber antitank rifle, which went straight through the tree and the sniper.

The Soviets had individual snipers who recorded more than 400 deaths on the Eastern Front.

The British army had long been intensely interested in long-range rifle marksmanship, and in February 1940 it established a sniper training school at Bisley Camp in England. Initially, British snipers used the vintage P1914 rifle. The British seldom used snipers in the first half of the war; the war of movement in France and the Low Countries in 1940 did not offer opportunities for sniping, and in the Western Desert Campaign, heat distortion and the lack of cover made sniping virtually impossible. In the campaign in Sicily, however, sniping regained its importance for the British. By this time, snipers were using the new British service rifle, redesignated Rifle No. 4 Mk 1 (T). Originally standard-issue weapons, the rifles were then sent to London gunmakers Holland and Holland for rebuilding. Although there was some criticism of the telescopic sight used, at least one British sniper engaged Germans at a range of 700 yards and scored several hits.

Begun as a minor activity in all armies in World War II, sniping soon accumulated its own lore, and the sight of an oddly dressed rifleman clutching a telescopic rifle, accompanied by another rifleman with a spotting telescope became more and more common. The effect of these men was remarkable, and defending troops went about their business in considerable peril of their lives. Sniping is a tradition perpetuated by many armies today.

Sokolovsky, Vasily Danilovich (1897–1968)

Soviet army marshal. Born in the village of Kozliki near Grodna (then Poland) on 21 July 1897, Vasily Sokolovsky

joined the Red Army in 1918. During the Russian Civil War, he rose to command the 32nd Rifle Division. He attended the Red Army Military Academy of the General Staff in 1921 and served in Central Asia as deputy chief of the Operations Directorate of the General Staff. Sokolovsky was then chief of staff of a division and corps, commanded a division from 1930 to 1935, was deputy chief of staff of the Volga Military District, and was chief of staff of the Urals Military District and then the Volga Military District.

Promoted to major general in May 1938 and to lieutenant general in June 1940, Sokolovsky was deputy chief of the General Staff in February 1941. In midsummer 1941 he became chief of staff of the Western Front, which was responsible for the defense of Moscow. Promoted to colonel general in June 1942, he commanded the Western Front in February 1943. He fought in the Battle of Kursk of July 1943 and was promoted to general of the army in August. As chief of staff of Marshal Georgii Zhukov's First Ukrainian Front beginning in April 1944, he alternated between duties in the field and in Moscow. In the last month of the war, Sokolovsky was deputy commander of the 1st Belorussian Front in the capture of Berlin.

After the war, Sokolovsky was deputy to Zhukov as commander of the Soviet occupation forces in Germany and governor of the Soviet zone of Berlin. Promoted to marshal in 1946, he commanded Soviet occupation forces in Germany from 1946 to 1949. He then became first deputy minister of war and then chief of the General Staff from 1952 to 1960. His final assignment was as general inspector and head of a group working to formulate Soviet nuclear war strategy, published as *Soviet Military Strategy* in 1962. Sokolovsky died in Moscow on 10 May 1968.

Solomon Islands, Naval Campaign (August 1942–February 1943)

Extended six-month-long South Pacific naval campaign between Allied and Japanese forces that halted the Japanese Pacific advance. Between May and July 1942, the Japanese

sought to expand their defensive ring into the eastern and central Solomon Islands. As a part of this drive, they sent elements of their Eighth Army to occupy the island of Guadalcanal. On 6 July, the Japanese began construction of an airfield there, from which they would be able to bomb the advanced Allied base at Espiritu Santo.

News of the construction project forced U.S. commanders to expedite their plans for the Solomons, known as Operation WATCHTOWER. Conceived and advocated by U.S. chief of naval operations Admiral Ernest J. King, WATCHTOWER called for securing the island of Tulagi as an additional base to protect the U.S.-Australia lifeline and as a starting point for a drive up the Solomons to Rabaul. Vice Admiral Robert L. Ghormley, U.S. commander in the South Pacific under Admiral Chester W. Nimitz, then dispatched an amphibious force under Rear Admiral Richmond K. Turner lifting Major General Alexander A. Vandegrift's 1st Marine Division from Nouméa to the Solomons. Vice Admiral Frank J. Fletcher's three-carrier task force provided protection. On 7 August 1942, the Marines went ashore on Tulagi and Guadalcanal and captured the airfield, which they renamed Henderson Field. The airfield soon became the focal point of fighting on the island. In all, the protracted struggle for Guadalcanal included 10 major land actions, 50 engagements involving warships or aircraft, and 7 major naval battles.

The Japanese did not send their main fleet, but rather vessels in dribbles. The Americans soon had Henderson Field operating; American land-based air power controlled "the Slot" (the narrow channel through the Solomon Islands) during the day, but the Japanese initially controlled it at night. The Imperial Japanese Navy excelled at night fighting, for which its crews had been intensively trained, as was shown in the Battle of Savo Island.

When he learned of the landings at Guadalcanal, Vice Admiral Mikawa Gunichi at Rabaul immediately made plans to reinforce the Japanese garrison on Guadalcanal and to attack the vulnerable ships at the landing site. Meanwhile, Vandegrift needed four days to unload all the transports, but Fletcher replied that he could not leave his carriers in position more than 48 hours, and he began removing them on the evening of 8 August. On the night of 8–9 August, Mikawa arrived off the landing site and proceeded to administer the worst defeat suffered by the U.S. Navy in a fair fight. In the Battle of Savo Island, Mikawa sank four Allied cruisers (three U.S. and one Australian) and a destroyer. Three other ships sustained heavy damage. Mikawa did not suffer any losses in the battle, although one of his cruisers was sunk by a U.S. submarine in the return to Rabaul. Mikawa, however, had hauled off without attacking the vulnerable transports. The battle clearly demonstrated Japanese superior night-fighting techniques, excellent gunnery, and the effectiveness of Japan's Long Lance torpedo.

Both sides now reinforced Guadalcanal, but U.S. possession of Henderson Field tipped the balance. Rushed to completion, it ultimately boasted about 100 U.S. aircraft. At night the so-called "Tokyo Express" of Japanese destroyers and light cruisers steamed down the Slot between the islands and into the sound to shell Marine positions and to deliver supplies. The latter effort was never sufficient and only haphazard. It often consisted of drums filled with supplies pushed off the ships to drift to shore. One of the great what-ifs of the Pacific war is the failure of the Japanese to exploit the temporary departure of the U.S. Navy to rush substantial reinforcements to Guadalcanal.

The next major naval action was the 22–25 August Battle of the Eastern Solomons. Rear Admiral Tanaka Raizo dispatched to Guadalcanal a small convoy of destroyers and transports carrying troop reinforcements. Admiral Kondō Nobutake steamed from Truk toward the Solomons with a task force to provide protection. Fletcher's carrier aircraft intercepted the Japanese and sank the light carrier *Ryujo* and several other vessels, but the carrier *Enterprise* suffered damage. On 31 August, the Japanese torpedoed and badly damaged the carrier *Saratoga*, reducing U.S. carrier strength to only the *Wasp*. The *Wasp* in turn fell victim to a Japanese submarine on 15 September. The carrier was so badly damaged by three torpedoes that she had to be scuttled.

Another big naval encounter, the Battle of Cape Esperance, occurred from 11 to 13 October. The Americans detected a Japanese convoy off the northwest coast of Guadalcanal. In a night engagement on 12–13 October, the Japanese lost a cruiser and a destroyer and had a cruiser heavily damaged; one U.S. destroyer was lost and two cruisers were damaged. The next day, American aircraft sank two other Japanese destroyers that were searching for survivors. Although the battle was not decisive, it was the first U.S. Navy night victory against the Japanese, and it substantially lifted U.S. morale. In October there were important command changes: Vice Admiral William "Bull" Halsey replaced Ghormley, and Rear Admiral Thomas C. Kinkaid replaced Fletcher.

Meanwhile, Kondō Nobutake's repositioning of vessels and Halsey's instructions to Kinkaid to seek out the Japanese fleet brought on a fourth naval battle for control of the Solomons: the Battle of the Santa Cruz Islands. In the ensuing battle on 26 October, each side launched simultaneous strikes against the other. In the exchange, U.S. aircraft badly damaged the Japanese light carrier *Zuiho* and fleet carrier *Shokaku*. The U.S. carrier *Hornet* was also severely damaged and was placed under tow; but with Kondō Nobutake closing in, she was abandoned to be sunk by Japanese destroyers. Japan won the Battle of the Santa Cruz Islands, leaving the Americans with only one carrier in the South Pacific, but the Japanese sustained such losses that they were unable to exploit the situation.

Landing operations on Rendova Island in the Solomons, 30 June 1943. Attacking at the break of day in a heavy rainstorm, the first Americans ashore huddle behind tree trunks and any other cover they can find. (National Archives)

From 12 November to 15 November, a series of intense sea fights took place off Guadalcanal. In the first, on 12 and 13 November, U.S. ships and land aircraft blocked reinforcement of the island by Japanese troops in 11 transports protected by destroyers. At the same time, Rear Admiral Daniel J. Callaghan, commanding 5 cruisers and 8 destroyers, moved to intercept a powerful Japanese force under Vice Admiral Abe Hiroaki that included 2 battleships that sought to shell Henderson Field. In a night action east of Savo Island, both sides suffered heavy losses. Abe lost the battleship *Hiei* (badly damaged in the fight, it fell prey to U.S. aircraft the next morning) and 2 destroyers. The Americans lost 2 cruisers and 4 destroyers. Virtually all other ships on both sides were damaged. Rear Admirals Callaghan and Norman Scott were among the dead, but Tanaka was forced to turn back, and the planned Japanese bombardment of Henderson Field was canceled.

On 13 and 14 November, Tanaka returned with his reinforcement convoy, and his cruisers shelled Henderson Field. The

Americans sank 6 Japanese transports and a heavy cruiser and damaged another cruiser. During the third phase of the naval battle of Guadalcanal (November 14–15), Rear Admiral Willis A. Lee with 2 battleships and 4 destroyers met and defeated yet another Japanese force under Kondō near Savo Island. The Americans lost 2 destroyers, but Kondō lost the battleship *Kirishima* and a destroyer. The net effect of this 3-day battle was that Tanaka landed only some 4,000 troops. The Japanese lost 6 transports sunk, but they had to beach another 4, representing some 70,000 tons of scarce shipping. Most important from the American standpoint was that U.S. forces now had around-the-clock control of the waters around Guadalcanal.

On 30 November, U.S. and Japanese naval forces again clashed in the Battle of Tassafaronga. Rear Admiral Carlton H. Wright moved with 5 cruisers and 7 destroyers to intercept Tanaka's force of 8 destroyers carrying supplies to Guadalcanal. In the ensuing fight, the Japanese lost 1 destroyer, while the Americans had 1 cruiser sunk and 3 others badly damaged.

As the numbers of U.S. troops ashore steadily grew and Japanese strength dwindled, at the end of December Tokyo decided to abandon Guadalcanal, and the naval battles of the Solomons came to an end. The final battle of the campaign was a skirmish off Rennell's Island on 30 January 1943, a victory for the Japanese. However, by this time the Japanese had almost completely withdrawn from Guadalcanal. The sustained battle for Guadalcanal gave U.S. naval forces the initiative and led to improved U.S. Navy night-fighting and fire-control techniques that served it well in the long years of fighting yet ahead.

Somalia

Somalia is located on the horn of Africa. Northern Somalia lies on the choke point of the Red Sea and the Gulf of Aden; Italian ports in southern Somalia offer bases for raiding into the Indian Ocean. In 1940, Somalia was divided into three colonies. Italian Somaliland, the largest territory, had 1,200 miles of coastline. Its capital was Mogadishu. In 1936, Italian Somaliland had been incorporated as an enlarged province (having received much of Ethiopia's southern desert region) into Africa Orientale Italiana (AOI). AOI consisted of all Italian East Africa. British Somaliland, with its capital of Berbera, bordered the Gulf of Aden. It lacked a good harbor and resources. French Somaliland was a tiny enclave sandwiched between British Somaliland and Italian Eritrea. Its harbor at Djibouti was the finest of any of the three Somali colonies. All three territories were arid or desert, although British Somaliland did have a high plateau in the interior. Djibouti boasted

the only railroad, which wound its way through the Ethiopian highland to Addis Ababa.

In 1939 and 1940, the French reinforced their colony of French Somaliland to a total of about 7,000 men under Brigadier General Paul L. Legentilhomme. When Germany defeated France in June 1940, Legentilhomme attempted to have the territory declare for the Free French. However, French Governor H. J. Deschamps and local commanders of the French navy and air force opposed him, forcing Legentilhomme to flee on 5 August 1940 to British Somaliland with some French troops and several hundred anti-Italian Ethiopian refugees who had been undergoing training by the French. French Somaliland then remained under a weak Allied naval blockade until December 1942, when Free French and Allied forces recaptured the colony. A local battalion from Djibouti participated in the liberation of France in 1944.

Following their own entry into the war in June 1940, the Italians successfully invaded British Somaliland that August. An overwhelming force with command of the air led by Lieutenant General Guglielmo Nasi advanced in three columns and fought a sharp action at Tug Argan on 12 August 1940, resulting in the British retreat to Berbera. The Royal Navy evacuated 5,300–5,700 troops and 1,000 civilians; most went to nearby Aden. Commonwealth losses in this campaign were 140 killed and wounded and 120 missing. Italian losses were 465 killed, 1,530 wounded, and 34 missing, the vast majority being Somali troops. This Italian military success shortened the AOI defensive perimeter substantially.

When Italy entered the war, there were few Commonwealth forces on the Kenya border with Somalia and Ethiopia. Lieutenant General Gustavo Pesenti commanded Italian forces on the Kenya border. With the Italian military effort focused largely on British Somaliland, cut off from home and with limited resources, the Italians went on the defensive. Meanwhile, British Commonwealth strength in Kenya increased under Lieutenant General Alan G. Cunningham, commanding the East Africa Force. The latter eventually numbered one South African division and two African divisions.

In mid-December 1940, Cunningham began raids on AOI from Kenya, using effective light South African armor as a key component. A raid on 16–17 December 1940 against El Wak in Somalia not only showed up Pesenti as an incompetent commander but also cost the Italians valuable cipher material that helped Commonwealth forces read Italian radio traffic. Major General Carlo de Simone, who had distinguished himself at the battle of Tug Argan, now replaced Pesenti.

Relying heavily on South African motorized units, Cunningham launched a full offensive against southern Somalia on the night of 8–9 February 1941. Commonwealth forces advanced with flanking movements up the Somalia coast, quickly collapsing the Italian positions. Mogadishu fell to the British on 25 February without a fight. Using captured ports

Arab cavalymen of Italian forces charging on a position in British Somaliland on 8 September 1940, just before British forces were evacuated from the African colony. (Bettmann/Corbis)

and supplies and innovative sea and land transport, by 1 March 1941, Cunningham had sent a column to pursue the Italians into the highlands toward Harar.

To complete the Italian debacle in Somalia, naval, air, and land forces, making up Aden Force, landed at and easily took Berbera on 16 March 1941. This port soon became a key supply point for Cunningham's advancing forces, which captured Addis Ababa on 16 April. The fighting in Somalia was over, although warfare continued in Ethiopia in Gondar north of Lake Tana until late November 1941. The campaign in Somalia and the southern AOI was a classic military operation, involving the defeat of an enemy in detail through the use of motorized columns to flank each successive defensive position.

Somervell, Brehon Burke (1892–1955)

U.S. Army general. Born in Little Rock, Arkansas, on 9 May 1892, Brehon Somervell graduated from the U.S. Military Academy in 1914 and was commissioned a second lieutenant in the engineers. He served in the Punitive Expedition into Mexico in 1916 and 1917 and in engineer and staff posts with the American Expeditionary Forces during World War I.

Somervell graduated from the Command and General Staff School in 1923 and from the Army War College in 1926. He directed a comprehensive study of the Turkish economy in 1933 and 1934 and headed the sprawling Works Progress Administration (WPA) in New York City from 1936 to 1940. In 1940, Somervell's army superiors, impressed by the managerial skills Somervell had demonstrated in his engineering assignments with the WPA, named him head of the army's floundering Construction Division, which had fallen behind in the building of training camps and munitions plants as the nation rearmed.

A hard-driving leader who had little tolerance for bureaucratic red tape, Somervell had the building program on schedule within a year, expediting its operation and initiating new projects including the construction of the Pentagon. In March

1942—after briefly serving as G-4, or supply officer, for the War Department General Staff—Somervell was appointed chief of the newly created Services of Supply, later renamed the Army Service Forces, with the rank of lieutenant general.

In this post, Somervell emerged as a major figure in the U.S. Army's conduct of the war, directing the procurement and shipping of supplies and equipment and the administration of the army and serving as the army's top logistics adviser and troubleshooter. Recognizing the importance of logistics to victory, Somervell spared no effort in seeing that the American fighting man had what he needed. As army Chief of Staff General George C. Marshall put it, he got things done "in Calcutta as fast as he did in the meadows around the Pentagon."

Following his retirement in April 1946, Somervell became president of Koppers Company, and within five years he turned the struggling company into a highly profitable enterprise. Somervell died in Ocala, Florida, on 13 February 1955.

**Somerville, Sir James Fownes
(1882–1949)**

British navy admiral. Born at Weybridge, Surrey, on 17 July 1882, James Somerville entered the Royal Navy as a cadet aboard HMS *Britannia* in 1897. During World War I, he distinguished himself in the Dardanelles/Gallipoli Campaign. Assigned to the navy Signal School, he was director of the Sig-

British Admiral James Somerville, 1945. (Photo by Wood/Express/Getty Images)

nal Department in the Admiralty from 1924 to 1927. In 1931, he commanded a cruiser. After service at Portsmouth, he won promotion to rear admiral and had charge of destroyer flotillas in the Mediterranean Fleet. He then commanded the East Indies station, but was invalided home in 1938 with tuberculosis and placed on the retired list as a vice admiral in July 1939.

When World War II began, Somerville volunteered his services. He distinguished himself working on the development of radar and then as Vice Admiral Bertram Ramsay's subordinate during the Dunkerque evacuation. After the fall of France, the Royal Navy established a covering force at Gibraltar with Somerville in command. In Operation *CATALPULT*, Somerville negotiated with French Admiral Marcel Gensoul in an attempt to neutralize French naval units at Mers-el-Kébir. His Force H launched successive attacks on Oran and Dakar with aircraft and gunfire. The *Ark Royal's* aircraft then struck Italian bases at Genoa, Livorno, and on Sardinia and Sicily, and Force H covered multiple convoys to Malta from August 1940 to March 1942. Force H fought in the Battle of Cape Teulada on 26 November 1940 and played a decisive role in the hunting down of the German battleship *Bismarck* in May 1941.

In March 1942, Somerville took command of the Eastern Fleet, conducting holding operations against the Japanese First Air Fleet's Indian Ocean offensive. His carriers covered the Diégo-Suarez and Madagascar operations in May and September 1942 before withdrawing to serve elsewhere. Somerville's Eastern Fleet carriers recommenced offensive operations in 1944 until he relinquished command in August. He was reinstated an admiral on the active list after five years' war service at sea.

Somerville went to Washington in October to head the British naval delegation. He became admiral of the fleet in May 1945 and retired permanently the next year. Somerville died at Wells, Somerset, on 19 May 1949.

Sonar

Sonar—known as ASDIC (for Allied Submarine Detection Investigation Committee) in British and Commonwealth navies until the 1950s—was the most important underwater detection device during World War II. Sonar took two forms: in its active form, it emitted sonic impulses and measured distance and direction through receiving their reflections. In its passive form, it determined bearing and range through comparative analysis of received sound.

The Allied Submarine Detection Investigation Committee produced an experimental sonar set in 1918, but the first operational units did not go to sea until 1928 (aboard British A-class destroyers). By 1940, most major navies deployed some form of active sonar aboard antisubmarine vessels. All were “searchlight” units that used high-frequency emissions (20–40 kilocycles). They had short ranges (to 3,500 yds) and were ineffective at speeds much above 15 knots. Such sets also had a 200-yd dead zone and slow operating rates, and they determined direction but not depth. Most navies, in consequence, relied heavily on hydrophones for submarine search and used sonar primarily for attack guidance.

Major wartime sonar developments attempted to address these deficiencies. Power rotation and improved displays enhanced operating rates, and streamlined steel domes raised useful search speeds. Dual-frequency sets (operating at either 14 or 30 kilocycles) enhanced ranges, and tilting transducers helped to eliminate or at least reduce the dead zone.

Realization of the performance capabilities of German submarines, in particular, drove sonar development. The introduction of “heavy” depth charges and the monster Mark X* weapon to counter deep-diving U-boats required methods for accurately determining the target's depth because of the still relatively slow sink rate of these weapons. For accurate depth determination, Britain developed a specialized sonar (Type 147B) that was fitted from 1943 to some Atlantic escorts in addition to its standard type.

A simultaneous line of development—scanning sonar that used an omnidirectional transmitter coupled to an array of fixed receiving transducers—offered a possible solution to several of the search problems: range, depth determination, and the dead zone. Such equipment required greater power to maintain range. However, since rotation was eliminated, it could be larger and so could operate at lower frequencies, enhancing performance. The successful operational deployment of such equipment in Allied navies, however, had to wait until after the war.

Wartime submarines also carried sonar. Most navies relied on active sets for target detection, but Germany pursued a different course with its GHG (Gruppen-Horch-Gerät)

Sound operator monitors early sonar gear on board the PC-488. (Corbis)

equipment, a standard installation from 1935. An array of sound-receiving diaphragms on each side of the bow connected to a pulse-timing compensator and provided bearings of received noise. This apparatus could detect single ships out to 16 miles and large groups to 80 miles, but the bearings it provided were insufficiently precise for accurate attacks. At short ranges, however, a supplemental swiveling hydrophone (Kristall-Basisgerät) generated bearings accurate to within 1 degree. Finally, to obtain ranges, U-boats carried an active sonar (SU-Apparatus) developed from surface-warship sets, although this was rarely used since its emissions revealed a submarine's presence. Trials late in the war, however, using GHG together with SU-Apparatus demonstrated that as few as three active pulses sufficed to determine target distance, course, and approximate speed.

At the outbreak of war, sonar was widely—though mistakenly—regarded as rendering the ocean transparent in the search for submarines. Its limitations, however, were rapidly appreciated, and major corrections were implemented. By 1942, sonar was an integrated part of a suite of search sensors that included, most importantly, radar and shipborne high-frequency direction finding.

Sopwith, Sir Thomas Octave Murdoch (1888–1989)

British aviation pioneer. Born in London on 17 January 1888, Thomas Sopwith received training as an engineer. A private income allowed him to pursue wide-ranging interests. A self-taught aviator, he was one of the first in Britain to secure a pilot's license. Flying a Howard-Wright biplane, in 1910 Sopwith won the £4,000 Baron de Forest Prize for the longest flight by a British pilot to a continental destination (169 miles). In 1912, he founded Sopwith Aviation Co. Ltd. and Flying School at Kingston-on-Thames. Sopwith began producing his own aircraft and, by August 1914, had delivered 45 aircraft to the Royal Naval Air Service (RNAS).

During World War I, Sopwith built for the British government, and often test-flew, such aircraft as the Pup, Dolphin,

Snipe, Tabloid, and Triplane. His Camel, introduced in 1917, was the finest British fighter aircraft of that war. Sopwith ultimately supplied some 16,000 aircraft to the RNAS and to the Royal Flying Corps and its successor, the Royal Air Force (RAF). He also built the multirole 11/2 Strutter, the first British two-seat fighter. In addition to Britain, Sopwith supplied aircraft to France, Russia, Belgium, and the United States. Sopwith also manufactured the Baby seaplane and the Cuckoo, the first carrier torpedo plane.

The military drawdown after the war forced Sopwith to liquidate his company in 1920. That November, he founded a new aviation firm, the H. G. Hawker Engineering Company, named for Sopwith test pilot Harry Hawker. In 1928, the highly successful Sydney Cramm–designed Hart light bomber brought substantial contracts for the firm and made it the principal supplier to the RAF. Between 1935 and 1938, Sopwith combined several aviation firms, forming the Hawker-Siddeley Group.

Sopwith's most famous aircraft, the Cramm-designed Hawker Hurricane, first flew in 1935. At the beginning of World War II, it constituted 60 percent of RAF Fighter Command strength and played an important role in the Battle of Britain. Usually pitted against bombers because they were marginally outclassed by the German Bf-109E fighter, Hurricanes claimed more German aircraft in the Battle of Britain than all other British defenses combined. Hurricanes underwent modification to fill ground-support and tank-busting roles. A naval version, the Sea Hurricane, saw wide service. Hawker also produced the Sea Fury, Tempest, and Typhoon fighters/light bombers.

In 1959, Sopwith took over the De Havilland firm, and in 1963, he took over Blackburn. He retired in 1963, although he remained a member of the board until 1978, shortly after the British government nationalized the firm as British Aerospace. Sopwith died at Compton Manor in Hampshire, England, on 27 January 1989.

Sorge, Richard (1895–1944)

Soviet spy. Born in Baku on 4 October 1895 to a German father and Russian mother, Richard Sorge moved with his family to

Germany when he was a child. Sorge enlisted in the German army at the start of World War I. Badly wounded and disillusioned by his wartime experiences, he joined the Communist Party after the war.

After working as an agitator, Sorge traveled to the Soviet Union in 1925, when he was recruited to become an espionage agent for Comintern (Communist International), the Soviet-sponsored international organization dedicated to world revolution. In 1930, Sorge arrived in Shanghai and began forming an espionage ring while developing his cover as a freelance journalist working for a variety of German newspapers. In September 1933, Sorge arrived in Japan on a new assignment and began recruiting agents. The most important recruit was Ozaki Hotsumi, a close associate of future prime minister Konoe Fumimaro.

Still using a journalistic cover, Sorge himself began to cultivate contacts in the German embassy in Tokyo. Using a mixture of false credentials (at the order of Comintern, he had joined the Nazi Party) and a genuine reputation as an expert on Asian affairs, Sorge eventually became a close confidante of German military attaché Major General Eugen Ott, who later became German ambassador to Japan.

During the critical year of 1941, Sorge's ring provided Moscow with valuable information about Japanese intentions. In August, Josef Stalin, informed by Sorge that Japan would not invade Siberia but instead would strike south, was able to transfer divisions from Asia to Europe. These Siberian reinforcements played a vital role in blunting the German drive on Moscow in the winter of 1941. Sorge also kept Moscow informed about the breakdown of negotiations between the United States and Japan until he was unmasked and arrested by the Japanese police in October 1941. Contrary to myth, Sorge did not know of Japan's plans to attack Pearl Harbor; he only predicted war between Japan and the United States.

A Japanese court sentenced Sorge to death for espionage, and he was hanged in Tokyo on 7 November 1944. Belatedly, in 1964 Moscow proclaimed him a Hero of the Soviet Union. Sorge was indisputably one of history's master spies.

Sosabowski, Stanisław (1892–1967)

Polish army general. Born on 8 May 1892 in Stanisławów, Galicia, Stanisław Sosabowski served in the Austrian army from 1913 to 1918. He joined the army of the newly reborn Poland in 1918 and was sent to Paris as an armaments expert on a committee charged with purchasing surplus Allied military equipment for the new Polish armed forces.

In 1922 and 1923, Sosabowski studied at the Warsaw Staff College. He then commanded various infantry units. From 1930 to 1937, he was instructor of military organization and on General Staff service. In 1937, Sosabowski took command of the 9th Infantry Regiment. In 1939, on the eve of the German invasion, he was ordered to take command of the 21st Infantry Regiment stationed in Warsaw and finally of all infantry units of the 21st Division.

After the September 1939 defeat of Poland and its occupation by German and Russian forces, Sosabowski escaped abroad, first to France and then, after France capitulated, to Great Britain. There he organized and trained the 1st Polish Parachutist Brigade. He demanded that the brigade be sent to assist in the Warsaw Rising, which was staged by Polish Resistance forces to destroy German army units stationed there. However, the British government vetoed this idea.

In September 1944, Sosabowski was ordered to participate with his brigade in the airborne phase of Operation MARKET-GARDEN, the effort to secure a crossing over the Rhine River at Arnhem. He protested, arguing that the order was based on faulty intelligence and therefore bound to end in catastrophe. Consequently, he insisted on a formal, written order. Dropped into Arnhem on the second day of the operation, his brigade fought well but was decimated by German armor. His gloomy prediction proved correct. Following the return to Scotland of Sosabowski and what remained of his brigade, he was dismissed from his post at the insistence of angry British superiors.

Sosabowski published two books of memoirs. He died in Middlesex, Britain, on 25 September 1967.

Sosnkowski, Kazimierz (1885–1969)

Polish army general. Born on 19 November 1885 in Warsaw, Kazimierz Sosnkowski graduated from the Polytechnical School of Lwów (Lviv). From 1914 to 1917 he served as chief of staff to Joseph Piłsudski, commander of the 1st Brigade of the Polish Legion formed to fight Russia at the side of the Austro-Hungarian armed forces. In July 1917 he was arrested by the Germans for his conspiratorial activity and kept at the fortress of Magdeburg until the eve of the capitulation. He returned to Warsaw on 10 November 1918 and, together with Piłsudski, worked to build the newly reborn country's army. As minister of war during the Russo-Polish war of 1919–1920, he was responsible for creating the armed forces that defeated the Red Army in the decisive Battle of Warsaw of 13–15 August 1920.

Sosnkowski continued to serve as minister of war from 1920 to 1924 and as inspector of the Polish armed forces from 1927 to 1939. He was a strong supporter not only of an alliance with France, but also of close cooperation with Czechoslovakia. During the September 1939 German invasion of Poland, he commanded the southern sector of the front and scored several local successes around Lwów. Following the unexpected Soviet invasion of Poland from the east on 17 September, Sosnkowski took refuge in Romania. After the internment of the Polish government there, he managed to escape to France and joined the cabinet of general Władysław Sikorski.

Sikorski appointed Sosnkowski minister without portfolio in charge of relations with the Polish Resistance movement, a post he held from 1940 to 1943. Sosnkowski succeeded Sikorski as commander in chief of the Polish armed forces following Sikorski's death at Gibraltar in July 1943 and continued in this capacity until 1944.

Rather than return to communist Poland, Sosnkowski remained in exile after the war, first in Great Britain and then in Canada. From there he unsuccessfully tried to unite all noncommunist elements of Polish émigrés. A talented writer, Sosnkowski published two books, the latter of which included his major speeches, military orders, and interviews. Sosnkowski died on 11 October 1969 on his farm near Toronto, Canada.

South Africa, Union of

The Union of South Africa played an important—and often overlooked—role in the Allied victory in World War II. Strategically located at the southern tip of the African continent, South Africa controlled vital shipping lanes from the Indian Ocean around the Cape of Good Hope into the South

Atlantic. Even the country's neutrality would have severely hindered Allied antisubmarine efforts. South Africa also possessed important natural resources, including rich deposits of coal, diamonds, iron, gold, and uranium important to both warring sides.

In 1939, South Africa was a British dominion. Nonetheless, sentiment in South Africa toward the war was sharply divided. In 1939, South Africa was home to 7 million native Africans (called *blacks*), 815,000 racially mixed people (called *coloreds*), 231,000 Asians (mostly Indians), and 2.1 million whites. The whites wielded all the power. To the great majority of black South Africans, the war was of scant interest. Unenfranchised, they saw little to gain in a "white man's war." Many harbored bitter memories of having fought in the 1899–1902 Boer War and then being betrayed by both sides. Many white South Africans, especially Boers, who were of Dutch ancestry, sympathized with Adolf Hitler's racist policies and harbored their own resentment against the British.

A South African Nazi party was formed in 1932 and was followed by other right-wing groups. The largest of these was the Ossewabrandwag (OB, Ox-Wagon Sentinels), which became committed to the violent overthrow of the government. The majority of South African citizens, disgusted by OB excesses, repudiated the protofascist groups by giving the moderate United South African National Party 73 percent of the vote in 1938—the largest electoral majority in the country's history. Hitler's demands for the return of Germany's former colony, South West Africa (Namibia), mandated to the Union of South Africa after World War I, also contributed to the election result.

Following the British declaration of war against Germany on 3 September 1939, there was sharp debate in the South African Parliament whether to follow suit. On 6 September, Minister of Justice Jan Christian Smuts, who favored intervention on the British side, won an 80–67 vote over Prime Minister (James) Barry Hertzog, who favored neutrality. Hertzog then resigned and was replaced by Smuts. Smuts also was minister of defense, and, from June 1940, he commanded South African military forces. In 1945, Smuts was made an honorary field marshal in the British army. A longtime friend of Winston L. S. Churchill, who frequently consulted him on strategy, Smuts pushed successfully for a British attack on Vichy French-held Madagascar to deny it as a possible Japanese base, and South African forces took part in the later stages of the Madagascar Campaign.

An energetic leader who held an unprecedented concentration of power, Smuts nonetheless proceeded cautiously on the domestic front. He edged extreme nationalists out of his coalition government, but a significant minority of pro-German citizens still resisted supporting Britain. In some schools of the Transvaal, students began the day with the Nazi salute and were told that shortwave radio broadcasts from

Germany were their only reliable source of information. A few right-wing terrorist acts occurred, but police rounded up the most dangerous elements late in 1940. Despite calls from his supporters, Smuts adroitly refused to suppress his fascist political opponents completely.

During the war, South Africa built a considerable armaments industry, which also employed thousands of women. It manufactured for South African and Allied use armored cars, howitzers, mortars, and ammunition. South Africa also exported food. Industry of all kinds boomed, and by 1945, South African industrial output had nearly doubled. New employment opportunities drew people into urban areas. By war's end, blacks outnumbered whites in towns, and they demanded changes in society. After the war, the reenergized African National Congress became a serious political factor, leading whites to elect a right-wing Parliament in 1948 that passed rigid segregation laws and introduced apartheid (separateness).

The Smuts government made no effort to begin conscription. In September 1939, Major General Pierre van Ryneveld commanded the Union Defence Force (UDF), comprising South Africa's land, sea, and air forces. Its Permanent Force of its regulars numbered only 5,385 men. Coastal defenses were antiquated, and much of the military equipment was obsolete. The UDF had no tanks or modern artillery. The South African Naval Service (SANS) had no ships, and the South African Air Force (SAAF) possessed exactly six modern aircraft. The same situation prevailed among the reserves.

During the war, South Africa raised three infantry divisions. South African troops won laurels in the campaign in Italian East Africa (Abyssinia) in early 1941, advancing more than 1,000 miles in less than two months. By September 1941, there were nearly 60,000 South African troops in Egypt. South Africans fought at Sidi Rezegh (where the 1st South African Division lost nearly one-third of its strength), at Tobruk (where nearly 11,000 men of the 2nd Division became prisoners on its fall in June 1942), and in both battles of El Alamein. Following these battles, what remained of the 1st South African Division was reconstituted as the new 6th Armored Division. It fought in Sicily and then in Italy until the end of the war.

The SAAF was in combat throughout the war. By the end of the conflict, it numbered four wings and 28 squadrons. South African pilots fought in the Battle of Britain and in East Africa and Madagascar under British command. The SAAF ultimately made up about one-third of the strength of the Western Desert Air Force. The SAAF also served in the Central Mediterranean and played a significant role in training Allied air crews.

The SAAF used British, German, and U.S. aircraft, plus indigenous models such as the Wapiti multipurpose biplane. J. E. Frost's total of 15 air victories was the highest among SAAF pilots, but three South Africans—Marmaduke T. Saint

South African troops on parade at a training camp before leaving on active service in the war. (Hulton-Deutsch Collection/Corbis)

John Pattle, Adolph Gysbert “Sailor” Malan, and J. J. le Roux—were among the five top-scoring aces of Britain’s Royal Air Force (RAF). Saint John Pattle’s records are incomplete, but he is believed to have achieved 41 victories, more than any other RAF pilot.

The SANS patrolled South Africa’s coastline and carried out minesweeping, antisubmarine, and rescue activities (more than 150 Allied merchant vessels and warships were sunk off South Africa by Axis submarines). SANS minesweepers removed mines laid by several German auxiliary cruisers, and South African ships provided support off Sicily and Italy. By 1945, the navy had 78 vessels, including three new frigates, one of which (the *Natal*) sank a German submarine, the *U-714*.

With very few exceptions, during the war South African blacks served only in noncombatant roles in the Non-European Army Service, but many came under enemy fire. By far the largest number of black recruits came from rural areas that had been hard-hit by drought. Pay was half that given to whites. The Native Military Corps provided mess and hygiene and specially trained support troops for the South African white fighting units.

Thousands of British women and children found wartime haven in South Africa, as did Greece’s royal family and former Shah of Iran Reza Khan Pahlavi. After hostilities ceased,

a stream of German children arrived for adoption; many were *Lebensborn* (Fount of Life) babies, conceived to increase the “Aryan” population and shunned in postwar Germany.

Altogether, 334,224 South Africans volunteered for full-time military service during the war. Of these, 132,194 whites and most of the 123,131 blacks who volunteered served in the South African land forces; 44,569 whites served in the SAAF and another 9,455 in the SANS. A total of 21,265 women served in the various branches of the women’s Auxiliary Defence Corps, and 3,710 served in the Military Nursing Service. The war claimed nearly 9,000 South African dead, more than 8,000 wounded, and 14,000 taken prisoner.

Southeast Pacific Theater

The U.S. Navy's strategy for the defeat of Japan by a thrust through the Central Pacific depended on control of the southeastern Pacific, particularly the Panama Canal region through which all shipping destined for the Central, South, and Southwest Pacific Theaters transited. In this regard, the Imperial Japanese Navy squandered a huge potential strategic advantage in not challenging the United States in these waters using their large and capable submarine force. But Japanese doctrine called for submarines to operate in direct fleet support or as scouting forces. The Japanese never adopted the more aggressive commerce raiding and interdiction roles for their submarines that were used with great success by both Germany and the United States in the Atlantic and the western Pacific. In this regard, once the anticipated threat to the Panama Canal failed to materialize, the United States dedicated little in the way of naval protection to shipping in the region.

The March 1941 ABC Conference of Britain, Canada, and the United States established Pacific operational areas that the Joint Chiefs of Staff reconfirmed in March 1942. The agreement gave the navy operational control over the central, southern, northern, and southeastern Pacific areas of operation; the army was responsible for the southwest Pacific. Further, the Pacific Military Council determined in March 1943 that all of the Pacific should be under the "strategic command" of Admiral Chester Nimitz, commander in chief, Pacific, although General Douglas MacArthur held overall command of the southwest Pacific. The actual boundaries had been established earlier in Joint Chiefs of Staff directives of 4 April 1942 to MacArthur and Nimitz that outlined the southeastern Pacific as everything east of a line drawn from the Mexico-Guatemala border to the mid-Pacific near Clipperton Island and then southward to the South Pole. To patrol this vast ocean area, Rear Admiral John F. Shafroth commanded a tiny force of three older light cruisers and several destroyers. As events played out, however, Shafroth's force proved more than sufficient, given the lack of Japanese activity.

Concern between the Pearl Harbor attack and the Midway victory over the security of the Panama Canal did not reflect in the naval defenses initially allotted to the region. To protect not only the canal itself but also transiting shipping, the U.S. Army had capable forces, but only in the 10-mile-wide Panama Canal Zone. The various Latin American countries

offered little in terms of genuine security, even after Mexico and Colombia declared war on the Axis powers in 1943. The navy provided only minimal resources for Rear Admiral Clifford E. Van Hook's Panama Canal Force, consisting of the elderly destroyers *Borie*, *Barry*, *Tattnall*, and *Goff* along with the gunboat *Erie*, 2 patrol craft, 2 small converted motor yachts, and 24 Catalina maritime patrol aircraft. Although a few Japanese submarines entered the area as part of the June 1942 Japanese naval offensive against Midway and the Aleutian Islands, they did no damage. However, German U-boats did tremendous destruction to shipping on the Caribbean side of the canal, including two sinkings just outside the eastern entrance. But, again, the Japanese threat, which might have included carrier strikes, a possibility envisioned in war plans prior to December 1941 (*Rainbow 5*), never materialized on the Pacific side. Nor did the large 5,200-ton Japanese submarines of the I-400 class carrying 3 bomber-seaplanes (fielded in late 1944 and clearly designed for operations against the U.S. west coast and the Panama Canal) ever deploy to the region as anticipated.

Despite the ultimate lack of a credible Japanese threat to American shipping in the southeastern Pacific, a fact not realized until later in the war, naval commanders in 1942 assigned whatever escort assets were available to open-ocean vessels, particularly troop convoys transiting to the Central and Southwest Pacific Theaters and Pearl Harbor. In late January 1942, Shafroth's light cruisers *Trenton* and *Concord* and some destroyers escorted 2 large convoys from the canal through to Bora Bora with 4,500 men assigned to the construction of a new naval fueling station. At about the same time, the carrier *Lexington* and its assigned force escorted an 8-ship convoy carrying 20,000 troops through the southeastern Pacific (2 for Christmas Island, 2 for Canton Island, and 4 for New Caledonia).

In retrospect, the failure of the Imperial Japanese Navy to harass Allied shipping or to attempt even limited interdiction operations in the Southeastern Pacific represented a tremendous missed strategic opportunity. Although such a southeastern Pacific campaign would likely not have changed the eventual outcome of the war, it certainly would have mitigated Allied pressure in other Pacific areas of operation and complicated thrusts against the Japanese defensive perimeter.

Southwest Pacific Theater

Geographical area known to the Japanese as the Southern Resource Area and also the Southeast Area and to the Allies as the Southwest Pacific Area (SWPA). Major land areas in this theater were the Philippine Islands, the Netherlands East Indies, New Guinea, Australia, the Bismarck Archipelago, and the Solomon Islands. In August 1942, the boundary was redrawn to exclude Guadalcanal and certain others of the Solomon Islands.

Japan entered the SWPA in a quest for oil. Oil powered Japan's economy and its armed forces, and the U.S. embargo of oil had helped trigger the Japanese decision to go to war against the United States. Dependent on foreign oil imports and rapidly using up its stocks, Japan needed to secure oil, the absence of which would paralyze Japanese industry within a year and immobilize the fleet within two years. Oil resources in the Netherlands East Indies, Japanese leaders believed, would make Japan self-sufficient in that vital commodity.

Japanese Southern Army headquarters in Saigon in French Indochina supervised army operations from the Philippines south. Navy leaders, meanwhile, decided that U.S. airfields and fleet bases could not be tolerated on the flank of this advance. Japanese Lieutenant General Homma Masaharu's Fourteenth Army with two divisions invaded the Philippines beginning on 8 December 1941. U.S. resistance officially ended on 7 May 1942. Meanwhile, Lieutenant General Ima-mura Hitoshi's Sixteenth Army with three divisions invaded the Netherlands East Indies beginning on 20 December. Dutch resistance there ceased on 8 March.

The Japanese had only a marginal shipping capacity during the war. By May 1942, the Japanese were securing oil from the conquests, but the fleet was only using about 42 percent of its merchant tanker capacity. Iron, manganese, chrome, and copper awaited exploitation in the Philippines. The Japanese desperately needed bauxite from the Netherlands East Indies for aircraft aluminum. Nickel was available from the Celebes. Local Japanese commanders were inefficient at developing these resources, and what materials the Japanese did extract from Borneo, Java, and Sumatra encountered shipping bottlenecks.

As the Japanese pushed south, their navy engaged in several actions. The Battle of the Java Sea largely destroyed the American-British-Dutch-Australian (ABDA) fleet. The United States won a small victory against Japanese transports in the Battle of Makassar Strait. There was also a fight at Badung

Strait, and the Allied cruisers *Houston* and *Perth* were destroyed in the Battle of Sunda Strait. The short-lived ABDA Command collapsed in early March 1942, and the Japanese breached the Malay Barrier.

The startling successes of their initial campaigns encouraged the Japanese navy leadership to propose that five divisions invade Australia. Shipping and logistics, however, posed insurmountable problems as Japan, already short of shipping capacity, had lost 700,000 tons of shipping—nearly 12 percent of total capacity—sunk or severely damaged in the first four months of war. The Japanese army had never considered operating in the SWPA and had not planned how to campaign over such a large area and with such extended lines of communications. Japanese army planners estimated that to capture Australia would require 12 divisions and 1.5 million tons of shipping. The Japanese did not have the military assets and resources for such an operation. Australia was simply one continent too far.

Rather than invade Australia, Imperial General Headquarters in Tokyo ordered six of the divisions that had participated in the southern operations back to the Japanese home islands, China, and Manchuria. Planners redirected their logistical effort to the northwest and west when they should have been building bases—especially air bases—and establishing and supplying garrisons in the south.

On 30 March 1942, the U.S. Joint Chiefs of Staff established the Southwest Pacific Area. General Douglas MacArthur received command. It succeeded the ABDA area formed on 15 January as well as the Australia–New Zealand Area (ANZAC) established at the end of January. The first priority was to strengthen lines of communications to Australia and to build up logistics and airpower. The air war here would be primarily land-based.

Japan landed troops on New Guinea in February and March 1942. Japan sought Port Moresby on the south coast as an air base, part of its campaign to cut the lines of communications to Australia and to deny the port as a base for Allied counterattacks. In the May 1942 Battle of the Coral Sea, the U.S. Navy deflected the Japanese seaborne invasion attempt. The Japanese then attempted to seize Port Moresby by land, crossing over the Owen Stanley Mountains. Australian forces fought a delaying action south toward Port Moresby that weakened the Japanese and ultimately halted this thrust. The Australians then drove the Japanese back to New Guinea's north coast. A Japanese landing at Milne Bay failed, boosting Allied morale.

On 2 July 1942, the U.S. Joint Chiefs of Staff ordered MacArthur to begin an offensive to clear the Japanese from New Guinea. This effort was limited by the availability of forces and because the Americans' army and navy were both constrained by the priority given to Europe. The long fight for Buna concluded in late January 1943. The Australians and

A Japanese fuel dump burns following U.S. attack in northern New Guinea, April 1944. (Hulton-Deutsch Collection/Corbis)

Americans executed shore-to-shore and ship-to-shore operations up New Guinea's coast. Rabaul on New Britain was initially a target, but the Americans chose to bypass that major Japanese bastion, cutting it off from outside resupply.

Although progress was slow, the Allies kept the initiative, imposed a tremendous drain on Japanese resources, and prevented the Japanese from consolidating their conquests. Weather, disease, and inhospitable terrain inflicted heavy losses on all combatants in this theater, but especially on the Japanese. Particularly devastating to the Japanese was the loss of so many of their air assets, and the destruction of Japanese transports in the Battle of the Bismarck Sea gave Japan a stark warning of the precariousness of its position.

The Americans launched almost every operation so as to extend their air umbrella and logistics closer to the Philippines. The strategy of island-hopping, which made use of growing U.S. Navy strength in the theater, allowed U.S. forces to advance, yet bypass strong Japanese ground forces. Allied shipping constraints and a shortage of service troops were greater impediments to the advance than shortfalls in combat troops.

The SWPA was the location of one of two major U.S. offensives (comprising mainly land-based air and ground forces) aimed at Japan. The second location was the Central Pacific, in which the U.S. offensives comprised mainly carrier air and sea power. The Japanese had insufficient assets to meet both offensives and were often off balance as they tried to maneuver against the two. The Japanese were simultaneously heavily committed in Burma and China and had to maintain major forces in Manchuria as a check on potential action by the Soviet Union.

The American SWPA and Central Pacific offensives indirectly supported each other early in the campaigns and then directly supported one another as they converged at the Luzon-Formosa-China coast area. The speed, flexibility, and mass of the two Allied thrusts neutralized the defender's traditional advantage of interior lines of communications. Coordination between the U.S. Army and Navy of current and future operations was critically important.

The Japanese regarded campaigns in New Guinea as a means to delay their enemies, reduce enemies' resources, and gain time to reorganize for a counteroffensive. Rather than

weakening the Allies, however, the campaigns here became a drain on Japanese manpower, ships, and aircraft. Allied airpower cleared Japanese from the air and sea. Nowhere did the Japanese stop the advance, nor could they sustain the attrition that went with it.

The vast majority of Japanese troop and logistics shipping occurred in SWPA waters. Oil moved north through these waters, and U.S. submarines attacked the vital Malaya/Netherlands East Indies–Japan line of communications. Japan lost half its cargo-carrying capacity in 1944 to air and submarine attacks. Critical oil and raw materials required for war production in the home islands were sent to the ocean bottom.

The Battle of the Philippine Sea in June 1944 largely destroyed what remained of Japanese naval aviation. Japanese navy leaders then developed plans for a decisive battle, depending on the avenue of the U.S. advance. When the Americans invaded the Philippines in October, the Japanese immediately initiated their plan, which resulted in the Battle of Leyte Gulf—the greatest naval battle, in terms of ships and numbers of men engaged, in history. In the ensuing battle, the U.S. Navy all but destroyed the Japanese navy as an organized fighting force.

The inability of Japan to transport men and supplies to Leyte and its similar difficulties in supplying and reinforcing Luzon hastened Japan's defeat in the Philippines. The U.S. conquest of the Philippines enabled U.S. airpower there to sever the seaborne supply lines between the Japanese home islands and its Southern Resource Area. U.S. Navy forces swept into the South China Sea in January 1945 and severed Japanese lines of communications with Indochina. The American conquest of the Philippines, the ability of carrier task forces to go wherever they pleased, and the strangulation wrought by the submarine fleet completely isolated the Southern Resource Area.

Large Japanese ground forces remained in Indochina and in the Netherlands East Indies, but they could play no role in defense of the home islands, nor could raw materials reach the home islands. This fact made MacArthur's use of Australian forces in Borneo in mid-1945 all the more questionable. It was a campaign with little strategic value.

The last operations in the SWPA were American preparations for the invasion of Japan. The Philippines provided staging areas for 18 U.S. Army divisions, large numbers of aircraft, logistics organizations, and hundreds of ships. With Japan's surrender in August, operations in the SWPA came to an end. The conclusion of hostilities did not bring peace, however, as wars in which indigenous peoples sought independence from their colonial occupiers soon began.

Soviet Union, Air Force

As part of the reorganization of the Soviet armed forces in 1923, air squadrons were retained under the control of the ground commanders to which they were attached. However, administratively they came under the control of a Chief Directorate of the Air Force of the Red Army. In 1925, the Soviets created a General Staff of the Air Force. Systematic numbering of squadrons began in 1926, and their formation was standardized as five squadrons—each divided into three sections—for an air brigade. As armed force doctrine evolved, in 1928 operational control of all air units was placed under the Chief Directorate of the Air Force.

Nikolai Polikarpov produced fighters such as the I-5 by 1924, and Andrei Tupolev created the first Soviet bomber designs, such as the ANT-4, in 1927. Development stalled during the Great Purges in the late 1930s, when the government ordered the imprisonment of some 450 aircraft designers and engineers, although most were allowed to continue their work from confinement. During the 1936–1939 Spanish Civil War, the Soviet Union supplied both I-15 and I-16 aircraft and pilot/instructors to the Republican side. However, these aircraft were outclassed by the German Messerschmitt Bf-109 fighter. From October 1936 to December 1938, the Soviet Union sent 1,409 aircraft to Spain, of which 1,176 were destroyed. Nevertheless, by January 1937, 17 Soviet pilots had been decorated as Heroes of the Soviet Union.

Ground crew loading bombs on a Red Army aircraft, which is covered with camouflaged net, 1941. (Library of Congress)

The Spanish experience spurred a Soviet response to develop aircraft specifically for ground-attack and close-support duties. Representative of this effort were the Yak-1, MiG-1, and LaGG-3, which entered service in 1939 and 1940. These three designs were later improved. Alexander Yakovlev's Yak-1 was powered by a 1,100 hp engine and had a top speed of 360 mph. It was armed with a 20 mm cannon and two 7.62 mm machine guns. The virtue of this fighter was its simple construction and reliability. The Yak-1 could complete a 360 degree turn in 17 seconds. It enjoyed one of the highest productions of any aircraft of the war; a total of over 30,000 manufactured. Artem Mikoyan and Mikhail Gurievitch combined to produce the 1,350 hp MiG-1, which had a maximum speed of 380 mph. However, the MiG-1 was best suited to an interceptor role at high altitude. The LaGG-3 was the collaboration of Semyon Lavochkin, Vladimir Gorbunov, and Mikhail Gudkov. The LaGG-3, built entirely of wood, had armament, engine, and speed comparable to that of the Yak-1. However, the LaGG-3 had a tendency to spin during sharp turns.

Another reorganization of the Soviet air force took place in July 1940, with a view toward concentrating air assets. The

20 to 30 plane squadrons were amalgamated into 60-plane regiments. Between 3 and 5 regiments made up an air division, each of which supported a ground army. By February 1941, although 106 new air regiments had been authorized, only 19 had actually been formed. Moreover, by the date of the German invasion on 22 June 1941, only 20 percent of Soviet air force units had been fitted with the new Yak, MiG, and LaGG models. In April 1942, Lieutenant General Alexander Novikov took command of the Red Army Air Force. In May, he ordered that all Soviet airpower—heretofore apportioned sporadically among the ground armies and employed without concentration—should be unified. These remnants of surviving post-German invasion Soviet airpower were gathered to become the First Air Army.

The initial success of Germany's invasion of the Soviet Union owed much to the German Luftwaffe, which destroyed many Soviet air force aircraft on the ground. In only the first two days, 2,500 Soviet planes had been destroyed and the Germans had achieved air superiority. Another factor contributing to the demise of the Soviet air force was poor tactics; Soviet bombers attempted to attack without fighter protection. When threatened, Soviet bombers formed a tight wedge pattern, while threatened Soviet fighters maneuvered into a defensive circle. At the beginning of the campaign against Germany—and frustrated by their lack of tactical training and having to fly outclassed aircraft—many Soviet pilots resorted to attempting to ram German aircraft during engagements.

As the German offensive into the Soviet Union continued, the Soviets organized an evacuation eastward of much of their industry, including more than half of the aircraft factories. As a result, production fell off dramatically in the second half of 1941. By June 1942, however, 1,000 aircraft per month were once again being produced in factories that had been relocated east of the Urals. Moreover, the refabricated aviation plants began to produce upgraded aircraft models such as the MiG-3, which had an increased combat radius, and an up-gunned version of the Yak-1 with 12.7 mm cannon and a 1,260 hp engine. LaGG production was decreased in favor of a new product that was the creation of Sergei Ilyushin. His Il-2 Shturmovik began to reach the front lines in mid-July 1942. The impetus behind the design was the creation of a "flying tank": an aircraft with the ability to operate at altitudes of 50 to 500 feet and survive enemy ground fire while supporting Soviet forces by destroying German tanks. A design revision, Il-2m3, began delivery in November 1942. It added protection from German fighters. The new Shturmovik was a two-seater; the gunner faced rearward and manned a 12.7 mm machine gun. The pilot now controlled two 23 mm cannon and either a 1,300 lb bomb load or 880 lbs of bombs and 8 rockets. The Il-2 proved so successful that, at 35,000 units, it was the highest-production aircraft of the war, indeed of all

time. Soviet leader Josef Stalin personally prioritized its production, reportedly remarking, “The Il-2 is as necessary to our armies as air or bread!” The Germans dubbed the Il-2 *Der Schwarze Tod* (the black death).

Soviet pilots revised and developed new principles of engagement, following the practices of their top aces such as Alexander Pokryshkin. His formula was “altitude-speed-maneuver-fire.” From a higher altitude, a pilot had the opportunity to select his target and maneuver with speed into an advantageous position for attack. Squadron formations gave way to the “loose pair” of two aircraft operating together, either covering the other (attacking) aircraft. This tactic was first used during the late 1941 Battle of Moscow and resulted in Luftwaffe losses of 1,400 aircraft between October and December 1941. The six Soviet air regiments taking part in the defense of the capital were given the honorific “Guards” designation. From 15 November to 5 December, Soviet pilots flew 15,840 sorties, compared with only 3,500 for the Luftwaffe.

The new air doctrine also stipulated that bombers have fighter escorts: 4 bombers with 10 fighters and 16–24 bombers protected by a group of 20 fighters. The fighters were organized into groups. Each group consisted of 3–4 pairs totaling 6–8 fighters. Normally, 4 groups would constantly patrol a sector of the combat area. When fighters escorted ground-attack aircraft, the fighters divided into an escort group and an assault group. The escort group remained with the ground-attack aircraft but flew 300 to 1,000 feet higher to engage enemy fighters. The assault group flew 1,500 to 3,000 feet above the escort group and usually a half mile ahead to scout for enemy patrols and act as an advance guard to prevent enemy fighters from closing on the escort group.

Soviet aircraft production continued to climb during the war. From June 1941 to December 1944, the Soviets produced some 97,000 aircraft. During the war, the Soviet air force also benefited greatly from Lend-Lease deliveries of British and U.S. aircraft. The Soviets received 2,097 P-40 Tomahawks, 1,329 Supermarine Spitfires, 4,746 Bell Airacobras, 2,400 Bell Kingcobras, and several transports and bombers. Lend-Lease provided a total of 18,865 aircraft.

By 1945, the Red Army Air Force numbered 17 air armies, each composed of 2 fighter divisions, 2 fighter-bomber divisions, a night-bomber regiment, a reconnaissance squadron, and a liaison squadron. These air armies were held in reserve and tasked to support ground operations on a case-by-case basis. They were under the command of air officers who coordinated efforts with ground commanders. General Novikov also established an air reserve that could be moved around to achieve local air superiority. By 1945, 40 percent of Soviet air strength was held in a reserve capacity. In October 1942, Lavochkin produced the La-5 aircraft. Its 1,600 hp engine pro-

pelled the aircraft 30 mph faster than the Messerschmitt Bf-109F. Simultaneously, Yakovlev produced the Yak-9, which increased the Yak-1’s combat radius and was armed with either a 20 mm or a 37 mm cannon and a 12.7 mm synchronized machine gun.

The Soviets had also organized a long-range aviation force in March 1942. The core of this was the Petlyakov Pe-8 four-engine bomber. But, throughout the war, Soviet emphasis, as with the Luftwaffe, was on ground-support aviation.

All major Soviet campaigns after the Battle of Moscow had substantial air involvement. One-quarter of Soviet airpower was concentrated in the area of Stalingrad by mid-November 1942 for the planned counteroffensive. In the Battle of Kursk in July 1943, the Soviets deployed 1,300 aircraft. During the Battle of Berlin in April 1945, Soviet aircraft were flying a daily average of 15,000 sorties.

The Soviets also organized foreign-piloted air formations, several of which distinguished themselves in combat. These included Regiment Normandie of French pilots, 1st Polish Warsaw Fighter Regiment, 2nd Krakow Night Bomber Regiment, 3rd Polish Ground Attack Regiment, and the Czechoslovak Fighter Regiment. Noteworthy also is the organization of a 400-woman-strong 588th Night Bomber Regiment, the pilots of which were known by the Germans as the “night witches.” During the course of the war, these women flew some 24,000 sorties. Lidiia Litviak was the first woman pilot to shoot down an enemy aircraft in daytime combat.

The Red Army Air Force, much of which was destroyed early in the German invasion of the Soviet Union in June 1941, grew dramatically in size during the war. It certainly played an important role in the Soviet victory in World War II on the Eastern Front, especially—as its name indicates—in ground-support aviation.

Soviet Union, Army

Russia's defeat in World War I gave strong impetus to Soviet dictator Josef Stalin's industrialization campaign of the 1930s. His emphasis on technological progress, articulated in a speech on 4 February 1931, also implied the need for improvements in military technology to enable the Soviet Union to catch up with the western powers. Soviet Commissar of War Kliment Voroshilov claimed that a future war would be "a war of factories." The Japanese takeover of all Manchuria in the same year provided a compelling reason for Soviet rearmament.

Stalinist repression, however, had sharply affected the military leadership. Perhaps 40 million people were "repressed" during the Stalin era; half that number died. The so-called Great Terror that did away with the old-guard Bolshevik leadership also struck down senior military officers. Among the executed were 3 of 5 marshals, 13 of 15 army commanders, 8 of 9 fleet admirals and admirals grade I, 50 of 57 corps commanders, and 154 of 186 divisional commanders. Undoubtedly the purges claimed the most aggressive and outspoken officers, and their loss was keenly felt, especially during the German invasion of the Soviet Union in June 1941. Among those killed was Marshal Mikhail Tukhachevsky, who had foreseen in his "Problems Concerning the Defence of the USSR" of 1936 the German operational concept for an invasion of the Soviet Union and had developed a counter to it. Although it enjoyed modern weapons at the beginning of the war, the Red Army remained committed to the concept that wars were won not by training and technology but by the masses and ideology.

Despite the purges, the Soviet military under Stalin had a strong influence on military-economic policy as it pushed for an armament-in-depth that implied not only state investment in stocks of weapons but support for civilian heavy industry. On the eve of World War II, aircraft, tank, and armament plants were concentrated in the western parts of the Soviet Union. Although some efforts were made during the period before the German invasion of June 1941 to relocate military and general industrial production to the less vulnerable area east of the Ural Mountains, advocates of such a policy were often branded as "defeatists." The German invasion of the western Soviet territories was in fact an economic near-disaster, depriving the Red Army of much of its military industrial base.

The alliance between the Soviet Union and Germany of 23 August 1939 brought advantages to each side. It allowed Adolf Hitler to attack Poland secure in the fact that he would not have to wage war with the Soviet Union, and it bought

time for Stalin to rebuild the Red Army, which he himself had so weakened in the Great Purges. The pact between Germany and the Soviet Union also yielded great economic advantages to the German war machine in the form of Soviet raw materials and the activities of the USSR as a purchasing agent for Germany abroad. It brought far less advantage to the Soviet Union, although it did secure time for Stalin to rebuild his military, and the Red Army also benefited from establishment of a joint tank training center at Kazan and an air base at Lipetsk. Germany also provided some finished machinery and a few weapons of war. But the German and Soviet division of Poland that flowed from the pact also meant the end of a buffer between the two states and the presence of a common military border.

Stalin was shocked at the speed with which Germany defeated France in 1940. Given the punishment that little Finland had inflicted on the Soviet Union in the Winter War of 1939–1940, it is no wonder that Stalin doubted the ability of the Red Army to stand up to the German military. The Soviet leadership counted on a stalemated struggle similar to that of the Western Front in World War I, or at least a war of several years. Critical to a prolonged struggle that would give the Soviet Union a chance to win was denying the Germans the eastern Ukraine, which was the reason why so much Soviet armor was positioned forward in June 1941. Stalin quickly acted on the fall of France to cash in any remaining chips under the pact of August 1939, annexing the Baltic states and taking Bessarabia and northern Bukovina from Romania.

The success of the German tank divisions in France also led Stalin to reverse his decision in the fall of 1939 to eliminate the five Soviet tank corps. A decree of 6 July 1940 ordered the creation of nine new Red Army mechanized corps, and, in February and March 1941, other decrees called for an additional 20 formations.

The invasion of the Soviet Union began early on the morning of 22 June 1941. Stalin was determined not to be tricked into a war with Germany. Not only did the Soviet Union provide no provocation, but it continued to make deliveries of goods under the German-Soviet Non-aggression Pact even as the invasion was in progress. Stalin rejected calls by his generals in the weeks and days before the attack to put Soviet forces in the border areas on alert. Even when he was informed that German troops were invading and firing on Soviet positions, Stalin refused for hours to allow an order to return fire; he claimed Hitler must not be aware of what was going on.

On paper, the Red Army seemed in an excellent position to resist a German attack. It had some 5.37 million men under arms, and in the two weeks after the invasion another 5 million were called to the colors. It also enjoyed superiority over its attacker in major areas of military equipment. Germany had some 6,000 tanks, the Soviets 23,140 (10,394 of them in the

Red Army soldiers shown as they move up on the Germans amid the ruins of houses in the worker's settlement on the outskirts of Stalingrad, 26 January 1943. (Bettmann/Corbis)

west). Much of this equipment was also of high caliber. By 1941, the Soviets possessed some of the best tanks of the war. Their BT-series and T-26 were superior in armor, firepower, and maneuverability to the German light PzKpfw I and II and could destroy any German tank. Similarly, the Soviet T-34 medium tank and KV-1 heavy tank were superior to the PzKpfw III and IV, and indeed to any German tank in June 1941. Soviet units also enjoyed superiority in numbers of certain weapons. Thus a fully equipped Soviet tank division was to have 375 tanks; a German panzer division had only between 135 and 208. A fully equipped Soviet rifle division had 1,304 machine guns, whereas a German infantry division possessed only 486.

Although Soviet formations in the west were not fully equipped when Operation BARBAROSSA occurred, they should have been able to repel the German attack. Nonetheless, the Red Army sustained staggering losses early in the invasion. The bulk of Soviet forces in the western areas were in forward positions, where they were easily cut off and surrounded. On the first day alone, 1,200 Soviet aircraft were destroyed, most of them on the ground. Within two days, 2,000 Soviet aircraft had been lost. Within five days, the Germans had captured or destroyed 2,500 Soviet tanks. Within three weeks, the Soviets had lost 3,500 tanks, 6,000 aircraft, and 2 million men, including a significant percentage of the officer corps.

For more than a week, Stalin remained incommunicado, stunned by his failure and hiding from his people. Not until 3 July did he address the nation. Others were made the scapegoats for Stalin's own failures. General Dimitri G. Pavlov, commander of the sector that had borne the brunt of the German attack, had pleaded with Stalin a week before the German onslaught to be allowed to establish rearward defensive positions. He and eight other generals and political officials were tried and shot.

In the first months of the invasion, Stalin consistently ignored sound military advice from his generals, with disastrous results. His orders that the army stand and fight merely meant that larger portions of it were surrounded and destroyed. German armored pincers took Minsk in mid-July, along with 290,000 prisoners, 2,500 tanks, and 1,400 guns. Smolensk followed a week later with 100,000 prisoners, 2,000 tanks, and 1,900 guns. During August and September, instead of letting his armies escape a German panzer pincer on Kiev, Stalin ordered the city held. German infantry then sealed off Kiev. It fell on September 19 and with it most of five Soviet armies: 665,000 prisoners and vast quantities of weapons.

Fortunately for the Soviet Union, the campaign was sufficiently prolonged for Stalin to grow as a war leader. He absorbed specialist knowledge, and, if lacking in imagination, by the end of the war had grown into an highly effective military strategist. He was also famed, and feared, for his frequent and often abrupt interference in the conduct of operations. Front commanders reported to him daily and received orders directly from him. On 8 August, Stalin took over the position of supreme commander in chief. There were frequent changes in the top professional leadership of the General Staff (Glavnokommand). At first, Georgii K. Zhukov was commanding general; from the end of July 1941, it was Boris M. Shaposhnikov; from May 1942 it was Aleksandr M. Vasilevskii; and from February 1945 to March 1946 it was Alexi I. Antonov. Officers who had been imprisoned under the purges were now released to take command. Prominent among some 4,000 so freed was colonel, later marshal of the Soviet Union, Konstantin K. Rokossovsky, who had undergone extensive torture.

Supply remained a serious problem for the army. Early in August 1941, a Main Directorate of the Red Army was established under the General Staff that was responsible for sup-

plying the army. Arms shortages were especially acute in the winter of 1941–1942. By December 1941, only 39 percent of aircraft production goals had been met, and artillery shell production was no more than 20 to 30 percent of targets.

The rapid conversion of Soviet industry to military purposes and the relocation of entire factories east of the Urals both registered considerable results in 1942, when 59 percent of industrial production was devoted to arms manufacture, compared with only 30 percent before 1940. The military share of the state budget on the army also increased dramatically. The General Staff and government concentrated the Soviet Union's entire productive capacity on the war effort, and achievements were dramatic. During 1942, Germany produced 9,200 tanks, but the Soviet Union built 24,089; only the United States, with 24,997, built more. Superior military production to that of Germany was a major factor in the Soviet military victory in the war. In 1944, thanks in large part to the organizing genius of Albert Speer, Germany managed to produce 22,100 tanks, but the Soviet Union kept ahead, with 28,963. Artillery production also grew, from 42,300 guns in 1941 to 127,000 in 1942. Other weapons systems underwent similar production increases.

The vast distances in the Soviet Union and the primitive transportation helped to break down the German blitzkrieg, which had prospered on the short distances of Poland and France. Weather also helped to save the Red Army. Hitler believed that the Red Army could be defeated in a short campaign of only six weeks, and the German army was ill-prepared to deal with the Russian winter and temperatures of –5 degrees Fahrenheit. Eventually, temperatures in the winter of 1941–1942 plunged to –60 degrees Fahrenheit. Soviet forces were able to fight in those conditions, but the German army was unprepared.

Hitler also miscalculated Soviet manpower resources. In 1941, some 22 million Soviet citizens had experienced some degree of military training. Before the invasion, the Germans had estimated Soviet strength in the west at about 155 divisions: 100 infantry, 25 cavalry, and the equivalent of 30 mechanized. This was not far off the mark; actual Soviet strength was 177 divisional equivalents, but this included air force and border troops, and Soviet divisions were smaller than their German counterparts. By mid-August, the Germans had met and defeated the Soviet force they had expected, but by then another 160 Soviet divisions had appeared. By the summer of 1942, despite near-catastrophic losses, the Soviet field army numbered 5,534,000 officers and men.

The bulk of Soviet soldiers were poorly trained. The low educational level of the population hampered creation of technically effective combat units. The numerous nationalities and languages of the Soviet Union also worked against an efficient, cohesive military establishment. Women proved invaluable in the war effort; some 10 percent of Soviet military personnel and 15 percent of partisan forces were female,

many of them serving in combat roles. Women went to the front as pilots, navigators, mechanics, and political officers. In sharp contrast to other armies in the war, there were also all-women ground units, including the 1st Independent Volunteer Women's Rifle Brigade and the 1st Independent Women's Reserve Rifle Regiment. Women also were heavily involved in partisan activities in the western portions of the Soviet Union occupied by the Germans.

Improving circumstances enabled the Red Army to take the offensive in November 1942. The winter campaign of 1942–1943 broke the German stranglehold on Leningrad and drove Axis forces west. Stalingrad, Rostov, and Kursk were all liberated. When the Germans began Operation CITADEL in the summer of 1943, the Red Army halted the German drive in the great Battle of Kursk. That summer and fall, the Red Army resumed the advance, and from this point the Soviets maintained the initiative for the remainder of the war. On a 1,200-mile front, Soviet forces destroyed more than 200 Axis divisions and more than 14,000 aircraft. During this period, partisan activity complemented the combat actions of the regular Soviet forces, tying down large numbers of German troops in maintaining lines of communication stretching all the way back to Germany. In the newly liberated regions, industrial enterprises were set up that increased steadily growing military production. Soviet forces also received improved arms: the machine pistol (PPS), a new heavy machine gun, the 76 mm artillery piece, a 57 mm anti-tank gun, a new 152 mm howitzer, and 120 mm and 160 mm mortars. Furthermore, production was increased of the magnificent T-34 tank with its 76 mm gun, and new KV-85 and IS heavy tanks were introduced.

A large amount of U.S. Lend-Lease aid was certainly important to the Red Army's war effort. The Soviet Union received 375,000 American trucks, 50,000 Jeeps, and 12,000 railroad cars. These greatly enhanced the mobility of the Red Army and allowed it to carry out sustained offensive operations. The United States also supplied sufficient food to provide one-half pound per Russian soldier a day.

If lacking in flair, many Soviet soldiers fought hard during the war with a dogged persistence, even in hopeless situations. Nonetheless, a staggering 5.25 million Soviet soldiers were taken prisoner during the war. Desertion rates remained high, in part because of the brutal conditions. One source estimates that the Soviet Union executed 157,000 people during the war on charges of cowardice or desertion.

Soviet military casualties continued to be high, in part because of the costly Soviet practice of attacking without

In 1941, some 22 million Soviet citizens had experienced some military training.

tanks, holding the armor back until a breakthrough was achieved. The Soviets lost more men in the battle for Berlin alone at the end of the war than the United States lost during the war in all theaters combined.

By the end of 1944, the Red Army had almost completely liberated Soviet territory. In January 1945, the Red Army began its offensive against Berlin. The East Prussian Campaign and the Vistula-Oder Operation were the most important strategic operations for the Red Army in the war. In spring 1945, the Red Army mounted simultaneous operations on a vast front extending from the Baltic to the Carpathians. On 25 April, troops of the First Ukrainian Front met the First American Army in Torgau at the Elbe, symbolizing the end of Nazi Germany. By the end of the fighting in Europe, despite its horrific losses during the conflict, the Red Army had 6 million men under arms, double the number for the German army.

Three months after the conclusion of fighting in Europe, the Soviet Union declared war on Japan. On 9 August, Soviet forces mounted a large, rapid, and highly successful invasion of Manchuria. Lasting only a week, this bold operation was conducted in difficult terrain against what were considered some of Japan's best troops and ended with Soviet control of Manchuria.

extending over 11 time zones. The Soviet Union was, in fact, as large geographically as the two next-largest countries—China and Canada—combined. Although Great Russians living around Moscow comprised a majority of the population, the country was composed of many different nationalities who spoke nearly 170 different languages. The largest republic by far in the Union of Soviet Socialist Republics (USSR) was the Russian Soviet Federation Socialist Republic, which had more than 100 million people.

Soviet dictator Josef Stalin refused to believe warnings, many of which were supplied by the western powers, that Germany intended to invade. He chose to regard these as attempts by the west to entangle the Soviet Union and Germany in an armed conflict, and he continued to believe that any war between the Germany and the Soviet Union lay years in the future. Stalin's refusal to prepare adequately for a German attack was made worse by his orders that Red Army units stand fast rather than retreat, leading to the cutting off and surrender of vast numbers of Russian soldiers. Stalin's orders were largely responsible for the disastrous Red Army encirclements at Kiev and Vyazma in 1941 and at Kharkov in 1942.

Decisions such as these almost drove the Soviet Union from the war. But while Hitler unlearned the art of war, Stalin proved he was capable of learning it, absorbing specialist knowledge and technical information and paying attention to knowledgeable subordinates. He continued to make the major decisions, shifting units and commanders about. Front commanders reported to him at the end of each day and received their instructions directly from him.

During the war, Stalin deliberately downplayed communism, choosing to emphasize Russian patriotism. Toward this end, he even enlisted the services of the Russian Orthodox Church. Indeed, World War II is known in Russian history as the "Great Patriotic War." The Soviet populace was more used to deprivation and suffering than most peoples, but the war took a huge toll on the population as German and Soviet forces fought back and forth across the Russian heartland and practiced scorched-earth policies.

During the first months of the war, the government exercised total control over the media and withheld any information as to the real losses suffered by the Red Army. There was no hint in the press of hunger or starvation, which were widespread. Even news of the suffering in besieged Leningrad was suppressed. Those spreading rumors were subject to severe punishment under article 58 of the Soviet criminal code. Strict censorship often delayed evacuation of populations westward ahead of German army advances.

On 22 June 1941, the Supreme Soviet declared martial law in all front regions, and two days later it extended martial law to the entire European part of the Soviet Union. Millions of civilians were conscripted to build bunkers, barricades, and tank traps. During July and August 1941, at Leningrad alone,

Soviet Union, Home Front

In 1941, the Soviet Union numbered some 193 million people inhabiting an area of more than 8 million square miles

German soldiers salvaging belongings left behind by withdrawing Russians, in a village on the outskirts of Leningrad, 28 November 1941. (Bettmann/Corbis)

nearly 1 million citizens helped build defensive works. A decree of 26 December 1941 announced that unauthorized leave would be punished by five to eight years' imprisonment. Even more draconian was a decree of 28 July 1942 that stated that all workers who left their jobs without permission would be treated as deserters and would be handed over to military tribunals. All facets of ordinary Soviet life were militarized, with civilian activities directed by the Commissariat of Defense and the secret police. War put a severe strain on the state budget, and the Soviet government therefore imposed a "war tax" on all adult citizens that further tightened the already draconian conditions for most of the population.

The Soviet government pursued a scorched-earth policy. As the Red Army withdrew, it destroyed absolutely everything in its path with no regard to the civilian population left behind. Hundreds of thousands of tons of grain and agricultural products were simply burned to prevent them from falling into the hands of the Germans. This suffering was repeated several times over with the ebb and flow of the war.

At the time of the German invasion, some 11 million Soviet citizens had undergone some military training during the

previous 15 years, and a like number had received some military instruction. Even at the end of the war, after its horrendous casualties, the Red Army had 6 million men under arms, twice the German total.

Increasing industrial production would be vital if the Soviet Union was to have any chance of victory, and it registered great success in this area. In the Third Five-Year Plan (1938–1942), increasing attention had been given to armaments production; to developing new industry in the east; and to relocation of existing production east of the Ural Mountains, where it would be safe from the Luftwaffe. After the German invasion, whole factories were disassembled, loaded on flatcars, and then shipped east, where they were reassembled and resumed production of tanks, planes, and guns. Unfortunately for the USSR, much of the industrial effort was inefficient, the product of confusion and an inept bureaucracy. On the plus side, much of the conversion from peacetime to wartime production was carried out by local initiative, without central intervention.

Not even a majority of production could be relocated so quickly, and in the second half of 1941, the Soviet Union lost

68 percent of its iron production, 63 percent of its coal, 58 percent of its steel, and 40 percent of its farmland. The loss of Ukraine to the Germans was a particularly heavy blow, for it boasted the USSR's most fertile farmland. Despite this, the Soviet Union registered solid gains in arms production during the war. It emphasized simple yet durable weapons. The Russian Ilyushin Il-2 Shturmovik ground-attack aircraft and the T-34 tank were also easy to manufacture and maintain. Between 1940 and 1945, the Soviet Union far outproduced Germany; in that period, it manufactured 146,929 aircraft, 102,301 tanks, and more than 14.6 million rifles and carbines.

During the war, the Soviet civilian population endured hunger, cold, malnutrition, and disease. The German invasion had far-reaching consequences for the food supply, as a large part of Soviet agricultural production was soon in German hands. Also, in the first months of the war, Soviet authorities were far more intent on relocating industry than on saving agricultural production. The relocation of factories east of the Urals had priority over the shipment of food supplies. The Red Army also requisitioned tractors and horses from agricultural work. Soldiers and workers in armaments industries received priority in food and medical supplies at the expense of peasants, the old, and children. The cities were hard hit, and many people there sought refuge in the countryside, where they worked as day laborers to secure bread. Given the lack of machinery, it is not surprising that harvests were poor. Agricultural production fell sharply, resulting in sharp increases in the price of food.

The vast casualties sustained by the Red Army in fighting the Germans, the manpower requirements of the armed forces, and the demands of war industries all led to a severe labor shortage. This shortage was taken up in part by women (who had long been in the industrial workforce in the Soviet Union), by men who were too old for the army, and by teenage boys. Women were the major labor source in the agricultural sector, and by the end of the war, they comprised a majority of the workers in the industrial sector, as well. The percentage of female labor in agriculture rose from 40 percent in 1940 to 70 percent in 1943, to 82 percent in 1944, and to 92 percent in 1945. The loss of their husbands to the army placed an additional burden on married women, who now had to support both children and aged relatives. Workdays were extended to 16 hours a day and longer.

The war exacted a frightful human toll on the Soviet Union. Immediate postwar calculations set the toll at 20 million people dead, an estimate raised 60 years later to as many as 27 million or more. This death toll swelled in part because of Stalin's own policies. During the war, the Soviet authorities executed an astonishing 157,000 of their own soldiers. Stalin wrote off Soviet prisoners of war (POWs) held by the Germans, for surrender was regarded as treason. When Hitler offered to exchange Stalin's only son, Yakov, for Hitler's nephew Leo

Raubal, Stalin refused, and Yakov died in captivity. Even Soviet prisoners who managed to escape from the Germans were severely punished, sometimes with death. To add insult to injury, Red Army POWs captured by the Germans who managed to survive the cruel circumstances of imprisonment were treated as traitors at the end of the war. Many were executed out of hand; others were shipped off to the gulags.

The war was the seminal experience for generations of Soviet citizens. Its legacy of burned villages and hatred came to be reflected in the brutal Soviet treatment of its zone of Germany at the end of the war.

Soviet Union, Navy

When World War II began in September 1939, the Soviet navy was in the process of implementing great changes. In late 1935, Soviet leader Josef Stalin had switched from the strategic concept of a small war at sea and planned to build a large oceangoing fleet. In August 1939, the Naval Staff had finalized a building plan for the next 10 years for 15 battleships, 16 battle cruisers, 2 light aircraft carriers, 28 cruisers, 36 destroyer leaders, 163 destroyers, 442 submarines, and many smaller vessels. Of the new ships, only 1 cruiser, 4 leaders, 13 destroyers, and 158 submarines had been completed by the time the war began. In addition to these, the Soviet navy had available only 3 old battleships, 5 cruisers, 17 destroyers, and 7 submarines.

During the November 1939–March 1940 war against Finland, the Baltic Fleet carried out shore bombardment and submarine operations against supply traffic to Finland. The fleet sank only a few Finnish ships, at the cost of one submarine lost. The end of the war, however, pushed the Soviet bor-

ders forward in the Arctic by inclusion of the entire “Fisher­man’s Peninsula” and in the Baltic in the Karelian sector. These territorial acquisitions and Hanko at the entrance of the Gulf of Finland as a new naval base greatly improved the defenses of Leningrad, the Soviet Union’s second-largest city.

A nonaggression pact with Germany brought further territorial gains for the Soviet Union. In the summer of 1940, acting under its secret provisions, the USSR incorporated the Baltic states, further improving the base situation for the Soviet Baltic Fleet. In the Black Sea, Soviet territorial gains in Bessarabia created an additional buffer for Odessa and allowed the establishment of a Danube Flotilla.

The rising danger of war with Germany forced the Soviet navy in October 1940 to scale down its naval building program. Although Soviet intelligence agencies received many reports about German preparations for an attack, and British and U.S. leaders also sent warnings based on their intelligence reports, Stalin refused to believe Adolf Hitler would attack the Soviet Union before he concluded the war in the west by subduing Britain. He even forbade preparations for a preventative counterattack into the German deployments, which his General Staff had proposed. The German attack of 22 June 1941, therefore, caused great disorder and led to heavy Soviet losses, especially in the army and air force, but also to the Baltic and Black Sea fleets.

The program to build an oceangoing fleet had to be scrapped, as well. By that time, 4 cruisers, 7 destroyer-leaders, 30 destroyers, and 204 submarines had been commissioned, and the Soviets had added a further 4 submarines from the Estonian and Latvian fleets to their own forces. Ships in the Far East yards would be completed, whereas the bigger ships in the western yards were laid up for completion after the war. Of the ships partly completed, only 3 battleships, 2 battle cruisers, 10 cruisers, 2 destroyer-leaders, 42 destroyers, and 91 submarines would be launched.

The Baltic fleet—now comprising 2 old battleships, 3 cruisers, 2 destroyer-leaders, 19 destroyers, and 70 submarines—had to defend the entrances to the Bay of Riga and the Gulf of Finland by laying mine barrages. At the same time, the Germans and the Finns (the Finns had reentered the war as a cobelligerent of Germany) tried to blockade the Baltic fleet by laying mines. The German attack forced the Soviets to abandon its Baltic bases and the Finnish harbor at Hanko, incurring great losses in the process. The German “Juminda barrage” of mines was particularly effective, augmented as it was by air attacks against Soviet ships in the enclosed harbor fortress at Kronstadt and at Leningrad. In 1941, the Leningrad shipyards managed to complete 7 destroyers and 5 submarines, but the Soviet Union lost 1 battleship, 15 destroyers, and 28 submarines in mine and air attacks, with many more vessels damaged.

From 1942 until October 1944, the Baltic fleet was confined to the innermost part of the Gulf of Finland by German

and Finnish mine barrages. Only the submarines could even try to break out into the open. This tactic met with some success in 1942, when the Soviets launched 31 submarine operations; 22 of these breached the mine barriers and reached the Baltic, where they sank 25 ships. Twelve submarines, however, were lost in these actions. In 1943, all attempts to break through the barriers failed, and 4 more submarines were lost. Only after the Finnish truce of October 1944 did Soviet submarines again try to reach the Baltic Sea. By the end of the war, the remaining 22 submarines managed to sink 35 ships, including the liners *Wilhelm Gustloff*, *General Steuben*, and *Goya*. The *Wilhelm Gustloff* was the largest German ship ever sunk by a Soviet submarine; some 9,300 people lost their lives. In the case of the *General Steuben*, of 4,000 people aboard (including 2,000 German military wounded), only 300 survived; and in the *Goya* only 183 survived of some 7,000 passengers and crew. Most of those perishing in these German ships were refugees from East Prussia and the Baltic states. Baltic fleet vessels, operating in conjunction with aircraft, also supported the operations of the Red Army in late 1944 and early 1945. They carried out landing operations in the Gulf of Finland and on the Baltic Islands, and they also attacked German naval forces in the area.

In June 1941, the Black Sea Fleet consisted of 1 old battleship, 6 cruisers, 3 destroyer-leaders, 13 destroyers, and 44 submarines. The German invasion of the Ukraine that month forced the fleet to first support and then evacuate the cities captured by German and Romanian forces in operations beginning in the Danubian estuaries and lasting through mid-1942. Nikolaev, which contained the chief Soviet building yards, had to be evacuated that August. The cruisers, leaders, and destroyers already launched there were towed to Caucasian ports, and the remaining ships were destroyed before the German forces occupied the city.

Between August and October, German and Romanian forces surrounded Odessa by land, and Soviet forces there had to be supported by the fleet, which then evacuated the city successfully. For six months, the Soviet main base at Sevastopol also had to be supplied and supported by naval operations that involved nearly all available naval forces.

In December 1941, the fleet undertook a great amphibious operation against German forces occupying the Kerch Peninsula in an attempt to relieve the defenders at Sevastopol. By May 1942, however, the Germans had annihilated the Soviet ground forces, and only remnants could be successfully evacuated. During and to the very end of the final German attack on Sevastopol, Soviet surface ships and submarines attempted to supply the fortress and evacuate the wounded. During these operations, which lasted through mid-July 1942, the Black Sea Fleet lost 1 cruiser, 2 destroyer-leaders, 9 destroyers, and 12 submarines. Five of the submarines were lost during operations to interdict Axis sea traffic on the west

coast of the Black Sea, an area heavily mined by both the Germans and Romanians.

From August 1942 until September 1943, the Black Sea Fleet concerned itself primarily with the supply of harbors on the Caucasian coast that were endangered by the continuing German offensive. This allowed the Red Army to hold Taupse, and naval landing operations coordinated with submarine and motor torpedo boat attacks assisted in the Soviet offensive on the Kuban Peninsula as well. Here Soviet forces successfully interrupted sea traffic between Romania and Crimea. The attacks against German sea traffic along the west coast, however, were largely a failure.

The battle for the Crimea began in October 1943 and lasted until May 1944. The Black Sea Fleet again tried to disrupt sea traffic from Konstanta to Sevastopol with submarines, light surface forces, and air attacks. On Stalin's order, the larger ships were kept out of these operations. After a short pause, in August 1944 the Red Army began its offensive into Romania. Once Romania capitulated, Bulgaria was occupied, and the Germans were forced to scuttle the remainder of their naval forces in the Black Sea—effectively ending naval combat in that theater. Between July 1942 and the end of Black Sea naval operations, the Black Sea Fleet lost 1 destroyer-leader, 2 destroyers, and 14 submarines. A few small submarines were transferred via inland waterways from the Arctic and by rail from the Pacific to augment the fleet there, but they arrived too late to participate in operations against German-Romanian shipping.

The Soviet Northern Fleet began the war with 8 destroyers and 15 submarines. Its first task was to support the Red Army in halting the German offensive toward Murmansk. The submarines were then sent to attack German supply traffic along the Norwegian coast from the Lofoten Islands to Kirkenes, although they met only limited initial success. A few British submarines sent to Murmansk for some months achieved slightly better results. The Northern Fleet was soon augmented by the transfer of 8 submarines along interior waterways from the Baltic in 1941. A further 5 submarines came from the Pacific in 1942 and 1943, and 12 new submarines arrived from the Caspian during that time as well. The fleet carried out operations throughout the war, inflicting some losses on German shipping and losing 25 submarines, mainly to mine barrages and antisubmarine forces. The fleet also supported Allied convoys over the final portion of the route to Murmansk with destroyers—including 3 sent from the Pacific Fleet via the northern sea route—and naval aircraft. The main defense burden for these convoys, however, fell to the British Home Fleet. In the later years of the war, British and American surface ships and submarines assisted in defending the northern sea route as well. Overall, the Northern Fleet suffered minimal losses beyond the submarines;

only 3 destroyers and some escort vessels and auxiliaries were damaged or sunk.

The Soviet Pacific Fleet served as a reservoir of personnel and for the training of naval crews for most of the war. However, the Pacific Fleet transferred a few destroyers to the Northern Fleet, along with some submarines. In the last month of the war, strengthened by Lend-Lease deliveries of U.S. ships, the Pacific Fleet took part in the war against Japan, conducting landing operations on the east coast of Korea, Sakhalin Island, and in the Kurile Islands. Lend-Lease played a vital role in securing the route along the Aleutian Islands to Kamchatka and Soviet bases in the Far East, especially Vladivostok. This proved to be a much safer route than either Murmansk or Arkhangelsk for Allied supplies to reach the Soviet Union, not least because of the Soviet-Japanese nonaggression pact of March 1941. The fleet lost only 5 submarines through accidents during these operations, though 2 were eventually recovered. One more submarine, which was en route to the Northern Fleet, was lost to a Japanese submarine attack just off the west coast of the United States. A submarine also went down in the final days of the war, sunk in all likelihood by a Japanese mine.

Outside of these major theater operations, the Soviet navy also used river flotillas. The first flotilla operations came on the Pripjet River in September 1939 against the Poles. Other operations followed: on the Danube and the Dnieper in 1941; on the Volga in 1942; and on the Danube again in 1944 and 1945. Flotillas carried out operations on Lake Ladoga and Lake Onega from 1941 to 1944, and they assisted the Red Army in its operations on smaller seas, rivers, and lakes.

Soviet Women's Combat Wings (1942–1945)

Soviet women's combat aviation regiments evolved from the 122nd Aviation Group, established in Moscow in October 1941 by Marina Raskova. The first of these was the 46th Taman Guards (initially designated 588th) Bomber Regiment. Commanded by Lieutenant Colonel Evdokiia Bershanskaia, it remained all-female throughout the war and produced 24 Heroes of the Soviet Union. It consisted of one training and three operational squadrons, with two-woman aircrews. The regiment flew about 24,000 short-range sorties in converted U-2 biplane trainers (renamed Po-2 in 1944). The unit became operational in the Ukraine and reached Berlin at the end of the war.

The 125th M. M. Raskova Borisov Guards (initially designated as the 587th) Bomber Regiment was commanded first by Major Marina Raskova and then Major Valentin Markov. It produced five Heroes of the Soviet Union. The unit consisted of two Pe-2 dive-bomber squadrons. These aircraft were armed with five machine guns that were fired by the pilot, navigator and gunner. Initially, the gunners were mostly male. The regiment flew 1,134 medium-range sorties. It became operational near Stalingrad, and by the end of the war, it was stationed in the Baltic.

The 586th Fighter Regiment was commanded first by Major Tamara Kazarinova and then Major Aleksandr Gridnev. It included some male technicians and one men's squadron, formed as replacement for a women's unit sent to Stalingrad. The regiment flew Yak-1 and Yak-9 aircraft and was charged with protecting Soviet industrial centers, rail junctions, and bridges, including those in Voronezh, Kastornaia, Kursk, Kiev, and Budapest. It became operational in Saratov and by the end of the war had reached Vienna.

Also noteworthy were Il-2 pilots Senior Lieutenants Tamara Fedorovna Konstantinova and Anna Aleksandrovna Timofeeva-Egorova, both Heroes of the Soviet Union. Konstantinova was deputy squadron commander of the 999th Ground Attack Regiment, 277th Ground Attack Division, First Air Army, 3rd Baltic Front. Timofeeva-Egorova was chief navigator of the 805th Ground Attack Regiment, 197th Ground Attack Division, Sixteenth Air Army, 1st Belorussian Front.

No statistics as to how many Soviet women flew combat missions were kept, but by the end of the war, women constituted 12.5 percent of all Soviet fighter aviation personnel, including ground support.

Spatz, Carl Andrew "Tooey" (1891–1974)

General in the U.S. Army Air Forces and later the U.S. Air Force. Born on 28 June 1891 in Boyertown, Pennsylvania, Carl Andrew Spatz (originally *Spatz*; he added the "a" in 1937) graduated from the U.S. Military Academy in June 1914 and began his military career as an infantry second lieutenant at Schofield Barracks, Hawaii. In October 1915, he was detailed to the Aviation School at San Diego, California, where he received his wings in May 1916. In June, he joined the 3rd Aero Squadron in the Punitive Expedition into Mexico.

Following U.S. entry into World War I, Captain Spatz served in France, first as commander of the 31st Aero Squadron and then as an instructor at the American Aviation School. In September 1918, he joined the 13th Squadron, 2nd Pursuit Group, and was credited with downing three German planes.

Following the war, Major Spatz commanded the 1st Pursuit Group (1921–1924), graduated from the Air Corps Tactical School in June 1925, and spent three years in the Office of the Chief of the Air Corps (OCAC), in Washington. During 1–7 January 1929, Spatz commanded an army aircraft, the famous "Question Mark," in a record endurance flight of nearly 151 hours aloft. From 1929 to 1935, he commanded the 7th Bombardment Group and 1st Bombardment Wing in California, subsequently returning to the OCAC. In June 1936, he graduated from the Command and General Staff School at Fort Leavenworth, Kansas, and was promoted to lieutenant colonel. He then served at Langley Field, Virginia, and had a third tour with the OCAC. In 1940, during the Battle of Britain, Spatz spent several weeks in Britain as a military observer. By July 1941, he had risen to the rank of temporary brigadier general, serving as chief of the Air Staff for the newly created Army Air Forces (AAF).

Major General Carl Spaatz (*left*) and Brigadier General Ira C. Eaker, 1942. (Library of Congress)

Following U.S. entry into World War II, Major General Spaatz traveled to England in July 1942 to command the U.S. Eighth Air Force. That December, Spaatz transferred to command the Twelfth Air Force in North Africa. Promoted to lieutenant general in March 1943, he assumed command of Allied Northwest Africa Air Forces. During the last six months of 1943, Spaatz served as deputy commander for the Mediterranean Allied Air Forces.

Spaatz returned to England in January 1944 to command U.S. Strategic Air Forces in Europe, consisting of the Eighth Air Force in Britain and the Fifteenth Air Force in Italy. These forces proved vital in preparation for, and then support of, the Allies' Normandy Invasion.

Promoted to temporary general in March 1945, Spaatz returned to AAF headquarters in June only to be assigned to command U.S. Strategic Air Forces, Pacific, in July. He supervised the final air campaign against Japan. Spaatz remained

certain of the efficacy of strategic bombing of industry in the war, and he believed that still heavier bombing might have obviated the need for the Normandy Invasion. In October 1945, he recommended that atomic weapons should form the backbone of U.S. defense strategy.

In late 1945, President Harry S Truman nominated Spaatz for the permanent rank of major general, and in February 1946, he made Spaatz commander of the AAF, a post held previously by General of the Army Henry H. "Hap" Arnold. Spaatz played a leading role in the creation of the separate United States Air Force. Indeed, he was the last commander of the AAF and first chief of staff of the Air Force in September 1947. Spaatz retired in June 1948. Later, he served as chair of the Civil Air Patrol and wrote a column for *Newsweek* magazine. Spaatz died in Washington, D.C., on 14 July 1974.

Spain, Role in War (1939–1945)

After the Nationalist victory in the Spanish Civil War (1936–1939), Francisco Franco-Bahamonde ruled Spain as dictator. El Caudillo (leader) continued his repressive policies with the aim of preserving the values of traditional Catholic Spain. Spain sided early with the Fascist states of Germany and Italy. On 27 March 1939, Spain joined the Anti-Comintern Pact (*Comintern* is a truncation of Communist International) with the Axis side. Germany, desperate for

Spanish exports of wolfram—the source of tungsten and armor-piercing projectiles—courted Franco. Spain, economically devastated by its Civil War, needed nitrates for fertilizers and oil, of which it had no domestic supply. Pushed by foreign minister and Falangist leader Ramón Serrano Suñer (his brother-in-law), Franco edged Spain closer toward the Axis camp.

When World War II erupted, Franco openly sided with the Fascist states of Germany and Italy. Following the German defeat of France, Hitler met with Franco at Hendaye on 23 October 1940 along the border with Spain and demanded that Franco enter the war. Hitler was angry at Franco's noncommittal response, which was accompanied by an impressive shopping list of required military hardware. Franco was displeased at Hitler's vague reply to the Spanish dictator's demand for territorial compensation, especially French Morocco.

Although he promised Hitler a quick response, Franco dallied and never brought Spain into the war. He did not wish to entangle his still-prostrate country in a new war, and he believed his cause was better served if he posed as a technical neutral. This attitude of nonbelligerency (not neutrality)

Chief of the State Francisco Franco-Bahamonde inspecting members of the German Kondor Legion, 28 May 1939. (Bettmann/Corbis)

infuriated Hitler, who even considered invading Spain (Operation FELIX) as part of a Mediterranean strategy following his defeat in the Battle of Britain.

Franco did congratulate Hitler after each of his early victories and sent troops, under the guise of volunteers, to fight Russia after Hitler's invasion of the Soviet Union. This was the Blue Division, so named because the troops wore blue Falange Party shirts with their red Carlist berets and brown Foreign Legion trousers. Commanded by General Agustín Muñoz Grandes, this force of 18,000 men was sent to fight in the Soviet Union to demonstrate Franco's hatred of communism, to get rid of Falange hotheads, as a sop to Hitler, and to demonstrate to Hitler that Spaniards would fight a German invasion of Spain and fight well. The Blue Division, which joined the German order of battle as the 250th Infantry Division in Army Group North, distinguished itself in fighting around Leningrad. From August 1941 to March 1944, some 47,000 Spanish soldiers served in the division. The division sustained 22,000 casualties, a casualty rate of 47 percent, of whom 4,500 died. Fewer than 300 prisoners of war were repatriated in 1954. The Allies pressed Franco to withdraw the Blue Division, but Hitler released it without being asked in order to strengthen Franco's hand against the Allies. The last troops returned to Spain in April 1944, although Spanish volunteers continued to fight for Germany afterward. Several were organized into Waffen-Schutzstaffel (Waffen-SS) units, and a Spanish SS battalion helped defend Berlin to the last.

Throughout the war, Franco provided the Germans and Italians with assistance in the form of observation posts in Spanish Morocco to monitor Allied ship movements, and he allowed German submarines to be serviced in Spanish ports. During the Allied buildup at Gibraltar preceding Operation TORCH, Franco ordered partial mobilization of the Spanish military but did nothing more. The success of TORCH and especially the toppling of Benito Mussolini from power led Franco to shift to a more neutral position. He reduced the strength of the Blue Division and at the end of 1943 dissolved the Falangist militia.

In February 1944, President Franklin D. Roosevelt also ordered an embargo on fuel and food exports to Spain. On 2 May 1944, with stocks of oil nearly exhausted, Franco signed an agreement with the Allies whereby he promised a strictly neutral stance. He agreed to hand over all interned Italian ships, to close the German consulate in Tangier, and to expel German intelligence agents from Spain. He also agreed to curtail wolfram shipments to Germany to a token 20 tons a month. Despite this agreement, until the end of the war Spain continued to furnish the Germans with intelligence information. Only in April 1945 did Spain sever diplomatic relations with Nazi Germany and Japan.

When World War II was over, Spain became a primary refuge for leading Nazis and collaborators. The Allies sought

to punish Franco's wartime conduct with quarantine treatment. Spain was excluded from the United Nations and condemned for its political nature and close association with the Axis nations. The Cold War changed the western attitude, however, and the United States came to view Spain as a bulwark against communism. The boycott of Franco was lifted; U.S. air and naval bases were established in Spain, and U.S. aid helped prop up the regime, a fact remembered with bitterness by many Spanish democrats.

Special Operations Executive (SOE)

British intelligence agency specializing in overseas sabotage and secret operations. British officials established the Special Operations Executive (SOE) in July 1940, impelled by a much-exaggerated belief that fifth-column activities in western Europe had contributed greatly to the successful German conquest of those countries. Intended in British Prime Minister Winston L. S. Churchill's words to "set Europe ablaze" by promoting resistance activities in occupied countries, the organization initially combined sabotage, research, and propaganda functions. In August 1941, propaganda operations were transferred to the Political Warfare Executive, a separate agency under the Foreign Office; SOE remained under the Ministry of Economic Warfare, which was headed by Hugh Dalton.

SOE operations focused primarily on delivering agents to European countries to work with—and, where appropriate, inspire—indigenous resistance movements. Because these activities frequently attracted unwelcome attention from the German Gestapo and local police, they aroused the enmity of

the British intelligence agencies, especially MI6, which focused primarily on gathering information and which preferred obscurity to ensure the safety of its operations.

At its height, SOE employed 10,000 men and 3,000 women, many recruited through the British “old-boy” network. At least half of the men and some women spent periods as agents in hostile or neutral countries. SOE was normally organized in country sections, although in France it had six sections each of which worked with a different faction of the French Resistance. Activities of the SOE sections eventually provided arms for half a million French opponents of Germany and so facilitated the success of the June 1944 Allied landings.

Although its earlier efforts in Italy had proved fruitless, in 1943 SOE took part in the unconditional-surrender negotiations between General Dwight D. Eisenhower and Marshal Patrice Badoglio; thereafter it assisted Italian partisans who fought the remaining German occupation forces. SOE’s Scandinavian efforts were also largely successful, assisting Danish and Norwegian anti-German Resistance efforts, foiling German plans to use Norwegian heavy water to develop atomic weapons, gathering military intelligence in Denmark, and securing valuable seaborne supplies of special steels and ball bearings from Sweden. In Poland, SOE operatives assisted in extensive sabotage efforts by severely damaging 6,000 locomotives, which disrupted German railroad traffic to the Eastern Front. SOE agents in Czechoslovakia helped in the May 1942 assassination of German Obergruppenführer Reinhard Heydrich, a propaganda coup that nonetheless provoked savage reprisals against Czech Jews and the town of Lidice. SOE efforts in the Netherlands, by contrast, proved disastrous; in 1942 and 1943, German intelligence secretly penetrated SOE communications networks, capturing—and in many cases executing—more than 50 SOE agents.

SOE sent a mission to the Soviet Union, where officials welcomed it politely and pointedly excluded it from any operational role. Until late 1941, the British agent Kim Philby, later revealed to be a Soviet spy, served as a rather effective SOE trainer.

Communist operatives penetrated the large SOE mission in Cairo, which supervised Balkan missions and helped to steer SOE assistance toward Communist resistance factions. In Greece, the SOE armed several thousand agents, but it found that Communist partisans often used this weaponry to eliminate rival Greek forces rather than the Germans. In Yugoslavia, the SOE initially supported General Draza Mihajlović’s Četnik resistance fighters, but it later switched its support to Josip Broz’s (Tito’s) Communist forces, a decision that aided the latter appreciably in winning control of Yugoslavia. In Albania, SOE operatives likewise tended to favor Communist over right-wing guerrilla groups.

SOE operations extended far beyond Europe. In 1940 and 1941, SOE agents escorted Emperor Haile Selassie back to

Ethiopia. With quiet acquiescence from the United States, in Latin America the SOE secretly established sleeper groups that were ready to take action should pro-Nazi forces seem likely to become predominant.

The most significant non-European SOE operations were in Asia. Australian-based SOE agents of Force 136 clashed, sometimes bitterly, with their counterparts from the U.S. Office of Strategic Services (with whom, by contrast, they cooperated well in Europe). In Burma, SOE contravened its own charter by undertaking intelligence-collecting work. It also helped to organize highly effective bodies of Karen guerrillas, who killed more than 17,000 Japanese troops in the war’s final months. In April 1945, the SOE persuaded the Japanese-sponsored Burmese National Army to switch its loyalties to the Allies. SOE operations in Thailand and French Indochina were limited and somewhat ineffective.

Although it was forbidden to operate in China, the SOE secretly sent two missions there. One undertook highly profitable foreign exchange and smuggling ventures that left SOE finances with a surplus when the agency disbanded in January 1946. The other instructed the Chinese Communists of the Eighth Route Army of Mao Zedong (Mao Tse-tung) in SOE sabotage methods.

Although its personnel were relatively few and its resistance and guerrilla efforts in occupied countries could only supplement, not substitute for, full-scale military invasions of those territories, SOE operations proved valuable in boosting Allied morale and dislocating Axis control of subjugated areas.

Speer, Albert (1905–1981)

German minister for armaments from 1942 to 1945. Born on 19 March 1905 in Mannheim, Albert Speer was educated at the Munich Institute of Technology and the Institute of Technology in Berlin-Charlottenburg. He received his architect's license in 1927. He was the protégé and academic assistant of Heinrich Tessenow when he first met Adolf Hitler at a Nazi rally in December 1930. Speer joined the Nazi Party in March 1931. He also joined the Nazi organization for professional architects and soon began receiving party commissions. In 1933, Speer designed the party's celebrations at Tempelhof Airport, introducing the "cathedral of light" concept that became a hallmark of party rallies. This brought him to the attention of Josef Goebbels, the minister of propaganda, who put Speer in contact with Hitler. The Führer soon commissioned Speer to design his official apartments.

By 1934, Albert Speer was "Hitler's architect," and he also held several official posts. In January 1937, Speer added the title of inspector general of construction for Berlin. He reported directly to Hitler and impressed the Nazi leader by completing the Reichs Chancellery in only nine months. In January 1938, Hitler made Speer the first commissioner for the Chancellery. He now controlled all building and industrial materials as well as the transport and labor—some 65 million workers—associated with them.

In 1941, Speer offered his services to the army reserve and became chief of defense construction. When Fritz Todt died in a plane crash in February 1942, Hitler again turned to Speer. On 15 February Speer was sworn in as the new minister for armament and munitions. His brief also covered most aspects of construction and transportation.

Between 1942 and 1944, Speer tripled overall German armament output. Ammunition production increased 300 percent, and tank output rose 600 percent. By 1943, he was in charge of naval armaments as well as German rocket and atomic programs. Many saw him as Hitler's successor, since the two shared a close acquaintance based on their mutual interest in architecture.

The workload, however, took its toll on Speer. It also brought him into contact with the concentration camps and the conditions of slave labor, which Speer claimed to have found abhorrent. After touring facilities in the northeast, Speer fell gravely ill in the winter of 1943–1944. He remained hospitalized until early May 1944.

When he returned, Speer found his influence diminished. His name appeared on the list of putative ministers during the attempted coup of 20 July 1944; his friendship with Hitler and the fact that he was listed as someone to be approached after

Albert Speer (left) with Adolf Hitler in 1942. (Library of Congress)

the attempted coup saved him. Speer remained at his posts and was made responsible for the construction of Germany's western defenses. Yet Speer was now less than committed to the Nazi cause. He spoke publicly of final victory and promised miracle weapons, but he privately doubted both. When Hitler adopted a scorched-earth policy, Speer sought to undermine it, and he involved himself in several wild schemes to assassinate or eliminate the top Nazi leadership.

On 23 April 1945, Speer visited Hitler in his bunker. He then flew to join Admiral Karl Dönitz's successor government at Flensburg as minister of economics and production. While there, following the German surrender, Speer was debriefed for the U.S. Strategic Bombing Survey before being arrested by the British on 23 May 1945. He then became one of the main defendants at the Nuremberg trials. Speer adopted the strategy of accepting collective responsibility while simultaneously denying personal culpability. Found guilty, he received 20 years' imprisonment and served the full sentence.

While he was in prison, Speer wrote the accounts of his work and experiences in Nazi Germany that would make him

both famous and infamous. He remained a significant literary and historical figure until his death in Paddington, England, on 1 September 1981.

Sport and Athletics

The value of sports and athletics programs in maintaining combat effectiveness was thoroughly demonstrated in World War I. Spectator sports and fitness programs during that conflict helped to maintain both the morale and productivity of the civilian populace. As a result, many nations promoted official athletic programs and policies during World War II. The preferred sports and the nature of officially sanctioned athletic programs differed from nation to nation, as did their announced purposes. Those variations demonstrate the cultural differences among the combatant nations and the separate paths each had taken in developing sports and athletics.

However different in their particulars, officially promoted sports and athletics programs can be loosely grouped into four functional categories. Physical training programs featured mandatory athletic activities, often specialized, that were intended to develop physical and psychological fitness for military service as part of routine duty. Recreational athletic programs supported morale, discipline, and physical fitness through voluntary—but often heavily encouraged—leisure activities. Mass-participation sports programs employed competition as a means to foster physical and psychological fitness while improving morale and esprit de corps. Both recreational athletics and mass-participation sports programs were often deliberately promoted as alternatives to less beneficial pursuits. Finally, elite spectator sports programs provided morale-boosting entertainment while encouraging more active participation in sports and athletic pursuits.

Britain established the Army Sport Control Board in 1918 to govern an expanding number of military sports associations, thus regulating and promoting recreational athletics, mass participation, and spectator sports programs. The board supplemented efforts by the Army Physical Training

Corps and its staff of instructors from the Army School of Gymnastics at Aldershot to promote uniform physical training throughout the British army. When Britain entered World War II, it boasted an established and centralized program of military sports and athletics.

Australia, Canada, New Zealand, and South Africa followed the British model to various degrees. France had its own apparatus for regulating physical training and promoting recreational athletics. The armies of Denmark, Norway, and Sweden each promoted physical training, recreational athletics, and participant and spectator sports. But Japan may have reaped the earliest substantive benefit from such programs, as it began fighting in China in 1937.

The Japanese armed forces featured systematic physical training and some forms of competitive sport. Physical training played a particularly important role in the development of Japanese fighter pilots. A program of gymnastics, diving, and trampoline exercises incorporated into the lengthy flight training process theoretically improved a pilot's ability to remain oriented and under control during violent aerial maneuvers. While the material contributions of such physical and mental conditioning to the early success of Japanese aviation are anecdotal, the rigorous and unparalleled training did contribute to the mystique and esprit de corps of Japanese fighter pilots early in the war. As the United States began mobilization, American flight training programs responded by adopting some of the same techniques.

U.S. military personnel were the beneficiaries of programs formally established following World War I. Both the army and navy trained all officers to lead physical training, sports, and athletic activities as part of their routine duties. Specially trained instructors supplemented the officers' efforts, benefiting from the expansion of military athletic facilities undertaken as relief projects during the Great Depression. As the nation mobilized, the growing network of military posts offered such facilities in accordance with both official regulations and public expectations. American men and women entering wartime service generally viewed themselves as civilians temporarily in uniform rather than as military personnel, and their government went to great lengths to support that view by providing them with familiar civilian comforts. These included provisions for sports and athletics.

As a result, Americans, perhaps more than the people of any other nation, created an extensive sporting infrastructure that extended to frontline areas. Facilities and equipment for baseball, basketball, and other favored sports became commonplace, and American military newspapers devoted substantial space to sports coverage. That coverage linked soldiers and the home front by including major civilian sporting events. Some concessions had to be made, however; American football, with its substantial equipment

Two British gunners and heavyweight boxers practice for boxing championships in London with an audience of mostly women gunners, 1943. (Hulton-Deutsch Collection/Corbis)

requirements and high risk of injury, was deliberately deemphasized in the U.S. military during the war.

Despite some controversy, American professional sports continued through the war to support both military and civilian morale and to promote civilian physical fitness. The health, stamina, and strength of civilian workers were significant concerns to fully mobilized nations. Both the programs and the propaganda efforts of the Soviet Union and Germany demonstrate that concern was not limited to the democratic combatants. Germany, in particular, employed an athleticism to support nationalism and the National Socialist ideology, a famous factor in the 1936 Olympic Games in Berlin.

Sport also contributed to the cohesion of Allied forces. Both formal and informal competitions flourished when military forces came into close contact. In North Africa, for example, British, French, and American servicemen shared an interest in boxing. Competitions in boxing and other sports, coordinated by an Allied Sports Commission, fol-

lowed the advance from North Africa through Italy. This social interaction and less formal athletic competition promoted an awareness of common interests and shared participation in the war.

Sports and athletics provided the same unifying function within national or imperial forces. The cultural ties of the British Empire found expression in the shared sporting interests of its military forces. Within the U.S. armed forces, sport provided a venue to express common interests and culture despite gender and racial segregation. Although programs generally reflected gender and racial segregation policies, the shared interest, language, and experience of sports and athletics reinforced American nationalism just as it highlighted the common experiences of the British Empire.

Sprague, Clifton Albert Frederick (1896–1955)

U.S. Navy admiral. Born in Dorchester, Massachusetts, on 8 January 1896, Clifton Sprague graduated from the U.S. Naval Academy in 1918. He served on board the gunboat *Wheeling* in the Mediterranean from June 1917 to October 1918.

Following shore duty, Sprague qualified as a naval aviator at Pensacola Navy Air Station in 1920. He then served aboard the airship tender *Wright* on the West Coast (1920–1923). From 1926 to 1928 at Hampton Roads Naval Air Station, he helped develop arresting gear for aircraft-carrier landings. He was then assistant air officer aboard the aircraft carrier *Lexington* (1928–1929) before commanding a patrol squadron aboard the *Wright* at San Diego, in the Panama Canal Zone, and at Pearl Harbor. He served once again at the Hampton Roads Naval Air Station before helping to outfit the *Yorktown*, where he was air officer from 1937 to 1939. From 1939 to 1941, he commanded auxiliaries. He was commanding the seaplane tender *Tangier* at Pearl Harbor when the Japanese attacked.

In June 1942, Sprague became chief of staff of the Gulf Sea Frontier, helping to develop convoy techniques. In 1943, he commanded the Seattle Naval Air Station. Promoted to captain, Sprague outfitted the carrier *Wasp* and brought it into commission that November. He continued as skipper of the *Wasp* through the Battle of the Philippine Sea. Promoted to rear admiral in August 1944, Sprague commanded escort carrier Task Unit 77.4.3 ("Taffy 3") in the invasion of Leyte, Philippines.

On the morning of 25 October 1944, Japanese Vice Admiral Kurita Takeo's superior force suddenly surprised the Americans in Leyte Gulf. Sprague's command of six escort carriers, three destroyers, and four destroyer escorts was nearest to an advancing Japanese force that consisted of four battleships, six heavy cruisers, and numerous destroyers. While ordering his destroyers to attack the Japanese, Sprague summoned air support from other escort-carrier groups. His defensive efforts eventually led the Japanese to withdraw. Sprague's handling of the battle, as well as the bravery of the men on the destroyers, are credited with preventing the

Captain Clifton A. F. Sprague on the bridge of the U.S. Navy aircraft carrier *Wasp*, in 1944. (Corbis)

Japanese force from destroying the American transports anchored off the invasion beaches. In February 1945, Sprague took command of Carrier Division 26, participating in support of the U.S. landings at Iwo Jima and Okinawa. He then headed Carrier Division 2.

In summer 1946, Sprague commanded Joint Task Group 1.1.2 and Navy Air Group Joint Task Force 1 in the Bikini atomic bomb tests. From 1946 to 1948, he was chief of naval air basic training at Corpus Christi, Texas. He commanded Carrier Division 6 in the Mediterranean in 1948 and 1949 and the 17th Naval District and Alaskan Sea Frontier from 1941 to 1951. Sprague retired in November 1951 as a vice admiral. He died at San Diego, California, on 11 April 1955.

Sprague, Thomas Lamison (1894–1972)

U.S. Navy admiral. Born in Lima, Ohio, on 2 October 1894, Thomas Sprague graduated from the U.S. Naval Academy in 1917. Following U.S. entry into World War I, he served in Atlantic convoy duty aboard a cruiser and then on antisubmarine patrol aboard the destroyer *Montgomery*, commanding her as a lieutenant in 1920.

Sprague next underwent flight training at Pensacola Naval Air Station and was designated a naval aviator. Staff and flight assignments followed. During 1931 and 1932, he commanded Scouting Squadron 6. He then supervised a laboratory at the Philadelphia naval aircraft factory, was air officer aboard the carrier *Saratoga* in 1935 and 1936, and became superintendent of naval air training at Pensacola from 1937 to 1940. Sprague served as executive officer of the carrier *Ranger* in the Atlantic in 1940 and 1941. He next helped to commission the new escort carrier *Charger* and took command of her during Chesapeake Bay training operations for antisubmarine patrols.

Following a tour of duty as chief of staff to the commander of air units in the Atlantic Fleet in the first half of 1943, Sprague fitted out and commanded the carrier *Intrepid* through operations in the Marshall Islands and off Truk. He was promoted to rear admiral in June 1944 and assumed command of Carrier Division 22, which comprised 18 escort carriers and numerous destroyers and destroyer-escorts, for operations off Guam and the Philippine Islands.

On the morning of 25 October 1944, Sprague's division, designated Task Group TG 77.4 ("Taffy 1"), was divided into three groups spread across Leyte Gulf supporting the amphibious operation when a powerful Japanese surface force under Vice Admiral Kurita Takeo surprised the Americans. Sprague ordered all of his aircraft to attack the enemy while two of his groups made smoke and moved away from the foe. The other group (TG 77.4.3, "Taffy 3"), commanded by Rear Admiral Clifton A. F. Sprague (no relation), bore the brunt of the Japanese attack. The ferocity of the American counterattack convinced Kurita that his forces had encountered the bulk of the American fleet, not merely an escort carrier group. Kurita then called off the attack, sparing both Thomas Sprague's unit and the vulnerable transports supporting the invasion of Leyte.

Sprague next commanded Carrier Division 3 off Okinawa (April–June 1945) and Task Force 38.1 off Japan (July–August 1945). Following the war, Sprague was first deputy chief and then chief of the Bureau of Naval Personnel (1946–1949). He was promoted to vice admiral in August 1949, and he then commanded all air units in the Pacific Fleet until his retirement in April 1952. He returned briefly to duty

in 1956 and 1957 to negotiate with the Philippine government about bases in the Philippines. Sprague died in Oakland, California, on 17 September 1972.

Spruance, Raymond Ames (1886–1969)

U.S. Navy admiral. Born on 3 July 1886 in Baltimore, Maryland, Raymond Spruance graduated from the U.S. Naval Academy in September 1906. His early assignments included service on the battleship *Minnesota* during the around-the-world cruise of the Great White Fleet. His first command was the destroyer *Bainbridge* in 1913. During World War I, Spruance rose to the rank of commander and commanded a troop ship. He then commanded destroyers, attended the Naval War College, served in the Office of Naval Intelligence, taught at the Naval War College, and commanded the battleship *Mississippi*.

Spruance was promoted to captain in 1932 and to rear admiral in 1939. In July 1941 he took command of Cruiser Division 5 at Pearl Harbor. As surface screen commander for Vice Admiral William F. Halsey's carriers, he participated in raids on the Gilberts, Marshalls, Wake, and Marcus Islands, and in the raid on Tokyo in April 1942. When Halsey was confined to the hospital with a severe skin allergy, Pacific Fleet commander Admiral Chester Nimitz, on Halsey's recommendation, appointed Spruance to replace him as Task Force 16 commander. Spruance brilliantly handled the air and naval assets available to him and his forces won the Battle of Midway. Nimitz then named Spruance his chief of staff.

In May 1943, Spruance was promoted to vice admiral. In August he took command of the Pacific Fleet and Pacific Ocean Area, later known as the Fifth Fleet. Promoted to admiral in February 1944, he then led campaigns against Japanese naval forces and island strongholds from the Gilberts and Marshalls through the Battle of the Philippine Sea and the invasions of Iwo Jima and Okinawa.

Spruance took command of the Pacific Fleet from Nimitz in November 1945. In February 1946 he became the president

U.S. Vice Admiral Raymond Spruance. (Photo by Hulton Archive/Getty Images)

of the Naval War College. He retired from the navy in July 1948, only to serve as ambassador to the Philippines during 1952–1955. Spruance died on 13 December 1969. The Spruance-class of destroyers is named for him.

Stalin, Josef (Iosif Vissarionovich Dzhugashvili) (1879–1953)

General secretary of the Central Committee of the Communist Party, supreme commander of the Soviet armed forces, marshal of the Soviet Union, and Soviet dictator. Stalin was

indisputably one of the most powerful rulers in history, as well as one of the greatest murderers.

Born Iosif Vissarionovich Dzhugashvili in the Georgian town of Gori on 21 December 1879, Josef Stalin was the only child of his parents to survive infancy. His parents were semi-literate peasants, the descendants of serfs; his father worked as cobbler and his mother as a washerwoman and domestic. Soso, the common Georgian nickname for Iosef, was admitted to the four-year elementary ecclesiastical school in Gori in September 1888 and graduated (six years later) in July 1894. His mother wished a career in the priesthood for him, so in September 1894, he entered the Tiflis theological seminary on a free scholarship.

Stalin's "official" biographies obscure more than they reveal, and they differ for the most part on the cause of Soso's exit from the seminary in 1899. Some say he was expelled for revolutionary activity, and others claim that he quit, but it was at seminary that Dzhugashvili was introduced to Russian socialism and Marxism. His career as a low-level party functionary began in 1901 and included "expropriations" (robbery) and counterfeiting in support of the Russian Social Democratic Labor Party (RSDLP). Arrested, he was tried, convicted, and exiled to Siberia in 1903 under the pseudonym Koba.

Koba escaped from exile in 1904, and the next year he joined the Bolshevik faction of the RSDLP (Georgia being a stronghold of the Menshevik faction), which was led by Vladimir Lenin. By 1907, he was recognized as an outstanding Bolshevik propagandist—particularly on the nationalities question—in the Caucasus. By 1912, he was sponsored by Lenin to membership in the Bolshevik-controlled RSDLP Central Committee at the Prague conference where the final split between the Bolsheviks and Mensheviks took place. Stalin (steel), as he was then known, was freed from Siberian exile by the Russian Revolution of March 1917. He returned to Petrograd and became editor of the party newspaper *Pravda*. His seniority on the Central Committee allowed him to assume leadership of the Bolsheviks until Lenin's return to Petrograd from Switzerland in April 1917. Stalin seems to have played little role in the Bolshevik seizure of power in October 1917.

Stalin's supposed expertise on the nationalities question led to his appointment as commissar of nationalities in the new Bolshevik government. Through the Civil War period, the real government of Russia was the Bolshevik Politburo of five men: Lenin, Leon Trotsky, Lev Kamenev, Nikolai Bukharin, and Stalin. To Stalin fell the day-to-day management of the party, which gave him considerable power. In 1922, his power base was expanded when he was appointed general secretary of the Central Committee, whereby de facto control of the Politburo accrued to him.

Following Lenin's incapacitation by stroke in 1923 and his death on 21 January 1924, over time Stalin was able to parlay

Josef Stalin, general secretary of the Communist Party of the Soviet Union, 1942. (Library of Congress)

his base of power into control of the organs of Soviet governance. By 1929, his accumulation of power was complete and unchallengeable. In the 1930s, he began to purge “old Bolsheviks”—his former adversaries—in his quest to maintain and strengthen his hold on power.

Periodic purges were not unprecedented after the Bolshevik seizure of power. Most were directed at subordinate officials and low-ranking party members, who bore the brunt of policy failures. The Great Purges, conducted on Stalin’s orders, were characterized by their focus on party and state elites, the use of mass terror, and dramatic public “show trials” and “confessions” by the accused.

Beginning in 1936, in a series of show trials held in Moscow, numerous leading Communists and old Bolsheviks were tried; they confessed and were executed or sentenced to hard labor. At the same time, millions of ordinary Soviet citizens simply disappeared in what became known as the “deep comb-out.” Eventually some 8 million people were arrested, 1 million of whom were executed; the remainder were sent to the gulags. In 1937, after the destruction of his former adversaries, Stalin began to eliminate potential threats to his power with the purge of Red Army leaders. Eventually, 40 to 50 percent of the senior officer corps disappeared. Not all were executed or died in the gulags; many survived and were rehabilitated in World War II. Others left in the army found the previously closed path to military prominence open.

Simultaneously, Stalin reversed Lenin’s New Economic Policy, which had introduced a degree of capitalism in order to revive the economy, purged the middle-class peasants who had emerged under that policy (the Kulaks), and carried out the collectivization of agriculture. Reliable casualty figures for the collectivization drive are unavailable, but if one includes the famine fatalities, the number of those who died may exceed 10 million people—a figure that, for whatever it is worth, Stalin gave to Winston L. S. Churchill in Moscow in August 1942. Russian writer Nikolai Tolstoi has put the number who died in the gulags under Stalin at 12 million people. These numbers compare with a total of 15,000 executions in the last 50 years of the tsars. In terms of the sheer number of victims, the Soviet Union under Stalin unquestionably outdistanced Hitler’s Germany.

In addition to pushing the collectivization of agriculture, Stalin also implemented a series of five-year plans that set quotas for growth in all areas of the economy. Much of this effort was devoted to the exploitation of Soviet natural resources and development of heavy industry. The last of these plans prior to World War II also emphasized armaments production. Although growth was uneven, considerable progress was registered, much of which came at the expense of the living standards of the Soviet people.

In the 1930s, German ambitions alarmed Stalin, who grew interested in collective security. He instructed People’s Com-

missar for Foreign Affairs Maksim Litvinov to pursue an internationalist course. In 1934, the USSR joined the League of Nations. Stalin also secured defensive pacts with other nations, including France. In the late 1930s, many western leaders still distrusted the Soviet Union; thus, even though the Kremlin was willing to enter into arrangements with the west against Germany and Japan, no effective coalition was forged, and events during the decade took a course that largely ignored the Soviet Union. Unsentimental in such matters, in August 1939 Stalin arranged a nonaggression pact with Germany that allowed Adolf Hitler to invade Poland without fear of war with the Soviets. Stalin hoped, thereby, to gain time to strengthen his own military. He also gained territory in eastern Poland and the Baltic states. When Finnish leaders rejected his demands, in November 1939 Stalin ordered Soviet forces to invade Finland in order to secure territory and bases against a potential German attack.

Stalin rejected numerous western warnings in the winter and spring of 1941 that Germany was preparing to attack the Soviet Union, viewing these as efforts by the Allied powers and the United States to trick the USSR into war with Germany. In consequence, Soviet forces were largely unprepared for Operation BARBAROSSA, the German invasion of 22 June 1941. Soviet military units were not even immediately authorized to return fire.

For nearly two weeks after the German attack, Stalin remained incommunicado, but he finally reappeared to proclaim the “Great Patriotic War” and rally his people and the Red Army to the defense of the “motherland.” During the course of the fighting on the Eastern Front, Stalin grew dramatically as a military commander. All important strategic and operational decisions—and some not so important—required his personal approval as supreme commander. He also absorbed specialist military knowledge, although he held no strategic dogmas or pet operational blueprints. For the most part, Stalin allowed his generals to formulate their own views and develop their own plans following his general ideas, based on well-founded knowledge of the situation. If Stalin bears great responsibility for the early defeats suffered by the Soviet Union in the first two years of the war, he must also be credited for Soviet successes in its last two years.

Besides rallying the Soviet people and armed forces with speeches and rhetoric, Stalin demonstrated his own readiness to stand firm against the German onslaught. On 15 October 1941, the Germans having driven to within 50 miles of Moscow, the Soviet government and diplomatic community were evacuated to Kuibyshev on the Volga. This caused a panic among the Muscovites, who believed they had been abandoned. The announcement on 17 October that Stalin was in the Kremlin restored relative calm to the city. Stalin remained in the Kremlin, directing strategic operations throughout the siege of Moscow and, with rare exceptions, for the remainder of the war.

During the war, Stalin had a clear picture of his postwar objectives. As the western powers had used the new eastern European states after World War I to isolate Communist Russia and contain Bolshevism, so Stalin planned to use the same states—under Soviet control as satellites—to exclude western influences from his own empire. At no time in the war after June 1941 was less than three-quarters of the German army committed on the Eastern Front. Stalin used this fact, delays by the western Allies in opening a true second front, and the great suffering of the Soviet Union (up to 27 million dead in the war) to secure massive amounts of Lend-Lease aid. He also used the actual occupation of eastern and much of central Europe by the Red Army to secure major concessions from the west at Tehran, Yalta, and Potsdam, thereby ushering in the Soviet empire.

Stalin continued to rule the Soviet Union with an iron fist almost until the day of his death. He died on 5 March 1953, a month after suffering a stroke, at Kuntsevo near Moscow.

In spring 1942, Hitler placed major emphasis in the summer campaign on the southern portion of the German-Soviet Front in Operation BLAU (BLUE). Hitler sent General Fedor von Bock's Army Group South east from around Kursk to secure Voronezh, which fell to the Germans on 6 July. Hitler then reorganized his southern forces into Army Groups A and B. General Siegmund W. List had command of the southern formation, Army Group A; General Maximilian von Weichs commanded the northern formation, Army Group B.

Hitler's original plan called for Army Groups A and B to cooperate in a great effort to secure the Don and Donets Valleys and capture the cities of Rostov and Stalingrad. The two army groups could then move southeast to capture the oil fields that were so important to the Red Army. On 13 July, Hitler ordered a change of plans, demanding the simultaneous capture of Stalingrad—a major industrial center and key crossing point on the Volga River—and the Caucasus. Dividing the effort placed further strains on already inadequate German resources, especially on logistical support. This also meant that inevitably a gap would appear between the two German army groups, enabling most Soviet troops caught in the Don River bend to escape eastward. Meanwhile, on 23 July, Army Group A captured Rostov. It then crossed the Don River and advanced deep into the Caucasus, reaching to within 70 miles of the Caspian Sea.

Hitler now intervened again, slowing the advance of General Friedrich Paulus's Sixth Army of Army Group B toward Stalingrad when he detached General Hermann Hoth's Fourth Panzer Army to join Army Group A to help secure the Caucasus oil fields. Nonetheless, the Sixth Army reached the Volga north of Stalingrad on 23 August.

The great city of Stalingrad curved for some 20 miles along the high western bank of the Volga River. Hitler's original intent was merely to control the river by gunfire and to destroy the city's arms factories, notably the Tractor, Red October, and Barricades works, but now he demanded a full occupation of the Soviet dictator's namesake city.

To meet the German thrust toward Stalingrad, on 12 July 1942 the Soviet General Staff had formed the Stalingrad Front. It consisted of the Sixty-Second, Sixty-Third, and Sixty-Fourth Armies, all under the command of Marshal Semen K. Timoshenko, who was replaced by Lieutenant General V. N. Gordov on 27 July. The Twenty-First Army and the Eighth Air Army were also integrated into the Stalingrad Front. General Vasily Chuikov, a protégé of Marshal Georgii Zhukov, commanded the Sixty-Second Army, which was holding on the west bank of the Volga. Stalin, meanwhile, rushed reinforcements and supplies to Stalingrad.

Angry over the slow progress of the Sixth Army into Stalingrad, Hitler on 11 August ordered Hoth's Fourth Army from the Caucasus north to that place, leaving a badly depleted Army Group A holding a 500-mile front and stalling

Stalingrad, Battle of (23 August 1942–2 February 1943)

One of the epic battles of the war; some hold that the Battle of Stalingrad was the turning point on the Eastern Front. The Battle of Stalingrad, the first large encirclement of a German army in the war, gave the Soviets a psychological lift and the military initiative.

In the outskirts of Stalingrad, where each street is a small, furious battleground, Soviet soldiers move toward one of many demolished and burning buildings, December 1942. (Bettmann/Corbis)

the southernmost drive. Hitler also ordered his sole strategic reserve in the area, Field Marshal Erich von Manstein's Eleventh Army, north to Leningrad.

Such wide-ranging shifts of German resources took a terrible toll on men but especially on equipment. They also consumed precious fuel and stretched the German lines far beyond what was reasonable or safe. German army High Command Chief of Staff General Franz Halder and other German generals grew more and more alarmed. They pointed out to Hitler that the German army in Russia now had to maintain a front of more than 2,000 miles. Between the two armies of Army Group B, a sole division held a 240-mile gap. North of Stalingrad, Romanian troops protected the single railroad bringing supplies to the Sixth Army. The possibilities open to the Soviets were enormous, providing they had the resources available. Hitler claimed they did not. Halder continued warning Hitler and tried to get him to break off the battle for Stalingrad. This time, Hitler sacked Halder. He also relieved List, and from a distance of 1,200 miles, Hitler took personal command of Army Group A, which was nominally under General Paul L. E. von Kleist. The irony is that the Germans might have taken Stalingrad in July had Hitler not diverted Hoth south to assist Kleist.

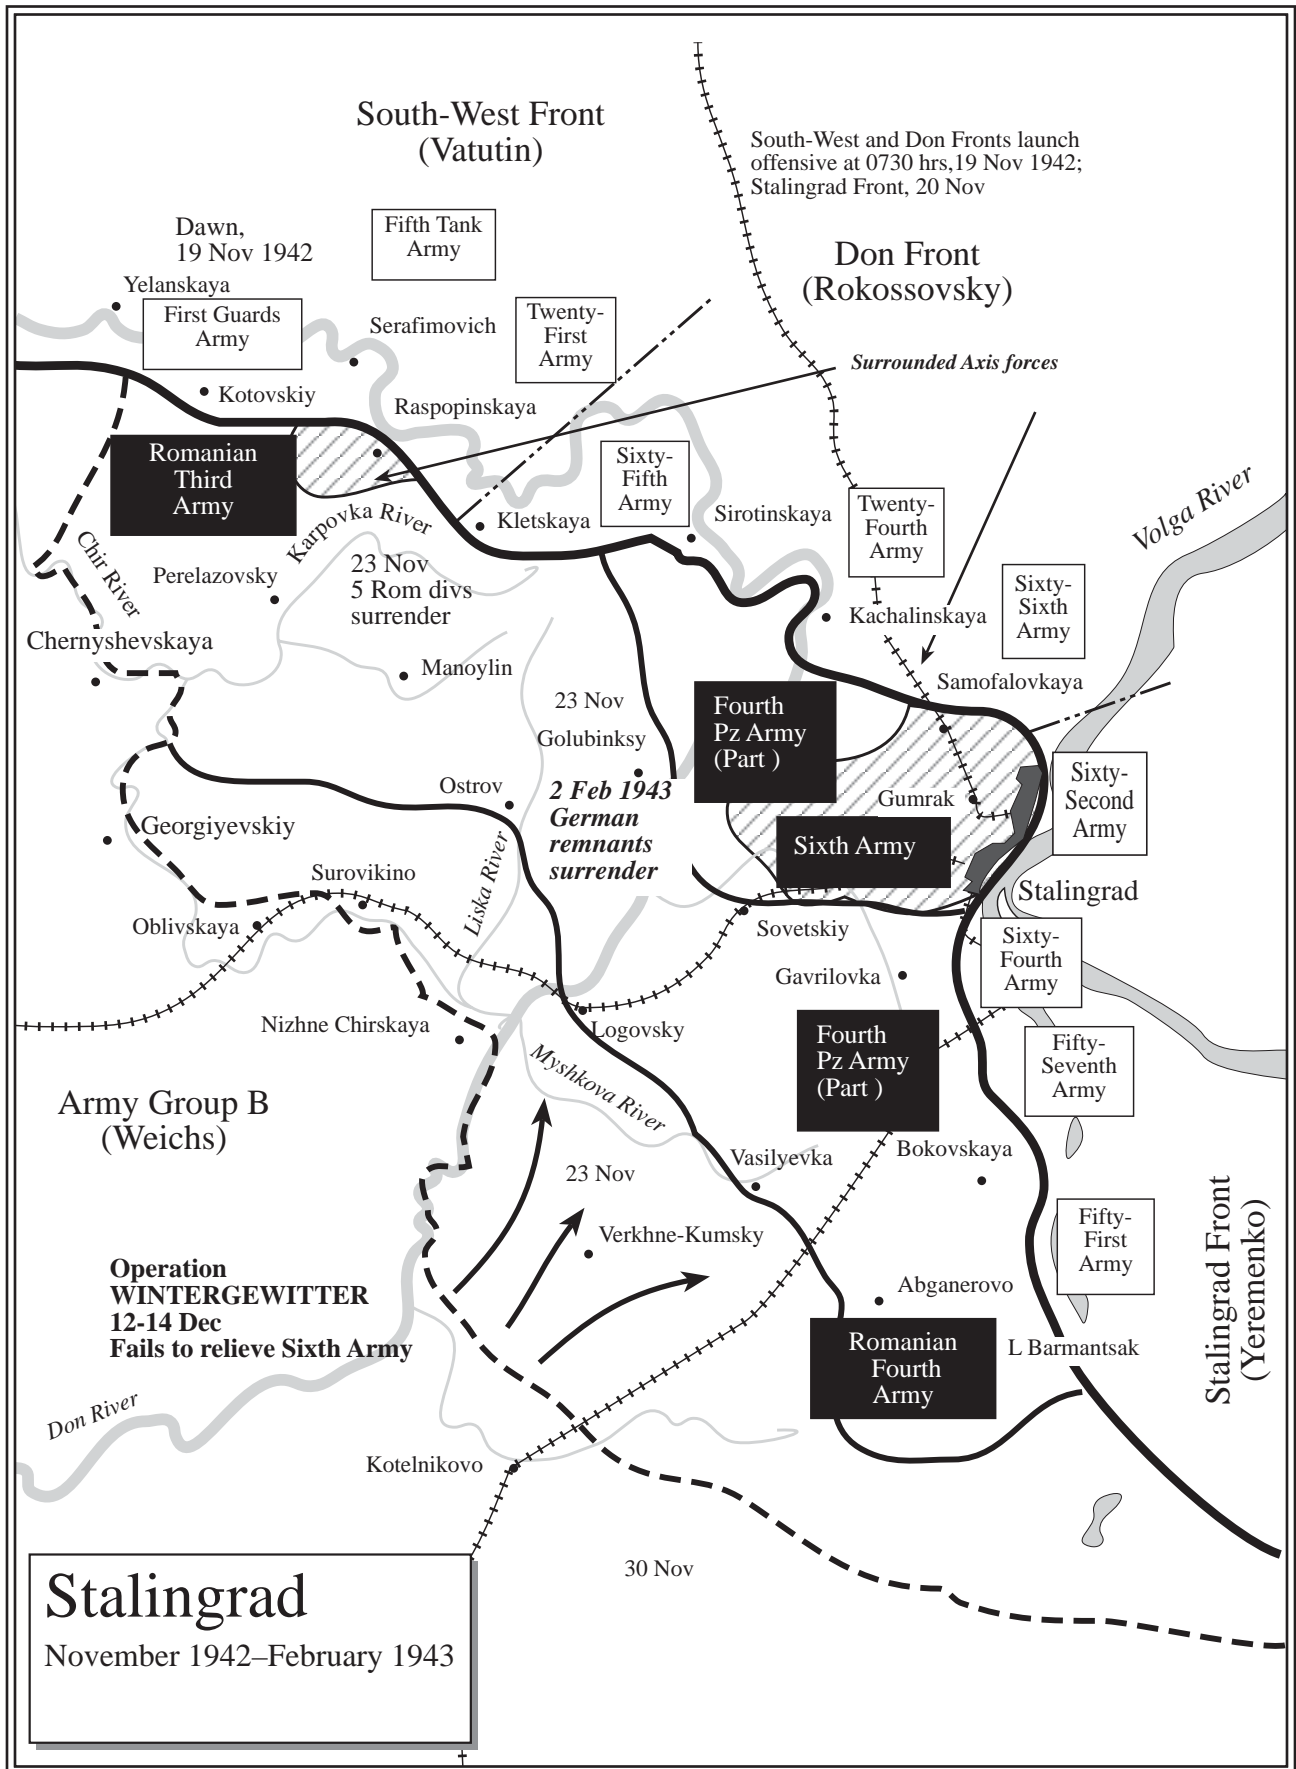

Beginning on 24 August, a costly battle of attrition raged over Stalingrad. Luftwaffe carpet bombing at the end of

August killed some 40,000 people, but it also turned the city into defensive bastions of ruined buildings and rubble. Stalin refused to allow the evacuation of the civilian population, believing that this would force the defenders, especially local militia forces, to fight more tenaciously.

The ruined city posed a formidable obstacle. Germany's strength lay in maneuver warfare, but Hitler compelled the Sixth Army to engage the Soviet strength of static defense. Stalin ordered the city held at all costs, and Soviet forces resisted doggedly. To make things as difficult as possible for German artillery and aviation, Chuikov ordered his troops to keep within 50 yards of the Germans. Zhukov, who had just been appointed deputy supreme commander—second in authority only to Stalin—arrived at Stalingrad on 29 August to take overall charge of operations.

Meanwhile, Hitler became obsessed with Stalingrad, and he wore down his army in repeated attempts to capture that symbol of defiance. Taking Stalingrad was unnecessary from a military point of view; the 16th Panzer Division at Rynok controlled the Volga with its guns, closing it to north-south shipping. But Hitler insisted the city itself be physically taken.

For a month, the Sixth Army pressed slowly forward, but casualties in the battle of attrition were enormous on both sides, with advances measured in yards. The battle disinte-

grated into a block-by-block, house-by-house—even room-by-room—struggle for survival.

General Paulus has been blamed for refusing to disobey Hitler's order to stand firm and extracting his army before it was too late, but his and Hitler's greatest failing lay in not anticipating the Soviet encirclement. Nor did Paulus possess mobile tank reserve to counter such a Soviet effort and keep open a supply corridor.

While he fed the cauldron of Stalingrad with only sufficient troops absolutely necessary to hold the city, Zhukov patiently assembled 1 million men in four fronts (army groups) for a great double envelopment. This deep movement, Operation URANUS, began on 19 November and was timed to coincide with the frosts that would make Soviet cross-country tank maneuvers possible against Axis infantry. For the northern pincer, the Soviets assembled 3,500 guns and heavy mortars to blast a hole for 3 tank and 2 cavalry corps and a dozen infantry divisions. They encountered Romanian infantry divisions. The Romanians fought bravely, but their 37 mm guns and light Skoda tanks were no match for the Soviet T-34s. The southern Soviet prong of 2 corps, one mechanized and the other cavalry, broke through on 20 November against 2 Romanian infantry divisions.

By 23 November, URANUS had encircled the Sixth Army and had driven some units of the Fourth Army into the pocket. Hitler now ordered Manstein from the Leningrad Front and gave him a new formation—Army Group Don, drawn from Army Group A—with instructions to rectify the situation.

Hitler forbade any withdrawal, convinced that the Sixth Army could be resupplied from the air. Reichsmarschall (Reich Marshal) Hermann Göring is usually blamed for assuring Hitler that this could be done, but responsibility is more properly be shared among Göring, chief of the General Staff of the Luftwaffe General Hans Jeschonnek, and Hitler. Hitler was no doubt misled by Luftwaffe success the previous winter in supplying by parachute drops 5,000 German troops surrounded at Kholm near Moscow and 100,000 men at Demyansk.

The decision that Stalingrad could be supplied by air was taken at a time when the Soviets enjoyed air superiority. By 20 November, the second day of URANUS, the Soviets committed between 1,350 and 1,414 combat aircraft (depending on the source) to Stalingrad. Meanwhile, General Wolfram F. von Richtofen's Luftflotte 4, flying in support of the Sixth Army, had 732 combat aircraft, of which only 402 were operational. The Soviets used their air superiority to attack German army positions and for bombing raids on the main Ju-52 base at Zverevo, where they destroyed a substantial number of German transport aircraft. Worsening weather impeded the relief effort, and much of the Luftwaffe's airlift capability was redeployed to resupply Axis troops in North Africa after Allied landings there in early November.

A fair appraisal of air transport available, even in the best weather conditions, was that the Luftwaffe could only bring in one-tenth of the Sixth Army's requirements. By the last week in December, the Luftwaffe delivered only an average 129 tons of supplies a day, condemning the German forces in the pocket to slow starvation and death. Then, on 16 January 1943, the Soviets took Pitomnik, the principal airfield within the Stalingrad pocket. Its loss was the death blow to the airlift operation. During the last days of the battle, supplies were dropped only by parachute, and many of the supplies fell into Soviet hands.

Hitler still refused to authorize any attempt by the Sixth Army to escape. He would allow only a linking up of a relief force. None of the hard-won territory was to be surrendered, but it was simply impossible for Sixth Army to link up with a relief force and not surrender territory in the process. Paulus favored a breakout, but he was not prepared to gamble either his army or his career. Manstein's force of three understrength panzer divisions managed to reach within 35 miles of Sixth Army positions, and he urged a *fait accompli*, forcing Hitler to accept it. However, Paulus replied with a pessimistic assessment of his army's ability to close the short distance to reach Manstein's relief force. There was insufficient fuel, the horses had mostly been eaten, and it would take weeks to prepare. The relieving forces would have to come closer. A linkup could succeed only if Sixth Army pushed from the other side against the Soviets, but this could not be done without shrinking the Stalingrad pocket, which Hitler forbade.

In mid-December, the Volga froze, allowing the Soviets to use vehicles to cross the ice. During the next seven weeks, Zhukov sent 35,000 vehicles across the river along with 122 mm howitzers to blast the German defensive works. By then, seven Soviet armies surrounded the Sixth Army, and breakout was impossible. Even in this hopeless situation, Paulus refused to disobey Hitler and order a surrender. He himself surrendered on 31 January (he maintained he had been "taken by surprise"), but he refused to order his men to do the same. The last German units capitulated on 2 February.

There may have been 294,000 men trapped at Stalingrad, including Hiwis (Soviet auxiliaries working with the Germans) and Romanians. Of only 91,000 men (including 22 generals) taken prisoner by the Soviets, fewer than 5,000 survived the war and Soviet captivity. The last Germans taken prisoner at Stalingrad were not released until 1955. Including casualties in Allied units and the rescue attempts, Axis forces lost upward of half a million men. The Stalingrad Campaign may have cost the Soviets 1.1 million casualties, more than 485,000 dead.

The effect of the Battle of Stalingrad on the German war effort has been hotly debated. It is frequently seen as the turning point in the European theater of war, the decisive defeat from which the Wehrmacht could never recover, but militarily Stalingrad was not irredeemable. The German front lines had

A TURNING POINT?
Battle of Stalingrad

No historian doubts that the battle of Stalingrad ranks among the most important engagements of World War II. Indeed, the significance of the battle between August 1942 and February 1943 was readily apparent to contemporaries. In an article published on 2 February 1943, the day the German Sixth Army finally surrendered, *Washington Post* columnist Barnet Novet called it the equivalent of the Battle of Verdun and the First and Second Battles of the Marne, combined. In November 1943, during the Tehran Conference, British Prime Minister Winston L. S. Churchill presented Soviet Premier Josef Stalin with the Sword of Stalingrad on behalf of King George VI and the British people, and U.S. President Franklin D. Roosevelt said in 1944 that the battle was the turning point of the war.

Scholars and veterans have questioned, however, whether Stalingrad represents the most significant turning point of the war, and whether it ranks as the single most critical battle on the Eastern Front. Some opine that the successful Soviet defense of Moscow in November and December of 1941 was a more important battle (see Albert Seaton's *The Battle for Moscow*), whereas others point to the Battle of Kursk in July 1943 as more critical. In a November 1943 Moscow speech, Stalin suggested that Kursk was decisive, and modern authors David M. Glantz and Jonathan M. House argue in *The Battle of*

Kursk (1999) that Kursk represented "a turning point in the war strategically, operationally, and tactically." Moreover, German and Soviet generals shared this view in their memoirs (see works by Heinz Guderian, F. W. von Mellenthin, Erich von Manstein, Aleksandr M. Vasilevsky, and Georgii K. Zhukov), although all of them also suggested that the battles for Moscow and Stalingrad were critical, as well.

Despite these debates, however, many historians remain convinced that the battle for Stalingrad represents the decisive turning point of World War II in Europe. Michel Henri summarized the case well in *The Second World War* (1975), and it has been reinforced by Antony Beevor's *Stalingrad* (1998), Geoffrey Roberts' *Victory at Stalingrad: The Battle That Changed History* (2002), and Stephen Walsh's *Stalingrad, 1942–1943: The Infernal Cauldron* (2000). These authors hold that Stalingrad was significant because of massive German personnel losses, the psychological blow to German morale of losing an entire army for the first time in the war, the corresponding lift in Soviet and Allied morale as the myth of German invincibility was shattered, the political and diplomatic impact on neutral nations and at the 1943 Tehran Conference, and the inability of Germany after Stalingrad to launch strategic offensives on a scale matching those of 1941 and 1942.

Finally, if contemporary accounts have any meaning, there is little doubt that ordinary Germans marked Stalingrad as a significant downward turn in their fortunes. All German radio broadcasts were suspended for an unprecedented three days of mourning following the defeat, and it became readily apparent after the battle that Germany was suddenly fighting for survival rather than victory.

been largely recreated in the time the remnants of the Sixth Army surrendered. Stalingrad was more important for its psychological than its military value. If any single battle denied Germany victory, it was Kursk, still six months and several German successes away.

Stark, Harold Raynsford "Betty" (1880–1972)

U.S. admiral and chief of naval operations. Born in Wilkes-Barre, Pennsylvania, on 12 November 1880, Harold Stark graduated in 1903 from the U.S. Naval Academy, where he acquired the nickname "Betty" for a remark made by Revolutionary War hero John Stark. He was commissioned an ensign in the U.S. Navy in 1905. Stark participated in the Great White Fleet's 1907–1909 around-the-world cruise, and, as a World War I staff officer, he helped coordinate Anglo-American naval operations. He then commanded a flotilla in the Mediterranean, and he subsequently captained torpedo boats, destroyers, and an armed cruiser.

Stark graduated from the Naval War College in 1924 and then served as an aide to the secretary of the navy from 1930 to 1933. Promoted to rear admiral in November 1934, he was chief of the Bureau of Ordnance from 1934 to 1937. After his promotion to vice admiral, he commanded all cruisers in the Battle Force in 1938 and 1939. During these years, Stark was a staunch proponent of naval preparedness.

In August 1939, one month before World War II began in Europe, President Franklin D. Roosevelt named Stark chief of naval operations as a full admiral. Stark, who shared Roosevelt's profoundly interventionist outlook, immediately launched an expansion program designed to make the U.S. Navy the world's largest naval force. His memorandum Plan D (Dog), prepared for Roosevelt in November 1940, delineated what became the fundamental U.S. wartime strategy—that Germany, the greatest threat to the United States, must be defeated first.

Convinced that Britain's survival was essential to U.S. national security, in early 1941 Stark proposed and held staff talks with a high-level British delegation. The resulting ABC-1 (America-Britain-Canada) Rainbow 5 strategic agreement, much of which Stark drafted, became the basis of wartime Anglo-American cooperation. Stark constantly urged Roosevelt to do more to assist Britain, and, by autumn 1941, American naval forces were effectively at war with Germany in the Battle of the Atlantic.

Although Stark attempted to improve Pacific fortifications and naval strength, he opposed measures (such as an oil embargo) that might provoke forceful Japanese responses. Like other American military and civilian officials, he failed to interpret correctly or transmit to Admiral Husband Edward Kimmel, U.S. commander in chief of the Pacific Fleet, deciphered cable traffic indicating Japan might attack America's Hawaiian Pearl Harbor naval base. One investigation later faulted him for this misjudgment.

Shortly after the Japanese attack on Pearl Harbor, Roosevelt replaced Stark as commander of U.S. naval forces with

U.S. Admiral Harold A. Stark shown here during the Congressional Pearl Harbor Inquiry on 31 December 1941. (Bettmann/Corbis)

Admiral Ernest J. King. In March 1942, Roosevelt dispatched Stark to Europe as commander of U.S. naval forces in that theater. Stark performed valuable wartime liaison functions between London and Washington, established and later dismantled certain American naval bases in Europe, directed logistical support for U.S. naval forces, and served as Washington's unofficial envoy to Free French leader General Charles de Gaulle. Stark retired from active duty in 1946. He died in Washington, D.C., on 20 August 1972.

STARVATION, Operation

The mining by U.S. aircraft of Japan's home waters. By 1945, Japan had withdrawn most of its remaining merchant shipping to the home islands, where it operated principally in coastal waters, relatively safe from submarine attack. After some delays and interservice squabbles in which U.S. Army Air Forces Major General Curtis LeMay protested the diversion of his aircraft to this mission, on 27 March 1945, U.S. B-29s of the Mariana Islands-based XXI Bomber Command launched Operation STARVATION. It was a systematic mining campaign designed to disrupt Japan's overseas and inter-island trade, complete the submarine blockade, and thus prevent food and raw materials from reaching Japan. B-29s planted mines outside Japan's major ports, in the Inland Sea, and in critical straits, particularly the heavily trafficked Shimoseki Strait.

Japan proved to be as unprepared for mines as it had been for submarines. It relocated searchlights and antiaircraft batteries in an effort to shoot down the minelaying B-29s, and it increased research into mine countermeasures, but the efforts were inadequate. Japan never developed effective techniques to sweep acoustic and pressure mines. Instead, the Japanese continued to sail ships into mined waters, hoping to run ships through the minefields faster than the United States could lay additional mines.

In May 1945, U.S. mines sank or disabled more Japanese ships than did submarines. Mines blocked 19 of Japan's 22 principal shipyards, preventing the repair of damaged ships. Arrivals at Japan's industrial ports dropped from 800,000 tons in March to 250,000 tons in July, when food displaced coal and iron as Japan's predominant import. Yet Japan failed to import enough food to meet its people's needs, and average daily per capita food intake dropped from 1,900 calories in 1944 to 1,680 calories by midsummer 1945. Hundreds of thousands of Japanese (millions, according to some estimates) faced imminent starvation, and growing numbers of Japan's remaining factories were rendered idle for lack of raw materials.

Mining sorties accounted for only 5.7 percent of XXI Bomber Command's sorties that summer. Short of mines and more interested in bombing Japanese cities, the XXI Bomber Command never devoted the effort to laying mines that the navy had hoped for. Yet, at a cost of only 15 planes, 1,528 B-29 sorties dropped 12,135 mines into Japanese home waters by the war's end. These damaged or sank at least 750,000 tons of Japanese shipping (possibly as much as 1.25 million tons) and closed most of Japan's ports. Damaged ships piled up in Japanese ports, and mercantile traffic dropped to a trickle. Pacific Fleet commander Admiral Chester Nimitz described

Operation STARVATION's results as "phenomenal." It proved a vital element of the strategy of blockade and bombing that forced Japan's surrender.

Stauffenberg, Claus Philip Schenk von (Graf) (1907–1944)

German army officer who attempted to assassinate Adolf Hitler. Born on 15 November 1907 at Greifenstein Castle, Jettigen, into a staunchly Roman Catholic Prussian noble family, Claus von Stauffenberg was strikingly handsome and highly intelligent. With a passion for languages, culture, and horses, he qualified for the German Olympic team.

In 1926, Stauffenberg joined the 17th Bamberg Cavalry Regiment as an officer cadet, and he was commissioned in 1930. He attended the War Academy in Berlin in 1936 and—then a captain—became a logistics officer in 1938. He served in the campaigns in Poland in 1939 and France in 1940 and was posted to the General Staff in 1940. Stauffenberg seriously questioned National Socialism after the virulent anti-Jewish Kristallnacht of 9 November 1938. Service with German forces in the Soviet Union exacerbated his disillusionment with Hitler's inhumane policies.

Stauffenberg was badly wounded by the explosion of a mine in April 1943 while serving in the 10th Panzer Division in North Africa. He injured his knee and left ear and lost his left eye, right hand, and two fingers of his left hand. While convalescing, he came to realize that removing Hitler was the only answer to Germany's dilemma, and he then became a leading figure in the conspiracy to assassinate the German leader.

Promoted to colonel in June 1944, the next month Stauffenberg was appointed chief of staff to General Friedrich Fromm, commander of the Reserve Army. This position allowed him access to Hitler. As a severely disabled war hero, he was spared the searches of persons who were admitted to see Hitler. Two assassination attempts, on 11 July and 15 July,

German Army Major Claus Schenk von Stauffenberg who led the July 1944 assassination attempt on Adolf Hitler. (Photo by Keystone/Getty Images)

were aborted, but on 20 July 1944, Stauffenberg placed a bomb hidden in a briefcase beside Hitler at his headquarters, the Wolf's Lair, in Rastenberg, East Prussia, and quickly left the scene to fly to Berlin. The briefcase was moved, and the explosion only slightly injured Hitler. However, Stauffenberg was convinced the Führer was dead. The subsequent coup in Berlin failed because of delays, poor coordination, and simple bad luck. Stauffenberg and several others were arrested on the night of 20 July, court-martialed, and shot in the courtyard of the War Ministry in Berlin. Several thousand others who were also opposed to the regime also subsequently perished.

Stettinius, Edward Reilly, Jr. (1900–1949)

U.S. Lend-Lease administrator (1942–1943), undersecretary of state (1943–1944), and secretary of state (1944–1945). Born in Chicago, Illinois, on 22 October 1900, Edward Stettinius was the son of a prominent industrialist who moved to New York in 1914 to direct World War I Allied purchasing for the private banking house J. P. Morgan and Company. After attending the University of Virginia, Stettinius joined General Motors, implementing innovative employee benefit programs. He moved to U.S. Steel in 1934, and four years later he became chairman of the board.

In 1940, because of his earlier business-government liaison work on New Deal industrial recovery programs, Stettinius received the government position of chairman of the War Resources Board, which had been established to survey potential American war needs. In 1941, President Franklin D. Roosevelt placed Stettinius on the National Defense Advisory Commission. At that point, Stettinius resigned from U.S. Steel to devote full time to government service. As director of priorities in the Office of Production Management, he encouraged the development of synthetic rubber. Then, in 1942, Roosevelt appointed Stettinius to head administration of the Lend-Lease program, which he streamlined and made more effective while successfully winning congressional support for its sometimes-controversial programs of aid to the European Allies.

In September 1943, Stettinius became undersecretary of state, working under Secretary of State Cordell Hull with a commission to improve and coordinate the State Department's notoriously inefficient organizational structure and improve its lackluster public image. Stettinius's other major responsibility was the creation of an international security organization, the United Nations (UN). After laying the groundwork for this organization in discussions with British Foreign Office counterparts in the spring of 1944, Stettinius attended the August 1944 Dumbarton Oaks conference, where he played a major role in drafting the UN Charter.

When poor health caused Hull's resignation in November 1944, Stettinius succeeded him. The new secretary of state instituted public relations policies that greatly enhanced his department's popularity. He attended the controversial February 1945 Yalta Conference of Allied leaders, helping to draft American proposals for a Declaration on Liberated Europe

and to further clarify the UN Charter. Stettinius's greatest diplomatic contributions occurred between April and June 1945 at the San Francisco Conference, which drafted the final UN Charter. His diplomatic skills were instrumental in persuading the numerous delegates to reach consensus on a charter all could support.

Many officials considered Stettinius a lightweight, and during the San Francisco conference, Harry S Truman, who had succeeded Roosevelt as president in April 1945, decided to replace him with the South Carolina Democrat James F. Byrnes. On 27 June 1945, one day after the conference ended, Stettinius resigned to become first U.S. representative to the new United Nations. Disillusioned with the Truman administration's failure to use UN mechanisms to resolve the developing Cold War, in June 1946 Stettinius resigned to become rector of the University of Virginia. In 1949, he published a carefully documented account of the Yalta Conference, defending Roosevelt's decisions there. Stettinius died in Greenwich, Connecticut, on 31 October 1949.

Stilwell, Joseph Warren (1883–1946)

U.S. Army general. Born on 19 March 1883 near Palatka, Florida, Joseph Stilwell was commissioned a second lieutenant of infantry on graduation from the U.S. Military Academy in 1904. Promoted to temporary major in August 1917, Stilwell served with British and French forces before his assignment to the U.S. Army IV Corps of the American Expeditionary Forces in France during World War I. After the war, he studied Chinese and spent several years in China, serving with American units stationed there and as attaché to China and Siam (Thailand). He was promoted to colonel in August 1935. Stilwell earned his nickname “Vinegar Joe” as a result of his direct and critical manner while an instructor at the Infantry School at Fort Benning, Georgia. Promoted to temporary major general in October 1940, by July 1941 Stilwell was commanding III Corps at Monterey, California.

In February 1942, Stilwell, promoted to temporary lieutenant general, received command of all U.S. Army forces in the China-Burma-India Theater, while also serving as chief of staff to Guomindang (GMD [Kuomintang, KMT], Nationalist) Chinese leader Generalissimo Jiang Jieshi [Chiang Kai-shek]. Charged with coordinating the efforts of Britain, China, and the United States against Japan, Stilwell was also responsible for preparing China for the planned Allied invasion of the Japanese home islands. When the Japanese captured Burma in the spring of 1942, Stilwell personally led an Allied column on a 140-mile march through the Burmese jungle to avoid capture. To prevent the collapse of China, Stilwell continued to resupply Jiang's forces, but the loss of the Burma Road forced the Americans to fly the needed matériel over the Himalayas, known as “the Hump.”

Stilwell's belief that China's best hope for recapturing its territory from the Japanese was through the employment of Western-trained and equipped Chinese army forces brought him into direct conflict both with Jiang and Major General

Lieutenant General Joseph W. Stilwell, 1942. (Library of Congress)

Claire Chennault, former commander of the American Volunteer Group (“Flying Tigers”). As commander of the Fourteenth Army Air Force and a firm proponent of airpower, Chennault believed his air force capable of defeating the Japanese without the assistance of significant ground forces; he continually argued that he should receive the bulk of supplies coming over the Himalayas. Jiang, worried that any forces used against the Japanese would not be available for his anticipated postwar conflict with the Chinese Communists, was more than willing to support Chennault’s position. Throughout 1943 and 1944, tensions between Stilwell, Chennault, and Jiang mounted. Despite the demonstration of the potential of Chinese forces against the Japanese and the gains in Burma, highlighted by the capture of Myitkyina in August 1944, Stilwell was unable to convince Jiang to reform his army. When President Franklin D. Roosevelt urged Jiang to place Stilwell (who had been promoted to temporary general in August 1944) in command of all Chinese forces, Jiang refused and then demanded Stilwell’s relief. Unwilling to alienate Jiang, Roosevelt ordered Stilwell’s return. On 18 October 1944, Lieutenant General Daniel Sultan replaced him.

After his relief, Stilwell received command of the Tenth Army, a command slated for the planned invasion of Japan.

Following Japan’s surrender and the inactivation of the Tenth Army, Stilwell returned to the United States and took command of the Sixth Army. Suffering from advanced stomach cancer, Stilwell died at the Presidio in San Francisco, California, on 12 October 1946.

Stimson, Henry Lewis (1867–1950)

U.S. secretary of war. Henry Stimson was born in New York City on 21 September 1867 into a family whose American ancestry dated back to the seventeenth-century Puritans and whose tradition of service he himself would embody. He was educated at Phillips Andover Academy, Yale University, and Harvard Law School. In 1891, he entered the law firm of Root and Clarke. Its leading partner, Elihu Root, a future secretary of war and secretary of state, became one of Stimson’s two life-long role models, the other being future president Theodore Roosevelt.

Like Roosevelt, Stimson found public service more satisfying than the pursuit of a career in the law, and he soon became active in New York Republican politics. Appointed secretary of war in 1911, Stimson followed in Root’s footsteps in attempting to modernize the army and improve troop training and the efficiency of the General Staff, although congressional opposition blocked his contemplated consolidation and rationalization of army posts around the country.

When World War I began in Europe in 1914, the staunchly interventionist and pro-Allied Stimson campaigned ardently for “preparedness”—massive increases in American military budgets in anticipation of war with Germany. After Congress declared war on Germany in April 1917, Stimson volunteered, serving in France as a lieutenant colonel of artillery. He returned from the war convinced that the United States must assume a far greater international role.

As governor general of the Philippines in 1928, Stimson ruled in the spirit of benevolent paternalism. Appointed

U.S. Secretary of War Henry L. Stimson. (Corbis)

secretary of state in 1929, he played a prominent role in negotiating the London Naval Treaty of 1930. He attempted to strengthen the League of Nations by protesting firmly against Japan's establishment in 1931 of the puppet state of Manchouguo (Manchukuo), instituting the U.S. policy of nonrecognition that endured throughout the 1930s.

In the later 1930s, Stimson was among the strongest advocates of firm American opposition to the fascist states' demands for territory and international influence. When World War II began in 1939, Stimson, a convinced believer in an Anglo-American alliance, outspokenly demanded extensive American assistance to the Allies and massive United States rearmament. Seeking bipartisan support for his foreign policies, in June 1940 the Democratic President Franklin D. Roosevelt recruited Stimson as secretary of war, a position Stimson held throughout the war. He attracted an able group of younger lawyers and businessmen, including Robert A. Lovett, Robert P. Patterson, and John J. McCloy. With army chief of staff General George C. Marshall, they not only oversaw the massive recruitment and industrial mobilization programs the war effort demanded, but also accepted and wished to carry forward the forceful internationalist tradition their revered chief embodied. Stimson directed the development of atomic weapons in the MANHATTAN Project, and in April 1945

he informed new president Harry S Truman of this initiative's existence. In summer 1945, Stimson suggested that the Allies publicly warn the Japanese government that, unless Japan surrendered, it faced attack by unspecified but devastating new weaponry. This advice led the United States, Britain, and the Soviet Union to issue the July 1945 Potsdam Declaration to this effect. Shortly afterward, Stimson argued to Truman that in the interests of bringing this new scientific discovery under international control, the Allies should—with appropriate safeguards—share the secrets of nuclear power with the Soviet Union. After retiring in 1945, Stimson endorsed a greatly enhanced American international role. He died at Huntington, New York, on 20 October 1950.

Stirling, Sir Archibald David (1915–1990)

British army colonel and founder of the British Special Air Service (SAS). Born the son of a British general in Kier, Scotland, on 15 November 1915, David Stirling studied architecture at Trinity College, Cambridge, but he did not complete his academic work. He preferred other activities, such as mountaineering. Stirling was in the Canadian Rockies preparing for a Mount Everest climb when war commenced.

Stirling joined the British army as a junior officer and served a short stint in the Scots Guards before joining “Layforce,” founded by Lieutenant Colonel Robert E. Laycock, whose commandos were soon dispersed as reinforcements. Stirling deployed to the Middle East with Number 3 Commando. Hospitalized for several months following his injury in a parachute training jump, Stirling formalized plans for a special raiding group. Still on crutches, in July 1941 he secured approval from his commander in chief, General Claude Auchinleck, for the plan. Auchinleck designated 66 men of Layforce as L-Detachment, Special Air Service Brigade, under Stirling's command. The unit designation implied the presence of a large formation. The men were to mount parachute operations against Axis airfields in Libya.

This was the beginning of the elite SAS, which grew to regimental size. The first attack encountered high winds and sandstorms, and only 22 men of the force survived. Stirling then switched to specially equipped ground vehicles of the Long Range Desert Group. His tactics were to make the final approach on foot, strike the target, and then move by vehicle deeper into enemy territory. In 18 months, his SAS destroyed 350 Axis aircraft and also blew up ammunition dumps, supply depots, and trains. These raids forced the Axis powers to divert frontline troops to provide rear-area security. The Germans came to know Stirling as “the Phantom Major.” Captured in Tunisia on 10 January 1943, Stirling escaped four times, but he was recaptured thanks in large part to his 6-foot 5-inch height. He ended the war imprisoned at Colditz Castle, a maximum-security prison near Leipzig.

Stirling’s force expanded into three regiments and remained in existence for the remainder of the war. Today, the SAS Stirling founded is recognized as one of the world’s premier counterinsurgency forces. Following his release at the end of the war, Stirling settled in Southern Rhodesia (now Zimbabwe). He returned to the United Kingdom in 1961, where he became involved in numerous security-related ventures. Stirling died in London on 4 November 1990, having been knighted that year.

STRANGLE, Operation (15 March–11 May 1944)

Interdiction campaign by Allied air forces during the spring of 1944 directed against German supply lines in central Italy that supported the Gustav Line. Operation STRANGLE was intended to force a German withdrawal through the application of airpower alone.

The Germans established the Gustav Line centered on Monte Cassino to block an Allied northward advance on Rome. By spring 1944, three major ground assaults had failed to breach this line, and even the amphibious landing at Anzio in January 1944 had failed. Lieutenant General Ira C. Eaker, commander of the Mediterranean Allied Air Forces, decided to launch a supply interdiction operation to break the stalemate and force a German withdrawal.

Operation STRANGLE was directed mainly against the Italian rail system, Germany’s primary means of supply transportation, but it also encompassed ports and bridges. The campaign involved an interdiction belt running across Italy from east to west as far north of the Gustav Line as possible to force the Germans to use alternate transport means to the front. Medium bombers of the U.S. Army Air Force’s Twelfth Air Force and British First Air Force began operations on 19 March, and the strongly escorted daylight raids continued until 11 May 1944. The bombers succeeded in inflicting substantial damage on the rail system, cutting the lines more than 100 times each day and coming close to closing down all rail traffic 100 miles north of Rome. Nonetheless, the operation failed to force the Germans to withdraw from the Gustav Line in order to shorten their supply lines.

The campaign failed for four principal reasons. First, there were no significant ground operations during this period, and the aerial campaign was thus unsupported by other arms. Second, the Allies significantly overestimated (by a factor of close to 10) German supply requirements while they were in the static defenses of the Gustav Line, especially in the absence of any serious ground actions. Third, the German army minimized the effects of the campaign against the rail system through rapid repair of damage and construction of bypasses around destroyed rail sections, imposition of stricter rationing, movement at night, and diversion of scarce motor vehicles to transport supplies. Finally, the Allies could not deploy an adequate night bombing force, which prevented their air forces from neutralizing the Germans’ very effective countermeasures.

By the end of April, the Allies determined that airpower alone would not force a German withdrawal from the Gustav Line, and they launched Operation DIADEM on 11 May. The operation combined an aerial interdiction campaign against supply lines with a ground offensive. This air offensive was focused closer to the immediate German rear areas and also targeted their operational reserves and major command-and-control facilities. Within less than a month, Allied ground forces penetrated the Gustav Line, linked up with the Anzio beachhead, and captured Rome on 4 June.

Strategic Bombing

Strategic bombing may generally be defined as air attacks directed at targets or systems capable of having a major impact on the will or ability of an enemy nation to wage war. Airpower proponents have touted strategic bombing as a unique war-winning capability and have used it to justify independent air services.

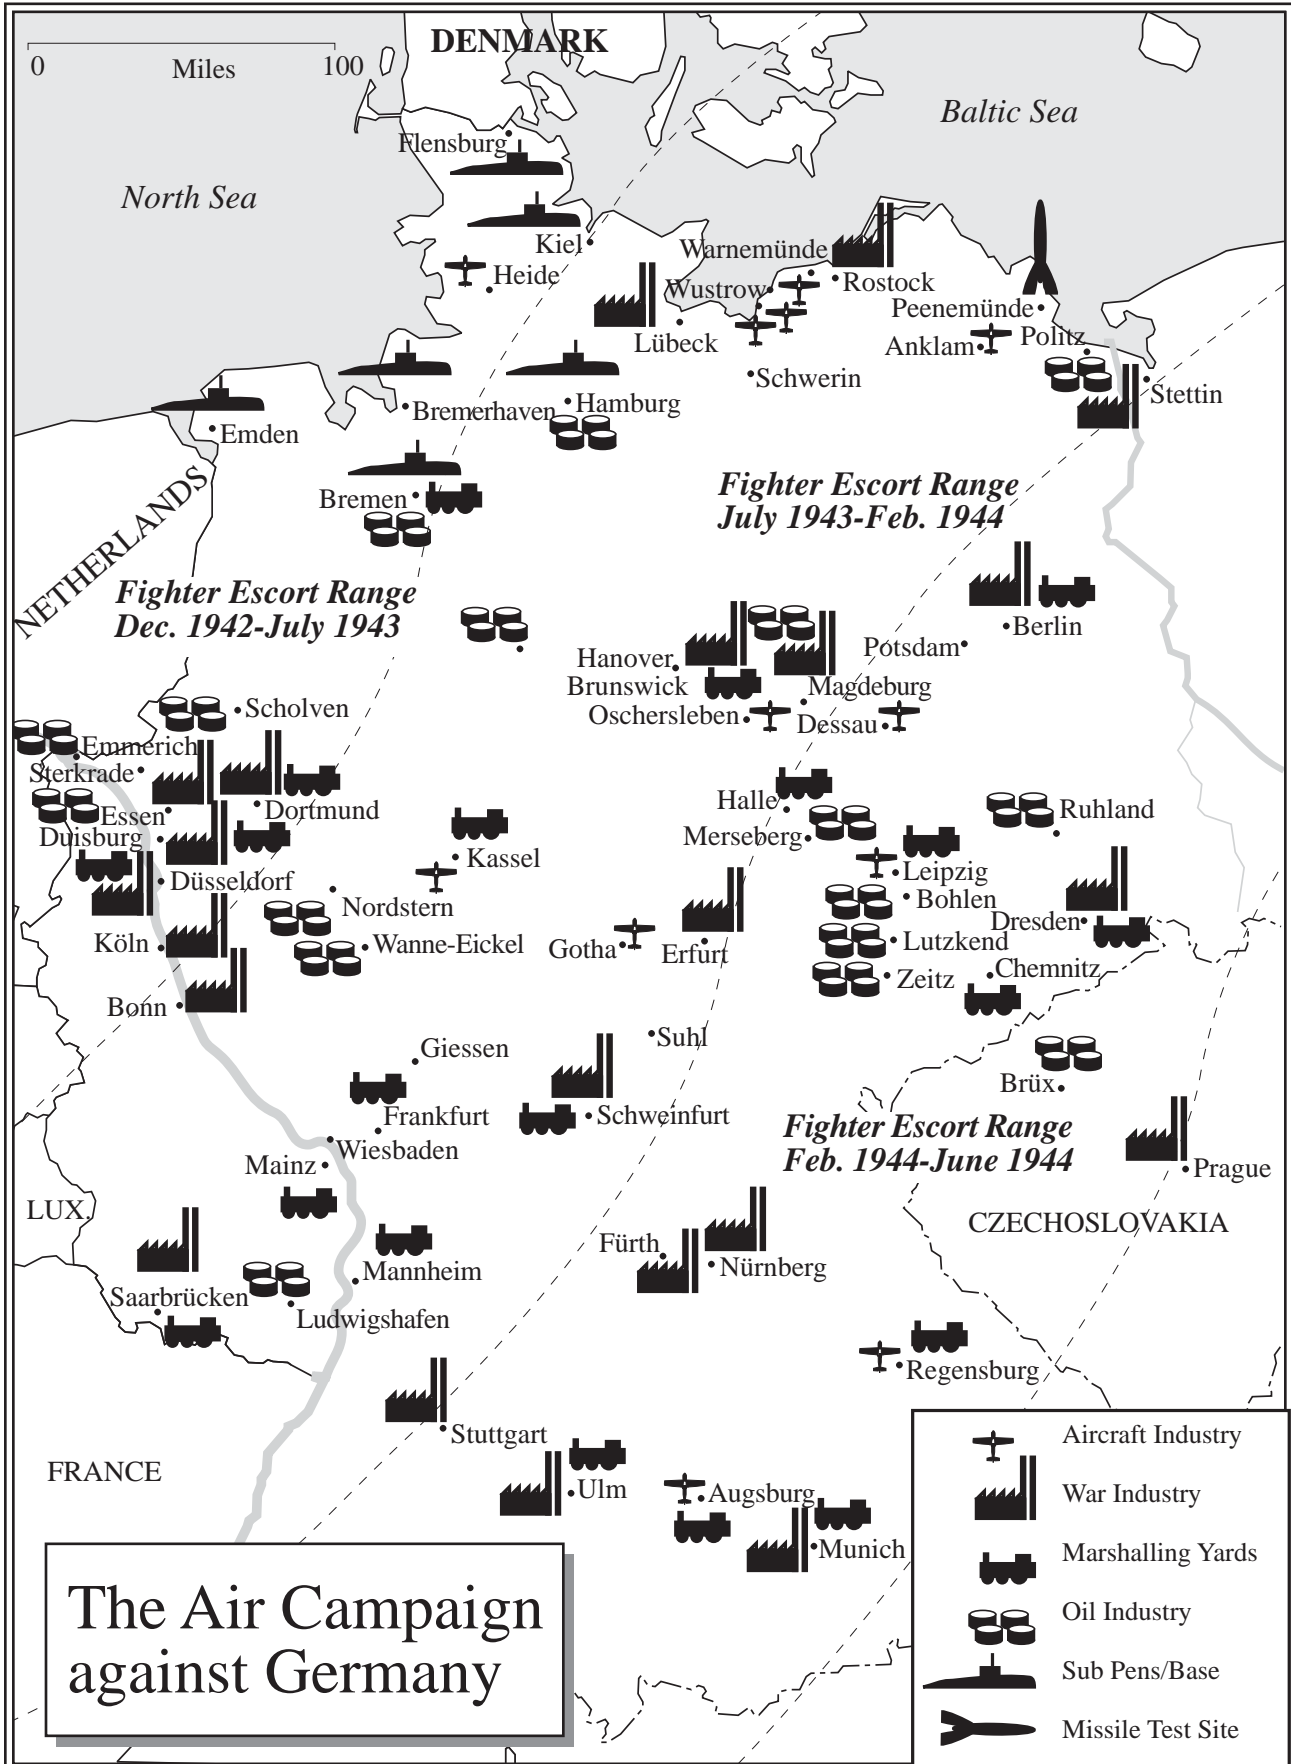

When World War II began, only two nations had a coherent and committed strategic bombing program: Great Britain and the United States. Although most states with advanced militaries had interest in powerful airpower, continental concerns, resource limitations, or misguided procurement poli-

cies hindered most aspirants to powerful long-range bombing forces. Only relatively protected naval powers such as the United States and Britain could afford to focus so much attention on strategic bombing, lured by the strong political appeal of its promise of quick victory at relatively low cost. Both efforts had roots in the experience of the Royal Air Force (RAF) in World War I, when Sir Hugh Trenchard developed tactics and policies for the world's first independent air service and when talented subordinates such as Hardinge Goulburn Giffard, 1st Viscount Tiverton (subsequently 2nd Earl of Halsbury) pioneered target analysis for morale and material effects to assault the foundations of the German war economy. Although airmen in both countries became aware of the ideas of Giulio Douhet during the interwar years and used them to support arguments for strategic airpower, Douhet had little impact on the evolution of the RAF or the U.S. Army Air Corps.

The RAF continued to pursue Trenchard's ideal of a massive aerial offensive, assisted by politicians who were willing to fund an aerial deterrent instead of large expensive land armies that could become involved in more bloody conti-

B-17 Flying Fortresses of the 303rd (Hell's Angels) Bomber Group dropping their bombs on industrial targets in Germany, 1944. (Bettmann/Corbis)

mental wars. However, targeting priorities remained vague, and the war would soon reveal the large gap between claims and capabilities.

The Americans took a different approach that can be traced back to Tiverton's precedents. Although the subordinate army air service's primary mission remained ground support, a group of smart young officers at the Air Corps Tactical School (ACTS) developed a theory of precision daylight bombing of carefully selected targets in the industrial and service systems of enemy economies. Pinning their hopes on the capabilities of new aircraft such as the B-17 Flying Fortress, these airmen expected unescorted self-defending bombers to destroy vital nodes of the enemy's war economy that would grind it to a halt.

Bombing examples before and during the early days of World War II—in Spain and China and even the German Blitz on London—appeared to demonstrate the ineffectiveness and drawbacks of indiscriminate attacks on cities and to support the superiority of precision tactics. When President Franklin D. Roosevelt asked the army and navy for munitions estimates for a potential war in 1941, many of those ACTS instructors had joined the Air Staff in Washington. They soon developed a plan called AWPD/1 that envisioned a precision bombing campaign as a key component of the American war effort. When a larger plan that included AWPD/1 was accepted, the U.S. Army Air Forces (USAAF) finally had a justification for pursuing its own independent strategic bombing. They also found it difficult to put theory into practice.

Early British attacks moved from a Tivertonian focus on key systems like power plants or oil to a more Trenchardian reliance on widespread morale effects. Daylight raids proved deadly for RAF Bomber Command, revealing critical deficiencies in the number and quality of their bombers. Operations shifted to the nighttime, but the August 1941 Butt Report concluded that only about one in five aircrews were bombing within five miles of their intended targets. Adapting to the reality of their capabilities, in February 1942 Bomber Command was directed to attack area targets—that is, cities—with the objective of undermining German civilian morale, particularly that of industrial workers. Under the direction of Air Chief Marshal Sir Arthur Harris, Bomber Command built up its strength and obtained better aircraft, especially Halifax and Lancaster four-engine bombers. On 30 May 1942, Bomber Command mounted the first “thousand bomber raid” on Cologne, and in July 1943 it achieved the first bombing-induced firestorm against Hamburg, killing about 45,000 people. However German night defenses also adapted. When Harris decided to mount a full-scale assault on Berlin in late 1943, the Luftwaffe shot down so many British aircraft, and bombing results were so disappointing, that the utility of the whole night area campaign was brought into question.

Meanwhile, the Americans had also encountered difficulties. At Casablanca in January 1943, Allied leaders had agreed to a Combined Bomber Offensive (CBO) of round-the-clock attacks. It was rather poorly coordinated, but it did allow each air force to pursue its preferred approach. The most significant USAAF strategic attack of that year was General James Doolittle's July 1943 attack on Rome from North Africa, which heavily damaged the marshaling yards, limited collateral damage with impressive accuracy, and contributed to the fall of Benito Mussolini's government. Elements of the Eighth Air Force began bombing the continent from England in August 1942, although they did not fly deep penetration raids into central and eastern Germany until a year later. Losses among unescorted B-17 and B-24 “Liberator” bombers were horrendous, especially during attacks against ball-bearing plants at Schweinfurt in August and October 1943. Although the Fifteenth Air Force in Italy joined the daylight campaign in November 1943, the Americans were unable to sustain such attrition. By the end of the year, such deep attacks on Germany were suspended, and it appeared that the Luftwaffe was on the verge of winning the strategic air war in Europe.

Everything changed, however, with the advent of the Allied long-range escort fighter, most notably the P-51 “Mustang.” In mid-February 1944, the U.S. Strategic Air Forces (USSTAF) began their “Big Week” attacks against German aircraft factories. The air battles that ensued decimated the Luftwaffe, and by the time of the D-day landings in June, the Allies achieved air supremacy over France and air superiority over Germany. The escort fighters began by sticking close to their bombers, but they proved most effective when they were released to sweep against enemy aircraft in the air and on the ground. Because of the American adoption of radar-directed bombing methods through overcast skies, the Germans had little respite even in poor weather, and their losses were increased by many accidents. Although the strategic bombers had an initial priority to operations in support of the coming invasion, Allied airpower had built up to the point that USSTAF commander General Carl Spaatz could begin sustained attacks against oil targets in May. By the fall of 1944, Luftwaffe and Wehrmacht operations were severely crippled by fuel shortages, and concentrated attacks against transportation networks further limited German mobility and economic activity.

During this period, Harris resisted diversions against “panacea targets” such as oil and remained committed to “dehousing” German workers. However, British bombers did sometimes assist with attacks on oil and transportation targets, and their larger loads of bombs could cause considerable damage. The RAF greatly improved its ability to navigate and bomb at night or in bad weather, and it usually achieved greater accuracy than the Americans under such conditions. Even in clear weather, precision bombing did not

Aerial view of Kobe docks during a raid by 500 B-29 bombers. Smoke obscures most of the city, with more bombs falling, 4 June 1945. (Corbis)

approach the image often portrayed in the press of bombs dropping down smokestacks. Usually, all aircraft in the B-17 and B-24 formations dropped their loads together, with intervals set between bombs so they would fall a few hundred feet apart. The pattern therefore covered a wide area. As USSTAF strength increased and targets became scarcer, planners became more tolerant of civilian casualties, adopting less accurate radar-directed bombardment methods in bad weather and hitting transportation objectives in city centers.

At least in Europe, American air leaders remained committed to attacks aimed primarily at economic and military targets instead of at civilian morale, a policy that sometimes caused friction with their British allies. There were also differences over bombing in occupied countries, where the British were particularly sensitive to political repercussions. The Americans were willing to bomb any Axis factory regardless of the nationality of the workers, whereas the British preferred to strike any German anywhere. The British also favored heavy attacks on the capitals of Axis allies in the Balkans, although the Americans successfully blocked what they saw as an inefficient and ineffective diversion of valuable

airpower. Debates about the relative success and morality of RAF and USAAF bombing have continued to the present day.

The differing national approaches also played a role as the war in Europe approached its end, and both air forces sought an aerial death blow to finish the war. The British plan, code-named *THUNDERCLAP*, was based on shattering morale by destroying Berlin. That major assault was conducted by the Eighth Air Force on 3 February 1945. Allied concerns about assisting the Soviet advance helped produce the firestorm that devastated Dresden 10 days later. The corresponding American plan, code-named *CLARION*, aimed to awe the German populace with widespread attacks on targets in every village. It was eventually changed into primarily a transportation assault because of concerns for efficiency, public image, and even morality. The controversy in Great Britain over the Dresden attack was one factor in the suspension of the strategic air war against Germany in April, although it was not as important as the simple fact that Allied bombing forces were running out of suitable targets.

American air leaders such as USAAF commanding General Henry H. “Hap” Arnold, who had hoped to build support

for service independence by demonstrating the ability of air forces to win wars on their own, still had a chance against Japan. The USAAF referred to the B-29 Superfortress either as a very heavy bomber or a very long range bomber, and by World War II standards it was assuredly both. Every theater wanted to receive the B-29s, but the aircraft's impressive capabilities and late availability destined it for the Pacific. The Joint Chiefs of Staff established the Twentieth Air Force and named Arnold its "executive agent" to command the B-29s. Although operational control of the aircraft supposedly remained in Washington, in practice the commanders of the subordinate XX and XXI Bomber Commands enjoyed a great deal of independence.

The XX Bomber Command, based in India and China, mounted its first raid against Japan in June 1944. Operation MATTERHORN had little success, even after Arnold assigned his leading troubleshooter, Curtis LeMay, to command it. Bases were too far from key Japanese targets, difficult to supply, and hard to protect from Japanese ground attacks. Additionally the B-29s had been deployed a year early, and testing had to be completed in combat.

More was expected from the XXI Bomber Command based in the Mariana Islands, which was within range of the most important enemy industrial complexes in Honshu. Initial attacks were launched from Saipan in November 1944,

but again results were disappointing. Besides technical and logistical problems, the command faced severe weather over target areas that made normal high-altitude precision bombing impossible. Although the vulnerability of Japanese cities to fires was well known and had inspired some USAAF planning for incendiary bombing, there was no meaningful pressure from Washington for such tactics. Impatient, however, for a better payoff on a huge investment, Arnold decided in January 1945 to concentrate all the B-29s in the Marianas under LeMay. Although the feisty and innovative air commander received little specific guidance from Washington, LeMay knew that he, too, could be relieved if he proved ineffective.

After trying to make daylight precision bombing work, on his own initiative LeMay adopted a new approach to destroy key industrial targets. His first low-level night area incendiary raid in March 1945 was a spectacular military success, incinerating 16 square miles of Tokyo and killing 90,000 people. Although he would mount some periodic day and night precision attacks, the fire raids dominated LeMay's air campaign against Japan. Eventually, he burned 178 square miles of some 66 Japanese cities, killing hundreds of thousands of people and causing millions to flee to the countryside. B-29s also dropped the two atomic bombs on Hiroshima and Nagasaki. MacArthur's Far East Air Forces contributed three attacks against Kyushu before the Japanese surrender, but the last American bombs that fell on Japan came from the Twentieth Air Force. More than 1,000 planes hit Japan on 14 August, some even after the Japanese radio had announced acceptance of the terms of surrender.

Both the British and Americans conducted postwar assessments of the strategic bombing campaign. The massive U.S. Strategic Bombing Survey compiled an impressive collection of data, although differing personalities and agendas within the survey committees produced several conflicting conclusions. They agreed, however, that the American approach to targeting was superior to RAF area bombing. The British Bombing Survey Unit relied on the American data along with some of its own, but overall it was not as thorough or comprehensive. It was also critical of the city attacks, but it gave much credit to the RAF-USAAF campaign against transportation.

In retrospect, the most important contribution strategic bombing made in Europe was to defeat the Luftwaffe and ensure that when Allied troops driving across northwestern Europe saw aircraft, they could be certain the planes were friendly. The CBO did not prevent the late-mobilizing German economy from peaking in 1944, but the oil and transportation campaigns had a major impact on degrading it thereafter. Civilian morale did not break, but some British observers have noted that the city bombing motivated German industry to disperse, thus making it more vulnerable to transportation interdiction. More than 700,000 German

civilians died from Allied bombing, about the same number who succumbed to the effects of the British naval blockade in World War I. The cost of the CBO was also high for the air forces involved. The USSTAF lost 9,949 bombers, 8,500 fighters, and 64,000 airmen killed. RAF Bomber Command lost 57,000 killed or missing from all causes. In the Pacific, the incendiary attacks and atomic bombs were an important component of the series of shocks that produced the Japanese surrender, although the significance of other factors such as the submarine and naval blockade, as well as Soviet entry into the war, cannot be underestimated.

The World War II strategic bombing experience had several legacies. In the United States, the new U.S. Air Force was born in 1947, espousing a doctrine of air warfare based on the perceived lessons of their air campaigns against Germany and Japan along with the awesome power of nuclear weapons. "Vertical" targeting approaches against key Soviet industries resembled the German oil and transportation attacks, whereas "horizontal" methods based on LeMay's incendiary campaign were aimed at Soviet industrial concentrations in cities. One planner described the Strategic Air Command's early war plans as "precision attacks with area weapons." Since that time, the U.S. Air Force has dedicated itself to the pursuit of real precision, and the extreme accuracy of its contemporary munitions as well as current targeting doctrines have roots in the ideas developed at ACTS in the 1930s. However, while Americans trumpet their ongoing commitment to the principles of precision bombing, the rest of the world also remembers the images of Tokyo, Hamburg, and Dresden.

Stratemeyer, George Edward (1890–1969)

U.S. Army Air Forces general. Born in Cincinnati, Ohio, on 24 November 1890, George Stratemeyer graduated from the U.S. Military Academy in 1915. On graduation, he was commissioned in the infantry and served along the Mexican border. In 1916, however, Stratemeyer transferred to the Signal Corps and became an aviator, completing flight training in 1917 at Rockwell Field in San Diego, California.

During World War I, Stratemeyer commanded the School of Military Aeronautics at Ohio State University. He was then chief test pilot at Kelly Field, Texas, and Chanute Field, Illinois. He transferred to the Army Air Service in 1920. In 1921, he took command of Chanute Field, Illinois. Stratemeyer was next assigned to Hawaii and then taught tactics at West Point from 1924 to 1929. He graduated from the Air Corps Tactical School at Langley Field, Virginia, in 1930 and the Command and General Staff School at Fort Leavenworth, Kansas, in 1932, where he then taught for several years. Promoted to lieutenant colonel, he commanded the 7th Bombardment Group at Hamilton Field, California, from 1936 to 1938. He graduated from the Army War College in 1939 and then commanded the Southeast Air Corps Training Center, Maxwell Field, Alabama. He next served as chief of the Air Staff at Washington, D.C., and was promoted to major general in 1942.

In August 1943, Stratemeyer arrived in India to take command of U.S. Army Air Forces in the China-Burma-India Theater, where his forces performed important work in the resupply of Chinese troops fighting the Japanese. President Franklin D. Roosevelt approved Stratemeyer's plan to bomb Japanese forces from a base in India and others in China. Stratemeyer next headed the Eastern Air Command (a joint U.S.-British air organization) and Army Air Forces in China with headquarters in Chongqing (Chungking). His units helped relocate some 200,000 Chinese troops and 5,000

horses from eastern to western China. Stratemeyer was promoted to lieutenant general in 1945.

From February 1946 to April 1949, Stratemeyer led the new Air Defense Command. A forceful advocate of an expanded air force, he promoted the establishment of an air force academy. He then took command of the Far East Air Force. When the United States entered the Korean War, Stratemeyer's meager air assets attacked the invading North Korean forces and helped prevent their victory. Throughout, his units maintained air supremacy over Korea.

A massive heart attack in May 1951 cut short Stratemeyer's career, and he retired in January 1952. He died in Orlando, Florida, on 9 August 1969.

Student, Kurt (1890–1978)

German army general. Born at Birkholtz, Brandenburg, on 12 May 1890, Kurt Student was educated at the cadet school at Lichterfelde (1905–1908). He joined the German army as an ensign in 1910 and was commissioned a lieutenant in 1911. He volunteered for flying school and qualified as a pilot in 1913. On the outbreak of World War I, he was testing aircraft armament. From 1916, he commanded a fighter squadron on the Western Front, where he was wounded in aerial combat.

Student continued in the army after the war and was posted to the Central Flying Office, where he worked with the illegal German air units training in Russia. He then reverted to the infantry (1928–1933), where he was promoted to major and served as a battalion commander. Following Adolf Hitler's accession to power, Student directed air training schools for the Aviation Ministry. Promoted to full

German General Kurt Student, under arrest and being escorted by British Military Police. (Photo by Hulton Archive/Getty Images)

colonel in August 1933, he headed the test center for aviation equipment and organized Germany's first airborne forces. Promoted to Generalmajor (U.S. equiv. brigadier general) in 1938, Student was inspector of Airborne Forces. As commander of the 7th Air Division of paratroops and gliderborne infantry, Student was chiefly responsible for this major innovation of airborne warfare. Thanks in part to his high standards and his talent in picking capable subordinates, Student soon commanded some of the finest infantry in the world.

Student played a key role in Hitler's May 1940 invasion of France and the Benelux, directing his elite forces in reducing key strong points, most notably Fortress Eben Emael in Belgium. He suffered a serious head wound while personally directing an assault at Rotterdam, the Netherlands, and departed on leave. Student urged an immediate assault on Britain and establishment of an airhead in the Folkstone area before Britain could recover its balance. However, Adolf Hitler believed the British would recognize the inevitability of a German victory and negotiate. Hitler let the opportunity pass. Student returned to duty in September, when he was promoted to major general.

Student participated in operations against Greece and then directed the successful airborne assault on Crete in May 1941. The heavy casualties in this operation, the consequence of ULTRA intercepts, convinced Hitler that the days of parachute troops were over. From that point, the German airborne forces were employed as elite infantry. Student planned and his airborne forces carried out the rescue of Mussolini in September 1943.

As lieutenant general, Student commanded First Parachute Army during the Normandy Invasion. As a full general in September 1944, he assisted in the defense of Holland during Operation MARKET-GARDEN. In November 1944, he assumed command of Army Group H in defense of the Rhine. In late April 1945, he commanded Army Group Vistula. Taken prisoner by the British in Schleswig-Holstein, he was charged and convicted of war crimes by a British court, but he was released in 1948. Student died in Lemgo, Federal Republic of Germany, on 1 July 1978.

Stülpnagel, Karl Heinrich von (1886–1944)

German army general and leader in the Resistance. Born in Darmstadt on 2 January 1886, Karl Stülpnagel received a classical education and pursued studies in Geneva. In 1904, Stülpnagel entered the German army as a cadet officer. He served on the General Staff during World War I, rising to the rank of major.

Stülpnagel continued in the army after the war and held infantry commands. Promoted to colonel in 1932, he headed the foreign studies branch of the General Staff from 1933 to 1937. Promoted to Generalmajor (U.S. equiv. brigadier general) in 1936 and Generalleutnant (U.S. equiv. major general) in 1937, he was appointed head of the Operations Section of the General Staff in 1938.

Stülpnagel impressed his colleagues with his wit and intelligence. Fellow officers praised his abilities and believed him to be one of the best officers in the German army. Stülpnagel's personal opposition to war against Britain led him to join his close associates, Generals Ludwig Beck and Franz Halder, in the conspiracy against Adolf Hitler.

Stülpnagel was promoted to General der Infanterie (U.S. equiv. lieutenant general) in April 1939, and he served as quartermaster and deputy chief of the General Staff from August 1938 to May 1940. He commanded II Corps in the 1940 invasion of France, and following the defeat of France, he served as chairman of the Armistice Commission at Wiesbaden from June 1940 to February 1941. He then commanded the Seventeenth Army in Operation BARBAROSSA, the invasion of the Soviet Union. Poor health forced him to relinquish this command in November 1941.

In March 1942, Stülpnagel took over from his cousin Otto von Stülpnagel the post of military governor of Paris. In this position, he enforced German occupation policies, including the execution of 29,000 hostages in an effort to end resistance to German rule. Here, too, he became active in the Resistance plot to assassinate Hitler. He was the only German general outside of Berlin who actively pursued the coup plans of July 1944. Believing that the bomb plot of 20 July had been successful, Stülpnagel ordered the arrest of some 1,000 German security personnel in Paris.

Stülpnagel's inability to convince Field Marshal Günther von Kluge (German commander in chief west) to support the coup doomed his efforts. Kluge ordered Stülpnagel to release the German prisoners and then fired the beleaguered general. Ordered to report to Berlin on 21 July, Stülpnagel stopped en route at Verdun and there attempted suicide by shooting himself in the head. Only blinded, he was arrested by the Gestapo and taken to Berlin. He was tried by the People's

German Army General Karl-Heinrich Stülpnagel. (Photo by Hulton Archive/Getty Images)

Court, convicted, and sentenced to death. Stülpnagel was hanged at Ploetzensee Prison on 30 August 1944.

Submachine Guns

The submachine gun (SMG) was a pistol-caliber automatic firearm that could be carried by one man in vehicles for local defense. It was also extremely useful in trench fighting and in operations to clear buildings. In the latter form of warfare, the SMG came into its own, able to fire bursts of pistol ammuni-

tion in enclosed spaces at short ranges within which the cartridge was still fully effective. On the battlefield, it also had its uses in fighting in bunkers and in wooded areas where ranges were short. All special forces used it during World War II.

Bethel Abiel Revelli, an Italian more famous for his machine-gun designs, invented the first submachine gun. His Villar Perosa weapon of 1915, although a tactical failure, used a pistol cartridge but fired it automatically by the blow-back principle. This principle relies simply on the weight of the breech block to delay rearward movement caused by the explosion of the gases in the cartridge case. These gases push the cartridge case to the rear, and safety is assured by delaying the movement of the breech block until the pressure in the barrel has dropped after the bullet has left the barrel. Also in World War I, the Germans used their Mauser pistol as an SMG and issued an attachable stock for it, but this weapon was too light to be really effective.

In the interwar period, the Americans developed the highly effective Thompson SMG using a .45 caliber automatic Colt pistol cartridge. The Thompson was an important development, for it used a pistol cartridge but was of sufficient weight to fire accurately in short bursts. At the same time, the Germans further developed their World War I Bergmann SMG. It eventually became well known as the MP38 and MP40 SMGs.

The United States continued to make and issue the Thompson in .45 caliber throughout the war, although a much cheaper variant, the M3 (known as the "grease gun" from its appearance), was also issued. Both weapons were very effective at the short ranges for which they were designed, and British troops were often armed with the Thompson, which they preferred to their own Sten gun.

The Sten gun was a weapon born from economic need. British forces needed an SMG, but only rimmed cartridges were in use for the British army pistol. The 9 mm Parabellum round was, however, available, and so the design was based on that cartridge. The weapon was initially quite crude, although it developed as the war progressed. It had the unfortunate capability of firing when it was not required to do, and British troops often relieved German troops of their MP38 or MP40 SMGs as soon as they could.

These weapons utilized the same ammunition, which simplified supply. The Germans used the MP38 and MP40, as well as some older Bergmann SMGs, throughout the war. These solid and reliable weapons were effective to 50 yards. They were steel and plastic throughout and had no wood in their construction, a hallmark of all later examples of SMGs.

German troops in the field often preferred the Soviet PPSH M1941. A much cruder weapon, it had a wooden stock and fired from a 71-round drum magazine (as opposed to the MP38 32-round magazine). Further, the weapon took little

U.S. Marine Corps patrol pushes through the New Britain jungle in pursuit of Japanese forces on Cape Gloucester with the lead soldier carrying a Thompson submachine gun. (Bettmann/Corbis)

notice of weather and could be fired in dusty, muddy, or icy conditions, a characteristic of immense value to the operator.

The later PPS 1943 models were stamped out so that tolerances were maximized, allowing the weapon to gather dust, dirt, carbon deposits, and other encrustations that defeated the more accurately made German weapons. This fact allowed the Soviet weapons to keep on firing when the Germans were struggling with their own weapons. In the fighting in Stalingrad and Berlin, these were the standard house-clearing weapon, in concert with grenades and shovels.

The Japanese came upon the SMG idea late in the war, and the Type 100 SMG was used by Japanese paratroops in the attack at Leyte in 1944. It was not well made and was considered inferior to European and American standards, but it could also be seen as a simple, cheap weapon, two of the characteristics of the SMG.

The Italians, having invented the weapon, did not fail to develop the idea themselves. Pietro Beretta and his company designed and manufactured the Model 38 SMG, which was followed by the Models 38A and 18/42, all in 9 mm Parabellum. These were wooden-stocked weapons and were highly regarded at the time.

A combination of the SMG and the standard rifle evolved into the assault rifle, which was first developed by the Germans in World War II.

Submarines

During the period between the two world wars, the world's major navies constructed small series of submarines that served the dual purpose of meeting immediate operational needs and providing data for the development of improved vessels. By the mid-1930s, most of these navies had evolved one or two basic types that were well matched to their operational requirements, had attained substantial design maturity, and were suited to large-scale series production. The vast majority of submarines that served during World War II, rather than having radical new designs, were of standardized types that had been modified in the light of operational experience.

These standardized submarine types shared many common features. Functionally, they were submersibles rather than true submarines; their designs were optimized for operation on the surface, and they had only limited capabilities while submerged. Underwater, they relied on electric motors powered by large storage batteries for propulsion; on the surface, they used diesel engines for propulsion and to recharge the batteries. The submarines incorporated substantial numbers of torpedo tubes and reload torpedoes, and they also mounted guns for use against surface or aerial targets. Their operational range was a function of the capacity of their bunkers for diesel fuel; their radius of action while submerged was limited by battery cell capacity. Maximum speed while submerged usually was not much more than half their surface speed, and maintaining high submerged speeds was impossible for any length of time without totally draining the batteries and forcing the submarine to the surface. Consequently, most navies during the conflict primarily operated their submarines as stealthy surface vessels that could submerge for evasion or escape before or after an attack.

Britain

British submarine development was influenced by the cruiser and fleet submarine concepts. The main thrust of early evolution between the wars centered on the overseas patrol type, which displaced 1,475 tons on the surface and had a range of 10,900 miles at 8 knots, a submerged endurance of 36 hours at 2 knots, and a diving depth of 500 feet. Armament included a battery of 8 torpedo tubes with 14 torpedoes and a 4-inch deck gun. A group of similar-sized minelaying submarines also was built, as was a small series of very fast large submarines for work with the fleet, but both of these developments proved very expensive and of limited operational usefulness.

In the early 1930s, a fresh start was made with the Swordfish-class, which was designed for offensive patrols in

narrow waters. These boats displaced 640 tons standard. They had a cruising range of 3,800 miles at 9 knots on the surface and 36 hours at 3 knots submerged, and they could dive to 300 feet. Armament was 6 torpedo tubes with 12 torpedoes and a 3-inch gun. A larger overseas patrol type, the Triton-class, appeared in 1937. These displaced 1,090 tons standard; they had a cruising range of 4,500 miles at 11 knots on the surface and 55 hours at 3 knots submerged, and they could dive to 300 feet. Armament was 10 torpedo tubes with 16 torpedoes and a 4-inch gun. Britain concentrated its production of submarines during the war on these two types, producing a total of 62 of the S type and 53 of the T type.

Just before the war, the Royal Navy developed a small submarine for training not only crews and new commanding officers but also antisubmarine vessels. When war came, the design was quickly adapted for operational use, and the submarine proved particularly useful in confined waters such as the North Sea and Mediterranean. The U class displaced between 540 and 646 tons on the surface, with a range of 3,600 miles at 10 knots on the surface, a submerged endurance of 60 hours at 2 knots, and a diving depth of 200 feet. Armament included a battery of 6 torpedo tubes with 10 torpedoes and a 3-inch deck gun. A total of 71 boats were constructed of this class and its slightly improved successors of the V class. Although they were useful boats in the early part of the war, the later examples diverted resources from construction of more effective vessels. Britain also built some 36 midget submarines; with 4-man crews, these vessels attacked ships at anchor in harbor.

France

France constructed three series of submarines in the period between the wars: large oceangoing long-range vessels for worldwide service and for operation with the fleet, smaller boats for offensive patrols in European waters, and a successful group of minelayers. The first postwar French submarines were of the 1922 and 1923 programs and were based on the study of German U-boats taken as reparations. These 9 submarines of the Requin-class had a standard surface displacement of 947 tons and were armed with 10 × 21.7-inch torpedo tubes, 1 × 3.9-inch deck gun, and 2 × 25.2 mm machine guns. The 31 large submarines of the Redoutable-class (launched between 1928 and 1937) generally were regarded as very effective boats. They displaced 1,384 tons standard on the surface; their maximum range was 10,000 miles at 10 knots on the surface, and their submerged endurance was 60 hours at 2 knots. They had a battery of 11 torpedo tubes (7 of them in 2 remotely controlled trainable external mounts) with a total of 13 torpedoes and a single 3.9-inch deck gun.

The French also constructed several smaller seagoing patrol-type submarines. A 1922 building program called for

4 × 600-ton boats. These were the Sirène-class, 9 of which were eventually built. Several other patrol-type submarine classes were authorized in the years before the war, but not all were complete when France fell in June 1940. These submarines displaced between 600 and 900 tons. The Aurore-class, the last series of French submarines being constructed when World War II began, displaced 893 tons and were armed with 9 × 21.7-inch torpedo tubes (3 in an external remotely controlled trainable mount) plus a single 3.9-inch deck gun and 2 × 13 mm machine guns.

The French minelaying submarines of the Saphir-class displaced 761 tons on the surface and could cruise for 7,000 miles at 10 knots on the surface. They had a submerged endurance of 48 hours at 2 knots and could safely operate to a depth of 250 feet. They carried 5 torpedo tubes (3 in a trainable external mount) with 7 torpedoes, 32 mines, and a single 3-inch deck gun.

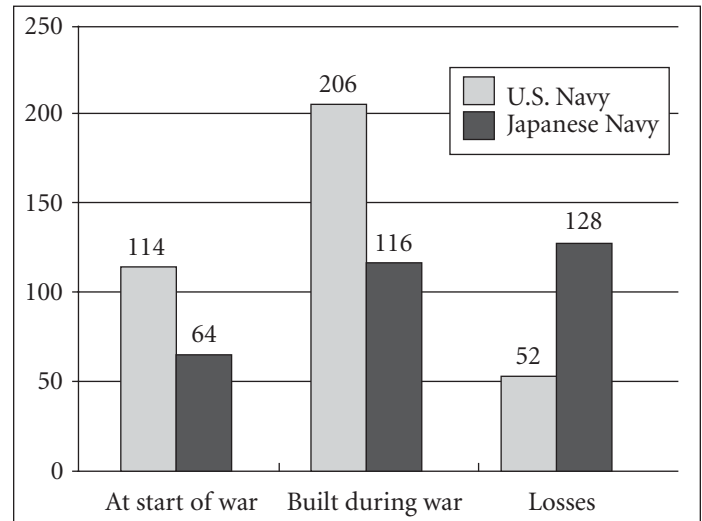

The French navy also operated the largest submarine in the world at the outbreak of the war. The *Surcouf*, designed for long-range commerce warfare, displaced 2,880 tons standard on the surface and had a range of 10,000 miles at 10 knots on the surface. It had a range of 60 hours at 2 knots submerged and could operate safely at a depth of 250 feet. The *Surcouf*'s battery included no fewer than 12 tubes (8 in external mounts) with 22 torpedoes, 2 × 8-inch guns in a special turret mounting, and a seaplane stowed in a hangar and launched with a catapult. The *Surcouf* also was equipped with a special compartment to accommodate prisoners taken from intercepted vessels and a small motor launch to transport boarding parties. The submarine proved to be successful in peacetime, but it never operated as designed during combat because of the fall of France and the boat's subsequent loss in a collision.

Soviet Union

At the outbreak of war in September 1939, the Soviet Union deployed the world's largest submarine force, with 168 boats in service. Soviet mass production of submarines began early and produced a wide variety of different types. There were two basic series of M-type coastal submarines, two basic medium submarine series (the S-type, derived from the same basic design as the German Type VII, and the Shch or Pike-type of indigenous origin), minelayers of the L-type, and long-range boats of the K-type.

The final M-type displaced 283 tons when surfaced, had a range of 4,500 miles at 8 knots on the surface or 36 hours at 3 knots submerged, could dive to 295 feet, and had a battery of 2 torpedo tubes with 4 torpedoes and a 45 mm anti-aircraft gun. The S-type displaced 856 tons surfaced, had a range of 9,500 miles at 9 knots on the surface or 45 hours at 3 knots submerged, could dive to 330 feet, and had a battery of 6 torpedo tubes with 12 torpedoes and a 4-inch deck gun. Their indige-

Submarines, U.S. and Japan during World War II

nous rivals displaced 587 tons, had a range of 3,650 miles at 7 knots on the surface or 50 hours at 2.5 knots submerged, could dive to 295 feet, and carried 6 torpedo tubes with 10 torpedoes. The minelayers displaced 1,108 tons, had a range of 10,000 miles at 8.6 knots on the surface or 60 hours at 2.5 knots submerged, could dive to 330 feet, and carried 8 torpedo tubes with 14 torpedoes and 20 mines. The K-type were very popular with their crews and were regarded as the best Soviet submarines of the war. These displaced 1,480 tons, had a range of 15,000 miles at 9 knots on the surface or 50 hours at 2.5 knots submerged, could dive to 330 feet, and carried 10 torpedo tubes with 24 torpedoes. Despite this variety, the Soviet Union's yards produced a great many submarines, completing some 200 boats during the course of the war.

United States

The U.S. Navy took the process of type standardization the farthest, entering World War II with a single basic design that was improved but never replaced during the course of the conflict. These "fleet boats" emerged through the crystallization and synthesis of a series of designs produced to meet requirements for fleet submarines to accompany the battle fleet, cruiser submarines for long-distance raiding, and patrol submarines for offensive operations in the Pacific. Nine vessels (essentially experimental prototypes) in five classes were produced between 1921 and 1934, ranging in size from 1,100 tons to 2,700 tons standard on the surface. Overall, these submarines were not very successful, suffering problems with their diesel machinery, diving ability, and general reliability, but they provided valuable experience and data for an improved design.

The new series that began with the Porpoise-class of 1934 were of 1,310 to 1,475 tons standard on the surface. They

Looking forward along the deck from the stern of a U.S. submarine off the coast of New London, Connecticut, August 1943. (Navy, National Archives)

introduced diesel-electric reduction drive, which proved vastly more reliable than previous arrangements. Surface cruising range was 11,000 miles at 10 knots, and they had a patrol endurance of 75 days. They could operate for up to 48 hours submerged at 2 knots and had a safe-operating-depth limit of 250 feet. A battery of 6 to 8 torpedo tubes with 16 to

24 torpedoes was fitted, along with a light deck gun. Between 1934 and 1940, 38 submarines of this group were constructed, and they formed the backbone of the American submarine force when the United States entered the war.

The Gato-class that followed became the first wartime standard class. Displacement rose to 1,526 tons, the torpedo

tube battery increased to 10 tubes, and safe depth increased to 300 feet. They were followed by the very similar Balao-class; its deeper safe-operating depth of 400 feet was accomplished by substituting high-tensile steel for the mild steel used in earlier boats. The Tench-class introduced diesel-electric direct drive that brought about a very significant reduction in noise and internal machinery space, leading to the addition of 4 reload torpedoes to the outfit. A total of 221 submarines from these 3 classes were completed during or immediately after the war. Significant wartime modifications included reducing superstructure, adding radar, and enlarging the gun armament by fitting 4-inch or 5-inch deck guns and adding multiple light anti-aircraft weapons.

Germany

Germans developed their submarines clandestinely, since the Versailles Treaty prohibited them such weapons. Design work continued for foreign navies, with production undertaken in the customers' yards under German supervision. The first new German submarine, *U-1*, was completed only five weeks after the repudiation of the Versailles Treaty on 29 June 1935.

The overwhelming majority of the 1,150 U-boats commissioned between 1935 and 1945 belonged to two groups: the so-called 500-ton Type VII medium boats and the 740-ton Type IX long-range submarines. The Type VIIC actually displaced between 760 and 1,000 tons on the surface; it had a cruising range of 6,500 to 10,000 miles at 12 knots on the surface and 80 miles at 4 knots submerged. It had a battery of 55 torpedo tubes with 14 torpedoes, an 88 mm deck gun, and ever-increasing numbers of light anti-aircraft weapons. Almost 700 of these boats in all their variants entered service during World War II. The Type XIIC actually displaced 1,120 tons; it had a cruising range of 11,000 miles at 12 knots on the surface and 63 miles at 4 knots submerged. It had a battery of 6 torpedo tubes with 22 torpedoes, a 105 mm deck gun, and ever-increasing numbers of light anti-aircraft weapons. Almost 200 of this type and its variants were commissioned.

Germany also commissioned several other important types of submarines during the war. Among the most important were the Type X minelayers and the Type XIV supply boats. Both variants operated as resuppliers for the operational boats during the Battle of the Atlantic, providing fuel, provisions, medical supplies, reload torpedoes, and even medical care and replacement crew members. Consequently, they became prime targets for Allied anti-submarine forces, and few survived. The other major vessels were the radical Type XXI and Type XXIII boats designed for high submerged speed and extended underwater operation. Revolutionary streamlined hull shapes, greatly increased battery space, and the installation of snorkels allowed these boats to operate at submerged speeds that made them very difficult targets for Allied anti-sub-

marine forces. However, confused production priorities and the general shortage of materials late in the war prevented more than a very few from putting to sea operationally.

Italy

Italian submarines were of four basic types: very large ocean-going cruiser submarines, large minelayers, large long-range patrol boats, and medium-size vessels. The cruisers were few in number and proved rather unsuccessful, especially as they were slow to dive; they saw little operational service. The minelayers were much more successful. They displaced between 1,054 and 1,305 tons standard on the surface, with a range of 8,500 miles at 9 knots on the surface, a submerged endurance of 60 hours at 2 knots, and a diving depth of 330 feet. Armament included a battery of 6 to 8 torpedo tubes with 8 to 14 torpedoes, 36 mines, and 1 or 2 3-inch deck guns.

The 2 series of patrol submarines emerged as essentially standard designs immediately before the war began. The larger group displaced between 920 and 1,000 tons standard on the surface, with a range of 9,000 miles at 8 knots on the surface, a submerged endurance of 60 hours at 2 knots, and a diving depth of 330 feet. Armament included a battery of 8 torpedo tubes with 12 torpedoes and 1 × 4-inch deck gun. The smaller group displaced between 650 and 680 tons standard on the surface, with a range of 5,000 miles at 8 knots on the surface, a submerged endurance of 60 hours at 2 knots, and a diving depth of 330 feet. Armament included a battery of 6 torpedo tubes with 12 torpedoes and 1 × 4-inch deck gun. These smaller patrol submarines were very successful boats and performed well in the shallow, clear waters of the Mediterranean. The larger boats performed quite effectively in the Atlantic.

Japan

Japan constructed very large submarines intended to operate primarily as integral components of the battle fleet. The *kaidai* (admiralty) type design was based on a large German cruiser submarine from World War I, and the type evolved into a series of 24 boats in 5 classes, constructed between 1921 and 1935. These vessels displaced between 1,390 and 1,635 tons standard, had operating ranges between 10,000 and 14,000 miles at 10 knots, carried a battery of 6 to 8 tubes with 14 to 16 torpedoes, could operate submerged for 36 hours at 2 knots, and had a safe operating depth of between 200 and 250 feet. Japan also developed very large cruiser submarines of the *junsen* (cruiser) type between 1924 and 1938. These 8 huge vessels had standard displacements between 1,970 and 2,231 tons and an operational range of 24,000 miles at 10 knots on the surface. They could dive safely to 300 feet.

In 1939, Japan essentially standardized its large submarine type with a vessel design displacing about 2,100 tons and capable of cruising on the surface for 14,000 miles at 16 knots

or 24,000 miles at 10 knots. They could dive to 330 feet. Three models were produced—a headquarters type emphasizing communications and command facilities, an attack type emphasizing torpedo armament, and a scouting type that added hangar space and a catapult for a small reconnaissance floatplane. Some 46 of these large submarines were constructed, plus 3 others that brought together the facilities of all 3 types into the sen-toku (special submarine) type, a single monster hull displacing 3,530 tons standard. Japan also constructed 10 final examples of the kaidai type early in World War II.

Japan also developed and constructed a series of medium submarines intended for coastal work. In addition, Japan expended considerable effort on the development of midget submarines: small boats with two-man crews intended for stealthy attacks on ports and roadsteads after they were transported close to the scene of operation by larger submarines. Finally, late in the war, Japan was developing submarines with high underwater performance, but these never entered service.

Technology played a major part in determining the effectiveness of submarines. Most navies encountered problems with their torpedoes early, especially those submarine arms that relied on magnetic rather than contact pistols. Radar development conferred a special advantage on Allied submarines in particular, offsetting the edge in optical quality possessed by German and Japanese vessels. U.S. submarines were almost unique in their level of habitability, and they were almost the only boats that featured full air-conditioning and adequate space for their crews to sleep. Sonar developed rapidly, as did countermeasures; some navies put considerable effort into stealth and self-defense measures by emphasizing use of wakeless electric torpedoes and special antisubmarine homing torpedoes. The course of the submarine war demonstrated that those arms that fell behind in the technological battle suffered disproportionately heavily in combat.

Submarines, Midget

Small submarines, “human torpedoes,” and submersibles. Although envisioned as a low-cost, mass-producible weapon against both shipping and warships, midget submarines as a group achieved little success. First developed by Italy and then by Germany, Japan, and Great Britain, midget submarines have had a history of futility mottled with occasional success. Other than the unprecedented success of the British X-Craft, midget submarines proved costly in terms of human losses and ineffectual in the overall war effort. However, their low production costs doubtless made the designs attractive to increasingly desperate nations.

On 1 November 1918, Italian divers riding a modified torpedo sank the ex-Austrian, now Yugoslav dreadnought *Viribus Unitas*. This provided the foundation for the first human-torpedo designs. The Italians continued to experiment with these craft and used them in World War II against the British in the Mediterranean and against the Soviet Union in the Black Sea.

When a prototype of the *Siluro a Lenta Corsa* (slow-running torpedo) class of submersibles proved hard to handle during testing, its operators cursed the boat with the enduring name of *Maiale* (pig). A two-man crew straddled the 22'-long, 21"-wide *Maiale*. Mounted on the nose was a 5'11"-long 485-lb warhead, which would be attached underneath the keel of a target. Later, the *Maiale* employed heavier warheads weighing 550 and 660 pounds. Shrouded propellers afforded propulsion through netted waters.

Operating from one end of a converted tanker, several *Maiale* boats engaged in assaults against British ships at Gibraltar. Although many of their operators were captured or killed, these efforts nonetheless produced results. Three crews sank more than 20,000 tons of British vessels at Gibraltar on 19 September 1941. On 19 December, three crews were captured after heavily damaging the battleships *Queen Elizabeth* and *Valiant* at Alexandria. Similar attacks damaged other ships but at the loss of most of the operators.

However limited their success, the *Maiale*-class design gave rise to the *Forzatori di Basi*. CB-class craft were the only ones of this type to see action. In these, a four-man crew coned a 49'3" × 9'10" boat armed with two 17.7-inch (450-mm) torpedoes. Most of the operational CB craft were used in a blockade of Sevastopol in the summer of 1942. The Italians planned to conduct a raid on New York harbor by a refitted version, the CA.2-class boat. On 25 May 1943, however, British warships sank the Marconi-class submarine *Leonardo da Vinci*, which was to shuttle the CA.2 across the Atlantic.

A German program, hoping to build on the success of the *Maiale*, was perhaps the most extensive yet least productive

Japanese midget submarine beached at Bellows Field, Hawaii, after the attack on Pearl Harbor of 7 December 1941. (National Archives)

effort by the warring powers to build a midget submarine. The *Biber* (beaver) was a small, single-man vessel armed with two torpedoes attached underneath. The *Molch* (salamander) was its larger cousin. During 25–26 December 1944, Molch boats attacked Allied vessels supporting Operation DRAGON. Ten of the 12 Molch boats involved were sunk, with no Allied vessels lost. During the first months of 1945, 70 Molch and Biber craft were lost, having sunk only seven Allied vessels and damaging two.

The *Neger* (Negro) was a slight improvement with increased range. On 5 July 1944, a flotilla of Neger boats attacked the Allied Normandy Invasion fleet, losing 15 of 24 of their own and sinking only the British minesweepers *Magic* and *Cato*. The flotilla attacked again on 7–8 July, losing all 21 Neger boats to antisubmarine forces and sinking only one additional minesweeper, HMS *Rylades*. The German navy ordered more than 1,000 *Seehund* (seal) design craft, but only

138 were commissioned. Operated by a two-man crew and armed with two torpedoes, 35 *Seehund* craft were lost in early 1945 over the course of 140 missions, having sunk only eight Allied ships.

The Japanese counterpart to these, the *Ko-Hyoteki*, was well designed but had a poor service record. The Type A-class boats had a crew of two aboard a vessel 24 meters long by 1.85 meters wide that was armed with two torpedoes. Piggybacked on C1-class submarines, five *Ko-Hyoteki* boats took part in Japan's 7 December 1941 attack on Pearl Harbor. Ensign Sakamaki Kazuo of the *Ko-Hyoteki* that ran aground near Bellows Field became the first U.S.-held Japanese prisoner of war.

The Japanese also deployed Type B-class boats off their Pacific islands. Slightly larger and slower than the Type A, these boats could carry a three-man crew for two or three days. Seven Type-B *Ko-Hyoteki* craft were sunk in attacks on Diégo-Suarez and Sydney on 31 May 1942, in which they

damaged two British warships and sank a ferry. On 5 January 1945, *No. 82* launched its two torpedoes at the U.S. cruiser *Boise*, which was carrying General Douglas MacArthur and his staff. The cruiser evaded the torpedoes, and one of her escorts rammed and sank the Japanese midget sub.

The naval version of Japanese kamikaze (divine wind) suicide aircraft came in the form of the *Kaiten* (heaven-shaker). Essentially a human-guided torpedo, it had a 3,416-lb warhead. Limited range and dependence on a “mother” submarine severely restricted the effectiveness of these, and 900 men and several mother submarines were lost in largely unsuccessful limited operations from November 1944 through July 1945.

The British, after fortifying their Mediterranean harbors against the Italian and German raiders, designed their own improved midget submarines. On 21 November 1943, the British used four *Welmans* (a *Welman* was a single-man boat with 3-knot speed) against a floating U-boat dock near Bergen, Norway. One man was captured when his *Welman* became entangled in antisubmarine netting; the other three craft encountered various other problems. They escaped to the north, and all three were scuttled. The *Chariot* was a much-improved design. It was essentially a hollowed-out 21-inch torpedo with a 600-lb detachable warhead. Only six operations involving *Chariots* were launched, including an aborted attack on 1 November 1942 against the German battleship *Tirpitz*. The British also sank an Italian cruiser completing for sea in 1943 and attacked and sank the German (ex-Italian) heavy cruisers *Bolzano* and *Gorizia* at La Spezia on 21 June and 26 June 1944, respectively.

The British X-Craft exemplified the best designs and the most successful midget submarines of the war. Three types saw the most service: the X510, X20, and XE series. Each had a four-man crew aboard a 49'3" × 5'9" boat, could achieve nearly 6 knots in speed, and could dive to about 300 feet. Craft X5 through X10 were all tasked with sinking the *Tirpitz*. X6 and X7 successfully placed charges that severely damaged the German warship in its harbor at Bergen, but both crews were captured. X20 and X23 served an important role in the Allied D day invasion of Normandy, placing a navigational beacon just before the invasion of 6 June 1944. In 1945, several of the XE-class saw action in the Far East. On 31 July, multiple operations achieved success, including the sinking of the Japanese cruiser *Takao* by XE1 and XE3 and the destruction by XE4 and XE5 of the underwater telephone cables connecting Saigon to Hong Kong and Singapore.

Daring in design and operations, midget submarines represented the marriage of technology and desperation. The difficulty of transport and the risks of loss of support craft and personnel outweighed the benefits of these small craft. Although midget submarines and human torpedoes did have

some spectacular successes, their limited range, speed, and offensive capabilities rendered them largely ineffectual.

Sugihara Chiune (1900–1986)

Japanese diplomat. Born 1 January 1900 at Yaotsu, Gifu Prefecture, Sugihara Chiune entered Waseda University in 1918. The next year, he passed an examination given by the Ministry of Foreign Affairs for overseas studies, and he became a student at a language institute in Harbin, Manchuria. After graduation, in 1924 Sugihara entered the Ministry of Foreign Affairs and worked in the Japanese consulate in Harbin.

In 1932, Sugihara was transferred to the Division of Foreign Affairs of Manchouguo (Manchukuo) and was involved in negotiations with the Soviet Union for the transfer of the Eastern Chinese Railway. He then returned to the Ministry of Foreign Affairs in Tokyo. After working in the ministry's Personnel Section and the Information Bureau, he was assigned in 1937 as a secretary and interpreter of legation in Helsinki, Finland.

Two years later, Sugihara was assigned as a vice consul to the Japanese consulate in Kaunas, Lithuania, where he was acting consul. In July 1940, as the annexation of the Baltic countries to the Soviet Union loomed, many refugees (most of them Jews who had escaped from Poland) asked Sugihara for Japanese transit visas to escape from Lithuania. Sugihara took personal responsibility for issuing visas until the end of August. As a result, more than 6,000 Jewish refugees were saved.

Sugihara then worked in the Japanese consulates in Praha and in Königsberg and in the Japanese legation in Romania. After internment following the end of the war, Sugihara returned to Japan. He resigned from the diplomatic service in 1947. In 1978, the Israeli government honored him with a medal for his services in saving the lives of Jews during World War II. The government also bestowed on him Israel's highest honor as “Righteous among Nations.” Sugihara died on 31 July 1986, at his home near Tokyo.

Sugiyama Hajime (1880–1945)

Japanese army general. Born in Fukuoka Prefecture on 2 January 1880, Hajime Sugiyama graduated from the Military Academy in 1900. Following routine assignments, he gradu-

Japanese Army General Sugiyama Hajime. (Photo by Hulton Archive/Getty Images)

ated from the Army War College in 1910. During World War I, Sugiyama commanded the 14th Infantry Battalion. In February 1915, he became military attaché in India. He then held several overseas assignments, including with the Japanese mission to the League of Nations.

In 1922, Sugiyama began his rise in the Ministry of War, first as chief of the Aviation Section of the Military Affairs Bureau and then as director of the Military Affairs Bureau. In 1930, he became deputy minister of the army. Appointed army deputy chief of staff in 1934, in February 1937 he joined the cabinet of Senjuro Hayashi as army minister. He was retained in that position in the succeeding cabinet of Fumimaro Konoe. After the 7 July Marco Polo Bridge Incident, Sugiyama was among the faction that pushed for escalation of the conflict, leading to the Sino-Japanese War.

In December 1938, Sugiyama assumed command of the North China Theater. Between October 1940 and February 1944, he was army chief of staff. Although Sugiyama's career was capped by the conferment of the title of generalissimo in 1943, he did not distinguish himself for enlightened leadership. He excelled only in political maneuvering and followed the prevailing political winds within the army. Emperor Hirohito often reprimanded Sugiyama for his evasive statements and his claims that victory over China and then the United States would be easily achieved.

In July 1944, Sugiyama joined the cabinet formed by his former classmate Kuniaki Koiso, who replaced Hideki Tōjō as prime minister. Sugiyama presided over the final mobilization efforts as Japan began preparations for an anticipated Allied invasion of the main islands in early 1945. He responded to the Japanese surrender by taking his own life with a pistol on 12 September 1945.

Sultan, Daniel Isom (1885–1947)

U.S. Army general. Born in Oxford, Mississippi, on 9 December 1885, Daniel Sultan graduated from the U.S. Military Academy in 1907 and was commissioned a second lieutenant in the Corps of Engineers. During the next decades, he rose

to the rank of colonel while holding a variety of engineer assignments, including assisting in the construction of fortifications on Corregidor in the Philippine Islands and conducting surveys for a proposed canal in Nicaragua. He also served as a member of the Board of Engineers for Rivers and Harbors; had tours as district engineer for Savannah, Georgia, and Chicago, Illinois; and was engineer commissioner for Washington, D.C. Sultan graduated from the Command and General Staff School and the Army War College.

In December 1938, Sultan, recently promoted to brigadier general, was named commander of the 22nd Infantry Brigade in Hawaii. In April 1941, as a major general, he received command of the 38th Infantry Division. A year later, he took command of VIII Corps. In November 1943, Sultan, now a lieutenant general, was appointed deputy commander of the China-Burma-India Theater (CBI), headed by Lieutenant General Joseph W. Stilwell.

Operating from Delhi, India, Sultan assumed much of Stilwell's administrative and logistical burden, concentrating on getting vitally needed supplies to beleaguered China by air over the Himalayan Mountains (the Hump) and through the construction of a road (known as the Ledo Road, later renamed the Stilwell Road) and a pipeline across northern Burma from Ledo, India, to Wanting, China. Following the recall of Stilwell in October 1944, Sultan became commander of the India-Burma Theater. In this post, he was in charge of all U.S. forces in the theatre, and he personally commanded a combined force of American, British, and Chinese troops that helped drive the Japanese from northern Burma in 1945.

At the end of the war in the summer of 1945, Sultan was named U.S. Army inspector general. A skilled engineer, able administrator, and successful field commander, Sultan died in Washington, D.C., on 14 January 1947.

Sun Liren (Sun Li-jen) (1900–1990)

Nationalist Chinese general, regarded as one of the best Chinese commanders of the war. Born in Lujiang (Lukiang), Anhui (Anhui) Province on 17 October 1900, Sun Liren (Sun Li-jen) graduated from Qinghua (Tsinghua) University in 1923. He added an engineering degree from Purdue University in 1924 and a bachelor's degree from the Virginia Military Institute in 1927. Returning to China, he enlisted as a corporal in the Guomindang (GMD [Kuomintang, KMT], Nationalist) Army, and by 1930 he commanded a regiment. In the 1937 Battle of Shanghai in Jiangsu (Kiangsu) Province, Japanese grenade fragments grievously wounded Sun.

Sun recovered, and in 1942 he and his 38th Division gained fame during the Allied retreat in Burma by rescuing a nearly surrounded British division at Yenangaung. For this action, London awarded Sun the Commander Order of the British Empire. While other units collapsed before the Japanese onslaught, Sun kept his division together, withdrawing in good order through mountainous northwest Burma and joining Lieutenant General Joseph Stilwell's training operation at Ramgarh as deputy commander of the Chinese army in India—the so-called X-Force.

In late 1943, Sun led his New First Army into northern Burma to help clear the Ledo Road route. In December, Sun took Yupbang Ga, initiating a six-month drive through the Hukawng and Mugaung valleys, toward Myitkina. Sun had impressed Stilwell earlier as aggressive and professional. But in January 1944, "Vinegar Joe" fulminated at apparent Chinese malingering, convinced that Jiang Jieshi (Chiang Kai-shek) had ordered Sun not to risk well-trained Chinese forces in Burma's jungles. Sun countered that American intelligence grossly underestimated Japanese strength, necessitating slowing for more reconnaissance. Scholars substantiate both allegations. Still, in March the 38th fought successfully alongside Merrill's Marauders in the first joint Sino-American combat operation. Sun took Kamaing, just west of Myitkina, in June and Bhamo, near the Chinese border, in December. Sun's 38th Division led the X-Force across the frontier, linking up with the Yunnan Province-based Y-Force on 27 January 1945. This action ended the three-year blockade of China and opened the way for the newly christened Stilwell Road to Kunming. In August, Sun took the Japanese surrender in Guangzhou (Canton), Guangdong (Kwangtung) Province.

After combat in the Chinese Civil War, Sun became commander in chief of all Nationalist forces in Taiwan in 1950. In 1955, however, he was forced to resign following a subordinate's alleged anti-Jiang plot. Although a secret investigation cleared him of any wrongdoing, he was not only forced from his position but was placed under house arrest from 1955

Sunda Strait, Battle of (28 February–1 March 1942)

Naval battle in the southwest Pacific between Allied and Japanese forces. By February 1942, the collective Allied

defense of the southwest Pacific, the ABDA (American-British-Dutch-Australian) command, had largely collapsed.

Following the Battle of the Java Sea on 27 February, three Japanese invasion forces continued to steam toward landings on the island of Java. The Western Attack Force, which included the aircraft carrier *Ryujo*, four heavy cruisers, and several destroyers, under the command of Rear Admiral Kurita Takeo, began landing troops at the eastern entrance to Sunda Strait late on 28 February 1942. Allied intelligence knew of the Japanese intention to land in the region but did not know the exact timetable. Believing a landing would not occur until the following day, overall ABDA naval commander Dutch Vice Admiral Conrad Helfrich ordered the surviving Allied naval forces to reassemble at Tjilatjap in a futile effort to halt the Japanese.

The U.S. heavy cruiser *Houston* and Australian light cruiser HMAS *Perth* exited Batavia harbor at 7:00 P.M. on 28 February as ordered. Their escort, the Dutch destroyer *Evertsen*, was delayed, however, and did not take part in the coming battle. The crews of both Allied ships were exhausted after weeks of incessant action. Morale was also low; Japanese forces had handed the Allies one defeat after another in the Pacific. Neither ship carried a full load of fuel, both were low on ammunition and in need of maintenance, and the *Houston*'s after turret was inoperable following an air attack on 4 February.

At approximately 10:15 P.M. on 28 February, the Japanese destroyer *Fubuki* spotted the *Perth* and *Houston* approaching Bantam Bay on the eastern edge of Sunda Strait. At the same time, the Allied cruisers sighted Japanese transports off-loading troops and supplies, and the cruisers immediately attacked. The *Fubuki* fired a signal flare and launched nine torpedoes. No torpedoes struck the Allied ships, but some ran long and hit the Japanese transports.

By 11:40 P.M., however, Japanese covering forces converged on the Allied ships. In the ensuing melee, minesweeper *No. 2* sank, as did the *Sakura Maru*. The *Ryujo Maru*—headquarters ship of General Imamura Hitoshi, commander in chief of the Sixteenth Army—was also struck, and the explosion threw the general into the water. He reached shore three hours later after swimming through oil-coated water. Two additional transports were heavily damaged. The heavy cruisers *Mikuma* and *Mogami* opened fire with their 8-inch guns. The light cruiser *Natori* then arrived and commenced firing as well.

Japanese destroyers launched torpedoes as the Allied cruisers attempted to escape. Over the course of the battle, the Japanese ships fired 87 torpedoes. The *Perth*, struck by multiple torpedoes and several 8-inch shells, sank about midnight. The *Houston* continued to fight for another 30 minutes, resorting to firing star and practice shells once available live ammunition had been expended. Shrapnel killed Captain Albert Rooks just after he had issued an abandon-ship order

at 12:25 A.M. By that time, the *Houston* had absorbed overwhelming punishment. Four to six torpedoes had struck the American cruiser as well as numerous 8-inch and smaller-caliber shells. A full salvo had struck the after engine room, bursting steam lines and killing the entire engine room crew. The cruiser finally rolled over and sank at about 12:45 A.M. on 1 March. Nearly two-thirds of the *Houston*'s crew died during the battle. The survivors of both ships spent the next three and a half years as Japanese prisoners of war. Excluding the transports, damage among Japanese ships was light. Worst hit was the destroyer *Harukaze*, which had three men killed and five wounded. The Battle of Sunda Strait finalized the Japanese navy's victory at sea in the East Indies.

Suzuki Kantarō (1867–1948)

Japanese navy admiral and prime minister of Japan. Born in Osaka on 18 January 1867, Suzuki Kantarō graduated from the Naval Academy in 1887 and the Naval War College in 1898. He saw combat in the 1894–1895 Sino-Japanese War and in the 1904–1905 Russo-Japanese War. Following service in a variety of positions at sea and ashore, including command of the Naval Academy, Suzuki was promoted to admiral in 1923. In 1925, he became chief of the Naval General Staff. He retired in 1929. Transferring to the reserves, he was appointed grand chamberlain to the emperor and a member of the Privy Council. Suzuki served in that post until he was badly wounded by assassins during a failed military coup attempt on 26 February 1936.

On 5 April 1945, Suzuki was recalled from retirement to replace Koiso Kuniaki as prime minister. Faced with Japan's military collapse, Suzuki's cabinet remained deadlocked over whether to surrender or fight a last-ditch battle in defense of the home islands. Although Suzuki continued to maintain a bellicose pose in public, he supported foreign minister Tōgō Shigenori's desperate and ultimately unsuccessful attempt to enlist the help of the Soviet Union as a mediator with the United States.

By August 1945, the situation for Japan had become dire. On 6 August, the United States dropped an atomic bomb on Hiroshima; it followed with an atomic attack on Nagasaki three days later. On 8 August, the Soviet Union declared war on Japan and invaded Manchuria. Nevertheless, the members of Suzuki's cabinet were unable to reach a decision until Emperor Hirohito broke the deadlock himself. Suzuki and his cabinet resigned on 17 August 1945, two days after accepting the terms of the Potsdam Declaration. Suzuki died in Noda-city in Chiba Prefecture on 7 April 1948.

Sweden

In September 1939, Sweden was a democratic state with a population of just under 6.5 million people. Strategically located in northern Europe, Sweden shared a common border with Norway to the west and Finland to the east. Denmark lay across the Baltic Sea to the south. Swedish interests before the war had been served by the balance of great powers in Europe, and Swedes greatly feared this would be upset during the conflict. Sweden had a long tradition of neutrality; it had last been at war during the Napoleonic Wars in 1814. Despite Nordic solidarity and strong Swedish sympathy for the plight of its neighbors, this sentiment was not allowed to upset Swedish national interests during the war.

Sweden was underprepared militarily in 1939. Although the nation had begun a rearmament program in 1936, it still lacked modern equipment in any significant quantities. Military weakness continued until near the end of the war. In 1937, the Swedish army had only 403,000 men, with only 79 antiaircraft guns and no tanks. In 1945, the army had grown to 600,000 men, 2,750 antiaircraft guns, and 766 tanks. The air force went from 596 aircraft in 1940 to 1,018 in 1945; the navy increased from 47 vessels of all types in 1939 to 126 by May 1945. The expansion of Sweden's military and the generally deteriorating German military position after 1942 precluded any German invasion of the country.

The Swedish army used reindeer to transport reinforcements and food supplies. (Hulton-Deutsch Collection/Corbis)

Sweden had large deposits of high-grade iron ore, and in 1939 it provided half of all German iron-ore imports. This trade was vital for the German war effort. Depending on the season, the ore came either down the Baltic or through the northern Norwegian port of Narvik. Sweden was less fortunate in other areas, having to import such vital commodities as coal and oil. During the war, Sweden lost 241 ships involved in its foreign trade.

Sweden proclaimed its neutrality at the beginning of the war in September 1939. When the Finnish-Soviet War (the Winter War) began in November 1939 with the Soviet invasion of Finland, Swedish Prime Minister Per Albin Hansson, leader of the Socialist Party, established a coalition government that included all political parties save the Communists. Its principal goal was to keep Sweden out of a wider war. Swedish sentiment heavily favored Finland, and by the end of the war, some 10,000 Swedes had volunteered to fight with the Finns against the invading Soviet forces. Plans to occupy the Åland archipelago between the two countries were never carried out, however. At the same time, the Swedish government denied Britain and France the right to send troops across its territory to assist Finland. Stockholm correctly assumed that the western Allies had plans to seize the north-

ern Swedish ore fields in the course of such an operation. Sweden did act as an intermediary between the Soviet and Finnish governments to end the Winter War in March 1940.

In April 1940, when Germany invaded Denmark and Norway, Sweden's military was placed on full alert, but this time the government insisted on absolute neutrality. The national government lengthened military conscription from four months to 450 days and ordered army strength increased to 600,000 men. The failure of Allied arms in Norway and in the campaign for France and the Low Countries effectively cut Sweden off from the west and placed it within the German zone of control. This development caused the Swedish government to yield to German demands that a portion of the Swedish railroad network be made available for the passage of supplies to Norway and the rotation of German troops between Norway and Germany. The Swedish government was also forced to accede to German demands for the transit to Finland of a German division stationed in Norway so it could participate in the German invasion of the Soviet Union.

As the tide of war turned against Germany—and with the Swedish military considerably stronger than it had been at the beginning of the war—under Allied pressure, Sweden canceled its transit agreement with Germany in August 1943.

Although Sweden remained neutral until the end of the war, it was generally accommodating to the Allied side. In addition, many Norwegian and Danish volunteers wishing to combat the Germans received military training in Sweden. These forces played little role in the fighting at the end of the war, however.

Sweden emerged from the war as the leading Nordic power, although the end of the European balance of power and Soviet domination of Eastern Europe presented a difficult challenge for Sweden's political leadership in the decades that followed.

Switzerland

Switzerland occupied a key position between warring nations during World War II. In 1939, Switzerland was a democratic state of some 4.2 million people with a strong tradition of neutrality. The situation was nonetheless delicate for Switzerland, because it had German- and Italian-speaking minorities. Because Germans comprised a majority of the population, Switzerland could be the target of German expansionist policies; likewise, Italian dictator Benito Mussolini cast his sights on securing the Italian-speaking Swiss canton of Ticino.

The Swiss observed Axis politics in the 1930s with growing alarm, and from 1934 they acted to shore up their national defenses. Germany's absorption of Austria and Czechoslovakia confirmed Swiss fears. By 1939, Swiss citizens were used to air-raid drills; they had gas masks and stockpiles of food at home, while the government moved foodstuffs for army use to fortified emplacements in the Alps and relocated the country's gold reserves. Eligibility for military service was continuously extended. Aside from these precautionary measures, Switzerland adopted a strategy of dissuasion that later would be adapted to the circumstances. For the time being, this meant increased military spending, modernization of equipment, and construction of a defensive line at the national

frontiers. Bridges and roads running to the frontiers were mined. Artillery, small arms, and munitions stocks were concentrated along the borders, and antiaircraft batteries protected the industrial centers.

On 30 August 1939, the Swiss Parliament elected Colonel Henri Guisan commander in chief of the army. Colonel Jakob Labhart became chief of the General Staff. On 2 September, following the German invasion of Poland and realizing that a German invasion of Switzerland was possible, the Federal Council declared general mobilization and issued a formal declaration of neutrality. The small Swiss air force was also mobilized. It consisted of 150 Swiss-built fighters of indifferent quality and 50 modern Messerschmitt Me-109s. Switzerland had the one advantage of being (and remaining) only a secondary objective of the Axis powers. German war plans to outflank the French through Swiss territory were dismissed because of the difficult terrain and potentially stubborn Swiss resistance.

When World War II began, 435,000 Swiss citizens were mobilized for the armed forces, a number that approached 700,000 during the war. The army was organized into three army corps, including nine divisions (three of which were specially trained mountain divisions) and three mountain brigades. A fourth corps was created in 1939 and 1940.

When Poland, Denmark, and Norway fell to the German blitzkrieg, Guisan and Labhart planned to mass infantry (and what little artillery existed) behind the Swiss fortified northern borders along a line of rivers, lakes, and mountains parallel to Germany. The joint orders for resistance issued by Guisan and the Federal Council in April 1940 made it plain that surrender was not an option; an invader would have to fight for every inch of ground.

Switzerland's situation became perilous on the defeat of France in June 1940, when the Axis effectively surrounded Swiss territory (the remaining exit was closed off after the occupation of Vichy France near the end of 1942). Assuming that an invasion from all sides would occur in just a matter of time, Guisan developed the idea of the "Alpine redoubt," relying on a mountain fortress centered on the Saint Gotthard massif. Even though they would be defeated at the borders, Swiss forces could resist from the massif indefinitely, controlling (and, if necessary, destroying) the transportation routes through the Alps and thus defeating the main purpose of any Axis invasion.

After June 1940, Axis attention to Switzerland became more intense. Plans for occupation were made, but these were never carried out. After Germany turned east and invaded the Soviet Union in June 1941, Switzerland again became an issue only when the Allies started rolling back Axis forces in Italy, and the Alpine republic blocked the German retreat. Eventually, Switzerland was able to avoid invasion until the end of the war. A meeting point for diplomats and a

Sentry guards the gateway along the Swiss border. (Bettman/Corbis)

center for espionage (the Swiss arrested 387 spies and executed 17 of them) as well as for Red Cross relief efforts throughout the war, Switzerland by 1945 was also a venue for diplomatic negotiations to bring the war to an end.

Although Switzerland's effort to establish credible defenses against the Axis powers was remarkable, some aspects of its role in the war became the matter of considerable controversy during the 1990s. The Alpine republic's economic transactions with all belligerents—although permitted by its neutral status—sufficed to tarnish its image as the tiny defender of liberty in fascist-ruled Europe. Switzerland's restrictive refugee policy cast another shadow when the world learned how Germany annihilated Europe's Jews, and some isolated yet notorious remarks made by Swiss politicians advocating acceptance of the "New Order" did not help. The manner in which Swiss banks handled the Nazi gold issue is perhaps the biggest stain on Helvetia's shield.

In the final analysis, this criticism boils down to the question of whether Switzerland was too accommodating in its relations with the Axis powers. It is probably true that the Swiss avoided invasion partly by cooperating to the extent

allowed under the concept of armed neutrality. Then again, German military planners took Swiss defenses seriously and advised against getting entangled in protracted mountain warfare. It is difficult to see what other options Switzerland might have followed.

Sydney, Japanese Raid on (31 May 1942)

Sydney, a major Australian port for Allied merchant shipping, was within striking distance of Japanese oceangoing submarines based in Rabaul and New Guinea. In an attempt to disrupt this vital Allied commerce, Japanese naval officials ordered the submarines to the harbor. On the night of 31 May 1942, the *I-22*, *I-24*, and *I-27* arrived at Sydney, and each deployed a Type A two-man midget submarine to penetrate the port's defenses and torpedo shipping that lay at anchor.

The element of surprise was lost when the midget submarines approached antitorpedo netting in the harbor. Allied forces were alerted when one of the Japanese craft became entangled in the netting. The American heavy cruiser *Chicago* then opened fire on the vessel but only inflicted damage on the shore. The failure to hit the midget submarine notwithstanding, the Japanese elected to scuttle their boat.

A second midget submarine avoided the nets and launched its torpedoes. One failed to detonate, but the other hit an

accommodation ship, the explosion killing 19 servicemen and wounding 11 more. The fate of this midget submarine is unknown, although presumably it sank during the attack. The crew of the third midget submarine, after being hunted for hours by a collection of Australian light warships, chose to commit suicide. Contributing to the attack of their diminutive counterparts, the fleet submarines, joined by *I-21* and *I-29*, shelled Newcastle and Sydney with their deck guns and sank three merchantmen with gunfire and torpedoes as they left port, before retiring to base.

After the raid, the Allies recovered one of the midget submarines. Following its study by naval architects, it went on a tour of Australia in an effort to raise the morale of the Australian people. Today it is on display at the Australian War Museum in Canberra.

The Japanese submarine attack against Sydney was the last executed by Japanese naval forces against Australian ports in World War II.

Syria

Formerly part of the Ottoman Empire, after World War I Syria became a mandate of France. Following the defeat of France by Germany in June 1940, Syria was controlled by the Vichy government headed by Marshal Henri Philippe Pétain, which appointed General Henri Dentz as high commissioner with a cabinet headed by Khalid al Azm. Pétain ordered Dentz to allow landing rights in Syria for German and Italian aircraft on their way to support Radhid Ali's regime in Iraq.

On 8 June 1941, Allied forces commanded by British Lieutenant General Maitland Wilson that included the British Ninth Army, Australian, and Major General Paul Legentilhomme's Free French Forces, along with troops of the Transjordan Arab Legion, crossed from Palestine into Lebanon and

Syria. By 15 June, they had reached the Syrian capital of Damascus, which fell on 21 June. On 13 July, Dentz and the Vichy French surrendered and the next day signed the Acre Convention. The fighting had claimed 4,500 Allied and 6,000 Vichy French casualties.

Syria was then turned over to the Free French authorities. The French recognized Syria's independence but continued to occupy the country, which was used as an Allied base for the rest of the war. Free French Commander General Georges Catroux became Syria's Delegate-General and Plenipotentiary. French authorities declared martial law, imposed strict press censorship, and arrested political subversives.

In July 1943, following pressure from Great Britain, France announced new elections. A nationalist government came to power that August, electing as president Syrian nationalist Shukri al-Quwwattî, one of the leaders of the 1925–1927 uprising against the French. France granted Syria independence on 1 January 1944, but the country remained under Anglo-French occupation for the remainder of the war. In January 1945, the Syrian government announced the formation of a national army, and in February it declared war on the Axis powers.

Australian troops just before they advance into French-mandated Syria in collaboration with Free French forces, 10 July 1941. (Bettman/Corbis)

Syria became a charter member of United Nations in March 1945. In early May 1945, anti-French demonstrations erupted throughout Syria, whereon French forces bombarded Damascus, killing 400 Syrians. British forces then intervened. A United Nations resolution in February 1946 called on France to evacuate the country, and by 15 April, all French and British forces were off Syrian soil. Evacuation Day, 17 April, is still celebrated as a Syrian national holiday.

Syria and Lebanon, Campaign in (8 June–14 July 1941)

The growing German commitment in the Balkans and the Mediterranean encouraged Iraqi elements that favored the Axis side to stage a coup on 2 April 1941. The coup brought to power Rashid Ali el-Gaylani, who was closely linked with the violently anti-British mufti of Jerusalem, Haj Amin el Husseini. The Arab nationalists hoped a German victory would liberate their country and the Arabs from the yoke of British control and restrict the growing Jewish presence in Palestine. Encouraged by the Germans, who promised air support and promised to persuade the Vichy French in Syria to provide matériel help, Rashid Ali refused the British the right to transit troops through Iraq and surrounded the British air base at Habbaniya, 25 miles west of Baghdad.

With the British fully committed in the Western Desert, Greece, and East Africa, it seemed an opportune time to move. In desperation, British commander in the Middle East General Sir Archibald Wavell, apprehensive about losing British communications with India and the supplies of Iraqi oil, ordered a minor offensive. The besieged garrison at Habbaniya attacked on 2 May. A 5,800-member-strong column, Habforce, was hastily organized from the 1st Cavalry Division in Palestine. Habforce made a 500-mile trans-desert dash to reach Habbaniya on 19 May, by which time the 10th Indian Division had landed in Basra. Although Axis planes flew to Syria in support and were involved in the fighting, the Iraqis moved a month too early, before the Germans were able to offer effective assistance. The Germans were themselves too slow in reacting, and the British captured Baghdad on 31 May.

The British were alarmed by ULTRA evidence that the Vichy high commissioner in Syria General Henri Ferdinand Dentz,

who buttressed his pro-Vichy patriotism with a strong personal Anglophobia, had supplied weapons to the Iraqis and freely cooperated with the Germans. The British worried that Germany—supported by the vehemently anti-British French Admiral Jean Darlan, who was now in control of Vichy France—would extend its victories beyond Crete and through Syria into the Middle East.

This fear, combined with the threat posed to the British base in Egypt by the French Army of the Levant, a force of 45,000 hard-core professional soldiers that included four battalions of Foreign Legionnaires, convinced the British to launch Operation EXPORTER, the invasion of Syria and Lebanon. On 8 June, a hastily concocted force consisting of the 21st and 25th Australian Brigades, the 5th Indian Brigade, and the weak 1st and 2nd Free French Brigades, all commanded by General Maitland “Jumbo” Wilson, invaded in three drives—through Deraa to Damascus, through Merjayun to Rayak, and along the coast from Haifa to Beirut.

The British had hoped for a peaceful occupation by guaranteeing the independence of Syria and Lebanon, but Dentz was aware of negotiations between Vichy France and Germany that would culminate in the Paris Protocols, and he was determined to demonstrate solidarity with Germany. By the end of the first phase on 13 June, it was evident that the Vichy French showed no sympathy with Free French ambitions, and all advances were stalled by fierce fighting at Kissoué, Mezze, the River Litani, and especially at Merjayun. Damascus finally fell on 22 July, and with the conclusion of Operation BATTLEAXE in the Western Desert, the British were able to bring up two fighter and three bomber squadrons. Meanwhile, Habforce and Major General William Slim’s 10th Indian Division invaded Syria from Iraq against Palmyra and Aleppo on 21 June to isolate Dentz’s force.

The campaign for Syria and Lebanon also involved naval operations. Vice Admiral E. L. S. King commanded a British force of three cruisers, eight destroyers, and a landing ship with a small commando unit. Opposing them was a Vichy French force of two large destroyers, a sloop, and three submarines. The naval portion of the campaign consisted of small skirmishes as the British carried out both coastal landings and shore bombardment. The French damaged several of the British warships through both air and naval attack, necessitating the dispatch of other ships. The French lost to air attack on 21 June just 50 miles from Syria one of two large destroyers dispatched from Toulon. The other French destroyer made it safely to Beirut on 21 June, but it was damaged there in bombing the next day. The Vichy French government considered dispatching the battle cruiser *Strasbourg* from Toulon but, with the campaign too far gone, decided against it.

After five weeks of bitter fighting, Dentz capitulated on 11 July, and an armistice known as the Acre Convention was

French cavalry on the march along the frontier between Syria and Palestine, July 1941. (Hulton-Deutsch Collection/Corbis)

signed on 14 July. Although its terms were generous, the immediate results of the armistice did little to encourage belief in any French desire to see the defeat of Nazi Germany. Only 5,668 troops (only 1,006 of whom were native Frenchmen) opted to join Free French Forces rather than be repatriated to France.

This tragic, regrettable episode, which cost the lives of 3,500 men, was a short but sour war imbued with resentment, particularly between the Vichy and Free French Forces who wreaked sacrilegious vengeance on each other. For the British, however, the campaign consolidated their flank and guarded against any German attack through Turkey.

A few weeks later, Britain, in unison with the Soviet Union, occupied Iran to guarantee the transfer of Lend-Lease supplies through Iran to Russia. In the process, Britain secured its position in the Middle East. Thus, in midsummer 1941, Germany consolidated its position in the Balkans while Britain dominated the entire Middle East. The British commander was liberated from all other preoccupations but that of defeating Axis forces in Libya, and for the first time he could concentrate all his force on a single task.

Szabo, Violette Bushnell (1921–1945)

British Special Operations Executive (SOE) agent. Born in Paris on 26 June 1921 to an English father and a French

British Special Operations Executive (SOE) agent Violette Szabo. (Photo by Hulton Archive/Getty Images)

mother, Violette Bushnell grew up in both countries. An avid bicyclist and crack marksman, the tomboyish Bushnell left school at age 14 and held a series of jobs, including as apprentice corsetière and cosmetic saleswoman. In 1940, she joined the British Land Army and developed a reputation for fearlessness during air raids and blackouts. On Bastille Day, 14 July 1940, she met Étienne Szabo, a former French Foreign Legionnaire and Free French soldier, whom she married on 21 August, shortly before he shipped out for Africa. She saw Szabo only once more, during a week in Liverpool in March 1941.

Szabo worked as a telephone operator and then for the Auxiliary Territorial Service as part of an antiaircraft battery,

where she proudly wore her husband's Free French insignia. In June 1942, she gave birth to a daughter, Tania. Shortly afterward, Szabo learned that her husband had been killed in the Battle of El Alamein. Szabo's courage and loyalties had been noted by Captain Selwyn Jepson of the SOE, and he recruited her for intelligence and Resistance work. Assigned to the First Aid Nursing Yeomany, a cover for SOE female recruits, Szabo underwent screening at Wanborough Manor and attended the commando course, parachute school, and psychological training at Beaulieu.

Szabo's first mission, a parachute drop outside Paris, took place in April 1944. She then worked with the French Resistance in Rouen. Although police questioned her twice, Szabo's cover as a commercial secretary held. Her second mission, to aid French sabotage during the D day landings, began on 5 June 1944. Sent north to Corrige as an escort to Jacques Dufor, a valuable agent, with information about an advancing panzer division, Szabo encountered an unexpected concentration of Germans at Salon La Tour. Covering Dufor's escape, Szabo was captured after engaging the soldiers in a running gun battle through the town. The Gestapo transferred her to Paris, where she was physically and psychologically tortured before being shipped to Ravensbruck concentration camp in Germany. From there, she was sent to Torgau to be a factory slave and then to a labor camp at Königsberg in East Prussia.

Szabo returned to Ravensbruck in early February 1945. There she and two Resistance colleagues, Denise Bloch and Lilian Rolfe, were executed by firing squad on the orders of the Gestapo and were cremated. In January 1947, Violette Szabo was posthumously awarded the French Croix de Guerre and the British George Cross, the first occasion the latter award was made to a woman.

Taiwan (Formosa)

Taiwan (Formosa), an island about 14,000 square miles in area, is located 115 miles off China's eastern coast; it was named *Formosa* (Beautiful) by the Portuguese who visited it in 1590. As a consequence of the 1894–1895 Sino-Japanese War, China ceded control of the island to Japan. The Japanese subsequently expanded existing military bases on Taiwan while constructing additional facilities. With the beginning of the Sino-Japanese War in 1937, Japan used Taiwan as a base for air attacks against the Chinese mainland. By late 1941, the island had a population of some 6 million people and served as the base for Japan's Eleventh Naval Air Fleet and its Fifth Army Air Force. On 8 December 1941, the Japanese used Taiwan to launch the first air attacks against U.S. bases in the Philippines.

As Taiwan lay deep within Japan's defensive perimeter, it was not subjected to concerted attacks until 1944, when U.S. forces pushed across the Central Pacific toward the Japanese home islands. By that time, many U.S. military officials, including Chief of Naval Operations Ernest J. King and the Pacific Fleet commander, Admiral Chester W. Nimitz, favored an invasion and occupation of the island in order to sever the Japanese lines of communication south to the Netherlands East Indies. Air attacks by the China-based XX Bomber Command against Japanese installations on Taiwan were largely ineffectual.

Ultimately, these bombing raids proved unnecessary in the context of a prelude to a U.S. amphibious assault, for in July 1944, President Franklin D. Roosevelt decided to pursue the conquest of the Philippines, followed by Iwo Jima and Okinawa rather than Taiwan. The Japanese air bases on Tai-

wan, however, maintained aircraft capable of reaching the Philippine Islands. Consequently, between 12 and 14 October 1944, the U.S. Third Fleet launched punishing air strikes against Japan's facilities on Taiwan in order to reduce Japanese air strength there prior to the invasion of the Philippines. These assaults destroyed more than 500 Japanese aircraft, with important effects on the subsequent Battle of Leyte Gulf.

Taiwan was attacked by Allied naval aircraft twice more during the war. The first of these strikes occurred in January 1945, prior to the U.S. invasion of the Philippine island of Luzon. The second was executed in April 1945 by air assets of the British Pacific Fleet in order to reduce the number of Japanese planes capable of flying kamikaze missions against Allied naval forces off Okinawa.

On 25 October 1945, formal surrender ceremonies took place on Taiwan, and the island reverted to Chinese control in accordance with an agreement reached at the Cairo Conference in November 1943. In 1949, the island became a refuge for Chinese Nationalist forces. Today, it is known as the Republic of China. The People's Republic of China, however, claims Taiwan.

Takamatsu Nobuhito, Imperial Prince of Japan (1905–1987)

Japanese Imperial prince and navy officer during the war. Born on 3 January 1905, the third son of Emperor Taishō and younger brother of Emperor Hirohito (1901–1989), Takamatsu Nobuhito graduated from the Naval Academy and the Naval War College. He pursued a career as a gunnery officer in the Imperial Navy.

In November 1941, following several line and staff appointments, Commander Prince Takamatsu became a member of the Operation Planning Section of the Navy General Staff. In November 1942, he was promoted to captain, and in August 1944, he was appointed deputy head of the Yokosuka Gunnery School.

As a liberal thinker in the navy and within the Imperial family, Prince Takamatsu was highly critical of the government's decision to go to war with the United States, and during the war, he advocated an early peace with the Allies.

Elements in Japan opposed to Premier General Tōjō Hideki, including Prince Konoe Fumimaro, saw in Prince Takamatsu a possible candidate for prime minister. Takamatsu died in Tokyo on 3 February 1987. His posthumously published diaries are an important source for the study of Japanese political history of the 1930s and 1940s.

Tanaka Giichi (Baron) (1864–1929)

Japanese army general and prime minister in the interwar period. Born on 22 June 1864 in the Choshu Hagi domain of Japan, he graduated from the Japanese Military Academy and served in the 1904–1905 Russo-Japanese War as the chief of operations. After the war, Tanaka held several key positions within the Ministry of War and on the Army General Staff. He pressed for an expansionist foreign policy on the Asian mainland while he overhauled military training and effected greater coordination between military and civilian education.

Tanaka was appointed army minister in the Hara Takashi cabinet in 1918 and cooperated with Hara in withdrawing troops from Siberia. Tanaka understood the nature of modern warfare as total war and sought to incorporate the lessons of World War I into army preparedness and training reform. His service in the Hara cabinet and his strategic vision shaped Tanaka as a politician. Awarded the title of baron in 1920, he served as army minister again in the second cabinet of

Yamamoto Gonnohyoe in 1923. Then, in April 1925, he assumed the presidency of the Rikken Seiyukai Party on the recommendation of Korekiyo Takahashi and left the army. He was elected to the House of Peers the following year. In April 1927, Tanaka became prime minister and foreign minister. He convened the Eastern Council two months later to refashion Japan's China policy, a move widely perceived as reflecting his hard-line position on Chinese affairs.

The so-called Tanaka Memorandum, cited by a Chinese journal in December 1927 as evidence of Japan's expansionist intent, allegedly evolved from this conference and was presented to Emperor Hirohito. In all likelihood, this document, containing many stylistic and factual errors, was fabricated. Tanaka was reprimanded by the emperor for his handling of the bombing death of Chang Hsueh-liang in July 1929, and his cabinet collapsed as a result. Tanaka died in Tokyo on 29 September 1929.

Tanaka Raizo (1892–1969)

Japanese navy admiral who was famous for his night-fighting prowess and his supply runs to provision troops. Born in Yamaguchi Prefecture, Japan, on 27 April 1892, Tanaka Raizo graduated from the Naval Academy in 1913 and trained as a torpedo specialist. He developed a reputation for excellence in seamanship. Promoted to captain in 1935, he held command of destroyers, the cruiser *Jintsu*, and then the battleship *Kongo*. In 1937, he took charge of a destroyer squadron.

Made a rear admiral in October 1941, Tanaka commanded the 2nd Destroyer Flotilla, one of the most highly trained units of the Japanese navy and especially expert in night action. In his flagship cruiser *Jintsu*, Tanaka was involved in most major battles of the first 18 months of the war. He was particularly well known for the so-called Tokyo Express—nightly supply runs to Japanese army units on Guadalcanal. Called by the Americans “Tenacious Tanaka,” he routinely slipped past often superior Allied naval forces equipped with radar and gained a reputation in the West as one of the most brilliant and indefatigable Japanese navy commanders of the war. In the Battle of Tassafaronga on 30 November 1942, a superior U.S. force under Rear Admiral Carlton H. Wright intercepted Tanaka's ships trying to float barrels of supplies ashore to Guadalcanal. The ships were not deployed for combat, and Tanaka lost a destroyer, but his crews used their Long Lance torpedoes to good effect and sank one U.S. cruiser and damaged three others before making their escape.

The Americans learned from their mistakes in this and other actions and developed improved night-fighting techniques. In July 1943, while Tanaka was trying to reinforce the Japanese garrison on Kolombangara in the Solomon Islands, U.S. Navy warships badly damaged his flagship, the *Jintsu*, which then sank. Shortly thereafter, Tanaka was dismissed from his post and assigned to command an obscure naval base in Burma, allegedly for criticizing his superiors' decision to squander scant Japanese destroyer assets in trying to supply Japanese island outposts. Although promoted to vice admiral in 1944, Tanaka did not again see combat. He died in Yamaguchi, Yamaguchi Prefecture, Japan, on 9 June 1969.

Tanks, All Powers

Armored, tracked, armed vehicles, originally developed in World War I. Improved in the years leading up to World War II, the tank came into its own as a weapon system in the latter conflict. After World War I, a number of pioneers surfaced who greatly influenced the structure of armored forces and the design of tanks: J. F. C. Fuller and Basil Liddell Hart in Britain, Jean E. Estienne and Charles de Gaulle in France, Heinz Guderian in Germany (also secretly in the Soviet Union), and Adna Chaffee in the United States. These intel-

A German tank near Grodno, Poland, in June 1941, on its way to the Russian border in the initial phase of Hitler's Operation BARBAROSSA, the invasion of the Soviet Union. (Corbis)

lectuals shaped the armored forces of World War II. Yet even as imaginative military thinkers contemplated what could be done with a properly organized and equipped armored force, some of the senior leaders in each army continued to see tanks only as support to traditional infantry and cavalry elements. Limited military budgets also greatly hindered the development of armored forces, at least until Germany rose again as a threat to peace. The impact of prewar thinking and actions on tank designs varied among nations.

France

In the 1930s, the French General Staff considered tanks primarily as infantry support. New ideas emerged, however, including the development of mechanized infantry and cavalry. The cavalry concept involved three types of reconnaissance vehicles, one that was wheeled for long-range reconnaissance, a machine-gun-armed light tank for cross-country reconnaissance, and a more heavily armed and armored tank capable of fighting. A four-year rearmament plan in 1936 included the formation of three *divisions légères*

mécaniques (DLM), equipped with S-35 and H-35 tanks, and two *divisions cuirasses de réserve* (DCR), with B tanks and R-35 and FCM-36 light tanks to accompany infantry forces.

The S-35 (SOMUA) was a medium tank designed for cavalry combat. One of the best tanks of the time, it was the first to use an all-cast hull and turret construction. Weighing 20 tons, with a crew of three, its electric-drive turret mounted a 47 mm main gun. The 190 hp gasoline engine provided a speed of 25 mph. About 500 were manufactured. After the defeat of France, both the Germans and Italians employed them in their armies.

The H-35 (Hotchkiss) light tank, developed for cavalry use, was later also adopted by the infantry. Product improvements—a long-barreled 37 mm main gun and a new engine—led to production of the H-39 by 1939. This 10.6 ton tank had a crew of two and was driven by a liquid-cooled gasoline engine. Captured vehicles were used by Germany in the Soviet and Mediterranean Theaters of war. Free French Forces also used the H-39.

The 1935 production version of the Char B heavy tank was the Char B1, further improved as the Char B-1 bis. The main

battle tank of the French army in 1940, it weighed 32 tons, had a crew of four, and mounted a 75 mm main gun in the hull and a 47 mm gun in the turret. Final production models were powered by 300 hp aircraft engines.

Germany

From an analysis of the writings of British theorists Fuller and Liddell Hart, Guderian led the development of panzer (armored) divisions, three of which were formed in 1935. Based on tanks, they also included infantry, artillery, and other elements. Initially, the divisions were equipped with the specially developed light tanks PzKpfw I and II (PzKpfw is the abbreviation for *Panzerkampfwagen*, or tank), while two larger designs, the PzKpfw III and IV, were being built. Germany planned to phase out the earlier tanks but kept PzKpfw I and II in service with second-line units into 1945.

Many product improvements of the PzKpfw I, II, III, and IV were incorporated in production. The PzKpfw I, originally intended as a cheaply produced training vehicle, weighed less than 6 tons, had a crew of two, and mounted only two machine guns. Its 60 hp gasoline engine could drive it at 25 mph. The main production version of the PzKpfw II weighed 9.5 tons, had a crew of three and a 20 mm main gun, and was driven by a 140 hp gasoline engine. From 1937 through 1942, several versions of the PzKpfw III were produced. The main armament was increased from 37 mm to 50 mm, with some of these tanks mounting a close-support, short-barreled 75 mm cannon. Added armor increased the weight from 15 to 22.3 tons. Gasoline engine power increased from 230 hp to 300 hp.

Late versions of the PzKpfw IV became the backbone of German armor at the end of the war. The most important tank of the series, upgunned and uparmored from earlier versions, it weighed 23.6 tons, carried a crew of five, and mounted a long-barreled 75 mm main gun. Its 300 hp gasoline engine could drive the PzKpfw IV at 25 mph. Its main armament gave it parity in hitting power with later Soviet and American tanks.

When Germany invaded the USSR in 1941, German armor encountered the Soviet T-34, whose superior firepower, speed, shape, suspension, armor, and maneuverability made all German tanks virtually obsolete. By March 1942, however, Germany had prototypes of the PzKpfw VI Tiger heavy tank. With armor up to 100 mm thick and an 88 mm main gun, based on the successful anti-aircraft gun, it was superior to any other tank, in spite of its low speed and poor reliability. It had a five-man crew. The 700 hp gasoline engine could drive the 55 ton tank at 23.5 mph.

In November 1942, the first production PzKpfw V Panther was delivered. A new tank designed to counter the T-34, it was Germany's best tank of the war. The 1944 version carried a crew of four and mounted a long-barreled 75 mm gun. The 44.8 ton vehicle was equipped with a 700 hp gasoline engine.

The final German tank of the war was the PzKpfw Tiger II, with production models appearing in November 1944. Also known as the King Tiger, it was, at 69.7 tons, the heaviest operational tank of the war. With a massive turret mounting a long-barreled 88 mm gun, the tank's maximum armor thickness reached 150 mm. It had a five-man crew. Its 700 hp gasoline engine could drive the tank at 23.5 mph. A total of 484 were produced.

Great Britain

By World War II, Britain had opted for two categories of tanks—high-speed cruiser tanks and heavily armored but slow infantry tanks. An emphasis on mobility and armor protection, obscuring the importance of gun power, plagued British tanks throughout the war.

In 1940, the army was equipped with the Cruiser Mark I and II and the Infantry Tank Mark I and II (Matildas). The 12 ton Cruiser Mark I had a crew of six men and a 2 pounder main gun. The major production version, the Cruiser Mark IIA, an improved Mark I, weighed 13.5 tons, held a crew of four to five men, and had a 2 pounder main gun. The Infantry Tank Mark I (Matilda I) quickly proved inadequate. Although well armored, it carried only a crew of two and an armament of one machine gun. The Mark II (Matilda II), of which 2,987 were manufactured between 1940 and 1943, was the most important British tank in the Western Desert. This 26.5 ton tank carried a crew of four men and a 2 pounder main armament. Two diesel engines drove it at 15 mph.

German tanks armed with more powerful guns led to British attempts to design replacements. However, when the British designs, the Centaur and Cromwell, were ready in 1942, German tanks had even heavier armament. The redesigns, the Challenger and Black Prince, respectively, were either unsuccessful (in the case of the Challenger) or produced too late (the Black Prince).

Meanwhile, British requirements were met by American tanks, originally the M-3 and M-4 medium tanks and the M-3 light tanks. The most effective British tank of the war became the M-4 with a 17 pounder gun, known as the Sherman Firefly.

Britain fielded an effective tank of its own design, the Churchill, before the end of the war. Originally produced in 1941, it was not truly successful until 1944, with the Churchill VII production. This 40 ton version had a crew of five and a 75 mm main gun. Its 350 hp engine could drive it at 12.5 mph. Variations were used for many purposes, for example, as engineer vehicles and for close support.

United States

U.S. tank development and doctrine were hampered before World War II by a decision to assign tanks to the infantry only and a reluctance on the part of the cavalry to give up the horse.

A U.S. M-4 Sherman tank transporting infantrymen forward in southern Okinawa, 5 May 1945. (Corbis)

By the 1930s, however, the army had formed a mechanized cavalry brigade, leading to the creation of the Armored Force by 1940. A number of tank designs had also been explored.

Based on the earlier M-2 series, the M-3 light tank was standardized in July 1940. The Stuart weighed 12.3 tons, had a crew of four, and mounted a 37 mm gyro-stabilized main gun. Improvements finally resulted in the M-5A1. With twin gasoline engines, this tank could reach a speed of 40 mph.

Serious tank production began with the 1940 design of the M-3 medium Lee and Grant tanks, in service by mid-1941. Six basic models were eventually produced, with their weight growing from 30 to 32 tons. The crew of six men operated a sponson-mounted 75 mm gun and a turret-mounted 37 mm gun. Various engines were utilized, both gasoline and diesel, in the 340 to 375 hp range. The limited-traverse 75 mm gun was less than ideal, but the M-3 provided a quickly available tank with a large gun.

Production of the M-4 medium Sherman tank, with a 75 mm cannon in a fully traversable turret, began in October 1941. The standard U.S. Army medium tank, the Sherman was improved as the war progressed to the M-4A3 version;

almost 50,000 of them were produced. This tank's weight, initially 33.25 tons, grew to 35.5 tons. The most significant improvement was the high-velocity 76 mm gun. The crew was composed of five men. Engines varied widely, and the maximum speed was 24 to 26 mph. Variants to the standard tank included flamethrowers and recovery vehicles.

The United States was slow to develop a heavy tank, the consequence of General George S. Patton's belief that tank destroyers rather than other tanks should deal with German armor. The heavy tank M-26 was standardized in January 1945, but only a few reached Europe before the end of the war there. With a crew of five men, the Pershing weighed 46 tons and mounted a 90 mm main gun. The 470 hp engine could drive the tank at 20 mph.

Soviet Union

In the late 1930s, it was the Soviet Union, rather than Germany, that was most interested in massive armor formations. It also possessed more armored fighting vehicles than any other nation. In June 1941, the Soviets had 23,140 tanks (10,394 of them in the west), whereas the invading Germans

had only some 6,000. Moreover, the Soviets had some of the best tanks in the world. During the war, the Soviet Union built more tanks than any other power, including a wide range of armored fighting vehicles (AFVs), from light to heavy tanks.

At the beginning of World War II, the Soviets possessed a large number of their medium BT-series tanks, chiefly the BT-5s and BT-7s. These and the Soviet T-26 tanks were superior in armor, firepower, and maneuverability to the German light PzKpfw Marks III and IV and could destroy any German tank. The Soviet T-34 medium tank, introduced in 1941, and the KV-1 heavy tank, introduced in 1940, both mounted the 76.2 mm (3-inch) gun and were superior to the PzKpfw III and IV and indeed any other German tank in 1941.

The T-34 was probably the best all-around tank of World War II, better armed and armored than the German tanks it faced. The short-barreled 76.2 mm gun initially mounted on this tank was replaced by a longer version that was mounted in most vehicles, followed later by an 85 mm version. Weighing 26.3 tons, with a crew of five men, the tank could reach 31 mph with its 500 hp diesel engine.

The USSR also produced a series of heavy tanks. The Soviets began the war with the KV-1, which entered service in December 1940. Wholly a Soviet design, the KV was named for Defense Commissar Kliment Voroshilov. Initially, the KV-1 had a 550 hp diesel engine, but this was upgraded to 600 hp in the KV-1B. The KV-1B weighed nearly 47.5 tons, carried a five-man crew, and had a maximum speed of 22 mph. The KV-1 mounted the powerful 76.2 mm gun and three machine guns. It had a maximum 100 mm armor protection and was proof against the 88 mm gun and anything else the Germans might throw against it, save for heavy artillery. The KV-1 disproved the myth that the Soviets were technologically backward.

The KV-1 evolved into the IS-1 through IS-3, the final Soviet heavy tanks of the war and the most powerful tanks in the world for a decade thereafter. (IS or JS stood for the Soviet dictator Josef Stalin.) The IS-1 was produced beginning in 1944 to counter the new, more powerful German tanks. The IS-1 had an improved transmission and suspension system as well as a redesigned hull and a new, larger turret mounted well forward.

The IS-1 weighed nearly 49.5 tons and had a crew of four. Powered by a 600 hp diesel engine, it was capable of a speed of 23 mph. The first IS-1 tank mounted the 85 mm gun, but shortly thereafter, a 100 mm gun was used; some IS-1s even mounted the 122 mm gun. In addition, this tank had four machine guns. The IS-1 was followed by the IS-2, with an improved hull shape and streamlining throughout. The IS-3 was a complete redesign, based on the experience of the IS-1 and IS-2 in combat. The IS-3 had a lower silhouette, a ballistically shaped hull, and a new "inverted frying pan," lower-profile turret shape to provide maximum deflection against

incoming shells. It weighed nearly 51 tons and mounted an improved 122 mm gun and had two machine guns. The IS-3 entered service in January 1945 and participated in the spring 1945 Battle of Berlin. Although never available in large numbers, it was, for a decade, the most powerful tank in the world and a major influence on subsequent tank design across the globe.

Czechoslovakia

The Czechs produced LT-34 and LT-35 light tanks for their army. Germany later provided LT-34 tanks to its ally Romania and used LT-35 tanks on the Eastern Front. The LT-38 was chosen as the light tank after the LT-35 and was produced up to 1942 for Germany. All these vehicles were armed with the 37 mm gun. Only prototypes of the medium tank ST-39, armed with a 47 mm gun, had been made when Germany took over Czechoslovakia in March 1939.

Italy

The basic Italian light tank of the war was the Fiat Carro Armato L6/40, somewhat equivalent to the German PzKpfw II. It weighed approximately 7.5 tons, had a 70 hp engine, and was capable of a speed of 26 mph. It mounted a 20 mm main gun and one machine gun. Unsuitable for frontline service because of its light armament, the L-6/40 was utilized in North Africa in cavalry and reconnaissance roles. It also was sent to the Eastern Front in fighting against the Soviet Union, and it served in Italy.

In 1940, the Italians decided on a new tank, the Fiat M-13/40, which became their principal medium tank and the mainstay of Italy's armor force in North Africa. The 15.5 ton M-13/40 had a crew of four men. It carried a new high-velocity 47 mm gun in the turret, with a secondary armament of four machine guns in the hull. There were no other significant tank-producing countries in Europe during the war.

Japan

Although no match for Allied tanks, the most successful Japanese tank was the medium tank Type 97, initially produced in 1937. This 15 ton tank had a crew of four and mounted a 57 mm main gun. Its 170 hp diesel engine could drive it at 23.5 mph. The tank was based on the light tank Type 95, designed in 1933 and produced until 1942. With a crew of three and armed with a 37 mm gun, the light tank weighed 7.4 tons and could reach 25 mph with its 110 hp diesel engine. Some additional work was done by Japan on medium tanks with larger main guns.

Throughout the war, the trend was to field tanks with larger main guns to counter the other trend of adding heavier armor. These trends continued in the postwar years.

Taranto, Attack on (11 November 1940)

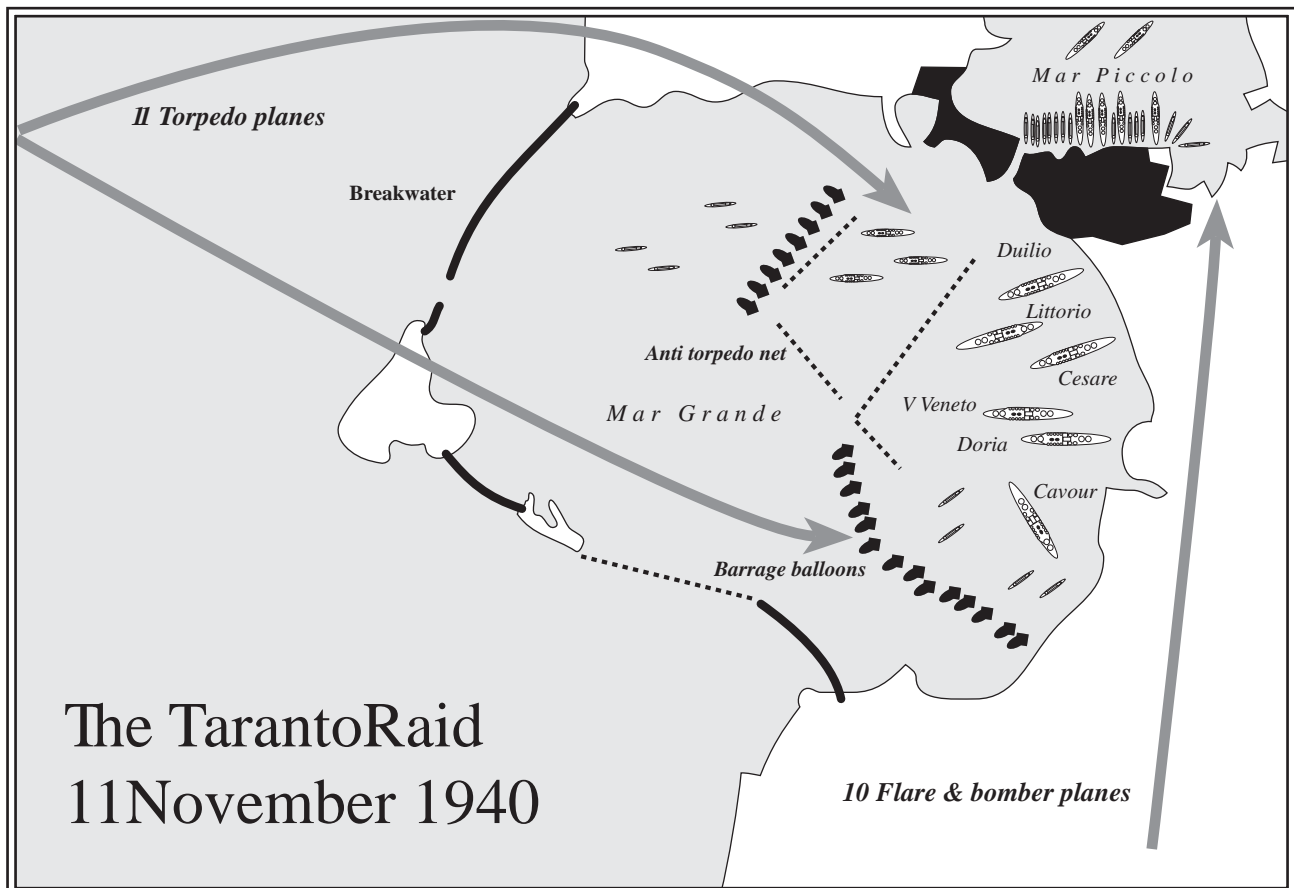

British navy raid on the principal Italian naval base, the fortified harbor of Taranto. Admiral Sir Andrew Cunningham and Rear Admiral A. L. St. G. Lyster of the carrier *Illustrious*

planned the operation, code-named JUDGMENT. The date for the raid was to be 27 October 1940, the anniversary of the Battle of Trafalgar and a night with a full moon. Thirty Fairey Swordfish were slated to make the attack from the aircraft carriers *Illustrious* and *Eagle*. The Swordfish, though it was a 10-year-old biplane, was nonetheless a reliable, sturdy torpedo platform, especially effective in night operations.

A fire on the *Illustrious*, which destroyed several aircraft, forced postponement of the operation. Then the *Eagle*, which had sustained near misses from Italian bombs, was found to have been more seriously damaged than originally estimated.

As a consequence, the attack was delayed until the next full moon, when the raid was conducted by the *Illustrious* alone. Twenty-one Swordfish fitted with extra fuel tanks participated, with 11 of them armed with torpedoes and the remainder carrying bombs and flares. The torpedoes were modified to negate the effects of “porpoising” in the harbor’s shallow water.

At 8:30 P.M. on 11 November, *Illustrious* launched her aircraft some 170 miles from Taranto. All six of Italy’s battleships were in the harbor, where they were protected by barrage balloons, more than 200 antiaircraft guns, and torpedo nets,

although the quantity of the latter was far short of the number the Italian navy considered necessary. The planes set out in two waves an hour apart. The first wave achieved complete surprise when it arrived at Taranto at 11:00 P.M. The pilots cut off their engines and glided in to only a few hundred yards from their targets before releasing the torpedoes against the battleships, which were illuminated by the flares and Italian anti-aircraft tracers. *Conte di Cavour* was the first battleship struck, followed by *Littorio*. In the second attack at 11:50, *Littorio* was struck again, and *Duilio* was also hit. In the two attacks, *Conte di Cavour* and *Duilio* each took one torpedo and *Littorio* three.

Conte di Cavour was the only battleship to sink, and she went down in shallow water. Italian tugs towed the other two damaged ships to shore. The cruiser *Trento* and destroyer *Libeccio* were both hit by bombs, but the bombs did not explode and caused only minor damage. Fifty-two Italian sailors died in the attack. The British lost two planes; the crewmen of one were rescued by the Italians.

Conte di Cavour was later raised and towed to Trieste to be repaired, but the work was not completed and she was never recommissioned. The *Littorio* was overhauled by March 1941, and the *Duilio*, which was transferred to Genoa, was repaired and returned to Taranto in May 1941. The Taranto raid thus deprived Italy of its naval advantage and at least temporarily altered the Mediterranean balance of power, and it also underscored the effectiveness of naval aircraft. The attack was also useful to the Japanese. They were already working on techniques to employ air-dropped torpedoes in shallow water. Taranto provided confirmation for their own plan to strike Pearl Harbor.

Tarawa, Battle of (20–24 November 1943)

One of the bloodiest amphibious assaults in military history. In December 1941, a Japanese task force seized Tarawa—part of the Gilbert Islands, which stretch some 500 miles along the

U.S. Marine fires at a Japanese pill box from behind the remains of a palm tree, November 1943. (National Archives)

equator. Tarawa is a hook-shaped atoll with a lagoon formed by a coral reef just beneath the ocean surface. The barb in the hook is formed by 2-mile-long, triangular-shaped Betio Island, less than 300 acres of nondescript coral sand and coconut palms rising no more than 15 feet above sea level.

The Japanese constructed an airfield there, and by November 1943, they had turned Betio into a fortress. Rear Admiral Shibasaki Keiji commanded 5,000 naval infantry troops who manned reinforced concrete blockhouses, coconut-log bunkers, and gun pits, all connected by a network of tunnels and trenches. Heavy guns in hardened revetments commanded virtually every approach to the island, prompting Shibasaki to remark that Betio could not be taken by a million men in a hundred years.

The Central Pacific commander, U.S. Admiral Chester W. Nimitz, decided to seize the Gilberts in a joint assault by the army and the Marines as the first test of offensive amphibious operations. V Amphibious Corps, commanded by Marine Major General Holland M. Smith, was responsible for the landing, code-named Operation GALVANIC. The 2nd Marine Division, led by Major General Julian C. Smith, would seize Tarawa, while the army's 27th Infantry Division, commanded by Major General Ralph C. Smith, landed at Makin.

V Corps staffers decided the portion of Betio that faced the lagoon was the least heavily defended terrain, and they designated landing areas there as Red Beaches 1, 2, and 3. A disadvantage to those sites was the precise navigation required for the landing craft to pass into the lagoon and then maintain formation as they approached the beaches. Amphibious doctrine called for landings at high tide so the landing craft could clear defensive obstacles. Unfortunately, however, the planners did not have reliable tide charts, and when Holland Smith designated 20 November 1943 as D day, the tides would not be favorable to the Marines. By then, U.S. aircraft had flown hundreds of sorties against Betio, saturating the island with bombs as ships of Fifth Fleet pounded the island's defenses one last time. Faulty U.S. reconnaissance reports indicated that nothing was left alive on Betio.

At 9:00 A.M., almost two hours after the last bombardment began, Colonel David M. Shoup led three reinforced battalions of his 2nd Marine Regiment toward Red Beaches 1, 2, and 3. Japanese heavy guns then opened up, unleashing a deadly hail of fire into the tightly packed amphibious tractors (amphtracs) as they neared the reef, paused briefly to climb over it, and then landed on the beaches. However, the shallow-draft Higgins boats that followed could not get over the reef. A nightmare for the Marines began when they were forced to debark into the water about 600 yards from the shore. Withering Japanese machine-gun fire met the Marines, who were unable to return fire as they slowly waded toward shore laden with equipment. A small seawall afforded little cover from Japanese small-arms fire as navy corpsmen set up aid stations.

By afternoon, the Marines had penetrated no more than a few hundred feet in many places. Shoup, who was wounded, still directed the fight and requested that reserves be committed in a message that emphasized the precariousness of the situation, stating, "Issue in doubt." Of the 5,000 Marines who landed that day, almost 1,500 became casualties. During the night, the Japanese threatened with counterattacks, snipers, and infiltrators. Many Marines had drained their canteens and emptied their cartridge belts. The wounded suffered and could only wait for evacuation in the morning.

The morning saw little improvement. Stiff resistance compelled the attackers to destroy each Japanese strong point at a heavy price as U.S. Navy destroyers provided fire support at dangerously close ranges. The day of 21 November ended with more of Betio in Marine hands, but the island was not yet secure. At midmorning on 22 November, the Marines began their final assault on the Japanese command post, where they poured gasoline down air vents and then ignited it, killing those inside, including Shibasaki. Many Japanese committed suicide as the Marines cleared the western portion of the island and pushed the remaining defenders into a narrow tail of land in the east.

The final Japanese act entailed a series of nighttime banzai attacks, in which mobs of enemy soldiers charged Marine positions with drawn swords and bayonets. They were cut down by artillery and machine-gun fire from the exhausted Marines. Commanders declared the battle over on the morning of 23 November, after 76 hours of horrendous fighting. The Japanese had 4,690 men killed; only 17 prisoners were taken, along with 129 Korean laborers. The desperate Japanese defense of the island cost the Marines and the navy 1,027 dead, 88 missing, and 2,292 wounded. The casualties shocked an American public that viewed the fight on Tarawa as evidence there would be no cheap victories as the battles were carried to the Japanese homeland. The Battle of Tarawa brought many changes, including improved naval fire support and significant increases in firepower ashore, to include more automatic weapons, tanks, explosive charges, and flamethrowers.

Tassafaronga, Battle of (30 November 1942)

Naval battle of the Guadalcanal Campaign. Responding to intelligence that the Japanese navy intended to resupply Guadalcanal on the night of 30 November 1942, Rear Admiral Thomas C. Kinkaid dispatched Rear Admiral Carlton H. Wright's Task Force 67 (TF 67)—consisting of the heavy cruisers *Minneapolis*, *New Orleans*, *Pensacola*, and *Northampton*, the light cruiser *Honolulu*, and six destroyers—to intercept Rear Admiral Tanaka Raizo's 2nd Destroyer Squadron, which was steaming in a southeasterly direction. Tanka had eight destroyers, six of which carried supply drums; the other two destroyers were unencumbered.

To avoid enemy identification and detection problems, the Americans formed into one destroyer and two cruiser groups, each having one ship equipped with the new SG surface-search radar. Cruiser scout planes would provide reconnaissance and night illumination. Destroyers took station on the engaged bow of the cruisers to deliver a torpedo attack prior to the commencement of gunnery.

Tanaka sought to avoid a general engagement. He intended to have his destroyers drop their floating supply drums, to be

retrieved by small Japanese craft from the beaches. As TF 67 approached the Lengo Channel on a northwesterly heading, the lack of a U.S. forward destroyer picket heralded a critical mistake. Tanaka was cruising only 2 miles off the Guadalcanal beach but remained undetected until radar picked up his column dead ahead at 23,000 yards. However, no flare planes had been able to launch to illuminate the Japanese ships. Wright delayed in ordering the destroyers to commence their torpedo attack, believing the range was greater than the 7,000 yards reported by the destroyer *Fletcher* at 11:20 P.M. Thus, the initial tactical advantage provided by radar had been squandered, with the loss of four precious minutes until Wright unleashed the destroyers. The Japanese column had already passed abaft the destroyers' port beam, making hits difficult as the range opened.

At about 9,000 yards, the U.S. cruisers opened fire, hitting the nearest Japanese destroyer, the *Takanami*. Several ships fired illumination star shells, but the accuracy of the U.S. gunfire was poor. Well drilled in night-detection, maneuver, and torpedo tactics, Tanaka's crews executed a column turn and launched 20 torpedoes at the U.S. ships even while sustaining some shell hits themselves. At 11:27 P.M., the *Minneapolis* suffered two torpedo hits, destroying her bow. Putting her rudder over hard right to avoid a collision, the *New Orleans* took a torpedo near a magazine, which blew off her bow back to no. 2 turret. The third in line, the *Pensacola*, veered left to avoid the *New Orleans* but took a torpedo hit at 11:39 that flooded the after engine room and knocked out three turrets and all power. Steaming behind the three damaged U.S. cruisers, the *Honolulu* avoided any hits, but the *Northampton* proved not so fortunate. She first turned right with the *Honolulu*, then back to a westerly heading. Two torpedoes struck her at 11:48, destroying the after engine room and setting her afire from the mast to the stern.

Tanaka reformed his squadron for a second but unsuccessful attack and then cleared the area by 1:30 A.M., with the undamaged *Honolulu* in fruitless pursuit. The *Minneapolis* limped safely into Tulagi harbor, as did the *New Orleans* and *Pensacola*, all heavily damaged. The *Northampton* sank at 3:04 A.M., with the loss of 58 hands. Jury-rigged to make the voyage home, all three damaged cruisers returned to action by October 1943. The Tassafaronga debacle for the U.S. forces resulted from superb Japanese night-fighting training and techniques combined with poor American gunnery and the failure to detach destroyers ahead for forward operations.

Tedder, Sir Arthur William (First Baron Tedder) (1890–1967)

Royal Air Force (RAF) marshal who helped plan the Normandy Invasion and commanded the tactical air forces from late 1944. Born on 11 July 1890 at Glenguin, Scotland, Arthur Tedder graduated from Magdalene College, Cambridge. Commissioned in the British army in 1913, he served in France at the beginning of World War I but was posted to the Royal Flying Corps in 1916. He rose to command 70 Squadron and accepted a commission in the RAF in 1919.

From 1929 to 1931, Tedder was assistant commandant of the RAF Staff College. He then held administrative positions

at the Air Armament School and the Air Ministry. He headed up training from 1934 to 1936, then was commander in the Far East. He returned to Britain to become director of research in the Air Ministry in 1938.

In the summer of 1940, Tedder was transferred to North Africa as deputy air commander. He became air commander in chief of the Middle East Air Force in June 1941, directing air operations against the Axis powers in North Africa. Tedder constantly struggled with a shortage of air assets. A forceful advocate of airpower, along with his subordinate Arthur Coningham, he worked to combine and coordinate RAF activities with ground forces in innovative ways. In February 1943, as commander in chief of Allied air assets in the Mediterranean, he was overall air commander for the 1943 Tunisia and Sicily Campaigns.

In late 1943, Tedder used the experience gained in these operations to help plan air support for the Normandy Invasion as deputy supreme commander, earning high praise from General Dwight D. Eisenhower. He developed a detailed plan to use airpower to disrupt German communications and supply lines prior to the actual landings. In November 1944, he replaced Air Chief Marshal Trafford Leigh-Mallory as commander of tactical air forces.

At the end of the war in Europe, Tedder signed the surrender agreement with Germany on behalf of Eisenhower. On his return to Britain, he was promoted to air marshal. In January 1946, Tedder was made a baron and appointed chief of the air staff, a post he held until his retirement in 1950. From 1954 to 1960, he was chairman of the Standard Motor Company. He published his memoirs, *With Prejudice*, in 1967. Tedder died in Surrey, England, on 3 June 1967.

meeting at Tehran was in fact equally or more important than Yalta because of the decisions that were made there. Attending were the “Big Three”—U.S. President Franklin D. Roosevelt, British Prime Minister Winston L. S. Churchill, and Soviet leader Josef Stalin. The conference was also the first face-to-face meeting between Roosevelt and Stalin. The Soviet leader claimed that his wartime responsibilities would not allow him to travel far, so the conference, code-named EUREKA, took place at Tehran, Iran; the journey to Tehran was Stalin’s first trip abroad since 1912. Held from 28 November to 1 December 1943, the conference was immediately preceded by a meeting at Cairo (code-named SEXTANT) that involved Chinese Nationalist leader Jiang Jieshi (Chiang Kai-shek) and featured a discussion of the Allied effort against Japan. Since the Soviet Union was not then at war with Japan, Stalin refused to attend that meeting, necessitating the EUREKA conference.

At the Tehran meeting, Roosevelt was convinced that he could win over Stalin, and toward that end, he turned on all his formidable charm to try to secure the Soviet leader’s confidence. At Tehran and later at Yalta, Roosevelt deliberately distanced himself from Churchill, a serious mistake. The British prime minister could not believe that the democracies would take separate paths.

The Western leaders labored under a number of disadvantages at Tehran. The first involved the strategic military situation. British and U.S. troops were then fighting the Germans only in Italy with 14 divisions, whereas the Soviet Union had 178 divisions locked in combat. If the Tehran Conference marked the beginning of the Soviet empire, it also reflected the reality of forces on the ground. In addition, the Western leaders feared that Stalin might yet seek a diplomatic accommodation with Adolf Hitler, and Roosevelt was also anxious to secure Soviet assistance in the war against Japan.

At Tehran, Stalin pressured the West on an early date for an Allied invasion of France. The Soviet ambassador to London, Ivan Maisky, had counseled Stalin to press for an immediate second front, which he knew was impossible, in order to secure additional Lend-Lease aid. Stalin insisted on learning the name of the commander of OVERLORD as proof that the Western Allies were indeed serious about a cross-Channel invasion, and in a follow-up meeting in Cairo after EUREKA, Roosevelt named General Dwight D. Eisenhower to the post. The three leaders also spent a great deal of time discussing Germany and its possible future division at Tehran. Roosevelt suggested splitting Germany into five states and internationalizing the Ruhr and other areas. Churchill, fearful of potential Soviet expansion into Europe, thought that Prussia might be detached from the rest of Germany.

Discussions over Poland were more controversial. All three leaders agreed on the Oder River as the future Polish-German boundary, but the Western leaders rejected the

Tehran Conference (28 November–1 December 1943)

One of the most important Allied conferences during the war. Usually overshadowed by the later Yalta Conference, the

Marshal Josef Stalin (left), President Franklin D. Roosevelt (center), and Prime Minister Winston L. S. Churchill (right) at historic conference, Russian Embassy, Tehran, Iran, 28 November to 1 December 1943. (Library of Congress)

Soviet demand that a tributary of the Oder, the Western Neisse River, be the southern demarcation line. Nor did they sanction Poland securing the important port of Stettin on the west bank of the Oder. The three did concur that Poland would receive most of East Prussia, although the Soviet Union claimed the Baltic port of Königsberg (the future Kaliningrad) and land to the northeast. The Western leaders could hardly oppose the Curzon Line, established by the victorious Allies at the Paris Peace Conference following World War I, as the eastern boundary of Poland. The British did object, however, to the Soviet seizure of the predominantly Polish city of L'viv (Lvov).

Churchill pointed out to Stalin that Britain had gone to war over Poland, but Stalin insisted that the Red Army needed security in its rear areas and that a primary goal of the war was to protect the Soviet Union against future German attack.

Obviously, a Poland that had been compensated for the loss of its eastern territory to the Soviet Union by receiving German territory in the west would necessarily have to look to the Soviet Union for security. Later, Churchill had the difficult task of promoting all these arrangements to the Polish government-in-exile in London; the large Polish community in the United States was also upset by then. Stalin refused normal diplomatic relations with the London Poles, charging that they were stirring up trouble for the Red Army. No independent Polish government would ever concede changes that put the country at the Soviet Union's mercy. Thus, a Polish government subservient to Moscow was probably inevitable.

Stalin also demanded that the Soviet Union be allowed to keep its 1939–1940 acquisitions of Bessarabia, the Karelian isthmus, and the Baltic states. Although these acquisitions were clear violations of the Atlantic Charter, the siege of

Leningrad gave Stalin a strong argument for a security zone there. He also demanded that Finland cede its Arctic port of Petsamo, pay heavy reparations, and provide space for a base to protect sea approaches to Leningrad. In return, he promised to respect Finland's independence, assuming that country behaved properly.

Stalin reassured Roosevelt that the Soviet Union would enter the war against Japan after the defeat of Germany. He also stressed the importance of an Allied invasion of France to relieve pressure on the Red Army from German troops on the Eastern Front. Further, Stalin expressed the view that a landing in southern France (the future Operation ANVIL) would be most helpful. He was pleased when the Western leaders told him that the invasion of northern France (Operation OVERLORD) was scheduled for May 1944. He promised to launch a Soviet ground offensive to coincide with it. The three leaders also agreed that after the war, Iran, which was serving as a supply corridor to the Soviet Union and occupied by Allied troops, would be restored to full territorial integrity and sovereignty and that all troops would be withdrawn.

Although the Tehran Conference served to dissipate tensions between the two Western leaders and Stalin, sharp differences on the conduct of the war and the composition of postwar Europe remained. These differences were very much in evidence at the February 1945 Yalta Conference.

Terauchi Hisaichi (Count) (1879–1946)

Japanese army field marshal and commander of the Southern Expeditionary Army. Born in Yamaguchi Prefecture on the Japanese island of Honshu on 8 August 1879, Terauchi Hisaichi was the eldest son of a prominent Meiji-era general, Count Terauchi Masatake, who was prime minister of Japan between 1917 and 1918. Terauchi graduated from the Military Academy in 1899 and the War College in 1903. He was appointed assistant military attaché in Austria in 1911, regimental commander of the 3rd Imperial Guards in 1919, chief of staff of the Imperial Guards Division in 1922, commander of the 19th Infantry Brigade in 1924, and chief of staff of the Korea Army in 1927. Promoted to lieutenant general in August 1929, he commanded the Imperial Garrison Unit in 1929 and then the 5th Division in August 1930. In January 1932, he took command of the 4th Division, and in August 1934, he became Formosa Army commander. In October 1935, he was promoted to full general.

A prominent member of the Control Faction, Terauchi served as minister of war in the Hirota Kōki cabinet (March 1936–January 1937) and was one of the leading figures in the ouster of Hirota. He next served as inspector general of military training (1937), North China Area Army commander (1937–1938), and military counselor (1938–1941). In November 1941, he took command of the Southern Expeditionary Army, which, at the start of the Pacific war, conquered the Philippines, Malaya, Burma, and the Netherlands East Indies (December 1941–May 1942). He subsequently became responsible for the defense of an area extending from Burma to western New Guinea. Promoted to the honorary rank of field marshal in June 1943 and briefly considered to succeed Tōjō Hideki as prime minister in July 1944, Terauchi commanded the Southern Expeditionary Army until September 1945, the only senior general in the Japanese army to hold the same post throughout the war.

As a commander, Terauchi was essentially a coordinator who typically allowed subordinate officers great latitude in the conduct of operations. He also carried out his orders to the letter—for example, in his ruthless 1942–1943 execution of an order to construct the infamous, 265-mile “railway of death” linking the Thai and Burmese rail systems.

Thanks to the intervention of Lord Louis Mountbatten, Allied supreme commander in Southeast Asia, Terauchi, who had suffered a debilitating stroke in April 1945, avoided prosecution as a war criminal. Allowed to settle near Johore Bahru, Malaya, he died there on 12 June 1946.

Theobald, Robert Alfred (1884–1957)

U.S. Navy admiral who commanded the North Pacific Force. Born in San Francisco, California, on 25 January 1884, Robert Theobald graduated from the U.S. Naval Academy in 1907 and was commissioned an ensign. Over the next years, he served in a variety of assignments at sea and in shore posts, impressing his superiors with his skills in gunnery, his seamanship, and his intellectual acumen. During the 1930s, Theobald was both a student and an instructor at the Naval War College. He commanded the battleship *Nevada*, served as a member of the navy's General Board, and commanded a cruiser division and later a destroyer flotilla.

Shortly after the Japanese attack against Pearl Harbor on 7 December 1941, Rear Admiral Theobald took charge of the destroyers in the Pacific Fleet. In May 1942, he was appointed commander of the North Pacific Force. Since the force initially had a main body of only five cruisers and four destroyers, Theobald was inclined to be cautious in moving against the Japanese in the Aleutian Islands, an approach that placed him at odds with the more aggressive-minded army commanders in the theater.

The conflict between Theobald and the army, along with the admiral's irritation at being assigned to a backwater in the war, angered Admiral Chester W. Nimitz, commander of the Pacific Fleet. On 4 January 1943, Nimitz relieved Theobald, who then took charge of the First Naval District and the Boston Navy Yard. Theobald retired from the navy in February 1945.

After the war, he involved himself in the Pearl Harbor controversy, arguing that Admiral Husband E. Kimmel, commander of the Pacific Fleet in 1941 and a friend of long standing, and Lieutenant General Walter Short, commander of the Hawaiian Department, were unfairly made the scapegoats for the Japanese success on 7 December 1941. In his book *The Final Secret of Pearl Harbor: The Washington Contribution to the Japanese Attack* (1954), Theobald charged that President Franklin D. Roosevelt and members of his administration did not adequately warn Hawaiian commanders of a possible attack and had shifted the blame to

Kimmel and Short to cover up their own errors in judgment. Theobald died in Boston on 13 May 1957.

Thierry d'Argenlieu, Georges Louis Marie (1889–1964)

French admiral and commander of Free French naval forces. Born in Brest, Brittany, France, on 7 August 1889, Georges Thierry d'Argenlieu graduated from the École Navale in Brest in 1906 and was commissioned in the navy. During World War I, he served in the French marines and commanded a patrol boat in the Mediterranean.

In September 1919, Thierry d'Argenlieu left the navy and entered the Carmelite Order as Père Louis de la Trinité (Father Louis of the Trinity). In February 1932, he became provincial superior in Paris. In 1939, he was called back into the navy at Cherbourg, and in February 1940, he was appointed captain. Captured by the Germans on 19 June, Thierry d'Argenlieu escaped three days later and joined General Charles de Gaulle's Free French movement in Britain by the end of the month. Thierry d'Argenlieu participated in the ill-fated September 1940 Free French attack on Vichy forces at Dakar and was wounded three times. He then took command of Free French naval forces in Equatorial Africa. Operating in conjunction with Colonel Philippe Leclerc on land, he led the naval operations at Gabon.

Between February and May 1941, Thierry d'Argenlieu led a mission to Canada seeking to rally support for de Gaulle, and by July, he was named high commissioner for the Pacific, which involved, in conjunction with the other Allies, defending French territories in the Pacific and easing diplomatic tensions between Free French administrators in Tahiti and New Caledonia. The following year, in May, he helped rally the Wallis and Futuna Islands.

In June 1943, Thierry d'Argenlieu was promoted to rear admiral and became commander in chief of all Free French

Free French Navy Captain Georges Thierry D'Argenlieu, January 1941. (Photo by William Vandivert/Time Life Pictures/Getty Images)

naval forces. Following the liberation of France, he was advanced to vice admiral in December 1944 and made “chef d'état major general adjoint de la marine.” He had been named a “compagnon de la libération” on 29 January 1941, when he also became the first grand chancellor of that order, serving until 1958.

After the war, the French government sent Thierry d'Argenlieu to San Francisco in April 1945 as a delegate to the UN meetings and then to Indochina as high commissioner to reestablish French control there. His efforts to roll back the colonial clock and his decision to employ force and order the shelling of Haiphong by the cruiser *Suffren* on 23 November 1946 led directly to the outbreak of the First Indo-China War.

In June 1946, Thierry d'Argenlieu was promoted to admiral. The following year, he was recalled to Paris, and in 1948, he returned to his monastery in Brest. He died in Relecq-Kerhuon (Finistère), France, on 7 September 1964.

Thoma, Wilhelm Ritter von (1891–1948)

German army general who briefly commanded the Afrika Korps (Africa Corps) in September 1942. Born on 11 September 1891 at Dachau, Germany, Wilhelm von Thoma joined the German army in 1914 as an officer candidate and was commissioned in the infantry. He continued in the Reichswehr after World War I and became a leading theorist of armored warfare, second in the German army only to General Heinz Guderian. In 1934, Major Thoma took command of Germany's only tank battalion. He then had charge of all German ground troops in the Spanish Civil War, from 1936 to 1939.

Thoma led the 3rd Panzer Regiment in the 2nd Panzer Division during the invasion of Poland in September 1939, where he performed brilliantly. Following the conquest of Poland, he became director of Mobile Forces. Sent to North Africa to report on whether German forces should be dispatched there, he submitted a negative report but urged that, if a commitment were to be made, four armored divisions should be sent. Promoted to brigadier general in August 1940, he received command of the elite 3rd Panzer Division.

In July 1941, Thoma replaced Lieutenant General Hans Jürgen von Arnim as commander of the 17th Panzer Division in the Soviet Union and participated in the encirclement of Smolensk and Kiev. That September, he assumed command of the 20th Panzer Division in the Moscow region, a post he held until January 1942.

In September, having been promoted to head a corps as a major general, Thoma was ordered to North Africa in command of the Afrika Korps. He arrived there in time to participate in the October Battle of El Alamein, when British General Bernard Montgomery's Eighth Army took the offensive against Axis forces. On the death of General Georg Stumme, Thoma briefly commanded Panzerarmee Afrika and was promoted to lieutenant general. Adolf Hitler then ordered Field Marshal Erwin Rommel to return to Africa from sick leave and resume command. On his arrival on 25 October, Rommel criticized Thoma for his tactics.

Thoma had been slightly wounded in the fighting, and he reported to Rommel that he had only 35 tanks remaining. Rommel ordered a withdrawal, which Hitler countermanded. On 4 November 1942, complaining of Hitler's “unparalleled madness,” Thoma donned a clean uniform, put on his medals, and climbed into a tank, racing from one point to another on the front lines in the thick of the battle. His tank was hit

several times and caught fire, and Thoma was taken prisoner. That same night, he dined with Montgomery but refused to discuss German strategy in the battle. Released from prison in early 1948, Thoma died in Starenberg, Germany, on 30 April 1948.

Timoshenko, Semen Konstantinovich (1895–1970)

Soviet marshal who had numerous commands during the war and served as defense commissar between 1940 and 1941. Born in the village of Furmanka, near Odessa in Ukraine, on 18 February 1895, Semen Timoshenko was drafted into the Russian army in 1915. He served as a machine gunner and was decorated. In 1917, then a noncommissioned officer (NCO), he was jailed for striking an officer, but he was freed during the Russian Revolution. Timoshenko joined the Red Army in April 1918 and earned his military reputation in the Russian Civil War, fighting at Tsaritsyn (later Stalingrad), near Warsaw, and in the Crimea. A man of great personal courage, he also developed a friendship with Josef Stalin, to whom he remained intensely loyal.

Virtually illiterate until he began his military schooling, Timoshenko duly graduated from the Frunze Military Academy in 1922, from cavalry schools, and from the Lenin Political Academy in 1930. He then held a succession of military commands. In August 1933, he was appointed deputy commander of the Belorussia Military District. He went on to head the Northern Caucasus, Kharkov, and Kiev District commands. He escaped persecution in the Great Purges and certainly benefited from the execution of thousands of fellow officers.

A member of the Supreme Soviet on its creation in 1937, Timoshenko retained this position for life. In September 1939, he commanded the Ukrainian Front in the Soviet occupation of eastern Poland. When Soviet forces performed poorly in the Finnish-Soviet War, Stalin appointed Timoshenko to command in Finland on 7 January 1940.

The day after being promoted to marshal on 7 May 1940, Timoshenko succeeded Kliment Voroshilov as defense commissar. Rough and blunt, he was, in many ways, unsuited for high command. He worked to rebuild the Red Army, although

Marshal of the Soviet Union Semen Timoshenko. (Corbis)

he slavishly followed Stalin's guidelines. As such, he must bear, along with Stalin, responsibility for the military debacle that followed the German invasion of 22 June 1941. Initially, Timoshenko refused authorization for Soviet commanders to return fire. On 21 July, he yielded the post of defense commissar to Stalin and became commander in chief of the Western Front, where he had some success in delaying the German advance.

Transferred to command the Southwestern Front in September 1941, Timoshenko failed to prevent a German breakthrough to the Crimea and the disaster of the Kiev encirclement, which, however, could be blamed on Stalin's refusal to allow a withdrawal. He was transferred to the Finnish Front in January 1942 and remained there through May, then he was back in the Ukraine, where his offensive at Kharkov that month failed. During the remainder of the war, he served in lesser assignments and, at one point or another, commanded operations on the Northern Caucasus, 2nd and 3rd Baltic, and 2nd, 3rd, and 4th Ukrainian Fronts.

After the war, Timoshenko commanded the South Ural Military District between 1946 and 1949 and the Belorussian Military District in 1946 and again from 1949 to 1960. Timoshenko died in Moscow on 31 March 1970.

Tinian, U.S. Invasion of (24 July–1 August 1944)

U.S. action in the Marianas chain, located in the west-central Pacific. Located some 3 miles south of the island of Saipan, Tinian Island is roughly 13 miles long from north to south and 5 miles wide from east to west. It was the site of an amphibious landing by the U.S. Marines on 25 July 1944 as part of Operation FORAGER, itself part of the U.S. Navy's campaign across the Central Pacific as directed by the Pacific Fleet commander, Admiral Chester Nimitz. The invasion of Tinian followed assaults, also part of FORAGER, on Saipan and Guam

in the Marianas. Saipan was secured between 15 June and 9 July, and Guam—a U.S. territory taken by Japan at the beginning of the war—was recaptured between 21 July and 12 August 1944.

In the summer of 1944, the Marianas were an important part of the Japanese defensive ring, sitting astride the Pacific supply routes to Japan's home islands. U.S. Navy planners decided to seize the islands to provide forward naval bases for the Allied push toward the home islands, to interdict Japanese supply lines, and to draw out the Japanese fleet so that it might be engaged in decisive battle. This engagement did indeed occur, resulting in significant aircraft and ship losses for Japan in the Battle of the Philippine Sea, also known by the Americans as "the great Marianas turkey shoot." U.S. Army Air Forces' planners strongly advocated the Marianas operation to provide air bases from which Boeing B-29 Superfortress bombers might strike Japan. Tinian was especially valuable for airfields because it was relatively flat.

General Obata Hideyoshi, the commander of the Japanese Thirty-First Army, directed the defense of the Marianas, and Colonel Ogata Takashi commanded the reinforced 50th Infantry Regiment and other supporting army and navy

From Coast Guard–manned landing craft, U.S. soldiers waded through a shallow surf to the beach of Tinian Island. (National Archives)

forces on Tinian. Ogata had a total of some 8,000 to 9,000 men. The Japanese expected the assault, and the defenders did what they could with their limited resources to prepare, determined to inflict as many casualties on the Americans as possible.

In Operation FORAGER, Vice Admiral Richmond Turner commanded the Joint Amphibious Forces and Marine Lieutenant General Holland Smith commanded the landing forces. Rear Admiral Henry W. Hill served as the commander of the assault forces for Tinian, and Marine Major General Harry Schmidt led the landing force. U.S. ships and both army and navy aircraft subjected Tinian to a heavy preparatory bombardment, during which napalm was first used. Additionally, since Tinian was only 3 miles from Saipan, Marine and army artillery units there contributed gunfire support to the invasion force.

The landing forces embarked from Saipan several days before the 24 July landing on Tinian. Vice Admiral Turner wanted the landing to take place on the more suitable but more heavily defended southwestern beaches, but the Marines insisted it occur on two small northern beaches (allowing only one division to come ashore at a time), and Turner reluctantly agreed. A feint at the southern beach served to attract much of the defenders' attention, while the V Amphibious Corps, consisting of the 4th Marine Division and then the 2nd Marine Division, went ashore to the north. U.S. artillery on Saipan and aircraft flying from that island provided support throughout the battle.

The Marines overcame fierce Japanese counterattacks and were able to declare Tinian secure on 1 August. Almost all Japanese defenders died in the fighting. U.S. casualties included 389 killed in action and more than 1,800 wounded.

Navy Seabees quickly converted Tinian into a massive air-support facility. Soon, B-29s of the Twentieth Air Force were striking Japanese cities. Additionally, Seventh Air Force fighters and bombers supported other operations in the Central Pacific, including the subsequent invasions of Iwo Jima and Okinawa. Tinian was also the home base for the two atomic bomb missions at the end of the war.

Tiso, Jozef (1887–1947)

Slovak nationalist leader named president of the Slovak Republic in 1939. Born on 13 October 1887 at Velka Bytca, Slovakia (then Hungary), Jozef Tiso was ordained a Roman Catholic priest in 1910. In 1918, he helped to found the Slovak People's Party (SPP). Tiso represented the SPP in the Czechoslovakian Parliament in 1925 and served as minister of health between 1927 and 1928. With the death of SPP leader Andrej Hlinka in August 1938, Monsignor Tiso took over as head of the party.

On 6 October 1938, he became prime minister of an autonomous Slovakia created under the terms of the Munich Pact. In March 1939, the Czechoslovakian government deposed him for promoting Slovak independence, but Tiso received

Josif Tiso, appointed prime minister of Slovakia when the German Reich took it under its "protection" on 16 March 1939. (Corbis)

Adolf Hitler's support during a visit to Berlin on 13 March, and the following day, he proclaimed Slovak independence. The Germans occupied Czechoslovakia on 15 March, and on 16 March, Tiso placed the new Slovak state under the protection of Germany, primarily to avoid its annexation by Hungary.

On 26 October 1939, Tiso became president of the newly created Slovak Republic. Although he personally opposed Nazism, he was forced to share power with the fascist paramilitary Hlinka Guards, and his government willingly collaborated with the Germans, allowing some 68,000 Slovakian Jews to be deported to German concentration camps.

Tiso's government survived an internal uprising in August 1944 but fell to the Red Army and Czech partisans in April 1945. Tiso fled to Austria but was apprehended by U.S. authorities and extradited to Czechoslovakia, where he was tried and convicted of treason and war crimes. He was executed by hanging at Bratislava, Czechoslovakia, on 18 April 1947. Largely as a consequence of his authoritarian, collaborationist regime, the postwar Communist government of Czechoslovakia treated the Slovaks as second-class citizens and repressed the Catholic Church.

Tito (born Broz, Josip) (1892–1980)

Yugoslav Resistance leader and later the head of Yugoslavia. Born into a peasant family in the village of Kumrovec in Croatia, then part of the Austro-Hungarian Empire, Josip Broz was apprenticed to a mechanic. He then followed this trade, traveling throughout the Dual Monarchy. In 1913, he was drafted into the Austro-Hungarian army. An excellent soldier, Broz was a sergeant major commanding a platoon in a Croatian regiment at the outbreak of World War I, and he fought on the Carpathian Front against the Russians until his capture in 1915. While a prisoner of war, Broz became fluent in Russian. Released following the March 1917 Russian Revolution, he joined the Bolsheviks at Petrograd but was then a political prisoner until the Bolsheviks took power in October 1917.

Broz fought in the Red Guard during the Russian Civil War but returned to Croatia in 1920 to take an active role in the

Josip Tito, leader of Communist Partisan movement in Yugoslavia. (Bettmann/Corbis)

Yugoslav Communist Party (YPJ). His underground work, often conducted from jail, brought his rapid rise in the party apparatus as a member of the YPJ Politburo and Central Committee. He took the pseudonym "Tito" for security reasons.

Imprisoned from 1929 to 1934, Tito became secretary general of the YPJ in 1937. Following the German invasion of Yugoslavia in April 1941, he assumed command of the Communist Partisan movement, with the twin goals of expelling the Germans and ultimately securing control of the government. Tito and the Partisans employed guerrilla tactics to compensate for their lack of advanced weaponry. His Partisans were in competition with the Serbian-dominated Četniks (Chetniks) led by General Dragoljub "Draza" Mihajlović, minister of war in the exiled government. For the most part, the Četniks were unwilling to embark on the types of actions that would bring widespread reprisals by the Germans against the Yugoslav population, whereas the Partisans had no such inhibitions. In a controversial decision that had far-reaching repercussions for the political future of Yugoslavia, the British government, which provided the Allied military support for the Yugoslav Resistance, shifted all support to the Partisans in 1943.

Tito's Partisans grew to a force of 800,000 men and women by the end of the war, tying down a large number of Axis divisions. By then, Tito was in full control of Yugoslavia, and he insisted that the Red Army ask permission to enter Yugoslavia in pursuit of the Germans. Tito's forces attempted to annex the southern provinces of Austria, moving into Carinthia. The seizure of this territory was only prevented by the timely arrival of the British V Corps. The Yugoslavs were finally convinced by threat of force to leave Austria in mid-May 1945.

Tito took his revenge on the Croats, many of whom had been loyal to the Axis powers, as had the Slovenes. Perhaps 100,000 people who had sided with the Germans were executed by the Partisans without trial within weeks of the war's end. The majority of German prisoners taken in the war also perished in a long "march of hate" across Yugoslavia.

With the support of the Red Army, Tito formed the National Front and consolidated his power. He nationalized the economy and built it on the Soviet model. He often went his own way in matters of foreign policy, leading to a break with the Soviet Union in 1948. After that, he became more pragmatic in economic matters and allowed a degree of decentralization. He claimed there might be "different paths to socialism," giving birth to what became known as "polycentralism."

Tito traveled widely and became one of the principal leaders of the nonaligned nations. By 1954, however, he had ended reform, and in the mid-1970s, the Yugoslavian economy began to falter and nationalist pressure from various ethnic groups threatened to break up the state. Tito died on 4 May 1980, in Ljubljana, Yugoslavia. The complicated federated state system that he had decreed did not long survive his death, as the various ethnic groups asserted their independence.

August 1885, Henry Tizard studied math and chemistry at Magdalen College, Oxford, and established his academic reputation with the publication of a paper on the color changes of indicators in 1911. Tizard joined the Royal Garrison Artillery at the start of World War I. In June 1915, he transferred to the Royal Flying Corps as an experimental equipment officer, testing bombsights and then aircraft. In 1917, he published his scientific system for investigating the performance of aircraft. As a lieutenant colonel, he was assigned to the headquarters of the Ministry of Munitions in 1917.

Tizard left the army and returned to Oxford as a lecturer in the spring of 1919. There, he conducted pioneering work on aviation fuel, which led to a new understanding of the internal combustion engine. He accepted an invitation to join the Department of Scientific and Industrial Research in 1920, and by 1927, he was its permanent secretary. He was largely responsible for establishing the Chemical Research Lab. Tizard became rector of the Imperial College of Science and Technology in 1929, a post he held until 1942. He was also increasingly involved with defense matters as a member of the Aeronautical Research Committee, which he chaired from 1933 to 1943, as he did the engine subcommittee.

That period saw revolutionary advances in aircraft and engines as well as research into ways to defend against hostile aircraft. The Air Ministry appointed Tizard to head a committee that would apply technical and scientific knowledge to strengthening British air defenses. Known as the Tizard Committee, it first met in January 1935. Its efforts led to the development and deployment of ground and airborne radar in time for the Battle of Britain and the Battle of the Atlantic. Britain led the world in such work, and Tizard was knighted in 1937.

Tizard was instrumental in establishing a government group to conduct scientific intelligence, and he also investigated the feasibility of an atomic bomb. His greatest service to the war effort, however, may have been the mission he headed to Canada and the United States in August 1940. Tizard proposed that Britain share its most sensitive technical secrets with the United States. Ultimately, Britain provided full information on radar and the cavity magnetron.

On his return to Britain, Tizard became a semiofficial adviser to the minister of aircraft production and served on the Air Council. He did not get along with Frederick A. Lindemann (later Lord Cherwell), Prime Minister Winston L. S. Churchill's scientific adviser, which led Tizard to accept the presidency of Magdalen College, Oxford, in 1942, although two years later, he agreed to chair a new committee to study the potential effects of new weapons on defense policy. He left Magdalen College in 1946 and returned to Whitehall as chairman of the Defence Research Policy Committee and the Advisory Council on Scientific Policy. He retired in 1952. Tizard died in Fareham, Hampshire, England, on 9 October 1959.

Tobruk, First Battle for (6–22 January 1941)

North African battle between Italian and British forces. The Mediterranean port of Tobruk, located in northeast Libya some 70 miles from the Egyptian border, was an important focal point in the North Africa fighting between 1941 and 1942. On 9 December, 1940, Major General Richard O'Connor's Western Desert Force launched Operation COMPASS to drive invading Italian forces from Egypt. On 11 December at Sidi Barrani in Egypt, O'Connor's unit soundly defeated the Italians but was unable to capitalize on this victory immediately, as one of its two divisions, the Indian 4th Division, was withdrawn for service in the Sudan several weeks before the arrival of the replacement Australian 6th Division.

Following this necessary pause, O'Connor's forces crossed into Libya, and on 5 January 1941, they took Bardia on the coast, just across the border and east of Tobruk. On 6 January, the British 7th Armoured Division (the Desert Rats) and the Australian 6th Division assaulted Tobruk, completely besieging the fortress there three days later.

Italian Lieutenant General Pitassi Mannela defended Tobruk with 32,000 men, 220 guns, and 70 tanks along a defensive perimeter of some 30 miles. Following preparations, the Australian 6th Division launched an attack on the morning of 21 January. It began with the largest artillery barrage in the western desert to that point, on a front about 2,500 yards wide along the southeast portion of the Italian perimeter, and it was supported both by British naval gun fire against the town itself and by Royal Air Force (RAF) bombers. Bangalore torpedoes blasted holes in the Italian wire, and the infantry moved forward, supported by Matilda tanks. That portion of the Italian defensive line was secured, and General Mannela was taken prisoner. The remainder of the Italian garrison surrendered the next day but not before destroying some of the port facilities.

At Tobruk, for a cost of some 500 casualties, the British took 25,000 prisoners. They also captured 208 guns, 23 medium tanks, and 200 trucks. In the campaign thus far,

O'Connor's forces had taken 100,000 Italian prisoners. The British were soon able to get the port of Tobruk back into working order. Most of the city, including two water-distillation plants, was undamaged. O'Connor then continued his drive west.

At Tobruk in 1941, British forces captured 25,000 prisoners, 208 guns, 23 medium tanks, and 200 trucks with only 500 British casualties.

Tobruk, Second Battle for (April 1941–January 1942)

Important land battle between the Afrika Korps (Africa Corps) and British Commonwealth forces in Tripoli, Libya, North Africa. Spearheaded by German Lieutenant General Erwin Rommel's 5th Light Division (later reconstituted as the 21st Panzer Division), Axis forces had driven Commonwealth units back through Cyrenaica to the Egyptian border in March and April 1941. Allied losses had been heavy, but the commander in chief for the Middle East, Lieutenant General Archibald Wavell, had made the crucial decision to defend the port of Tobruk.

Initially garrisoned by the Australian 9th Division, Tobruk repulsed several Axis attacks during mid-April. Throughout the following siege, Allied naval units and aircraft provided critical supplies and reinforcements to the garrison. During the summer and fall, Germany sent in the nonmotorized Afrika Infantry Division, the remainder of the 15th Panzer Division, and some miscellaneous German units. Italy supplied both regular infantry and Bersaglieri, artillery, and better armor elements, upgrading its previously poor-performing units. All this was in preparation for an Axis seizure of Tobruk, followed by an advance on Egypt.

Axis forces also established a line of interlocking fortified posts at Bardia and along the Egyptian border, built around the Savona Division. Between Tobruk and the border, Rommel, nominally under the command of the Italian governor

British soldiers patrolling in tanks at Tobruk, Libya. (Library of Congress)

of Libya, General Ettore Bastico, established armor units centered on the Afrika Korps. The Italian Maneuver Corps was in support; it consisted of the Ariete Armored Division and elements of the Trieste Motorized Division.

In May and June, General Wavell conducted Operations *BREVITY* and *BATTLEAXE*, respectively, in an attempt to break through the frontier line and to relieve Tobruk. Both failed, and Wavell was relieved and replaced by Lieutenant General Claude Auchinleck. Under him, Lieutenant General Alan Cunningham commanded Eighth Army. Auchinleck began gathering his growing strength for Operation *CRUSADER*, scheduled for November, while Rommel brought in siege artillery for a final assault of the now largely British-garrisoned Tobruk.

The Allies struck the first blow, their well-camouflaged preparations being complete by 17 November. The two-pronged Allied operation consisted of a slow but steady advance along the coast road by infantry and heavy tanks, while inland, Cunningham moved with his armor units. A portion of the Ariete Division repulsed the British 22nd Armour Brigade at Bir el Gobi on 18 November, but it was not until two days later that Rommel began to react to the Allied attack.

As Rommel shifted armored forces to attack and hammer some of the Allied mobile units, the British 70th Division in Tobruk assaulted the largely Italian infantry units holding the siege lines. Rommel wanted to force the Allies back so he might make his “dash to the wire” (the barbed wire along the Egyptian border erected by the Italians in the 1930s), but his advance failed to disrupt the Allies or to capture Allied supply dumps. Believing Cunningham was moving too slowly, Auchinleck replaced him with Lieutenant General Neil Ritchie. Meanwhile, the elite 2nd New Zealand Division continued its advance to link up with the 70th Division at Tobruk.

Throughout this period, the Allied naval stranglehold in the Mediterranean kept supplies from arriving in North Africa. The dramatic destruction of the *Duisburg* convoy on the night of 8–9 November resulted in the temporary halt of all Axis convoys to Libya at the same time that Rommel’s battles exhausted his ammunition and tanks. He had no choice but to retreat.

As Axis forces began to pull back near Gazala, just west of Tobruk, and the Allies linked up with Tobruk, the Second Battle of Bir el Gobi occurred on 4 December. The *Giovani*

Fascisti (Young Fascists), a two-battalion volunteer unit, held off the advance of a brigade of the 4th Indian Division. However, with this battle and one other small action, Bastico and Rommel were in agreement by the middle of the month that Axis forces had to fall back through Cyrenaica in mid-December. The retreat went well, although all of Cyrenaica was lost. Isolated Axis units along the border were forced to surrender. The first German general of the war to be captured, Major General Arthur Schmitt, and 13,800 men marched off to prisoner-of-war camps.

This action was the first major victory by the British against an army with a substantial German element. Axis forces had sustained 38,300 casualties, with almost 30,000 of them prisoners. Allied losses were only 17,700 (7,500 prisoners).

The Axis supply situation from Italy soon improved, enabling the shipment of important reinforcements to North Africa. In January 1942, an Axis counterattack went as far as Gazala, where both armies would face each other over the next several months.

Tobruk, Third Battle of (20–21 June 1942)

The port of Tobruk in eastern Libya held great military significance but had also become a symbol of Allied defiance

German Ju-87 Stuka bombers flying over Tobruk, 21 June 1942. (Keystone/Getty Images)

after it had withstood an eight-month Axis siege. During the 1941–1942 winter, the British commander in the Middle East, General Claude Auchinleck, had decided not to defend Tobruk in the event of another Axis advance. At the last moment, British Prime Minister Winston L. S. Churchill reversed this decision, and in March 1942, the 2nd South African Division took over the defense of Tobruk. The Tobruk garrison consisted of two brigades of the 2nd South African Division, the 11th Indian Brigade, the 201st Guards Brigade, and the British army's 32nd Tank Brigade with 61 operational Valentine tanks and a few Matildas. South African Major General H. B. Klopper exercised command, but he and his men had little time to prepare for an approaching Axis assault. The defenses had deteriorated over time, and many of the mines had been removed and placed on the Gazala Line. As Major General Ettore Baldassarre's Italian XX Motorized Corps and Major General Walther Nehring's Afrika Korps (Africa Corps) approached, the overall Axis commander, Lieutenant General Erwin Rommel, feinted toward the Egyptian border as if in pursuit of Major General Neil N.

Ritchie's retreating British Eighth Army; then he wheeled north to the eastern end of the Tobruk defenses, which he reached on 18 June. In 1941, Rommel had attacked the western end and failed in a series of bloody assaults. This time, however, he had both momentum and surprise on his side, and he was determined not to leave an enemy's fortified position to his rear as he advanced eastward.

The Axis attack began at dawn on 20 June 1941, led by assault engineers and supported by air attacks. The Afrika Korps had the most success, and the Italian XX Corps followed through a break in the defenses created by the Afrika Korps. A series of rapid movements within the fortress itself paralyzed the Allied response, and by the evening of 21 June, the last of the garrison had surrendered, destroying as many supplies and as much of the port facilities as possible beforehand.

The Allies had 32,220 troops captured, including virtually all of the 2nd South African Division. Axis forces also secured invaluable supplies, including nearly 2,000 tons of fuel, 5,000 tons of food, 2,000 vehicles, and large amounts of ammuni-

tion (including both German and Italian stores). This booty was of immense help to Rommel in resuming his eastward drive, although there was considerable squabbling over its distribution.

The fall of Tobruk provided a supply port for the Axis forces close to the front. Moreover, it was a tremendous psychological blow to the Allies. With this and the Axis victory at Gazala earlier in the campaign, Rommel and the Italian commander in chief in Libya, General Ettore Bastico, were promoted to field marshals. Conversely, the Allied defeat led Britain's Middle Eastern commander, Auchinleck, to remove Ritchie from command of Eighth Army on 25 June and assume that position himself. The fall of Tobruk also led Adolf Hitler to delay an assault against Malta in favor of allowing Rommel to continue his advance eastward toward the Nile, setting the stage for the great First Battle of El Alamein.

Todt Organization (OT)

Organization Todt (OT), named for German Minister of Arms and Munitions Fritz Todt, handled construction projects throughout territory occupied by the German army during World War II. Formed in 1933 by Todt, then head of technology and road construction, the OT was at first chiefly identified with construction of the great autobahn road system in Germany that was the pride of the Third Reich. In 1938, German leader Adolf Hitler assigned OT the task of quickly completing the West Wall (also known as the Siegfried Line), defenses in western Germany that were designed to hold back a French army attack in order to allow Germany to concentrate

Fritz Todt leading procession along the new Autobahn from Halle to Leipzig, Germany, 6 May 1936. (Bettmann/Corbis)

its military resources in the east. Todt was an adroit manager, and in record time, some 500,000 workers constructed 5,000 concrete bunkers.

With the beginning of World War II, the OT provided the German army with engineers and construction specialists involved in the building and repair of bridges, dams, airfields, and fortifications, as well as factories. In March 1940, Todt became the Reich's minister of arms and munitions. The OT was in fact the only organization in the Third Reich, apart from the Hitler Youth, that bore the name of a member of the governing elite.

Following the German invasion of the Balkans in the spring of 1941, the OT was in charge of extracting minerals there and shipping them to the Reich. With the invasion of the Soviet Union, it took on the great responsibility of reconstructing and maintaining the Soviet transportation network. OT also made use of vast numbers of conscript laborers throughout German-occupied Europe. In all, the OT mobilized some 1.4 million people, 80 percent of whom were non-Germans (many were prisoners of war).

OT's most ambitious task was the construction of the Atlantic Wall, the German defenses against an invasion of France by the Western Allies; it ran from Norway to the Bay of Biscay. On this effort, the OT expended some 13.3 million tons of concrete and 1.2 million tons of steel in 3,000 fortifications. The ruins of many of these may still be seen today. The OT also built the submarine pens in France that proved so difficult for Allied aircraft to destroy.

Following Todt's death in an airplane crash in February 1942, his assistant, Albert Speer, took over the organization, and under him, it reached its greatest extent. Increasingly, the OT was involved in cleaning up bomb damage from Allied air raids on Germany. In autumn 1944, the organization was renamed the Front-OT, when it was armed and enlisted in the defense of German territory.

Tōgō Shigenori (1882–1950)

Foreign minister of Japan from 1941 to 1942. Born in Kagoshima Prefecture, on Kyushu, on 10 December 1882, Tōgō Shigenori graduated from Tokyo Imperial University in

Japanese Foreign Minister Tōgō Shigenori. (Corbis)

1908 and became a member of the faculty of Meiji University. He joined the Foreign Ministry as a moderate in 1912. Developing an expertise in European and American affairs, he served in a number of increasingly senior posts at home and abroad during the 1920s and 1930s. From the mid-1930s, Tōgō emerged as a vocal, if ineffective, critic of the diplomatic orientation toward Nazi Germany that accompanied the military's growing domination of the Japanese government. He opposed the decision of Foreign Minister Hirota Kōki to conclude the Anti-Comintern Pact with Germany, which both countries nonetheless signed in November 1936.

Ironically, Tōgō became ambassador to Germany in 1937, but his tenure was short because of his views, and in 1938, pro-Nazi Ōshima Hiroshi replaced him. That same year, Tōgō became ambassador to the Soviet Union, where he played a major role in settling a long-standing dispute over fishing rights in the northern Pacific. He also helped to prevent the Soviet-Japanese border clash at Nomonhan from becoming a full-scale war in the summer of 1939. Tōgō then launched an initiative to conclude a nonaggression pact with the Soviets. Although unsuccessful at the time, those negotiations helped to lay the groundwork for the Japanese-Soviet Neutrality Pact of April 1941.

In November 1940, two months after the government concluded the Tripartite Pact with Germany and Italy, Tōgō was recalled to Japan. Despite his opposition to the pact, Tōgō became foreign minister in the cabinet of Prime Minister Tōjō Hideki in October 1941. As Japan prepared for war with the United States and other Western powers in Asia and the Pacific, he continued to conduct last-minute negotiations with Washington through Japanese Ambassador Nomura Kichisaburō and Special Envoy Kurusu Saburō.

Following the outbreak of hostilities in the Pacific on 7 December 1941, Tōgō and the Foreign Ministry were increasingly marginalized within the Japanese government. In the summer of 1942, the Tōjō cabinet established the Greater East Asia Ministry, an umbrella organization charged with coordinating Japanese policy in occupied areas of China and Southeast Asia. Tōgō opposed the creation of the new ministry, not only because it took over part of the conduct of Japan's foreign relations but also because it drew personnel away from the Foreign Ministry. He resigned from his post in protest on 1 September 1942, when Tōjō himself took over the Foreign Ministry portfolio.

After resigning, Tōgō was appointed to the House of Peers, where he remained throughout most of the war. In April 1945, he became foreign minister in the cabinet of Suzuki Kantarō. An advocate of pursuing an early peace before Japan lost all diplomatic leverage, Tōgō hoped at least to be able to preserve the Imperial throne. He continued an ultimately abortive effort to secure Soviet mediation with the United States during the summer of 1945. With Japan facing imminent destruction by August 1945, the Suzuki cabinet remained deadlocked over the issue of accepting unconditional surrender or fighting to the finish. By that time, Tōgō had emerged as the cabinet's most forceful opponent of the military's plans for a last-ditch defense of the home islands. Following the atomic bombings of Hiroshima and Nagasaki on 6 and 9 August and the Soviet declaration of war and invasion of Manchuria on 9 August, Emperor Hirohito himself broke the deadlock in favor of peace. On 15 August 1945, Hirohito announced Japan's surrender.

After the war, Tōgō was tried for war crimes by the International Military Tribunal for the Far East in Tokyo. He was accused of conspiring with the militarists to wage aggressive war by conducting bad-faith negotiations with the United States in order to give the military time to complete its final preparations. Tōgō acknowledged that he was aware of the plans for the surprise attack on Pearl Harbor, but he claimed that he was forced by the military into continuing negotiations with the United States even after the decision for war had been made. Nevertheless, Tōgō was convicted on the charge of conspiracy to wage aggressive war and received a 20-year sentence. He died in Sugamo Prison, in Tokyo, on 23 July 1950.

Tōjō Hideki (1884–1948)

Japanese army general and prime minister from 1941 to 1944. Born in Tokyo on 30 December 1884, Tōjō Hideki graduated from the Military Academy in 1905. A career staff officer, he served as an attaché in Europe in the early 1920s. During the early 1930s, he associated himself with the Control Faction, an influential clique within the Japanese military that favored military cooperation with the civil bureaucracy and large corporations to expand Japanese influence in China. The failure of a coup attempt by the rival Imperial Way Faction in February 1936 paved the way for the Control Faction's domination of the army and eventually of Japan itself.

Because of his position as one of the Control Faction leaders, Tōjō's career in the late 1930s prospered. In 1938, he was recalled to Tokyo from Manzhouguo (Manchukuo), where he had been serving on the staff of the Guandong (Kwantung) Army, to take up an appointment as a vice minister of the army. In 1940, he became army minister in the cabinet of Konoe Fumimaro. An ardent militarist determined to advance Japanese power by force of arms, Tōjō was a keen supporter of the Axis alliance with Nazi Germany and expansion of the war in China.

Following the collapse of the Konoe cabinet in October 1941, Tōjō, still an active army officer, was appointed prime minister in an atmosphere of escalating tension with the United States. As prime minister, he did nothing to alleviate those tensions but rather prepared Japan for a war that he considered inevitable. On 7 December 1941, Japan initiated hostilities in the Pacific with its attack on Pearl Harbor.

Following an early succession of victories in Southeast Asia and the Pacific during 1941 and 1942, it became increasingly apparent that Tōjō and other Japanese leaders had grossly underestimated the political will and resources of the United States and its allies. In view of Japan's growing matériel inferiority, Tōjō attempted to centralize and coordinate the war effort by taking personal control of key posts in the cabinet and in the army in 1943 and 1944. These actions,

Japanese General and Prime Minister Tōjō Hideki, January 1942. (Photo by MPI/Getty Images)

however, aroused opposition among members of powerful civil and military circles who resented Tōjō's intrusions. He also made a vain attempt to cultivate closer relations with Japan's Asian neighbors by convening the Greater East Asia Conference in November 1943. But the conference, which was attended by Japanese-sponsored puppet rulers from China and Southeast Asia, merely produced a vague declaration of Asian solidarity.

Under increasing pressure from his military and political rivals, who held him responsible for Japan's mounting defeats, Tōjō resigned in July 1944 after the fall of Saipan. Koiso Kuniaki became the new prime minister. Following Japan's surrender on 15 August 1945, Tōjō was tried and convicted of war crimes. He was hanged in Tokyo on 23 December 1948.

Tokyo, Bombing of (18 April 1942)

On 18 April 1942, 16 U.S. Army Air Forces (AAF) B-25 Mitchell bombers, launched from the aircraft carrier *Hornet*, bombed Tokyo and other Japanese cities. They were led by Lieutenant Colonel James "Jimmy" Doolittle. Although physical damage caused by the Doolittle raid was slight, the psychological and military impacts were considerable.

The original idea to launch twin-engine army bombers against Japan from a navy ship came from Captain Francis Low, a submariner on Chief of Naval Operations Admiral Ernest J. King's staff. The mission was planned at the highest levels and had the full support of King and Lieutenant General Henry H. Arnold, the chief of the AAF. President Franklin D. Roosevelt approved the plan. Doolittle, the army liaison officer, secured command of the mission. He and his handpicked crews trained on short landing fields, but none had made a takeoff with a fully loaded aircraft from a carrier until the actual mission. The plan required each B-25 to drop 1 ton of bombs on its specified target, fly to Zhuzhou (Chuchow), China, to refuel, and then proceed 800 miles farther to Chungking.

Unfortunately, the U.S. ships were spotted early by a Japanese picket boat. Task force commander Vice Admiral William "Bull" Halsey decided to launch the aircraft about 200 miles early, 650 miles from the coast. Most of the planes dropped their loads, each consisting of two 500-pound high-explosive bombs and two 500-pound incendiary bombs, on Tokyo, although others hit Kobe, Yokohama, and Nagoya. The Americans were lucky in attacking soon after a practice air-raid drill, when defenses were relaxed.

The combination of the early launch, inaccurate maps, and the lack of a radio at Chuchow meant that the B-25s had no place to land. Most of the crews headed for friendly Chinese territory and bailed out or ditched, although one plane landed at Vladivostok (the crew was interned in the USSR). All the planes were lost. Of the 80 crewmen, 3 were killed, 4 were seriously injured, 5 were interned, and 8 were captured by the Japanese. Of the latter group, 3 were executed after a show trial and 1 died in captivity. Their experience inspired the classic 1944 propaganda movie *The Purple Heart*. The Japanese also killed many thousands of Chinese in retaliation for the assistance given the crewmen who escaped.

Although bomb damage from the mission was insignificant, its results were important. President Roosevelt's announcement of the raid launched from "Shangri-La" (his mountain retreat in the Catoctin Hills of Maryland) boosted American morale, and the attack shocked the Japanese nation and embarrassed the government in Tokyo. The Japanese Supreme Command overreacted by assigning extra fighter groups to protect Japan and ordering the Chinese Expedi-

tionary Army to root out enemy air bases there. Most important, the impact of the Doolittle raid allowed Admiral Yamamoto Isoroku to gain final approval for his operation to take the island of Midway and destroy the American carriers, setting the stage for the decisive Battle of Midway in June.

Tokyo, Bombing of (9–10 March 1945)

The B-29 incendiary raid on Tokyo on the night of 9–10 March 1945 was the deadliest air attack of World War II. Conducted as a test of new tactics after disappointing results with precision methods, the raid set the pattern for a new fire-bombing campaign that devastated Japanese cities over the next five months.

By February 1945, the U.S. Twentieth Air Force's strategic bombing campaign against Japan was in trouble. The new commander of its combat operations from the Marianas, Major General Curtis LeMay, knew he had been given the assignment in January to get results. He had reorganized the staff, instituted new training, and designed new maintenance programs, but the achievements of his high-altitude precision-bombing attacks remained disappointing. Besides technological problems with the hastily fielded B-29 Superfortress, the

Incendiary bombs leveled entire city blocks of downtown Tokyo during air raids in 1945. (Corbis)

biggest difficulty he faced was the weather. Overcast skies and jet stream winds at normal bombing altitudes obscured targets and negated flight patterns.

Other theater commanders were trying to gain control of the expensive B-29s, and LeMay knew he could be relieved just as his predecessor had been if he did not produce significant success. He had had some experience with fire raids in China and had conducted some experiments over Japan. Although unsure how higher headquarters would react to a departure from precision bombing, he and his staff decided to destroy key targets by burning down the cities around them. This result would be achieved with low-level, mass night raids. These tactics would avoid high winds, reduce the strain on the B-29s' problematic engines, allow aircraft to carry more bombs, and exploit weaknesses in the Japanese air defenses.

The first raid employing these new tactics, Operation MEETINGHOUSE, was conducted against Tokyo beginning on the night of 9 March. The selected zone of attack covered six important industrial targets and numerous smaller factories, railroad yards, home industries, and cable plants, but it also included one of the most densely populated areas of the world, Asakusa Ku, with a population of more than 135,000 people per square mile. For the first time, XXI Bomber Command had more than 300 bombers on a mission—325 to be exact—and they put more than 1,600 tons of incendiary bombs on the target.

Before the firestorm ignited by Operation MEETINGHOUSE had burned itself out, between 90,000 and 100,000 people had been killed. Another million were rendered homeless. Sixteen square miles were incinerated, and the glow of the flames was visible 150 miles away. Victims died horribly as intense fires consumed the oxygen, boiled water in canals, and sent liquid glass rolling down streets. The B-29 crews fought superheated updrafts that destroyed at least 10 aircraft. They also wore oxygen masks to avoid vomiting from the stench of burning flesh. A total of 14 Superfortresses were lost on the mission.

The attack on Tokyo was judged a great success. It resuscitated the flagging strategic bombing campaign against Japan and restored the hopes of Army Air Forces leaders that the B-29s could prove the worth of independent airpower by defeating an enemy nation without the need for an invasion. MEETINGHOUSE set the standard for the incendiary raids that dominated Twentieth Air Force operations for the remainder of the war.

"Tokyo Rose" (Iva Ikuko Toguri D'Aquino) (1916–)

Japanese propagandist to U.S. troops in the South Pacific during World War II. Toguri D'Aquino achieved notoriety as one of several women who broadcast from Tokyo between 1943 and 1945. "Tokyo Rose" was a moniker created by her listeners, as there is no trace of the name in broadcast records. Born in Los Angeles on 4 July 1916, she graduated from the University of California in Los Angeles with a BS degree in zoology in January 1940 and pursued graduate work there until June, when she began working with her father's business. In July 1941, she sailed for Japan without a U.S. passport, planning to visit a sick aunt and to begin the study of medicine. By September 1941, she had decided to return permanently to the United States and applied for a passport, but that application was still in State Department hands when the war began. By mid-1942, she had worked as a typist for a news agency in Tokyo and then for Radio Tokyo. In November 1943, she began to host *Zero Hour* on Radio Tokyo, part of the Japanese psychological warfare designed to lower U.S. military morale. The 75-minute program was broadcast early each evening. Toguri was variously introduced as Orphan Ann, Orphan Annie, "Your favorite enemy Ann," or "Your favorite playmate and enemy, Ann." The program was popular because it featured recorded big-band music.

Only in early 1944 did Toguri become aware that U.S. troops had given her—and other Japanese women broadcasting over Radio Tokyo—the "Tokyo Rose" title. She was the only American citizen given that nickname; the others were all Japanese. In April 1945, she married Felipe D'Aquino, a Portuguese citizen of Japanese-Portuguese ancestry.

Following her postwar admissions to the press about her wartime role as well as inflammatory stories by columnist Walter Winchell, among others, Toguri D'Aquino was arrested by the U.S. Army in September 1948 and taken to the United States to stand trial for treason. Federal Bureau of Investigation (FBI) inquiries into her activities took several years (the nearly 750-page FBI report is available on the Internet). Her treason trial began in San Francisco on 5 July 1949 and ended on 29 September when the jury delivered a guilty verdict. On 6 October 1949, she was sentenced to 10 years of imprisonment, fined \$10,000, and stripped of her American citizenship. She became only the seventh person to be convicted of treason in U.S. history.

On 28 January 1956, Toguri D'Aquino was released after serving six years and two months of her sentence. She fought

Iva (Tokyo Rose) Toguri D'Aquino on her release from federal women's reformatory, 1956. (Library of Congress)

several efforts at deportation and went to work in the Chicago area. In November 1976, she filed a third petition seeking a presidential pardon (she had applied unsuccessfully in 1954 and 1968). She received a full pardon on 19 January 1977 from President Gerald Ford and now lives in the Chicago area.

concentrate on Germany, the most powerful of the Axis opponents. Indeed, U.S. planners, especially Army Chief of Staff General George C. Marshall, sought the earliest possible invasion of France. They supported GYMNAST, a British contingency plan based on a cross-Channel invasion, and ROUNDUP, a 48-division invasion of France projected to occur by April 1943. However, the failure of the attack on Dieppe, France, on 19 August 1942 (Operation JUBILEE) led the Americans to concede that a cross-Channel invasion lay many months if not years in the future. Winston L. S. Churchill and British planners, meanwhile, attempted to interest the United States in a more opportunistic approach that would include operations in the Mediterranean Theater.

Roosevelt had promised Soviet leader Josef Stalin that the Western Allies would undertake an invasion by the end of 1942, and he was determined to honor that pledge. But if a cross-Channel invasion was impossible, where might such an assault be mounted? Churchill argued for attacks against what he termed the "soft underbelly of Europe," in the Mediterranean. Even before the Dieppe raid, Roosevelt and Churchill had settled on an invasion of North Africa, supposedly not to the exclusion of ROUNDUP.

TORCH, Operation (8 November 1942) and Aftermath

The Allied invasion of North Africa. Following the Japanese attack on Pearl Harbor, U.S. President Franklin D. Roosevelt agreed with the British position that the Allies should first

Some of the many vessels in the Allied convoy crossing the Atlantic to the North African coast to take part in Operation TORCH, November 1942. (Corbis)

Gaining control of Vichy-administered Morocco, Algeria, and Tunisia would provide bases from which the Allies could conduct both air operations to help protect their Mediterranean shipping and strategic bombing raids against targets in southern Europe. The area would also offer a location from which to mount invasions of such Mediterranean islands as Sicily, Sardinia, and Crete or even mainland Europe in Italy or Greece. Further, an invasion of northwest Africa would provide badly needed combat experience for inexperienced U.S. troops but against a military substantially inferior to the German Wehrmacht.

Roosevelt became the chief proponent of the operation and insisted on it over the objections raised by many of his own service chiefs, including Marshall. The invasion, code-named TORCH, was timed to coincide with the planned breakout of British Empire forces at El Alamein in Egypt; the Allies hoped to crush Axis troops in a pincer movement between the two forces. On 23 October, British Eighth Army commander

General Bernard Montgomery initiated the final contest for control of North Africa in Operation LIGHTFOOT, the Battle of El Alamein. Superior British resources carried the day against tenacious Axis resistance, and by 2 November, the Eighth Army had broken through. The army then began a pursuit of German Field Marshal Erwin Rommel's Axis forces, which made good their escape. Again and again, Axis forces eluded Montgomery's lethargic encirclement attempts.

On 8 November, British and U.S. forces carried out their surprise landings in Morocco and Algeria, the largest amphibious operation in history to that time. The British had favored landings in central North Africa, at Tunis and Bizerte in Tunisia, or at least at nearby Bône in eastern Algeria, but the Americans were more cautious and won the point. The landings occurred at Casablanca in Morocco and at Oran and Algiers in Algeria. U.S. Army Lieutenant General Dwight D. Eisenhower, commanding U.S. troops in Britain, was appointed commander in chief, Allied Expeditionary Force. His deputy was another

American, Major General Mark W. Clark. Eisenhower saw to it that both U.S. and British officers were thoroughly integrated within his staff, and British Fleet Admiral Andrew B. Cunningham directed all naval forces.

The most westerly landing, at Casablanca on the Atlantic, assured the Allies a lodgment in North Africa even if the other two landings inside the Mediterranean went awry. Major General George S. Patton commanded the Western Task Force of 38,000 men, escorted by warships led by U.S. Rear Admiral Henry K. Hewitt. The force had steamed all the way from Norfolk, Virginia, one of the longest expeditionary efforts in history.

The other two invasions were mounted from England and went ashore in Algeria. Central Task Force, under U.S. Army Major General Lloyd Fredendall, numbered nearly 41,000 men (37,100 Americans and 3,600 British), supported by British Commodore Thomas H. Troubridge's covering warships. The 55,000-man Eastern Task Force headed for Algiers was largely British in composition (45,000 British troops and only 10,000 Americans), but to give the illusion that it was mostly American, U.S. Major General Charles Ryder had command. Once Algiers was secured, British Lieutenant General Kenneth A. N. Anderson took charge. British Vice Admiral Sir Harold M. Burrough commanded its covering warships.

During the landings, the Allies made every effort to emphasize the U.S. role and downplay British participation. Given the British attack against French ships at Mers-el-Kébir, Algeria, in July 1940 and British operations in Syria, Allied leaders rightly assumed that Americans would receive a far friendlier reception from French forces than would the British. Thus, efforts were made to show the American flag, quite literally, wherever possible.

No one knew the extent to which French troops would resist the invasion. U.S. diplomat Robert Murphy made preliminary contacts with Vichy French officials in North Africa, and on 22 October, General Clark had a secret meeting near Algiers with French Major General Charles Mast, chief of staff of XIX Corps. This meeting did not bring the desired agreement, and for the most part, French troops resisted the landings.

TORCH began early on the morning of 8 November. The Casablanca operation was widely dispersed, at Safi, Fedala, Mehdiya, and Port Lyautey. Although taken by surprise, the French troops fought well. The unfinished French battleship *Jean Bart* lay at Casablanca. Although she was incapable of movement, her 15-inch guns nonetheless soon began a duel with the U.S. battleship *Massachusetts*. French naval units, including the cruiser *Primauguet*, attempted a sortie, but superior U.S. naval strength beat them back. In the battle, four destroyers and eight submarines of the French navy were either sunk or missing, and 490 French fighters were killed and another 969 wounded. The French at Casablanca surrendered on 11 November.

The two Allied landings east and west of Oran encountered heavy French resistance. An attempt by two former U.S. Coast Guard cutters to run into the port failed, and a U.S. airborne battalion, flying all the way from Britain, was only partially successful in securing nearby airfields. At Algiers, the frontal naval assault failed, but the city was soon ringed by Allied troops on the land side.

The Allies secured their objectives before long. Overall casualties were light, and the landings provided the Allies with excellent training for their subsequent invasions of Europe. Although the British were correct in that they could easily have landed farther east, Adolf Hitler now decided to reinforce North Africa. Had these resources been sent to Rommel earlier, the Axis powers might have secured the Suez Canal. Hitler's belated decision only delayed the inevitable and ensured that the ultimate Axis defeat in Tunisia would be more costly.

Despite misgivings, Eisenhower negotiated with the commander of Vichy France's armed forces and former premier Admiral Jean Darlan, who was visiting in Algiers at the time of the landings. On 11 November, Darlan agreed to assist the Allies by ordering a cease-fire in return for heading the administration of French North Africa. Darlan was, however, assassinated on 24 December, allegedly by a monarchist acting alone, a deed that removed a potential embarrassment to the Western governments. The British and French then installed General Henri Giraud, who had escaped from France, as commander of French forces in North Africa, ignoring General Charles de Gaulle. The latter, understandably furious, had not even been informed of the landings beforehand.

On 9 November, Marshal Henri Philippe Pétain's Vichy French government responded to the Allied North African invasions by severing diplomatic relations with the United States. Nonetheless, Hitler ordered German troops into "unoccupied" France. Operation *ATTILA* had been drawn up by the Germans in 1940. Its main objective was to capture the principal French naval units at Toulon. But on 27 November, French crews frustrated the German attempt and scuttled 77 ships, including 3 battleships.

Once the Allied forces that had landed in North Africa had secured their initial objectives ashore, they proceeded on to accomplish two key objectives: to secure ports in Tunisia in order to block the resupply of Axis units and to build up a force in Morocco to occupy Spanish Morocco if Spain—or the Germans acting through Spain—should attempt to take Gibraltar. As it transpired, the latter was unnecessary, since the landings alone caused Franco to move Spain into a more neutral stance.

Allied forces were unprepared for immediate overland operations but nonetheless were forced into conducting a land campaign by Hitler's prompt reinforcement of North

Africa. As early as 9 November, he had dispatched troops to Tunisia to occupy the important airfield at El Aouina. German and Italian units began arriving in North Africa at a rate of about 1,000 men a day.

Patton's force at Casablanca linked up with units moving west from Oran to threaten Spanish Morocco, and the British moved east to secure airfields in eastern Algeria, necessary for providing air support for ground operations beyond the range of Gibraltar. On 12 November, two British parachute companies dropped on Bône, supported by commandos from the sea. The Souk-el-Arba airfield fell on 16 November. The next day, General Anderson's I Corps drove from Oran and Algiers into Tunisia, with the objective of securing the port of Bizerte.

Although I Corps had moved from Bône into the mountains only 20 miles southwest of Bizerte, the drive stalled after several weeks. It fell victim to insufficiently aggressive Allied leadership, rainy weather that delayed reinforcements from Algiers some 500 miles to the west, the rapid Axis reinforcement, and aggressive defensive actions by Lieutenant General Walther Nehring, whose counterattacks ended the Allied "race for Tunis." But Nehring, who was pessimistic about Axis chances, soon found himself replaced by General Jürgen von Arnim. Thus, 1942 ended in a temporary stalemate once Rommel's forces successfully linked up with von Arnim's Tunisian defenders. TORCH, which many claim delayed the Allied goal of a cross-Channel invasion, had nonetheless proven successful. Subsequent Allied amphibious operations in Sicily, Italy, and Normandy benefited immensely from the operation.

Torpedoes

Self-propelled weapons armed with explosive charges designed to be launched by ships, submarines, or aircraft against enemy shipping. Torpedoes were the deadliest of naval weapons, especially when launched from submarines.

The torpedo was invented by Englishman John Whitehead for the Austro-Hungarian navy in 1866, but those in use by 1939 were far more capable than his 7-knot, flywheel-driven weapon. However, except for Japan, no nation entered World War II with torpedoes that differed significantly from those of World War I. All were straight running and had the same top speeds (39–47 knots), ranges (2,500–7,000 yds), and depth-setting mechanisms as those of the earlier war. A few countries had influence warheads that were expected to detonate as they passed under the ship's hull, thereby breaking its back, but those weapons proved unreliable in early operations and had to be withdrawn until their technical faults were corrected. However, by war's end, the most advanced torpedoes had homing guidance and a complex variety of influence warheads, and more important, they had become the critical weapon of war between naval forces on and above the surface and those below.

Employed mostly by submarines, torpedoes were responsible for more than 30 percent of the warship losses and 70 percent of merchant shipping losses during the war. Those statistics are rather ironic, given that, before the war, submarines were not expected to play a significant role in naval operations and that the three naval powers that employed torpedoes most effectively suffered torpedo reliability problems during the war's early years. U.S. and German difficulties with their weapons' warheads, depth-setting mechanisms, and guidance systems are the best known, but Great Britain suffered similar problems with its own torpedoes. However, the Royal Navy accepted the fleet's reports and corrected the technical faults within nine weeks of receiving the first report. The United States and Germany waited nearly a year to examine their problems, and another year passed before they corrected their weapons' deficiencies. Nonetheless, those two countries best demonstrated the deadly effectiveness of the submarine-torpedo combination in naval warfare. In fact, Germany and the United States possessed the most technologically advanced torpedoes at war's end, with the former having the best anti-ship torpedo and the latter the world's only antisubmarine torpedo, designated the Mark 24 "mine" to hide its true nature.

For its part, Japan entered the war with the only torpedoes that were significantly better than those used in World War I. Japanese submarine and ship torpedoes employed an oxygen-alcohol power train that gave their torpedoes a speed

One of the aerial torpedoes carried by the U.S. Navy's crack torpedo bomber, the Grumman TBF Avenger, aboard an aircraft carrier in the South Pacific, January 1943. (National Archives)

of almost 50 knots and a range exceeding 42,000 yds, with little wake. They also had the war's most powerful warheads (weighing more than 1,000 lbs) and were extremely reliable, providing Japan's highly trained crews with a critical advantage in ship-to-ship and submarine-to-ship engagements.

Japan, however, wasted that technological advantage by not employing the torpedoes' most effective platform, the submarine, effectively. Moreover, unlike Germany, Japan never developed a homing system to guide their torpedoes toward a ship's engine noises or wake, which reduced the probability of their hitting a distant maneuvering target. More important, by 1943, naval airpower and air defenses including radar had increased engagement ranges to the point that submarines became the torpedo's only tactically viable weapons platform, rendering Japan's advantage in torpedo range all but irrelevant. Indeed, antiship torpedoes diminished in importance as ship and aircraft weapons from that year and have been supplanted on those platforms by antisubmarine torpedoes since the early 1950s.

France entered the war with torpedoes that were obsolete by World War II standards, and the nation was defeated by Germany before newer models could be developed. The Soviet Union and Italy also suffered from a lack of torpedo research and development. All three nations were slow to make the change from the 45 cm (18-inch) torpedoes for surface ships and submarines to the 533 mm (21-inch) torpedoes adopted by most other nations, whereas Japan had gone to 61 cm (24-inch) torpedoes (but only in surface ships, for Japanese submarines used the 21-inch oxygen-driven torpedo). However, Soviet and Italian torpedoes were simple and reliable. In fact, Italy's aircraft-carried torpedoes were so much better than those of Germany that Luftwaffe antishipping squadrons preferred to use Italian models rather than their own.

Many of the minor navies still employed the smaller and older torpedoes on their ships and submarines, but 45 cm torpedoes were carried primarily by aircraft until 1943, when they also began to carry the larger 533 mm models.

Much has been written about the revolutionary changes torpedoes underwent in the course of the war. Most of this transformation was driven by the Battle of the Atlantic between the Western Allies and the German Kriegsmarine (navy), where torpedo and antisubmarine-detection systems shaped the course of the battles.

Denied heavy weapons by the Versailles Treaty, post-World War I Germany's naval doctrine underemphasized torpedo engagements. This situation changed when Adolf Hitler rose to power and, with the navy under Admiral Erich Raeder, sought to build a large, conventional German naval force capable of challenging Britain on the seas. Partly as a result of this concentration, there were no new designs or concepts in torpedo warfare before the U-boat arm's effectiveness became essential to

Germany's war effort after 1940. By 1942, however, Germany had homing torpedoes that guided onto the target ship's engine noises and pattern-running torpedoes that made evasion difficult. Research programs included wake-homing, active sonar-based terminal guidance, and even a rocket-propelled high-speed torpedo, which, however, never got past the drawing board.

Fortunately for the Allies, Germany's research and development effort lacked direction before Admiral Karl Dönitz took command of the Kriegsmarine in January 1943. As torpedoes proved critical to the German U-boat arm, so, too, did they figure in the Western Allies' struggle against the U-boat. The Allies developed search and guidance systems for torpedoes to attack maneuvering underwater submarines. The Mark 24 "mine" employed from Allied antisubmarine aircraft used a descending circular search and "passive acoustic homing" guidance to seek, find, and attack submerged German submarines by detecting and following the noises made by the U-boats' machinery. The Mark 24 was the precursor to modern antisubmarine torpedoes, as was the German homing torpedo, father to the antiship torpedoes carried by today's submarines.

Toulon, Scuttling of French Fleet at (27 November 1942)

When British and U.S. forces invaded French North Africa on 8 November 1942, 81 ships of the French navy were anchored at Toulon, France, under the command of Admiral Jean de Laborde. Only a third of the fleet's ships were ready to sail. Another third required significant work, and the remainder had been decommissioned in accordance with the armistice with Germany.

Even before the July 1940 armistice with Germany, the French government had promised Britain that it would destroy the fleet if necessary in order to prevent it falling into

German hands. This pledge notwithstanding, London made an effort to secure units of the French fleet, and at Mers-el-Kébir during Operation CATAPULT in July 1940, British ships opened fire on French ships, sank a number of them, and killed nearly 1,300 French seamen. Despite these actions, France honored its pledge.

Two years later, after arranging a cease-fire with the Allies in North Africa on 11 November 1942, French navy commander Admiral Jean Darlan ordered the fleet to sail from Toulon to North Africa. That same day, German soldiers began occupying the area around the port city and positioned artillery to fire on the fleet should it attempt to depart. While the Germans tightened their noose, the fleet's officers debated their options. They feared both a German effort to capture the French ships from the land and a repetition of the incident at Mers-el-Kébir. Most remained loyal to the Vichy government and opposed the idea of attempting to sail the fleet to Africa, although the officers subsequently had to quell anti-German demonstrations on several ships. Darlan tried to convince the Vichy minister of the navy, Admiral Paul Auphan, to order the fleet to sail, but Vichy officials replaced Auphan with the more pliable Admiral Jean Abrial. They negotiated an agreement with the Germans that promised the neutrality of the Toulon naval base and handed over the remaining 158 ships of France's merchant fleet (totaling 646,000 tons). Germany, however, continued its preparations to seize Toulon.

On 14 November, Laborde ordered all ship crews to make the necessary preparations to scuttle in order to prevent the capture of their vessels. German troops entered the Toulon base in force at 4:45 A.M. on 27 November but failed to surprise the French. Laborde then ordered the ships scuttled, and most had sunk by the time German soldiers reached the piers at 6:20 A.M. French crews sabotaged critical systems and heavy guns with explosives to prevent their salvage, and they detonated explosives on those ships in dry dock. Five submarines managed to reach the open sea, and of these, 1 was lost at sea, 3 joined the Allies in North Africa, and 1 was interned in Spain. In all, the French scuttled 77 ships, roughly half the tonnage of the entire French navy. The total included 3 battleships (the *Strasbourg*, *Dunkerque*, and *Provence*), 7 cruisers, a seaplane tender, 32 destroyers, 16 submarines, and 18 smaller craft. German and Italian engineers subsequently managed to salvage and repair 4 destroyers, 2 torpedo boats, and 2 submarines.

Towers, John Henry (1885–1955)

U.S. Navy admiral and pioneer naval aviator who played a key role in developing the navy's air arm during the war years. Born in Rome, Georgia, on 20 January 1885, John Towers graduated from the U.S. Naval Academy in 1906. He qualified as a pilot in 1911, only the second U.S. Navy officer to win his wings, and he then helped develop and test early naval aircraft. In 1913, he led the navy's first air unit in exercises in the Caribbean. In 1914, he commanded the naval aircraft in operations at Veracruz, Mexico.

During World War I, Towers served as assistant director of the new Division of Naval Aviation in the office of the chief of naval operations, helping to organize the navy's air effort, including antisubmarine activity. After the war, as an early and committed advocate of naval airpower, he commanded the navy's first aircraft carrier, the *Langley*, between 1927 and 1928. He also studied at the Naval War College and commanded the San Diego Naval Air Station and the aircraft carrier *Saratoga*.

U.S. Navy Admiral John H. Towers. (Corbis)

In June 1939, Towers was promoted to rear admiral and began a three-year appointment as chief of the Bureau of Aeronautics, where he oversaw the growth of U.S. naval air forces and pilot training. Under his leadership, the air arm of the navy grew from 2,000 aircraft in 1939 to 39,000 in 1942. In October 1942, he became commander of U.S. naval aviation in the Pacific (ComNavPac) and was promoted to vice admiral. In early 1944, Towers became deputy commander in chief, U.S. Pacific Fleet and Pacific Ocean Area. However, his fervent advocacy of naval aviation created enemies and kept him from a combat assignment until July 1944, when he received command of Task Force 38, too late in the war to see any significant action.

Promoted to full admiral, Towers assumed command of the Fifth Fleet in November 1945 and of the U.S. Pacific Fleet in February 1946. He consistently opposed the creation of an independent air force. He headed the General Board until his retirement in December 1947 and then worked as assistant to the president of Pan American World Airways. Towers died in Saint Albans, New York, on 30 April 1955.

Toyoda Soemu (1885–1957)

Japanese navy admiral who was made commander in chief of the Combined Fleet in 1944. Born in Ōita Prefecture, Japan, on 22 May 1885 into a Samurai family, Toyoda Soemu graduated from the Naval Academy in 1905 and became a gunnery officer. He graduated from Gunnery School, then taught there, and from the Naval War College. Between 1919 and 1922 as a lieutenant commander, he was a resident officer in Britain. Promoted to captain in 1925, Toyoda commanded the cruiser *Yura* and then the battleship *Hyuga*. In 1927, he took command of the Submarine Division 7. Promoted to rear admiral in 1931, he was assigned as chief of the Intelligence Department. He next served as chief of the Operations Department of the Naval General Staff and then as chief of staff of the Grand Fleet (1933) and chief of the Education Bureau of the Navy Ministry (1934).

Promoted to vice admiral in 1935, Toyoda assumed command of the Second Fleet and then the Fourth Fleet in 1937. Thereafter, he was assigned as chief of the Naval Affairs Bureau of the Navy Ministry and chief of the Shipbuilding Office. Promoted to admiral in September 1941, Toyoda

commanded the Kure Naval District. In 1941, he was recommended for the post of minister of the navy, but General Tōjō Hideki blocked the appointment because of Toyoda's strong antiarmy sentiments. Toyoda joined the Supreme War Council in November 1942 and assumed command of the Yokosuka Naval Yard in May 1943.

In May 1944, Toyoda succeeded Admiral Koga Mineichi as commander in chief of the Combined Fleet. He was firmly committed to the policy of making a strong offensive strike. His first attempt took place in Operation A-Gō and resulted in the 19–20 June 1944 Battle of the Philippine Sea, which turned out to be a catastrophic defeat for Japan. Nonetheless, Toyoda continued his policy of initiating a major offensive fleet action, and he developed a series of contingency plans (the SHŌ operations). Operation SHŌ-1 culminated in the Battle of Leyte Gulf, waged from 23 to 26 October 1944. The largest naval battle in history, it was a major Japanese defeat. In April 1945, Toyoda instituted steps to save Okinawa, resulting in kamikaze attacks, including that of the battleship *Yamato*. He replaced Admiral Ozawa Jisaburo as navy chief of staff in May 1945 and held that position to the end of the war. He was one of the triumvirate of die-hard military leaders, with Generals Umezu Yoshijiro and Anami Korechika, who rejected unconditional surrender. Following the war, Toyoda was arrested as a war criminal. He was then tried but acquitted. Released in September 1949, he died in Tokyo on 22 September 1957.

Trident Conference (15–25 May 1943)

Anglo-American diplomatic conference. The Trident Conference, also known as the Third Washington Conference, was held in Washington, D.C., between British Prime Minister Winston L. S. Churchill and U.S. President Franklin D. Roosevelt and their political and military advisers. The debate in the conference involved military activities for the rest of the year and the date of a possible cross-Channel invasion. The British objective was to get the Americans to agree to an invasion of Italy after the conquest of Sicily (Operation

HUSKY) was completed. The British argued that such a course would deprive Germany of an ally and make the western and central Mediterranean an Anglo-American lake. Churchill hoped that new options for Anglo-American strategy would be opened and perhaps break the U.S. obsession with a cross-Channel attack.

The Americans, particularly Army Chief of Staff General George C. Marshall, were prepared for such arguments by the British. They pointed out that Soviet and American public opinion would demand an invasion of France. The Americans insisted that BOLERO, the buildup of men and matériel in England, should take precedence and that it would not prevent an invasion of Italy, although they did not commit to that invasion. Roosevelt and Marshall agreed to follow up HUSKY with the best means to drive Italy from the war and tie down the maximum number of German forces. Certainly, this position pointed toward an invasion of Italy, but it left options open. For the first time, Roosevelt had not come down in favor of Churchill's position, and the British leader would never again feel confident that Roosevelt would support him once they had discussed all aspects of a question. The two leaders agreed on a date of 1 May 1944 as the deadline for the cross-Channel attack, splitting the difference between the preferred American date of 1 April and the British date of 1 June.

Other topics of discussion included the China-Burma-India Theater, which generated much talk but little action, and the atomic bomb. Over British skepticism, the conferees approved (but never implemented) plans for operations in Burma. Churchill and Roosevelt could not agree on whether aiding Chinese leader Jiang Jieshi (Chiang Kai-shek) or forcing the Japanese from Southeast Asia should be the goal. Churchill was further frustrated because no one, not even members of his own delegation, favored his proposal for a landing in Sumatra.

Churchill and Roosevelt continued their debate from the Casablanca Conference on developing an atomic bomb, with the British leader protesting the U.S. refusal to share information, a course of action recommended by most of Roosevelt's advisers. The president reluctantly agreed to reveal secrets to the British but had not done so by the Quebec Conference that August.

Tripartite Pact (27 September 1940)

Diplomatic agreement between Germany, Italy, and Japan. Negotiated in Tokyo, the pact was signed in Berlin on 27 September 1940 by German Foreign Minister Joachim von Ribbentrop, Italian Foreign Minister Galeazzo Ciano, and Japanese Ambassador Kurusu Saburo. Primarily designed to forestall the entry of the United States into the war, the agreement stated as its main principle the establishment and maintenance of a new order, calculated to promote the mutual prosperity and welfare of the peoples concerned. The pact formalized the Axis partnership.

The agreement, which was to last 10 years, contained six articles. In Article 1, Japan recognized the establishment of a new order in Europe under the leadership of Germany and Italy. In Article 2, Germany and Italy recognized Japanese leadership in the establishment of a new order in greater East Asia. Article 3 pledged each partner to cooperate in the processes that would lead to the final goal stated in Articles 1 and 2. Article 3 was also a direct warning to the United States, although there was no mention of that power by name. In it, the three Axis powers vowed to “to assist one another with all political, economic, and military means when one of the contracting powers is attacked by a power not involved in the European war or in the Chinese-Japanese conflict.” Thus, Germany and Italy would be bound to fight on the side of Japan were the United States to attack that country. Article 4 called for joint technical commissions from the three powers to meet without delay to implement the agreement. Article 5 stated that the three powers respected the agreements made by the date on which the agreement was signed by any of the three powers with the Soviet Union. Article 6 set the 10-year limit of the agreement and provisions for its renewal.

Soviet leaders were alarmed by the pact, although Article 5 supported the German-Soviet Non-aggression Pact of 1939. In November 1940, to allay Soviet concerns, the German government formally asked the Soviet Union to join the pact, and meetings were held to discuss that possibility. Soviet Foreign Minister Vyacheslav M. Molotov was invited to Berlin, and talks concerning German-Soviet relations began on 12 November 1940. These negotiations did not result in agreement, as

German, Italian and Japanese leaders sign the Tripartite Alliance Pact in Berlin, 27 September 1940. (Photo by Keystone/Getty Images)

Adolf Hitler, already planning to invade the Soviet Union, rejected the Soviet insistence on concrete agreements concerning territory and spheres of influence.

Other nations were also pressured by Germany to adhere to the Tripartite Pact. Romania signed on 23 November 1940, as did Slovakia the next day. Bulgaria joined on 1 March 1941, when Tsar Boris III pledged his country's allegiance. Yugoslavia adhered to the pact on 25 March 1941 but renounced its action two days later, after the government of Prime Minister Dragiša Cvetković was overthrown on the issue and replaced by that of General Dušan Simović. Unlike the Allies, the Axis coalition never developed a grand strategy for fighting the war.

Truk

Principal Japanese fleet anchorage in the Central Pacific during the war. In 1940, the Japanese began fortifying the island of Truk, strategically located at the center of Micronesia. Although the base never became the “Gibraltar of the Pacific” or a facility comparable to Pearl Harbor, it was headquarters for the Japanese Combined Fleet by July 1942. Defensive construction continued into early 1944, eventually including four airstrips and two seaplane bases supporting 335 aircraft, 3 torpedo boat bases, and heavy coastal artillery. There were

only 40 anti-aircraft guns, however, and the total garrison of soldiers, sailors, and airmen amounted to fewer than 12,000 individuals.

American plans for attacking Truk emerged from preparations for assaulting Eniwetok, 669 miles northeast, in order to secure the U.S. hold on the Marshall Islands. Neutralizing Truk would also enhance efforts to isolate the Japanese base at Rabaul, 696 miles south, that had begun in the fall of 1943. Alerted by an American reconnaissance flight on 4 February 1944, the Combined Fleet commander in chief, Fleet Admiral Koga Mineichi, dispatched most of his combatant ships to Palau in the Marianas, 1,055 miles west. Before dawn on 17 February, Rear Admiral Marc Mitscher, commander of U.S. Task Force 58, sent planes from three of his four fast carrier groups lying 90 to 100 miles east-northeast of Truk on the first of 30 strikes during that day and the next. These air attacks destroyed or damaged 250 to 275 of the 365 Japanese aircraft stationed there and

sank 2 auxiliary cruisers, a destroyer, 2 submarine tenders, an aircraft ferry, 6 tankers, and 17 other transports/freighters. These losses amounted to almost 200,000 tons sunk.

During the first day of the attack, Vice Admiral Raymond Spruance, commander of the U.S. Fifth Fleet, circumnavigated the atoll with a powerful task group to catch escaping Japanese ships; they sank a light cruiser, a destroyer, and an auxiliary vessel. Japanese resistance was relatively light—only 25 American planes were lost—but a Japanese torpedo-bomber struck the large carrier *Intrepid* on the night of 17 February, inflicting damage that kept her out of action until June 1944.

The February U.S. attacks ended Truk's usefulness to the Japanese fleet. Another carrier raid, on 29 April 1944, left only 12 aircraft on the island serviceable and destroyed nearly all air-support facilities. Thereafter, heavy bombers from Eniwetok and the Admiralties routinely pounded Truk, but the

U.S. naval bombing attack on the Japanese base of Truk in the Carolines, 16 and 17 February 1944. A flotilla of Japanese vessels of varying sizes under the rain of U.S. Navy bombs. The largest of the ships is on fire from a hit forward. (Bettmann/Corbis)

earlier attacks showed that a major base could be eliminated by carrier-based planes alone.

Truman, Harry S (1884–1972)

U.S. political leader and president from 1945 to January 1953. Born in Lamar, Missouri, on 8 May 1884, Harry Truman grew up on the family farm in Grandview. Poor eyesight kept him from the U.S. Naval Academy and the U.S. Military Academy. Truman never formally attended college, but he read for the bar at night at the Kansas City School of Law. He enlisted in the National Guard as a young man and served in combat in France during World War I as a field artillery battery commander.

Following the war, Truman entered politics, and with the backing of “Boss” Tom Pendergast, he was elected a judge in the court of Jackson County, Missouri. He served in that post from 1926 to 1934, when he was elected to the U.S. Senate from Missouri. Truman remained active as a reserve officer, rising to the rank of colonel and only retiring from the Army Reserve after he left the presidency. He was reelected to the Senate in 1940, but he remained relatively obscure until his service as chairman of the Committee to Investigate the National Defense Program, when he helped eliminate millions of dollars of waste in defense contracting. His efforts contributed significantly to the efficiency of the U.S. defense industry on the eve of the U.S. entry into World War II and thereafter.

President Franklin D. Roosevelt selected Truman as his running mate in 1944, and Truman was sworn in as vice president in January 1945. Roosevelt did not share with Truman his thinking on many significant war-related issues, and Truman was thus poorly prepared to become president when Roosevelt died suddenly on 12 April 1945. Yet despite his almost blind start, Truman made some bold moves virtually immediately. He supported the San Francisco Conference of Nations that established the United Nations, and he mustered popular and bipartisan support for that fledgling organiza-

U. S. President Harry S Truman, ca. 1945. (Library of Congress)

tion, with the intention of altering the nation’s traditionally isolationist outlook in favor of a postwar internationalist foreign policy.

When the Germans surrendered only 26 days after he assumed office, Truman appointed General Dwight D. Eisenhower to head the American occupation zone in Germany, and he supported a vigorous program of de-Nazification and war crimes prosecution. He opposed, however, the draconian Morgenthau Plan, the goal of which was to convert Germany into an agricultural state. Attending the July 1945 Potsdam Conference, Truman worked with Soviet dictator Josef Stalin and new British Prime Minister Clement Attlee to build on the agreements that had been reached by Stalin, Roosevelt, and British Prime Minister Winston L. S. Churchill at Yalta. Truman also decided to employ the atomic bomb against Japan, a decision he later said he never regretted or agonized about.

As it became increasingly clear that the Soviet Union was systematically acting contrary to the Yalta and Potsdam agreements, Truman concluded that a strong Anglo-American stand was the only means of preventing a total Soviet domination of Europe. But rapid American demobilization had reduced U.S. military strength in Europe to 391,000 men by 1946, whereas the Soviets still had 2.8 million troops under arms. Truman used U.S. economic power and the country’s

momentary nuclear monopoly to blunt the Soviet aspirations in postwar Europe. He also effectively blocked the Soviets from assuming any role in the occupation of Japan.

Truman was wary of Soviet conventional military power in Europe, but he also tried to maintain the wartime alliance that he considered essential to the viability of the United Nations. When Soviet intentions finally became crystal clear—first with the 1948 Communist coup in Czechoslovakia and then with the Berlin Blockade—the defining Cold War American policy of containment solidified with three landmark decisions: the Truman Doctrine, the Marshall Plan, and the establishment of the North Atlantic Treaty Organization (NATO).

Truman laid down the principles of the Truman Doctrine in a speech before Congress on 12 March 1947, when he stated he believed the United States had to adopt a policy to support free peoples resisting subjugation by armed minorities or by outside influences. In response, Congress approved his request for \$400 million in economic and military aid for both Greece and Turkey. Greece was then being torn apart in a civil war, and Turkey was under heavy pressure from Moscow over control of the Dardanelles. The support package for Greece also included U.S. military advisers.

The \$12 billion Marshall Plan was the engine of economic recovery in Europe, and it effectively prevented Moscow from stoking and exploiting economic chaos. The Soviet Union rejected aid under Washington's conditions and forced what were now its Eastern European satellites to do likewise. In March 1948, Britain, France, and the Benelux countries, with American backing, formed the Brussels Pact, which developed into the Western European Union in 1955.

Truman decided on an airlift as the answer to a Soviet blockade of Berlin, demonstrating U.S. resolve to block the spread of communism in Western Europe. In April 1949, the United States entered into its first (and still its most durable) standing military alliance since 1800 with the establishment of North Atlantic Treaty Organization. Truman also put Moscow on notice that the United States was willing to use its fledgling nuclear arsenal to defend Western Europe. In May 1949, when it became clear that the Soviets had no intention of allowing all of Germany's four occupation zones to reunite under a democratically elected government, Truman supported the establishment of the Federal Republic of Germany, formed from the three western occupation zones. The Soviets retaliated almost immediately by establishing the German Democratic Republic in the east.

In what he described as his most difficult decision while in office, Truman authorized the employment of U.S. forces in Korea in June 1950, within a week of the North Korean invasion of South Korea. He also supervised the reorganization of U.S. defense and intelligence establishments along the lines that remain familiar at the start of the twenty-first century. His administration established the National Security Council, the

Department of Defense, the U.S. Air Force, and the Central Intelligence Agency, and it formally established the Joint Chiefs of Staffs and the global network of joint military commands.

Truman's decision to remove General Douglas MacArthur as U.S. and UN commander in Korea and the negative American public reaction to this, together with the stalemate in the war there, led Truman not to run for reelection in 1952. He left office in January 1953.

Harry Truman played an important role during World War II, and his postwar policies rebuilt Western Europe, integrated the greater part of Germany into the West, and prevented the spread of communism outside the Soviet occupation zone. Truman died in Kansas City, Missouri, on 26 December 1972.

Truscott, Lucian King, Jr. (1895–1965)

U.S. Army general who assumed command of VI Corps and then Fifth Army in 1944. Born in Chatfield, Texas, on 9 January 1895, Lucian Truscott had a limited formal education but taught school in Oklahoma. He joined the army when the United States entered World War I and was selected for officer training. Commissioned into the cavalry in August 1917, he did not see overseas service during the war.

Between 1919 and 1925, Truscott was stationed at Schofield Barracks, Hawaii. He was promoted to captain in 1925, major in 1926, and lieutenant colonel in 1935. He was first a student and then an instructor at the Cavalry School (1925–1931) and the Command and General Staff School (1934–1940).

In February 1941, Truscott joined IX Corps as assistant G-3 and profoundly impressed his chief, Colonel Dwight D. Eisenhower. As both men rose in the army, Eisenhower

repeatedly selected Truscott for important assignments. Promoted to brigadier general in May 1942, he was assigned to Britain's Combined Operations headquarters, where he developed ranger units that participated in the Dieppe raid that summer. After becoming a major general in November 1942, he commanded the force that seized Port Lyautey in French Morocco. During the fighting for Tunisia, Truscott served as Eisenhower's deputy in charge of training, and in March 1943, he took command of the 3rd Infantry Division.

In fighting in Sicily and again in peninsular Italy, Truscott's division established an exemplary reputation. He himself became known for his rigorous training, steely leadership, and ability to inspire confidence. A month after the Anzio landing on 22 January 1944, he replaced Major General John P. Lucas as commander of the U.S. VI Corps after Lucas became the scapegoat for the operation's initial failure. On 23 May, Truscott's greatly augmented VI Corps broke out of its beachhead. Had Fifth Army commander Lieutenant General Mark W. Clark not redirected Truscott's advance to Rome, VI Corps might have trapped large numbers of retreating Germans.

On 15 August 1944, Truscott's corps landed on the French Riviera as the vanguard of Lieutenant General Alexander M. Patch's Seventh Army in Operation DRAGOON. VI Corps drove rapidly up the Rhône Valley and again only narrowly missed making a major entrapment of German troops. Promoted to lieutenant general in September 1944 and thus too senior to keep his corps, Truscott handed over command in the Vosges Mountains in late October. In mid-December, back in Italy, he succeeded Clark as commander of Fifth Army, and in April 1945, he directed its 19-day final offensive through the Po Valley to the Alps.

Truscott was the only U.S. general of the war to command in battle at four successively higher echelons. Had his superiors in the Mediterranean not blocked his transfer to England—which Eisenhower had requested early in 1944—he, instead of Major General J. Lawton Collins, would have led VII Corps over Utah Beach into Normandy.

Truscott retired from the army on medical grounds in 1947. In retirement, he wrote his memoirs and served in various advisory capacities. He was promoted to full general on the retired list in 1954, and he died in Washington, D.C., on 12 September 1965.

Tulagi Island, Battle of (7–8 August 1942)

Tulagi is a 2-mile-long and half-mile-wide island in the Solomon chain, located just off Florida Island and 20 miles north of Guadalcanal. It was part of the British Solomon Islands Protectorate until occupied by Japan in May 1942. At the beginning of the war, Tulagi was the site of an Australian-built seaplane base. The Japanese began bombarding the island in January 1942, and with the approach of the Japanese task force in the Coral Sea operation, the Australian government ordered

U.S. Marines wading ashore in the assault on Tulagi in the Solomon Islands, 1 January 1942. (Photo by U.S. Navy/Getty Images)

the evacuation of the island on 1 May. The Japanese then garrisoned Tulagi with a 350-man detachment of the 3rd Kure Special Landing Force, under Commander Suzuki Masaaki.

Targeted for invasion as part of the U.S. Guadalcanal Offensive, Tulagi had to be cleared of Japanese forces in order to secure the chief U.S. target—the airfield being constructed by the Japanese on Guadalcanal. Transport Group Yoke, consisting of three transports and four destroyer transports, delivered Brigadier General William Rupertus's landing force of the 1st Raider Battalion, 1st Battalion 2nd Marines, 2nd Battalion 5th Marines, and 1st Parachute Battalion.

The landing on Tulagi on 7 August 1942 was unopposed, but the Marines soon ran into stiff Japanese resistance. Tulagi was the first battle in which U.S. troops had encountered Japanese defensive tactics, including strongly entrenched dugouts and tunnels constructed to withstand heavy naval or air bombardment. These fortifications had to be taken by assault with grenades and high-explosive charges.

It was not possible to secure the small island on the first day, so the Marines dug in. During the night of 7–8 August, they encountered a Japanese banzai charge. Turning back this attack, the Marines secured the island the next day. Some 200 of the Japanese defenders were killed and only 3 were captured; 40 others escaped to nearby islands. U.S. forces had 36 men killed and 54 wounded in the operation.

Tunis, Battle of (3–13 May 1943)

By the end of April 1943, the converging Allied offensive conducted by General Harold Alexander's 18th Army Group with Lieutenant General Bernard Montgomery's British Eighth Army and Lieutenant General Kenneth Anderson's British Fifth Army had pushed the Axis forces into a pocket around Tunis and Bizerte. Although the two Axis armies in Colonel General Jürgen von Arnim's Army Group Afrika—General Giovanni Messe's First Italian Army and General Gustav von Vaerst's Fifth Panzer Army—had linked up for the final defense, their loss of equipment had been so great that defending even the

100-mile arc was impossible in the face of the massive Allied superiority. Alexander had 20 divisions with 300,000 men and 1,400 tanks against Arnim's fighting strength of only 60,000 men and up to 100 tanks.

The Allies took some 250,000 prisoners in the Battle of Tunis, the largest surrender by the Axis troops to that time.

The British had taken the high ground around Medjez-el-Bab, allowing a direct attack against Tunis and Bizerte. Arnim held off the Allied offensive, delivered simultaneously on every sector between 19 and 25 April, but in doing so, the

Axis forces consumed the last of their scanty resources. The tourniquet applied by the Allied air and naval blockade across the Mediterranean from Italy was now so tight that few reinforcements or supplies reached Tunisia. Field Marshal Erwin

Rommel and Arnim had reported in February that 140,000 tons per month would be required to maintain the fighting power of the Axis forces, but they received just 23,000 tons in April and a paltry 2,000 tons in the first week of May.

As a result, Axis forces suffered severe shortages of food, ammunition, and fuel. Fuel resources were sufficient to move just 16 miles, which drastically restricted all tactical movement. Despite heroic efforts to transfer even the smallest amounts by air and submarine, Arnim later admitted that he would have been forced to capitulate by the beginning of June regardless of Allied operations simply because of a shortage of food. The complete breakdown of the logistics system explains the collapse of Axis resistance far more clearly than any Allied offensive.

Montgomery's failure to break through the Enfidaville bottleneck led Alexander to devise a new final plan. He switched the 4th Indian and 7th Armoured Divisions and the 201st Guards Brigade from Eighth to First Army and charged Lieutenant General Brian Horrocks's IX Corps with making

Colorful Spahis (Algerian cavalry) troops of the French colonial army passing a French tank in the foreground in the Allied victory parade along Avenue Gambetta in Tunis, 1943. (Library of Congress)

the final attack. Operation STRIKE was to be an overwhelming onslaught on a 3,500-yard front by the 4th Indian and 4th British Divisions, supported by a massive phalanx of 470 tanks in the valley south of the Medjerda River. Its goal was the capture of Tunis. American forces, meanwhile, had captured Mateur on 3 May and had pushed the German line back to Chouïgui, just 15 miles from Bizerte, preventing the Germans from reinforcing their positions in the Medjerda Valley.

The assault opened at 3:00 A.M. on 6 May with a concentrated barrage by up to 652 guns, which pulverized Axis strong points with a concentration of shells five times greater than the opening barrage in the October 1942 Battle of El Alamein; this was followed by an intense air assault at dawn. Under this massive onslaught, German resistance collapsed, and the Allied infantry broke through almost without opposition, so that by 10:00 A.M., tanks of the 6th and 7th Armoured Divisions were pouring through the gap and could “go as fast and as far as they liked.” They failed, however, to grasp the elementary principles of exploitation that Rommel had earlier demonstrated and advanced with extreme and unnecessary caution.

On 7 May, the 11th Hussars entered Tunis, the first unit to cross the Egyptian border in 1940, aptly crowning the end of the campaign, and U.S. forces entered Bizerte later the same day. The Fifth Army was thus trapped between the British and American spearheads, and Vaerst surrendered on 8 May, furnishing 40,000 prisoners. Also on that day, British Admiral Andrew Cunningham carried out Operation RETRIBUTION, a rejoinder to the agonies suffered by the British during the evacuation of Greece and Crete in 1941, to prevent any escape of the Axis forces by sea, signaling, “Sink, burn and destroy. Let nothing pass.”

Alexander’s principal concern thereafter was to prevent the vast bulk of the Axis troops south of Tunis from retreating with Messe’s First Army into the Cape Bon peninsula and establishing a redoubt. Immediately, 1st and 6th Armoured Divisions drove to Hamman Lif at the neck of the peninsula, but the hills there reach almost to the beach, and a small detachment of Germans held up the Allies for another two days. Without fuel or ammunition or any hope of escape, further resistance was futile, and the remaining Germans were mopped up, the last units surrendering on 13 May. In all, the Allies took some 250,000 prisoners in the Battle of Tunis, the largest capitulation yet suffered by the Axis powers.

Tunisia Campaign (1943)

Allied military campaign leading to the clearing of Axis forces from North Africa. Following the Anglo-U.S. invasion of north-west Africa on 8 November 1942, German Chancellor Adolf Hitler belatedly recognized that a collapse of Axis power in Africa threatened not just Benito Mussolini’s regime in Italy but also Germany itself by exposing the whole of southern Europe to Allied attack. He therefore allocated massive reinforcements to Tunisia, on a scale far greater than ever before seen in Africa. By the end of 1942, the commander of the Fifth Panzer Army, Colonel General Jürgen von Arnim, had achieved his short-term objectives. He had prevented the Allies from reaching the central Tunisian coastline and thereby isolating Fifth Army from General Erwin Rommel’s Panzerarmee Afrika, which was withdrawing into southern Tunisia. He had also deepened the Axis bridgehead by pushing back the British around Tébourba in the north, and he had blocked the way to Tunis by tenaciously recapturing Longstop Hill, which the Germans finally took on Christmas Day 1942 and renamed Christmas Hill. Thereafter, Allied operations ground to a halt as winter rain turned the terrain into a muddy morass.

Allied judgments that German tanks could not operate in the drier, mountainous terrain were dramatically proven wrong on 18 January 1943, when Arnim launched an offensive against the French around Pont du Fahs. By the end of January, the veteran 21st Panzer Division had captured the Faid Pass and the Allies had been pushed back from the Eastern Dorsals, whereas Rommel had withdrawn to the Mareth Line, a prewar French defensive system in southern Tunisia.

Rommel now had close to 80,000 troops, and Fifth Army had risen to a strength of 100,000 men, mostly German troops, giving the Axis forces a much better ratio to Allied strength, despite being significantly weaker in tanks. Moreover, the strategic position had now reversed, as the Axis units were able to concentrate their forces in a strong central position with the advantage of “interior lines,” and fleetingly, the two panzer armies had the opportunity to strike back. Rommel was not dismayed by the threat of Lieutenant General Lloyd Fredendall’s U.S. II Corps poised on the line of his retreat, and indeed, he conceived an ingenious plan to crumple the Americans, while Lieutenant General Bernard L. Montgomery’s British Eighth Army was still stretched out

Axis prisoners of war are herded out of the city as Allied armies enter Tunis. (National Archives)

along a supply line across Libya, before turning the Axis strength against it.

On 14 February, Arnim attacked Sidi bou Zid and Sbeitla with the 10th and 21st Panzer Divisions, while Rommel occupied Gafsa virtually unopposed and then captured the American airfields at Thelepte, 60 miles beyond. Rommel wanted to exploit the Allied confusion with a combined drive to Tebessa and secure Allied supply dumps, then sweep up behind the British army in the north. Unfortunately for him, he no longer had the freedom that he had enjoyed in the desert to disregard Comando Supremo's instructions, which were to push on toward Thala and Le Kef.

By 20 February, Rommel had broken through Kasserine Pass, instead of farther north as the Allies had been led to expect through ULTRA intelligence. Fredendall's force cracked after losing two tank, two infantry, and two artillery battalions. Nevertheless, increasing Allied resistance, poor terrain

for mobile operations, Arnim's lack of cooperation, and growing Axis losses obliged Rommel to call off the operation on 22 February.

Rommel's offensive was a brilliant success as a limited objective and came perilously close to driving the Allies from Tunisia, but it had no long-term effect on Allied strategy. The Americans had suffered a humiliating defeat and significant losses of men, matériel, and confidence. The commander in chief, Mediterranean, General Dwight D. Eisenhower, replaced Fredendall with the more aggressive Major General George S. Patton Jr. U.S. forces had, however, gained invaluable battle experience. The Allies quickly retook most of the passes, and on 20 February, they formed First and Eighth Armies into 18th Army Group under General Harold Alexander, with the aim of ending the campaign before May.

Rommel was promoted to commander in chief of Army Group Afrika, and his Panzerarmee was renamed First Ital-

ian Army, under General Giovanni Meese. On 26 February, Arnim launched an abortive offensive, which merely delayed Rommel's second strike against the Eighth Army at Medenine until 6 March. The interval also enabled Montgomery to rush extra divisions forward, which decisively shattered Rommel's attack. The defeat did not end the war in Africa, but it dispelled any hope that the Axis forces could overcome one of the two Allied armies before they developed a combined pressure and therefore decided the final conclusion. Rommel was ill, and on 9 March, he flew to Germany in an effort to convince Hitler to evacuate the Tunisian bridgehead. As it turned out, Rommel never returned to his beloved Afrika Korps (Africa Corps).

At the end of March, after his initial frontal attack had failed, Montgomery's forces outflanked the Mareth positions and then joined with the First Army in the early days of April. Montgomery, however, failed to prevent Meese from withdrawing to the defensive bottleneck at Wadi Akarit, north of Gabes. Although the two Axis armies formed a strong force, the Allied air and naval tourniquet prevented reinforcements or supplies of food, ammunition, and fuel from reaching Tunisia, and the Axis forces suffered severe shortages, particularly of fuel, which drastically restricted all tactical movement. Patton's U.S. II Corps now threatened Messe's rear and flank, but Meese withdrew to Enfidaville as the two Axis armies were pressed into a pocket around Tunis and Bizerte. Although both armies had linked up for the final defense, improving their position, their loss of equipment had been so great that defense of even the 100-mile arc was impossible in the face of the massive Allied superiority.

Political and psychological considerations strongly influenced the final assault, as Eisenhower ordered that the Americans, now under Lieutenant General Omar Bradley, should make the main effort in the north. Alexander launched the final offensive on 22 April, with the British First Army attacking toward Tunis and Bradley striking against Bizerte and Montgomery on the defensive at Enfidaville. When the advance stalled, two of Montgomery's best divisions were switched to First Army, and a fresh assault was launched.

Axis defenses quickly collapsed, and Tunis and Bizerte both fell on 7 May; the last German and Italian units surrendered six days later. Some 250,000 prisoners were captured, the largest capitulation yet suffered by the Axis powers, depriving them of experienced troops that would have been invaluable in the defense of Europe. Coming soon after the German defeat at Stalingrad, the situation was a further humiliation for Hitler. For Benito Mussolini, however, the Tunisia Campaign was a disaster. The best part of the Italian army had been lost, and the Italian empire on which he had based the credibility of his regime simply ceased to exist. Mussolini's survival now depended entirely on Hitler.

Turing, Alan Mathison (1912–1954)

British mathematician and cryptologist. Born in Paddington, England, on 23 June 1912, Alan Turing was educated at Cambridge University, where he was a brilliant student in quantum mechanical and mathematical logic. While still an undergraduate, he published a seminal article suggesting a machine that could, by following a proscribed set of rules, move from one “state” to another. Afterward known as the “Turing Machine,” this concept was the foundation for the logical structure of modern-day computers.

From 1939, British intelligence collected top mathematicians and code-breakers at Bletchley Park outside of London to assist in breaking the German codes of the Enigma machine. There, Turing led a mix of individuals attempting to build on work that had been conducted by the Poles. Bletchley Park was ultimately able to read all German encrypted radio traffic, although not in real time. Nonetheless, this work was immensely successful, and the information it provided, code-named Top Secret ULTRA, proved vital to the Allied victory in World War II. Turing left Bletchley Park in 1943 to develop a speech encipherment system.

Following the war, he worked on the development of the first electronic (as opposed to mechanical) computers and wrote papers that are considered the foundation of today's field of artificial intelligence. Arrested, tried, and convicted

in 1952 for homosexual activities, Turing acceded to a regimen of estrogen injections in lieu of imprisonment and continued with his research while under observation by members of a security detail, who were vexed when he took a Greek vacation in 1953. Turing, whose mother claimed he often experimented with poisonous chemicals, died on 4 June 1951 at Winslow, Cheshire, England, after eating part of an apple laced with potassium cyanide; an inquest deemed his death a suicide.

Turkey

Straddling both Europe and Asia Minor, Turkey occupied an important strategic position during the war. The nation had been on the losing side in World War I and had been forced to give up substantial territory. Turkish political leaders were also well aware that their military machine was obsolete. For these reasons, despite their hatred of their traditional enemy, the Soviet Union, the Turkish leaders were determined to keep the nation neutral in World War II.

Domestically, Turkey had been a secular state since 1924, but it was hardly a democracy. The father of modern Turkey, Mustafa Kemal (Kemal Atatürk), died in 1938. Premier Ismet İnönü, his closest associate, then took over the leadership of the nation and its one political party, the People's Party. İnönü was reelected president in 1943.

Turkish infantrymen, May 1940. (Bettmann/Corbis)

Turkish leaders were particularly apprehensive over the German-Soviet Non-aggression Pact of 23 August 1939, as well as the possibility that Germany and the Soviet Union might combine against their country. In September 1939, they attempted without success to negotiate a mutual security pact with the Soviets. Turkey also kept its large army mobilized throughout the conflict, worried not only by the ambitions of Germany and the Soviet Union but also by those of Italy in the Balkans. The period of greatest threat for Turkey was from the beginning of the war to the German invasion of the Soviet Union.

Although it remained neutral, Turkey was pro-West in its orientation. Once the Germans controlled the Balkans, however, Ankara signed the Treaty of Territorial Integrity and Friendship with Berlin on 18 June 1941, which offered economic concessions to Germany. Nonetheless, İnönü strongly resisted pressure by German Ambassador Franz von Papen to get Turkey to enter the war on the German side. When the tide of war turned against the Axis powers, Turkey resumed its pro-West position, although it also resisted pressure from the United States and Britain to enter the war on the Allied side. Indeed, by 1944, relations between the Allies and Turkey had reached a low point. Although Turkey declared war on Germany on 23 February 1945, this step was taken to ensure membership in the United Nations.

Following the war, the Soviet Union applied tremendous pressure on Turkey in an effort to annex Kars and Ardahan. These two northeast Turkish provinces had long been a source of contention between the two nations. Moscow also demanded a share of control over the defense of the Bosphorus and Dardanelles Straits. This Soviet pressure on Turkey and the communist threat to Greece led to the 1947 Truman Doctrine and to Turkish membership in the North Atlantic Treaty Organization (NATO) in 1952.

Turner, Richmond Kelly (1885–1961)

U.S. Navy admiral who oversaw the bulk of amphibious operations carried out by U.S. forces in the Pacific Theater. Born on 27 May 1885 in Portland, Oregon, Richmond Turner graduated from the U.S. Naval Academy in 1908. Following service in World War I, he held a variety of posts, eventually qualifying as a pilot at the age of 42. He attended the Naval War College in 1935 and remained there until 1938 as head of the Strategy Section. He then became director of the War Plans Division of the Navy Department in Washington. In March 1941, Turner was promoted to rear admiral.

Following the U.S. entry into World War II, Turner assumed additional duties as assistant chief of staff to Admiral Ernest J. King. In this dual capacity, he played a significant role in strategic planning for the Pacific Theater. In July 1942, he became commander of the Amphibious Force, South Pacific, and he directed most U.S. amphibious landings in the Pacific during the war. "Terrible Turner" had a reputation for being both brilliant and hot-tempered. His first operation involved the amphibious landings at Guadalcanal and Tulagi in August

U.S. Navy Admiral Richmond Kelly Turner. (Corbis)

1942. Turner also had charge of amphibious assaults in the central Solomons: Russell Island (February 1943) and Rendova Island (June 1943). As U.S. forces readied for their drive through the Central Pacific, he received command of the Fifth Amphibious Force, U.S. Fifth Fleet.

Turner planned and commanded the landings against the Gilbert Islands of Makin and Tarawa (November 1943). In early 1944, he also had charge of the landings against the Marshall Islands of Kwajalein (January–February 1944) and Eniwetok (February 1944). He was promoted to vice admiral in February 1944.

In March, Turner became commander, Amphibious Forces Pacific, while simultaneously retaining command of the Fifth Amphibious Force. He directed the June–August invasions of the Mariana Islands of Saipan, Tinian, and Guam. He also commanded the amphibious forces in the onslaughts against Iwo Jima (February 1945) and Okinawa (March–June 1945). In May 1945, in the midst of the Okinawa Campaign, Turner received promotion to admiral, and he next worked on plans for the invasion of Japan (Operation OLYMPIC), scheduled for the fall of 1945. He attended the Japanese surrender ceremonies on 2 September 1945 in Tokyo Bay.

Following the war, Turner served as U.S. naval representative on the UN Military Committee until his retirement in July 1947. Richmond Kelly Turner died in Monterey, California, on 12 February 1961.

Tuskegee Airmen

Personnel of the all-black combat units of the U.S. Army Air Forces during World War II. The U.S. Army Air Corps

(USAAC) specifically saw to it that no African Americans had ever entered its ranks. But in 1938, the Civil Aeronautics Authority, in a far-sighted move, authorized flight training for 20,000 college students per year, and soon after its inception, the program was opened to African Americans. The following year, Public Law #18 provided for contracting with civilian aviation schools for the elementary and primary phases of USAAC combat aviation training. This program also was reluctantly opened to blacks.

Tuskegee Institute, Alabama, would emerge as the primary site for training African American military aviation cadets. Air Corps commanders favored Tuskegee, comforted by the belief that the institution still adhered to the "accommodationist" philosophy of its founder, Booker T. Washington. But contrary to popular opinion, the training at Tuskegee was fully the equal of any "white" USAAC facility. The USAAC realized that the Tuskegee program was of minor importance in the total air-training effort and that its success or failure would have very little effect on the total World War II effort.

On 19 July 1941, the USAAC activated the pioneer all-black 99th Pursuit Squadron. After lengthy training at Tuskegee, the 99th, under the rigorous command of Lieutenant Colonel Benjamin O. Davis Jr., was sent into combat in North Africa and Italy. It was later joined by the 100th, 301st, and 302nd Pursuit Squadrons to form the 332nd Pursuit Group, again commanded by Davis. Davis insisted that his men stick close to the bombers that they were to escort, and consequently, the 332nd's "Good Shepherds" compiled a unique and enviable record in never losing an escorted aircraft to aerial attack while shooting down 103 German aircraft. The 332nd's pilots flew a greater variety of fighter aircraft than any other U.S. fighter group: P-39s, P-40s, P-47s, and P-51s.

In the postwar decades, many Tuskegee Airmen pursued distinguished careers in the U.S. Air Force and in the civil aviation industry. Many historians have argued that the militant effort of American blacks to participate unsegregated in World War II was the catalyst of the U.S. civil rights movement beginning in the 1950s. It is certainly true that the American armed forces ended racial segregation a full decade ahead of civil society in the United States.

Twining, Nathan Farragut (1897–1982)

U.S. Army Air Forces (USAAF) and U.S. Air Force (USAF) general who commanded U.S. air forces in both the European and Pacific Theaters during the war. Born in Monroe, Wisconsin, on 11 October 1897, Nathan Farragut Twining joined the Oregon National Guard in June 1916 and served as a corporal in the 3rd Oregon Infantry Regiment when the National Guard was called for service on the Mexican border in 1916. He received an appointment to the U.S. Military Academy in May 1917 and graduated from an abbreviated wartime course there in November 1918 but remained as an officer cadet until June 1919.

Twining's early career was in the infantry, but he entered the Primary Flying School at Brooks Field, Texas, in August

1923. He graduated from Advanced Flying School at Kelly Field, Texas, and received his wings in September 1926. Twining transferred to the Air Corps that November. His first operational assignment was to the 18th Pursuit Squadron in Hawaii. He returned to the mainland in March 1932.

Between March 1932 and August 1935, Twining served with several operational units and was promoted to captain. He graduated from the Air Corps Tactical School, Maxwell Field, Alabama, in 1936 and from the Command and General Staff School, Fort Leavenworth, Kansas, in 1937. From 1937 to 1940, Twining was stationed at Duncan Field, Texas. Promoted to major in August 1940, he became assistant chief of the Technical Inspection Division, Headquarters (HQ) Air Corps, Washington, D.C., and was later promoted to lieutenant colonel.

In March 1942, Twining was promoted to brigadier general and became chief of staff to Major General M. F. Harmon, commander of U.S. Army Forces in the South Pacific. In January 1943, he took command of the newly formed Thirteenth Air Force, operating in the Solomon Islands and Bismarck Archipelago. Nicknamed the "Jungle Air Force," the unit

U.S. General Nathan F. Twining. (Library of Congress)

provided invaluable support to General George C. Kenney's Fifth Air Force. On 26 January, Twining's B-17 was forced down in the Coral Sea. He and the other 15 survivors spent five days in a life raft before being rescued. In July, Twining, now a major general, assumed command of all Allied air assets in the South Pacific.

In November 1943, he took charge of the newly formed U.S. Fifteenth Air Force in Italy. Among his command's critical targets were the Romanian oil refineries at Ploesti. In June 1945, he was promoted to temporary lieutenant general and then was given command of Twentieth Air Force in the Pacific in August. His new command dropped the atomic bombs on Hiroshima and Nagasaki.

In December 1945, Twining took charge of the Air Matériel Command, Wright Field, Ohio. In 1947, he headed the Alaska Command, and in May 1950, he became deputy chief of staff of the air force. Promoted to general in October and made vice chief of staff, Twining oversaw much of the air force's conversion from propeller to jet aircraft.

In June 1953, Twining became chief of staff of the U.S. Air Force. He oversaw the reorganization of the service, the intro-

duction of new aircraft, and improvements in training and living conditions. He also fought against decreases in conventional forces in favor of nuclear missiles.

In August 1957, Twining became the first air force general to be chairman of the Joint Chiefs of Staff. His 1957 assertions that there was a "bomber gap" with the Soviet Union led to a substantial increase in air force appropriations from Congress. Twining retired in 1960 and entered private business as vice chairman of the publishing firm of Holt, Rinehart and Winston. His book *Neither Liberty nor Safety* (1966) sharply criticized the administration of President Lyndon B. Johnson for refusing to upgrade U.S. missile weaponry. Twining died at Lackland Air Force Base, San Antonio, Texas, on 29 March 1982.

Two-Ocean Navy Program

Massive U.S. Navy expansion approved by Congress in 1940. Because agreements signed at the Washington Conference in early 1922 limited most U.S. naval construction, Washington could counter the rising naval power of Japan only by shifting naval assets from the Atlantic to the Pacific. After 1933, however, Germany's rearmament raised new potential dangers in the Atlantic; meanwhile, the administration of Franklin D. Roosevelt, himself a naval enthusiast, viewed naval expansion as one of many economic stimuli and promoted building programs in 1933 and 1934 to bring American numbers of noncapital ships up to treaty-authorized limits. In 1935, Germany and Britain reached an agreement stipulating that the German fleet could have up to 35 percent of the tonnage of the Royal Navy, and in 1936, Japan abandoned its 1922 limits. A "two-ocean" war now became a real possibility for U.S. planners.

Early in 1938, Roosevelt proposed a 20 percent increase in U.S. warship tonnage, an increase that Congress approved on 17 May. Through the remainder of 1938 and into 1939, as Germany's aggressive moves led to the absorption of Czechoslova-

kia and prompted Anglo-French guarantees of Poland's security, Roosevelt concluded that the greater danger to U.S. national interests lay in the Atlantic rather than the Pacific, with a special concern for defending the Panama Canal. After World War II began in September 1939, Roosevelt organized a "neutrality patrol" in the western Atlantic, defined in October 1939 as lying west of a line from the Saint Lawrence River to Trinidad.

German conquest of the Low Countries and France in May and June 1940 affected the Pacific as well as the Atlantic. French possessions in Indochina and Dutch holdings in the Netherlands East Indies were tempting targets for the Japanese, as were the Philippines. On 14 June 1940, as he was still planning a defensive posture in the Pacific while making the Atlantic the main theater of American naval operations, Roosevelt requested a 25 percent increase in the carrier, cruiser, and submarine tonnage authorized in May 1938, amounting to an 11 percent rise in total U.S. fleet tonnage. Three days later, after German troops had occupied Paris, Chief of Naval Operations Admiral Harold Stark asked Congress to appropriate \$4 billion for a two-ocean navy—a 70 percent increase in the combat fleet, which would add 1,325,000 tons of new construction, amounting to 257 ships above the 488 that already existed or were being built at that time.

Roosevelt signed the Two-Ocean Navy Act on 19 July 1940. The largest naval appropriation in U.S. history and designed to increase the size of the navy by 70 percent, it

authorized construction of 2 new Iowa-class and 5 Montana-class battleships, 6 Alaska-class battle cruisers, 18 aircraft carriers, 27 cruisers, 115 destroyers, 43 submarines, and 15,000 aircraft. It also provided for the purchase or conversion of 100,000 tons of auxiliary ships and the expenditure of \$50 million for patrol, escort, and miscellaneous vessels. Although modified to meet the changing demands of the war, the act created the combat core of the U.S. Navy as it developed from the middle of 1942 through the remainder of the war and for much of the decade that followed. Under its aegis were built the Essex-class carriers, Baltimore-class heavy cruisers, Cleveland- and Atlanta-class light cruisers, Bristol- and Fletcher-class destroyers, and numerous submarines and smaller surface vessels.

U

Udet, Ernst (1896–1941)

German air force general and armaments director who was blamed for the Luftwaffe's failings early in the war. Born on 26 April 1896 at Frankfurt am Main, Germany, Ernst Udet took flying lessons at the outbreak of World War I. He then joined the German army and became a pilot. In March 1918, he joined Baron Manfred von Richthofen's Flying Circus. After Richthofen's death, Udet temporarily led this military unit until Hermann Göring assumed command. Udet ended the war with 62 victories, the highest-scoring German ace to survive.

Thereafter, he remained in aviation as a stunt pilot and explorer. Göring recruited his old comrade into the new German air force (the Luftwaffe) in 1935. Udet assumed the rank of general and was the first inspector of fighters, a post for which he was well suited. Later, Göring made him director of armaments, overseeing technical development. Udet was a brilliant flyer and technically proficient but ill suited for administration. He constantly clashed with Inspector General of the Luftwaffe General Erhard Milch. Udet did oversee the procurement of the Messerschmitt Bf-109 and the Junkers Ju-87 Stuka, and he also pushed for the development of jet aircraft, but overall, he lacked the temperament needed for his position. As a result of his actions, as well as those of Göring, Milch, and Chief of Staff of the Luftwaffe General Hans Jeschonnek, German industry continually failed to meet production goals. The situation was so serious by the spring of 1941 that Göring replaced Udet with Milch. After having become the scapegoat for the air force's failures over Britain and elsewhere, a despondent Udet committed suicide in Berlin on 17 November 1941.

Ukraine Campaign (November 1943–July 1944)

Soviet campaign to retake Ukraine. During the period between August and November 1943, the Soviet 1st, 2nd, 3rd, and 4th Ukrainian Fronts pushed back German Field Marshal Erich von Manstein's Army Group South from the Donets River to the Dnieper River. On 6 November, General Nikolai Vatutin's 1st Ukrainian Front took the Ukrainian capital of Kiev, and by the beginning of December, Soviet forces had crossed the Dnieper in a number of places, forcing the Germans from their hastily prepared positions. The Soviets then committed massive resources to liberate the remainder of Ukraine, including 70 percent of their armor and more than half of their air strength. The Soviet advantage in the air was especially glaring: a four-to-one superiority in numbers of aircraft over Luftwaffe units supporting Army Group South.

On 11 November 1943, German units launched a counter-attack toward Kiev, and on 20 November, they retook Zhitomir. Although fighting seesawed back and forth, the 1st Ukrainian Front launched a major assault on the First and Fourth Panzer Armies on 24 December. By 31 December, the Soviets again held Zhitomir.

As Soviet pressure mounted, Manstein feared that Army Group South would be cut off, and he requested permission from Adolf Hitler to withdraw from the Dnieper bend. Hitler refused, and on 5 January 1944, General of the Army Ivan Konev's 2nd Ukrainian Front drove southwest from the vicinity of Cherkassy. Over the next three weeks, the Soviets trapped 70,000 to 80,000 German troops of XI and XLII Corps in a pocket near Korsun. Over a five-day period, the Germans lost 44 Ju-52 transport aircraft in a vain attempt to supply the pocket by air. Manstein's efforts to break through with two panzer corps failed, and the Soviets continued to reduce the pocket. On 15 February, Hitler finally authorized a breakout, and on the night of 16–17 February, some 30,000 Germans managed to escape in the direction of Lysyanka, although they abandoned their wounded and heavy equipment. The Germans sustained 20,000 deaths in the Korsun pocket, and

the Soviets captured another 17,000 German troops, including 1,500 wounded. The victory led to Konev's promotion to marshal of the Soviet Union.

Simultaneous with Konev's attack, part of the 1st Ukrainian Front began the Rovno-Lutsck operation on 27 January 1944 to separate Army Group South from Army Group Center. On 2 February, Rovno fell, and nine days later, the Soviets took the major railroad junction at Shepetovka. To the south on 7 February, Colonel General Fedor Tolbukhin's 4th Ukrainian Front occupied Nikopol on the east bank of the Dnieper. It then turned south into the Crimean Peninsula, and on 22 February, General Rodion Malinovsky's 3rd Ukrainian Front took Krivoy Rog, with its important metallurgical deposits.

On 29 February, Vatutin was fatally wounded by Ukrainian partisans while on an inspection tour north of Kiev. Marshal Georgii Zhukov then took command of the 1st Ukrainian Front, and on 4 March, he began an offensive from Shepetovka toward the juncture between the First and Fourth Panzer Armies. On 5 March, the 2nd Ukrainian Front drove southwest toward Uman, joined the next day by the 3rd Ukrainian Front. Vast quantities of U.S. Lend-Lease trucks provided a degree of mobility that was previously lacking in Soviet offensive operations.

The 1st Ukrainian Front entered Tarnopol on 9 March, outflanking the Germans on the Bug River, which Konev's 2nd Ukrainian Front forces reached three days later. Striking south from Tarnopol into the rear of the First Panzer Army, Zhukov's 1st Ukrainian Front reached the Dniester River at the end of March. Meanwhile, the 2nd Ukrainian Front gained the Prut River by 26 March, and when tank units of both fronts linked up, they completely isolated the First Panzer Army. Farther south, the 3rd Ukrainian Front drove back the German Sixth Army to the Bug, sealing off the Crimean Peninsula.

On 25 March, Manstein flew to Berchtesgaden and managed to convince a reluctant Hitler to allow First Panzer Army to break free to the west of its encirclement, but on 30 March, the Führer relieved Manstein and replaced him with Field Marshal Walther Model. Hitler also renamed the two army groups in the south. Army Group South became Army Group North Ukraine, and Army Group A became Army Group South Ukraine. First Panzer Army managed to break free of its encirclement, and Model then launched a counteroffensive along the Dniester River.

For the next several months, the front remained relatively static. However, Zhukov's armor reached the Carpathian Mountains, effectively cutting the German front in two. Having gained the Romanian border, 2nd Ukrainian Front now turned south and joined with General Malinovsky's 3rd Ukrainian Front in a night attack led by General Vasily Chuikov's Eighth Guards Army to retake the Black Sea port

A Soviet soldier runs past a burning German tank in the battle for Kiev. (Corbis)

of Odessa, which Sixth Army abandoned on 10 April. Hitler then relieved Field Marshal Ewald von Kleist of command of Army Group South Ukraine, replacing him with General Ferdinand Schröder.

On 8 April 1944, Soviet forces launched an offensive into the Crimea. Too late, Hitler authorized an evacuation. By the evening of 9 May, the Soviets had retaken Sevastopol, capturing another 30,000 Axis troops. The Soviets now controlled most of the Ukraine, including its key industrial and agricultural areas. Stavka (the Soviet High Command) had employed all six of its tank armies in the Ukrainian operation but now began to transfer units, including four tank armies, to Operation BAGRATION—the destruction of Army Group Center in Belorussia, which began on 22 June 1944, the third anniversary of Operation BARBAROSSA. The Soviets retook the remainder of the Ukraine following the Battle of Brody-Lwów in July.

Unarmored Vehicles

General-purpose and specialized vehicles vital to mobile warfare, sometimes known as “soft” vehicles as opposed to “hard” (armored) vehicles. During World War II, the Allied side produced an overwhelming number of unarmored vehicles, an important factor in its ultimate victory. Most such

U.S. Army trucks leaving the motor pool to join the first convoy to travel over the Stilwell Road into China, 1 June 1945. (Photo by Fox Photos/Getty Images)

vehicles were in fact hurriedly evolved from existing commercial designs.

During the war, the United States manufactured 3.2 million military vehicles, a production level previously believed unattainable. Canada made no military vehicles in 1938 but turned out nearly 816,000 between 1939 and 1945, more than were produced by all Axis nations combined. Germany led the Axis powers in production of unarmored military vehicles, but the majority of the German infantry units nonetheless moved on foot or by rail and horse: nearly 3 million horses pulled German supply wagons.

Trucks were especially important in resupply, as a combat division could require up to 750 tons of supplies daily. In the seven-month-long Tunisia Campaign, for example, 6,000 Allied supply vehicles traveled a total of more than 35 million miles. During the Allied drive through France from 25 August to 16 November 1944, the Red Ball Express hauled more than 412,000 tons of supplies. Even this effort was not sufficient to meet all needs, however. Britain's equivalent, the Red Lion Express, delivered 500 tons daily to its Second Army. Axis operations, by contrast, often suffered for want of adequate supply transport and fuel.

The war's most notable truck design was the General Motors (GM) CCKW series (C for model year 1941, C for conventional cab, K for all-wheel drive, and W for tandem rear axle); this 22 ton truck was popularly known as the "deuce-and-a-half" or "Jimmy" (for GMC, or General Motors Corporation). One in four was to have a ring for mounting a .50 caliber anti-aircraft gun. The Jimmy was so popular that a joke claimed Adolf Hitler ordered 11,000 of them but told GM not to deliver; his army would pick them up on its way through Detroit.

The U.S. Army's Quartermaster Corps determined 22 tons was the maximum weight possible for a truck that could be produced quickly in unlimited quantities. Few such trucks existed in 1939, but more than a half million were made by various manufacturers during the war. The CCKW series featured six-wheel drive and cab-mounted levers to engage the front wheels. About half the trucks were made with Timken split-housing axles, the rest with GM's "banjo"-style axles. On the latter version, front and rear driveshafts turned in reverse rotation of each other. Engines blocks were cast iron. Bodies might be wood or steel or a combination of both. Variants included cargo trucks, flatbed trucks, troop carriers, fuel

and water tankers, dump trucks, tractors, and wreckers. Their distinctive Saginaw Steering recirculating ball gear made for exceptionally easy steering.

International Harvester created the M-5H-6—a 22-ton 6 × 6 for use by the U.S. Navy and Marines. Its Hendrickson rear walking-beam suspension was more durable off-road and allowed greater flexibility on uneven terrain than the standard 6 torque rod version. Thornton locking differentials let both rear axles lock together and turn all four rear wheels at the same time for exceptional traction, even on Pacific beaches.

Most Canadian trucks were Canadian Military Pattern (CMP), developed jointly by GM and Ford of Canada from British military specifications and used by all Commonwealth forces. Their cab-over-engine design was a radical departure.

Britain utilized Canadian and U.S. vehicles extensively but also made its own. Vauxhall Motors, Ltd., manufactured more than 250,000 trucks during the war, notably the Bedford 15 cwt (15 hundredweight, or 1,680 lbs) and the 3 ton Model OY. The USSR depended on the U.S. Lend-Lease program for the bulk of its motor transport, supplemented by its own GAZ and ZIS trucks.

Germany's most successful truck was the Blitz (Lightning), a 1938 design by Opel, Germany's General Motors subsidiary. More than 82,000 were produced between 1937 and 1944. The standard model was a 4 × 2 with 6 cylinder motor and 5 speed gearbox. Some 100 variants served as mobile workshops, laundries, labs, command vehicles, radio vans, and ambulances. A 4 × 4 version, Type A, was a reasonably good cross-country vehicle.

Italy's heavy trucks, such as the 6 ton Autocarro Unificato Pesante (heavy unified truck), won the respect of the British, who captured and used them in North Africa. Among medium trucks, the most modern was the Fiat 665 NL. Tough and powerful, it had very large wheels and front drive.

Japan's land transport consisted principally of trucks purchased earlier from the United States and captured vehicles. As these broke down, no spare parts were available, but for the most part, the terrain of the Pacific islands and Japanese jungle-infiltration tactics did not lend themselves to extensive motorized transport. The primary Japanese truck was the 4 wheeled, 12 ton Type 97. Other models included the 52 ton Type 2 heavy truck and the 6-wheeled Type 94. All were built by Isuzu, Japan's largest wheeled-transport manufacturer during the war.

China had an estimated 7,000 trucks in 1937, mostly small European models suited to the primitive Chinese road system. Some light American trucks were received through Lend-Lease. Chinese Communist forces procured transport by capture from the Japanese.

U.S. military planners saw the need for a specially designed small truck, something extremely lightweight, high-speed,

exceptionally rugged, and dependable in all terrain—essentially, a mule with wheels and an engine. The result became an American icon. Officially designated Truck, 3 ton, 4 × 4, or General Purpose (GP) 4 × 4, it was dubbed “jeep,” an existing nickname for any handy utility vehicle, by the troops. Soon, “jeep” was identified exclusively with the GP 4 × 4. The versatile little vehicle hauled supplies and wounded, performed reconnaissance duties, served command and communications roles, and shot up soft targets with its .50 caliber machine gun. Willys-Overland, Ford, and American Bantam produced more than 654,000 jeeps between 1940 and 1945. The jeep inspired a Soviet look-alike, the GAZ-67B Field Car, a 4 × 4 with a 4 cylinder Ford Model A engine and steel ladder-frame chassis.

Britain also developed a lightweight utility vehicle, the Austin 10. It featured a “pickup” truck body (that term was coined later). Replaced by jeeps in fighting units, it saw extensive service with signal, military police, and headquarters units.

Germany's Kfz Kublewagen (bucket car), Volkswagen (VW) 82, was based on existing plans for a civilian car (the famous VW Beetle, which began production in 1945). The Kublewagen had an open, boxy body of flat panels for rapid production and a rear-mounted engine. It had excellent cross-country performance and was easy to handle, although it lacked four-wheel drive. More than 520,000 were built. Japan's Type 95 by Kurogane was a light, 4 × 4 scout and field car with a 2 cylinder, air-cooled, front-mounted engine. Some 4,700 were made.

Tractors towed antitank and artillery guns cross-country and performed vehicle recovery. Breakdown recovery vehicles often had a trailer that pivoted on a turntable mounted on the tractor.

Britain's Scammell tractors were famous for their articulating rear bogie. The USSR's fully tracked agricultural tractors were slow and primitive compared with Western military models, but they were well suited to Soviet terrain and climate and were readily available due to a prewar Five-Year Plan production drive. The S-65 and S-80 6 cylinder diesel Stalinets saw extensive service.

The U.S. M26 truck-tractor from Pacific Car Foundry Company became the U.S. Army's standard tank-recovery vehicle, used in conjunction with 8 wheeled M15 and M15A1 transporter semitrailers, which had capacities of 40 to 45 tons. Its three winches could pull 35,000 to 60,000 lbs each.

Italy favored compact tractors with big wheels and powerful engines, such as the snub-nose Fiat TM40 Trattore Medio (medium tractor) 4 × 4. Germany developed specialized designs to cope with mud and snow in the Soviet Union. The Ostradschlepper (east wheel tractor) 4 × 4 Skoda 175, designed by the father of the VW Beetle, Ferdinand Porsche, had extremely large wheels with cleats but offered no great advantage and proved hard to handle. The more successful

U.S. Army soldiers on Harley-Davidson motorcycles. The Harley-Davidson Motor Co. built more than 90,000 motorcycles during World War II for the U.S. armed forces. (Bettmann/Corbis)

Raupenschlepper-Ost (Caterpillar-east) Steyr RSO/1 could replace its conventional 340 mm wide steel tracks with a 600 mm version for better traction.

Motorcycles carried messengers, reconnaissance patrols, sharpshooters, and even mortars. Britain's premier wartime cycle was the M20 from Birmingham Small Arms. More than 125,000 served in Allied armies around the world. In the United States, Harley-Davidson received so many government contracts it eclipsed rival firm Indian for dominance in the U.S. motorcycle market. Harley's WLA, a cheaper, hardier military version of its popular V-twin WL, proved to be the best motorcycle of the war, used in every theater. More than 90,000 were made.

Japanese troops also rode a version of the Harley. In 1935, the Rikuo Nainen Company obtained a Harley-Davidson license, from which it developed the Type 37 motorcycle for military use, with an air-cooled gas engine, higher body, and magnetic plugs. German motorcycle troops were as much a symbol of blitzkrieg as tanks or dive-bombers. Bayerische Motoren Werke (BMW, Bavarian Motor Works) produced its R-71 model throughout the war. Germany developed a unique

crossbreed for paratroopers. First used on Crete in 1941, the Kleine Ketterkraftrad Sd Kfz (small, linked vehicle) placed a tracked rear end behind the front of a motorcycle to create a compact half-track cycle for supply transport.

Amphibious vehicles ran on land and swam through water. The most famous was America's DUKW (D for model year 1942, U for amphibian, K for all-wheel drive, and W for tandem rear axles), built on the dependable CCKW truck chassis. About 21,000 were built. The USSR's ZIL-485 and Britain's Terrapin were essentially enlarged DUKWs. Japan's Su-Ki was based on Toyota's 4 × 4 truck of the same name, and Germany's Kfz1/20 Schwimmwagen, VW 166, was a Kublewagen with a propeller and a bathtub-shaped body.

Unarmored vehicles were the yeomen that kept armored fighting vehicles (AFVs) moving and permitted infantry to keep up with fast-moving armored units. The ability to deploy effective designs quickly in unprecedented numbers allowed the Allies to maintain constant pressure on their enemies and respond rapidly to fluid combat situations, critical components for victory in mobile warfare.

Unconditional Surrender

Total surrender without conditions or terms. At the Casablanca Conference, on 24 January 1943, U.S. President Franklin D. Roosevelt announced, “The elimination of German, Japanese, and Italian war power means the unconditional surrender by Germany, Italy, and Japan.” Caught off guard by the announcement, Britain’s Prime Minister Winston L. S. Churchill nonetheless supported the president. In his Guildhall Speech of 30 June 1943, Churchill declared that unconditional surrender meant “that [the Axis] willpower to resist must be completely broken, and that they must yield themselves absolutely to our justice and mercy.”

The term *unconditional surrender* was identified with Union Brigadier General Ulysses S. Grant in 1862 during the U.S. Civil War when he demanded the surrender without terms of Fort Donelson, Tennessee. The demand for unconditional surrender had not been U.S. policy in conflicts with other nations prior to World War II. It sprang from the widespread belief in Germany after World War I that the German armed forces had not been defeated on the battlefield but rather had been “stabbed in the back” by the civilian government. This myth greatly assisted the rise to power of Adolf Hitler. To obviate another stab-in-the-back theory, Roosevelt demanded unconditional surrender, which would make it clear to all that the Axis powers had been defeated militarily. Unconditional surrender would also allow the victors to dictate peace terms to the vanquished in order to destroy the racist, aggressive philosophies extant in the Axis states. In addition, the policy reassured Soviet leader Josef Stalin that the United States and Great Britain were committed to the war effort and to the complete defeat of the Axis nations.

Under unconditional surrender, there would be no negotiations with members of the Axis. There would also be no “recognition” or “vacuum” rule, meaning that enemy leaders

would not be able to act or exercise political authority. The victorious alliance would install a military government to exercise the defeated powers’ higher governmental functions.

In one sense, this declaration played into the hands of the Axis leadership. German Minister of Propaganda Joseph Goebbels told the German people, “Enjoy the war; the peace will be awful.” Some have also charged that it prolonged the war because it precluded negotiations with the German Resistance.

Unit 731, Japanese Army

Japanese army's secret biological warfare unit. Established under the command of Lieutenant Colonel Ishii Shiro in Harbin, Manchuria, in August 1936, Unit 731 was officially known as the Epidemic Prevention and Water Purification Bureau. Some 3,000 personnel worked to produce bacteria for anthrax, bubonic plague, cholera, dysentery, tetanus, typhoid, typhus, and other infectious diseases.

To develop methods to disperse biological agents and enhance their effectiveness, Unit 731 infected prisoners of war. At least 3,000 of them died in the experiments. Unit personnel referred to the prisoners—mostly Chinese, Koreans, and Soviets—as *maruta* (logs) because the Japanese informed the local Chinese that the Unit 731 facility was a

lumber mill. U.S., British, and Australian prisoners were also used as human guinea pigs.

Unit 731's activities were outrageous crimes against humanity. After infecting a prisoner with the virus, researchers might then cut open his body, sometimes while he was still alive, to determine the effects of the disease. No anesthetics were employed, as these might affect the results.

Medical researchers also confined infected prisoners with healthy ones to determine how rapidly diseases spread. In addition, Unit 731's doctors conducted experiments on compression and decompression and the effects of extreme cold on the body, subjecting limbs to ice water and then amputating them to determine the effects. The Japanese army also repeatedly conducted field tests using biological warfare against Chinese villages.

In a more widespread use, Japanese aircraft spread plague-infected fleas over Ningbo (Ningpo) in Zhejiang (Chekiang) Province in eastern China in October 1940, causing 99 deaths. The Chinese government correctly concluded that an epidemic of plague in these areas was caused by Japanese biological weapons, and it publicized its findings. Japanese troops also dropped cholera and typhoid cultures into wells and ponds. In 1942, germ-warfare units deployed dysentery, cholera, and typhoid in Zhejiang Province.

At the end of the Pacific war, Ishii and other researchers escaped to Japan. They left behind their laboratory equipment, as well as plague-infected mice that produced out-

breaks of the disease in the Haerbin (Harbin) area between 1946 and 1948. The U.S. government feared that the Japanese might employ biological warfare against North America via balloon bombs from Japan, but such a plan was never carried out.

After the Japanese surrender, the United States did not bring Ishii and his colleagues before the International Military Tribunal for the Far East (the Tokyo War Crimes Trials) for their crimes. Instead, they were granted immunity in exchange for providing information on the experiments to U.S. authorities, which Washington considered invaluable in its own biological warfare program. The Soviet government did prosecute 12 members of the unit at Khabarovsk in December 1949, all of whom admitted their crimes. They were convicted and received sentences of from 2 to 25 years in a labor camp.

United Nations, Declaration (1 January 1942)

Declaration of cooperation that led to the establishment of world institutions. The Atlantic Charter of basic war goals resulted from the Placentia Bay Conference involving U.S. President Franklin D. Roosevelt and British Prime Minister Winston L. S. Churchill in August 1941. The Washington Conference held from 22 December 1941 to 14 January 1942 (code-named ARCADIA) brought together Roosevelt, Churchill, and their staffs to develop an overall strategic war plan. The resulting United Nations Declaration was issued by China, Great Britain, the United States, and the Soviet Union on 1 January 1942. Later, 22 other nations signed and were designated "joint declarers." Signatory nations agreed to use their full resources to secure the defeat of the Axis powers, to continue the war until victory was achieved, and to avoid making any separate peace. There was also a concluding declaration that the agreement could be joined by any other nation that provided or that in the future would provide "mutual assistance and contributions" for the defeat of the Axis powers. Eventually, 19 other governments signed that accord. This understanding thus became not only a statement of general principles but also a device for binding diverse governments together. Further, the Washington Conference addressed

such topics as an invasion of North Africa, countering the Japanese invasion of the Philippines, and Lend-Lease aid for the Soviet Union. In addition, Roosevelt agreed to send U.S. troops to Iceland and Northern Ireland.

The conference led to the first official use of the term *United Nations*, coined by President Roosevelt and immediately accepted to describe the Allies. This label both implied the impressive diversity of the Allied regimes and encapsulated Roosevelt's own very comprehensive—critics would argue utopian—vision of the postwar system of international relations. Throughout the war, Churchill and other leaders readily employed the term as a shorthand reference to the great, inclusive military alliance. Immediately after the war, the term would become the title for new global institutions established to encourage international agreements, facilitate international cooperation, and endeavor to prevent a future global war as well as more limited armed conflicts.

United Nations, Formation of

The creation of the United Nations represented an attempt by the World War II Allies to establish an international organization that would be more effective than the interwar League of Nations at mediating international disputes and preventing

Edward Stettinius, chairman of the United States delegation to the United Nations Charter meeting in San Francisco, signs the Charter for the U.S. while President Harry Truman (second from left) and others look on, 25 June 1945. (Corbis)

full-scale conflicts. In the war's early months, even before the United States intervened, U.S. Secretary of State Cordell Hull established a departmental planning group for this purpose. Meeting off the Newfoundland coast in August 1941, U.S. President Franklin D. Roosevelt and British Prime Minister Winston L. S. Churchill included a broad proposal for an international security system in the Atlantic Charter, their declaration of overall war objectives.

On 1 January 1942, the governments of 26 nations fighting Germany, Italy, and Japan issued a declaration affirming their alliance against the Axis powers and also stating their commitment to liberal war objectives, as set forth in the Atlantic Charter, and the restoration of the principles of international law. In 1943, both houses of the U.S. Congress also passed resolutions demanding the creation of a postwar international security organization, in which they implied their own country should take the leading role it had abdicated in the League of Nations. Meeting in Moscow in Octo-

ber 1943, foreign ministers of the four leading Allied powers—the United States, Great Britain, the Soviet Union, and China—signed the Declaration of Four Nations on General Security, committing themselves in general terms to the creation of a postwar international organization.

More specific proposals emerged from the Dumbarton Oaks Conference of 39 nations held in Washington, D.C., from August to October 1944. These proposals represented a compromise between the ideas of Roosevelt and other devotees of *realpolitik*—that agreement between the “Big Four” Allied powers that “the four policemen” must be the foundation of postwar international security—and more idealistic popular visions of a world in which all powers, great and small, enjoyed equal status and protection. Participants at the Dumbarton Oaks Conference agreed to create the bipartite United Nations organization, modeled on the earlier League of Nations but reserving ultimate authority to the dominant Allied states. All member states would be represented in the

General Assembly, which would debate, discuss, and vote on issues that came before it. Executive authority was to rest with the 11-member Security Council, which would have 5 permanent members—Britain, France, the United States, the Soviet Union, and China. The remaining Security Council representatives were to be drawn from other United Nations states, all of whom would serve two-year terms in rotation. Besides providing an international security mechanism, the United Nations was also expected to promote international cooperation on economic, social, and humanitarian issues.

At the Yalta Conference in February 1945, the Allies agreed, on Soviet insistence, that each permanent Security Council member should enjoy veto power over all General Assembly decisions. The Soviet Union also obtained separate representation for Belorussia (Belarus) and the Ukraine. Participants at the Yalta Conference further agreed on a United Nations trustee system to administer both former League of Nations mandatory territories—originally colonies taken from Germany and Turkey after World War I—and areas seized from the Axis powers when the ongoing war ended.

The Yalta Conference formally invited all Allied and most neutral powers to attend a meeting that would open in San Francisco on 25 April 1945 to establish the new United Nations organization. Representatives of 50 nations attended this gathering, which ended on 25 July 1945 and hammered out the details of the charter of the new organization. The charter accorded smaller states slightly more authority than had the original Dumbarton Oaks proposals, and it also incorporated the International Labor Organization established under the original 1919 League of Nations Covenant. To pursue its stated nonsecurity objectives, the charter created the United Nations Economic, Social and Cultural Organization. By the end of 1945, all states represented at San Francisco had ratified the United Nations Charter. In 1946, the body held its first session in London, and a year later, it moved permanently to the United States, where its headquarters in New York City were completed soon afterward.

Although sometimes derided as ineffective and handicapped in international crises by its reliance on military forces contributed by member states, the United Nations often provided a valuable forum for the quiet exchange of views and the promotion of humanitarian and social goals. On occasion, it also conveniently furnished a useful alternative channel of communications among powers whose diplomatic relations were otherwise limited or even nonexistent.

United States, Army

When World War II began in Europe, the U.S. Army ranked nineteenth in the world in size; with only 190,000 men, it was just after that of Portugal. On 1 September 1939, as the war started in Europe, President Franklin D. Roosevelt named General George C. Marshall to be army chief of staff. Junior to some 60 other general officers when appointed, Marshall proved to be a brilliant choice. A superb organizer and staff officer, he came to be known as the “Organizer of Victory.”

In September 1940, Congress passed the Selective Training and Service Act (the Burke-Wadsworth Act), the nation's first peacetime draft. The measure provided for the registration of all males between the ages of 21 and 35 and the induction into the armed forces of 800,000 draftees. Securing men was relatively easy, but training them and mobilizing U.S. military production would take time, and much of the new U.S. weaponry was going to Great Britain to keep that nation in the war. Marshall's draftees trained with broomsticks for rifles and logs representing artillery pieces. Trucks bore signs with the word *tank*.

In World War II, the United States deployed a citizen army, mainly volunteers and draftees. Only two Regular Army divisions in 1940 were sufficiently equipped to be considered real divisions. In any case, most of the army's Regulars were soon scattered to assist in training. At the height of the war, Regulars made up only 3.5 percent of the Army Ground Forces, 2.6 percent of the Army Service Forces, and 1.3 percent of the Army Air Forces. The vast majority of the officers—54 for every 1,000 enlisted men—were National Guardsmen, Reservists, or newly commissioned. Ultimately, 59 percent of army officers were drawn from the ranks.

By 7 December 1941, the army was training 16 Regular Army divisions in the continental United States, along with

U.S. troops of the 163rd Infantry Regiment hit the beach from Higgins boats during the invasion of Wadke Island, Dutch New Guinea, 18 May 1944. (Army, National Archives)

18 National Guard divisions, and 2 Army of the United States divisions (composed of Regulars, federalized Guardsmen, and Reservists). There were also the Regular Army's Philippine Division and 12 Philippine army divisions, all of which were destroyed in fighting there early in 1942.

U.S. forces were initially poorly equipped and ineffectively trained, and they lacked supporting weaponry such as tanks and antitank and anti-aircraft guns. Ammunition was also scarce. All this changed when the United States fully mobilized for war. By 1944, U.S. steel production was about half the world total. This statistic translated into large numbers of aircraft and ships but also 86,333 tanks, 650,000 Willys jeeps, and 12,573,000 rifles and carbines. The army had so many vehicles that it could have placed every man and woman in the service in them at the same time and had room left over.

Marshall stressed firepower and maneuver. To him, this meant not only that tanks would play a prominent role but also that the entire army would be mechanized and motorized to a degree beyond that of any other military in the world. This emphasis would also enable the army to make effective use of the "triangular" concept, worked out while he was

deputy commander of the Infantry School at Fort Benning, Georgia, between 1927 and 1932. The army went from large, foot-bound, 2-brigade (4-regiment) infantry divisions of 22,000 men to highly mobile, 3-regiment, 15,245-man (14,037 in January 1945) divisions. This triangular concept extended to the lowest level. One maneuver unit would fix an enemy formation in place while another turned its flank and the third maneuver unit remained in reserve.

In July 1941, President Roosevelt called for an estimate of the forces required to defeat "potential enemies." Tasked with this assignment, Major Albert C. Wedemeyer estimated that by the end of 1943, Germany and its allies might field 400 divisions. Conventional wisdom held that attacking forces needed a 2-to-1 ratio to overcome defenders, and Wedemeyer thus set the requirement at 800 divisions. Leaving out the Soviet Union, which he believed might not be able to withstand the German onslaught, he calculated that other allies could provide 100 divisions, which meant the United States would have to raise 700. Counting support troops, this would mean a total U.S. military of 28 million men. But the U.S. population was only 135 million people, and industrial produc-

tion requirements, which experts believed would limit any military to a maximum of 10 percent of the overall population, meant that the armed forces could comprise no more than 13.5 million men. Of this total, the army would get 8.8 million—2.05 million in the air forces and 6.75 in the ground forces. The latter were to be formed into 5 armies, 3 purely offensive task forces and 2 defensive ones. Wedemeyer postulated 215 maneuver divisions—61 armored, 61 mechanized, 54 infantry, 4 cavalry, 10 mountain, and 7 airborne. He thought that with overwhelming air superiority, firepower, and heavy armored components as well as a high degree of mechanization and motorization, such a force would be sufficient. Transporting a force of this size to Europe would require 1,000 ships, and building these alone would take two years, as would raising, equipping, and training the troops.

As it evolved, the U.S. Army fell far short of Wedemeyer's figure. Instead, the so-called 90-division gamble was instituted. Actually, the U.S. Army of World War II numbered only 89 divisions—66 infantry, 1 (dismounted) cavalry, 16 armored, 5 airborne, and 1 mountain. Only 2 divisions did not enter sustained combat, and only 1 failed in combat.

In early 1943, Marshall reorganized the army into three major components: the Army Ground Forces, the Army Service Forces, and the Army Air Forces. In personnel, the army grew to 8,157,386 men and women by April 1945, of whom 1,831,091 served in the 16 Army Air Forces. Many of the army's best soldiers were not in the infantry, however. The Army Air Forces and specialist branches, such as rangers and paratroops, and the service staffs were permitted to skim off too high a proportion of the best-educated and fittest recruits. The infantry rifle companies were, however, called on to fight the Wehrmacht, the most skilled army of modern times.

The army worked on developing new high-firepower weapons. These included remodeled Browning automatic rifles; the Browning air-cooled, lightweight .30 caliber machine gun; the Mark II .50 caliber machine gun (which remains in use); and the superb M1 Garand infantry rifle with an 8-round clip. The M1, designed by John C. Garand and adopted by the army in 1936, fired 40 rounds a minute in the hands of the average rifleman, but an expert could get off 100 rounds in the same time frame. It had 40 percent less recoil than the Springfield '03 it replaced and had only 72 parts, compared to 92 for the Springfield. The Garand could be entirely broken down using only one tool, a .30 caliber round. There was also the lightweight (5 lb) M1 Carbine, which was issued to officers instead of a handgun. Later, the army introduced the M3 submachine gun, most of the parts of which were stamped out. This weapon was capable of a rate of fire of 450 rounds per minute.

The artillery developed new techniques to minimize the time necessary for all guns in a battery to fire on a target and to coordinate the fire of several batteries so that their shells

rained down on one spot simultaneously (the "time on target," or TOT, technique). The 105 mm howitzer and the 155 mm "Long Tom" artillery pieces provided the U.S. Army with remarkably effective firepower. Self-propelled guns also enabled the artillery to keep up with the fast-moving armored and mechanized formations.

The army was not so efficient in other areas. Congress had abolished the Tank Corps in 1920 and relegated tanks to the infantry. Not until 1931 did the cavalry, which still employed horses, receive light "tankettes," known as "combat cars." The U.S. Armored Force came into being only in July 1940 after the defeat of France, but its M-3 Grant, designed hurriedly in 1940, was obsolescent before it was built. Even the M-4 Sherman medium tank, the main U.S. and British tank of the war, had trouble matching up with some of the more powerful German tanks. The army had no heavy tank in the field until the M-26 Pershing arrived in Europe in January 1945 because its armor commanders, notably Lieutenant General George S. Patton, believed that tanks should not fight other tanks. Between 1944 and 1945, the 3rd Armored Division alone had 648 Shermans completely destroyed in combat and another 700 knocked out of action, repaired, and put back into operation—a loss rate of 580 percent. The U.S. lost 6,000 tanks in Europe in World War II, whereas the German army never had more than 1,500 tanks operable at any one time.

Despite shortcomings, the U.S. Army had greater firepower than any other army in the world. It was not only the quality and quantity of military equipment and supplies produced but also the speed with which new weapons came online. The bazooka antitank weapon, for example, went from development to production of 5,000 units in only 30 days.

The U.S. way of waging war is to use machines if possible to do the killing and to minimize American loss of life. The army carried a strong indirect fire punch, including massive air forces and substantial quantities of field artillery. For Operation COBRA, the Normandy breakout in July 1944, VII Corps disposed of 43 battalions of field artillery. In December 1944 in Europe alone, the army fired more than 3 million rounds of 105 mm ammunition. Artillerymen were able to shift and mass fire on a target on a scale never before seen. The time-on-target technique was a devastating weapon. Air-ground coordination vastly exceeded that of other combatants. Joint and combined operations typified the army's campaigns.

The bazooka antitank weapon went from development to production of 5,000 units in only 30 days.

Europe was the U.S. Army's principal theater. It was accorded a priority over the Pacific, which affected all fighting and supply efforts. Seventy-seven percent of army divisions, a total of 68, went to Europe, and there were over 3 million army personnel in Europe and the Mediterranean by April 1945. The Pacific absorbed only 23 percent of all army divisions (21). But despite the priority of Europe, the Pacific Theater claimed half or more of the army forces for the first two years of the war. Only in October 1943 were there more divisions in Europe than in the Pacific; 1.8 million army personnel served in the Pacific by the end of the war.

Although green U.S. Army divisions experienced some problems at first, notably in the Battle of Kasserine Pass in February 1943, they also showed a great ability to learn from their mistakes and adapt. As the army gained experience in the late summer of 1944, its units were arguably better, man for man, than the highly touted Germans. Average U.S. infantry divisions could defeat average German divisions and could even match elite German divisions. They were signifi-

cantly better than Japanese divisions, whose tactics had deteriorated to digging in and dying in place.

Army doctrine and tactics were also basically sound and flexible. The Germans and Japanese were impressed at how quickly the Americans adapted and how rapidly they replaced unsuccessful tactics with effective ones. Communications, engineering, and medical services were the best in the world. Only at the senior command level in Europe did the army show some debatable weaknesses, with a desire to execute the safe rather than the risky course of action—for instance, the broad-front strategy. Yet even that “cautious” approach presented the Germans with crisis piled on crisis, unsustainable attrition, and too much pressure everywhere to allow recovery.

European combat, especially long, multiple-month campaigns, cut heavily into available army manpower. In Europe, 81 percent of all casualties occurred in the divisions, and they were heavily concentrated in the infantry. Units might lose 30 percent of their men in a week, yet they stayed in the line and

continued to fight. The 9th Division, for instance, sustained 17,974 casualties in a four-month period, yet it fought on.

The army did not replace combat losses efficiently or in the necessary quantities, despite training 1.1 million men as replacements and despite a peak strength of 99,288 Women's Army Corps personnel to replace men for battle. There were too few divisions to allow frequent rotation off the line for rest and training. Units were usually short of personnel, and replacements from the States could hardly replace battle casualties, let alone nonbattle losses. A flow of replacements from the States was mandatory. But that system did not always work well. Regardless, the personnel system did keep the divisions fighting for extended periods of time. Units learned how to receive, train, and integrate replacements.

The manpower situation was different in the Pacific. Campaigns were usually relatively short in duration and limited in space, with obvious exceptions such as those on New Guinea and Luzon. Battalions and regiments were the key maneuver units, not divisions and corps as in Europe. And in the Pacific, infantry losses were far higher than expected. During the entirety of the war, the U.S. Army sustained in action 937,259 total casualties—killed, wounded, taken prisoner, and missing (234,874 dead).

The U.S. Army had come a long way since 1939. By 1945, it was the best-armed, most-mobile, best-equipped, best-supplied, most-educated, and highest-paid army in history.

United States, Army Air Forces

World War II witnessed a dramatic change in the scope and use of airpower by the U.S. military. Prior to and during World War II, there was no independent air force. Instead, the army controlled the employment of airpower over land, and the navy had charge of it over water. Since World War I, airpower advocates such as Brigadier General William Mitchell had argued for an independent air force. (And for his outspoken criticism of the military leadership, a tribunal court-martialed Mitchell in 1926.) Whatever its status, the pre-World War II Army Air Corps remained a relatively small coterie of professionals in which all pilots had to be officers.

By the mid-1930s, Air Corps theory centered around strategic bombing—the use of large bombers to destroy specific industrial targets and thereby cripple an opposing army for lack of essential supplies and win a war without a costly ground assault. Not only was such a campaign relatively inexpensive, it also created an argument for air force independence, since this was a mission unique to airpower. The strategic bombing theory entailed a number of corollary assumptions. First was the belief that the bomber would always reach the target. The aircraft envisioned by army leaders were large, fast, and heavily armed. As a result, there was little development of long-range fighter aircraft prior to the war, since escorts were held to be unnecessary. Another assumption involved the denigration of tactical aviation—aircraft used to support the immediate needs of the battlefield. Leaders believed that by tying aircraft to ground forces, airpower lost its unique advantage along with the justification for independence. These ideals were epitomized by Major General Henry “Hap” Arnold, who became chief of the Army Air Corps in October 1938 and held that post throughout the war.

Whatever theory existed, tight budgets and isolationist views in Congress limited the growth of American aviation between the world wars. In 1939, even with war clearly on the horizon, the American aviation industry delivered only 921 aircraft to the U.S. Army and U.S. Navy. Changes quickly ensued following the German invasion of Poland in September 1939. European governments placed large orders with American aircraft firms. And earlier, in November 1938, President Franklin D. Roosevelt, long concerned about the threat posed by Adolf Hitler's Germany had privately expressed a desire for an Air Corps of 20,000 aircraft, but publicly, he sought half that number. At the time, the Air Corps only possessed some 1,600 aircraft. Following the fall of France in May 1940, Roosevelt increased his goal to 50,000 aircraft for the army and navy together.

Despite massive orders, the aviation industry mobilized slowly. By 1941, the Air Corps possessed only 5,500 aircraft, and few matched the performance of their European counterparts. Only in heavy bombers, with the Boeing B-17, did American equipment approach that of Europe. In March 1941, Robert Lovett became assistant secretary of war for air, and he immediately set about increasing U.S. production. Output rose from 12,000 aircraft annually to 96,000 by the end of 1944. Manpower also increased dramatically. From 43,000 personnel in 1939, the number of people serving in the Air Corps rose to 300,000 by December 1941. To meet increased manpower requirements, the Air Corps lowered its standards, but it remained much more difficult to enter the Air Corps than other services.

The organization of the corps also changed with expansion. In 1941, the Air Corps gave way to the U.S. Army Air Forces (USAAF), with Arnold as chief; it was coequal with the Army Ground Forces and the Army Service Forces. In return for greater autonomy, Arnold verbally promised Army Chief of Staff General George C. Marshall, himself a strong supporter of airpower, that he would not seek independent status for the air force for the duration of the war.

Individual theaters each had their own numbered air forces, sometimes further divided by primary mission. For example, the First Air Force remained in New York, provided training, and oversaw the defense of the Northeast region of the United States; the Eighth Air Force served in Great Britain and undertook the strategic bombardment of continental Europe; and the Ninth Air Force, which began in the Mediterranean Theater, moved to Britain in 1943 as a tactical air force for the invasion of France. By the end of the war, there were 16 numbered air forces.

In 1941, to utilize airpower properly, the Air War Plans Division wrote AWP/1 as an annex to the army's comprehensive plan to defeat the Axis powers. AWP/1 embodied the tenets of strategic bombardment. It called for 1,060 medium bombers, 3,740 heavy bombers, 3,740 very heavy bombers, and 2,000 fighters to destroy 154 specific industrial targets in Germany—primarily aircraft-manufacturing sites, followed by power plants, the transportation network, and synthetic petroleum plants. In six months, the authors argued, Germany would be unable to resist the Allied armies, and civilian morale would be shattered, making an invasion unnecessary. These attacks were to be carried out in precision daylight strikes.

With the American entrance into the war on 7 December 1941, the USAAF could not immediately launch the kind of offensive action envisioned in AWP/1. In the Pacific Theater, the Japanese advanced so rapidly that American forces found themselves fighting defensive battles for their very survival. With the American aircraft industry just beginning to gear up, it would take time to deploy the kind of force called for in AWP/1 to defeat either Japan or Germany.

Major General Carl Spaatz commanded the Eighth Air Force, charged with carrying the air war to Germany. Activated in January 1942, the Eighth did not fly its first mission until 4 July 1942, when American medium bombers joined British aircraft attacking German airfields in the Netherlands. On 17 August 1942, American strategic bombardment began when 12 B-17s attacked the railroad marshaling yard in Rouen, France. That November, the Eighth lost much of its force to the Mediterranean Theater, where Allied troops had invaded North Africa. The North African Campaign provided valuable experience to American airmen. Most important, the Americans learned from the British the value of close cooperation between air and ground forces.

In January 1943, President Roosevelt, British Prime Minister Winston L. S. Churchill, and their respective military staffs met in Casablanca to discuss strategy. Despite British pressure for the USAAF to join the Royal Air Force in its area attacks against German cities at night, the Americans argued for daylight precision strikes, which meant that Germany would be bombed around the clock. From the meeting came a directive for the Combined Bomber Offensive (CBO) that eventually destroyed Germany's industrial base as well as its civilian morale. To accomplish the goals of the CBO, Brigadier General Ira Eaker, the new commander of the Eighth Air Force, oversaw the development of the Pointblank Directive, which called for establishing air supremacy first by using the bomber to attack aircraft-manufacturing plants. To protect themselves from enemy fighters, bombers flew in large box formations that massed defensive firepower. The first large Pointblank raid was against the Schweinfurt ball-bearing works, with a second mission against the Messerschmitt plant at Regensburg. American P-47 fighters had only enough range to escort the bombers to the German border. As a result, the Eighth lost 60 bombers, one-sixth of the attacking force. A second raid in October cost an equal number of bombers during a day referred to as "Black Thursday." The USAAF could not sustain such losses, and American bombers suspended raids deep into Germany until long-range escorts became available. Meanwhile, Arnold questioned the leadership of the Eighth and replaced Eaker, whom he sent to the Mediterranean, with Major General James H. Doolittle. Spaatz returned to England to oversee all American air operations as commander of the U.S. Strategic Air Forces in Europe.

Technical changes improved USAAF performance. By January 1944, external fuel tanks and increased tankage permitted P-47 and P-38 fighters to escort the bombers far into Germany. Finally, P-51 Mustangs began reaching units in Britain; they could escort bombers as far as Berlin.

In February 1944, the Americans launched Operation ARGUMENT, a coordinated attack on the German aircraft industry by both the Eighth Air Force and the Fifteenth Air

General Henry H. Arnold (center), commanding general of the U.S. Army Air Forces, chats with Captain George Roberts (right), pilot, of Fairmount, West Virginia, at an advanced air base in Italy, 1943. At left is Lieutenant General Carl Spaatz, commander of the USAAF in the Mediterranean, who had charge of the strategic American bombing force operating against Germany from Italy. (Bettmann/Corbis)

Force flying from Italy. “Big Week,” 20–25 February 1944, witnessed thousands of sorties. The loss rate was only one-sixth that of the previous year, and U.S. fighter escorts began to take a grievous toll on inexperienced German pilots. In the air battles of 1944, the USAAF gained mastery of Europe’s skies not directly through bomb damage but rather through the attrition of German pilots. In March 1944, Spaatz began the systematic bombing of Germany’s petroleum industry. German fighters had to defend their source of fuel. Attrition among German aircrews could not be replaced, and the lack of fuel meant replacement pilots had greatly reduced training time. By the date of the Allied invasion of France on 6 June 1944, the German air force could not challenge Allied airpower. The appearance of Germany’s jet and rocket fighters, the Me-262 and Me-163, created brief consternation within the USAAF, but these aircraft were too few in number and their pilots were too inexperienced to pose a serious threat.

On the other side of the world, the USAAF provided support for General Douglas MacArthur’s ground forces in the southwest Pacific. Initially, the Pacific Theater lacked large industrial targets within range; however, heavy bombers did contribute to the ultimate victory. More important were the medium bombers of the Fifth Air Force commanded by Major General George C. Kenney. Operations tended to be directed against Japanese island garrisons and shipping. To meet the low-level operations found in the theater, Kenney modified many B-25 bombers to carry additional machine guns or cannon in the nose. His pilots also practiced bombing from treetop level using fragmentation bombs slowed by parachutes. Finally, to better strike ships, Kenney’s bombers attacked from mast height.

The USAAF also flew missions in the China-Burma-India Theater, although operations there were decidedly of secondary importance. Part of the problem involved logistics.

The Japanese controlled all of coastal China as well as Burma. To supply China and the American forces there, the USAAF developed an aerial route over the Himalayas, referred to as “the Hump.” By July 1944, despite a slow start, the operation was finally delivering sufficient matériel to meet operational needs, although at a very high cost. In China, Major General Claire Chennault led the Fourteenth Air Force in its efforts to push back the Japanese. Always operating at the limits of supply, his forces enjoyed only moderate success.

By 1944, the U.S. Navy’s advance through the Central Pacific included the Mariana Islands. These islands provided bases for the Boeing B-29 Superfortresses then entering service. To ensure the proper use of the new bombers, Arnold maintained operational authority over their employment by controlling the Twentieth Air Force directly from Washington. Though the bombers were initially deployed in India and China, the Marianas proved far superior as bases, and all of the bombers eventually flew from there. But initial efforts to strategically bomb Japan did not fare well. The B-29 was unique in that it was the first aircraft to contend with the jet stream, making bombing accuracy more difficult than normal. Not until January 1945, when Major General Curtis LeMay arrived in the Marianas to improve effectiveness, did the B-29s have a vital impact on Japanese industry. Instead of high-altitude, precision strikes against industrial targets, the B-29s switched to low-altitude, night incendiary attacks against cities. The largely wooden structures in Japan became so much kindling. The most destructive of these raids—and probably the single most destructive raid in the history of air warfare—occurred on the night of 9–10 March 1945, when the B-29s set 16 square miles of Tokyo aflame, killing at least 90,000 people. The destruction of cities peaked on 6 August 1945, when the B-29 *Enola Gay* dropped the first atomic bomb on Hiroshima. A second atomic bomb fell on Nagasaki three days later.

The U.S. Army Air Forces fought in every theater of World War II, contributing substantially to the Allied victory. As Germany and Japan surrendered, teams from the United States conducted a survey of the exact impact of the bombing. The U.S. Strategic Bombing Survey (USSBS) concluded that airpower had a notable impact on Germany and Japan, yet bombing itself could not have won the war. Aircraft played an integral part in the Allied war-fighting capabilities, making victory possible. The most effective uses of bombing were the systematic assault on the German petroleum industry late in 1944 and the assault against transportation. In the Pacific, to avoid conflict with the navy, the USSBS assessed the USAAF campaign as part of the overall force applied against Japan. The report concluded that the atomic bombs simply compelled Japan’s leaders to accept reality.

By the end of the war, the USAAF had taken delivery of some 158,800 aircraft, including 51,221 bombers and 47,050

fighters. A total of 22,948 aircraft were lost in action. During the conflict, the USAAF flew 2,363,800 combat sorties and dropped 2,057,000 tons of bombs, 75 percent of them on Germany. By March 1945, the USAAF had more than 1,831,000 personnel, representing 22.4 percent of the army’s total strength. USAAF personnel casualties over the course of the war came to 115,382, including 40,061 dead. Even without the unqualified endorsement of the USSBS, the USAAF had proved its worth, leading to its independence from the army in 1947.

United States, Coast Guard

U.S. sea service that played a notable role in antisubmarine and escort efforts in the North Atlantic, in domestic port safety and security missions, and in amphibious operations in both the Pacific and Atlantic theaters while maintaining its peacetime search-and-rescue and law-enforcement responsibilities. During World War II, the Coast Guard saw worldwide action manning destroyers, transports, and auxiliary vessels, as well as cutters, patrol boats, and landing craft.

The late 1930s and early 1940s brought the expansion of the Coast Guard in terms of missions, ships, and personnel. The Lighthouse Service joined the Coast Guard in July 1939, and the Bureau of Marine Inspection transferred to the service in 1942, strengthening its marine safety and security mission. As war approached for the United States, the service began preparing its 19,000 men and cutter fleet for war.

Even before the United States formally entered the war, the service went on a wartime footing when, in September

Coast Guard–manned LST at Iwo Jima. (U.S. Coast Guard Historian's Office)

1941, Coast Guard Commandant Rear Admiral Russell R. Waesche ordered cutters to don wartime paint schemes and, pursuant to President Franklin D. Roosevelt's order, to engage German and Italian submarines and aircraft operating west of 26 degrees west longitude. The Coast Guard cutter *Northland* promptly seized a German weather station and supporting trawler on the Greenland coast in September 1941. Then, on 1 November 1941, Roosevelt ordered the Coast Guard transferred to the Navy Department.

On North Atlantic escort duty, the Coast Guard sank 12 German submarines and rescued over 1,000 Allied sailors, while losing the cutters *Escanaba* and *Alexander Hamilton* to hostile action. Notable in this service was the cutter *Bibb*'s rescue of nearly 250 survivors from three ships sunk by U-boats in convoy SC.118 during February 1943 and the destruction of *U-175* by the cutters *Spencer* and *Duane* in April 1943. Coast Guard cutters also provided important escort and antisubmarine service in the Greenland Patrol Area, including the October 1944 capture of the German aux-

iliary *Externsteine*, the only German surface combatant taken at sea by U.S. forces during World War II.

At home, Coast Guard captains of the port oversaw marine safety and security and assumed responsibility for the inspection of commercial vessels and the administration of professional seamen. Search-and-rescue stations and a wartime beach patrol provided coastal surveillance for Axis submarines and espionage activity. The volunteer Temporary Reserve was also formed and provided numerous civilian vessels for coastal patrol duties. Seaman John Cullen of Station Amagansett on Long Island, New York, helped foil German saboteurs when, while conducting a beach patrol in June 1942, he discovered them landing. Cutters, small boats, and aircraft all played an important role in antisubmarine and rescue efforts in the western Atlantic. During the war, the Coast Guard rescued some 1,500 sailors from vessels torpedoed along the U.S. Atlantic coast.

The Coast Guard manned attack transports and LSTs (landing ships, tank) and applied its small-boat handling

skills to operating landing craft in all the major amphibious assaults of the war. Just as significantly, Coast Guard surfmen trained others for this dangerous and difficult duty. The Coast Guard crews of the attack transport *Leonard Wood* and the attack cargo ship *Aquarius* each participated in eight amphibious assaults. Signalmen First Class Douglas A. Munro, operating from the Coast Guard–manned attack transport *Hunter Liggett*, led a group of landing craft evacuating U.S. Marines near Matanikau on Guadalcanal in September 1942. Munro beached his Higgins boat between a large Japanese force and the Marines on the beach, shielding the other boats from hostile fire and engaging the Japanese with light weapons while the evacuation was completed. In the course of the fighting, he was fatally wounded by Japanese fire. For his actions, Munro was posthumously awarded the Medal of Honor.

Active in numerous assaults in the European Theater as well, the Coast Guard had a large presence at Normandy. The 60 83-foot Coast Guard patrol boats assigned to search-and-rescue duties during the Operation OVERLORD assault rescued more than 1,500 Allied soldiers whose landing craft had been destroyed on D day.

As commandant, Admiral Waesche piloted the service through the war and oversaw the enlistment of women and blacks into the Coast Guard. Led by Captain Dorothy C. Stratton, the Women's Reserve—better known as the SPARs (an acronym from the Latin and English versions of the Coast Guard motto)—played an important support role during the war. More than 230,000 men and 10,000 women served in the Coast Guard over the course of World War II. Ultimately, their skill and bravery were the service's major contributions to victory.

Although the nation's security from direct attack played a considerable role in its remarkable capacity for production, the U.S. achievement was a peculiarly American phenomenon and a function of distinctly American traits.

Still reeling from the effects of the Great Depression, many Americans saw the war as a means to escape hard economic times. In 1940 and 1941, war orders and Lend-Lease contracts had already begun to bring the nation's economy out of a decade of hardship. The introduction of peacetime conscription removed thousands of young men from the job market, thereby improving job opportunities for those who remained. The military's preparedness campaign also sparked the economy through construction of new military facilities and orders for goods required by the armed services, from tents to aircraft. Grateful for meaningful, well-paying jobs, Americans threw themselves into war work with ardor and energy.

The war eventually pulled 12 million young men and women out of the labor force and into the armed services, but the United States was still able to increase production tremendously. The U.S. Army, cognizant of the supremely important role that war production would play, opted to have only 90 divisions—the “90-division gamble.” This decision put a ceiling on the number of men called to military service, thereby ensuring that workers with critical industrial skills would be exempt from conscription. The military gamble also permitted the exemption of most miners and agricultural workers, ensuring the continued growth and expansion of those sectors as well.

The United States also had three significant underutilized sources for labor on which it could draw. More than 6 million women entered the workforce. Marginalized by New Deal programs that had emphasized male breadwinners, many women welcomed the chance to work outside the home. They also embraced the opportunity to make direct contributions to the American war effort, though many worked for unequal wages and were discouraged from joining unions. Most women worked in traditionally female sectors or in newly created industrial jobs, and their share of nonmilitary government jobs nearly doubled during the war. The image of “Rosie the Riveter,” sleeves rolled up and bandanna tied in her hair, sent the powerful propaganda message that women in the workforce were crucial to American industrial might.

The United States also called on the labor of African Americans. The combination of Jim Crow segregation in the South and the availability of industrial jobs in the West and North created a “second great migration” (the first occurred during World War I) of nearly 700,000 blacks from the South. Others moved to industrial and commercial jobs in southern cities such as Atlanta, Montgomery, and New Orleans. African American workers found they could escape Jim Crow in the North and West, but they continued to face discrimination, lower pay, and outbreaks of white violence. Few of

United States, Home Front

Following its entry into World War II in December 1941, the United States devoted its considerable resources to the production of industrial goods at previously unimagined levels. This effort allowed the country to become the “arsenal of democracy” envisioned by President Franklin D. Roosevelt.

these individuals returned to the South after 1945, however. Some white workers protested the modest advances made by black workers, especially in skilled sectors, and race riots in Detroit and Mobile underscored abiding problems.

A presidential executive order guaranteeing blacks equal wages and freedom from discrimination did little to create real equality in the workplace. Nor was it lost on black Americans that the United States was fighting a war against fascism while retaining segregation in the military. Many blacks embraced the “double V campaign” aimed at achieving victory over fascism abroad while also destroying racism at home, although the United States proved more ready to fight the first battle than the second. Despite segregation, the service of African Americans in the armed forces, especially the prestigious Tuskegee Airmen, was a source of great pride to the black community.

Mexicans also helped to solve the nation’s need for agricultural labor. The labor crisis caused by the war forced the United States to rethink its immigration policies toward Mexicans. In 1942, the government admitted 200,000 Mexican workers under the bracero program. Untold thousands of other Mexicans entered illegally as immigration restrictions were informally relaxed to meet labor needs. The braceros worked primarily as fruit pickers in western states, although they also had jobs in construction and maintenance. The bracero program proved to be so beneficial to the American economy that it was continued into the 1960s.

The growth of labor unions, which gained millions of members in the 1930s, also helped U.S. production. Unions provided spokespeople and leaders with whom the government could negotiate. Many unions, such as the American Federation of Labor, were willing to work with both government and business. They agreed to suppress strikes and work stoppages in return for higher wages and guarantees of overtime pay. As a result, both organized and wildcat strikes (work stoppages called without the support of national organizations) were kept to a minimum. Unions that did strike during the war, such as the United Mine Workers, faced a backlash of public opinion and charges that ranged from antipatriotism to treason. The increase of industrial work, of course, meant more workers and more union members. Over 4 million American workers joined unions during the war years.

As a result of these factors, the United States easily met its labor needs without resorting to coercion. The nation added more than 6 million industrial jobs in three and a half years; General Motors alone added 750,000 workers to its payroll. Careful use of selective service, the 90-division gamble, support from organized labor, and the introduction of new groups to the industrial labor pool gave the United States the workforce required for vastly increased production.

Control of the economy proved to be a contentious issue. Most leaders of American big business disliked and dis-

Movie star Rita Hayworth sacrificed her car's bumpers for the duration. Besides setting an example by turning in unessential metal car parts, Hayworth was active in selling war bonds. (National Archives)

trusted President Roosevelt and the New Deal. The president first tried to manage the economy through a series of bureaucratic agencies that were based on the New Deal model and appealed to American patriotism and volunteerism. That approach proved ineffective and led to creation of the War Production Board. When that in turn failed, the Roosevelt administration created another board under the stewardship of former Supreme Court Justice James Byrnes. Roosevelt introduced two dozen separate agencies to enforce centralized control of the economy, but none of these met the government’s need for production and business’s desire for autonomy. The government eventually secured the cooperation of big business through a “cost-plus” system, by which the federal government paid for the costs of wartime conversion and guaranteed contractors a profit.

The results were amazing. In 1940, President Roosevelt stunned leaders in the aviation industry by asking them to produce what seemed an impossible goal of 50,000 airplanes; by the end of the war, the United States had produced nearly 300,000. In 1944 alone, the country built 96,318 airplanes, while Germany and Japan together built 67,987. In the same

year, the United States built 2,247 major naval vessels; Japan built just 248. Also by 1944, the United States was producing half of the world's steel. The Ford Motor Company alone produced a greater value of durable goods than did the entire nation of Italy. America's wartime industrial capacity provided the nation tremendous strategic flexibility and allowed the United States to conduct warfare in the European and Pacific Theaters simultaneously, while also supplying allies such as the British Empire, the Soviet Union, and China through the Lend-Lease program.

The massive war production ended the period of chronic unemployment and underemployment in the United States. Job security and high wages meant near universal improvements in American standards of living. Nutrition levels and housing quality increased dramatically, although the concentration of industry in war production meant that many desirable consumer goods, such as automobiles, were hard to find. After its entry into the war, the United States halted production of civilian vehicles. As a consequence, money was available for the purchase of war bonds. Individual savings also rose. Thus, despite being involved in a two-front global war, many people remember World War II as "the good war" in part because of its beneficial effects on the economy.

Relative affluence and a common sense of purpose contributed to a national mood of unity. The war led to a reduction of the divisiveness that had characterized the depression years. Community activism rose amid a sense of shared struggle. Whereas most people experienced the depression as an individual or familial crisis, the war was communal and national. The Okies and Arkies who had been reviled as unwelcome migrants to California in the 1930s had, by 1942 or 1943, become soldiers or well-paid industrial workers. The War Department's decision to conscript men into national units, a policy used to great effect in World War I, underscored the idea of the war as an American endeavor, although select National Guard units also went to war as representatives of specific states or regions.

Some scholars have argued that the American home front was devoid of both ideology and romanticism. The internment of 110,000 Japanese Americans and alliances struck with the Soviet Union and with China under Jiang Jieshi (Chiang Kai-shek) disturbed those Americans who tried to find ideological justifications for the war. But most Americans understood the war more practically as a job that needed to be done. Appeals to Roosevelt's Four Freedoms—freedom from fear and want and freedom of speech and worship—therefore did not carry the same patriotic meaning as similar appeals in World War I.

The persistency of racism notwithstanding, most Americans experienced better economic times and a great deal more optimism in the 1940s than in the 1930s. The sharp contrasts between the war years and the depression years undoubtedly

helped to make the home front a more hopeful place than would have been expected. Government policies that assigned relatively few fathers to combat units helped as well: by sending proportionally fewer fathers into combat, the U.S. military ensured that the nation would have as few widows and orphans as possible. World War II was surely not "the good war" for all Americans, but the U.S. home front did witness dramatic social and economic changes that improved the lives of millions.

United States, Marine Corps

Founded in 1775 as a shipboard security force for the Continental navy, the Marine Corps struggled to maintain its institutional viability while performing numerous and varied missions around the globe during the first century of its existence. Sustained by its reputation as a rapidly deployable, tenacious combat force, the corps and its civilian proponents argued that the U.S. expansionist policies of the late nineteenth and early twentieth centuries demanded a naval infantry force capable of seizing and defending advanced naval bases. Progressive Marine Corps leaders had begun preparing this new doctrine when World War I interrupted their planning, although the valiant exploits of the corps during this conflict further endeared the service to the American public. Following World War I, the prevalent antimilitarism of the 1920s ushered in a period of military retrenchment, and the resulting scramble for available funds heightened inter-

Marines take cover behind a seawall on Red Beach Number 3, Tarawa, November 1943. (Marine Corps, National Archives)

service rivalries. The Marine Corps's lack of a clearly defined mission brought tremendous scrutiny on its funding and reductions in its strength that threatened its very existence. A massive public relations campaign featuring the Marine service in policing domestic mail routes and protecting American interests in Latin America and China bolstered the Corps's public image and political clout with Congress, allowing the Marines to withstand meager appropriations and perpetuate the claim of being America's premier fighting force.

In the early 1920s, U.S. military strategists began planning for numerous wartime contingencies, focusing primarily on Japan, the nation's Pacific rival. Recognizing the navy's need to secure advance operating bases on islands west of Hawaii in any war against Japan, the Marine Corps adopted amphibious assault as its *raison d'être*.

Integrating the newly constituted Fleet Marine Force into the U.S. Navy, the Marines streamlined their bureaucracy and

concentrated on preparations for seizing and defending advance bases in the Pacific. The corps assigned personnel to naval intelligence and planning staffs and began educating its officers in the tactics of amphibious operations. Lieutenant Colonel Earl "Pete" Ellis's exhaustive studies of Japanese-held Pacific islands in the early 1920s formed the nucleus of the Marines' amphibious assault doctrine. In 1934, the corps published a more exhaustive guide to amphibious operations, *The Tentative Manual for Landing Operations*, and held a series of fleet landing exercises designed to test its concepts. These exercises were crucial in highlighting the need for detailed logistical planning, speed in ship-to-shore movement, overwhelming fire superiority from air and naval bombardment, and specialized equipment to successfully carry out opposed landings. Although Marine aviation utilized previous experience in Latin America to develop rudimentary close-air support tactics based on dive-bombing (which the German Luftwaffe then

adopted), the navy's ambivalence toward developing close-in naval gunfire support techniques and constraints on the procurement of new equipment severely limited the development of U.S. amphibious warfare prior to 1939.

Between 1939 and 1941, as the U.S. military buildup went forward, the Marine Corps tripled in size from some 25,000 to 75,000 men and improved its amphibious capabilities. However, the corps was spread thinly to cover a wide range of duties in garrisons and aboard ships, from Iceland to the Caribbean to Hawaii and numerous smaller islands throughout the Pacific.

On 7 December 1941, Marines aboard battleships at Pearl Harbor and at nearby airfields assisted in defending Hawaii against the Japanese attacks. Elsewhere in the Pacific, isolated Marine garrisons on Guam and in China had little choice but to surrender. Marines on Wake Island and in the Philippines valiantly attempted to resist Japanese invasions, but Wake fell after two weeks of resistance, and the Philippines surrendered in May 1942.

Marines were at the forefront of early U.S. operations against Japan. In the southwest Pacific, the 1st Marine Division carried out assaults in the Solomon Islands in August 1942. The long campaign for Guadalcanal revealed the complexities of conducting amphibious operations under battle conditions, including the need for increased logistical support and a simplified command-and-control structure. Advancing up the Solomons from 1942 to 1944 toward the Japanese fortress at Rabaul, the Marines found themselves engaged in jungle warfare against a determined Japanese foe.

In 1943, encouraged by success in the Solomons, the U.S. Navy and Marine Corps undertook a thrust through the Central Pacific toward the main Japanese islands. The atolls of the Gilbert and Marshall Islands proved a different kind of challenge to the Marines than the jungle warfare of the southwest Pacific. Ineffective fire support, confused communications, and a shortage of proper equipment made the initial assault at Tarawa a bloody and sobering affair.

Employing the lessons learned from Tarawa to refine their amphibious doctrine, the Marines advanced through the key Marshall Islands atolls of Kwajalein, Roi-Namur, and Eniwetok. During the summer of 1944, Marines landed on Saipan, Tinian, and Guam in the Marianas. They also learned how to conduct sustained combat operations on these larger, extensively fortified islands. In the fall of 1944, Marine infantry and aviation forces assisted General Douglas MacArthur's advance on the Philippines. Marines landed on Peleliu in September and suffered heavy casualties in a savage, week-long battle. From September 1944 to April 1945, Marine Corps tactical air support became a vital component of army operations on Leyte and Luzon.

In February 1945, the Marines invaded the island of Iwo Jima in their most spectacular and costly operation of the war.

Nearly the entire 21,000-man Japanese garrison died defending the island, while inflicting almost 30,000 casualties on American forces in a 36-day slugfest. During the battle, a journalist snapped a photo of five Marines and one navy corpsman raising a flag on Iwo's Mount Suribachi. This image instantly became an icon of Marine Corps valor and esprit de corps as well as a symbol of American fortitude in World War II. In June 1945, the Marines and the army secured Okinawa, just 360 miles from Japan, after three months of ferocious combat in the hills and caves across the island. After the Japanese surrender on August 1945, the Marines served throughout the Pacific in occupation duties.

World War II was a defining moment for the Marines. Their seemingly prophetic development of amphibious assault doctrine in the interwar period proved invaluable to winning the Pacific campaigns, and their prior planning and experience also aided the army-led invasions of Europe. The corps had grown to twenty times its prewar strength, with approximately 500,000 men in six Marine infantry divisions and four Marine air wings. It had honed its amphibious doctrine, while expanding its aviation and combat support capabilities. Though the corps comprised less than 5 percent of the U.S. military in the war, Marines constituted nearly 10 percent of all American wartime casualties, with 19,733 killed and 67,207 wounded.

Despite continued and often heated interservice clashes between the army, the navy, and the new U.S. Air Force, the Marines' combat performance during World War II further attached the corps to the public, thus ensuring the service would survive demobilization as a separate institution within the navy and an elite component of the U.S. military establishment.

United States, Navy

U.S. naval preparations for war were under way long before the Japanese attack on Pearl Harbor on 7 December 1941. The government was well into the move away from its post-World War I emphasis on naval arms limitation following the outbreak of war between China and Japan in July 1937. On 7 May 1938, Congress passed a naval expansion bill authorizing a 20 percent increase in the overall tonnage of the navy. President Franklin D. Roosevelt and his advisers hoped that this step would deter the Japanese from further expansion in the Pacific that might threaten American interests there. The Japanese, however, continued their actions. The concern of the Roosevelt administration over this failure was heightened by the outbreak of war in Europe in September 1939 and the string of Allied defeats that followed. On 20 June 1940, believing that the United States might soon stand alone in the face of Axis aggression, Congress passed a second naval expansion bill, which called for a two-ocean navy through a 70 percent increase in overall naval tonnage.

Despite the fact that the bulk of the navy was based in the Pacific, the initial deployment of U.S. naval forces in World War II was in the Atlantic theater and took place while the United States was still technically neutral. President Roosevelt aligned the United States with the European Allied powers, and following the fall of France, he sent material aid to Great Britain. The transport of these supplies across the Atlantic via merchant convoys led to the need to protect them against German submarines. By mid-1941, U.S. naval forces were engaged in escorting convoys to Iceland, where they then became Britain's responsibility. This situation led to an escalation of hostilities with the September 1941 German torpedo attack on the escorting destroyer *Greer*. Roosevelt responded with a "shoot on sight" order regarding Axis warships threatening convoys. On 31 October 1941, a German submarine torpedoed and sank the U.S. destroyer *Reuben James*, the first American warship lost in World War II.

Yet war for the United States came not in the Atlantic but in the Pacific. With the Japanese attack on Pearl Harbor, the nation formally joined the Allied side. The U.S. Navy, which by late December was under the direction of the commander in chief of the U.S. Fleet, Admiral Ernest J. King, faced a multiple-theater conflict. In the Atlantic, the war at sea centered on the protection of Allied supply lines to Great Britain. Although the Battle of the Atlantic was fought primarily by British and Canadian forces, the United States contributed through the deploy-

ment of convoy escorts largely under the direction of the Atlantic Fleet commander, Admiral Royal E. Ingersoll. In early 1943, the United States assumed responsibility for the protection of convoys in the Central Atlantic. In addition to the destroyer forces deployed for this duty, "hunter-killer groups" based around escort carriers executed search-and-destroy operations against Axis submarines. Through the use of radar and sonar, these forces played an important role in the Allied victory in the critical Battle of the Atlantic. By the close of the war, U.S. naval units had accounted for 25 percent of the 781 German U-boats sunk during the conflict.

In addition to commerce protection, the U.S. Navy also contributed warships to aid the Royal Navy in fleet surface operations in the Atlantic. In March 1942, the United States sent its first naval task force, centered on the aircraft carrier *Wasp*, into the Atlantic. The U.S. Navy provided critical gunfire support and sealift in all the Allied amphibious operations of the war, beginning with Operation TORCH, the Allied invasion of North Africa, and extending through Operation OVERLORD, the Normandy Invasion. As with the U-boat war, the British provided the lion's share of the vessels required for this task.

Initial American involvement in the Mediterranean Theater was the result of Allied disagreement over the strategy to attack the European Axis powers. Although the United States favored an attack on German-held France via the English Channel, to take place in mid-1943, the prevailing British view called for a peripheral attack via the Mediterranean. This attack took the form of the November 1942 Operation TORCH, the amphibious invasion of North Africa. The Royal Navy conducted assaults on the Mediterranean beachheads of northern Africa, and the United States had responsibility for the Atlantic coast. The majority of the naval units covering the landing forces and providing fire support were British, and overall command of the naval force rested with the Royal Navy, but the U.S. Navy employed a task force under Rear Admiral H. Kent Hewitt that included 1 fleet carrier, 3 battleships, and 4 converted escort carriers. Following this operation, U.S. involvement increased through the mid-1943 Allied invasion of Sicily. Hewitt once again commanded an American squadron under the direction of the Royal Navy. This arrangement was repeated in the Allied invasion of mainland Italy.

In the June 1944 Normandy Invasion, of all the Allied gunfire support ships—7 battleships, 23 cruisers, and 80 destroyers—the United States supplied 3 battleships, 3 cruisers, and 31 destroyers. These vessels provided invaluable covering fire for amphibious forces landing on the beaches. The final major Allied landing in the Atlantic theater, Operation DRAGOON—the August 1944 invasion of southern France—was predominantly composed of U.S. units and under the command of Admiral Hewitt. The U.S. gunfire support ships included 3 battleships, 3 heavy cruisers, and numerous destroyers.

The gun crews of a Navy cruiser covering American landing on the island of Mindoro scan the skies in an effort to identify a plane overhead. Two 5-inch guns and inboard 20 mm antiaircraft crews are ready to act, 15 December 1944. (National Archives)

Although the involvement of the U.S. Navy in both the Atlantic and the Mediterranean was eclipsed by that of the Royal Navy, the chief reason for this was that the United States bore the brunt of the naval war in the Pacific. This effort faced great challenges from the outset, as the U.S. Pacific Fleet, under the command of Admiral Husband E. Kimmel, was gravely wounded by the Japanese attack on Pearl Harbor, which put all of the fleet's battleships out of commission. In any case, the initial American effort in the vast Pacific centered on U.S. Navy's carriers, which had not been in Pearl Harbor at the time of the attack. The denuded U.S. Pacific Fleet was further weakened following the loss of the British capital ships *Prince of Wales* and *Repulse* on 10 December 1941 and the February 1942 destruction of the American-British-Dutch-Australian (ABDA) Command, a collection of Allied warships. As a result of these blows, the U.S. Navy was,

for most of the war, the sole Allied naval force pitted against the Japanese, who seized the U.S. possessions of Wake Island, Guam, and the Philippines.

Amid these disasters, U.S. and British military officials met in early 1942 and resolved that the United States would assume responsibility for the Pacific Theater. American strategists realized that, to defeat Japan, it was necessary to recapture lost American possessions and take Japanese Pacific holdings, thus isolating the Japanese home islands and starving their war machine of supplies. Command of the Pacific was divided into two theaters to achieve this end. The Southwest Pacific was under General Douglas MacArthur, who pursued an advance from Australia through the Netherlands East Indies to the Philippines. The North, Central, and South Pacific areas were assigned to Admiral Chester Nimitz, who succeeded Admiral Kimmel as commander of the U.S.

Pacific Fleet. Consequently, Nimitz was in charge of the majority of U.S. naval forces in the Pacific. He pursued War Plan Orange, a prewar strategy that called for an advance toward Japan through the Central Pacific.

These operations, however, could not take place until the country's industrial strength produced more warships to augment the force that remained after Pearl Harbor. War Plan Orange saw the role of submarines as scouts for the U.S. battle line, but after the Japanese attack on Pearl Harbor, the U.S. Navy deployed its submarines with the destruction of Japanese overseas commerce as a key mission. Surface units were charged with preventing further Japanese expansion. While the submarine war unfolded, a critical concern was the threat posed to Australia, which was both a vital naval base and an area to station troops. The need to protect Australia led to the Battle of the Coral Sea in May 1942. This engagement aborted a Japanese landing at Port Moresby in New Guinea. A Japanese attempt to take Midway Island and draw out and destroy the U.S. carriers led to the pivotal Battle of Midway in June 1942. The loss of four of Japan's finest carriers in this battle was a great blow to further Japanese expansion in the Pacific and, in a very real sense, the turning point in the Pacific war.

The U.S. Navy subsequently implemented its plan to defeat Japan. The amphibious operations that ensued were made possible by the tremendous wartime naval production of the United States. By 1944, the U.S. Navy was larger than all other navies of the world combined, and the Pacific Fleet comprised 14 battleships, 15 fleet carriers, 10 escort carriers, 24 cruisers, and hundreds of destroyers and submarines. The Japanese, whose industrial base was much smaller than that of the United States, could not match this production.

One of the keys to Allied victory in the war was the ability of U.S. Navy task forces to operate at great distances across the vast Pacific. To support this effort, the navy created an extensive logistics network. This Service Force Pacific Fleet, known as the "fleet train," included tankers and supply and repair ships moving in the wake of the combat ships. A massive system of reprovisioning and repair, the fleet train markedly reduced the need for combat ships to spend precious time moving to and from their home bases and thus greatly increased the number of combat ships deployed.

In the Central Pacific, the navy lifted army and marine elements to take Japanese-held islands in the Marshall, Caroline, Mariana, and Philippine Islands. In the Battle of Leyte Gulf from 23 to 26 October 1944, the U.S. Navy eliminated the Imperial Japanese Navy (IJN) as a cohesive fighting force and cut the Japanese off from their southern resources area. The Allied conquest of Okinawa in mid-1945 signaled to American amphibious forces the completion of Plan Orange. With the destruction of the IJN and the seizure of bases within striking distance of Japan, the home islands were both iso-

lated and subjected to the strategic bombing of cities and the devastation of coastal trade.

Equally important in the isolation of Japan was the submarine campaign, the most successful *guerre de commerce* (war against trade) in modern history. Of Japan's total of 8 million tons of merchant shipping (at best marginal for meeting Japanese requirements in peacetime), U.S. submarines sank almost 5 million tons, thus crippling Tokyo's ability to supply the home islands, especially with oil.

By the end of World War II, the U.S. Navy had participated in every major theater of the naval war. The cost was high, as the navy lost 36,674 officers and enlisted personnel. In the Battle of Okinawa alone, Japanese kamikaze attacks caused the navy more casualties than it had suffered in all its previous wars combined. Materially, the navy lost 2 battleships, 4 fleet aircraft carriers, 1 light carrier, 6 escort carriers, 12 cruisers, 68 destroyers, and 47 submarines in the course of the war. Nevertheless, the manpower and industrial strength of the United States had not only made good the losses but also augmented the navy to the point that its size in both personnel and ships eclipsed that of all the other naval powers of the world combined. This force was pivotal to the Allied victory in World War II.

United States, Submarine Campaign against Japanese Shipping (1941–1945)

One day after the Japanese attack on Pearl Harbor on 7 December 1941, Chief of Naval Operations Admiral Harold R. Stark declared unrestricted submarine warfare against Japan. On the outbreak of the war, the U.S. Navy’s Asiatic and Pacific Fleet submarine forces included 55 large boats and 18 medium-sized ones (out of a total of 111). Some 73 submarines were under construction.

Yet until 1 April 1942, U.S. submarines only sank a modest 93,300 tons of Japanese shipping, less than one-tenth of what an average of 100 operational German submarines sank in the same period. At this stage of the war, American submarine operations suffered from the early loss of the Philippines, for which the poorly developed Australian submarine bases could not compensate. In addition, operations were hobbled by a doctrine that required submarines to concentrate on enemy heavy warships and by the chronic problems of the Mark XIV torpedoes.

Following the erratic performance in 1942 that yielded a total of 620,616 tons of Japanese merchant shipping, the U.S. submarine campaign gathered pace in 1943. The smaller S-class coastal submarine and the T-class fleet submarines were gradually replaced by the larger and more capable submarines of the Gato, Balao, and Tench classes. Beginning in mid-1942, the U.S. Navy began installing the first SJ surface search radars in the submarines, which further enhanced their combat value (German submarines, by comparison, only received radars in mid-1944), and in October 1943, the torpedo problems were finally resolved.

The Japanese mercantile fleet amounted to 6.4 million tons at the time of Pearl Harbor. Following the cessation of neutral shipping to Japan, this volume was barely sufficient to cover the needs for industrial and civilian imports (3 million tons) and the movement of troops and supplies across the sea. The situation was briefly alleviated by the capture of 1 million tons of merchant ships during the Japanese advance in early 1942. By mid-1943, however, the U.S. submarine campaign had already eaten up these small gains made by captures and new construction.

In 1943, the U.S. submarine service was fully committed to the war against the Japanese sea lines of communications,

even though an operational order issued by Admiral Chester W. Nimitz in June 1943 still listed aircraft carriers and battleships as prime targets. Key traffic patterns of Japanese shipping had been identified, and American submarines operating from Pearl Harbor and Australian bases conducted systematic patrols of such choke points as the “Luzon bottleneck.” Because the Japanese navy failed to respond to the increasing threat and organize valuable transports and cargo vessels into convoys, Japan lost merchant shipping weighing a total of 1,668,000 tons in 1943, of which 1.34 million were claimed by submarines. The volume of imports into Japan fell from 35 million tons in 1942 (already down from a peacetime level of 67 million tons) to 27 million in 1943. In late 1943, the Japanese navy reluctantly committed itself to convoying some of the more valuable transports and cargo ships, but the assets assigned remained woefully short of what was necessary to stem or even reduce the bloodletting. In addition, Japanese escort vessels possessed neither active sonars nor radars, and their depth charges were ineffective. Nonetheless, U.S. submarine losses were substantial.

In response to the Japanese convoys, the U.S. Navy introduced the Coordinated Submarine Attack Groups—small, ad hoc wolf packs. Throughout 1944, U.S. submarines continued to inflict crippling losses on the Japanese merchant marine, amounting to 2.43 million tons. In 1944, imports dropped to a mere 16 million tons. The figures for the key materials were even more alarming. Oil imports fell from 1.75 million barrels a month in August 1943 to 360,000 barrels in July 1944. After September 1943, only 28 percent at best of the petroleum shipped from the southern regions actually made it to the home islands, and during the last 15 months of the war, only an average of 9 percent did. By the time the massive strategic air attacks began to lay waste to Japan’s cities, a substantial part of the industry located therein was already idle due to the lack of materials. The destruction of more than 3 million tons of Japanese merchant shipping in 1944 left barely enough tonnage to cover the basic military requirements of the Japanese army and navy.

During this phase of intensive war on the enemy’s sea lines of communications, the U.S. submarines also achieved some remarkable successes against Japanese warships. During the Battle of the Philippine Sea on 19 June 1944, they claimed 2 Japanese carriers (*Taiho* and *Shokaku*), and during the prelude to the Battle of Leyte Gulf (for which no less than 29 submarines had been deployed), they sank 2 heavy cruisers and fatally damaged a third on 23 October 1944.

Toward the end of 1944, the diminutive Japanese escort force was raised to the status of an escort fleet and provided with somewhat better means, including aircraft, simple radar sets, and useful depth charges. Thus, in the last quarter of 1944, the Japanese antisubmarine forces reached their peak efficiency (as did the U.S. submarines), sinking four U.S. sub-

A sinking Japanese destroyer seen through the periscope of a U.S. submarine. (National Archives)

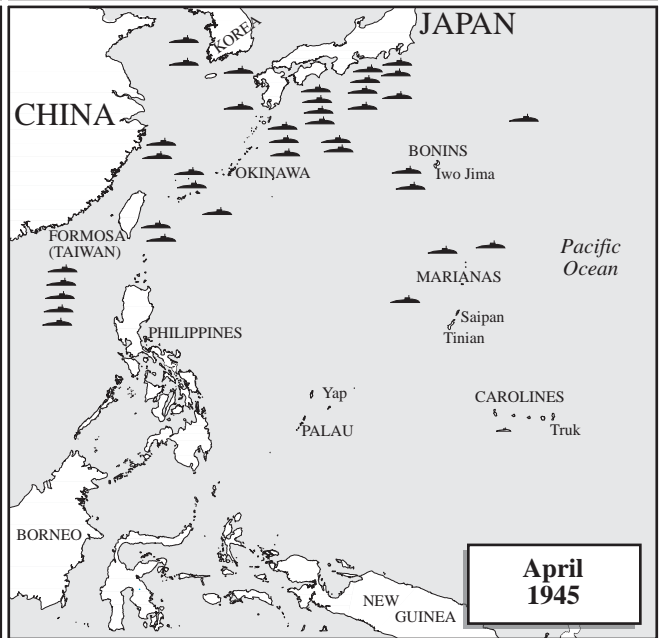

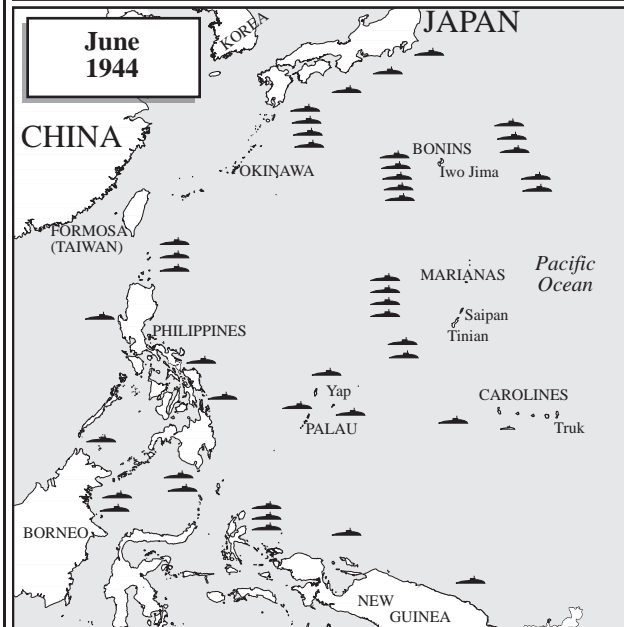

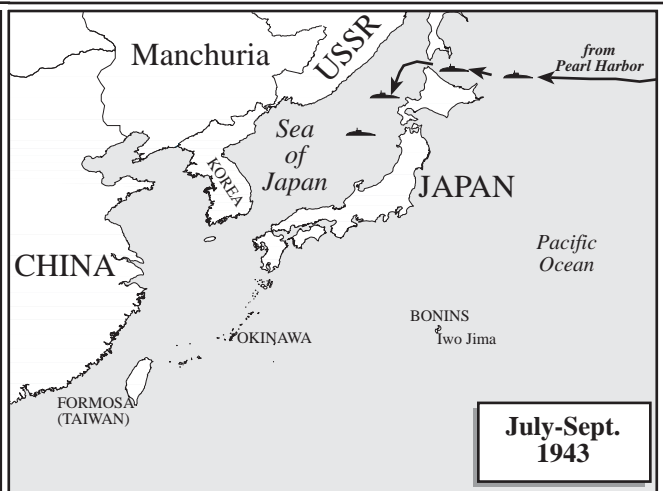

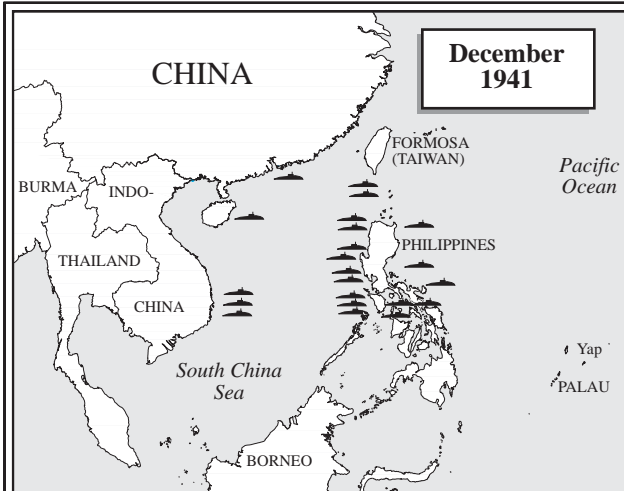

marines in October and another four in November. Thereafter, crushing Allied naval and air superiority and the lack of fuel oil put an end to most organized Japanese naval activities, although not before U.S. submarines had scored further spectacular successes against the Japanese fleet. In November, the U.S. submarine *Archerfish* sank the giant carrier *Shinano* on its shakedown cruise and the *Sealion* dispatched the battleship *Kongo*, and in December, *Redfish*'s torpedoes claimed the new carrier *Unryu* in the East China Sea.

The number of U.S. submarine successes—of any kind—declined steeply in 1945 for want of suitable targets and because of a highly successful mining campaign in the Japanese home waters that year, which claimed the lion's share of the 1.6 million tons of Japanese shipping lost in 1945. U.S. submarines entered the last sanctuaries of Japanese shipping in the Sea of Japan in June 1945 to ravage the remnants of the Japanese merchant fleet but found targets exceedingly scarce thereafter. During the last months of the war, the submarines were confined to seeking what little coastal traffic had managed to escape the mine barrages and the attention of American aircraft. When the war was over, Japan's merchant fleet had been reduced to 12 percent of its prewar size, and only

half of the surviving ships—a paltry 312,000 tons of mostly minor vessels were in operation due to fuel shortages.

In addition to their economic impact, the American submarines played a decisive role in paralyzing Japan's maritime empire in the western and southwestern Pacific by denying the Japanese the use of their interior lines of communications for the movement of troops and equipment by sea. Thus, they facilitated the advance of the U.S. amphibious forces, which could safely bypass the immobilized and isolated Japanese island garrisons.

The U.S. submarine service started the war with 111 boats, added 203, and lost 52 (50 of them in the Pacific). Of the 16,000 submariners who sailed on war patrols, 3,506 did not return—a casualty rate of 22 percent, the highest of all arms in the American services during the war. Nevertheless, the U.S. submarine campaign in World War II was the only campaign of its type in the history of naval warfare that can be rated a complete success. The submarines played a decisive role in the war by incapacitating the Japanese Empire's economy. Of the 7.8 million tons of Japanese merchant shipping lost between 1941 and 1945, nearly two-thirds (4.8 million tons) was sunk by U.S. submarines, which were also responsible for one-third

of the Japanese warship losses. *The U.S. Submarine Operational History*, however, conceded that scholars would do well to “ponder the fact that Japanese anti-submarine defenses were not the best. If our submarines had been confronted with Allied anti-submarine measures, the casualty list of the submarine force would have been much larger and the accomplishment of Allied submarines much less impressive” (Van Der Vat 1992, 339).

United States, Women Accepted for Volunteer Emergency Service (WAVES)

U.S. Navy Women’s Reserve (1942–1948). The acronym WAVES stood for Women Accepted for Volunteer Emergency Service. The WAVES was established on 30 July 1942 under Public Law 689, H.R. 6807, an amendment to the Naval Reserve Act of 1938. The first director of the WAVES, Lieutenant Commander Mildred McAfee, was also the president of Wellesley College in Massachusetts.

Public Law 689 specifically stated that the WAVES would remain restricted to the continental United States and not serve on board naval vessels or aircraft. This restriction is, however, misleading, as women did serve on vessels and in combat areas as nurses in the Navy Nurses Corps, established in 1908. The restriction keeping WAVES in the continental United States did not last, and by September 1944, they were allowed to volunteer for duty in Alaska, Hawaii, the Caribbean, and Panama. By the end of the war, women constituted nearly 2 percent of the U.S. Navy. In some areas, such as the Navy Department in Washington, over half the uniformed personnel were WAVES.

WAVES served in many noncombat roles during the war. Eighty were naval air navigators. Some trained future naval aviators in instrument flying and served as gunner’s mates to teach men antiaircraft gunnery. Others were involved with decoding messages or with the hospital corps. Well over 85,000 women served in the WAVES during World War II. A

Recruiting poster for the WAVES, 1943.

study conducted in 1944 showed that the WAVES then in service released from noncombat duties enough male personnel to man 10 battleships, 10 aircraft carriers, 28 cruisers, and 50 destroyers. There was also a Coast Guard women’s auxiliary, the SPARS (combining the Latin and English versions of the Coast Guard motto, *Semper Paratus*, meaning “always ready”) and the Marine Corps Women’s Reserve (MCWR).

The WAVES became a permanent part of the navy in 1948 when Congress passed the Women’s Armed Service Integration Act (Public Law 625). This step eventually led to the full integration into the armed forces of all women’s units in the 1970s.

United States, Women's Army Corps (WAC, Formerly WAAC)

As the likelihood that the United States would join the war intensified, many American women expressed an interest in assisting the U.S. military. By the spring of 1941, Edith Nourse Rogers, a member of Congress from Massachusetts, prepared legislation that outlined the formation of a women's military corps. She sought legal benefits and protection that had been denied to contract and volunteer nurses in previous wars. However, reluctant to give women military recognition equivalent to that granted to men, the War Department ensured that the bill under consideration did not entitle women to full military benefits.

The Japanese attack on Pearl Harbor on 7 December 1941 and the U.S. entry into the war underscored the need for women who could perform routine noncombat work and thereby free men for combat duties. Army Chief of Staff General George C. Marshall encouraged a resistant Congress to pass a bill creating the Women's Auxiliary Army Corps (WAAC) in May 1942.

Oveta Culp Hobby, head of the Women's Interest Section in the War Department's Bureau of Public Relations, became the WAAC commanding officer. Assigned the rank of major, she oversaw the enlistment of qualified applicants. Recruitment posters for the WAAC featured a uniformed woman standing in front of an American flag and above the statement "This Is My War Too!" The WAAC was open to women who were 21 to 45 years of age and without dependents and who met minimum height and weight requirements. Marital status was not a factor. Applicants went to army recruitment stations, where interviewers evaluated their abilities and skills. The women also took aptitude tests and had to pass physical examinations.

Every applicant wrote an essay to explain her motivation to join the corps. Many sought service for patriotic reasons and to help bring the war to an earlier end because they had a boyfriend, a spouse, or another relative in service. Economic incentives motivated many; they enjoyed having employment and professional opportunities unavailable to them in peacetime. Some considered wartime service as a valuable work experience that would be helpful in acquiring jobs in the future. The potential for adventure lured many.

Initial WAAC officer candidates trained at Fort Des Moines, Iowa, and were commissioned in September 1942. The officers then trained the first 12,200 enlistees for the 150,000 WAAC positions authorized by Congress. Instructors taught the enlistees basic military skills, such as map reading and defense against air attack, as well as military customs and protocol. Women also practiced first-aid tech-

niques and drilled to acquire discipline and physical fitness. WAACs perfected administrative procedures for assignments to supply and company positions.

At first, WAACs were deployed to assignments such as translation and folding parachutes. Although many WAACs served in nursing or clerical roles, some utilized mechanical skills for radio operation and motor pool duties. Later WAACs were trained at specialist schools and sent to assignments where their skills were needed. Some attended officer candidate school. Officials often assigned WAACs to U.S. military bases where they could perform routine tasks so that male soldiers could be sent overseas more quickly. WAACs were assigned to such specialty units as the Transportation Corps, Chemical Warfare Service, Signal Corps, Army Medical Department (where they served on land and in hospital ships), Army Ground Forces, and Corps of Engineers (where some worked on the MANHATTAN Project).

Some WAACs were sent overseas. The 149th Post Headquarters Company, assigned to Lieutenant General Dwight D. Eisenhower at Algiers, was the first to go, in January 1943. Women also served with Lieutenant General Mark W. Clark's Fifth Army in Africa and Italy, often near the front lines.

WAACs encountered varying attitudes. Many male officers and soldiers accepted their presence, but some men disliked them and attempted to make their service difficult and force them to quit. WAACs occasionally faced unfair disciplinary actions or endured verbal abuse and hostility. Such treatment, health concerns, fear, disillusionment with military service, or family pressure led some WAACs to ask to be discharged. Others deserted. Military officials could not court-martial these women because the WAACs did not have full military status.

In July 1943, legislation reorganized the WAAC into the Women's Army Corps (WAC), granting women the same military status as male troops. WAACs who wanted to transfer to the WAC as soldiers were expected to meet more demanding standards, including more thorough medical examinations. Each also had to secure the recommendation of her commander. Approximately 75 percent of the WAACs transferred. Hobby held the highest WAC rank, that of colonel.

Soon after the establishment of the WAC, the U.S. Eighth Air Force asked for the services of a WAC battalion. The first WACs assigned there went to London in July 1943. Notable WAC service included providing assistance to the 1944 Normandy Invasion. WACs plotted bomber positions, collected intelligence, censored soldiers' mail, and served as cryptographers. Only women considered sufficiently mature and stable were selected to serve in Europe.

Most commanders recognized the competence and efficiency of the WACs. Ultimately, the army requested as many as 600,000 women in the corps. That demand was never met

WACs, part of a convoy of ATS drivers going to Paris, were among the first women to drive their own vehicles through France, 16 November 1944. (Photo by Harry Todd/Fox Photos/Getty Images)

because many women preferred higher-paying jobs on the home front or joined rival military auxiliaries. Overall, approximately 150,000 served in the corps. WACs were stationed in the United States, in Europe, in North Africa, in the Middle East, in the China-India-Burma Theater, and in the southwest Pacific. Many were awarded Purple Hearts for wounds they received from bombings and artillery fire. Others received Air Medals, Bronze Stars, and other citations.

Although it consisted primarily of whites (94 percent), the corps also represented the diverse population of the United States. Some 4,000 African Americans as well as Hispanic, Asian, and Native American women served in the corps. As with other military units at that time, African American units were segregated, but Hobby sought improvements such as the integration of black officers and equitable salaries for WACs.

An estimated 2,000 WACs chose to enlist after World War II. Most of the women, however, were honorably discharged at the end of the conflict. Hobby retired in July 1945, and Lieutenant Colonel Westray B. Boyce became WAC director. The public reception given to returning WACs was generally apathetic and unappreciative: men, not women, were regarded as war heroes. Because of their military status, WAC veterans were, like their male colleagues, eligible for such benefits as the GI Bill, but they often had to fight legally to receive health care from the Veterans Administration. The WAC enabled women to seek careers in the postwar military, although many initially encountered difficulties in achieving ranks and pay equivalent to their service achievements. In 1948, the Women's Armed Services Integration Act incorporated the WAC as a corps within the U.S. Army. Thirty years later,

the separate corps came to an end and female soldiers joined the army directly instead of the WAC. The Army Women's Museum, located at Fort Lee, Virginia, preserves artifacts and materials documenting the WAC's history.

United States, Women's Auxiliary Ferrying Squadron

Women's auxiliary component of the U.S. Army Air Forces, formed during World War II. When war broke out in Europe in 1939, two notable women aviators, Jacqueline Cochran and Nancy Harkness Love, proposed separate military flight-training programs. Love proposed using women pilots who held commercial licenses to fill noncombat flying positions in the United States to deliver or ferry military aircraft. Cochran proposed a military flight-training program for women holding private pilot licenses.

In 1942, when manpower requirements became critical, both plans were implemented. Love was placed in charge of

the Women's Auxiliary Ferrying Squadron, and Cochran headed the Women's Flying Training Detachment. After some advanced instruction, Love's group began ferrying fighters and bombers from factories to bases throughout the United States. Cochran's group trained at Sweetwater, Texas, completely segregated from male training units.

In September 1943, the two groups were merged into the Women Airforce Service Pilots (WASPs). Cochran remained in charge of the training program and Love the ferry squadron. WASPs was disbanded on 20 December 1944.

United States, Women's Land Army (WLA)

U.S. government program to provide agricultural labor to the nation's farmers, loosely based on the British program of the same name. By mid-1943, an extreme shortage of farm labor forced the government to develop a comprehensive plan to assist farmers. The Emergency Farm Labor Program, Public Law 45, under the control of the Department of Agriculture and Extension Service, created several farm labor programs, including the Women's Land Army (WLA). As part of the Emergency Farm Labor Program, the WLA brought women to the forefront of agricultural labor. Beginning in April 1943 and continuing to the end of 1945, the WLA recruited, hired, and placed more than 3 million farm and nonfarm women over the age of 18, putting them to work in full- or part-time positions on American farms.

Mirroring the New Deal program structure, the WLA established a national office, under the direction of home economist Florence L. Hall. It disseminated information and moneys to state-level organizations run by extension agents. The national WLA mandated federal policy for its members, whereas state programs implemented plans for housing, insurance, local transportation, uniforms, and equitable wages. In 1943, 13 states had full-time WLA supervisors, and 30 states had part-time supervisors. In some states where the WLA organization was quite large, state supervisors were

assisted by county supervisors who worked on the local level. Successful state supervisors planned recruitment campaigns, organized camps for women workers, provided training courses, opened child care centers, and monitored farmer/worker opinion of the WLA. States without the WLA or the Emergency Farm Labor Program in place hired women through local labor initiatives.

Farmers in the western and eastern coastal regions of the United States readily accepted and hired female labor in 1943 and throughout the war. Continuing a prewar trend, eastern and western states supported the use of women in agricultural labor to harvest perishable crops. But even though much of the nation favored wartime domestic policy, some areas of the country resisted the placement of nonfarm women on farms. States in the South and Midwest, historically opposed to nonfarm and middle-class women in the fields, did not accept the WLA in 1943. In the Midwest, the opposition to nonfarm women in agriculture left farms understaffed and crops unharvested. In the South, racial issues plagued several states and state labor programs. In 1943, some southern states made a conscious effort to recruit only white women, effectively preventing African American women from joining the organization. In 1944 and 1945, as the labor situation became dire, it proved impossible to hire African American women, as many had left the region or taken jobs in industry.

Most midwestern and southern farmers who protested the WLA in 1943 would ultimately use women as farm laborers by the end of the war; in all, several hundred thousand women would work on farms in these regions. Farmers in the Great Plains and eastern Rocky Mountains, however, remained opposed—sacrificing agricultural production and money—to having women as farm workers.

By the end of 1945, farmers had, for the most part, accepted the WLA, and agricultural production goals were met. The Emergency Farm Labor Program continued until 1947, but the WLA ended with World War II.

Upham, Charles (1908–1994)

Soldier who was awarded the Victoria Cross (VC) twice for his service in World War II. Born on 21 September 1908 at Christchurch, New Zealand, Charles Upham was the only British Commonwealth soldier in the war to win the Victoria Cross and Bar and only the third soldier in history to do so. He was actually recommended for the VC three times, but the last two recommendations were consolidated into a single award.

Upham won his first VC as a second lieutenant in the 20th Battalion, 2nd New Zealand Expeditionary Force on Crete for actions between 22 and 30 May 1941. At Minqar Qaim in North Africa while in command of a company, he was recommended for his second VC when, on the night of 27 June 1942, he single-handedly attacked a stalled column of German trucks while armed with a sandbag full of hand grenades. At Ruweisat Ridge, he was severely wounded twice on the night of 14–15 July, but he refused evacuation. When the Germans attacked his company for the last time, he led the counterattack, personally destroying a German tank and several guns. He kept going until he passed out from loss of blood.

Captured, Upham spent the rest of the war as a prisoner of war (POW), but he received a third VC recommendation for his conduct at Ruweisat Ridge. After his many attempts to escape, the Germans finally sent Upham to Colditz, where he remained until he was freed by American forces in 1945. Even then, he demanded that his rescuers give him an American uniform and a weapon and allow him to accompany them as they pursued the retreating Germans.

Following his repatriation, Upham's two pending VC recommendations were resurrected from the files where they had sat while he was a POW. For whatever reason, the British military could not accept the idea of a soldier with three VCs, so he essentially received the Bar for the Ruweisat Ridge action. After being decorated in London by King George VI, Upham returned to his native New Zealand and became a sheep farmer. For the remainder of his life, he resisted all urging to enter politics or to exploit in any way his status as one of the greatest Allied heroes of World War II. Upham died in Christchurch, New Zealand, on 22 November 1994.

Ushijima Mitsuru (1887–1945)

Japanese army general who was a key figure in the Battle of Okinawa. Born on 31 July 1887 in Kagoshima Prefecture, Japan, Ushijima Mitsuru graduated from the Military Academy in 1901 and the Army War College in 1916. He held major military posts as a staff officer and a commander of troops both within and outside Japan. Promoted to lieutenant general in 1939, he assumed the post of head of the Military Academy three years later.

Arriving in Okinawa in August 1944, Ushijima took command of Thirty-Second Army. That unit had been established under direct control of the Imperial headquarters in March 1944 specifically for the purpose of defending the Ryukus Islands. By that time, the Thirty-Second Army numbered four divisions and five mixed brigades. However, its military potential was hugely diminished when the 9th Division, one of the elite units in the army, was relocated to Taiwan (Formosa) in December and not replaced on Okinawa. Ushijima

did what he could to strengthen the island's defenses, but the loss of his best division forced him to change his strategy from pursuing a "fight to the finish" to instigating delaying tactics. The goal of this strategy was to prolong the battle against U.S. forces in order to forestall a landing in the main Japanese home islands as long as possible.

The Battle of Okinawa began on 26 March 1945 when the U.S. forces landed on the Kerama Islands. On 1 April, those forces went ashore on Okinawa proper. The landing was deceptively easy, as Ushijima had withdrawn the bulk of his forces to fight for the populous interior. The fighting continued into late June. With the battle lost, Ushijima committed ritual suicide on a cliff on 23 June (22 June, according to another account), leaving as his last orders: "Guard your own position, follow the orders of your superiors, and fight bravely to the last breath for your homeland." Ushijima had been promoted to the rank of general on 20 June, just prior to his death.

Ustinov, Dmitry Fedorovich (1908–1984)

Soviet marshal and minister of defense during World War II. Born in the city of Samara, Russia, on the Volga River on 30 October 1908, Dmitry Ustinov volunteered for service in the Red Army in 1926, but his one stint of active duty was cut short when his unit was demobilized the next year. Ustinov joined the Communist Party in 1927 and worked as a metals craftsman between 1927 and 1929. In 1934, he graduated from the Institute of Military Mechanical Engineering in Leningrad, where he studied artillery design. He was then a design engineer at the Bolshevik Arms Factory in Leningrad, becoming its director in 1938.

The Bolshevik factory produced considerable quantities of weapons for the 1939–1940 Finnish-Soviet War (the Winter War). Ustinov's efficient management of the factory attracted the attention of Josef Stalin, who made him commissar (minister) of armaments just after the German invasion of the Soviet Union in June 1941. As armaments minister, he oversaw the relocation of factories east from the

western Soviet cities endangered by the German advance. He also dramatically increased the production of tanks and other military matériel. Commissioned colonel general of military engineers in 1944, Ustinov continued as minister of armaments well after the war, until 1957.

An enthusiastic supporter of the space program, Ustinov was a key participant in the successful 1961 launching of the first man to go into space, Yuri Gagarin. Appointed minister of defense in 1976, Ustinov was named a marshal of the Soviet

Union that same year. He was responsible for the deployment of troops to Afghanistan in 1979 and remained minister of defense until his death in Moscow on 20 December 1984.

V

V-1 Buzz Bomb

The first operational cruise missile, produced by the Germans during World War II. On 13 June 1944, a British Observer Corps watch post on the Kentish coast spotted a stubby-winged aircraft with a strange engine inbound from the North Sea. Its engine made a buzzing sound as it flew overhead. This “buzz bomb” was on its way to London and was the first of more than 7,900 to be launched by Germany against Great Britain. Another 4,883 attacked Antwerp late in the war. Although only 4 of the first 12 missiles launched against Britain actually reached the island and only 1 hit its target of London, the campaign drew extensive Allied defensive and offensive reactions and gave birth to today’s cruise missile programs.

Germany’s Vergeltungswaffe 1 (Vengeance Weapon 1, or V-1) had its origins in a 1938 Luftwaffe research program to develop new aircraft propulsion systems. Given the code name FLAKZEILGERÄT (antiaircraft training device) 76 to hide its true purpose, the project was centered on the Schmidt pulse-jet engine designed in 1928. Fiesler, the manufacturer, designated it the Fi-103 and intended it as a test platform; however, on 19 June 1942, the Luftwaffe directed that it be developed as a flying bomb.

The first airframe flew successfully on 24 December 1942. Subsequent testing revealed and led to the correction of problems with the autopilot and airframe design. Both surface- and air-launched variants were built. The result was a 25-ft-long, midwing monoplane missile with a 17.6 ft wingspan; it was fueled by cheap 75 octane gasoline and could deliver a 1,870 lb warhead to a target up to 200 miles away.

Guidance was simple: a gyro-based autopilot ensured the V-1 stayed on course and at the correct altitude. A nose pro-

peller connected to a counter determined the missile’s flight range. The propeller spun as the missile flew, and the V-1 dived when the counter reached a preset number of rotations. This system resulted in half of the missiles landing within 8

A German V-1 flying bomb about to strike a residential area of southern England. (Corbis)

miles of the aim point. Dual fuzing made the warhead one of the most reliable of the war: fewer than 4 out of every 1,200 missiles were duds. A steam-powered catapult system was developed for the surface-launched version.

Development and production of this weapon occurred rapidly. The V-1 campaign was to have begun on 13 December 1943, but delays were caused by strategy disagreements; the debate concerned whether to launch the new weapons as missiles became available or to wait until stockpiles and protective bunker sites could be built to support a sustained campaign. The Allied landings in Normandy on 6 June 1944 forced a decision, and six days later, Adolf Hitler ordered the offensive to commence.

The Western Allies reacted swiftly, as they had anticipated the flying-bomb campaign. They directed hundreds of bombing sorties at the launch sites, the V-1 production facilities, and the transport systems that delivered the missiles. The Allies also reinforced their antiaircraft defenses, assigning some 944 heavy guns, 700 rocket launchers, and 1,200 light antiaircraft guns as well as 4 Mosquito fighter-bomber squadrons and 8 single-engine fighter squadrons to defend London and other

Germany launched more than 10,000 buzz bombs against Great Britain, killing 6,184 people and injuring 17,981.

strategic targets from the V-1. One daring approach was to intercept the V-1 (which was possible because of its 360 mph speed) and then carefully tip up one of its wings, causing the missile to crash.

The Germans launched slightly more than 10,000 V-1s against England. Of these, some 7,488 crossed the English Channel; 3,957 were shot down. Of the 3,531 that made it past the defenses, 2,419 reached London. About 30 fell on Southampton and Portsmouth, and 1 made it to Manchester. The V-1 offensive killed 6,184 people and injured an additional 17,981. Although the V-1s were relatively ineffective, their use marked the beginning of a new era in weaponry.

V-2 Rocket

German strategic guided missile, first launched against London on 8 September 1944. Germany's *Vergeltungswaffe 2* (Vengeance Weapon 2, or V-2) had its origins in the Versailles Treaty imposed on Germany by the Allied powers after World War I. That agreement prohibited Germany from possessing long-range artillery or military aircraft, limitations that ultimately led to a secret German army program to develop long-range rocket artillery. The program initially focused on relatively simple solid-fuel artillery rockets, but in early 1930, the military's interest shifted to liquid-fueled rockets when Captain Walter Dornberger joined the Heereswaffenamt (Army Weapons Bureau, or HWA). A year later, Dornberger established a small research center at Kummersdorf, south of Berlin, to conduct army-controlled research into liquid-fueled rockets. Progress was slow until he recruited scientist Wernher von Braun and two of his colleagues to the program. The V-2 design team was formed.

Originally designated the Aggregat 4 (or A-4), the V-2 was based on the stated requirement for a 200 mile bombardment rocket to enter service by mid-1943. The team's first liquid-fueled rocket, the A-1, was a static, proof-of-concept design that led to the A-2, first launched in 1934 from Borkum Island in the Baltic Sea. The more powerful A-3 followed, and three years later, the project moved to a new test center at Peenemünde on the Baltic coast. However, most of the A-3's early flights failed, with test rockets rarely getting off the launchpad. The rocket's fins and guidance systems suffered design faults because little was understood about high-speed flight and powerful-thrust rocket engines.

The A-5 was built to resolve these problems. Slightly larger than the A-3 at 16 ft in length, the A-5 incorporated parachute-recovery, telemetry, and radio-control systems to ensure a thorough monitoring of the rocket's flight and problems. These additions and the construction of a supersonic wind tunnel greatly enhanced the designers' ability to discover and correct problems.

Progress slowed significantly in 1940, however, when Adolf Hitler suspended any weapons research projects that could not be placed in production immediately. Things accelerated again in December 1942, when the Army General Staff restored the project's pre-1940 funding. In late 1943, it provided increased support, including a program involving a submerged launch from a U-boat. But on 17–18 August 1944, the Royal Air Force (RAF), which had been made aware of the program in large part by the work of the Polish underground, launched a raid on Peenemünde that killed at least 120 personnel and damaged sufficient facilities there to set back the program by some six months. Development decelerated fur-

German V-2 rocket at Cuxhaven, 1944. (Hulton-Deutsch Collection/Corbis)

ther as equipment and personnel were dispersed to reduce the program's vulnerability. As a consequence, production of the V-2 did not begin until June 1944.

The V-2 weighed 13.6 tons and was 46 ft in overall length. Its gyroscopic autopilot controlled graphite fins located in the rocket-engine exhaust to direct the missile's flight. The early missiles used a radio-controlled fuel cutoff to control range, but most production models incorporated a gyro-integrating accelerometer for that purpose. The last models used a combination of the two systems. The rocket engine employed alcohol and liquid oxygen to generate some 55,000 lbs of thrust. The warhead consisted of 1,605 lbs of cast amatol, a relatively weak explosive that was chosen because it did not detonate when atmospheric friction drove up the missile's skin temperature. As with the V-1, warhead fuzing was extremely reliable. Of 1,150 V-2s hitting Great Britain, only 2 were duds.

Unlike the V-1, however, the V-2's supersonic speed and ballistic flight profile precluded in-flight intercept, forcing the Allies into an expensive bombing campaign to destroy the missiles before they could be launched. That effort was further complicated by the V-2's reliance on a mobile, quickly set up launch system. The Western Allies directed hundreds of bomber sorties at V-2 production facilities and Germany's transportation network to prevent the missiles from reaching operational units. Hundreds of other fighter-bombers conducted low-level sweeps over suspected launch areas to attack V-2 units before they fired. A later commander would face the same challenge and employ similar tactics in the 1991 Iraq War against the V-2's Soviet-built successor, the Scud missile.

The first V-2 fell on Chiswick, near London, on 8 September 1944, killing 3 people and wounding 17. Between that date and 27 March 1945, 1,054 V-2s fell on England, and 517 of these struck London. Slightly more than 2,700 Londoners died because of the V-2s. The port of Antwerp also came under heavy V-2 attack, with 900 missiles fired on it in the last three months of 1944.

The V-2 was expensive (one estimate suggests it cost about one-third as much as the MANHATTAN Project in the United States), and many have argued that resources expended on it would have been better used to develop surface-to-air missile (SAM) systems to protect Germany from Allied bombing. This argument overlooks two critical elements of the V-2 program. First, it diverted a significant portion of the Allied bombing effort. Second, SAMs require electronic guidance systems that are susceptible to countermeasures, and by 1943, the Allies enjoyed a massive superiority in this area. Viewed in that context, the V-2 was an early asymmetrical warfare system that allowed the Germans to use technologies that circumvented Allied capabilities, forc-

ing them into an expensive countereffort with forces that might otherwise have been employed against German industry or forces on the ground.

Vandegrift, Alexander Archer (1887–1973)

U.S. Marine Corps general who commanded the I Marine Amphibious Corps in the Pacific. Born on 13 March 1887 in Charlottesville, Virginia, Alexander Vandegrift attended the University of Virginia from 1906 to 1908 and was commissioned a second lieutenant in the Marine Corps in 1909. Much of his early years in the Marine Corps were spent in Latin America and the Caribbean, with operations at Vera Cruz and in Haiti. He subsequently served in China and on various staffs and was promoted to brigadier general in April 1940.

Vandegrift took command of the 1st Marine Division in April 1942 and led it on Guadalcanal from August to December 1942. The division's success was due largely to the training program that he instituted. In three months of hard fighting, despite the haphazard nature of air and naval support, Vandegrift and his men gradually pushed back the Japanese forces. For his actions at the Battles of Tenaru River (21 August) and Bloody Ridge (12 September), Vandegrift received the Navy Cross and the Medal of Honor.

Promoted to lieutenant general in June 1943, Vandegrift commanded the I Marine Amphibious Corps during its assault on Empress Augusta Bay, Bougainville, in November 1943. Using deception and a careful choice of landing sites, his forces surprised the Japanese ashore and quickly established a beachhead. On the successful completion of this operation, Vandegrift returned to the United States in January 1944 to serve as commandant of the Marine Corps. He was promoted to general in March 1945, becoming the first Marine to achieve that rank. He served as commandant until December 1947, when he left active service. He was placed on

U.S. Marine Lieutenant General Alexander Archer Vandegrift. (Hulton-Deutsch Collection/Corbis)

the retired list in April 1949. Vandegrift died in Bethesda, Maryland, on 8 May 1975.

Vandenberg, Hoyt Sanford (1899–1954)

U.S. Army Air Forces (USAAF) and U.S. Air Force (USAF) general who helped plan the Normandy Invasion and took command of Ninth Air Force in August 1944. Born in Mil-

waukee, Wisconsin, on 24 January 1899, Hoyt Vandenberg graduated from the U.S. Military Academy in 1923 and was assigned to the Air Service. He earned his wings in 1925. He attended the Command and General Staff School at Fort Leavenworth, Kansas, in 1936 and the Army War College in 1939.

Vandenberg joined the Planning Division under Chief of the Army Air Corps Brigadier General Henry H. Arnold. His work in helping to direct the Air Corps buildup following Pearl Harbor led to his promotion to colonel. In June 1942, he was assigned to Major General Dwight D. Eisenhower's staff in Britain to assist in the development of air plans for Operation TORCH, the Allied invasion of North Africa. Promoted to brigadier general in December, he accompanied Brigadier General James Doolittle to North Africa as chief of staff of Twelfth Air Force in February 1943. In the summer of 1943, Vandenberg became chief of strategic forces under Lieutenant General Carl Spaatz, commander of Northwest African Air Forces. In March 1944, he received a promotion to major general and was assigned to England as deputy commander of the Allied Expeditionary Air Forces under British Air Chief Marshal Sir Trafford Leigh-Mallory. In August 1944, Vandenberg assumed command of Ninth Air Force, which covered the

U.S. Air Force General Hoyt S. Vandenberg, April 1948. (Bettman/Corbis)

advance of Allied forces across France and into Germany. In the process, he won high praise from army generals for the Ninth's close support of their forces. In March 1945, he was promoted to lieutenant general.

After the war, Vandenberg held a number of staff assignments, including service as director of the Central Intelligence Group, forerunner to the Central Intelligence Agency. Promoted to full general in 1947, Vandenberg played an important role in making the air force a separate service in September of that year. Spaatz became its first chief of staff, and Vandenberg was vice chief of staff. After Spaatz retired in April 1948, Vandenberg succeeded him. When the Soviet Union imposed a blockade on Berlin that summer, he helped convince President Harry S Truman that the air force could adequately supply West Berlin.

Vandenberg was a forceful and effective advocate for the Strategic Air Command in battles with the navy over strategic deterrence in 1949. The Korean War saw a doubling of air force strength, to 106 wings. He vigorously defended the need for a flexible and technologically advanced conventional and nuclear air force capable of strategic and tactical missions, which ran counter to the Eisenhower administration's emphasis on nuclear weapons. Vandenberg retired in June 1953 and died in Washington, D.C., on 2 April 1954.

Vasilevsky, Aleksandr Mikhailovich (1895–1977)

Soviet marshal and chief of staff of the Red Army. Born in Novaya Golchikha in the Volga region on 30 September 1895, Aleksandr Vasilevsky was the son of an Orthodox priest and attended a seminary before entering the tsar's army and rising to captain. He joined the Red Army in 1919, and during the Russian Civil War, he was elected commander of a rifle regiment. Vasilevsky then commanded the 143rd Regiment of the Moscow Military District and was chief of the Red Army's Combat Training Directorate from 1931 to 1934. In 1935, he was appointed deputy chief of staff of the Volga Military District. Between 1936 and 1937, he attended the Frunze General Staff Academy and taught tactics there for several months.

Vasilevsky was then attached to the General Staff as chief of the Operations Training Section. Admitted to the Communist Party as a full member in 1938, he was deputy chief of operations of the General Staff in 1939 and 1940 and then chief of the Operational Department in 1941. Following the German invasion of the Soviet Union in June, Vasilevsky became invaluable to Stavka (the Soviet High Command) in his visits to and coordination of the various military fronts. Only General Georgii Zhukov, with whom he worked out the successful 1942–1943 Soviet winter offensives, was more active in this regard. Appointed chief of the General Staff in June 1942, Vasilevsky was promoted to full general in January 1943 and to marshal of the Soviet Union in February 1943.

Vasilevsky coordinated the 3rd and 4th Ukrainian Fronts from Kursk through the advance from the Dnieper River to the Dniester and Prut Rivers. He subsequently coordinated operations for the 1st Baltic and 2nd Belorussian Fronts in East Prussia. In February 1945, he stepped down as chief of the General Staff to take command of the 3rd Belorussian Front following the death of its commander, General Ivan Chernyakhovsky.

Less volatile than Zhukov, Vasilevsky is said to have been a "rational influence" on Josef Stalin, who selected him in July 1945 for the singular honor of being the first Soviet theater commander against the Japanese. Vasilevsky's Manchurian campaign was a lightning operation that required the coordination of three fronts from three directions, with the object of penetrating into central Manchuria to destroy the Japanese Guandong (Kwantung) Army. The campaign was a complete success.

In November 1948, Vasilevsky was reappointed chief of the General Staff, and in March 1949, he became minister of defense. He retired from public life following Stalin's death in March 1953. Vasilevsky was one of 11 Soviets to receive the five-star ruby Order of Victory and was twice named a Hero of the Soviet Union. He published his war memoirs, *Delo Vsei Zhizni* (A Lifelong Cause), in 1973. The work revealed Stalin's failure to follow the recommendations of his military advisers in the opening and disastrous stages of the German invasion. Vasilevsky died on 5 December 1977.

Vella Gulf, Battle of (6–7 August 1943)

Pacific Theater naval battle, fought around midnight when an American destroyer force under Commander Frederick Moosbrugger intercepted a Japanese transport group off northwest Kolombangara. Following the Battles of Kula Gulf and Kolombangara, the Japanese had switched to the Vella Gulf–Blackett Strait route. On the night of 1–2 August, the Japanese had made a successful run by this route, the only opposition coming from an unsuccessful attack by U.S. patrol torpedo (PT) boats. Against the advice of his ship captains, who worried that the Americans would be waiting, the Japanese commodore, Captain Sugiura Kaju, decided to try it again. This time, however, a U.S. search plane spotted the Japanese force approaching off Bougainville at 5:30 P.M.

The Americans were indeed lying in wait. Moosbrugger with Destroyer Division 13—the *Dunlap*, *Craven*, and *Maury*—and Commander Roger R. Simpson’s Destroyer Division 15—the *Lang*, *Sterett*, and *Stack*—were on the prowl south of Vella Gulf when the search plane’s warning came. The moon had set when Moosbrugger led his destroyers in two columns into the gulf. The sky was overcast, and rainsqualls reduced visibility to less than 4,000 yards. Moosbrugger hugged the shore of the high, volcanic cone of Kolombangara.

At 11:33 P.M., radar picked up the Japanese destroyers: Sugiura in the *Hagikaze*, followed by the *Arashi*, *Kawakaze*, and *Shigure*. The Japanese ships, crammed with 50 tons of supplies and 900 troops, sailed into an ambush. Moosbrugger had been privy to Captain Arleigh Burke’s planning for a night destroyer action, and he executed it to near perfection. With Simpson’s division covering, Moosbrugger delivered the torpedo attack on the unsuspecting Japanese ships at 11:41 and then turned away to avoid any Japanese torpedoes. Simpson turned to port to cross the Japanese T, and a few minutes later, as the three leading Japanese destroyers exploded in flames that lit up the dark night, he opened fire. Only the *Shigure*, lagging behind because of engine problems, escaped and then only because the torpedo that stuck her rudder failed to explode.

For the Japanese, the Battle of Vella Gulf marked the first time they had been bested in a night destroyer action. The second time, in the Battle of Cape St. George, Burke himself, in an action remarkably similar to Vella Gulf, would administer the defeat.

Hara, Tamichi, Fred Saito, and Roger Pineau. *Japanese Destroyer Captain*. New York: Ballantine Books, 1961.

Vella Lavella, Land Battle of (15 August–7 October 1943)

Vella Lavella is the northwestern island of the New Georgia group in the Solomons chain. Its capture marked the first time that the Allies successfully bypassed a major Japanese position in the South Pacific.

The costly New Georgia Campaign of July and August 1943 had made the South Pacific Theater commander, Admiral William F. Halsey, reluctant to assault the nearby and strongly defended Kolombangara. But Vella Lavella, which lay beyond Kolombangara, was only lightly held by the Japanese and offered superior prospects as an Allied air base. Because it was only some 35 nautical miles from the recently captured Munda Airfield on New Georgia, planes from the latter could easily provide air cover for a landing on Vella Lavella.

A small U.S. landing party reconnoitered Vella Lavella in late July and found, at Barakoma on the southeast coast, suitable sites for both a landing beach and an airstrip. Several days before the scheduled invasion on 15 August, an advance landing party of about 100 men slipped ashore with orders to mark the landing beaches. Most of the few Japanese troops on the island proved to be emaciated refugees from the New Georgia fighting.

The main landing on 15 August was executed by Task Force 31, commanded by Rear Admiral Theodore S. Wilkinson. Once the landing was completed, overall command of the Vella Lavella force passed to Major General Oscar W. Griswold, commander of XIV Corps and the New Georgia Occupation Force. A Marine defense battalion was included, but the principal ground component was the army’s 35th Regimental Combat Team (RCT), led by Brigadier General Robert B. McClure, assistant commander of the 25th Division. Overall, the landing force totaled about 4,600 soldiers, Marines, and Seabees.

Confronted with such a strong invasion force, General Imamura Hitoshi, commander of the Eighth Area Army at Rabaul, decided not to mount a counterlanding at Vella Lavella. Instead, he would fight a delaying action in order to evacuate as many men as possible northward to Bougainville. Thus, most of the fighting in and around Vella Lavella—and most of the 198 Allied casualties in the operation—resulted from Japanese aerial attacks against the landing force and its supporting ships. Ground combat was essentially limited to patrolling and skirmishing.

On 18 September, McClure and his American troops turned over their operation to elements of Major General H. E. Barrowclough's 3rd New Zealand Division. While American Navy Seabees completed the Barakoma Airfield, the New Zealanders worked their way up both the east and west coasts of the island. Although they failed to trap the escaping Japanese, the island was fully in Allied hands by 7 October. The Allies also failed to prevent the withdrawal of nearly 10,000 Japanese from bypassed Kolombangara. Nevertheless, the air bases at Barakoma and at Munda and Ondonga on New Georgia brought all of Bougainville within the combat radius of Allied fighters and greatly facilitated the landings that began there on 1 November.

Vella Lavella, Naval Battle of (6–7 October 1943)

Pacific Theater naval battle, the last surface action of the New Georgia Campaign. The battle resulted from Japan's decision to evacuate 600 of its troops on Vella Lavella Island. For this purpose, the Japanese put together at Rabaul a transport group of three old destroyers, four subchasers, and eight smaller craft supported by the destroyers *Akigumo*, *Isokaze*, *Kazegumo*, *Yugumo*, *Shigure*, and *Samidare*, under the command of Rear Admiral Ijuin Matsuji.

The U.S. Navy force patrolling the Slot (the passage formed by the Solomons) on the night of 6–7 October consisted of the destroyers *Selfridge*, *Chevalier*, and *O'Bannon*, under the command of Captain Frank R. Walker. When an accurate assessment of Ijuin's strength became known, however, three destroyers under Captain Harold O. Larson were detached from convoy duty and sent speeding to the scene. Larson arrived too late to participate in the action.

The sea was calm, and a brilliant half moon made for excellent visibility when a Japanese search plane reported, at 8:58

P.M., that Walker's force consisted of one cruiser and four destroyers, the first of a number of mistakes the Japanese were to make. Ijuin allowed the subchaser group to proceed on to Vella Lavella (this group had left earlier and was ahead of the main body), but he ordered the destroyer-transport (which were also ahead of the main body) back to the Shortlands; their two escorts, the destroyers *Samidare* and *Shigure*, were to join the main group. Walker made contact at 10:31, and his radar picked up the two Japanese groups just before they joined. Walker made for the larger group.

Ijuin mishandled his force, missed a chance to cap the T, and ended up with his ships staggered and the *Yugumo* masking the torpedo tubes of the other three. In the exchange that followed, U.S. gunfire and a torpedo sank the *Yugumo* but not before a torpedo from the latter struck the *Chevalier* a mortal blow. The *O'Bannon*, following through thick gun smoke, collided with the *Chevalier*, and although she was able to back clear, she was also out of the fight. The *Selfridge* continued on alone as all five of the Japanese ships headed west (Japanese aircraft had reported Larson's force coming up from the south as cruisers), but at 11:06 P.M., a torpedo caught the *Selfridge* on her port side. Ijuin fled the scene, leaving the U.S. destroyer *Chevalier* damaged so badly she had to be sunk and the other two ships barely able to limp home to Tulagi. The subchaser group meanwhile rescued the stranded Japanese troops and escaped unnoticed.

The final chapter was written the next morning when four U.S. patrol torpedo (PT) boats were sent in 5 miles west of Vella Lavella to look for survivors. The *PT 163* picked up 33 of the *Yugumo*'s crew and put in at Biloa to transfer them to the army; at that point, 1 of the Japanese killed a sailor with his own gun and was in turn killed, along with 3 other prisoners who joined in the fray.

Vereker, John Standish Surtees Pendergast (Sixth Viscount Gort, Lord Gort) (1886–1946)

British army field marshal who led the British Expeditionary Force (BEF) in France at the outset of the war. Born in London on 10 July 1886, John Standish Surtees Pendergast Vereker, Sixth Viscount Gort, was educated at Harrow and the Royal Military Academy, Sandhurst. He served in World War I first as an operations officer and then with the Grenadier Guards, winning the Victoria Cross. Between the wars, Gort rose steadily in rank and responsibility. He commanded the Staff College, Camberley, and then a brigade. Advanced ahead of other officers in his class, he was appointed chief of the Imperial General Staff (IGS) in December 1937 and promoted from major general to full general.

Gort's appointment as IGS was a mistake, for he did not work well with the secretary of state for war, Leslie Hore-Belisha, who was both unorthodox and flamboyant. Gort, the traditional soldier, was neither. He did develop plans for cooperation with the French in the event of war, but he failed in key areas of modernization, including the development of armored forces and air-ground coordination.

When World War II began, Gort assumed the job of commander in chief of the BEF in France, even though he lacked experience in high command. He was glad to escape the bureaucracy and openly anticipated the excitement of war. He built up the BEF in France from 4 to 13 divisions, and as a commander, his dependability and determination stood him in good stead. But he was frequently criticized for his penchant for details: even as the German blitzkrieg drove into France in May 1940, he was discussing uniforms. Gort's relationship with Hore-Belisha worsened when the war minister, during an inspection trip to France, was critical despite the real progress that had been made on defensive positions. Gort may not have been directly involved in the subsequent campaign that led Hore-Belisha to resign from office, but his friends certainly were.

Following the German invasion of 10 May 1940, Gort took personal command of the BEF troops in the field. This move was a mistake because his place was at headquarters, not in the field directing specific operations, and he only worsened the situation by taking many experienced staff officers with him. He did manage to mount a counterattack on 21 May. Prime Minister Winston L. S. Churchill ordered him to provide two British divisions for a last-ditch French counterattack, but on 27 May, Gort disregarded the order. Believing the attack would most certainly fail and anticipating the impending surrender of Belgian forces, he took the decision on his

British Field Marshal John Standish Surtees Pendergast Vereker (Sixth Viscount Gort, Lord Gort) (1886–1946)

own to use the two divisions to protect his flank. Disregarding Churchill's orders and those of the French army commander, Maxime Weygand, Gort ordered the BEF to fall back on the port of Dunkerque, through which it was evacuated to England. He intended to stay to the end, but on 1 June, he was ordered home.

Gort feared being made a scapegoat for the military disaster of the BEF in France. His next two assignments were as inspector general of training forces (1940–1941) and governor of Gibraltar (May 1941–May 1942). In May 1942, he was appointed governor of Malta, a vital British outpost then under heavy attack. There, his proclivity for details and his leadership paid off. He organized both military and civil defenses, and in January 1943, he was promoted to field marshal.

Gort remained in Malta until July 1944. Later that year, he was sent to Palestine as high commissioner and commander in chief. In 1945, King George VI made him a viscount, but he was already mortally ill. Gort returned home in November 1945 and died in London on 31 March 1946.

Vian, Sir Philip Louis (1894–1968)

British navy admiral. Born in London on 13 June 1894, Philip Vian entered the Royal Navy in 1910. Educated at the Hillside School and the Royal Naval Colleges of Osborne and Dartmouth, he served in destroyers and cruisers during World War I and the interwar years.

At the beginning of World War II, Vian was commanding a reserve destroyer flotilla on Atlantic convoy duty. He soon

distinguished himself as an aggressive and effective leader of light forces: as commodore commanding the 4th Destroyer Flotilla, composed of four modern Tribal-class destroyers and a cruiser; when he boarded the German supply ship *Altmark* in Norwegian territorial waters on 16 February 1940 and freed 299 British prisoners held on her; and in the 1941 Norwegian Campaign and the chase of the German battleship *Bismarck*, which led to his early promotion to rear admiral that July. Vian then led Force K, a squadron of light cruisers, in offensive operations along the Norwegian coast until he was transferred to command Cruiser Squadron 15 in the Mediterranean in October 1941.

In the Mediterranean, Vian further demonstrated his skill as his ships covered resupply convoys to Malta, most notably during the Second Battle of Sirte on 22 March 1942. In 1943, he commanded a squadron of five escort carriers charged with providing fighter cover and close-air support for the Salerno landings. Force V, operating in light winds and confined waters, provided over half of all air support during the

British Admiral Sir Philip Louis Vian (left) confers with U.S. Admiral William F. Halsey. (Corbis)

operation's first four days. This success was tempered, however, by his inexperience in carrier operations, which showed in extraordinarily high operational losses.

Vian then led the Eastern Task Force covering the Normandy Invasion before taking command of the British carrier squadron destined for the Pacific. After preliminary strikes against oil refineries in Sumatra, the carriers joined the U.S. Pacific Fleet in March 1945 at Okinawa. After two months of providing important air support to U.S. land operations on that island, the British Pacific Fleet withdrew to refit, then rejoined the U.S. Third Fleet for the final attack on the Japanese home islands. Vian's adaptability to carrier warfare requirements supported the integration of U.S. practice into the Royal Navy, and his drive was manifest in the fleet's accomplishments.

Following World War II, Vian served ashore and afloat until his retirement in 1952, when he was specially promoted to Admiral of the Fleet. He died at Ashford Hill, Berkshire, England, on 27 May 1968.

Victor Emmanuel III, King of Italy (1869–1947)

Italian monarch during both world wars. Born in Naples on 11 November 1869, the only child of Umberto I and Margherita of Savoy, Victor Emmanuel, Prince of Naples, was tutored in a rigorous, Prussian-style military regimen despite his diminutive size. He inherited the Italian throne after his father's assassination in 1900. Presiding over a Liberal constitutional monarchy and playing Italy's Triple Alliance position against overtures to the Triple Entente, he procured Libya following the 1911–1912 Italo-Turkish War and entered World War I in 1915 on the side of the entente. Fascist Party leader Benito Mussolini made a bid for primacy in ruling Italy in 1922, and the king failed to remove him by invoking his cabinet's martial law decree; in 1924, he sealed the Fascist triumph by allowing the embattled Duce to stay

King Victor Emmanuel III of Italy. (Corbis)

on despite widespread furor over the murder of socialist leader Giacomo Matteotti by Fascist operatives.

The attentive yet reticent figurehead acquiesced in the 1935–1936 Italian war with Ethiopia, the intervention in Spain's civil war, Mussolini's inchoate anti-Semitic laws, the 1939 invasion of Albania, the Pact of Steel approved later that year, and Italy's ill-advised declaration of war on the Allies on 10 June 1940. Witnessing his country's abysmal military efforts, the king did not relish being swept away in the inevitable Fascist defeat. Retaining his authority over Italy's armed forces, Victor Emmanuel arrested Mussolini after his ouster by the Fascist Grand Council on 25 July 1943, replacing him with the army's Marshal Pietro Badoglio.

Following the 8 September 1943 armistice with the Western Allies, the king, with his family and aides, fled Rome for Brindisi as German troops surrounded the capital, provoking the ire of his subjects in liberated and occupied Italy alike. Urged by the Allies to abdicate, he nonetheless clung to his title but relinquished power as his son, Crown Prince Umberto, was installed as the ruling "lieutenant of the realm" following the 4 June 1944 liberation of Rome. On 9 May 1946,

the stubborn Victor Emmanuel III formally passed the throne to Umberto II, but it was too late to save the monarchy. He then went into exile in Egypt and died in Alexandria on 28 December 1947.

Vietinghoff genannt Scheel, Heinrich Gottfried von (1887–1952)

German army general in command of Germany's forces in Italy in 1945. Born on 6 December 1887 at Mainz, Germany, into an old noble family, Heinrich Vietinghoff genannt Scheel joined the Garde-Grenadier Kaiser Franz Regiment in 1906 and was commissioned a year later. In 1914, he was promoted to lieutenant and the next year to captain. During World War I, he served on both the Western and Eastern Fronts and was awarded the Iron Cross, both First and Second Class. In December 1916, he was assigned to the Army High Command; in April 1917, he was posted to the General Staff, where he remained until the end of the war.

Vietinghoff remained in the Reichswehr after the war and served on the staff of army commander General Hans Seeckt and later at the War Ministry. He also held various troop assignments. In November 1938, as a Generalleutnant (U.S. equiv. major general), Vietinghoff assumed command of the 5th Panzer Division, and from October 1939, he commanded XIII Army Corps. He served ably in these positions, and in June 1940, he was promoted to General der Panzertruppen (U.S. equiv. lieutenant general) and given command of the XLVI Panzer Corps under General Heinz Guderian on the Russian Front until June 1942. After briefly leading Ninth Army in the Soviet Union on an interim basis, he took charge of the Fifteenth Army on the Channel coast.

In August 1943, Vietinghoff assumed command of Tenth Army in Italy and the next month was promoted to Generaloberst (U.S. equiv. full general). He temporarily replaced the wounded Field Marshal Albert Kesselring as commander of Army Group C and the Southwest Front and, following a month in command of Army Group Kurland from the end of January to early March 1945, he returned to Italy to be named

German General Heinrich von Vietinghoff-Schiel is questioned by U.S. Captain Ralph C. Opperman, interpreter for Lieutenant General Lucian Truscott following the German surrender. (Corbis)

commander of German forces in that country, on 10 March. That same month, he and Schutzstaffel (SS) General Karl Wolff met in Switzerland in secret talks with the Allies regarding a separate surrender of German forces in Italy. Following discussions at his headquarters at Recoaro and pressed by his chief of staff, General Hans Röttiger, Vietinghoff dispatched the special envoys who signed the surrender on the Italian Front that went into effect on 2 May 1945. Taken prisoner by the Allies, Vietinghoff was held until 1948. He died at Pronten on 25 February 1952.

Vlasov, Andrei Andreyevich (1901–1946)

Soviet army general who would head the German-sponsored Russian Liberation Army. Born on 16 December 1901 in Chepukhimo, Nizhni-Novgorod Province, Russia (now Kursk Oblast), Andrei Vlasov fought in the Red Army during the Russian Civil War. In 1928, he attended a course in infantry tactics in Moscow, and two years later, he became an instructor at the Leningrad Officers' School. Between 1937 and 1938, Vlasov was a military adviser in China to Nationalist leader Jiang Jieshi (Chiang Kai-shek). He returned to the Soviet Union and, as a general major, led the 90th Infantry Division into Bessarabia.

After Germany invaded the Soviet Union in June 1941, Vlasov assumed command of IV Mechanized Corps in delaying actions around Przemysl and L'viv (Lvov). In August, he had charge of Thirty-Seventh Army in the defense of Kiev. In December 1941, Vlasov, now a lieutenant general, commanded the reinforced Twentieth Army before Moscow and was regarded as one of the principal heroes of the battle that drove the Germans from the Soviet capital city. In January 1942, he was awarded the Order of the Red Banner.

Vlasov was one of Josef Stalin's favorite generals, and in March 1942, the Soviet dictator sent him to beleaguered Leningrad as second in command of the new Volkhov Front. The next month, Vlasov took over the Second Guards Army. Under heavy German attack, their supply lines severed, and permission to withdraw denied until it was too late, he and his unit were surrounded. Vlasov ordered his troops to split into small units and fend for themselves. He himself was taken prisoner in July 1942.

Vlasov's hatred of Stalin for his disastrous mismanagement of the military situation led German intelligence officers to seek his cooperation in heading an army of Soviet prisoners of war (POWs) committed to fight against the Soviet Union. Hundreds of thousands of Soviet POWs were already serving as auxiliaries to the German army in non-combat roles, many of them doing so simply to stay alive. Vlasov worked out a political program for a non-Communist Russian state, but this concept flew in the face of Adolf Hitler's policy of subjugating and colonizing the Soviet Union. Although German intelligence officers proceeded to create the Russian Liberation Army (ROA), Hitler refused it any combat role, and it became a device only to encourage Red Army desertions.

German Schutzstaffel (SS) Chief Heinrich Himmler met with Vlasov in September 1944 and promised him a combat role. Himmler also arranged for the creation of the multiethnic Committee for the Liberation of the Peoples of Russia (KONR), which was announced in Prague that November.

Two divisions of the ROA came into being, one of which was sent along the Oder River in mid-April 1945 but retreated before the Red Army. The "Vlasov Army" then changed sides. Cooperating with the Czech Resistance, it helped liberate Prague and disarmed 10,000 German soldiers, hoping to be recognized by the Western Allies.

At the end of the war, Soviet authorities demanded Vlasov's return in accordance with repatriation agreements reached at the Yalta Conference, and on 12 May 1945, U.S. units handed him over, together with other ROA prisoners of war. On 13 August 1946, the Soviet Supreme Court condemned Vlasov as a "German collaborator" and an "enemy of the Russian people" and imposed the death penalty on him the same day.

Vörös, János (1891–1968)

Hungarian army general, chief of staff, and minister of defense during the war years. Born in Csabrendek, Hungary, on 25 March 1891 to a family of the lesser nobility, János Vörös graduated from a military prep school in 1911 and joined the joint army of the Dual Monarchy. He distinguished himself during World War I as a first lieutenant and was decorated. On graduation from the Military Academy in 1921, Vörös joined the General Staff. Between 1931 and 1936, he taught strategy at the Military Academy. In May 1941, he was promoted to brigadier general, and in November 1943, he took command of II Corps. Appointed chief of staff of the Hungarian army under pressure from the Germans after their occupation of Hungary, he served between 19 April and 16 October 1944. That May, he was promoted to full general.

It was partly Vörös's fault that Governor Miklós Horthy's attempt to surrender failed on 15 October 1944. Although Horthy made a proclamation requesting an armistice, Vörös ordered the continuation of military operations. A day later, Hungarian Fascists took power in Budapest, appointed a prime minister friendly to Germany, and relieved Vörös, who

had concluded that Hungary must leave the war. Vörös fled, disguised as a Franciscan monk, and surrendered to the Soviets on 1 November. He was taken to Moscow, and he served as a member of the Hungarian delegation that negotiated an armistice with the Soviet Union. On his return from Moscow, Vörös was appointed minister of defense in the new interim government (December 1944–November 1945) and was a member of the Hungarian government delegation that signed the peace treaty with the Soviet Union on 20 January 1945. Vörös resigned his position as chief of staff on 2 March 1946.

On 25 March 1949, Vörös was arrested by the Hungarian government on charges of spying for the United States. Tried and convicted, he was sentenced to life in prison, but he was freed during the 1956 Hungarian Revolution. He died in Balatonfüred, Hungary, on 23 July 1968. In 1992, the Hungarian Supreme Court annulled the charges against Vörös and rehabilitated him.

Voroshilov, Kliment Efremovich (1881–1969)

Marshal of the Soviet Union who commanded the Northern Axis in the defense of Leningrad but was removed from that post by Josef Stalin. Born in Verkhneye, Bakhmut Region, Yekaterinoslav Province, Russia, on 4 February 1881, Kliment Voroshilov joined the Bolshevik Party in 1903 and participated in November 1917 Russian Revolution. He served as a military commander in the civil war that followed. He was a member of the Ukrainian provisional government and organized the defense of Tsaritsyn, where he became acquainted with Josef Stalin. His close relationship with Stalin rather than his military competence led to his rapid advance to prominence.

In 1925, after the death of Mikhail Frunze, Voroshilov was appointed people's commissar for army and navy affairs and chairman of the Revolutionary Military Council of the USSR.

Marshal of the Soviet Union Kliment Voroshilov, shown here c. 1930. (Hulton-Deutsch Collection/Corbis)

In 1934, he was appointed people's commissar for defense (minister of defense), a post he held until 1940, when he was removed for serious Soviet military deficiencies in the war with Finland. When the Red Army reinstated officer ranks in 1935 and established the rank of marshal of the Soviet Union, Voroshilov was one of the first five appointed. He was also one of only two marshals who survived the Great Purges of the military in 1937, supporting the tribunal that condemned his colleagues and announcing their fate. The Soviet KV-1 heavy tank, which entered service in December 1940, was named for him.

When the Germans attacked in June 1941, Voroshilov was appointed to command the strategic Northern Axis defending Leningrad. In August of that year, when Leningrad was seriously threatened because of Voroshilov's incompetence, Stalin relieved him from command and replaced him with General Georgii Zhukov. Voroshilov was shortly thereafter appointed to the State Defense Committee, where he served for the remainder of the war.

In 1945, as Stalin's representative, Voroshilov supervised the establishment of the Communist regime in Hungary as the chairman of the Allied Control Commission. On Stalin's death in 1953, he became the chairman of the Presidium of

the Supreme Soviet. Voroshilov died in Moscow on 2 December 1969.

Vosges, Advance to (29 August–15 September 1944)

Allied campaign following the 15 August 1944 ANVIL-DRAGOON landings in southern France. The Allied landings opened a new phase in the war in the European Theater of Operations (ETO). One day after the surrender of Toulon and Marseille on 28 August 1944, American and French troops commenced a campaign northward up the Rhône River valley, linked up with Lieutenant General George S. Patton's American Third Army, and halted at the Vosges Mountains passes on 15 September.

The ensuing campaign was a joint American-French effort. Lieutenant General Alexander M. Patch, commanding the U.S. Seventh Army, led the American troops. Directly under

Frenchwoman exclaims to neighbor and to American soldier, "Tout Belfort est libre" (All Belfort is liberated). (Hulton-Deutsch Collection/Corbis)

Patch was Lieutenant General Lucian K. Truscott Jr., who commanded VI Corps. Truscott's corps consisted of three American infantry divisions—the 3rd, 36th, and 45th. General Jean de Lattre de Tassigny commanded the First French Army, which ultimately was divided into I and II Corps. Facing this array of Allied forces was the German Nineteenth Army under General der Infanterie (U.S. equiv. lieutenant general) Friedrich Wiese, with eight divisions, the most reliable of which was the 11th Panzer (the “Ghost Division”).

The Allied plan was to strike quickly up the Rhône River valley, trapping as many Germans as possible in southern France and closing off the Rhône as an escape route. By forcing Wiese's troops northward, the Allies hoped to either push them into Patton's advancing Third Army or place themselves between the Germans and the Reich. By 25 August, General Patch had finalized his plans for the campaign. The American VI Corps was to drive up the east bank of the Rhône to Lyon, proceed on to Dijon, and then head northeastward toward Strasbourg on the Rhine. The French II Corps was to advance up the west bank of the Rhône, and the I Corps would guard the right flank of VI Corps.

The VI Corps jumped off on 29 August, and by 1 September, the 36th Division reached the high ground overlooking Lyon. By 2 September, the Germans had all but abandoned the city, and on the next day, the 1st French Infantry Division had the honor of liberating France's third-largest city. By 3 September, it was obvious that the German Nineteenth Army was in full retreat, so General Truscott requested permission to press on without pause and close off the Belfort gap in the Vosges Mountains. In short order, the 3rd Division accepted the surrender of Besançon on 7 September, and on 10 September, the French II Corps captured Dijon. Later that evening, elements of the American Seventh and Third Armies linked up, forming a united Allied front. Truscott then ordered his troops to wheel eastward to take Vesoul, which the Germans evacuated on 12 September. On 13–14 September, the VI Corps pivoted again, this time in the direction of the Belfort gap.

The advance against the Belfort gap was not carried out, as the U.S. Seventh Army and French First Army came under the command of General Dwight D. Eisenhower and Supreme Headquarters, Allied Expeditionary Forces (SHAEF). The troops were realigned so that Truscott's three divisions were on the left, connected to Patton's forces, and the French troops were on the extreme right of the Allied line. The campaign to the Vosges Mountains, sometimes called the “Champagne Campaign,” was over.

Vyazma-Bryansk, Battle for (2–20 October 1941)

Important Eastern Front land battle. After German forces encircled Leningrad in the north, Adolf Hitler turned his attention to the center part of the Soviet front. His Führer Directive 36 on 6 September focused German preparations on a drive against Moscow in Operation TAIFUN (TYPHOON), entrusted to Field Marshal Fedor von Bock's Army Group Center. Bock commanded 5 field armies consisting of 14 panzer divisions, 9 panzergrenadier divisions, and 44 infantry divisions. He planned to use his armor to seize two key towns, Vyazma (some 150 miles west of Moscow) and Bryansk (220 miles southwest of Moscow) in order to open the road to the Soviet capital for his infantry. The leading German units involved were Colonel General Heinz Guderian's 2nd Panzer Group, Colonel General Hermann Hoth's 3rd Panzer Group, Colonel General Erich Hoepner's 4th Panzer Group, and Colonel General Maximilian von Weich's Second Army.

To defend Moscow, the Soviets had assembled 6 armies under Colonel General Ivan Konev's Western Front. They were backed by 4 second-echelon armies. To Konev's immediate south were 2 additional armies of Marshal Semen Budenny's Reserve Front. Three more reserve armies were eventually brought forward. All the armies were badly understrength: totaling 80 divisions, they were, in fact, the equivalent of only 25 full-strength divisions. The Germans had more than twice the number of tanks (an estimated 1,000 to 479), and the Soviets had only about 360 aircraft to at least twice as many German planes. The Soviets also suffered from a shortage of trained officers, as many had been pulled out of their units in August and September to organize new formations in the rear. In addition, the Soviets had shortages in modern antitank and anti-aircraft weapons.

Lieutenant General Andrei Yeremenko commanded Soviet forces in the Bryansk area where the Germans planned to attack. On 2 September, Stavka (the Soviet High Command) ordered Yeremenko's Bryansk Front to move in two different directions, toward Roslav and southwest on Starodub in an

effort to halt the German advance. The Soviet effort ended in failure, necessitating a return to defensive operations by 13 September. German forces also moved into a gap of some 36 miles between the Bryansk and Southwestern Fronts.

On 30 September, Guderian's 2nd Panzer Group began an advance that carried it 50 miles the first day and 100 miles over the next three days. Guderian took the key rail junction of Orel, 150 miles in the Soviet rear, on 8 October. Two days earlier, 2nd Panzer Group had surrounded Bryansk. At the same time, von Weich's forces moved from the west, trapping the Soviet Third, Thirteenth, and Fiftieth Armies, although some of Yeremenko's forces escaped to the east on 25 October.

To the north, meanwhile, Hoth's 3rd Panzer Group drove into the gap between the Soviet Nineteenth and Thirtieth Armies northwest of Vyazma, while 4th Panzer Group penetrated a vulnerable area between the Reserve and Bryansk Fronts. Konev countered by sending his deputy, Lieutenant General I. V. Boldin, and his operational group of three divisions and two tank brigades to strike the flank of 3rd Panzer Group on 3–4 October, but these efforts came too late. Boldin's force was caught in the German encirclement, along with the greater part of Konev's Nineteenth, Twentieth, Twenty-Fourth, and Third-Second Armies west of Vyazma. General Konstantin Rokossovsky had been sent to Vyazma with his staff to gather five reinforced divisions there for a counterattack on 6 October, only to find no Soviet divisions and German tanks already on the scene. He fled the town and soon discovered that he was between the inner and outer rings of the encirclement; he decided to break out to the northeast, picking up units along the way, including the 18th Infantry (the Home Guard Division) and an NKVD unit. These units broke out and joined Konev in Mozhaisk, 40 miles west of Moscow, where surviving elements of the West-

ern and Reserve Fronts were forming a new 135-mile-long line to Kaluga.

Lieutenant General M. F. Lukin, Nineteenth Army's commander, also broke out of the encirclement to the east with two-plus divisions on the night of 12–13 October. The Germans were hampered by the onset of the rainy season, which turned the roads into quagmires. But Stalin's penchant for linear defense with fronts deployed in single operational echelon had been pierced by German armor supported by artillery and Stukas, resulting in the encirclement and capture of as many as 660,000 Soviet troops, 1,242 tanks, and 5,412 artillery pieces. Vyazma surrendered on 14 October and Bryansk on 20 October. This engagement was, however, the last of the great German encirclements.

When word reached Moscow of the defeat, a great many citizens took flight, necessitating the proclamation of martial law in the capital on 19 October. Konev received the blame for the defeat; he was replaced by General of the Army Georgii Zhukov, who was charged with the final defense of Moscow.

Waesche, Russell R. (1886–1946)

U.S. Coast Guard admiral and commandant during the war years. Born on 6 January 1886 at Thurmont, Maryland, Russell Waesche was educated at Purdue University and the U.S. Revenue Cutter Service School of Instruction (later the U.S. Coast Guard Academy). After commissioning in October 1906, he served aboard and commanded several cutters. In 1915, Waesche was assigned to Coast Guard Headquarters in Washington, D.C., as the chief of the Communications Division, where he served throughout World War I. During the 1920s, he commanded several patrol cutters and destroyers and returned to headquarters in 1928 as the chief ordnance officer. In 1932, he was appointed as the aide to the new commandant, Rear Admiral Harry G. Hamlet. In June 1936, he succeeded Hamlet as commandant and was promoted to the rank of rear admiral.

From 1936, Waesche oversaw the growth, reorganization, and modernization of the Coast Guard, its vessels, and its facilities, and in the later half of 1941, he prepared the service for war. In September, he transmitted President Franklin D. Roosevelt's order for all cutters to engage German and Ital-

ian aircraft and submarines west of 26 degrees west longitude. On 1 November, Roosevelt ordered the transfer of the Coast Guard to the Navy Department.

During the course of the war, Waesche worked closely with both Chief of Naval Operations Admiral Ernest King and

U.S. Coast Guard Admiral and Commandant Russell R. Waesche. (U.S. Coast Guard Historian's Office)

Treasury Secretary Henry Morgenthau to ensure the Coast Guard successfully prosecuted both its peacetime and wartime missions. Even while diligently preserving his service's identity, he pursued a policy of unprecedented cooperation with the navy and army, in which Coast Guardsmen served with distinction in every theater of operations. He ensured that the Coast Guard's unique capabilities in such areas as small-boat handling and Arctic operations were recognized and utilized in the war effort.

Waesche shaped the postwar Coast Guard as he worked diligently to have the service returned to the Treasury Department and to retain several missions acquired during the war, including marine inspection and licensing. After seeing his service through unprecedented changes and challenges, the Coast Guard's first four-star admiral and arguably its most important commandant retired from active service in December 1945. Waesche died in Bethesda, Maryland, on 17 October 1946.

Waffen-SS (Schutzstaffel)

Military component of the German Schutzstaffel (SS) that fought alongside the Wehrmacht (German army) as an elite National Socialist force. Created in 1925 through the merger of the guard organization of the Nazi Party (the Stabswache) and the Nazi Stosstruppe (shock troop), the SS initially functioned as a body-guard unit for the Nazi hierarchy and contained the most ideologically fervent party members. Party leader Adolf Hitler appointed Heinrich Himmler as the SS-Reichsführer in 1929, and Himmler increased SS membership from 280 to 50,000

In 1929, Heinrich Himmler increased SS membership from 280 to 50,000 and gave members the distinctive black uniforms.

and endowed members with a distinctive black uniform, as well as the skull and double runic S symbols. Himmler's aim was to transform the SS from its security function within the

Nazi Party into a separate and powerful bureaucratic organ of the German state.

Between 1933 and 1936, Himmler combined all state police functions, merging the Gestapo (Geheime Staatspolizei, or secret state police) with the Nazi Party's security organization (Sicherheitsdeinst, or SD) to create the Reichssicherheitshauptamt (RSHA). He ensured his organization a more pervasive role in 1939 after his appointment as Reichskommissar for the Strengthening of German Ethnicity. Through this post, the SS was assured economic and political control of occupied Europe, especially in the east where Nazi ideology envisaged a German territorial expansion (*Lebensraum*) and the subordination/elimination of the Slavic and Jewish populations. To achieve this goal, Himmler created a separate economic office for the SS, the Wirtschafts und Verwaltungs Hauptamt (WVHA), and oversaw the Race and Population Resettlement program (Rasse und Siedlungshauptamt, or RuSHA).

Himmler had much higher ambitions for the SS than mere police functions. He wanted it to be a professional military body that might one day subsume the German army itself. As its political and bureaucratic functions expanded, the SS formed illegal military units, originally known as Verfügungstruppe, or special assignment troops. On 17 March 1933, Josef "Sepp" Dietrich established, on Hitler's direct order, a personal armed guard, the Leibstandarte. Early on, members of the unit served, among other things, as honor guards and color guards at parades and other events, such as the 1934 Nuremberg rally. The rally involved Dietrich's SS Leibstandarte Adolf Hitler, composed of 2,600 men. But Himmler also employed such units in liquidating the leadership of the Sturmabteilung (SA, or storm troops) during the Blood Purge of June 1934.

To qualify for the Verfügungstruppe, males had to be between 17 and 22 years old and at least 5'11" tall. These units were supposed to be superior to army formations in training and morale and were to receive the best weapons. Early armed SS personnel also included concentration camp guards, the SS Totenkopfverbände (or Death's Head formations), organized by Theodor Eicke. By March 1936, the SS was subdivided into five Sturmabteilungen (battalions) totaling 3,500 men: No. 1 Oberbayern, No. 2 Elbe, No. 3 Sachsen, No. 4 Ostfriesland, and No. 5 Brandenburg. After Germany introduced conscription in 1935, the SS organized two 5,000-man regiments, the Deutschland and the Germania.

On 1 October 1936, the SS Inspectorate was created to supervise the two SS officer training schools in operation at Bad Tolz and Braunschweig, under the supervision of Oberstgruppenführers Paul Hausser and Felix Steiner. Early applicants had to have served at least two years in the army. Training emphasized physical fitness and endurance rather than parade-ground drill, so that fully equipped troops could

A mortar squad of the Waffen-SS mans a Leichte Infanterie Geschütz 18, a small 75 mm infantry support weapon. (Corbis)

march/run 1.86 miles within 20 minutes. There was also a rigorous combat-training course. Steiner's demanding standards meant that, in 1937, only 15 of every 100 SS applicants were accepted. Steiner also sought to instill a sense of family in each SS unit, encouraging officers to consort with non-commissioned officers (NCOs) and not to address one another by rank but rather as "comrade." In addition, the SS oath contained a sense of elitism and personal bond to the Führer: "I swear to Adolf Hitler, as Führer and Chancellor of the German Reich, loyalty and bravery. I vow obedience to you and to the superiors whom you shall appoint, obedience unto death, so help me God."

The SS motto was "Loyalty is my honor" (*Meine Ehre Heisst Treue*). Mystique and symbolism were used to entice and muster group solidarity. Only those who had graduated from the two officer training schools and possessed the rank of Untersturmführer or above were permitted to carry a special dagger. SS recruits were also tattooed in their armpits, and the first 10,000 received an SS ring (later on, only officers who had served three years might wear the ring). Himmler

also created a pseudo-Arthurian court at Wewelsburg Castle near Paderborn in Westphalia, where he organized a round table of favorite officers (the Circle of Friends of the SS-Reichsführer), with a runic coat of arms for each member.

On 17 August 1938, a decree by Hitler set up a separate headquarters for the military training of these SS units and established their military character as fighting (*Waffen*) SS. For obvious reasons, the leaders of the Army High Command (OKH) rejected the idea of another military establishment independent of its authority and had some success in limiting its size. By the eve of the war, there were only about 23,000 men in the SS formations, including the Death's Head groups. But with the coming of the war, the size and scope of SS activities increased dramatically. During the Polish Campaign of September 1939, Waffen-SS regiments were merged together within regular Wehrmacht divisions. In October, the first three SS divisions were formed, one each from the Verfügungstruppe (later known as SS Das Reich Division), the Death's Head units (SS Totenkopf Division), and the police (Polizedivision). Hitler's Leibstandarte, initially a motorized

regiment, became a fourth SS division (SS Leibstandarte Adolf Hitler). In November, the various SS branches were united under the name Waffen-SS.

SS divisions were fully integrated into the regular army command structure, but that did not mean that there was no tension between regular army and SS commanders. The SS divisions were highly politicized and supported the National Socialist credo and its racial policies, especially in eastern Europe. They were also guilty of numerous atrocities. The same was not true of many German regular army units. There was also anger in the army over the fact that the SS units had claim on the best weaponry. Sharp tensions and inefficiencies also existed within SS headquarters, where Himmler mirrored his master in practicing a divide-and-rule style of leadership.

The Waffen-SS role was greatly expanded after the German invasion of the Soviet Union began in June 1941. It was a foregone conclusion that the SS would play a paramount role during this ideological war of annihilation. In addition to the 1st SS Panzer Division (Leibstandarte Adolf Hitler), there were five other Waffen-SS divisions at this time: the 2nd SS Panzer Division (Das Reich), the 3rd SS Panzer Division (Totenkopf), the 4th SS Polezei Panzergrenadier Division, the 5th SS Panzer Division (Viking), and the 6th SS Gebirge Division (Nord, composed largely of Norwegians). The SS Einsatzgruppen (special action groups), death squads to murder Jews and Communists, were also formed, a third of their membership being recruited from Waffen-SS units. Four of these groups of about 3,000 men each were formed by July 1941 to follow Army Groups North, Center, and South into the Soviet Union. Their role of exterminating Jews and Soviet officials had been decided prior to the Soviet invasion, and it was sanctioned by Hitler through his Commissar Order (*Kommissarbefehlen*) of May 1941, as well as the operational orders to the Wehrmacht stipulating that no German soldiers were to be disciplined for any action against the civilian Soviet population.

SS formations fought on all battlefronts in which Germany was engaged, with the exception of the Western Desert campaigns. As casualties mounted and following the general army reform of May 1943 that reduced divisional size, Waffen-SS units were amalgamated and renamed. By the end of the war, when the total number in the SS mounted to more than 800,000 men in 38 divisions, some 200,000 were foreign volunteers (*Freiwilligen*). This practice of recruitment was accepted despite the SS pretense of representing only the most racially pure Germanic elements. Among the militarily effective new formations were the 9th SS Panzer Division (Hohenstaufen), the 10th SS Panzer Division (Frundsberg), and the 12th SS Panzer Division (Hitler Jugend, composed largely of Latvians).

Paradoxically, the early Waffen-SS units suffered higher casualties than their regular Wehrmacht counterparts, specifically as a result of their ideological zeal to fight the enemy. As the war progressed, anti-Semitic and anti-Communist ele-

ments of the occupied populations formed their own Waffen-SS units, for example: Nordland, which was the first non-German organized (Norwegian and Danish); Lettisches (Baltic); Skanderbeg (Albanian); Maria Theresa (Austrian); Kama (Croatian); Nederland (Netherlands); Hunyadi (Hungarian); Charlemagne (French); Bohmen-Mahren (Czech and Slovak); Kalevala (Finnish); Galicia (Ukrainian); and Kamin-ski (Ukrainian and Russian).

Some Waffen-SS units were among the most effective German military formations, and there were a number of capable commanders. Undoubtedly, the most effective of the latter was Hausser, who became the first SS general to command a German field army and directed the Normandy defenses beginning in late June 1944. But Waffen-SS formations were also the most brutal German military units in their treatment of enemy prisoners and conquered peoples, and they committed numerous atrocities. The growing strength of the SS also posed a real threat to the ascendancy of the Wehrmacht, especially in the last year of the war. Hitler despised many of the army generals, and it is clear that, had Germany won the war, the Waffen-SS would have replaced the Wehrmacht as the army of the Reich. In all, as many as 250,000 Waffen-SS members may have been killed during the course of the war.

Wainwright, Jonathan Mayhew (1883–1953)

U.S. Army general and commander of U.S. forces in the Far East in 1942. Born on 23 August 1883 at Fort Walla Walla, Washington Territory, Jonathan "Skinny" Wainwright grad-

U.S. Army Lieutenant General Jonathan M. Wainwright in Yokohama, Japan, after his release following the Japanese surrender, 1945. (Corbis)

uated from the U.S. Military Academy in 1906 and was commissioned in the cavalry. During his early career, he fought against Moro rebels in the Philippines (1906–1908) and was assigned to various military posts in the western United States. Following the U.S. entry into World War I, he served with the American Expeditionary Forces in France and participated in the Saint-Mihiel and Meuse-Argonne Offensives. He ended the war as a lieutenant colonel.

Wainwright then reverted to his permanent rank of captain and held a variety of command and staff slots. Promoted to lieutenant colonel in 1929, he graduated from the Command and General Staff School, Fort Leavenworth (1931), and the Army War College (1936). Promoted to colonel, he commanded the 3rd Cavalry Regiment at Fort Myer, Virginia (1936–1938). After being made a temporary brigadier general (1938), he was put in charge of the 1st Cavalry Brigade. In September 1940, Wainwright was advanced to temporary major general and assigned to the Philippines to command the Philippine Division.

Following the Japanese landings there on 8 December, Wainwright commanded the North Luzon Force. General Douglas MacArthur, confident his forces could throw back any Japanese invasion, had scrapped the original plan to meet a Japanese invasion by withdrawing into the Bataan Peninsula.

Wainwright's Filipino and U.S. forces fought well but were ultimately forced from the Lingayen Gulf onto Bataan. Much of their equipment and supplies were lost in the withdrawal.

With a Japanese victory in sight, Washington ordered MacArthur to leave the Philippines for Australia. He was then awarded the Medal of Honor. On MacArthur's departure on 11 March 1942, Wainwright took over as commander of U.S. forces in the Far East, with the rank of lieutenant general. Forced off Bataan to Corregidor, he had no choice but to surrender on 6 May 1942. MacArthur protested Army Chief of Staff General George C. Marshall's recommendation that Wainwright receive the Medal of Honor.

Treated harshly as a prisoner of war in camps in northern Luzon, Formosa, and Manchuria for the next three years, Wainwright was liberated by the Soviets in August 1945. He witnessed the formal Japanese surrender on 2 September on the USS *Missouri* and traveled to the Philippines to receive the surrender of Japanese forces there.

Wainwright returned to the United States and, despite MacArthur's opposition, was awarded the Medal of Honor. In September 1945, he was promoted to full general. He took command of Fourth Army at Fort Sam Houston, Texas, in 1946 but retired in August 1947. Wainwright died in San Antonio, Texas, on 3 September 1953.

Wake Island, Battle for (8–23 December 1941)

Early Pacific Theater battle. Strategically located in the Central Pacific, Wake Island—which is actually an island group—had been a U.S. possession since 1899. Approximately 2,000 miles west of Hawaii, it is composed of three islets: Wake, Peale, and Wilkes. This otherwise insignificant spit of coral served as a refueling stop for the Pan American Airways Clipper Service, but it gained strategic importance as war loomed between the United States and Japan. Both sides recognized the value of Wake Island as a base for reconnaissance operations, but the United States did not begin fortifying it until 1941.

Wake Island, December 1941. (Photo by Hulton Archive/Getty Images)

In January of that year, the first of more than 1,000 workers arrived to begin converting Wake Island into a naval air station. They were followed by the 500 men of the U.S. Marine Corps's 1st Defense Battalion, commanded by Major James P. S. Devereux. To assist in the defense of the island, this unit brought with it 6 5-inch naval guns, 12 3-inch antiaircraft guns, and numerous .30 and .50 caliber machine guns. On 28 November, Commander Winfield S. Cunningham arrived to assume command. On 4 December, 12 F-4F-3 Wildcats of VMF 211 flew off the carrier *Enterprise* and landed at the partially completed airstrip on Wake.

On 8 December (7 December Hawaiian time), the defenders were notified that Pearl Harbor had been attacked. As the Marines went to general quarters, Pan American Airways prepared their passengers and personnel for evacuation. At 11:58 A.M., however, 18 Japanese land-based bombers from the Marshalls struck the island, destroying 8 Wildcats on the ground and damaging the 3-inch batteries and fire-control equipment of a 5-inch battery. Although riddled by Japanese

machine-gun bullets, the Pan American Clipper resting in the lagoon was otherwise undamaged, and it took off with a capacity load of civilians that afternoon. Japanese air attacks continued for two more days.

Convinced that the defenses on Wake Island had been sufficiently reduced, a Japanese invasion force arrived on 11 December. The force consisted of three light cruisers, six destroyers, four transports, and 450 troops of the Special Naval Landing Force (Japanese marines). The defenders held their fire until the Japanese were in point-blank range. After a short, sharp fight, the Japanese withdrew—but not before the defending U.S. Marines had sunk two Japanese destroyers and damaged other ships.

On 23 December, the Japanese returned with a larger invasion and support force including the aircraft carriers *Hiryu* and *Soryu*, which had participated in the Pearl Harbor raid. Superior Japanese numbers overwhelmed the defenders before a relief force—en route from Pearl Harbor and centered on the carrier *Saratoga*, three cruisers, and nine destroy-

ers—could arrive. The defenders held out for 11 hours before Commander Cunningham ordered Major Devereux to surrender the island. All defenders, save 100 civilians, were sent to prison camps. The Japanese put the remainder to work finishing the air station. They were executed in October 1943 (the Japanese commander was later tried on war crimes' charges and executed). The heroic Marine defense of Wake Island provided a boost to American morale during the early days of the U.S. involvement in World War II.

Major General Walton H. Walker. (Hulton-Deutsch Collection/Corbis)

Walker, Walton Harris (1889–1950)

U.S. Army general and commander of XX Corps in France in 1944. Born in Belton, Texas, on 3 December 1889, Walton Walker attended the Virginia Military Institute (1907–1908) before graduating from the U.S. Military Academy in 1912. Commissioned in the infantry, he commanded a machine-gun battalion in the 5th Infantry Division in France during World War I, winning promotion to major, but he reverted to captain on his return to the United States.

Between 1919 and 1923, Walker was both a student and an instructor at the Field Artillery School, Fort Sill, Oklahoma, and the Infantry School, Camp (now Fort) Benning, Georgia. He was then posted to West Point as an instructor and tactical officer until 1925. Walker graduated from the Command and General Staff School in 1926 and was then infantry representative at the Coast Artillery School until 1930. Between 1933 and 1935, he served as a battalion commander in the 15th Infantry Regiment in Tianjin (Tientsin), China. Walker then served at Headquarters, III Corps Area, Baltimore, Maryland. Promoted to lieutenant colonel in 1936, he graduated from the Army War College that year and was assigned as executive officer to Brigadier General George C. Marshall at Vancouver Barracks, Washington. Having impressed Marshall, Walker moved to the War Plans Division of the War Department General Staff in 1937. Shortly before the U.S. entry into World War II, he was promoted to colonel and took command of the 36th Armored

Infantry Regiment. In January 1942, he was placed in command of the 3rd Armored Division, and that August, he assumed command of the IV Armored Corps at Camp Young, California. There, he established the Desert Training Center, responsible for training armored units for desert warfare in North Africa.

In February 1944, Walker's IV Armored Corps was redesignated XX Corps and ordered to Britain. In July, the corps was committed in Normandy as part of Third Army, commanded by Walker's idol, Lieutenant General George S. Patton Jr. XX Corps became known as the "Ghost Corps" for the speed of its advance. In August 1944, Walker was awarded the Distinguished Service Cross for battlefield heroism. Pushing into France from the Loire River to the Moselle, XX Corps reduced German fortifications at Metz in November 1944. Walker was criticized during this time for an apparent lack of concern about taking heavy casualties.

During the German Ardennes Offensive (Battle of the Bulge), Patton swung the bulk of his Third Army north to counterattack into the southern flank of the German thrust. Walker's XX Corps remained to cover the front that had been previously held by an entire army. In April 1945, his units liberated the Buchenwald concentration camp near Weimar. By May 1945, the units reached Linz, Austria, the farthest advance east of any of Patton's units.

Promoted to lieutenant general in April 1945, Walker ended the war as commander of the 8th Service Command in Dallas, Texas. In June 1948, he received command of Fifth Army, headquartered in Chicago. That September, he assumed command of Eighth Army in Japan, the ground-force element of General Douglas MacArthur's Far Eastern Command (FEC). The four divisions there were at two-thirds of their authorized wartime strength. Although Walker instituted a training program, it had reached only the battalion level when the Korean War began in June 1950.

Eighth Army was committed to the defense of South Korea, and Walker had the daunting task of stopping the rapidly advancing North Korean army. To add to his problems of insufficient strength and lack of equipment, only three of his four U.S. division commanders and none of the Republic of Korea (ROK) division commanders had ever previously commanded a division. ROK and American troops carried out delaying actions back to the Naktong River, where the Pusan Perimeter was formed. There, Walker led the longest, largest, most complex, and most successful mobile defense in U.S. military history. He combined a magnificent sense of timing, helped by the U.S. success in reading North Korean communications, with a judicious employment of his meager reserves and threatened, coerced, and exhorted his American and ROK commanders, refusing to yield ground without a fierce struggle, justifying his "Bulldog" nickname. Failure in the campaign would have ended the war.

Eighth Army then took the offensive but was forced to withdraw from North Korea following the Chinese military intervention. Walker had Patton's weakness for driving at high speeds, and on 23 December 1950, while racing to inspect units north of Seoul, his jeep was struck by a truck and he was killed. Walker was posthumously promoted to full general.

Wang Ching-wei

See Wang Jingwei.

Wang Jingwei (Wang Ching-wei) (1883–1944)

Chinese politician who became head of a puppet government in Nanjing, China, in 1940. Born in Guangzhou (Canton) in Guangdong (Kwangtung) Province, China, on 4 May 1883, Wang Jingwei (Wang Ching-wei) studied law in Tokyo in his youth, but his avocation was politics. An early ally of Sun Yixian (Sun Yat-sen), he quickly rose to a prominent position in Sun's revolutionary movement devoted to overthrowing the ruling Qing (Ch'ing) dynasty. Imprisoned for participating in a plot to assassinate the regent Prince Qun (Ch'ün) in 1910, Wang was released after the fall of the Qing dynasty in 1911. He then spent the period from 1912 to 1917 in exile after Sun's movement collapsed.

Wang's revolutionary credentials and his role in rebuilding the Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT)—made him the logical candidate to succeed Sun after the latter's death in 1925, but he was pushed aside by Jiang Jieshi (Chiang Kai-shek), who controlled the army. Wang attempted to form his own government, but he failed and eventually mended fences with Jiang in a show of unity following the Japanese invasion of Manchuria in 1931.

Appointed titular head of the Nationalist government in 1932, Wang was forced to bear the onus of appeasing the Japanese while Jiang led the army in a campaign to exterminate

Wang Jingwei, who led the puppet government of China during its occupation by the Japanese. (Corbis)

nate the Communists. Disillusioned, he resigned and left China in 1935 to recover from an assassination attempt. He returned following the outbreak of the Sino-Japanese War in 1937, but he quickly grew pessimistic about China's military prospects. After failing to persuade Jiang to make peace with Japan (which led Nationalist agents to make another attempt on his life), Wang fled to Japanese-occupied China. In March 1940, the Japanese army installed him as head of the puppet Reorganized Nationalist Government in Nanjing (Nanking), Jiangsu (Kiangsu) Province.

Wang's hopes of presenting himself as a credible alternative to Jiang were ultimately doomed by the harsh reality of Japanese military domination. He died in Nagoya, Japan, on 10 November 1944 while undergoing medical treatment.

Obergruppenführer Reinhard Heydrich, who convened and organized the Wannsee Conference. (Corbis)

Wannsee Conference (20 January 1942)

Day-long conference of German leaders to discuss the bureaucratic demands of arranging for the emigration, deportation, concentration, and elimination of the Jewish population within Germany and the occupied territories. The conferees also established policies for the treatment of Jews who were of mixed blood or in mixed marriages.

The conference was convened and organized by Chief of the Security Police Reinhard Heydrich, who invited 15 top Nazi bureaucrats and Schutzstaffel (SS) officers to plan for the concentration of Jews and their execution. It took place in the Wannsee villa in suburban Berlin on 20 January 1942.

The German invasion and occupation of much of eastern Europe, especially Poland and the Soviet Union, presented a demographic challenge to the German government because of the large Jewish populations in those areas, especially in Poland and the western Soviet Union. By the end of 1941, the head of the SS, Heinrich Himmler, recognized that deportation and emigration were no longer adequate for the task of eliminating the Jewish population. He authorized Heydrich to create the bureaucracy and arrangements for a “final solution to the Jewish question.” The Wannsee Conference dealt with these matters. Jews were to be “evacuated” to the east, with the “Jewish question” to be resolved first in the General Government.

The organizational challenges of identifying, transporting, housing, and eventually eliminating what the conferees overestimated as a population of 11 million European Jews (this number included those in neutral nations, such as Ireland and Switzerland) demanded that the Nazi government establish an infrastructure and clear procedures for implementing the goals of the regime. Although much of the discussion focused on forced emigration and deportation to eastern Europe, the underlying objective of the conference was initiating the “final solution,” the systematic murder of the Jewish population in Europe. Specific topics discussed at the conference included estimating the size of Europe's Jewish population, organizing a systematic sweep of Europe to eliminate all Jewish remnants, and confronting local resistance in occupied countries.

Using the Nazi racial laws (the Nuremberg Laws), those attending the Wannsee Conference established criteria for dealing with mixed-blood Jews and mixed marriages. Mixed-blooded individuals were divided into a complex classification system based on “Mixed Blood of First Degree” and “Mixed Blood of Second Degree.” This juridical understanding of race was designed to bring about the complete extermination of Jews in Europe.

Stenographers carefully documented the day's events in a complete record of the conversations. In 1984, a German

documentary about the Wannsee Conference appeared, based on this source and letters written by Hermann Göring and Adolf Eichmann.

Warsaw, Battle of (8–27 September 1939)

On 1 September 1939, German forces invaded Poland from three directions, with the bulk of German forces deployed on the flanks in Army Groups North and South. Only weak German forces to the west connected the two army groups. The meeting point for the German northern and southern pincers was to be the capital of Warsaw, which, with 1.3 million people, was Poland's largest city.

On 5 September, the government began evacuating its offices in the city, and the next day, Marshal Edward Rydz-Śmigły and his commanders departed for Brest in the east. On 8 September, as German troops closed on Warsaw, Lord Mayor Stefan Starzyński formed a defense committee composed of both civilian and military leaders; its Order No. 1 proclaimed that the city would be defended. All public transport was commandeered, rationing was begun, and the populace was organized into guard and labor battalions. Polish General Juliusz Rommel had overall command, and General Walerian Czumę was charged with the actual defense of the city; he commanded some 120,000 Polish army troops.

The Poles did what they could, utilizing old Russian city defenses, turning city blocks into strong points, covering intersections with artillery, and taking advantage of rubble for ambush positions. They also made use of makeshift weapons, including gasoline bombs used against German tanks. The Polish defensive positions were difficult to detect, and the German formations, organized for rapid movement, would have little advantage in city fighting at close quarters.

Defending against the Luftwaffe was another matter altogether. The city had 54 fighter aircraft, which had some success against the Germans in the first days. But their numbers were steadily reduced both through aerial combat and lack of spare parts. Those that remained were withdrawn entirely on 8 September, leaving only 40 mm and 75 mm anti-aircraft guns and machine guns, and these were spread thin. German

air strength was so dominant that the Poles were forced to restrict ground counterattacks to night actions.

In addition to shortages of military equipment, particularly for use against air attack, Warsaw had little in the way of food. By 14 September, even with rationing, stocks were sufficient only for two weeks. Despite this, people in the city were defiant, and morale remained high.

At first, Warsaw was subject only to German air attacks, but on 8 September, German ground units arrived and entered the fray. On that day, Polish troops repulsed an attack by the 4th Panzer Division in the Ochota suburb, destroying some 60 German armored vehicles. This rebuff convinced the Germans on the ground that a direct ground assault on the city would be costly and that the best course would be a protracted siege. That day also, the Germans began what would be a growing artillery bombardment, probably the key factor in the city's eventual surrender. Warsaw had been under intermittent terror bombing from the first day of the invasion, but on 13 September, the Germans announced their intention to bomb cities, and Adolf Hitler himself ordered that civilians be prevented from leaving Warsaw. These decisions were based on the belief that terror bombing would hasten the Polish surrender. The next day, 14 September, the bombing of Warsaw was especially severe. That day was the Jewish New Year for Warsaw's 400,000 Jews, who were specially targeted by German bombers while in the streets and in the synagogues of Nalewki, the Jewish quarter.

Hitler rejected any talk of a siege, and German army units were sent into the city on 15 September. Five days later, 12 German divisions supported by more than 1,000 artillery pieces

began an assault that reached its peak on 25 September, when the Germans launched Operation COAST, an air attack that was expressly ordered by Hitler and involved some 400 bombers and dive-bombers. They dropped 72 tons of incendiary bombs, causing fires throughout the city. On 26 September, the Germans captured two of the three Polish defensive lines and the Poles opened negotiations with the German Eighth Army commander, General Johannes von Blaskowitz.

On 27 September, Warsaw surrendered unconditionally. The Germans took 140,000 Poles prisoner, 36,000 of them wounded. In addition, some 2,000 Polish military troops died in the battle, along with 60,000 civilians. Damage to the city itself was immense, with an estimated 12 percent of the structures destroyed. Warsaw was the first capital to suffer such devastation in the war.

Warsaw Ghetto Uprising (1943)

Armed attempt by Jews living in the Warsaw ghetto to prevent further deportations to concentration camps. Through the summer of 1942, the Germans deported or executed over 300,000 Jews, leaving between 55,000 to 60,000 people in the Warsaw ghetto. Resolved to fight back against the Germans, inhabitants of the ghetto formed the Jewish Fighting Organization (Żobytowska Organizacja Bojowa, or ŻOB) and prepared to obstruct future German deportations.

Lightly armed and poorly trained for combat, the ŻOB saw its first action against a small German *Aktion* (the German euphemism for an operation to round up and deport those destined for concentration camps) in January 1943. Surprised by the opposition and suffering several casualties, the Germans withdrew from the ghetto to regroup their forces and evaluate the situation.

Jewish civilians during the destruction of the Warsaw Ghetto, Poland, 1943. (German photo, U.S. National Archives)

Shocked that the Jews would arm themselves and fight another round of deportations, the Germans returned in force in April to liquidate the ghetto completely. On 19 April 1943, Waffen-SS, police, and Wehrmacht units moved into the ghetto to complete the January operation. To ensure success, they sent in columns of troops, a tank, and two armored cars. Shortly after the Germans began to fan out to round up the deportees, the ŻOB struck with pistol fire, homemade hand grenades, and Molotov cocktails.

Despite facing an overwhelming superiority of men and matériel, the ŻOB forced the Germans from the ghetto within two hours, a noteworthy, though short-lived, achievement. Chagrined and angered by the resistance, SS-Brigadeführer Jürgen Stroop, the police chief of Warsaw, ordered his troops back into the ghetto. Using their superior firepower, the Germans forced the ŻOB fighters from the rooftops and into the buildings and below the streets into the sewers. Desiring to force a rapid conclusion to the Aktion, Stroop petitioned and received permission from SS-Reichsführer Heinrich Himmler to use whatever means necessary to eliminate resistance. Unable to quell the ŻOB, the Germans set about systematically destroying each building in the ghetto with explosives and fire.

Despite the destruction of its headquarters building on 8 May, the ŻOB continued to engage the German troops. Increasingly frustrated by his units' inability to subdue the resistance completely, Stroop ordered that the main synagogue be destroyed as a signal that the reduction of the ghetto was at an end. On 16 May, with sporadic fighting continuing as small bands of ŻOB fighters persistently engaged the German troops, Stroop declared the operation complete when Warsaw's most prominent synagogue collapsed into a pile of rubble. In his report to his superiors, he acknowledged that 16 of his troops were killed and 85 wounded; deaths among the ghetto's inhabitants ran into the thousands, with roughly 50,000 taken into custody and either shot outright or deported.

Although some members of the underground Polish Home Army (Armia Krajowa, or AK) assisted the ŻOB during the ghetto uprising, the majority did not participate in the fighting, waiting instead for their own planned revolt.

Warsaw Rising (1 August–2 October 1944)

By the summer of 1944, the Red Army had pushed the German army almost completely out of the Soviet Union and continued moving west across German-occupied Poland. The Soviets, however, had split with the London-based Polish government-in-exile and established their own Communist provisional government. As the Soviet troops advanced, they disarmed the Polish Home Army (Armia Krajowa, or AK), a branch of the London-based government. On 26 July, the London Poles ordered AK commander General Tadeusz Bór-Komorowski to capture Warsaw from the Germans before the Soviets arrived.

The AK had around 40,000 fighters in Warsaw, and they were desperately short of arms and ammunition. Although they had some clandestine arms factories in the city, their total armament amounted to little more than 2,000 pistols, 1,000 rifles, 25,000 homemade grenades, and a handful of antitank rifles. The German garrison in Warsaw numbered more than 21,000 well-equipped, combat-experienced troops, including three Waffen-SS divisions and two Wehrmacht panzer divisions. Lieutenant General Reiner Stahel had command of German combat units around Warsaw.

Operation BURZA (TEMPEST) began on 1 August 1944. The lead units of the Red Army were only some 12 miles away, closing in on the east bank of the Vistula River. On the first day of the rising, the AK gained control of most of the west bank of the Vistula, but the Poles never managed to take the bridges. Fighting back almost immediately, the Germans took Warsaw's Old Town on 2 August. By the next day, German reinforcements were pouring into the battle, and the Luftwaffe had begun round-the-clock bombing of the Polish-controlled areas.

The savage street fighting ground on for weeks, with the Polish insurgents using the city's sewers for lines of communication and as routes of escape. Schutzstaffel (SS) Chief Heinrich Himmler ordered that the entire city should be "razed to the ground" and all its inhabitants killed as an object lesson to all other cities under German occupation.

On 10 September, Red Army units under General Konstantin Rokossovsky finally moved into Warsaw's Praga district on the east bank of the Vistula. After five days of heavy fighting, the Soviets consolidated their positions on the east bank and ceased to advance. Not only did the Soviets provide no further support to AK forces fighting desperately on the other side of the river, they also refused permission for Western Allied aircraft to land on Soviet airfields after making supply drops to the beleaguered insurgents. Under pressure from U.S. President Franklin D. Roosevelt, the Soviets finally

allowed a single wing of 110 U.S. B-17 bombers to refuel at Poltava for a supply drop on 18 September.

On 30 September, as the Germans systematically reduced the pocket of Polish resistance, Bór-Komorowski appointed General Leopold Okulicki as his successor in command of the AK. Bór-Komorowski and his surviving fighters finally surrendered on 2 October, after 63 days of fierce resistance. Some 15,000 insurgents and 150,000 Polish civilians died during the rising. Another 700,000 of Warsaw's inhabitants were sent to concentration or slave labor camps, where 245,000 later died. Approximately 93 percent of the city was a featureless pile of rubble.

The Germans lost about 10,000 killed during the fighting. Shortly after suppressing the rising, the German army withdrew from Warsaw at its own pace, and the Red Army followed it into the city. Soviet commanders later claimed that stiff German resistance and the lack of supplies had prevented them from giving the AK any more support. Many historians, however, have suggested that the Soviet commanders were following specific orders from their leader, Josef Stalin, who wanted the German army to eliminate any Polish opposition to the establishment of a postwar government under Moscow's control.

Watson-Watt, Sir Robert Alexander (1892–1973)

British scientist who developed radar. Robert Watson Watt (who would hyphenate his name after being knighted in the 1940s) was born in Angus, Scotland, on 13 April 1892. He graduated in 1912 in engineering from University College, Dundee, part of the University of St. Andrews, where he won medals in mathematics and electrical engineering. His interest in radio

Sir Robert A. Watson-Watt. (Bettmann/Corbis)

waves began after graduation, when he worked as an assistant to the professor of natural philosophy, William Peddie.

During World War I, Watson Watt volunteered for the war effort, working as a meteorologist at the Royal Aircraft Factory, Farnborough, and applying his knowledge of radio to locate thunderstorms that posed hazards to airmen. In 1916, he proposed the use of cathode ray oscilloscopes to record and display such information, a project that led to his development of cathode ray direction finders in the mid-1920s, by which date Watson Watt was superintendent of the Radio Research Station at Slough, part of the National Physical Laboratory.

In 1933, Watson Watt took over a new radio department in Teddington, where he elucidated the theoretical basis for radar, conducting early experiments in using radio waves to locate aircraft. By 1938, he was director of communications development in the Air Ministry, and in 1940, he was appointed scientific adviser on telecommunications to the Ministry of Aircraft Production.

Watson Watt's assorted inventions proved their worth in the Battle of Britain, which might have been lost without them, and made major contributions to the ultimate Allied victory. In 1938, Chain Home, a pioneering early-warning system of fixed radar stations, was installed along Britain's

east coast, where incoming German aircraft might be expected, and the system was later refined to detect low-flying airplanes. Watson Watt also developed airborne interception radar for installation in aircraft, to allow them to locate other airplanes and also seaborne vessels; these proved invaluable in the Battle of the Atlantic. And he developed identification, friend or foe (IFF) devices that could distinguish between friendly and hostile aircraft and could be installed on anti-aircraft artillery, as well as radio navigation for bomber airplanes, which greatly facilitated the massive Allied bombing raids on Germany and Japan. Britain shared these technological innovations with the United States, and they represented the most significant instance of reverse Lend-Lease, save perhaps for ULTRA intercepts.

Knighted in 1942, Watson-Watt received a substantial financial award from the British government after the war for his work on radar, as well as numerous other professional honors and prestigious appointments. He established a consulting firm and lived in Canada for some years before returning to Britain. He died in Inverness, Scotland, on 5 December 1973.

Wavell, Sir Archibald Percival (First Earl) (1883–1950)

British army field marshal who was commander in chief and then viceroy in India during the war. Born in Colchester, England, on 5 May 1883, Archibald Wavell was educated at Winchester and graduated at the top of his class from the Royal Military Academy, Sandhurst, in 1901 and was commissioned in the Black Watch. He established his military reputation during the 1899–1902 Boer War and in service on the Northwest Frontier in India. Wavell graduated, again at the top of his class, from the Staff College of Camberley and then studied the Russian language for two years in Russia. During World War I, he served in France, losing an eye in fighting at Ypres. After his recovery and eight months with the Russian army in the Caucasus, he served in Palestine under General Edmund

British Field Marshal Sir Archibald Wavell. (Corbis)

Allenby as a brigadier general. He held a variety of posts in the 1920s and 1930s and returned to Palestine in 1937 to command British forces there during the Arab-Jewish riots.

Promoted to lieutenant general in 1938, Wavell was appointed commander in chief, Middle East, in August 1939. He had to create the command virtually from scratch in Cairo, with few resources. His heavily outnumbered forces halted the Italian invasion of Egypt from Libya, and he then launched Operation COMPASS. The operation was a spectacular success, destroying more than a dozen Italian divisions and clearing all of Cyrenaica. Empire forces operating under his command also had considerable success in Ethiopia and against anti-Allied elements in Syria and Iraq. Reversals followed, however, largely due to the arrival in North Africa of German reinforcements under General Erwin Rommel and Prime Minister Winston L. S. Churchill's decision to strip resources from Wavell's command for an ill-fated intervention in Greece. Following the British defeat in Greece and Crete (over which Wavell had no control) and the failure of Operation BATTLEAXE to drive the Germans from Egypt and relieve Tobruk, Churchill replaced Wavell with General Claude Auchinleck in July 1941 and transferred Wavell to India as commander in chief there.

With the U.S. entry into the war, Wavell was briefly Allied commander in the Far East. Following the loss of Malaya, Singapore, and Burma, he prepared India for invasion, then mounted a counterattack against Japanese forces in Burma, which the Japanese repulsed. Promoted to field marshal in January 1943 and raised to the peerage in July, he was named viceroy of India in June 1943, a post he handled well until he was replaced by Admiral Louis Mountbatten in 1947. Made an earl with the title Viscount Keren, of Eritrea and Winchester, Wavell returned to Britain and settled in London. A prolific and talented writer, he wrote *The Palestine Campaigns* (1928), *Allenby* (two volumes, 1940 and 1943), *Generals and Generalship* (1941), *Allenby in Egypt* (1943), *Speaking Generally* (1946), and *The Good Soldier* (1948). He also edited a poetry anthology, *Other Men's Flowers* (1944). Wavell died in London on 24 May 1950.

Wedemeyer, Albert Coady (1897–1989)

U.S. Army general who succeeded General Joseph Stilwell as chief of staff to Jiang Jieshi (Chiang Kai-shek) in China in 1944. Born in Omaha, Nebraska, on 9 July 1897, Albert Wedemeyer graduated from the U.S. Military Academy in 1918 in an accelerated program and was commissioned in the infantry. Between the wars, he served in the United States, the Philippines, and China and attended the Command and General Staff School, making captain in 1936. Wedemeyer's father-in-law and mentor, Colonel Stanley Embick, inspired in him a lifelong interest in strategic questions and economic issues in warfare.

From 1936 to 1938, Wedemeyer attended the German War College (Kriegsakademie), producing a lengthy final report on the German military. This document strongly impressed Major General George C. Marshall, then assistant chief of staff

U.S. Army Major General Albert C. Wedemeyer. (Corbis)

in the War Department General Staff War Plans Division; in fact, in 1941, after he became chief of staff, Marshall placed Wedemeyer, a major at the time, in the same division. Wedemeyer contributed heavily to the War Department's "Victory Plan," which governed overall planning for the wartime mobilization of American manpower and industrial resources. In 1942 and 1943, promoted to brigadier general, he served in the War Department Operations Division, where he fervently advocated an early cross-Channel invasion of western Europe and opposed British Prime Minister Winston L. S. Churchill's alternative proposals for Mediterranean operations.

In the fall of 1943, Wedemeyer, now a major general, became deputy chief of staff to the new South-East Asia Command. In that capacity, he helped to develop plans for future operations and unsuccessfully attempted to resolve differences between China's Jiang Jieshi, president of the Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT)—and General Joseph W. Stilwell, commander of American military forces in the China-Burma-India Theater and Jiang's chief of staff. In October 1944, Wedemeyer replaced Stilwell and soon developed a far less antagonistic working relationship with Jiang. Though critical of corruption and ineptitude within the GMD government and military, Wedemeyer, who was promoted to lieutenant general in early

1945, energetically helped to reorganize the Chinese army and enhance its fighting abilities, drafting plans—never implemented—to retake south China's coast from Japanese forces. He urged greater levels of U.S. aid for Jiang's government and the denial of such assistance to Chinese Communist leaders.

Following the Japanese surrender in August 1945, Wedemeyer supervised the demobilization of Japanese troops in China and their replacement by Jiang's forces. Despite continuing to criticize corruption and inefficiencies within the Nationalist government, he believed the United States should give it staunch backing and much-expanded economic and military aid, and he expressed misgivings over Marshall's year-long 1946 effort to establish a coalition Chinese government that would include Communist leaders. In April 1946, Wedemeyer left China. After Marshall sent him on a two-month fact-finding mission to China and Korea the following year, he repeated these recommendations, while also forcefully urging the Chinese government to institute major reforms in order to survive and to attract U.S. aid. The Truman administration ignored Wedemeyer's advice and deemed his report too politically sensitive, suppressing it for two years.

After serving on the War Department General Staff and commanding the Sixth Army, Wedemeyer retired in 1951 to become a business executive. In 1954, he was promoted to full general on the retired list. He was active in conservative Republican politics, and in his memoirs, he openly condemned the Truman administration's failure to provide greater assistance to China. Wedemeyer died at Fort Belvoir, Virginia, on 17 December 1989.

Wei Lihuang (Wei Li-huang) (1897–1960)

Chinese Nationalist military commander. Born in Hefei (Hofei) in Anhui (Anhui), China, on 16 February 1897, Wei

Lihuang (Wei Li-huang) began his military career as a volunteer in the revolutionary army of his native province in 1912. In 1916, Wei went to Guangzhou (Canton) in Guangdong (Kwangtung), where he joined the Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT)—participating in the 1925–1928 Eastern and Northern Expeditions and the antiwarlord and anti-Chinese Communist “bandit extermination campaigns” of the early 1930s. In late 1935, Wei became commander in chief of GMD forces on the border between Hunan, Hubei (Hupeh), Anhui, and Jiangxi (Kiangsi), a position second only to Chen Cheng (Ch’en Ch’eng).

After the Sino-Japanese War began in July 1937, Wei led the Fourteenth Group Army to defend Beijing (Peking) in Hebei (Hupeh), and in October, he became deputy commander of the Second War Area of Shanxi (Shansi) and the two defunct provinces of Chaha’er (Chahar) and Suiyuan (today’s northwestern Hebei plus part of Inner Mongolia contingent to Hebei and the central part of Inner Mongolia west of Chaha’er, respectively). There, he engaged the Japanese in the Battle of Xinkou (Hsinkow) near Taiyuan in Shanxi, which fell in November. In January 1939, Wei also became commander in chief of the First War Area of Hebei, northern Shandong (Shantung), Henan (Honan), and Anhui, and, in October, also governor of Henan. Between September and December 1940, Wei joined the Chinese Communist Eighth Route Army to launch the One Hundred Regiments Offensive against the Japanese in north China. At year’s end, he received the concurrent command post of the Hebei-Chaha’er War Area. Because of his growing connections with the Eighth Route Army, Wei was relieved of all of his posts at the end of 1941 and assigned to the GMD Military Affairs Commission’s Xi’an (Sian) office in Shaanxi (Shensi). In October 1943, he succeeded Chen Cheng (Ch’en Ch’eng) as commander in chief of the Chinese Expeditionary Force, with headquarters at Kunming in Yunnan, where he participated in the joint Anglo-American-Chinese campaign for the recovery of Burma. In the Second Burma Campaign of May 1944 to January 1945, Wei, as deputy commander of the Chinese ground forces, led five Chinese armies across the Nu River, captured Wanting, and reopened the Burma Road through Tengchung and Lungling in coordination with Allied forces stationed in India. The Chinese mission then ended, and Wei was militarily inactive throughout the remainder of the war.

In January 1948, he succeeded Chen as acting director of the Northeastern Headquarters and commander in chief of “bandit suppression” in the northeast, which fell to the Chinese Communists in October. Subsequently relieved of all his titles and posts, Wei was then imprisoned at Nanjing (Nanking) in Jiangsu (Kiangsu), awaiting trial on charges of corruption. Released after Li Zongren (Li Tsung-jen) became acting president in January 1949, Wei retired in Hong Kong until March 1955, when he returned to Beijing and spent the rest of his life

Chinese Generalissimo Jiang Jieshi (Chiang Kai-Shek) conferring with Wei Lihuang (Wei Li-Huang), November 1948. (Photo by Jack Birns/Time Life Pictures/Getty Images)

serving the Chinese People’s Political Consultative Conference, the GMD Revolutionary Committee, and the National Defense Council. Wei died in Beijing on 17 January 1960.

Weichs zur Glon, Maximilian Maria Joseph von (Baron) (1881–1954)

German army field marshal who was given command of Army Group B in 1942. Born in Dessau, Germany, on 12

November 1881 into an old and established Roman Catholic family, Maximilian Weichs zur Glon joined the 2nd Bavarian Heavy Cavalry Regiment in July 1900 and would maintain an association with the cavalry for most of his military career. He attended the War Academy in 1910 and served in several positions as a General Staff officer during World War I.

After the war, Weichs was selected to continue in the Reichswehr, the new German army. He then held several cavalry-related positions. Promoted to Generalmajor (U.S. equiv. brigadier general) in April 1933, he took command of the 3rd Cavalry Division at Weimar, which became the 1st Panzer Division in 1935. Weichs was promoted to Generalleutnant (U.S. equiv. major general) in April 1935 and to General der Kavallerie (U.S. equiv. lieutenant general) in October 1936. His career suffered a temporary setback when he and 15 other generals were “retired” by Adolf Hitler following the Fritsch Affair.

Weichs was recalled to duty for the 1939 Polish Campaign that began World War II. He commanded the XIII Corps and enjoyed success at Kutno and Warsaw. Given command of the new Second Army, he participated in the Battle for France under Field Marshal Karl Rudolf Gerd von Rundstedt in the mop-up phase and was promoted to colonel general in July 1940. He commanded the forces invading northern Yugoslavia in April 1941, and after occupying Zagreb, Sarajevo, and Belgrade, he received the Yugoslav surrender on 18 April.

Second Army then moved east and participated in Operation BARBAROSSA, the invasion of the Soviet Union, as part of the southern flank of Army Group Center. Weichs fought in the battles for the Bialystok pocket, Gomel, and Bryansk. He fell ill in November and did not return to duty until January 1942, at which time his Second Army was on the northern wing of Army Group South. His forces captured Voronezh in July 1942.

Weichs received command of Army Group B when Hitler divided Army Group South into two army groups in July 1942. Army Group B eventually consisted of the Second and Sixth German Armies, the Fourth Panzer Army, the Second Hungarian Army, the Eighth Italian Army, and the Third and Fourth Romanian Armies. Not only was Weichs short of German troops, but Hitler also stripped him of half his motorized transport to support Army Group A. As the Sixth Army under General Friedrich Paulus invested Stalingrad, Weichs worried about the ability of his Axis allies to protect his flanks, and he called attention to this concern.

In November, when the Soviets launched their encirclement of Stalingrad, Weichs had no reserves, and Hitler refused his request to withdraw Sixth Army westward. Although restoring the situation was beyond the means Weichs had available, Hitler showed his lack of confidence in him by assigning most of Army Group B in late November to the newly created Army Group Don, commanded by Field Marshal Erich von Manstein. Weichs was promoted to field marshal in February 1943, but his remaining forces were distributed between Army Group

Center and Army Group Don. He was transferred to the Führer Reserve on 10 July.

Weichs’s retirement was short-lived. He was recalled on 26 July and named both commander in chief, Southeast, and commander in chief, Army Group F. With responsibility for all Axis forces in the Balkans, he was forced to contend both with growing guerrilla activity and with the Italian defection in September 1943. Weichs performed well, conducting several successful antipartisan operations. He also kept open supply lines for vital raw materials going to the Reich.

With the collapse of Romania and the defection of Bulgaria in August and September 1944, Weichs successfully extricated German forces in the Balkans with minimal losses. By January 1945, the remnants of Army Group F were fighting in Hungary. Hitler retired him in March. The aristocratic Weichs, despite his deep religious beliefs, remained loyal to the Führer and had the latter’s respect, though not his full confidence, until the very end of the war.

Weichs was held as a prisoner after the war and was one of the defendants at the International War Crimes Tribunal, but he was released due to poor health in 1948 before the trial took place. He died in Burg Rösberg/Bonn on 27 September 1954.

Welles, Benjamin Sumner (1892–1961)

U.S. undersecretary of state in the Roosevelt administration. Born in New York City on 14 October 1892 into a socially prominent family, Sumner Welles attended Groton School and Harvard University, acquiring a strong interest in history and literature. In 1915, on the advice of family friend Franklin D. Roosevelt, he applied to join the Foreign Service. Assigned to Buenos Aires in 1917, he decided to specialize in Latin America. Welles resigned from the department in 1922, but

within three months, Secretary of State Charles Evans Hughes appointed him commissioner to the Dominican Republic. His mandate was to implement the withdrawal of U.S. troops and the restoration of the indigenous government there.

Appointed assistant secretary of state by Roosevelt in 1933, Welles implemented the administration's Good Neighbor policy of greater equality with Latin American nations. In 1937, Roosevelt promoted him to undersecretary, annoying Secretary of State Cordell Hull, who resented Welles's close relationship with the president. When World War II began in Europe, Welles won Latin American nations' acquiescence in the declaration of a neutral zone around the entire continent.

In February and March 1940, Roosevelt dispatched Welles on a well-publicized peace mission to Rome, Berlin, Paris, and London, the major European belligerent capitals, purportedly to explore the possibility of negotiating peace before Germany launched its anticipated spring offensive and, if this proved impossible, to detach Italian dictator Benito Mussolini from German leader Adolf Hitler. Another objective of this unsuccessful venture was almost certainly to demonstrate to American voters that the president had made every possible effort to bring about peace.

Welles attended Roosevelt's August 1941 meeting with Winston L. S. Churchill off the Canadian coast, where he helped

to draft the Atlantic Charter. In January 1942, shortly after the Axis powers declared war on the United States, he met with all Latin American foreign ministers at Rio de Janeiro, winning their consent to a proclamation recommending a break with Germany, Italy, and Japan. For the sake of maintaining unanimity, Welles accepted this measure rather than the outright declaration of a diplomatic break preferred by Hull.

From 1939 onward, Welles was heavily involved in postwar planning undertaken jointly by the State Department and the Council on Foreign Relations. After the United States entered the war, he began an extensive speaking campaign to win popular support for the creation of a postwar international organization, which would eventually become the United Nations. In 1943, Hull, prompted by his antagonism toward Welles, used reports of his subordinate's involvement in a homosexual incident as a reason to insist on his resignation. Welles retired that September. He then wrote and spoke extensively on foreign affairs, publishing four books. He died in Bernardsville, New Jersey, on 24 September 1961.

WESERÜBUNG, Operation (April 1940)

German invasion of Norway and Denmark, the first and only joint operation of German armed forces in the war. On the order of Adolf Hitler, the commander of the German navy, Admiral Erich Raeder, instigated plans to occupy Norway in order to protect Swedish iron ore imports and to forestall an expected Allied invasion. Norway would also provide the German navy with bases for surface raiders and U-boats to break out into the Atlantic for its commerce war.

The *Altmark* Incident of February 1940 provided strong evidence, in German eyes at least, of a pro-British stance in the Norwegian government, on the grounds that the Norwegians had not defended their territorial waters against the British. Hitler was convinced that the British intended to invade Norway, a move he sought to forestall. Psychological

considerations also played a role, but Raeder warned Hitler that such a venture would violate all the rules of naval warfare and would force the commitment of virtually the entire navy.

Until this point in the war, the navy had made no significant contribution, and it was not slated to have a major role in the upcoming campaign against France. Hitler placed operational planning for the first time under his Oberkommando der Wehrmacht (Armed Forces High Command). His stipulation that forces for WESERÜBUNG, the code name for the invasion, be placed under a “special command” threatened the autonomy of both the army and the Luftwaffe.

On 4 April 1940, Hitler decided the operation would begin five days later. On 8 April, the British began their own mining operation in Norwegian waters, which was to be followed by the landing of troops. German naval units were, however, already at sea and successfully stole a march on the British. Strong Norwegian resistance, assisted by Allied forces, led to sharp fighting, particularly at Narvik, where 10 German destroyers were trapped by British naval units and destroyed. At one point, Hitler lost his nerve and ordered the Narvik forces to seek internment in Sweden. Raeder convinced Hitler to change his mind and send reinforcements to Oslo instead of using the more dangerous sea routes to Trondheim and Bergen. The German campaign against France and the Low Countries, begun on 10 May, forced the British and French to withdraw their forces from Norway on 4 June. Two days later, the Norwegian armed forces surrendered.

Raeder ordered his battleships to attack enemy shipping and protect supply shipments for German relief forces linking up with German forces at Narvik (Operation JUNO, 4–9 June). On 8 June, the German battleships *Scharnhorst* and *Gneisenau* encountered the British aircraft carrier *Glorious* and sank her with gunfire. The *Glorious* had, in addition to Hurricane fighters, a half dozen Swordfish torpedo-bombers on board, but for some reason, none of her aircraft were aloft. Both of the two escorting British destroyers were also sunk, but one of them, the *Acosta*, succeeded in torpedoing and damaging the *Scharnhorst*. As a result, Admiral Wilhelm Marschall chose to return to base, perhaps saving several nearby British convoys steaming without battleship escort.

Royal Navy losses in the campaign had been severe: a fleet carrier and 2 cruisers, as well as a number of smaller vessels. In addition, 8 large merchantmen, including 2 troop ships and 2 tankers, were lost, but the destroyers suffered the most. Nine were sunk and another 12 were damaged.

In WESERÜBUNG, the German navy lost its new heavy cruiser *Blücher*, 2 light cruisers, and 10 destroyers. Other ships were damaged. These losses created serious operational problems for the German surface navy. Moreover, WESERÜBUNG had revealed serious command problems, leading to the replacement of the second fleet commander of the war, Admiral Marschall. In addition, a large number of torpedo failures had cost the U-boats

major opportunities to inflict more serious damage on the Royal Navy. Yet for the German navy, WESERÜBUNG was its major “feat of arms” of the war. Hitler considered Norway as Germany’s “zone of destiny,” to be defended at all costs, especially after the invasion of the Soviet Union, but this opened a considerable drain on German resources, as the navy and army were forced to commit major resources to defend Norway.

West Wall, Advance to the (17 August–10 September 1944)

Allied pursuit of German forces from the Seine to the German border. The breakout of the Allied armies from the Normandy beachheads in Operation COBRA on 25 July was followed by a rapid pursuit of the retreating German forces to the Seine River. On 19 August, Supreme Allied Commander General Dwight D. Eisenhower decided to continue the advance east of the Seine River, despite growing logistical difficulties.

Allied plans called for the main effort to be made northeast of the Ardennes Forest by Field Marshal Sir Bernard Montgomery’s 21st Army Group (First Canadian Army and Second British Army), supported by Lieutenant General Omar Bradley’s First U.S. Army of the 12th Army Group. Montgomery’s forces were to move northeast from the lower Seine through Liège to cross the Rhine and seize the Ruhr industrial area. Meanwhile, Lieutenant General George S. Patton Jr.’s Third U.S. Army (also part of 12th Army Group) was to make a secondary effort south of the Ardennes and east from the upper Seine across the Moselle between Metz and Nancy and into the Saarland. Intermediate Allied objectives were to clear the Channel ports; seize the German V-weapons sites in the Pas de Calais area; liberate northwestern France, Belgium, and Holland; and destroy German forces between the Seine and Germany. But the ultimate Allied objectives were a quick crossing of the Rhine and seizure of the Ruhr.

Speed was essential for the Allied forces to reach the Rhine before the Germans could organize an effective defense of the West Wall, a fortified line on Germany's western border running some 300 miles from Cleves on the Dutch-German border to Basel, Switzerland. Known by the Allies as the Siegfried Line, this fortified barrier consisted of mutually supporting pillboxes, concrete antitank obstacles, and extensive barbed-wire entanglements. Constructed between 1936 and 1938, the West Wall had been neglected after the German victories in 1940, and parts of it had been dismantled to construct the Atlantic Wall.

The general German retreat in the west began on 17 August. Leaving behind the garrisons in the Channel ports, Field Marshal Walther Model's Army Group B (elements of 46 divisions of the First, Seventh, Fifth Panzer, and Fifteen Armies) withdrew to the northeast. Closely pursued by the Allies, the retreating German forces conducted an orderly withdrawal but were unable to reestablish a continuous line of defense until they reached the West Wall. By 10 September, Army Group B and Army Group G (7 divisions of Nineteenth Army withdrawing from southern France) had met at the West Wall and formed a continuous front with some 63 understrength divisions spread from the North Sea to Switzerland.

Paris was liberated on 25 August, and the Allied pursuit east of the Seine achieved quick success. General Sir Henry Crerar's First Canadian Army advanced up the Channel coast, overrunning the German V-weapon sites in the Pas de Calais on 6 September and taking Ostend on 9 September. Farther east, General Sir Miles Dempsey's Second British Army rapidly advanced to the Albert Canal between Antwerp and Hasselt, taking Brussels on 3 September, Antwerp on 4 September, and Ghent on 5 September. However, the Germans retained the Scheldt estuary, thus preventing Allied use of the Belgian ports.

On the British right, Courtney Hodges's First Army attacked from Melun on 26 August and captured Laon on 30 August, Tournai on 2 September, and Mons on 3 September, taking some 25,000 German prisoners in the "Mons pocket." First Army then crossed the Meuse on 4–5 September, liberating Liège on 7 September and Luxembourg two days later. By 10 September, First Army was deployed from Hasselt on the Albert Canal through Liège, Verviers, and Malmédy to Luxembourg.

Despite logistical restrictions, Patton's Third Army also made good progress, and by 1 September, it had crossed the Meuse between Verdun and Commercy and was in position to attack toward the Moselle and the West Wall between Metz and Nancy when its advance ground to a halt for lack of gasoline and other supplies. On 2 September, Alexander Patch's Seventh U.S. Army, advancing northward from southern France, linked up with Allied forces near Lyon, thereby completing the Allied line from the Channel to the Swiss border and ending the great pursuit.

Men of the Organization Todt building the West Wall. (Library of Congress)

The Normandy Invasion and breakout and the subsequent pursuit to the West Wall was costly for both sides. From 6 June to 11 September 1944, the Germans lost about 500,000 men. In the same period, the Allies suffered some 224,000 casualties. The continuation of the Allied drive into Germany would be much slower and even more costly.

Western European Theater of Operations

In accordance with its military pact with the Poles, France was to invade Germany two weeks after a German attack on Poland occurred, thereby forcing the Germans into a two-front war. However, following the German invasion of 1 September 1939, the best the French could manage was a token drive in the Saar region by nine divisions. French forces advanced a maximum of 5 miles on a narrow front. Casualties were negligible, but the French then halted; and when Poland collapsed, they withdrew to the Maginot Line. A more vigorous French thrust would have driven forward to the Rhine, with untold consequences for the course of the war. German forces manning the West Wall had little ammunition, no tanks, and virtually no air support.

But if the French effort in response to the German invasion of Poland was pathetic, Britain's was worse. The Royal Navy did impose a naval blockade on Germany, but the effects of this were far different from those caused by a similar blockade in World War I. This blockade was nullified by Germany's nonaggression pact with the Soviet Union, the secret terms of which promised Germany strategic natural resources. Germany could also secure necessary supplies from Italy, and both countries acted as purchasing agents for Berlin abroad. Two weeks into the war, the British Expeditionary Force (BEF) had not even completed assembling, and London rejected pleas for the Royal Air Force (RAF) bombing raids against Germany that had been agreed to before the war.

Following the German victory over Poland and the rejection by Britain and France of his terms for peace on a "forgive and forget" basis, Adolf Hitler prepared to move west. In late November 1939, he informed his military chiefs that Germany could deal with the Soviet Union only when it was free in the west. He was determined to attack France and Britain "at the earliest moment."

All was then quiet in the west. This period of the war came to be known as the "Sitzkrieg," the "Phony War," or the "Bore War." France carried out a full mobilization, and its forces manned the Maginot Line, but Britain imposed only a partial conscription, and by mid-October, it had only four divisions in France. Hardly any air action took place, with both sides reluctant to unleash the bombing of cities. Bad weather and the pleas of his generals for additional time caused Hitler to postpone the German invasion of France.

The Allies had no intention to take the offensive themselves. The commander of the French army, General Maurice Gamelin, said, "The first one who comes out his shell will be in peril." Meanwhile, First Lord of the Admiralty Winston L. S. Churchill developed a scheme to mine the coastal waters of neutral Norway in order to deny Germany access to high-grade Swedish iron ore shipped from the port of Narvik. Allied Scandinavian plans, including discussions of sending troops to aid Finland in its war against the Soviet Union, were soon an open secret. Initially, Hitler had no intention of opening a new front in northern Europe, for in mid-December, he set 14 January 1940 as the start date for the western offensive, which was then postponed again. In February, however, Hitler concluded that the British intended to move against Norway and that Germany would have to move first. The German invasion of Norway began on 9 April 1940, catching the Allies by complete surprise.

The Germans took Denmark in only one day, but Norway proved more difficult to subdue. The Allies landed troops in the north and occupied Narvik, but mounting aircraft losses, the unsatisfactory situation elsewhere in Norway, and the German invasion of France brought evacuation in early June. The Norwegian Campaign badly hurt the German surface navy; it lost 3 cruisers and 10 destroyers, half of its total, but Hitler secured additional food production for the Reich and protection for his northern flank on the Baltic. Most important, the Kriegsmarine (German navy) secured locations for naval bases nearer to the Allied Atlantic convoy routes. Thus, it could now launch attacks into the North Atlantic and later strike Allied convoys bound for the Soviet Union. But Hitler also suffered the consequences of strategic overreach; by 1944, he had 365,000 of his best troops in Norway, a serious drain on his badly stretched resources.

Hitler's next stroke was the oft-delayed invasion of France and the Low Countries. On 10 January 1940, a German military aircraft was forced to land in Belgium. Its passenger was carrying the operational plans for the German attack in the west. Compromise of this plan led Hitler to abandon it and caused the German invasion to be delayed until May. The old plan would have seen the Germans encountering the best British and French divisions, but the new plan, *SICHELSCHNITT* (meaning "the cut of the sickle"), shifted the major effort from central Belgium to just north of the Maginot Line. The northern effort would occur first, drawing the Allies into Belgium. Then the major blow would fall to the south, in the hilly and wooded Ardennes. The Germans planned to cross the Meuse River and crack the French lines at Sedan, then swing northwest to the Channel and cut off the best British and French divisions in Belgium.

The campaign for France and the Low Countries began on 10 May 1940. The Allies matched the German invading forces on the ground and outnumbered the Germans in tanks. Their

Crossed rifles in the sand serve as a comrade's tribute to this American soldier who died in the Normandy Invasion. (National Archives)

problem lay in tactical employment. The first three French tank divisions did not assemble for training until January 1940, and the majority of French tanks along the eastern frontier were split into isolated packets as infantry support. The Germans dominated the air, a vital factor in their success, and the Allies were sadly deficient in anti-aircraft weapons. Other important factors in the outcome of the campaign included appallingly inadequate senior French military leadership, catastrophic failures in French military intelligence, and the lack of adequate reserves to deal with the German breakthrough.

German airborne forces in the north secured vital bridges and also the Belgian bastion of Eben Emael. The Allies followed the German script by pouring their forces into Belgium. On 13 May, German forces to the south crossed the Meuse. For all intents and purposes, the struggle for France was over on 15 May when the Germans penetrated the Meuse defenses.

Once the panzer divisions were free, the way was clear to drive to the English Channel and cut off the main Allied

armies in Belgium. By 24 May, the Germans had captured Boulogne and isolated Calais, forcing the BEF to rely on Dunkerque (Dunkirk) for resupply. Allied forces in Belgium were now cut off from the bulk of the French forces to the south. As British forces withdrew northward to the coast, King Leopold III surrendered his armed forces on 28 May, despite promises that his nation would not undertake any such unilateral action. This action opened a gap between the BEF left flank and the sea, into which the Germans now poured, threatening to cut off the BEF entirely. At this point, Hitler, in his first major military blunder of the war, intervened. For five days, he kept the German armored thrust from the south in place, saving the BEF and probably enabling Britain to continue in the war.

During the period between 27 May and 4 June, the British carried out an epic evacuation at Dunkerque. In Operation DYNAMO, they evacuated some 365,000 troops, of whom about 225,000 were British. The BEF was forced to abandon virtually

all its equipment in France, but it did extract almost all its remaining personnel. In Britain, the evacuation swept away the “phoniness” of the war, but many Britons were oblivious to the fact that, in May 1918, there had been 10 times the number of British divisions in France as in May 1940, that they had left the French in the lurch, or that the French First Army had held the Germans from the beaches and allowed the BEF to escape.

On 5 June, after having consolidated, the Germans struck south, cutting through French forces and reaching the Seine River west of Paris four days later. Stunned by these developments and unprepared for improvised action, much of the French army simply disintegrated. On 13 June, the government declared Paris an open city to spare it air attack, and the next day, German troops took peaceful possession of the French capital.

On 12 June, the new French army commander, General Maxime Weygand, had concluded that the situation was hopeless and so informed the cabinet. Two days earlier, Italian dictator Benito Mussolini, convinced that the war was all but won, had brought his country into the conflict on the German side by invading southeastern France. Thirty-two Italian divisions attacked five French divisions along the Italian border but made little headway.

On 16 June, French Premier Paul Reynaud was forced to resign, and a majority of the cabinet voted to ask Hitler for terms. The new premier was 84-year-old Marshal Henri Philippe Pétain, a World War I hero who had been brought into the government as deputy premier in order to bolster French resolve but who now favored an immediate armistice. On 17 June, the Pétain government opened negotiations with the Germans. Fighting ceased on the battlefields of France on 25 June.

France was divided into occupied and unoccupied zones, and its army was reduced to 100,000 officers and men. The navy, almost entirely intact, remained under French control but was to be disarmed in French ports. France also had to pay for the German occupation of three-fifths of its territory.

Paris was included in the German occupation zone, so the new French government established itself at Vichy, in south-central France. The new Vichy France was frankly totalitarian and, to a considerable degree, collaborationist. Pétain and his advisers believed that Germany had won the war and that, at least for the foreseeable future, France would be under German control. It took something akin to clairvoyance in the dark days of June 1940 to foresee a possible Allied victory, but a small number of Frenchmen and Frenchwomen vowed to continue the fight and took the lead in forming resistance groups. In London, on 18 June, young Brigadier General Charles de Gaulle, who had been undersecretary of war only a few days before, announced over the British Broadcasting Corporation (BBC) the establishment of the Free French. He soon secured British military assistance and, ultimately, recognition of his government.

Winston Churchill, who had become British prime minister on 10 May, feared that the Germans would acquire the French fleet, although the French government had promised London that it would scuttle its ships rather than see them fall into German hands. This pledge was not sufficient for Churchill, who ordered Operation CATAPULT. The British would offer French naval commanders a cruel choice between continuing the fight, disarming in neutral ports, or scuttling their ships. The British rather easily acquired some 130 French vessels of all types, but at Mers-el-Kébir in Algeria, there was fighting in which the British sank a number of French ships and killed nearly 1,300 French seamen. Despite this, the French government honored its pledge more than two years later. In November 1942, the Germans tried to seize the bulk of the French navy—80 ships assembled at Toulon—but the French scuttled 77 of them.

The Germans now dominated the Continent. They were emphatically the senior partner in the German-Italian combination, and they were on good terms with Francisco Franco in Spain, and the Soviet Union was benevolently neutral. History seemed to repeat itself, for the Germans now controlled almost exactly the same geographic area as had Napoleon, and in 1940, as in 1807, only Great Britain remained at war with the would-be conqueror.

Britain now awaited a German attack. In early June, there was only one properly equipped and trained division to defend the British Isles. BEF equipment abandoned in France included 600 tanks, 1,000 field guns, 500 antiaircraft guns, a vast number of small arms, and half a million tons of stores and ammunition. The fleet was far to the north, away from the Luftwaffe. If German forces could have landed in Britain in the weeks following Dunkerque, there would have been little means of stopping them. Hitler and his military chiefs, however, were caught off guard by the speed of the French defeat and had no plans for a follow-up invasion of Britain. Not until late July did they begin planning for a descent on England, code-named SEA LION (SEELÖWE).

Following the defeat of France, Hitler had postponed any decision regarding Britain. He hoped and expected that the British people would recognize that Germany had won and agree to a negotiated peace. Some of his generals urged him to strike Britain before it could reorganize and consolidate its strength, but he refused. In early June, RAF Fighter Command had only about a sixth the number of aircraft that the Germans could send against Britain. Yet when formal orders were issued for SEA LION, German preparations were half-hearted. In any case, command of the air was the necessary prerequisite for any invasion.

Official British dates for the Battle of Britain are 10 July to 31 October 1940. The Germans, however, never achieved their goal of driving the RAF from the skies. Ineffective German leadership, intelligence failures resulting in poor target-

ing decisions, radar and ULTRA in the hands of the British, the lack of a strategic bomber on the German side, superior British pilot and aircraft replacement, and the German concentration on London all contributed to the German defeat.

Finally, on 1 November, with the Luftwaffe sustaining prohibitive losses, the Germans shifted to night bombing—what Londoners called “the Blitz.” Heavy bombing continued into May 1941. Although savage and relentless, night area bombing had no strategic result. The German air offensive had failed, in what was the first serious German military setback of the war. In mid-October 1940, Operation SEA LION was officially shelved until the spring, when it was postponed indefinitely.

Hitler failed to recognize the need to maintain the pressure on Britain. He could have intensified aircraft and submarine attacks against shipping to the British Isles, which might have brought an eventual British collapse, but his attention was increasingly drawn eastward to the Soviet Union. The commander of the German navy, Grand Admiral Erich Raeder, and the commander of the air force, Hermann Göring, both believed that the defeat of Britain would leave Germany in a much stronger position vis-à-vis the Soviet Union. Hitler contended that the Soviet Union was preparing to attack Germany and that Britain was holding out only because its leaders hoped that Germany and the Soviet Union would go to war: if he could eliminate the Soviet Union, then Britain would capitulate. Hitler lacked patience and failed to understand the limitations of the blitzkrieg in terms of distance and resupply. He also did not appreciate interdiction or an indirect approach. Finally, Hitler was driven by ideological and political factors. In June 1941, after shoring up his Balkan flank, he sent his armies against the Soviet Union.

In December 1941, the United States joined the conflict as an active participant. Hitler and Mussolini then declared war on the United States, resolving a possible strategic dilemma for President Franklin D. Roosevelt concerning the Allied policy of concentrating first on Germany. Soviet leader Josef Stalin called for an immediate invasion of western Europe by British and U.S. ground forces, but it would take many months for the vast U.S. industrial base to shift to war production, for armed forces to be raised and trained, and for the Battle of the Atlantic to be won. In 1942, the U.S. contribution to the war in Europe came in the form of strategic bombing, and there was little of that.

The Americans preferred the earliest possible cross-Channel invasion of northern France. Army Chief of Staff General George C. Marshall was a strong supporter of an invasion of northwestern Europe in the fall of 1942. The British were leery, fearful that such a move would lead to a repeat of the situation in northeastern France in World War I. Proof that the Western Allies were not ready to undertake a cross-Channel invasion was provided in Operation JUBILEE, the raid

on Dieppe on the coast of Normandy on 19 August 1942. The raid buried the myth that a cross-Channel invasion was feasible in 1942, and it cast grave doubts on the Allied plan for a cross-Channel invasion in 1943.

Roosevelt had promised Stalin that the Western Allies would undertake an invasion by the end of 1942, and he was determined to honor that pledge. He met that commitment with Operation TORCH, the Allied invasion of French North Africa in November 1942. With success there, U.S. military leaders, most notably General Marshall, attempted to secure British approval for a cross-Channel invasion in 1943. Churchill demurred and convinced Roosevelt to pursue operations in the Mediterranean against Italy. The British leader wanted an Allied concentration in the Mediterranean, which he termed the “soft underbelly of Europe.” The Americans reluctantly agreed to invasions first of Sicily and then of Italy, but they insisted on the cross-Channel invasion of France for the spring of 1944.

The Allies developed precise and elaborate plans for the invasion in Normandy. Prior to the landing, Allied air forces would conduct a massive bombing campaign to isolate the region. The landing itself would be preceded by a night drop of three divisions of paratroops. The next morning, five infantry divisions would go ashore along the 50-mile stretch of coast. Some 10,000 aircraft would secure the skies, while hundreds of ships provided naval support.

Success was probable if the Allies could establish a bridgehead large enough to build up their strength. Once they broke through the German lines, the Allies would have the whole of France for maneuver because their armies were fully mechanized and the bulk of the defending German forces were not. Field Marshal Erwin Rommel, who had charge of the coastal defenses, well understood that the German defense was doomed unless it could destroy the invaders on the beaches. Hitler did not agree and indeed welcomed the invasion as an opportunity to destroy the British and U.S. forces. In Britain, the Allied armies were immune to attack; in France, they could be destroyed. Let them come, he said: “They will get the thrashing of their lives.”

The only possibility of German success was to introduce panzer reserves rapidly, but this step was fatally delayed by Allied air superiority and Hitler’s failure immediately to commit resources available elsewhere. Operation FORTITUDE, the Allied deception plan, convinced Hitler that the Normandy Invasion was a feint and that the main thrust would come in the Pas de Calais sector.

The Allies put ashore a million men within a month following D day, but a great storm severely damaged one of two artificial harbors that had been towed across the Channel. The Germans then turned the French ports into forts, destroying them when they had to surrender. Supply became a major problem and remained so until near the end of the war. The

Normandy countryside also proved ideal defensive terrain, and not until the end of July were the Allies able to break out in Operation *COBRA* (25–31 July), when Lieutenant General Omar Bradley's U.S. First Army forced the German line west of Saint-Lô, with Major General J. Lawton Collins's VII Corps making the main effort. Lieutenant General George S. Patton Jr. arrived in France on 6 July, and two days after the start of *COBRA*, Bradley ordered him to take command of VIII Corps.

On 1 August, the U.S. command was reorganized. Bradley moved up to command 12th Army Group, Lieutenant General Courtney Hodges assumed command of the First Army, and Patton's Third Army was activated. In the British zone of operations, General Bernard Montgomery's mostly British Commonwealth 21st Army Group comprised Lieutenant General D. G. Crerar's Canadian First Army and Lieutenant General Miles C. Dempsey's Second British Army. Patton's Third Army scored the greatest success, although the general was fortunate to arrive in command when the static warfare of the previous two months had finally passed into the mobile warfare at which he excelled. The weather was also dry, and the flat terrain of northern France was ideal tank country. Patton took full advantage of the circumstances. He was certainly the outstanding general of the campaign for France. Third Army displayed instant efficiency and soon had parlayed the local breakthrough of *COBRA* into a theater-wide breakout. After the breakout, Patton's Third Army turned west to clear out the Brittany peninsula, then turned to the east after taking Brest. In a single month, the Third Army liberated most of France north of the Loire River.

Meanwhile, the Allies launched Operation *DRAGOON* on the Côte d'Azur near Cannes in southern France. The operation had been planned largely to secure the large French Mediterranean ports for a rapid Allied buildup in France. Originally code-named *ANVIL* and planned to coincide with D day, this effort had to be postponed because of a shortage of landing craft as a consequence of *OVERLORD* priorities and the British reluctance to divert assets from Italy. On 15 August, some 86,000 men went ashore on a 30-mile front 20 miles east of the French naval base of Toulon. German ground forces were thinly spread and inadequate in numbers and resources. Lieutenant General Alexander Patch's Seventh Army ultimately consisted of 10 divisions: 7 U.S. and 3 French. The invaders then pushed up the Rhône River valley. By the time of the linkup with Bradley's 12th Army Group near the Swiss border in the fall of 1944, the southern Allied force had grown into the 6th Army Group of 23 divisions under Lieutenant General Jacob Devers. *DRAGOON* provided him two large, intact French ports that could be used to help supply the expanding Allied buildup in France.

The Allies now squandered a golden opportunity. Montgomery was making little progress, while Patton and his Third Army swung wide in an enormous enveloping move-

ment that prevented German forces from consolidating along the Seine. Patton's rapid drive made it possible to trap large numbers of two German field armies, including seven panzer divisions, in the so-called Falaise pocket. The destruction of these German forces was within Allied reach, but Eisenhower and Bradley did not grasp the significance of the situation and refused to authorize Patton to span a 15-mile-wide gap between Argentan and Falaise, the former having been assigned as a British objective.

The pocket was finally closed, and 60,000 Germans were killed or captured in the pocket, with substantial amounts of arms and equipment seized; yet some 100,000 Germans escaped. Without Bradley's imposition of a delay, which gave the Germans from 13 to 18 August to extract their forces, the Allies might have captured them all and brought the war to an end in 1944. German forces in France now fought their way homeward under Allied pursuit. Paris was liberated on 25 August, a task wisely left to the French. By 31 August, Patton's Third Army reached the Meuse at Verdun, and the following day, it gained the Moselle River. In the north, Montgomery drove into Belgium, all the while complaining of shortages of supplies and fuel and pressing for a single thrust under his command into Germany itself.

Between the two Allied spearheads, there was virtually little resistance. Facing Patton's six strong divisions were five weak German divisions with few tanks or antitank guns. Facing the British was the hastily assembled German First Parachute Army, a scratch force of some 18,000 men, boys, and walking wounded. In the sector between Aachen and Metz, the Germans had only eight infantry battalions. On the whole front, the Germans fielded some 100 tanks and 570 aircraft. In tanks and in aircraft, the Allies had a 20-to-1 advantage.

Yet the Allied advance stalled. The supply lines of the Allies were lengthening even as those of the Germans were contracting. The original Allied plan had been to consolidate on the Seine while opening the Brittany ports and establishing a sound logistical base, but that plan had been nullified by their unanticipated rapid advance after the Saint-Lô breakout. Much of the French railroad system had been destroyed by Allied air strikes, and the bulk of the supplies had to move from the Normandy beaches by road to the front. Despite the best efforts of the Allies, supplies were simply insufficient for the broad-front strategy on which Eisenhower insisted. The supply situation was made even worse by the need of essential services for liberated French cities and towns, and there were natural obstacles in the Vosges Mountains, the Ardennes, and the Hürtgen Forest.

By the end of August, the German army had suffered more casualties than at Stalingrad—losing roughly 500,000 soldiers and 1,600 tanks in what was one of the greatest defeats in the history of warfare. One daring thrust through the north, south, or center might have proved decisive. There were two com-

peting schools of Allied operational strategy: the narrow front and the broad front. Montgomery and Patton were the two leading proponents of the narrow front, provided it was for their own forces; Eisenhower wanted the broad front. Eisenhower controlled the flow of supplies and made the ultimate decision. Arguing that there were only sufficient resources for one major thrust, Montgomery pressed Eisenhower to halt Patton's Third Army and concentrate resources behind his troops. He believed he could make a quick end to the war, and he wanted the British to lead the charge and take Berlin. Patton wanted, above all else, to beat Montgomery to that prize.

While this discussion was in progress, Montgomery missed a chance to shorten the war. British tanks took Brussels on 3 September and Antwerp the next day, so rapidly that the Germans were unable to destroy its port facilities. Only the opening of the 45-mile-long Scheldt estuary stood between the Allies and relief of their growing supply difficulties. But Montgomery preferred to concentrate his troops for a thrust across the Rhine into northern Germany and overlooked the enormous logistical implications of Antwerp. The British were well positioned to take the German Fifteenth Army fleeing northeastward up the coast. An advance of less than 10 miles beyond Antwerp would have sealed off the Walcheren and South Beveland peninsula. But Montgomery halted at Antwerp. Consequently, the Fifteenth Army escaped across the Scheldt at night and then went back into Holland.

Eisenhower now had to decide between concentrating on a narrow front or launching a broad-based attack in which the Allies would attack, regroup, and then attack again. Although Allied headquarters had always known that no major thrust could be made into Germany until Antwerp had been secured as a supply base, Eisenhower allowed Montgomery to ignore opening Antwerp in favor of securing a bridgehead across the Rhine and perhaps ending the war in one bold stroke. Also affecting the plan was pressure to use the airborne divisions that had participated in the Normandy Invasion and were now recuperating in Britain. Unfortunately, Montgomery failed to carry out the detailed staff planning of his earlier campaigns to make the plan work.

The operation was code-named MARKET-GARDEN. MARKET, the airborne segment, involved three paratroop divisions; GARDEN, the ground portion, was centered in the British Second Army. The airborne forces were to secure key bridges over the Maas (Meuse), Waal, and Lek (lower Rhine) Rivers, then Second Army would race up a corridor from Belgium along a 60-mile-long narrow causeway, cross the rivers, and secure Arnhem on the lower Rhine. The plan involved a high degree of risk, but the prize of outflanking the Siegfried Line (called the West Wall by the Germans) and gaining entry into northern Germany seemed worth it.

Factors involved in the failure of the operation included the refusal to modify the hastily developed plan, the lack of

coordination with the Dutch underground, and the ignoring of Dutch warnings as well as ULTRA intercepts and late photographic evidence of the presence of two battle-hardened panzer divisions transferred from the Eastern Front and reconstituting around Arnhem. The operation also suffered from insufficient men and logistical support. But the greatest tactical mistake was to drop the British 1st Airborne Division 7 to 8 miles from Arnhem, allowing German panzers to isolate it. MARKET-GARDEN began on 17 September and ended on 26 September. The operation, which Montgomery later termed "90 percent successful," was, in fact, a total failure.

By mid-September, the Allied opportunity had been lost and the Germans had recovered sufficiently to slow the advance almost to a standstill. The task of forcing the Germans from the Scheldt fell chiefly to Lieutenant General Guy Simonds's First Canadian Army. This effort consumed two months of hard fighting. Patton was also held up in a month of bloody fighting before the fortress of Metz. With the onset of bad weather, any chance for the Allies to win the war in 1944 was gone. The Germans not only managed to rebuild their shattered divisions but also transferred new units into the battle, so that they actually enjoyed a manpower advantage over the Allied Expeditionary Forces, although they were numerically inferior in tanks, artillery, and, above all, airpower. Between September and December 1944, the U.S. Army suffered one of its worst defeats in the Battle of the Hürtgen Forest, ideal defensive terrain. The Germans, who were now defending their own homeland, resisted with great tenacity.

Hitler now proposed a final offensive in the west. In September 1944, with the Eastern Front static for several months and the Allied offensive in the west gaining ground, he conceived of a sudden offensive to take the Allies by surprise, break their front, and recapture Antwerp. He hoped at the least to buy three to four months to deal with the advancing Soviets. Western Front commander Field Marshal Karl Gerd von Rundstedt thought the plan was unrealistic, as did other high-ranking officers. But Hitler refused to change his mind, and substantial German forces were transferred from the Eastern Front to the west for what would be the biggest battle fought on the Western Front in World War II and the largest engagement ever fought by the U.S. Army.

On 16 December, the Germans launched their Ardennes Offensive. It caught the Western Allies completely by surprise, and bad weather restricted the use of Allied airpower. The German force of 24 divisions pushing against 3 divisions of Hodges's First Army drove a "bulge" 50 miles deep and 70 miles wide into the American defenses, which gave the Battle of the Bulge its name.

Allied resources diverted to the battle and clearing skies that permitted the intervention of Allied aircraft turned the tide. The battle dragged on to mid-January, but before the Germans could switch resources to the east, the Soviets

launched their last great offensive. In effect, the Ardennes Offensive hastened the end of the war. Both sides suffered heavily, but the Western Allies quickly made up their losses, whereas the Germans could not. Deaf to all reason, Hitler categorically forbade retreat. Everything that could be of use to the enemy had to be destroyed. The fate of his people was irrelevant, for he concluded that if the Germans were unable to win, then they did not deserve to survive.

On 7 March 1945, U.S. forces captured intact a German bridge across the Rhine at Remagen and immediately put forces across. In the west, the Germans now had fewer than 60 understrength and poorly equipped divisions to oppose 85 well-equipped Allied divisions. With both Patton and Hodges making solid progress, Eisenhower ordered Bradley's 12th Army Group to make the main thrust, pushing through central Germany and ignoring Berlin, on which the Soviets were advancing. Ninth Army would encircle the Ruhr while the remainder of Montgomery's 21st Army Group covered Bradley's drive by moving northeast, cutting off German forces in Denmark and Norway. Lieutenant General Jacob Devers's 6th Army Group, meanwhile, provided right-flank security for Bradley, advancing down the Danube to secure the so-called *Alpenfestung*, or National Redoubt. The Ruhr was encircled on 1 April. Seventh Army, in the meantime, took Nuremberg, crossed the Danube, and moved into Austria, joining up in the Brenner Pass with elements of the Fifth Army from Italy. On 11 April, the Ninth Army reached the Elbe near Magdeburg. German resistance now rapidly collapsed. Soviet forces took Berlin, and on 8 May, Admiral Karl Dönitz, Hitler's successor, surrendered German forces unconditionally. The war in Europe was over.

Westphal, Siegfried (1902–1982)

German army general who served as chief of staff to Field Marshal Albert Kesselring. Born in Leipzig, Germany, on 28 March 1902, Siegfried Westphal entered the military as an officer candidate in the 12th Grenadier Regiment in November 1918. He remained in the army after World War I, and in December 1922, he was commissioned as a lieutenant in a cavalry regiment. He was assigned to the 13th Cavalry Regiment in 1938.

When World War II began, Westphal was operations officer of the 58th Infantry Division. Promoted to lieutenant colonel in 1941, he became operations officer of General Erwin Rommel's Panzergruppe Afrika that November and was promoted to colonel in August 1942 and then, as one of the youngest generals in the German army, to Generalmajor (U.S. equiv. brigadier general) in March 1943. In June, Westphal became chief of staff to Field Marshal Albert Kesselring, commander in chief, South, and as such, he played an important role in the Sicily and Italy Campaigns. Westphal was promoted to Generalleutnant (U.S. equiv. major general) in April 1944.

In September 1944, Westphal became chief of staff to the commander in chief, West, Field Marshal Karl Gerd von Rundstedt. He helped plan the German Ardennes Offensive that led to the December 1944–January 1945 Battle of the Bulge. Promoted to General der Kavallerie (U.S. equiv. lieutenant general) in February 1945, Westphal returned to his prior position as chief of staff to Kesselring a month later, a post he retained until the end of the war. He was hard-working and quick with decisions, and his chiefs had only high praise for his abilities. Westphal rejected all involvement with National Socialism and firmly believed in the separation of politics from the military. Westphal died at Celle, Germany, on 2 July 1982.

Weygand, Maxime (1867–1965)

French army general who became commander of French forces in 1940. Born on 21 January 1867 at Bruxelles (Brussels), Belgium, Maxime Weygand was probably of distinguished parentage; rumor had it that he was the illegitimate son of Belgian King Leopold II. He arrived in France in mysterious circumstances at age six. He graduated from the French Military Academy of St. Cyr in 1887 and from the Cavalry School at Saumur the following year. Over the next two decades, Weygand worked hard at his chosen career and enjoyed rapid promotion. In 1902, he returned to Saumur as an instructor. In 1912, he was promoted to lieutenant colonel and selected to attend the Centre des Hautes Études Militaires, where he performed brilliantly and caught the attention of the French army commander, General Joseph Joffre.

In mid-August 1914, Weygand became chief of staff to General Ferdinand Foch's new Ninth Army. He continued as Foch's chief of staff for the next nine years and was the only officer on the general's staff to have his full confidence; the two men were virtually inseparable. At the end of the war, Weygand was a major general.

In 1920, Foch sent Weygand to Poland to head the French military mission to that country during its war with Russia. Weygand returned to France after the Polish victory and was promoted to lieutenant general. Between 1923 and 1924, he was high commissioner to the Levant. Removed as a "rightist general" after the victory by the Left in the 1924 elections, he next headed the Centre des Hautes Études Militaires. In January 1930, he succeeded Marshal Henri Philippe Pétain as chief of staff of the French army. As commander of the army, he advocated mechanization instead of the construction of the Maginot Line. He managed to push through the motorization of 7 of the 20 peacetime French divisions and in 1933 secured the creation of light mechanized divisions.

Weygand retired from the army in 1935. Recalled to service four years later on the eve of World War II, he received command of French forces in the Middle East. On 19 May 1940, in the midst of the campaign for France, Premier Paul Reynaud ordered the 73-year-old Weygand to return to France and replace General Maurice Gamelin as Supreme Allied Commander in Flanders.

Weygand arrived too late to save France. He failed in his effort to get the British to attack from the north in a joint effort to pinch off the German armored thrust to the sea, the last

Supreme Allied Commander General Maxime Weygand, 1939. (Photo by Pictorial Parade/Getty Images)

hope of an Allied victory at that point. Realizing the hopelessness of the French position, he urged the government to capitulate. Following the French surrender on 22 June, Weygand was briefly defense minister of Vichy France, in which position he worked to transfer military assets from the occupied zone to the unoccupied zone and to North Africa. Removed from his office on suspicion of being anti-Vichy, he was sent to Algeria. His connections with anti-German forces there brought his forced retirement to Cannes, where he was under constant police surveillance.

After the November 1942 Anglo-American landings in North Africa, Weygand urged the Vichy chief of state, Pétain, to break with Germany and join forces with the Allies. In November 1942, he attempted to fly to North Africa to meet with the Americans, but the Gestapo arrested him and imprisoned him in Germany. Released at the end of the war, Weygand was flown to Paris, where General Charles de Gaulle ordered his arrest as a member of the Vichy government. He was, however, let out of prison in 1946 and rehabilitated in 1948. Weygand lived a quiet retirement and wrote many books, including his memoirs and a biography of Foch. He died in Paris on 28 January 1965.

White Rose

German Resistance group. At the center of the group were a brother and sister, Hans and Sophie Scholl (ages 24 and 21 at the time of their deaths). They were both bright and attractive and had been leaders in Nazi youth groups, but they and their friends became disillusioned with the course of events in Germany.

Formed in Munich, the White Rose actually began in the Wehrmacht. Hans was a sergeant in the army, as were others in the conspiratorial group. These young men had served briefly on the Eastern Front and were aware of the full bestiality of the Nazi regime. When they returned to Munich to pursue medical studies at the University of Munich, they decided to act. The Scholls and their friends refused to be indifferent to what was happening in the world around them. Hans had not planned to involve his sister, also a student at the university, but she found out about the group's activities and insisted on being included.

The White Rose organization printed a number of carefully worded leaflets attacking the Third Reich and calling for resistance against it. These were circulated around the universities and mailed to prominent individuals in a half dozen cities. In addition, slogans against the regime were painted on walls in Munich. These activities were all the more courageous because they began as a moral protest: in the fall of 1942, Germany was not yet losing the war.

By early 1943, the Gestapo was closing in on the organization, but Hans Scholl did not seem to notice or care. Most members of the group believed that the end of the war was near. In February, the Gestapo arrested three members of the White Rose. Four days later, they were taken before Roland Friesler, the notorious chief justice of the People's Court for the Reich. There was no trial in any acceptable meaning of the term, and that same day, they were condemned and beheaded. Soon, other members of the group were located, and three of them—including a university professor—were also executed.

The defiant acts of the White Rose hardly disturbed the authority of the Reich. There would eventually be memorials to the Scholls in Germany, but it is doubtful that they would have wanted such recognition nor thought it proper. That their actions were not influential was unimportant; what mattered was that they stood up for what they believed. As Sophie Scholl put it in a letter to a friend, "I think that right and justice are superior to other loyalties."

Whittle, Sir Frank (1907–1996)

British aviation engineer who invented the jet engine. Born on 1 June 1907 at Coventry, England, Frank Whittle entered the Royal Air Force (RAF) in 1923 as a cadet at the RAF College at Cranwell. He graduated from its Air Apprentices Wing in 1926 and from the RAF College, Cranwell, in 1928. He dreamed of an aircraft able to fly at enormous speed and altitude, and his 1928 senior thesis, "The Future Developments in Aircraft Design," was on jet propulsion. Whittle qualified as a pilot, and in 1928, he joined a fighter squadron. Three years later, he became a test pilot. Whittle attended both RAF engineering school and, from 1934 to 1937, Cambridge University.

Although the Air Ministry challenged the idea of jet propulsion as impractical, Whittle persevered and secured a patent for his turbojet engine in 1930. Obtaining a leave of absence from the RAF, he tested his first jet engine on the ground in April 1937, the year after he and his backers formed Power Jets, Ltd. (nationalized by the British government in 1944). With the beginning of World War II, the British government supported his project. Whittle's first flightworthy engine, the W.1, took to the sky in May 1941 powering an experimental Gloster E.28/39 aircraft. This effort led to the twin-engine Gloster Meteor, which first flew in March 1943. The Gloster Meteor ultimately flew at nearly 600 mph and went into service in July 1944, only weeks after the debut of the German Messerschmitt Me-262. The first Royal Air Force jet aircraft, the Meteor played a major role in

British aeronautical engineer Sir Frank Whittle. (Photo by Central Press/Getty Images)

intercepting and downing German V-1s, and several improved Mk III Meteors performed ground-attack missions in Europe in the last weeks of the war. Subsequently, the U.S. Air Force copied Whittle's centrifugal jet engine in the twin-engine Bell P-59A.

In 1946, Frank Whittle received the Daniel Guggenheim Medal, and in 1948, he was knighted after having retired from the RAF as an air commodore. His book, *Jet: The Story of a Pioneer*, was published in 1953. In 1977, he became a research professor at the U.S. Naval Academy. Sir Frank Whittle died in Baltimore, Maryland, on 8 August 1996.

Wilhelm Gustloff (German Ship)

German passenger ship, the sinking of which was history's worst maritime disaster. The 25,000-ton *Wilhelm Gustloff* was launched in 1937 as the flagship of Adolf Hitler's "Strength through Joy" movement, which provided low-cost vacations for German workers. The *Wilhelm Gustloff* was employed as a cruise ship until World War II, when she became a floating barracks for German submariners training in the Baltic.

With the advance of the Soviet army, the *Wilhelm Gustloff* was used in evacuating German personnel from the Baltic. On the night of 30 January 1945, it was sunk in the Baltic Sea by the Soviet submarine *S-13* (commanded by Captain Third Class Alexander Marinseko). When she went down, the ship was carrying nearly 1,000 submariners and other military personnel, but just before she sailed, she had taken on a large number of refugees, so there were probably more than 8,000 people on board. The ship sank quickly, and only 964 survivors were picked from the sea. Some of these died of their wounds or exposure, so the total number of people who perished in the tragedy probably exceeds 7,000.

The *Wilhelm Gustloff* was the largest German vessel ever sunk by a Soviet submarine. More people were lost when she went down than in the sinking of either the *Titanic* or the *Lusitania*. The next month, *S-13* sank another German liner—the *General Steuben*—with 3,000 people on board, including 2,000 wounded German troops. Only 300 survived. A third German liner, the *Goya* with 7,000 people on board, went down to another Soviet submarine in April, and only 183 survived.

Many Germans erroneously believed that the *Wilhelm Gustloff* was marked with red crosses and was a noncombatant. In reality, the ship mounted antiaircraft guns and was transporting naval personnel as well as refugees. The submarine command should never have allowed her to sail virtually unescorted. A footnote to her sinking is the speculation that the ship may have been carrying a priceless art treasure—the carved amber panels commissioned by King Frederick I of Prussia in the early eighteenth century.

The *Wilhelm Gustloff*, *General Steuben*, and *Goya* had been taking part in what was the largest seaborne evacuation in history. The sinking of the three liners, with the loss of more than 15,000 people, obscured the fact that only 1 percent of the refugees the Germans evacuated from the Baltic by sea perished. This operation, carried out from January to May 1945, was the greatest German navy success of the war and also a personal triumph for Grand Admiral Karl Dönitz, who directed the operation. Despite shortages of fuel and shipping and threats from mines, air attacks, and submarines, the

The German passenger ship *Wilhelm Gustloff*, April 1938. (Photo by Topical Press Agency/Getty Images)

German navy transported more than 2 million Germans by sea to the west ahead of the advancing Red Army.

Wilhelmina, Queen of the Netherlands (1880–1962)

Monarch of the Netherlands during both world wars. Born at The Hague on 31 August 1880, Wilhelmina Helena Paulina Maria was the only child of King William III of the Nether-

lands (1817–1890) and his second wife, Queen Emma of Waldeck-Pyrmont. After William's death on 21 November 1890, Wilhelmina became queen, but Queen Emma acted as regent for her until 1898. Wilhelmina was educated by tutors. She often toured the Netherlands with her mother so that her subjects would know her before she reached her majority. Wilhelmina married Heinrich Vladimír, the duke of Mecklenburg-Schwerin. They had one daughter, Juliana.

Wilhelmina played an important role in keeping her country neutral during World War I, but maintaining neutrality proved to be an unsuccessful strategy. Germany invaded the Netherlands on 10 May 1940, and it was immediately clear that the country would soon be defeated. Wilhelmina arranged the evacuation of Crown Princess Juliana and her husband, Prince Bernard, together with their two infants, Beatrix and Irene, on 13 May; the next day, she herself escaped along with senior members of her government. She established a government-in-exile in London, infuriating Adolf Hitler.

In radio addresses to her people, Wilhelmina justified her flight abroad on the grounds that she needed the freedom to

Queen Wilhelmina of the Netherlands. (Corbis)

act in the best interests of her country. Her stirring, patriotic radio speeches strengthened the people's resolve over the long period of German occupation. Wilhelmina steadfastly encouraged the Dutch Resistance movement and appointed her son-in-law, Prince Bernhard, as its chief. She personally received Netherlands who reached Britain during the war. In 1942, she visited both Canada and the United States.

Wilhelmina returned to liberated southern Holland on 13 March 1945, where she was welcomed enthusiastically. In September 1948, she abdicated in favor of her daughter, Juliana. Wilhelmina died at Het Loo Palace, Appeldoorn, Holland, on 28 November 1962.

Wilhelmshaven, Raid on (11 June 1943)

The German city of Wilhelmshaven was the first attacked in the coordinated American and British bombing known as the Combined Bomber Offensive (CBO). The port of Wilhelmshaven was also the location of submarine pens, bases, and construction yards. Reflecting the serious situation in the Battle of the Atlantic, the destruction of German submarine construction yards was a top priority of the American Eighth Air Force. The end of the North African Campaign in early 1943 freed resources needed to resume the bomber offensive against Germany.

On 10 June 1943, the Combined Chiefs of Staff issued the Pointblank Directive, which, among other things, called for a united effort to destroy Germany's industrial base. Springing from decisions reached at the January 1943 Casablanca Conference, Pointblank marked the beginning of a coordinated air offensive against major German cities by the U.S. Eighth Air Force, flying precision-bombing missions by day, and the RAF Bomber Command, conducting area bombing missions by night. The first of these missions was a raid by 252 B-17s of the Eighth Air Force against the German naval yards at Bremen and Wilhelmshaven on 11 June 1943, while the RAF attacked Münster and Düsseldorf. As clouds obscured Bremen, 168 B-17s attacked Wilhelmshaven, and 30 struck the port area of Cuxhaven.

The bombers lacked fighter support, since the targets were too distant for the available escorts. Over Wilhelmshaven, they ran into flak, which scattered some of the groups. The German fighters waited until the bombers executed their bombing runs, a period when pilots and bombardiers focused on the ground target and not on evasive maneuvers and defensive nose fire. Employing head-on attacks, notably against 379th Bomb Group in the "high group" position, the German fighters disrupted the lead bombardiers' efforts. None of the 417 tons of bombs that were dropped hit the primary target. Eight bombers were lost and another 62 damaged.

The raid on Wilhelmshaven demonstrated the difficulty of conducting strategic bombing beyond the range of fighter escorts. Nevertheless, the increased coordination by the Allied air forces meant that from that time forward, German cities would be subjected to round-the-clock bombing.

Wilkinson, Theodore Stark "Ping" (1888–1946)

U.S. Navy admiral who had command of the 3rd Amphibious Force in the Pacific. Born in Annapolis, Maryland, on 22 December 1888, Theodore Wilkinson graduated at the top of his class in 1909 from the U.S. Naval Academy. In 1912, he earned a master of science degree from George Washington University. In 1914, he won the Medal of Honor at Veracruz, Mexico. During World War I, he served in the Bureau of Ordnance, designing mines and antisubmarine depth charges. Between the wars, Wilkinson, a specialist in gunnery, captained a destroyer, was fleet gunnery officer for the Scouting Force, and served in shore assignments as an ordnance officer and secretary to the navy's General Board from 1934 to 1937.

A battleship captain for most of 1941, Wilkinson became director of Naval Intelligence in October of that year. He escaped blame for Pearl Harbor because the evaluation and dissemination of intelligence was another bureau's responsibility, even though his office gathered intelligence information. Promoted to rear admiral in April 1942, Wilkinson took command of Battleship Division 2 that August, and in January 1943, he became deputy commander of the South Pacific Force, under Admiral William F. Halsey. During the Solomon Islands Campaign, he not only solved numerous operational problems but also exercised his considerable diplomatic skills on often contentious Allied colleagues.

From July 1943 to late 1945, Wilkinson commanded the 3rd Amphibious Force, with headquarters at Guadalcanal. He firmly advocated a "leapfrogging" strategy of avoiding heavily fortified Japanese-held islands and concentrating on easier targets. Wilkinson successfully organized landings on Cape Torokina, Green Islands, New Georgia, Vella Lavella, Treasury Island, Bougainville, Palau Island, Leyte, and Lingayen Gulf on Luzon, winning promotion to vice admiral in September 1944. His final wartime assignment was to airlift General Robert Eichelberger's Eighth Army to Tokyo Bay on the day of the Japanese surrender in September 1945.

Returning to Washington, Wilkinson became a member of the Joint Chiefs of Staff joint strategic survey committee. He drowned accidentally when his automobile plunged off the car ferry at Norfolk, Virginia, on 21 February 1946.

Willkie, Wendell Lewis (1892–1944)

U.S. industrialist and politician who helped President Franklin D. Roosevelt pursue his foreign policy goals during the war years. Born on 18 February 1892 in Elwood, Indiana, Wendell Willkie earned a law degree from Indiana University in 1916. After serving in the U.S. Army during World War I, he practiced law in Ohio and New York before he became president of the Commonwealth and Southern Utility Company. Willkie left the Democratic Party as a result of the New Deal and joined the Republicans. As his party's nominee in the 1940 presidential race, he polled more than 22 million votes but lost to incumbent President Roosevelt, who garnered 27 million.

A supporter of Roosevelt's foreign policy, Willkie was offered but refused positions in the cabinet and the War Department. He played an active role, however, in pushing for passage of the Lend-Lease Act, even though most of the Republican Party leadership opposed it. In January 1941, Roosevelt sent Willkie to England on a fact-finding mission. The trip received significant press coverage and helped secure the bill's passage. Willkie also backed Roosevelt's efforts to extend the peacetime draft and repeal the Neutrality Act of 1935. In August 1942, Roosevelt sent Willkie as a special envoy on a 50-day trip to more than a dozen countries on three continents to confirm the U.S. commitment to defeat the Axis powers. On 26 October, Willkie addressed the nation over the radio. His "Report to the People" was a great success.

Willkie was in great demand as a speaker throughout 1943 and 1944, and his books, *One World* (1943) and *An American Program* (1944), were highly influential. Although popular, he was not among the leaders of the Republican Party, and he had to withdraw from the 1944 presidential primary. Years of smoking and overeating and a disdain for exercise led to a massive heart attack and his death in New York City on 7 October 1944.

on 5 September 1881, Henry Wilson was educated both at Eton, where he acquired the nickname “Jumbo” for his impressive frame, and at the Royal Military College Sandhurst, where he was commissioned in 1901. He then saw military action in the Boer War. Promoted to captain in April 1908, he was appointed adjutant of the Oxford University Officer Training Corps in October 1911. In October 1914, he was appointed brigade major of the 48th Infantry Brigade. Wilson was posted to France with the brigade in December 1915, serving on the Western Front and winning the Distinguished Service Order.

In January 1919, Wilson was promoted to brevet lieutenant colonel and attended the Staff College, Camberley. Between 1920 and 1923, he was a company commander at Sandhurst. He next commanded a battalion of the Rifle Brigade in India. In 1930, Wilson was promoted to colonel and appointed a senior instructor at the Staff College. He then commanded the

Wilson, Henry Maitland (First Baron of Libya and Stowlangtoft) (1881–1964)

British army field marshal who succeeded General Dwight D. Eisenhower as commander in chief of the Mediterranean Theater in 1944. Born in Stowlangtoft Hall, Suffolk, England,

British Field Marshal Henry Maitland Wilson, 1944. (Corbis)

6th Rifle Brigade. After being promoted to major general in 1935, Wilson went on half pay until August 1937, when he took command of the 2nd Division at Aldershot.

In June 1939, Wilson was promoted to lieutenant general and assigned to command the British Army of the Nile in Egypt. As such, he oversaw the 1940 campaign of Lieutenant General Richard O'Connor against Marshal Rodolfo Graziani's Italian forces in Egypt and Libya. Following the British victories against the Italians in Libya, Wilson became military governor of Cyrenaica in February 1941. The next month, however, he assumed command of the four-division Allied force sent to Greece. His skill in the delaying action and retreat that ensued did much to reduce losses and allowed the Royal Navy to extricate most of the expeditionary force.

In May 1941, General Archibald Wavell, commander in chief of British forces in the Middle East, appointed Wilson to command British troops in Palestine and Transjordan. With a two-division force, Wilson quelled a pro-German coup in Iraq that same month, and in June, he launched a campaign against Vichy French forces in Syria. In July, he concluded the armistice that gave that Allies control of Syria and Lebanon.

Wilson then commanded the Persia-Iraq Theater and the Ninth Army before succeeding General Harold Alexander in as commander in chief, Middle East, in January 1943, con-

ducting an operation against the Dodecanese Islands. In January 1944, Wilson replaced Eisenhower as commander in chief of the Mediterranean Theater and thus had overall responsibility for Allied operations in Italy. He also helped plan the landing at Anzio and Operation DRAGOON, the Allied landing in southern France. After the death of General Sir John Dill in November, Wilson was promoted to field marshal in January and dispatched to Washington as head of the British Joint Staff Mission. In this capacity, he attended the final wartime conferences at Yalta and Potsdam. Elevated to the peerage in 1946 as First Baron Wilson of Libya and Stowlangtoft, Wilson retired from the army in April 1947 and wrote his memoirs. He was constable of the Tower of London between 1955 and 1960. He died in the Chilterns (Aylesbury), England, on 31 December 1964.

Windsor, Edward Albert Christian George Andrew Patrick David (Duke of) (1894–1972)

King of Great Britain and Northern Ireland, then duke of Windsor. Born at White Lodge, Richmond Park, England, on 23 June 1894 to the Duke and Duchess of York—later King George V of Great Britain (r. 1910–1936) and Queen Mary—Edward Patrick David of the House of Saxe-Coburg-Gotha (changed in 1917 to Windsor) was educated at the Royal Naval College in Osborne, Dartmouth Naval College, and Magdalen College, Oxford. Given the title prince of Wales in 1911, he served in the Grenadier Guards during World War I. He ascended the throne as Edward VIII on 20 January 1936 but was never crowned.

Because of his desire to marry a twice-divorced American, Wallis Warfield Simpson—of whom the royal family and the British government did not approve—the king was forced to issue an instrument of abdication on 10 December 1936 in favor of his brother Albert, who then became king as George VI. Edward formally abdicated on 11 December 1936. Subsequently titled His Royal Highness the Duke of Windsor, he mar-

The Duke of Windsor (center), shown here on 1 November 1937 with the Duchess of Windsor and Adolf Hitler on a visit to the latter's alpine retreat following a tour of German industrial projects. (Bettmann/Corbis)

ried Simpson on 3 June 1937. In October 1937, the Windsors visited Germany, and the duke met with several top Nazis, including Adolf Hitler and Hermann Göring, and was said to have admired improved housing and social conditions under Nazi rule. The Nazis attempted to involve him in many schemes, including promises to restore his crown. During World War II, there were rumors that the Nazis threatened to kidnap the duke.

Until 1940, the Windsors traveled throughout Europe, primarily residing in France, where the duke served as a British liaison officer. Forced to flee France on that nation's defeat in June 1940, the duke then became governor of the Bahamas, serving in that post until 1945.

The duke of Windsor's later years were spent traveling between France, where he lived, and the United States. He published three books, notably his memoirs, *A King's Story*. He died on 28 May 1972 in Paris and is buried in the royal burial ground at Frogmore, near Windsor Castle. The Duchess died on 24 April 1986 and is buried next to him.

Wingate, Orde Charles (1903–1944)

British army general who raised an unconventional force known as the Chindits in World War II. Born in India on 26 February 1903, Orde Wingate was educated at Charterhouse School and the Royal Military Academy, Woolwich, from which he was commissioned in the Royal Artillery in 1923. In 1927, he was posted to Khartoum, where he served with the Sudan Defence Force until 1933.

In 1936, Wingate was sent to Palestine, then in the throes of the Arab Revolt. Despite his Arabist training and the pro-Arab sentiment of Palestine's British rulers, he became a fanatical Zionist and by 1938 had secured official permission to organize the Special Night Squads, joint Anglo-Jewish units that conducted small-unit operations against Arab terrorist hideouts. However, in 1939, his extreme views led to his transfer back to England.

The following year, Wingate went to the Sudan to help organize the effort to drive the Italians from Ethiopia and restore Haile Selassie to his throne. The troops he raised, the Gideon Force, ultimately played a key role in achieving success in ousting the Italians and restoring Haile Selassie, and he and the emperor entered Addis Ababa on 4 May 1941. But Wingate's outspokenness severely angered his superiors. Exhausted, ill with malaria, and probably suffering from clinical depression, Wingate attempted suicide in June 1941.

In early 1942, Sir Archibald Wavell, who had high regard for Wingate's abilities, requested his transfer to the Far East. In India, Wingate raised the "Chindits," an irregular force designed for operations in the enemy rear in Burma. The first Chindit operation, from February to April 1943, was conducted by a brigade-sized force. It achieved limited success but raised morale in a theater that had seen only Japanese victories to that point. Wingate, now a major general, secured the personal support of Prime Minister Winston L. S. Churchill for further operations. The second Chindit operation, conducted by three brigades and supported by an American air contingent ran from March to July 1944, but its results were also

British General Orde Wingate. (Photo by Hulton Archive/Getty Images)

mixed, in part because of Wingate's untimely death in a plane crash on 24 March 1944 near Imphal in India.

Despite his extreme opinions, eccentricity, and disdain for the conventional, Wingate was a soldier of great self-confidence, determination, and mental and physical toughness. His innovations in irregular warfare cannot be denied.

Witzleben, Erwin von (1881–1944)

German field marshal and leading member of the 1944 conspiracy against Adolf Hitler. Born in Breslau, Silesia (now Wrocław, Poland), on 4 December 1881, Erwin von Witzleben joined the German army in 1901 as a lieutenant. He spent much of World War I on the Western Front, where he was decorated for valor. After the war, he rose steadily in rank and responsibility.

When Adolf Hitler rose to power in 1933, Witzleben was named to command the Berlin Military Area. He was promoted to brigadier general in February 1934 and major general that December. In 1935, he took command of III Corps. He was raised to lieutenant general in October 1936.

Witzleben became an opponent of Hitler as early as 1934 and an active conspirator in 1938 as a result of Hitler's purge of senior generals and Hitler's threat of war against Czechoslovakia. Witzleben commanded Army Group C in the September 1939 Polish Campaign. Promoted to Generaloberst (U.S. equiv. full general) that November, he commanded First Army in the 1940 Campaign for France. On 19 July 1940,

German General Erwin von Witzleben, 1939. (Corbis)

Winter War

See Finnish-Soviet War (30 November 1939–12 March 1940).

Hitler named him a field marshal, and until March 1941, Witzleben commanded Army Group D. He then became Oberbefehlshaber West (commander in chief of the Army West) in France, but his attitude toward Hitler became known. In March 1942, Witzleben went on medical leave for an operation, and Hitler used this as an excuse to retire him on 21 March. He was never reemployed.

The bomb plot to assassinate Hitler was to be carried out on 20 July 1944, with Witzleben assuming the position of commander in chief of the armed forces thereafter. Witzleben, however, dallied, and when the plot failed, he was arrested and tried for treason by the Nazi People's Court. As the principal army officer among the accused, he was treated with special ridicule. Condemned to death on 8 August 1944, he was strangled by piano wire that same day.

Wolf Pack

German submarine tactic involving coordinated attacks against Allied convoys. The Battle for the Atlantic hinged on the Allied ability to produce sufficient ship tonnage to move supplies and matériel to strategic points, whereas the Germans sought to sink as much of that tonnage in as short a time as possible. Early in the war, the U-boats operated mostly as lone raiders, partly due to the small numbers available for operations. To counter the U-boats, the Allies turned to convoys with armed escorts for protection, thereby causing the U-boats to focus on evasive tactics to survive rather than sinking merchant tonnage.

Admiral Karl Dönitz, commander of the German submarine force, recognized that unless the U-boats could overcome the defenses of Allied merchant convoys, the tonnage war would inevitably be lost. His solution was a concept that came to be called *Rudeltaktik*, or wolf pack attack—a method for U-boats to penetrate a convoy's antisubmarine defenses and destroy the merchant ships. Once a U-boat located an Allied convoy, other submarines would be vectored to that

location. Groups of U-boats would then attack on the surface at night at relatively high speeds, maximizing the effect. U-boats would operate in a "hit-and-run" manner, launching their attack and then fleeing on the surface before the convoy's surface escorts could react.

Dönitz's intelligence staff also broke the British convoy codes and supplied specific information concerning departure and arrival schedules, escort strength, and weather reports from all ocean areas. Success in the intelligence war was critical in locating targets for U-boat concentrations.

By late 1942, Dönitz had over 200 operational U-boats with which to implement wolf pack operations. Some Italian submarines also participated. A wolf pack generally consisted of 6 to 9 U-boats, but some utilized as many as 20 to 30. Wolf packs were identified with code names, such as *LOWENHERZ* (LIONHEART) OF *STREITAXT* (BATTLE AXE), giving the submariners a sense of cohesion and collective focus for the operation. Each pack deployed into a concave patrol line with about 10 miles between each pack member. Using darkness, the U-boats would operate on the surface to lessen the effectiveness of Allied asdic, and the compact silhouette of the U-boat helped provide natural protection.

A typical wolf pack consisted of 6 to 9 boats, though some were as large as 20 to 30.

The patrol line combed the Atlantic in an east or west direction, maintaining radio silence while under control by radio from Dönitz's command post at Lorient, France.

When an individual submarine sighted a convoy, it would immediately radio the convoy's position and course to Dönitz's headquarters, which would then relay orders for the pack to concentrate the line inward on the projected course of the convoy. The U-boat that originally established contact would shadow the convoy at a safe distance and keep headquarters advised of any change in the convoy's course.

When at least three U-boats came in contact with the convoy, the attack began, and Dönitz turned immediate control of the battle over to the individual U-boat commanders. The wolf pack, however, had little opportunity to cooperate tactically, as Allied radio detection prohibited communications between individual boats. However, the multiboat attack would confuse and disrupt the escorts, thereby improving each boat's chance of gaining an effective position from which to launch an attack. The U-boats would fire a "fan" or salvo of three or four torpedoes along several paths to increase the chances of a hit. Because the convoy formed a compact target, a single salvo might result in several hits on different ships within the formation. After their attacks, the U-boats submerged to escape counterattack.

Unless the convoy managed to elude the wolf pack by a radical change of course, the merchant ships might be hounded by the pack over several successive nights. The action would be broken off only when the U-boats had exhausted their torpedoes or the convoy reached a point where continuous air cover could be provided. These tactics resulted in the sinking of almost 400,000 tons of Allied shipping a month during late 1942, with a peak occurring in November when 118 ships were sunk for a total of 743,321 tons.

The Achilles heel of the wolf packs, however, was the radio communication between the U-boats and Dönitz's headquarters. The Allies introduced high-frequency direction finding (HF/DF) equipment in faster Allied escort vessels to drive away the shadowing U-boat, thereby forcing it to submerge or destroying it with depth charges or air attack. Allied technical superiority, the use of long-range aircraft, and code breaking culminated in May 1943 when the Allies destroyed over 40 German submarines. "Black May" signaled the defeat of the wolf packs as the ratio of Allied tonnage produced to tonnage sunk by the U-boats tipped against the Germans.

During World War II, over 130 wolf packs operated against Allied shipping, sinking more than 2,759 Allied merchant ships and 138 warships and killing almost 60,000 seamen. Of the 1,170 U-boats Dönitz employed throughout the war, 753 were lost, along with some 29,000 crewmen.

Women Accepted for Voluntary Emergency Service

See United States, Women Accepted for Voluntary Emergency Service.

Women in World War II

No field of military history expanded more dramatically late in the twentieth century than the study of women during World War II. Scholars have access to monographs, biographies, and autobiographies detailing the critical role women

played in almost every country involved in the fighting, and even traditionalists now admit that women were more important to the outcome of the war than once imagined. And yet, in spite of this wealth of new scholarship, the contributions and experiences of women between 1937 and 1945 remain understudied and undervalued. Perhaps this reflects the fact that the number of women who enlisted during the war was relatively small in comparison to men; that (predominantly male) military historians tend to focus on combat units; that little attention has been given to the role of women on the home front or in resistance movements; and that the inclination of many writers is to suggest that women who engaged directly in combat were so rare that their experiences can be dismissed as peripheral to the overall conflict. Specialists in the field have argued against each of these trends, of course, and as their work continues, we may yet reach a point when the contributions of women are consistently woven into accounts of every aspect of World War II. Until then, however, we are left primarily with overviews such as this one and with the knowledge that historians have a great deal more work to do before women are accorded a balanced and proper place in accounts of World War II.

The best place to begin a summary of the contributions of women during the war is on the home front, where women served as traditional guardians of the family and culture in every country and in a wide variety of nontraditional roles created in the crucible of total war. In Allied countries, millions of women worked as volunteers for government agencies and distributed ration books, assisted with salvage projects, joined blood and scrap drives, planted victory gardens, served in the Civil Air Patrol, sold war bonds, or worked as air raid wardens and ambulance drivers. In the United States, many of the more than 36 million Americans who joined the Red Cross and the over 5 million who served as volunteers were women. They distributed 29 million food parcels for prisoners of war and refugees, 13 million units of blood, and packaged kit bags for U.S. soldiers deploying overseas. The Red Cross employed 6,500 women by 1945 and thousands more in Australia, Canada, and the United Kingdom.

Women also played a key role in the United Service Organizations (USO), which operated over 3,000 clubs worldwide (including 300 for African Americans) that catered to the social and entertainment needs of Allied soldiers. The USO included 1.5 million volunteers, most of whom were women, and more than 7,000 performers who conducted 428,521 performances by 1947. Alice McLean's American Women's Voluntary Services (AWVS) also served a vital support role, training 18,000 women to drive ambulances, give first aid, and set up field kitchens. Between 1940 and 1945, the AWVS carried out relief work at military bases, taught Braille to soldiers blinded in action, and shoveled snow during harsh win-

Woman worker in Canadian small arms factory, June 1942. (Hulton-Deutsch Collection/Corbis)

ter months to free soldiers for training. Similar services were performed in Britain by the Navy, Army, and Air Force Institute (NAAFI) and the Entertainment National Service Association (ENSA), both of which included a high percentage of women workers and volunteers, and other organizations such as the Young Women's Christian Association (YWCA) and a wide array of religious groups. In government, women conducted much of the official business and administrative details in the United States, Great Britain, and the Soviet Union. They worked in such agencies as the U.S. Office of War Information, which produced propaganda and translated enemy broadcasts and publications between 1942 and 1945.

The Allies were also adept at recruiting women for industrial work. In Britain, where more than half the population served in the armed forces or in key war industries (5 million in uniform and 21 million in agriculture or manufacturing), women represented 38 percent of the workforce by 1945. More than 6 million women took jobs in war-related industries in the United States, and they proved especially adept at

aircraft construction and welding. They were generally superior to men in repetitive skilled jobs such as riveting or parachute construction, and they were encouraged to work by government advertising campaigns that urged them to support their loved ones at the front by working at home for victory. In the Soviet Union, 1 million women worked in industrial jobs by December 1941, and before the war ended, they constituted 55 percent of the overall civilian workforce. By 1945, women constituted 92 percent of the agricultural workforce.

In most countries, women struggled with housing shortages, sexism, and lower wages than men. Women in the United States suffered from a lack of any national service legislation that might have organized their wartime contributions at home and provided child care. Two-thirds of American men stayed at home during World War II, and millions of women remained homemakers, but few men saw the need to help provide child care for the women the government was encouraging to take war-related jobs. Instead,

Women welders of Ingalls Shipbuilding, Pascagoula, Mississippi, 1943. (National Archives)

many people criticized women who left their children at home while they worked, and they lambasted the decay of the traditional family under the exigencies of war.

In contrast, Great Britain passed a law in December 1941 that required unmarried young women to enlist in war work of some kind. The British proved much more adept at organizing women for their war effort. At least 125,000 women were drafted and given a choice of service (which was denied to drafted men) in auxiliary units, civil defense, or the Women's Land Army (WLA), and eventually, more than 470,000 women served in the armed forces or uniformed auxiliary units; another 80,000 joined the WLA and worked in agriculture to release men for war services between 1939 and 1945.

Efforts to recruit women were much weaker in Germany, Italy, and Japan, where conservative cultures and racial ideology emphasized the importance of women as homemakers and the primary transmitters of race and culture. Still, German, Italian, and Japanese women suffered from shortages of food, water, and medicine, and large numbers went to

work in war-related industries. Young single German girls had to work as nurses, on farms, or as domestics for terms ranging between 6 and 12 months, and by the end of the war, 1.5 million German women had entered the workforce, along with another 1.5 million foreign women brought into Germany to toil in forced-labor camps. Efforts to mobilize women in Japan were delayed until the war was clearly being lost, but more than 1.5 million Japanese women took jobs outside the home by 1945.

In occupied countries, women were less likely to be involved in industrial labor, but they were vulnerable to detention in labor, concentration, or death camps and exposed to sexual exploitation in addition to the vagaries of food and housing shortages. Millions died during the Holocaust, and many women were raped by soldiers in China, the USSR, Germany, and other countries as the fortunes of war changed. Thousands more were compelled by some occupying armies or by economic need to become prostitutes, and although accurate statistics are difficult to determine, it is

known that the Japanese forced 200,000 *ianfu*, or “comfort women,” from Korea, China, the Philippines, and Malaya to serve as prostitutes for their soldiers. Though women were never systematically forced by the Allies to do similar work, they did sell their bodies in order to feed themselves and their families. Following the Allied invasion of Italy, for example, an estimated 42,000 prostitutes were working the streets of Naples in 1944, and almost all of them catered to soldiers. It will never be known how many millions more were compelled by circumstance (such as the famines that ravaged India, Greece, the Netherlands, Italy, and the Soviet Union) to sell themselves or become virtual concubines for their captors or liberators throughout Europe, Asia, the Middle East, North Africa, Oceania, and the Western Hemisphere, but it is certain that those who lived in countries that changed hands were vulnerable to charges of treason. French women suspected of overfamiliarity with German forces had their heads shaved after their liberation, and the Soviets called women suspected of collaboration “German bed straw” and sent them to the gulags. Women in occupied countries and Great Britain were also subjected to blackouts and bombardment. Of the estimated 1.3 million civilian casualties of strategic bombing in Germany, Japan, and the United Kingdom during the war, more than half were women, a ratio that almost certainly holds true for the 15 to 25 million Soviet and 20 million Chinese civilians who died as well. These data reflected both the higher ratio of women in cities where the male population had been reduced by conscription and the danger faced by civilians generally. Significantly, more civilians died in Britain between 1939 and 1941 (approximately 45,000) than members of the British armed forces, and in countries that suffered under strategic bombing longer than Britain (Germany and Japan, in particular), civilians were killed in staggering numbers as the war progressed.

Beyond the home front, all the major combatants in World War II utilized female nurses, and all save Japan made use of uniformed women’s auxiliaries to help support their war machines and to free men for combat. These units were typically distinguished by military branch and performed virtually all noncombatant roles, and most were patterned after those formed by the British in the early years of the war. Women eventually composed more than 10 percent of the British armed forces, a ratio over five times higher than that in the United States, and at least 700 died in air-defense roles or as firefighters and air raid wardens during German attacks.

By 1943, the British were utilizing 7.75 million women in industry or in the military, in organizations as disparate as the First Aid Yeomanry (affectionately known as the FANYs), the Women’s Transport Service (WTS), the Auxiliary Territorial Service (ATS), the Air Transport Auxiliary (ATA), the Women’s Royal Naval Service (WRNS), the Women’s Auxiliary Air Force (WAAF), and the Women’s Voluntary Services

U.S. Women in Uniform during World War II

for Civil Defense (WVS). The WVS enlisted more than 1 million women to help clear rubble, organize relief shelters, and fight fires, and more than 470,000 other women served as nurses, 2 million worked in munitions, and 400,000 served full- or part-time in the Home Guard or the Royal Observer Corps. More than 207,000 women in the ATS supported the British army, including 57,000 who served in the Anti-Aircraft Command as spotters, searchlight operators, and radar technicians. In the ATA, women pilots from all over the Commonwealth and the world ferried aircraft between bases and from factories to the front; 15 of them died in the line of duty.

In Canada, 45,000 women served in the Women’s Division of the Royal Canadian Air Force, the Canadian Women’s Army, or the Women’s Royal Canadian Naval Service. Similarly in Australia, 64,833 women served in military auxiliaries such as the Australian Army Nursing Service (AANS), the Australian Army Medical Women’s Service (AAMWS), the Women’s Auxiliary Australian Air Force (WAAAF), and the Women’s Royal Australian Naval Service (WRANS).

Even occupied countries with governments-in-exile followed the British example, as in the case of Poland. The Poles formed the *Pomocnicza Lotnicza Sluzba Kobiet*—Women’s Auxiliary Air Force (PLSK)—in 1942, and as many as 1,653 officers and enlisted women joined up to support Polish air force units in the field by performing noncombatant office, supply, and repair duties, just like women in the British WAAF.

People in the United States responded in similar fashion, forming the Women Accepted for Voluntary Emergency Service (WAVES), the Women Airforce Service Pilots (WASPs), the Women’s Army Corps (WAC), the women’s Coast Guard arm known as the SPARS (from the Coast Guard motto “Semper Paratus,” or “always ready”), and the Women Marines. The WAVES organization was formed in 1942 as part of the U.S. Naval Reserve and trained women for a wide array of technical and support specialties. At its height, the WAVES numbered 8,000 officers and 76,000 enlisted women, most of

whom were stationed in the continental United States—equivalent to the manpower of an entire carrier task force. The WASPs were formed in 1943 by combining the Women's Auxiliary Ferrying Squadron (WAFS) and the Women's Flying Training Detachment (WFTS). They served with, but not as a part of, the U.S. Army Air Forces (AAF).

WASP pilots ferried military aircraft from factories to bases and filled aviation support roles stateside, towing targets and training pilots and navigators. The number of WASPs eventually peaked at 1,074, but despite an outstanding record that included 12,650 ferrying missions in 27 different types of aircraft, they were disbanded late in 1944 because of protests from Congress and from male pilots who feared competition with women during and after the war. Thirty-eight WASPs died in the line of duty.

In contrast to the WASPs, the WAC (which began as the Women's Army Auxiliary Corps) lasted from 1942 to 1978 and served during World War II as a separate corps of women that performed all levels of support work for the army, including military intelligence and air-traffic control. WACs were eventually stationed at more than 225 bases worldwide, and 150,000 of them (including 6,500 African Americans) served in every theater of the war by 1945.

More than 800,000 women served in the Soviet army, including antiaircraft batteries, snipers, and pilots.

These were the first American military women formally to serve apart from nurses, and they amassed 3 Air Medals, 16 Purple Hearts, 10 Soldiers' Medals, and 565 Bronze Stars. More than 32,000 WACs served with the AAF in 200 enlisted and 60 officer specialties; 7,530 WACs were deployed to Europe, and 5,500 went to

the southwest Pacific. Their record of success led U.S. Army leaders to ask Congress to make the WAC permanent in 1946. Women's units were rounded out by the SPARs, which enlisted almost 11,000 women to help free men for sea duty with the Coast Guard, and the Women Marines, the last women's reserve unit formed by the U.S. armed forces.

Interestingly, Marine Corps Commandant Thomas Holcomb opposed enlisting women for a long time, but when he relented, he insisted on giving them the title Women Marines and making them a regular part of the Marine Corps. By 1945, 800 officers and 14,000 enlisted Women Marines were in uniform, and their service freed enough men from support duty to form the 5th Marine Division. All told, more than 350,000 U.S. women served in uniform, including over 74,000 army and navy nurses, a handful of whom were captured by the Japanese and became prisoners of war.

Neither Germany nor Japan utilized auxiliaries or military women to the same extent as the Allies, but a number of women and organizations still played an important part in the war. In Germany, Hanna Reitsch flew helicopters, gliders, an experimental version of the V-1 rocket, the Me-163 Komet rocket plane, and bombers as a test pilot for the Luftwaffe; in addition, she landed a light plane in the streets of Berlin during a mission to Adolf Hitler's underground bunker during the final days of the war. Melitta Schiller Stauffenberg also flew as a test pilot and won the Iron Cross Second Class and the Gold Pilot badge before being shot down by a U.S. fighter in April 1945. The largest number of German women (100,000) served in Luftwaffe flak units from 1944 onward, and a handful joined SS units and guarded women at concentration and death camps. A small number of those guards were executed after the war. In Japan, the most important mobilization of women was conducted by the Greater Japan's Women's Association, which trained volunteers for civil defense and military training designed to battle the anticipated American invasion.

Although most countries took steps to limit the participation of women in combat, the Soviet Union broke with broad cultural convention by placing them in or near the front lines. More than 800,000 women served in the Soviet army, including approximately 400,000 in the Air Defense Forces and another 400,000 in ground units. Air Defense women began in traditional support roles, and eventually, a small number served in combat with both single-sex and integrated units by 1945. Women manned thousands of antiaircraft batteries, completely replaced men in barrage balloon units, and manned searchlights throughout the war, most famously during the final Soviet offensive against Berlin. On the ground, women served in tank and artillery crews, as mechanics and cooks, and in medical or headquarters units on all fronts. The most famous women were those who fought as snipers or as fighter and light bomber pilots, including Lidiia V. Litviak, who racked up 11 individual kills, 3 group kills, and 1 balloon kill prior to being shot down in August 1943. The first female ace in history, she fought with integrated units and at Stalingrad. Among snipers, the most famous was Liudmila Mikhailovna Pavlichenko, who is credited with 309 kills; wounded four times, she became the first Soviet citizen to visit the White House. She eventually visited 43 US cities as well as Britain and Canada, then returned home and became a master sniper instructor and trained 80 snipers who were collectively credited with killing more than 2,000 Germans. Her expertise encouraged the Soviets to form the Central Women's School for Sniper Training in 1943, and by the end of the war, 1,885 snipers had graduated and claimed 11,280 German kills. Pavlichenko was ultimately named a Hero of the Soviet Union, an honor shared by 94

Members of the Australian Women's Auxiliary Service. (Bettmann/Corbis)

other Soviet women who fought during World War II. Alongside the Soviets, liberated or exiled Poles formed the Emilia Plater Independent Women's Battalion in 1943, and between 8,000 and 14,000 women fought with Polish armies under Soviet command.

Although the Western powers were unwilling to follow the Soviet example, they did enlist women for espionage operations behind enemy lines. The most important of these missions were conducted by the British Special Operations Executive (SOE) and the U.S. Office of Strategic Services (OSS). At least 50 women were dropped into occupied France to work with Resistance forces, and others worked with intelligence agencies such as the British MI-6. One of the most legendary was the American Amy Thorpe, who worked for both MI-6 and the OSS. Among other activities, she secured both Italian naval and Vichy French ciphers, leading the MI-6 chief of station in Washington to say she had saved at least 100,000 lives. Thorpe survived the war, but a number of OSS and SOE women did not, including Noor Inayat Khan, an SOE operative killed in 1944 at Dachau who was posthumously awarded the Croix de Guerre and became the first female saint of the Sufis in India. Other famous female operatives include Virginia Hall and

Jeanette Guyot, who received Distinguished Service Crosses for their work with the OSS, and Violette Szabo, an SOE operative who was arrested in France and executed by the Germans at the end of the war. She was posthumously awarded the French Croix de Guerre and the British George Cross, the first occasion that award was given to a woman.

Women also fought behind the lines as members of the resistance in occupied countries. Women composed 12 to 20 percent of the French Resistance; many performed support work by decoding messages, serving as couriers, and operating Resistance newspapers. Others fought directly against the Germans, utilizing assassination, bombing, and sabotage to support the Allied war effort. As in most cultures, their ability to fight was limited by men, though Communist cells often gave women more latitude to engage in direct combat. Famed female Resistance fighters include Lucie Samuel, who was awarded the Croix de Guerre; Marie-Madeleine Fourcade, who led a Resistance network of more than 3,000 people; and Georgette "Claude" Gerard, who led more than 5,000 men and women in the Forces Françaises de l'Intérieur (French Forces of the Interior, or FFI), better known as the maquis. The number of women who served in the Resistance is difficult to

determine with any precision, but the French government did recognize more than 200,000 women after the war for their service. Women fought in the Paris uprising of 1944, in the Massif Central and Haute Savoy uprisings, and in hundreds of other places, and their valor earned them a permanent place in the French military after 1945. In Poland, Resistance leaders formed the Armia Krajowa (Polish Home Army), and one-seventh of its members were women. They served as couriers and medics and in some specialized units, including one designed for fighting in the Warsaw sewers during the uprising of 1944. Women also served in the Resistance forces of all other occupied countries, including Belgium, the Netherlands, Norway, and Denmark. More than 20 percent of the 150,000 people in Allied intelligence networks in western Europe were women, and they helped rescue 5,000 Allied airmen and 1,600 other soldiers. Women were especially valuable in this role because couples were far less suspicious when traveling than men walking alone. These women also assisted with the Normandy Invasion, and they paid a high price when they were captured. Between 200 and 300 French women are known to have been executed by the Germans, and 8,500 were sent to the infamous female concentration camp at Ravensbrück. Only 400 survived. Other women were executed in countless places, including the Ardeatine catacombs in 1944 and the Czech village of Lidice in 1942. In the Soviet Union, an estimated 200,000 women fought with the partisans, and in Italy, 35,000 women (one-third of the Resistance) fought against the Germans in support roles or in small squads. Some were members of the all female Novella Albertazzi, and by the end of the war, 5,000 women had been imprisoned by the Germans; 3,000 were deported to Germany, and at least 650 died in combat or were executed. Mussolini's Italian Social Republic also recruited women support units. In the Balkans, women fought with the Greek Resistance in large numbers, and about 100,000 served with the Yugoslav National Liberation Army under Josip Broz (Tito). They trained and fought in integrated units, and the death rate for women was 25 percent, twice that of the men.

This litany of sacrifice and service is hardly complete, for it omits the thousands of women who were taken prisoner by the Japanese when Singapore fell or the thousands more who experienced some aspect of the war in Africa, the Middle East, Burma, or Indonesia. It also neglects the handful of women captured when Japanese forces seized or sank civilian ships in the opening days of the war or the women on Soviet and Scandinavian merchant ships who helped fight the Battle of the Atlantic. These and other women remain largely unknown to history, and until their stories are told, our knowledge of World War II will remain incomplete.

What we can determine at this juncture is that virtually all women who served in the war were demobilized in 1945 and encouraged to go home. They had confounded social and military expectations of the prewar years, which made no

allowances for the importance of women to national war efforts, and in many ways, their societies were ungrateful for their service. France (in 1944) and Italy (in 1946) extended suffrage to women as a reward for their sacrifices, but other gains were few and far between. Most men and many women wanted to return to traditional roles, and in the rush toward peace, many valiant women were slighted. They were not eligible for the Victoria Cross, were banned from some Italian Resistance group parades, and were denied admittance into the American Veterans of Foreign Wars. Some women found their wartime experiences such a social liability that they hid them for the rest of their lives, much to the dismay of historians.

We are left today with the discomfiting knowledge that male-dominated political systems created World War II and that the vital contributions of women during the war were forgotten by most men afterward. Although much has improved over recent decades in terms of our knowledge and our appreciation, much work remains to be done. After all, no insight into the nature of World War II can be complete without coming to terms with this fact: the victors of the war were those countries that most successfully mobilized their women.

Wood, Edward Frederick Lindley (First Earl of Halifax) (1881–1959)

British statesman who served in various capacities before, during, and after World War II. Born at Powderham Castle, Devonshire, England, on 16 April 1881, Edward Wood earned honors in history at Oxford in 1903 and entered Parliament in 1910. His career was undistinguished until 1925, when he was appointed viceroy of India and given the title of Baron Irwin. Convinced that India must eventually have Dominion status, Irwin was also determined to maintain civil order. His conversations with Indian nationalists offended much of British opinion, and his forceful administration alienated most Indians. In 1931, he returned to England.

Irwin became Viscount Halifax in 1934, and for five months in 1935, he served as British secretary for war. On Anthony Eden's resignation in February 1938, Prime Minister Neville Chamberlain appointed Halifax foreign secretary. By then,

First Earl of Halifax, Edward Frederick Lindley Wood, 1938. (Photo by Hulton Archive/Getty Images)

Halifax had had ample opportunity to observe Britain's military weakness, and a semiofficial visit to Germany in late 1937 exposed him to that country's military and territorial aspirations. He believed, however, that Adolf Hitler's regime would negotiate sincerely, if aggressively, and that, in any event, British and French obstruction of German aims in central Europe was impracticable.

Halifax's willingness to appease German demands weakened after Germany occupied the Czechoslovak rump state in March 1939. His readiness to guarantee Polish sovereignty and support British rearmament exempted him from much of the condemnation that later fell on Chamberlain. Some, including King George VI, preferred him above Winston L. S. Churchill to succeed Chamberlain as prime minister in May 1940, a prospect that horrified Halifax himself. He remained foreign secretary until December 1940, when Churchill persuaded him to become the British ambassador to the United States.

In Washington, strong isolationism confronted Halifax until December 1941 and the Japanese attack on Pearl Harbor. Despite Halifax's friendships with President Franklin D. Roosevelt and members of Roosevelt's circle, his ambassadorial

role was eclipsed by the far more powerful relationship between Roosevelt and Churchill. Serving until May 1946, Halifax participated in the conferences that established the United Nations, and he worked alongside John Maynard Keynes to negotiate a U.S. loan to Britain after the Lend-Lease program ceased in 1945.

In retirement, Halifax, a devout Anglo-Catholic, dedicated himself to his lifelong avocations of church work, scholarship, hunting, and estate management. He died at Garrowby, Yorkshire, England, on 23 December 1959.

Y

Yalta Conference (4–11 February 1945)

In January 1944, the Allied Powers' European Advisory Commission on Germany began meeting in London. It was decided that Germany's postwar government would be an Allied control council in Berlin, composed of commanders of the occupying forces of the various powers. But the commission members needed clarification from the Allied leaders on other matters. Between August and October 1944, delegates at the Dumbarton Oaks Conference in Washington worked to draft proposals for a postwar United Nations international organization. They, too, needed to decide several issues. To resolve these and other matters, a second and last meeting of the Big Three—British Prime Minister Winston L. S. Churchill, U.S. President Franklin D. Roosevelt, and Soviet leader Josef Stalin—and their staffs (some 700 people in all) occurred from 4 to 11 February 1945 in the Soviet Union, at Yalta in the Crimea.

The meeting at Yalta (code-named ARGONAUT) was less significant than either its detractors or supporters alleged. Many of the decisions confirmed there had already been taken during the earlier 1943 Tehran Conference and other meetings. At the time, its outcome generated considerable satisfaction. Only with the developing Cold War and the realization that Soviet help had not been necessary in the Pacific war did Yalta become such a fractious issue in U.S. politics, with Republican Party leaders charging that there had been a Democratic Party “giveaway” to the Communists.

The bargaining position of the Western leaders had not appreciably improved since the Tehran Conference. Indeed, they had just suffered the humiliation of the initial German successes in the Ardennes Offensive (Battle of the Bulge). The

Red Army, by contrast, had smashed German Army Group Center and was then only 50 miles from Berlin.

Another factor at Yalta was Roosevelt's determination to draw Stalin “out of his shell” and bring the Soviet Union into postwar cooperation with the Western powers. As a result, he continued the conciliatory tactical approach he had employed at the Tehran Conference by making every effort to accommodate the Soviet leader. It did not enhance the Western bargaining position when Roosevelt announced that U.S. troops were unlikely to remain long in Europe. He also continued his practice of distancing himself from Churchill, most notably on colonial issues. Another factor at work was that Roosevelt and the United States had chosen to seek the speediest possible conclusion to the war with the least expenditure of American lives, rather than wage the war for certain geopolitical objectives, as Churchill had preferred.

Stalin, however, knew exactly what he wanted. After World War I, the Western Allies had sought to construct a *cordon sanitaire* (protective barrier) to contain Bolshevism. Stalin's goal was now the reverse—he wanted a belt of east European satellite states to exclude the West. This arrangement was to provide security against another German invasion and to protect a severely wounded Soviet Union, which had suffered the deaths of as many as 27 million citizens and terrible material losses against the West and its influences.

Roosevelt secured Soviet agreement to the Declaration on Liberated Europe. The leaders pledged that the provisional governments of liberated areas would be “representative of all democratic elements” and that there would be “free elections . . . responsive to the will of the people.” But events

HISTORIOGRAPHICAL CONTROVERSY

Yalta—A Giveaway to the Soviets?

In February 1945, U.S. President Franklin D. Roosevelt, British Prime Minister Winston L. S. Churchill, Soviet dictator Josef Stalin, and their staffs gathered at Yalta in the Crimea. Some have contended that the Yalta Conference yielded too much to Moscow. Others have suggested that the British and American leaders made a last-ditch but largely ineffective effort to fashion some provisions to ensure a modicum of liberty for the peoples of central and eastern Europe, who were guaranteed “free and unfettered elections.” In an untempered view, it could be said that at Yalta, the West simply acquiesced in the division of Europe.

The Western bargaining position at the conference was weak. The Allies had suffered an embarrassment in—and only recently recovered from—the German Ardennes Offensive, and the Red Army, which had borne the brunt of the Wehrmacht’s fury, already controlled Bulgaria, Poland, Romania, and East Prussia. Roosevelt did not yet know whether an atomic weapon might be successfully produced or if it would be ready in time to precipitate Japan’s surrender without an enormously costly U.S. invasion of the Japanese home islands. The Americans desperately wanted Soviet assistance in the conflict against Japan after Germany’s surrender, and though Stalin might well have been willing to provide it, the timing of any such decision rested with him. Securing early Soviet participation in the war against Japan was paramount to Roosevelt.

Historian John Keegan argued that the most important decisions made at Yalta

concerned the conduct of the war in the Pacific and led Roosevelt to barter the future of Poland and agree to a tacit division of Germany. Zbigniew Brzezinski contended that at Yalta, the West failed to confront the ruthlessness of emerging postwar Soviet power and to give adequate thought to the clash between Stalinism and democratic principles that was bound to ensue.

As Vojtech Mastny and others pointed out, Churchill could do little to reconcile the respective positions of an idealistic Roosevelt and a resolute, pragmatic Stalin. In the minds of many, Roosevelt was an idealist who failed to understand the hard realities of international politics. British Foreign Minister Anthony Eden quipped that he demonstrated a discernible lack of consideration when dealing with the fate of nations. But Roosevelt believed that any problems with the peace settlement would be addressed by the soon-to-be-established United Nations, guided by the victorious wartime Allies. He thought that he could charm Stalin and win his trust. But in the spring of 1945, Stalin remarked that World War II would prove to be unlike previous conflicts, since whoever occupied a territory would impose his own social system there. As Joseph Noguee and Robert Donaldson suggested, Stalin exploited divisions with the Western alliance and extracted political concessions of high priority to Moscow.

Roosevelt’s defenders, such as Edward Stettinius Jr., have endeavored to demon-

strate that Stalin made at least as many concessions at Yalta as did the West. These concessions included the final arrangements for the United Nations, French participation in the occupation of Germany, and better coordination of current military operations. Ultimately, Yalta’s lingering legacy lay in its symbolism of the enduring struggle for the future of Europe.

would prove that such lofty phrases were subject to completely different interpretations.

In discussions on Germany, the Big Three agreed to government by an Allied control council. German occupation zones were also set, and at the suggestion of the Western leaders, France was allowed a zone, although Stalin insisted it be carved from territory already assigned to Britain and the United States. The three leaders also agreed on steps to demil-

itarize Germany, dissolve the National Socialist Party, and punish war criminals. Further, in what would later be regarded as a controversial decision, they agreed that all nationals accused of being “deserters or traitors” were to be returned to their countries of origin.

The Soviets insisted on exacting heavy reparations from Germany for damages inflicted by that nation on the Soviet Union. The Western Allies, remembering the trouble caused

British Prime Minister Winston L. S. Churchill (left), U.S. President Franklin D. Roosevelt (center), and Soviet Premier Josef Stalin (right) at Yalta, February 1945. (National Archives)

by reparations after World War I and fearful they would be subsidizing Soviet exactions, refused to set a specific amount but tentatively agreed to discuss the sum of \$20 billion. The Soviet Union was to receive half of any reparations.

Particularly important to Roosevelt was the establishment of a postwar United Nations organization. Well aware of this and not greatly interested in the organization himself, Stalin used it to secure concessions on other matters. The Big Three adopted recommendations from the Dumbarton Oaks Conference that the United Nations be organized on the lines of the old League of Nations, complete with the General Assembly, Security Council, and Secretariat. It also set the composition of the Security Council. Roosevelt agreed that the Soviet Union might have three votes in the General Assembly. The most difficult matter to resolve was that of the veto in the

Security Council, although this only became an issue in U.S. politics later, when the Soviet Union exercised that privilege so liberally. The U.S. Senate would not have approved American participation without the veto provision.

Poland was a particularly vexing matter for the two Western leaders, but the Red Army already occupied the country. Regarding boundaries, Stalin demanded and succeeded in establishing the Curzon Line, with slight modifications, as Poland's eastern border. The Allies were more strenuous in objecting to the Oder-Neisse Line as its western boundary, and there was no agreement on this matter at Yalta. Regarding the Polish government, Moscow had, only a month before Yalta, recognized the Lublin Poles as the official government of Poland. Stalin agreed to broaden this puppet government on a "democratic basis," and he pledged to hold "free and

unfettered elections as soon as possible on the basis of universal suffrage and secret ballot.” The Western Allies secured the same concessions for Yugoslavia, Romania, and Bulgaria.

The most controversial decisions taken at Yalta concerned the Far East. These decisions were kept secret from China. Stalin had already made it clear that the Soviet Union would enter the war against Japan sometime after the defeat of Germany. This matter was, in fact, never in doubt. The problem lay in the timing. Here, Stalin was in the same position enjoyed by the Allies before the invasion of northern France. Tardy Soviet entry into the Pacific war might mean heavy U.S. casualties in an invasion of the Japanese home islands. No one knew whether the atomic bomb would work and, even if it did, whether it would be decisive in bringing about Japan’s defeat.

Stalin pledged to enter the war against Japan “two or three months” after the defeat of Germany. In return, the Soviet Union would receive South Sakhalin Island, concessions in the port of Dairen, the return of Port Arthur as a naval base, control over railroads leading to these ports, and the Kurile Islands (which had never been Russian territory). Outer Mongolia would continue to be independent of China, but China would regain sovereignty over Manchuria. In effect, these concessions would replace Japanese imperialism with that of the Soviet Union, but the Western leaders believed they were necessary to secure the timing of the Soviet entry into the Pacific war. In future years, what Americans disliked most about Yalta was that these concessions turned out to be unnecessary.

Yamada Otozō (1881–1965)

Japanese army general who took command of the Guandong (Kwantung) Army in 1944. Born in Nagano Prefecture, Japan, on 6 November 1881, Yamada Otozō graduated from the Military Academy as a cavalry officer in 1902. Between April and November 1904, he participated in the Russo-Japanese War. He graduated from the Military Staff College in 1912 and then served on the Army General Staff. From 1914 to 1922, he was an instructor at the Cavalry Command. Between 1922 and 1926, Yamada commanded a cavalry regiment, and he was promoted to colonel in 1925. From 1926 to 1927, he was chief of staff of the Japanese forces in Korea.

Yamada commanded the 4th Cavalry Brigade between 1931 and 1935. He was promoted to major general in 1934. He was then chief of the Third Department (transportation and communication) and chief of the General Affairs of the Army General Staff. In 1935, Yamada also became a director of the Military Staff College. In 1937, he took command of the 12th Division in Manchuria. A year later, he was appointed to command Third Army, then the Central China Area Army during the 1937–1945 Sino-Japanese War. In 1939, he became director of the Education Department of the War Ministry. He was promoted to full general in the following year.

In July 1944, Yamada assumed command of the Guandong Army in Manchuria. As the American offensive in the Pacific placed Japan under increasing military pressure, the Guandong Army lost 20 ground divisions and 2 air divisions, all transferred to the Pacific Theater and the Japanese home islands between February 1944 and March 1945. Yamada recruited 75,000 Japanese civilians living in Manchuria to supplement his military forces, but their training and equipment were both deficient, and the Guandong Army became a hollow force.

Following the Soviet invasion of Manchuria on 9 August 1945, Yamada surrendered his forces to the Soviet army on the order of the Japanese government. Despite this, the Red Army continued its offensive against Japanese troops until the end of August. The Soviets did not accept a cease-fire until 5 September, after they had occupied the Kurile Islands. Before the Soviet cease-fire, about 60,000 Japanese had been killed in combat, and 185,000 Japanese were killed or died in Manchuria after the cease-fire. Between 1947 and 1950, approximately 600,000 soldiers from Manchuria, North Korea, Sakhalin, and the Kurile Islands were sent to Soviet labor camps. The last group of detainees was released in 1956. More than 55,000 did not return. Yamada himself was

arrested by the Soviets after his surrender and was sentenced to 25 years of imprisonment at hard labor. He was released in 1956 with the last of the detainees on the normalization of relations between Japan and the Soviet Union. Yamada died in Tokyo on 18 July 1965.

Yamaguchi Tamon (1892–1942)

Japanese admiral and commander of Carrier Division 2. Born in Shimane Prefecture, Japan, on 17 August 1892, Yamaguchi Tamon graduated from the Japanese Naval Academy in 1912. Trained as a torpedo officer, he was promoted to senior lieutenant in 1918. He was then assigned to assist in the effort to return to Japan the submarines that formed part of the German reparations in 1919.

Yamaguchi attended Princeton University in the United States between 1921 and 1923 and then graduated from the Naval Staff College in 1924. He next served on the Naval General Staff. Promoted to commander in 1928, he was a member of the Japanese delegation to the 1929–1930 London Naval Disarmament Conference. Yamaguchi was promoted to captain in 1932 and then served as naval attaché in the United States between 1934 and 1937. Thereafter, he commanded the battleship *Ise* and the First Combined Air Fleet in China, engaged in air operations over China. Promoted to rear admiral in 1940, Yamaguchi assumed command of Carrier Division 2, composed of the aircraft carriers *Hiryu* and *Soryu*. A close confidant of Admiral Yamamoto Isoroku, he was an outspoken supporter of Yamamoto's Pearl Harbor plan and, later, his Midway plan.

Yamaguchi and the cautious Vice Admiral Nagumo Chūichi were often at odds. During the Japanese attack on Pearl Harbor, Yamaguchi urged Nagumo to make follow-up strikes on Pearl Harbor facilities and to destroy the U.S. carriers absent on 7 December 1941, but Nagumo refused. In early 1942, Yamaguchi took part in actions against the British in the Indian Ocean.

Yamaguchi and his carriers next participated in the Battle of Midway. Again, he and Nagumo disagreed on tactics. On 4 June 1942, Yamaguchi stressed the necessity for the Japanese to strike first, and on the sighting of the American carriers,

he urged that the Japanese launch an immediate dive-bomber attack without the torpedo-bombers, but Nagumo refused. Nagumo's decisions left his carriers vulnerable, and three of the four were sunk by U.S. Navy dive-bombers. With his own carrier *Akagi* sinking, Nagumo transferred command of air operations to Yamaguchi.

Twice Yamaguchi launched attacks against what he thought were two different U.S. carriers; actually, there was only one, the *Yorktown*. Although Yamaguchi lost 24 aircraft, his attacking planes badly damaged the *Yorktown*, and she was later sunk by a Japanese submarine. As Yamaguchi prepared a third strike that evening, U.S. dive-bombers from the carriers *Enterprise* and *Yorktown* mortally damaged the *Hiryu*. He assumed blame for the loss of his ship and refused to leave it. His staff tried to dissuade him, as they believed that he was invaluable to the Japanese navy, but Yamaguchi rejected their appeals. The 800 survivors then abandoned ship, and *Hiryu* was scuttled, sinking on 5 June. Yamaguchi was last seen reciting poetry and sipping tea.

William Head and Spencer C. Tucker

Between 1947 and 1950, approximately 600,000 Japanese soldiers were sent to Soviet labor camps.

Yamamoto, U.S. Ambush of (18 April 1943)

Aerial ambush and killing of Fleet Admiral Yamamoto Isoroku over Bougainville in the South Pacific. On 14 April 1943, U.S. intelligence intercepted and decoded the inspection trip travel schedule for Admiral Yamamoto, revealing an opportunity to intercept his flight over Bougainville four days later. Yamamoto had been the architect of the attack on Pearl Harbor and was commander in chief of the Combined Fleet.

There was some hesitation about an effort to intercept and shoot down Yamamoto's aircraft, stemming from concerns that the move might compromise U.S. code-breaking operations. Also, Yamamoto, though a superb officer, had proved to be a disaster as a strategist, which had worked to the advantage of the U.S. force. The order for the attack came from Secretary of the Navy Frank Knox through Admiral Chester Nimitz to Admiral Marc A. Mitscher, air commander in the Solomons area.

Mitscher assigned the mission to the Army Air Forces' 339th Fighter Squadron of the Thirteenth Air Force on Guadalcanal because of the long-range capability of its Lockheed P-38 Lightning fighters. The operation, code-named *Y-MISSION*, was carefully planned and carried out at low altitude under radio silence to ensure surprise. Major John W. Mitchell, the squadron commander, led the 400-mile mission. The 16 aircraft that performed the mission conducted a successful flight and interception, arriving over Bougainville just as two Japanese G4M Betty medium bombers and six Mitsubishi A6M Reisen Zero fighter escorts approached to land at Kahili Field at Buin in southern Bougainville. Both Japanese bombers were shot down, along with three of the Zeros, and Yamamoto was killed. Captain Thomas G. Lanphier and Lieutenant Rex Barber shared the credit for downing Yamamoto's aircraft, although a debate over the actual pilot responsible for shooting down the plane continued after the war.

Yamamoto Isoroku (1884–1943)

Japanese navy admiral who devised the December 1941 attack against U.S. forces at Pearl Harbor. Born in Nagaoka, Honshu, Japan, on 4 April 1884, Yamamoto Isoroku was the biological son of the former samurai Takano Sadayoshi and the adoptive son of Yamamoto Tatewaki. Educated at the Naval Academy (1901–1904), he fought in the 1904–1905 Russo-Japanese War and took part in the great Japanese naval victory in the Battle of Tsushima. He attended the Naval Staff College in 1915 and 1916.

Initially trained in gunnery, Yamamoto became a leading advocate of naval airpower during the 1920s and 1930s, in part because of his experiences as chief executive officer at Kasumigaura Naval Flight School between 1924 and 1926, when he became a pilot as well. Also significant in forming Yamamoto's perceptions were his two periods as a resident officer in the United States. Between 1919 and 1921, he studied English at Harvard University. Promoted to captain in 1923, he served as naval attaché in Washington, D.C., from 1926 to 1928. Yamamoto's time in the United States persuaded him of that country's unlimited economic potential and the relatively low quality of the U.S. Navy.

On returning to Japan from the United States, Yamamoto took command of the aircraft carrier *Akagi* and used her as a platform to test out new concepts in naval aviation. He was a delegate to the 1929–1930 London Naval Conference. He became chief of the navy's technical service in 1930 and was promoted to rear admiral the next year. In this position, he pushed the development of modern aircraft for the navy. In 1933, he took command of the 1st Naval Air Division. Yamamoto headed the Japanese delegation to the 1935–1936 London Naval Conference, where he presented Tokyo's position that it would no longer abide by the 5-to-5-to-3 naval ratio with the United States and Britain. He returned home a hero. Appointed vice minister of the navy in 1936, Yamamoto opposed his government's decision to proceed with construction of the giant Yamato-class battleships, believing they were a waste of precious resources. Unable to overcome the reliance on traditional battleships, Yamamoto nonetheless pushed the construction of aircraft carriers, long-range bombers and flying boats, and the new Zero fighter. His opposition to the increasingly belligerent official position led to his removal from his government post.

Appointed commander in chief of the Combined Fleet in August 1939 and promoted to full admiral in November 1940, Yamamoto opposed Japan's adherence to the Tripartite Pact and the movement toward war with the United States. Although he allegedly remarked privately that he would "run wild" for six months to a year, he had "utterly no confidence" after that. Nonetheless, he rejected the navy's original plan to lie in wait for the U.S. Pacific Fleet in the Far East, after the American ships had been savaged by submarine and torpedo attacks. Instead, Yamamoto devised a preemptive strike against the Pacific Fleet anchorage at Pearl Harbor in the Hawaiian Islands. He hoped that by crippling U.S. naval power at the war's outset, Japan might use the breathing spell that would ensue to conquer the Southern Resource Area and erect an impregnable defensive barrier.

Yamamoto did what he could to prepare his fleet for war, purging ineffective officers and insisting on realistic, rigorous—even dangerous—training, both day and night, so that when war came, the fleet was the best trained in the world, certainly at night fighting. However, he ignored technologi-

Japanese Fleet Admiral Yamamoto Isoroku. (Corbis)

cal advances, such as radar, which Japanese ships did not receive until 1943.

The success of the Pearl Harbor attack on 7 December 1941 enhanced Yamamoto's prestige, which he used to persuade the Naval General Staff to accept his overly complex Midway plan in April 1942. Designed to draw out the remnants of the U.S. Fleet, specifically the carriers absent from Pearl Harbor on 7 December, Yamamoto's Midway campaign ended in disaster on 4–6 June with the Combined Fleet's loss of four fleet carriers, a blow from which the Japanese navy never recovered.

Although the tide of the Pacific war clearly shifted in favor of the Allies after Midway, U.S. leaders remained wary of Yamamoto's leadership. Accordingly, when U.S. intelligence learned that Yamamoto intended a one-day inspection trip to the northern Solomons in April 1943, the Pacific Fleet commander, Admiral Chester Nimitz, with the approval of President Franklin D. Roosevelt, dispatched aircraft to intercept his plane. On 18 April, P-38 fighters shot down Yamamoto's aircraft near Buin in southern Bougainville Island, killing the admiral. His remains were recovered and returned to Tokyo, where he was honored with a state funeral.

Yamashita Tomoyuki (1885–1946)

Japanese army general in command of the Twenty-Fifth Army that conquered Malaya and Singapore. Born in Osugi Nara, Kochi Province, Shikoku, Japan, on 8 November 1885, Yamashita Tomoyuki may have been Japan's greatest general of World War II. He graduated from the Military Academy in 1908 and the War College in 1916. Trained as an infantry officer, he distinguished himself early on in a variety of assignments.

Yamashita served on the General Staff in 1918 and then was resident officer in Germany, from 1919 to 1921. Promoted to major in 1922 and to lieutenant colonel in 1923, he served concurrently as military attaché to Austria and Hungary (1927–1929). Promoted to colonel in 1929, he then commanded a regiment before serving in the Army Ministry (1932–1936). He next commanded a brigade in the Korea Army (1936–1937) and was promoted to lieutenant general in 1937. He was chief of staff of the North China Area Army between 1937 and 1939 in the Sino-Japanese War before commanding the 4th Division (1939–1940).

Recalled to Tokyo in July 1940, Yamashita became inspector general of army aviation. In November of that year, Minister of War General Tōjō Hideki, who saw Yamashita as a rival, sent him on a six-month military mission to Germany and Italy. On his return to Japan in June 1941, Yamashita warned against going to war with Great Britain and the United States until Japanese forces could be modernized—unwelcome advice that produced his exile to command the Guangdong (Kwantung) Army in Manzhoukiuo (Manchoutikuo).

In November 1941, just weeks before Tokyo launched the Pacific war, Yamashita received command of Twenty-Fifth

Lieutenant General Yamashita Tomoyuki (*left*) arraigned before the War Crimes Commission in Manila with a U.S. MP, 1945. (National Archives)

Army, which he proceeded to lead to the greatest land victory in Japanese history. In a campaign lasting 70 days (from 7 December 1941 to 15 February 1942) and outnumbered by the British, Yamashita conquered Malaya and Singapore and earned the nickname “Tiger of Malaya.”

Shortly thereafter, Prime Minister Tōjō engineered Yamashita’s transfer back to Manchuria. After languishing there for two years, Yamashita received command of Fourteenth Area Army in September 1944, and from 20 October 1944 to 2 September 1945, he directed an effective defense of the Philippines. Surrendering to U.S. forces at the end of the war, he was arrested and tried as a war criminal for failing to control Rear Admiral Iwabuchi Sanji’s Naval Defense Force, which committed atrocities in Manila in February 1945. Yamashita had ordered that Manila not be held and certainly had not ordered the atrocities committed there, but the court ruled him responsible for the actions of his subordinate. Sentenced to death, he was hanged on 23 February 1946.

Yamato (Japanese Battleship)

Lead ship of the Japanese Yamato-class battleships. Conceived in 1934, *Yamato* was the largest battleship ever built. Of five of her class originally planned, only *Yamato* and her

Japanese battleship *Yamato* under attack by U.S. aircraft, 25 October 1944. (Corbis)

sister *Musashi* were finished as battleships. A third ship, *Shinano*, was completed as an aircraft carrier.

Yamato's keel was laid at the Kure Naval Yard in November 1937; she was launched in August 1940 and commissioned on 16 December 1941. *Yamato* measured 826.6' in length, 127.6' in beam, and 34.1' in draft (263 m × 38.9 m × 10.4 m). She displaced 72,809 tons fully loaded and carried a crew of 2,500 sailors. Her armament consisted of 9 × 18.1-inch main guns in three triple turrets, 12 × 6.1-inch guns, 12 × 5-inch antiaircraft (AA) guns, 24 × 25-mm AA guns, and 4 × 13-mm machine guns. She also carried seven floatplanes, launched from two catapults. She had an armor belt of 16.1" and turret armor of 25.6". *Yamato* was capable of speeds up to 27.7 knots, made possible by 12 Kampon boilers and four-shaft Kampon geared turbines. She had a fuel capacity of 6,300 tons, giving her a cruising radius of 7,200 nautical miles at 16 knots.

Yamato had a rather uneventful career. Assigned as Fleet Commander Admiral Yamamoto Isoroku's flagship in February 1942, she was part of the Japanese Midway operation but saw no action in that battle. The *Yamato* might have played an important role in the fighting for control of the

Solomons, but the Japanese were reluctant to risk such a national symbol. With her subsequent activities curtailed by the shortage of oil, her actions were severely limited, and she saw little combat.

On 24 December 1943, the U.S. submarine *Skate* attacked the *Yamato* near Truk, damaging her on her starboard side near turret 3, which resulted in the flooding of the magazine. She returned to Japan for repairs, which were completed at Kure by April 1944. During the Battle of Leyte Gulf, *Yamato* and *Musashi* formed the core of Vice Admiral Kurita Takeo's Force A. Departing Lingga, *Yamato* sustained two bomb hits in the Sibuyan Sea while under way to San Bernardino Strait, where she encountered six escort carriers, three destroyers, and four destroyer escorts of escort carrier group Taffy 3, at the Battle of Samar. Although she escaped intact from this encounter, she also did not inflict any damage.

Yamato's next and final mission was to disrupt the U.S. landing on Okinawa, where she was to beach herself and use her guns to provide artillery support. Loaded with only enough fuel to make a one-way trip, *Yamato* set out from Japan and was spotted by U.S. submarines and tracked. Aircraft from Task Force 58 attacked the Japanese battleship on

7 April 1945. It took a force of hundreds of aircraft, a dozen aerial torpedoes, and half a dozen bombs to sink *Yamato*.

Yamato, Suicide Sortie of (6–7 April 1945)

The sinking of the Japanese battleship *Yamato* is a classic case of a surface warship, unsupported by air cover, succumbing to devastating air attack. Built at the Kure Naval Yard and launched in 1941, the 863-ft-long battleship *Yamato* displaced 72,000 tons and was armed with a main battery of 9 × 18.1-inch guns. Other armament by 1945 included 150 anti-aircraft and machine guns. Her maximum speed was 27.5 knots.

In response to the U.S. invasion of Okinawa, the Japanese navy prepared a desperate surface ship sortie and air attack against American naval forces investing the island. The plan called for the *Yamato*, supported by the light cruiser *Yahagi* and eight destroyers, to steam to Okinawa and attack Allied shipping there. The *Yamato* would then be run aground off Okinawa, where, as a stationary battery, she would provide gunfire support to the Japanese defenders of the island. *Yamato* was only provisioned with sufficient fuel for a one-way mission. The Second Fleet commander, Vice Admiral Itō Seiichi, had overall charge of the operation and was aboard the *Yamato*, which was commanded by Rear Admiral Aruga Kosaku.

U.S. Navy forces off Okinawa had been alerted to a coming sortie by signals intelligence, and the Japanese task force was quickly detected by U.S. submarines as it emerged from the southernmost exit of Japan's Inland Sea on 6 April. Since all available Japanese aircraft were targeted at naval forces around Okinawa, the *Yamato* was left exposed and vulnerable to air attack. American aircraft carrier-based planes began striking the Japanese task force on 7 April at 12:32 P.M.

The Japanese warships were subjected to repeated air attacks, but they only shot down 10 of 386 attacking aircraft. The *Yamato*'s guns were eventually knocked out. The Ameri-

can report on the ship's sinking claimed hits by at least 11 torpedoes and 8 bombs; Japanese survivors put the total at nearer to 16 torpedoes and 18 bombs. In any case, amid massive explosions, she sank at 2:23 P.M., less than two hours after the air attacks began. Only 269 of the *Yamato*'s 2,767 crew members survived. The light cruiser *Yahagi* and four of the destroyers were also sunk, and four damaged destroyers escaped to Japan.

Yenangyaung, Battle of (10–19 April 1942)

Important battle in Burma. With the capture of Rangoon (Yangon) in March 1942, the Japanese were able to establish effective supply lines and bring reinforcements into Burma (Myanmar). Although the Royal Air Force (RAF) and the American Volunteer Group (the AVG, or Flying Tigers) were still inflicting losses, the Japanese held air superiority.

The Japanese Fifteenth Army commander, General Iida Shōjirō, now turned his 33rd and 55th Divisions north. His objective was to seize the oil fields and refinery at Yenangyaung on the Irrawaddy, north of Prome. Supported by Burmese dissidents in a growing unconventional warfare capability, the Japanese employed frontal assaults, small-unit infiltrations, guerrilla operations, and sabotage to keep Allied forces on the defensive. Lieutenant William Slim's I Burma Corps held a defensive line with the 17th Indian Division forward of Prome on the Irrawaddy River and the 1st Burma Division near Toungoo and the Sittang River. Three Chinese armies—the Fifth, Sixth, and Sixty-Sixth—were moving south to reinforce. U.S. Lieutenant General Joseph Stilwell, who arrived in China in March to lead the U.S. effort to train the Nationalist Chinese Army, planned to reopen the land supply routes to China.

The Japanese captured Prome and Toungoo in early April. The British then concentrated their resources near Allanmyo, on the Irrawaddy, redeploying the 17th and 1st Divisions from Toungoo. Slim's mission was to prevent the Japanese from taking the oil fields and to defend northern Burma. Critical to this effort was the ability of the Chinese to hold in the

The forest of derricks that marked the great oil fields of Yenangyaung, Burma, the immediate objective of the Japanese invasion up the Irrawaddy Valley, 16 April 1942. (Bettmann/Corbis)

east in the Sittang Valley and the speed with which they could bring in reinforcements to allow the British to redeploy and form a reserve force large enough to conduct large-scale offensive operations to stop the Japanese advance up the Irrawaddy. On 8 April, Slim moved the I Burma Corps headquarters from Taunggyi to Magwe, just south of Yenangyaung. The oil fields were still producing fuel for the Allied forces, but as a precaution, they were to be destroyed rather than having them seized.

The main Japanese effort against Yenangyaung began in earnest on 10 April with direct assaults against forward British brigades and attempts to infiltrate small elements and units disguised as Burmese forces and Chinese. By 14 April, the Japanese had split the defending British forces. The next day, Slim ordered the destruction of the oil fields and refinery as heavy fighting continued in the Yenangyaung area.

British forces, now supported by the 38th Chinese Division, continued to engage the Japanese 33rd Division. Slim prepared an offensive thrust in which the 38th Division would reduce pressure on the 1st Burma Division, allowing elements

of the 17th Indian Division to counterattack the Japanese. As the Battle of Yenangyaung continued, however, the collapse of Chinese forces in the Sittang area put the entire British effort in the west at risk. At the same time, the Japanese cut off the 1st Burma Division, but British counterattacks, coupled with attacks by the Chinese 38th Division, allowed Slim to extract the 1st Burma Division. By 25 April, however, Allied forces had begun a general withdrawal. The complete loss of Burma and the retreat of all British forces to India was now only a matter of time.

Yeremenko, Andrei Ivanovich (1892–1970)

Soviet army marshal who was in command of the 4th Ukrainian Front at the end of World War II. Born in Markovka, Russia, on 14 October 1892, Andrei Yeremenko was drafted into the Russian army in 1913. He fought in World War I as a junior officer. He joined the Red Guards in October 1917 and the Red Army and Communist Party in 1918. Yeremenko fought as a cavalry officer in the Russian Civil War, ending that conflict as deputy commander of a regiment. He then commanded a regiment and attended the Military Political Academy and the Frunze Military Academy in 1935. Yeremenko commanded a cavalry division between 1935 and 1938, then the VI Cossack Cavalry Corps, which he led in the Soviet invasion of eastern Poland in September 1939.

In June 1940, Yeremenko took command of a mechanized corps and was promoted to lieutenant general. When the German army invaded the Soviet Union in June 1941, he was commanding the First Red Banner Far Eastern Army. Recalled to the west, he replaced General Dimitri Pavlov as Western Front commander, helping to restore a degree of stability. An outstanding tactician, he understood the importance of airpower and the need to mass armor.

In August 1941, Yeremenko assumed command of the new Bryansk Front, where he was seriously wounded in October. After his recovery, he was promoted to colonel general and put in command of Fourth Shock Army in the defense of Moscow. Again seriously wounded in February 1942, Yeremenko took command of the Southeast Front, defending Stalingrad, in August. In January 1943, he assumed command of the Southern Front, pushing the Germans out of the Caucasus. Transferred to command the Kalinin Front in April 1943, he was made General of the Army in August.

Yeremenko commanded the 1st Baltic Front in October and November 1943 for the advance on Smolensk. He then led the Independent (Black Sea) Maritime Front in the eastern Crimea, before heading the 4th Ukrainian Front from March to July 1945.

Following the end of the war, Yeremenko commanded, in turn, the Carpathian, West Siberian, and North Caucasus Military Districts until 1958. He next served as inspector general of the Ministry of Defense, until his death in Moscow on 19 November 1970.

Yokoyama Shizuo (1890–1961)

Japanese army general who commanded the Shinbu Group on Luzon in 1944. Born in Fukuoka Prefecture, Japan, on 1 December 1890, Yokoyama Shizuo graduated from the Military Academy in 1912 and was commissioned into the infantry. He graduated from the Army War College in 1925. After assignment to the General Staff, he was transferred to the Korea Army Headquarters in 1929. In 1932, he was doubly assigned as chief of the Railway Division of the Railway and Shipping Section of the General Staff and on the Naval General Staff. Yokoyama became commander of the Guandong (Kwantung) Army Railway District in 1935. Promoted to colonel in 1936, he served in the Guandong Army Headquarters in 1937.

During the 1937–1945 Sino-Japanese War, Yokoyama commanded the 2nd Infantry Regiment in offensive operations in northern China. Promoted to major general in 1939, he next took charge of the 2nd Field Railway Headquarters and then the 1st Field Railway Headquarters in 1940. Having

been made a lieutenant general in 1941, Yokoyama assumed command of the 8th Division in eastern Manchuria and from 1942 to 1944, he prepared for possible fighting with the Soviet Far East Command.

Yokoyama and his division were sent to Luzon in the Philippines in October 1944, where he commanded the Shinbu Group, later known as the Forty-First Army. Its mission was to defend central and southern Luzon under the overall authority of General Yamashita Tomoyuki, commander of Fourteenth Area Army. Yokoyama prepared to hold the mountainous region east of Manila City.

The issue of the defense of Manila was never resolved, as orders from the Fourteenth Area Army were unclear and the chain of command was complicated. Rear Admiral Iwabuchi Sanji's Manila Naval Defense Force, nominally under Yokoyama, had authority in the Manila area. General Yamashita did not want to fight for Manila, but Iwabuchi defied his orders and staged a bitter contest for the city that claimed an estimated 100,000 civilian lives. Yokoyama surrendered his surviving forces to U.S. authorities in September 1945. Arrested as a war criminal for atrocities committed by Japanese troops in Manila, he was sentenced to death by a Philippine military tribunal in 1948. His sentence was later reduced to life imprisonment. He was removed to Tokyo's Sugamo Prison and was released on amnesty in December 1953. Yokoyama died in Tokyo on 6 January 1961.

Yoshida Shigeru (1878–1967)

Japanese diplomat and prime minister. Born in Tokyo on 22 September 1878—the fifth son of Takeuchi Tsuna, leader of the Jiyū-tō (Liberal Party)—Yoshida was adopted by his father's wealthy friend Yoshida Kenzō. He graduated from Tokyo Imperial University and became a diplomat in 1906.

Yoshida served as the Japanese consul general in Mukden (Shenyang) (1925–1928), deputy minister of foreign affairs (1928–1930), and ambassador to Great Britain (1936–1939). While in Mukden, he believed that Japan should colonize China, and he supported the army's aggressive policies there.

Yoshida Shigeru in 1945. (Library of Congress)

In the 1930s, however, Yoshida criticized the army for its anti-Western attitude. A candidate for minister of foreign affairs in 1936, he was not appointed because army leaders objected. He retired in 1939.

Yoshida worked with his father-in-law, Count Makino Nobuaki, and Prince Konoe Fumimaro in an effort to try to end the Pacific war, activities that brought his arrest in April 1945 by military police and his imprisonment for 40 days. After the war, Yoshida became minister of foreign affairs in the cabinets of both Prince Higashikuni Naruhiko and Shidehara Kijyūrō. He himself served as prime minister from May 1946 to May 1947 and from October 1948 to December 1954.

Yoshida played a key role in the reconstruction of the Japanese economy after the war in cooperation with the United States, but in 1950, when negotiating the peace treaty he signed in San Francisco on 8 September 1951, together with the U.S.-Japan Security Pact, he rejected the demand of U.S. Special Emissary John Foster Dulles for Japanese rearmament. His administration fixed the basic pro-Western Japanese orientation in the Cold War era. Yoshida retained considerable political influence after his retirement. He died in Ōiso, Kanagawa, Japan, on 20 October 1967.

Yugoslavia

During War II, Yugoslavia was the setting for Europe's greatest resistance struggle but also a bloody civil war. A country of some 16 million people in 1941, Yugoslavia was one of the new states formed at the end of World War I. Serbia, which had been on the winning Allied side in the war, was its nucleus, with the addition of territories from the defunct Austro-Hungarian Empire. Unfortunately, the new state consisted of nationalities that had been on opposing sides in the war and had strong religious, linguistic, and cultural differences. The nation began as the Kingdom of Serbs, Croats, and Slovenes, but in 1929, it was renamed Yugoslavia, the "land of the South Slavs." The country was held together not so much by common ties as by outside pressures and by the fact that its peoples believed they had a better chance of surviving together rather than separately.

The Serbs were the largest single nationality in Yugoslavia, and their king, Alexander, became head of the new state. Many non-Serbs complained of being second-class citizens, and in 1934, King Alexander was assassinated by Croatian terrorists while on a state visit to France. In September 1939, World War II began, and Yugoslavian leaders declared the country neutral. They hoped to keep their state out of the war, although Serb sentiment at least was heavily pro-Allied. Serbs also dominated the army officer corps. In late 1940, to counter Russian moves and to solidify his flanks before attacking the Soviet Union in Operation BARBAROSSA, German leader Adolf Hitler forced the Balkan states to join the Axis alliance.

Prince Paul, regent for the young King Peter II, tried to stall for time, but in March 1941, following a meeting with Hitler at Berchtesgaden, he concluded that resistance was futile and might lead to the extermination of the Yugoslav state. On 25 March, Yugoslav leaders traveled to Berlin to sign the Tripartite Pact. In taking this step, they hoped they were preserving their country's independence; however, Yugoslav public opinion was sharply opposed to the Axis alliance, and this opposition found expression in nationwide demonstrations that prompted a coup on 27 March by Yugoslav air force officers, headed by General Dušan Simović. He formed a new

government under Peter II. Although the new government assured the Germans that there would be no immediate change of course in Yugoslav foreign policy, Hitler interpreted the coup as a personal affront and planned a military reprisal. Code-named Operation RETRIBUTION, the reprisal began on 6 April and included heavy air strikes against the Yugoslav capital of Belgrade.

This Axis operation also involved troops from Italy, Hungary (Hungarian Premier Pál Teleki committed suicide rather than dishonor himself by participating in such an act), and Bulgaria, for a total of 52 Axis divisions. These units easily defeated Yugoslavian regular forces, overrunning the country in only 11 days. The Yugoslav government leaders and King Peter fled to London, arriving there in mid-June. Despite the poor performance of their armed forces, Yugoslav leaders found themselves acclaimed as heroes for having resisted Hitler. Soon, they had established a government-in-exile.

Defeated Yugoslavia was now partitioned among the Axis states. Slovenia was divided between Germany and Italy; Croatia and Bosnia-Herzegovina were combined into the independent state of Croatia under the direction of the Fascist Ustaše government of Ante Pavelić; Italian forces occupied the Dalmatian coast and Montenegro; Albania annexed the Kosovo region and Macedonia; Bulgaria received Macedonia east of the Vardar River; Hungary took the Bachka and Baranya regions; and Serbia and the Banat fell under German military control.

All ethnic Croatians among the 300,000 Yugoslav prisoners of war taken in the invasion were freed, and by August 1941, the Germans had established a Serb collaborationist government under General Milan Nedich. In Croatia, meanwhile, the fascist Ustaše began the mass murder of minorities and forced Serbs to convert to Catholicism from Orthodox Christianity. In 1941, these Croatian fascists killed at least 200,000 Serbs, Jews, and Gypsies, most of them at the Jasenovac concentration camp.

Yugoslavian resistance to the Germans began immediately. Centered in the Serbs, it was divided in two factions. Colonel Dragoljub "Draza" Mihajlović retreated with a small force to the mountains and set up the Četniks (named for Serb guerrillas who had fought the Turks). The Četniks began receiving assistance from the British Special Operations Executive (SOE) in June 1941. Mihajlović hoped to build up his strength, avoiding reprisals by the Germans against the civilian population, and at the opportune time lead an uprising against the Germans. He strongly supported restoration of the monarchy.

Josip Broz (Tito), leader of the Yugoslav Communist Party since 1937, headed the second major resistance group. Known as the Partisans, the group favored immediate attacks on the Germans regardless of the cost to the civilian population in German reprisals. Following the German invasion of

Reichsmarschall Hermann Göring and Crown Prince Paul of Yugoslavia inspecting anti-aircraft guns at Doberitz airfield, 1939. (Library of Congress)

the Soviet Union on 22 June 1941, the Wehrmacht redeployed all but four of its divisions from Yugoslavia. Tito capitalized on this situation, and the Partisans were particularly active in Montenegro, Serbia, and Bosnia. By autumn 1941, Tito's Partisans numbered 50,000 people and contested the Germans for control of much of the countryside. In contrast to Mihajlović, Tito stressed a pan-Yugoslav platform after the war, stressing participation of all ethnic groups and establishment of a federated Yugoslav state.

Tito and Mihajlović met on two separate occasions in September and October but failed to develop a cooperative approach against the Germans. Hostilities between these two groups began in November 1941 when Četniks attacked the Partisan base at Uzice. Moreover, the Četniks often collaborated with Italian troops and the Nedich government in attempts to rid Serb and Montenegrin areas of Partisan influence. An agreement with German forces concluded on 11 November allowed the Četniks freedom of movement in return for taking action against the Partisans.

The Partisans' strength continued to grow. During 1942, their numbers reached 100,000 people, and by 1943, they had swelled to 250,000. By the end of the war, Tito claimed nearly 800,000 followers. So effective were their activities that the Germans recalled their 113th Division from the Eastern Front and the 342nd Division from France to help contain the Partisans. The Yugoslav resistance is thus credited with tying down a large number of Axis troops who would otherwise have been available for deployment elsewhere.

German forces mounted a half dozen major anti-Partisan operations between 1941 and 1944, yet the chief consequence of these sweeps was to force Tito to abandon any fixed base of operations. German reprisals against civilians, sometimes at the rate of 20 civilians killed for every dead German, usually generated still greater Partisan support. By 1943, both the Nedich government in Serbia and the Ustaše government in Croatia were unstable, and Tito's strength had grown to the point where he transformed the Partisans into the National Liberation Army of Yugoslavia. Also in 1943, Tito created a

shadow Yugoslav provisional government known as the Anti-Fascist Council for the Liberation of Yugoslavia (AVNOJ). Located in Bosnia, the AVNOJ established a network of district committees in Partisan-controlled areas of Croatia, Montenegro, and Serbia.

The British continued to support Mihajlović and his Četniks until December 1943, when, falsely convinced by a Communist agent that the Serb-dominated Četnik (Chetnik) resistance group was not fighting the Germans, Winston L. S. Churchill's government decided to channel all its aid to the Partisans. On 29 November 1943, the AVNOJ created the Yugoslav National Liberation Committee as a shadow government. It banned King Peter from returning to Yugoslavia and announced its intent to create a postwar federated state.

When Italian troops withdrew from Yugoslavia at the end of 1943, Tito's force seized the Italian arms depots. Faced with surprisingly successful resistance movements in the hills of Serbia and Bosnia, the Germans launched a number of operations, two of the largest coming in 1943, in an increasingly frustrated and futile attempt to crush the Partisan movement. Accounts of Partisan survival and heroism in the midst of these assaults assumed mythic dimensions in postwar Yugoslavia.

When the Germans pulled out many of their troops, the Partisans, largely recruited from the peasantry, already held most of the countryside and the main lines of communication. In a coordinated effort on 20 October 1944, the Soviet army and Partisan forces moved into Belgrade. On 7 March 1945, Tito's provisional government formally declared itself the legitimate leadership of the Federal People's Republic of Yugoslavia. For Yugoslavia, the toll of World War II had been heavy. By its end, an estimated 1.7 million Yugoslavs had been killed, both in combat and in atrocities committed by and against civilians.

At the end of the war, Yugoslavia attempted to annex Italian Istria and Trieste and the southern provinces of Austria. Tito's forces moved into Carinthia and tried to take it by coup de main. The speedy advance of the British V Corps prevented this, but there was a tense standoff. In mid-May 1945, the threat of force finally convinced the Yugoslavs to leave Austria. Clearly, Tito had hoped to seize any area where there was a blood tie to any ethnic group in Yugoslavia, including Carinthia, Istria, and Slovenia.

Tito did exact vengeance on the Croats, many of whom had been loyal to the Germans, as had many Slovenes. Within weeks of the war's end, the Partisans executed without trial up to a quarter of a million people who had sided with the Germans, most of them Croats. In addition, the majority of German prisoners taken in the war perished in a long "march of hate" across Yugoslavia. German soldiers captured in Yugoslavia worked as slave laborers; 60 percent of them were dead within a year. Also, despite protests by Western gov-

ernments, the new Yugoslav government tried and executed General Mihajlović.

The fact that the Yugoslav resistance had fought so well against the Germans and that it had liberated most of the country placed Tito in a strong position to demand and secure a Red Army withdrawal from those parts of Yugoslavia it occupied. In 1948, however, Yugoslavia was expelled from the international Communist movement.

Yugoslavia Campaign (1941)

German-led Axis conquest of Yugoslavia in April 1941. On 13 December 1940, Adolf Hitler issued orders for the conquest of Greece (Operation MARITA) to succor the Italians in Albania and protect Germany's southern flank during the planned invasion of the Soviet Union. Use of the Belgrade-Nis-Salonika railroad line was essential for German operations in Greece, and thus, the cooperation of Yugoslavia was needed. Accordingly, Hitler pressured Yugoslavia to join the Tripartite Pact on 25 March 1941. This move precipitated a bloodless military coup in Belgrade on 26–27 March. Prince Regent Paul fled to Greece, 17-year-old King Peter II took the throne, and the Yugoslav air force's General Dušan Simović formed a new government. Although Simović assured Hitler that Yugoslavia would remain friendly, the Führer was enraged by the coup, and on 27 March, he issued Directive No. 25 ordering the German conquest of Yugoslavia, which assigned supporting roles in the operation to both Italy and Hungary.

The German High Command quickly prepared plans for the operation and began to assemble the necessary forces. The latter included General Maximilian von Weich's Second Army, then in Austria and southwest Hungary (11 divisions in 4 corps); Lieutenant General Georg-Hans Reinhardt's XLI

German infantrymen engaged in mopping up operations in a small town on the Drau River in Yugoslavia, 9 May 1941. (Bettmann/Corbis)

Panzer Corps, near Timisoara, Romania (1 Schutzstaffel [SS] motorized infantry division, plus 1 infantry and 1 panzer regiment); and General Paul Ludwig Ewald von Kleist's 1st Panzer Group (5 divisions in 2 corps), assembling in Bulgaria for the planned invasion of Greece. Luftwaffe assets assigned to the operation included some 1,148 aircraft of the Fourth Air Fleet in Austria, the VIII Air Corps in Bulgaria, and the X Air Corps on Sicily.

The weak Yugoslav army was no match for the Germans. Mobilized on 29 March, it totaled fewer than 1 million men in 35 divisions, other troops under 3 army groups, 1 independent field army headquarters, and the Coastal Defense Command. The Yugoslavs had few modern tanks and little artillery and relied on animal transport. Most Yugoslav war matériel had been obtained from Germany, and there were few reserves of ammunition or other supplies. The Yugoslav air force had some 459 military aircraft, its airfields were vulnerable, and it lacked spares and other equipment. The Yugoslav navy consisted of 1 old training cruiser, 4 modern destroyers, 4 submarines, 2 river monitors, and 16 old motor torpedo boats. Its

ships were manned largely by Croats. Politically unreliable, the navy would play no role in the coming campaign.

After only 10 days for planning and preparations, the Germans began their assault on 6 April 1941 with a massive air attack on Belgrade that killed some 17,000 civilians, destroyed much of the Yugoslav air force, and cut communications between the Yugoslav Supreme Command and its units in the field. The same day, Field Marshal Siegmund Wilhelm List's Twelfth Army launched Operation *MARITA*. The German XL Panzer Corps took Skopje on 7 April, thereby cutting off the Yugoslav line of retreat toward Salonika, and Twelfth Army continued into Greece.

Plans for Operation No. 25 called for a three-pronged attack aimed at Belgrade. The 1st Panzer Group attacked from Bulgaria on 8 April on the Nis-Kragujevac-Belgrade axis, overcame stiff resistance by the Yugoslav Fifth Army, and took Nis on 9 April. At the same time, XLI Panzer Corps attacked from Romania and plowed through the Yugoslav Sixth Army. Using bridges over the Danube, Drava, and Sava Rivers seized by Second Army between 1 and 7 April, XLVI Panzer Corps attacked toward Belgrade on 10 April, routing the Yugoslav Fourth and Second Armies and reaching Novi Sad on 11 April. That same day, Zagreb fell to LI Infantry Corps, aided by 14th Panzer Division detached from XLVI Panzer Corps. Meanwhile, XLIX Mountain Corps forced the surrender of Yugoslav forces in Slovenia, and the Italian Second Army attacked from Trieste down the Yugoslav coast, meeting little resistance.

On the evening of 12 April, the three converging German corps surrounded Belgrade, and the next morning, German forces entered Belgrade unopposed. Second Army then assumed responsibility for all operations in Yugoslavia and acted to prevent the withdrawal of Yugoslav forces into the Serbian mountains. General von Weich's two pursuit groups moved toward Sarajevo from Zagreb and from Belgrade via Uzice. On 14 April, the Yugoslav government was evacuated to Greece, and negotiations for an armistice began. Sarajevo fell the next day, and on 17 April, Yugoslavia surrendered unconditionally at Belgrade. The armistice went into effect on 18 April, ending a 12-day campaign in which the Germans had only 558 casualties, including 151 killed. Yugoslavia was then annexed or occupied by the victorious Axis powers, except for Croatia and Bosnia-Herzegovina, which formed the pro-Axis Independent State of Croatia.

Yugoslavia Campaign (1944–1945)

Campaign to drive German forces from Yugoslavia, by Communist-led Partisans. By mid-1944, the Partisans led by Josip Broz (Tito) were poised to achieve both of their principal objectives: the annihilation of the royalist Četniks led by “Draza” Mihajlović and the expulsion of Axis occupation forces from Yugoslavia. The Italian capitulation in September 1943 provided the Partisans with enormous quantities of arms and other equipment, and in December 1943, the Allies cut off all aid to the Četniks and increased their support for the Partisans. Having survived several German assaults on his headquarters in early 1944, Tito saw his prestige enhanced when he was named minister of war in the new government-in-exile formed by King Peter II on 17 May 1944. In June 1944, Tito launched the Partisans against the Četnik stronghold in Serbia, aiming to destroy his rival and deliver a significant blow against the Axis occupation forces.

The Germans managed to hold the Partisans in eastern Serbia, and in July 1944, Tito asked Soviet leader Josef Stalin to divert the Soviet Red Army toward Belgrade to hasten the defeat of the 60,000 to 70,000 remaining Četniks and the Axis occupation forces. On 2 August, the Partisans advanced into Macedonia, and on 20 August, the Red Army launched a drive deep into Romania, which surrendered on 24 August. The Soviets declared war on Bulgaria on 5 September, and three days later, the Bulgarians asked for an armistice, declared war on Germany, and moved forces from Sofia toward the Yugoslav border.

The German commander in chief, Southeast, Field Marshal Maximilian von Weichs, controlled German forces in both Greece and Yugoslavia. Principal forces available to Weichs in Yugoslavia were the Second Panzer Army (9 divisions in 4 corps; no panzer units), with headquarters at Kragujevac, and Military Command Southeast (3 divisions under 2 corps headquarters), with headquarters in Belgrade. The situation at the end of August 1944 made it necessary for

German Army Group E (11 divisions under 6 corps-level headquarters) to begin the withdrawal of all troops from Greece (save for garrisons on Crete and Rhodes) to Macedonia. With the Bulgarian declaration of war on 8 September, the German 1st Mountain Division moved north, occupied Skopje, and secured the critical Belgrade-Nis-Salonika railroad line. On 14 October, Army Group E headquarters assumed responsibility for a 375-mile defense line in southeastern Yugoslavia facing 13 and a half Soviet and Bulgarian divisions of the Soviet Third Ukrainian Front (Thirty-Seventh and Fifty-Seventh Armies) and the Bulgarian First, Second, and Fourth Armies. On 8–9 September, a general uprising in Greece hastened the German withdrawal, and by 2 November, the last organized German units had left Greece.

By late September, Soviet forces advancing from Romania were fighting north of Belgrade, and on 29 September, the Red Army entered Serbia. On 20 October, Belgrade was “liberated” by the Red Army and Tito’s I Partisan Corps. The Red Army subsequently moved on toward Hungary, leaving the Partisans to mop up the remaining Četnik forces and hasten the withdrawal of German occupation forces. At this point, the guerrilla war fought by the Partisans against the Axis occupation forces became a conventional campaign. The combined onslaught of the Partisans and the Red Army brought about the collapse of the Četniks. In September, Mihajlović had called for a general mobilization to rid Serbia of Partisans and Axis occupation forces, but, attacked on three sides, the Četniks were forced to retreat and regroup in Bosnia. They subsequently ceased to be a major factor in the Yugoslav equation. Mihajlović returned to Serbia in April 1945 hoping to organize resistance to the Communists, but he was captured by the Partisans and executed in July 1946.

After the fall of Belgrade, German forces withdrew from Macedonia, Albania, and Montenegro, moving in good order to the northwest. Unable to mount a major counterattack, they also abandoned Serbia to form a defensive line in Bosnia and western Croatia. In March 1945, a new Communist-dominated coalition government was formed with Tito as premier, and on 20 March, the Partisan forces were redesignated as the Yugoslav National Army and began a general offensive against the Germans. The Germans held in central Bosnia and eastern Croatia until 10 April, when they began a headlong retreat toward Austria, where the bulk of the German units surrendered to the British. On 9 May, the Partisans took Zagreb, having smashed the Ustaše and the Independent State of Croatia. By 15 May, all of Yugoslavia had been retaken, and the Partisans exacted a terrible revenge on the remaining Axis troops and their Yugoslav collaborators. Those Germans taken prisoner by the Partisans were severely mistreated, and some 50,000 of them died in captivity.

Z

Z Plan

German naval construction program initiated prior to World War II. The Z Plan had its origins in the early 1930s and was based on Adolf Hitler's assertion that no major military undertakings would be initiated until 1944 or 1945. Under restrictions imposed by the Versailles Treaty following World War I, Germany was limited to having 6 pre-dreadnought battleships, 6 cruisers, 12 destroyers, 12 torpedo boats, and no submarines. The Z Plan, which clearly violated the Versailles Treaty, called for a powerful balanced fleet, and it was eagerly supported by the commander of the German navy, Grand Admiral Erich Raeder, and his fellow admirals, who were in competition with the army and air force for scarce strategic resources.

Hitler approved the Z Plan on 27 January 1939, three months before he revoked the British-German Naval Agreement of 1935 that had limited his navy to a maximum of 35 percent of its British counterpart; that move itself was a violation of the Versailles Treaty. The Z Plan received supreme priority and called for a powerful fleet of surface ships and submarines, centered on 6 superbattleships of 56,000 tons (H-class), 12 small battleships of 20,000 tons, 4 aircraft carriers, 44 light cruisers, 68 destroyers, 90 torpedo boats, and 240 U-boats. Four battleships of the Bismarck and Scharnhorst classes and 5 heavy cruisers, as well as the 3 Deutschland-class pocket battleships already completed or under construction, would join this planned fleet. The total program would include 800 vessels of all types and was scheduled to be completed in 1948. Later, the completion date was advanced to 1944.

At the beginning of World War II, the program was canceled, but it was revived again in July 1940 after the defeat of

France. The plan was even expanded with schemes for a post-war German navy of some 1,200 ships, including 25 battleships, 8 aircraft carriers, 100 cruisers, and 400 U-boats. At that time, the program also foresaw a massive buildup of harbors in many of the newly occupied territories, among them the French Atlantic coast and Norway. Trondheim was to become the largest German naval base in Europe. Colonies overseas would provide additional bases, with control of the Atlantic to follow in a second phase.

Contrary to this unrealistic plan, little construction was actually undertaken because of the lack of human and industrial resources. After the German defeat at Stalingrad in January 1943, the Kriegsmarine (German navy) suspended all

German Naval Construction; Z Plan versus Treaty of Versailles

German Navy warships at Hamburg, February 1939. (Bettmann/Corbis)

construction of heavy surface warships in favor of submarines. Since September 1939, industrial facilities had been geared to the rapid completion of the battleships *Bismarck* and *Tirpitz*, the cruisers *Prinz Eugen* and *Seydlitz*, the aircraft carrier *Graf Zeppelin*, as well as the buildup of submarines. The *Seydlitz* and *Graf Zeppelin* were never completed.

Hitler saw the Z Plan as a means whereby Germany would be able to challenge Britain and the United States for world naval mastery. The plan remains one of the most striking examples of the lack of realism in German military planning. From its inception, the program wasted enormous resources, and up to 1943, it worked against a buildup of submarines, the major threat to British and U.S. mastery of the Atlantic.

Zeitzler, Kurt von (1895–1963)

German army general who was appointed chief of the Army High Command (OKH) in 1942. Born in Cossmar-Luckau, Germany, on 9 June 1895, Kurt von Zeitzler joined the German army and rose to command the 72nd Infantry Regiment in World War I. He continued in the army after the war and underwent staff training.

Zeitzler was an early supporter of Adolf Hitler in the officer corps, and in 1934, he was one of the first to join the panzer forces. He was a lieutenant colonel in the army staff under Colonel Walter Warlimont and helped plan the German movement into Czechoslovakia in March 1939. Promoted to colonel, Zeitzler briefly commanded a regiment before becoming chief of staff of General Ewald von Kleist's XII Corps in the September 1939 invasion of Poland and of Army Group Kleist (later First Panzer Army) in the invasion of France and the Low Countries in 1940. He continued as chief of staff of First Panzer Army for Operation BARBAROSSA, the invasion of the Soviet Union, in June 1941. Regarded as a competent staff officer, Zeitzler played important roles in organizing the German drive through the Ardennes in 1940 and in Kleist's panzer operations in Greece and the Ukraine in 1941. He proved especially adept at logistical matters, ensuring that supplies kept up with the fast-moving tanks.

In April 1942, Zeitzler was assigned as chief of staff to the commander in chief, West, Field Marshal Karl Gerd von

Rundstedt and promoted to Generalmajor (U.S. equiv. brigadier general). He played a major role in bringing about the Allied disaster at Dieppe that August. In September, Hitler named Zeitzler to replace General Franz Halder as chief of the Army High Command and promoted him to Generalleutnant (U.S. equiv. major general). An aggressive officer with the nickname “*Kugelblitz*” (Thunderball), Zeitzler seemed to be the type of officer who would fit in well with Hitler.

As the senior staff officer of the German army, Zeitzler made a number of changes to improve procedures. Effecting change in Hitler’s strategic thinking proved more difficult, although he did stand up to the Führer on a number of occasions. The Battle of Stalingrad drove a wedge between the two men. Once Sixth Army was cut off, Zeitzler urged that it be allowed to break out, whereas Hitler demanded it remain in place. Zeitzler went so far as to predict that an airlift of supplies to the beleaguered army would not be successful, angering Hitler further. Zeitzler also proposed a major restructure of the High Command, suggesting the OKW (Armed Forces High Command) and OKH (High Command of the Army) be fused and that Generals Wilhelm Keitel and Alfred Jodl be replaced. He also argued that the Schutzstaffel (SS) should be placed under OKH control. Hitler rejected these suggestions.

Following the collapse of Operation CITADEL, the Battle of Kursk, which he had largely planned, Zeitzler fell out completely with Hitler. He had offered his resignation four times, but each time, Hitler had refused to accept it. Having gained the enmity of Keitel and Jodl, dumbfounded by Hitler’s prosecution of the war, and frustrated at his own inability to affect decisions, Zeitzler simply walked off the job on 30 June 1944 for “reasons of health.”

In January 1945, an angry Hitler took the extraordinary step of dismissing him from the army and forbidding him to wear his uniform. Imprisoned after the war, Zeitzler was released in 1947. He died at Hohenassachau in Upper Bavaria, Germany, on 25 September 1963.

Zhanggufeng (Chang-ku-feng)/Khasan, Battle of (29 July–11 August 1938)

Armed clash along the border between the Soviet Maritime Province and Japanese colonial Korea. The border dispute between the two sides led to fighting, beginning on 29 July 1938, on a small hill known as Zhanggufeng (Chang-ku-feng) and the adjacent Lake Khasan.

On 6 August, Lieutenant General V. N. Sergeev’s Soviet Thirty-Ninth Army of 23,000 infantry troops, with tanks and armored vehicles and supported by heavy artillery and air cover, attacked units of Lieutenant General Suetaka Kamezō’s 14th Division of 7,000 infantry troops defending Zhanggufeng. By 9 August, lacking heavy artillery and armor, the Japanese were driven from the hill. The Soviet forces then broke off contact save for reconnaissance. The Japanese refrained from a counterattack on the eve of their Wuhan operation in China. A truce was arranged between the two sides on 11 August 1938. The Japanese sustained 1,440 casualties (526 killed). The victorious Soviets paid a higher price, with 792 killed or missing and 3,279 wounded.

As a consequence of the battle, the Soviets gained confidence in their combat effectiveness. The battle revealed glaring Japanese weaknesses in firepower and tanks, but the army did nothing to rectify these shortcomings, continuing to believe in the superiority of fighting spirit over firepower. This mistaken doctrine eventually led to an overwhelming victory for the Soviets and defeat for the Japanese in their border dispute in the renewed fighting at Nomonhan/ Khalhin-Gol the following year.

Zhou Enlai (Chou En-lai) (1898–1976)

Chinese Communist Party (CCP) leader who was later prime minister of the People’s Republic of China (PRC). Born into a wealthy family in Shaoxing (Shaohsing), Zhejiang (Chekiang) Province, on 5 March 1898, Zhou Enlai (Chou En-lai) studied at Waseda University and, from 1917 to 1919, at Japan University in Tokyo. He returned to China to continue his studies at Nankai University in Tianjin (Tientsin), Hebei (Hupeh) Province, and joined the May Fourth Movement demonstrations in Beijing (Peking) in 1919 that called for

Chinese foreign minister Zhou Enlai, ca. 1950s. (Bettmann/Corbis)

modernization and democracy in China. Imprisoned briefly for this activity, Zhou left China in late 1920 for France on a work-study plan. There, he helped organize a branch of the Chinese Communist Party.

Returning to China in 1924, Zhou embarked on his revolutionary career. He directed the Guangdong (Kwangtung) Province CCP Military Affairs Department. He then served as director of the Political Department of the Huangpu (Whampoa) Military Academy under Jiang Jieshi (Chiang Kai-shek), leader of the Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT). Zhou secretly helped plan the Shanghai uprisings of 1925, 1926, and 1927 in Jiangsu (Kiangsu) Province, narrowly escaping arrest by the GMD.

From April 1927, Zhou directed the CCP Central Committee's Military Affairs Department. He assisted with in the planning for the Nanchang Uprising of August 1927 in Jiangxi (Kiangsi) and was an important figure in the formation of the Red Army. He participated in the Long March but was removed from the Central Military Commission at the 1935 Zunyi (Tsunyi) Conference in Guizhou (Kweichow) Province. Zhou supported the idea of a conventional army to oppose Jiang's GMD and disagreed with Mao Zedong's (Mao Tse-tung's) concept of guerrilla warfare. Zhou initially out-ranked Mao in the party leadership but later assumed a sub-

ordinate role. During the next four decades, the two men worked closely together, despite their great differences in approach and outlook. Zhou proved an indefatigable and gifted administrator, a master diplomat, and an adroit politician. He was also the ultimate survivor.

Zhou was the chief CCP negotiator with Jiang following the Xi'an Incident in 1936, and he helped form the united front with the GMD against the Japanese. Following World War II, he tried without success to negotiate a coalition government with the GMD.

Named China's prime minister on 1 October 1949, Zhou remained in that post for more than 26 years until his death. For the first 8 years, he served concurrently as foreign minister. Zhou played a key role during the Korean War, paving the way for China's entry into the conflict and warning the United States not to cross into North Korea. Zhou headed China's delegation to the 1954 Geneva Conference to end the Indochina War and deal with other Asian problems. He worked to stabilize the mercurial Mao and to keep China's government functioning through the constant upheavals of Mao's Great Leap Forward and the Cultural Revolution. The urbane and sophisticated Zhou served as China's chief emissary to the outside world. He died in Beijing on 9 January 1976.

Zhu De (Chu Teh) (1886–1976)

Chinese Communist marshal who was commander of the Chinese Communist Eighth Route Army from 1937 to 1945 and then commander of the Chinese People's Liberation Army between 1945 and 1954. Born in Yilong (Yi-lung), Sichuan (Szechwan) Province, on 18 December 1886 to extremely poor peasant parents, Zhu De (Chu Teh) possessed the ability to pass the civil service entrance examination. By 1906, he had transferred to the Yunnan Military Academy, graduating in 1911, whereon he participated in the Chinese Revolution. Until the end of World War I, Zhu served in warlord armies in Yunnan and Sichuan (Szechwan) Provinces, apparently acquiring both wealth and an addiction to opium that he ultimately defeated, before traveling to Germany to study in

Chinese Communist Marshal Zhu De (Chu Teh). (Bettmann/Corbis)

Berlin and Göttingen. An encounter with the young Chinese revolutionary Zhou Enlai (Chou En-lai) converted him to communism, which brought Zhu's expulsion from Germany.

Returning to China in 1926, Zhu concealed his new sympathies and joined the army of the Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT). In August 1927, he joined the unsuccessful Communist uprising in Nanchang, Jiangxi (Kiangsi) Province, later considered the birth of the Communist Red Army. Subsequently, he took his troops to join the Communist guerrilla forces of Mao Zedong (Mao Tse-tung) in Hunan Province. Zhu became commander and Mao political commissar of their combined force, the Fourth Red Army, which moved to Jiangxi in 1929, expanding to 200,000 men by 1933. The two men developed strategies for modern, large-scale Chinese guerrilla warfare, focusing on control of the country.

In 1934, after repeated Nationalist attacks, Zhu's forces escaped encirclement in what became the epic, 6,000-mile Long March to a new base at Yan'an (Yenan) in northwestern Shaanxi (Shensi) Province, during which Mao, with Zhu's support, won control of the Chinese Communist movement. When Communist forces allied with Nationalist troops after the 1937 Japanese invasion of China, Zhu commanded all Chinese Communist troops in what had become the Eighth Route Army. After directing the disastrous Hundred Regiments campaign against Japanese troops in late 1940, Zhu returned to guerrilla operations in Japanese-controlled areas. By 1945, he had built the Red Army into a force of 800,000, controlling much of northern China's countryside. During the 1945–1949 Chinese Civil War, Zhu directed Communist

military strategy. From 1949 to 1954, he served as China's defense minister, and in 1955, he became one of ten marshals of the People's Republic of China. Persecuted for several years during the Cultural Revolution, he was subsequently rehabilitated. When he died in Beijing (Peking) on 6 July 1976, Zhu was head of the Standing Committee of the National People's Congress.

Zhukov, Georgii Konstantinovich (1896–1974)

Marshal of the Soviet Union and perhaps better known in the West than any other Soviet military leader of World War II. Born in Strelkovka, Kaluga Province, Russia, on 19 November 1896, Georgii Zhukov was the son of peasants, his father a cobbler and his mother a carter. He was apprenticed as a furrier at age 12. Conscripted into the Russian army in 1915, Zhukov served in the cavalry during World War I, rising to noncommissioned officer (NCO) rank. After recovering from wounds received from an enemy mine, he joined the Red Army in 1918.

Zhukov commanded from platoon through squadron in the Russian Civil War, joining the Communist Party in 1919. He took charge of a cavalry regiment in 1922 and a brigade in 1930. In 1932, he received command of a cavalry division; four years later, he led a corps. Zhukov was one of the few senior officers to survive the military purges of 1937. Serving as deputy commander of the Belorussian Military District, he was sent to the Far East in June 1939 to deal with Japan's attempted invasion of Mongolia. By the end of August, he had decisively repulsed the Japanese in the Battle of Khalkin Gol. In 1940, he was promoted to full general, and near the end of the Russo-Finnish War, he was appointed chief of the General Staff. After the Germans invaded the Soviet Union in June 1941, Zhukov asked to be relieved from that post when Josef Stalin rejected his suggestion that Kiev be abandoned before it was lost to the Germans. Stalin's decision cost the Soviets some 665,000 soldiers captured by the Germans.

During the course of World War II, Zhukov was involved in the planning and execution of nearly every major campaign of the Eastern Front. In October 1941, he replaced

Soviet Marshal Georgii Zhukov, 1945. (Bettmann/Corbis)

Marshal Kliment Voroshilov at Leningrad and galvanized the defense there. Then, as commander of the West Front that same month, he organized the defense of Moscow; in November and December, he launched the counteroffensive that forced the Germans back from Moscow. In the fall of 1942, Zhukov and General Aleksandr Vasilievsky planned the counteroffensive at Stalingrad that trapped German General Friedrich Paulus's Sixth Army. Promoted to marshal of the Soviet Union and appointed deputy supreme commander of

the Red Army, he returned to Leningrad in 1943 and lifted the siege there. Then, in July, as special representative for Stavka (the Soviet High Command), again along with Vasilievsky, Zhukov supervised the defense of the Kursk salient and the subsequent offensive that swept across the Ukraine.

In the summer and autumn of 1944, Zhukov commanded the Belorussian Campaign, which destroyed German Army Group Center and ended the German occupation of Poland and Czechoslovakia. In April 1945, he personally commanded the final assault on Berlin, and he took the official German surrender for the Soviet Union on 8 May 1945, then remained to command Soviet occupation forces in Germany.

In 1946, Zhukov assumed command of all Soviet ground forces, but one year later, he fell victim to Stalin's paranoia and desire to diminish the reputation of potential rivals and was demoted to command the Odessa Military District. After Stalin's death in 1953, Zhukov became deputy minister of defense and then, in 1955, defense minister. During the Nikita Khrushchev years, his fortunes rose and fell but rose again when Khrushchev was deposed in 1964. Zhukov died in Moscow on 18 June 1974.

Chronology, Glossary, Bibliography, and Contributors

Chronology

Annette Richardson and Lawton Way

September 1939

- 1 Germany invades Poland
- 3 Great Britain and France declare war on Germany
- 7 French forces cross German border near Saarbrücken
- 17 Soviet Union invades eastern Poland

October 1939

- 5 Polish organized resistance ends at Kock
- 14 German submarine *U-57* sinks British battleship *Royal Oak* at Scapa Flow, Orkney Islands

November 1939

- 30 Soviet Union invades Finland

December 1939

- 13 Battle of the River Plate
- 17 German pocket battleship *Graf Spee* scuttled off Montevideo, Uruguay

February 1940

- 13 Soviets are able to breach Mannerheim Line

March 1940

- 12 Soviets and Finns sign peace treaty, ending the Finnish-Soviet War (Winter War)

April 1940

Katyn Forest Massacre takes place throughout April and into early May

- 9 Germany invades Norway and Denmark

May 1940

- 3 Vidkun Quisling becomes leader of Norway; King Haakon departs
- 10 Germany invades the Netherlands, Belgium, Luxembourg, and France
- Winston L. S. Churchill becomes British prime minister
- 13 Queen Wilhelmina leaves the Netherlands for exile in London
- 14 German air force bombs Rotterdam
- 15 Netherlands army surrenders to Germany
- 19 German ports of Hamburg and Bremen bombed by British
- 26 Operation DYNAMO, the evacuation of British and French forces at Dunkerque (Dunkirk), commences
- 28 Belgium capitulates to Germany

June 1940

- 4 Operation DYNAMO ends
- 8 Allied forces complete evacuation from Norway
- 9 Norway signs armistice with Germany
- 10 Italy declares war on France and Great Britain
- Norway surrenders to the Germans
- 11 Italian forces invade southeastern France
- 14 Paris falls to the Germans
- 15 Soviet forces invade Estonia

June 1940 (*cont.*)

- 16 Marshal Henri Philippe Pétain becomes French premier
- 17 Soviet forces invade Latvia and Estonia
- 18 Neutral Sweden accedes to a transit agreement with Germany
- 22 France signs armistice with Germany
- 27 Soviet forces invade Romania
- 28 British government recognizes Charles de Gaulle as leader of the Free French
German forces bomb two British Channel Islands, Guernsey and Jersey

July 1940

- 1 German submarines attack merchant ships in the Atlantic Ocean
- 3 In Operation CATAPULT, British navy units secure portions of the French fleet but engage and sink a number of French warships at Mers-el-Kébir, Algeria
- 9 Vichy becomes temporary capital of France
British government rejects Adolf Hitler's peace offer
- 10 Battle of Britain commences
- 16 Hitler plans Operation SEA LION, the invasion of Great Britain
- 25 United States announces embargo of strategic materials to Japan

August 1940

- 5 Italian forces invade British Somaliland
Latvia is formally admitted into the USSR
Lithuania is formally admitted into the USSR
- 6 Estonia is formally admitted into the USSR
- 17 Hitler declares a blockade of Great Britain

September 1940

- 3 Destroyer-for-Bases deal between the United States and Britain announced by U.S. President Franklin D. Roosevelt as an executive order
Britain receives 50 World War I-vintage U.S. destroyers in return for leases on base territory in North America
- 13 Italian forces invade Egypt
- 15 Major German air attack made on London

- 16 Conscription introduced in the United States
- 22 Vichy France allows Japanese air bases and troops in French Indochina
- 23 British and Free French Forces attack Dakar
Hitler and Spanish dictator Francisco Franco meet at Hendaye, France, on the border with Spain
- 27 Axis Tripartite Pact signed between Germany, Italy, and Japan

October 1940

- 7 German forces enter Romania
- 10 Operation SEA LION is shelved
- 28 Italian forces invade Greece from Italian-occupied Albania
- 31 Battle of Britain ends; Germans switch to night bombing (the Blitz)

November 1940

- 5 Roosevelt wins election to third four-year term as U.S. president
- 11 British forces stage air attack on the Italian fleet at Taranto, Italy
- 14–15 Germans stage air attack on Coventry, England, destroying much of the city
- 19–20 Germans stage air attack on Birmingham, England
- 20 Hungary joins the Axis alliance
- 22 The Greeks defeat the Italians, capturing Koritsa, Albania
- 23 Romania joins the Axis alliance

December 1940

- 9 British forces begin to drive the Italians from Egypt in Wavell's offensive

January 1941

- 19 British forces invade Italian Eritrea
- 22 Tobruk falls to Australian/British forces

February 1941

- 5–7 Battle of Bada Fomm takes place; British defeat Italian forces in Libya
- 8 British forces take Benghazi, Libya
Bulgaria and Germany sign military pact
- 12 German General Erwin Rommel arrives in North Africa

March 1941

- 1 Bulgaria joins Tripartite Pact
- 11 Roosevelt signs Lend-Lease Bill
- 16 British mount counteroffensive in Somaliland and Ethiopia
- 24 Rommel commences offensive in Libya
- 25 Yugoslavian government agrees to join the Axis alliance
- 26 Pro-Axis Yugoslav government is overthrown
- 28 Britain inflicts losses on the Italian fleet in the Battle of Cape Matapan

April 1941

- 3 Pro-Axis regime established in Iraq
- 6 Germany invades Greece and Yugoslavia
British occupy Addis Abba, capital of Ethiopia
- 11 Axis siege of Tobruk commences
- 13 Five-year nonaggression pact signed between Japan and the Soviet Union
- 17 Yugoslavian army surrenders to the Germans
- 23 Greece signs armistice with Germany

May 1941

- 1 British repulse German attack on Tobruk
- 2 British invade Iraq
- 5 Emperor Haile Selassie returns to Addis Ababa
- 10 German Deputy Führer Rudolf Hess flies to Scotland
- 20 Germans mount airborne assault against Crete
- 24 Germany battleship *Bismarck* sinks Britain's battle cruiser *Hood*
