List of Documents

SECTION I: The Coming of War

- 1.1. The Impact of World War I
Report of Oxford Union Debate, London Times, 9 February 1933
- 1.2. Benito Mussolini
Benito Mussolini (and Giovanni Gentile): “What is Fascism,”
Article for the Italian Encyclopedia, 1932
Benito Mussolini, “A Call to Arms,” speech to his followers, 2
October 1935
- 1.3. Adolf Hitler
Extract from Adolf Hitler, *Mein Kampf* (1924)
- 1.4. The Attraction of Hitler
Excerpts from William Shirer’s *Berlin Diary*, 5–10 September
1934
- 1.5. Arthur Koestler on the Spanish Civil War
Arthur Koestler, excerpt from *Spanish Testament*, 1937
- 1.6. The Sino-Japanese War Begins
Japanese Embassy to the Dept. of State, 12 July 1937
Press Release Issued by the Dept. of State on 12 July 1937
The Nanjing Massacre
- 1.7. Appeasement: For and Against
Neville Chamberlain, “Peace for Our Time”, 30 September 1938
Parliamentary Debate: Neville Chamberlain, 3 October 1938
Parliamentary Debate: Clement Attlee, 3 October 1938.
- 1.8. The German-Soviet Non-Aggression Pact and
Protocols
The German-Soviet Non-Aggression Pact, Protocols, and
Clarifications, 23 August 1939

SECTION II: Poland to Pearl Harbor

- 2.1. Clare Hollingworth on the German Invasion of Poland,
1940 and 1990
Excerpts from *The Three Weeks’ War in Poland*
Excerpts from *Front Line*

- 2.2. Diary of Lord Alanbrooke
Diary of Lord Alanbrooke
- 2.3. Winston Churchill, “The Few”
Winston Churchill, “The Few”, speech in The House of
Commons, 20 August 1940
- 2.4. Henry R. Luce on the U.S. Role in International Affairs
Henry Luce, “The American Century,” February 1941
- 2.5. “America First”
Charles Lindbergh, Radio Address, 23 April 1941
- 2.6. Hitler’s Decision to Invade the Soviet Union, June 1941
Hitler’s Decision to Invade the Soviet Union: Adolf Hitler to
Benito Mussolini, 21 June 1941
- 2.7. Pearl Harbor, 7 December 1941: Japanese and
American Views
Japanese Air Force Commander Mitsuo Fuchida recalls Pearl
Harbor
Marine Corporal B.C. Nightingale at Pearl Harbor
- 2.8. “A Day Which Will Live in Infamy”: Franklin D.
Roosevelt on Pearl Harbor
Franklin D. Roosevelt, Address to the United States Congress,
8 December 1941
Franklin Roosevelt, Radio Address to the People of the United
States, 9 December 1941

SECTION III: Waging War

- 3.1. Enigma Codebreaking in World War II: Recollections
of Edward Thomas
Excerpts from Edward Thomas, “A Naval Officer in Hut 3”
- 3.2. The Battle of Stalingrad
Excerpts from Soviet Textbooks on the Battle of Stalingrad
- 3.3. The Left in Europe: Frank Thompson and Bulgaria
Frank Thompson letters and diary entries
Account by Raina Sharova of Frank Thompson’s Death, 7
June 1944

- 3.4. D-Day: American and German Perspectives
Forrest C. Pogue on D-Day, 6–7 June 1944
German infantryman Robert Vogt Describes D-Day Landings and Normandy Campaign
- 3.5. The Men Who Fought the War: Experiences of U.S. Soldiers
Oral History of Chuck Hurlbut, 229th Combat Engineer Battalion
Bob Levine, Company K, 358th Infantry Regiment, 90th Infantry Division, Letter to His Family, 13 August 1944
Oral History of Sergeant Vincent “Mike” McKinney of the 1st Infantry Division, recorded 5 February 1999
Oral History of Corporal Sam Cropanese, Gunner, 712th Tank Battalion, Recorded 17 May 1993
Oral History of Private First Class Joe Bernardino, Loader, 712th Tank Battalion, Recorded 27 August 1994

SECTION IV: The Home Fronts

- 4.1. American Industrial and Economic Mobilization
United States National Defense Advisory Commission Directive, 31 August 1940
Full Text of Directive of 31 August 1940
Directive of the National Labor Advisory Commission on Government Wartime Contracts, 6 September 1940
Recollections of Joe Marcus, Head of the Civilian Requirements Division
Henry S. Truman Recalls His Work on the Senate Committee to Investigate the National Defense Program
- 4.2. The United States Home Front
Recollections of Robert Heide
Evan Griffith, Appeal to Buy War Bonds, 3 August 1942
Elsie McCormick, “Essential Civilian Needs Will be Met”
- 4.3. Race in the Wartime United States
A. Philip Randolph, “Why Should We March?,” November 1942
Statement of Truman K. Gibson, Jr., Civilian Aide to the Secretary of War, at Press Conference, Monday, 9 April 1945
Racial Conflicts in the US Army: Recollections of Allen Thompson
- 4.4. Wartime Racial Tensions
The Zoot Suit Riots, Los Angeles, June 1943: Report of the Governor’s Citizens Committee
Earl Brown, “The Detroit Race Riot of 1943”
- 4.5. American Women’s Wartime Experiences
Susan B. Anthony II on Women’s Rights, 1943
Kathryn Blood, *Negro Women War Workers*, Report Submitted to the Women’s Bureau, U.S. Department of Labor, 1945
Oral History of Fanny Christina Hill
Oral History of Lola Weixel

- 4.6. Women in Wartime Around the World
The Comfort Women of World War II
Recollections of Takamizawa Sachiko, housewife, 1986
A Russian “Night Witch”, Reminiscences of Lt. Olga Lisikova
Reminiscences of Juliane Hartmann
- 4.7. The Wives They Left Behind Them
Oral History of Helen Grottola, Widow of Joe Grottola, 712th Tank Battalion, recorded 22 September 1994
Oral History of Jeannie Roland, Widow of Jack Roland, 712th Tank Battalion, recorded 26 January 1995
- 4.8. A Child in the London Blitz
The British Home Front: Recollections of Pamela Lazarus, 10 October 2001

SECTION V: The Human Impact of War

5.a. Issues of Conscience, Civil Liberties, and Occupation

- 5.a.1. The Internment of Japanese-Americans
Recollections of Mary Tsukamoto
- 5.a.2. The German Resistance: Count Helmuth von Moltke
James von Moltke to Lionel Curtis, 25 March 1943
- 5.a.3. German Occupying Forces in Soviet Territory
Recollections of Hans Herwarth von Bittenfeld
Reminiscences of Gen. Aleksey Kirillovich Gorlinskiy on Soviet Advance
- 5.a.4. Japanese Maltreatment of Prisoners-of-War and Internees
Bill Nolan Recalls the Bataan Death March, April 1942
The “Death Railway” from Burma to Thailand: Experiences of Roy M. “Tex” Offerle
Truus Clydesdale Recalls Muntilan Camp
- 5.a.5. The Greater East Asia Co-Prosperity Sphere
Joint Declaration of the Greater East Asia Congress, Tokyo, 6 November 1943
Claro M. Recto to Lt. Gen. Takazi Wachi, 15 June 1944

5.b. Jews and the Holocaust

- 5.b.1. American Exclusion of Jewish Refugees
Memo from Assistant Secretary of State Breckinridge Long, to State Department Officials Adolf A. Berle and James Dunn, 26 June 1940
Margaret Jones, Memorandum to Clarence E. Pickett (exact date not given, but early November 1940)
- 5.b.2. The Final Solution: The Wannsee Conference
Minutes of the Wannsee Protocol, 20 January 1942
- 5.b.3. The U.S. Refuses to Bomb Auschwitz
John J. McCloy, Assistant Secretary of War, to John W. Pehle, Director, War Refugee Board, 18 November 1944
- 5.b.4. Martha Gellhorn, “Dachau,” May 1945
Excerpts from “Dachau,” included in *The Face of War* by Martha Gellhorn

5.c. Total War Targets Civilians

- 5.c.1. Dorothy L. Sayers on Attacks of Civilians
Target Area 1944
Dorothy L. Sayers to the Editor
Sayers to Maurice Reckitt
- 5.c.2. An American Bomber Pilot: Robert S. Raymond
Robert S. Raymond to His (Future) Fiancee, 27 January 1943
- 5.c.3. The Civilian Victims of Total War
Lothar Metzger, May 1999 Eyewitness Account of the Fire-
bombing of Dresden, 13–14 February 1945
The Firebombing of Tokyo, 10 March 1945: Reminiscences of
Shinoda Tomoko
Refugees on the Eastern Front: A Teenage Girl Describes the
Flight from East Prussia, January-February 1945
- 5.c.4. The Bombings of Hiroshima and Nagasaki
President Harry S. Truman Recalls the Decision to Drop the
Atomic Bomb
Hiroshima, by Father John A. Siemes

SECTION VI: The Long-Term International Impact

- 6.1. The Atlantic Charter, 14 August 1941
The Atlantic Charter, 14 August 1941
- 6.2. Plans for a United Europe
Jacques Maritain on European Unity 1940
Extract from Manifesto, “Combat and Revolution”
- 6.3. Planning for the Postwar World
Extract from the Beveridge Report, December 1942
- The Economic Bill of Rights: President Franklin D.
Roosevelt, State of the Union Message to Congress,
11 January 1944
- 6.4. The United States in the Middle East
“American Policy in Iran,” Memorandum by Mr. John D.
Jernegan of the Division of Near Eastern Affairs,
U.S. Department of State, Washington, 23 January
1943
- 6.5. Soviet Espionage During World War II
Robert J. Lamphere to Meredith Gardner, “EMIL JULIUS
KLAUS FUCHS aka Karl Fuchs,” 26 September 1949
- 6.6. The Yalta Accords
The Yalta Accords, 11 February 1945
- 6.7. China in Turmoil
General Joseph W. Stilwell on China, 1942–1944
President Jiang Jieshi (Chiang Kai-shek), Speech before the
Preparatory Commission for Constitutional Government,
Chongqing, 1 March 1945
“Chiang Kai-Shek is Provoking Civil War,” 13 August 1945,
Mao Zedong
- 6.8. Calls for Asian Independence and Revolution
Declaration of Independence of the Democratic Republic of
Vietnam, 2 September 1945
- 6.9. U.S. Planning for the Future
George C. Marshall, “For the Common Defense,” Extract from
Final Biennial Report to the Secretary of War, 1 September
1945
William J. Donovan to Harold D. Smith, Director, Bureau of
the Budget, 25 August 1945

Introduction

Documents are the raw materials of history. The historian must recognize their unique properties and exercise great caution in handling them. The story the documents tell may or may not be true, and each type of document has its own advantages and disadvantages. One distinguished World War II historian, Sir John Wheeler-Bennett, edited collections of German documents on interwar foreign policy and termed documents “the bare bones of history.” He recalled, as “a young and budding historian I had a thing about documents. I believed that in documents lay the real truth of history.” He nonetheless confessed that, though never losing his basic interest in documents, he later discovered “. . . that historical truth—in that it exists at all—lies not in documents alone, nor in memoirs, diaries, biographies or oral history. All these are essential and invaluable factors in the historian’s armoury but, when the chips are down, the final result depends on the historian himself alone, on his ability to weigh, assay and analyse the accumulated material at his disposal and to come up with his own honest opinions and conclusions. There are no answers at the back of the book.” (Wheeler-Bennett 1976, 58)

The further back we go in the historical record, the fewer documents we normally have at our disposal. This is due in part to the loss or destruction of many documents over time and to the fact that mass literacy has been largely a phenomenon of the nineteenth and twentieth centuries. When fewer people were able to read or write, the written record was less extensive. Those who lacked the ability to leave any written record of their own were underrepresented in historical accounts, which relied heavily on written sources.

The documents in this volume are only a tiny fraction of the millions of documents World War II generated. In a few

cases, tracking down these documents presented a challenge demanding persistence and ingenuity. In assembling this collection, the editor was fortunate in having at her disposal the outstanding resources of the libraries of the University of Hong Kong, George Washington University and its associated consortium, and the Library of Congress. Perhaps the hardest task, however, was not simply locating these documents but making the final selection.

Quite a number of documents chose themselves. One important priority was to provide reasonably full coverage of both the diplomatic and the military courses of the war. Another was to give some sense of its geographical extent and implications. Whether actual fighting took place on its soil, for every country involved in World War II, the political, social, and economic impact was profound. The documents included here were chosen to convey some sense of the wider domestic consequences of the experience of total war.

World War II did not have tidy temporal limits. Powers entered the war at different times: Great Britain, Germany, and France in 1939, Italy in 1940, the Soviet Union in mid-1941, and the United States at the end of 1941. In a broader perspective, the causes of World War II can be traced back at least to World War I, which fragmented and weakened the existing international system, creating a set of problems it would take another war to resolve. Nor did the consequences of World War II end when the fighting ended in 1945. The power vacuum it created in large parts of the world was effectively filled by the Cold War, which evolved out of the balance of forces that existed when the war ended and from ideological and geopolitical conflicts, the ancestry of which was far more venerable. The documents in this volume therefore cover the rise of Benito Mussolini and

Adolf Hitler, the development of the Sino-Japanese conflict, the Italo-Ethiopian War, the Spanish Civil War, and the reaction of the large Western democracies, including the United States, to these events.

Although the formal time-frame for this volume ends in 1945, one can already discern in the documents the burgeoning Cold War, as tensions mounted between the Soviet Union and the Western Allies over control of Eastern Europe and the treatment of Germany. From early in the war, liberal Europeans demonstrated a real wish to integrate their continent so as to prevent future wars resembling the two of the previous thirty years. The rise of nationalist and communist political forces in Asia was also clearly apparent even before World War II began, but the war enormously enhanced the position of both and ultimately ended formal Western colonialism there. Significantly, by 1945, top American political and military leaders were urging that their country indefinitely maintain a strong and modern military capable of responding immediately to international challenges, and also an overseas intelligence capability.

Politicians, diplomats, and generals made—or tried to make—the war’s biggest decisions, but their ultimate success in implementing these decisions depended on their ability to win support or at least acquiescence from their populations. Tens of millions of ordinary people fought in the war, as soldiers or irregular partisans. At least as many worked in the war industries and hundreds of millions lived in territories that were fought over, bombed, or occupied. Tens of millions of soldiers and civilians died, in combat, as prisoners of war or as the victims of bombing, atrocities, concentration camps, exposure, starvation, and disease. From small children to the elderly, even among those fortunate enough to escape the war’s worst ravages, its effects were still felt long after the actual fighting ceased. For many, the war was a period of brutal hardship; of battles and experiences they would rather forget. For others more fortunate, the war was a period of camaraderie and excitement, of using their skills and living their lives with an intensity they would never again attain, and of shared effort in a common and uplifting cause. And for many, maybe even the majority, the war and its effects were simply to be endured. Some, of course, left no records behind.

For many years, newspapers reported the war in detail, from the level of high policy down to human interest stories of its impact on individuals who might or might not be typical. Official government broadcasting operations and private broadcasting stations also kept extensive collections of transcripts and recordings of radio broadcasts. Official government records in the political, military, diplomatic, economic, and domestic spheres record the information that the government wanted to share with its citizens.

Less official materials were also abundant, their survival in many cases dependent upon the vagaries of chance. Private organizations, business or philanthropic, often maintained what were effectively their own archives, and some individuals saved large collections of personal papers. Many of those involved in the war kept diaries—those in prominent or interesting positions perhaps in the hope of enshrining their claims to historical recognition, many ordinary people in the expectation that their wartime experiences would be among the high points of their lives. After the war ended, new technology, especially light and easily operable recording machines, contributed to the development of the new field of oral history, whose practitioners made dedicated efforts to collect, transcribe, and make available the recollections of all levels of wartime participants, from those who were children at the time to high-ranking officials. The growing interest in family history likewise impelled individuals to set down their recollections for future generations.

One must always, however, approach every source with what will often prove to be well-warranted skepticism. Documents are never simply neutral records of events. Every document is written for a purpose, even if it is simply to record one’s own private experiences and feelings. In no circumstances can one treat a document in a vacuum; the more one knows about its context, the better one can appreciate it.

What, then, is the value of documents to historians? Should we conclude that, since every document is inherently problematic, it is impossible to make any credible use of them? To that, the dedicated historian would undoubtedly answer: Certainly not. Historians regard documents as treasures and devote much effort and ingenuity to tracking down new and previously overlooked sources. The interpretation of written sources, while overwhelming at times, is not a task requiring superhuman talents. It merely demands the fundamental qualifications of any good historian: knowledge, skill, discernment, and critical abilities.

No single collection of documents could ever hope to encapsulate the vast range of individual experiences in and responses to World War II. Even though several were chosen at least in part because each seemed broadly representative of a particular type of wartime experience, the small selection of personal letters and memoirs included here perhaps suggests how very differently the same war could be felt by each man, woman, or child involved.

— Priscilla Mary Roberts

Section I

The Coming of War

Throughout the 1930s, as economic depression took hold and politics became more extreme, in both Asia and Europe the threat of war loomed ever closer. In Germany, Adolf Hitler, leader of the National Socialist Party, became chancellor in 1933, whereupon he quickly moved to implement the program expounded in his notorious *Mein Kampf* [My Struggle], ending democracy and establishing a right-wing police state, persecuting German Jews, rearming his country, and embarking on a program of territorial expansion. In 1935 Italy's Benito Mussolini, Europe's first Fascist dictator, who had seized power in 1922, openly defied the League of Nations and invaded Abyssinia. The Spanish Civil War that began in 1936 served as an arena where left- and right-wing forces from around Europe confronted each other with a savagery that foreshadowed the larger battles to come. In 1937 the Japanese military launched an unofficial war in China, a conflict marked by extreme brutality against civilians, most notably in the December 1937 Nanjing massacre. Haunted by memories of the enormous loss of life during World War I, many in the European democracies embraced pacifism. In the hope of avoiding war, for several years British leaders acquiesced in German and Italian expansion, a course that would later be condemned as "appeasement." In August 1939 an unexpected rapprochement between two purportedly sworn ideological enemies, Germany, Europe's strongest Fascist power, and the Soviet Union, the continent's leading Communist state, whereby the Soviet Union pledged itself to remain neutral in the forthcoming conflict, paved the way for World War II to begin in Europe.

1.1. The Impact of World War I

British Pacifism between the World Wars

One immediate legacy of World War I (a war in which, from a 1914 population of 37 million, 947,000 British soldiers died and 2,122,000 were wounded; with comparable figures for France of 1,385,000 dead and 3,044,000 wounded from a population of 40 million) was a steadfast determination to avoid war in the future at almost any cost. Initially, the hope was that the international organization the League of Nations, created by the 1919 Treaty of Versailles, a body in which both Britain and France were key members, would serve this purpose. In Great Britain, the League of Nations Union, founded in 1918, was the key organization for those who shared this faith. By the late 1920s, its membership approached 1 million.

Various developments caused antiwar sentiment to intensify in the late 1920s and early 1930s. A flood of personal

World War I memoirs appeared at that time, most of them highly skeptical as to the value of the war itself. The year 1928 saw *Undertones of War* by Edmund Blunden and *Journey's End* by R. C. Sherriff; 1929 *Death of a Hero* by Richard Aldington and *All Quiet on the Western Front* by the German Erich Maria Remarque; 1930 *Memoirs of an Infantry Officer* by Siegfried Sassoon, *Good-Bye to All That* by Robert Graves, and *Her Privates We* by Frederick Manning. Women's experience of war and loss was graphically described in *Testament of Youth* (1933) by Vera Brittain, a professional writer, former Oxford University student, and wartime nurse who lost her fiancé, brother, and closest friends in the war, and in consequence, became a lifelong pacifist. All these works suggested that, even for the victorious powers, winning the war had not been worth the sacrifices of lives it entailed. Most suggested that on all sides, incompetence and wasteful disregard of the consequences in terms of dead and wounded characterized the military prosecution of the war. They also argued that, far from creating a world in which war would be less

rather than more likely, World War I had proved futile in terms even of resolving the immediate issues involved.

By the end of the 1920s, disillusionment with the fruits of World War I was widespread. Scholarly works of the 1920s generally suggested that the outbreak of war had stemmed from mistaken policies and actions on all sides, the prewar armaments race, or the demands of international capitalism. Moreover, from 1929 onward, in almost every country around the world, economic depression superseded the relative prosperity of the 1920s, a development that greatly exacerbated existing international tensions, with the result that the outbreak of new conflicts soon appeared only too likely. In 1931, Japan ignored its pledges under the Washington Conference Treaties of 1921–1922 and invaded the northeastern Chinese region of Manchuria, soon establishing there the puppet government of Manzhouguo (Manchukuo), nominally headed by the last emperor of China, who had been deposed in 1911. The Japanese government responded to formal protests by the League of Nations by leaving that organization, a course subsequently imitated in 1935 by both Germany and Italy, when the former abrogated the military restrictions imposed on Germany under the Treaty of Versailles and resumed control of the Rhineland and the latter invaded Abyssinia. In Italy, from the early 1930s, the one-party Fascist government of Benito Mussolini, in power since 1922, became increasingly aggressive, demanding that Italy should be permitted to acquire colonial territories in nearby North Africa. In Germany, another Fascist leader, the National Socialist Adolf Hitler, came to power as chancellor in January 1933. He soon eliminated all rival political parties and began to implement a major German rearmament program. Hitler demanded the rectification of the wrongs he claimed the Treaty of Versailles had inflicted upon Germany, depriving it of territory, colonies, and natural resources, and assertively claimed that Germany's growing population entitled it to *lebensraum* at the expense of neighboring countries, especially those whose populations included substantial numbers of ethnic Germans. It seemed increasingly probable that he would use his country's revitalized military strength to enforce these demands.

In response, British pacifist sentiment burgeoned. Both the Liberal and Labour Parties supported disarmament and attacked the predominantly Conservative National government then in power when a major international disarmament conference, which opened in 1932, broke down the following year over Hitler's demand for immediate military parity with France, Germany's great continental rival. The economic depression that took hold from 1929 onward made military spending more difficult to justify domestically, as welfare benefits were cut and any new defense programs implied higher taxation in some form or other. Until 1937, the Labour

Party, although ideologically strongly anti-Fascist, placed its faith in the League of Nations and declined to vote for even the modest rearmament policies the British National government embraced in the mid-1930s. Even in 1939, the Labour Party refused to endorse the introduction of military conscription. Although there were some exceptions, among them future prime ministers Winston Churchill and Harold Macmillan, with bitter memories of the slaughter World War I inflicted upon a generation of their country's potential leaders, most prominent British politicians, notably Neville Chamberlain, who became prime minister in 1937, were deeply reluctant to contemplate another major war.

For much of the 1930s, popular sentiment was equally antiwar. In several parliamentary by-elections in 1933 and 1934, antiwar Labour candidates succeeded in overturning Conservative majorities, most spectacularly at East Fulham in October 1933, where a safe Conservative seat with a majority of 14,000 fell to Labour by 5,000 votes. In 1934, the charismatic priest Canon Dick Sheppard founded the Peace Pledge Union, calling upon British men—but not women, whom he thought were already over-represented in the peace movement—to send him cards indicating that they would be ready to renounce war in all circumstances. That same year, Lord Robert Cecil, an architect and long-time supporter of the League of Nations, devised what he termed a Peace Ballot, a voluntary questionnaire that a total of 11,640,600 British people completed. When its results were tabulated in June 1935, they indicated that a majority supported the imposition of economic but not military sanctions on aggressor nations.

It was against this context that, 10 days after Hitler became German chancellor, the Oxford Union, a debating society of students at the prestigious University of Oxford, passed by 275 votes to 153 a resolution to the effect “that this House will in no circumstances fight for King and country.” One of Britain's two elite universities, Oxford was the pre-eminent nursery of future political leaders and statesmen and had educated many of the contemporary members of the British cabinet and other leading figures in the governing elite. In consequence, rather than being ignored or treated as high-spirited undergraduate hyperbole, the passage of this motion quickly provoked a national and even international furor. A few days later, in a letter to the conservative *Daily Telegraph*, 64 Oxford graduates expressed their dismay over the resolution and suggested that it be expunged from the Union's records. On 2 March 1933, Randolph Churchill, a former Oxford man and son of the leading anti-Hitler future Conservative Prime Minister Winston Churchill, submitted a motion to this effect, which was subsequently defeated by 750 votes to 138, largely because Union members resented such interference by past undergraduates.

In practice, the great majority of those Union members who stated that they opposed war in February 1933 would later support the war against Germany, either fighting in it or playing some other role. It was once alleged that the passage of this resolution emboldened Hitler in dealing with Britain, though this has since been disproved. The Oxford Union motion was nonetheless significant, in that it indicated the strength of the prevailing disillusionment with war, precipitated by the experience and outcome of the last major conflict in which Great Britain had been involved, World War I. For much of the 1930s, this perspective would remain a pronounced feature of the British political scene.

About the Document

The *Times* report of the Oxford Union debate was extremely brief, perhaps an inch of text in all, tucked away on an inside page. This did not, however, make it unimportant. Since the mid-nineteenth century, the *Times* newspaper had effectively functioned as the notice board of the British establishment or governing elite. A great many members of the 1930s British ruling class had themselves studied at Oxford University, where membership in the Union and, even more, the attainment of high office in that society were passports to a successful political or administrative career. Such individuals could easily perceive the seeming refusal of their putative successors to fight for their country in any future war as a betrayal of the values of their own class: hence, the apparently disproportionate attention and emotions stirred up by this undergraduate prank.

This was also the reason why, for several weeks, the august *Times* proceeded to cover the controversy in some detail. On 13 February, an editorial devoted specifically to this incident pointed out that “the Union is in no sense representative of the University” and, although undoubtedly “a training-ground for Parliament . . . has always been liable to fall into the hands of cranks.” Three days later, the *Times* reported that a package of 275 white feathers (a symbol of cowardice) had arrived at the Union, one for each of the resolution’s supporters, and that a motion to expunge it from the record book had been submitted. The day after, a group of dissident undergraduates raided the Union and solemnly tore the offending page out of the record book, and a second package of white feathers arrived. Meanwhile, the City of London School Old Boys Association and Winston Churchill both stated that the Oxford Union’s action was unrepresentative of general British attitudes. Churchill forthrightly condemned it as “very disquieting and disgusting,” adding, “One could almost feel the curl of contempt upon the lips of the manhood of Germany, Italy, and France when they read the message sent out by Oxford University in the name of Young England.” At a crowded Union meeting on 2 March, however, with more than 1,000 attending, the largest turnout in years, Churchill’s son Randolph was

booed and stink bombs exploded during his speech in favor of expunging the earlier motion. By 750 to 138, the Union voted in favor of allowing it to stand. For the rest of March, the *Times* traced the fate of similarly worded antiwar motions in various student meetings at Belfast University and Armstrong College, Newcastle, both of which rejected it, and the University College of South Wales and Monmouthshire at Cardiff, whose students concurred with the Oxford position.

The initial *Times* report on the Oxford Union motion was brief and dry, though subsequent articles on the continuing controversy included considerably more detail and local color. The fact that this report on an undergraduate society appeared at all, however, in this forum, was symptomatic of the degree to which Oxford University and the Union society were considered part of the elite apparatus of government. The same factors accounted for the attention the motion attracted from both prominent politicians and the general public, the unsuccessful attempt to overturn it, and the manner in which other British universities took up the same debate. They were also the reason why, even today, historians of interwar Britain still ascribe some significance to the February 1933 Oxford Union motion.

Primary Source

Report of Oxford Union Debate, 9 February 1933 The London *Times*, 11 February 1933

After a debate the Oxford Union Society on Thursday night, a motion “that this House will in no circumstances fight for its King and country” was carried by 275 votes to 153.

In addition to the five principal speakers, one of whom was Mr. C. F. M. Joad, notice had been received from 57 members, the largest number on record, that they intended to take part in the debate.

1.2 Benito Mussolini

About the Author

From 1922 until his overthrow in 1943, Benito Mussolini, a former schoolmaster and journalist, was the Fascist dictator of Italy, heading a one-party state in which he exercised supreme power. Born in 1883, the son of an Italian blacksmith who was a fervent socialist, Mussolini trained as a schoolteacher, did his national service in the Italian army, and in 1908, became the editor of a socialist newspaper, *La Lotta di Classe* (*The Class Struggle*). Working in the town of Forlì, he became the secretary of its Socialist Party in 1910. In 1911, he was jailed for his outspoken opposition to Italy's declaration of war on Turkey, emerging from prison a popular hero and celebrated public figure. In 1912, he moved to Milan to become editor of the prominent socialist journal *Avanti* and quickly became one of his party's most prominent and forceful Italian leaders, urging that the proletariat should unite and seize power.

When World War I began, Mussolini initially opposed Italian intervention, which did not occur until summer 1915, when Italy joined Britain and France against Germany and Austria, but in November 1914, he reversed his position, founded a new journal, *Il Popolo d'Italia* (*The People of Italy*), and adopted a strongly prowar stance. He also founded a prowar group, *Fasci d'Azione Rivoluzionaria* (Fascists for Revolutionary Action), the members of which formed themselves into militia units and terrorized their opponents. The term *fascists* drew on imagery of the Roman Empire, referring to the “bundles” of rods carried by the disciplinary officers of Imperial Rome. Fascists were supposed to be united as closely as those rods and to perform similar authoritarian functions. At that time, Mussolini probably hoped that war would precipitate a general collapse of the existing Italian political system, facilitating his own seizure of power. Although he was called up for military service and saw combat fighting in the Alpine trenches where Italy's frontier met that of Austria, he was seriously wounded in grenade practice in 1917 and subsequently mustered out.

Mussolini's war service convinced him of the need for national unity in prosecuting the war effort. In late 1917, after the military disaster of Caporetto, he turned against the Socialist Party, urging that, since their antiwar attitudes were

weakening the Italian military to a treasonous degree, socialist newspapers should be suppressed. By the time the war ended in Allied victory in November 1918, Mussolini had moved well over to the political Right. Italy ended the war polarized between Left and Right, gaining far less territory—mostly at Austrian expense—in the subsequent peace settlement than the Italian leaders and people believed they deserved. Mussolini attacked the government for not simply seizing the lands it coveted, notably the city of Fiume near Trieste, on the Yugoslav border. Effectively revitalizing his old militia units, he also founded a new political group, the *Fasci de Combattimento* (Fighting Fascists), which attracted many discontented and nationalistic returning soldiers. The party platform embraced an interventionist social welfare state, providing substantial benefits to all workers, national direction of the economy, and an assertive foreign policy. Mussolini also vehemently attacked the “rich nations,” especially Italy's former allies, Great Britain and France, for ignoring Italy's needs.

From 1919 onward, serious social disorder, riots, strikes, and bitter battles between Right and Left characterized Italian politics. Elected to parliament in 1921, as head of the Fascist Party, Mussolini was formally established that year as *Il Duce* (The Leader). Mussolini used his paramilitary supporters, who wore black shirted uniforms, to terrorize opponents on the Left. In summer 1922, disorder continued. Socialists called a general strike, many workers in frustration joined the Fascist Party, and no politician was willing to head the government. Mussolini's followers threatened to march on Rome, the Italian capital, to restore political and social stability. In October 1922, they began to do so, and in response, King Vittorio Emanuele III named Mussolini prime minister.

Once in office, Mussolini initially ruled with assistance from the Liberal Democratic Party, introducing strict censorship. Socialist opponents were subject to harassment and even murder. Fascist ideology glorified the role of the strong charismatic leader, a figure who virtually embodied the state and was effectively above the law. In 1925 and 1926, he restructured the electoral system so as to permit him to assume dictatorial powers, dissolving all other political parties by 1929. Mussolini centralized power in his own person, at various times augmenting his premiership with the posts of Minister of the Interior, Foreign Affairs, Corporations, the Armed Forces, and Public Works, while also heading the all-powerful Fascist Party and militia. All workers and public officials were expected to pledge allegiance to the party, and no independent organizations were permitted to exist. Mussolini prided himself on restoring efficiency to Italian public life, eliminating unemployment through large public works programs, and making Italy self-sufficient. In addition, the Fascist Party used mass rallies and grandiloquent appeals to

a glorified Imperial Roman past that it claimed to have restored to win popular support. Business support for the regime was ensured by the restoration of order, especially the government's suppression of the Communist and Socialist Parties and independent trade unions.

Mussolini also followed an aggressive foreign policy, its overall objective to restore Italian national glory and make the neighboring Mediterranean Sea an Italian lake. In 1923, he bombarded the Greek island of Corfu and later that decade, established a puppet regime in Albania and reconquered the North African territory of Libya, making it once more an Italian colony. Eager for additional territorial acquisitions, in 1935, he declared war upon the African state of Ethiopia (Abyssinia), intending to incorporate it into Italy's colonial empire.

The Italo-Ethiopian War, 1935–1936

On 3 October 1935, Italian troops invaded Ethiopia, a Christian African state ruled by Emperor Haile Selassie, supposedly a descendant of the biblical King Solomon of Israel and the Queen of Sheba. The war, the first major occasion on which a European Fascist power used military force to annex part or all of another country, quickly became an international cause of contention and an embarrassment to the League of Nations, one of the functions of which was purportedly the prevention of such conflicts. Although Great Britain and France formally deplored Italy's action, at the end of the year, they tried to broker a deal whereby Ethiopia would have ceded approximately half its territory to Italy, an arrangement Emperor Haile Selassie forthrightly rejected as a betrayal of his country. The League of Nations called on its members to impose economic sanctions upon Italy, but these efforts proved largely ineffective, especially since Italy could count on supplies from Germany, a fellow European Fascist state.

In May 1936, Italy formally annexed Ethiopia, and Haile Selassie and his family went into exile. Most member states of the League of Nations followed that organization in refusing to recognize the Italian annexation, as did the United States. In the short run, the Italo-Ethiopian War represented a triumph for the Fascist states' tactics of ignoring international agreements and relying upon military force to attain their objectives. It also drove Italy closer to Germany and Japan, two other "have-not" authoritarian nations determined to fulfill their territorial ambitions regardless of international disapproval. The war therefore contributed to the growing ideological polarization of the international system into fascist and nonfascist camps.

About the Documents

The two documents included here were written for rather different purposes. The first was a brief exposition, written 10 years after Mussolini came to power in Italy, of the meaning

of fascism as he understood it. Designed for inclusion in an official encyclopedia, it was intended to provide a short and comprehensible primer of the movement's basic principles. The second document was a speech designed for a particular occasion, exhorting the Italian people to support war against Ethiopia. Both pieces, however, made much use of the rather overblown, grandiloquently heroic rhetoric that characterized Fascist public pronouncements in both Italy and Germany. Both, too, glorified war and territorial expansion as the highest purpose of the state and the most glorious endeavor in which men could hope to engage. Drawing on Social Darwinist ideas popular from the mid-nineteenth to the mid-twentieth centuries, he portrayed an international system characterized by constant struggle between nations, in which the strongest and best disciplined would win, whereas weak and "decadent" states would be pushed aside or even annexed by the stronger.

Although Mussolini's own political roots originally lay in the Socialist Party, "What is Fascism" made it clear that, on the ideological level, although all three were supposedly collectivist in outlook, fascism was diametrically opposed to both socialism and communism. At least theoretically, the ultimate purpose of the latter two ideologies was to make the state the servant of the people, improving the lives and status of the masses. Fascism, by contrast, subordinated the interests of individuals to the state. In addition, it repudiated the belief in majority rule common to most democracies, relying instead upon the direction of affairs by a supposedly benevolent elite. Like other fascist leaders, Mussolini claimed that in the twentieth century, collectivism would supersede liberalism and individualism and that the state itself would effectively direct economic, political, and social affairs.

Mussolini's 1932 article argued that the pursuit of outside empire was one means of combating national decadence and imposing internal discipline and authority. There could, he claimed, be no substitute for war, which "brings up to its highest tension all human energy and puts the stamp of nobility upon the peoples who have courage to meet it." Three years later, by contrast, appealing to Italians to support war to annex Ethiopia, in a speech blending practical caution with sweeping rhetoric, he used more concrete and specific arguments. To begin with, he referred to Italy's longstanding grievances stemming from World War I, which his country had entered in 1915 on the understanding that it would obtain a "place in the sun," major territorial gains at the expense of Austria and perhaps other countries. In Mussolini's view, the failure of the Allies to give Italy all it sought in the postwar peace settlement justified Italy in seeking new colonial territories. So, too, did Ethiopia's 40-year history of resisting Italian incursions, which by intellectual sleight of hand he translated into evidence of Ethiopian misbehavior toward Italy, rather than the reverse.

Mussolini also minimized the probable detrimental consequences to Italy itself. He suggested that even if the League of Nations should impose economic or military sanctions on Italy, something it had threatened to do should Italy invade Ethiopia, neither France nor Britain would be likely to regard this as an adequate reason for declaring war on Italy. Seeking to allay popular apprehensions that this conflict, like Austria's invasion of Serbia in 1914, might expand into a general European war, he pledged to do all he could to avoid such an outcome. Even so, Mussolini boasted that if necessary, Italy could cope with any military or economic sanctions it might encounter. Finally, Mussolini wound up his speech by appealing to his listeners' nationalist and patriotic spirit.

A) Benito Mussolini (and Giovanni Gentile): "What Is Fascism," Article for *Enciclopedia Italiana di scienze, lettere ed arti*, 1932

. . . [A]s regards the future development of mankind,—and quite apart from all present political considerations—Fascism does not, generally speaking, believe in the possibility of utility of perpetual peace. It therefore discards pacifism as a cloak for cowardly supine renunciation in contra-distinction to self-sacrifice. War alone keys up all human energies to their maximum tension and sets the seal of nobility on those people who have the courage to face it. All other tests are substitutes which never place a man face to face with himself before the alternative of life or death. . . . The Fascist accepts and loves life; he rejects and despises suicide as cowardly. Life as he understands it means duty, elevation, conquest; life must be lofty and full, it must be lived for oneself but above all for others, both near by and far off, present and future. . . .

Such a conception of life makes Fascism the resolute negation of the doctrine underlying so-called scientific and Marxian socialism, the doctrine of historic materialism which would explain the history of mankind in terms of the class-struggle and by changes in the processes and instruments of production, to the exclusion of all else.

. . . . Fascism believes now and always in sanctity and heroism, that is to say in acts in which no economic motive—remote or immediate—is at work. Having denied historic materialism, which sees in men mere puppets on the surface of history, appearing and disappearing on the crest of the waves while in the depths the real directing forces move and work, Fascism also denies the immutable and irreparable character of the class struggle which is the natural outcome of this economic conception of history; above all it denies that the class struggle is the preponderating agent in social transformations. . . .

After socialism, Fascism trains its guns on the whole block of democratic ideologies, and rejects both their premises and their practical applications and implements. Fascism denies that numbers, as such, can be the determining factor in human society; it denies the right of numbers to govern by means of periodical consultations; it asserts the irremediable and fertile and beneficent inequality of men who cannot be leveled by any such mechanical and extrinsic device as universal suffrage. . . .

. . . . In rejecting democracy Fascism rejects the absurd conventional life of political equalitarianism, the habit of collective irresponsibility, the myth of felicity and indefinite progress. . . .

. . . . Granted that the XIXth century was the century of socialism, liberalism, democracy, this does not mean that the XXth century must also be the century of socialism, liberalism, democracy. Political doctrines pass; nations remain. We are free to believe that this is the century of authority, a century tending to the "right", a Fascist century. If the XIXth century was the century of the individual (liberalism implies individualism) we are free to believe that this is the "collective" century, and therefore the century of the State. . . .

The key-stone of the Fascist doctrine is its conception of the State, of its essence, its functions, and its aims. For Fascism the State is absolute, individuals and groups relative. Individuals and groups are admissible in so far as they come within the State. Instead of directing the game and guiding the material and moral progress of the community, the liberal State restricts its activities to recording results. The Fascist State is wide awake and has a will of its own. For this reason it can be described as "ethical". . . .

The Fascist State organises the nation, but it leaves the individual adequate elbow room. It has curtailed useless or harmful liberties while preserving those which are essential. In such matters the individual cannot be the judge, but the State only.

. . . . Fascism sees in the imperialistic spirit—i.e. in the tendency of nations to expand—a manifestation of their vitality. In the opposite tendency, which would limit their interests to the home country, it sees a sign of decadence. Peoples who rise or rearise are imperialistic; renunciation is characteristic of dying peoples. The Fascist doctrine is that best suited to the tendencies and feelings of a people which, like the Italian, after lying fallow during centuries of foreign servitude, is now reasserting itself in the world.

But imperialism implies discipline, the coordination of efforts, a deep sense of duty and a spirit of self-sacrifice. This explains many aspects of the practical activity of the State, as also the severity which has to be exercised towards those who would oppose this spontaneous and inevitable movement of XXth century Italy by agitating outgrown ideologies of the

XIXth century, ideologies rejected wherever great experiments in political and social transformations are being dared.

Never before have the peoples thirsted for authority, direction, order, as they do now. If each age has its doctrine, then innumerable symptoms indicate that the doctrine of our age is the Fascist. That it is vital is shown by the fact that it has aroused a faith; that this faith has conquered souls is shown by the fact that Fascism can point to its fallen heroes and its martyrs.

Fascism has now acquired throughout the world that universality which belongs to all doctrines which by achieving self-expression represent a moment in the history of human thought.

B) “A Call to Arms,” Mussolini’s Speech to His Followers, 2 October 1935

Black Shirts, of revolution, men and women of all Italy, Italians all over the world, beyond the mountains, beyond the sea, listen. A solemn hour is about to strike in the history of the country. Twenty million Italians are at this moment gathered in the squares of all Italy. It is the greatest demonstration that human history records. Twenty millions, one heart alone, one will alone, one decision.

This manifestation signifies that the tie between Italy and Fascism is perfect, absolute, and unalterable. Only brains softened by puerile illusions, by sheer ignorance, can think differently, because they do not know what exactly is the Fascist Italy of 1935.

For many months the wheel of destiny and of the impulse of our calm determination moves toward the goal. In these last hours the rhythm has increased and nothing can stop it now.

It is not only an army marching towards its goals, but as if forty-four million Italians were marching in unity behind this army. Because the blackest of injustices is being attempted against them, that of taking from them their place in the sun. When in 1915 Italy threw in her fate with that of the Allies, how many cries of admiration, how many promises were heard? But after the common victory, which cost Italy six hundred thousand dead, four hundred thousand lost, one million wounded, when peace was being discussed around the table only the crumbs of a rich colonial booty were left for us to pick up. For thirteen years we have been patient while

the circle tightened around us at the hands of those who wish to suffocate us. We have been patient with Ethiopia for forty years, it is enough now.

The League of Nations instead of recognizing the rights of Italy dares talk of sanctions, but until there is proof to the contrary I refuse to believe that the authentic people of France will join in supporting sanctions against Italy. Six hundred thousand dead whose devotion was so heroic that the enemy commander justly admired them—those fallen would now turn in their graves.

And until there is proof to the contrary, I refuse to believe that the authentic people of Britain will want to spill blood and send Europe into a catastrophe for the sake of a barbarian country, unworthy of ranking among civilized nations. Nevertheless, we cannot afford to overlook the possible developments of tomorrow.

To economic sanctions, we shall answer with our discipline, our spirit of sacrifice, our obedience. To military sanctions, we shall answer with military measures. To acts of war, we shall answer with acts of war.

A people worthy of their past and their name cannot and never will take a different stand. Let me repeat, in the most categorical manner, that the sacred pledge which I make at this moment before all the Italians gathered together today, is that I shall do everything in my power to prevent a colonial conflict from taking on the aspect and weight of a European war. This conflict may be attractive to certain minds, which hope to avenge their disintegrated temples through this new catastrophe. Never, as at this historical hour, have the people of Italy revealed such force of character, and it is against this people to which mankind owes its greatest conquest, this people of heroes, of poets and saints, of navigators, of colonizers, that the world dares threaten sanctions.

Italy! Italy! Entirely and universally Fascist! The Italy of the black shirt revolution, rise to your feet, let the cry of your determination rise to the skies and reach our soldiers in East Africa. Let it be a comfort to those who are about to fight. Let it be an encouragement to our friends and a warning to our enemies. It is the cry of Italy, which goes beyond the mountains and the seas out into the great world. It is the cry of justice and of victory.

1.3. Adolf Hitler

About the Author

In 1933, the National Socialist (Nazi) politician Adolf Hitler became chancellor of Germany, the head of that country's government, a position he retained until his death in April 1945. Hitler was born in 1889 in Braunau, Austria, a small town close to the German frontier, the son of Alois Hitler and his third wife, Klara. Alois Hitler was the illegitimate son of a servant girl and was a minor customs official of 51 when his son was born. Adolf Hitler's demanding father expected him to excel academically and follow him into the Austrian civil service, but after performing well at primary school, Hitler fell behind in high school, where he was a mediocre student, and left school in 1904 with no qualifications. The only subjects he enjoyed were art and history. Hitler was greatly influenced by his inspiring history master, Leopold Pötsch, a German Nationalist who believed that Austria should have allied itself more closely with the increasingly powerful German Empire and attacked France during the 1870–1871 Franco-Prussian War. From an early age, Hitler also loved games involving fighting and frequently staged mock battles. Hitler's father died in 1903 and his mother died four years later, leaving Hitler a modest pension and inheritance sufficient to support him. He moved to the Austrian capital, Vienna, but failed to win admission to the art and architecture academies to which he applied. For several years, Hitler sketched and studied art independently.

Feeling little but contempt for his own country, Hitler refused in 1909 to register for compulsory military service in the Austrian military, but when the authorities eventually forced him to do so four years later, they classified him as medically unfit. A few months later, when World War I began in August 1914, Hitler enthusiastically volunteered for the German army, which accepted him. The rigors of trench warfare notwithstanding, the following four years were the hap-

piest period of his adult life to that date. Hitler enjoyed belonging to a group united in fighting for a common purpose and was willing to undertake hazardous missions. He served as a dispatch-runner, carrying messages from regimental headquarters to the front, a dangerous job that won him five medals, including the coveted Iron Cross. Although highly decorated, Hitler never rose above corporal. His failure to win further promotion may have been due to his extreme views on socialists, communists, and Jews, all of whom he alleged were deliberately undermining the war effort, and also to his somewhat eccentric and aloof behavior.

When the war ended in November 1918 with Germany's defeat and the establishment of a republic, Hitler blamed this outcome upon the baleful influences of Jewish Socialists within Germany itself and in Bolshevik Russia. Socialism and communism were, he argued, all part of a greater Jewish conspiracy to overthrow the existing order. His suspicions were confirmed in early 1919 when the Bavarian city of Munich, where his military unit was stationed, experienced a Socialist uprising, suppressed by the German army several months later in May 1919. Hitler helped to identify dissident left-wing soldiers who had supported the rebellion, an effort that led the military authorities to make him a political officer. German resentment of the harsh terms of the June 1919 Treaty of Versailles—which deprived Germany of 13 percent of its territory, 6 million people, all its colonies, and much of its raw materials—gave Hitler's once extremist views new credibility. In September 1919, he joined the newly formed German Worker's Party (GWP), the outlook of which resembled his own, and persuaded his army superiors to finance this organization. The GWP, which was—at Hitler's insistence—renamed the National Socialist German Worker's Party (NSDAP or Nazi Party) in February 1920, recognized and quickly made full use of Hitler's remarkable oratorical skills, which soon attracted thousands of new members. In fall 1921, Hitler became the Nazi Party's leader. After a one-month stint in prison for breach of the peace in late 1921, he also established a paramilitary branch, the Sturm Abteilung (SA, or Storm Section), composed mainly of former German military men, who terrorized political opponents, disrupted rival meetings, and indulged in violence against Jews and left-wing Germans.

The local Bavarian government sympathized with the Nazi Party's activities, but the more liberal national government responded in 1922 by passing a "Law for the Protection of the Republic." In return, Hitler organized a rally of 40,000 supporters, during which he demanded the overthrow of the existing government. Runaway inflation and the eventual decision by German Chancellor Gustav Stresemann to pay reparations to the Allied powers for their wartime losses intensified Hitler's commitment to this course. On 8 November 1923, storm troopers under his command, backed by

General Eric von Ludendorff, who had been wartime quartermaster general and a guiding spirit of the German army, took over the Bavarian government and planned to march on Berlin. The national government, however, still controlled the radio and telegraph facilities and ordered its supporters to oppose the coup. Stiff resistance by local Munich police who remained loyal to the government led Hitler and most of his supporters to panic and flee.

Arrested after several days in hiding, Hitler stood trial with other Nazi Party members. Although he theoretically faced the death sentence for treason, he succeeded in making the court proceedings a platform to publicize his political views. Hitler received the minimum sentence of five years but was released in December 1924 after serving slightly more than one year. His imprisonment in Landberg Castle, near Munich, was far from onerous. He was permitted unlimited visitors, gifts, and reading materials, wore his own clothes, and took agreeable strolls in the castle grounds. At the urging of his supporters, Hitler also used his enforced leisure to produce his autobiography, *Four Years of Struggle against Lies, Stupidity, and Cowardice*, later retitled *My Struggle* (*Mein Kampf*), which he dictated to his chauffeur, Emil Maurice, and Rudolf Hess, then a student at Munich University. For the next 20 years, *Mein Kampf* served as the Nazi Party's intellectual underpinning.

On his release from prison, Hitler resumed his Nazi Party activities but played down the more violent aspects of its work. The party won only a few seats in the 1924 and 1928 national elections, but its membership continued to grow, reaching 108,000 in 1928. The Wall Street Crash of October 1929 and the subsequent four years of depression—during which international bankers refused further financing to Germany, the system of German reparation payments collapsed, and unemployment soared—gave Hitler's message new salience. In the September 1930 elections, the Nazi Party increased its seats in the Reichstag from 14 to 107, making it the second largest party, a position Hitler skillfully exploited to enhance his position and influence within the governing coalition. Fearing a military coup, German Chancellor Ernest Bruening in 1931 banned the Nazi Party's SA forces, which at 400,000 outnumbered the small German army of 100,000, but in 1932, President Paul von Hindenburg replaced Bruening with Franz von Papen, who removed the proscription. In the July 1932 elections, the Nazi Party won 230 seats and 37.3 percent of the vote, making it the largest party even though it did not hold an overall parliamentary majority. SA forces employed brutal violence against all their political opponents, especially socialists and communists, which provoked a political reaction, and in the November 1932 elections, the German Communist Party increased its representation to 100. In January 1933, Hitler was appointed chancellor. The following month, a fire, almost certainly set by Nazi support-

ers, destroyed the Reichstag, giving Hitler the opportunity to suppress the Social Democratic and Communist Parties and assume dictatorial powers. Even though the Nazis only obtained 44 percent of the vote in the March 1933 elections, Hitler quickly moved to make Germany a one-party state and, in 1934, combined the positions of president and chancellor in his own person. He now had the opportunity to put into practice the program described in *Mein Kampf*, under the direction of a charismatic leader who, as fascist ideology prescribed, was effectively above the law.

About the Document

Although a spellbinding orator, Adolf Hitler was not a natural writer. While in prison in 1924, he dictated *Mein Kampf* to two amanuenses, his chauffeur, Emil Maurice, and Rudolf Hess, a Munich University student who would eventually become deputy leader (*Führer*) of the Nazi Party. The resulting book was turgidly written, its style less than inspired. Even so, Hitler's supporters eventually bought millions of copies, and its historical interest is such that it still remains in print today.

Mein Kampf was considerably more than just the autobiography it purported to be. It also represented the most coherent statement of Hitler's political philosophy and long-term objectives, which over the next two decades, remained virtually unchanged until his death. The autobiographical passages are extremely revealing in terms of how Hitler himself perceived his own life up to that time, especially his enjoyment of his wartime service and his belief that in late 1918 Jews and socialists betrayed a victorious German army. The book also served as a political manifesto, designed to attract new adherents to the National Socialist Party. Today's politicians, driven by focus groups and opinion polls, tend to moderate their more extreme views to conciliate their potential audience. In *Mein Kampf*, Hitler, by contrast, was extremely frank in setting forth his racial views that Germans of pure stock—or “Aryans,” as he ahistorically termed them—were inherently superior to Jews and other racial groups, including gypsies and those of Slav, Asian, or African stock. He made it clear that in any Nazi-run state, Jews would suffer discrimination and persecution, whereas the true German *volk* (folk, or people) would enjoy special privileges. Hitler was also quite frank as to his anti-Semitic conviction that there existed a shadowy international Jewish conspiracy of businessmen, bankers, politicians, and others, whose members had enormous political influence and who were closely linked to the international Socialist movement.

The particular extract selected here deals primarily with Hitler's plans to expand German territory, his belief that his country's increasing population and the inherent superiority of its people entitled Germany to *lebensraum* (living space),

at the expense of other nations if necessary. As with all his writings and speeches, Hitler's racial views permeate this passage. He was obviously determined to restore Germany to its prewar status as a great power, a theme likely to resonate with the millions of Germans who resented the peace terms imposed upon their country by the 1919 Treaty of Versailles. He truthfully stated that his objective was not only to regain the territories Germany had lost in 1918 but also to improve upon them by incorporating all areas of Europe with a majority German population into the German state. Hitler specified that his major target was Communist "Russia and her vassal border states" and that he believed the prominence of Jewish individuals within these governments would cause them to collapse quickly under German assault. He also made it clear that he believed Germany should not tolerate a military rival, or even a potential one, in Europe.

Once they have attained power, as Hitler did in January 1933, politicians often yield to expediency and circumstances and tone down their earlier objectives. It was both Hitler's strength and his weakness that he never modified the essentials of the ideology that from 1919 onward became his driving force. He rebuilt the German army; reoccupied the Rhineland in 1936; and annexed Austria and much of Czechoslovakia in 1938, and the remainder of Czechoslovakia in spring 1939, before demanding Danzig from Poland. Germany and the Soviet Union signed a nonaggression pact in 1939 that enabled Germany to conquer much of Poland, followed in 1940 by Norway, Denmark, the Netherlands, Belgium, Luxembourg, and France. Nevertheless, in June 1941, Hitler finally invaded the Soviet Union, a decision that was one of the major reasons for Germany's eventual defeat and Hitler's own suicide in April 1945. Many who read *Mein Kampf* considered its recommendations to be largely rhetorical, too extremist to be taken seriously. In reality, Hitler gave an honest if frightening description of his program should he attain power.

Extract from Adolf Hitler, *Mein Kampf* (1924)

If under foreign policy we must understand the regulation of a nation's relations with the rest of the world, the manner of this regulation will be determined by certain definite facts. As National Socialists we can, furthermore, establish the following principle concerning the nature of the foreign policy of a folkish state:

The foreign policy of the folkish state must safeguard the existence on this planet of the race embodied in the state, by creating a healthy, viable natural relation between the nation's population and growth on the one hand and the quantity and quality of its soil on the other hand.

As a healthy relation we may regard only that condition which assures the sustenance of a people on its own soil. Every other condition, even if it endures for hundreds, nay, thousands of years, is nevertheless unhealthy and will sooner or later lead to the injury if not annihilation of the people in question.

Only an adequately large space on this earth assures a nation freedom of existence.

Moreover, the necessary size of the territory to be settled cannot be judged exclusively on the basis of present requirements, not even in fact on the basis of the yield of the soil compared to the population. . . . If a nation's sustenance as such is assured by the amount of its soil, the safeguarding of the existing soil itself must also be borne in mind. This lies in the general power-political strength of the state, which in turn to no small extent is determined by geo-military considerations.

Hence, the German nation can defend its future only as a world power. . . .

Germany today is no world power. Even if our momentary military impotence were overcome, we should no longer have any claim to this title. What can a formation, as miserable in its relation of population to area as the German Reich today, mean on this planet? In an era when the earth is gradually being divided up among states, some of which embrace almost entire continents, we cannot speak of a world power in connection with a formation whose political mother country is limited to the absurd area of five hundred thousand square kilometers.

From the purely territorial point of view, the area of the German Reich vanishes completely as compared with that of the so-called world powers. . . .

Thus, in the world today we see a number of power states, some of which not only far surpass the strength of our German nation in population, but whose area above all is the chief support of their political power. Never has the relation of the German Reich to other existing world states been as unfavorable as at the beginning of our history two thousand years ago and again today. Then we were a young people, rushing headlong into a world of great crumbling state formations, whose last giant, Rome, we ourselves helped to fell. Today we find ourselves in a world of great power states in process of formation, with our own Reich sinking more and more into insignificance.

We must bear this bitter truth coolly and soberly in mind. We must follow and compare the German Reich through the centuries in its relation to other states with regard to population and area. I know that everyone will then come to the dismayed conclusion which I have stated at the beginning of this discussion: *Germany is no longer a world power, regardless whether she is strong or weak from the military point of view.*

We have lost all proportion to the other great states of the earth, and this thanks only to the positively catastrophic leadership of our nation in the field of foreign affairs, thanks to our total failure to be guided by what I should almost call a testamentary aim in foreign policy, and thanks to the loss of any healthy instinct and impulse of self-preservation.

If the National Socialist movement really wants to be consecrated by history with a great mission for our nation, it must be permeated by knowledge and filled with pain at our true situation in this world; boldly and conscious of its goal, it must take up the struggle against the aimlessness and incompetence which have hitherto guided our German nation in the line of foreign affairs. Then, without consideration of 'traditions' and prejudices, it must find the courage to gather our people and their strength for an advance along the road that will lead this people from its present restricted living space to new land and soil, and hence also free it from the danger of vanishing from the earth or of serving others as a slave nation.

The National Socialist movement must strive to eliminate the disproportion between our population and our area—viewing this latter as a source of food as well as a basis for power politics—between our historical past and the hopelessness of our present impotence. And in this it must remain aware that we, as guardians of the highest humanity on this earth, are bound by the highest obligation, and the more it strives to bring the German people to racial awareness so that, in addition to breeding dogs, horses, and cats, they will have mercy on their own blood, the more it will be able to meet this obligation. . . .

I still wish briefly to take a position on the question as to what extent the demand for soil and territory seems ethically and morally justified. This is necessary, since unfortunately, even in so-called folkish circles, all sorts of unctuous big-mouths step forward, endeavoring to set the rectification of the injustice of 1918 as the aim of the German nation's endeavors in the field of foreign affairs, but at the same time find it necessary to assure the whole world of folkish brotherhood and sympathy.

I should like to make the following preliminary remarks: The demand for restoration of the frontiers of 1914 is a political absurdity of such proportions and consequences as to make it seem a crime. Quite aside from the fact that the Reich's frontiers in 1914 were anything but logical. For in reality they were neither complete in the sense of embracing the people of German nationality, nor sensible with regard to geomilitary expediency. They were not the result of a considered political action, but momentary frontiers in a political struggle that was by no means concluded; partly, in fact, they were the results of chance. With equal right and in many cases with more right, some other sample year of German history could be picked out, and the restoration of the conditions at

that time declared to be the aim of an activity in foreign affairs. . . .

The boundaries of the year 1914 mean nothing at all for the German future. Neither did they provide a defense of the past, nor would they contain any strength for the future.

Through them the German nation will neither achieve its inner integrity, nor will its sustenance be safeguarded by them, nor do these boundaries, viewed from the military standpoint, seem expedient or even satisfactory, nor finally can they improve the relation in which we at present find ourselves toward the other world powers, or, better expressed, the real world powers. The lag behind England will not be caught up, the magnitude of the Union will not be achieved; not even France would experience a material diminution of her world-political importance. . . .

And so we National Socialists consciously draw a line beneath the foreign policy tendency of our pre-War period. We take up where we broke off six hundred years ago. We stop the endless German movement to the south and west, and turn our gaze toward the land in the east. At long last we break off the colonial and commercial policy of the pre-War period and shift to the soil policy of the future.

If we speak of soil in Europe today, we can primarily have in mind only Russia and her vassal border states.

Here Fate itself seems desirous of giving us a sign. By handing Russia to Bolshevism, it robbed the Russian nation of that intelligentsia which previously brought about and guaranteed its existence as a state. For the organization of a Russian state formation was not the result of the political abilities of the Slavs in Russia, but only a wonderful example of the state-forming efficacy of the German element in an inferior race. Numerous mighty empires on earth have been created in this way. Lower nations led by Germanic organizers and overlords have more than once grown to be mighty state formations and have endured as long as the racial nucleus of the creative state race maintained itself. For centuries Russia drew nourishment from this Germanic nucleus of its upper leading strata. Today it can be regarded as almost totally exterminated and extinguished. It has been replaced by the Jew. Impossible as it is for the Russian by himself to shake off the yoke of the Jew by his own resources, it is equally impossible for the Jew to maintain the mighty empire forever. He himself is no element of organization, but a ferment of decomposition. The Persian empire in the east is ripe for collapse. And the end of Jewish rule in Russia will also be the end of Russia as a state. We have been chosen by Fate as witnesses of a catastrophe which will be the mightiest confirmation of the soundness of the folkish theory.

Our task, the mission of the National Socialist movement, is to bring our own people to such political insight that they will not see their goal for the future in the breath-taking sen-

sation of a new Alexander's conquest, but in the industrious work of the German plow, to which the sword need only give soil. . . .

If the National Socialist movement frees itself from all illusions with regard to this great and all-important task, and accepts reason as its sole guide, the catastrophe of 1918 can some day become an infinite blessing for the future of our nation. Out of this collapse our nation will arrive at a complete reorientation of its activity in foreign relations, and, furthermore, reinforced within by its new philosophy of life, will also achieve outwardly a final stabilization of its foreign policy. Then at last it will acquire what England possesses and even Russia possessed, and what again and again induced France to make the same decisions, essentially correct from the viewpoint of her own interests, to wit: A political testament.

The political testament of the German nation to govern its outward activity for all time should and must be:

Never suffer the rise of two continental powers in Europe. Regard any attempt to organize a second military power on the German frontiers, even if only in the form of creating a state capable of military strength, as an attack on Germany, and in it see not only the right, but also the duty, to employ all means up to armed force to prevent the rise of such a state, or, if one has already arisen, to smash it again.—See to it that the strength of our nation is founded, not on colonies, but on the soil of our European homeland. Never regard the Reich as secure unless for centuries to come it can give every scion of our people his own parcel of soil. Never forget that the most sacred right on this earth is a man's right to have earth to till with his own hands, and the most sacred sacrifice the blood that a man sheds for this earth.

1.4. The Attraction of Hitler

About the Author

In the twentieth century, prominent journalists often exercised substantial influence upon public opinion. One such was William L. Shirer, one of a small group of Americans reporting regularly from Europe during the 1930s. The son of a lawyer, Shirer was born in Chicago in 1904. After his father's death in 1913, his mother moved the family to Cedar Rapids, Iowa. In 1925, after earning his bachelor of arts degree from Coe College, Cedar Rapids, while simultaneously working on the sports page of the local newspaper, Shirer worked his way to Europe on a cattle boat. In Paris, he obtained a job on the *Chicago Tribune*, remaining with that newspaper until the economic fallout from the Great Depression lost him his job in 1933. Two years earlier, Shirer, by then fluent in French and German, had married Theresa Stiberitz, an Austrian photographer who worked as his assistant. In 1932, he lost one eye in a skiing accident.

Hired by the *New York Herald* for its Paris office in 1934, Shirer moved in August to Berlin as a correspondent for the Universal News Service, where he remained until 1937, when its proprietor, William Randolph Hearst, closed it down. During this period, Shirer became familiar with all the leading officials in the Nazi government. He was then hired by Edward R. Murrow of Columbia Broadcasting Service to broadcast from Vienna, the Austrian capital. After the March 1938 Anschluss, the German annexation of Austria, Shirer based himself in Geneva. When war began in Europe in September 1939, Shirer returned to Berlin. In June 1940, the German army allowed him to visit Paris, where he was one of very few foreign correspondents permitted to observe firsthand the triumph of the lightning German campaign against France. Overhearing an internal German transmission that France was about to sign an armistice, Shirer scooped even the German Foreign Office in announcing this event in the United States. By mid-1940, he was increasingly at odds with the Nazi regime, which heavily censored his broadcasts to the United States, though Shirer occasionally foiled such efforts by adroitly using American slang. On the advice of friends, Shirer finally left Germany in December 1940. Despite the historical interest of his Berlin vantage point, Shirer was glad to depart, finding the constant Nazi repression and oppressive surveillance increasingly claustrophobic and fearing that despite his neutral status, he himself might easily fall victim to arbitrary arrest and imprisonment on charges of espionage.

On returning to the United States, Shirer began a sustained campaign to awaken Americans to the evils of Nazism in Germany. He lectured around the country. He also edited for

publication the journal he had kept from 1934 to 1940, which, at some personal risk, he successfully smuggled out of Germany. The book, *Berlin Diary*, became an immediate best-seller. In one of its final entries, Shirer asked himself: “[D]oes Hitler contemplate war with the United States?” He answered: “I am firmly convinced that he does contemplate it and that if he wins in Europe and Africa he will in the end launch it unless we are prepared to give up our way of life and adapt ourselves to a subservient place in his totalitarian scheme of things.” Taking issue with such American opponents of war as the celebrated aviator Colonel Charles A. Lindbergh, he suggested potential scenarios whereby Germany might attack the United States, either by moving across the North Atlantic by way of Greenland, Iceland, Labrador, and Newfoundland, or by basing German forces in South America.

For most of the 1940s, Shirer continued to write for the *New York Herald Tribune* and also as a CBS commentator, though he switched to the Mutual Broadcasting System in 1947. He returned to Germany in 1945 and reported on the Nuremberg trials, in which a wide range of Nazi leaders were held to account for the crimes they had committed during the war. From 1950 onward, Shirer, always a liberal, fell foul of the domestic American anticommunist movement headed by Senator Joseph R. McCarthy of Wisconsin, which he and his former colleague Murrow both publicly opposed. Black-listed for much of the 1950s, Shirer could not find a steady job. He had already published several novels, a diary of his return to Germany in 1945–1946, and volumes on postwar European politics. In the 1950s, he wrote his best-known book, *The Rise and Fall of the Third Reich*, a 1,200-page blockbuster account of the years of Nazi rule in Germany. After several rejections by publishers, the volume appeared in 1960, quickly heading the bestseller lists and winning a National Book Award. Shirer followed up its success with an account of the fall of France in 1940. He also wrote three well-received volumes of autobiography and a memoir of the Indian independence leader Mohandas Gandhi, whom Shirer first met in the 1930s and considered the most impressive personality he ever encountered. Shirer remained active well into his eighties, finishing the proofs of his book recounting the stormy marriage of the Russian writer Leo Tolstoy and his wife, Sofya, just before his own death in 1993.

Shirer represented a breed of twentieth-century American journalist—similar cosmopolitan figures included Dorothy Thompson, Harrison Salisbury, William Sheean, and David Halberstam—who were deeply familiar with countries other than their own and could influence public opinion and events not just through their reporting but also through well-received if sometimes controversial books. Often exposed to danger, sometimes arrested, and occasionally expelled from their host countries, they helped in their reports and broad-

casts to bring the outside world closer to Americans who had previously found it remote. The immediacy of such contact was particularly pronounced in the radio broadcasts that, albeit under less than ideal conditions, Shirer made from Nazi Germany and Nazi-occupied France. It would be even more the case with Edward R. Murrow’s broadcasts from Britain during the London Blitz, made in conditions of considerable danger that brought the reality of war home to the American public. Despite their personal reservations on such issues as British colonialism and social inequities or French military irresolution, during World War II, such American journalists were almost invariably pro-Allied in sympathy. Their writings and broadcasts helped to convince many Americans that, however risky such policies might be, assisting the Allies and opposing the Nazis in Europe was morally justifiable. The activities of such journalists therefore helped to bolster the pro-Allied course steered by the administration of President Franklin D. Roosevelt.

About the Document

These entries from Shirer’s diary are a small part of a volume of more than 600 pages, based on the journal he kept during his time in Europe, which he published in 1941, after his return from Germany and shortly before the United States formally entered World War II. In his memoirs—though not in the published diary—Shirer dramatically described how he managed, at considerable personal risk, to smuggle his original journal out of Germany, packing it in two suitcases, well hidden under stamped copies of his government-censored radio broadcasts, which he then persuaded the Gestapo (the Nazi secret police) to approve and seal up the day before he took them to the airport. The reason he omitted this information even from the preface of the published diaries may well have been that he did not wish, by alerting German officials to his tactics, to close that route for other individuals.

Published diaries often differ from the original version in omitting certain material, sometimes because it is personally sensitive or embarrassing, in other cases because the information seems, upon reflection, to be irrelevant or trivial. When material is overly lengthy, cutting is also common. According to Shirer, in publishing his diary he drew when necessary upon his professional reports and broadcasts and occasionally had to rely upon his memory to reconstruct particular episodes he had considered too dangerous to trust to paper. In the published version, he deliberately changed names and identifying information for individuals whose safety might otherwise be jeopardized. In his memoirs of the period, published in 1984, Shirer could be far more frank than he could in 1941 about his informants and other contacts within the Nazi regime. To resolve some of these questions, a dedicated researcher, determined to check the accuracy and completeness of Shirer’s diary, would find it necessary to

consult his personal papers, now in the library of Coe College, Cedar Rapids, Iowa, including the original manuscripts of his diary and the several books he wrote on the period. Writing a diary or journal is, moreover, inevitably a selective process in which the diarist records those events or matters that seem most significant in the moment. With hindsight, other and different issues or occurrences may appear far more important than they did at the time of the entry.

It is also necessary to remember that Shirer himself had certain objectives in publishing his diary at the particular time he did. Almost certainly, one reason he did so was one shared by numerous authors: to profit financially by publishing a popular book. More broadly, however, his purpose in recounting his experiences in Germany was to heighten the consciousness of the American public to the evil, oppressive, and aggressive nature of the Nazi regime and to convince his countrymen that it constituted a genuine threat not just to other European nations but also to the United States.

The particular extract selected here is among the earliest entries in Shirer's diary. When he moved to Berlin in 1934, his first major assignment was to attend that year's rally of the Nazi Party at Nuremberg in Bavaria, the regime's earliest home. This was the first occasion on which he saw Hitler in person, and the experience had a significant impact on him. A major preoccupation for Shirer was to understand for himself and explain to others why and how the Nazi Party, with its rather crude and brutal ideology and often less than appealing personnel, had been able to win the loyalties of the German working and middle class, so that, even if they had not originally supported the party, they were prepared to tolerate and acquiesce in the regime. Much as he detested Hitler, Shirer recognized the power of his almost mesmerizing rhetorical talents. His week at Nuremberg also forced him to acknowledge the skillful manner in which the Nazi Party deployed pageantry and organization to maximize the impact of its message upon the military, the general public, and "the little men of Germany who have made Nazism possible." European Fascist regimes of the interwar years followed the time-honored formula of keeping the masses happy with "bread and circuses." Personally deeply unsympathetic to Hitler's regime, Shirer himself nonetheless clearly felt the emotional impact and exhilarating appeal of this weeklong mass rally.

During all the time he kept his diary, explaining German support for the Nazi government and acquiescence in its destruction of civil liberties, elimination of all political rivals, and persecution of dissidents and Jews remained one of Shirer's major themes. He reported how many of his middle-class friends—formerly liberals, socialists, or even communists, often artists and students—praised National Socialism for restoring national pride and dignity to the German Fatherland; reversing the humiliations the Treaty of Ver-

sailles had inflicted on Germany in 1919; and providing order, authority, stability, and firm rule. In return for such reinvigoration, they were prepared to compromise individual and collective rights and liberties. The working class made a similar bargain, acquiescing in Hitler's eradication of the trade union movement in return for well-paid steady jobs, good benefits, and the psychological boost participation in national regeneration bestowed. Even some of Shirer's seemingly most helpful German informants were eventually revealed to be government spies. Shirer left his readers with no illusions as to the level of general German support for the Nazi regime, though he sometimes attributed this enthusiasm to the pervasive egotism of the national character, a belief that whatever was beneficial to Germany was right, and a corresponding popular inability to comprehend general concepts of international rights, as opposed to what was in the German national interest. This perspective, implicitly suggesting that German support for Hitler was so entrenched that only military defeat and conquest would cause the regime's overthrow, was a theme Shirer repeated over several decades in his various works on Nazi rule. It was also an outlook well crafted to persuade Americans to enter the war as the only means of effecting the eventual destruction of Nazi government in Germany.

Excerpts from William Shirer's *Berlin Diary*

Entry, 5 September 1934

I'm beginning to comprehend, I think, some of the reasons for Hitler's astounding success. Borrowing a chapter from the Roman [Catholic] Church, he is restoring pageantry and colour and mysticism to the drab lives of twentieth-century Germans. This morning's opening meeting in the Luitpold Hall on the outskirts of Nuremberg was more than a gorgeous show; it also had something of the mysticism and religious fervour of an Easter or Christmas Mass in a great Gothic cathedral. The hall was a sea of brightly coloured flags. Even Hitler's arrival was made dramatic. The band stopped playing. There was a hush over the thirty thousand people packed in the hall. Then the band struck up the *Badenweiler March*, a very catchy tune, and used only, I'm told, when Hitler makes his big entries. Hitler appeared in the back of the auditorium, and followed by his aides, Göring, Goebbels, Hess, Himmler, and the others, he strode slowly down the long centre aisle while thirty thousand hands were raised in salute. It is a ritual, the old-timers say, which is always followed. Then an immense symphony orchestra played Beethoven's *Egmont* Overture. Great Klieg lights played on the stage, where Hitler sat surrounded by a hundred party officials and officers of the army and navy. Behind them the "blood flag," the one carried down the streets of Munich in the ill-fated putsch. Behind

this, four or five hundred S.A. standards. When the music was over, Rudolf Hess, Hitler's closest confidant, rose and slowly read the names of the Nazi "martyrs"—brown-shirts who had been killed in the struggle for power—a roll-call of the dead, and the thirty thousand seemed very moved.

In such an atmosphere no wonder, then, that every word dropped by Hitler seemed like an inspired Word from on high. . . .

Entry, 6 September 1934

Hitler sprang his *Arbeitsdienst*, his Labour Service Corps, on the public for the first time today and it turned out to be a highly trained, semi-military group of fanatical Nazi youths. Standing there in the early morning sunlight which sparkled on their shiny spades, fifty thousand of them, with the first thousand bared above the waist, suddenly made the German spectators go mad with joy when, without warning, they broke into a perfect goose-step. Now, the goose-step has always seemed to me to be an outlandish exhibition of the human being in his most undignified and stupid state, but I felt for the first time this morning what an inner chord it strikes in the strange soul of the German people. Spontaneously they jumped up and shouted their applause. There was a ritual even for the Labour Service boys. They formed an immense *Sprechchor*—a chanting chorus—and with one voice intoned such words as these: "We want one Leader! Nothing for us! Everything for Germany! *Heil Hitler!*" . . .

Entry, 7 September 1934

Another great pageant tonight. Two hundred thousand party officials packed in the Zeppelin Wiese with their twenty-one thousand flags unfurled in the searchlights like a forest of weird trees. "We are strong and will get stronger," Hitler shouted at them through the microphone, his words echoing across the hushed field from the loud-speakers. And there, in the flood-lit night, jammed together like sardines, in one mass formation, the little men of Germany who have made Nazism possible achieved the highest state of being the Germanic man knows: the shedding of their individual souls and minds—with the personal responsibilities and doubts and problems—until under the mystic lights and at the sound of the magic words of the Austrian they were merged completely in the Germanic herd. Later they recovered enough—fifteen thousand of them—to stage a torchlight parade through Nuremberg's ancient streets, Hitler taking the salute in front of the station across from our hotel. . . .

Entry, 10 September 1934

Today the army had its day, fighting a very realistic sham battle in the Zeppelin Meadow. It is difficult to exaggerate the frenzy of the three hundred thousand German spectators when they saw their soldiers go into action, heard the thunder of the guns, and smelt the powder. I feel that all those Americans and English (among others) who thought that German militarism was merely a product of the Hohen-

zollerns—from Frederick the Great to Kaiser Wilhelm II—made a mistake. It is rather something deeply ingrained in all Germans. They acted today like children playing with tin soldiers. The Reichswehr [German army] "fought" today only with the "defensive" weapons allowed them by Versailles, but everybody knows they've got the rest—tanks, heavy artillery, and probably airplanes.

LATER.—After seven days of almost ceaseless goose-stepping, speech-making, and pageantry, the party rally came to an end tonight. And though dead tired and rapidly developing a bad case of crowd-phobia, I'm glad I came. You have to go through one of these to understand Hitler's hold on the people, to feel the dynamic in the movement he's unleashed and the sheer, disciplined strength the Germans possess. And now—as Hitler told the correspondents yesterday in explaining his technique—the half-million men who've been here during the week will go back to their towns and villages and preach the new gospel with new fanaticism.

1.5. Arthur Koestler on the Spanish Civil War

The Spanish Civil War, 1936–1939

In summer 1936, a civil war began in Spain, when discontented Fascist army officers led by General Francisco Franco launched a Nationalist rebellion from the Spanish colony of Morocco against the newly elected leftist Republican govern-

ment. The uprising spread rapidly throughout Spain, and by the end of 1936, Nationalist troops controlled much though not all of the country. Franco and his supporters, who appealed to national pride and honor, were determined to thwart the Left and impose a Fascist government on Spain. They soon won recognition, together with encouragement and support in men and weaponry, from the sympathetic Fascist governments of Germany and Italy. Italy sent more than 200 aircraft, 2,500 tons of bombs, 50 tanks, almost 4,000 motor vehicles, and 12,000 machine guns. Germany contributed almost 12,000 men, organized in the autonomous Condor Legion under Franco's control, whose forces included more than a dozen well-equipped fighter and bomber airplane squadrons. These developments occurred despite the establishment at the beginning of the war of an international Non-intervention Committee on which all major nations were represented, its purported mission to localize and contain the civil war to Spain itself and to preclude foreign involvement. At the end of the year, the indignant Spanish government appealed to the League of Nations to force Italy and Germany to cease their assistance to the Nationalist rebels. In response to appeals from the Spanish government, in December 1936 the League of Nations Council passed a resolution urging all nations to refrain from intervention in the civil conflict in that state. All parties to the war effectively ignored this and several successive resolutions along the same lines passed by the League between 1937 and 1939.

In practice, the Republican government received assistance not only from the Spanish Communist Party but also from the Soviet Union, which like the Fascist states sent "volunteers" to fight in Spain. By 1936, fear of attack from both Japan and Nazi Germany persuaded Soviet leaders to embrace the "Popular Front" strategy of cooperating with all anti-Fascist forces, Communist and non-Communist alike. From 1937, Soviet leader Josef Stalin encouraged communists from all countries to enroll in the Republican forces. He sent Soviet advisers to assist the Spanish government and train guerrilla forces, together with 1,000 aircraft, 900 tanks, 300 armored cars, 1,500 heavy guns, 15,000 machine guns, and large quantities of small-arms weapons and munitions. Communists were represented in the Spanish government but did not dominate it, and they supported its suppression of the May 1937 Anarchist uprising in Barcelona. Such policies of setting aside leftist ideological differences, characteristic of the Popular Front era, continued until Franco's forces finally prevailed in March 1939. Popular Front collaboration was not popular with all communists, and the Trotskyist Workers' Party of Marxist Unity (POUM) opposed it, leading to bitter feuding and violence among Spanish communists and those who came from elsewhere to join in the fighting.

For many on the Left, the Spanish Civil War, the first occasion on which Communist and Fascist forces fought each other in Europe, evoked a profound emotional response. Great Britain and France refused to assist or sell munitions of war to either side in the war, including the legitimate government, claiming that they were merely observing the anti-intervention resolutions of the League of Nations. The United States likewise imposed an embargo on arms sales to each side. Left-wing critics argued that, far from being neutral, these policies effectively assisted the Fascist rebels. Many liberals from Europe and the United States went to Spain to fight or provide medical assistance to the Republican forces, often joining the International Brigade of left-wing soldiers fighting for the government. Among the better known were the American novelist and journalist Ernest Hemingway, the British writer George Orwell, the German-Hungarian journalist Arthur Koestler, and such young Cambridge intellectuals as John Cornford and Julian Bell, both of whom were killed in action during the war.

The fighting forces on all sides treated enemy forces, civilians, and political rivals with great brutality, aspects of combat and warfare that a few years later would also characterize World War II, especially in partisan and guerrilla situations. Total war regarded both soldiers and noncombatants as legitimate targets, as demonstrated in the brutal bombing of the town of Guernica in April 1937, an episode that generated international protests and one of the most famous antiwar paintings of the renowned Spanish artist, Pablo Picasso. Atrocities against troops and civilians were common, exploited by both sides for propaganda purposes. Total deaths during and immediately after the war were estimated at 500,000, including approximately 10 percent of the fighting forces in each camp and 10,000 civilians killed in bombing raids. Approximately 120,000 were executed during the war by both sides and a further 100,000 by the Nationalists when the war ended. Internecine fighting was common among government supporters, as Popular Front and Communist forces, encouraged by their Soviet advisers, routinely assassinated dissident Anarchists and other political rivals. The brutal Communist intolerance of any dissent from the party line was one major reason why such leftists as George Orwell and Arthur Koestler subsequently became disillusioned with communism and publicly turned against their former faith. On 1 April 1939, the war finally ended in a Nationalist victory. Unlike his fellow Fascist dictators in Germany and Italy, Franco remained neutral during World War II and stayed in power until his death in 1975.

About the Author

Arthur Koestler was born in Hungary to well-to-do Jewish parents. In 1922, he entered the University of Vienna, where

he joined the militant Zionist movement that demanded the establishment of a Jewish state in Palestine, where Koestler moved in 1926. He soon became a journalist, assigned to Paris in 1929 and Berlin the following year. Based in France from 1932 to 1936, for six years, until 1938, he belonged to the German Communist Party. When the Spanish Civil War began in 1936, the Comintern dispatched Koestler to Spain. Posing as a right-wing journalist but accredited to the liberal, anti-Franco *British News Chronicle*, he was expected to spy on the Nationalist forces. His cover was unconvincing, and in February 1937, he was arrested and imprisoned in Seville, where he was sentenced to death. Koestler was luckier than most such prisoners in that he escaped execution, primarily due to the extensive publicity and lobbying campaign for his release that his influential friends in Britain and France promptly launched on his behalf. In an exchange of prisoners, he was freed on 15 May 1937.

Koestler promptly published a book describing his experiences in Spain. In 1938, he left the Communist Party, disillusioned not only by his exposure to its unscrupulous tactics in the Spanish Civil War but also by Stalin's purges and show trials of rivals in Moscow. In 1940, Koestler published the strongly anticommunist novel *Darkness at Noon*, an account of the Soviet persecution of an idealistic "old Bolshevik" and his loss of faith, which won him new prominence as a leading anticommunist European intellectual. In subsequent works, including *The Yogi and the Commissar* (1945) and *The God That Failed* (1949) and his memoirs, *Arrow in the Blue* (1951) and *The Invisible Writing* (1954), Koestler enlarged on his idealistic search for a political creed and his eventual personal disillusionment with communism. From the mid-1950s onward, his predominant interest was the paranormal. Suffering from terminal illness, he committed suicide in 1983, as did his third wife. Allegations that he had sexually assaulted numerous women diminished posthumously Koestler's liberal reputation.

About the Document

Arthur Koestler wrote and published the book from which this account is taken shortly after his escape from imprisonment in Spain. Its British publisher was the strongly pro-Republican Left Book Club, which used the book as propaganda to vindicate the Republican government's position and discredit the Right in Spain by exposing the extent of German and Italian military intervention in the conflict and the brutality and atrocities committed by the Nationalist camp. Though Koestler's account may well have been truthful, he was also decidedly selective in what he chose to include. At that point, Koestler himself disingenuously failed to reveal his own membership in the Communist Party, let alone the espionage mission with which the party had

entrusted him, preferring to present himself "as a journalist of liberal convictions and author of fragments of pacifist novels" and "an incorrigible Left-wing liberal." He described his own interest in "tracking down the German airmen" and assessing the degree of Adolf Hitler's involvement in Spain as a "private hobby."

Koestler's description of his encounters with German aviators in a Seville hotel was designed to illustrate that, despite professions of nonintervention, Germany was providing extensive military assistance to the Nationalist rebels. He indicated, moreover, that German officers were not only present in Spain but that they were prepared to use violent methods to eliminate any dissenters on the Left. The book also gave graphic descriptions of fighting, including the bombing of civilians, incidents in which German and Italian airplanes were usually prominent, and of massacres of noncombatant government supporters by Nationalist forces. It minimized the degree of communist influence within the Republican government and also the extent of international communist involvement in the war. In addition, its accounts of prison life emphasized the harsh and arbitrary nature of Nationalist justice, with Koestler's own survival due largely to his foreign connections and Nationalist reluctance to provoke an international incident. Interestingly, after leaving the Communist Party and publicly condemning that ideology, Koestler published in 1942 a revised and more honest version, *Dialogue with Death*, which played down the heroism and ideological fervor of communists inside and outside jail and revealed his own covert espionage assignment for the party.

Excerpt from *Spanish Testament* (1937)

My stay in Seville was very instructive and very brief.

My private hobby was tracking down the German airmen; that is to say, the secret imports of 'planes and pilots, which at that time was in full swing, but was not so generally known as it is today. It was the time when European diplomacy was just celebrating its honeymoon with the Non-Intervention Pact. Hitler was denying having despatched aircraft to Spain, and Franco was denying having received them, while there before my very eyes fat, blond German pilots, living proof to the contrary, were consuming vast quantities of Spanish fish, and, monocles clamped into their eyes, reading the *Volkischer Beobachter*.

There were four of these gentlemen in the Hotel Cristina in Seville at about lunch time on 28 August 1936. The Cristina is the hotel of which the porter had told me that it was full of German officers and that it was not advisable to go there, because every foreigner was liable to be taken for a spy.

I went there, nevertheless. It was, as I have said, about two o'clock in the afternoon. As I entered the lounge, the four

pilots were sitting at a table, drinking sherry. The fish came later.

Their uniforms consisted of the white overall worn by Spanish airmen; on their breasts were two embroidered wings with a small swastika in a circle (a swastika in a circle with wings is the so-called “Emblem of Distinction” of the German National-Socialist Party).

In addition to the four men in uniform one other gentleman was sitting at the table. He was sitting with his back to me; I could not see his face.

I took my place some tables further on. A new face in the lounge of a hotel occupied by officers always creates a stir in times of civil war. I could tell that the five men were discussing me. After some time the fifth man, the one with his back to me, got up and strolled past my table with an air of affected indifference. He had obviously been sent out to reconnoitre.

As he passed my table, I looked up quickly from my paper and hid my face even more quickly behind it again. But it was of no use; the man had recognized me, just as I had recognized him. It was Herr Strindberg, the undistinguished son of the great August Strindberg; he was a Nazi journalist, and war correspondent in Spain for the Ullstein group. This was the most disagreeable surprise imaginable. I had known the man years previously in Germany at a time when Hitler had been still knocking at the door, and he himself had been a passionate democrat. At that time I had been on the editorial staff of the Ullstein group, and his room had been only three doors from mine. Then Hitler came to power and Strindberg became a Nazi.

We had no further truck with one another but he was perfectly aware of my views and political convictions. He knew me to be an incorrigible Left-wing liberal, and this was quite enough to incriminate me. My appearance in this haunt of Nazi airmen must have appeared all the more suspect inasmuch as he could not have known that I was in Seville for a newspaper.

He behaved as though he had not recognized me, and I did the same. He returned to his table.

He began to report to his friends in an excited whisper. The five gentlemen put their heads together.

Then followed a strategic manoeuvre: two of the airmen strolled towards the door—obviously to cut off my retreat; the third went to the porter’s lodge and telephoned—obviously to the police; the fourth pilot and Strindberg paced up and down the room.

I felt more and more uncomfortable and every moment expected the Guardia Civil to turn up and arrest me. I thought the most sensible thing would be to put an innocent face on the whole thing, and getting up, I shouted across the two intervening tables with (badly) simulated astonishment:

“Hallo, aren’t you Strindberg?”

He turned pale and became very embarrassed, for he had not expected such a piece of impudence.

“I beg your pardon, I am talking to these gentlemen,” he said.

Had I still had any doubts, this behaviour on his part would in itself have made it patent to me that the fellow had denounced me. Well I thought, the only thing that’s going to get me out of this is a little more impudence. I asked him in a very loud voice, and as arrogantly as possible, what reason he had for not shaking hands with me.

He was completely bowled over at this, and literally gasped. At this point his friend, airman number four, joined in the fray. With a stiff little bow he told me his name, von Bernhardt, and demanded to see my papers.

The little scene was carried on entirely in German.

I asked by what right Herr von Bernhardt, as a foreigner, demanded to see my papers.

Herr von Bernhardt said that as an officer in the Spanish Army he had a right to ask “every suspicious character” for his papers.

Had I not been so agitated, I should have pounced upon this statement as a toothsome morsel. That a man with a swastika on his breast should acknowledge himself in German to be an officer in Franco’s army, would have been a positive tit-bit for the Non-Intervention Committee.

I merely said, however, that I was not a “suspicious character,” but an accredited correspondent of the London “News Chronicle,” that Captain Bolín [the rebel press chief in Seville] would confirm this, and that I refused to show my papers.

When Strindberg heard me mention the “News Chronicle” he did something that was quite out of place: he began to scratch his head Herr von Bernhardt too grew uncomfortable at the turn of events and sounded a retreat. We went on arguing for a while, until Captain Bolín entered the hotel. I hastened up to him and demanded that the others should apologise to me, thinking to myself that attack was the best defence and that I must manage at all costs to prevent Strindberg from having his say. Bolín was astonished at the scene and indignantly declared that he refused to have anything to do with the whole stupid business, and that in time of civil war he didn’t give a damn whether two people shook hands or not.

In the meantime the Civil Guards had actually arrived on the scene, with fixed bayonets and pugnacious expressions, to arrest the “suspicious character.” Bolín angrily told them to go to the devil. And to the devil they went.

I decamped there and then from the confounded Cristina. Arrived at my hotel, I began hurriedly to pack. I had hardly finished when a French colleague of mine came up to my room and privately advised me to leave for [British-controlled] Gibraltar as quickly as possible. He was obviously acting as the mouthpiece of some higher authority; but he refused to say

whom. He merely said that he had heard of the shindy and that the whole affair might turn out very seriously for me.

Eight hours later I was in Gibraltar.

Twenty-four hours later I learned from private sources that a warrant for my arrest had been issued in Seville.

So Strindberg junior had had his say after all.

1.6. The Sino-Japanese War Begins

The Outbreak of War in China

From at least 1931, when Japan seized China's northeastern Manchurian region, establishing the puppet state of Manchoukuo (Manchukuo) there the following year, Japan and China enjoyed poor relations. Japan sought to increase its influence in north China, holding Hebei province and administering much of the Shandong peninsula as a virtual protectorate, and claiming special rights over various strategic railway lines.

During the mid-1930s, Chinese resentment of Japanese incursions grew dramatically. In 1935, troops commanded by Marshal Zhang Xueliang, a leading Manchurian warlord who had sworn allegiance to Jiang Jieshi [Chiang Kai-shek], the Nationalist or Guomindang [Kuomintang] president of China, defied the latter's orders to launch another campaign against Chinese Communists. They contended that all Chinese political factions should unite against the Japanese invaders, not fight each other. In December 1936, Zhang kidnapped Jiang at a spa in Xi'an in China's far west, not releasing him until he agreed to an anti-Japanese rapprochement

with Communist leaders. In all probability, Jiang also agreed to take a harsher line toward future Japanese incursions.

On 7 July 1937, a skirmish took place between Chinese and Japanese troops stationed near the historic Marco Polo Bridge 10 miles outside Beijing, a landmark that stood next to a strategically significant railroad bridge. Japanese forces on night maneuvers fired blank cartridges, prompting nearby Chinese soldiers to retaliate with live fire, though without injuring anyone. At next day's roll call, one Japanese soldier was missing, and his commander assumed he had been taken captive by Chinese units based in nearby Wanping. On 8 July, the Chinese commander refused entry to Japanese forces seeking the missing soldier, whereupon they unsuccessfully attacked the town. The missing soldier, who apparently had never been in Chinese custody, reappeared the following day, and both sides began negotiations intended to resolve the dispute, which at this time involved only 135 Japanese troops.

Although Japanese officials of that time undoubtedly sought to increase their influence in Wanping and the neighboring Lu-kou-ch'iao area, in all probability the initial incident was a spontaneous accident, not a premeditated effort to provoke a broader crisis. Such minor clashes were not uncommon. In this case, however, officials in both governments seized upon it as a pretext to demand a broader comprehensive settlement of outstanding issues dividing Japan and China. Japanese military commanders in Manchoukuo (Manchukuo) and north China sought extensive concessions from China, and Jiang Jieshi feared that further acquiescence to Japanese demands would irretrievably damage his political standing. On 20 July, Jiang sent several Chinese divisions to reinforce North China, while Japanese forces quickly seized control of the entire Beijing-Tianjin area, transferring 15 additional divisions there and killing several thousand Chinese. Japan sought outright control of North China, whereas Jiang insisted on maintaining full Chinese sovereignty there. Both Chinese and Japanese policies hardened until no compromise was possible, though neither side formally declared war. On 7 August, however, Jiang and his advisers decided to wage a full-scale war of resistance against Japan, the beginning of eight years of bitter and brutal fighting between the two countries, ended only when Japan surrendered unconditionally to the Allies in August 1945. Japan never formally declared war on China, and China left its formal declaration of war on Japan until December 1941, after Pearl Harbor, when it could join hostilities as a full ally of the powerful United States.

The Nanjing Massacre (13 December 1937–22 January 1938)

In its early stages, China's war with Japan was one of rapid movement and military disaster. In late July 1937, Japanese

troops took over the entire Beijing-Tianjin area of north China. They inflicted a series of major defeats upon Jiang's military, wiping out most of his modernized units and, over the following 18 months, successively taking Shanghai, Nanjing, Guangzhou, and Wuhan, China's provisional capital after Nanjing fell. Chinese Nationalist forces under Guomindang [Kuomintang] President Jiang Jieshi [Chiang Kai-shek] initially offered strong resistance to the Japanese invasion, holding out at Shanghai, the country's greatest port city and the site of a major international settlement, from 13 August to 9 November 1937. They then fell back, moving inland in a near-rout upon the Nationalist capital of Nanjing, a symbolic location housing more than 1 million Chinese that Jiang was not prepared to abandon without a fight but for whose defense or evacuation no plans had been made. Another of Jiang's objectives in defending both the treaty port of Shanghai and Nanjing, home to numerous foreign embassies, was to attract worldwide attention and win foreign support for China's anti-Japanese war.

In early December, Japanese troops converged upon Nanjing, opening a massive assault on 9 December after Chinese troops rejected their demands to surrender. Three days later, the Chinese defenders fell back across the Yangzi River, and the following day the 6th, 9th, and 116th Divisions of the Japanese army entered the city as two Japanese navy fleets arrived up the Yangzi. Over the following six weeks, the Japanese occupiers deliberately instituted a reign of terror, apparently designed to cow China's population into ready submission to Japanese invasion. Frustration over Jiang's refusal to surrender, which Japanese leaders had expected him to do before the end of 1937, may have been another contributing factor. Entering the city on 13 December, Japanese forces fired on streets crowded with refugees, wounded soldiers, and civilians and also on many thousands of refugees attempting to escape by swimming the river. The occupying forces used machine guns, bayonets, fire, burial alive, and poison gas to massacre captured Chinese soldiers and any young men suspected of being such. Scattered atrocities and murders, often marked by great brutality, continued throughout the city for six weeks, as did heavy looting. Counts of how many soldiers and civilians died in the Nanjing massacre range from 42,000 to 300,000. During this period Japanese soldiers raped an estimated 20,000 women, most of whom were then killed.

The Nanjing massacre shocked many in the West and generated extensive international sympathy for China, though this did not necessarily translate into tangible support and assistance. It was an early example of the use of organized brutality to cow and terrorize civilian populations characteristic of many World War II military occupations. As the twenty-first century began, memories of the Nanjing massacre remained bitter in China, with a major museum com-

memorating the event in Nanjing. For many decades, Japanese officials, by contrast, sought to deny the episode ever took place, or at least to minimize its scale, and omitted it from official accounts of the war. In the late 1990s, however, several Japanese journalists and academics who investigated the subject mounted dedicated efforts to bring the event to the attention of their countrymen.

About the Documents

Official diplomatic correspondence between governments is normally drafted by civil servants and rarely emotional or personal. The letter and press release here are quite typical. In its official account of the incident, delivered five days later to the U.S. Secretary of State, the Japanese government sought to justify the actions of its own forces during the Marco Polo Bridge incident, to prove that Japanese troops had been in the right and their Chinese counterparts in the wrong. Japanese government officials stipulated that these troops' presence in North China was justified under long-standing international agreements signed between China and Japan. They cited Chinese unwillingness to reach a settlement of this episode to justify their own decision, reached within five days of the initial incident, to send additional Japanese military forces to North China. The Japanese government also stated that it still hoped to resolve the previous two clashes in a peaceable manner that would prevent their recurrence. In all probability, at this stage, Japanese leaders had not yet definitely decided to make these skirmishes a pretext for demanding broader concessions from China and a settlement of various outstanding issues dividing the two countries that would be acceptable to Japan.

For many years, at least since the dispatch of the Open Door notes of 1899–1900, the United States had presented itself as the guardian of China's international position. Both the United States and Japan were also signatories of the 1921–1922 Washington Conference Treaties, which were designed to safeguard the status quo in the Asia-Pacific region. The Japanese government delivered similar messages to all the signatory powers, hoping that by taking this action, it would allay any apprehensions on their part that Japan nurtured broader territorial designs upon China.

The initial U.S. reaction was noncommittal. The State Department issued a brief announcement that both the Chinese and Japanese ambassadors had called, to deliver their versions of the episode. This statement emphasized that U.S. diplomats had told both sides of their hopes that peace would be maintained. Despite their country's traditional rhetorical friendship for China, for several decades, U.S. officials had rarely been willing to provide much in the way of concrete military or economic backing for their verbal pledges to China. For most of the 1930s, for example, the U.S. govern-

ment protested against Japan's actions in Manchuria and refused to recognize the puppet state of Manchukuo (Manchukuo) but continued to permit Japan to purchase from U.S. suppliers the iron, steel, and gasoline that underpinned Japanese military activities in East Asia. In 1937, the United States was still suffering from the economic impact of the Great Depression that took hold from 1929 onward, and domestic recovery remained a major priority. President Franklin D. Roosevelt was, moreover, increasingly preoccupied with the deteriorating situation in Europe, where Italy had annexed Ethiopia, the Spanish Civil War was in progress, and German plans to take over Austria, Czechoslovakia, and other territories were becoming ever more apparent. As this document demonstrates, the prospect of an additional international crisis in Asia alarmed the U.S. government, which therefore sought to prevent this outcome to the Sino-Japanese clashes.

This newspaper account of the early stages of the Nanjing Massacre was written and published four or five days after the massacre began. The writer, Frank Tillman Durdin, a correspondent for the *New York Times*, was one of only five non-Chinese journalists present in Nanjing from 11 December until 15 December, when the few remaining foreign newsmen were finally evacuated to the relative safety of a U.S. naval vessel moored in Shanghai harbor. He was therefore in a position to view many of the atrocities and to obtain first-hand testimony from other witnesses. Durdin later had a long and distinguished career as a foreign correspondent in Asia, and during World War II he won a reputation for courage in physically dangerous situations. His second paragraph suggests that he may have relied heavily on accounts from other Westerners in the city, whom Japanese soldiers were less likely to attack than they would Chinese or other Asians.

Durdin's account conveyed rather well the sense of shock that the atrocities in Nanjing generated throughout the Western world. His description of the killing of numerous Chinese individuals and the obvious enjoyment and relish many Japanese troops found in casual slaughter and in murdering and tormenting Nanjing's inhabitants, soldiers and civilians alike, was gruesome and graphic, though rather general. He rightly suggested that, by employing wholesale terror, Japanese officials sought to cow the Chinese population into submission.

Interestingly, even though other writers at the time and since did so, Durdin did not mention the mass rapes—often a prelude to murder—of Chinese women, which were very common during the Nanjing massacre. It may be that, since he only witnessed the first few days of almost six weeks of frenzied atrocities, he was not aware of these occurrences. It is equally possible, however, that an element of self-censorship by either Durdin himself or his editor was involved. The *New York Times*, where his report was published, famously

boasted that it provided “all the news that's fit to print.” In deference to the sensibilities of readers, the acts of violence recounted in this article, though clearly horrific, are often left slightly vague in detail. In the 1930s, this respectable newspaper of record might well have refrained from publishing even well-attested accounts of mass rapes on the grounds that decent readers would not wish to be confronted with descriptions of such sensational and unpleasant events. It would take another world war and several lesser conflicts, plus the Holocaust and a revolution in Western sexual mores, to remove such inhibitions upon the fare the editors of well-regarded journals saw fit to offer their readers.

Primary Source

A) The Japanese Embassy to the Department of State, 12 July 1937

1. In the evening of July 7, 1937 a detachment of the Japanese troops stationed at Fengtai, near Peiping, was engaged in a night maneuver in the vicinity of Lukow Kiao. At 11:40 p.m. Chinese troops under the command of Feng Chih-an (29th Army) made an attack upon the Japanese soldiers for no cause at all.

Thereupon the detachment stopped the maneuver and asked the command at Fengtai to send out reinforcements.

2. At such maneuvers, the Japanese troops immediately carry a very small quantity of loaded shells for use in case of emergency. In point of fact the commanding officer of the said detachment had with him one box of loaded shells for the machine guns. In view of these facts, it is absolutely impossible for the Japanese soldiers to have challenged the Chinese.

3. The right of maneuver of the Japanese troops stationed in North China is clearly stipulated in the China-Japanese Protocol of 1902 concerning the restoration of Tientsin to China. Moreover, the Japanese authorities had informed the Chinese in advance of the holding of the maneuver in question. It is entirely groundless to say that the recent maneuver of the Japanese troops is an unlawful act committed outside the region stipulated in the said Protocol as reported in the newspapers.

4. Since the night of July 7, the Japanese authorities have made an earnest endeavor to localize the incident and once succeeded in bringing the Chinese authorities to agree to a peaceful settlement. On the night of July 10, however, the 29th Army, in violation of the agreement, suddenly fired on the Japanese troops, causing considerable casualties. In addition, it is reported, China has been increasing the forces of the first line by ordering Suiyan troops to march south and by sending central forces and air corps to the front.

Since the night of July 10, China not only has failed to manifest any sincerity toward a peaceful settlement but has flatly rejected the local negotiation at Peiping.

5. The presence of disorderly Chinese troops in the Peiping and Tientsin area not only disturbs peace and order in North China which is of vital importance to Japan, but also endangers the lives and property of the Japanese nationals there.

In the circumstances, the Japanese Government has decided to take precautionary steps to meet all situations, including the dispatch of additional military forces to North China.

6. The Japanese Government, desirous as ever to preserve peace in East Asia, has not abandoned hope that through peaceful negotiations the aggravation of the situation may yet be prevented.

An amicable solution can yet be attained if China agrees to offer apologies for the recent lawless action and to give adequate guarantees against such outrages in future.

In any case the Japanese Government is prepared to give full consideration to the rights and interests of the Powers in China.

B) Press Release Issued by the Department of State on 12 July 1937

The Japanese Ambassador and the Counselor of the Chinese Embassy each called at the Department this morning, and communicated information in regard to events in North China. In the course of the conversations which ensued both were given expression of the view that an armed conflict between Japan and China would be a great blow to the cause of peace and world progress.

C) The Nanjing Massacre: F. S. Tillman Durdin, “All Captives Slain,” *New York Times*, 18 December 1937.

Aboard the U.S.S. Oahu at Shanghai, Dec. 17 [1937].

Through wholesale atrocities and vandalism at Nanking the Japanese Army has thrown away a rare opportunity to gain the respect and confidence of the Chinese inhabitants and of foreign opinion there. . . .

The killing of civilians was widespread. Foreigners who traveled widely through the city Wednesday found civilians dead on every street. Some of the victims were aged men, women and children.

Policemen and firemen were special objects of attack. Many victims were bayoneted and some of the wounds were barbarously cruel.

Any person who ran because of fear or excitement was likely to be killed on the spot as was any one caught by roving patrols in streets or alleys after dark. Many slayings were witnessed by foreigners.

The Japanese looting amounted almost to plundering of the entire city. Nearly every building was entered by Japanese soldiers, often under the eyes of their officers, and the men took whatever they wanted. The Japanese soldiers often impressed Chinese to carry their loot. . . .

The mass executions of war prisoners added to the horrors the Japanese brought to Nanking. After killing the Chinese soldiers who threw down their arms and surrendered, the Japanese combed the city for men in civilian garb who were suspected of being former soldiers.

In one building in the refugee zone 400 men were seized. They were marched off, tied in batches of fifty, between lines of riflemen and machine gunners, to the execution ground.

Just before boarding the ship for Shanghai the writer watched the execution of 200 men on the Bund [dike]. The killings took ten minutes. The men were lined against a wall and shot. Then a number of Japanese, armed with pistols, trod nonchalantly around the crumpled bodies, pumping bullets into any that were still kicking.

The army men performing the gruesome job had invited navy men from the warships anchored off the Bund to view the scene. A large group of military spectators apparently greatly enjoyed the spectacle.

When the first column of Japanese troops marched from the South Gate up Chungshan Road toward the city’s Big Circle, small knots of Chinese civilians broke into scattering cheers, so great was their relief that the siege was over and so high were their hopes that the Japanese would restore peace and order. There are no cheers in Nanking now for the Japanese.

By despoiling the city and population the Japanese have driven deeper into the Chinese a repressed hatred that will smolder through tears as forms of the anti-Japanism that Tokyo professes to be fighting to eradicate from China.

The capture of Nanking was the most overwhelming defeat suffered by the Chinese and one of the most tragic military debacles in the history of modern warfare. In attempting to defend Nanking the Chinese allowed themselves to be surrounded and then systematically slaughtered. . . .

The flight of the many Chinese soldiers was possible by only a few exits. Instead of sticking by their men to hold the

invaders at bay with a few strategically placed units while the others withdrew, many army leaders deserted, causing panic among the rank and file.

Those who failed to escape through the gate leading to Hsiakwan and from there across the Yangtze were caught and executed. . . .

When the Japanese captured Hsiakwan gate they cut off all exit from the city while at least a third of the Chinese Army still was within the walls.

Because of the disorganization of the Chinese a number of units continued fighting Tuesday noon, many of these not realizing the Japanese had surrounded them and that their cause was hopeless. Japanese tank patrols systematically eliminated these.

Tuesday morning, while attempting to motor to Hsiakwan, I encountered a desperate group of about twenty-five Chinese soldiers who were still holding the Ningpo Guild Building on Chungshan Road. They later surrendered.

Thousands of prisoners were executed by the Japanese. Most of the Chinese soldiers who had been interned in the safety zone were shot in masses. The city was combed in a systematic house-to-house search for men having knapsack marks on their shoulders or other signs of having been soldiers. They were herded together and executed.

Many were killed where they were found, including men innocent of any army connection and many wounded soldiers and civilians. I witnessed three mass executions of prisoners within a few hours Wednesday. In one slaughter a tank gun was turned on a group of more than 100 soldiers at a bomb shelter near the Ministry of Communications.

A favorite method of execution was to herd groups of a dozen men at entrances of dugouts and to shoot them so the bodies toppled inside. Dirt then was shoveled in and the men buried.

Since the beginning of the Japanese assault on Nanking the city presented a frightful appearance. The Chinese facilities for the care of army wounded were tragically inadequate, so as early as a week ago injured men were seen often on the streets, some hobbling, others crawling along seeking treatment.

Civilian casualties also were heavy, amounting to thousands. The only hospital open was the American managed University Hospital and its facilities were inadequate for even a fraction of those hurt.

Nanking's streets were littered with dead. Sometimes bodies had to be moved before automobiles could pass.

The capture of Hsiakwan Gate by the Japanese was accompanied by the mass killing of the defenders, who were piled up among the sandbags, forming a mound six feet high. Late Wednesday the Japanese had not removed the dead, and two days of heavy military traffic had been passing through, grinding over the remains of men, dogs and horses.

The Japanese appear to want the horrors to remain as long as possible, to impress on the Chinese the terrible results of resisting Japan.

Chungshan Road was a long avenue of filth and discarded uniforms, rifles, pistols, machine guns, fieldpieces, knives and knapsacks. In some places the Japanese had to hitch tanks to debris to clear the road.

1.7. Appeasement: For and Against

The Munich Agreement and Appeasement

The Munich crisis of August—September 1938; the agreement between Great Britain, France, Germany, and Czechoslovakia that ended it; and the broader policies of appeasement that the agreement epitomized are among the most controversial and emotive issues of the years leading to World War II. Ever since the Munich Agreement was concluded, debate has raged over whether British (and French) policy at that time toward Adolf Hitler's Germany was either pragmatically or morally justifiable. Philip Caputi's recent survey of the scholarly literature on British Prime Minister Neville Chamberlain and Munich reveals that, after two-thirds of a century, the jury is still out.

One of the centerpieces of Nazi Germany's foreign policy under Hitler was the demand that portions of neighboring

countries where the population was predominantly German should be incorporated into Germany proper. In spring 1938, Hitler annexed the largely ethnic German state of Austria, which enhanced his ability to threaten Czechoslovakia. The Czech state, which had only existed since 1919, included a substantial number of ethnic Germans, who were concentrated in the Sudetenland, which bordered on Germany. With tacit German encouragement, in the 1930s, a strong German separatist movement developed in that area, whose members alleged that they suffered political and social discrimination in Czechoslovakia and campaigned for unification with Germany. In summer 1938, Hitler aggressively demanded that Czechoslovakia cede the Sudetenland to Germany, threatening war should the Czech government, headed by Edvard Beneš, decline.

France was allied to Czechoslovakia by a mutual assistance pact, and Great Britain, as one of the signatories of the Treaty of Versailles, also had an interest in the future relationship of Czechoslovakia and Germany. British ties to France were also likely to involve Britain in any European war. The Communist Soviet Union, which Hitler had long depicted as Germany's ultimate opponent, made no definite pledges but encouraged Czechoslovakia to resist German demands. The French and British governments were each reluctant to risk war on behalf of Czechoslovakia, and the Soviet Union made its assistance conditional on France coming to the assistance of Czechoslovakia. Even as the well-armed Czechs declared their readiness to fight and mobilized their army, Britain, France, Italy, and Germany negotiated with each other over Czechoslovakia's fate. When talks appeared stalemated in late September, Chamberlain made the dramatic gesture of flying to Germany to meet Hitler at his mountain retreat of Berchtesgaden. Hitler promised to drop all further demands on Czechoslovakia in exchange for British and French acquiescence in his seizure of the Sudetenland. Hungary, Germany's ally, would also receive portions of Slovakia. When the Czech government protested its readiness to fight Germany, the British government made it clear that it would do so alone, without British or French assistance. After the Czechs yielded, the Soviet Union professed its readiness to help, an offer that was almost certainly deliberately made too late to affect events. Six months later, in March 1939, Hitler's troops marched into what was left of Czechoslovakia, which remained under German control until liberated by Soviet forces in 1944.

At the time and since, Chamberlain's conduct in particular attracted much opprobrium. Even since World War II, Western politicians have cited the Munich Agreement as a symbol of the folly of believing that any compromise is possible with dictators. Concessions and appeasement, it is argued, simply whet their appetite for more gains. The Munich analogy, used most recently during the Second Gulf

War of 2003, has been invoked to justify Western intervention in many other international crises: the early Cold War, the Korean War, the Vietnam War, the 1979–1989 Afghan War, and the first Gulf War of 1990–1991, among others. Condemnation of the Munich Agreement intensified in 1939, when Hitler took the rest of Czechoslovakia and began to demand the Danzig corridor from Poland. German documents captured after World War II revealed that most of the German military leadership opposed Hitler's 1938 threat of war against Britain and France over Czechoslovakia, believing that Germany was unprepared for such a campaign. Some German officers even planned a coup should such a conflict begin. These revelations further tarnished the reputation of Chamberlain and his supporters. (The rather unimpressive record of German military conspiracies against Hitler during World War II itself demonstrated that, even when such opposition existed, it did not guarantee that in reality any such coup would have taken place or that it would then have succeeded.)

Though debate still rages over the wisdom of Chamberlain's policies, many subsequent historians have been less harshly critical of his policies during the 1930s. In the first half of the decade, the quest to recover from economic depression preoccupied the British government, and military spending was cut. The British peace movement was also at its peak, and many of its members opposed large defense budgets on the grounds that armaments themselves contributed to war. British political leaders had perennial bitter memories of the heavy casualties World War I inflicted upon their population, when the trenches swallowed up a generation of bright young men from the ruling elite. In 1935, the British government embarked on moderate rearmament policies, with endorsement from the British Labour Party, whose leader, Clement Attlee, bested the pacifists among his own supporters. Even so, in 1938, British production of modern fighter aircraft, tanks, and other military hardware still lagged well behind that of Germany, and British land forces were relatively small. With a large overseas empire, Britain faced serious threats in Asia from Japan and was suffering from imperial overstretch, as its defense obligations outran its ability to meet its commitments. Although the Foreign Office was divided, British military planners virtually unanimously opposed British intervention in 1938, arguing that a further two or better still three years were needed for full-scale rearmament. Military planners also generally overestimated the likely damage that large-scale bombing raids would inflict on Britain's almost unprotected cities.

On purely practical grounds, it would have been difficult in 1938 for either Britain or France to assist Czechoslovakia militarily. A landlocked nation surrounded by Germany, Austria, Hungary, Romania, and Poland, Czechoslovakia was at the mercy of its neighbors. Given France's military per-

formance two years later, it is difficult to suppose that a Franco-British war against Germany's western frontier would have enjoyed great chances of success. The banker Lord Brand, a strong critic of British appeasement policies, ascribed most of the blame for the Munich Agreement to the failure of the government of Stanley Baldwin, Chamberlain's predecessor as prime minister, to adopt strong rearmament policies in the early 1930s.

At the time that Chamberlain signed the Munich Agreement, from the royal family downward, the British public demonstrated considerable relief and support for his position. The white British dominions (Canada, Australia, New Zealand, and South Africa, who had attained virtual independence during the 1920s) were not prepared to fight over Czechoslovakia, so Britain would have gone to war without their backing. It also seemed unlikely that Britain could have expected any substantial support from the United States, where Congress passed a series of neutrality acts in the later 1930s, designed to keep the country aloof from any international conflict. When the Munich Agreement was signed, a thankful President Franklin D. Roosevelt cabled Chamberlain: "Good man" (Dallek 1995, 166). The Soviet Union made skilful propaganda out of the Munich Agreement, charging that Western powers had deserted Czechoslovakia when the Soviets were prepared to offer assistance. In practice, though, the Soviets carefully left loopholes in their pledges and seem to have treated the Munich crisis primarily as an exercise in international public relations. Even if the Soviet offer of military assistance was genuine, the Russian military was still recovering from the purges earlier that decade, and the Soviet Union shared no common border with either Czechoslovakia or Germany.

Chamberlain's admirers have claimed that his policies bought the time Britain needed for rearmament, so that when Britain finally did declare war on Germany one year later, its military position had become far less disadvantageous. Although some detractors have claimed that this delay was more beneficial to the German than the British rearmament effort, overall it seems that British gains in the intervening year were substantial. In truth, however, accelerated post-Munich British rearmament was apparently primarily due to Chamberlain's cabinet rather than himself, and until Hitler took the rest of Czechoslovakia in March 1939, Chamberlain seemingly genuinely believed that he had reached an understanding with Hitler that would permanently avert any European war. Several highly controversial books by John Charmley have argued that Chamberlain's real mistake was his eventual pledge to Poland in 1939 and the subsequent British declaration of war against Germany. Charmley further faults Winston Churchill, Chamberlain's successor as prime minister, for deciding to fight on in 1940 rather than make a compromise peace with Germany, on the grounds that these

policies effectively brought British dependence upon the United States, the dissolution of the British Empire, and the end of Britain's great power status. Although Charmley is perceptive regarding the weakness of Britain's broad international position in 1938, one has to wonder whether his alternative solution, of British acquiescence in a German-dominated Europe, was a more feasible or palatable long-run position.

Except for Czechoslovakia, none of the powers involved in the Munich crisis came out of it with any great credit. The history of wars and diplomacy in the twentieth and other centuries alike is, however, crammed with instances when nations have been forced to rely primarily upon their own efforts to defend themselves or else go under. Given the history of the previous five years, it was perhaps unrealistic of the Czechs to expect more effective assistance from their allies (or from the League of Nations). Counterfactual history being inherently indemonstrable, it is impossible to prove that firm action by Britain and France in September 1938 would not have checked Hitler. Clearly, though, one year later, the much more definite prospect that an attack on Poland would involve Germany in war with both nations failed to deter him. The failure of Britain and France at Munich was, however, a humiliating revelation of the degree to which, even before World War II effectively precipitated the breakup of their overseas empires, those two countries, in the absence of assistance from the United States, were increasingly incapable of bearing the burdens their international status as great powers imposed upon them.

About the Authors

Neville Chamberlain, a leading British Conservative politician from a prominent Birmingham political family with a strong commitment to strengthening the British Empire, was the dominant figure in successive British governments of the 1930s. He served in the National Government as chancellor of the exchequer from 1931 until 1937 when he replaced Stanley Baldwin as prime minister. Chamberlain believed that at least some of Germany's grievances regarding the post-World War I peace settlement were justified and that, if concessions were offered to Germany and also to Italy, a general European war might be avoided. He therefore supported the broadly conciliatory foreign policies Britain followed for much of the 1930s, effectively acquiescing in Italy's forcible annexation of Ethiopia, German rearmament, Hitler's 1936 remilitarization of the Rhineland, and the 1938 Anschluss in Austria. Chamberlain did so with the broad approval of most of the Conservative Party and, until the mid-1930s, of many Labour supporters. At the time, the Munich Agreement won him considerable public acclaim, but within six months, Hitler's blatant disregard for the accord left it discredited, a blow from which Chamberlain's popular reputation never

recovered. In September 1939, Chamberlain declared war on Germany, remaining prime minister until May 1940, when the rapid German campaign against Norway brought about his replacement by the fiercely antiappeasement Winston Churchill, a Conservative dissident for most of the 1930s. Later that year Chamberlain died of cancer.

Clement Attlee, a barrister and university academic, was leader of the British parliamentary Labour Party in 1938. In World War I, he fought at Gallipoli in Mesopotamia, where he was badly wounded, and on the Western front, winning promotion to major. Unlike many in his party, Attlee believed in strong defense policies. Alarmed by the growing demands of Hitler and of Italy's dictator, Benito Mussolini, in 1935, Attlee successfully challenged the much-loved pacifist George Lansbury, head of the Labour Party since 1931, for the leadership. Under Attlee, Labour endorsed strong rearmament policies. During World War II, Attlee, head of the second largest parliamentary grouping, effectively served as deputy to Prime Minister Winston Churchill. In 1945, Attlee led the Labour Party to a landslide victory over the Conservatives. In his six years as prime minister, he put in place the British welfare state reforms, while staunchly backing major U.S. Cold War policies, including the establishment of the Marshall Plan and the North Atlantic Treaty Organization, and supporting the United States in the Korean War. Attlee lost office in the 1951 general election, retired as leader of his party in 1955, and died in 1967.

About the Documents

The documents given here are all official statements, in which two leading British politicians attempted to defend or attack the government's policy and to win others to their perspective. Chamberlain, ironically as it transpired, publicly claimed that he had brought back from Germany "peace in our time," a phrase taken from the sixteenth-century Anglican prayer book of Archbishop Thomas Cranmer.

In the more adversarial setting of the House of Commons, where he had to defend his policies against harsh criticism, Chamberlain again stated his belief that Britain could maintain peaceful relations with even totalitarian states, such as Germany and Italy. However distasteful members of the British government might find the "personal contact with dictators," Chamberlain argued, war would be far worse. He drew particularly heavily upon the still fresh memory of World War I (then termed the Great War). Chamberlain also called for a strong rearmament program to back up Britain's diplomatic efforts.

Attlee bluntly challenged Chamberlain's claim that he had ensured peace and expressed his personal disgust and shame over British policies toward Czechoslovakia. He also warned that the Munich Agreement represented a bloodless victory

for Hitler, who by simple intimidation had accomplished more than German military forces had attained in the four years of World War I and now dominated the European continent. Attlee condemned the Chamberlain government for refusing to back the collective security policies of the League of Nations and for allowing the Czechs to believe until the last moment that they could rely upon the protection afforded them by their mutual security pact with France. Like many on the Left, Attlee deplored the Franco-British failure to consult or cooperate with the Soviet Union. He finished by stating that Chamberlain had become "the dupe of the dictators" and that his policies at Munich had eroded rather than enhanced British national security.

A parliamentary debate in the British House of Commons is by its nature an adversarial situation, especially when the prime minister and the leader of the opposition disagree strongly on specific policies. In this case, the normal disagreements were dramatically intensified by the fact that Attlee and Chamberlain undoubtedly had very different concepts of what policies Britain should follow. Although both men rhetorically supported rearmament, Chamberlain clearly thought that compromise and agreement with Hitler and other dictators were attainable objectives, whereas Attlee had grave doubts that this was the case and believed that a strong military posture must serve as the essential foundation of British foreign policy. Chamberlain obviously felt he deserved congratulations for his efforts at Munich, but Attlee believed the entire episode represented a shameful national humiliation. Lastly, in criticizing Chamberlain's policies, Attlee could count upon support from prominent and vocal dissident Conservatives, including Winston Churchill, a former chancellor of the exchequer, and Alfred Duff Cooper, who resigned his position as first lord of the Admiralty to protest the Munich Pact. Attlee's criticisms eloquently expressed the fact that, however practically expedient the Munich Agreement might have been for Britain and France, from any honest perspective, it could at best only be described as a regrettable but unavoidable evil. Chamberlain's somewhat misplaced pride in the Munich accord was one major reason its negotiation would inflict such lasting damage upon his popular reputation.

A) Neville Chamberlain, "Peace for Our Time," 30 September 1938

[Neville Chamberlain read out this statement to a cheering crowd assembled outside 10 Downing Street, the British Prime Minister's official residence, on the evening of his return from Germany, where Britain, France, and Germany had signed the Munich Agreement.]

We, the German Führer and Chancellor, and the British Prime Minister, have had a further meeting today and are agreed in recognizing that the question of Anglo-German relations is of the first importance for two countries and for Europe.

We regard the agreement signed last night and the Anglo-German Naval Agreement as symbolic of the desire of our two peoples never to go to war with one another again.

We are resolved that the method of consultation shall be the method adopted to deal with any other questions that may concern our two countries, and we are determined to continue our efforts to remove possible sources of difference, and thus to contribute to assure the peace of Europe.

[He then added:]

My good friends this is the second time in our history that there has come back from Germany to Downing Street peace with honor. I believe it is peace for our time. And now I recommend you go home and sleep quietly in your beds.

B) Parliamentary debate in the British House of Commons Speech by Neville Chamberlain, 3 October 1938

[Three days later, Chamberlain defended his policy in Parliament. In a formal debate, he made his case for the Munich agreement.]

In my view the strongest force of all, one which grew and took fresh shapes and forms every day was the force not of any one individual, but was that unmistakable sense of unanimity among the peoples of the world that war somehow must be averted. The peoples of the British Empire were at one with those of Germany, of France and of Italy, and their anxiety, their intense desire for peace, pervaded the whole atmosphere of the conference, and I believe that that, and not threats, made possible the Concessions that were made. . . .

Ever since I assumed my present office my main purpose has been to work for the pacification of Europe, for the removal of those suspicions and those animosities which have so long poisoned the air. The path which leads to appeasement is long and bristles with obstacles. The question of Czechoslovakia is the latest and perhaps the most dangerous. Now that we have got past it, I feel that it may be possible to make further progress along the road to sanity. . . .

As regards future policy, it seems to me that there are really only two possible alternatives. One of them is to base

yourself upon the view that any sort of friendly relations, or possible relations, shall I say, with totalitarian States are impossible, that the assurances which have been given to me personally are worthless, that they have sinister designs and that they are bent upon the domination of Europe and the gradual destruction of democracies. Of course, on that hypothesis, war has got to come, and that is the view—a perfectly intelligible view—of a certain number of hon. and right hon. Gentlemen in this House. . . .

If that is hon. Members' conviction, there is no future hope for civilisation or for any of the things that make life worth living. Does the experience of the Great War and of the years that followed it give us reasonable hope that if some new war started that would end war any more than the last one did? No. I do not believe that war is inevitable. . . .

What is the alternative to this bleak and barren policy of the inevitability of war? In my view it is that we should seek by all means in our power to avoid war, by analysing possible causes, by trying to remove them, by discussion in a spirit of collaboration and good will. I cannot believe that such a programme would be rejected by the people of this country, even if it does mean the establishment of personal contact with dictators, and of talks man to man on the basis that each, while maintaining his own ideas of the internal government of his country, is willing to allow that other systems may suit better other peoples. . . .

I am told that the policy which I have tried to describe is inconsistent with the continuance, and much more inconsistent with the acceleration of our present programme of arms. I am asked how I can reconcile an appeal to the country to support the continuance of this programme with the words which I used when I came back from Munich the other day and spoke of my belief that we might have peace in our time. I hope hon. Members will not be disposed to read into words used in a moment of some emotion, after a long and exhausting day, after I had driven through miles of excited, enthusiastic, cheering people—I hope they will not read into those words more than they were intended to convey.

I do indeed believe that we may yet secure peace for our time, but I never meant to suggest that we should do that by disarmament, until we can induce others to disarm too. Our past experience has shown us only too clearly that weakness in armed strength means weakness in diplomacy, and if we want to secure a lasting peace, I realise that diplomacy cannot be effective unless the Consciousness exists, not here alone, but elsewhere, that behind the diplomacy is the strength to give effect. . . .

Primary Source

C) Parliamentary debate in the British House of Commons Speech by Clement Attlee, 3 October 1938

[In the same debate Clement Attlee, the leader of the opposition Labour Party and a future British Prime Minister, together with Alfred Duff Cooper, who resigned as First Lord of the Admiralty in protest over Munich, and Winston Churchill, harshly condemned the Munich Agreement. Attlee spoke in the following terms.]

We all feel relief that war has not come this time. Every one of us has been passing through days of anxiety; we cannot, however, feel that peace has been established, but that we have nothing but an armistice in a state of war. We have been unable to go in for carefree rejoicing. We have felt that we are in the midst of a tragedy. We have felt humiliation. This has not been a victory for reason and humanity. It has been a victory for brute force. At every stage of the proceedings there have been time limits laid down by the owner and ruler of armed force. The terms have not been terms negotiated; they have been terms laid down as ultimata. We have seen today a gallant, civilised and democratic people betrayed and handed over to a ruthless despotism. We have seen something more. We have seen the cause of democracy, which is, in our view, the cause of civilisation and humanity, receive a terrible defeat.

I think that in the mind of every thoughtful person in this Country when he heard that this settlement had been arrived at Munich, there was a conflict. On the one hand there was enormous relief that war had been averted, at all events for the time; on the other, there was a sense of humiliation and foreboding for the future. . . .

The events of these last few days constitute one of the greatest diplomatic defeats that this country and France have ever sustained. There can be no doubt that it is a tremendous victory for Herr Hitler. Without firing a shot, by the mere display of military force, he has achieved a dominating position in Europe which Germany failed to win after four years of war. He has overturned the balance of power in Europe. He has destroyed the last fortress of democracy in Eastern Europe which stood in the way of his ambition. He has opened his way to the food, the oil and the resources which he requires in order to consolidate his military power, and he has successfully defeated and reduced to impotence the forces that might have stood against the rule of violence.

The Prime Minister has given us an account of his actions. Everybody recognises the great exertions he has made in the cause of peace. . . . [Yet] Parliament is the grand inquest of the British nation, and it is our duty to inquire not alone into the actions of the Prime Minister during the last few days or the last few weeks, but into the whole course of policy which has brought this country into such great danger and such great anxiety. . . .

I want to turn now to the cause of the crisis which we have undergone. The cause was not the existence of minorities in Czechoslovakia; it was not that the position of the Sudeten Germans had become intolerable. It was not the wonderful principle of self-determination. It was because Herr Hitler had decided that the time was ripe for another step forward in his design to dominate Europe. . . .

The history of the last seven years is the background of this crisis, and the first point I must make to the Government is this. This crisis did not come unexpectedly. It was obvious to any intelligent student of foreign affairs that this attack would come. The immediate signal was given by the Prime Minister himself on 7th March of this year when he said: "What country in Europe today if threatened by a larger Power can rely upon the League for protection? None." It was at once an invitation to Herr Hitler and a confession of the failure of the Government. The invitation was accepted a few days later by the Anschluss in Austria. Then our Government and the French Government could have faced the consequences. They could have told Czechoslovakia "We cannot any longer defend you. You had better now make the best terms you can with Germany, enter her political orbit and give her anything to escape before the wrath comes upon you." But they did nothing of the sort. Czechoslovakia continued under the supposed shelter of these treaties. True, it was urged that something should be done for the Sudeten Germans but there was no attempt made to take early steps to prevent this aggression. . . .

I heard a suggestion from the benches opposite. "What about the U.S.S.R.?" Throughout the whole of these proceedings the U.S.S.R. has stood by its pledges and its declarations and there has been some pretty hard lying about it, too. There have been lies told, and people knew they were lies, about alleged conversations between M. Litvinoff and the French Foreign Minister. At no time has there been any difficulty in knowing where the U.S.S.R. stood. At no time has there been any consultation. I am aware that the Prime Minister may say that we were not the prime factor in this problem and that we were only concerned after France had been brought into it. But we have had very close collaboration with France, and in the order of commitment the U.S.S.R. comes before this country, and it has been a very great weakness that throughout there has been this cold-shouldering of the U.S.S.R. . . .

When the National Government overthrew the whole policy of collective security and abandoned it and the League, we told this House over and over again that we were entering on a very dangerous course. We realised that we were back in 1914 with all its dangers, and we knew that sooner or later a challenge would come to this country; and that is what has happened. The real pith of it is that, having decided to leave the League system which we practised and in which we believed, and to embark on a policy of alliances and power politics, instead of strengthening the people whose natural

interests were with ours, we have had nothing but constant flirtations with this and that dictator. The Prime Minister has been the dupe of the dictators, and I say that to-day we are in a dangerous position.

1.8. The German-Soviet Non-aggression Pact and Protocols, 23 August 1939

The German-Soviet Non-aggression Pact

On 23 August 1939, Count Joachim von Ribbentrop, the German Foreign Minister, and Vyacheslav M. Molotov, his Soviet counterpart, signed a nonaggression pact between their two countries, together with several secret protocols delineating the Soviet and German spheres of influence in Eastern Europe and the Baltic republics. For both parties involved, the pact represented a massive reversal of their past ideological orientation, since Nazi Germany, the strongest European Fascist state, and the Soviet Union, the world's largest Communist nation, had each previously characterized the other as its foremost enemy. Expediency and realpolitik drove each signatory to conclude this agreement. For German leader Adolf Hitler, it removed the danger that, should Germany attack Poland, the Soviet Union would come to that country's assistance, at the same time that Great Britain and

France honored their own guarantees of Poland's territorial integrity. He thereby deftly stymied the proposals advanced ever since the mid-1930s that Britain, France, and the Soviet Union should form a united anti-German and anti-Italian front, something many on the British and French Left favored, as did even some staunch anti-Hitler Conservatives, including the strongly antiappeasement Winston Churchill. Soviet President Josef Stalin, meanwhile, safeguarded his country against the military attack upon communism that Hitler had stated since the mid-1920s should be Germany's ultimate objective. Interestingly, the agreement's preamble referred back to the earlier Treaty of Rapallo that Germany and the Soviet Union signed in 1926, when both countries were still largely pariah states within the post-World War I international system.

The German-Soviet Pact bestowed more tangible benefits than those of simple mutual nonaggression. In protocols kept secret at the time, the Soviet Union and Germany effectively agreed to divide the territory of Poland between themselves. When Hitler's forces invaded Poland from the west just over one week later, Soviet troops moved in from the east to take control of their designated sphere. The Soviet Union was also granted a largely free hand to attack Finland and to occupy the Baltic republics of Latvia, Lithuania, and Estonia, which were incorporated in the Soviet Union in 1940, only regaining independence when the Soviet state collapsed in 1989. Between September 1939 and 1941, additional protocols clarified some of the details of these agreements. Germany recognized Soviet claims to the Rumanian province of Bessarabia. In the case of Lithuania, in return for substantial payments, Germany renounced its own alleged rights there in favor of the Soviet Union. Each power also agreed to suppress agitation against the other in those portions of Poland under its own control. In addition, the Soviet Union signed agreements whereby it provided Germany with appreciable quantities of useful war supplies, enhancing Hitler's ability to wage war in Western Europe.

Defenders of the Soviet Union have justified Stalin's dramatic switch in foreign policy on the grounds that by August 1939, Soviet diplomats had for several years unavailingly sought to form a united anti-Soviet front with the British and French governments, only to have their overtures rejected or at least treated suspiciously. In May 1939, Stalin appointed Vyacheslav Molotov to replace foreign minister Maxim Litvinov, the prime architect of the united front policy and of Soviet support in the 1930s for collective security efforts orchestrated by the international organization the League of Nations. Stalin undoubtedly feared that the Western European powers sought to divert Hitler's military might from their own countries toward Russia. In his defense, one must admit that neither the British nor French government had welcomed Soviet overtures with any great enthusiasm, in part

because they doubted the sincerity of these proposals and disliked the Soviets ideologically and also because they feared that Stalin's sweeping 1930s purges of the Soviet military had greatly reduced his country's effectiveness as a potential ally.

To most Western leaders, the conclusion of the Non-aggression Pact, Soviet moves against Poland and the Baltic states and the Soviet declaration of war against Finland in autumn 1939, and Stalin's orders to Communist parties in West European countries to discourage and even sabotage anti-German war measures all confirmed that their earlier anti-Soviet views had been well founded. Admirers of Stalin have argued that even when he concluded the Non-Aggression Pact, he recognized that a German-Soviet war would ultimately be inevitable but hoped to defer it as long as possible. If so, Stalin was no match in brutal cynicism for Hitler, who broke the pact in June 1941, when his troops launched a German invasion of the Soviet Union. Stalin ignored repeated warnings from outside sources, including well-founded Western intelligence information, that Hitler planned such a move, and the early months of war with Germany were near-disastrous for the Soviet Union, reducing Stalin for some time to a state of nervous collapse.

The history of the two years after the German-Soviet Pact was concluded helped to ensure that the Soviet alliance with the Western Allies, primarily Great Britain and the United States, was essentially one of mutual convenience between largely incompatible and often suspicious coalition partners. The memory of the two preceding years would not be easily forgotten and contributed substantially to the Cold War that developed immediately after World War II ended.

About the Documents

Like most international agreements, the German-Soviet Non-aggression Pact was primarily a carefully drafted legal document, designed to bind its signatories and to describe very precisely the specific obligations each party had undertaken to fulfill. Perhaps the most interesting feature of this particular accord was that (as was not uncommon with such treaties, particularly those with controversial aspects) both parties were to keep secret the protocols containing many of the most important clauses. This applied particularly to the arrangements for Poland, the Baltic states, and Finland, which converted an otherwise relatively innocuous neutrality and nonaggression pact into a cold-blooded agreement—in total contravention of existing international law—to assign and partition those countries between the Soviet and German spheres of influence. The fact that these protocols were to remain secret perhaps demonstrated that both Germany and the Soviet Union retained some vestigial concern for international public opinion, which the revelation of these

territorial bargains would undoubtedly have outraged. As it was, in late 1939, the invasion of Finland led to the formal expulsion of the Soviet Union from the League of Nations.

Primary Source

A) Non-Aggression Pact between Germany and the Union of Soviet Socialist Republics, 23 August 1939

The Government of the German Reich and the Government of the Union of Soviet Socialist Republics, guided by the desire to strengthen the cause of peace between Germany and the Union of Soviet Socialist Republics, and taking as a basis the fundamental regulations of the Neutrality Agreement concluded in April 1926 between Germany and the Union of Soviet Socialist Republics, have reached the following agreement:-

Article I. The two Contracting Parties bind themselves to refrain from any act of force, any aggressive action and any attack on one another, both singly and also jointly with other Powers.

Article 2. In the event of one of the Contracting Parties becoming the object of warlike action on the part of a third Power, the other Contracting Party shall in no manner support this third Power.

Article 3. The Governments of the two Contracting Parties shall in future remain continuously in touch with one another, by way of consultation, in order to inform one another on questions touching their joint interests.

Article 4. Neither of the two Contracting Parties shall participate in any grouping of Powers which is directed directly or indirectly against the other Party.

Article 5. In the event of disputes or disagreements arising between the Contracting Parties on questions of this or that kind, both Parties would clarify these disputes or disagreements exclusively by means of friendly exchange of opinion or, if necessary, by arbitration committees.

Article 6. The present Agreement shall be concluded for a period of ten years on the understanding that, in so far as one of the Contracting Parties does not give notice of termination one year before the end of this period, the period of validity of this Agreement shall automatically be regarded as prolonged for a further period of five years.

Article 7. The present Agreement shall be ratified within the shortest possible time. The instruments of ratification shall be exchanged in Berlin. The Agreement takes effect immediately after it has been signed.

B) Secret Supplementary Protocol on the Border of the Spheres of Interest of Germany and the USSR, Signed by V. M. Molotov and Joachim von Ribbentrop, 23 August 1939

In signing the nonaggression pact between Germany and the Union of Soviet Socialist Republics, the undersigned plenipotentiaries of the two sides discussed in strict confidentiality the issue of delimiting the spheres of mutual interest in Eastern Europe. This discussion led to the following result:

1. In the event of territorial-political reorganization of the districts making up the Baltic states (Finland, Estonia, Latvia, Lithuania), the northern border of Lithuania is simultaneously the border of the spheres of interest of Germany and the USSR. The interests of Lithuania with respect to the Vilnius district are recognized by both sides.

2. In the event of territorial-political reorganization of the districts making up the Polish Republic, the border of the spheres of interest of Germany and the USSR will run approximately along the Pisa, Narew, Vistula, and San rivers.

The question of whether it is in the signatories' mutual interest to preserve the independent Polish State and what the borders of that state will be can be ascertained conclusively only in the course of future political development.

In any event, both governments will resolve this matter through friendly mutual agreement.

3. Concerning southeastern Europe, the Soviet side emphasizes the interest of the USSR in Bessarabia. The German side declares its complete political disinterest in these areas.

4. This protocol will be held in strict secrecy by both sides. [These agreements were the subject of further clarifications on 28 August 1939, 28 September 1939 and, in one case, also on 10 January 1941.]

C) Clarification of the Secret Supplementary Protocol of 23 August 1939, Signed in Moscow by V. M. Molotov and Count F. W. Schulenburg, 28 August 1939

In order to clarify the first paragraph of point 2 of the “Secret Supplementary Protocol” of 23 August 1939, this is to explain that said paragraph is to be read in the following final version, namely:

“2. In the event of the territorial-political reorganization of the districts making up the Polish State, the border of the spheres of interest of Germany and the USSR will run approximately along the Pisa, Narew, Vistula, and San rivers.”

Source: U.S., Department of State, *Nazi-Soviet Relations 1939–1941: Documents from the Archives of the German Foreign Office*, eds. Raymond James Sontag and James Stuart Beddie (Washington, DC: Government Printing Office, 1948), pp. 76–78, 105–107.

D) Confidential Protocol Concerning the Possibility of Resettling the Population Residing within the Spheres of Interest of the Governments of the USSR and Germany, Signed by V. M. Molotov and Joachim von Ribbentrop, 28 September 1939

The Government of the USSR will not impede German citizens or other persons of German ancestry residing within its spheres of interest should they desire to move to Germany or to German spheres of interest. It agrees that this resettlement will be conducted by persons authorized by the German Government in accordance with responsible local authorities and that in the process the property rights of the resettled persons will not be infringed.

The German Government assumes the same obligation with respect to persons of Ukrainian or Belorussian ancestry residing within its spheres of interest.

E) Secret Supplementary Protocol on Changing the Soviet-German Agreement of 23 August Concerning the Spheres of Interest of Germany and the USSR, Signed by V. M. Molotov and Joachim von Ribbentrop on 28 September 1939

The undersigned plenipotentiaries state the concurrence of the German Government and the Government of the USSR in the following:

Point 1 of the secret supplementary protocol signed on 23 August 1939, is changed so that the territory of the Lithuanian state is included in the sphere of interest of the USSR because, on the other side, Lublin voivodeship and parts of Warsaw voivodeship are included in the sphere of interest of Germany (see map accompanying the Treaty on Friendship

and the Border between the USSR and Germany, signed today). As soon as the Government of the USSR takes special measures on Lithuanian territory to protect its interests, the present German-Lithuanian border, with the objective of making it a natural and simple border, will be adjusted so that the Lithuanian territory that lies southwest of the line shown on the map goes to Germany.

It is further stated that economic agreements between Germany and Lithuania now in force must not be broken by the aforementioned measures by the Soviet Union.

F) Secret Supplementary Protocol on Preventing Polish Agitation on the Territory of the Other Treaty Signatory. Signed by V. M. Molotov and Joachim von Ribbentrop on 28 September 1939

The undersigned plenipotentiaries, in concluding the Soviet-German treaty on the border and friendship, have stated their concurrence in the following:

Neither side will permit on their territories any sort of Polish agitation affecting the territory of the other country. They will abort such agitation on their own territories and will inform each other as to effective measures to accomplish this.

G) Secret Protocol of 10 January 1941, Clarifying the Agreements of August 1939

The Chairman of the Council of People's Commissars of the USSR V. M. Molotov, with the authorization of the Government of the USSR on one side, and German Ambassador Count von der Schulenburg, with the authorization of the Government of Germany on the other side, have concurred on the following:

1. The government of Germany renounces its claims to the part of the territory of Lithuania indicated in the Secret Sup-

plementary Protocol of September 28, 1939, and shown on the map that is attached to this Protocol;

2. The Government of the USSR agrees to compensate the Government of Germany for the territory indicated in point 1 of the present Protocol with a payment to Germany in the amount of 7,500,000 gold dollars, the equivalent of 31,500,000 German marks.

Payment of the sum of 31.5 million German marks will be made as follows: one-eighth, i.e., 3,937,500 German marks, in deliveries of nonferrous metals over a three-month period beginning from the day of signing of the present Protocol, and the remaining seven-eighths, i.e., 27,562,500 German marks, in gold through deductions from German payments of gold that the German side has to make before February 11, 1941, based on an exchange of letters between the People's Commissar of Foreign Trade of the USSR A. I. Mikoyan and the Chairman of the German Economic Delegation Mr. Schnurre that took place in conjunction with the signing of the "Agreement of January 10, 1941, on Mutual Deliveries of Commodities for the Second Treaty Period according to the Economic Agreement of February 11, 1940, between the USSR and Germany."

3. The present Protocol . . . comes into force immediately upon signing.

Section II

Poland to Pearl Harbor

World War II began in September 1939 with an unannounced German onslaught on Poland, selected as Hitler's next target after Germany had taken over Austria and Czechoslovakia. By the end of October, German forces had conquered much of Poland, and in accordance with the August 1939 Nazi-Soviet pact, in mid-September Soviet forces likewise invaded and took over eastern Poland. After several months of inactivity and "phony war," during which the Soviet Union took the opportunity to attack neutral Finland and annex strategically valuable territory, in May 1940 swift-moving German forces launched a lightning "blitzkrieg" in northern and western Europe, quickly defeating Denmark, Norway, Belgium, the Netherlands, and France, each of which suffered several years of humiliating German domination or occupation. British troops fled France in disarray, as the maverick aristocrat and politician Winston Churchill became prime minister and defiantly pledged that Britain would continue the fight against Hitler, alone if necessary. In reality, he looked for assistance to the United States, where, despite a fierce national debate on the issue and bitter opposition from American isolationists who hoped to remain aloof from the European conflict, Democratic President Franklin D. Roosevelt moved his country ever closer to war, building up American armed forces and providing massive economic and military assistance to Britain. Once Hitler broke his pact with Soviet leader Josef Stalin and invaded Russia in June 1941, United States aid also embraced the Soviet Union. Meanwhile, efforts by Japan, now linked with Italy and Germany in the Tripartite Pact, to expand into Southeast Asia encountered growing U.S. opposition and economic sanctions. Once Japan's efforts to win United States endorsement for its territorial ambitions proved futile, in December 1941 its warplanes launched an attack on the U.S. Pacific fleet, then based at Pearl Harbor, Hawaii, initiating fullscale war between the two countries. Within a few days, Germany and Italy followed suit and formally declared war on the United States.

2.1. Clare Hollingworth on the German Invasion of Poland, 1940 and 1990

The Opening of World War II in Europe: Germany Invades Poland

After annexing the remainder of Czechoslovakia in spring 1939, Adolf Hitler almost immediately embarked on his next move, denouncing the existing Non-Aggression Pact between Germany and Poland and making emotional speeches demanding the return of Danzig (Gdansk) and condemning the treatment of ethnic Germans in Poland. As reconstituted in 1919, after more than a century in which its lands had been divided among Prussia, Austria, and Russia, Poland included

substantial territory that had previously been part of Germany. Hitler's tactics closely resembled those he had utilized against Czechoslovakia in 1938–1939, and he clearly coveted not just Danzig but additional portions of Poland itself. At this stage, British Prime Minister Neville Chamberlain finally resolved to change the policy of effective British acquiescence in German expansion. Addressing the House of Commons at the end of March 1939, Chamberlain pledged that, should Germany attack Poland, Britain would go to war on Poland's behalf. Such promises were insufficient to deter Hitler. His rhetorical demands on Poland continued, and in April, he directed the German army General Staff to prepare plans for Operation WHITE, a potential war against Poland and, if necessary, against Britain and France too. Hitler nonetheless seems to have believed that when it came to the crunch, Britain and France would draw back from war, just as they

had done in September 1938. He refused all Polish offers to compromise and anticipated that war, should it come, would begin in September 1939.

In May 1939, Soviet dictator Josef Stalin jettisoned his foreign minister, Maxim Litvinov, who had attempted to cooperate with the League of Nations and the major Western powers in opposing Hitler's expansionist policies, and replaced him with Vyacheslav Molotov. In lengthy and inconclusive negotiations, the new Soviet foreign minister continued to explore the possibility of collaborating with Hitler's opponents. Fearing that an Anglo-German rapprochement directed against Russia might well be in the cards, he also responded to overtures from the German foreign minister, Joachim von Ribbentrop, that led to the conclusion in August 1939 of the German-Soviet Non-aggression Pact. Secret protocols to this agreement envisaged the future division of Poland between Germany and the Soviet Union. Immediately after it was signed, Hitler, charging once again that Germans in Poland were enduring brutal persecution, demanded that Poland accede to his demands or face immediate war.

In the final days of August, the governments of Great Britain and France issued formal guarantees of Poland's territorial integrity, but these pledges had no deterrent effect. German military forces massed on the frontier with Poland. On 31 August 1939, German officials staged incidents in which, they claimed, ethnic Poles living in the German border town of Gleiwitz unsuccessfully attacked a German radio station and customs house, scattering the corpses of Poles from their own concentration camps around the scenes of these alleged atrocities to add verisimilitude. These episodes were cited as the immediate pretext for the German invasion of Poland, which began when German airplanes attacked Danzig at 4:45 a.m. on 1 September 1939, while German troops moved into Poland. Later that day, Great Britain and France demanded that Germany withdraw its forces within 24 hours, an ultimatum Hitler completely ignored. On 3 September, both countries declared war on Germany but were unable to aid Poland directly and ill-prepared militarily to open hostilities with Germany on its western border. Although Polish forces resisted bravely, within three weeks, overwhelming German military and air superiority and a blitzkrieg campaign forced the Polish government to surrender. Meanwhile, as agreed under the German-Soviet Non-aggression Pact, Soviet troops had occupied the eastern portion of Poland, territory that remained part of the Soviet Union when World War II ended six years later.

About the Author

The British war correspondent Clare Hollingworth was one of the most distinguished journalists of World War II. She was one of a small number of remarkable women reporters of the twentieth century—others included the Americans

Martha Gellhorn, Marguerite Higgins, and Agnes Smedley—who specialized in covering war and foreign affairs, in the process enduring physical danger and often harsh working conditions. In summer 1939, Hollingworth, a well-brought-up young English woman, was still a novice at her trade. She had previously studied at the Institute of Slavonic Studies of London University, worked for the League of Nations Association, and assisted refugees from Eastern Europe. Hired by the *Daily Telegraph* newspaper in August 1939, she went out to cover the developing crisis between Germany and Poland, first going to Berlin, then, after British citizens were no longer welcome there, staying with the British consul in the Polish border town of Katowice. Crossing over into Germany on 30 August, she observed large numbers of German tanks and armored cars, hidden rather ineffectively behind canvas shields, massed for the coming invasion. Returning to Poland, in what would be the greatest coup of her long and notable career, on the morning of 1 September 1939, she broke the news of the invasion not only to her own newspaper but even to the British embassy in Warsaw.

A woman who found physical danger and fighting exhilarating, Hollingworth reported for the next three weeks on the course of the war, before escaping to Britain through the Balkans. In 1940, she returned to southern Europe, first reporting from inside still neutral Rumania, then covering the Greek campaign, and finally basing herself in Cairo, Egypt, attached to British forces as a military correspondent during the North African campaigns. After the war ended, Hollingworth spent many years in the Middle East, winning numerous awards for her reporting on Algeria, before covering the Vietnam War, as well as the 1971 Indo-Pakistan War. In the 1950s, she broke the sensational story that the British espionage operative and Soviet secret agent Kim Philby, long suspected of being the "third man" who had earlier warned two other Russian secret agents, Donald Maclean and Guy Burgess, that they were under suspicion, had himself followed them to the Soviet Union. Hollingworth ended her career in Asia, moving to Beijing in 1973 to open the *Daily Telegraph's* first bureau in Communist China.

About the Documents

Hollingworth filed an immediate report to the *Daily Telegraph* that Germany had invaded Poland, thus breaking the news that actual war had begun. In two books published fifty years apart, she also gave more comprehensive accounts of the background to this news story. These are particularly interesting because they demonstrate the manner in which participants in historic events often refine and adapt their recollections over time.

In her first book, published in 1940, Hollingworth gave an overview of the war in Poland, including the days immedi-

ately before it began and published within a year of Poland's defeat. The centerpieces of both accounts are her drive of 30 August across the German border, where she stumbled across Hitler's military preparations, and the German attack on Poland two days later. She vividly recalls conversations with both Germans and Poles. Awakened by the sound of German planes and bombs, Hollingworth and her hosts phone the wife of the chief of police, who confirms that war has begun. We are conscious that this is an ambitious young journalist just starting her career, as Hollingworth confesses both her hope that "the *Telegraph* would produce a Special Edition for my news," and her sudden fear that, having phoned her newspaper, she may have mistaken an air-raid practice for a genuine war.

By the time Hollingworth wrote her memoirs, she was an eminent correspondent who had retold this story to admiring audiences countless times over the previous half century. As often happens with such "party pieces," during that time, it settled into a near-formulaic tale, with certain details once included being omitted and others added. We learn, to begin with, that she was actually staying with the British Consul in Katowice and that it was his official car that, to the baffled consternation of the German authorities, she drove across the border. Although in both books, the wording of her account of German military preparations is very similar, in 1990, other portions of the previous account are less vivid or absent altogether. Hollingworth's second account places her more at the center of the story; she is also more omniscient. She now makes much of her host's disbelief and astonishment that she should have been able to cross into Germany and return, of the fact that he promptly informed the British Foreign Office of what she had seen, and of her efforts the following day on the consul's behalf to warn British citizens to leave Poland. When the German attack begins, she herself rouses the British consul and then immediately personally passes on the news of the German attack to a diplomat friend at the British embassy in Warsaw, holding the telephone receiver out her bedroom window to allow him to hear the advancing tanks and aircraft. No longer does she wait while the British consul phones the home of the local police chief to learn whether the disturbance was genuinely war or merely a false alarm; she knows at once that it is war. Finally, deceptive German propaganda announcements give her greater excuse for fearing she might have mistaken an air-raid practice for a real war.

Over fifty years, then, significant changes crept in. It is quite possible that most of the details given in both accounts were true, even if that being the case would make the time frame on 1 September rather tight. Discretion perhaps dictated the omission of some facts from Hollingworth's first account; maybe in 1940, the British government would not have appreciated a journalist revealing just how close she was to their diplomats in Poland. Yet, all such caveats notwith-

standing, whereas the first version depicts a young woman fortunate and enterprising enough to be in the right place at the right time to report a major story, the second portrays a more self-assured, even intrepid, journalist-observer who remains throughout better informed and more *au fait* (to the point) with events than any British diplomat in Poland. By immediately contacting a friend at the embassy in Warsaw, she even seems to be preempting the duties of the consul in Katowice, not to mention commandeering his telephone at a rather crucial juncture. And why, if she phoned the embassy first and her newspaper second, was it the *Daily Telegraph* rather than the British embassy that informed the Polish government of the German invasion? One cannot but wonder as to the precise sequence of all the various telephone calls made from the consul's house in the early hours of 1 September.

A comparison of these two accounts is an illuminating exercise, demonstrating the reasons why historians feel obliged to treat even firsthand testimony with considerable skepticism. Other things being equal, historians usually give greater credence to personal recollections recorded shortly after an individual participated in a given event, when the impressions were still fresh in the author's mind, than to memories recounted many years later. (In some cases, however, especially where confidential information is involved, officials may well be more frank when their careers are over and they have nothing to lose, or when individuals who might earlier have been embarrassed by certain revelations are safely dead.) More than sixty years on, with Hollingworth almost certainly the only surviving protagonist of the story, we may never be certain which of the versions—if either—was a more accurate representation of her role as Germany invaded Poland or exactly which details of each are credible. Eyewitness accounts of events are notoriously slippery, even more so when they harden into an authorized version that has been told repeatedly to admiring audiences. By 1990, the past Hollingworth chose to remember had long since settled into a much-loved story almost as formulaic as an episode from a Scandinavian saga or one of Homer's epics. Much, even most, of it was undoubtedly true, but over the years, numerous details had subtly shifted and adapted to conform to the image of herself she wished to present and the past she preferred to remember. This is not to suggest that Hollingworth ever consciously decided to rework the story of what was indisputably the greatest and most spectacular triumph of her career. Human memory is malleable, and personal acquaintance with her suggests that over time some aspects of this episode simply became more prominent in her mind while others faded, a process that almost certainly occurred unconsciously. By 1990, the second version had probably effectively supplanted the first in her own memory, and she was cheerfully recounting it in all good faith. The very fact that individual memories even of episodes of deep personal

and historical moment can evolve significantly over time is the reason why, no matter how honest and straightforward any eyewitness may appear, historians must not automatically regard such testimony as more authoritative than any other source.

A) Excerpts from *The Three Weeks' War in Poland*

[On 30 August 1939, Clare Hollingworth, who had begun working for the British newspaper the Daily Telegraph, beginning what would become a renowned career as a war correspondent, was staying with friends in Katowice, Poland, on the border with Germany. War was generally considered imminent. She decided to cross the frontier into Germany, borrowing the British Consul's official car for the purpose, a trip of which, a few months later, she gave the following account in a book describing the early days of the war.]

Since all British correspondents had been expelled from Berlin some days before, I decided to have a look round in German Silesia. Katowice was too quiet for news. I crossed the frontier at Beuthen without trouble. (Though news of my crossing so upset the Polish Foreign Office that the British Embassy were required to vouch for me.) The German frontier town was nearly deserted. It was open to enfilading fire from Polish batteries, and the Germans evidently thought it prudent to evacuate civilians. Those who remained looked depressed and unhappy. I spoke to old acquaintances and found increased trust in Hitler, even among those who had been critical—but, linked with this, a refusal to believe in war.

'It won't come to that, *liebes Fraülein*, don't you worry. The Führer will get Germany her rights without war this time, just as he did before.'

They told me stories of the 'atrocities' committed by Poland against her German minority, and asked me if I had seen such things. I had not.

'Ah, you don't see them, but they happen every day. Why do you suppose our people come across the frontier to escape the Poles?' Then I learned an interesting thing. German 'refugees' from Poland were not being allowed into the Reich. They were being kept for use on the frontier. We were to hear much of them before the end of the war.

I found a noticeable shortage of supplies in Beuthen. There was no soap for foreigners, while even for Germans it was strictly rationed. Aspirin itself, the German product par excellence, was unobtainable. A friendly butcher showed the meat ration, the weekly allowance for a family with two children; it was enough for three meals, I reckoned, and your German is no vegetarian. The family's tea ration would have made a good 'mash' (as they say in the Midlands) for six English tea-drinkers; and the coffee, which tasted like burnt toast, and *was* burnt maize, could perhaps serve twelve. Oils and

fats could be bought with a special permit only. Butter, cream and milk had been unobtainable for five weeks. I found it impossible to get meals in restaurants, and should have gone hungry, had not a waiter, well tipped in the past, produced a partridge from nowhere. What kind of victualling is this, I wondered, on which to begin a major war?

I drove along the fortified frontier road via Hindenburg, (which in the nineteen-twenties the townsfolk voted to call 'Leninburg') to Gleiwitz, which had become a military town. On the road were parties of motor-cycle despatch-riders, bunched together and riding hard. As we came over the little ridge into the town, sixty-five of them burst past us, each about ten yards behind the other. From the road I could see bodies of troops, and at the roadside hundreds of tanks, armoured cars and field guns stood or moved off toward the frontier. Here and there were screens of canvas or planking, concealing the big guns; they seemed not to be camouflaged against air-attack. I guessed that the German Command was preparing to strike to the north of Katowice and its fortified lines: the advance which was to reach Czestochowa in two days of war.

In the middle of all this I bought odd things—wine, electric torches—and drove back peacefully. Now and then a trooper would spot the Union Jack on my car and give a sudden, astonished gape. As we reached a length of road which lies parallel with the frontier, I looked across a hollow, some wire and tank-barricades, and watched the peasant-women moving about the Polish fields, a few hundred yards away. In the evening I returned to Poland, without trouble, the feverish preparations of the German military uppermost in my mind.

[The next day, Hollingworth learned that in her absence the Polish authorities had uncovered and, so they believed, squelched various plots by German-Polish nationals, activities in which the German Consul was openly implicated, a fact which "showed me again that we stood on the edge of war." She nonetheless retired to bed, but was awoken in the early hours of 1st September, 1939.]

Slam! Slam! . . . a noise like doors banging. I woke up. It could not be later than five in the morning. Next, the roar of airplanes and more doors banging. Running to the window I could pick out the 'planes, riding high, with the guns blowing smoke-rings below them. There was a long flash into the town park, another, another. Incendiary bombs? I wondered. As I opened my door I ran against the friends with whom I was staying, in their dressing-gowns.

'What is all this about?'

'We aren't sure. A big air-raid practice was announced for to-day. Or it may be something more. We are trying to reach Zoltaszek' (my old friend the Chief of Police). Just then the Polish maid appeared.

'Only Mrs. Zoltaszek is at home.'

‘Then ask her what’s going on. Is this an air-raid practice? What does she know?’ they pressed the girl. She spoke into the telephone for a moment and then turned, her eyes wide open.

‘She . . . she says it’s the beginning of war! . . .’

I grabbed the telephone, reached the *Telegraph* correspondent in Warsaw and told him my news. I heard later that he rang straight through to the Polish Foreign Office, who had had no word of the attack. The *Telegraph* was not only the first paper to hear that Poland was at war—it had, too, the odd privilege of informing the Polish Government itself.

I had arranged for a car to come on the first hint of alarm, but it did not arrive. We stood, drank coffee, walked about the rooms and waited; I was alternately cursing my driver and wondering whether the *Telegraph* would produce a Special Edition for my news. The war, as a tragic disaster, was not yet a reality. When my driver came at last, he met my fury with a pitying smile.

‘It’s only an air-raid practice,’ he said.

We ran down to the British Consulate, which I knew well. On our way I noticed smiles on the faces turned up to the sky. ‘Well,’ they seemed to be saying, ‘so this is the air-raid practice.’

‘But of course it’s an air-raid practice, Herr Konsul,’ the Secretary of the Consulate was saying as I arrived. My own reaction, for the moment, was actual fear: fear that I had made the *gaffe* of my life by reporting a non-existent war.

However, official confirmation of the war came soon enough. At once the Secretary—one of the German minority, who had worked at the Consulate since its opening in 1920—burst into tears.

‘This is the end of poor Germany,’ she wept.

Just then my sympathy with ‘poor Germany’ was not all that it might have been.

Everyone at the Consulate was working furiously. Papers were being stuffed into the big, old-fashioned stoves until ashes fluffed under one’s feet. The Consul was whipping round by telephone to ensure the departure of those British subjects who remained.

B) Excerpts from *Front Line*

[Fifty years later, Hollingworth again recounted these events, in her autobiography]

In Katowice I notified the British Consul General, still John Anthony Thwaites, that I had arrived to report developments for the *Daily Telegraph*. As Polish officers had taken all the hotel rooms, Thwaites offered to put me up in his flat: his wife

and family had been evacuated to Britain. I accepted his kind offer and the next day I set off on my first story for the *Daily Telegraph*.

I found officials genuinely cheerful and confident that in the approaching war, which most of them expected to break out in a few weeks or months at most, the Poles would give the hated Germans a good hiding. Indeed, optimism was everywhere. Even so, the wives of wealthy citizens had left for Warsaw or towns in the interior.

The border with Germany, of course, was closed except for flagged cars that enabled German consular officials or staff officers in civilian clothes to travel across the frontier as they pleased. This gave me an idea and I asked Thwaites if I might borrow his car.

‘Where do you want to go?’ he asked.

‘Into Germany,’ I replied.

He roared with laughter and disbelief. However, he did allow me to take his car and so off I went into Germany with the Union Jack fluttering from the bonnet. Nazi officers seemed somewhat surprised when they realised that they had been saluting the British flag but, in fact, no one tried to stop me and I crossed the frontier at Beuthen without trouble. It was almost deserted now that all civilians had been evacuated apart from a few traders. Soap was strictly rationed, there was [no] aspirin—that excellent German product—and oil and fats were obtainable only with special permits. Tea, coffee made from burnt maize, and meat were also rationed. Yet amid all this shortage, a waiter I had tipped well in the past produced from a restaurant kitchen—a partridge!

I thoroughly enjoyed that meal and then went off to buy all the films I could find along with bottles of wine, electric torches and other oddments in short supply in Poland.

I drove along the fortified frontier road through Mindenburg [sic] to Gleiwitz, which had been transformed into a military base. Just as I was leaving the town sixty-five motorcycle despatch riders, bunched together and riding hard, overtook me. By the roadside there were large numbers of troops, literally hundreds of tanks, armoured cars and field guns. Screens of hessian beside the road, constructed to hide the military vehicles, blew in the wind, thus I saw the battle deployment. I guessed that the German Command was preparing to strike to the north of Katowice and its fortified lines and this, in fact, was exactly how they launched their invasion in the south.

Back in Katowice, I described what I had seen to Thwaites, who listened with obvious disbelief; he did not consider it possible even to cross the border into Germany. ‘Then see for yourself,’ I said, and opened ‘his’ car door to reveal my purchases—things that were just not available in Poland. Finally convinced, Thwaites locked himself in his office and enciphered a top secret message to the Foreign Office via the British Embassy in Warsaw.

I telephoned [the *Daily Telegraph* correspondent, Hugh Carleton] Greene in the Polish capital and dictated my story. He relayed it within minutes to the *Daily Telegraph*. In those days there were no bylines in quality newspapers in Britain, which was a good thing because my family would have been worried.

The following day I drove to nearby towns in Silesia to try to contact British subjects working there and warn them on behalf of the British Consul General to leave. More and more Polish soldiers appeared in the streets to be cheered by schoolchildren and townsfolk. In Katowice itself anyone owning a car packed their belongings and headed out of town. Everyone was tuned in to the BBC as well as German and Polish radio stations. The count-down to war was nearing zero hour.

As the first light of dawn pierced the sky over Katowice on 1 September, I was awakened by explosions. Distant gunfire created a noise like banging doors. Aircraft roared over the city.

More heavy explosions. From my window—it was not even 5 A.M.—I saw the bombers riding high in the sky, and looking towards the German border less than twenty miles away I saw the flash of artillery fire. There was a lightning burst in the park, then another . . . then another. So the invasion was on and Britain and France were on the brink of war through their promise to defend Poland if Hitler attacked.

I woke up Thwaites and then dashed off to telephone Robin Hankey, second secretary at the British Embassy in Warsaw. ‘Robin!’ I shouted. ‘The war has begun.’

‘Are you sure, old girl?’ he asked.

‘Listen!’ I held the telephone out of my bedroom window. The growing roar of tanks encircling Katowice was clearly audible. ‘Can’t you hear it?’ I cried.

He seemed convinced and wisely advised that I got out of Katowice as soon as possible. I rang off, then telephoned Greene and broke the news to him. It was 5.30 a.m. Greene contacted the Foreign Ministry in Warsaw. ‘I hear from our correspondent in Katowice that the Germans have crossed the border and are advancing,’ said Greene.

‘Absolute nonsense,’ came the reply. ‘We are still negotiating.’

But as they talked the air-raid sirens wailed in Warsaw. For the first time Nazi bombers flew over the capital and the bombs fell.

Greene telephoned my story to London and suggested that I remain as near as possible to the action. In Katowice, Thwaites stowed his valuable pictures in the cellar of his home while we waited for his car and driver to take us to the consulate. There the senior and most trusted member of his local staff, a German-Silesian, was in floods of tears. ‘This will be the end of poor Germany,’ she kept moaning. While she wept, I emptied file after file into the heating furnaces until

ashes danced around my feet. Thwaites burnt all his ciphers and telephoned the British subjects who were still in the town.

The telephone rang repeatedly. The city police chief advised that it seemed that the Germans were slowing down after they crossed the border; he thought there was no immediate threat to Katowice. A Polish army contact predicted that the invaders would mount a pincer movement without inflicting any damage.

From the street outside the consulate came a shrill voice urging children to go to school and adults to their offices. The loudspeaker insisted that the report of a German invasion was rubbish. This was one of the first examples of German psychological warfare and their agents were doing their job well. For a moment I thought that I had started a phoney war. But the guns were still firing and they grew louder . . .

2.2. Diary of Lord Alanbrooke

The Aftermath of the Battle and Evacuation of Dunkerque, 27 May–4 June 1940

On 10 May 1940, Adolf Hitler’s forces launched an offensive in Western Europe, invading Belgium and the Netherlands; two days later, the German military entered the territory of France, its most powerful continental opponent in Western Europe. A British Expeditionary Force (BEF) headed by General Sir John Gort was already in France, but British and French forces only assumed their intended defensive posi-

tions in still neutral Belgium after German forces had already invaded that country. Employing blitzkrieg (lightning war) tactics, German forces swept through the heavily wooded Ardennes Mountains in northern France, reaching the Channel by 21 May, thereby trapping the BEF in the north and separating it from the bulk of the French forces. Together with the French First Army, on 24 May, Gort began to retreat to the channel port of Dunkerque, which offered the British troops an escape hatch to Britain. In the nine days, from 27 May to 4 June, British naval forces, together with every civilian vessel that was prepared to assist, evacuated 365,000 men from France, together with 140,000 French troops.

Heroic though the Dunkerque evacuation was, as small British boats manned by nonprofessionals converged on the port to rescue their soldiers, an aspect that legend and British propaganda—including a book by the British poet laureate Sir John Masefield—quickly emphasized, in reality it represented a stunning defeat. Thirty thousand British troops were taken prisoner, and the British were forced to jettison virtually all their scarce military equipment, tanks, armored cars, heavy guns, and even small arms and helmets. Replacing these would be slow, expensive, and difficult. The British also faced accusations that they had abandoned their French ally when the bulk of French forces elsewhere in France were still doggedly fighting the German invasion. On 4 June, Churchill relieved Gort of his command and ordered Lieutenant General Sir Alan Brooke to “[r]eturn to France to form a new BEF.” Well over 100,000 additional British and Empire troops were still in France, south of the German-controlled area in the north. On 11 June, a gloomy Brooke, who did not share Churchill’s hopes that the remaining French armies would fight on for any considerable time, embarked for France on a mission he thought futile. Meeting with French Commander in Chief General Maxime Weygand on 14 June, Brooke learned that his allies intended to open surrender negotiations with the Germans, whose military had effectively routed their French opponents. He withdrew British forces from French control, advised London that it was pointless to send any additional troops to France, and prepared to evacuate those under his command. Over the next three days, Brooke did so, departing himself on a trawler late on 17 June. The day before, Marshal Henri Philippe Pétain, hero of World War I and the new French president, had called upon French troops to cease fighting while he conducted ceasefire negotiations. Five days later, France concluded an armistice agreement with Germany, and military operations ended once Italy signed an armistice with France on 25 June.

About the Author

Sir Alan Brooke, as he was throughout the war, was a specialist in artillery and one of the strongest military intellectuals in the British army. He came from a prominent Ulster fam-

ily, several of whose members won military or political distinction. When Brooke returned to Britain in June 1940, Churchill appointed him commander of Home Forces, entrusted with the vital task of defending Britain against the expected German invasion. In December 1941, Brooke became chairman of the Imperial General Staff, the highest military staff position in the British Empire, where he remained throughout the war. Brooke, a forbidding, aloof, austere, and apparently unemotional figure, coordinated broad British military and strategic planning, directed the war effort, and attended all the wartime conferences as an adviser to Churchill. Created a field marshal in 1944, Brooke went off the active military list in September 1945, when he was created First Viscount Alanbrooke of Brookeborough.

About the Document

Throughout World War II, Brooke kept a diary, supposedly addressed to his much-loved second wife, Benita, from whom official duties kept him apart much of the time. In early life, he had developed a habit of writing regular letters to his equally adored mother, and he clearly needed the sense that he was writing for an audience. In his mind, did that audience include posterity? Quite possibly so. Brooke must have been aware that he was living in historically significant times, for which his diary would serve as an important source. It also had other functions. Brooke’s formidable outward façade hid a man who was often frustrated, who found much to deplore—though, it should also be remembered, often much to admire—in the behavior and actions of his superiors, especially Prime Minister Winston Churchill, colleagues, and associates, both American and British. Some of these criticisms were probably exaggerated. His nightly handwritten outpourings undoubtedly served as a safety valve, permitting him to release some of the tensions that might otherwise have impeded his performance in a difficult, demanding, stressful, and wearing job. Brooke himself commented how tired he and most of his colleagues were by the end of the war.

Brooke’s diaries had a controversial subsequent history. Brooke made his own handwritten copies after the war, adding additional notes and reflections of his own as he did so, and the Royal Regiment of Artillery that commissioned his biography arranged for a typed transcription. Brooke made his own notes available to the historian Sir Arthur Bryant, who published a best-selling two-volume history of the war that drew very heavily upon this source. Although Bryant toned down some of Brooke’s harshest criticism of Churchill in particular and other leading British and U.S. military and political figures, enough survived to infuriate many of Brooke’s former associates. Bryant also quietly softened or omitted information on episodes that might have reflected on British conduct of the war, including Brooke’s unflattering

1940 reflections on his Belgian and French allies and material on Brooke's decision to withdraw British troops from France. With Brooke's encouragement, moreover, Bryant's selections from the diaries exaggerated Brooke's strategic ability and percipience at the expense of other participants in major wartime military decisions. The fact that the financially straitened Brooke received substantial payments for making these materials available to Bryant won him additional opprobrium. In 2001, two respected historians published a complete version of Brooke's wartime diaries, correcting his numerous errors of spelling and punctuation but including all the available material, regardless of the light it shed upon both the author and those mentioned in his diaries. Although more than half a century had elapsed since the war ended, this book, from which the excerpts given here are taken, generated much public interest and extensive media attention, a tribute to the fascination that World War II and its leading protagonists still exert upon the popular imagination.

The diary entries of 15–18 June are interesting for several reasons. First, they present a vivid picture of the desperate military situation facing both French and British forces at the time. Fearing that British troops might find themselves interned in France, Brooke decided they must cut their losses and leave, even if this meant abandoning and sometimes deceiving his French allies. It is worth noting that on 17 June, when he left himself, there was no available British destroyer, and Brooke and his staff were forced to take a slow trawler that had been pressed into military service, hoping that they might “look sufficiently small and insignificant as not to be worth bombing!” It was not the most luxurious accommodation for a commander in chief and a telling indication of the military humiliation Germany had inflicted on Britain and France. Brooke wrote scathingly about the manner in which, in his view, throughout this episode, the British government subordinated military commonsense to the political need to be seen to be supportive of even a doomed French defense against Germany. If published earlier, these comments, and Brooke's unwavering determination to withdraw his forces from France and salvage what he could before Britain's ally surrendered, would have fueled bitter French accusations that the British army deliberately deserted them in 1940. As late as the sixtieth anniversary of D-Day in 2004, many Frenchmen still remembered with rancor the British evacuation of Dunkerque and deeply resented what they perceived as their ally's decision to abandon their country to its fate in 1940.

The saga of the publication of successive versions of Brooke's diaries is an interesting illustration of the way in which political, diplomatic, and other constraints and the wish to avoid embarrassment to oneself, others, and one's own or other governments, often mean that, for many years after particular events, even primary documents that are not

strictly speaking official government records often appear in print only in a heavily sanitized form. Inevitably, the history of the recent past, especially of such bitterly debated events as those of World War II, almost every aspect of which has generated often fierce controversy, has implications for the present. The conscientious historian who seeks to provide an accurate and quite possibly less bland account of that past must be prepared to go back to the original sources and cannot rely simply on the published versions that may well have been heavily edited. He should also realize that, in doing so, he may be depicting aspects of the past that some of his readers will find upsetting and offensive and that are liable to be used as ammunition in debates, some of them highly politicized and emotional, that remain controversial at the time of writing.

Primary Source

Diary of Lord Alanbrooke, 15–18 June 1940

15 June, Vitre (West of Laval)

Woken at 3 am by arrival of [British General] Jimmy Cornwall. Told him that I wanted him to take command of the forces under French X [Tenth] Army as soon as they could be detached by him, and to then retire on Cherbourg. Gave him a written order to the effect that he was to take command of these troops, and whilst rendering all possible assistance to X French Army to direct his axis of retirement on [the French port of] Cherbourg. . . . Got up at 6.30 am after poor night's sleep and after early breakfast moved my HQ [headquarters] and that of L of C [Lines of Communication] from Le Mans to Vitre. I considered the former too exposed owing to the absence of any French troops between this place and the Germans when the gap exists in which the German 4th Army is advancing with its left on Chartres.

We are still very exposed here to raids from armoured cars or tanks and have practically no protection. We may consequently have to move further back before long. It is a desperate job being faced with over 150,000 men and masses of material, ammunition, petrol, supplies etc, to try and evacuate or dispose of, with nothing to cover this operation except the crumbling French army.

Just before lunch the CIGS [Sir John Dill, Chief of the British Imperial General Staff] called up on a very bad telephone line to say that the 2 Brigades at Cherbourg were not to be embarked without orders from UK. This can achieve nothing but lead to chaos! It means that Jimmy Cornwall will probably arrive on the rest of the crowd before they have had time to be evacuated. After lunch I had another talk with Dill and was again told that for political reasons it is desirable that the two Brigades of the 52nd Div[ision] [Drew] should not be re-embarked for the present. In the evening I was told that

shipping was available at Cherbourg to remove Drew's brigades, but that owing to WO [War Office] instruction it could not be made use of! We are wasting shipping and valuable hours; at present bombing is not serious, at any moment it may become so. Received Liaison Officer from Jimmy Cornwall with his situation, and statement that he had not yet informed Altmayer of decision to re-embark BEF. Sent him reply not to disclose this fact for the present.

After dinner had another talk with Dill and Anthony Eden and pointed out to them that from a military point of view we were committing a grave error, we are wasting shipping, valuable time, and opportunities while hostile air interference is not serious. Subsequently was again called up by Dill and informed that I could embark some of the gunners of the 52nd Div and RE [Royal Engineers] at Cherbourg, provided I retained the infantry of the two bdes [brigades]. I am therefore trying to fill one ship with gunners etc. at Cherbourg.

[Material in italics indicates Alanbrooke's later addition to the diary.] *Modern developments, such as wireless and telephones, may constitute serious dangers for a commander in the field, if these systems are being made use of by politicians to endeavour to influence operations without being conversant and familiar with the circumstances prevailing in that theatre of operations. Wellington was indeed fortunate!*

Later Guy Rack commanding L of C troops at Rennes called up and said that 2 French generals were enquiring what all this movement towards the ports was implying!! I have replied that we are thinning out Base and L of C organization of BEF, originally intended for 12 Div but now much smaller. I hope this answer will satisfy them.

16 June, Redon (North of St Nazaire)

Got to bed shortly after midnight and had good sleep till 6 am when I was called up by CIGS on very bad telephone line. Told [me] to prepare to carry on embarking 2 brigades of 52nd Div at Cherbourg confirmation to follow shortly. Also probably orders for Cornwall's force. At 8.45 had second message by telephone from Dill, telling me to fire ahead with 52nd Div but to wait a little longer as regards Cornwall's force. Asked him whether Cornwall could agree to embarkation of French from Cherbourg for England if they desired, and told yes. . . .

At 6.25 pm I called up again and got Dill who informed me that the decision was that troops with the X Army should remain there and continue fighting with the X Army as long as it remained intact. Should X Army begin to disintegrate they may retire on Cherbourg. This is an unsatisfactory arrangement, but possibly inevitable. At 6.30 pm Drew called up from Cherbourg to say that half his army there was embarked, the remainder to embark tomorrow. He asked about his brigade with the X French Army and I told him he was not to wait for it but was to sail with his 2 brigades.

Dill in his last call said that [French Commander-in-Chief General Maxime] Weygand was not satisfied that I should have departed from our signed agreement. . . . However, I do not mind what accusations may be made against me. If I were faced with the same situation again I should act exactly in the same way, and am convinced that any other course of action could only result in throwing good money after bad. . . .

Midnight reports of embarkation are good. Some 45,000 have been embarked in last 24 hours, 12,000 previous 24 hours, giving total of just under 60,000 in 48 hours. Transportation hopeful of making 60,000 figure in next 24 hours which should complete evacuation.

17 June, Aboard trawler *Cambridgeshire*

Received report in early morning that X French Army was in full retreat and that Jimmy Cornwall was retiring British forces under his command on Cherbourg. X French Army [illegible] on Laval and Rennes. Barratt's air reconnaissance reports Germans in Orléans and tanks advancing from there on north bank of Loire.

Had several conferences in place for the day. Settled that Fighter Squadron should move during the day from Dinant to the Channel Islands, to protect Cherbourg landings from there. Saw Naval Officer and instructed him to have destroyer ready for my HQ at St Nazaire this evening in case it should be necessary. Informed Naval Commodore and De Fonblanque of necessity to push on with all speed loadings today as this will probably be the last 24 hours clear for all ports.

At 10 AM put call through to Dill to tell him of situation on X Army Front and of Jimmy Cornwall's move on Cherbourg. First reaction of Dill was that Jimmy should have remained with French X Army. However, as this army is in full retreat and as the forces of Jimmy Cornwall are based on Cherbourg, and further since Jimmy said that any pressure from Germans would result in disintegration of the X French Army, I cannot see that any other course was open to him. Dill then said that he hoped that if French wished they should be given opportunity of retiring in this direction. I assured him that Jimmy had already been instructed to that effect. I then gave him figures of embarkation and asked him what he wished me to do as I could not see that I was performing any useful function stopping on out here. He seemed to consider that my presence out here was important from a political point of view, which I fail to see as I am not in contact with any French forces nor under the command of any French formation. He then suggested that I should proceed by sea to Cherbourg to find out how evacuation was proceeding there. Finally informed me that he would call me up about 3 pm to let me know what I was to do. Telephone line to WO very bad and interrupted by bombing attack on Rennes. . . .

2.30 PM. Have just seen Meric [French liaison officer] who told me he heard the French broadcast by Pétain telling

French armies to cease hostilities, whilst he negotiates with the Germans. This renders situation very critical lest negotiations should lead to internment of British troops in France! It is essential for us to get away early. . . .

4.30 PM. We left Redon and motored to the vicinity of St Nazaire. There we parked in a lane hidden from aeroplanes and waited for the destroyer to arrive. We sent Allen the Naval officer on ahead to find out when the destroyer would arrive. He came back about an hour later saying that the *Lancastria* had been bombed with 6,000 on board as she was sailing out and sunk. The destroyer detailed for us had to be used to save the survivors and was no longer available! We had to choose between the *Ulster Sovereign*, not sailing till tomorrow, and an armoured trawler which would just take our HQ and could sail at once. We chose the latter. It can only sail at 9 knots per hour and will take some 30 hours to reach Plymouth!

When we arrived on board we found that she had just been saving 900 survivors from the *Lancastria*. She was in an indescribable mess, soaked in fuel oil and sea water with discarded wet clothes lying all over the place. Everything sticky with this beastly black fuel oil, all the walls, chairs, furniture etc. black with it. I have just spent an hour clearing up what I have taken as my cabin. We are going to have a rough trip from most points of view. But I hope that we may look sufficiently small and insignificant as not to be worth bombing! I have got what is left of my HQ with me, and also de Fonblanque and part of his staff. It's going to be hard to keep clean here. But I have so far salvaged my whole kit!

18 June, Aboard trawler *Cambridgeshire*

After midnight there were 3 air raids on the port before we sailed. All AA [anti-aircraft] guns, including the one on this trawler, firing furiously, but I did not hear any bombs being dropped. He may have been dropping magnetic mines. At 4 am we sailed instead of the previous evening as we had hoped. Did not get very much sleep owing to continued noise. . . .

The last week has been a very trying one, and I hope never to be entrusted with a similar task again! To try and relate political considerations, with which you are not fully informed, with military necessities, which stare one in the face, is a very difficult matter when these two considerations pull in diametrically opposed directions. Politically it may have been desirable to support our allies to the very last moment even to the extent of being involved in the final catastrophe and annihilation. Militarily it was self evident from the start that the very small forces at our disposal could do *nothing* towards restoring the military situation which would have required at least 2 complete armies to exercise any influence. Furthermore, it was clear that any additional forces landed in France, or existing forces retained in that country must inevitably be annihilated if left to fight the war to the last. The

difficulty has been to extract the existing forces without giving the impression that we were abandoning our ally in its hour of need. Pétain's order to cease hostilities gave the ultimate necessary relief to this situation, but unless this situation had been anticipated in our preparations I doubt whether we should have saved much.

2.3. Winston Churchill, “The Few”

About the Author

One of the towering figures of World War II, the man who brought hope to the British people and the Allied cause at the European war's darkest moment, was Winston Churchill, who became prime minister of Great Britain on 10 May 1940, as Germany launched its assault on the Low Countries and France. The next few months brought a succession of disasters: the rapid German conquest of Belgium, the Netherlands, and France, followed by a major air assault on Great Britain, first against British air fields and facilities and then on the major industrial cities. Most of the British army escaped ignominiously from France, leaving behind 30,000 prisoners and its equipment, much of which the German forces captured. Britain had no allies left in Europe, and if it decided to fight on alone, needed to make up the losses of matériel as fast

as possible. North America, Canada and even more the United States, were the only major potential sources of outside supplies. Although U.S. President Franklin D. Roosevelt was broadly sympathetic to the Allied cause, he was wary of sending much in the way of military equipment, since he feared that Britain might be forced to capitulate and was in any case preoccupied with a tough reelection campaign. The United States itself was only beginning to rearm, and military supplies were scarce and valuable; moreover, he feared that if Britain surrendered, such weapons might well fall into German hands. Great Britain's international record for most of the 1930s gave some reason to believe that before long the British government would reach some form of humiliating peace settlement with Germany whereby it would acquiesce in Nazi domination of the European continent.

When Churchill took office, therefore, high among his first tasks were the need to restore British morale and the necessity to convince the outside world that his country was determined to fight on, no matter what the odds. He was peculiarly equipped to do so, and in some sense, all his life had been an apprenticeship for the five years he spent as wartime premier, which in his own words became both his own and Great Britain's "finest hour." Churchill, then in his late sixties, was a political maverick, whose past career had at best been somewhat checkered. A minor British aristocrat, he was the grandson of the Duke of Marlborough and the son of Lord Randolph Churchill, a brilliant but erratic nineteenth-century Conservative politician who died young, leaving his eldest son to fulfill his own political ambitions. Churchill inherited and even surpassed his father's talents but also had something of his instability. In the early twentieth century, he switched from the Conservative to the Liberal Party over the issue of protectionism, serving as home secretary, first lord of the admiralty, and colonial secretary; once the Liberals went into permanent decline in the mid-1920s, he returned to the Conservatives and served as chancellor of the exchequer. When the Conservatives lost office in the late 1920s, Churchill began a forceful campaign for British rearmament, which he continued throughout the 1930s, sounding the alarm against Nazi Germany's intentions (though he rather admired other European dictators, including Benito Mussolini of Italy and Francisco Franco of Spain). The National Government that took power in 1931, successively headed as the decade wore on by Prime Ministers J. Ramsay MacDonald, Stanley Baldwin, and Neville Chamberlain, was deeply unsympathetic to Churchill's views, considering them extreme, provocative, and impractical. He spent more than 10 years in the political wilderness before returning to office in September 1939 as first lord of the Admiralty once more.

Those who considered Churchill untrustworthy had some excuse. Apart from his switches of political allegiance—"I

belong to the noble order of rats," he once said—his personal style alarmed many. Ambitious, self-promoting, and somewhat grandiloquent, throughout his career he went in for self-advertisement, beginning with his early escape from captivity when he was a journalist in the Boer War. Many questioned his political judgment, especially on such matters as the disastrous World War I Gallipoli expedition, for which many held Churchill responsible, Indian independence, which he opposed ferociously during the 1930s, and his support for King Edward VIII during the 1936 abdication crisis. Churchill's personal reputation was also less than savory. Both his father and his mother, Jennie, the beautiful daughter of a wealthy American businessman, belonged to the high-living set centering around the Prince of Wales (later Edward VII, 1901–1910) and enjoyed its fast-paced, extravagant, and racketsy lifestyle of frenetic socializing, gambling, love affairs, and debts. Churchill himself was devoted to his wife and often sought relaxation in bricklaying and painting. Even so, most of his closest political associates were rather disreputably raffish, and his own lifestyle was decidedly sybaritic, marked by expensive and exotic holidays, gambling, rich food, and massive consumption of cigars and alcohol, to the point that some considered him a functioning alcoholic. Far from wealthy but undoubtedly industrious, for most of his political career Churchill subsidized his expensive tastes by writing numerous well-received popular books and articles, though he also received welcome subventions from richer friends. Given the political establishment's reservations toward him, Churchill was only likely to become prime minister in a major national emergency.

A romantic imperialist with a deep attachment to his own vision of Great Britain and its empire, an outstanding wordsmith who possessed a photographic memory for poetry, history, and literature, Churchill rose to this occasion magnificently to become one of the world's great war leaders. All his life, he had prided himself on his (in other contexts, sometimes slightly overblown) rhetorical skills, and in a national crisis, they proved their worth. Arrogant, egotistical, inconsiderate, and demanding, Churchill also possessed vast courage and stamina, a strong sense of occasion, and a fundamental belief in both Great Britain and democracy that translated into an unquestioning conviction that his own country would not only survive but eventually—admittedly with American help—would defeat Germany and Italy. In this sense, he greatly resembled the equally temperamental and idiosyncratic Free French leader General Charles de Gaulle.

Besides running the government and the war effort, as soon as he took office in mid-May 1940, Churchill delivered a year-long series of rousing speeches, some in the House of Commons, others over the radio, in memorable language, rallying the British people to withstand defeat in Europe and German bombing and potential invasion, and proving to the

rest of the world that Britain remained indomitable and would fight on. To many at home and abroad, he came to seem the national embodiment of all the best—as well as some of the worst—qualities of Great Britain. Speaking against a changing but always perilous background of the retreat from Dunkerque, the fall of France, fearsome air battles between British and German fighter squadrons, and the bombing of Britain's cities, dangers he never attempted to minimize, Churchill caught the popular imagination both within and outside his own country. Refusing to admit the possibility of defeat, by the end of 1940, Churchill had restored morale within Britain and won massive international sympathy and respect for his country in its battle against Hitler. His campaign also ensured him permanent recognition as one of the greatest figures of the twentieth century and the finest war leader in British history.

About the Document

Churchill delivered this particular speech to the British House of Commons at the height of the Battle of Britain, the protracted German attacks on British air facilities that followed Churchill's refusal to negotiate peace with Hitler once France had fallen. The destruction of British air capabilities was considered an essential preliminary to a successful German invasion of Britain, so virtually every British political and military leader believed that their country's fate ultimately hinged upon the outcome of this contest.

Although Churchill had a gift for words and quick-witted repartee, his speeches were normally set pieces whose oratory was rarely spontaneous. Even before entering politics, he had hoped to be able to sway audiences through the power of his rhetoric. (Interestingly, oratorical skill and the ability to project it, not just in mass gatherings but also over the new medium of radio, was one important common denominator shared by many of World War II's most prominent political leaders, including Hitler in Germany, Mussolini in Italy, and Roosevelt in the United States.) Churchill put intensive preparation and rehearsal into all his speeches, many of which—like this one—were primarily descriptive but sections of which usually contained notably stirring rhetoric. As with most of his speeches to parliament, Churchill subsequently rebroadcast it as a radio address for the British people, and it was also sent out live to the United States and other overseas countries. So admired was his oratory at this period of the war that, even in German propaganda radio stations, work stopped so that everyone could listen to Churchill.

In this speech, Churchill intended both to give an overview of the existing state of British defenses and to encourage his people to believe that victory was attainable and that they could endure the sustained German assaults and, if necessary, the feared invasion. Churchill sought neither to disguise the gravity of the existing situation nor to exaggerate its dan-

gers. Interestingly, he made extensive comparisons between the British situation in August 1940 and that of 25 years earlier, one year into World War I. For Churchill, and indeed the entire generation of British political leaders to which he belonged, the earlier conflict was a constant reference point, a memory they found it impossible to forget. Churchill rightly pointed out that British casualties in the first year of World War II were far lower than those in the earlier conflict, but he also noted how quickly France had surrendered, whereas in World War I, it stubbornly fought Germany for more than four years.

Speaking three months after becoming prime minister, Churchill put the best gloss possible on the recovery of British defenses from the disasters of May and June 1940. He pointed out that British arms production facilities had been greatly expanded and that massive amounts of munitions had recently arrived from the United States, enabling the British to rebuild their armed forces. He also contended that British naval and air defenses and food production were all in far better shape than they had been one year earlier. In an implicit reference to an ongoing debate with the United States over whether Britain would allow food and other supplies to enter occupied Europe, Churchill uncompromisingly warned that his government would not do so, since any such imports would release other vital materials for the German war effort.

Delivered at the height of the Battle of Britain, Churchill's speech became famous for his generous and well-deserved tribute to the youthful pilots whose airplanes met German fighters in raid after raid, suffering heavy casualties in the process: "Never in the field of human conflict was so much owed by so many to so few." He also thanked the less glamorous bomber squadrons who were contemporaneously raiding German industrial facilities, and as he did so, probably exaggerated for the sake of domestic morale the damage these operations inflicted on the enemy.

A particularly interesting feature of this speech is the degree to which, though delivered in the British House of Commons, its intended audience was not just the general British public but also that of the United States. Two months earlier, as France capitulated, Churchill had stated that upon the impending Battle of Britain "depends the survival of Christian civilization." If Britain failed, he argued, "then the whole world, including the United States, including all that we have known and cared for, will sink into the abyss of a new Dark Age" (Churchill, speech in the House of Commons, 18 June 1940, as reported in *Hansard*). Roosevelt found these arguments and the now indisputable British determination to fight on persuasive. In August, he agreed to transfer 50 overage American destroyers to Britain in return for U.S. base rights in British possessions in the Caribbean and North America. Churchill presented this agreement as evidence of the degree to which, even though the United States was not

formally at war, the countries were now coordinating their defense policies against common enemies. Though the destroyers arrived too late to make any great contribution to British defense in 1940 and many were in very poor repair, the very fact that the U.S. government was prepared to conclude this agreement gave the embattled British an enormous psychological boost. Although Churchill tactfully depicted these two transactions as unrelated, in reality, they were closely linked. The version of the negotiations given in this speech was only the first of many, both during and after the war, when he deliberately exaggerated the extent of wartime Anglo-American unity, harmony, and cooperation.

Although Churchill refused at this stage to lay out a formal program of war aims on the pragmatic grounds that the war still had to be won, he did make clear his belief and expectation of the inevitability that in the future “these two great organizations of the English-speaking democracies, the British Empire and the United States, will have to be somewhat mixed up together in some of their affairs for mutual and general advantage.” Himself of mixed Anglo-American heritage, Churchill had long believed that close international collaboration between the two would benefit both nations, but more especially his own Great Britain, between the wars already an empire in decline. After World War II, he would deliberately promote an image of the grand alliance that won the conflict as an object lesson in harmonious British-American cooperation, urge even closer coordination of the two nations’ Cold War foreign policies, and appeal to U.S. leaders to remain actively involved in international affairs. At least in part, Churchill’s determination to draw the United States into both World War II and the postwar world sprang from a shrewd appreciation that, without American assistance, the flagging British Empire lacked the resources to win World War II or dominate the subsequent settlement. His public speeches reveal that as early as 1940, he recognized the potential of the United States to play a crucial role in international affairs. Ensuring that the United States fulfilled this potential, ideally in partnership with Great Britain, would eventually become the consuming preoccupation of Churchill’s final two decades.

Winston Churchill, “The Few,” Speech in the House of Commons, 20 August 1940

Almost a year has passed since the war began, and it is natural for us, I think, to pause on our journey at this milestone and survey the dark, wide field. It is also useful to compare the first year of this second war against German aggression with its forerunner a quarter of a century ago. Although this war is in fact only a continuation of the last, very great differences in its character are apparent. In the last war millions of

men fought by hurling enormous masses of steel at one another. “Men and shells” was the cry, and prodigious slaughter was the consequence. In this war nothing of this kind has yet appeared. It is a conflict of strategy, of organization, of technical apparatus, of science, mechanics and morale. The British casualties in the first 12 months of the Great War amounted to 365,000. In this war, I am thankful to say, British killed, wounded, prisoners and missing, including civilians, do not exceed 92,000, and of these a large proportion are alive as prisoners of war. Looking more widely around, one may say that throughout all Europe, for one man killed or wounded in the first year perhaps five were killed or wounded in 1914–15.

The slaughter is only a small fraction, but the consequences to the belligerents have been even more deadly. We have seen great countries with powerful armies dashed out of coherent existence in a few weeks. We have seen the French Republic and the renowned French Army beaten into complete and total submission with less than the casualties which they suffered in any one of half a dozen of the battles of 1914–18. The entire body—it might almost seem at times the soul—of France has succumbed to physical effects incomparably less terrible than those which were sustained with fortitude and undaunted will power 25 years ago. . . .

There is another more obvious difference from 1914. The whole of the warring nations are engaged, not only soldiers, but the entire population, men, women and children. The fronts are everywhere. The trenches are dug in the towns and streets. Every village is fortified. Every road is barred. The front line runs through the factories. The workmen are soldiers with different weapons but the same courage. These are great and distinctive changes from what many of us saw in the struggle of a quarter of a century ago. There seems to be every reason to believe that this new kind of war is well suited to the genius and the resources of the British nation and the British Empire; and that, once we get properly equipped and properly started, a war of this kind will be more favorable to us than the somber mass slaughters of the Somme and Passchendaele. If it is a case of the whole nation fighting and suffering together, that ought to suit us, because we are the most united of all the nations, because we entered the war upon the national will and with our eyes open, and because we have been nurtured in freedom and individual responsibility and are the products, not of totalitarian uniformity, but of tolerance and variety. If all these qualities are turned, as they are being turned, to the arts of war, we may be able to show the enemy quite a lot of things that they have not thought of yet. Since the Germans drove the Jews out and lowered their technical standards, our science is definitely ahead of theirs. Our geographical position, the command of the sea, and the friendship of the United States enable us to draw resources from the whole world and to manufacture weapons of war of

every kind, but especially of the superfine kinds, on a scale hitherto practiced only by Nazi Germany.

Hitler is now sprawled over Europe. . . . It is our intention to maintain and enforce a strict blockade, not only of Germany, but of Italy, France, and all the other countries that have fallen into the German power. . . . There have been many proposals, founded on the highest motives, that food should be allowed to pass the blockade for the relief of these populations. I regret that we must refuse these requests. The Nazis declare that they have created a new unified economy in Europe. They have repeatedly stated that they possess ample reserves of food and that they can feed their captive peoples. . . . Many of the most valuable foods are essential to the manufacture of vital war material. Fats are used to make explosives. Potatoes make the alcohol for motor spirit. The plastic materials now so largely used in the construction of aircraft are made of milk. If the Germans use these commodities to help them to bomb our women and children, rather than to feed the populations who produce them, we may be sure that imported foods would go the same way, directly or indirectly, or be employed to relieve the enemy of the responsibilities he has so wantonly assumed. Let Hitler bear his responsibilities to the full, and let the peoples of Europe who groan beneath his yoke aid in every way the coming of the day when that yoke will be broken. Meanwhile, we can and we will arrange in advance for the speedy entry of food into any part of the enslaved area, when this part has been wholly cleared of German forces, and has genuinely regained its freedom. We shall do our best to encourage the building up of reserves of food all over the world, so that there will always be held up before the eyes of the peoples of Europe, including—I say deliberately—the German and Austrian peoples, the certainty that the shattering of the Nazi power will bring to them all immediate food, freedom and peace.

Rather more than a quarter of a year has passed since the new Government came into power in this country. What a cataract of disaster has poured out upon us since then! The trustful Dutch overwhelmed; their beloved and respected Sovereign driven into exile; the peaceful city of Rotterdam the scene of a massacre as hideous and brutal as anything in the Thirty Years' War; Belgium invaded and beaten down; our own fine Expeditionary Force, which King Leopold called to his rescue, cut off and almost captured, escaping as it seemed only by a miracle and with the loss of all its equipment; our Ally, France, out; Italy in against us; all France in the power of the enemy, all its arsenals and vast masses of military material converted or convertible to the enemy's use; a puppet Government set up at Vichy which may at any moment be forced to become our foe; the whole western seaboard of Europe from the North Cape to the Spanish frontier in German hands; all the ports, all the airfields on this immense front employed against us as potential springboards of inva-

sion. Moreover, the German air power, numerically so far outstripping ours, has been brought so close to our Island that what we used to dread greatly has come to pass and the hostile bombers not only reach our shores in a few minutes and from many directions, but can be escorted by their fighting aircraft. Why, Sir, if we had been confronted at the beginning of May with such a prospect, it would have seemed incredible that at the end of a period of horror and disaster, or at this point in a period of horror and disaster, we should stand erect, sure of ourselves, masters of our fate and with the conviction of final victory burning unquenchable in our hearts. Few would have believed we could survive; none would have believed that we should today not only feel stronger but should actually be stronger than we have ever been before.

Let us see what has happened on the other side of the scales. The British nation and the British Empire, finding themselves alone, stood undismayed against disaster. No one flinched or wavered; nay, some who formerly thought of peace, now think only of war. Our people are united and resolved, as they have never been before. Death and ruin have become small things compared with the shame of defeat or failure in duty. We cannot tell what lies ahead. It may be that even greater ordeals lie before us. We shall face whatever is coming to us. We are sure of ourselves and of our cause, and that is the supreme fact which has emerged in these months of trial.

Meanwhile, we have not only fortified our hearts but our Island. We have rearmed and rebuilt our armies in a degree which would have been deemed impossible a few months ago. We have ferried across the Atlantic, in the month of July, thanks to our friends over there, an immense mass of munitions of all kinds: cannon, rifles, machine guns, cartridges and shell, all safely landed without the loss of a gun or a round. The output of our own factories, working as they have never worked before, has poured forth to the troops. The whole British Army is at home. More than 2,000,000 determined men have rifles and bayonets in their hands tonight, and three-quarters of them are in regular military formations. We have never had armies like this in our Island in time of war. The whole Island bristles against invaders, from the sea or from the air. . . .

Our Navy is far stronger than it was at the beginning of the war. The great flow of new construction set on foot at the outbreak is now beginning to come in. We hope our friends across the ocean will send us a timely reinforcement to bridge the gap between the peace flotillas of 1939 and the war flotillas of 1941. There is no difficulty in sending such aid. The seas and oceans are open. The U-boats are contained. The magnetic mine is, up to the present time, effectively mastered. The merchant tonnage under the British flag, after a year of unlimited U-boat war, after eight months of intensive min-

ing attack, is larger than when we began. We have, in addition, under our control at least 4,000,000 tons of shipping from the captive countries which has taken refuge here or in the harbors of the Empire. Our stocks of food of all kinds are far more abundant than in the days of peace, and a large and growing program of food production is on foot.

Why do I say all this? Not, assuredly, to boast; not, assuredly, to give the slightest countenance to complacency. The dangers we face are still enormous, but so are our advantages and resources. I recount them because the people have a right to know that there are solid grounds for the confidence which we feel, and that we have good reason to believe ourselves capable, as I said in a very dark hour two months ago, of continuing the war "if necessary alone, if necessary for years." . . .

The great air battle which has been in progress over this Island for the last few weeks has recently attained a high intensity. It is too soon to attempt to assign limits either to its scale or to its duration. We must certainly expect that greater efforts will be made by the enemy than any he has so far put forth. . . .

On the other hand, the conditions and course of the fighting have so far been favorable to us. I told the House two months ago that, whereas in France our fighter aircraft were wont to inflict a loss of two or three to one upon the Germans, and in the fighting at Dunkirk, which was a kind of no-man's-land, a loss of about three or four to one, we expected that in an attack on this Island we should achieve a larger ratio. This has certainly come true. . . .

A vast and admirable system of salvage, directed by the Ministry of Aircraft Production, ensures the speediest return to the fighting line of damaged machines, and the most provident and speedy use of all the spare parts and material. At the same time the splendid—nay, astounding—increase in the output and repair of British aircraft and engines which Lord Beaverbrook has achieved by a genius of organization and drive, which looks like magic, has given us overflowing reserves of every type of aircraft, and an ever-mounting stream of production both in quantity and quality. The enemy is, of course, far more numerous than we are. But our new production already, as I am advised, largely exceeds his, and the American production is only just beginning to flow in. It is a fact, as I see from my daily returns, that our bomber and fighter strength now, after all this fighting, are larger than they have ever been. We believe that we shall be able to continue the air struggle indefinitely and as long as the enemy pleases, and the longer it continues the more rapid will be our approach, first towards that parity, and then into that superiority, in the air upon which in a large measure the decision of the war depends.

The gratitude of every home in our Island, in our Empire, and indeed throughout the world, except in the abodes of the

guilty, goes out to the British airmen who, undaunted by odds, unwearied in their constant challenge and mortal danger, are turning the tide of the World War by their prowess and by their devotion. Never in the field of human conflict was so much owed by so many to so few. All hearts go out to the fighter pilots, whose brilliant actions we see with our own eyes day after day; but we must never forget that all the time, night after night, month after month, our bomber squadrons travel far into Germany, find their targets in the darkness by the highest navigational skill, aim their attacks, often under the heaviest fire, often with serious loss, with deliberate careful discrimination, and inflict shattering blows upon the whole of the technical and war-making structure of the Nazi power. On no part of the Royal Air Force does the weight of the war fall more heavily than on the daylight bombers, who will play an invaluable part in the case of invasion and whose unflinching zeal it has been necessary in the meanwhile on numerous occasions to restrain.

We are able to verify the results of bombing military targets in Germany, not only by reports which reach us through many sources, but also, of course, by photography. I have no hesitation in saying that this process of bombing the military industries and communications of Germany and the air bases and storage depots from which we are attacked, which process will continue upon an ever-increasing scale until the end of the war, and may in another year attain dimensions hitherto undreamed of, affords one at least of the most certain, if not the shortest, of all the roads to victory. Even if the Nazi legions stood triumphant on the Black Sea, or indeed upon the Caspian, even if Hitler was at the gates of India, it would profit him nothing if at the same time the entire economic and scientific apparatus of German war power lay shattered and pulverized at home. . . .

The defection of France has, of course, been deeply damaging to our position. . . .

Most of the other countries that have been overrun by Germany for the time being have persevered valiantly and faithfully. The Czechs, the Poles, the Norwegians, the Dutch, the Belgians are still in the field, sword in hand, recognized by Great Britain and the United States as the sole representative authorities and lawful Governments of their respective States.

That France alone should lie prostrate at this moment is the crime, not of a great and noble nation, but of what are called "the men of Vichy." We have profound sympathy with the French people. Our old comradeship with France is not dead. In General de Gaulle and his gallant band, that comradeship takes an effective form. These free Frenchmen have been condemned to death by Vichy, but the day will come, as surely as the sun will rise tomorrow, when their names will be held in honor, and their names will be graven in stone in the streets and villages of a France restored in a liberated Europe to its full freedom and its ancient fame. . . .

A good many people have written to me to ask me to make on this occasion a fuller statement of our war aims, and of the kind of peace we wish to make after the war, than is contained in the very considerable declaration which was made early in the autumn. Since then we have made common cause with Norway, Holland and Belgium. We have recognized the Czech Government of Dr. Benes, and we have told General de Gaulle that our success will carry with it the restoration of France. I do not think it would be wise at this moment, while the battle rages and the war is still perhaps only in its earlier stage, to embark upon elaborate speculations about the future shape which should be given to Europe or the new securities which must be arranged to spare mankind the miseries of a third World War. The ground is not new, it has been frequently traversed and explored, and many ideas are held about it in common by all good men, and all free men. But before we can undertake the task of rebuilding we have not only to be convinced ourselves, but we have to convince all other countries that the Nazi tyranny is going to be finally broken. The right to guide the course of world history is the noblest prize of victory. We are still toiling up the hill; we have not yet reached the crest-line of it; we cannot survey the landscape or even imagine what its condition will be when that longed-for morning comes. The task which lies before us immediately is at once more practical, more simple and more stern. I hope—indeed, I pray—that we shall not be found unworthy of our victory if after toil and tribulation it is granted to us. For the rest, we have to gain the victory. That is our task.

There is, however, one direction in which we can see a little more clearly ahead. We have to think not only for ourselves but for the lasting security of the cause and principles for which we are fighting and of the long future of the British Commonwealth of Nations. Some months ago we came to the conclusion that the interests of the United States and of the British Empire both required that the United States should have facilities for the naval and air defense of the Western Hemisphere against the attack of a Nazi power which might have acquired temporary but lengthy control of a large part of Western Europe and its formidable resources. We had therefore decided spontaneously, and without being asked or offered any inducement, to inform the Government of the United States that we would be glad to place such defense facilities at their disposal by leasing suitable sites in our Transatlantic possessions for their greater security against the unmeasured dangers of the future. The principle of association of interests for common purposes between Great Britain and the United States had developed even before the war. Various agreements had been reached about certain small islands in the Pacific Ocean which had become important as air fueling points. In all this line of thought we found

ourselves in very close harmony with the Government of Canada.

Presently we learned that anxiety was also felt in the United States about the air and naval defense of their Atlantic seaboard, and President Roosevelt has recently made it clear that he would like to discuss with us, and with the Dominion of Canada and with Newfoundland, the development of American naval and air facilities in Newfoundland and in the West Indies. There is, of course, no question of any transference of sovereignty—that has never been suggested—or of any action being taken without the consent or against the wishes of the various Colonies concerned; but for our part, His Majesty's Government are entirely willing to accord defense facilities to the United States on a 99 years' leasehold basis, and we feel sure that our interests no less than theirs, and the interests of the Colonies themselves and of Canada and Newfoundland, will be served thereby. These are important steps. Undoubtedly this process means that these two great organizations of the English-speaking democracies, the British Empire and the United States, will have to be somewhat mixed up together in some of their affairs for mutual and general advantage. No one can stop it. Like the Mississippi, it just keeps rolling along. Let it roll. Let it roll on full flood. Let us not view the process with any misgivings. I could not stop it if I wished; no one can stop it. Like the Mississippi, it just keeps rolling along. Let it roll. Let it roll on full flood, inexorable, irresistible, benignant, to broader lands and better days.

2.4. Henry R. Luce on the U.S. Role in International Affairs

About the Author

Henry R. Luce was one of the most influential journalists and publishers in U.S. media history. Born in 1898 in China to American missionary parents, he spent the first 14 years of his life there. Luce then studied at Hotchkiss School in Connecticut and at Yale University, where he was voted “most brilliant” of the class of 1920. Even in his teens, Luce was active in journalism, working as an editor on weekly and monthly newspapers at Hotchkiss and becoming editor of the *Yale Daily News*. He also served as a second lieutenant in Yale’s Reserve Officer Training Corps and, after graduation, spent a year studying history at Oxford University in England. After finishing his studies, Luce went into journalism, and in 1923, he and a school friend, Briton Hadden, raised the funds to establish *Time*, the first weekly newsmagazine in the United States. The new publication, of which Luce became the business manager, proved enormously successful. After Hadden’s sudden death in 1929, Luce also became its editor, and his abilities in this role soon became legendary as he attracted a stable of brilliant young writers and helped to hone their professional skills. Luce founded several other publications, most notably the business magazine *Fortune* in 1930, *Life* magazine in 1936, and *Sports Illustrated* in 1954. Luce remained editor in chief of all until 1964.

By the late 1930s, Luce publications dominated the market for popular middlebrow news in the United States, and he had become immensely wealthy. However, like many twentieth-century press magnates, Lord Northcliffe and Lord Beaverbrook in Britain, for example, or the more recent Rupert Murdoch, Robert Maxwell, and Conrad Black, Luce sought to translate wealth into political clout, so that eventually he would be making the news rather than simply reporting it. Luce’s missionary background, from which he took a nearly messianic sense of his own destiny and that of his country, probably contributed to his broader ambitions. Dour and forbidding, he was not obviously suited for a political career. He chose a more indirect route, becoming a close associate of leading Republican politicians. In 1936, his publications supported the Republican presidential candidate against Franklin D. Roosevelt, but the latter won a landslide victory, leaving Luce still outside the charmed circles of power.

Given his background, Luce always took particular interest in China. He admired the Guomindang (GMD, Kuomintang, KMT, Nationalist) government of Jiang Jieshi (Chiang Kai-shek), who took power in the later 1920s and unified most of China under his own leadership. Luce used his mag-

azines to promote the image of Jiang, together with his American-educated wife, Song Meiling (Soong May-ling), as the model of a Christian, modernizing Asian leader. Luce supported Jiang’s efforts to eliminate what was by the mid-1930s his major political rival, the Chinese Communist Party, led by Mao Zedong (Mao Tse-tung). When the Sino-Japanese War began in summer 1937, Luce supported the Chinese cause, helped to raise substantial funding for war relief there, and supported American assistance to Jiang. Later in the war, the Luce publications would become closely identified with continued assistance to Jiang and his wife, an integral part of what was to become the American China lobby of Jiang supporters.

For much of the 1930s, Luce was sympathetic to the demands of the European Fascist powers, Germany and Italy, and this stance was reflected in his publications, which praised the Munich Agreement of September 1938. Adolf Hitler was made “Man of the Year,” albeit with a highly unflattering cover cartoon and some anti-Fascist copy in the text. Luce was, however, strongly anticommunist, which led him to turn against Hitler after the August 1939 German-Soviet Non-aggression Pact. In 1940, he became a strong supporter of American assistance to British premier Winston Churchill’s efforts to fight on against Germany, making Churchill *Time*’s “Man of the Year” for 1940.

Although strongly pro-Allied by mid-1940, Luce was almost equally hostile to Roosevelt. He was one of those Republicans who engineered the nomination of the pro-Allied Wendell L. Willkie as their party’s presidential candidate in 1940. Luce publications slanted their reporting in Willkie’s favor, as their proprietor was on close terms with the candidate and apparently hoped to become secretary of state in a Willkie administration. Such ambitions evaporated early in November 1940 when Roosevelt won the election. Luce now used his own press facilities to try to establish himself as an influential voice in foreign affairs.

About the Document

In February 1941, *Life* published Luce’s essay, “The American Century.” In this piece, whose title would be used as a cliché to describe the twentieth-century international role of the United States, Luce argued that his country was already effectively in the current war and that it should in the future play a far greater part in world affairs. Luce made Herculean efforts to publicize his views beyond *Life*’s 12 million readers. He reprinted the piece in full-page advertisements in newspapers throughout the country and sent copies of a reprint pamphlet edition, bolstered by generally favorable commentary by several well-known journalists and commentators, to hundreds of influential friends and associates. This was clearly a well-financed full-scale campaign to establish Luce

as someone whose foreign policy views deserved recognition and discussion, an effort that his personal wealth and media access greatly facilitated.

“The American Century” used high-flown language to urge that Americans should address themselves to “the authentic creation of the 20th Century—our Century.” Luce did not adopt Roosevelt’s view that vital U.S. interests were necessarily at stake in Europe; in fact, he flatly suggested that “regardless of what happens in Europe, it would be entirely possible for us to organize a defense of the northern part of the Western Hemisphere so that this country could not be successfully attacked.” In this, he was at one with the members of the contemporary anti-interventionist America First Committee.

What Luce did argue was that the United States had a choice as to whether to enter the war and that, if it did so, the country must therefore decide what it was fighting for and what it hoped to get out of the war in terms of “a workable Peace.” In his view, the United States, though it had already become “the most powerful and the most vital nation in the world,” did not know how to deploy its strength, and to date, Americans had “failed to play their part as a world power—a failure which has had disastrous consequences for themselves and for all mankind.” The remedy he prescribed was that the country should “accept wholeheartedly our duty and our opportunity as the most powerful and vital nation in the world and in consequence to assert upon the world the full impact of our influence, for such purposes as we see fit and by such means as we see fit.” The United States should “shar[e] with all peoples . . . our Bill of Rights, our Declaration of Independence, our Constitution, our magnificent industrial products, our technical skills.”

Luce’s article sounded many of the themes that would characterize postwar American internationalism. Implicit in it was the message that, if Americans did not rise to this challenge and become actively involved in the outside world, they would themselves suffer materially and psychologically. Rather than simply pursuing its own interests, the United States was also to propagate American political, economic, and cultural values, serving as a model to other countries. Luce envisaged his country disseminating the American way of life around the world, pointing out the extent to which “American jazz, Hollywood movies, American slang, American machines and patented products” had already spread internationally, so that, in his view, “America is already the intellectual, scientific and artistic capital of the world.” Luce urged Americans consciously to provide scientific, technological, educational, and cultural leadership. He suggested that a free American economy depended on the acceptance of “free economic system[s]” elsewhere in the world and that the United States should therefore ensure freedom of the seas and the air and become the top international trading nation.

Luce also believed that Americans must provide humanitarian aid to a world facing famine and destitution. Lastly, he called upon the United States to propagate and spread abroad both specifically American ideals and those more broadly associated with Western civilization generally. He clearly hoped that this would be only the beginning of American world dominance, finishing his article by stating that Americans should work together “to create the first great American Century.”

As he intended, Luce’s article provoked wide-ranging discussion throughout the United States and beyond. Then and afterward, many on the Left, Vice President Henry A. Wallace, for example, and socialist leader Norman Thomas, condemned Luce for envisaging a new international order run in the interests of American capitalism and business, a world system in which U.S. imperialism and militarism would replace those of the European colonial powers. In its confident messianic sense of American international destiny, the essay drew not only on Luce’s personal missionary heritage but also on the long-standing broader sense of the United States as an exceptional chosen nation whose “manifest destiny” gave it a special mission to the world, an outlook epitomized earlier in the twentieth century in the rhetoric of President Woodrow Wilson during World War I. Somewhat optimistically, but very much in the Wilsonian tradition, Luce affirmed that whereas other great powers were distrusted, “throughout the world [there] is faith in the good intentions . . . of the whole American people.” The absence of any real humility in Luce’s writing, his blunt insistence that his country was already the world’s greatest power, was undoubtedly less than tactful and an example of the kind of triumphalist rhetoric that has so often repelled even nations friendly to the United States.

In the short run, Luce’s article generated great discussion but, given his alienation from the Roosevelt administration, had little immediate impact on policy. Despite Luce’s caveats that intervention was inevitable, it nonetheless strengthened those, among whom the president and his close associates were prominent, who sought to argue that the United States could no longer remain at least semidetached from international developments, a participant in the economic sphere but still a state whose national security was not vitally affected by events outside the Western Hemisphere. Luce had, moreover, indelibly and memorably labeled the growing world role of the United States. Scores of future books—and many, no doubt, still to come—would bear the title or discuss the concept of “The American Century.” If he had intended to set the terms of popular debate, Luce undoubtedly succeeded. In retrospect, “The American Century” would seem both prophetic and symptomatic, a seminal essay that both accurately predicted the nature of the future American international role during the Cold War and beyond and in itself embodied the

hubris and exaggerated sense of omnipotence that would on occasion be highly detrimental to the effective exercise of U.S. power.

Primary Source

Henry Luce, "The American Century," February 1941

There is one fundamental issue which faces America as it faces no other nation. It is an issue peculiar to America and peculiar to America in the 20th Century—now. It is deeper even than the immediate issue of War. If America meets it correctly, then, despite hosts of dangers and difficulties, we can look forward and move forward to a future worthy of men, with peace in our hearts.

If we dodge the issue, we shall flounder for ten or 20 or 30 bitter years in a chartless and meaningless series of disasters. . . .

Where are we? We are in the war. All this talk about whether this or that might or might not get us into the war is wasted effort. We are, for a fact, in the war. . . .

Now that we are in this war, how did we get in? We got in on the basis of defense. Even that very word, defense, has been full of deceit and self-deceit.

To the average American the plain meaning of the word defense is defense of the American territory. Is our national policy today limited to the defense of the American homeland by whatever means may seem wise? It is not. We are now in a war to promote, encourage and incite so-called democratic principles throughout the world. The average American begins to realize now that's the kind of war he's in. And he's halfway for it. But he wonders how he ever got there, since a year ago he had not the slightest intention of getting into any such thing. Well, he can see now how he got there. He got there via "defense."

Behind the doubts in the American mind there were and are two different picture-patterns. One of them stressing the appalling consequences of the fall of England leads us to a war of intervention. As a plain matter of the defense of American territory is that picture necessarily true? It is not necessarily true. For the other picture is roughly this: while it would be much better for us if Hitler were severely checked, nevertheless regardless of what happens in Europe it would be entirely possible for us to organize a defense of the northern part of the Western Hemisphere so that this country could not be successfully attacked. . . . No man can say that that picture of America as an impregnable armed camp is false. No man can honestly say that as a pure matter of defense—defense of our homeland—it is necessary to get into or be in this war.

The question before us then is not primarily one of necessity and survival. It is a question of choice and calculation. The true questions are: Do we want to be in this war? Do we prefer to be in it? And, if so, for what? . . .

This questioning reflects our truest instincts as Americans. But more than that. Our urgent desire to give this war its proper name has a desperate practical importance. If we know what we are fighting for, then we can drive confidently toward a victorious conclusion and, what's more, have at least an even chance of establishing a workable Peace.

Furthermore—and this is an extraordinary and profoundly historical fact which deserves to be examined in detail—America and only America can effectively state the war aims of this war. . . .

The big, important point to be made here is simply that the complete opportunity of leadership is ours. . . . [I]f our trouble is that we don't know what we are fighting for, then it's up to us to figure it out. Don't expect some other country to tell us. Stop this Nazi propaganda about fighting somebody else's war. We fight no wars except our wars. "Arsenal of Democracy?" We may prove to be that. But today we must be the arsenal of America and of the friends and allies of America. . . .

In the field of national policy, the fundamental trouble with America has been, and is, that whereas their nation became in the 20th Century the most powerful and the most vital nation in the world, nevertheless Americans were unable to accommodate themselves spiritually and practically to their fate. Hence they have failed to play their part as a world power—a failure which has had disastrous consequences for themselves and for all mankind. And the cure is this: to accept wholeheartedly our duty and our opportunity as the most powerful and vital nation in the world and in consequence to assert upon the world the full impact of our influence, for such purposes as we see fit and by such means as we see fit. . . .

Consider the 20th Century. It is ours not only in the sense that we happen to live in it but ours also because it is America's first century as a dominant power in the world. So far, this century of ours has been a profound and tragic disappointment. No other century has been so big with promise for human progress and happiness. And in no one century have so many men and women and children suffered such pain and anguish and bitter death. . . .

What can we say about an American Century? It is meaningless merely to say that we reject isolationism and accept the logic of internationalism. What internationalism? Rome had a great internationalism. So had the Vatican and Genghis Khan and the Ottoman Turks and the Chinese Emperors and 19th Century England. After the first World War, Lenin had one in mind. Today Hitler seems to have one in mind—one which appeals strongly to some American isolationists whose opinion of Europe is so low that they would gladly hand it over to anyone who would guarantee to destroy it for ever. But what internationalism have we Americans to offer?

Ours cannot come out of the vision of any one man. It must be the product of the imaginations of many men. It must be

a sharing with all peoples of our Bill of Rights, our Declaration of Independence, our Constitution, our magnificent industrial products, our technical skills. It must be an internationalism of the people, by the people and for the people. . . .

Once we cease to distract ourselves with lifeless arguments about isolationism, we shall discover that there is already an immense American internationalism. American jazz, Hollywood movies, American slang, American machines and patented products, are in fact the only things that every community in the world, from Zanzibar to Hamburg, recognizes in common. Blindly, unintentionally, accidentally and really in spite of ourselves, we are already a world power in all the trivial ways—in very human ways. But there is a great deal more than that. America is already the intellectual, scientific and artistic capital of the world. Americans—Midwestern Americans—are today the least provincial people in the world. They have traveled the most and they know more about the world than the people of any other country. America's worldwide experience in commerce is also far greater than most of us realize.

Most important of all, we have that indefinable, unmistakable sign of leadership: prestige. And unlike the prestige of Rome or Genghis Khan or 19th Century England, American prestige throughout the world is faith in the good intentions as well as in the ultimate intelligence and ultimate strength of the whole American people. We have lost some of that prestige in the last few years. But most of it is still there.

* * *

No narrow definition can be given to the American internationalism of the 20th Century. It will take shape, as all civilizations take shape, by the living of it, by work and effort, by trial and error, by enterprise and adventure and experience.

And by imagination!

As America enters dynamically upon the world scene, we need most of all to seek and to bring forth a vision of America as a world power which is authentically American and which can inspire us to live and work and fight with vigor and enthusiasm. And as we come now to the great test, it may yet turn out that in all of our trials and tribulations of spirit during the first part of this century we as a people have been painfully apprehending the meaning of our time and now in this moment of testing there may come clear at last the vision which will guide us to the authentic creation of the 20th Century—our Century.

* * *

Consider four areas of life and thought in which we may seek to realize such a vision:

First, the economic. It is for America and for America alone to determine whether a system of free economic enter-

prise—an economic order compatible with freedom and progress—shall or shall not prevail in this century. We know perfectly well that there is not the slightest chance of anything faintly resembling a free economic system prevailing in this country if it prevails nowhere else. What then does America have to decide? Some few decisions are quite simple. For example: we have to decide whether or not we shall have for ourselves and our friends freedom of the seas—the right to go with our ships and our ocean-going airplanes where we wish, when we wish and as we wish. The vision of Americas [sic] as the principal guarantor of the freedom of the seas, the vision of America as the dynamic leader of world trade, has within it the possibilities of such enormous human progress as to stagger the imagination. Let us not be staggered by it. Let us rise to its tremendous possibilities. Our thinking of world trade today is on ridiculously small terms. For example, we think of Asia as being worth only a few hundred millions a year to us. Actually, in the decades to come Asia will be worth to us exactly zero—or else it will be worth to us four, five, ten billions of dollars a year. And the latter are the terms we must think in, or else confess a pitiful impotence.

Closely akin to the purely economic area and yet quite different from it, there is the picture of an America which will send out through the world its technical and artistic skills. Engineers, scientists, doctors, movie men, makers of entertainment, developers of airlines, builders of roads, teachers, educators. Throughout the world, these skills, this training, this leadership is needed and will be eagerly welcomed, if only we have the imagination to see it and the sincerity and good will to create the world of the 20th Century.

But now there is a third thing which our vision must immediately be concerned with. We must undertake now to be the Good Samaritan of the entire world. It is the manifest duty of this country to undertake to feed all the people of the world who as a result of this worldwide collapse of civilization are hungry and destitute—all of them, that is, whom we can from time to time reach consistently with a very tough attitude toward all hostile governments. For every dollar we spend on armaments, we should spend at least a dime in a gigantic effort to feed the world—and all the world should know that we have dedicated ourselves to this task. Every farmer in America should be encouraged to produce all the crops he can, and all that we cannot eat—and perhaps some of us could eat less—should forthwith be dispatched to the four quarters of the globe as a free gift, administered by a humanitarian army of Americans, to every man, woman and child on this earth, who is really hungry.

* * *

But all this is not enough. All this will fail and none of it will happen unless our vision of America as a world power

includes a passionate devotion to great American ideals. We have some things in this country which are infinitely precious and especially American—a love of freedom, a feeling for the equality of opportunity, a tradition of self-reliance and independence and also of co-operation. In addition to ideals and notions which are especially American, we are the inheritors of all the great principles of Western civilization—above all Justice, the love of Truth, the ideal of Charity. The other day Herbert Hoover said that America was fast becoming the sanctuary of the ideals of civilization. For the moment it may be enough to be the sanctuary of these ideals. But not for long. It now becomes our time to be the powerhouse from which the ideals spread throughout the world and do their mysterious work of lifting the life of mankind from the level of the beasts to what the Psalmist called a little lower than the angels.

America as the dynamic center of ever-widening spheres of enterprise, America as the training center of the skillful servants of mankind, America as the Good Samaritan, really believing again that it is more blessed to give than to receive, and America as the powerhouse of the ideals of Freedom and Justice—out of these elements surely can be fashioned a vision of the 20th Century to which we can and will devote ourselves in joy and gladness and vigor and enthusiasm. . . .

It is in this spirit that all of us are called, each to his own measure of capacity, and each in the widest horizon of his vision, to create the first great American Century.

2.5. “America First”

The America First Committee

Though President Franklin D. Roosevelt and his chief advisers were strongly interventionist in World War II, taking measures that effectively made American entry into the conflict more likely, opposition to the war also existed. The America First Committee was established in July 1940, as that year’s presidential election campaign gained momentum, to organize those forces who believed that the best way the United States could meet the ever more serious international crisis was by building up American defenses and by holding itself aloof from Europe. America First members argued that the European crisis, however deplorable, did not threaten U.S. security sufficiently to justify American intervention and that domestically, American involvement in war would be highly detrimental to the nation. Liberals believed that it would mean the end of New Deal reforms; conservatives, who already resented the expansion of governmental bureaucracy and functions during the 1930s, argued that intervention would further enhance the government’s role and bestow near-dictatorial powers upon Roosevelt, their greatest enemy. Though usually supportive of greater American defense spending and a strong military posture, America First members generally believed that their country should confine its activities to the Western Hemisphere. Most opposed such administration-backed measures as the summer 1940 Destroyers-for-Bases Deal, the passage and implementation of Selective Service legislation in September 1940, the Lend-Lease Act of spring 1941, and the various naval measures whereby the Roosevelt administration moved ever closer to war with Germany.

About the Author

The best known member of America First was the famed aviator Charles Lindbergh, who won international celebrity in 1927 when he became the first person to make a solo flight across the Atlantic. Tragedy struck in 1932, when his two-year-old son, Charles Jr., was kidnapped and killed, a highly publicized crime that led Lindbergh, his wife, and their growing family to spend much of the later 1930s living in Europe, only returning to the United States in April 1939, as general European war seemed ever more likely. During these years, Lindbergh frequently visited Germany, where he was welcomed as an honored guest and invited to inspect German military installations, especially the aviation facilities. In retrospect, it seems that German officials deliberately gave Lindbergh an inflated idea of their own aerial capabilities, though at the time when he left Europe these were still almost certainly superior to those of Great Britain and France. Even after the Battle of Britain, Lindbergh remained convinced

that Germany had gained irreversible air superiority over its opponents.

Lindbergh believed that the outbreak of general European war was a terrible mistake that would erode the international position of the “Anglo-Saxon” powers, in whose racial and political superiority he believed, and destroy Western civilization; he therefore hoped that Britain and Germany would soon reach a negotiated settlement. From September 1939 until Pearl Harbor in December 1941, Lindbergh was one of the most prominent Americans publicly to oppose American intervention in the developing European war. Working closely with anti-interventionist Republican opponents of Roosevelt, he wrote numerous articles, gave frequent speeches, and appeared before congressional committees, opposing the Destroyers-for-Bases Deal, Selective Service legislation, and Lend-Lease, and urging his countrymen to improve American defenses but hold strictly aloof from European affairs. His antagonism to the Roosevelt administration’s policies was sharpened by earlier disputes during the 1930s over the introduction of airmail postal services. Only in April 1941, however, did Lindbergh join the America First Committee after careful reflection over whether its attitude and objectives coincided with his own. After Germany invaded the Soviet Union in June 1941, Lindbergh also warned that neither the United States nor Britain was justified in joining forces with a communist power with whom they had nothing in common except their shared antagonism to Hitler.

Lindbergh’s role as one of the best-known antiwar spokesmen carried a personal price. His wife, Anne Morrow Lindbergh, daughter of a partner in J. P. Morgan and Company, a fervently pro-British New York private bank that served as Allied purchasing and financial agent during World War I, loyally though perhaps rather unhappily supported him. Her sister, however, was married to Aubrey Morgan, a key official in the New York-based British Information Service, and her mother was a prominent member of the Committee to Defend America by Aiding the Allies (CDAAA). For his part, Lindbergh warned that the British were encouraging American intervention for entirely self-interested reasons, to save them from otherwise inevitable defeat.

Lindbergh’s anti-interventionist stance soon brought allegations that he was a fascist sympathizer and perhaps even in German pay, charges elaborated in a 28-page pamphlet, *Is Lindbergh a Nazi?*, which American interventionists published in September 1941. Such accusations were given added force later that month when Lindbergh addressed a meeting in Des Moines, Iowa, and listed American Jews, with “their large ownership and influence in our motion pictures, our press, our radio, and our Government” (Cole 1974, 172)

among those groups who were promoting American intervention in the European war for their own ends. Naively at best, he warned that, if war came, American Jews might well face discrimination, even persecution, at home. Lindbergh’s ill-considered though undoubtedly sincere remarks, made against his wife’s advice, immediately raised a storm of protest and denunciation from Jews, Protestants, Catholics, newspapers, and politicians of every stripe, many of whom called upon America First—which split over his remarks—to repudiate Lindbergh. His reputation remained permanently tarnished by this episode, and his expressed beliefs in eugenics and the superiority of Western civilization lent charges of anti-Semitism additional credibility. At best, the speech revealed a near-foolhardy political insensitivity and imprudence that rebounded extremely detrimentally upon both Lindbergh and the cause he was representing.

About the Document

The radio address given here was less controversial than Lindbergh’s notorious Des Moines speech. Lindbergh delivered it just after formally affiliating himself with the America First Committee, an association that meant he added all that organization’s enemies to his existing opponents. Like any public address, Lindbergh’s speech was designed to win over his audience to his own viewpoint. This did not, of course, mean that his arguments were insincere; indeed, all we know of Lindbergh suggests that he spoke from deep conviction and at a considerable sacrifice of the personal privacy he greatly valued. Lindbergh based his antiwar position upon three fundamental propositions: that, if the United States should go to war with Germany, it could not win; that it was possible for his country to remain aloof from the war without compromising essential American interests; and that the great majority of Americans strongly opposed intervention.

Lindbergh set forth what remained his very pragmatic conviction right up to Pearl Harbor that the United States was still unprepared for war and therefore should not involve itself in a conflict it could not win. In 1938 and 1939, he had based his pessimistic assessments of British and French abilities to resist Germany upon similar material calculations. Much of what he said as to the contemporary unreadiness of the American military was undoubtedly true. It remains interesting that Lindbergh, a skilled engineer who prided himself on his rational assessment of military and industrial capabilities, was unable to predict the rapidity with which the United States would eventually mobilize itself for war, the inability of German factories to match those of the United States on a long-term basis, or even Britain’s ability to withstand the German assaults of the Battle of Britain and the Blitz. British attempts to draw the United States into war

were, in his view, entirely self-interested. Apart from making the pragmatic argument that, should his country go to war against Germany, it could not win, Lindbergh contended that Germany would not attack the United States first. The most prudent strategy for his country, he believed, was to strengthen its own defenses in the Western Hemisphere and make that area an unshakable bastion of Western civilization. Drawing on time-hallowed tradition, he invoked the policies of George Washington, first president of the United States, and the Monroe Doctrine in justification of “the maintenance of armed forces sufficient to defend this hemisphere from attack by any combination of foreign powers.”

Finally, Lindbergh played the democratic card, charging that 80 percent of Americans were opposed to U.S. intervention and that efforts to move the country toward war were therefore undemocratic. Lindbergh, the son of a populist Minnesota congressman who was deeply suspicious of New York banks and the “money trust,” was always somewhat socially ill at ease among the elite East Coast circles into which he married. The way in which patricians such as the Morgan partners and other staunch supporters of the pro-Allied groups the Committee to Defend America by Aiding the Allies and Fight for Freedom (FFF), admittedly working closely with Roosevelt administration officials, arrogated to themselves the right to set the national agenda left him uncomfortable. “We have been led toward war,” he charged, “by a minority of our people,” with “power,” “influence” and “a loud voice,” but a minority that, in his view, “d[id] not represent the American people.” In a tactic more astute politicians would later emulate, he claimed to be speaking for the majority of ordinary people, “[o]ver a hundred million,” who “[we]re opposed to entering the war” but had no real voice in politics. The irony here, of course, was that Lindbergh himself, speaking first on his own behalf and then for the pressure group America First, could not claim to be any more democratic or representative of the American people than were the CDAAA or FFF groups, who were at least working closely with the Roosevelt administration. Lindbergh had not, as he might have done, made any effort to run for political office in the 1940 election. However unenthusiastic the American people were for war and however slippery the president might be, when Roosevelt won in November 1940 with a solid majority, few who supported him could have doubted that he was strongly pro-Allied in sympathy and ready to make considerable efforts to assist the British in their war against Germany. Such factors may have been one reason for the increasing desperation with which Lindbergh made a case he believed to be rational, could he but persuade others to share his viewpoint, and for the fact that he eventually resorted to arguments that so drastically and lastingly backfired on him.

Primary Source

Charles A. Lindbergh, Radio Address, 23 April 1941

There are many viewpoints from which the issues of this war can be argued. Some are primarily idealistic. Some are primarily practical. One should, I believe, strive for a balance of both. But, since the subjects that can be covered in a single address are limited, tonight I shall discuss the war from a viewpoint which is primarily practical. It is not that I believe ideals are unimportant, even among the realities of war; but if a nation is to survive in a hostile world, its ideals must be backed by the hard logic of military practicability. If the outcome of war depended upon ideals alone, this would be a different world than it is today.

I know I will be severely criticized by the interventionists in America when I say we should not enter a war unless we have a reasonable chance of winning. That, they will claim, is far too materialistic a viewpoint. They will advance again the same arguments that were used to persuade France to declare war against Germany in 1939. But I do not believe that our American ideals, and our way of life, will gain through an unsuccessful war. And I know that the United States is not prepared to wage war in Europe successfully at this time. We are no better prepared today than France was when the interventionists in Europe persuaded her to attack the Siegfried line.

I have said it before, and I will say it again, that I believe it will be a tragedy to the entire world if the British Empire collapses. That is one of the main reasons why I opposed this war before it was declared and why I have constantly advocated a negotiated peace. I did not feel that England and France had a reasonable chance of winning. France has now been defeated; and, despite the propaganda and confusion of recent months, it is now obvious that England is losing the war. I believe this is realized even by the British Government. But they have one last desperate plan remaining. They hope that they may be able to persuade us to send another American Expeditionary Force to Europe, and to share with England militarily, as well as financially, the fiasco of this war.

I do not blame England for this hope, or for asking for our assistance. But we now know that she declared a war under circumstances which led to the defeat of every nation that sided with her from Poland to Greece. We know that in the desperation of war England promised to all those nations armed assistance that she could not send. We know that she misinformed them, as she has misinformed us, concerning her state of preparation, her military strength, and the progress of the war.

In time of war, truth is always replaced by propaganda. I do not believe that we should be too quick to criticize the

actions of a belligerent nation. There is always the question whether we, ourselves, would do better under similar circumstances. But we in this country have a right to think of the welfare of America first, just as the people in England thought first of their own country when they encouraged the smaller nations of Europe to fight against hopeless odds. When England asks us to enter this war, she is considering her own future and that of her Empire. In making our reply, I believe we should consider the future of the United States and that of the Western Hemisphere.

It is not only our right, but it is our obligation as American citizens, to look at this war objectively and to weigh our chances for success if we should enter it. I have attempted to do this, especially from the standpoint of aviation; and I have been forced to the conclusion that we cannot win this war for England, regardless of how much assistance we extend.

I ask you to look at the map of Europe today and see if you can suggest any way in which we could win this war if we entered it. Suppose we had a large army in America, trained and equipped. Where would we send it to fight? The campaigns of the war show only too clearly how difficult it is to force a landing, or to maintain an army, on a hostile coast.

Suppose we took our Navy from the Pacific and used it to convoy British shipping. That would not win the war for England. It would, at best, permit her to exist under the constant bombing of the German air fleet. Suppose we had an air force that we could send to Europe. Where could it operate? Some of our squadrons might be based in the British Isles, but it is physically impossible to base enough aircraft in the British Isles alone to equal in strength the aircraft that can be based on the continent of Europe.

I have asked these questions on the supposition that we had in existence an Army and an air force large enough and well enough equipped to send to Europe; and that we would dare to remove our Navy from the Pacific. Even on this basis, I do not see how we could invade the continent of Europe successfully as long as all of that continent and most of Asia is under Axis domination. But the fact is that none of these suppositions are correct. We have only a one-ocean Navy. Our Army is still untrained and inadequately equipped for foreign war. Our air force is deplorably lacking in modern fighting planes.

When these facts are cited, the interventionists shout that we are defeatists, that we are undermining the principles of democracy, and that we are giving comfort to Germany by talking about our military weakness. But everything I mention here has been published in our newspapers and in the reports of congressional hearings in Washington. Our military position is well known to the governments of Europe and Asia. Why, then, should it not be brought to the attention of our own people.

I say it is the interventionists in America as it was in England and in France, who give aid and comfort to the enemy. I say it is they who are undermining the principles of democracy when they demand that we take a course to which more than 80 percent of our citizens are opposed. I charge them with being the real defeatists, for their policy has led to the defeat of every country that followed their advice since this war began. There is no better way to give comfort to an enemy than to divide the people of a nation over the issue of foreign war. There is no shorter road to defeat than by entering a war with inadequate preparation. Every nation that has adopted the interventionist policy of depending upon someone else for its own defense has met with nothing but defeat and failure. . . .

There is a policy open to this Nation that will lead to success—a policy that leaves us free to follow our own way of life and to develop our own civilization. It is not a new and untried idea. It was advocated by Washington. It was incorporated in the Monroe Doctrine. Under its guidance the United States became the greatest Nation in the world.

It is based upon the belief that the security of a nation lies in the strength and character of its own people. It recommends the maintenance of armed forces sufficient to defend this hemisphere from attack by any combination of foreign powers. It demands faith in an independent American destiny. This is the policy of the America First Committee today. It is a policy not of isolation, but of independence; not of defeat, but of courage. It is a policy that led this Nation to success during the most trying years of our history, and it is a policy that will lead us to success again. . . .

The United States is better situated from a military standpoint than any other nation in the world. Even in our present condition of unpreparedness no foreign power is in a position to invade us today. If we concentrate on our own defenses and build the strength that this Nation should maintain, no foreign army will ever attempt to land on American shores.

War is not inevitable for this country. Such a claim is defeatism in the true sense. No one can make us fight abroad unless we ourselves are willing to do so. No one will attempt to fight us here if we arm ourselves as a great nation should be armed. Over a hundred million people in this Nation are opposed to entering the war. If the principles of democracy mean anything at all, that is reason enough for us to stay out. If we are forced into a war against the wishes of an overwhelming majority of our people, we will have proved democracy such a failure at home that there will be little use fighting for it abroad.

The time has come when those of us who believe in an independent American destiny must band together and organize for strength. We have been led toward war by a minority of our people. This minority has power. It has influ-

ence. It has a loud voice. But it does not represent the American people. During the last several years I have traveled over this country from one end to the other. I have talked to many hundreds of men and women, and have letters from tens of thousands more, who feel the same way as you and I.

Most of these people have no influence or power. Most of them have no means of expressing their convictions, except by their vote which has always been against this war. They are the citizens who have had to work too hard at their daily jobs to organize political meetings. Hitherto, they have relied upon their vote to express their feelings; but now they find that it is hardly remembered except in the oratory of a political campaign. These people, the majority of hard-working American citizens, are with us. They are the true strength of our country. And they are beginning to realize, as you and I, that there are times when we must sacrifice our normal interests in life in order to insure the safety and the welfare of our Nation.

Such a time has come. Such a crisis is here. That is why the America First Committee has been formed—to give voice to the people who have no newspaper, or newsreel, or radio station at their command; to the people who must do the paying, and the fighting, and the dying if this country enters the war.

2.6. Hitler's Decision to Invade the Soviet Union, June 1941

Adolf Hitler's Invasion of Russia

In retrospect, one of the two worst military decisions Führer Adolf Hitler of Germany ever made—the second being his declaration of war on the United States in December 1941—was the launching in June 1941 of Operation BARBAROSSA, the invasion of Soviet Russia. He did so despite the misgivings of his senior military advisers, who believed that, given continuing serious warfare against Great Britain and in the Middle East, Germany should concentrate all its resources on those operational theaters. Hitler disregarded this advice and broke his Non-aggression Pact with the Soviet Union a little less than two years after he had concluded it. Although his campaign met with swift and easy success in its early weeks, by the end of the year, German forces were bogged down in front of Moscow, Russia's symbolic heartland. A brutal winter, overextended supply lines, savage partisan resistance, and stubborn opposition from Soviet troops culminated in August 1942–February 1943 in the Battle of Stalingrad, the turning point of the war. Though the Soviet army and people lost something in the region of 26 million dead, the German army also suffered by far its heaviest casualties on that front, which devoured the Wehrmacht's (German army's) finest divisions. Another cross his troops had to bear was the fact that Hitler's own military orders, though sometimes brilliant, were on other occasions ill-conceived, as when in August 1941 he divided his forces in Russia rather than concentrating all on a knockout blow against Moscow. Even if Germany had refrained from declaring war on the United States six months later, the Russian campaign would probably have sufficed to wear Germany down in a protracted war of attrition.

The Relationship between Adolf Hitler and Benito Mussolini

As Europe's two leading Fascist dictators, Hitler and Mussolini had a somewhat uneasy relationship. In terms of seniority, Mussolini came to power 10 years before Hitler, but in terms of effective military strength, Germany soon overshadowed Italy. From November 1937 onward, the two countries were associated, together with Japan, in the Anti-Comintern Pact, expanded in September 1940 into the Tripartite Pact, but this agreement did not necessarily make them genuine equals. Mussolini's triumphs in Abyssinia were swiftly dwarfed by German successes in remilitarizing the Rhineland, annexing Austria and Czechoslovakia, and then overrunning Norway, Denmark, the Low Countries, and eventually France. In practice, Hitler was far more bellicose

than the blustering but often cautious Mussolini, who tried never to enter a fight he thought he might not win. In August 1939, Mussolini had originally promised to join Germany in war against Poland, a pledge withdrawn in nervous haste when Britain and France gave formal military guarantees to Poland, whereupon Hitler deferred by five days his invasion of Poland while he and his generals decided whether they should still go ahead. Mussolini only entered the war against France in mid-June 1940, when German victory was expected within a few days, arriving just in time to lay claim to assorted useful patches of territory. German forces had to rescue Italian troops from initial disaster in the poorly executed 1940–1941 campaign against Greece, and in the North African desert, German Field Marshal Erwin Rommel effectively took over operations against the British. Although some Italian units fought courageously in Russia, for the most part, German leaders regarded their Italian ally as a rather weak reed.

Even so, Hitler and Mussolini each represented the best ally either was likely to find and, by summer 1940, were both at war with the British Empire and increasingly at odds with the United States. Though there was no real joint strategic consultation and coordination between them of the kind that would quickly develop between Great Britain, the United States, and even the Soviet Union once all were at war, Italian and German leaders found it necessary at least to inform each other of major strategic decisions. In regular exchanges of correspondence, they apprised each other of their own military progress (such bulletins tended to be fuller, faster, and more expansive when there were successes to report), requested assistance of various kinds, and discussed the conduct of other leaders, hostile, friendly, or neutral.

About the Document

This letter from Hitler to Mussolini, announcing his decision to invade the Soviet Union the following day, was one of the more important missives among their regular correspondence. Captured by the Allies at the end of World War II, these documents were subsequently published in their original languages and also translated into English. To avoid international embarrassment, correspondence between heads of state often remains classified for many decades, but in this case, the circumstances ensured that the exchanges between Hitler and Mussolini became public within a few years of their countries' World War II defeat. Although the German and Italian Foreign Offices, who were responsible for transmitting messages—in this case by cable—between Hitler and Mussolini, were almost certainly aware of their contents, it is apparent that the leaders themselves normally drafted their letters to each other. Though letters between two heads of state are rarely entirely frank—they undoubtedly sought to impress, to

make their own case to, and on occasion to obtain concessions from each other—the correspondence of Hitler and Mussolini bears the stamp of their own individual personalities.

In this instance, Hitler faced the challenge of explaining why he had embarked on yet another major military venture while still facing a serious war against Britain in Europe and the Middle East, together with problems in the Balkans. It is worth noting that he only informed Mussolini of his plans, whose outcome would almost certainly be highly important to Italy as well as Germany, one day before the invasion of Russia began. As fairly often happens even in alliances—and as, to be fair, Mussolini himself had recently done in Greece—one partner acted without bothering to consult the other. In this case, Hitler could appeal to the common ideological antipathy that, as good fascists, he and Mussolini were supposed to harbor toward all communist nations. As he so often had done in the past before attacking another state, he alleged that the Soviet Union was planning aggressive action against him, massing its troops on what was now its border with Germany in an effort to “extort” concessions while Hitler was preoccupied with the war against Britain. Some revisionist historians have recently tried to suggest that Soviet President Josef Stalin was at this juncture contemplating launching a war against Germany, but the evidence for this is unconvincing. Russian military forces were still recovering from the purges of the 1930s, the Soviet Union was assiduously supplying much useful war matériel to Germany, and Stalin ignored numerous warnings from outside sources, including the Allies, that Hitler was about to launch an invasion.

Hitler clearly resented Soviet gains in the Baltic republics and Poland and told Mussolini he feared that, if he turned all his attention to the projected invasion of England, he would leave the east open to further stealthy Soviet depredations. He argued that, if he simply left things as they were and did nothing for a year, Britain would become steadily less willing to sue for peace; the interim would enable the British to appreciably improve their position, as supplies from the United States arrived in ever greater amounts. Assuming that, even though the campaign would “surely be difficult,” his forces would nonetheless be rapidly victorious in Russia, Hitler argued that this would have a drastic impact on British morale but skated over the possibility that these operations would also remove the worst of the German pressure from Britain and give that enemy a badly needed breathing space. Perhaps Hitler’s most significant remark on Russia was that he felt “spiritually free” now that he had reached the decision to break “[t]he partnership with the Soviet Union” and return to his older ideological orientation. A long string of quick military victories had apparently given him almost unbounded confidence that German troops could repeat these against the

country that, ever since he wrote *Mein Kampf* (1924), he had portrayed as Germany's ultimate opponent.

Hitler was very frank in discussing other European states with Mussolini, warning quite accurately that Vichy "France is, as ever, not to be trusted" and that it was impossible to guarantee that France's North African territories would not "suddenly desert" and that "irresolute" Spain "will take sides only when the outcome of the war is decided." He was far too confident in dismissing the potential of both Britain and the United States as enemies of Germany. He did, however, express the hope that a German attack on Russia would embolden Japan, whose foreign minister had recently visited Berlin and also signed a Non-aggression Pact with the Soviet Union, to move more aggressively against the United States in East Asia. Hitler thanked Mussolini for his offer of at least one corps of Italian troops for the Eastern Front, which he accepted; asked that Il Duce also build up his forces in North Africa for a potential offensive against British interests there; and requested him to carry the air and submarine war against the British into the Mediterranean. Surely seeking to flatter Mussolini, Hitler told him such assistance might be decisive to the war's overall successful outcome. He also assured Mussolini that he was leaving adequate forces in Western Europe to hold down and occupy those areas and that, if British aerial attacks on Germany intensified, the Luftwaffe had more than enough bomber and fighter squadrons to defend the homeland and retaliate against Britain.

Hitler's letter to Mussolini provides interesting insight into his state of mind at this crucial juncture of the war, when by breaking his August 1939 agreement with the Soviet Union, which had been one of his greatest diplomatic coups, he made what was probably his worst decision of the war. Though Hitler obviously sought to reassure Mussolini that his war against the Soviet Union was not only justified but, even more significantly, could be won without great detriment to German and Axis strategic interests elsewhere, unless he himself genuinely believed this to be the case, he would hardly have embarked on this new venture. He was clearly quite confident that German forces would triumph in Russia and could then turn back to the task of mopping up remaining British redoubts in the Middle East, the Mediterranean, and the British Isles themselves. Although the war would by then have lasted longer than he had initially planned, Hitler still seems to have expected that it would be over in the near future, perhaps within a year. Though even greater detail would make it yet more valuable, in most respects, it would be difficult to improve on this letter to his closest ally as a revelation, written just one day before his invasion of Russia, of Hitler's broad perspective on the challenges of the war that still lay ahead of him.

Primary Source

Adolf Hitler to Benito Mussolini, 21 June 1941

Duce!

I am writing this letter to you at a moment when months of anxious deliberation and continuous nerve-racking waiting are ending in the hardest decision of my life. I believe—after seeing the latest Russian situation map and after appraisal of numerous other reports—that I cannot take the responsibility for waiting longer, and above all, I believe that there is no other way of obviating this danger—unless it be further waiting, which, however, would necessarily lead to disaster in this or the next year at the latest.

The situation: England has lost this war. With the right of the drowning person, she grasps at every straw which, in her imagination, might serve as a sheet anchor. Nevertheless, some of her hopes are naturally not without a certain logic. England has thus far always conducted her wars with help from the Continent. The destruction of France—in fact, the elimination of all west-European positions—is directing the glances of the British warmongers continually to the place from which they tried to start the war: to Soviet Russia.

Both countries, Soviet Russia and England, are equally interested in a Europe fallen into ruin, rendered prostrate by a long war. Behind these two countries stands the North American Union goading them on and watchfully waiting. Since the liquidation of Poland, there is evident in Soviet Russia a consistent trend, which, even if cleverly and cautiously, is nevertheless reverting firmly to the old Bolshevik tendency to expansion of the Soviet State. The prolongation of the war necessary for this purpose is to be achieved by tying up German forces in the East, so that—particularly in the air—the German Command can no longer vouch for a large-scale attack in the West. I declared to you only recently, Duce, that it was precisely the success of the experiment in Crete that demonstrated how necessary it is to make use of every single airplane in the much greater project against England. It may well happen that in this decisive battle we would win with a superiority of only a few squadrons. I shall not hesitate a moment to undertake such a responsibility if, aside from all other conditions, I at least possess the one certainty that I will not then suddenly be attacked or even threatened from the East. The concentration of Russian forces—I had General Jodl submit the most recent map to your Attaché here, General Maras—is tremendous. Really, all available Russian forces are at our border. Moreover, since the approach of warm weather, work has been proceeding on numerous defenses. If circumstances should give me cause to employ the German air force against England, there is danger that Russia will then begin its strategy of extortion in the South and North, to which I would have to yield in silence, simply

from a feeling of air inferiority. It would, above all, not then be possible for me without adequate support from an air force, to attack the Russian fortifications with the divisions stationed in the East. If I do not wish to expose myself to this danger, then perhaps the whole year of 1941 will go by without any change in the general situation. On the contrary, England will be all the less ready for peace, for it will be able to pin its hopes on the Russian partner. Indeed, this hope must naturally even grow with the progress in preparedness of the Russian armed forces. And behind this is the mass delivery of war material from America which they hope to get in 1942.

Aside from this, Duce, it is not even certain whether I shall have this time, for with so gigantic a concentration of forces on both sides—for I also was compelled to place more and more armored units on the eastern border, also to call Finland's and Rumania's attention to the danger—there is the possibility that the shooting will start spontaneously at any moment. A withdrawal on my part would, however, entail a serious loss of prestige for us. This would be particularly unpleasant in its possible effect on Japan. I have, therefore, after constantly racking my brains, finally reached the decision to cut the noose before it can be drawn tight. I believe, Duce, that I am hereby rendering probably the best possible service to our joint conduct of the war this year. For my overall view is now as follows:

1. France is, as ever, not to be trusted. Absolute surety that North Africa will not suddenly desert does not exist.
2. North Africa itself, insofar as your colonies, Duce, are concerned, is probably out of danger until fall. I assume that the British, in their last attack, wanted to relieve Tobruk. I do not believe they will soon be in a position to repeat this.
3. Spain is irresolute and—I am afraid—will take sides only when the outcome of the war is decided.
4. In Syria, French resistance can hardly be maintained permanently either with or without our help.
5. An attack on Egypt before autumn is out of the question altogether. I consider it necessary, however, taking into account the whole situation, to give thought to the development of an operational unit in Tripoli itself which can, if necessary, also be launched against the West. Of course, Duce, the strictest silence must be maintained with regard to these ideas, for otherwise we cannot expect France to continue to grant permission to use its ports for the transportation of arms and munitions.
6. Whether or not America enters the war is a matter of indifference, inasmuch as she supports our opponent with all the power she is able to mobilize.

7. The situation in England itself is bad; the provision of food and raw materials is growing steadily more difficult. The martial spirit to make war, after all, lives only on hopes. These hopes are based solely on two assumptions: Russia and America. We have no chance of eliminating America. But it does lie in our power to exclude Russia. The elimination of Russia means, at the same time, a tremendous relief for Japan in East Asia, and thereby the possibility of a much stronger threat to American activities through Japanese intervention.

I have decided under these circumstances as I already mentioned, to put an end to the hypocritical performance in the Kremlin. I assume, that is to say, I am convinced, that Finland, and likewise Rumania, will forthwith take part in this conflict, which will ultimately free Europe, for the future also, of a great danger. General Maras informed us that you, Duce, wish also to make available at least one corps. If you have that intention, Duce—which I naturally accept with a heart filled with gratitude—the time for carrying it out will still be sufficiently long, for in this immense theater of war the troops cannot be assembled at all points at the same time anyway. You, Duce, can give the decisive aid, however, by strengthening your forces in North Africa, also, if possible, looking from Tripoli toward the West, by proceeding further to build up a group which, though it be small at first, can march into France in case of a French violation of the treaty; and finally, by carrying the air war and, so far as it is possible, the submarine war, in intensified degree, into the Mediterranean.

So far as the security of the territories in the West is concerned, from Norway to and including France, we are strong enough there—so far as army troops are concerned—to meet any eventuality with lightning speed. So far as air war on England is concerned, we shall, for a time remain on the defensive—but this does not mean that we might be incapable of countering British attacks on Germany; on the contrary, we shall, if necessary, be in a position to start ruthless bombing attacks on British home territory. Our fighter defense, too, will be adequate. It consists of the best squadrons that we have.

As far as the war in the East is concerned, Duce, it will surely be difficult, but I do not entertain a second's doubt as to its great success. I hope, above all, that it will then be possible for us to secure a common food-supply base in the Ukraine for some time to come, which will furnish us such additional supplies as we may need in the future. I may state at this point, however, that, as far as we can tell now, this year's German harvest promises to be a very good one. It is conceivable that Russia will try to destroy the Rumanian oil region. We have built up a defense that will—or so I think—prevent the worst. Moreover, it is the duty of our armies to eliminate this threat as rapidly as possible.

I waited until this moment, Duce, to send you this information, because the final decision itself will not be made until 7 o'clock tonight. I earnestly beg you, therefore, to refrain, above all, from making any explanation to your Ambassador at Moscow, for there is no absolute guarantee that our coded reports cannot be decoded. I, too, shall wait until the last moment to have my own Ambassador informed of the decisions reached.

The material that I now contemplate publishing gradually, is so exhaustive that the world will have more occasion to wonder at our forbearance than at our decision, except for that part of the world which opposes us on principle and for which, therefore, arguments are of use.

Whatever may now come, Duce, our situation can become no worse as a result of this step; it can only improve. Even if I should be obliged at the end of this year to leave 60 or 70 divisions in Russia, that is only a fraction of the forces that I am now continually using on the eastern front. Should England nevertheless not draw any conclusions from the hard facts that present themselves, then we can, with our rear secured, apply ourselves with increased strength to the dispatching of our opponent. I can promise you, Duce, that what lies in our German power, will be done.

Any desires, suggestions, and assistance of which you, Duce, wish to inform me in the contingency before us, I would request that you either communicate to me personally or have them agreed upon directly by our military authorities.

In conclusion, let me say one more thing, Duce. Since struggling through to this decision, I again feel spiritually free. The partnership with the Soviet Union, in spite of the complete sincerity of the efforts to bring about a final conciliation, was nevertheless often very irksome to me, for in some way or other it seemed to me to be a break with my whole origin, my concepts, and my former obligations. I am happy now to be relieved of these mental agonies.

2.7. Pearl Harbor, 7 December 1941: Japanese and American Views

Pearl Harbor, 7 December 1941

On 7 December 1941 an unexpected Japanese attack on the U.S. naval base in Pearl Harbor, Hawaii, headquarters of the Pacific Fleet, marked the opening of the Pacific War. Skillfully planned by Admiral Yamamoto Isoroku, commander in chief of the Japanese Combined Fleet, the operation was designed to destroy the American fleet. Japanese leaders hoped thereby to gain a year's breathing space, during which they would take control of all Southeast Asia, and that afterwards the United States, faced with a *fait accompli*, would be prepared to reach a negotiated peace settlement leaving Japan with its gains intact. They failed to anticipate how swiftly American forces would recover and regain their strength in the Pacific. Although Japanese diplomats initially intended to hand American officials in Washington a declaration of war approximately an hour before the assault started, slowness in transcribing this message meant that it was not delivered until half an hour after the raid began. Popular resentment of what was generally considered an unheralded sneak attack contributed to American determination to fight Japan to the finish.

Operationally, Pearl Harbor was implemented with exceptional skill. As a Japanese task force under Admiral Nagumo Chūichi approached Pearl Harbor in late November, it maintained radio silence for several days so that American and British scanners would be unable to locate its position. On 7 December 1941, Nagumo dispatched 352 aircraft toward Pearl Harbor. Beginning at 7:55 a.m., Hawaiian time, the Japanese launched a two-wave air attack against shore installations and the U.S. Pacific Fleet itself, then at anchorage in Pearl Harbor. Within two hours, Japanese aircraft had destroyed or seriously damaged 18 American vessels, including 8 battleships, 3 light cruisers, 3 destroyers, and 4 auxiliary craft. Some 73 aircraft were destroyed and 120 damaged,

most of them on the ground at Hickham Field. The raid, the worst foreign attack to occur on American soil until the 11 September 2001, destruction of the New York World Trade Center towers, left 2,403 Americans dead and a further 1,178 wounded. Japanese losses included 29 planes, 1 large and 5 midget submarines, and 64 men. The Japanese failed, however, to eliminate two aircraft carriers, which were then at sea, and also left unscathed the machine shops and oil storage tanks with 4.5 million barrels of fuel oil, all vitally important to the Pacific Fleet's subsequent ability to recover.

About the Authors

By August 1945, when Japan surrendered, Fuchida Mitsuo was the only pilot still living who had taken part in the Pearl Harbor attack. Fuchida, who fought numerous air battles over China in the late 1930s, was considered one of Japan's most able and experienced pilots, the reason he was chosen to lead the Pearl Harbor attack. Returning to base afterwards, he transmitted the famous radio message "Tora! Tora! Tora!" (Tiger, Tiger, Tiger) indicating that his force's mission was accomplished. Badly wounded at the Battle of Midway in 1942, Fuchida thereafter held various staff positions. Japan's defeat in August 1945 left him severely depressed, and he became a peasant farmer. In 1952, he converted to Christianity and became a well-known traveling evangelist in the United States. Fuchida published studies of Pearl Harbor and Midway and recorded extensive oral histories on his World War II military experiences, the basis of a subsequent biography by Gordon W. Prange.

In 1941, Earl Nightingale was a young marine corporal. One of the relatively few 334 survivors from the USS *Arizona*, on which 1,177 crewmen lost their lives, he spent five more years in the U.S. military. When the war was over, Nightingale became a radio announcer, first in Phoenix, Arizona, and then in Chicago, after which he bought and ran an insurance company. Nightingale eventually became a leading author of inspirational, motivational, and self-improvement literature. With a friend, he established a publishing company that soon became a multi-million dollar business. According to their publicity, their daily five-minute "radio program, *Our Changing World*, . . . became the longest-running, most widely syndicated show in radio" (Winner Strategies Inc. 2004).

About the Documents

Both these documents are personal accounts by individuals who took part in a battle and survived to tell the tale. Every war is ultimately fought by thousands, even millions, of individual combatants, each of whom usually sees only his small piece of the action taking place. Since the mid-twentieth century, perhaps even before, oral history programs have made

Herculean efforts to record the memories of ordinary people, not just the elite. Even such endeavors, however, tend to be disproportionately dominated by the more articulate. It is probably not entirely coincidental that for several decades after World War II, both Fuchida and Nightingale had lengthy careers as speakers and writers. Since both were designed for publication or something very close to it, their oral histories were also relatively polished, a final product rather than a rough draft.

Because both Fuchida and Nightingale played their separate parts in Pearl Harbor and were moreover fortunate enough to survive until the end of the war—by their nature, the dead do not record *ex post facto* oral histories—they became recognized as authorities on that event. Nightingale's oral history is part of the official USS *Arizona* commemorative web site, and Fuchida became an important source for such well-known historians as Gordon W. Prange. For each, Pearl Harbor was undoubtedly one of the high spots of their respective careers, its details etched on their memories as they dined out and lectured on that particular story for decades. For Fuchida, Pearl Harbor was one of the great triumphs of his career, a display of professional skill in which—notwithstanding Japan's subsequent defeat—he could take justifiable pride and an accomplishment deservedly admired by other pilots of all nationalities. For Nightingale, Pearl Harbor was a providential escape from the death that entrapped so many of his shipmates. Over time, the oft-told narratives of these two men may well have crystallized into a slightly stylized and formalized pattern, but one can be quite certain that neither was likely to forget the day of Pearl Harbor. Each gave a vivid and immediate account of his own part in that battle; Fuchida from on high, dropping his bombs, watching the damage inflicted by the 352 airplanes he commanded, and trying to avoid fierce anti-aircraft fire; and Nightingale from below, trying to survive the destruction of his ship, where more than half of all Pearl Harbor deaths occurred.

Oral histories and similar recollections are usually particularly valuable in conveying two types of information: accounts, as in this case, of specific well-remembered and highly significant events that were high points in the narrators' lives; and broad general outlines of routines and experiences, such as, for example, what it was like to train and serve as a U.S. marine corporal or a top Japanese pilot. As a rule, oral histories are usually far less reliable when narrators try to describe lengthy chronological sequences of events with any accuracy, a whole series of aerial raids, for example, or a battleship's operational history over months or even years. Human memory is fallible, and though it is easy to recall a crucial and unique episode, which Pearl Harbor undoubtedly was, comparable incidents

are quite easily confused with each other. Oral histories often provide details missing from the official record, but whenever possible, their overall accuracy should always be checked against whatever documentary evidence may be available.

A) Japanese Air Force Commander Mitsuo Fuchida Recalls Pearl Harbor

One hour and forty minutes after leaving the carriers I knew that we should be nearing our goal. Small openings in the thick cloud cover afforded occasional glimpses of the ocean, as I strained my eyes for the first sight of land. Suddenly a long white line of breaking surf appeared directly beneath my plane. It was the northern shore of Oahu.

Veering right toward the west coast of the island, we could see that the sky over Pearl Harbor was clear. Presently the harbor itself became visible across the central Oahu plain, a film of morning mist hovering over it. I peered intently through my binoculars at the ships riding peacefully at anchor. One by one I counted them. Yes, the battleships were there all right, eight of them! But our last lingering hope of finding any carriers present was now gone. Not one was to be seen.

It was 0749 when I ordered my radioman to send the command, 'Attack!' He immediately began tapping out the pre-arranged code signal: 'TO, TO, TO . . .'

Leading the whole group, Lieutenant Commander Murata's torpedo bombers headed downward to launch their torpedoes, while Lieutenant Commander Itaya's fighters raced forward to sweep enemy fighters from the air. Takahashi's dive-bomber group had climbed for altitude and was out of sight. My bombers, meanwhile, made a circuit toward Barbers Point to keep pace with the attack schedule. No enemy fighters were in the air, nor were there any gun flashes from the ground.

The effectiveness of our attack was now certain, and a message, 'Surprise attack successful!' was accordingly sent to *Akagi* (Flagship of the Japanese attack fleet) at 0753. The message was received by the carrier and duly relayed to the homeland. . . .

The attack was opened with the first bomb falling on Wheeler Field, followed shortly by dive-bombing attacks upon Hickam Field and the bases at Ford Island. Fearful that smoke from these attacks might obscure his targets, Lieutenant Commander Murata cut short his group's approach toward the battleships anchored east of Ford Island and released torpedoes. A series of white waterspouts soon rose in the harbor.

Lieutenant Commander Itaya's fighters, meanwhile, had full command of the air over Pearl Harbor. About four enemy fighters which took off were promptly shot down. By 0800 there were no enemy planes in the air, and our fighters began strafing the airfields.

My level-bombing group had entered on its bombing run toward the battleships moored to the east of Ford Island. On reaching an altitude of 3,000 meters, I had the sighting bomber take position in front of my plane.

As we closed in, enemy anti-aircraft fire began to concentrate on us. Dark gray puffs burst all around. Most of them came from ships' batteries, but land batteries were also active. Suddenly my plane bounced as if struck by a club. When I looked back to see what had happened, the radioman said: 'The fuselage is holed and the rudder wire damaged.' We were fortunate that the plane was still under control, for it was imperative to fly a steady course as we approached the target. Now it was nearly time for 'Ready to release,' and I concentrated my attention on the lead plane to note the instant his bomb was dropped. Suddenly a cloud came between the bombsight and the target, and just as I was thinking that we had already overshot, the lead plane banked slightly and turned right toward Honolulu. We had missed the release point because of the cloud and would have to try again.

While my group circled for another attempt, others made their runs, some trying as many as three before succeeding. We were about to begin our second bombing run when there was a colossal explosion in battleship row. A huge column of dark red smoke rose to 1000 meters. It must have been the explosion of a ship's powder magazine. (This was the Battleship *Arizona*.) The shock wave was felt even in my plane, several miles away from the harbor.

We began our run and met with fierce anti-aircraft concentrations. This time the lead bomber was successful, and the other planes of the group followed suit promptly upon seeing the leader's bombs fall. I immediately lay flat on the cockpit floor and slid open a peephole cover in order to observe the fall of the bombs. I watched four bombs plummet toward the earth. The target—two battleships moored side by side—lay ahead. The bombs became smaller and smaller and finally disappeared. I held my breath until two tiny puffs of smoke flashed suddenly on the ship to the left, and I shouted, 'Two hits!'

When an armor-piercing bomb with a time fuse hits the target, the result is almost unnoticeable from a great altitude. On the other hand, those which miss are quite obvious because they leave concentric waves to ripple out from the point of contact, and I saw two of these below. I presumed that it was battleship *Maryland* we had hit.

As the bombers completed their runs they headed north to return to the carriers. Pearl Harbor and the air bases had been pretty well wrecked by the fierce strafings and bomb-

ings. The imposing naval array of an hour before was gone. Antiaircraft fire had become greatly intensified, but in my continued observations I saw no enemy fighter planes. Our command of the air was unchallenged.

B) Marine Corporal B. C. Nightingale at Pearl Harbor

At approximately eight o'clock on the morning of December 7, 1941, I was leaving the breakfast table when the ship's siren for air defense sounded. Having no anti-aircraft battle station, I paid little attention to it. Suddenly I heard an explosion. I ran to the port door leading to the quarterdeck and saw a bomb strike a barge of some sort alongside the NEVADA, or in that vicinity. The marine color guard came in at this point saying we were being attacked. I could distinctly hear machine gun fire. I believe at this point our anti-aircraft battery opened up.

We stood around awaiting orders of some kind. General Quarters sounded and I started for my battle station in secondary aft. As I passed through casement nine I noted the gun was manned and being trained out. The men seemed extremely calm and collected. I reached the boat deck and our anti-aircraft guns were in full action, firing very rapidly. I was about three quarters of the way to the first platform on the mast when it seemed as though a bomb struck our quarterdeck. I could hear shrapnel or fragments whistling past me. As soon as I reached the first platform, I saw Second Lieutenant Simonson lying on his back with blood on his shirt front. I bent over him and taking him by the shoulders asked if there was anything I could do. He was dead, or so nearly so that speech was impossible. Seeing there was nothing I could do for the Lieutenant, I continued to my battle station.

When I arrived in secondary aft I reported to Major Shapley that Mr. Simonson had been hit and there was nothing to be done for him. There was a lot of talking going on and I shouted for silence which came immediately. I had only been there a short time when a terrible explosion caused the ship to shake violently. I looked at the boat deck and everything seemed aflame forward of the mainmast. I reported to the Major that the ship was aflame, which was rather needless, and after looking about, the Major ordered us to leave.

I was the last man to leave secondary aft because I looked around and there was no one left. I followed the Major down the port side of the tripod mast. The railings, as we ascended, were very hot and as we reached the boat deck I noted that it was torn up and burned. The bodies of the dead were thick,

and badly burned men were heading for the quarterdeck, only to fall apparently dead or badly wounded. The Major and I went between No. 3 and No. 4 turret to the starboard side and found Lieutenant Commander Fuqua ordering the men over the side and assisting the wounded. He seemed exceptionally calm and the Major stopped and they talked for a moment. Charred bodies were everywhere.

I made my way to the quay and started to remove my shoes when I suddenly found myself in the water. I think the concussion of a bomb threw me in. I started swimming for the pipe line which was about one hundred and fifty feet away. I was about half way when my strength gave out entirely. My clothes and shocked condition sapped my strength, and I was about to go under when Major Shapley started to swim by, and seeing my distress, grasped my shirt and told me to hang to his shoulders while he swam in.

We were perhaps twenty-five feet from the pipe line when the Major's strength gave out and I saw he was floundering, so I loosened my grip on him and told him to make it alone. He stopped and grabbed me by the shirt and refused to let go. I would have drowned but for the Major. We finally reached the beach where a marine directed us to a bomb shelter, where I was given dry clothes and a place to rest.

2.8. “A Day Which Will Live in Infamy”: Franklin D. Roosevelt on Pearl Harbor

Franklin D. Roosevelt and Pearl Harbor

More than two years elapsed between the outbreak of war in Europe in September 1939 and the entry of the United States into the conflict in December 1941, immediately after the Japanese attack on Pearl Harbor. Democratic politician Franklin D. Roosevelt, president of the United States since 1933, was the key figure in the U.S. decision to follow anti-German and anti-Japanese policies. A distant cousin of former president Theodore Roosevelt, he shared the latter's belief that American security from attack ultimately depended upon the protection of the British fleet. From 1913 to early 1920, including all of World War I, Roosevelt served as Assistant Secretary of the Navy in the administration of President Woodrow Wilson. While holding this position he took an extremely pro-Allied and anti-German attitude, welcoming American intervention in April 1917. In 1920 Roosevelt ran as his party's vice-presidential candidate and, though he lost, until the early 1930s he remained one of the strongest American supporters of Wilson's League of Nations. Decidedly a politician, in the presidential campaign of 1932 Roosevelt jettisoned his support of the League of Nations in order to win the endorsement of influential anti-League Democrats, including the California press lord William Randolph Hearst. Even so, at heart he still believed that the United States should take on a far more substantial international role than that it had played between the wars.

For much of the 1930s one major preoccupation of the American Congress was how best to ensure that the United States remained uninvolved in any future international conflict in either Europe or Asia. From 1935 onward, Congress passed a series of Neutrality Acts whose fundamental objective was to ensure that the United States should not be drawn into war as it had been in 1917, either through trade with a belligerent nation or because Americans wished to travel on the ships of belligerent states. The American Neutrality Acts decreed that, if such trade or travel took place at all, it would be entirely at the risk of those Americans involved, whose government would have no responsibility to defend them. During the 1930s Roosevelt acquiesced somewhat reluctantly in the passage of neutrality legislation, endorsed the Munich settlement of 1938, and hoped against hope that it might be possible to preserve European peace. In spring 1940 he even dispatched an abortive peace mission to Europe, headed by Sumner Welles, his Under Secretary of State. Few doubted, however, that fundamentally Roosevelt supported the Allies.

In November 1939 he obtained the amendment of the current neutrality legislation to permit belligerent nations to buy war supplies in the United States, provided they paid in cash and transported the matériel in their own ships.

Once Hitler launched his May 1940 blitzkrieg of Western Europe, Roosevelt's major fear was that all western Europe would crumble and there would be nothing left to defend. Although Scandinavia, the Low Countries, and France each quickly surrendered to German forces, leaving Great Britain to fight on alone, in May 1940 Winston Churchill, for at least a decade a dedicated opponent of European fascist powers, replaced Neville Chamberlain as Britain's prime minister. Churchill's rousing speeches made it clear that, whatever the cost, Great Britain was not prepared to sue for peace with Germany, but intended to fight on, alone if necessary, but preferably with the benefit of some material assistance at least from the United States. The fact that, although the majority of the soldiers of the British Expeditionary Force escaped from France in late May and June 1940, they left most of their equipment behind on the beaches of Dunkerque and other ports, made such aid even more vital.

Roosevelt responded in kind. Initially, he still feared that Great Britain stood next on the list of easy conquests for Hitler's forces. Churchill's stirring speeches, affirming that at no matter what cost Britain would fight on to the bitter end, and Britain's steadfast resistance, first to attacks by German fighters on its air facilities, then to brutal bombing raids on its cities, convinced him that Great Britain now constituted a European redoubt Hitler could not take. Churchill's rhetoric also won his country the admiration and sympathy of many ordinary Americans, who followed the war's course in great detail. Britain's determination to stand firm and continue the fight, a great contrast to the behavior of its government for much of the 1930s, resonated with American journalists based in London, the sources from whom much of the American public learned about the European war. Within the United States dedicated groups of pro-British Americans, most upper class members of the East Coast patrician elite, lobbied with a determination surpassed only by that of Churchill himself for increased American aid to the Allies (at this stage primarily Great Britain), whatever the risk to the United States itself. Many such individuals began to join the growing wartime bureaucracy, centered on the War and Navy Departments, that was beginning to prepare the country for actual intervention in the war, upgrading American military and naval procurement and lobbying for peacetime conscription in the form of selective service legislation, under which all young American men between the ages of 21 and 35 would be subject to call-up for compulsory military training. In September 1940 Roosevelt signed an agreement under whose terms the United States gave Britain 50 obsolescent

destroyers, in return for rights to eight bases in British possessions in the Caribbean and North America. Few doubted that Roosevelt, whatever caveats he might utter in public, was personally profoundly pro-British in sympathy, and prepared to offer all assistance short of war to enable Great Britain to continue to resist German attacks and invasion attempts.

Although a fierce debate over foreign policy was still raging, in early November 1940 Roosevelt won an unprecedented third term as United States president, and would not face another election until 1944. The outcome emboldened him to move more decisively against both Germany in Europe and Japan in Asia. On Roosevelt's initiative, on 11 March 1941 Congress passed the Lend-Lease Act, which permitted the United States president to send aid to "the government of any country whose defense the President deems vital to the defense of the United States." Payment for such aid was to be deferred until the end of the war. Britain was the first recipient of assistance under the new program, quickly joined by the Soviet Union after Hitler declared war on that country in July 1941, and China, which had been in a state of undeclared war with Japan since 1937. In September 1940 Japan, Germany, and Italy had signed the Tripartite Pact, an alliance which led the Roosevelt administration to view all three powers as united in a coordinated international attack on the Western democracies. After the Atlantic conference of August 1941, the United States and Great Britain began military staff talks to coordinate their strategic planning. Throughout 1941, Roosevelt's policies toward both Germany and Japan became increasingly uncompromising, as he moved ever closer to naval warfare with German ships in the Atlantic, and in summer 1941 embargoed the sale of virtually all U.S. raw materials, including essential petroleum, to Japan.

When Roosevelt received the news of the Pearl Harbor attack on the afternoon of 7 December 1941, he was apparently profoundly shocked. Ever since that date, a variety of conspiracy theories have been advanced regarding Pearl Harbor. Roosevelt's political opponents charged that he deliberately set out to provoke a war with Japan in order to enter the European war against Adolf Hitler's Germany through the "back door" of a war with Japan. Others subsequently alleged that the president and his top advisers received advance warning through intelligence intercepts that an attack was planned on Pearl Harbor but deliberately forbore to warn the military officers in charge there because they sought an unsailable pretext for war. More recently, former British intelligence operatives have rather sensationally suggested that, thanks to the cryptographic skills of ultra code-breakers at Bletchley Park, Oxfordshire, British premier Winston Churchill knew several days in advance of the projected Japanese attack on Pearl Harbor but purposely left Roosevelt

ignorant of this, since Churchill sought American intervention in the war, whatever the cost to his ally.

On close examination, none of these theories carries any great conviction. Had Germany and Italy not taken the initiative and declared war on the United States a few days after Pearl Harbor, the United States would in all probability have concentrated the bulk of its efforts on winning the war in Asia, rather than focusing on the European war that Roosevelt considered the higher priority. Even if the U.S. government had been able to warn its forces at Pearl Harbor to expect a Japanese assault and they had been better prepared to resist it, the attack would still have led to war between the two countries. Indeed, defensive measures might well have reduced the damage to the fleet and the number of casualties, leaving the United States better equipped to handle the subsequent Japanese onslaught throughout Southeast Asia. The same considerations held true for Churchill: though he later cheerfully admitted welcoming the fact that Pearl Harbor brought the United States fully into the war, he would undoubtedly have been happier had his ally's naval forces been in healthier shape immediately after Pearl Harbor, something a timely British warning might have remedied.

Intercepted and decoded Japanese cables had informed top American leaders that war was coming and they should expect a near immediate attack on some major Western target in Asia but did not specify precisely where this would come. Pearl Harbor represented above all a distinct intelligence failure, as overworked code-breakers deciphered Japanese cables but spent too little time collating and analyzing them. Complacent racist contempt for Japanese abilities, moreover, led most if not all Western policymakers grossly to underestimate just how devastatingly effective Japanese onslaughts would be over the six months following Pearl Harbor. This may also have been one reason top officials in Washington never insisted strongly enough that Pearl Harbor and other American redoubts in Asia must observe a permanent maximum alert.

From the president down, Pearl Harbor came as an overwhelming shock to virtually every American. Roosevelt immediately faced the task of requesting a declaration of war from Congress and of rallying the American people for what would inevitably be a long and almost certainly a difficult war. The day after Pearl Harbor, he asked both houses of Congress formally to declare war on Japan, and with only one dissenting vote, they did so. The following day the president addressed the American people on the national crisis, laying out at considerably more length what this war would mean for the United States and for average Americans.

About the Documents

Though Roosevelt usually spent considerable time working on his major speeches, both these addresses were drafted in

great haste. The first, his message to Congress, was extremely brief, simply laying out in terse and simple language how Japanese forces had first attacked the American Fleet and naval base at Pearl Harbor, causing heavy loss of life and much material damage, and had now launched assaults on numerous other places in the Pacific, and requesting a declaration of war. Roosevelt pointed out that Japan must have set the Pearl Harbor operation in motion several weeks earlier, when negotiations with the United States were still proceeding, and asked Congress formally to recognize the state of hostilities that already existed. He also pledged to continue the war until “absolute victory” was achieved. His one rhetorical flourish was to describe 7 December 1941 as “a date which will live in infamy,” a description that quickly became famous. Understandably, in the circumstances, Roosevelt’s message was very much to the point, intended simply to elicit an immediate declaration of war from Congress.

Even though he prepared his next speech under almost equally intense time pressure, when he addressed the American people one day later, Roosevelt ranged far more widely, discussing not just his country’s response to the immediate Japanese attack but the broader implications of the state of war that now existed. Once more, his tone was businesslike, direct, and straightforward, as he sought to reassure shaken Americans and restore their confidence that they could surmount this crisis triumphantly.

Although his rhetoric on this occasion was less memorable, Roosevelt almost certainly drew on his earlier experience when he first took office in March 1933, at the nadir of the Great Depression, and his first task was to inspire his countrymen with hope that they could survive their economic difficulties. Roosevelt spoke to the American people directly by radio, and this speech was only one in a lengthy series of such addresses he delivered at irregular intervals throughout his presidency, that he termed “fireside chats”. The president wished his listeners to feel that he had come to their house to sit beside the fire in their living room, and discuss the major issues of the day with them. In the first of these speeches, made in March 1933, immediately after his first inauguration, Roosevelt resoundingly declared that the United States had “nothing to fear but fear itself.” In the 1930s radio was still a relatively new technology, and politicians were only beginning to recognize its potential. The fascist dictators Adolf Hitler and Benito Mussolini used radio to broadcast their major speeches, as did Winston Churchill for his great wartime addresses. Roosevelt’s speeches, however, were rather different in style from the conscious oratory of these political leaders. He deliberately aimed for a low-key, relaxed, intimate and friendly approach, almost deprecating in effect, rather than the overblown rhetoric of Mussolini and Hitler or the grand oratorical flourishes of Churchill. One might even say that he sought to be a national teacher, setting out impor-

tant issues in simple language that anyone could readily understand, and appealing for support for his actions on them.

Although American policies had for at least the previous eighteen months been primarily directed at Germany and Italy, when Roosevelt spoke the United States was still only at war with Japan. As it transpired, a few days later, the two remaining Axis powers themselves declared war on the United States, but despite his hostility to both states, on 9 December, Roosevelt could not count on this. Significantly, therefore, his radio address emphasized not simply Japan’s disregard for all rule of international law in attacking the United States without any warning but placed this in the context of a global struggle, in which all three Axis nations had for the past 10 years used similar tactics of launching wars without issuing any warning, coordinated their strategies, and considered the entire world “one gigantic battlefield.” Roosevelt urged Americans to eradicate “Axis aggression” everywhere, not just in Asia, and to consider the wars in Europe and the Pacific as parts of one coordinated whole. His address reflected his own concern that the United States would focus exclusively on the war with Japan, to the neglect of the ongoing crisis in Europe, which he ultimately considered an even greater danger. He therefore made every effort to tie the two together and argue that the defeat of one would inevitably involve the defeat of both and that neither the United States nor the world could enjoy real security until this was accomplished.

Roosevelt recognized that the United States had now taken on a colossal task and, though reassuring Americans that they would eventually win through to victory, did not attempt to minimize the difficulties they must surmount. He warned that all would be required to make real sacrifices: to serve in the armed forces, to work harder as civilians, to pay heavy taxes, to buy war bonds, and if necessary, to deprive themselves of unnecessary luxuries. Though rather smugly congratulating himself that the industrial buildup of the previous 18 months had both substantially enhanced American defenses and helped anti-Axis states to hold their mutual enemies at bay, Roosevelt bluntly stated that winning the war would in the future require the economic mobilization of all his country’s massive industrial strength on a yet unprecedented scale, envisaging the doubling or even quadrupling of production.

Just two days into the war, Roosevelt stressed that he would not contemplate a negotiated peace with any of those “gangster” nations he numbered among his country’s enemies, whether or not they were yet formally at war. The United States, he warned, could “accept no result save victory, final and complete.” In his view, this implied not just the defeat of Japan, but that “the sources of international brutality, wherever they exist, must be absolutely and finally

broken.” Specifically, this meant that the power of Germany and Italy must also be overthrown. Moreover, when the war eventually ended, the United States would have to make drastic changes in its international policies, jettisoning its earlier attempts to remain aloof from world affairs and “abandoning once and for all the illusion that we can ever isolate ourselves from the rest of humanity.” He envisaged the United States rebuilding “a world in which this Nation, and all that this Nation represents, will be safe for our children.” The task that lay before the United States was not just to win the war, but also “to win the peace that follows.”

Roosevelt’s address, delivered little more than 48 hours after Pearl Harbor, was short, workmanlike, and almost entirely devoid of the stirring rhetoric that Churchill in Britain had used 18 months earlier to rally the British people to resist Hitler’s air assaults. It was also extremely comprehensive, setting out an ambitious program of war objectives embracing the defeat of all the Axis powers, not just Japan; the massive mobilization of American military, industrial, and economic resources that would be required to accomplish this; and the long-term aim of American assumption of a prominent global role, in which capacity the United States would take the lead in reconstructing the international system to ensure a more peaceful and prosperous postwar world. Over the previous months and years, the American president had obviously devoted much careful thought to his country’s future international policies. In this one brief speech, he effectively described the policies the United States would indeed follow throughout the war and beyond.

When the occasion finally arose, at two days’ notice, Roosevelt was able to present a clear, concise, comprehensible, and carefully argued summary of the broad lines of his wartime military and domestic strategies and his overall war aims. Even more impressively, he did so while reassuring his countrymen that, however grave the immediate situation, the problems facing the United States were in no sense insurmountable. Roosevelt’s behavior on this occasion demonstrates why, even 30 or 40 years later, many Americans would still regard him as the yardstick against whom all American presidents should be judged.

A) Franklin D. Roosevelt, Address to the U.S. Congress, 8 December 1941

Yesterday, December 7, 1941—a date which will live in infamy—the United States of America was suddenly and deliberately attacked by naval and air forces of the Empire of Japan.

The United States was at peace with that Nation and, at the solicitation of Japan, was still in conversation with its Gov-

ernment and its Emperor looking toward the maintenance of peace in the Pacific. Indeed, one hour after Japanese air squadrons had commenced bombing in Oahu, the Japanese Ambassador to the United States and his colleague delivered to the Secretary of State a formal reply to a recent American message. While this reply stated that it seemed useless to continue the existing diplomatic negotiations, it contained no threat or hint of war or armed attack.

It will be recorded that the distance of Hawaii from Japan makes it obvious that the attack was deliberately planned many days or even weeks ago. During the intervening time the Japanese Government has deliberately sought to deceive the United States by false statements and expressions of hope for continued peace.

The attack yesterday on the Hawaiian Islands has caused severe damage to American naval and military forces. Very many American lives have been lost. In addition American ships have been reported torpedoed on the high seas between San Francisco and Honolulu.

Yesterday the Japanese Government also launched an attack against Malaya.

Last night Japanese forces attacked Hong Kong.

Last night Japanese forces attacked Guam.

Last night Japanese forces attacked the Philippine Islands.

Last night the Japanese attacked Wake Island.

This morning the Japanese attacked Midway Island.

Japan has, therefore, undertaken a surprise offensive extending throughout the Pacific area. The facts of yesterday speak for themselves. The people of the United States have already formed their opinions and well understand the implications to the very life and safety of our Nation.

As Commander in Chief of the Army and Navy I have directed that all measures be taken for our defense.

Always will we remember the character of the onslaught against us.

No matter how long it may take us to overcome this premeditated invasion, the American people in their righteous might will win through to absolute victory. I believe I interpret the will of the Congress and of the people when I assert that we will not only defend ourselves to the uttermost but will make very certain that this form of treachery shall never endanger us again.

Hostilities exist. There is no blinking at the fact that our people, our territory, and our interests are in grave danger.

With confidence in our armed forces—with the unbounded determination of our people—we will gain the inevitable triumph—so help us God.

I ask that the Congress declare that since the unprovoked and dastardly attack by Japan on Sunday, December 7, a state of war has existed between the United States and the Japanese Empire.

B) Franklin D. Roosevelt, Radio Address to the United States People, 9 December 1941

The sudden criminal attacks perpetrated by the Japanese in the Pacific provide the climax of a decade of international immorality.

Powerful and resourceful gangsters have banded together to make war upon the whole human race. Their challenge has now been flung at the United States of America. The Japanese have treacherously violated the long-standing peace between us. Many American soldiers and sailors have been killed by enemy action. American ships have been sunk, American air-planes have been destroyed.

The Congress and the people of the United States have accepted that challenge.

Together with other free peoples, we are now fighting to maintain our right to live among our world neighbors in freedom and in common decency, without fear of assault. . . .

The course that Japan has followed for the past 10 years in Asia has paralleled the course of Hitler and Mussolini in Europe and Africa. Today, it has become far more than a parallel. It is collaboration so well calculated that all the continents of the world, and all the oceans, are now considered by the Axis strategists as one gigantic battlefield.

In 1931, Japan invaded Manchukuo—without warning.

In 1935, Italy invaded Ethiopia—without warning.

In 1938, Hitler occupied Austria—without warning.

In 1939, Hitler invaded Czechoslovakia—without warning.

Later in 1939, Hitler invaded Poland—without warning.

In 1940, Hitler invaded Norway, Denmark, Holland, Belgium, and Luxembourg—without warning.

In 1940, Italy attacked France and later Greece—without warning. In 1941, the Axis Powers attacked Yugoslavia and Greece and they dominated the Balkans—without warning.

In 1941, Hitler invaded Russia—without warning.

And now Japan has attacked Malaya and Thailand—and the United States—without warning.

It is all of one pattern.

We are now in this war. We are all in it—all the way. Every single man, woman, and child is a partner in the most tremendous undertaking of our American history. We must share together the bad news and the good news, the defeats and the victories—the changing fortunes of war. . . .

Now a word about the recent past—and the future. A year and a half has elapsed since the fall of France, when the whole

world first realized the mechanized might which the Axis nations had been building for so many years. America has used that year and a half to great advantage. Knowing that the attack might reach us in all too short a time, we immediately began greatly to increase our industrial strength and our capacity to meet the demands of modern warfare.

Precious months were gained by sending vast quantities of our war materials to the nations of the world still able to resist Axis aggression. Our policy rested on the fundamental truth that the defense of any country resisting Hitler or Japan was in the long run the defense of our own country. That policy has been justified. It has given us time, invaluable time, to build our American assembly lines of production.

Assembly lines are now in operation. Others are being rushed to completion. A steady stream of tanks and planes, of guns and ships, of shells and equipment—that is what these 18 months have given us.

But it is all only a beginning of what has to be done. We must be set to face a long war against crafty and powerful bandits. The attack at Pearl Harbor can be repeated at any one of many points in both oceans and along both our coast lines and against all the rest of the hemisphere.

It will not only be a long war, it will be a hard war. That is the basis on which we now lay all our plans. That is the yardstick by which we measure what we shall need and demand—money, materials, doubled and quadrupled production, ever increasing. The production must be not only for our own Army and Navy and air forces. It must reinforce the other armies and navies and air forces fighting the Nazis and the war lords of Japan throughout the Americas and the world.

I have been working today on the subject of production. Your Government has decided on two broad policies.

The first is to speed up all existing production by working on a 7-day-week basis in every war industry, including the production of essential raw materials.

The second policy, now being put into form, is to rush additions to the capacity of production by building more new plants, by adding to old plants, and by using the many smaller plants for war needs. . . .

On the road ahead there lies hard work—grueling work—day and night, every hour and every minute.

I was about to add that ahead there lies sacrifice for all of us.

But it is not correct to use that word. The United States does not consider it a sacrifice to do all one can, to give one's best to our Nation when the Nation is fighting for its existence and its future life.

It is not a sacrifice for any man, old or young, to be in the Army or the Navy of the United States. Rather is it a privilege.

It is not a sacrifice for the industrialist or the wage earner, the farmer or the shopkeeper, the trainman or the doctor, to pay more taxes, to buy more bonds, to forego extra profits, to work longer or harder at the task for which he is best fitted. Rather is it a privilege.

It is not a sacrifice to do without many things to which we are accustomed if the national defense calls for doing without.

A review this morning leads me to the conclusion that at present we shall not have to curtail the normal articles of food. There is enough food for all of us and enough left over to send to those who are fighting on the same side with us.

There will be a clear and definite shortage of metals of many kinds for civilian use, for the very good reason that in our increased program we shall need for war purposes more than half of that portion of the principal metals which during the past year have gone into articles for civilian use. We shall have to give up many things entirely.

I am sure that the people in every part of the Nation are prepared in their individual living to win this war. I am sure they will cheerfully help to pay a large part of its financial cost while it goes on I am sure they will cheerfully give up those material things they are asked to give up.

I am sure that they will retain all those great spiritual things without which we cannot win through.

I repeat that the United States can accept no result save victory, final and complete. Not only must the shame of Japanese treachery be wiped out, but the sources of international brutality, wherever they exist, must be absolutely and finally broken.

In my message to the Congress yesterday I said that we shall make very certain that this form of treachery never “will endanger us again.” In order to achieve that certainty, we must begin the great task that is before us by abandoning once and for all the illusion that we can ever again isolate ourselves from the rest of humanity.

In these past few years—and, most violently, in the past few days—we have learned a terrible lesson.

It is our obligation to our dead—it is our sacred obligation to their children and our children—that we must never forget what we have learned.

And what we all have learned is this:

There is no such thing as security for any nation—or any individual—in a world ruled by the principles of gangsterism.

There is no such thing as impregnable defense against powerful aggressors who sneak up in the dark and strike without warning.

We have learned that our ocean-girt hemisphere is not immune from severe attack—that we cannot measure our safety in terms of miles on any map.

We may acknowledge that our enemies have performed a brilliant feat of deception, perfectly timed and executed with

great skill. It was a thoroughly dishonorable deed, but we must face the fact that modern warfare as conducted in the Nazi manner is a dirty business. We don’t like it—we didn’t want to get in it—but we are in it and we’re going to fight it with everything we’ve got.

I do not think any American has any doubt of our ability to administer proper punishment to the perpetrators of these crimes.

Your Government knows that for weeks Germany has been telling Japan that if Japan did not attack the United States, Japan would not share in dividing the spoils with Germany when peace came. . . . We also know that Germany and Japan are conducting their military and naval operations in accordance with a joint plan. That plan considers all peoples and nations which are not helping the Axis Powers as common enemies of each and every one of the Axis Powers.

That is their simple and obvious grand strategy. That is why the American people must realize that it can be matched only with similar grand strategy. . . . Remember always that Germany and Italy, regardless of any formal declaration of war, consider themselves at war with the United States at this moment just as much as they consider themselves at war with Britain and Russia. . . .

The true goal we seek is far above and beyond the ugly field of battle. When we resort to force, as now we must, we are determined that this force shall be directed toward ultimate good as well as against immediate evil. We Americans are not destroyers; we are builders.

We are now in the midst of a war, not for conquest, not for vengeance, but for a world in which this Nation, and all that this Nation represents, will be safe for our children. We expect to eliminate the danger from Japan, but it would serve us ill if we accomplished that and found that the rest of the world was dominated by Hitler and Mussolini.

We are going to win the war, and we are going to win the peace that follows.

Section III

Waging War

By bringing the United States fully into the war, Pearl Harbor gave the Allied powers a massive advantage in manpower and economic resources over their Axis opponents. Even so, the conflict lasted almost another four years. 1942 began badly, as the Japanese swept through much of Asia, taking Hong Kong, Singapore, Malaya, the Philippines, and Burma within a few months. In June 1942 U.S. naval forces in the Pacific Ocean nonetheless blocked further Japanese expansion by winning the battle of Midway. Both this victory and the British triumph over German forces in North Africa at the El Alamein the following November were greatly assisted by the success of the Allies in breaking many of the Japanese and German top secret communication codes. On the eastern front, from mid-1942 until early 1943 German and Soviet forces contended for the crucial stronghold of Stalin-grad, a brutal contest that ended in the encirclement and defeat of Hitler's forces, a vital turning-point in that contest. The failure of his Western allies, the United States and Britain, to mount a second front in Europe in 1943 nonetheless infuriated Stalin. Throughout Europe and Asia it became increasingly clear that, when the war had ended, leftist and communist forces were likely to engage in bitter contests for power with centrist or right-wing rivals. On D-Day, 6 June 1944, British and American forces under the command of General Dwight D. Eisenhower finally launched the long-awaited invasion of Western Europe, landing on the Normandy beaches and eventually fighting their way to Germany in May 1945. In the Pacific, General Douglas MacArthur's Allied forces faced even bloodier fighting in a far-flung "island-hopping" campaign against Japanese troops who, almost to a man, fought with bloody and desperate resistance for every inch of ground.

3.1. Enigma Codebreaking in World War II: Recollections of Edward Thomas

Codebreaking in World War II

One of the great Allied triumphs of World War II was the ability to read many, though not all, of the coded cable messages sent by the Axis powers, both internal communications dispatched by the units of their armies, navies, foreign ministries, and so forth, and some of those that passed between the different Axis governments. Enormous quantities of official cable traffic were generated every day by the various states involved in the war, some of it routine, some highly significant. Units of the armed forces and naval vessels received their instructions by cable and reported back in the same way; military commanders communicated with their superiors at home and their subordinates in the field by wire; diplomats

exchanged messages, and supplies were ordered by cable. Allied radio watchers in Cairo could tell, simply by monitoring the cable traffic, whether Field Marshal Erwin Rommel was at his headquarters, since his presence there vitalized all around him, dramatically affecting the quantity, tone, and atmosphere even of German radio transmissions, something that simple traffic analysis could pick up even without decryption.

Although the Allied achievements were the more spectacular, both sides in World War II had some successes with code-breaking. For much of 1942–1943, German cryptographers had broken the British naval codes used to direct convoys in the Battle of the Atlantic, causing a crisis in the shipment of supplies from North America to Britain. The Japanese were less skilled at decryption. The Finns and the neutral Swedes were able to read some German cables, and the latter, preferring the prospect of an Allied victory, even passed naval information on to the British. The great tri-

umphs for the United States, operations collectively known as magic, were deciphering first the Japanese “Purple” diplomatic codes, in 1940, and eventually the Japanese army and naval codes. These latter were especially valuable to the United States, contributing appreciably to the American naval victory at the Battle of Midway in June 1942 and to subsequent American victories in the Pacific. In April 1943, information obtained by decrypting Japanese naval traffic also enabled U.S. fighters to shoot down the airplane carrying Admiral Yamamoto Isoroku, the architect of the December 1941 Pearl Harbor attack. Apparently both German and Soviet code-breakers emulated the Americans in breaking the Japanese Purple diplomatic code. After the June 1941 German invasion, Josef Stalin was therefore able to switch Soviet military forces in Asia to oppose Hitler’s troops, safe in the knowledge that Japan did not intend to declare war on Russia but intended instead to move south.

During World War II, the British took the lead in decrypting German and Italian cables, greatly assisted by earlier Polish experience in doing so, and the Polish capture of one of the German Enigma cipher machines. The British headquarters for these efforts, collectively known as *ULTRA*, was the country mansion of Bletchley Park, Oxfordshire, in whose grounds various prefabricated huts were erected, each concentrating upon a different German (Enigma) or Italian (Fish) cipher. In earnest of their good faith, even before outright American intervention in World War II, British premier Winston Churchill informed U.S. President Franklin D. Roosevelt of this operation, and a team of qualified Americans soon joined the British cryptanalysts. Strict secrecy regarding these operations was observed during the war, since any hint that the Allies were reading their cable traffic would have impelled the Axis powers to change their codes. Some, such as Grand Admiral Karl Dönitz, commander of the German U-boat squadrons and subsequently commander in chief of all German naval forces, were in any case suspicious that the Allies might be able to do so and took measures to upgrade the security of the existing Enigma machines by enhancing their complexity. For almost all of 1942, British cryptographers were therefore unable to read the German naval traffic.

Code-breaking was difficult and demanding work. Most encryption was the work of machines, but the settings on them often changed daily, usually at human direction, so the decipherers faced constant new challenges. Some decrypting could be entrusted to machines, especially the replicas of captured German Enigma transmitters, but the work also demanded considerable mathematical skills, plus the ability to outguess the enemy through sheer human ingenuity. The teams of cryptographers, many of them brilliant civilian scientists and other academics temporarily in uniform, were distinguished by their brains, informality, and sense of cama-

raderie. Rank counted for little, provided that the job was done. Despite the impact and ravages of war and though they often worked under great stress, for many, their time at Bletchley Park represented one of the most stimulating and memorable experiences of their lives.

About the Document

Among the numerous denizens of Bletchley Park was Edward Thomas, a young naval officer in his twenties who joined Hut 4 there in early 1942, after 18 months in Iceland as a naval intelligence officer, and subsequently transferred to the associated Hut 3N. Professor Edward Norman, his former German teacher at King’s College, London, who helped to establish the Bletchley Park operation, was probably responsible for his secondment. Many years later, Thomas was one of around 30 Bletchley Park employees who contributed their reminiscences to a volume compiled by the noted Cambridge historian F. H. (Harry) Hinsley, who had been one of Bletchley’s leading figures, and his former colleague Alan Stripp. The editors themselves noted that, since it was easier for them to contact the British than the Americans who had worked there, the volume underrepresented the contributions of the U.S. Bletchley team. Thomas’ reminiscences were therefore only one part of a coordinated project intended to give a systematic overview of the accomplishments at Bletchley Park. Although this is a memoir written almost 40 years after the fact, Thomas prepared it at the request and under the editorial direction of two sophisticated historians, one of whom was responsible for the multivolume history of wartime British intelligence. Hinsley and Stripp admitted that, although they had made every effort to cross-check their facts, their entire book, a collection of comparable memoirs, “rested almost entirely on personal memories; and this is unusual in an account which pretends to any sort of accuracy” (Hinsley and Stripp 1993, p. vi). The nature of the book was dictated in part by the tight secrecy that until the mid-1970s, enshrouded the very existence of Bletchley Park, let alone the operations that took place there.

Thomas’ recollections focused rather precisely on the operations of Huts 3 and 4 during the approximately 18 months from early 1942 to mid-1943 that Thomas spent working there, a period that included the worst stretch of the Battle of the Atlantic, when German naval codes had been upgraded and an 11-month hiatus in their decryption ensued. It also covered the war in the Middle East, up to the time of the British victory at El Alamein, from the British perspective, one of the war’s great turning points. Thomas gave a lively picture of the informal atmosphere at Bletchley, despite or perhaps even because of the great pressures under which its inhabitants habitually worked. His lucid description of the assorted codes on which the two huts’ cryptogra-

phers would be working at any given time and the coordination of these efforts gives some sense of the complexity of the Enigma operation, with different codes altering on a sometimes daily basis and having to be cracked anew. The verve and vigor with which Thomas tells his tale makes it clear that, despite the rather bleak working conditions and the still rather desperate British position in the war, like many others, he found his time at Bletchley Park immensely stimulating and rewarding. For a serving naval officer, particularly one who had until recently been part of the Iceland contingent battling the U-boats, the revelations of the instructions behind the German maritime operations were both fascinating and illuminating, giving him a glimpse of the other side of the war.

Thomas is perhaps slightly too self-congratulatory on Bletchley Park's contributions to the Desert War, substantial though these undoubtedly were. The code-breakers themselves could be taken in by inaccurate information. On at least one occasion, British forces attacked Rommel in the belief that he was short of military equipment, only to discover that this was not the case. To ensure that his requests for supplies received the highest priority, Rommel often exaggerated the gravity of his existing position in communications to Berlin requesting additional matériel. (Whether Thomas realized this, even retrospectively, is of course another question.) General Sir Bernard Montgomery had some excuse for his cautious approach toward Rommel after El Alamein, however frustrating this appeared to Huts 3 and 4.

Primary Source

Excerpts from Edward Thomas, "A Naval Officer in Hut 3"

In early 1942 some half-dozen naval officers knowing German were summoned to Bletchley's Naval Section. Current gossip at the Park had it that there were two explanations for this. One was that the Section's head, observing that Hut 3 boasted several individuals in RAF and Army uniform, wished to have some navy-clad folk about the place to impress visiting VIPs. The other was that officers with first-hand experience of the naval war might be able to add a touch of verismo to the interpretation and analysis of the German naval Enigma decrypts then being done in Hut 4, mainly by men and women in civilian garb. We naval folk were soon to learn the super-erogatory character of this second explanation. There was precious little that Hut 4's civilians did not know about how navies worked. Most of what I ever knew about the German navy came from those who had been working on the naval Enigma since it was first broken a year earlier.

I vividly remember the sense of shock produced on my first arrival at the Park by the grimness of its barbed-wire

defences, by the cold and dinginess of its huddled accommodation, and by the clerk-work we were first set to do. But this was soon swept aside by the much greater shock of discovering the miracles that were being wrought at the Park. In Iceland I had been interrogating the survivors of the many merchant ships sunk in the, at first, highly successful offensive against the Atlantic convoys launched by the U-boats in March 1941. I had spent many hours trying to analyse their strength and tactics. I could have spared my pains. For I now discovered that all this, and everything else about the U-boats, was known with precision by those privy to the Enigma decrypts. Leafing through the files of past messages—for the dreaded Shark key for U-boats, that had been introduced a week before my arrival, was to defeat Hut 8's cryptographers for another ten months—I shivered at seeing the actual words of the signals passing between Admiral Dönitz and the boats under his command whose terrible work I had seen at first hand. . . .

I can place the date of my arrival in Hut 4 pretty exactly. It was shortly before 11 February 1942, the day of the famous 'Channel Dash' of the *Scharnhorst*, *Gneisenau*, and *Prinz Eugen*. There was great commotion in the hut and cries of 'Where's Harry? Harry will be furious!' Indeed he was. Harry Hinsley, whom we naval newcomers had already pin-pointed as perhaps the most knowledgeable of all those in Hut 4, flew in late in the afternoon scattering smiles, scarves, and stimulus in every direction, exclaiming, 'It's happened again: whenever I take a day off something big blows up.' There had, indeed, been good indications that the ships were about to move; but the Enigma settings of 10, 11, and 12 February, by a stroke of the ill luck which precipitated tragedy from time to time, were not solved until three days later.

Hinsley was a key figure in Hut 4. His uncanny ability to sense, from tiny clues in the decrypts or the externals of the radio traffic, that something unusual was afoot was already legendary in the Park. He was well versed in the ways of navies, having more than once visited the Home Fleet in Scapa Flow to explain the workings of the Enigma to the Commander-in-Chief. He was a popular figure there and was known, as I later discovered when I joined the Home Fleet, as 'the Cardinal'. He was the chief channel for the exchange of ideas between the Naval Section and the Admiralty's Operational Intelligence Centre (OIC). This capable—but not infallible—organization had already in 1940 rejected a suggestion by Hinsley which, if adopted, might have saved the aircraft carrier *Glorious*. On the other hand, during the 'Channel Dash' it was smart work done in the OIC which contrived to use the decrypts to have the *Scharnhorst* and the *Gneisenau* mined off the Dutch coast with resounding strategic consequences. . . .

This episode coincided with the onset of Hut 8's ten-month-long inability to break into the newly introduced

Shark. Severe losses of merchant ships were to follow, largely in consequence of this. But already by the end of 1941 a turning-point had been reached in the battle of the Atlantic. The evasive routing of convoys made possible by Hut 8's breaking of the naval Enigma in the spring of 1941 had, according to some historians' calculations, spared some three hundred merchant ships and so provided a cushion against the heavy losses yet to come. It also defeated Dönitz's offensive, which was intended to knock out Britain while the German armies disposed of Russia, so avoiding a two-front war. The six-months' long decline in sinkings also provided a crucial breathing-space during which the Allies could develop anti-submarine weapons and tactics, and get on with building more merchant ships. This victory, which saved Britain, was based entirely on the work of Bletchley Park. It was also responsible, though I did not know it at the time, for the great reduction in the number of survivors who passed through my hands in Iceland, reducing my work-load and making it possible for me to be released to Bletchley. . . .

We naval newcomers were at once impressed by the easy relations and lack of friction between those in, and out of, uniform. Despite the high tension of much of the work, a spirit of relaxation prevailed. Anyone of whatever rank or degree could approach anyone else, however venerable, with any idea or suggestion, however crazy. This was partly because those in uniform had mostly been selected from the same walks of life as the civilians—scholarship, journalism, publishing, linguistics, and so forth—and partly because these were the people who saw most clearly what stood to be lost by a Hitler victory. All at the Park were determined to give their all to see this did not happen. Service officers gladly served under civilians, and vice versa. Dons from Oxford and Cambridge worked smoothly together. . . .

. . . Hut 3 [was] responsible for translating and elucidating the German Air Force and Army decrypts from Hut 6, for supporting its cryptanalysts, and for signalling the gist of the decrypts to operational Commands in the Mediterranean and, later, in other theatres. . . . New, fascinating, and exciting work was found for us. [German General Erwin] Rommel, fighting in Africa, depended on shipments of fuel, ammunition, and other supplies sent across the Mediterranean in convoys controlled by the Italians. His fortunes waxed or waned with the adequacy, or inadequacy, of his supplies. His most notable victories came when his logistic position was good; and his defeats when he was weakened through want of supplies. They were adequate when the fortunes of war permitted his convoys to arrive safely and in sufficient number: but he faltered when the RAF and Navy contrived to prevent this. His final defeat owed much to the sustained sinking of his supply ships. Bletchley played a big part in bringing this about.

Hut 6's decrypts told us a great deal about these convoy movements. One source was the Air Force Enigma which throughout 1941 had been revealing, albeit somewhat spasmodically, the instructions for their air escort. This intelligence had, for example, resulted in considerable disruption of the transport to Africa of the first of Rommel's armoured formations. The second and more important source was the Italian administration machine cipher, C38m, broken by Hut 8 in the summer of 1941. This yielded, amongst other things, advance warning of the sailing dates, routes, and composition of virtually all trans-Mediterranean supply convoys. It also threw occasional light on Italian main-fleet movements. During 1941 the gist of the relevant Enigma decrypts had been signalled by Hut 3 to the Mediterranean authorities by the SCU/SLU channel, while that of the C38m decrypts had been sent by a part-naval, part-civilian processing watch in Hut 4 separately to Malta and elsewhere. An outstanding result of these messages had been a spate of sinkings in late 1941 which played a big part in Rommel's retreat to El Agheila at that time.

It was probably a coincidence that, at the time of the Hut 3 reorganization of early 1942, a twenty-four hour watch of naval officers—one of them a regular—was set up and became an integral part of that hut. Called 3N, one of its jobs was to provide advice, hitherto lacking, to the watch on naval problems arising from the Army-Air Force decrypts. Its other and more important task was to co-ordinate the shipping intelligence from these decrypts with what came out of the C38m. To bring this about 3N and Hut 4's Italian watch became virtually a single team, the former being responsible for the final shape of the outgoing signals—and for taking on the chin any riposte from bewildered recipients at the other end (which was seldom). This development came at a bad time for the British in the Mediterranean. The Axis had greatly strengthened its convoy defences and Malta was all but immobilized by the attacks of the newly arrived Luftflotte 2. Axis convoys were getting through wholesale, and opportunities for attacking them were much reduced. Rommel's recovery in January 1942 was made possible by these developments. Every scrap of intelligence became doubly valuable. The co-ordination of the two sources came at the right moment. . . .

The Air Force Enigma, unlike the C38m, would sometimes indicate the importance—to the German Air Force, of course—of a given convoy, occasionally specifying that it carried urgent supplies of fuel or ammunition. Though these indications were made only in general terms, they were invaluable to the attack planners. From about August 1942 Hut 6 regularly broke the Chaffinch key of the German Army in Africa and this provided, as well as much else of the highest importance, precise details of cargoes. Ships carrying

operationally urgent supplies could now be distinguished from those with routine shipments. This made selective attack possible and greatly increased the effectiveness of the anti-ship campaign. An example of its effectiveness may be found in the Allies' ability, which came as a surprise to some historians, to feed the 250,000 prisoners trapped in Cape Bon during the final phase of the war in Africa. Ships known from the decrypts to be carrying rations had been spared; while those with cargoes of tanks, fuel, and ammunition had been selected for attack.

The arrival of Chaffinch, supplementing the former sources, coincided with that of Rommel on the Egyptian frontier. It now became doubly urgent to deprive him of supplies. It also coincided, to our great good fortune, with the recovery of Malta as a base for anti-ship operations, and with the breaking by Hut 8 of the naval Enigma key used by the Germans in the Mediterranean. Its yield made for much more efficient attacks on coastal supply shipping, on which Rommel, far from his supply bases and convoy terminals, now largely depended. All this sharply increased the pace of our work. Rommel clamoured for fuel, and attacks on tanker convoys were now given highest priority. Many were successful. Those during August 1942 were largely responsible for his failure at Alam Haifa. After the war I found my initials at the bottom of the signals giving details of the three supremely important tanker movements at the time of the October battle of El Alamein. Their sinking was largely responsible for Rommel's long and halting retreat westwards. I well remember the frustration that exploded from our Hut 3 colleagues at Montgomery's failure to overtake and destroy him. I had not seen such a demonstration since the Knightsbridge fighting six months earlier, when the Eighth Army advanced against an anti-tank trap at the so-called 'Cauldron' position and lost heavily. Hut 3 believed that it had provided full details of Rommel's intentions on this occasion.

The Hut 4/3N routine continued until the final victory at Cape Bon. It seemed scarcely credible that the Axis could have sufficient ships left unsunk to succour the fighting in Tunisia. But they did. And the pressure continued right up to the end.

3.2. The Battle of Stalingrad

Tensions in the Grand Alliance: The Soviet Union and the Western Allies

The Soviet Union effectively became an ally of Britain and the United States shortly after the German invasion of June 1941. Even so, deep fissures divided the major Allies, and these fractures would eventually contribute to the Cold War that developed immediately after the end of World War II.

The alliance between the Soviet Union and the Western allies, Great Britain and the United States, was essentially one of convenience. Ever since the Bolsheviks took power in Russia in late 1917 and created the Soviet Union, the world's first communist state, their relations with the Western democracies had been cool. At the end of World War I, the Allies, including Britain, France, the United States, and Japan, sent troops to Russia, in part to protect Allied personnel, supplies, and railway concessions there, but in most cases, with the unstated mission of attempting to strengthen anti-Bolshevik forces in the ongoing civil war. Although the Allies withdrew their forces in 1921, the bitter memory of the intervention lingered on, poisoning Soviet relations with the West. Official Communist ideological hostility to the capitalist world made it difficult for the new regime to develop warm relations with those states, as did the Soviets' refusal to settle the tsarist government's official debts to former Allied governments and private Western bankers. Most Western states recognized the Soviet Union during the 1920s, and even the United States did so in 1933, but relations still remained chilly.

During the 1930s, Soviet leaders, alarmed by the growing assertiveness of the authoritarian governments of Germany in Europe and Japan in Asia, in both cases quite possibly targeted at Russian interests, moved closer to the Western democracies, adopting a "united front" strategy of a coalition

of all antifascist forces. Even so, neither side fully trusted the other, a situation epitomized in the exclusion of the Soviet Union from the negotiations leading to the September 1938 Munich Agreement, and the subsequent Soviet decision to reach an accommodation with Nazi Germany in the August 1939 German-Soviet Non-aggression Pact. With German collaboration, in September 1939, the Soviet Union annexed much of eastern Poland, together with the Baltic states of Latvia, Lithuania, and Estonia. Later that year, Soviet leader Josef Stalin demanded that Finland cede certain strategically valuable areas to Russia, in exchange for less desirable lands; when Finland refused, the Soviet Union declared war and invaded the country, bringing its own expulsion from the largely moribund League of Nations. Until Hitler launched his invasion in June 1941, the Soviet Union was effectively supporting Germany's war effort against the Allies by selling the Nazi government substantial amounts of useful war supplies. After Pearl Harbor, the Soviet Union remained neutral toward Japan until August 1945, during which time Russia likewise continued to sell appreciable quantities of goods to that nation, many of which contributed to Japan's Pacific war effort.

After June 1941, first Great Britain and then the United States became formal allies of the Soviet Union and together constituted the Big Three Allied powers of World War II, who made most of the major wartime decisions. Even so, their relationship was by no means entirely happy. Despite the near inevitable tensions that the contrast between the decline of British international power and the growing global might of the United States imparted to Anglo-American relations, for the most part, military and diplomatic representatives of those two countries worked together relatively harmoniously, their collaboration smoothed by the numerous personal ties to each other's countries linking many of the individuals involved and the shared political and intellectual mindsets of both states. This was far from true of Soviet relations with the two Western powers. Disputes frequently occurred over the dispatch of Lend-Lease goods, when Western representatives believed that the Soviets exaggerated their requirements and Russian officials refused to account for those supplies they had received. Soviet military and political leaders were often churlish and unforthcoming in their meetings with Western counterparts.

More significant, however, was Stalin's fear that his allies were prepared to fight to the last Russian and that they sought to win the war with Russian lives. He particularly resented the Allied failure to open a second front against Germany in Europe until June 1944, which meant that for exactly three years, the Soviet Union faced the undiluted force of the German armies there. The war on the Eastern Front was brutal: 8.5 million Soviet soldiers died in action, and, though the numbers were never precisely calculated, civilian casualties

brought the Russian death toll up to perhaps 27 million in all. Two million German soldiers died in the war, almost 5 million were seriously wounded, and close to another 2 million went missing in action; the great bulk of all these losses occurred on the Eastern Front, where Soviet forces gradually wore down the once mighty Wehrmacht in savage and brutal warfare, waged both by regular troops and by partisans.

Top military and political leaders in the Western democracies, conscious that excessive casualties might eventually lead the public to turn against the war, did not wish to open another front against Germany until they enjoyed a massive advantage in military equipment, which would in turn tend to minimize their own losses. British premier Winston Churchill in particular had bitter memories of World War I trench warfare in Flanders and northern France, which devoured a generation of British young men, and was wary of once again committing huge armies on the same front. He devoted some of his remarkable ingenuity to devising diversionary schemes of "periphery-pecking" to attack Germany on the fringes, in North Africa, Sicily, and Italy, in the hope that it might be possible to avoid a direct assault upon the center of German power through France and the Low Countries. Although American officials were more eager to launch an all-out continental assault against Germany, they too were not prepared to do so until they had assembled a huge, well-equipped, and highly trained expeditionary force for the purpose. Despite Stalin's passionate pleas for the opening of such a second front, first in 1942, then in 1943, this only occurred in June 1944. Until then, he had to rest content with receiving extremely substantial but to his mind, still inadequate Lend-Lease supplies from the "great arsenal of democracy," accompanied by secondary Allied campaigns in the Mediterranean and the Middle East. Allied strategic decisions fueled the never-trusting Stalin's suspicions that his Western Allies sought to pay in Russian blood for defeating Germany, even, perhaps, that they hoped the war would exhaust both Russia and Germany. In practice, this deferred second front meant that when the war ended, Russian military forces would effectively control most of eastern and east-central Europe, a great improvement on the prewar Soviet strategic position and a development Western leaders would dislike but find themselves virtually powerless to prevent. Resentment over what many Russian officials perceived as their disproportionately high sacrifices of lives nonetheless lingered on.

The Battle of Stalingrad (August 1942–2 February 1943)

The Battle of Stalingrad marked the turning-point of World War II in Europe. In July 1942, Adolf Hitler ordered General Friedrich Paulus, commander of the German Sixth Army, to capture the southwest Russian city of Stalingrad. Symboli-

cally important to Stalin because it bore his own name and was therefore identified with himself, the city also controlled southern Russia's road and rail communications, and its capture would open the way for German forces to take Moscow and so bring about Russia's defeat. Stalin therefore rushed 1 million troops to the area. In early September, 250,000 German troops began to enter Stalingrad, which first endured heavy bombing from the Luftwaffe but encountered bitter resistance in street fighting that continued into November, by which time Paulus controlled 90 percent of Stalingrad.

Both Stalin and Hitler now regarded the battle for Stalingrad as a test of will and rushed additional forces there. On 10 November, the Sixth Army launched a new offensive, but Soviet troops drove the Germans back southward to the outskirts of Stalingrad, where they risked encirclement by Soviet troops. Hitler nonetheless ordered Paulus to hold his ground rather than retreat, promising to airlift supplies to him if necessary, a pledge the Luftwaffe could not honor in full. Although most of his officers believed they should attempt a breakout before it was too late, Paulus chose to obey Hitler's orders. Within a month, the shortage of supplies caused 28,000 German troops to starve to death, and eventually, rations were denied any wounded who were unable to fight. In December 1942, an attempt by General Erich von Manstein of the IV Panzer Corps to break through and rescue the trapped Sixth Army ended in failure, and Manstein himself, fearing similar encirclement, withdrew on 27 December and ordered the Sixth Army to break out. Paulus refused to do so, claiming his men were too weak, and on 31 January 1943, the 91,000 German survivors surrendered to the surrounding Soviet forces. Although Soviet losses were far higher, 150,000 German troops died during the siege of Stalingrad, and only 7,000 of those taken prisoner survived the war, 45,000 dying during the forced march to prison camps in Siberia, most of the remainder while in captivity. For the Soviets, Stalingrad proved that they could not merely withstand but defeat the Germans. For Hitler, it was the war's greatest humiliation to date, worse even than El Alamein the previous November, in that the German commander was not merely defeated but also surrendered ignominiously.

About the Document

This description of the differences dividing the Soviet Union and its two greatest allies, and of the Battle of Stalingrad, the turning-point of the war on the Eastern Front, is a composite account based on the two Soviet history textbooks most commonly used by preuniversity students. For twenty years after the mid-1950s, it remained essentially unchanged. Endorsed by the Soviet government, it purveyed the approved official version of World War II to several generations of Soviet schoolchildren.

As one might expect, Soviet textbooks set out the orthodox and ideologically correct Marxist interpretation of the war, citing the alliance with Britain and the United States as an example of the successful application of Soviet founder Vladimir Ilyich Lenin's precept on the treatment of capitalist and imperialist states. The war was presented as an exercise in triumphant Soviet Communist leadership of an antifascist coalition, a crusade undertaken in part, too, due to the mass pressure the British and American peoples exerted on their own governments, but dominated and guided by the Soviets. Writing in the early 1950s, probably while Stalin was in power, the authors of school textbooks prudently took great pains to praise their leader's foresight, diplomatic skill, and implementation of communist principles.

The unidentified authors also sedulously minimized the role of other nations in World War II. Three years of "heroic" Soviet resistance against Germany, "practically on her own," was cited as the primary reason for Hitler's defeat. The Western powers, by contrast, were depicted as quite deliberately deceiving the Soviet Union by failing to launch a second front in 1942 or even 1943, leaving the Red Army to fight alone against Hitler for three years and to defeat his forces unaided at Stalingrad, the turning point in the war. Lend-Lease aid to the Soviet Union, by then quite substantial, was not mentioned except in the context of an alleged eight-month hiatus in supplies, and all emphasis was on the valiant but solitary Russian fight against Germany. Minor details were also altered, so that Stalingrad became a straightforward tale of outnumbered but staunch Soviet defenders courageously beating off an attack from much stronger forces and, in the process, reversing the course of the war. The huge numerical superiority of Soviet troops was transformed into a German "numerical advantage," with 1 million rather than 250,000 German soldiers fighting at Stalingrad; the enormous Russian casualties were quietly left unmentioned; and much was made of the efforts of political commissars to rally soldiers and workers for the battle and how these succeeded. In a straightforward morality tale, the virtuous Soviet Communists succeed in overcoming not just German Fascist forces but also the obstacles placed in their way, all too often deliberately, by the untrustworthy governments—though not, of course, the valiant and enlightened peoples—of their purported allies.

School textbooks habitually emphasize their own country's contributions to significant international events and downplay those of other nations. When envisaging World War II, Americans habitually focus upon Pearl Harbor, North Africa, Italy, D day, and the war in the Pacific; the British highlight an overlapping but not identical series of events and operations, with special emphasis not just on the West European and North African campaigns but also on D day, the Battle of Britain, and the Battle of the Atlantic, whereas their

Pacific war consists largely of Singapore, Hong Kong, and Burma. Soviet textbooks provide a salutary reminder that, for virtually every Russian, all those events were mere sideshows, and the war on the Eastern Front was the “real” war.

In this instance, the intense Cold War antagonisms of the 1950s undoubtedly sharpened the normal tendency in any country to feature its own national contribution to any great international event, deepening the unquestionable resentment of many Russians over the deferment of the European second front, so that the United States and Britain were characterized as untrustworthy, even treacherous, imperialist-capitalists who deliberately sought to win the war at Soviet expense. Though it is difficult to quantify the influence of these particular textbooks and their official, state-sponsored version of the conflict Russians still term “the Great Patriotic War,” given that they were read by hundreds of thousands, even millions, of teenagers in high school, whose parents probably reinforced at least some of these textbooks’ messages with their own memories of the war, one suspects the impact of these writings was probably quite substantial.

Excerpts from Soviet Textbooks on the Battle of Stalingrad

THE CREATION OF THE ANTI-FASCIST COALITION

The [Soviet] victory outside Moscow [in late 1941] finally brought about the decisive formation of an anti-Fascist coalition. On 1 January, 1942, in Washington, twenty-six states, including the USSR, the USA and England, signed the United Nations Declaration. They pledged themselves to make use of their resources for the struggle against the aggressors, to cooperate in waging the war and not to conclude a separate peace. Later, on 26 May, representatives of the Soviet Union and England met in London and signed an agreement of alliance in the war against Hitler’s Germany and its accomplices in Europe. This agreement also provided for collaboration and mutual aid in the post-war world.

Simultaneously in Washington Soviet-American negotiations were set up, culminating in a written agreement on 11 June. Both sides pledged the mutual supply of defence materials and information, as well as the development of trade and economic collaboration.

The Governments of the USA and England, in entering into an anti-Fascist coalition, were pursuing their own imperialist aims. But the formation of the coalition was also a great success for Soviet foreign policy; it was the result of putting into practice the precepts of Lenin on how to take advantage of the deep conflict that exists between the imperialist states. The coalition came into being not only as a result of an agreement between the great powers, but its creation can also be

attributed to the tremendous anti-Fascist struggle waged by millions, with the Communists always to the fore. Of great significance was the pressure the mass of the people exerted on their Governments in England and the United States.

The mainspring and chief protagonist in the united anti-Fascist front of freedom-loving nations was the Soviet Union. The heaviest burden of the struggle against the Fascist hordes lay on the shoulders of the Soviet people and their armed forces.

The Difference in Aims between the Main Participants in the Coalition

Sharp differences of opinion existed between the members of the anti-Fascist coalition about the aims of the war, and about the programme of post-war reconstruction. The USSR was fighting for the defeat of Fascism, the liberation of the enslaved nations, the rebirth of democratic freedom and the creation of favourable conditions for the approaching peace.

The imperialists of the USA and England considered the main aim of the war to be the defeat of Germany and Japan in their capacity as chief rivals, and the consolidation of their domination of the world. At the same time reactionary circles in the USA and England were aiming to preserve Germany and Japan and to provide military power for a struggle against the USSR.

The Soviet Union strictly observed the obligations placed upon her by this alliance, but the USA and England flagrantly infringed the conditions. In the course of Anglo-Soviet and Soviet-American negotiations, agreement was reached about the opening of the Second Front in Europe. In 1942 the USA and England had at their disposition a large body of armed forces and enormous military and technical reserves for waging war in Europe, and, what is more, 70 per cent of the German army was concentrated on the Eastern Front. However, the Western Powers deliberately deceived their ally. They preferred to await the course of events, expecting the exhaustion of the warring parties.

The delay in opening the Second Front postponed the defeat of Fascism and condemned to death yet more millions. For three years the Soviet Union waged a heroic struggle, practically on her own, against the Hitlerite hordes, thus saving world civilization from Fascist barbarism. . . .

The battle outside Moscow had caused the transfer of enemy troops from North Africa. . . .

Because the main Fascist forces had been drawn on to the Soviet-German front, the English command, led by General Montgomery, could now build up their reserves and in October, 1942, begin an offensive. The enemy retreated from Egypt. . . .

The defeat of the Hitlerites, who had flung the main body of their forces into the battle of Stalingrad, now created favourable conditions for an attack by Anglo-American troops in North Africa. In hot pursuit of the Fascists, the Allies

occupied Cyrenaica and Tripolitania, followed by Tunis. In May, 1943, the Italian and German troops in North Africa surrendered utterly. . . .

In spite of repeated assurances by the Allies, the Second Front was not opened in 1943. The Governments of the United States and England were well aware of the needs of the Red Army and of the tremendous losses sustained by the USSR in the war. But in the spring of 1943 they suspended the convoys of military supplies to the northern ports of the USSR and did not start them up again until eight months later. Delays such as this occurred repeatedly. The conduct of the Allies seriously impaired the trust placed in them by the USSR.

STALINGRAD

The Fierce Defensive Battles in the Summer of 1943

Taking advantage of the absence of any Second Front in Europe, the Hitler command concentrated 237 divisions on the Soviet-German front in the summer of 1942, and by the autumn they had increased these to 266 divisions and were preparing a large-scale offensive. The enemy's aim was the destruction of the Soviet troops on the Western Don, and the capture of the extremely rich agricultural areas of the Don and the Kuban and the oil-fields of the Caucasus.

Following the capture of Stalingrad, they planned to cut our lines of communication along the Volga. The Hitlerites thought that a victory in this vital area would allow them to win a decisive campaign and bring the war to an end in 1942.

At the end of June the enemy, gathering its forces in a south-easterly direction undertook a great offensive with forces outnumbering the Soviet troops two to one. . . . The Red Army was faced with the task of halting the enemy, come what may. 'Not one step backwards'—thus ran the command of the Fatherland. The commanding officers and political workers explained to the troops that to retreat further would be to court disaster, and that to withstand the enemy onslaught was to guarantee victory.

The Heroic Defense of Stalingrad

From the middle of July fierce battles against the superior forces of the enemy took place on the distant approaches to Stalingrad. This was the beginning of the mighty battle for Stalingrad. The Soviet troops just managed to hold off a furious attack by the enemy on the west bank of the Don. More than 150,000 inhabitants of Stalingrad, led by the regional party committee, built defensive lines. Workers increased the production of arms to fulfil the needs of the front. Every day forty tanks were sent straight from the factory conveyor belt to the front. Tens of thousands joined the People's Volunteer Corps and fighting battalions. In August the German-Fascist troops, who had the numerical advantage, forced a crossing over the River Don. At the cost of huge losses they succeeded in breaking through our front on 23 August and advancing

towards the Volga. The enemy subjected the town to severe bombardment from the air. 'We have turned the town into a burning hell', boasted the Fascist airmen. German tanks broke through to the area around the tractor factory. But their attack was beaten off by the workers in the factory.

The Hitlerites continued to bring in fresh detachments and concentrated in this area more than a million soldiers, a fifth of all their infantry, and about a third of their tank divisions. Besides this, one Italian army and two Rumanian armies fought by their side. But all the time the enemy offensive was losing impetus. Only at the price of tremendously severe losses did the Hitlerites succeed on 13 September in getting really close to Stalingrad.

From that day on fierce fighting took place in the town itself, the defence of which was entrusted to the 62nd Army under the command of General Chuikov and the 64th Army commanded by General Shumilov.

The enemy tried to break our defences, isolate the defenders and annihilate them in groups. But all their attempts failed. . . .

The Red Army's Triumphant Completion of the Battle of Stalingrad

From the end of 1942 the Great Patriotic War entered upon a new phase. The Red Army definitely passed to the attack, now that they had begun the massive expulsion of the German-Fascist invaders from our soil. . . .

One foggy morning, 19 November, 1942, a great force of Soviet artillery rumbled along the banks of the Don and the Volga, hundreds of planes bearing the Red Star soared into the air. A heavy artillery bombardment lasting eighty minutes preceded the attack, then the troops of the South-Western and Don fronts, commanded by General Vatutin and General Rokossovsky, moved to the offensive.

Shock units of tanks battered the enemy defences. Caught unawares, the enemy troops wavered and began to fall back. The following day, 20 November, the troops of the Stalingrad front, under the command of General Yerenenko, joined the attack and broke through the enemy defences. Mechanized divisions drove through the breach that had been made in the enemy lines. As a result of this speedy attack the troops of the Stalingrad front joined up with those of the South-Western front on 22 November in the area around the town of Kalach. Thus they surrounded twenty-two German Fascist divisions, numbering 330,000 men, together with a large quantity of military equipment. . . .

On 8 January the Soviet command delivered an ultimatum calling for the capitulation of the surrounded German Fascist troops. But Hitler ordered them to continue their resistance, and the ultimatum was declined. Then the Soviet troops began military operations to exterminate this company of enemy soldiers, and on 2 February, 1943, it ceased to exist.

The bodies of 147,200 Fascist officers and men who had been killed in the fight were picked up from the battlefield and buried. The Soviet troops took prisoner 91,000, including 2,500 officers and twenty-four generals, together with General-Fieldmarshal Paulus.

The International Significance of the Victory at Stalingrad

The battle at Stalingrad was the greatest military and political event of the Second World War. This victory turned out to be the beginning of a fundamental change in the course of the war to the advantage of the USSR and the whole of the anti-Fascist coalition. From the banks of the Volga the Red Army began its advance which culminated in the unconditional surrender of Hitler's Germany.

The scale of the German defeat at Stalingrad, unprecedented in the history of war, made the ruling circles of Japan regard matters in a more sober light and staved off Japan's entry into the war against the USSR. It also upset the calculations of Turkey's rulers, who although formally neutral, were in fact assisting Germany and were waiting for the fall of Stalingrad to enter the war on the side of Germany.

3.3. The Left in Europe: Frank Thompson and Bulgaria

Annotations

About the Author

Frank Thompson came from a liberal intellectual Oxford family with a cosmopolitan background. His anti-imperialist father, an academic and writer, became a strong supporter of Indian nationalism while teaching there; his American mother was born in the Near East to missionary parents. Many slightly older contemporaries of the young Frank fought and some died in the Spanish Civil War, a conflict with which he personally identified emotionally. Frank himself, a gifted linguist who spoke nine European languages, won a scholarship to the elite Winchester College, and in 1938, he entered New College, Oxford. In 1939, Thompson joined the Communist Party at Oxford, but in September that year, he ignored the party's Soviet-ordained antiwar stance and joined the British Army immediately on the outbreak of war. Thompson's linguistic skills soon marked him as a natural recruit for the elite GHQ Liaison Regiment (Phantom), a military unit specializing in communications and intelligence that provided liaison officers to work with the enormously varied and diverse national units included among the forces fighting the Axis. He fought for three years in the Middle East, in the Western Desert, Egypt, Iran, Iraq, Jordan, Syria, the Lebanon, Palestine, and Sicily, and in autumn 1943 transferred to Special Operations Executive (SOE) to work with European partisan resistance movements, many of which were Communist or left-wing. By that time, Thompson had won promotion to the rank of captain; he became a major during his Bulgarian mission, after the death of his superior officer.

Thompson, who retained his left-wing sympathies throughout the war, had hoped to be attached to a Greek partisan group but instead was assigned to a Bulgarian guerrilla unit, the 2nd Sofia Brigade, parachuting to join it in Bulgarian-occupied Serbia in January 1944. At the time, Bulgaria was still controlled by a right-wing government allied to Nazi Germany, and captured partisans were often subjected to brutal torture and execution. For the next four months, Thompson and his associates were constantly on the run, closely pursued by Bulgarian government troops, who surrounded them and other partisan units in April. In mid-May 1944, what remained of the 2nd Sofia Brigade, desperately short of food and supplies, broke out and crossed into Bulgarian territory, and on 31 May 1944, its surviving members were captured. Some were executed immediately, others taken prisoner and held in the village of Litakovo, where they were brutally interrogated, and some—possibly including Thompson—were tor-

tured. On 10 June 1944, most of those still alive, Thompson among them, were shot, killed, and buried in a mass grave. In September 1944, a bloody insurrection in Bulgaria overthrew the existing government, which was replaced by a largely Communist people's regime. Thompson posthumously became a National Hero of the new regime, though over the next 50 or more years, his precise status varied according to the dictates of the government then in power.

About the Documents

Shortly after the war ended, Thompson's family published selections from his wartime diaries, letters, and poems, together with reminiscences of him, in the time-honored format of a memorial volume to a brilliant young man whose career was cut short in war. Numerous such publications had appeared during and just after World War I, when so many promising young men died in the trenches, and grieving families sought some way to memorialize them. If only because the preparation of such works usually required a certain amount of time and money, their subjects were predominantly middle or upper class, a bias intensified because those from such backgrounds were more likely to be well educated and articulate and to leave an extensive cache of written materials behind them. The work on Thompson, prepared by his mother and younger brother, clearly conformed to this by now conventional pattern.

Thompson, a highly articulate young man, wrote frequently to his family and friends during the war and also kept extensive diaries, all of which were returned to his family after his death, together with their letters to him. The letters were originally written not for publication but to convey his wartime experiences and his feelings about them to his correspondents, most of whom he knew shared his own consciously liberal-radical outlook. Although, as is usual in such circumstances, especially when letters are published very close to their time of writing, some material is excluded from the published letters, these omissions appear to be purely personal information rather than anything substantive. Like many on the Left, Thompson hoped that the war would bring a fairer, more just, and more democratic social order to both the victorious and vanquished countries. He expressed great sympathy for the wartime sufferings of the Russian and Eastern European peoples and praised the role of Communists, including Soviet Russia, in defeating Nazi Germany. This was, he felt, the same cause for which several of his friends—Ralph Fox, Geoffrey Garratt, and Anthony Carritt—had fought and all but Garratt had died in the Spanish Civil War. Thompson was also enthusiastic about the prospect of greater postwar European unity, an ideal his own linguistic facility made particularly attractive to him but that many others among his contemporaries shared. His were almost conventional views for the idealistic young Western Left of the

time. His letters and diaries also gave a vivid picture of the multinational Allied forces in the Middle East, conveying the atmosphere of that war with considerable literary skill.

The manner of his death meant that Thompson's memorial volume would be more controversial than most, and ascertaining the precise circumstances in which he died would become an exercise in the politics of the developing Cold War. Thompson's younger brother, Edward, would become one of the foremost radical British historians of his generation, another factor that helped to make Thompson's memory debatable. His mother and brother printed Raina Sharova's account of Thompson's death in good faith, but in reality, it was apparently largely an exercise in fiction: there was no such formal set-piece trial and so no opportunity for Thompson to give the bravura performance reported here. The most credible account is that soldiers of the Bulgarian army commanded by a Captain Stoianov told Thompson, together with around twelve partisans, that they were being moved to another village, marched them to a ditch, and then shot them. Why, then, this highly colored account? The Communist government that seized power in Bulgaria in September 1944 made Thompson an official National Hero, naming a railway station and schools in his honor, erecting memorials, and welcoming his surviving relatives to Bulgaria immediately after the war. National Heroes are expected to behave heroically, to make stirring speeches, and to meet their death with defiance; a squalid unannounced death in a ditch does not suffice. The Bulgarian government therefore ensured that the official version of Thompson's death accorded with the approved scenario of heroic behavior.

Thompson's brother, a dissident Marxist who himself left the British Communist Party in 1956, disgusted by the party's reaction to the "secret speech" of Soviet leader Nikita S. Khrushchev condemning the excesses of his predecessor Josef Stalin, later traced the vagaries of his brother's Bulgarian reputation. In internal power struggles within the Bulgarian Communist Party in 1948, Moscow-trained Communists triumphed over "homegrown" leaders. The Western agents who had been wartime associates of the latter were now depicted as imperialist spies sent to undermine the Communist position, though, because the British Communist Party had claimed Frank Thompson as a member, when not ignored entirely, he was normally depicted as a dupe of his imperialist colleagues, one who had been used and then abandoned by them. From the late 1950s, as Soviet president Nikita Khrushchev relaxed Soviet control over Bulgaria and former partisans emerged from prison to rehabilitation and regained power, Thompson's stock rose, he once more became a National Hero, and in the late 1970s, books and even a film on his life appeared. Rumors abounded, however, that though Thompson himself was trustworthy, anti-Communist SOE operatives in Cairo had passed on the contents of his

wartime radio messages to Bulgarian government forces, thereby absolving the partisans of any blame for his mission's disastrous end. All Bulgarian documents on the subject, however, remained firmly closed to research.

From the British side, there were still more twists to the tale. Here, too, many though not all of the official SOE, War Office, and Foreign Office files were still closed to general research, though some official historians and individuals with SOE connections were able to use them. Thompson's death became one of those episodes that generates its own crop of rumors. Some former British SOE figures alleged that he had disregarded radio instructions from headquarters in Cairo to avoid crossing the Bulgarian frontier with the partisan forces and even forced his radio operator to accompany him at gunpoint. The two men, this story alleged, were then robbed by their Bulgarian associates, who were more bandits than partisans, betrayed to the Bulgarian military, and abandoned to their fate. The sergeant, who survived his capture, later indignantly repudiated this tale to E. P. Thompson. The latter also carefully investigated all the records available to him and found that assorted communications failures and delays due to incompetence meant that Thompson had effectively been left to make his own decisions in extremely hazardous situations and received little support of any kind from his base; in other words, this SOE mission was poorly conceived, administered, and backed up, though perhaps no more so than comparable efforts, some of which still, against the odds, succeeded.

The most bitter surmise regarding British policy toward Frank Thompson, however, sprang from the fact that, as British relations with the Soviet Union deteriorated in early 1944 and the shadow of the coming Cold War became apparent, British premier Winston Churchill ordered that SOE be cleansed of operatives with Communist sympathies. According to E. P. Thompson, his brother's membership in the British Communist Party was primarily a response to the rise of fascism in Europe, his party association and loyalty remained loose if not nonexistent, and Frank did not belong to any communist cell or group within the army; indeed, Edward Thompson was certain his brother would have repudiated the party no later, at most, than he himself did. Even so, he made no secret of his broad leftist orientation, and British authorities almost certainly knew of and disliked his past affiliations. According to the accepted version, Captain Stoianov, who ordered Thompson's execution and that of his comrades, exceeded his orders in doing so, crimes for which, together with six of his men from the firing party, he was summarily tried and himself executed in September 1944. E. P. Thompson nonetheless speculated that, at this stage in the war, when their own position was precarious, Bulgarian government officials would not have shot a British officer out

of hand and risked alienating his country. He suspected, therefore, that prior consultations with some British representative occurred, in which the Bulgarian government learned that his superiors considered Thompson expendable.

If this were indeed so, any British records relating to the subject would almost certainly have been destroyed, if indeed anything were ever put on paper in the first place. Though the Bulgarian government then in power conceivably might have protected itself by keeping some written record of any such conversations, it might equally well have found it more convenient to place all the blame on Captain Stoianov. Even though the Bulgarian records are closed, one suspects that, if any proof of such an understanding had still been extant on the Bulgarian side, the Communist regime would long since have made this evidence of dual betrayal public. Most of those involved are now dead, some many decades ago. It will never be possible either to prove or disprove E. P. Thompson's theory, but a brutal question mark will always hang over the reason for Frank Thompson's death.

Aren't the Slavs a splendid lot? The Poles have suffered more than any nation in Europe. The Czechs, especially their students, have done far more than we had any right to expect. I try to imagine myself standing in Broad Street [Oxford] while the officials of the National Union of Students are shot in cold blood. That's what happened in Prague. Serb rebels are currently reported to be in virtual control of a quarter of Serbia. Perhaps it's not just coincidence that Serb resistance has been much stronger since Russia came in. There's a strong Communist movement in Yugoslavia. Even the old peasant Bulgars will turn in the end—just you see. Nor is it the first time the Slavs have thrown their bodies between Europe and destruction. They bore the brunt of the Turks and the Tartars too. 'To suffer like a Slav' will soon become a byword in all the world's languages.

B) Frank Thompson, Diary Entry, 5 August 1942

There is something epic about this 'Middle East' if only one could get a frame for it. We have an assortment of nationalities that would make Caesar's legions look like a team from the Home Counties. The Russians, driving north through

Hamadan, close-cropped, berry-brown, in dark blue breeches with knee-boots, grinning fit to bust and giving the V-sign to every one they pass; the diminutive Iraqis in khaki breeches and puttees mounting guard among the white holyhocks on the Persian frontier; the Arab legion and the French *meharistes*, slender and almost girlish in their red-and-white kefiyehs and long brown cassocks, camps like old Tamurlane on the green steppe-land, swaying round the fire in dances that might have come from *Sanders of the River*; Indians everywhere, the neatest, cleanest and most dignified soldiers in our army—fat, bearded Sikhs, P.M.s with their pointed puggarrees, and Gurkhas (are those Gurkhas with their almost Malayan features?) travelling impassively on the backs of trucks; coons everywhere, squatting round brushfires, driving down main roads like a wind out of hell, grinning in road-gangs, but never, that I could see, working (on the Phoenician sea coast a camp with a large crocodile mosaicked out in white pebbles with the word BASUTOLAND); elegant Greek and Yugoslav officers preening themselves on the streets of Alex[andria]; Fighting French, Poles, Canucks, Yanks in jeeps, huge South Africans almost childlike in their docility, New Zealanders, rough-hewn and intelligent, Aussies, rough-hewn and undoubtedly villainous. And Englishmen? Yes, there are quite a few Englishmen—nearly always to be recognized by their utter civilianity, the complete lack of martial fire or any other eccentricity with which they stroll down streets and stare wistfully into shop windows. And glimpses, not always without humour, of the Wops and Dutchies. This war is demonstrating, beyond any hope of refutation, the Unity of Man. No one, at least, who's been in the Middle East will want to deny it.

C) Frank Thompson, Diary Entry, 25 February 1943

How wonderful it would be to call Europe one's fatherland, and think of Krakov, Munich, Rome, Arles, Madrid as one's own cities! I am not yet educated to a broader nationalism, but for a United States of Europe I could feel a patriotism far transcending my love for England. Differences between European peoples, though great, are not fundamental. What differences there are serve only to make people mutually more attractive. Not only is this Union the only alternative to disaster. It is immeasurably more agreeable than any way of life we have known to date.

D) Frank Thompson, Excerpt from a Letter to His Family, 26 July 1943

Every one just now is exulting about [the fall of] Mussolini. My chief regret is that Geoffrey Garratt is not here to enjoy and record this last chapter of his story. It's more than ever necessary now, with this wave of self-righteousness spreading over British propaganda, with the First and Eighth armies wearing Crusader's shields, with the Church doing its level best to corner the moral credit for the war on Fascism, to remember those men who, in the sierras and on the banks of the Ebro, bore the heat of the day alone; who fought against hopeless odds, while many of our leading churchmen were expressing delight that the trains ran on time in fascist Italy. This is their victory—Cornford's victory, Ralph Fox's victory, the victory of the Carritts and the Garratts, of the Asturian miners and Barcelona working men. Those of us who came after were merely adopting an idea that they proved—that freedom and Fascism can't live in the same world, and that the free man, once he realises this, will always win.

E) Frank Thompson, Excerpt from a Letter to His Brother, Edward Palmer Thompson, 25 December 1943

My Christmas Message to you is one of Greater Hope than I have ever had in my life before. There is a spirit abroad in Europe which is finer and braver than anything that tired continent has known for centuries, and which cannot be withstood. You can, if you like, think of it in terms of politics, but it is broader and more generous than any dogma. It is the confident will of whole peoples who have known the utmost humiliation and suffering and have triumphed over it, to build their own life once and for all. . . . And for every one that is killed or mutilated by the Gestapo, the Ustasha, the Brigades Speciales of Vichy, and all the other despicable quislings, two more are made by that example. There is a marvellous opportunity before us—and all that is required from Britain, America and the U.S.S.R. is imagination, help and sympathy. This may look like an over-simplification, but it isn't. Four years of Nazi occupation have made the main issues in Europe very clear. . . . 1944 is going to be a good year though a terrible one.

F) Frank Thompson, Excerpt from a Letter to Iris Murdoch, 26 December 1943

I have had the honour to meet and talk to some of the best people in the world. People whom, when the truth is known, Europe will recognise as among the finest and toughest she has ever borne. Meeting them has made me utterly disgusted with some aspects of my present life, reminding me that all my waking hours should be dedicated to one purpose only. This sounds like all New Year resolutions, but in this case I think I shall soon have a change in my way of living which will give me a real chance. Nothing else matters. We must crush the Nazis and build our whole life anew. 'If we should meet again, why then, we'll smile.' If not, why then those that follow us will be able to smile far more happily and honestly in the world we have all helped to make. And, believe me, no men are more disarming in their gaiety than these men our allies, who have known more suffering than we can easily imagine.

G) Account by Raina Sharova of Frank Thompson's Death, 7 June 1944

Major Frank Thompson . . . was executed about June 10 after a mock trial at Litakovo. . . . He had been in captivity about ten days. With him perished four other officers—one American, a Serb and two Bulgarians—and eight other prisoners. Fifty-seven of Thompson's other companions had already been executed. . . .

When the partisans were taken to Litakovo it appears that the plan was to have them lynched so that, if enquiry were made, their deaths could be represented as due to a spontaneous outburst of popular indignation. This attempt failed; the people were on their side.

A public 'trial' was hastily staged in the village hall. A Bulgarian officer, whom the eye-witness calls 'the captain,' was in charge. The hall was packed with spectators.

The eye-witness saw Frank Thompson sitting against a pillar smoking his pipe. When he was called for questioning, to everyone's astonishment he needed no interpreter, but spoke in correct and idiomatic Bulgarian. He was asked his name, rank, race and political opinions.

'By what right do you, an Englishman, enter our country and wage war against us?' he was asked.

Major Thompson answered, 'I came because this war is something very much deeper than a struggle of nation against nation. The greatest thing in the world now is the struggle of Anti-Fascism against Fascism.'

'Do you not know that we shoot men who hold your opinions?'

'I am ready to die for freedom. And I am proud to die with Bulgarian patriots as companions.'

The crowd was deeply stirred, and an old woman broke from it. . . .

'I am an old woman, and it does not matter what happens to me. But you are all wrong. We are not on your side; we are on the side of these brave men.'

The captain struck her to the ground. He saw that the crowd were against him and the trial was hustled to a finish; it was all over in less than half an hour.

Major Thompson took charge of the condemned men and led them to the castle. As they marched off before the assembled people, he raised a clenched fist, the salute of the Fatherland Front which the Allies were helping. A gendarme struck his arm down, but Thompson called out to the people, 'I give you the Salute of Freedom!'

All the men died raising this salute.

The spectators were sobbing, many present declared the scene was one of the most moving in all Bulgarian history, that the men's amazing courage was the work of the English Officer who also carried their spirits, as well as his own.

3.4. D-Day: American and German Perspectives

D-Day, 6 June 1944

On 6 June 1944, 2,727 ships, part of an armada of more than 5,000, landed a combined U.S., British, and Canadian invasion force, 5 infantry divisions of 156,000 men, on 5 Normandy beaches over a 30-mile front, the greatest and best equipped such operation ever undertaken in history. Three airborne divisions totaling 23,000 troops, two-thirds of them American, also parachuted in the night before, taking heavy casualties of more than one-third. In the following two days, another 156,000 troops landed, and within a month a total of more than 1 million Allied men had come ashore. Ten thousand Allied aircraft provided air cover, and immediately before the invasion began, had bombarded all German communications in the surrounding area, destroying almost every bridge across the Seine. This was the opening of Operation OVERLORD, the long-awaited Allied Second Front against Germany, the full-scale invasion of Western Europe, aimed at the center of German power, which Soviet leader Josef Stalin had demanded ever since Pearl Harbor. Conscious that failure would be disastrous, U.S. leaders had waited until they had assembled an invasion force sufficiently large and well-equipped to maximize their chances of victory.

By this time Soviet forces were advancing into Eastern Europe, and Stalin coordinated a major Soviet military offensive with D-Day, to give the Allied invasion the greatest chances of success. Germany now faced attack by huge armies from both the west and the east, who would eventually meet at the Elbe River in Germany itself in late April 1945. Field Marshal Erwin Rommel, the charismatic commander of the 50 German divisions facing the Allied invasion, begged German Führer Adolf Hitler for as much additional support as possible, especially German panzer reserves. The only German chance of resisting defeat, he believed, was to repel the Allied invasion force on the beaches themselves, since once they broke through the highly mechanized North American and British units, who faced far less well equipped and therefore less mobile German troops, they would be able to range throughout France. Hitler did order the reinforcement of Normandy's defenses in late April 1944, believing that the Allies would land airborne forces there as part of a broader invasion concentrated on the Pas de Calais, but the new fortifications, mines, and other defensive preparations were patchy and incomplete.

Despite continuing German reverses on the Eastern Front, Hitler himself welcomed the Allied invasion, which would finally give German troops the opportunity to meet the main bulk of the Anglo-American armies. Allied disinformation,

moreover, had convinced Hitler, and, initially, Rommel too, that that the Normandy invasion was only a feint, with the main thrust to come elsewhere, and additional German units and equipment were slow in arriving, in part due to Allied air supremacy. German airplane production could not match that of the United States and the Soviet Union, and gasoline shortages caused cutbacks in pilot training time, so that German fliers were increasingly inexperienced and accident-prone, and their craft were no longer of the highest quality. The Luftwaffe (German air force) had virtually no planes in reserve in France, and though 10 wings were supposedly transferred from Germany to meet the invasion, in practice, few arrived, and between 50 and 150 German aircraft faced 10,000 Allied counterparts. Even so, despite the absence of air support and tanks, German troops put up fierce resistance, inflicting 2,500 casualties on the American forces that landed at Omaha Beach on D-Day itself. During the Normandy Campaign, the casualty rate among Allied troops was 50 percent higher than that they inflicted on German soldiers, who fought highly efficiently in desperate circumstances. Indeed, according to the military historian Martin L. Van Creveld, despite their inferiority in matériel and supplies, German troops consistently outfought their American counterparts, something he ascribes to superior German training; the Wehrmacht's cultivation of teamwork, leadership abilities, and camaraderie from the lowest level upward; and the proliferation of administrative paperwork and bureaucracy that bedeviled the U.S. armed forces (Van Creveld 1982). Over the first three days, the invasion force took 10,300 casualties, and not until the end of July did the Allies break out of their Normandy bridgehead into France proper.

About the Author

Forrest Pogue was one of the great combat historians and military biographers of the twentieth century. Born in Murray, Kentucky, as a young graduate student, he studied in both Paris and Germany in the late 1930s. Returning to pursue an academic career, after Pearl Harbor, he was called up for military service and selected as one of the U.S. Army's combat historians. During World War II, the War Department decided to establish a special unit of professional historians, some of whom would accompany the American forces during the operations, and Pogue was among them. He went with American units as they fought their way through France and into Germany, an assignment during which he became well-known for taking risks in the pursuit of historical truth. After the war, Pogue wrote the official history of the U.S. Supreme Command during World War II. He was later selected as the official biographer of General George C. Marshall, chief of staff of the U.S. Army throughout the war and subsequently both secretary of state and secretary of defense, on whom

Pogue produced a massive four-volume work. Pogue pioneered the use and techniques of oral history, conducting extensive interviews with personnel in the armed forces, and later with Marshall himself and many of his associates. He also became famed for the generous encouragement he gave to younger scholars just beginning their careers.

About the Documents

The two documents given here are different in type. Pogue kept a diary of his adventures as a combat historian, which was published after his death. Besides the actual diary, the published version included a retrospective account of his own experience on D-Day and the day after, together with a summary of the picture he was able to put together from interviews with many of the combat personnel involved within a few days of the invasion. From the other side, Robert Vogt was a 19-year-old German infantryman who took part in 10 days of fighting, from the actual invasion until 16 June 1944, when he was wounded and captured. His reminiscences, published more than 40 years after D-Day as part of a book of oral history reminiscences on the Third Reich at the time, give one rather young soldier's individual view of his small part of a vast operation.

Pogue was a trained historian in his early thirties when he took part in the D-Day landings. His chance to accompany the D-Day landings was undoubtedly one of the most exciting episodes in his entire professional career. He was, moreover, not without courage. Finishing his studies in Germany in the late 1930s, he risked attracting unwelcome attention from German customs officials and secret police and brought out with him a suitcase full of both Nazi and anti-Nazi propaganda he had collected during his months there. His own observations on D-Day are those of a trained and rather skeptical observer, who saw no need to exaggerate the role that he and his fellow "parasites," the combat historians, played in that event. Particularly illuminating is his comment how badly Omaha Beach was obscured by smoke, making it unlikely that the media correspondents who sent back such vivid eyewitness reports of what they had watched that day from 10 miles offshore were giving their readers and listeners quite the unvarnished truth!

Pogue's description of the overall landings, drawn from a lengthy series of interviews extending over six weeks with officers and men who took part in the landings, beginning on 7 June, when various wounded men came aboard his ship, was a synthesis of the information given him by many different individuals, each of whom had seen only his small part of an operation involving hundreds of thousands of men on each side. Pogue was primarily interested in providing an accurate overview of the Normandy invasion and did not attempt to minimize any blunders that had occurred, such as the dispersion of units, losses of equipment, "land[ings] on

the wrong beaches," or confusion once the troops were ashore. He cited a long list of difficulties encountered on Omaha Beach in particular, some at least probably avoidable. Pogue's objective was to put together a picture of what actually happened during the Normandy invasion, not to glorify American feats of arms and ignore any mistakes.

Robert Vogt was only 19 on D-Day, a private in the German infantry facing his first big operation. Infantry privates, such as Vogt, were the basic fighting men who had to carry out the orders given by those above them and do the bulk of the fighting. Even though far more soldiers serve in the lower ranks, they tend to leave fewer individual and personal records behind them than do their seniors. Though each separate soldier's experience of war differs from every other one, that of any one private is probably the most typical overall. In every war, the infantry do most of the usually rather unglamorous ground fighting, often facing the heaviest casualties and the greatest danger. By 1944, many of the more battle-hardened German soldiers had died on the Eastern Front, and new recruits, of whom Vogt "was one of the oldest," were increasingly young and obviously inexperienced. Even 40 years on, his recollections were still vivid, perhaps understandably given that the 10 days he was recounting were his only real experience of combat.

Vogt gives a vivid picture both of his part in the actual fighting and of the state of the German army at this stage of the war. He also graphically describes the chaos and confusion that characterize almost every war, especially when an army is on the receiving end of an offensive attack. His experiences during his 10 days of fighting probably resembled those of many other German troops, fighting in foxholes and rather hopelessly trying to oppose the oncoming invaders. He frankly confessed that he "was scared stiff the entire time," feelings undoubtedly common among soldiers in combat, which many, however, might not wish to admit. He remembered only too well and, even 40 years later, obviously intensely resented the shortages of ammunition and weapons, as well as the absence of air cover—something on which Pogue also commented—that plagued the German army by this time. It is doubtful whether, at this stage, Hitler had yet written off Normandy, but American propaganda that he had done so clearly sank in, depressing the spirits of Vogt and his fellow soldiers. Vogt vividly recalled the contrast between the German forces' scanty equipment and the abundant weaponry at the disposal of their opponents, whether in shipping, airpower, tanks, or weaponry, and how this material superiority meant "[t]he Allies could afford to spare their troops." Morale apparently sometimes flagged, as his anecdote of a German officer forcing soldiers to advance at gunpoint illustrates. Vogt's unit was perhaps particularly badly supplied; it is worth remembering that Allied forces took six weeks to break out of Normandy itself. Vogt's reminiscences

are the kind of raw material from which Pogue eventually put together his own composite account. Inasmuch as they are the recollections of one particular individual, they have a personal immediacy not present in Pogue's synthesis, which does, however, provide an excellent broad overview of the early stages of the Normandy Campaign from the Allied perspective.

Primary Source

A) Forrest C. Pogue on the D-Day Landings

[Forrest C. Pogue, then a young official combat historian in the United States army, was present at the D-Day landings. His group of five combat historians was attached to part of the 175th Infantry, who were supposed to land on the afternoon of 6 June 1944, D-Day itself. Congestion on the invasion beaches meant the 175th did not land until 7 June 1944, while the historical personnel remained on board ship until the following day. Pogue described what he was able to observe of the day's fighting on 7 June.]

Naval craft off the beaches fired sporadically. Everyone seemed pleased that the French ships were joining in the attack on shore positions. Destroyers lay near the shore and fired on shore positions several miles in. The Germans replied occasionally to the fire, but without effect, and as for German air, we saw only one enemy plane, a reconnaissance aircraft, during the day. British and American planes were over in force all day. In one fifteen-minute period we counted five flights of eighteen Marauders each.

After three o'clock the skies cleared except for a few clouds over the fighting area and it turned hot, to our great discomfort. We wanted to go ashore, but orders came out that only people with rifles, who were prepared to use them, were to go in. So we parasites, armed for the most part with pistols, stayed aboard as spectators of the second act. Standing on jeeps and trucks, we watched developments off Omaha Beach as if we were at a fair. Actually, we could make out very little on the shore. Signs of movement were obscured by smoke from the firing, fires that had been started by shells, and by the demolition of mines. I did not see how it was possible for troops to have recognized any landmarks, nor have I been able to understand how correspondents, who watched the D-Day attack from ten miles out, ever got such vivid pictures of the shore. . .

My own picture of D-Day was gleaned from dozens of interviews with officers and men who went in during the morning of 6 June. Some I talked to shortly after they were wounded, others I interviewed as they rested near the front lines, and some gave their stories weeks later. A short outline of that morning is given below.

The ships that took the assault elements to Normandy had been loaded, much like ours, in many coves and inlets in Wales, southern England, and the eastern counties. On the

evening of 5 June they had proceeded from the rendezvous area near the Isle of Wight southward toward France. Shortly after midnight, minesweepers of the Allied fleet began to clear channels through the minefields for the ships. British and American airborne units took off from English fields and flew overhead to drop over their objectives—the British east of the Orne and the Americans in the Cotentin Peninsula. The British reached their bridgehead early and secured it, while the American forces, scattered to a considerable degree, had a tough job of assembling for concerted action.

Toward daylight the planes and ships took up their task of softening up the enemy, the chief change in plan being that . . . the air force struck a few miles inland instead of at the beaches. On the western limit of Omaha Beach, the Rangers scrambled ashore to find that the six guns they were to knock out were pulled back out of their way.

By daylight, ship channels had been cleared to the beaches and the small landing craft had been filled with men from the LSTs and larger transports and were on their way in from rendezvous points some ten miles out. The floating tanks were started in, as were guns in small craft. Only five out of thirty-two DDs survived of those that tried to float in under their own power, while most of those in the other tank battalion, sent in at the last minute by boat, got in safely. In one field artillery battalion all but one gun was lost when the craft carrying them capsized.

The accounts of the early landings tend to follow the same pattern. Heavy seas threatened to swamp the smaller craft and made many of the soldiers seasick. Enemy fire struck numerous craft or forced navy crews to unload in deep water. Poor visibility, obstacles, and inexperience led other navy crews to land on the wrong beaches. Many of the soldiers in the first waves had to wade ashore carrying heavy equipment, which they often disposed of in deep water. At the extreme ends of the beaches, the cliffs interfered to some extent with the enemy fire and gave our troops some protection. In front of Vierville, the men hid behind the seawall that ran along the beach, and near Saint-Laurent-sur-Mer they found mounds of shingles to use as cover. Accounts of the first hours on the beaches speak of efforts of officers and non-coms [non-commissioned officers] to organize their units and get them off the beaches, but often those who tried to direct the attack fell as soon as they exposed themselves to the enemy. In some cases, platoons stuck together, but in others sections landed some distance apart—and there were instances where dispersed elements attached themselves to entirely different regiments and divisions and did not return to their parent organization for two or three days.

The first real effort to give direction to the attack came after the regimental commanders landed. The command group of the 116th Regimental Combat Team, which included Brigadier General Norman D. Cota, the assistant division

commander, and Colonel C. D. W. Canham, the regimental commander, came in at about 7.30 a.m. The S-4 of the regiment was killed near the water's edge and other members of the command group were hit. Colonel Canham was wounded as he tried to organize the attack, but after receiving first aid he returned to his task. One of the most active commanders was General Cota, who, according to the accounts of the soldiers, was apparently everywhere that morning. Some spoke of his handling the bangalore torpedo that breached the wire at one of the exits, and others had him handling a Browning automatic rifle. His activities in the first weeks ashore made him almost a legendary figure. Noncoms were also called on to give leadership, as heavy casualties were inflicted on the junior officers. In one case, a private who had worked until a short time before in the regimental Post Exchange rallied the men of his unit by calling them by name and persuading them to follow him over the seawall.

On the 16th Infantry's beaches, Colonel George Taylor, the RCT commander, gained lasting fame by saying to his officers and men: "The only people on the beach are the dead and those who are going to die—now let's get the hell out of here." In a short time he had the men in his sector moving. He and Colonel Canham were promoted to the rank of brigadier general for their work on D-Day.

The manner of the advance up the bluffs differed somewhat among the various units. Some stayed behind the seawall until units in the second and third waves came in through them and went up the cliffs. Others, after being reorganized, pressed forward and by noon were on top of the bluffs.

By midnight on 6 June all of the regiments in the 1st Division (the 16th, the 18th, and 26th) and two from the 29th (the 116th and 115th) had been landed on Omaha Beach. The 2d and 5th Ranger Battalions were in position to their right. Heavy seas, landings on the wrong beaches, intense fire from well-trenched positions, the foundering of DD tanks and artillery pieces, abnormally high casualties among officers, failure to open all the beach exits, beach congestion, the slowness of some of the assault waves to move forward from the seawall, the difficulty of using the full force of naval gunfire because of the fear of inflicting losses on the infantrymen, the lack of sufficient gaps in underwater obstacles and beach obstacles, and the failure, for various reasons, of air bombardment to take out beach fortifications all placed V Corps a considerable distance from its D-Day objectives, and, as a result of the presence of the German 352d Division in the area, in danger of a counterattack before the time estimated. In the face of this situation, the regiments were reorganized, defenses were set up for the night, and preparations made for a vigorous offensive to attain the D-Day objectives as quickly as possible.

B) German Infantryman Robert Vogt Describes the D-Day Landings and the Normandy Campaign

Before June 6, 1944, the day of the D-Day landings, we were directly on the coast near Arromanches, planting "Rommel Asparagus." We did all of this at low tide when the sea retreated for several miles. We put in a wooden beam and then, at a distance of, I'd say, five yards, another beam. On top of these, we attached a third beam with clamps—all of it done by hand—and secured more clamps. We attached land mines to the tips of the beams, all such that at high tide, the mines were so close to the water surface that even a flat-bottomed boat would touch them and be destroyed.

All this construction went on under great pressure, because there were virtually no bunkers at our location, only dugouts. This was the time when Field Marshal Rommel said the famous words, "You must stop them here on the first day. If you don't stop them here, it's over."

We worked in shifts around the clock. I caught some shut-eye that night. We had built two- and three-story bunk beds in a farmhouse about 500 yards from the beach. It must have been around 2:30 A.M. when I jumped out of bed at the sound of a huge crash. At first I had absolutely no idea what was going on. Of course we had been expecting something, but we didn't have a clue as to where and when. We didn't know that this was the invasion. In the distance, we heard bomb carpets falling all along the coast and in the rear areas. There were intermittent pauses which lasted anywhere from half an hour to an hour, but the area we were in was a terrible mess.

All at once we were under alarm condition three, the highest level. By then we guessed it must be the invasion, but since it was still dark outside and we couldn't see any ships or anything, we still weren't sure.

In the morning, my platoon leader told me to go to the coast to try and make contact with the other platoons in our company. On the way, I ran into a bomber attack, but I managed to get to our position on the Arromanches cliffs. Guns and machine guns were already firing. Then a voice called, "Enemy landing boats approaching!" I had a good view from the top of the cliffs and looked out at that ocean. What I saw scared the devil out of me. Even though the weather was so bad, we could see a huge number of ships. Ships as far as the eye could see, an entire fleet, and I thought, "Oh God, we're finished! We're done for now!"

During the following days, we were stuck in foxholes along the front. And when these foxholes were shot up—if the Americans were stalled for long enough—other troops came and we were pulled out again.

I last saw action on July 16, 1944. We only had infantry weapons; we didn't even have a bazooka. And to top it off, we were even short of small-arms ammo. The supply columns had not taken the Allies' total air superiority into account. They got caught in heavy fire and were terribly shot up, so we didn't get any supplies. Our company commander sent several men to the shot-up supply units at night to pick up ammunition and bring it back to us at the front. And the Americans were right. They dropped leaflets in German which read, "Attacked from the front, Cut off from behind, Written off by Hitler."

Every day we told ourselves, "Now, finally, the Luftwaffe squadrons are going to come and whip them good." They didn't come. I didn't see a single German tank the entire time, either. We only had some light machine guns and the ammunition we had scrounged up, no heavy weapons or anything else. Well, we dug ourselves in at the edge of some woods, and when the Yanks came over the next hedgerow, we shot at them with our machine guns, trying to use our ammunition sparingly. After two or three bursts it usually got quiet, but it didn't take long until mortar and artillery fire set in. What was really bad were the heavy battleship guns. And then came the Marauders, the Lightnings, and the Thunderbolts—that was the worst.

I think we were used as cannon fodder. You know, it was the fifth year of the war, and we just didn't have the means. The Allies could afford to spare their troops, what with their superiority in equipment. They said, "Why should we sacrifice a single GI against German infantry fire; the Germans outdo us there anyway. No, we'll just carpet-bomb them. We'll just use our fliers to drop the sky on their heads. We'll just make use of our superior artillery."

At the time, we had to rely on little apple trees for cover. I could still hug those trees today. The pilots flew 100 feet over our heads and if they saw anything, they didn't only drop bombs, they sent their Thunderbolts to fire rockets at us. It was pretty bad. We made use of every blade of grass and every little tree when we heard the planes coming.

I was scared stiff the entire time, but at the same time, I was incredibly angry that we were being used against such odds. Still, we wanted to hold the front under any circumstances, and hoped from day to day that the German tanks would finally show up, that some artillery would arrive, and, above all, that the German Luftwaffe would fly in. One single time I saw two German fighter planes, and that was at Arromanches on the morning of June 6. Two Messerschmitts. When we saw them, we all shouted hurrah, but they were the only ones. That was it. It was so terribly depressing.

On the morning of June 16, between 11:00 and 11:30, we came under heavy machine gun fire. And then the monsters came: tanks. They approached our positions through the brush and fired at us. At this point we were in a large meadow surrounded by hedges. I would guess that the tanks were

about 250 yards away. I counted 15 of them. They didn't come directly at us. They stopped, practically taunting us. And whenever they spotted any of us, they let loose a barrage of shells. It was horrible.

I looked right and I looked left, and I told myself that shooting any more with a machine gun was pointless. We didn't have any bazookas. They must have thought we did, though, otherwise they would have advanced more quickly. As it was, they stopped at a distance slightly out of bazooka range. Then they came forward very slowly. We got tank fright and I saw German *Landser* moving back to my left and right. My comrades and I took off too. We only took our weapons along with us. We left all of our personal belongings—there wasn't much—back in the foxholes.

About 400 yards from the positions we had just left, we came upon a great miracle: an 88 mm ack-ack gun. We reported to the commanding officer that tanks were coming up. At nineteen, I was one of the oldest. The officer pulled out his machine pistol and said, "If you don't advance and reinforce our position in a half-circle of at least 200 yards, I'll shoot you!" To say the least, we suddenly got our courage back!

I had advanced about 150 yards when I came under heavy fire again. I hit the dirt behind a tree and then, oh God, I heard our flak gun shooting. I can't tell you what a tremendous lift that gave me! The next moment I saw a tank coming toward me, crushing the shrubbery in its path, and I did exactly what I shouldn't have done: I jumped up and ran away because I thought it was going to crush me flat. I hadn't gone three or four steps when I was hit above the left knee with what felt like a sledgehammer. It hurt, and then again, it didn't. I tried to stand up two or three times, but my leg just wouldn't participate. Uh-oh, I thought, now they've got you. And then my only thought was the hope that I wouldn't be run over by that tank.

Later I heard that the attack was stopped by the German flak gun, and that the Americans drew back again. The unwounded German soldiers were able to hold the position for a few more days.

3.5 The Men Who Fought the War: Experiences of U.S. Soldiers

U.S. Soldiers in World War II

Sixteen million Americans served in their country's armed forces between 1939 and 1945, with the majority by far entering the army in some capacity. Some of them were volunteers, but the great bulk were conscripted ("drafted") under the Selective Service legislation passed in 1940 and periodically revised throughout the war. While all the armed forces obviously had significant numbers of long-serving career personnel ranging in age from their late twenties well into their fifties and even beyond, and as the war progressed older men were drafted in increasing numbers, for the most part the American troops who fought the war were relatively young men, in their late teens and early twenties. In the United States, the minimum age for conscription was originally twenty-one, but fell to eighteen during the war, while the British government gradually dropped its lower limit from twenty to eighteen. The same was largely true of the military of other countries that took part in the conflict. Indeed, by the time the war ended huge military casualties were forcing the German armed forces to enlist boys of seventeen, sixteen, and even fifteen or fourteen, together with elderly men previously considered unsuitable for active service. Equally youthful troops fought with the Soviet forces, especially as partisans, and in both the Japanese and Chinese military.

Of those who joined the American military, by no means all saw active combat service, but even support personnel providing backup services, handling supplies, or doing administrative work were liable to encounter decidedly hazardous situations once they left the security of the United States. Some of those who belonged to glamorous elite units of the armed forces, bomber and fighter pilots, for example, parachute regiments, commandos, and marines, also faced extremely high casualty rates. Overall, however, it was the ground troops or infantry who bore the brunt of both fighting and casualties. In his final report on the war, U.S. Army Chief of Staff General George C. Marshall, a man who always

demonstrated particular concern and respect for the infantry, wrote: "The heaviest losses have been on the ground where the fighting never ceases night or day. Disregarding their heavy losses to disease and exposure, the combat divisions have taken more than 81 percent of all our casualties. . . . In the Army at large, the infantry comprises only 20.5 percent of total strength overseas, yet it has taken 70 percent of the total casualties." Tank units, although supposedly protected by their armor, also fought under extremely dangerous conditions, not least because they were exposed to assaults from their deadly enemy counterparts. Relatively young men, whose physical fitness and stamina was at its peak, were disproportionately represented in all combat units. Those aged thirty or above, even officers, they usually considered to be "old" men.

Young men who joined the armed forces were often extremely "gung ho" and confident at the beginning of their service, especially when undergoing the lengthy training most received before they were eventually sent overseas. If only to enable themselves to function psychologically, even under combat conditions many individuals believed that they would not be killed or wounded, a faith large numbers rather superstitiously tried to reinforce by observing particular rituals or routines or carrying lucky medals, bullets, coins, medals, toy elephants, and other modern-day tokens and amulets. The reality of combat, its often random and casual brutality, savagery, and danger, the filth and squalor in which troops routinely lived and fought, the dismembered bodies, fearful deaths, and equally horrific and sometimes bizarre wounds, shocked many. To survive and function while retaining their sanity, many distanced themselves emotionally from their own actions and those of both their comrades and enemies. On all sides, atrocities and breaches of the rules of war were relatively routine, especially when prisoners were considered to have stepped beyond the boundaries of acceptable behavior, by having themselves committed atrocities for which revenge was due, for example, or by turning on their captors. Pilots who were shot down and captured during bombing raids were likewise liable to be abused, beaten, or killed out of hand in retaliation for the damage they had wreaked on civilians on the ground. The most savage behavior generally took place in the Pacific War or on the German eastern front, where few prisoners on either side survived and all involved waged battle with particular ferocity. The various Anglo-American campaigns in North Africa, Italy, France, and Germany between 1942 and 1945 were by comparison reasonably civilized. Yet, for those taking part in it, the fact that the war in western Europe was somewhat less barbaric than those in Asia or Russia and the chances of survival rather better did little to mitigate the brutality and savagery they not only faced but also habitually demonstrated themselves.

Those British and American troops who survived World War II returned to a hero's welcome, applauded for their role in defeating fearsome and cruel authoritarian dictatorships in Germany, Italy, and Japan in what some have termed the last good war, a conflict in which the lines between good and evil could supposedly be clearly drawn and there were few moral ambiguities. While the reasons for which the Allied powers had entered the war were often complex, the terrors and oppression of the German Holocaust against the Jews, the fearful concentration and extermination camps, German and Japanese biological experimentation on human beings, and the savagery with which the Axis powers treated conquered civilian populations, provided almost impeccable moral justification for the war they had waged against Hitler, Mussolini, and Japan. The men who fought the war, however, often found it less simple to come to terms with their memories. On the battlefield itself, as some survivors noted, soldiers could fall victim to "combat fatigue" or "battle fatigue," taking senseless risks in the conviction either that they were invulnerable, or that they were in any case fated to die. Stress-related nervous breakdowns that left fighting men unable to function any longer in combat situations were far from uncommon, a condition—often termed "shellshock" in World War I—that would later be known as "post-traumatic stress disorder" (PTSD). During the bitter battle for Okinawa that took place in the Pacific in February 1945, for example, in addition to 40,000 casualties killed or seriously wounded, 26,000 men were withdrawn from fighting due to combat fatigue.

The effects were often protracted. One woman remarked: "I don't think any of these men came home the same as they went." (Oral history of Jeannie Roland, Essay 47. It seems that among U.S. World War II veterans perhaps fewer were affected than was the case with those who later went to Vietnam, perhaps because the fact that they had fought in a war often gave them a certain insulation against the worst effects. This may also, however, have reflected the fact that, among the "greatest generation" who fought in World War II, it was considered less acceptable to suffer from or admit to psychological difficulties or permanent traumas. While some undoubtedly dined out on their more spectacular war stories, for decades many other soldiers of all nationalities simply refused to discuss their experiences, especially when speaking to outsiders with no personal knowledge of combat. Substantial numbers also suffered from nightmares or flashbacks, going for long drives in the middle of the night or walking for hours, and in some cases finding it difficult to hold down jobs or maintain marriages or long-term relationships. Some turned to alcohol for escape and consolation.

Human beings are nonetheless resilient. Bob Levine, whose letter to his family after he had lost his foot at the age of nineteen may seem a preternaturally cheerful and optimistic effort to put a brave face on a terrible injury, recalled

many years later that "when you're on the front line and in combat, you really don't think you're going to make it. I had come to the conclusion that I would never survive. . . . And so when you wake up and all it is is an amputation, you think, 'That's all it is.'" A man of great vitality, he went on to marry his high-school sweetheart and enjoy a successful career. In all probability, the majority of returned American World War II veterans who had seen combat service still pursued lives they found satisfying, fulfilling, and rewarding, and coped reasonably well with whatever challenges they encountered when they came back. Yet even those who survived the war had generally lost close friends and, whether or not they had been personally responsible for these, seen some fairly horrific events. For the rest of their lives, most would feel the impact of these experiences.

About The Document

The letter and oral histories here are all taken from a collection of World War II materials compiled since the late 1980s. While it includes some documents from the war itself, such as the letter Bob Levine sent his family in August 1944, describing the recent amputation of his foot, the oral histories were all recorded at least forty-five years after the war ended. They are therefore very different in nature from those gathered by the official military historian Forrest C. Pogue during the weeks and months immediately after D-Day, as he accompanied American troops slowly battling their way through France into Germany during the last year of the European war. These oral histories are more personal and biographical. They focus less on the details of a specific military operation, and more on the broad wartime experiences of average soldiers. They concentrate upon the individual histories of particular men going through training and battle, in many cases suffering serious injuries or being taken prisoner, and give the story of each man's own specific role in his unit and in the campaigns in which he took part. These oral histories also provide information on their subjects' pre-war and post-war careers and often discuss the long-term impact they believe the war had upon them.

The subjects of these oral histories were typical ordinary soldiers, mostly privates, corporals, and sergeants, plus a few officers. At the core of the collection are the stories of the 712th Tank Battalion, to which the father of Aaron Elson, the working copy-editor who gathered them together in his spare time, belonged, but the focus was broadened to include members of other units, and even the wartime stories of some women, generally wives or sisters of military personnel. There might seem to be an obvious element of self-selection, in that only those who cared enough about their wartime experiences to recount them are included, but, interestingly, this turned out not to be the case. Although some of the interviewees already belonged to veterans' groups organized around their units,

which in turn stimulated them into joining the oral history program, in other cases Elson went to great lengths to track down initially reluctant subjects, such as Sam Cropanese and Joe Bernardino, whom he believed had valuable stories to tell. The oral histories do seem to give a rather accurate cross-section of the basic make-up of the World War II army. Like most American draftees, the subjects were generally young, in their late teens or twenties, when they were called up or enlisted. Few were professional soldiers, and most returned to civilian careers once the war was over.

These oral histories present history from the bottom-up rather than the top-down, focusing on the lives of average soldiers. One appreciates just how young most of the troops who actually fought World War II were, in many cases only recently out of high school. They recount how and why young men joined the forces and give details of training, of how they crossed to Europe and Asia, and of what it felt like to be fighting in a tank, in the infantry, in a transport or engineer unit, or accompanying the troops in a medical or other ancillary role. Not surprisingly, fifty years after those events took place, men from the same unit sometimes disagree over the details of particular episodes. The war they describe was rarely particularly glamorous, romantic, or fun. They include episodes which were sometimes discreditable and therefore might not be recounted at all in connection with an official history, when frankness might compromise the teller. Some were minor: the behavior of American troops, for example, in throwing out of train windows meat pies given to them by British civilians who had taken these from their own scarce rations, but which the American recipients found unpalatable and were too tactless to wait until later before disposing of. Shootings of prisoners in defiance of the rules of war, by contrast, might well have been classified as war crimes and were episodes unlikely to be volunteered until many years after the fact, when confirmation was difficult and those involved themselves unlikely to live much longer. In many cases, the oral histories also give detailed accounts of how their subjects came to be wounded, often quite seriously, or spent lengthy periods in German or Japanese prisoner-of-war camps, during which some were fairly brutally treated. Many made it clear that, while fighting the war, the interviewee was permanently frightened, waiting nervously for unanticipated and threatening events endangering his life to happen and wondering how long he himself would survive. Several interviewees reflected on how combat brutalized those taking part in it, and argued that their actions while fighting could not be judged by the standards of normal life, but fell outside the rules of "civilization", since "being in combat is not like going to a party of something."

Why, several decades after the war had ended, did these interviewees decide to volunteer their stories. There were probably a variety of motives. Jerome Auman of the 22nd

Marines, who fought under General Douglas MacArthur in the Philippines, and clearly took pride in his large family of children, grandchildren, and great-grandchildren, recorded his oral history in 1998. In it he recalled how, just before a memorial service for a dead comrade, he stood up, told those assembled how seven members from their unit had died over the past year, and urged those still surviving to write their stories, even if these were not particularly distinguished, because, "[i]f you don't write them, there's nobody can write it. Look at our age. We aren't going to be around, as seven are showing us that are no longer with us. Write your story. Your children, your grandchildren, and history needs these. . . . Now I know a lot of veterans never want to talk about their experiences, but that's not the attitude to have. You should want to write this down, want to record it. . . . We'll never know how soon it'll be too late." Auman also recalled that another man present then confessed that his son, who had recently died of cancer, had complained that his father had never told him about his past service in the marines, which he had longed to learn about. Ed Hays, a B-17 tail gunner who was shot down over Denmark and held prisoner in Germany, confessed that after the war he "came home. I got started in life. Got married. Went to college. Had three kids, and got on with our life." He did not talk in any detail of his wartime experiences from 1945 until 1995, when the Danish boy who had found him in a field got in touch with him and helped him make contact with the German pilot who had shot him down, the beginning of a somewhat surprising friendship between the two old fliers, both of whom had spent time as prisoners of war. The sense of their impending mortality gave many a new impetus to make some permanent record of the past.

For some, too, the process of recording these oral histories may have served a cathartic function, taking the poison out of memories they still found painful to recall. Aaron Elson, who conducted most of these interviews, noted "that these men cut off their feelings, and they were almost aware of it. They couldn't feel anything after a certain point. . . . If a friend was killed, they would still be overwhelmed, but in order to go on, they would see things, and it would almost be like looking at a photograph." A psychiatrist described this reaction as "emotional numbing", something very common with post-traumatic stress disorder. Joe Bernardino and Sam Cropanese, two friends in the same tank crew who were both badly wounded in the same engagement, seem to have suffered from such symptoms, and Bernardino also recalled suffering nightmares which he found himself unable to discuss with his wife. Even in their oral histories, both men sought to distance themselves from the worst aspects of war, placing it in another category of experience distinct from normal life, and stressing that "war is hell, and I accepted it as that." One suspects that for both men their memories had become a burden, and that finally retelling these to a sympathetic and non-

judgmental listener may have released them from at least part of the load they had been carrying.

One last question remains. How and why was this collection of oral histories and other materials put together? Their existence is due primarily to the energy, enthusiasm, initiative, and hard work of one man, Aaron Elson, whose father served in the 712th Tank Battalion, which fought its way through France and Germany after D-Day. Some years after his father's death in 1980, Elson began recording the stories of other veterans from his unit, at first in the hope of reconstructing his father's service more exactly, but soon for their own sake, because he realized that they were, in his words, not just a valuable historical record but also "great stories" of the lives "of ordinary men and women who did extraordinary things under the most adverse of circumstances." Over time, Elson compiled over 600 hours of interview tapes, published four books of selected oral histories, and also used the interviews as the basis for a major website, Tankbooks.com. In many cases, those who recorded these oral histories are now dead, and without Elson's encouragement and willingness to listen their stories would have been lost for good. As with all oral histories, they tend to give detailed accounts of particularly significant episodes, and a good deal of general background and atmosphere on individuals' experiences. This particular collection is also valuable because, although World War II is obviously Elson's primary focus, he has gathered data on his subjects' earlier and subsequent lives, so that one has a sense of how the war fitted into the pattern of their entire careers.

Several millions of Americans could probably have told comparable tales. These particular individuals were fortunate in having someone available to record them at a time when they were willing to talk. More often than we like to suppose, the survival of historical memories, data, and documents depends on the determination and enthusiasm of one person or, at most, a few individuals, who can energize others into contributing and helping to gather them. In this case, Elson has played a vital role in facilitating the creation of a crop of source materials which would otherwise have been lost. In personal terms, the families of those who recorded these oral histories now have a permanent record of an earlier generation. Historians, meanwhile, will also find this treasure trove of documents of great value in reconstructing the texture of a vanishing past which, as it moves ever further away in time, fewer and fewer people will still be alive to remember in any detail.

Primary Source

A) Oral History of Chuck Hurlbut, 229th Combat Engineer Battalion

[E]ver since high school I had heard about Hitler and all this stuff in Europe. It was getting to me. But I never realized

how deeply it was going to affect me until Pearl Harbor. Whenever you talked about Hitler and Europe, that was their war, don't get involved. Pearl Harbor turned everyone around. They were so united, so determined. I don't think there'll ever be a time again when this country is so unified. . . .

I graduated at 16. . . I got a job and then Pearl Harbor hit, and now I'm 17. I never wanted to be a soldier; that was the farthest thing from my mind. But when something like Pearl Harbor happens, you get a feeling. "I'm supposed to do something." I got overwhelmed, and I couldn't wait to become 18 so I could be drafted. I wanted to do my part. So when I hit 18, within days I was down at the draft board, registered. In three months I was called, went for my physical, passed. Then you wait around until they call you.

I got the announcement, "You are to report to the Greyhound bus station on such and such a date." This is in Auburn, New York. So we went down there, and here's 60 or 70 guys, all in this draft group. I think this is true: It was the largest draft contingent ever to come out of Auburn. And the mothers and fathers and sweethearts, brothers and sisters were there. It was quite a congregation.

Finally they put us on a bus and sent us to Fort Niagara, which was the big gathering center for this area of New York State. And most of us guys knew each other. We had gone to school together, worked together, dated the same girls; there was a real strong camaraderie there. And you said, "Well, guys, this can't last. You're gonna go here, I'm gonna go there. We're gonna be all split up."

When the announcement came, about 90 percent of us stayed together. We couldn't believe it. We were going to be combat engineers. We couldn't care less. The idea we're all together was the big point. We don't care what we're gonna be.

So they put us on a train and they sent us to Camp White, Oregon, where they activated the 299th Engineer Combat Battalion. We are the original members of the 299th. And we went through basic training.

The first few weeks were basic military skills: close order drills, marches, hikes, how to clean a rifle, what is a machine gun? And then you were introduced to the specialties of an engineer: the bridge building, the mine detection. We were combat engineers. We had specific things that we did that the big engineering groups didn't do. Engineers are always thought of as building these enormous bridges. The combat engineers do the same thing on a minor scale in a quicker fashion, under fire. We learned how to throw a treadway or a pathway across a river. How to ford a river. How to blow up a bridge. How to wire a bridge. How to build a Bailey bridge. We became pretty good at it. . . .

We took all our training, and then we went out in the ocean and came in on rubber rafts, learned demolition, hand to hand combat, the whole business. A lot of the big brass—this was in December 1943—came down to watch us, and we put

on a big show. I guess we got pretty good credentials, because we were commended. I guess right then they decided we can use this unit in an invasion; that's the feeling we got.

And we realized that we're no longer just a combat engineer unit, we're a specialized group now; we're specialists in invasion techniques, beach assault techniques. And some of the guys thought, "Hey, piece of cake. We're so good."

But a lot of guys thought, "Hey, wherever we go, it's gonna be a suicide mission."

[Asked: "What was your feeling?"]

Piece of cake. Hey, I know all this stuff, and we're so good. We can do it. Hey, I'm 18 years old, I just had my 18th birthday. And when you're 18, nothing bothers you. You're gung-ho. I'm on top of the world. That was a big attitude, but a lot of the guys were a little more serious than I was. They had these feelings. So a lot of guys went AWOL [Absent Without Leave]. I think it was because of what they saw coming. But they were picked up and returned, and our commanding officer made damn sure that they were part of the invasion.

B) Bob Levine, Company K, 358th Infantry Regiment, 90th Infantry Division, Letter to His Family, 13 August 1944

Dearest All,

Back in good old England once more, and let me tell you it didn't break my heart to leave France. We were flown out and in one hour we were on terra firma. I'm not in a station hospital awaiting shipment to still another hospital. I've been eating like a king, and right now enjoying my first days in a real bed in I don't know how long. I have already written to you but it suddenly occurred to me that the government might not have informed you as to what had happened to me in the past month or so, since they are sometimes very slow in getting news out.

The story in brief is that I was wounded and subsequently captured by the Jerries. After spending three or four unpleasant weeks in a prison hospital, I was recaptured when the Americans started to make their recent drive. The sadder news of the story is that my right foot had to be amputated at the ankle. However, it has in no way broken me up or made me miserable, because as I wrote at first, my main concern was just to come through alive. I think I can best explain my feelings when I see you, which may be in the very near future, I hope. I believe I'll be sent to a hospital in the States before anything else is done to me.

So now you know just what the score is, but although you might think I'm a couple of runs behind, in reality I'm way ahead. My plans for the future are still the same, and I believe more apt to be realized because of some good first-hand experiences. Guess the one change I'll have to make is to take up golf and just watch tennis from the bench. Not too

great a sacrifice, I don't think. I just want you to remember that the good Lord has been a lot kinder to me than you could ever imagine. If I seem too nonchalant about the loss of my foot, it is only because I realize it and I'm grateful it was not worse. Remember me to everyone, and perhaps not too long after you've read this I'll be saying hello to you again.

C) Oral History of Sergeant Vincent "Mike" McKinney of the 1st Infantry Division, recorded 5 February 1999

Asked "Did you become hardened?", McKinney replied:

Yes, I did. I can remember, my troops were up on a hill, it seems we were always on a hill. I took one guy from the left, a little guy, I remember, a little Italian guy, only about four and a half feet tall. I took him from the left side and I said, "Go down to the end there and dig in down there by those guys." There were a couple of shots back and forth. A little while later I went down there, and he had been killed. I felt bad I had sent him down there. If I had left him alone maybe he would still be alive. But he's there, I'm in the foxhole. He's alongside the foxhole. I remember I started eating a can of beans. I had no place to lay it; I laid it on his chest. I thought about that after the war. I'm eating beans on his chest, there's a dead body there. You become hardened, it's just . . . you're half human, I think. You're a lot animal. The way you're living. You're laying in mud and dirt, and you're filthy. You straighten up a little bit when you go back to reserve for a while, a rest area, or if there's a break in the action, you go back to civilization. When I think of how I acted during the war a lot of times, yeah, you're not all human.

D) Oral History of Corporal Sam Cropanese, Gunner, 712th Tank Battalion, Recorded 17 May 1993

We had so many battles. Mayenne, Avranches, St. Lo was the first one. Then came the Falaise Gap. There was one time there that we bivouacked, and the company commander told us to watch all the roads. Put the tanks on the main roads. Of course, when you park the tanks you have to watch the roads, but he was so strict about it. Watch these roads. Don't let anything come through.

So we were watching. All of a sudden, at night, we heard rumbling. Tanks, coming down the road, and they let the tanks get close. They said, "Don't fire, don't fire." All of a sudden all hell broke out. It was the German tanks, they were trying to break through our lines. Well not only our company, our whole battalion of tanks were there and had every road covered, our whole battalion of tanks, caught 'em like crazy. What a beating they got. They were hit from all over. They didn't know where the firing was coming from. We took in a lot of prisoners there. . . .

We were attached to the 82nd Airborne. What fighters they were! One time, the 82nd was told not to take any prisoners, because the Germans had taken the 82nd and they were hanging them on trees, they were pulling out their nails, they'd done something real bad, so the 82nd Airborne division commander must have told them not to take any prisoners. They would take them, but they would take them back in a field and all of a sudden they would open up on them. But it was because of what they did to them. If it wasn't for that, the Americans, they wouldn't do that. But they were so mad because of what they did to their buddies.

They were one hell of a nice outfit to work with, the 82nd Airborne. Always there. Always with us. Always watching. Telling us if there was anything around. If we needed to scout out anything, they would go out and scout it out. Let us know if a road was clear, if anything was there they would tell us. . . .

Every time we went out, I had to shoot at the houses, and the fields, just rake the fields where we were going. Just in case there was anything there, we would rake the fields. A lot of times you saw them getting up and they'd get down again, but we'd just pass and go.

We had a 75 and a .30 caliber in the front when I was the assistant driver. When I was in the back I was loading the 75. I had a little porthole on the side, and one time I saw a German on the ground, like one of our machine guns, we were just passing, he couldn't harm us. We were passing him and he was firing at us, and I got a grenade and just dropped it out of the porthole and kept right on going. It must have blown him all up. I never even looked around to see what happened.

I must have killed a lot of them, because I raked a lot of the bushes, hit a lot of the homes, the hedgerows. We would rake the whole hedgerows, in case there was an 88 [German gun] there, you'd hit him, because they're wide open. You would hit them or scare them to just abandon the thing and go hide until we got out of there.

. . . [T]anks, oh my God, tanks, talking about tanks. I've seen tanks that were knocked out, you'd see pieces of the arm, a hand, all crumpled up, fingers all black, just a piece, scattered, over there, a piece of an arm here, the head blown off. On an 88 I've seen the same thing, a German 88, just seen charred pieces here and there, I'm telling you, it was a disgusting thing to look at.

But while you're there, you're in the battle and everything, it's not as bad as after. After, you start thinking about it, you say, Holy geez, I saw all that stuff there? These Germans all charred up. Americans in the small tanks that were hit, they were all charred, the tanks, and you could still see the GIs in the tanks, all black, like they were looking at you. All charred up. Oh my God, what a thing to look at.

God, when you see stuff like that, you really say to yourself, my God, we're next. When's it gonna hit us? Every time

we were called out, to go into a battle to help out the infantry or whatever you got called on, we used to say, "Well, maybe this is it." Every time we went out. Maybe this one's it. Maybe this one's it. You never knew if you were gonna come back.

We'd say to ourselves, Boy, we were lucky this time.

Primary Source

E) Oral History of Private First Class Joe Bernardino, Loader, 712th Tank Battalion, Recorded 27 August 1994

. . . [W]e also saw Lieutenant Bell, when he was killed. I saw someone in the side of the ditch, with no head. And I said to my captain, "Boy, look at that guy. No head." Well, we went back to our headquarters, and he called me and asked me if I could remember where that place was that I saw the man without the head. So we went back there, and we're looking down at him and he says, "You know who that is?"

I said, "No."

He says, "That's Captain Bell." I mean Lieutenant Bell. And I think, he always used to tell him, "George, one of these days," his first name was George, "one of these days you're gonna lose your head." . . .

There were other things, but you know, war is hell, what are you gonna do. We had a lot of fun, we went out, we were knocking down church steeples and all kinds of stuff. I was a machine gunner, and I used to like to set the curtains on fire in the houses. I used to set the gun one and one, one bullet and one tracer, the tracers were incendiary. And if they fired back, then we hit the 75 and we'd blow the roof off. But that's the way we did it. . . .

Toward the end of the war, we had hundreds and thousands of Germans, all loaded with their gear and all, they just didn't want to fight anymore. Then we went, we were with Patton, they switched us from the First Army to the Third. Oh, I've had a rough, terrific, exciting life. I stayed with it till the end of the war. I was in the little town of Stroh, Germany, when the war ended. But then it didn't end for us. We fought two weeks after that, mopping up those who didn't know the war ended. So those who got killed after the declaration that the war ended, I felt sorry for. . . .

[A]t one point, we came around a corner and here's this tank. It's a tiger, and it was a question of who got the first shot. We got the first shot and it just peeled the side of that cannon, so they couldn't use it. And something must have exploded inside. I, as the bow gunner, jumped off of my tank when we got there. I opened the hatch, and saw a guy there, eating. He had a can of sardines open and a loaf of black bread. So I pulled the pin and dropped a grenade in and closed the hatch, and jumped back in my tank and we left. The rest were dead. He was the only one alive. This is a story that I've never told, and I think that was up around Avranches. . . .

I went with three or four other guys to get some replacement tanks, so they put Russell in my place, as a bow gunner. They went out on a mission, and were gone two days. Their tank didn't come back. And then I heard about what happened. The tank got hit, Russell got both his legs blown off and part of his rear end, he died two days after that. That was supposed to have been me. As much as I didn't want to go and get those tanks, I was glad then that I did. But that would have been me.

In one of our travels also, we saw a German who was taught in Ohio. He was a lieutenant. We got him in a barnyard and we were marching him with a branch in his shoulder, making him goose step, and he said too many things that we didn't like. One of the things was that he had killed so many people, and he was honored by the fuhrer, he was personally, the fuhrer's this and that, so while he talked too much we finally shot him. Which we didn't want to do, but hey, war is war, what are you gonna do? . . . [W]e just pumped so many shots into him, like he said he had done to some of our people. Of course, we don't know who hit him and who didn't, we were at a distance. But we didn't class it as an atrocity or anything like that. It's just that he was an SS, and if we turned our backs and he had a gun, we would have all been dead. . . . But to me, war is hell, and I accepted it as that, and I always tried to look after myself and my fellow man. . . .

I remember, I don't know if anybody ever told you, but there were bodies on the beach stacked up six and twelve high, American bodies, waiting for the trucks to come along and pick them up. Germans were coming out, getting in the LSTs and being brought over to England. There was all kinds of stuff, but you don't remember everything. You remember the things that maybe you don't want to remember, that you can't forget, and many people have gone crazy. As you know, being in combat is not like going to a party or something. And then, when you live with it all these years and you have no one to talk to about it, that's worse yet. I could never talk to my wife about it . . .

I used to wake up, whatever hour of the night it might be, in a cold sweat, and I'd sit up, and I'd look around the room,

and everything's all right, and I'd go back to sleep. At first my wife was very concerned, and then I told her, and I guess she began to realize what it was from, and so we just never bothered with it anymore. I haven't had that for quite some time now, but this is something that never leaves you, you never forget these things. This is not a thing that you went out and somebody played ball and somebody lost and nothing was lost. This is memories, this is friends, this is buddies, the closest people to you, and what you see, what you hear, what you smell, you can't tell anybody what it's like that wasn't there. . . .

The only time we would talk would be if I bumped into another buddy of mine, like at the bus garage, another veteran, we started to talk about different things, and everything comes out a little bit, it's like religion. You don't talk about religion. If you're a Catholic, you don't tell a Protestant about your religion. And you don't want to hear his, because it's not gonna match up with yours. So it's one of those things. And I always say, if I had to do it over again, I would do it.

Section IV

The Home Fronts

The demands of fighting large-scale war made heavy economic demands on every nation and affected every aspect of civilian life. Each belligerent state reorganized its economy to meet the industrial needs of war, redeploying factories and plants to produce goods needed for the war effort, urging labor to work longer hours and jettison restrictive workplace regulations, and rationing civilian consumption of scarce commodities. With millions of men absent in the various armies, women took over many jobs and responsibilities previously considered masculine preserves, and in almost every country some joined female auxiliary branches of the armed forces. In the United States, large numbers of African-American young men were also called up for the military, while many more American blacks than ever before found employment in industrial manufacturing. So, too, did Mexican-Americans and other Hispanics, some U.S. citizens, others attracted over the border under the “bracero” program, established in 1942 to encourage Mexican-Americans to work in American agriculture. Rather predictably, these major social and demographic changes generated severe ethnic tensions and resentments, which peaked in June 1943, when major race riots between blacks and whites broke out in Detroit, and almost simultaneously brutal conflicts erupted between “zoot-suited” Mexican-Americans and white military and naval personnel in Los Angeles. In every country, millions of wives and children had to cope as best they could, only too often in conditions of physical danger and great insecurity, with the protracted absences of husbands and fathers enlisted in the armed forces. Civilians everywhere, even in the United States, distant from the actual conflict, suffered the suspense of wondering whether much-loved friends and relatives would return unscathed from combat.

4.1. American Industrial and Economic Mobilization

“The Arsenal of Democracy”: U.S. Economic Mobilization for World War II

Several months before President Franklin D. Roosevelt formally proclaimed in December 1940 that for the duration of the war his country would “be the great arsenal of democracy,” he launched a major rearmament drive, and modifications to the Neutrality Act simultaneously permitted the British to order enormous quantities of North American war supplies. Throughout the 1930s, the American economy had run below capacity, with persistently high unemployment rates of 15 percent or more. Up to 60 percent of American industrial productive capacity was unused in 1939. From 1940 onward, however, output and productivity began to soar—developments enhanced by the Lend-Lease program

for Britain and other allies established in March 1941, under which \$50 billion worth of goods eventually went abroad, and the full-scale economic mobilization needed to support a huge U.S. Army at war after December 1941. By the time of the attack on Pearl Harbor, American military spending every month amounted to \$2 billion, and the government’s total overall expenditure on the war was \$381 billion, dwarfing the New Deal economic recovery spending of the 1930s. American wartime production totaled 300,000 airplanes, 77,000 ships, 372,000 big guns, 20 million small arms, 6 million tons of bombs, 102,000 armored vehicles, and 2.5 million trucks. During the war, the U.S. gross national product rose 60 percent and wages increased by 50 percent, whereas the cost of living only went up 30 percent. Unemployment disappeared, as the armed forces absorbed 16 million men and as women, African Americans, and Hispanics were encouraged to take up jobs in defense plants and elsewhere. Many Americans thought of World War II as “the good war,”

not simply, perhaps, because they felt they were fighting in a just case but also because most among them who stayed at home did better materially than they had for more than a decade.

Organizing the industrial war effort was a major undertaking, largely directed by the government in cooperation with both big business and labor. By 1940, businessmen, bankers, and corporation lawyers with industrial experience had begun to flock to Washington to staff the wartime defense bureaucracy. The War and Navy Departments were responsible for placing most wartime contracts, but an extensive network of government agencies also developed to supervise these agreements. Such bodies normally included representatives of both business and labor, usually drawn from the larger corporations and the major unions. Fuelled by government contracts, employers were willing to pay higher wages. The Roosevelt administration depended heavily on the labor movement for political support and also sought to encourage labor to work long hours and raise production, even if this sometimes meant breaching work contracts and union regulations. In exchange, top union officials expected good working conditions for their members, together with representation along with business on such public bodies as the National Defense Advisory Commission, established in May 1940 to assist the revived Council of National Defense in setting official guidelines for the industrial war effort.

About the Author

Lithuanian-born Sidney Hillman was one of the founders and first president of the Amalgamated Clothing Workers of America. In 1933, President Franklin D. Roosevelt appointed him a member of his Labor Advisory Board, where he helped to draft the Fair Labor Standards Act, and in 1936 and again in 1940, Hillman worked tirelessly for Roosevelt's reelection. Hillman also became the first vice president of the umbrella labor federation the Committee on Industrial Organization (CIO), founded in 1937, that spearheaded the drive of the later 1930s to unionize such major industries as steel and automobile production. After September 1939, Hillman broke with the CIO's president, John L. Lewis, in supporting Roosevelt's policies of all-out aid to the Allies, even at the risk of American intervention in the war. In May 1940, as German forces appeared likely to defeat France, Roosevelt announced a huge new program to increase American military and naval production. At the same time, he appointed a seven-man National Defense Advisory Commission to supervise this effort and define the basic principles that should govern wartime contracts and labor policies. Hillman was appointed to this body, where his primary responsibilities were the organization and coordination of labor for the defense effort; the post also effectively rewarded him for supporting Roosevelt politically and on defense issues. Throughout the war,

he remained prominent in the various government agencies successively entrusted with organizing wartime production. In 1941, Roosevelt made Hillman associate director of the Office of Production Management, and in 1942, he became head of the War Production Board's labor division, positions where Hillman sought to protect and further the interests of labor. In 1944, Hillman mobilized the entire CIO organization in support of Roosevelt's final reelection campaign, efforts that may well have given the president his margin of victory that year.

About the Documents

Two different kinds of documents are included here: official government directives setting out the principles and standards that should govern the allocation of government contracts and the labor practices to be observed by businesses receiving such contracts; and oral history reminiscences from individuals who played some part in the bureaucratic apparatus generated by the industrial war effort.

The two directives included here were both public documents, issued by the National Labor Advisory Commission, which the president then forwarded to Congress. In return for supporting the industrial war effort, labor leaders expected their members to receive excellent wages and benefits, provisions that were to be included in government contracts and that the directive argued would also enhance industrial efficiency. As one might expect, Hillman was the prime author of this particular directive. Designed to win labor support for a program that might be politically controversial, it also emphasized the importance of the new defense program in reducing unemployment. The second directive, issued a week later, set "general principles governing" the allocation of the many billions of defense contracts that the U.S. government itself placed from May 1940 onward. When selecting suppliers, speed of delivery, quality, and price were all to be taken into account. Other things being equal, officials allocating war orders were also instructed to pay due regard to geographical distribution, so that all parts of the United States would share the economic benefits these contracts would generate. Suppliers were expected to comply with the labor standards laid down a week earlier and also to have a good reputation for honesty and financial probity. Competitive bidding was desirable but not essential; the efficient fulfillment of national defense needs took priority. These guidelines tended to favor big business, since large firms were more likely to be able to meet these requirements. In effect, the government's wartime industrial mobilization was run on lines that ensured it support from both big labor and big business, the precursor of the cozy and mutually beneficial government-business-labor defense contracts arrangements that President Dwight D. Eisenhower would later term the "military-industrial complex."

Both liberals and politicians had some misgivings over these developments, though congressional representatives, senators, and local officials normally sought to win as large a share as possible of lucrative government orders for their own states and districts. The two memoirs included here illustrate some of the strains and suspicions that characterized the relationships of businessmen with liberal government bureaucrats and with politicians. The New Deal bureaucracy of the 1930s included many bright young leftist intellectuals, who often regarded business with considerable suspicion, a feeling most businessmen strongly reciprocated. Wartime industrial mobilization required extensive government direction of the economy and careful planning of the allocation of scarce resources, a kind of bureaucratic intervention that businessmen often resented. An oral history recorded by Joe Marcus, a New Deal economist who became head of the Civilian Requirements Division of the National Defense Advisory Committee in 1940 and later joined the War Production Board, is rather short on detail but ably conveys much of the hectic atmosphere and confusion that characterized the enormously rapid wartime buildup of American production facilities. It also describes the clashes that inevitably occurred among all the disparate and ill-assorted groups involved. Marcus worked primarily with businessmen, and even though he recognized that most were genuinely patriotic, the experience apparently did little to increase his respect for their sagacity or foresight as a group. Military procurement was also a nightmare, as the navy and army competed with each other for scarce resources, eventually forcing the establishment of a coordinated priority allocation system. Marcus shared the prevalent liberal view that the war largely ended the New Deal. He also believed that the creation of a powerful, even dominant military-industrial complex was “[t]he single most important legacy of the war.”

American taxpayers ultimately funded wartime contracts, and almost immediately, Congress therefore demanded the right to supervise and investigate their allocation and fulfillment. In spring 1941, Senator Harry S Truman of Missouri took the lead in establishing a committee “to look into defense expenditures,” a move that brought him new political prominence and ultimately his selection in 1944 as the Democratic vice presidential nominee. A collection of Truman’s own previously unpublished autobiographical writings compiled and published by the historian Robert Ferrell in 1980 included Truman’s own rather informal account of the Truman Committee’s establishment, operations, and achievements, which extended from 1941 to 1944. Whereas Marcus recorded his reminiscences for a book by Studs Terkel in the knowledge that some portions would probably be published, Truman wrote this in retirement and primarily for his own reference. He may, nonetheless, have had one eye on posterity; he did know that all his papers would eventually

be deposited in his presidential library in Independence, Missouri, and that at some stage scholars and researchers would be likely to read the account. Truman stressed that, despite some of his colleagues’ suspicions of his motives, he undertook this work not for any political advantage that might accrue to him but in the national interest. He emphasized the committee’s bipartisan character, the excellence of its staff, and its reputation for integrity. He also stated that though the Truman Committee unearthed numerous examples of graft, waste, overcharging, profiteering, and deliberately substandard production, these were only a small percentage of the total, and overall, the industrial war effort was well run and honestly conducted. Judging from Truman’s recollections, the committee was more interested in ensuring the honest disbursement of government funds than in enforcing the social provisions of contracts, an outlook that probably reflected both its bipartisan search for consensus and growing conservative hostility to labor unions during and after World War II. Truman’s verdict seems plausible not only because there were numerous official reports to back it up but also because he prided himself on his populist outlook, and by the time he wrote down these reminiscences, he could neither gain nor lose politically through frankness on this or any other subject. It is interesting, too, to note his rather sharp characterization of Senator James F. Byrnes, a political rival whom Truman appointed secretary of state when he first became president but later fired when Byrnes proved too independent. In his final years, Truman did indeed acquire the reputation of occasionally—especially after imbibing several glasses of his favorite bourbon—being rather embarrassingly blunt and outspoken on both past and current events.

Primary Source

A) United States National Defense Advisory Commission Directive, 31 August 1940

By unanimous vote the National Defense Advisory Commission has adopted a labor policy which calls for compliance with all Federal, State and local statutes protecting labor, a statement by the Commission said today.

It was reported that Sidney Hillman, Labor member of the Defense Commission, had worked with his associates for more than a week on several drafts of the policy and that the discussions were at times animated. However, when the members of the Commission became convinced, it was said, that the conservation of labor’s social gains and their extension would insure an increase of production in the interests of national defense, they approved the proposals.

Primary Source

B) Full text of Directive of 31 August 1940

Primary among the objectives of the Advisory Commission to the Council of National Defense is the increase in production of materials required by our armed forces and the assurance of adequate future supply of such materials with the least possible disturbance to production of supplies for the civilian population. The scope of our present program entails bringing into production many of our unused resources of agriculture, manufacturing and man power.

This program can be used in the public interest as a vehicle to reduce unemployment and otherwise strengthen the human fiber of our nation. In the selection of plant locations for new production, in the interest of national defense, great weight must be given to this factor.

In order that surplus and unemployed labor may be absorbed . . . all reasonable efforts should be made to avoid hours in excess of 40 per week. However, in emergencies or where the needs of the national defense cannot be otherwise met, exceptions to this standard should be permitted. When the requirements of the defense program make it necessary to work in excess of these hours, or where work is required on Saturdays, Sundays or holidays, overtime should be paid in accordance with the recognized local practices.

All work carried on as part of the defense program should comply with Federal statutory provisions affecting labor wherever such provisions are applicable. This applies to the Walsh-Healey Act, Fair Labor Standards Act, the National Labor Relations Act, etc. There should be compliance with State and local statutes affecting labor relations, hours of work, wages, Workmen's Compensation, safety, sanitation, etc.

Adequate provision should be made for the health and safety of employes;

As far as possible, the local employment or other agencies designated by the United States Employment Service should be utilized;

Workers should not be discriminated against because of age, sex, race, or color;

Adequate housing facilities should be made available for employes.

The commission reaffirms the principles enunciated by the Chief of Ordnance of the United States Army in his order of Nov. 15, 1917, relative to the relation of labor standards to efficient production:

"Industrial history proves that reasonable hours, fair working conditions, and a proper wage scale are essential to high production. Every attempt should be made to conserve in every way possible all our achievements in the way of social betterment. But the pressing argument for maintaining industrial safeguards in the present emergency is that they actually contribute to efficiency."

C) Directive of the National Labor Advisory Commission on Government Wartime Contracts, 6 September 1940

The essence of the preparedness program is the getting of an adequate supply of materials of the proper quality in the shortest space of time possible. Considerations of price alone are highly important, but in the emergency are not governing.

1. Speed of delivery of all items on the defense program is essential. This means:
 - (A) That orders should be placed in such a manner as to insure the most efficient use of each particular facility from the point of view of the program as a whole;
 - (B) That proper consideration should be given to contributory industries, such as the machine tool industry, to avoid creating underlying bottlenecks;
 - (C) That once delivery dates are set, assurances be given that they will be met by the supplier.
2. Proper quality is also of prime importance. It is therefore necessary to determine first of all whether or not the supplier can meet the quality requirements, as specified. There should be a willingness on the part of both the Army and Navy, on the one hand, and of the supplier, on the other, to adjust specifications on a cooperative basis in order that such specifications may come as near as possible to meeting commercial standards while at the same time fulfilling the military requirements.
3. Price, while not the sole consideration, is of outstanding significance, and every effort must be made to secure a fair price. This must take recognition, among other things, of determination of proper cost factors.
4. The impact of the defense program upon the consumers must be recognized. This relates to such factors as:
 - (a) Due regard to the necessity of protecting civilian needs and morale;
 - (b) Proper health and housing conditions among employes;
 - (c) Consideration to possible off-season production in order to dovetail the military program into production for civilian requirements. Off-season production should also lead to lower overhead and consequently to lower prices for both the consumers and the government.
5. Adequate consideration must be given to labor. This means compliance with the principles on this subject

stated by the commission in its release of Aug. 31, copy of which is attached hereto.

6. Undue geographic concentration of orders should be avoided, both as to procurement districts and as to industrial sections within any such procurement district. Reasons for such decentralization relate to factors of military strategy, as well as avoiding congestion that will slow down production.
7. Financial responsibility of the supplier should be examined. Ability to post a bond does not necessarily dispose of this problem. The probability should exist that the supplier will be able to continue in business, at least long enough to complete his contract satisfactorily. Further, an ability to finance himself through private sources should take preference over necessity for securing government aid. . . .
11. The moral responsibility of the supplier is important and, in some respects, fundamental. There should be evidence of honest and sincere desire to cooperate with the Army and Navy in producing what is called for, and on time, without profiteering; to assume some risks himself rather than attempting to shift all such risks to the government, and to furnish a correct statement as to his capacity and experience. The supplier's general standing and reputation among reputable business men (as distinct from his financial rating) is one index of such qualifications.
12. The commission recognizes that competitive bidding is the better procedure in certain types of industry and circumstances. However, it is often impossible to make sure that the principles outlined above are followed when contracts are placed on the basis of price alone and are let to the lowest bidder. Therefore, in cases where competitive bidding will not fulfill the above-stated needs of national defense, the commission recommends that the use of the negotiated contract be authorized where necessary in order that these objectives be obtained in making defense purchases.

D) Recollections of Joe Marcus, Head of the Civilian Requirements Division, National Defense Advisory Committee

Most of my time was spent fighting with representatives of industry. Did we have the capacity to make enough steel, enough copper, for military as well as civilian needs? Our

reports showed we didn't. The top industrial boys resisted this very strongly. They had gone through the Depression and, from their standpoint, there was an excess of capacity. They weren't going to fiddle around, increasing the capacity just because some screwball kids tell them they don't have enough.

What happens in a severe depression is that your consumption goes down, say, twenty percent. With a decrease in construction and in the demand for machinery by about eighty percent, it's devastating. From '32 to '39, there is recovery. But there are still ten or eleven million unemployed. The production of consumer goods is still low. All they're doing is replacing worn-out equipment. Why add more machinery? Why build more factories? Let's say they have the capacity to produce 80 million tons of steel and the demand is for only 70 million. Why should they listen to some screwballs in Washington who say, If there's a war, you're going to need 150 million tons?

We were young New Dealers who found the military in their planning stodgy and backward. They thought we didn't have the industrial capacity to produce more than, say, 5 billion dollars worth of military goods. So a group of us wrote a memorandum showing that there were so many unemployed, so much machine-tool capacity, that it was possible to produce 75 billion dollars worth. It flew in the face of the military statements.

Roosevelt had that memo on his desk on the day of Pearl Harbor. When he reorganized the War Production Board, with Donald Nelson on board, he insisted that the boys who wrote the memo watch the program. He set up two committees on the board. One was planning. The other was program progress control. I was yanked out of my previous job and made program progress control officer. (Laughs.)

When we got into the war, everything was a mess. Suddenly you've got to produce an enormous number of planes, tanks, build an eleven-million-man army, supply the British and, soon afterwards, the Russians. And the Free French. We needed an enormous jump in production. There was a bottleneck: machine tools.

Nelson got on the radio and said the machine-tool producers were not doing their job. They were not working around the clock, not working three shifts. The Machinery and Allied Products Institute, the trade association, says to Nelson, We can't run three shifts. Nelson tells them not to bother him, to talk to the guy who wrote the speech. So they came to see me.

Now my studies were based on statistics. I don't know how to build a machine tool. I barely knew one machine tool from another. (Laughs.) They insisted I make a tour of the machine-building industries. I accepted the invitation. I came back with my report: the Machinery and Allied Products Institute was wrong. I had visited factories across the

street from each other, one working three shifts, one working one shift. Now they wanted me to take over planning and controls for the tool industry. (Laughs.)

I hesitated. It was a challenge: I was a critic, now I had to do something. It was a question of the war, too. I felt it was important. I was young. I was Jewish. I had never met a payroll. So I accepted the challenge.

Here I was, an outsider, reorganizing the whole goddamn thing. It was insane the way they were operating. You take government people: they don't know where the hell the factories are, don't know the possibilities. You take the industry people: they're concerned about their business after the war, doing things the way they have traditionally done it. They had no sense of the war needs and planning.

The heads of these divisions were dollar-a-year men. They kept their company salaries. They were the leaders of industry. Now, down below, you had heads of companies who actually knew their business. You also had guys the industry wanted to get rid of, executives they didn't know what to do with. Washington wants someone in charge of ball bearings? Send this clown there.

The first job I tackled was machine tools. Say an auto factory, an airplane factory, had all the lathes it needed but didn't have milling machines. Another factory, making tanks, was all ready to go with milling machines but didn't have lathes. I looked into it: how did they distribute these machines? I discovered it was done on the basis of conflicts within the military forces themselves. The army wanted machine tools for army products, the navy wanted theirs, the air force theirs. Ten percent went to one, five to another, three to a third. It made no sense. It had no connection to what the actual needs were. Someone had to take over, to allocate machine tools on a priority system. So I did. I couldn't have done it without support from some of the top people who really understood. It was a way of thinking different from what they'd been accustomed to. Others, well . . .

They all were patriotic, but in different ways. Many worried about how their regular customers would react. If I said, Send this abrasive to such and such a firm which was not their standard customer and wouldn't be after the war, don't send it to one which had been their customer, they were bothered—and how! Many fights took place.

In the early days, some of these industrialists wouldn't sign major military contracts until they had the right kind. The right kind? When the war ends, who's stuck with the supplies? What payment do we get when you terminate? Who's gonna pay when we move it out? They wanted to make sure of every cent of profit.

The concessions in these contracts was the biggest thing of all. The war had to be won. Dr. New Deal—with all of FDR's talk about economic royalists—goodbye. Dr. Win The War,

hello. The government gives in. The military, of course, is much more sympathetic to business. They feel more comfortable with them. They're the same kind of boys. (Laughs.)

The railroad industry didn't like what I was doing. They brought in their own people with Dun & Bradstreet reports. Everything, they said, was fine. My report remained downstairs. One day, Bernard Baruch shows up. He starts to yell at the top guys of the War Production Board: "You guys aren't doing anything. You're not prepared. There's not enough steel, not enough copper, not enough aluminum." So they rushed down and got me to come up with my report. To show him they were thinking about it. (Laughs.) That's the only time they ever paid any attention to my reports.

One of my early reports showed that there won't be enough railroad cars to move the wheat, the iron ore, the coal because an awful lot of cars were in disuse, needed repairs. We must build more cars. Otherwise, when push comes to shove, there'll be no way to move things around unless we have government controls. Well, do you know that my report, an internal report, was used by the Association of American Railroads in full-page ads in the *Washington Post*, all over? Scare headlines: Socialism proposed by the government.

Pearl Harbor comes along. We're at war. A system of controls of raw material is set up. According to priorities. At that point, guys from the Association of American Railroads come to see me. They want to wine and dine me. They say, "You understand our problem. Will you help us get our allocation of steel? Otherwise, we can't repair the cars." I did help them. But do you know they were so stupid, they never really did it right, as far as I'm concerned. There's resistance in industry to the idea of planning. Comes the big crisis, they'll learn.

We were a group of young people, idealistic, who came in with the New Deal. We were not career-minded. When it came to the New Deal, we carried out its basic principles. When it came to the war, it was to win it. That meant getting production out. It was as simple as that. Though we worked with big industrialists, we were not subservient to them. We understood their problems, but we had the nerve to fight 'em on policy matters. . . .

The most single important legacy of the war is what Eisenhower warned us about in his farewell speech: the military-industrial complex. In the past, there were business representatives in Washington, but now they are Washington. And with the military buildup beyond all our imagination, we have a new fusion of power. It has become a permanent feature of American life.

E) Harry S Truman Recalls His Work on the Senate Committee to Investigate the National Defense Program (The Truman Committee)

I started my second term as junior senator from Missouri on January 3, 1941. . . . After we had appropriated about twenty-five billions of dollars for national defense I took my old coupe and began inspecting camp construction and naval installations from Maine to Florida and from Pennsylvania to New Mexico. Some 30,000 miles were covered. This while the bitter Missouri election campaign [of 1940, which Truman won] was on also.

On February 18, 1941 I made a statement to the Senate on what I'd seen, and asked that a special committee be authorized to look into defense expenditures. I believe that statement resulted in the saving of billions of the taxpayers' money and thousands of lives of our fighting men.

A great deal of difficulty was experienced in getting the Committee on Audit and Control to authorize funds after the Military Affairs Committee had decided that a special committee to investigate the defense program ought to be authorized. [Democratic Senator for South Carolina] James F. Byrnes was chairman of the Committee on Audit and Control. He is a very cagey politician and he was afraid that the junior senator from Missouri [Truman] wanted a political weapon, although he'd just been returned to the Senate for another six years and could afford to be a statesman for at least four years. Mr. Byrnes finally agreed to give the committee the munificent sum of \$15,000 to investigate the expenditure of \$25 billion. The vice president [Henry A. Wallace] appointed the committee of seven senators with Truman as chairman and we went to work.

The committee was made up of five Democrats and two Republicans. If my memory is not at fault Senators Connally, Hayden, Wallgren, Mead and Truman were the majority members and Senators Ball and Brewster the minority. Senator Hayden couldn't serve because of his duties on the Appropriations Committee and chairman of the Joint Committee on Printing.

The first problem was the selection of a committee counsel. . . . [I] had some ideas on the subject of a counselor and before making a decision, having had some administrative experience in presiding over the county court in Jackson County, [Missouri] I knew what a vital part of the administrative procedure a counselor could be. So I made a trip down the Avenue to see the attorney general, who at that time was the Honorable Robert H. Jackson. He is a great man—was a

great attorney general and has made an able justice of the Supreme Court. I told the attorney general that I wanted a counselor for the new Special Committee to Investigate the National Defense Program; that I wanted an able lawyer, one who knew a fact when he saw one and that I wanted him to be able to prosecute a case to its conclusion, if prosecution became necessary, without being a persecutor. I wanted him to get the facts, question witnesses and advise the committee, but that policy would be decided by the committee itself. Jackson told me that such a man was impossible to find but he would try to get me one.

Mr. Hugh Fulton was recommended by Attorney General Jackson, was employed by the committee, and met the specifications. From first to last he did a real job. So with a good counselor and seven senators who wanted results in the war effort we had excellent results. We made no statements unless we had the facts. We wanted no one smeared or whitewashed and after two years of very hard work the committee had a national reputation for energy and integrity.

We saw the seamy side of the war effort. We had to investigate crooked contractors on camp construction, airplane engine manufacturers who made faulty ones, steel plate factories which cheated, and hundreds of other such sordid and unpatriotic ventures. We investigated procurement, labor hoarding, army and navy waste in food and other supplies. But when we were coming to our conclusion, we all decided that by and large the greatest production and war preparation job in history had been done.

We looked into rubber and made a report on it in May, 1941, which resulted in the Baruch plan. We found cartel agreements by the great oil and aluminum companies which were helpful to the enemy, and we found labor leaders who were willing to sacrifice the country for their own aggrandizement. Publicity is the best antidote for this sort of thing and the committee acted as a sounding board to the country. We made some thirty reports over a three-year period and due to the painstaking care with which facts were assembled and presented not one report contained minority views.

4.2. The United States Home Front

The U.S. Home Front in World War II

Most Americans did not serve overseas during World War II but remained at home, generally thousands of miles from the fighting. Unlike most of the populace of Europe and Asia, the average American civilian had no direct contact with actual war: no fighting took place in the United States, nor was the country subjected to bombing raids as were Great Britain and even, for a while, Australia. This did not mean, however, that the war had no domestic impact. From early 1941 onward, after President Franklin D. Roosevelt christened his country the “Arsenal of Democracy,” priorities boards allocated limited resources to industries producing for the war effort. Rationing of some scarce materials came into force in 1943: gasoline, rubber tires, shoes, and some foodstuffs, including coffee and meat. Other materials, though not necessarily rationed, were often in short supply and, though the war brought full employment, there was relatively little for Americans to spend their money on, as production for the war effort took priority over consumer goods. Many large consumer items—automobiles and household appliances—were soon unavailable. Manufacturers produced “utility” dresses and shoes, deliberately designed to stretch the available fabric and leather as far as possible; and buying and wearing these products rather than more voluminous and perhaps more flattering models became a patriotic act. The government exhorted citizens to exercise economy in every way, so as to conserve valuable food and raw materials: to grow their own fruit and vegetables in “Victory Gardens” and preserve these for the winter, to save tinfoil, scrap metals, rubber, paper, fabric, and fat, to give neighbors lifts or take public transportation, thereby conserving essential rubber and gasoline, and, rather than throwing out old clothes, to repair and refurbish them, or to use their fabric or unravel their wool to make new ones. Knitting or producing homemade children’s clothes on a sewing

machine, ideally by recycling materials one already possessed, thus came to be considered useful contributions to the war effort.

Americans were also asked to invest their savings in the war. The immediate direct cost of the war to the United States was \$381 billion, of which less than half, about 44 percent, was covered by direct taxation. By 1943, tax rates had been increased both up and down, as the wealthy and corporations were expected to pay higher taxes, but the lower and middle classes were also brought within the system, and withholding taxes on wages was introduced for the first time. Even so, the American national debt quintupled during the war, from \$50 billion to \$260 billion. The government borrowed to cover the remaining cost of the war. About \$135 billion of war costs, perhaps a third of the total, came from sales of government war bonds to both corporations and individuals, although individual purchases only amounted to a quarter of these overall. Though some Roosevelt administration officials recommended the introduction of a compulsory wartime savings program, Treasury Secretary Henry J. Morgenthau Jr. preferred to rely on voluntary sales campaigns using Hollywood celebrities, spectacular displays, stunts, and gimmicks. To attract small buyers who might otherwise have been unable to afford them, war bonds included E-bonds, a series sold in small denominations that bore interest at guaranteed rates and could be redeemed before maturity and purchased through employer-administered payroll savings programs. Seven war-loan drives, intensive sales campaigns each lasting a month and introducing a new series of bonds, were held during the war. The first, in December 1942, netted \$12.9 billion, and by 1944, war E-bond sales absorbed 7.1 percent of personal income after taxes.

The domestic impact of war in the United States should not, however, be exaggerated. Tax rates were far lower than in most of the belligerent countries. Shortages were rarely overly acute, and when they were, the government stepped in to address the problem. There was a black market in rationed or unavailable commodities, even if only one in five Americans were prepared to tell an interviewer that buying scarce goods at high black market prices could on occasion be acceptable. Although many families faced the prospect that a much-loved relative or friend might die in war, with 500,000 Americans dead in the war and around the same number wounded, these numbers were far lower in proportion to the population than those suffered in most other belligerent countries. American civilians never faced the serious prospect of invasion, occupation, or physical danger that the conflict represented to most other countries engaged. In 1943, halfway through the war, two-thirds of Americans, many of whom had undoubtedly been making the expected contributions to the war effort, felt that they had not been called upon to make any real sacrifices.

About the Documents

The three documents here are each different in nature. The first is a short memoir written many years after the event by one of the editors of a book on the American wartime home front that was published fifty years after the war ended. It gives an almost classic picture of that experience as seen through the eyes of a small boy, mentioning Spam, Victory gardens, canning, listening to the radio news, rationing, war bonds, civil defense, air-raid drills, and stars in windows to indicate family members serving in the armed forces. Robert Heide and his family lived in Irvington, New Jersey, a typical American small town of its time. Several members of the family served in the war, and one of his cousins died. His mother did not work outside the home, but his unmarried older sister did, and his father was working for the defense industry. As with most personal recollections of this kind, Heide remembers in detail one or two high points, especially hearing the news of his cousin's death, and much of the general atmosphere of the time. His recollections of the war years, which encapsulate all the major traditional features of the period, might seem almost too stereotypical to be true. It is worth remembering, however, that stereotypes often emerge in part because, though not necessarily true of all, they do represent the experiences of a substantial number. In this case, Heide's own vivid memories of the war years, clearly an important and notable period of his life as far as he was concerned, were a major reason why he was personally interested in putting together a book on the subject.

The second document is an example of government-sponsored efforts to persuade Americans to support the war effort by buying war bonds, campaigns facilitated by the fact that, since most production was devoted to the war effort, consumers had relatively little else on which to spend their money. Although purchases were voluntary, much moral pressure was exerted to persuade the general public that it was their patriotic duty to buy as many war bonds as they could afford and, moreover, that these represented an excellent investment for the future. Not only were most Americans making good wages for the first time in a decade, often in war-related jobs, but farmers, too, were enjoying unwonted prosperity after the hardships of the 1930s, with the government demanding all they could produce in order to feed Americans at home or in the army, or to be sent via Lend-Lease programs to U.S. Allies overseas. On 3 August 1942, Evan Griffith, administrator of the state's War Savings Staff, sent out an appeal to Kansas farmers urging them to buy war bonds for reasons of both patriotism and self-interest, a missive strategically timed to arrive about the same time that their profits from the recent agricultural harvest began to come in. Once the war was over, he suggested, farmers would be able to cash in their bonds and use the proceeds to buy "cars and tires and farm machinery," items that were not then available for general purchase.

Griffith's appeal to buy war bonds was one form of American government propaganda. The third document, an article by the journalist Elsie McCormick, published in the high-circulation middlebrow magazine *The Reader's Digest*, is an example of another type, a supposedly independent piece by a friendly author, setting out the government's case. It also provides evidence of how much less rigorously rationing and priorities were enforced in the United States than in most of the warring countries. In Great Britain, for example, the general population rarely saw oranges and bananas during the war except as gifts from American servicemen.

The priorities that war-related industries received in obtaining scarce raw materials and other commodities meant that in practice, even in the United States, by 1943 there were major shortages of items civilians often considered vital—diapers, safety pins, garbage and milk cans, rope, baby clothes, baby carriages, refrigerator parts, rat-traps, umbrellas, cutlery, steel wool, and needles. The government, which always had one eye on the election cycle, was not anxious to irritate American consumers unduly, especially when many knew that much of the production of U.S. factories was being shipped to other countries. As a matter of morale, therefore, in April 1943, the Roosevelt administration established an Office of Civilian Requirements (OCR) to attend to civilian needs. McCormick described this office's establishment and the efforts it made to remedy the shortages of such goods, all of which were presented as in some way essential to the efficient prosecution of the war effort. She also highlighted the OCR's campaign to increase production of clothing, especially nonluxury items, by raising textile output and using materials that could not be employed for war-related purposes, and even to maintain supplies of cosmetics, which the OCR "regard[ed] as important morale items." In addition, McCormick briefly mentioned its efforts to standardize production of such items as doorknobs, gas stoves, and dental drills, and to develop substitutes for others, including bed-springs and hairpins, all of which would release additional materials for the armed services. The article's overall thrust was to reassure American civilians that the sacrifices demanded of them would not be too great, since the government believed it essential to the effectiveness of the war effort itself to ensure them dependable supplies of those "things necessary to keep the home front in a state of health, efficiency and high morale."

A) Recollections of Robert Heide

For a boy living through the unsteady times of World War II in a small town in the United States, I remember the intense family togetherness mixed with feelings of sweet sadness, a

hopeful yearning for a peaceful future, and the directive that permeated everything: WE HAD TO WIN THE WAR! . . .

Irvington, New Jersey, where I grew up was typical of most small middle-class towns across America during the World War II years . . . A great number of German immigrants including my father Ludwig and mother Olga had settled in towns like Irvington or the bordering town of Union in the 'teens and twenties. Grandparents, aunts, uncles, cousins, and family friends often then referred to Europe as "the old country" and looked hopefully to America as a land of promise and opportunity. As U.S. citizens their loyalties had been given over to "the new country." To our extended German-American family Adolf Hitler was seen as a monster menace who was causing havoc in Europe, a terrible threat to the free world we now inhabited. Sons and sometimes daughters enlisted or were being drafted into the service to fight a "home" country in the grip of a Nazi party. My brother Walter, who turned eighteen during the war, joined the Army Air Force to become a tail-gunner on a bomber that flew many dangerous missions over Italy and Germany. Cousin Sonny became an Army Paratrooper and later joined the Navy full-time and another cousin, Teddy, went into the infantry.

For the war's duration we kept a small banner in our front window for my brother. A blue star against a white satin background framed in a red-felt border showed the world and passersby that our house like many other houses had a son—or daughter for that matter—on active duty in the service. Some banners had more than one blue star on a field of white; and if a serviceman lost his life in battle, a banner with a gold star was hung in the window, a symbol of the utmost sacrifice.

During the war my father, who had previously been a tool-and-dye-maker, contracted to do defense work for the Singer Company (manufacturers of sewing machines) in Elizabeth, New Jersey. My sister Evelyn worked part-time after high school at Uncle Fred's new stainless-steel diner located next to a gas station in the Vailsburg section of Newark. Following her job as a part-time diner-girl-waitress and after graduating from Frank Morell High School, Evelyn decided to accept an office position at the Prudential Insurance Company in downtown Newark. There she purchased savings bonds and a hopechest, and began making her own suits and dresses on her Singer sewing machine from sendaway fashion magazine patterns.

The home-front housewife activities accomplished by my mother, other than grocery shopping, cooking, washing, ironing, scrubbing floors, and cleaning windows, were knitting khaki-colored scarves, sweaters, and socks for the boys in camp or on overseas duty. Once a week a group of women, including my aunts Martha, Alma, and Great Aunt Gussie, would get together along with my mother at one another's homes to knit, gossip, play card games, and exchange wartime home recipes over perked Bokar coffee and homemade baked goods.

Spring, summer, and fall my father's spare time went into tending a Victory garden in our backyard. Each season would yield red ripe and yellow tomatoes, carrots, beets, lettuce, and other vegetables in great abundance. Some were given to our neighbors; but much of it would be cooked up by my mother to be preserved in glass-sealed Macon jars which were stored in the cellar pantry. My mother dressed for this chore in a flower print housedress, a plaid, floral, or checkered patterned apron, and always wore a hairnet to protect her tight permanent-wave hairdo. She regarded her Victory canning as serious work.

At that time few homes had freezing compartments although a company called Bird's-Eye began packaging frozen vegetables that easily fit into the freezing compartment of a Frigidaire, and could be purchased at the A & P. My mother's kitchen pantry was well stocked with canned goods and often at lunch she would serve Campbell's soup with a bologna, egg-salad, or tuna fish sandwich. Like artist Andy Warhol, a wartime baby who later transformed the label into a pop-art icon, I practically grew up on Campbell's "condensed" soups. Sometimes an entire meal would be served up out of a can. Canned Spam or a meat product called Treet could be pan-fried in Spry or Crisco or baked, just like a real ham, in the oven with slices of Dole canned Hawaiian pineapple. These cheap wartime meat products would then be sliced and put on a plate next to cost-saving, out-of-the-can Del Monte peas, Franco-American spaghetti, or Heinz baked beans.

Wartime regulation ration stamps seemed to confuse my mother and the grocer as well; but everyone made an effort to do their very best for the sake of Victory. Waste fat or bacon or chicken was saved and taken to the butcher, supposedly to be used in the making of bombs. (To this day, I'm not sure how.) Because meat was scarce we seldom had steaks, which were particularly hard to come by. For the most part, it was meatloaf, chicken, fricassee, beef stew (with potatoes and carrots), and an occasional pot roast, roast pork, or a roast chicken on Sundays. If fresh vegetables were used, like string beans or broccoli, they were always overcooked and unappetizing. Meat was stretched out; but there were always massive bowls of mashed potatoes to fill us up.

When my father came home from work at 5:30 P.M., it was supertime. Afterwards the family would gather together in the living room which was dimly lit with 25-watt light bulbs to save on energy. . . .

Entertaining and being hospitable to men in the service who were on leave or about to be shipped out overseas was considered almost a patriotic duty; and when my sister Evelyn and cousin Doris went out to one of these servicemen's dances it all seemed to be in good fun. True, there was the hope chest filled with blankets, curtains, and even a compartment for war bonds; and there was behind it the dream

of a married life off in the future. There would be tears in the eyes of the two girls as they talked quietly of a young man they had met and might never see again. Feelings of longing and loneliness were always just beneath the sparkling surface of upswept hairdos and cherry-red lips as the girls prepared to go out. . . .

One night the family was gathered around the console radio listening to a broadcast, when I heard the sound of a jalopy pulling into the driveway. Out of the window I could see my aunt and uncle in their 1928 Ford. When I opened the door Aunt Alma was standing there clutching a yellow envelope, tears rolling down her cheeks. Aunt Alma handed my mother the telegram which read: “We regret to inform you that . . .” It seemed that no one uttered a single word for a long period of time. Evelyn turned down the radio; and there was a choking silence. We were dumbstruck and bewildered, unable to explain why Teddy, out of so many, was one of the unlucky ones. The next time we went to visit Aunt Alma and Uncle Louie, a single gold star on a banner hung in the window. Teddy left behind his bereft parents, two sisters, Mildred and Gertrude, and a war bride with a newborn baby girl.

I remember the sense of unity the war seemed to bring to families like my own on the home front. Neighbors and teachers became Civil Defense officers, purchasing their uniforms from local dry goods or department stores. During trial air raids, which seemed all too real to me, we would sit silently on the floor as my mother and father pulled the blackout drapes across the windows. Until the sirens stopped, or an announcer on the radio station told us the air raid drill was over, we remained motionless and silent. I would sometimes imagine that a bomb was falling and would hide under my bed with Jiggs [the family dog]. I remember during kindergarten and grade school being led with my other classmates by my teacher to a sub-basement area during one of these trial raids. All the children were fearful that the enemy might drop a bomb on their school.

B) Evan Griffith, Appeal to Buy War Bonds, 3 August 1942

TO THE FARMERS OF KANSAS:

Your own sons and neighbors are fighting on foreign battle fields to hold back the Japs and Hitler. Millions of other American boys are being trained for overseas service. These men cannot fight bare-handed. They must have guns and tanks and ships and planes—which cost a lot of money. We

must supply these war implements in a hurry. We must win, and the sooner we win, the fewer American boys will be killed.

Farmers, like all Americans, have obligations to meet and families to support. Crop failures have occurred frequently in recent years. Some sections are just now recovering from the effects of drouth and depression years. This year, again, adverse weather conditions have hurt some localities. Farming in Kansas certainly has not been profitable for everyone every year. Still, the Kansas farmer has kept his faith in the “good earth” of Kansas—and that faith now is paying dividends. It appears that farm income for Kansas this year will be more than in any year since 1929—and I am writing to ask you to buy all of the War Bonds you possibly can. You can buy these Bonds through your banker, postmaster, building and loan association and many of our merchants.

You help win the war . . . you’re backing the boys in the service . . . when you Buy War Bonds.

War Bonds are the soundest investment on earth . . . you are always guaranteed at least what you pay for them, plus interest . . . War bonds can be cashed in at any time after sixty days . . . they are a liquid asset, like wheat in the bin.

We all realize that we can’t buy cars and tires and farm machinery . . . but we can convert Bonds into cash for farm machinery and other necessary articles when the war is over and these articles are available again.

C) Elsie McCormick, “Essential Civilian Needs Will Be Met”

By last spring, war demands had made such inroads into essential civilian supplies that something had to be done about it. In many parts of the country such homely but necessary articles as diapers, denim work clothes and garbage cans had almost completely disappeared. Safety pins were so scarce that in some towns policemen collected them from door to door for maternity hospitals. Dairymen were killing cows because they could not get milk cans. Rope was so scarce that some ranchers in Oklahoma threatened to break into a store and take a supply frozen by priority regulations.

To help the forgotten men and women on the home front, the War Production Board last April organized an Office of Civilian Requirements, and placed at its head soft-voiced but iron-willed Arthur D. Whiteside, president of Dun and Brad-

street. Under him, the OCR has fought vigorously to relieve shortages that might damage health, morale, and efficiency.

The OCR can claim allotments of raw materials for making essential civilian goods, have them sent to manufacturers, and then so earmark the goods that, except in a real emergency, not even war industry or the armed forces can take them away from the ordinary buyer. Its sphere includes practically everything except food, fuel and rubber.

One of the first emergencies faced by OCR concerned the American baby. The 1942 diaper supply had been 10,000,000 yards less than requirements and the birth rate was zooming. The looms that had made diaper cloth were busy turning out cotton bags for farm produce and army supplies, as substitutes for the burlap that could no longer be had from India. In addition, war factories were buying diapers in huge quantities for use in wiping off machines.

The OCR allocated enough looms for diaper production to bring the supply to near normal and forbade the sale of the cloth for factory rags. Meanwhile, clearing the Mediterranean sea lanes has opened the short route from India and the first shipments of an order for 850,000,000 yards of burlap are on the way.

Sixty percent of the safety-pin supply had been taken for the hospital needs of the army and navy. In addition, the batiste once popular for infants' clothing was being used in balloons; and baby carriages were being bought up by munitions plants, where their soft springs assured the safe handling of sensitive explosives.

The OCR doubled the allotment of steel for safety pins; captured some material for baby clothes; and arranged for the manufacture of more baby carriages. Reports from the field soon indicated that the new carriage, using only six pounds of steel, was not a success. Mothers were overloading them with groceries crammed in alongside the baby, and the wooden wheels buckled. The OCR has now claimed more steel for each carriage. In addition it has provided for twins, overlooked in the original order.

The OCR is one of the few government agencies that doesn't smother its public under questionnaires dreamed up by desk men in Washington. Its field investigators talk and listen to war workers, farmers and housewives all over the country, in informal, friendly fashion. It receives hundreds of letters describing cases of individual hardship. It has 21 "listening posts" throughout the country to spot local shortages in the early stages; it then rushes the needed articles into that area.

One important thing learned by the OCR has been the disastrous effects of irregular ice deliveries and the breakdown of mechanical refrigerators. The consequent spoilage of food—wasteful in itself—has meant more garbage, which, coupled with the scarcity of garbage cans, brought a danger-

ous increase in rats. Lack of spring wire led to a shortage of rat-traps.

The OCR is having refrigerator repair parts made by smaller war plants not working at capacity. Since the number of refrigerator servicemen has dropped from 16,000 to about 5300, local draft boards have been asked to defer such workers for several months. Meanwhile the electrical industry has begun a program of training new men.

The garbage cans, it turned out, were being bought by war plants to hold tools, small machine parts and greasy rags. Now plants no longer buy garbage cans on priorities, and the OCR is claiming more galvanized iron to help tide over the shortage. And the amount of steel for rat-traps has been almost doubled.

Cutting the umbrella output to 30 percent of normal resulted in illness and absenteeism among the millions of people who used to ride in cars but now often wait in the rain for buses. So the shortage of umbrellas is being relieved.

More steel wool is going to be made, too, because OCR investigators found that housewives often complained more about this shortage than any other. In homes where the kitchens serve as living rooms, rows of gleaming pots and pans are a great source of pride. The steel wool to keep them shining will be made out of wire scrap, not needed as war material.

The fact that more silver-plated flatware is to be manufactured will be good news to restaurant owners. Purchases by the army and navy, and diversion of the industry to making everything from Ranger knives to magnesium bombs, cut the total for consumers to about one sixth of normal. The pinch was felt chiefly in factory areas where thousands of people were establishing new homes. Thefts of cutlery from restaurants became so common that some eating places were severely handicapped.

No steel has been claimed for needles. We have never made needles for hand sewing. Our entire supply came from England and Japan and we are still getting needles from both countries. The Japanese needles are reaching us from indirect sources.

The OCR has successfully avoided clothes rationing. Many textile mills are being put on a three-shift basis, and enough material for essential needs is now assured. Luxury garments will be scarcer than cheap ones. There are fewer rayon dresses because rayon makes a good parachute for fragmentation bombs or for food supplies and ammunition floated down to isolated outposts. Dresses of heavy, solid colors are being replaced by prints and pastels, because the coal-tar derivatives from which dyes are made are in demand for TNT, synthetic rubber and aviation gasoline. There is no real scarcity of cosmetics. The OCR regards them as important morale items, and maintains their production.

By working with manufacturers and with other WPB departments to simplify styles and use substitutes, the OCR has also released large amounts of materials for the armed services. For instance, the 27,000 varieties of door-knobs and other formers of builders' hardware of prewar days have been reduced to only 3600. There are now fewer styles of incandescent lighting fixtures, and only one type of domestic gas stove. Your dentist's choice of burrs for drilling teeth has been reduced from 75 to 34.

Substitutes developed by WPB's Office of Production Research and Development, with the help of about 200 laboratories throughout the country, include waterproof baby pants, an efficient kitchen utensil cleaner made of bamboo and reeds, a coiled rawhide bedspring, a hairpin made of wood, and an all-clay stove.

The OCR is not trying to maintain civilians in their accustomed style. But Mr. Whiteside believes that without things necessary to keep the home front in a state of health, efficiency and high morale, the way to victory might be seriously impeded.

4.3. Race in the Wartime United States

African Americans and World War II

When World War II began, African Americans in the United States invariably faced pervasive discrimination, both formal and informal. In the southern states, formal legislative controls forced blacks to use public facilities that were separate from—and almost invariably inferior to—those provided for whites. These “Jim Crow” restrictions covered public schools, hospitals, transportation, restaurants, sports facilities, cinemas, bathrooms, and hotels. Poll taxes, literacy clauses, and other devices, backed up by violence, also made it very difficult for African Americans in the South to vote, and they had virtually no chance of winning elections themselves. The majority of southern blacks were agricultural workers or sharecroppers. Lynchings of “uppity” blacks who questioned this system remained quite common. In both the North and South, African Americans were largely restricted to menial jobs, as servants, janitors, porters, tram conductors, and the like. Few were admitted to prestigious educational institutions, the professions, or responsible business positions, and those who did win success often did so in almost all-black institutions and organizations. Few if any private clubs welcomed blacks, and many housing developments were restricted to whites only.

During the 1930s, President Franklin D. Roosevelt's New Deal offered limited but still substantial public assistance to American blacks, whose poverty and unemployment rates far surpassed those of whites. In several well-publicized incidents, his wife, Eleanor, publicly opposed racial discrimination. Roosevelt himself, however, invariably expressed deep sympathy but refused to take direct action against racism, even if only by sponsoring antilynching legislation; he cited the need to win support from influential southern Democratic senators and congressmen, almost all of whom were staunchly segregationist, first for his domestic New Deal policies and then for his wartime measures.

World War II itself gave a substantial boost to black activism, effectively kick starting what grew into the civil rights movement of the 1950s and 1960s. The stated values of the United States, as proclaimed in its liberal war aims, made the Roosevelt administration vulnerable to demands by African Americans, who constituted around 10 percent of the country's population, for legal equality and the end of segregation and discrimination. So, too, did Japanese characterizations of the United States as a racist nation where all nonwhites were second-class citizens. The requirements of war brought major demographic and employment changes to the black community, which in turn helped to generate

African American demands for equality with whites. In response to the American economy's need for manpower, 700,000 African Americans migrated from the agrarian southern states to take factory jobs in the large industrial conurbations of both the South and the North. Many defense contractors initially refused to hire them, and in 1942, blacks held only 3 percent of all jobs in defense industries, but by 1945, the proportion had grown to 8 percent. One million black Americans, of whom two-thirds were women, took new industrial jobs during the war, and the number of skilled black workers doubled, though most were still concentrated in unskilled positions, and relatively few were even considered for managerial and white-collar positions.

Some of these changes reflected greater activism within the black community itself. In the first half of 1941, A. Philip Randolph, a longtime African American activist who headed the labor union the Brotherhood of Sleeping Car Porters, a traditionally black occupation, took advantage of the wartime crisis to put pressure on Washington. He announced plans to hold a march on Washington, in which 100,000 African Americans would publicly protest racial segregation and their exclusion from wartime jobs. Such an event would have been exceptionally embarrassing to the Roosevelt administration's efforts to portray the United States as the opponent of totalitarian racism and brutality and the champion of democracy, equality, and the Four Freedoms. More than 20 years later, in 1963, the celebrated March on Washington actually did take place, headed by the black activist the Reverend Martin Luther King Jr., a gathering largely organized by Randolph and at which he himself also spoke. In the shorter term, Randolph called off the 1941 march, and in return for this concession, on 25 June 1941, Roosevelt issued Executive Order 8802, outlawing discrimination by government agencies, in job training programs, and in the employment of defense workers in any industrial plant awarded government defense contracts. The order also established an agency, the Fair Employment Practices Commission (FEPC), to supervise and enforce the implementation of Executive Order 8802.

In practice, these measures often proved ineffective, as Congress refused to vote the FEPC sufficient funds to enforce the order's provisions and dismantled the agency altogether in 1946, and the War Department normally refused to penalize or blacklist businesses that contravened the order, since it gave the efficient fulfillment of war contracts priority over efforts to combat racism. Even so, the government had finally taken a decisive public stance against racial discrimination in employment, a symbolic move of great importance. Black federal government employees increased from 60,000 to 200,000 during the war, increasingly at higher levels, though many still held menial positions. In the course of the war, the National War Labor Board prohibited the payment of differential wages

based on race, so that all workers doing the same job should now receive the same pay; the U.S. Employment Service ceased accepting job requests that specified one particular race; and the National Labor Relations Board refused to certify labor unions that excluded minorities. As more African Americans were hired, increasing numbers of employers stated that they found their work satisfactory. Average wages for black urban workers doubled, rising from \$400 to \$1,000 per year, and the average black family income also increased, while the take home pay of such heavily African American occupations janitors, truck-drivers, and Pullman porters rose by 50 to 80 percent. Wartime progress should not be exaggerated. The median income of black families remained approximately half that for whites; within labor unions, racial discrimination was still rife; and many employers only gave token compliance to Executive Order 8802. African Americans were still disproportionately concentrated in lower-level occupations. When the war ended, African Americans constituted 27.6 percent of all laborers, 21.1 percent of farm workers, 21.9 percent of service workers, and 75 percent of domestic servants, but only 3.6 percent of craftsmen and foremen, and they held only 3.3 percent of professional and technical positions and 2.8 percent of clerical and sales jobs.

Within the military, discrimination also remained pervasive, though there, too, World War II brought significant changes. More than 1 million African Americans served in the armed forces, representing 8 percent of the country's military personnel, and many felt that they were fighting a double battle, seeking victory against fascism abroad but also victory against racism and segregation at home. American military policies discriminated heavily against African Americans, in part because under the Constitution, the right to bear arms implied full citizenship, a status still effectively denied black Americans. In 1940, the Marines and Air Corps would not even accept them, the navy would only take them as messmen, and the army segregated them rigidly in separate combat and noncombat units, with the emphasis on the latter. Seventy-eight percent of blacks but only 40 percent of whites were in service units, where they often performed difficult and dangerous tasks but lacked the acclaim and recognition of combat troops. Whereas white officers commanded black combat units, black officers could only serve in segregated black service or reserve units and were not permitted to command white troops. The military leadership was initially reluctant to send black troops overseas, fearing that an egalitarian reception in other countries might send them home discontented with their own. Many army training camps were sited in the rigidly separatist southern states, where their facilities were segregated and black soldiers were liable to additional harassment and discrimination.

Civilian and military officials alike initially argued that blacks made inherently poorer soldiers and that in any case,

the stresses and demands of winning the war precluded any risky experiments with desegregation, which they feared might damage the morale of the white majority of soldiers. Nonetheless, pressures for change mounted, placing the military under escalating compulsion to demonstrate its commitment to equality and democracy. Understandably, many black soldiers deeply resented these policies of discrimination and challenged them as individuals and units. Civil rights activists also assailed military segregation, and the pressures of waging war efficiently also did much to erode discriminatory practices, which came to seem a liability in winning the war. From April 1942 onward, the navy changed its policies, admitting blacks for general labor service and eventually integrating several ships, on which African Americans served as radio and gunnery specialists. Twenty-two black combat units fought in Europe, and after the Battle of the Bulge decimated various all-white infantry regiments, 2,500 African Americans were formed into platoons that joined white companies. In July 1941, the Air Corps also established a black training program at Tuskegee, Alabama, that eventually graduated 992 pilots, including those who made up the famous all-black 99th Fighter Squadron and 332d Fighter Group. In combat, African Americans generally performed at least as well as whites, receiving more than 12,000 decorations and citations.

By the time World War II ended, American blacks had become far more militant and self-aware than in 1940. Membership in the National Association for the Advancement of Colored People (NAACP) increased from 50,000 to 500,000, and a new organization, the interracial Congress of Racial Equality, also came into existence. Young African Americans in particular participated in boycotts and picketing against racist businesses, and many blacks were consciously committed to the Double V for Victory campaign. In 1944, the Supreme Court declared all-white primaries, common in many southern states, unconstitutional, and the NAACP prepared to mount legal challenges to other segregationist practices. Blacks had become an important presence in most urban centers, and helping to defend their country energized many returning African American servicemen, who had claimed substantial educational and housing benefits under the GI Bill of Rights, to stand up for their rights at home. Though still doggedly opposed by many Americans, by the time the war ended, civil rights and the struggle for black equality had become part of the national liberal agenda.

About the Author

Born the son of a Florida Methodist minister, A. Philip Randolph moved to New York as a young man, where he studied economics and philosophy at New York City College. He later joined the Socialist Party, ran unsuccessfully for several city political posts, and lectured at the Rand School of Social

Science. In 1917, Randolph founded a magazine that campaigned for black civil rights and also urged African Americans not to join the army. During the 1920s, Randolph organized black workers in laundries, the garment trade, and movie theaters, and in 1929, he founded what became the first successful black labor union, the Brotherhood of Sleeping Car Porters (BSCP). In the mid-1930s, the failure of the American Federation of Labor (AFL) to act against racial discrimination among its membership led him to switch the BSCP to the newly formed Congress of Industrial Organizations (CIO). Randolph perceived World War II as offering an excellent opportunity to demand government action against racial discrimination. Once the war ended, he spearheaded the successful campaign to desegregate the U.S. military, which President Harry S. Truman did by executive order in July 1948. Randolph later served as a vice president of the merged AFL-CIO, and from 1960 to 1966 was president of the Negro American Labor Council. In this position, he took the lead in organizing the 1963 March on Washington for Jobs and Freedom, the occasion on which Martin Luther King Jr. delivered his famous "I Have a Dream" speech.

About the Documents

The three documents included here are each entirely different in nature. The first is an article by a political activist, advocating a particular cause; the second a government statement; and the third a personal oral history reminiscence. All, however, relate to the same subject, the treatment of African Americans during World War II, a subject into which each in various ways provides valuable insight.

By 1942, Randolph was a prominent public figure and a leader of the African American community. Randolph and much of the black press interpreted Roosevelt's decision to issue Executive Order 8802 as evidence that the tactics of threats and public action were more effective than simple moral appeals in winning concrete gains on civil rights. He therefore launched a program of massive but nonviolent public meetings to protest racial discrimination in the United States and warned that if necessary, he was still prepared to mount a march on Washington for this purpose. This article and the attached program, published in the progressive journal *The Survey Graphic* in November 1942, provided a clear and concise statement of the objectives toward which Randolph believed African Americans should work and the reasons he believed the U.S. government should support them. His program demanded the complete eradication of racial discrimination and segregation from American life. Essentially, he argued that it was impossible to fight for democracy abroad without also implementing democracy at home. If black Americans did not believe that they were fighting for the latter, they would also be extremely unenthusiastic in fighting for the former. As a good socialist, Randolph also

opposed imperialism abroad, especially since he perceived it as another example of white domination of dark peoples. During the war, his stance gradually became more radical, and in summer 1943, he called for further large civil rights demonstrations in 26 major American cities. By that time, he also advocated acts of civil disobedience, including black boycotts of segregated railroad trains, weeklong withdrawals of black children from “Jim Crow” public schools, and ostentatious black patronage of predominantly white hotels, restaurants, and other social centers in northern cities. At the time, many African Americans felt that Randolph’s tactics were too radical for wartime and might backfire on them, and for the remainder of the war, the March on Washington Movement was rather in eclipse. Randolph nonetheless set out what would become some of the most effective tactics of the postwar civil rights movement as well as its basic agenda.

Truman K. Gibson’s statement, made on behalf of the secretary of war at an official press conference, demonstrates how seriously the U.S. Army had been forced to address the issue of racial discrimination by the time the war ended. Gibson (1912–1994) was himself an African American, whose family relocated from Atlanta, Georgia, to Columbus, Ohio, in an effort to escape racial violence. He studied law at the University of Chicago, where his roommate was Benjamin O. Davis Jr., who eventually became the first black general in the U.S. Air Force. Gibson practiced law in Chicago, and in 1940, became assistant to William Hastie, the first black civilian aide to Secretary of War Henry L. Stimson, with the primary responsibility of investigating and handling issues relating to black troops. Early in 1943, Gibson replaced Hastie, who had become so dissatisfied with the military’s continued complacency over what top officials openly admitted were discriminatory and unfair segregationist policies that he resigned in January. The fact that Hastie, the first black aide in the War Department, had left under such circumstances perhaps smoothed Gibson’s path; other War Department officials apparently treated his opinions with some respect. Black journalists, however, annoyed by repeated requests from Gibson in 1943 that they tone down stories on racial conflict in the army, suggested that Gibson essentially functioned as an apologist for War Department policies and acquiesced too readily in racial discrimination. From the time Gibson replaced Hastie in the War Department, its policies gradually became more liberal, though even when he made this statement, the army remained a largely segregated force.

Gibson made his statement to newspapermen on behalf of the Press Branch of the War Department Bureau of Public Relations, and it must be understood as being to some extent—like his own appointment—an exercise in political spin. The office, not the man, was speaking. Gibson also had earlier blunders of his own to repair. In early 1945, he was strongly criticized in the black press and characterized as an

“Uncle Tom” for disparaging comments he gave at a press conference on the alleged poor performance in Italy of the all-black 92nd Division. Gibson presented a roseate and by no means entirely frank picture of race relations in the U.S. Army. He sought to emphasize that Allied military leaders in the European campaign were attempting to utilize all their men, whatever their color, as efficiently as possible. In pursuit of human interest, Gibson gave several anecdotal instances of this policy in operation. He also emphasized that black troops had fought exceedingly well and were at least as good as any other troops, that African American nurses were doing an outstanding job, and that the Supreme Command was insistent that there must be no racial discrimination within the Allied forces. Any that had occurred, according to Gibson, was individual, not institutional, in nature. The army, by Gibson’s account, was an integrated force in which blacks and whites were cooperating harmoniously together to win the war.

The individual stories Gibson recounted may well have all been true, but the overall picture he wished to present was primarily an exercise in wishful thinking. Perhaps the greatest significance of his statement was its demonstration that, whereas five years before, the U.S. Army had operated on blatantly segregationist and discriminatory lines, one month before World War II ended in Europe, such attitudes were no longer publicly acceptable. If the American military now felt obliged to portray itself as essentially a racially integrated organization, the actual implementation of such policies could probably not be long delayed. Interestingly, among the more significant factors impelling President Harry S. Truman to desegregate the army in 1948 were the findings and recommendations of a presidential Advisory Committee on Universal Military Training of 1946, a body that included Gibson.

Although Gibson’s official position obliged him to furnish reporters an upbeat account of military interracial cooperation, for much of World War II, racial conflicts bedeviled the U.S. Army. Allen Thompson of Cleveland, Ohio, part black, part Irish, was studying history and political science at Wilberforce University when he was drafted in October 1941. It may well be significant that his grandfather had left the southern state of Mississippi to escape lynching after he had beaten up a white man who was cheating him, an episode that had clearly long since become part of family legend. When army authorities tried to switch Thompson’s all-black unit, the 758th Tank Battalion, from training for tank service to becoming truckers and support troops, the entire group went on hunger strike until they were returned to tank training. Especially in the South, racially motivated fights between black and white soldiers often disturbed the routine of military training camps. In 1943, units of black soldiers clashed repeatedly with white paratroopers at Camp Patrick Henry, Virginia. Thompson recalls one such episode in which a paratrooper died and one black soldier was shot in the leg.

Thompson also assertively challenged racial segregation in Tennessee. Like most oral histories, that of Thompson concentrated on high points and was sometimes vague on details. It did, however, accurately convey not just the pervasiveness of racism within and outside the wartime U.S. Army but also the impact of wartime service in spurring black soldiers to fight discrimination and stand up for themselves.

Primary Source

A) A. Philip Randolph, "Why Should We March?" November 1942

Though I have found no Negroes who want to see the United Nations lose this war, I have found many who, before the war ends, want to see the stuffing knocked out of white supremacy and of empire over subject peoples. American Negroes, involved as we are in the general issues of the conflict, are confronted not with a choice but with the challenge both to win democracy for ourselves at home and to help win the war for democracy the world over.

There is no escape from the horns of this dilemma. There ought not to be escape. For if the war for democracy is not won abroad, the fight for democracy cannot be won at home. If this war cannot be won for the white peoples, it will not be won for the darker races.

Conversely, if freedom and equality are not vouchsafed the peoples of color, the war for democracy will not be won. Unless this double-barreled thesis is accepted and applied, the darker races will never wholeheartedly fight for the victory of the United Nations. That is why those familiar with the thinking of the American Negro have sensed his lack of enthusiasm, whether among the educated or uneducated, rich or poor, professional or nonprofessional, religious or secular, rural or urban, north, south, east or west.

That is why questions are being raised by Negroes in church, labor union and fraternal society; in poolroom, barbershop, schoolroom, hospital, hair-dressing parlor; on college campus, railroad, and bus. One can hear such questions asked as these: What have Negroes to fight for? What's the difference between Hitler and that "cracker" [Governor Eugene] Talmadge of Georgia? Why has a man got to be Jim Crowed to die for democracy? If you haven't got democracy yourself, how can you carry it to somebody else?

What are the reasons for this state of mind? The answer is: discrimination, segregation, Jim Crow. Witness the navy, the army, the air corps; and also government services at Washington. In many parts of the South, Negroes in Uncle Sam's uniform are being put upon, mobbed, sometimes even shot down by civilian and military police, and on occasion lynched. Vested political interests in race prejudice are so deeply entrenched that to them winning the war against Hitler is secondary to preventing Negroes from winning democracy for

themselves. This is worth many divisions to Hitler and Hirohito. While labor, business, and farm are subjected to ceilings and floors and not allowed to carry on as usual, these interests trade in the dangerous business of race hate as usual.

When the defense program began and billions of the taxpayers' money were appropriated for guns, ships, tanks and bombs, Negroes presented themselves for work only to be given the cold shoulder. North as well as South, and despite their qualifications, Negroes were denied skilled employment. Not until their wrath and indignation took the form of a proposed protest march on Washington, scheduled for July 1, 1941, did things begin to move in the form of defense jobs for Negroes. The march was postponed by the timely issuance (June 25, 1941) of the famous Executive Order No. 8802 by President Roosevelt. But this order and the President's Committee on Fair Employment Practice, established thereunder, have as yet only scratched the surface by way of eliminating discriminations on account of race or color in war industry. Both management and labor unions in too many places and in too many ways are still drawing the color line.

It is to meet this situation squarely with direct action that the March on Washington Movement launched its present program of protest mass meetings. Twenty thousand were in attendance at Madison Square Garden, June 16; sixteen thousand in the Coliseum in Chicago, June 26; nine thousand in the City Auditorium of St. Louis, August 14. Meetings of such magnitude were unprecedented among Negroes. The vast throngs were drawn from all walks and levels of Negro life—businessmen, teachers, laundry workers, Pullman porters, waiters, and red caps; preachers, crapshooters, and social workers; jitterbugs and Ph.D's. They came and sat in silence, thinking, applauding only when they considered the truth was told, when they felt strongly that something was going to be done about it.

The March on Washington is essentially a movement of the people. It is all Negro and pro-Negro, but not for that reason anti-white or anti-Semitic, or anti-Catholic, or anti-foreign, or anti-labor. Its major weapon is the non-violent demonstration of Negro mass power. Negro leadership has united back of its drive for jobs and justice. "Whether Negroes should march on Washington, and if so, when?" will be the focus of a forthcoming national conference. For the plan of a protest march has not been abandoned. Its purpose would be to demonstrate that American Negroes are in deadly earnest, and all out for their full rights. No power on earth can cause them today to abandon their fight to wipe out every vestige of second class citizenship and the dual standards that plague them.

A community is democratic only when the humblest and weakest person can enjoy the highest civil, economic, and social rights that the biggest and most powerful possess. To trample on these rights of both Negroes and poor whites is

such a commonplace in the South that it takes readily to anti-social, anti-labor, anti-Semitic and anti-Catholic propaganda. It was because of laxness in enforcing the Weimar constitution in republican Germany that Nazism made headway. Oppression of the Negroes in the United States, like suppression of the Jews in Germany, may open the way for a fascist dictatorship.

By fighting for their rights now, American Negroes are hoping to make America a moral and spiritual arsenal of democracy. Their fight against the poll tax, against lynch law, segregation, and Jim Crow, their fight for economic, political, and social equality, thus becomes part of the global war for freedom.

Program of the March on Washington Movement

1. We demand, in the interest of national unity, the abrogation of every law which makes a distinction in treatment between citizens based on religion, creed, color, or national origin. This means an end to Jim Crow in education, in housing, in transportation and in every other social, economic, and political privilege; and especially, we demand, in the capital of the nation, an end to segregation in public places and in public institutions.
2. We demand legislation to enforce the Fifth and Fourteenth Amendments guaranteeing that no person shall be deprived of life, liberty or property without due process of law, so that the full weight of the national government may be used for the protection of life and thereby may end the disgrace of lynching.
3. We demand the enforcement of the Fourteenth and Fifteenth Amendments and the enactment of the Pepper Poll Tax bill so that all barriers in the exercise of the suffrage are eliminated.
4. We demand the abolition of segregation and discrimination in the army, navy, marine corps, air corps, and all other branches of national defense.
5. We demand an end to the discrimination in jobs and job training. Further, we demand that the FEPC be made a permanent administrative agency of the U.S. Government and that it be given power to enforce its decisions based on its findings.
6. We demand that federal funds be withheld from any agency which practices discrimination in the use of such funds.
7. We demand colored and minority group representation on all administrative agencies so that these groups may have recognition of their democratic right to participate in formulating policies.
8. We demand representation for the colored and minority racial groups on all missions, political and technical, which will be sent to the peace conference so that the interests of all people everywhere may be fully

recognized and justly provided for in the post-war settlement.

B) Statement of Truman K. Gibson Jr., Civilian Aide to the Secretary of War, at Press Conference, Monday, 9 April 1945

The press has already reported that Negro and White Infantrymen are now fighting side by side in Germany. In France I visited some of the Negro platoons before they left for the front and talked with the men being trained at the Reinforcement Training Center. What I saw and heard was evidence that the Supreme Command in SHAEF was following in racial matters what must be the basic policy of any Army, in any way, namely, that of utilizing most efficiently all available resources of men and materiel to defeat the enemy.

Such a policy is working. At the Training Center a white noncommissioned veteran, who was assisting in the training program, said graphically, if ungrammatically, about the Negro trainees: "Sure they'll get along all right. It don't matter whose [sic] firing next to you when you're both killing Krauts." The Texas-born, battle-scarred Commanding Officer of the Center was confident that the trainees, all of whom volunteered for the training course with all noncommissioned officers taking a reduction to the grade of private, would do well in combat. He said, "These men will fight because they have been trained and treated just like the other soldiers here and they know they are going to be used in the same manner. In the same Divisions. They want to fight. When the first group went out we had only two cases of AWOL [Absent Without Leave] among all the Negro soldiers in the Center. We found out where the two men were when we received a wire from a front line Division Commander informing us that they had reported to him to fight."

The estimate of this officer has been confirmed by the report of an official observer who spent time with some of the platoons in the fighting around Remagen where the first of the units was committed to combat. He reported that the Negro soldiers fought as well as any others and that the mistakes they made were the same as those made by other troops lacking battle experience.

This policy of making the best use of all soldiers is further evidenced in the excellent performance of the Service of Supply troops throughout the theater. These troops, a large per-

centage of whom are Negroes, regard themselves as soldiers performing vital jobs. They had a very real identification with the fighting front. In one Quartermaster Depot, manned by Negro personnel, the first sergeant when questioned as to why the men were working voluntarily around the clock, replied: "We have got to keep the supplies moving and we all want to do our part." The officers in this unit were white and were enthusiastic about their men and their work. Discussing their men, Negro officers in a Quartermaster Truck Company said that on many occasions their drivers had insisted on delivering white Infantrymen into dangerous territory late at night far in advance of the debarkation points because "they hated to see the 'Doughs' walk."

In the European Theater of Operations are the first units of Negro nurses and Wacs to go overseas. The nurses, stationed at a hospital in the north of England, are busy treating American soldiers who have been wounded in action. They are described by their Commanding Officer as being the equals professionally of any nurses in the area. The Wacs officer and man the Central Postal Directory for the entire European Theater of Operations. Their efficiency has drawn repeated praise from the Commanding Officer of the United Kingdom Base Section. They have adjusted exceptionally well in the short time they have been overseas to their work and the community in which they are situated.

Generally, on both the Continent and in England, it was apparent that the attitude of the Supreme Command that there should be no discrimination against any soldier on account of his race had reached all elements of the Command. Discriminatory acts and incidents that have occurred were regarded by the soldiers as being individual in nature. As a result of my trip to the Mediterranean and European Theaters I am impressed that such differences as exist between soldiers are not due to racial characteristics but to such factors as training, motivation, and environment. The fact that the Commands in these theaters believe this is encouraging. Certainly the record being made by Negro soldiers gives the lie to any charge that Negroes cannot and will not fight.

C) Racial Conflicts in the U.S. Army: Recollections of Allen Thompson

We were in tank training at Fort Knox when all of the sudden they told us they were going to put us into a trucking com-

pany. So we refused to eat. We did not go to the mess hall. We did it as a whole unit. There were a couple of lawyers in the group, and they got us organized. We just did not eat. And we said that we wanted to be trained as tankers and used as tankers, that was our demand. We did not want to be truck drivers or port battalion or loaders. We wanted to be tankers. Finally, they saw it our way. We even got black cooks because we complained that the white guys didn't know how to cook for us. . . .

When we got to Camp Patrick Henry, I saw it brewing. I could smell trouble, and I could see it too. When we went in for our indoctrination, the paratroopers on that base were antagonistic. They would gesture. They had shroud knives, the kind you use to cut your shroud when you drop in a parachute. They patted them, and they made gestures with those knives. We were told when we got there we could go anywhere on the post, because we are in the United States Army and all that. It was the post commander talking. "You are not confined to any area. You can go anywhere you want to." Well, that wasn't the case.

Some of our men had gone to the PX and were escorted out or run away from the area. The PX in our area was mixed, white and black soldiers. But the problem began because some white girls were overly friendly with the black soldiers, and the white paratroopers didn't like it. I was in the PX that night with a couple of sergeants, and I said, "Let's get out of here. I see some problems." So we got out.

The next night I was in charge of quarters, and oh, about fifty of those paratroopers came down the road in front of our barracks. They were making a lot of racket. I said, "What do you fellas want?"

"Well, your boys are trying to emulate paratroopers," they said. "They have their pants stuck down in their combat boots like us, and we feel that you all are trying to emulate paratroopers."

I said, "Well, these men are authorized for combat boots." And I told them to get back to their unit because they had no business over here. They left, but the next night about two hundred of them came back.

That night they said, "We're gonna kill some niggers tonight." Well, some shooting started. I don't know what side started it. But I do know that my company commander was supposed to have been knocked down, and the key to the armory was taken. And guns were taken out. And we had a small gunfight. It lasted about a hot minute. Because when the shots rang out and people fell, those guys cleared out in about two seconds. One of my men in the company got shot in the foot. One of theirs got killed. So they more or less quarantined the company, and there was a large investigation.

They took us in one by one and questioned us. They didn't have any evidence. None of the guns had fingerprints; nobody remembered nothing. But they busted the staff sergeant in

my company, said that he had taken the key from the company commander. They couldn't figure out how my gun had been fired, and I said, "I don't know either."

We heard that paratrooper unit had jumped on every black unit that had come through. They found some excuse to jump on the black units, and they had never been stopped. One officer said, "Your outfit was the first to stop them." Yeah, my bunch of boys in the 758th Tank Battalion were crazy, I tell you. We had fellas from Chicago, New York, Detroit, Cleveland, Philadelphia, all, mostly, city boys, big city boys.

4.4. Wartime Racial Tensions in the United States

Race Riots in the United States, Summer 1943

In summer 1943, racial tensions peaked in the United States. From 1942 onward, numerous minor fights and small riots pitting white against black soldiers had broken out on or near military bases and training camps, and newspaper reports of such clashes, which often ended with one or more deaths and serious injuries, proliferated during 1943. More seriously, several large-scale, protracted, and well-publicized riots occurred in major American cities, the most serious involv-

ing the "zoot-suit" anti-Hispanic riots of June in Los Angeles, quickly followed by black-white race riots in Detroit the same month and black attacks on white-owned property in Harlem, New York, in August. Less serious riots also occurred in Beaumont, Texas, and Newark, New Jersey.

In a weeklong rampage beginning 3 June 1943, hundreds of servicemen clashed with "zoot-suited" young Mexican Americans in East Los Angeles, stripping them of their distinctive clothing and beating them up. Mexican Americans were generally impoverished, living in substandard housing, easy prey to disease, malnutrition, and discrimination, forced to attend segregated schools, and with few economic opportunities open to them. Young Mexican American men tended to join pachuco gangs, which were frequently at violent odds with each other as well as the white community. Gang members, together with other young Hispanic men, often sported duck-tailed hair, broad-brimmed hats, and long dangling chains over brightly colored zoot suits, outfits whose long jackets had broad shoulders and narrow waists over pants with pleated balloon-like legs. Racial feeling ran high in Los Angeles after the August 1942 Sleepy Lagoon murder of a young Mexican American, José Diaz, by members of the local "38th Street" gang. Police rounded up more than 600 young pachucos, 22 of whom were tried for murder, with nine found guilty in January 1943, though one year later, their convictions were overturned. The press characterized all young Latinos, especially those wearing zoot suits, as dangerous gangsters and even after the trial was over, continued with a near-hysterical anticrime campaign.

Racial tensions continued to rise, fueled by war-related social tensions. With the majority of young white men enlisted in the armed forces, women, Hispanics (many of whom were not U.S. citizens), and African Americans had taken up industrial jobs in Los Angeles. The West Coast was home to numerous military and naval bases, and young white servicemen, many from elsewhere in the United States, resented the highly visible presence of young, flamboyantly attired Latino males who were not in the armed forces. On the night of 3 June, several sailors were robbed and beaten, apparently by Mexican American pachucos. The following evening, a mob of 200 sailors swept into Los Angeles in taxicabs to wreak revenge, invading the Latin quarter, or *barrio*, where they assaulted all young Latino males, zoot-suited or not, together with any young black or Filipino men unfortunate enough to encounter them. The victims were usually beaten up and stripped of their clothing. For several days, these nightly riots continued and also spread to Long Beach, and the press applauded the public spirit and anticrime fervor of those attacking the local Latino community. Assorted soldiers and civilians joined the mob in its assaults, and zoot-suited young men in many cases fought back. Meanwhile, the Los Angeles police, who had been instructed to allow shore police and military police to handle

all service personnel, restricted themselves to observing the action and arresting on charges of rioting and vagrancy more than 500 Latino young men, many of whom had themselves been assaulted. The fact that some Latina young women, who had apparently formed gangs of their own, known as the Slick Chicks and Black Widows, occasionally took part in the fighting provoked considerable press comment and speculation. Similar but smaller-scale riots also spread to other cities with substantial Latino communities throughout California, Texas, and Arizona, and there were even some minor incidents in New York, Philadelphia, and Detroit. On 7 June, local naval and army commanders finally declared Los Angeles off-limits to their personnel; but they officially treated these events as episodes in which sailors and soldiers were simply defending themselves, and none of the perpetrators was punished. The next day the Los Angeles City Council banned the wearing of zoot suits in public; offenders were liable to a 30-day jail term. The only arrests that occurred were those among the Latino community.

A few days later, serious black-white race riots erupted in the major American industrial city of Detroit, Michigan. In the previous three years, Detroit's population had swelled from 1.6 million to 1.8 million, as around 50,000 blacks and 150,000 largely Southern whites immigrated to the city in response to the demands of the industrial war effort. Housing was in short supply, child care nonexistent, food was rationed, and workers who were earning good wages had little to spend them on. Tensions between blacks and whites and between newcomers and older residents were fierce. Blacks generally lived in expensive slums and were excluded from most public housing, and in early 1942, small-scale racial violence broke out when, over white opposition, African Americans moved into the Sojourner Truth Housing Project, located in a previously all-white area. White workers protested against working on the same assembly lines with blacks, and in many factories, white supremacist organizations, notably the Ku Klux Klan and the Black Legion, were highly visible and active. In protest against what they considered unfair treatment, some blacks began a "bumping campaign" of deliberately walking into whites on the streets and nudging them off the sidewalks. In early June 1943, 25,000 white workers in the Packard defense project, producing engines for bombers and PT boats, stopped work in protest over the promotion of three blacks.

On the evening of 20 June, minor skirmishes broke out between young black and white men in Belle Isle, quickly attracting additional participants, and before the police declared the riot over at midnight, more than 200 individuals had joined in. Rumors of various racial incidents swept through other parts of the city. By 4 a.m., angry mobs of both blacks and whites had gathered together, confronting each other in the city center, and virtual guerrilla warfare broke

out, watched by a crowd of 100,000 spectators, while 2,000 city police and 150 state police troops found themselves overwhelmed. Over two days, 34 people, 25 of them black, were killed, 461 injured, and extensive looting took place. On several occasions, white police officers opened fire on black crowds, and even though the chief of police had refused to issue "shoot-to-kill" orders, their guns were responsible for 17 black deaths. After 36 hours of chaotic violence, Michigan Governor Harry Kelly and Detroit Mayor Edward Jeffries Jr. requested assistance from President Franklin D. Roosevelt, and as armored cars and jeeps bearing federal troops with automatic weapons moved in, the mobs dispersed. Approximately 1,800 individuals, the majority of them black, were arrested for looting and other crimes, and 13 murders remained unsolved.

Additional though less serious racial clashes continued throughout the summer, providing valuable propaganda for the Japanese government, which gleefully cited these events as evidence that the United States was a white supremacist and racist society and that Japan's foremost enemy was collapsing due to internal social disunity. First Lady Eleanor Roosevelt openly expressed her concern over the state of race relations in Los Angeles. Black civil rights leaders accused the Detroit police of racist bias. The riots also generated much soul-searching in the United States and several inquiries, public and private, into the state of American race relations.

About the Documents

Although one is the report of an official inquiry and the other a lengthy article by a journalist, both the documents excerpted here highlighted the legitimate grievances of Latinos and blacks in the United States, and each was extremely critical of the behavior of the authorities in handling civil disorder. In different ways, each of these documents represented part of the broader national inquiry generated by the widespread shock and self-questioning that soon formed part of the aftermath of the various summer 1943 racial riots. Until that time, most white Americans believed that African Americans were relatively satisfied with their conditions; after these events, the numbers believing this fell dramatically, from 60 percent of whites in 1942 to a mere 25 percent in 1944. The disorders of 1943 were not repeated the following summer. Black leaders, alarmed that violence would rebound on their community and its ambitions for equality, consciously urged greater moderation on African Americans, and the federal government and many states moved more assertively to redress at least some black grievances in employment and the armed forces. By highlighting the existence of racial tensions and discontent and the need to alleviate them, these episodes of violence probably assisted the civil rights movement in the long run.

In early 1943, Governor Earl Warren of California established a Citizens Committee for Latin American Youth to investigate the interracial situation in Los Angeles County. Immediately after the zoot suit riots ended, he instructed this body to undertake a major investigation of these events. Allegations were rife that Los Angeles police had colluded with and acquiesced in the vigilante activities of white southern servicemen; members of the House Un-American Activities Committee, by contrast, claimed that Axis agents had instigated the riots, though no evidence was ever presented that bore out this theory. Although the committee's report, issued toward the end of 1943, was an official document, the outrage of its authors comes through very clearly in its language. The committee's report was highly critical of both the poor living conditions prevalent among Latinos in Los Angeles and the racial prejudice and suspicion of crime to which the entire community was subject. The behavior of the mob of sailors, soldiers, and civilians was strongly criticized, as was that of the police in standing by and doing nothing. The reports recommended that where identifiable, all perpetrators of the riots should be punished, but the only individuals who were ever penalized for them were those Latinos arrested at the time. Los Angeles Mayor Fletcher Bowron publicly challenged the report's findings, blaming the disorder on juvenile delinquents and white southerners from elsewhere and stating that racial prejudice had played no part in the riots.

In 1943, Earl Brown was the only black journalist working for *Life* magazine. His series of articles on race in the United States, published in that magazine and *Harper's* magazine over the years 1942–1944, have been listed among the 100 best examples of twentieth-century journalism. This lengthy account of the Detroit race riots, a model of what would today be termed in-depth investigative journalism, was published in 1944, several months after the riots occurred, as a separate pamphlet by the New York Public Affairs Committee, which two years earlier had also brought out a similar piece Brown co-authored on *The Negro and the War*. Brown was not writing sensational journalism, and he carefully described the background to the riots, putting them in the broader context of Detroit's lengthy history not just of racism but also of fanatical religious extremism, white supremacism, and labor conflicts, which when combined with longstanding racial discrimination, the substandard slum housing of African Americans, and immediate wartime tensions, made an explosive mix. Brown was, however, extremely critical of the failure of the police—whom he described as either “helpless or negligent”—and city authorities to take effective action themselves, declare martial law, or call in federal troops for almost 48 hours. This pamphlet was a serious effort, written after much research and reflection, to put the Detroit riots in their

broader historical context and thereby suggest how similar events might be avoided in the future.

Primary Source

A) The Zoot Suit Riots, Los Angeles, June 1943: Report of the Governor's Citizens Committee

There are approximately 250,000 persons of Mexican descent in Los Angeles County. Living conditions among the majority of these people are far below the general level of the community. Housing is inadequate; sanitation is bad and is made worse by congestion. Recreational facilities for children are very poor; and there is insufficient supervision of the playgrounds, swimming pools and other youth centers. Such conditions are breeding places for juvenile delinquency. . . .

Mass arrests, dragnet raids, and other wholesale classifications of groups of people are based on false premises and tend merely to aggravate the situation. Any American citizen suspected of crime is entitled to be treated as an individual, to be indicted as such, and to be tried, both at law and in the forum of public opinion, on his merits or errors, regardless of race, color, creed, or the kind of clothes he wears.

Group accusations foster race prejudice, the entire group accused want revenge and vindication. The public is led to believe that every person in the accused group is guilty of crime.

It is significant that most of the persons mistreated during the recent incidents in Los Angeles were either persons of Mexican descent or Negroes. In undertaking to deal with the cause of these outbreaks, the existence of race prejudice cannot be ignored. . . .

On Monday evening, June seventh, thousands of Angelenos, in response to twelve hours' advance notice in the press, turned out for a mass lynching. Marching through the streets of downtown Los Angeles, a mob of several thousand soldiers, sailors, and civilians, proceeded to beat up every zoot-suiter they could find. Pushing its way into the important motion picture theaters, the mob ordered the management to turn on the house lights and then ranged up and down the aisles dragging Mexicans out of their seats. Street cars were halted while Mexicans, and some Filipinos and Negroes, were jerked out of their seats, pushed into the streets, and beaten with sadistic frenzy. If the victims wore zoot-suits, they were stripped of their clothing and left naked or half-naked on the streets, bleeding and bruised. Proceeding down Main Street from First to Twelfth, the mob stopped on the edge of the Negro district. Learning that the Negroes planned a warm reception for them, the mobsters turned back and marched through the Mexican east side spreading panic and terror.

Throughout the night the Mexican communities were in the wildest possible turmoil. Scores of Mexican mothers were trying to locate their youngsters and several hundred Mexi-

cans milled around each of the police substations and the Central Jail trying to get word of missing members of their families. Boys came into the police stations saying: “Charge me with vagrancy or anything, but don’t send me out there!” pointing to the streets where other boys, as young as twelve and thirteen years of age, were being beaten and stripped of their clothes . . . not more than half of the victims were actually wearing zoot-suits. A Negro defense worker, wearing a defense-plant identification badge on his workclothes, was taken from a street car and one of his eyes was gouged out with a knife. Huge half-page photographs, showing Mexican boys stripped of their clothes, cowering on the pavement, often bleeding profusely, surrounded by jeering mobs of men and women, appeared in all the Los Angeles newspapers. . . .

At midnight on June seventh, the military authorities decided that the local police were completely unable or unwilling to handle the situation, despite the fact that a thousand reserve officers had been called up. The entire downtown area of Los Angeles was then declared “out of bounds” for military personnel. This order immediately slowed down the pace of the rioting. The moment the Military Police and Shore Patrol went into action, the rioting quieted down.

B) Earl Brown, “The Detroit Race Riots of 1943”

On Sunday, June 20, 1943, one of the most serious race riots in American history broke out in the city of Detroit. Before it was brought under control some thirty hours later, twenty-five Negroes and nine white persons were killed and property worth several hundreds of thousands of dollars had been destroyed.

The forces which led to the outbreak in that city exist, to a greater or lesser degree, in most of our cities. Similar outbreaks have occurred elsewhere. A study of the factors leading to the outbreak in Detroit is important because it can show us how to avoid similar outbreaks, not only in Detroit, but in other cities. . . .

My first visit to wartime Detroit occurred in July, 1942. I found that although Detroit is the munitions capital of the United Nations and its war production is essential to victory, there was a disturbing lack of unity of effort. The atmosphere was tense, and the tension was increasing. There were sudden gusts of strikes for unimportant reasons—a strike occurred at the Chrysler Tank Arsenal because the men were not allowed to smoke during work.

But racial feeling was the most alarming of all. Groups of Negro zoot-suiters were brawling with gangs of young white toughs; the determination of Negroes to hold the war jobs they had won was matched by the determination of numerous white groups to oust them. There were many signs of trouble. . . .

One of the features of Detroit that in many ways sets it off from many other cities is the presence of great numbers of religious and political fanatics. Even before the last war Detroit was known as the city of “jazzed-up religion.” Today all shades of opinion are to be found in the city, all races, all creeds, all political attitudes and beliefs. The first figure to attract national attention was Father Charles Coughlin. Railing against Hoover and Wall Street from his radio pulpit, he soon attracted a great following in Detroit and through the Middle West. Next came the Black Legion, an organization of native white Americans and an offshoot of the Ku Klux Klan—with hoods, grips, and passwords. It was organized originally for the purpose of getting and holding jobs for Southern whites, but it quickly developed into an elaborate “hate” organization—its enmity directed against Catholics, Jews, Negroes, and “radicals.” . . .

By the middle 30’s, Detroit had a representation of every kind of panacea, political nostrum, and agitation. There were the Anglo-Saxon Federation and an anti-Negro organization called the National Workers League. But the most steady, day-in and day-out exhortation came from the sensational preachers. Of these the best known are the Reverend Frank J. Norris and the Reverend Gerald L. K. Smith. . . .

These three men—Coughlin, Norris, and Smith—are the best known of the Detroit religious-political demagogues, but there are thousands of others. Some have been in Detroit for years; others came during the recent migrations. It is estimated that there are more than 2,500 Southern-born evangelists of one kind or another in Detroit alone, not counting those in near-by communities. This war has caused an upheaval among the little shouting sects in the South; they have split and split again, and new sects have been formed. . . .

There is a connection between the apocalyptic doctrine of these sects and religious and racial intolerance. The appeal is not only highly emotional but is grounded on old traditions—which which in the South mean White Protestant Supremacy. . . . Many of these exhorters are members of the Klan off-shoot organizations, defiantly “American,” suspecting “radicals,” and completely at home with White Supremacy. For more than a decade—and increasingly during the past three years—these rustic preachers have been spreading their brand of the Word. As feeling in Detroit became more aroused over the race issue, the effect of this kind of preaching was like pouring gasoline on a bonfire. . . .

It is interesting to note that despite the racial collisions and the frequent enforcement of Jim Crow practices in Detroit, Negroes have succeeded in getting some political preferment. There are two Negro assistant prosecuting attorneys, the State Labor Commissioner is a Negro, and one of the State Senators is a Negro. The Detroit Street Railway Company, which is owned by the city, employs about a thousand Negroes—both men and women—as motormen, bus drivers, conductors, and workers of other kinds. With the police it is another matter, and this has been a burning issue. Out of 3,600 policemen, only forty are Negroes. In addition, Southern whites have been taken into the force freely, and they have frequently shown a hostile attitude toward Negroes.

The local political machine was perfectly happy to cooperate with Negro gamblers, but they had no interest whatever in the fact that most of Detroit's Negroes lived in two wretched slum areas. The two principal Negro districts in Detroit cover about thirty square blocks on the West Side and a larger district on the East Side called Paradise Valley. . . . Here—on the East Side—live most of Detroit's Negroes. Almost everybody now has plenty of war wages to pay for lodging, but decent houses simply do not exist. The only recourse the Negroes have is to cram themselves into the filthy valley tenements. . . .

The war naturally aggravated Detroit's underlying instability. Anti-Negro sentiment was particularly strong in the Polish districts of Hamtramck, a suburb. As early as July, 1941, gangs of Polish youths provoked a series of minor riots. An editor of a Polish paper reports that anti-Negro handbills were distributed on the steps of St. Florian's Church in Hamtramck during the Sojourner Truth riots.

For many months the Negro press in Detroit and elsewhere busily promoted a "Double-V" campaign for victory at home as well as abroad. This campaign was based on the assumption that victory in the war against the fascists abroad did not mean much if there was Jim Crow at home. Colored soldiers had told a thousand bitter stories of discrimination and lack of respect for the uniform. The killings of colored soldiers at Alexandria, Louisiana, and in other Southern communities were taken to heart. The hopes roused by President Roosevelt's Executive Order 8802, issued June 25, 1941, forbidding job discrimination in plants with war contracts slowly faded. The Committee on Fair Employment Practice, set up by the President shortly after the issuance of the Executive Order, was left to pine away without money or authority and was finally placed under the War Manpower Commission. If the government would do nothing, there was nothing left but the union and the determination of the Negroes themselves. Colored workers who had been promoted to more skilled jobs were ready to hold on for dear life to their new jobs, and the brimstone evangelists, viewing with alarm this resolution of the Negroes, whipped up resentment.

Shortly after the beginning of 1943 a series of anti-Negro strikes broke out in the plants. Aside from fights between individuals, there was no violence in the plants, but much bitterness was aroused. The U.S. Bureau of Labor Statistics lists anti-Negro strikes in the following plants from mid-March until the end of May: United States Rubber Company; Vickers, Incorporated; Hudson Motor Car Company; Hudson Naval Arsenal; and the Packard Motor Car Company. In the Packard strike, which brought the climax, 26,883 men left work when three Negroes were upgraded. The circumstances of this strike were so peculiar that union leaders were convinced that it had been engineered by one of the anti-Negro groups in the city, but nothing was ever proved.

Shortly after the Packard strike Mayor Jeffries called together the editors of the three local dailies, the *Free Press*, the *News*, and the *Times*, to take counsel. The conference over, nothing was done. A procession of Negro leaders and a few prominent white citizens besought the Mayor to take heed and act before the explosion. The Mayor listened, but appeared to be more confused after these visits than before. Then everyone relaxed to await the inevitable. It came on the evening of June 24, 1945.

Belle Isle lies in the Detroit River, connected with the city and Grand Boulevard by a bridge. There were probably a hundred thousand persons in the park that hot, humid Sunday, and the greater number seem to have been Negroes. The atmosphere was anything but peaceful. Tension had increased to the breaking point. An argument between a Negro and a white man became a fist fight and the fighting spread.

A hurry call was made for the police, but by the time they arrived the brawl, involving some two hundred white sailors by this time, was eddying across the bridge into the riverside park on the mainland near the Naval Armory. The news that fighting had broken out traveled like the wind. A young man in a colored night club on Hastings Street is supposed to have grabbed the microphone about 11:30 and urged the five hundred customers present to "come on and take care of a bunch of whites who have killed a colored woman and her baby at Belle Isle Park." This rumor was, of course, false. It was matched by another story, which spread through the white districts, that Negroes had raped and killed a white woman on the park bridge. By midnight fighting and looting had spread into a dozen different districts and Paradise Valley was going crazy. By two o'clock that morning a crowd of Negroes stopped an East Side street car and stoned white factory workers who were passengers. White men coming from work at the Chevrolet Gear and Axle plant, three miles away from the center of Paradise Valley, were attacked by a Negro mob.

Alfred McClung Lee, chairman of the Sociology Department of Wayne University, and Norman Humphrey, Assistant Professor of Sociology at the same institution, have

pieced together a remarkable timetable of the violence in *Race Riot* (New York: Dryden Press, 1943), a report on the riot. Both the authors were present and moved about the city while the fighting was in progress. Their report shows that:

At four o'clock in the morning (Monday, June 21) there was a meeting in the office of Police Commissioner Witherspoon to determine action. Mayor Jeffries, Colonel Krech (the U.S. Army commander of the Detroit area), Captain Leonard of the Michigan State Police, John Bugas (in charge of the local office of the F.B.I.), and Sheriff Baird were present. Colonel Krech told the Mayor that the military police could be on duty in Detroit in forty-nine minutes after a request from the Mayor had been cleared through the Governor and the proper U.S. Army officials. Nothing was done about this at the time, and by 6:30 A.M. Commissioner Witherspoon decided that there was a let-up in "serious rioting."

But there was no let-up. At 8:30 in the morning a Negro delegation asked the Mayor to send for troops. At nine o'clock Commissioner Witherspoon asked the Mayor for troops. Mayor Jeffries telephoned to the Governor, who transmitted the request by telephone to the Sixth Service Command Headquarters in Chicago. By eleven o'clock it was known that troops could not come unless martial law was declared. Governor Kelly hesitated to do so. By this time gangs of white hoodlums were roaming the streets burning Negro cars.

The police had already shown themselves to be helpless or negligent. On the previous night, police had been stationed outside the all-night Roxy movie theater. A witness reported that a threatening white crowd assembled at the entrance and every time a Negro came out of the theater the mob went for him. When the witness asked the police to get Negroes a safe-conduct through the mob, the officers replied, "See the chief about it!"

At four o'clock on Monday afternoon Major General Aurand arrived from Chicago. By that time, according to Lee and Humphrey, "the crowds of whites were increasing in size on Woodward Avenue. Milling packs of human animals hunted and killed any of the easily visible black prey which chanced into the territory."

At 6:30 Monday night, just as Mayor Jeffries was going on the air with a plea for a return to sanity, four white boys, aged 16 to 20, shot down Moses Kiska, a middle-aged Negro, "because we didn't have anything to do." Still no troops, and all through the evening, after even the Mayor had admitted that the city administration and police were unable to deal with the situation, there went on an endless amount of official confusion until, at least, it was discovered precisely what had to be done to get federal intervention. Just before midnight President Roosevelt proclaimed a state of emergency, and by Tuesday morning 6,000 troops in trucks and jeeps were patrolling the city. The hold of the city authorities had so completely collapsed that it took the United States Army

to get twenty-nine Negro members of the graduating class of Northeastern High School away from the closing exercises in safety.

Two days later Governor Kelly decided to ease restrictions a little, and by degrees the city began to breathe again. . . .

4.5. American Women's Wartime Experiences

American Women and World War II

During World War II, the U.S. government actively encouraged American women to work, either at civilian jobs or in one of the auxiliary branches of the armed forces. With 12 million men enrolled in the armed forces and therefore withdrawn from the workforce, women's labor was one of the most readily available sources to fill the gap. One of the iconic images of World War II was the poster of "Rosie the Riveter," a woman worker in an aircraft plant who is often thought to

epitomize the wartime contributions American women made to the war effort.

At least temporarily, American women did indeed go to work in numbers never seen before. From 1942 onward, the U.S. government launched an aggressive publicity campaign to encourage women to take up jobs so as to free men to serve for the armed forces. Whether married or single, women were exhorted that it was their patriotic duty to do their share, and “Mrs. Stay-at-Home” became a figure of reproach. During the war, the number of American women working increased 60 percent, reaching a total of 19 million in 1940, and the proportion of all American women employed rose from 28 to 37 percent. The figure for African American women in employment expanded from 33 to 40 percent, and their actual numbers from 1.5 to 2.1 million. Some 350,000 women joined the armed forces: there were 150,000 in the Women’s Army Corps (WAC) and Women’s Airforce Service Pilots (WASP) unit, 100,000 joined the navy as WAVES (Women Accepted for Volunteer Emergency Service), 22,000 served in the Marines, and thousands more in the Coast Guard and the reserves. A further 74,000 of the total were army and navy nurses. Others went into the Women’s Land Army. The great bulk of women, however, took up civilian jobs. Approximately 72 percent of women joining the workforce during the war were married, and 60 percent, the majority of them, were over 35 years of age. In 1944, for the first time in American history, more married than single women had jobs.

Not all women, however, took jobs; of 33 million women not working in December 1941, more than 28 million had not taken jobs in 1944. Nine out of ten young mothers did not work, in many cases quite possibly because good child care was rarely available, and the employment rate for women under 35 increased by only 0.5 percent during the war. Two-thirds of adult American women were still homemakers. These figures were perhaps somewhat misleading, as such women often made appreciable contributions to the war effort. The American Red Cross had 5 million women volunteers, who sent 29 million food parcels to prisoners of war and refugees, collected blood, and packed up kit bags for U.S. soldiers posted overseas. Millions more worked without pay with the United Services Organization, the American Women’s Volunteer, and the Young Women’s Christian Association.

In 1940, only 2.2 million American women, about 20 percent of those in employment, worked in industry, the majority in poorly paid jobs in textile and garment factories. The bulk of women were concentrated in clerical, sales, teaching, and other white-collar positions, usually at the lower levels, or in the service industries. During the war, an additional 3 million joined the industrial workforce, and most of these women entered the war-related defense industries, where their numbers increased from around 550,000 to perhaps 3

million. Even so, only 16 percent of women employed in 1944 were working in the defense industries and only one-third in manufacturing. Far fewer American women were domestic servants, but the number who held white-collar jobs, whether in the federal government, in manufacturing, or in the service industries, increased dramatically during the war. The number of women office workers grew by 1 million, and the number of women civil servants increased from 200,000 to more than 1 million. Overall, by 1944, there were more than 50 percent additional women white-collar workers.

Looked at more closely, however, the picture was less roseate. Within the industrial labor force, in 1944, women held only 4.4 percent of positions as craftsmen, foremen, and skilled workers, up from 2.1 percent in 1940. Women were disproportionately concentrated at the level of semiskilled laborers, helpers, and record-keepers, and despite the fact that the government theoretically mandated equal pay for women in defense contracts, were often paid less for the same job. Overall, the weekly wages of women in industry were only about 60 percent those of men, and few women were ever promoted. Labor unions were usually prepared to accept women members, but not to treat them equally with men. White-collar women workers also tended to be concentrated at the lower end of their professions. The high visibility and subsequent celebration of around 1,000 wartime WASPs should not lead one to consider them typical of U.S. service personnel. Nurses apart, within the U.S. armed forces, 80 percent of women held clerical jobs, and they were banned from combat duties or from serving with units that had a combat mission. Women pilots were never granted full military status and were restricted to ferrying and delivering planes and test pilot duties, and in 1944, Congress terminated the entire program. No woman officer could give orders to a man, and neither the WAVES nor WACs would admit women with young children.

The restrictions upon American women perhaps reflected the fact that, despite all the demands for military and industrial manpower, the U.S. home front wartime situation was far less desperate than that in Great Britain, where from late 1941 the government expected all single women to accept some kind of war work, let alone the Soviet Union, where by 1945 women constituted 55 percent of the industrial and 92 percent of the agricultural workforce, and 800,000 women served in the Soviet army. In the United States, there was, moreover, a broad assumption that women’s wartime employment was only a temporary expedient for the wartime emergency and that once the war was over most women would be glad to give up their jobs and return to a life as homemakers. Although the WAC became a permanent part of the armed forces in 1946, after V-J Day, many women were laid off precipitately, especially those in industrial manufacturing. The broad assumption was that the returning servicemen

should automatically have priority for any employment that was available. By early 1947, approximately 1 million fewer women held factory jobs than in 1945, though female employment remained stable in light industry, white-collar, and service jobs, economic sectors that from World War II onward were considered women's jobs. Between 1945 and 1947, the percentage of women working dropped from 37 to 30 percent; by 1947, women, who constituted 36 percent of the workforce two years earlier, were only 28 percent; and by 1950, around one-third of the women who had joined the workforce during the war had left, though some of these departures reflected retirements by older women. Even so, during and immediately after World War II, the fundamental assumption was that women should invariably and as of right subordinate their own preferences to the broader dictates of the male-dominated state, so that when their labor was required for the war effort, they should work, but when they were no longer needed, they should once more retreat to dependent status.

About the Author

Susan B. Anthony II (1916–1991), the great-niece of the nineteenth-century woman's rights campaigner of the same name, became a notable liberal activist in her own right. The causes this staunch antifascist, working journalist, and broadcaster forthrightly supported included not just women's rights but also labor issues and civil rights. During World War II, she wrote her first book, *Out of the Kitchen—Into the War* (1943) and coauthored a comprehensive survey, "Women during the War and After." In 1945, Anthony, together with the journalist Helen Snow, cofounded the Congress of American Women, which she represented before the United Nations Status of Women Commission in 1948. For nine months in 1946, Anthony hosted a weekday New York radio show, "This Woman's World," which proved too controversial and was eventually cancelled. During the 1950s, Anthony's liberal views made her the subject of McCarthyite attacks, and after marrying an Englishman and acquiring British citizenship, for almost a decade, she was denied her U.S. citizenship. Until her death in 1991, she remained a committed feminist, endorsing the Equal Rights Amendment and also protesting against the use of nuclear weapons.

About the Documents

The documents included here are of several different types, but all provide useful insights into the wartime status of women, especially those who became industrial workers. Susan B. Anthony II's book, *Out of the Kitchen—Into the War*, was a public appeal, stating her view that American women should permanently enjoy the same status and opportunities as men. Temporary wartime dispensations were entirely inadequate, in her opinion. Anthony sought to present these

measures as essential to the war effort, arguing that if women were not treated equally with men, they would have no incentive to support the war effort wholeheartedly. She also presented the full utilization of women's energies and talents as essential to fulfill the social goals of the New Deal program of the 1930s, of ensuring all Americans "enough food, housing, clothing," deliberately echoing President Franklin D. Roosevelt's famous statement, that he saw "one-third of a nation ill-housed, ill-fed, ill-cared for." Implicitly equating the pre-war status of American women with that of women in Nazi Germany, Anthony urged the United States to reject the "fascist concept of woman . . . that her life's work is to breed and feed." Instead, she believed, women should be permanently assured of representation at top levels of government, business, and society. By publishing this book, Anthony was seeking to win public opinion over to her viewpoint, waging a campaign to convince Americans that women should in every way be treated equally with men, a cause she advocated by using multiple arguments, citing fairness, democratic principles, the need to win maximum support for the war effort from women, and the requirements of ensuring postwar prosperity for all. This was a struggle that, as she stated, she rightly expected to be long, arduous, and hard-fought. At the end of World War II, Anthony's goals for American women would still be very far from attainment.

Kathryn Blood's description of the achievements of African American women as industrial workers was part of an official report written for the U.S. Department of Labor. It did not advocate any particular policies, but graphically demonstrated that numerous black women had worked as efficiently as men at many different jobs in steel mills, foundries, and engineering plants, and had broken into jobs once reserved for men. The report stated, without comment, that it was unlikely that many women would remain in such jobs once the war was over, since returning veterans would have priority over them, and in "a predominantly male industry," they would automatically be denied opportunities to "acquire the higher skills" or win promotion. The report stated that some employers intended to keep women on in some of the lighter jobs at which they excelled but that they were unlikely to be left in "heavy" work. Neutral and non-judgmental in tone, this report sought to convey the situation on the ground and the probable position in the future.

Oral histories by two women, one African American, one a Jewish radical, give two contrasting pictures of the fortunes of American women who worked in industrial jobs. Fanny Christina Hill was a Texan-born black woman, aged 24 in 1940, who worked as a domestic servant in California until she took a job at a North American Aircraft plant. Although she stopped work late in the war to have a child, she returned to North American Aircraft in 1946, where she remained until she retired in 1980. She related that she, like other African

Americans, did on occasion encounter discrimination in work assignments but that the union was helpful in advising her how to obtain a transfer to pleasanter work. For Hill, factory work gave her an opportunity to lead a different and far more fulfilling lifestyle that she embraced wholeheartedly and, after a brief break, successfully continued (a rather atypical outcome) after the war.

Another woman who took a factory job was Lola Weixel, a young Jewish woman from New York. Highly politically conscious, far more so than Hill in most ways, she perceived the war in terms of an antifascist crusade. It also offered her the opportunity to become a welder, a trade she had unavailingly sought to learn during the 1930s. To her great regret, however, Weixel lost her job immediately after the war ended, the most common fate of women industrial workers at that time.

Apart from portraying their own personal experiences with some immediacy, these contrasting oral histories remind us that though many women lost their industrial jobs in 1945, for some at least, this development was only temporary, and the experience of war could genuinely alter not only women's expectations but also their long-term opportunities.

What assurance have the women of America that maximum exertion of their energies now will give them not only a place in the war today but a place in the world tomorrow? . . .

If we are to win the war it is clear that nursery schools, public cafeterias, housing projects, medical services, recreation facilities, and special services for maternity cases are vital necessities. But they are more than that—they are the key to the postwar position of women and a promise to men and women of a standard of living that will enable *three-thirds of a nation* to be well-housed, well fed, and well cared for.

If we do not obtain nursery schools, if we do not obtain adequate health programs, school lunch, and milk for our children *now, when they are desperately needed as wartime measures*, you can be sure of a reversion in the postwar world to substandards of living. . . .

Victory can no longer be regarded as separate from the assurance to our people of a future that will hold a place for them. To arouse the spirit of victory the people must be given a demonstration of what democracy means, what full employment means, what public services mean.

We are in a death struggle against fascism—a system whose ideology and practice reduces men and women to slaves, living on starvation levels. What better proof could we offer the American people of our absolute irreconcilability with Hitler's methods than to start *now* to provide employment and security for all. . . .

America has limped along for too many centuries utilizing half the productive forces of the nation. Only in wartime does our vast industrial and agricultural machine become nearly fully used. Only in wartime does the vast energy and talent of the American woman begin to be unleashed. It has been said that women are the margin for victory in this war. I would add that women are the margin for victory for the economic life of the peace. The kind of war we wage determines the kind of peace. The kind of peace we have will be determined largely by the kind of use we make of our labor potential.

If we plan a nation producing enough food, housing, clothing, for all of our people, then we will need the labor of all of the adult men and women to staff the factories, farms, and offices. Energies going into the weapons of war today should be used for the essentials and for the luxuries of life tomorrow. Unless we envisage a return to the economy of scarcity of prewar America, we are going to need our women as well as our men in production. Unless we envisage losing the war, we need community services *now* to release women for the big wartime tasks of production.

With them America will be on the road to victory, both in war and peace. Without them America cannot mobilize its labor forces either for war or peace. If we provide these services now, they will be a means to victory. They can then be utilized as a means of raising the peacetime standards of living of *all our people*.

Yet women need more than the mere extension of community services to give them a real stake in the war. They need the assurance that *never again will they be deprived of the right to work, and the right to hold top positions*. Temporary orders permitting equal pay for equal work, transitory demands of employers for their services, are not enough. . . .

When women formed only one-quarter of the productive forces of the nation, it was easy to push aside their claims to equal participation in governing the nation. The right to vote has been relied upon as the complete answer to our demands for a voice in the highest councils of the Government. In almost doubling the number of women workers this war doubles the justice of our demands for an equal place in the legislatures, on the court benches, and in law enforcement.

No longer can women be satisfied with a backseat in Congress, with one seat in the President's circle of advisers and administrators, *with no seat on the Supreme Court Bench*. Wherever people are governed, representatives of these people should be amongst the governors. That is part of the fundamental democratic principle for which we are now fighting. Women, being governed, must logically be among the governors. We would be but a poor pretender to democracy if, after having worked our women to the utmost to win the war, we barred them from a meaningful role in the peace. How can we

claim to be purified of fascist tendencies in our own nation if we permit a fascist concept of women to prevail?

As we know, the fascist concept of woman is that her life's work is to breed and feed. She breeds a dozen years and feeds for a lifetime. After breeding—after having fulfilled her biological function—she is then, according to the fascists, only useful to brood over the kitchen stove. The boundary for women, under fascism, is the home; and beyond that boundary she must not go. Democracy's task is to elevate woman so that the world is her home—not the home her world.

Fascism is determined to make women servants of the house. Democracy must encourage women to be servants of the world. The conditions of war are definitely pulling women out of the house into the world. The peace must not push them back into the house, unless they wish to go there.

We must recognize that woman's place is in the world as much as man's is. Woman's place is in the factory, in the office, in the professions, in the fields, and at the council table—wherever human labor, human effort, is needed to produce and create. In the postwar world there must be an abolition of the fatal distinctions between men and women—between “men's jobs” and “women's jobs.” Personal ability, not choice, must determine the job-holder. Present discriminations must be done away with, for they work against men as well as women.

The greatest distinction between men's and women's work is that jobs at the top are tacitly regarded as being “For Men Only.” The menial and the semiskilled jobs are thought to be ideal for women. Wartime necessity will to some degree wipe out this distinction; but extreme vigilance will be needed in the postwar period if we are to maintain any of the higher positions we reach now as an expedient because the men are fighting.

The hopeful thing is that each major American war has resulted in the extension of democracy to a group that was formerly under privileged. The American Revolution extended to white men the right to vote, the right to elect the world's first republican form of Government. The Civil War extended to black men the right to vote. The First World War extended to white and black women the right to vote.

This extension of democracy in past wars has not come easily. It has not been handed down generously from above. It has been wrenched from the hands and against the prejudices of those in power; it has been reluctantly granted, after great pressures and bloody battles.

In these wars of American history, the Government has had to extend democracy to new sections of the population for a specific reason of winning the war. Each war in our history has demanded the lives and the sweat of larger and larger sections of the population.

Today, we are engaged in the greatest war of our history. More men, more machines, more material are being used

against the enemy. Today, for the first time, whole populations, men and women, are involved as active belligerents.

And out of the necessities of our struggle against fascism, this nation is being forced to mobilize that great reservoir of anti-fascist fighters—the American women. As in the Civil War when the Union freed the Negroes to fight to win the war, so today our Government is being forced to free women to win this war. America must unlock the doors that have imprisoned millions of women. Women must be let out—liberated from the homes, so that they can take their place in the war of the world today—and in the work of the world tomorrow. [Italics as in original]

B) Kathryn Blood, *Negro Women War Workers, Report Submitted to the Women's Bureau, U.S. Department of Labor, 1945*

STEEL MILLS, FOUNDRIES

Negro women were employed in most of the 41 steel mills surveyed by the Women's Bureau in 1943. Areas visited by Women's Bureau agents included Pittsburgh-Youngstown, Buffalo, Chicago-Gary, and West Virginia, and one mill each in Colorado, Sparrows Point (Md.) and Bethlehem (Pa.). While women were working in most divisions of the steel industry, their proportion was small, about 8 percent, covering all races. In some of the mills, however, women were found in almost every department. There were women working at the ore docks, in the storage yards for raw materials, on the coal and ore trestles, in the coke plants, the blast furnaces, the steel furnaces, the rolling mills, and the finishing mills that were doing fabricating on shells, guns, and regular products such as nails, spikes, and bolts.

The majority of the Negro women, like the white women, worked on labor jobs. The proportion of Negro women in the masonry and outside-labor gangs was large. Where women were employed in the wintering plants they were chiefly Negroes, and were reported as moving as much dirt and material as men. Jobs around a sintering plant are all dirty and chiefly of a labor grade; everything around such a plant is covered with iron dust. The sintering plant salvages ore dust and blast-furnace flue dust by mixing it with water and spreading it on moving conveyors that carry it under gas

flames for baking into clinkery masses known as sinters, which are charged back to the furnace. Considerable numbers of women in these plants worked on dumping the cars of ore and dust, inspecting along the sides of the conveyor to remove lumps of slag and foreign matter, shoveling up spills along the conveyor lines, screening coal and dust, carrying tests to the laboratory, etc.

Plants on the Great Lakes receive most of their ore supply by boat. At one of these plants women were working on the ore docks. Though the boats are unloaded by electric ore bridge cranes that scoop up 15 to 20 tons in each bucketload and empty a boat in a few hours, it is necessary for labor gangs to go down into the bottom of the boats and sweep and shovel up the leavings of ore into piles for removal by special hoists, as the grab-buckets cannot clean up around the sides and edges. To do this work a crew of women, chiefly Negro and with a woman gang leader, went from boat to boat as needed. When there were no boats ready for cleaning, they worked around the docks and stockyards as part of a general clean-up labor gang. The ore, coal and limestones are heavy to handle even when a small shovel is used.

In 2 of the steel mills used by the Bureau, a Negro woman was employed as panman. The job of the panman is to mix the fire clay, shoveling the materials into a mixing mill, for sealing the casting hole of the blast furnace. The work is carried on in blast-furnace shed. Mud mixing is not a full-time job and is incidental to other labor.

Another unusual job held by a Negro woman was that of operating a steel-burning machine. This intricate machine, 25 feet long and 6 feet high, cuts parts for 6 different kinds of anti-aircraft guns from huge plates of steel. The acetylene torches cut two parts at a time and must be set and guided with precision. The operator must have a dozen or more controls set exactly right.

In the Buffalo area Negro women were breaking into many jobs traditionally closed to women in the steel industry. In one large plant in this area Negro women made up about one-third of the total number of women employed.

Review of the situation in the steel mills, however, indicates quite general acceptance of the position that women's employment in steel is only for the duration of the war, and that men returning from the armed services will take over the jobs on the basis of seniority and priority rights in the industry.

Negro women were employed in 8 of the 13 foundries visited by Women's Bureau representatives in the latter half of 1943. A few of the foundries produced small as well as large castings. In the foundry itself, excluding other departments, the 13 establishments surveyed reported the proportion of women (race not stated) as 16 percent (93,631) of the workers. In one midwestern foundry 50 percent of the women were Negro, and in one steel-casting corporation such percent was 67.

Women were found in occupations ranging from the shoveling and mixing of sand and other unskilled types of labor to fairly skilled work in the fine finishing of molds. A few foundries indicated that they might keep women after the war in some of these jobs, individual foundries stating that women may be retained in jobs at which they excelled. Included in the list of jobs mentioned were clerical work, drafting, laboratory work, sand testing, operation of the heat-treat furnaces, and the making of small cores. Many foundries were convinced that women were better than men at the making of small cores. No large numbers of women, however, seemed likely to remain in foundry work after the war, even if they wished to do so. In a predominantly male industry they would have little opportunity to acquire the higher skills or advance up the job-progression ladder. The heavy nature of much of the work itself would prevent that.

ARSENAL OF THE UNITED NATIONS—DETROIT

The Bureau of the Census reports that the number of non-white women employed in the Detroit-Willow Run area rose from 14,451 in March 1940 to 46,750 in June 1944. Fewer than 30 Negro women were employed in war plants in this area in July 1942, but by November 1943 about 14,000 were so employed. Early in 1944, 7 to 8 percent of the workers in the entire state of Michigan were Negroes, and it was estimated that almost 6 percent of them were women.

Negro women in the Detroit area early in 1944 were working as machine operators, assemblers, inspectors, stenographers, interviewers, sweepers, material handlers, and at various other jobs in all types of work where women can be used. The first woman hired as a detailer by a small engineering company was a Negro woman trained in engineering. A company that for some time resisted taking Negro women employed 2 as inspectors in the middle of December 1943; a few months later it had 47 Negro women inspectors and machine operators.

In one Detroit company Negro women made up 10 to 12 percent of the 1,000 women employed. Another that used a large number of women had about 25 to 30 percent Negro women; they were in every department and worked at almost every skill. In this company, management and the union backed the rights of its Negro workers—men and women—for advancement on the basis of seniority and skill.

A foundry that employed some 250 women had about 12 percent Negro women. Women applicants were interviewed and hired on a basis of qualifications and ability to adjust to other workers without regard to creed or color.

Though a company had been violating War Manpower Commission regulations on discriminatory newspaper advertising, it was persuaded to withdraw the advertisement and cooperate with the W.M.C. and the union in introducing Negro women workers. As a result, in 1944 the proportion of

Negro women in this company's two plants were 29 percent and 35 percent.

A company that had hired about 1,500 Negro women reported that they made up from 8 to approximately 25 percent of the women in its various plants. Another company opened certain departments to women in one of its plants. At the beginning it hired 8,000 women in this plant, around 75 percent were Negro, and the company was pleased with their production performance.

C) Oral History of Fanny Christina Hill

Most of the men was gone, and they wasn't hiring too many men unless they had a good excuse. Most of the women was in my bracket, five or six years younger or older. I was twenty-four. There was a black girl that hired in with me. I went to work the next day, sixty cents an hour.

I think I stayed at the school for about four weeks. They only taught you shooting and bucking rivets and how to drill the holes and to file. You had to use a hammer for certain things. After a couple of whiles, you worked on the real thing. But you were supervised so you didn't make a mess. . . .

I was a good student, if I do say so myself. But I have found out through life, sometimes even if you're good, you just don't get the breaks if the color's not right. I could see where they made a difference in placing you in certain jobs. They had fifteen or twenty departments [in the factory], but all the Negroes went to Department 17 because there was nothing but shooting and bucking rivets. You stood on one side of the panel and your partner stood on this side, and he would shoot the rivets with a gun and you'd buck them with the bar. That was about the size of it. I just didn't like it. I didn't think I could stay there with all this shooting and a'bucking and a'jumping and a'bumping. I stayed in it about two or three weeks and then I decided I did *not* like that. I went and told my foreman and he didn't do anything about it, so I decided I'd leave.

While I was standing out on the railroad track, I ran into somebody else out there fussing also. I went over to the union and they told me what to do. I went back inside and they sent me to another department where you did bench work and I liked that much better. You had a little small jig that you would work on and you just drilled out holes. Sometimes you

would rout them or you would scribe them and then you'd cut them with a cutters.

I must have stayed there nearly a year, and then they put me over in another department, "Plastics." It was the tail section of the B-Bomber, the Billy Mitchell Bomber. I put a little part in the gun sight. You had a little ratchet set and you would screw it in there. Then I cleaned the top of the glass off and put a piece of paper over it to seal it off to go to the next section. I worked over there until the end of the war. Well, not quite the end, because I got pregnant, and while I was off having the baby the war was over. . . .

I started working in April and before Thanksgiving, my sister and I decided we'd buy a house instead of renting this room. The people was getting a little hanky-panky with you; they was going up on the rent. So she bought the house in her name and I loaned her some money. The house only cost four thousand dollars with four hundred dollars down. It was two houses on the lot, and we stayed in the little small one-bedroom house in the back. I stayed in the living room part before my husband came home and she stayed in the bedroom. I bought the furniture to go in the house, which was the stove and the refrigerator, and we had our old bedroom sets shipped from Texas [where they had grown up]. I worked the day shift and my sister worked the night shift. I worked ten hours a day for five days a week. Or did I work on a Saturday? I don't remember, but know it was ten hours a day. I'd get up in the morning, take a bath, come to the kitchen, fix my lunch—I always liked a fresh fixed lunch—get my breakfast, and then stand outside for the ride to come by. I always managed to get someone that liked to go to work slightly early. I carried my crocheting and knitting with me.

You had a spot where you always stayed around, close to where you worked, because when the whistle blew, you wanted to be ready to get up and go to where you worked. The leadman always come by and give you a job to do or you already had one that was a hangover from the day before. So you had a general idea what you was going to do each day. . . .

Some weeks I brought home twenty-six dollars, some weeks sixteen dollars. Then it gradually went up to thirty dollars, then it went up a little bit more and a little bit more. And I learned somewhere along the line that in order to make a good move you gotta make some money. You don't make the same amount everyday. You have some days good, sometimes bad. Whatever you make you're supposed to save some. I was also getting that fifty dollars a month from my husband and that I saved straight away. I was planning on buying a home and a car. And I was going to go back to school. My husband came back, but I never was laid off, so I just never found it necessary to look for another job or to go to school for another job.

I was still living over on Compton Avenue with my sister in this small little back house when my husband got home. Then,

when Beverly [her daughter] was born, my sister moved in the front house and we stayed in the back house. . . .

I worked up until the end of March [1945] and then I took off. Beverly was born the twenty-first of June. I'd planned to come back somewhere in the last of August. I went to verify the fact that I did come back, so that did not go on my record that I didn't just quit. But they laid off a lot of people, most of them, because the war was over.

It didn't bother me much—not thinking about it jobwise. I was just glad that the war was over. I didn't feel bad because my husband had a job and he also was eligible to go to school with his GI bill. So I really didn't have too many plans—which I wish I had had. I would have tore out page one and fixed it differently; put my version of page one in there.

I went and got me a job doing day work. That means you go to a person's house and clean up for one day out of the week and then you go to the next one and clean up. I did that a couple of times and I discovered I didn't like that so hot. Then I got me a job downtown working in a little factory where you do weaving—burned clothes and stuff like that. I learned to do that real good. It didn't pay too much but it paid enough to get me going, seventy-five cents or about like that.

When North American called me back, was I a happy soul! I dropped that job and went back. That was a dollar an hour. So, from sixty cents an hour, when I first hired in there, up to one dollar. That wasn't traveling fast, but it was better than anything else because you had hours to work by and you had benefits and you come home at night with your family. So it was a good deal.

It made me live better. I really did. We always say that Lincoln took the [cotton] bale off the Negroes. I think there is a statue up there in Washington, D.C., where he's lifting something off the Negro. Well, my sister always said—that's why you can't interview her because she's so radical—"Hitler was the one that got us out of the white folks' kitchen."

D) Oral History of Lola Weixel

I was a welder during World War II. I worked hard, was an anti-fascist—thought about that every day—and thought about my loved ones. I think that nobody can imagine the passion that we had, first as human beings, as anti-fascists, and, in my case, as a Jewish woman, to defeat fascism and save the world—save civilization from the plans of the Nazis that we all knew Hitler had outlined in his writings and in his ravings. So, I went to school. They had the National Youth Administration set up to train what today we call disadvan-

tagged youth to learn trades. We were all disadvantaged during the Depression. I wanted to become a welder because the boy across the street from my grandma's house was learning to be a welder, and he told me it was the most exciting thing on earth but that women couldn't do it. I wrote to the National Administration, and they agreed that women couldn't do it. Then one day, Herman, the boy across the street, told me that there was a woman in the program and that maybe I should try again. I wrote again, and they said this was an unusual and special woman; she was different than all the other women. She was a protégé of Mrs. Roosevelt. She was going to be a pilot as well, and she was using welding as a means of earning a living and spending her money on flying lessons.

But aha! Pearl Harbor happened. Right away I got a letter, and there were lot of other women there overnight being trained. There were men in the program, too. We had a really good course. We had to take sheet-metal work before we could do welding; we had to learn to use tools. I was very bad. I was pretty dumb, but I was so determined, and they were so kind in that they didn't throw me out. They let me stay as long as it took, and it took me long compared to the other people, but then I got very good. We had two unusual teachers, and they were able to speak and tell me about what the heck I was doing there and what the function of welding was. I was never one who could learn something by imitating; I had to understand the process. Before I knew it, I was not only working as a welder, but I had a certificate that said I was a first-class welder. Lots of the women got that. We were very, very proud of it. It meant you were capable and could be trusted to work any kind of welding job. . . . Some people thought we were there to meet men. What men? We were there to get that "A" paper.

The women I worked with and the women I went to school with were largely, what we called at that time, working-class women. There's some talk saying that women came from every walk of life, and I suppose it's true, but women who chose to do hard, dirty work were working-class women whose fathers and brothers were often in the trades. They thought it was great. They knew about unions; they knew that they could make more money if they joined unions. Most of them were really down-to-earth, nice; I don't like to say ordinary or plain, but I mean that in the best sense of the words. Women who could be depended upon.

The first job I had as a welder was in a machine shop where they were making targets. We did the metal frames. They were round metal frames, and I understand that a colored sleeve would be put on it. They were towed up in the air on an airplane, and the men would do target practice on those. Now this was really very simple welding, and that made me a little unhappy because I felt that I could do more. I don't want to say that it was boring. It wasn't, because we had a lot of fun in the shop. We did a lot of singing, and the girls were swell. But I really wanted to do more skilled work.

There were some women who wanted to do what they called table work. They would sit, I guess these were some of the older women, and do small parts for the glider. The younger ones, and I was among them, wanted to do the climbing all over the glider, working in strange positions and doing more demanding work. That was fun. Now, the last job I had was very strange because they told us that we were making bomb cases. So I say we were making bomb cases. But I wouldn't swear to that. I don't know. They looked like metal coffins.

There were older men, and then, after awhile, wounded veterans . . . coming back, soldiers who had been hurt or whatever. For whatever reason, they were out of the army.

Of the women I worked with, well, there were some more political than others, but they were all very much for the war and against Hitler. I must say that the feelings against the Japanese bordered on the racist. Everybody watched where the Red Army was every day on the maps. Everybody cared about that because they knew damn well we were giving our production, but they were giving their lives. We all knew it; everybody knew it. It hurts me today when I realize that there are so many young people growing up who don't even know that we were a partnership. . . .

My husband [away in the army] wrote to me at one time when I guess he was contemplating how we would get along after the war, because we were not rich people. We were not even comfortable people. We were very uncomfortable people as far as money was concerned. And he said: "You'll be a welder after the war. And you'll make a decent living and I'll do something and together we'll be okay. Don't worry." We did depend on it. So what a shock to find out that it was not to be. I think that the question often is, Well, didn't you women expect to be thrown out after the war? Some women apparently, according to what they say, did. But people I worked with . . . thought we were learning a skill that would last us and be useful all our lives. We were very shocked and angry and hurt when we found that that was not true, that after the war they were finished with us, and we were gone—in spite of being a first-class welder and all that. It was not to be for the future.

I think the testimony of black women was especially touching, in that here they gained so much dignity and a feeling of self-worth from holding down these jobs in difficult situations. They were very good, very good. Black women wanted very much to excel because they had so much to gain. More than the rest of us, I would say. And to hear them say that they had to go back to cleaning somebody's house was really very, very maddening. You can imagine the frustration that went with that.

4.6. Women in Wartime around the World

Women and World War II

For almost all women, whatever their nationality, World War II eventually presented challenges and demands they would not normally have encountered. In the absence of husbands and fathers, many who had never expected to have to do so were forced to fend for themselves. Some survived, others did not. For women, war could as easily become a source of suffering and hardship as of liberation. Almost invariably, except perhaps in the United States, they had to deal with unusual deprivations and hardships, food shortages, even starvation, disease, bombing, evacuation, homelessness, and invasion or occupation. In the course of the war, millions became refugees, among whom women were disproportionately represented, since men were often away in the military. Germany recruited 1.5 million women from occupied countries for forced labor in industry or agriculture. Women were frequently the subjects of sexual exploitation, in many cases driven or forced to prostitution. In occupied countries in both Europe and Asia, many fought in the partisan movements, where if captured they were liable to be raped, as well as, like men, tortured and killed.

British women were expected to take on a vast range of new roles and responsibilities as their contribution to the

national war effort. Whereas, in the United States, government propaganda strongly encouraged women to take jobs outside the home, but they could not be compelled to do so, in 1940 the British Ministry of Labour acquired the power to direct able-bodied single women and married women without family responsibilities to undertake war work of national importance, employment which often meant work in munitions factories or in agriculture, rather than, for example, as domestic servants or manicurists. Many young women immediately volunteered for one of the women's armed forces, especially the supposedly glamorous Women's Royal Naval Service (WRNS) or WAAF (Women's Auxiliary Air Force). Tens of thousands of others served as nurses or in assorted volunteer organizations and units. In December 1941, the government went so far as to subject to conscription all unmarried women between 18 and 30 (the limit later went up to 35) not already engaged in work of national importance. At least 125,000 women were called up under these provisions and given the choice of joining one of the women's auxiliary armed forces, civil defense, or the Women's Land Army (WLA). Married women and single women with family responsibilities were not subject to conscription, but if their family circumstances permitted they too were urged to work, their path smoothed by generous childcare facilities and government canteens. Whereas, before World War II, women who were government employees, civil servants, teachers, even doctors, had been required to give up their jobs upon marriage, they now became the target of patriotic exhortations to return to work as a national duty.

Although the majority of women voluntarily took some form of employment deemed in the national interest, at least 125,000 British women were actually drafted under the December 1941 National Service Act; 80,000 joined the Women's Land Army, working on farms; and over 470,000 women served in the armed forces or women's auxiliary units. By 1943 7,750,000 women, over 40 percent of all women between 14 and 65, were enrolled in the British armed forces, auxiliary units, or industry. Women eventually comprised over 10 percent of the British armed forces. Unlike men, women in the armed forces or civil defense positions could not be assigned to what might be considered combat situations—including, for instance, anti aircraft duty, or service overseas—without their written consent. At least 700, however, died in air defense or fire fighting roles, and more than half of all civilian British casualties of bombing attacks were women. Women pilots in the Air Transport Auxiliary (ATA) ferried aircraft from factories to the front line and between different bases, efforts in which fifteen of them were killed. The majority of British women in the armed forces, however, served in support roles, as spotters, searchlight operators, radio and radar operators, drivers, cipher clerks, or providing clerical

services. Service in the Women's Voluntary Services for Civil Defense (WVS) could prove equally hazardous, as they fought fires, cleared rubble from bombing raids, and organized shelters and relief services. Although sometimes assigned in responsible positions to dangerous theaters of war, British women in the armed forces were restricted to non-combatant duties. This did not apply, however, to the relatively small number of women—perhaps 50 to 100—who enlisted in Special Operations Executive (SOE) and undertook espionage operations behind enemy lines.

The country where women's contributions to the war effort were most extensive, however, was the Soviet Union, where by 1945, women constituted 55 percent of the total civilian workforce and more than 80 percent of agricultural workers. Since its inception, the Soviet state had expected women to work, often in jobs traditionally considered male preserves, and during the war, this established tendency was reinforced by the shortage of able bodied men, great numbers of whom went into the armed forces. The Soviet Union also made the greatest use of women in the military, enlisting 800,000 in the Soviet armed forces, approximately half in the Air Defense Forces and the remainder in ground units. Though the other Allied armies generally restricted women's combat roles, the Soviet Union made extensive use of them in such capacities. Women operated anti-aircraft batteries, barrage balloon units, and searchlights. Some, though relatively few, joined much-publicized air combat fighter and bomber units that were sometimes integrated, sometimes all-women. Others served with combat units as tank and artillery crews, mechanics, cooks, and in medical and staff units. Almost 2,000 Russian women became snipers. Between 8,000 and 14,000 Polish women also served in national units under Russian command.

Nazi ideology precluded Germany from making as effective wartime use of women as did the Soviet Union. Adolf Hitler's National Socialist program sought to restrict women to the supposedly appropriate spheres of children, kitchen, and church; and mass mobilization of women, even though some of his subordinates urged it, would have challenged the prevailing mindset. Although legislation passed in 1940 required German women to register for work, in practice, its scope was restricted, applying only to women who had already held jobs and to the working class, which proved a fruitful source of social tensions and resentments. Even so, over time, efforts to recruit women intensified, with a new registration decree passed in early 1943, the enforcement of which became far more draconian from mid-1944 onward. From 1939 onward, all young, single German girls were expected to work for 6 to 12 months as nurses or agricultural or industrial workers, and 1.5 million German women entered the workforce during the war. Like the Allies, the Ger-

man forces also had women's auxiliary units that provided support services and freed men for combat duty, and their numbers eventually grew to more than 500,000. About 100,000 German women served in anti-aircraft units, and some who later became notorious were found among the guards in concentration camps. A few much-feted German women even served as test pilots.

Japan had no women's auxiliary armed forces, but toward the end of the war, the Greater Japan Women's Association trained female volunteers for civil defense duties in the hope of repelling the expected American invasion. Although Japanese women were not mobilized for war until late 1943, by the time the war ended, around 1.5 million, many extremely young, had been commandeered for war work.

About the Documents

The four oral histories included here are all taken from larger collections gathered together several decades after the war had ended. If recorded at an earlier date, two, at least, would probably not have been so frank, since one is the story of a Korean "comfort woman," one of the 200,000 attractive young Korean, Chinese, Indonesian, and Dutch women forced to serve Japanese troops as wartime prostitutes, effectively sexual slaves, and the other recalls the occasions the author was raped by Russian troops. Indeed, though prepared to speak, the Korean woman, identified only as "Ms. K," still wished to remain anonymous. Above all, these oral histories suggest the wide variety of wartime experiences women around the world might have. Some simply endured long-term sexual exploitation, which if they survived, left them permanently scarred emotionally; some concentrated their energies on survival, doing the war work required of them and dealing as best they might with defeat and occupation; whereas some flourished and even began promising careers.

By far the most spectacular of these women was the redoubtable Lt. Olga Lisikova, commander of a male aircraft crew during the war, who eventually became a general in the Soviet military. Even though British and American women served in their countries' armed forces, they were normally restricted to noncombatant jobs. Those who flew, for example, did so as ferry pilots, delivering airplanes or supplies. After the German invasion of June 1941, however, the Soviet Union raised three combat regiments of women fliers, most of them pilots who had trained in civil aviation before the war. The much-publicized "night witches" flew throughout the war on both bomber and fighter missions, more than 30,000 combat sorties in all. Many of the ground crew of these units were also women. The most prominent of the pilots was Major Marina Raskova, who died in an air crash. By no means all such fliers served in all-women units. Olga Lisikova, born

in 1917 into an intellectual family in the Russian Far East, flew with the 1st Regiment, the members of which were mostly men. She had entered flying school in 1937. During the war, she soon became commander of an otherwise all-male crew. Though occasionally the subject of sexual harassment and discrimination, with which, at least by her own account, she invariably dealt most competently, she managed to win an extremely fulfilling career for herself, one that continued for decades after the war.

The three other accounts are perhaps more typical, in that their authors' major task was simply to cope with the difficulties the war created for them. Two apparently dealt with hunger, cold, demanding factory work, defeat, and in one case rape, and survived reasonably well: the German Juliane Hartmann went on to have a fulfilling personal and professional life, working in the German Foreign Service, and Takamizawa Sachiko married and was a middle-aged housewife when she wrote down her recollections in response to a newspaper's appeal for memories of World War II. Although she begged her way back to her own country and made contact with her mother again, the Korean comfort woman was too ashamed of what had befallen her ever to rejoin her family. Her recollections were among those collected by advocates of the Korean women who sought to win compensation from the Japanese government. That does not, however, necessarily make them any more or less true than the others included here. In all cases, precise details may well have shifted over time and be somewhat inaccurate, but all appear to provide a reasonably convincing picture of the experiences of one particular woman in the war, experiences that were probably commensurate though not identical with those of others in similar situations. One must also, of course, remember that in at least one way, these women who survived to tell of their experiences were the lucky ones, in that they had not died in combat, bombing raids, of starvation, illness, casual brutality, or venereal disease.

A) The Comfort Women of World War II

I was born in Ulsan, a small town in the southern part of Korea, in 1928. I was the oldest among several children in my family.

My Japanese name was Kikuko Kanazima. Under the Japanese colonial rule at the time, we were forbidden to use our own Korean names or language. I finished elementary school under the direction of a Japanese principal. Twice a day, at the beginning and the end of school, we were instructed to bow to the picture of Emperor Hirohito placed at the top of classroom blackboard. We were also ordered to bow to soldiers whenever they passed.

I was about 15 years old when a tragic fate took hold of me. A town clerk and policeman visited my home and told me that I had to appear at the county office by a certain date. I was told that young girls had to join “*Jungshindae*,” the women’s labor corps, to fight for the Emperor so that the war would soon be won. They also told me that I would work at a military factory and that I would be paid wages.

My mother resisted this order. However, at the end of September, a policeman came again and took me to the county office by force. When I arrived, there were about 30 girls of my age there. The police put us on a truck that took us to a military cargo train. On the train I could see 30 or 40 Korean men who were drafted as laborers. We were put into a boxcar which had no windows, with lighting only from a dim candle. Two soldiers guarded us.

After about one week’s ride, we arrived at Uonkil Station in Manchuria. They separated us into different groups and put us into military trucks. After riding quite a while through the night, I and a few other girls were discharged at a military camp. Some young girls, including those of Chinese origin, were already at the camp. Each girl received two blankets, one towel, and a military-type uniform. Then guards took us to a wooden warehouse surrounded by barbed wire. They put one girl into each of the small cubicles. Our supervisors were Japanese soldiers or men wearing militia uniform. They told us to obey them.

For the first three days, only officers visited me. After that I was forced to have sex with 20 to 40 soldiers a day. I worked from eight in the morning till ten at night, but there were many nights I had to sleep overnight with an officer. A military doctor inspected us on a regular basis, but we all ended up having venereal diseases. Some girls died from these and other illnesses. Some girls became hysterical and crazy. In exchange for sex, soldiers apparently paid some kind of military money, but our supervisors took the money, saying that they would save it for us. In any case, I never received a penny from them.

During this horrifying enslavement, I was moved to three different military camps. The last unit was called “Koyabashi 8000” stationed near Jijiharu. Whenever we were moved, we were guarded by military policemen and kept under constant watch. I tried to escape several times, but I was caught each time by the soldiers and severely beaten by the supervisors. On one occasion, I jumped off a truck and tried to run away in the dark. But they caught me and my supervisor beat me savagely all over my body and then cut off my three left fingers with a knife.

Life in the camp became devastating toward the end of the war. We were starving. Those who were sick had no medical treatment. Then, one day, the camp became completely silent. I went outside. There were no soldiers in the camp. Finally, a Chinese told me that the war was over.

It took me about two months to walk back to Korea. I had to beg food from the Chinese on the way. I was glad to have survived, but very ashamed and angry about my past life. I decided not to go back to my home because of the shame and potential harm to my family.

I settled down in Pusan and worked as a waitress in restaurants and as a house maid. Eventually, I contacted an aunt who arranged a meeting with my mother. My mother asked me to come back to her, but I decided to live by myself. As time passed, I became sick and had to undergo a hysterectomy.

In 1979, my younger sister who was living in New York City invited me to live with her. So I came to America. At present, I live alone with financial assistance from my sister, the U.S. government, and the South Korean government. I wait for death.

If I were to speak to the Japanese government, there is one question I would ask: Is it right to ignore me like this as if they did nothing to me? Are they justified after trampling an innocent and fragile teenage girl and making her suffer for the rest of her life? How would you feel if your own daughter met the same fate as mine?

This should never happen again in the world. I hope the Japanese people will also join mankind’s march for justice and peace.

B) Recollections of Takamizawa Sachiko, Housewife, 1986

“Students, you are allowed to go home now.” All of us seated on tatami mats in the large hall fell silent at these unexpected words from the principal. In the next instant we pushed forward. The only sound was that of our work pants stiffened by arum-root paste as we slid across the tatami mats. “Did I really hear that?” said the intense expression on everyone’s face.

We automatically formed a circle around the principal. When the reality that we were able to go home sank in, a shriek went up. The sound of sobs filled the room. Such was the scene at the end of February 1945, at the Kokura munitions plant where our fourth-year class in girls’ high school had been mobilized to produce balloon bombs.

We glued several layers of Japanese paper together with arum-root paste, steamed them, and pressed them with steel plates. Fusing some seven hundred of these pieces of paper, we fashioned a balloon ten meters in diameter. A bomb was to be hung on the balloon. Launched on the prevailing west-

erly winds, these balloons floated toward the American mainland at altitudes above nine thousand meters. We worked on these through the frigid winter, and the food was very poor. We worked two twelve-hour shifts, standing the entire time. Those on the night shift were forced to take two stimulant pills to stay awake. It was a constant struggle against drowsiness. Our dormitory, which slept twelve to a ten-tatami-mat room, was a place where we went only to flop down to sleep.

In these vile conditions almost everyone got athlete's foot and frostbite. Nearly one-tenth of our number died soon after graduation. Many suffered from tuberculosis, neuralgia, rickets, and overexhaustion. Our response to the news that we were able to go home symbolized the severity of our lives and the sadness that we had endured as mobilized students.

C) A Russian “Night Witch”: Reminiscences of Lieutenant Olga Lisikova

Sixteen of us girls went to flying school, where we were issued flying uniforms. I put mine on, and it was terrible—I looked like a monster! It was so awfully oversized that I couldn't move in it. I cut it drastically, as well as the high boots. Out of the remainder I appeared in the formation, and I was given ten days in the guardhouse for destroying state property! The other girls decided to support me and express their solidarity, and the next day they all appeared for roll call in their altered uniforms. The commander of the battalion could do nothing but release me from the guardhouse. . . .

[After retraining in 1940] I was transferred to the Flying Division of Special Role, which was assigned to the State Committee of Soviet Defense. This organization completed missions on all fronts, from the Black Sea to the Barents Sea. The main base was at the Vnukovo airdrome, not far from Moscow. When we were fulfilling our combat missions, we flew out of auxiliary airfields closer to the front lines or to the location of our mission. The pilots were experienced airline pilots with many hours. Our missions were to bail out paratroopers, drop supplies for encircled troops, transport fuel and spare parts to advancing troops, fly to the partisans in the rear, drop intelligence officers to the enemy rear, and bring supplies to besieged Leningrad. . . .

In a month I was appointed commander of the aircraft. But a few days later I was ordered to fly to Siberia to be assigned as a copilot ferrying aircraft from America. It turned

out that the commander of my division learned that I, a woman, was flying in his division, and he was determined to get rid of me. But then he was ordered to another command, and my chief rescinded the order. . . .

I actively took part in all the combat missions my division carried out. The new commander of the division summoned me and told me that I, being the only female pilot in the division, had a great responsibility, because all eyes were on me. Each flight, every landing was closely watched by the staff. And where the failure of a male pilot could pass unnoticed, mine would be always under surveillance. Any blunder, or worse—an accident—would not serve me well. He cautioned me to be demanding of myself. After that talk I changed drastically; I didn't look or act like myself. Everything congested inside; I became very strict with myself and my subordinates. Before, I would go to rest and relax after a mission; now, I went to the navigators' room and scrupulously studied the route of the next mission. When the crew went to see a movie, I went to the meteorological station and studied the weather reports. I would do everything better than the men. . . .

We were transferred to a division of the long-distance flights, closer to the front. After this redeployment, the commanding staff of the division invited me to a dinner with their major-general at the head of table. As the dinner came to an end, I noticed the general's staff were quietly sneaking out of the room. I tried to follow their example, but I was stopped by the commander of the division. I understood that the general wanted to bed me down. Yes, I was only a lieutenant, but apart from that I was Olga Lisikova, and it was impossible to bed me down. His pressure was persistent. I had to think very fast, because nobody would dare to come to my rescue. In desperation I said, “I fly with my husband in my crew!” and he was taken aback. He didn't expect to hear that. He released me; I immediately rushed out and found the radio operator and mechanic of my crew. I didn't make explanations. I, as commander of the crew, ordered that one of them was to be my fictitious husband and gave them my word of honor that nobody would ever learn the truth! Then I released them.

I couldn't sleep all night; I couldn't believe any commander would behave like that. I thought, Were generals allowed to do anything that came to mind? I couldn't justify his behavior. The only explanation that seemed appropriate was that I was really very attractive in my youth. Thank God we flew away early the next morning.

I already had 120 combat missions when our division began receiving the C-47 aircraft. It was a most sophisticated plane, beyond any expectations. We pilots didn't even have to master it—it was perfect and flew itself! Before I was assigned a mission in it, I made one check flight. My next flight was a combat mission, to drop paratroopers to liberate

Kiev. Later, when Kiev had been liberated, I flew there again. There were few planes on the landing strip, and in the distance I saw an aircraft of unusual shape, like a cigar. I realized at once that it was an American B-29. I taxied and parked next to it. My radio operator, tail gunner, and I were invited aboard by the American crew. We spoke different languages, but my mechanic knew German and an American spoke it also; thus, the communication took place. The outside of the aircraft was no surprise, but when you got into it, touched it, and saw the most sophisticated equipment, you realized that it was the most perfect aircraft design. The Americans received us very warmly. The news that we flew the American C-47 made them respect us more. The most astonishing news for them was that I, a woman, was commander of the plane. They couldn't believe it. It was an instant reaction—I suggested that I would fly them in my plane to prove it! I put the crew in the navigator compartment and placed the copilot in the right seat beside me. The flight was short, six or seven minutes, but it was hilarious. After that I was strictly reprimanded by my commander.

By the time I had made 200 combat mission, I was entrusted at last to fly in the Intelligence Directorate of the General Staff of the Red Army. I will tell you about one of those flights. . . . I was assigned a mission to fly to the enemy rear and drop supplies to the partisans. I crossed the front line at 4,000 meters, and at the appointed place began a dive. The altimeter showed me to be lower and lower, but I could see nothing through the clouds. Finally the altitude read zero and then less than that. Judging by the meter I was to be deep in the soil, but still I held the dive. I couldn't return to base without completing my mission: I didn't want to be reproached after the flight that I hadn't fulfilled the risky mission only because I was a coward, because I was a woman. Then I glimpsed the ground, and below me was the target where we were to drop the cargo. The area was covered with dense, patchy fog. We dropped the supplies to the partisans and returned to base.

When we returned we learned that all the crews had turned back, not having managed to fulfill the mission. Everyone was astonished. How could I, a woman, do what other male pilots hadn't managed to accomplish? The division commander said he would promote me to be awarded the Gold Star of Hero of the Soviet Union, but I never received that award, because my crew consisted of males. If the crew had been female, it would have been awarded.

I flew with the division almost the whole war and completed 280 combat missions, but I was never awarded a single order. Although I was promoted for awards, it was always denied. The deputy commander of our division staff told me that it was totally his fault and responsibility that I had never been given an order. He had decided that I might get a swelled

head in the purely male division if I had been given a high award. Instead, he thought it quite healthy for stories about me to be published in the press. Twenty years later, when I met him at the reunion of our division, I saw that his breast was pinned with high awards. I told him that during the whole war I had made more than 280 combat flights as commander of the aircraft, while he had all the traces of distinction on his body although he hadn't made a single combat flight.

D) Reminiscences of Juliane Hartmann

It was the autumn of 1944. My father was at war, and, in the meantime, my stepmother had moved with my younger brothers and sisters to a farm in Bavaria. I was 19 and decided to stay in Berlin. Berlin was, after all, my home. Not much later I was drafted into the labor service and had to work 64 hours a week in an ammunition factory. Thank God I didn't end up in the main hall, but instead was sent to work with two wounded soldiers in a small room. It was said that we were doing solder work on some secret weapon, but all I recall soldering were pots and pans. I got up at five o'clock every morning and rode my bike to the factory to begin work at six. I worked 10 hours a day, 64 hours a week for "our Führer."

About that time, we began to really feel the food shortage at home. There was nothing left to hoard, and we had used up what we had in reserve. We relied totally on the official rations. Our noon meal consisted of cabbage and potatoes, while in the evening we generally ate potatoes and carrots. Besides my aunt and me, there were up to 35 refugees living in our house. I remember having to divide a tiny piece of butter up into "Monday to Friday"; the daily portions were never even enough to spread on one piece of bread.

I remember distinctly, it was April 14, 1945, when there was a major attack on Potsdam. From that day on, we had neither running water nor electricity. The telephones weren't working either. The first wave of Russians arrived shortly after that. The first thing we did was to hang a white sheet out the window. What followed was worse than anything we had ever imagined. Today, I am able to say that "I was the first victim on the street." The never-ending stealing and looting became a daily occurrence over the following weeks and months.

The man who lived next door had been bombed out of his house in Berlin. One night he was visited by an entire horde of Mongolians who pointed their guns at him and asked, "Where woman?" Since he lived alone, the only thing he could say was

that there were none in his house. And so they went to the next house, which was ours. They forced their way through the front door. I can't tell you now exactly how many of them there were. They went through the entire house—which was very large—with flashlights, from the basement to the attic. Some of the people living in the house were able to hide. As for myself, I fell into the hands of one of the Mongolians.

That was actually the second time. The first time occurred when I mentioned I was the first victim on the street. It was the middle of the day. One Russian went into the garage and the other headed for the house. Not having the slightest idea of what would happen, I followed the man into the house. First, he locked all of the doors behind him and put the keys in his pocket. I began to feel a bit funny when we got to one of the bedrooms. I wanted to go out on the balcony, but he pointed his gun at me and said, "*Frau komm!*" We had already heard about a few of the horrible things going on, so I knew one thing for certain and that was "Don't try to defend yourself." An upper-middle-class child, I had never been told about the facts of life. . . .

I was 19, not that young by today's standards. We were just so happy that the war was over, that we were still alive, and that no more bombs would fall. Of course, we contemplated what the future would have in store for us, but primarily we thought we were lucky to be alive at all. I was examined, and fortunately I hadn't been infected with venereal disease. At least I knew I was all right, though I admit that I did have nightmares for quite a while after that. But looking back at what happened to me, it's as though I wasn't really being violated. Instead I was standing next to myself, alongside my body, a detached observer. That feeling has kept the experience from dominating the rest of my life.

4.7. The Wives They Left Behind Them

The Women Who Waited

Civilians in the United States had a relatively easy time in World War II, spared the rigors and dangers of bombing, invasion, or occupation that were the common lot of most other countries taking part in the conflict. Despite government-sponsored campaigns to conserve vital materials, even rationing was far less strict for Americans. The demands of industrial mobilization and rearmament for the war effort also brought the end of the Great Depression that had acted as a drag on the American economy throughout the 1930s, when unemployment rates rarely fell below fifteen percent and wages, production, and industrial investment all lagged far behind capacity. For those Americans who were not called up for military service, the war brought full employment and good wages.

This did not, however, mean that American civilians escaped unscathed. Of none was this more true than for those millions of women married to soldiers who enlisted or were called up for combat service overseas. Over 16 million American men, most of them young and many married, served in the U.S. armed forces during the war, the majority of them spending at least some time outside the United States, often in conditions of great physical danger. Over 400,000 soldiers died on active service and an additional 670,000 were seriously wounded and 114,000 taken prisoner. While many of the young men who joined the armed forces were still single, a substantial and—as the war progressed—growing number were already married, and in many cases also fathers of young children.

The absences, periods that often stretched into long years of separation once soldiers had shipped overseas, were particularly hard for those wives left behind. Under the pressure of war, some enlistees had married in haste, and many such marriages of two incompatible individuals who hardly knew each other, or who had both changed greatly during protracted separations, quickly ended in divorce once the war was over. Thousands of husbands and wives who were parted for long periods of time found consolation, temporary or per-

manent, with other people, as did those who had believed themselves engaged or in serious relationships. There were good reasons why the American Legion, when advising civilians on what to include in letters to absent soldiers, warned: “Above all, do not write and tell about the ‘best girl’ going out with some other fellow” (Parillo, 53).

For many others, however, especially wives, war-enforced separation was an ordeal that only ended when their husbands finally returned, often as men much changed from when they went away and sometimes badly scarred by their experiences. For women left behind, the departure of their husbands or other relatives often meant a lengthy agony of waiting, frequently in great fear that any break in communications—generally through often inadequate and sporadic mail services—might mean that a much-loved husband had died in combat or, sometimes even worse, had been seriously wounded or captured by the enemy. The suspense and uncertainty were often the worst part. Financial worries and additional responsibilities were likewise common. Married women could often find relatively well-paid jobs, which also kept them occupied, but many often had to compensate for the absence of their family’s primary breadwinner. Even when soldiers sent most of their pay home, they received relatively low wages, and their dependants often had to manage with tight budgets on straitened finances. Women often found themselves taking on sole responsibility not just for their children but also for elderly relatives, who might worry as much as they themselves did over how their absent brothers, sons, or grandsons were faring. Those proud families with great clusters of stars displayed in their windows to denote absent relatives serving in the forces also bore multiple burdens of anxiety and uncertainty over the fates of all the soldiers who were dear to them. And when those men finally returned, if they did, they might well be suffering from what would now be called post-traumatic stress disorder, afflicted with nightmares caused by what they had seen or done in combat, and unable to share their fears and experiences. They also came back to wives who had managed for years without them and, in many cases, acquired far greater independence of mind and behavior, and children who frequently hardly knew them.

Such afflictions were not, of course, peculiar to women or families in the United States. Indeed, since casualty rates among American soldiers were relatively low, and their military authorities fairly efficient in notifying spouses and other survivors of deaths or injuries, their burdens were lighter than those of women and family members in many other countries. Nor did they have to carry their load in tandem with the fear or reality of physical hardship and danger due to starvation, bombing, or invasion. Thirty years later, one German from an aristocratic Prussian officer family, a young boy who had a father and two uncles fighting on the Eastern

front in Russia during World War II, recalled how, each time his family saw the telegram delivery boy approaching the house, they knew that one more of those brothers was dead. Others were even less fortunate; many families in Russia and Asia simply had to accept the fact that one or more members had joined the armed forces—or sometimes enrolled in a resistance group—and disappeared. In France and other conquered countries, in some cases family members simply lost contact with each for several years, with some joining forces in exile overseas and others enduring the rigors of enemy occupation. Many found their inability to know exactly what had happened to a dearly loved husband, fiancé, son, grandson, brother, or close friend particularly painful and distressing. Physical distance from actual fighting did not necessarily reduce the stake any individual civilian had in the war.

About the Documents

These two oral histories were both recorded during the mid-1990s by the wives or widows of men who had served in the 712th Tank Battalion, a military unit for which the oral historian Aaron Elson had already recorded numerous such reminiscences by the soldiers themselves. Apparently, what impelled him to include recollections by wives was a question from Helen Grottola during the 1994 reunion: “When are you going to interview some of the wives who stayed at home while their husbands went off to fight in the war?” Although some compilers of oral histories, especially those focusing on women, have attempted to fill this gap, collections of World War II reminiscences have tended to focus on the experiences of the many millions of men who fought in the armed forces. Perhaps almost inevitably, the memories of civilians have taken second place. As time passes and every year brings new absences in the ranks of those, men or women, soldiers or civilians, who actually took part in World War II, such gaps become ever more difficult to fill.

At the time of Pearl Harbor Helen Grottola and Jeannie Roland were both young women in their late teens or early twenties, and when their husbands joined the forces neither had been married long. Despite this, each marriage endured until the 1990s, when both men died of natural causes. There were differences between them: Grottola already had an infant daughter when her husband enlisted, whereas Roland and her husband had no children. Grottola, whose father was a career navy officer, also had a service background, which was not true of Roland. Both, however, found the separation of war a great trial, especially when they knew or suspected that their husbands had been injured. Grottola, juggling the demands of a job, a premature child with some problems, an absent husband and father, and straitened finances, perhaps faced more obvious difficulties than Roland, who had professional training as a home economics teacher. Both, how-

ever, referred to the suspense and worry of the time, their constant fears for their husbands, their anguished wait for letters, and the delight when their men finally returned, even though, in Roland's case, her husband was much changed from the rather carefree and lighthearted man who had sailed for Europe earlier in the war. Their accounts also give insight into the stratagems wives and other relatives and friends used to discover what their men were doing and where they were going, despite official orders that troops were not to give out such information. Roland bluntly said she found it "hell" having her husband away overseas, while Grottola confessed that only many years later was she able to "make a big joke" of that time, because "it was really not a very good experience for me." Yet Grottola, with a family military background, also suggested that, despite all the hardships involved, her husband—and by implication she herself—had gained something important from his wartime experience, sentiments absent from Roland's recollections.

As is usually the case with oral histories, especially those recorded many years after the events described, these contain a few vivid anecdotes which have stuck in the interviewee's mind, together with general descriptions of the atmosphere and prevailing conditions of the time. Recorded almost fifty years after the war had ended, they incorporate the interviewees' subsequent reflections on those experiences. One rather interesting difference between these two oral histories is that Grottola's is the direct transcript of an interview, at which her husband was also present, published on a website, whereas Roland's has been edited into a coherent narrative and included in a book containing a variety of such reminiscences. The different formats allow one to appreciate how the raw materials of history can be gently massaged into a shape which, though containing no word which the narrator or interviewee did not say, is easier to read and comprehend. The manner in which the historian or recorder handles and presents the data at his or her disposal is often an important factor in making these accessible to the general, non-specialist reader.

Primary Source

A) Oral History of Helen Grottola, Widow of Joe Grottola, 712th Tank Battalion, recorded 22 September 1994

Helen Grottola: My father was an orphan from the day he was born. His mother died in childbirth, and his father was killed six months later on the railroad. So he was an orphan when he was born. And when he was old enough he lied about his age and went into the Navy. . . . And I was raised a Navy brat.

I was seven or eight when [my parents] moved to Harrisburg [Pennsylvania]. In the meantime, Joe came to Harrisburg, but his family came to another section, so we went to

different grade schools. Then we started junior high in seventh grade. Then we came out [and graduated] in January of '41 and we got married in May of '41. But over half of our class was already in the service. A lot of our boys came to graduation in their uniforms.

Question: And this was before Pearl Harbor?

Helen Grottola: Yes. Then Joe went to work for the government. He was sewing uniforms. He and his father both. They were both tailors. . . . Then Joe went to welding school, and he left on Monday morning and didn't come back until Friday night. That was when he learned to weld. And he was doing that when he was called into the service.

Question: How old was he when he was drafted?

Helen Grottola: Around 20. . . .

Question: Did Joe go into the service before Pearl Harbor or after?

Helen Grottola: It was after. Let me see, our baby was 13 months old, and that would have been November of 1943. She was born in October of '42 and then the following November he went in.

Question: Would having a child have gotten him a deferment if he wanted? Or did he not want a deferment?

Helen Grottola: He didn't want it.

Question: And how about you?

Helen Grottola: Oh, I'd have given anything if he would have taken it. And he very easily could have because he was working at York Safe and Lock Company which was making safes for the military, and he could have gotten a deferment. His boss wanted him to get it, and he didn't want it. And like a very dutiful little wife at that time, I said, "Well, whatever he wants." You know, "If he wants to go. . . ." So he did. And he left a very small baby. And it was very hard, because she was a premie to begin with. I had her at seven months. . . . Marcia was 13 months old when Joe went in the service. It must have been between Christmas and New Year's when he shipped out, because I really cried.

Question: You did?

Helen Grottola: Oh, buckets. Buckets. Because I didn't know where he was going, what he was going to be doing.

Question: Did you get to see him off?

Helen Grottola: No. He went right from Fort Mead to wherever. I knew he was at Fort Mead, that was it.

Question: Was he writing home regularly?

Helen Grottola: Oh yes. I went down to Fort Knox, Kentucky, for a week with the baby. Then I came home, and he'd call on Saturday night, I always knew he'd be calling. We wrote back and forth, and then he said, "I'm going to Fort Mead." And I said, "Oh, great! That's in Maryland. That's about an hour, an hour and a half from home! Hot diggety dog!"

I think he wasn't down there too long, and he called one night and said, "If you don't hear from me, don't get worried."

And of course I wanted to know why. And he said, “I can’t tell you. There’s too many guys here at the phone.”

Well, with first my dad being military, I said, “You’re leaving.”

He said, “I didn’t say that. You said it.”

And I said, “Okay.”

The next call I got was from New York, and I said, “Can I come up?”

And he said, “No.”

I said, “You won’t be there?”

He said, “You said it. I didn’t.” So I knew that it was just a matter of time, and with my father being military I never asked questions. I knew better.

Question: Was your father still in the Navy?

Helen Grottola: Oh, yes.

Question: Was he in World War II also?

Helen Grottola: Yep. He went to Sicily and then they shipped him over to Oran, and they put him in ship’s receiving. He was taking stuff off of the ship and sending it to wherever it was to go. And in the meantime, my [younger] brother was over in the Aleutians and was on his way down to Australia. . . . My young brother was in the Navy. Had two ships torpedoed from under him. And of course Joe was in Europe. . . .

I lived with my mother and I had a house. And the two of us lived together. Because my brother was in the Pacific, my father was in Africa and Joe was in Europe. We had three stars hanging in our window. At that time, that was the big deal. You hung stars in the window for your servicemen. . . .

Question: Did you get many letters from Joe when he was overseas?

Helen Grottola: Oh yes. He wrote almost every week.

Question: Even when he was in combat?

Helen Grottola: I got a lot of letters. I never knew where he was. Even when he upset the truck, that was the worst part, because I didn’t get any letters, and I thought, uh-oh, something’s wrong. I didn’t get anything from the military saying that he’s been hurt or he’s been deceased or anything, and that went on for about six weeks.

Question: Did you contact the military and ask what was happening?

Helen Grottola: I called the Red Cross but that was a big laugh. We didn’t get much satisfaction out of them. Because they had too many to take care of.

Question: What happened to Joe?

Helen Grottola: He upset a truck. They went for coal. I don’t remember any more where they went, then they upset the truck. They were racing back and he missed a curve in the road, and they went over.

Question: Was the war still on?

Helen Grottola: Oh, yeah. That’s why I was scared to death.

Question: Did he write to you about it?

Helen Grottola: Oh, yes. That was the greatest thing in the world. The mailman even came up to the door and rang the doorbell and said, “Look what I’ve got for you!” . . .

Question: How was money? Were you poor?

Helen Grottola: Oh, very poor. Try living on ninety dollars a month, raising a baby.

Joe Grottola: She was getting eighty dollars a month and I was sending her I think twelve dollars of mine, and I was getting \$16 when I was overseas. I’d send her \$12 of the \$16, and that would leave me four dollars that came out of my salary.

Question: Sixteen a week?

Joe Grottola: A month.

Question: What rank were you?

Joe Grottola: A private. I didn’t get to be a Pfc [Private first class] until after the war was over. I was doing sergeant’s work, but they weren’t giving out any ratings because the war was on. So you just did the work. I never questioned it.

Helen Grottola: You try raising a child on ninety dollars a month, a child who needs new shoes every three months because their feet are growing, and being a preemie she’s got to have them, and then the shoes are rationed and you have to go to the Ration Board and get extra coupons so your baby can have shoes. You go to the other Ration Board, the Food Rationing Board, and you get extra stamps so that your baby can have meat, because the meat was rationed, butter was rationed, sugar was rationed, you don’t have a car, you’d ride a streetcar. It was a nickel a ride. . . .

Question: Did [your daughter] recognize him when he came home?

Helen Grottola: Yes she did. He got out of the car and she damn near tore out of my mother’s arms and screamed, “My Daddy! My Daddy!” And she was four and a half years old.

Question: And she hadn’t seen you in three years?

Joe Grottola: Two and a half. When I left Fort Knox I went right to New York, and right on a ship. In fact, she came to New York to see me, and the day she came up to see me they froze us, we weren’t allowed to go into New York. I was already in New York for about four days, and then the day she came up was the day they said, “You can’t go. You’re going overseas.” . . .

Question: What would you write in your letters to Joe? Would you try to be cheerful?

Helen Grottola: Oh, I’d tell him the neighbors ask about you and want to know how you’re doing. And did I know where you are. The baby’s fine. She has a new tooth. She’s walking. . . . the little stinker wouldn’t walk until the day after he left. Or I would write that I went to town, I saw so and so and they didn’t even know you were in the service, they just haven’t seen us for a long time but didn’t know what happened to us, and they thought maybe with the baby we were just staying at home, or we couldn’t get babysitters. That was the roughest thing, trying to get babysitters because all the

women were working, like his mother, she was in Middletown, which was a big military operation during the war. His sister went to Middletown and worked. And his other sister went to the newspaper and worked. So it was a problem to get babysitters. You almost had to work in between shifts and depend on your family. You couldn't call a high school kid because they were working too. And the boys were working in the mills, they really needed them. It was rough. . . .

Question: Was there a support network?

Helen Grottola: No. Not like they have now.

Question: What about other women whose husbands were overseas?

Helen Grottola: Well, for myself it was rough, because I lived in a neighborhood of older people. In fact, my brother and I and the girl next door were the only children within three blocks. It was an established neighborhood. I mean it was people who bought their homes and were raising their children, so when I married and stayed there, my girlfriend is really the only one that I had that I could cry on her shoulder and she could cry on mine. . . .

Question: Did you get married knowing Joe was going to be leaving, or sensing it?

Helen Grottola: Oh, no. I figured with him being with his father in the tailor shop making military clothes, oh, that was going to be it. He wouldn't have to go. And then he started taking this welding course and he liked it and he gave up the tailoring and then he went in making these safes, so I figured, well, he'll never go, they'll keep him out. But I didn't know my husband too well. I think most of the young boys were that way. . . . The fellows got the letter that said "Greetings from the President," and they all, hey, hot diggity dog! Cowboys and Indians.

Question: Did you work [during] the war?

Helen Grottola: Yes, I went to Bell Telephone because Bell Telephone would not employ married women until the war, and then during the war they had no choice. They had to employ married women because there weren't any men. . . . [M]y mother kept the baby, and then I worked there until right before Joe came home, and when I knew he was coming home I quit. . . .

Question: Did you save the letters that Joe wrote during the war?

Helen Grottola: I saved them on up until I guess it was when we sold the big house and went into the apartment and I burned them. And I wish now that I hadn't of. . . . I read every one of them again. It took me days to burn them. . . .

But I wouldn't give up the military experience that I've had, and I know he wouldn't. He wouldn't give you a nickel for to do it over again, but he wouldn't take all the money in the world for the experience of it either. And neither would I, because I think anybody who went through it I think it made a better person.

B) Oral History of Jeannie Roland, Widow of Jack Roland, 712th Tank Battalion, recorded 26 January 1995

I met Jack when he was at Pine Camp, in New York State, and I was teaching school. One of my students was going with a soldier there. I had a car and I took her out there and I met Jack. . . . We were married in August of '42 in Phenix City, Alabama. . . . We were in Columbus[, Georgia] for about a year, and then we were in Augusta, and then in Columbia, South Carolina. Jack was in the intelligence department. . . .

As a teacher in 1941, I was one of the people who had to sign people up for ration books for tires, for gasoline, for meat, for sugar, for coffee and so forth. I was a home economics teacher, and one of the things we did was I had the women in this small community get together to put on a meal for a large number of people, for practice, in case we had to have some kind of help for people. I hadn't thought about that in a long time. Those were some experiences. . . .

What was it like when Jack was overseas? It was hell. I was teaching school in another small town, over toward Elmira. When he came home, I hadn't heard from him for weeks. When the war ended, he was in Germany having his appendix taken out. The war in Europe ended in May, and he came home in September.

I weighed 104 pounds. I weighed 120 when he went overseas. I was so frantic, not knowing where he was. I boarded with a woman who was a volunteer for the Red Cross, and she came and called up the stairway one day and said, "Jean, how long has it been since you've had any word from Jack?"

And I said, "Eight weeks."

She said, "Would you like me to do something about it?"

I said, "Yes." A lot of mail was lost, there were all kinds of complications, but I was worried to death.

I had lost so much weight that Jack said when he got off that train, if he'd taken a good look at me, he'd have gone back. The bones in my hips were showing. But it was no worse for me than it was for anybody else, I'm sure.

Jack was wounded in the summertime. I was at my mother and father's house in Friendship, New York, when the letter came, and I opened it up, and he said, "I have been wounded and I'm in the hospital in England." Well, I got in my car and took off for my friend's house, I was so upset, and my father started looking for me all over town. In a few days I got a telegram from the War Department, but I'd already had the letter.

That was at the end of July and he was in the hospital until Thanksgiving. He had been hit in the front and the back with shrapnel. He went back in time for the Battle of the Bulge.

Penicillin had just come out as a treatment, and they used to put it in the shoulder. It was mixed with oil I guess and stung like mad, and he just about punched out the nurse one night, and finally he said, "Don't come in here and give me a shot until you know that I am thoroughly awake!" Because it hurts a lot. But I'm sure it saved a lot of lives, too.

When Jack came home he was not the same person that went overseas. And we didn't talk about it. He never did tell me a whole lot about what went on. He had nightmares. He'd get up out of bed in the middle of the night and disappear.

But I don't think any of these men came home the same as they went.

Before he went away, we laughed and laughed and laughed. Everything was lovely. When he came home he was more serious, but also, he was just not himself.

4.8. A Child in the London Blitz

World War II is enshrined in British mythology as a time when all Britons, whatever their class, sex, or age, held together in a spirit of national unity and endured heavy pun-

ishment rather than submit to German demands. As time passed the experience and even the hardships of civilian life in wartime attained a retrospective luster, buffed to its highest pitch during the 1995 British celebrations of the fiftieth anniversary of victory in Europe. Nostalgia shed romance and glamour on air raid shelters, the sound of the sirens, searchlights, the songs of Vera Lynn, wartime shortages and rationing, the fashions of the time, the "Dad's Army" Home Guard of men too old for military service who nonetheless prepared to defend Britain to the last should it be invaded, the street parties that celebrated the end of the war, and even on spam, the rather unpalatable canned luncheon meat shipped in bulk under the American Lend-Lease program that was a major staple of British wartime diet.

At the center of wartime mythology stood the Blitz, the incessant, heavy, and highly destructive bombing raids to which Hitler's air force subjected London and other major British cities between September 1940 and May 1941, in an effort to force Britain either to come to terms with Germany or to soften up the country in preparation for a German invasion. Over these nine months the Luftwaffe made 127 large-scale night-time attacks on British cities, 71 on London, the others against Liverpool, Birmingham, Plymouth, Bristol, Glasgow, Southampton, Coventry, Hull, Manchester, Sheffield, Newcastle, Nottingham, Cardiff, and Belfast, Northern Ireland. Most of these were major industrial centers. The objective was both to break the morale of the civilian population and to damage or destroy Britain's industrial capacity. London bore the brunt of the German assault: of two million houses destroyed or made uninhabitable, 1.2 million were in the capital, which also lost the bulk of the 60,000 civilians killed and 87,000 seriously injured. Even after these raids ended, for the rest of the war British cities endured more sporadic air raids, supplemented from early 1944 for the south of England by the German V-1 "buzz-bombs" or "doodlebugs," unpowered airplanes packed with high explosive which quite literally landed with a bang when their pre-programmed engines eventually cut out, and their successors, the silent and therefore even more sinister V-2 long-distance rockets, bearing similar cargoes.

World War II was also the height of the Anglo-American alliance. By late 1941 the United States had a massive and ever growing military mission in Britain, and from 1942 onward American servicemen began arriving in substantial numbers, initially often as fliers mounting raids on Germany and Italy, later in huge numbers in preparation for the forthcoming Allied invasion of Europe that eventually took place in June 1944. By 1945 three million American servicemen had spent time in Britain, in what their fascinated but sometimes resentful hosts on occasion termed the "American occupation" of their country. Famously described as "oversexed, overpaid, overfed, and over here," they tended to be phys-

cally large, the product of the superior United States diet, and brash and loud in a culture that emphasized restraint and understatement. In the midst of rationing, austerity, and shortages of every kind, which had by then lasted for several years, lonely American servicemen desiring female companionship—or simply seeking friendship and substitutes for their distant families—could tap the generous supplies of the military PX stores to offer British girls and women near unobtainable nylon stockings, perfume, chocolates, fruit, and other coveted luxuries. It was hardly surprising that envious British men often felt unable to compete. Many such relationships were undoubtedly shortlived, but during the war and shortly after it ended, between 40,000 and 45,000 British women married their American boyfriends, most going back to the United States with them as “war brides.” Countless children also remembered the almost casual bounty of unfamiliar fruit, chocolate, and candy they received from individual American soldiers.

There is a good deal of truth in the accepted picture of the war. Many found a spirit of camaraderie, and took pride in carrying on under fire. The latter was undoubtedly true of British Prime Minister Winston Churchill, whose defiant speeches of 1940 and 1941, their intended audience not just the British people themselves but also the outside world and particularly the United States, whose economic support and supplies Britain desperately needed, did much to create the image of British determination and unity. So, too, did contemporary newspaper reports, together with radio broadcasts by both the British Broadcasting Corporation (BBC) Overseas Service and American networks, many of them unobtrusively orchestrated by the British Ministry of Information.

Yet there were other sides to the civilian war. In an exercise in self-censorship, for example, British and American reporters—including Ed Murrow of CBS, whose verbatim radio reports to the United States from London rooftops at the height of the Blitz in 1940 soon epitomized the indomitable British spirit for many of his countrymen—downplayed anything that might discredit the British cause: the inadequacy of air-raid shelter provisions in the poorer, working class areas of London as opposed to those for the well-to-do, for example, or looting in bombed out areas. In recent years historians have begun to highlight different and more uncomfortable aspects of the British wartime civilian experience. Although all Londoners were targets during the Blitz, the working class areas of the East End and Lambeth undoubtedly suffered more heavily than did more upscale locations, as did their counterparts in other British cities. Yet government-provided shelter facilities were far superior in more affluent areas than in working-class districts. One historian has even suggested that the British government took more pains to protect art-works from bombing damage than it did to safeguard ordinary people. The British were by no

means immune to anti-semitism, a staple of the moderately popular British Fascist movement of the 1930s headed by Sir Oswald Mosley. Those with money could resort to a flourishing black market for goods officially unobtainable. Women and children evacuated from dangerous urban areas to the countryside on many occasions encountered kindness and generosity, but others found only a surly, even hostile reception. Official bureaucratic regulations ensured that financial compensation for destroyed homes and provision for alternative accommodation often arrived only tardily. It was perhaps not surprising that one of the major forces behind the Beveridge Report of 1943, that promised ordinary British people a welfare state providing greater security in old age and better healthcare, housing, and educational facilities, was a sense that, as civilians and soldiers, the working class had suffered the brunt of the war and in return deserved a better life and more opportunities in the future.

About the Documents

This oral history by Pamela Lazarus—then Pamela Rodker—recounts the wartime story of a young Jewish girl living in the East End of London throughout World War II. Three when the war began and nine when it ended, she was at an age when one’s memories are perhaps most vivid, as a child begins to focus on the outside world. Like most oral histories, her recollections tend to center on two sets of issues: memorable highlights, such incidents as meetings with American GIs or the return of her father, and the prevailing long-term conditions of life. Many of her memories focus upon almost conventional themes common to many recollections: the shortage of food during rationing, the blackout, the fear and horrors of bombing, the dramatic impact of American soldiers upon the British population, the absence of her father in the armed forces, and the street party that celebrated the ending of the war in 1945.

One also, however, gains a sense of the darker side of the war. Pamela Rodker Lazarus belonged to a Yiddish-speaking Jewish family from Russian Poland, with ramifications extending into “Berlin, Warsaw, Paris, London, Prague.” Her grandparents were among the many hundreds of thousands of Jews who left Eastern Europe at the turn of the century to escape pogroms and persecution. Her paternal grandfather, an affluent corsetier, was among them, moving to London with his wife and children, including Lazarus’ father, who became a barber. Although most of the family quickly learned English, her grandmother always refused to speak anything but Yiddish. Lazarus gives a vivid but unromanticized picture of life in wartime London. She is unsparing in recounting the anti-Semitism that all too many Jewish families often encountered in Britain before and during the war, a salutary antidote to the picture of a united country that had forgotten all class, ethnic, and religious distinctions.

Lazarus also gives a sense of the pressures that the demands of war placed upon children, even those who were relatively lucky, in that they were not killed in bombing raids or forced to become refugees. She mentions how grim and “scary” she found the war, and also that, because her father was away in the British armed forces and her rather young mother found it difficult to cope and was frightened during air raids, she herself “always felt responsible for her, like I should be her mother and take care of her. But I was only three and four and five and six and didn’t know how, except by not being a burden.” She was only one of millions of small children who found themselves catapulted by war into situations that placed on them burdens beyond their capacity to bear and only too often effectively stole their childhood. The war also had other consequences for families. When her father finally returned after several years away, like many men who had gone to war he found a wife who had learned to cope without him, almost totally different from the dependent girl he had left behind him. He also met a daughter and son who hardly knew him, the former of whom certainly resented his authority at times.

Some British children, especially those in country areas relatively remote from the war, undoubtedly enjoyed a relatively tranquil and happy childhood despite the conflict, albeit one marked by austerity, shortages, and the deaths of too many relatives, friends, and acquaintances not too much older than themselves. Lazarus, however, when asked if she had been happy during the war, retorted: “If I were to be offered one million dollars to relive my childhood, in a heartbeat I’d say ‘No way?’ . . . I remember my childhood with shivers.” In the mid-1950s she emigrated with her family, first to Canada, then to the United States, a move which almost certainly gave her the chance of a more affluent lifestyle, but which like many emigrants she also felt cut her off from her extended family and its traditions. A lively, competent, and outgoing woman, with a great sense of humor, she “married a young man from Brooklyn” in 1968, had two daughters and, once they were in school, began an excellent career in “classically men’s jobs” selling “first industrial chemicals and tools, then warehouses, land and office buildings.” Although she and her husband divorced in 1975, she “made lots of money and made sure my daughters went to and graduated from college.” Her daughters both have excellent careers, she has four grandchildren to whom she is clearly devoted, and she describes her life as “a very typical American immigrant success story.” It is hard to disagree.

Yet despite all these achievements Lazarus feels she did not escape unscathed from the war. She believes that her wartime experiences and the insecurity caused by “years of living in fear” left her “a young adult with absolutely no sense of self, or of safety, anywhere, at any time.” The aftereffects

of the war years were, she thinks, responsible for a nervous stomach disorder she suffered at the age of ten, and contributed to the breakup of her marriage, difficulties in interpersonal relationships, and her chronic health problems. When, fifty-five years after the war had ended, she came across the Timewitnesses website for survivors of World War II, set up in January 1994, its mission to ensure “that the lessons of the past will be learned by a new generation,” she quickly volunteered an oral history and also agreed to become one of those participants who were prepared to correspond with children and others seeking to learn more about the war. Her story is a moving testimony not just to the permanent collateral damage war often inflicts on its participants, especially the most vulnerable and those with the least opportunity to avoid its consequences, but also to the courage its survivors sometimes summon up in the effort to confront a difficult past and overcome its scars.

The British Home Front: Recollections of Pamela Lazarus, 10 October 2001

It wasn’t much fun being a small kid at that time. It was too scary. London was a smoggy city, filled with gray skies, gray fog, rainy days and one seldom saw a blue sky or sunshine. Or so it seemed. And indoors, it always seemed to be night. Everyone had black curtains on the windows so that no light would escape into the street, and more importantly, be seen from the German airplanes flying overhead. Lights could show them a good place to drop a bomb. Besides, electricity was expensive, and not to be used if not necessary.

My Dad was away in the army, somewhere in Europe and my mother was very nervous. She was a young woman in her mid 20’s, with a little girl (me) and a new baby, and she wanted someone to look after her, and there wasn’t anyone to do it. So she cried a lot, and when the siren would go off to warn of an air-raid, she would scream in fear. I always felt responsible for her, like I should be her mother and take care of her. But I was only three and four and five and six and didn’t know how, except by not being a burden.

In the beginning, the bombing was at night. She would tell me to quickly! quickly! put on a sweater or coat and shoes and run downstairs. I would hide under the kitchen table until she had dressed herself and wrapped up the baby. Then we would run through the long, narrow garden to the air-raid shelter. It seemed always to be night, and dark, with sirens screaming and wailing.

The shelter was simply some corrugated steel sheets made into a shed against the brick, garden wall, with a sloping roof. It had a dirt floor and two wooden benches inside on which to sit. No heat, no light. Mother brought candles if she remembered, or else we sat in the dark. If a stranger was on

the street when the sirens began, they could knock at any house door and be taken in to the shelter, and spend the night in the shelter.

Mother was always complaining about the rations. She wasn't a good cook and didn't know how to make exotic things like puddings or any treats, so our food was very simple. Mostly something boiled or fried. There was often nothing—nothing at all—to eat and we got used to being hungry. . . .

* * *

The City Authorities would regularly send people (women with small children) out of the City, into the country for safety. Mother would go with much grumbling and complaining. She was a City person.

The train would be packed to the limit with American soldiers coming and going somewhere. Every seat was taken, every foot of ground had someone crammed into it. As a small child, I could not step over the rucksacks or around the people, so the soldiers would pass me down the corridor, from hand to hand, with my mother trying to keep up. And they gave me chewing gum! I learned to say "Any gum, chum?" for a stick of Wrigley's Spearmint gum.

Those yanks! I thought they were the grandest, most glamorous people in the world.

Easy smiling, handsome, glamorous looking, movie-star sounding, generous and friendly.

Yanks! With oranges and chocolate bars in their backpacks, silk stockings in their hip pocket, chewing gum (Wrigley's Juicy Fruit) in their hands. All to be given away, to us, if only we can get to talk to them. If only your young and pretty aunt will go dancing with one, and then invite him home for tea.

They aren't like us English. To be proper we must be standoffish, serious, and quiet. (Children should be seen and not heard). And we shouldn't want or take more than one of anything.

But the Yanks! Their uniforms are smooth and beautiful; their movements are relaxed, spacious. They take up lots of space, just standing there. They have wonderful accents. Sometimes hard to understand, but wonderful to hear when they draaawl their words. It sounds soft, unthreatening, friendly. They talk easily, loudly to each other—they laugh easily, out loud, even in public places!

They like children! How astonishing—they actually like children! Talk to us, tousele our hair, sit us on their laps, tell us we're cute (what's cute??), give us sticks of gum. And we don't have to save it—we can eat it. Before dinner! And they don't get angry if we ask for more. Or if we hang around them, stay close, touch them. This must be what having a father is like.

Age 5—in love. Head-over-heels madly in love—with Yanks. . . .

During one of these exits from the city, we were staying with a woman and her four daughters in a big farm house. These pretty girls were being dated by American soldiers and one day one of the soldiers brought an extraordinary treat to the house. It was something I had never seen before and that the girls had not seen in 4 or 5 years—a fresh orange! The orange was peeled, with everyone standing around the table watching. Then, it was carefully divided into segments, and each person got one segment. First we licked it, so no drop of juice could escape. Then, we took tiny nibbles, letting the juice come slowly into our mouths, and held it there. Don't swallow too fast! Then take another tiny nibble, until finally, the whole slice was gone. How terrible that there was no more. Seeing what a great success the gift had been, the soldier decided he had to be a hero to the nth degree.

A few days later he came back with his friend, and a carton, a whole carton of cans of sliced peaches. 12 cans. 12 CANS! Wow! What to do with such booty? Urgent conversations took place. Suggestions made and discarded. Finally, with everyone watching, the carton, less one can, was taken down into the cellar, and buried under the heap of coal.

Then, everyone was sworn to secrecy. No one must tell what was hidden there.

Some time passed, and one day there was a knock at the door. Military police. They wanted to search the house for stolen contraband from the PX. My heart was racing . . . would we go to jail? Would the soldiers be arrested? What would happen? They searched everywhere, but did not want to get dirty moving the heap of black, sooty coal, and so the peaches were undiscovered. But we all felt horribly guilty whenever a can was opened, and it spoiled the pleasure in eating those sweet slices.

Most of our country trips were not so exciting or pleasant. The people in the country were paid for the room and board of the Londoners, and they didn't like us. They would come to the train station when we'd arrive, and choose the family they would take. They didn't like fat people much because they would eat too much. They didn't like Jews because they were supposedly all the awful things that have ever been said about Jews. And we were Jewish.

Mother had pinned a tiny Star of David to my undershirt, hoping it would work like a good luck charm to help keep me alive. One evening, the lady of the house walked into our room while my mother was giving me a sponge bath, saw the Star of David and became hysterical. She told us to leave her house, screaming that we had 'contaminated' everything we had touched—her dishes, her knives and forks—her very air!

We walked to the train station along the stony country lane, and my doll, my precious doll, my only toy, fell from the carriage where our bags of stuff were stacked. Her china head cracked and broke. We spent the night sitting on the bench at

the train station waiting for the morning train to take us back to London. I was heartbroken and cried for hours.

Back in London, one day my Zaida (Grandfather) and Mum were pushing the baby carriage along the High Street of our neighborhood, in the middle of the day, when the siren began it's up and down wailing. Mother wanted to run to the tube station shelter because it was closer. But Zaida said "No, we cannot leave Booba (Grandmother) alone. She would be too frightened." Mother insisted on going to the station But Zaida grabbed hold of the baby carriage and began pushing it, running, toward home. Mother and I had no choice but to follow him.

We spent the rest of the day and all the night in the dark, in the shelter. In the morning, when it was quiet, we came out, only to hear on the news that the subway station we had almost gone to had been bombed. All the people down there on the subway platform had died.

When the war was over, there was a party on the street. And some time later the soldiers began coming home.

I begged my mother to allow me to run down the stairs and answer the door when my daddy came home. And she said yes.

It seemed a long time later that the doorbell rang, and I remember very well the excitement of that moment. I ran to the door, opened it, and a giant stood there. A tall, tall man in uniform, with a backpack. A total stranger. I don't remember

him at all after that moment for many years. My mother told me that I kept asking her when he was going away again, because I didn't like this stranger telling me what to do.

Section V

The Human Impact of War

To many, the war brought great suffering. Often, too, it posed great dilemmas of conscience, as individuals both ordinary and distinguished faced harsh choices and ethical conundrums. Pacifists had to decide, often at the risk of imprisonment and social ostracism, whether or not to fight, to support the war effort in other ways, or to refuse to give any assistance whatever. In authoritarian states, political dissent on any grounds whatsoever could bring harsh incarceration in a concentration camp or even death. All belligerent governments interned enemy nationals, including women and children, in conditions ranging from acceptable to atrocious, together with those of their own citizens who were suspected security risks. In the United States, the latter category was expanded to include all Japanese-Americans, whatever their age, sex, or citizenship status, living on the west coast, most of whom spent several years in primitive camps. Conditions for prisoners-of-war spanned the gamut from basic to horrendous, with the worst examples found on the eastern front where German and Russian forces fought each other, and in Japanese facilities around Asia. Despite German and Japanese proclamations promising a “new European order” or a “Greater East Asia Co-Prospersity Sphere” in those areas they had conquered, occupation forces usually treated local populations with great brutality. Given that the rewards of collaboration often included not just additional food and resources and protection for oneself and one’s family, but also political power, among the subjugated there always existed at least some individuals ready to accept and work with their new rulers. In much of Asia, where Japanese troops drove out Western colonial overlords, some nationalist collaborators further justified their tactics as the best means of attaining ultimate independence.

From around 1933 until the war ended in 1945, many millions of people in both Europe and Asia endured horrific experiences and fearful sufferings, which often ended in death for them and their families. Even by these standards, the sufferings of European Jews were exceptional. From the early 1920s, Hitler proclaimed his belief that Jews were an inferior people, a cancer in the German body politic that must be eliminated. When he gained power, Hitler imposed increasingly harsh regulations and restrictions upon German Jews, who became non-citizens, subjected to an ever growing array of humiliations and brutalities, restricted to ghettos, and eventually deported eastward. Fearful of an influx of Jewish refugees, the United States and other Western nations erected numerous bureaucratic barriers deliberately designed to discourage Jewish immigration. In early 1942 German officials formally decided to murder all Jews in Europe, a policy implemented by means of such labor and extermination camps as Dachau and Auschwitz. In all, around 6 million European Jews died in what became known as the Holocaust.

Millions of other civilians in both Asia and Europe, many of them children or the elderly, became collateral victims of war, killed in the increasingly savage bombing raids upon cities and other major targets all countries mounted against their enemies, dead of starvation or exposure, or victims of casual violence from occupying forces or even “friendly fire” from those on their own side. Children had to cope, sometimes alone, with conditions and responsibilities most adults would have found difficult to bear. Simply because they had at least survived, the 9 million refugees in displaced persons camps when the war ended, many of them stateless, without homes and families, and often still only children or teenagers, were far luckier than many others.

5.a. Issues of Conscience, Civil Liberties, and Occupation

5.a.1. The Internment of Japanese-Americans

The Internment of Japanese Americans

On 19 February 1942, President Franklin D. Roosevelt issued Executive Order 9066, authorizing the U.S. military to ban any American citizen from a zone 60 miles wide along the American West Coast, extending from Washington State, through Oregon and California, and inland into Arizona. At the time, the United States had been at war with Japan, Germany, and Italy for slightly more than two months. Non-American citizens were also subject to relocation and internment. The continental United States had a population of 47,000 Issei, foreign-born Japanese who had emigrated before 1924 and were therefore ineligible for citizenship under the existing immigration rules and approximately 80,000 Nisei, American citizens of Japanese ancestry, most of whom had been born in the country. The area defined under the executive order contained numerous American defense plants and facilities. It also had a large population of ethnic Japanese descent, 9,000 of whom hastily departed and moved elsewhere in the United States. This loophole was soon closed, and over the next few months, the remaining 110,000 were forced to leave their homes and relocate to hastily constructed camps within and outside the affected states. Unless they joined the American military, most remained there until January 1945, when the order was lifted on all but 5,000 individuals who were still banned from the West Coast. At their own request, however, in 1943 about 8,000 of the internees, including one in every four Nisei of draft age, were eventually repatriated to Japan.

Camps were sparse and life there monotonous, bleak, and restricted. Internees had to leave their jobs and businesses and sell many of their possessions, often at fire-sale prices. Many were unable to maintain mortgage payments on houses and farms and were forced to sell the properties for whatever price buyers were prepared to pay. The justification given for this action was that, after Pearl Harbor, any American of Japanese descent had to be regarded as a potential fifth columnist or saboteur, on whose first loyalties the U.S. government could not safely count. No real attempt was made to investigate the Japanese American population; instead, this precautionary measure was applied wholesale to all, including children of every age born in the United States and elderly men and women, a gross infraction of civil liberties and the Bill of Rights. Japanese Americans were, however, partic-

ularly vulnerable. Their numbers were relatively small and few had any real political influence, greatly facilitating their relocation. Japanese Americans in California had always been the targets of much racist resentment and suspicion, and local business competitors on the West Coast also coveted their property and economic assets. In the atmosphere of national hysteria immediately after Pearl Harbor, superheated patriotism easily became a plausible disguise for covert racism and economic exploitation.

In Hawaii, where Japanese airplanes had after all launched a lethal and destructive bombing raid on the Pearl Harbor naval base, 37.8 percent of the population was of Japanese ethnic descent, and without them, the local economy would have collapsed. Hawaiian Japanese Americans were also reasonably well organized politically, at least in Hawaii itself. The result was that only those individually considered to be security risks were interned. The same was true of the much larger, politically influential, and more widely dispersed German American and Italian American communities in the United States, both of which included many millions of American citizens. Eleven thousand German Americans, some of them citizens, and 3,200 Italian American resident aliens were arrested under Executive Order 9066; eventually 5,000 of the former and 300 of the latter were interned, as were others of both ethnic derivations in other areas of the United States. To incarcerate German Americans and Italian Americans for protracted periods without trial or appeal, the government had to cite some specific reason, not just the blanket justification of their ancestry.

Although the ultimate responsibility rested with President Franklin D. Roosevelt, who soon came to consider the internment of Japanese Americans politically advisable, the War Department, especially Secretary of War Henry L. Stimson and his assistant John J. McCloy, was the agency largely responsible for first urging and then implementing these policies. In late 1944, the Supreme Court paved the way for the release of the internees when it decided that the existing executive order had given the government only the authority to remove Japanese Americans from the West Coast but not to imprison the evacuees, leaving undecided the question whether additional legislation to do so would be constitutionally invalid. Roosevelt died just before the war ended, and Stimson a few years later, leaving McCloy to bear the burden of defending them for several decades. He invariably argued stubbornly that the situation of national emergency had fully justified the infractions of civil liberties these policies represented, however unpalatable they might in other circumstances be to both those affected and to the implementers. McCloy also strongly opposed the payment of compensation to former internees or their heirs, a campaign that gathered force and visibility during the 1970s. In 1988, the surviving internees finally won a formal apology

from the U.S. government, together with individual compensation of US\$20,000 apiece.

About the Author

Mary Tsukamoto, then Mary Tsuruko Dakuzaku, was born in 1915 in San Francisco, the second of five children of parents who had emigrated from Okinawa. In 1925, the family moved to Florin, California, where they operated a market garden, growing strawberries for the nearby cities. Their children had to attend segregated schools, where Dakuzaku's teachers themselves paid part of the cost of her subsequent education at the College of the Pacific, Stockton, inspiring her to become a teacher herself. In 1936, Dakuzaku married Alfred Tsukamoto, the son of another Florin market gardener, and the couple had a daughter the following year.

By the time of the attack on Pearl Harbor, Mary Tsukamoto, then 27 years old, was a leader in the Japanese American Citizens League, which soon assumed the responsibility of serving as an intermediary between the government and Japanese Americans, some of whom spoke no English. From spring 1942 until January 1945, the family was interned at a camp in Jerome, Arkansas. After the war, the Tsukamotos returned to Sacramento, and Mary spent 26 years as a teacher, her dynamism such that eventually a district elementary school was renamed in her honor. She also became a prominent activist in the campaign to win compensation for the Japanese American internees. A leader of her community, she aggressively gathered together artifacts and materials relating to Japanese American immigrants in California, a collection eventually donated to California State University, Sacramento, together with a major oral history collection on the Japanese American experience. She died in 1998.

About the Document

As with many oral histories, this excerpt from that of Mary Tsukamoto provides a lively and vivid depiction of one of the central experiences in her and her family's life. The extract given here is only part of a longer oral history covering the period of internment as well as the months leading up to it. It was one of several such memoirs included in a book that appeared in 1984.

One need not doubt the truth of everything included in Tsukamoto's account, which by then she had almost certainly repeated innumerable times in both private and public settings. At the same time, it is important to realize that she probably had more than one motive for setting it down and allowing its publication. Tsukamoto probably shared the now very common desire to set down personal experiences for one's own family and posterity and had a well-attested interest in ensuring that some permanent record should remain of the history of the Japanese American community in Cali-

fornia. One should also recognize, however, that at the time this collection of memoirs appeared, she was one of the leaders of the campaign to win restitution from the U.S. government for the hardships Japanese Americans had endured during World War II.

Intentionally or otherwise, her portrayal of the Japanese American community in Florin carefully emphasizes aspects that might well facilitate this endeavor. We learn that the Japanese Americans were Christians who organized and attended church services, that they were hardworking, law-abiding, had a strong sense of community, and assisted each other in times of trouble. She exposes the pettiness of the post-Pearl Harbor restrictions on Japanese Americans—regulations never imposed on the Germans or Italians in Florin village—and she highlights how, even under these restrictions, their community consciously remained “Americans and loyal citizens, [who] wanted to do what Americans should be doing.” While their young men patriotically enlisted in the armed forces, the rest were buying war bonds, preparing bandages for the Red Cross, and taking first aid classes. The harsh consequences of evacuation are fully exposed: the stress on the elderly; the loss of property, much-loved gardens and possessions, and even cherished pets. Even so, as a representative of a Japanese American community organization she wrote letters to President Franklin D. Roosevelt and to local teachers and newspaper editors thanking them for their assistance.

In essence, Tsukamoto presented the Japanese American community as model Americans, embodying almost every virtue and characteristic traditionally associated with the American way of life. By implication, they were loyal and patriotic Americans who had not deserved such a fate and did deserve compensation for their sufferings. This is the story that Tsukamoto had by then told again and again, a discreetly flattering picture of the Japanese American community, carefully crafted to convert the general public and politically influential listeners to support delayed compensation to former internees. The reader readily understands why, in later life, she won great respect from both her own and the white community. She is not bitter or hysterical; the tone is reasonable, and she even has kind words for her white neighbors of that time.

One underlying reason for the very publication of this particular volume of reminiscences (together with another book on the subject that Tsukamoto coauthored three years later)—with its title, *We the People*, artfully emphasizing the theme of just how quintessentially American the Japanese Americans were—was to generate additional momentum in this ongoing battle. Despite Tsukamoto's rather judicious and unembittered tone, one has to regard her memoir as in some sense a public statement and expect that even harmless

or trivial episodes or matters that, deliberately or otherwise, might in any way discredit the Japanese American community would have been quietly ignored or edited out. Whatever other functions these reminiscences may and probably did serve, in one respect they must be regarded as an attractively packaged brief, presenting, with an underlying steely determination, the case that the U.S. government should recognize, accept its responsibility, and make belated restitution for the wartime sufferings of the Japanese American community. This document is interesting, vivid, and probably quite truthful as far as it goes, but the reader should bear in mind that the author did not necessarily seek to purvey the full and unvarnished truth and undoubtedly had specific ulterior motives for putting her community in a certain favorable, even blameless light. There might well have been a seamier side to the Japanese American internment experience, even some instances of espionage, for example. Mary Tsukamoto may or may not have known of such matters, but even if she did, it would be naive to expect this particular document to serve as an informative source on such matters.

Primary Source

Recollections of Mary Tsukamoto

I do remember Pearl Harbor Day. I was about twenty-seven, and we were in church. It was a December Sunday, so we were getting ready for our Christmas program. We were rehearsing and having Sunday School class, and I always played the piano for the adult Issei [Japanese-Americans born in Japan] service. Of course, because there were so many Japanese, all of it was in Japanese; the minister was a Japanese, and he preached in Japanese. But after the service started, my husband ran in. He had been home that day and heard on the radio. We just couldn't believe it, but he told us that Japan attacked Pearl Harbor. I remember how stunned we were. And suddenly the whole world turned dark. We started to speak in whispers, and because of our experience [with earlier anti-Japanese sentiment] in Florin, we immediately sensed something terrible was going to happen. We just prayed that it wouldn't, but we sensed that things would be very difficult. The minister and all of the leaders discussed matters, and we knew that we needed to be prepared for the worst.

Then, of course, within a day or two, we heard that the FBI had taken Mr. Tanigawa and Mr. Tsuji. I suppose the FBI had them on their list, and it wasn't long before many of them were taken. We had no idea what they were going through. We should have been more aware. One Issei, Mr. Iwasa, committed suicide. So all of these reports and the anguish and the sorrow made the whole world very dark. Then rumors had it that we were supposed to turn in our cameras and our guns, and they were called in. Every day there was something else

about other people being taken by the FBI. Then gradually we just couldn't believe the newspapers and what people were saying. And then there was talk about sending us away, and we just couldn't believe that they would do such a thing. It would be a situation where the whole community would be uprooted. But soon enough we were reading reports of other communities being evacuated from San Pedro and from Puget Sound. After a while we became aware that maybe things weren't going to just stop but would continue to get worse and worse.

We read about President Roosevelt's Executive Order 9066. I remember the Japanese American Citizens League (JACL) people had a convention in San Francisco in March. We realized that we needed to be able to rise to the occasion to help in whatever way we could in our community. We came home trying to figure out just how we could do that. We had many meetings at night and the FBI was always lurking around. We were told we couldn't stay out after eight o'clock in the evening.

Meanwhile, Hakuji [white] neighbors were watching us and reporting to the FBI that we were having secret meetings. We were not supposed to meet after eight o'clock, but often we couldn't cut off our JACL meeting at eight o'clock, and so we would have tea or coffee and keep talking. We would be reported and the police would come. There were so many people making life miserable for us. Then we heard that we had been restricted to traveling five miles from our homes; it was nine miles to Sacramento, and at that time everything was in Sacramento, like doctors, banks, and grocery stores. So it just was a terrible, fearful experience. Every time we went anywhere more than five miles away, we were supposed to go to the Wartime Civilian Control Administration (WCCA) office in Sacramento, nine miles away, to get a permit. It was ridiculous.

A lot of little things just nagged at us and harassed us, and we were frightened, but even in that atmosphere I remember we frantically wanted to do what was American. We were Americans and loyal citizens, and we wanted to do what Americans should be doing. So we were wrapping Red Cross bandages and trying to do what we could to help our country. By May 1942, more than a hundred of our boys were already drafted. We worried about them, and they were worried about what was going to happen to their families. We knew what we wanted to do. We started to buy war bonds, and we took first aid classes with the rest of the Hakuji people in the community. We went out at night to go to these classes, but we worried about being out after eight o'clock. It was a frightening time. Every little rule and regulation was imposed only on the Japanese people. There were Italian and German people in the community, but it was just us that had travel restrictions and a curfew. . . .

I had anxieties for Grandpa and Grandma. They were old and had farmed all their lives, and after more than fifty years here, the thought of uprooting these people and taking them away from their farm and the things they loved was terrible. Grandpa growing tea and vegetables, and Grandma growing her flowers. It was a cruel thing to do to them in their twilight years. But we had to get them ready to leave, anxious for their health and their safety. And my daughter, who was five, had to be ready to go to school. Al [her husband] had had a hemorrhage that winter, so we all had our personal grief as well.

The Farm Security Administration told us that we should work until the very last moment. Yet we had to worry about selling our car and our refrigerator and about what we should do with our chickens and our pets. . . . I wrote to the President of the United States and the principal of the high school and the newspaper editors thanking them for whatever they did for us. I don't know if I was crazy to do this, but I felt that history was happening, and I felt that it was important to say good-bye in a proper way, speaking for the people who were leaving and trying to tell our friends that we were loyal Americans and that we were sorry that this was happening. We needed to say something, and that's what I did.

We left early in the morning on May 29, 1942. Two days earlier we sold our car for eight hundred dollars, which was just about giving it away. We also had to sell our refrigerator. But some wonderful friends came to ask if they could take care of some things we couldn't store. . . .

It happened so suddenly to our community. You know, we grew up together, we went through the hardships of the Depression, and then finally things were picking up. People who had mortgages on their land were beginning to be able to make payments back to the bank. They were going to own the land that they had worked so hard to have. Then we had to evacuate. So there were still some people who owed some money on their property, and they lost the property because, of course, they couldn't make mortgage payments.

These were our people, and we loved them. We wept with them at their funerals and laughed with them and rejoiced at their weddings. And suddenly we found out that the community was going to be split up. The railroad track was one dividing line, and Florin Road the other dividing line. We were going to Fresno; the ones on the other side went to Manzanar; and the ones on the west side went to Tule. The ones on the west and north went to Pinedale and Poston. We never dreamed we would be separated—relatives and close friends, a community. The village people, we were just like brothers and sisters. We endured so much together and never dreamed we would be separated. Suddenly we found out we wouldn't be going to the same place. That was a traumatic disappointment and a great sadness for us. We were just tied up in knots, trying to cope with all of this happening. I can't

understand why they had to do this. I don't know why they had to split us up. . . .

I don't know, we had been a very happy family. When we left, we swept our house and left it clean, because that's the way Japanese feel like leaving a place. I can just imagine everyone's emotions of grief and anger when they had to leave, when the military police came and told them, "Get ready right now. You've got two hours to get ready to catch this train."

Early in the morning, Margaret and George File came after us in their car because we no longer had one to move our things. We had taken our luggage the day before on the pickup. We were very fortunate. Al had a very dear friend, Bob Fletcher, who was going to stay at our place and run our farm, our neighbor's farm, and Al's cousin's farm. So these three adjoining farms would be taken care of, at least the grape vineyards would be. Bob would stay at our place, and we left our dog with him. Nobody could take pets, and this was a sad thing for our daughter. There were tears everywhere; Grandma couldn't leave her flowers, and Grandpa looked at his grape vineyard. We urged him to get into the car and leave. I remember that sad morning when we realized suddenly that we wouldn't be free. It was such a clear, beautiful day, and I remember as we were driving, our tears. We saw the snow-clad Sierra Nevada mountains that we had loved to see so often, and I thought about God and about the prayer that we often prayed.

I remember one scene very clearly: on the train, we were told not to look out the window, but people were peeking out. After a long time on the train somebody said, "Oh, there's some Japanese standing over there." So we all took a peek, and we saw this dust, and rows and rows of barracks, and all these tan, brown Japanese people with their hair all bleached. They were all standing in a huddle looking at us, looking at this train going by. Then somebody on the train said, "Gee, that must be Japanese people in a camp." We didn't realize who they were before, but I saw how terrible it looked: the dust, no trees—just barracks and a bunch of people standing against the fence, looking out. Some children were hanging onto the fence like animals, and that was my first sight of the assembly center. I was so sad and discouraged looking at that, knowing that, before long, we would be inside too.

5.a.2. The German Resistance: Count Helmuth von Moltke

The German Resistance

A German resistance movement did still exist in wartime Nazi Germany, though it was small in size and generally too fragmented and poorly organized to be effective. Nazi persecution of political opponents began in 1933, immediately upon Adolf Hitler becoming German chancellor, and continued until 1945, so by the time World War II began, many socialists, communists, and others inimical to Nazi rule had already been eliminated. Most resistance groups were small and often based on close-knit internal family, personal, and professional ties.

In the big cities, some Communist cells still existed, usually based within German factories, and even after the conclusion of the German-Soviet Non-aggression Pact, these continued to exist and circulate occasional propaganda. After the German invasion of the Soviet Union in June 1941, they produced a massive outpouring of propaganda leaflets. In 1942–1943, however, Gestapo operatives infiltrated most of these largely working-class groups, and by spring 1943, virtually all had been “rolled up.” Two groups of middle-class intellectuals and professionals also had some successes. The Home Front group published a newspaper by that name for fifteen months, from summer 1941 to fall 1942, and also disseminated pamphlets providing news and information drawn from BBC and Soviet radio broadcasts. The Red Orchestra largely consisted of left-leaning officials within the Economics and Air Ministries, members of the radical middle-class intelligentsia, who from 1940, passed on intelligence information to Soviet officials and also disseminated

propaganda leaflets. For something like a year in 1941–1942, Communist German Jews also organized a Zionist resistance group in Berlin, but the Gestapo eventually arrested and executed its members. German churches generally endorsed World War II, but individual ministers and Christians sometimes took their own stand. The best known among these was the liberal Protestant theologian and pastor Dietrich Bonhoeffer, arrested in 1943 and executed in April 1945, who not only publicly opposed Nazism but also helped Jews and other refugees to escape from Germany. Another prominent Christian minister, the Berlin Protestant pastor Martin Niemöller, imprisoned in 1937 for his outspoken opposition to Nazi persecution of opponents, was only released in 1945. Small groups of idealists, the most famous among them probably the “White Rose” organization headed by the Munich students Hans and Sophie Scholl, also mounted brave if quixotic protests, usually sadly short-lived; the Scholls, for instance, began publishing leaflets in summer 1942 and were executed in February 1943.

Within the German military, where many among the traditional officer caste despised Hitler and the Nazis, substantial opposition to Hitler also gradually developed. Among them were General Wilhelm Canaris, head of the Abwehr, the army’s intelligence service, and Ludwig Beck, former chief of the German general staff. Carl Goerdeler, former mayor of Leipzig, who had opposed the Nuremberg laws and became one of Winston Churchill’s informants on German rearmament during the 1930s, was associated with them. In summer 1944, after the Allied invasion of the west had begun and Hitler refused to contemplate a negotiated peace, a group of military officers headed by Colonel Claus von Stauffenberg, chief of staff of the German reserve forces, made an unsuccessful attempt to assassinate Hitler and seize power. Many, including Stauffenberg himself, Canaris, and Goerdeler, were arrested, tortured, and executed. Germany’s most admired soldier, Field Marshal Erwin Rommel, commander of German forces in Normandy until he suffered serious head injuries when an Allied airplane strafed his car, was not a prime mover in the plot but, though he initially opposed the assassination, eventually reluctantly endorsed it as the only practicable means of ousting Hitler. Under torture, the conspirators implicated him. Reluctant to depress domestic morale by arresting and executing their outstanding national hero, the German authorities gave him the option of committing suicide, after which he received an impressive state funeral.

On various occasions, British and American intelligence operatives had some contact with the conspirators, who were disappointed that their overtures regarding a negotiated peace settlement were poorly received, the Allies insisting that only Germany’s unconditional surrender would satisfy them. The Stauffenberg group hoped for a peace settlement

that would enable Germany to retain many of its territorial gains of the 1930s and early 1940s, restoring its eastern frontiers of 1914, which would return much of western Poland to Germany, incorporating the Sudetenland, Austria, and much of the Tyrol within Germany, and granting autonomy to the provinces of Alsace-Lorraine, the possession of which Germany and France had disputed for almost a century. Allied authorities felt that many of the plotters sought to preserve the bulk of Hitler's gains though disposing of the man himself and finally eliminating the unsavory Nazi party from German politics. Bearing in mind the aftermath of World War I, which ended in a negotiated armistice forcing German troops to withdraw to their own country's borders, a peace settlement that Hitler and many on the right, including such leading military men as Quartermaster General Erich von Ludendorff, subsequently blamed upon the betrayal of the German army by weak-minded civilians, Allied officials were determined that the ending of World War II should demonstrate as irrefutably as possible that German forces had been conclusively defeated. The simultaneous invasion and occupation of German territory by Soviet and Western troops was, they believed, the best means of doing so.

About the Author

Count Helmuth James von Moltke came from a renowned German military family, being the son of General Helmuth von Moltke, the army's chief of staff from 1906 to 1914, who adopted and modified the Schlieffen Plan that directed early German strategy in World War I, and great-nephew of Field Marshal Count Helmuth Bernhard von Moltke, who built up and led the German military to victory over Denmark in 1866 and France in 1870. For more than a decade, his stellar ancestry accorded von Moltke a degree of protection within Nazi Germany, but on Hitler's orders, he was finally executed on 23 January 1945.

A liberal and progressive lawyer by training, who had no sympathy whatever for the Nazi regime, von Moltke nonetheless chose to remain in Germany and, during the later 1930s, assisted many refugees to escape. In 1939, von Moltke joined the Foreign Division of the Abwehr, the German military intelligence service, a base from which he attempted to mitigate human rights abuses and breaches of international law by the German armed forces during the war and also sought to rescue some Jews from extermination. Von Moltke, who traveled extensively in his professional capacity, used trips to neutral countries to seek sympathetic allies and to contact both neutral and Allied figures. Unlike many German resistance figures, he was not seeking a negotiated peace settlement, but believed that a conclusive defeat of Germany was a necessary precondition for its postwar reconstruction.

Von Moltke was the center of the "Kreisau Circle," a group of like-minded Germans, including several who held office

within the German Foreign Ministry and the military bureaucracy, who gathered around him and another distinguished Prussian nobleman, Count Peter Yorck von Wartenburg, at his Kreisau estate. This cosmopolitan group of anti-Hitler Christians, politicians, aristocratic lawyers, and intellectuals were liberal socialists who sought the overthrow of Hitler, a negotiated peace, and the total remaking of Germany's political and social system on liberal and democratic lines. They developed extensive plans for postwar Germany, envisaging a Christian democratic nation in which the state would have a major economic and social role and power would be divided between the central and provincial governments. They also advocated the integration of the various European countries into a federal system. After 1945, much of what they suggested eventually became reality within West Germany, something few of them survived to see. Following the discovery of their implication in the 1944 plot to overthrow Hitler, most of the Kreisau circle members were arrested and executed.

The Gestapo arrested von Moltke in January 1944 because he had warned a friend of his impending arrest on an unrelated matter. Von Moltke's superlative family, personal, and professional connections ensured that until the failed assassination attempt against Hitler in summer 1944, his conditions of imprisonment were relatively lenient. Several of von Moltke's associates, including Yorck von Wartenburg, took part in the plot to kill Hitler. Von Moltke himself had little faith in such efforts, writing in 1943 that Germany "need[ed] a revolution, not a coup d'état," something the generals were unlikely to accomplish, since "no revolution of the kind we need will give generals the same scope and position as the Nazis have given them, and give them today." The Gestapo nonetheless rightly suspected that he possessed at least some foreknowledge of this enterprise, which despite his initial reluctance, he had indeed eventually endorsed. This brought a drastic tightening of von Moltke's conditions of imprisonment and, though he escaped torture, his eventual condemnation to death. The American diplomat George F. Kennan, who met von Moltke several times, later described him as "the greatest person, morally, and the largest and most enlightened in his concepts, that I met on either side of the battle lines in World War II" (Von Moltke 1990, 4).

About the Document

In March 1943, von Moltke, seeking to establish a channel of communication with British liberals, wrote a letter in English to Lionel Curtis, a fellow of All Souls College, Oxford, and a leading member of the Royal Institute of International Affairs, an influential British foreign policy think tank closely associated with the British Foreign Office. Curtis, a long-time advocate and publicist of schemes for world government, was likely to welcome any efforts to encourage international

cooperation even with Britain's current enemies; he also had an enormous range of influential personal contacts in his own country and beyond. Von Moltke hoped that, using Curtis as an intermediary, he and other associates would be able to win assistance from British liberals for their efforts to disrupt and overthrow the Nazi government. His letter may have been precipitated by the executions of organizers of the "White Rose" resistance group, Hans and Sophie Scholl, an event he hoped might convince British officials that a credible German resistance movement genuinely existed. Von Moltke hoped that a Swedish friend, Dr. Harry Johansson, director of the Nordic Ecumenical Institute in Stockholm, would ensure that this missive was delivered to London, but Johansson feared that the task might be dangerous and also a compromise of Swedish neutrality, so he kept the original letter. In July 1943, an intermediary memorized the gist of it and, without indicating the precise source, passed on a summary to the British Bishop George Bell of Chichester, a controversial Anglican cleric who had extensive contacts with liberal German church figures, including Bonhoeffer, and who publicly urged the Allies to observe humanitarian standards when waging war. Bell in turn sent the summary to Curtis with a covering note urging him to follow von Moltke's suggestion of sending a trustworthy intermediary to Stockholm to meet with German resistance representatives, and another copy to Sir Robert Bruce Lockhart, head of the British Political Warfare Executive. Curtis would almost certainly have passed this letter on to the British Foreign Office and MI5, the intelligence agency, but after that point, it apparently sank without trace, the victim of a decree from British Prime Minister Winston Churchill that all approaches from Germans should be disregarded. Von Moltke's letter therefore had no practical impact whatever upon the course of World War II or Allied dealings with the German resistance. Given Allied reluctance to work with German dissidents, it must also remain doubtful whether, even if delivered slightly more expeditiously, his missive would have generated any closer collaboration between the Western Allies and anti-Nazi Germans.

The obstruction of its purpose does not necessarily mean, however, that von Moltke's letter has no value as a historical document or even that its historical significance is purely biographical. From at least three angles, it is extremely interesting. First, von Moltke's letter provides considerable information on the state of the German home front in 1943: the absence of all young men on combat service at the front; the constant shortages; the battle that daily life had become for the average German, especially German women; and the absence and deliberate suppression of reliable information. Even von Moltke, who had excellent official sources and was actively seeking information on the subject, could only unearth "rather vague and indistinct and inexact" data on the concentration camps that he knew were operating in consid-

erable numbers. The ordinary German preferred to disbelieve in their existence and to doubt "that we have killed hundreds of thousands of Jews."

Secondly, the letter is an important source on the state of the German resistance movement, insofar as it could even be considered deserving of the name. It gave an almost brutally clear-minded assessment of the practical difficulties under which the German resistance labored, including both the constant loss of personnel to the guillotine and yet also its accomplishments. According to von Moltke, successes included numerous quiet efforts to "throw sand into the machine" and prevent the effective implementation of Nazi commands; the saving of individual lives, especially in occupied countries; winning over the German churches; and "breaking down of the idea of a highly centralized German state." One notes the near complete absence of the spectacular though dangerous—even willfully foolhardy—operations deliberately intended to attract attention to their cause that were, however sporadically, mounted by resistance movements outside Germany. The final section of von Moltke's letter also suggested that some degree of cooperation already existed between the anti-Hitler opposition in Germany and counterparts in the occupied countries. Rather chillingly, von Moltke feared that, should details of his activities become known to the British secret service, before long the German secret police would also acquire this information. It undoubtedly took considerable courage for him even to dispatch this letter.

Thirdly, the letter provided interesting insights into von Moltke's ideas on postwar Germany and by extension those of the Kreisau Circle. Many of these views were later taken up by the Christian Democrats, the political party that directed West German affairs until the late 1960s. He sought the complete remaking of Germany, not just the change of leadership at the top and extirpation of the SS and Gestapo that many of the military conspirators envisaged. He clearly favored a federal state in which authority would be decentralized, a reflection of his revulsion against Hitler's concentration of power in his own hands and those of the Nazi party. Von Moltke called for the postwar punishment of war criminals, preferably by Germans themselves. Looking ahead to what would become the Cold War, he also clearly anticipated that communism, a totalitarian faith he disliked equally with nazism, would attract many Germans and that this would be a problem all those building the new Germany, both Germans themselves and the Allies, would have to guard against.

Primary Source

James von Moltke to Lionel Curtis, 25 March 1943

This letter has a chance of getting into your hands without passing any censor. And I want to take this singular oppor-

tunity of giving you an analysis of conditions in my country, and to make some proposals as to how matters could be speeded up. . . .

2.

People outside Germany do not realise the following handicaps under which we labour and which distinguish the position in Germany from that of any other of the occupied countries: lack of unity, lack of men, lack of communications.

Lack of unity: in all countries under Hitler but Germany and France the people are practically united. If it be in Norway or Poland, in Greece, Jugoslavia or Holland the vast majority of the people are one in mind. In Germany, and to a lesser extent in France this is different. There are a great many people who have profited from the third realm [Third Reich] and who know that their time will be up with the third realm's end. This category does not only comprise some few hundred people, no it runs into hundreds of thousands and in order to swell their number and to create new posts of profit everything is corrupted.—Further there are those who supported the Nazis as a counterbalance against foreign pressure and who cannot now easily find their way out of the tangle; even where they believe the Nazis to be in the wrong they say that this wrong is counterbalanced by a wrong done to us before.—Thirdly there are those who—supported by Göbbels' propaganda and by British propaganda—say: if we lose this war we will be eaten up alive by our enemies and therefore we have to stand this through with Hitler and have to put him right, i.e., get rid of him thereafter: it is impossible to change horses in mid-stream.—You may disagree with those reasons just as strongly as I do, but you must take them into account as politically effective in making for disunity. Therefore while, practically speaking, you can trust every Dutchman, Norwegian, etc., as to his intentions, you have to probe deep into every German before you find out whether or not you can make use of him; the fact that he is an anti-nazi is not enough.

Lack of men: In our country we have, practically speaking, no young men left, men of the age groups which make revolutions, or are at least its spearhead. You have got young men or at least fairly young workers in your home factories, you have your young men training in your own country. All this is different with us; all our young men, even those in training, are far beyond our frontiers. Instead we have got more than 8 million foreign and potentially hostile workers in the country, and their numbers are going to be swelled to 10 millions and not a man younger than the age group of 1899 in the country. The exceptions to this rule are, but for the secret police and the SS, negligible. And those who still are there and are active are terribly overworked and have no strength to spare. The women, if they are not engaged in war work of one kind or another, are fully occupied—physically but especially mentally—in keeping their houses in order. The worse

the economic strain gets the less likely a revolution becomes, because people are so occupied in simply living. Food distribution is fairly all right, though it also takes a lot of time; but if you endeavour to buy anything else you will have an exhausting experience. If you need an envelope, want your shoes repaired, your dress mended, your coat cleaned, if you are so audacious as to ask for nails or a toothbrush, for glue or a cooking-pot, a piece of pottery or glass, if you try to park your child anywhere or need a doctor you will find the fulfilling of any one of these desiderata a full-time job. You have to wait and to run, to stand and to bid, to press and to plead, and in the end you will probably only get what you want if you have something to offer in return, be it services or goods. And all this additional work falls on the women. While the men forget in their job of soldiering completely what work is like, the women are thoroughly overworked. And that means not only that they are occupied physically with these jobs, they are of course, but the worst is that their head is full of thoughts about stratagems to get what you need, be it a toothbrush or a doctor. When a woman goes to sleep her last thought probably is: "I must not forget that they said they might get some envelopes at three, and the doctor's office said he might be back by 6:30; but what do I do with my child while waiting for the doctor; it may be 9 before I come back." There is no time even to think of the war.

Lack of communication: That is the worst. Can you imagine what it is like if you

- a. cannot use the telephone,
- b. cannot use the post,
- c. cannot send a messenger, because you probably have no one to send, and if you have you cannot give him a written message as the police sometimes searches people in trains, trams, etc., for documents;
- d. cannot even speak with those with whom you are completely d'accord, because the secret police have methods of questioning where they first break the will but leave the intelligence awake, thereby inducing the victim to speak out all he knows; therefore you must limit information to those who absolutely need it;
- e. cannot even rely on rumour or a whispering-campaign to spread information as there is so effective a ban on communications of every kind that a whispering campaign started in Munich may never reach Augsburg.

There is only one reliable way of communicating news, and that is the London wireless, as that is listened in to by many people who belong to the opposition proper and by many disaffected party members.

3.

Some of this devilish machinery has been invented by the Nazis, but some of it has been produced by war itself. But this

machinery is used to great effect by the ruling class. Their first aim is to keep the army out of touch with the political trends in the country. They succeed in this to a great extent. None but men on leave and those managing anti-aircraft guns are in the country. When on leave they do not want to be bothered and their relatives do not want to bother them. When out of the country, the information they get by post is very scanty as their womenfolk dare not write to them for fear of repressive measures which are and have been taken. Besides, the soldiers lead a fairly secluded life. Where they are they usually appear in great strength and have only the enemy to cope with. Most officers especially lead a life far above their status in civilian life. The normal soldier does not know more about conditions in Germany than you, probably a great deal less. And besides the soldiers are continuously led into positions where there is no choice but to fight. Their mind is occupied with the enemy as fully as the housewife's is occupied with her requirements. "The German general and soldier must never feel secure, otherwise he wants to rest; he must always know that there are enemies in front and at his back, and that there is only one thing to be done and that is to fight." This remark Hitler addressed to field marshal [Eric von] Manstein, who proposed to fortify some line way behind the frontline.

But even in Germany people do not know what is happening. I believe that at least 9 tenths of the population do not know that we have killed hundreds of thousands of Jews. They go on believing that they just have been segregated and lead an existence pretty much like the one they led, only farther to the east, where they came from. Perhaps with a little more squalor but without air raids. If you told these people what has really happened they would answer: you are just a victim of British propaganda; remember what ridiculous things they said about our behaviour in Belgium in 1914/18.

Another fact: German people are very anxious about their men or boys who have been reported missing in Russia. The Russians have allowed our men to write home, which was a very wise thing for the Russians to do. Well, these letters are, on their arrival in Germany, locked up or destroyed but not allowed to reach the relatives. About 1000 of these cards had passed the censor through some technical error. The recipients who then tried to answer in the normal way through the ordinary channels were thereupon arrested, questioned, and kept in confinement until they had realized what it would mean to them if they ever talked about the fact that they had received news from their men. Things like that go on in Germany for months and perhaps years and this is a bit of information for which Germans are eagerly waiting; you cannot explain it away, as you could with the example given about the Jews, with the argument that the Germans are impolitic and do not want to hear, that they have put Jews to death. No, even these facts about the communications from Germans in Russia are neither known nor, where you tell them, believed.

And where the facts become known, as with officials dealing with the cards or their relatives, there is a widespread belief, that the cards are faked and that the Führer in his magnanimity does want to prevent the raising of hopes by the beastly Russians which are unfounded and must give way to still deeper despair once the facts become known.

A third fact: We have now 19 guillotines working at considerable speed without most people even knowing this fact, and practically nobody knows how many are beheaded per day. In my estimation there are about 50 daily, not counting those who die in concentration camps.—Nobody knows the exact number of concentration camps or of their inhabitants. We have got a concentration camp only a few miles from our farm, and my district-commissioner told me that he only learnt of the fact that there was a concentration camp in his district when he was asked for orders to stop an epidemic of typhoid spreading to a neighbouring village; by that time the camp had existed for months. Calculations on the number of KZ-inhabitants vary between 150,000 and 350,000. Nobody knows how many die per day. By chance I have ascertained that in one single month 160 persons died in the concentration camp of Dachau. We further know fairly reliably that there are 16 concentration camps with their own cremation apparatus. We have been informed that in Upper Silesia a big KZ is being built which is expected to be able to accommodate 40 to 50,000 men, of whom 3 to 4,000 are to be killed per month. But all this information comes to me, even to me, who is looking out for facts of this nature, in a rather vague and indistinct and inexact form. We only know for certain, that scores, probably many hundreds of people die not a glorious death, as those in the occupied countries do, knowing that their people consider them heroes, but an ignominious death knowing that they are classed among robbers and murderers.

4.

What is happening to the opposition, the men "of whom one hears so much and notices so little" as a headline in a paper lately said.

Well, first of all, it loses men, at a considerable rate. The quick-working guillotines can devour a considerable number of men. This is a serious matter, not alone because of the loss of life; that has to be faced, as we will not be able to get out of the quandary into which we have been led without considerable sacrifices in men. The worst is that this death is ignominious. Nobody really takes much notice of the fact, the relatives hush it up, not because there is anything to hide, but because they would suffer the same fate at the hands of the Gestapo if they dared telling people what has happened. In the other countries suppressed by Hitler's tyranny even the ordinary criminal has a chance of being classified as a martyr. With us it is different: even the martyr is certain to be classed as an ordinary criminal. That makes death useless

and therefore is a very effective deterrent. Secondly, the opposition has thrown sand into the machine. It will probably never be known to what extent this has helped your people. But the extent to which that has been done is very considerable, especially in the higher bureaucracy. There is seldom a week when I do not notice something that must have been done in order to prevent a command from being executed or at least from becoming fully effective.

Thirdly, the opposition is saving individual lives. We cannot prevent the ferocious orders from being given, but we can save individuals. And this is done in all walks of life. People who have been officially executed still live, others have been given sufficient warning to escape in time. This is especially so in occupied countries: there is no denying the mass-murders, but once the balance is drawn, people will perhaps realize that many thousands of lives have been saved by the intervention of some German, sometimes a private and sometimes a general, sometimes a workman and sometimes a high-ranking official.

Fourthly, the opposition has made many mistakes. The main error of judgement has been the reliance placed on an act by the generals. This hope was forlorn from the outset, but most people could never be brought to realize this fact in time. The same reasons which made it impossible for the french generals to get rid of Napoleon prevent this happening in Germany. To expound the reasons would be too long a process. The main sociological reason is that we need a revolution, not a coup d'état, and no revolution of the kind we need will give generals the same scope and position as the Nazis have given them, and give them today.

Fifthly, the opposition has done two things which, I believe, will count in the long run: the mobilisation of the churches and the clearing of the road to a completely decentralised Germany. The churches have done great work these times. Some of the sermons of the more prominent Bishops, Catholic as well as Protestant, have become known abroad, especially two sermons of the Bishop of Berlin, Count Freysing, of May 16th (?) 1942 and December 20th 1942. But the most important part of the churches' work has been the continuous process by which the whole clergy, practically without exception, have upheld the great principles in spite of all the intense propaganda and the pressure exerted against them. I do not know of a single parson who in a church demolished by British bombs held a sermon with an antibritish strain. And the churches are full Sunday after Sunday. The state dare not touch the churches at present, and in order to get over this difficulty the churches have been requisitioned in many places for storing furniture saved from bombed houses; thereby the state hopes to make church-work slowly impossible.

The breaking down of the idea of a highly centralised German state has made considerable progress. While two years ago the idea of a completely decentralised Germany was con-

sidered a utopia it is today nearly a commonplace. This will ease the transitory period between war and peace, and may, perhaps, make a meeting of the minds possible.

5.

Two general observations can be added: one on war criminals and one on the threat of communism. The punishment of political criminals once the third realm [Third Reich] has come to an end will this time be very popular with the German people. You must realize that we have a concentration-camp-population of some 250000, certainly once again that number of men have lost their lives through the nazis' hands, and probably another 250000 have once been in a camp but have been released and fight or work somewhere. These 750000 men and/or their relatives have only one big desire: to kill the person whom they consider responsible for their special case. And this by the quickest procedure possible, if attainable with their own hands. And those who are killing people in occupied countries are to a great extent the same people who have killed or imprisoned Germans, unless they are drawn from other countries, especially from Latvia.—By the way, most of the most brutal SD-men, murderers, etc., have been drawn either from Austria or from the Sudetenland, the minority are toughs from the smaller Germany, and probably a quite minute minority only from Prussia.—Therefore it is a need of the internal German politics to bring these men to justice, perhaps even to death without justice, and the only way in which this could be prevented would be by making these toughs national heroes suffering for Germany instead of being punished by Germans.

The "danger of communism" is in our position very real. But as things are this danger arises mainly in the group of intellectuals and not among the workmen. The reason is that those workers who would go communist are already nazis. And those who are nazi are ready to go communist any day. If one does not take care, one will find all those brutal SA and SS men posing as persecuted communists, who now have to avenge themselves on their opponents. But those workers who are not nazi now, and that is the majority of the older and highly skilled workers, are completely fed up with all kinds of totalitarianism. These are the workers on whom we must build, not on those who can escape with a simple change of colour without change of heart. You see, the fight against nazism is not confined to one class or another: it goes on inside the classes and there are adherents to each creed at all levels of the society, at the top as well as at the bottom. If there is anything you can say about classes it is this: broadly speaking, the middle classes are nazi or at least most highly afflicted by one form of totalitarianism or another, and the lower ranks of the Prussian nobility as far as it still possesses land is least afflicted, is in fact practically immune from any kind of totalitarianism. The nobility of the higher ranks from dukes

upwards and the nobility of the South and West of Germany is much more afflicted by this disease and the urbanized nobility is really part of the middle-classes. These middle-classes tend, where they are anti-nazi, to be philo-bolshevist, philo-Russian, etc. they feel uncertain of themselves and hope for the great new strength that shall come from the East.

6.

Now my plea in these circumstances is for a stable connection between the German opposition and Great Britain and a connection not based on secret service relations, not used mainly to extract information but a political connection. I do not want this in order to discuss possible peace terms, possibilities of a post-war world. I want this connection in order to assist our war against Hitler, our internal war. I enclose a note I made about a certain event which has occupied us lately. If we had had a stable connection with Great Britain we could have discussed common strategy in exploiting these facts. As we have not got this connection we have to grope about in the dark, hoping that the information which comes to your people will not be used in such a way as to discredit and perhaps endanger us.—Occasions like this will recur, and other occasions will make contact useful. But I hope that this one example will show you what I mean without further details or examples.

7.

Now, how can this be done technically? We would have to have a man in Stockholm who knows Central Europe and who, working under the general guidance of the ambassador, would have special functions to keep in touch with the various underground movements in Europe, especially in Germany, and would have to deal with them on a basis of political discussion and cooperation. We would supply him with addresses here which would contact him with the oppositions in various countries under Hitler. Preferably it should be a man whom I know or about whom I know something, because time is precious and with a stranger it will take some time to get intimate and real personal contact is required.

But there are two main points, one about his position and one about his powers. Although subject to the general guidance of the ambassador, he should be free from all entanglements of secret service work. As far as I can make out, the channels of all secret services of the various nations are the same, and most agents will work for at least two parties. Therefore whatever you put into the secret service of one country will in due course be known to the secret services of all other countries. As a result the secret services of all countries are secret to everybody but its opponent. There may be an all-important time-lag before one bit of information available to one secret service percolates to the other, but in the end it will get there, and there is not much to be thankful for if the guillotine is simply postponed for 3 months.

As to the powers, I have to offer the following remark: the man must be able in certain circumstances to provide one of us with everything necessary to get to Britain and back in a short time, so that if necessary common plans can be discussed *viva voce*.

Well these are the proposals and I hope you will be kind enough to give them a thought. Perhaps they will be brought to you by one of our Swedish friends; if not, they will contain the address of one of our friends, with whom you could put a man you sent here in contact. You will realise that you must please not mention my name in this connection unless it is to a man placed so highly as to be able to decide himself without handing the information with the name on to some superior. The name must most certainly never appear in writing anywhere.

5.a.3. German Occupying Forces in Soviet Territory

The German Occupation of the Soviet Union

German forces ruthlessly exploited and abused conquered or subject peoples, undercutting Hitler's claims to establish a "New Order" in Europe that would benefit areas under Ger-

man domination. Even in Western Europe, where German occupation policies were relatively mild, this was the case, but these practices were far more pronounced in Polish and Russian territories. Nazi doctrine considered Slavs, native Poles, Russians, Ukrainians, and the like intrinsically inferior races, suitable only for forced labor, exploitation, and eventual deportation as far east as possible, perhaps to Siberia, unless they conveniently died in the process. In Russia, many inhabitants of the Baltic States, the Ukraine, and the Crimea, who had suffered particularly harshly during the purges of the 1930s, initially welcomed the German invaders as liberators, until the harshness of German occupation, together with rousing appeals by Soviet leader Josef Stalin to patriotism, disabused most of the belief that German rule would be any improvement. German atrocities against not just Jews and Muslims but the Russian population of the occupied zones in general, soon turned the inhabitants against them. So, too, did German treatment of Russian prisoners, among whom the mortality rate was 57 percent, though Germans captured by the Soviets faced equally dismal survival prospects. Jewish prisoners and political officers among the POWs were shot out of hand, and many Soviet prisoners died of starvation, exposure, or overwork. Following explicit instructions from Adolf Hitler and Heinrich Himmler, head of the feared SS, German forces set out to kill all communist officials and wreaked harsh retribution for partisan activities on the Russian civilian population and eliminated any support they had originally received.

About the Authors

The well-born Hans Herwarth von Bittenfeld came from a Prussian noble family the members of which traditionally served in the army and as diplomats. In 1930, he himself joined the German Foreign Service, spending most of the 1930s as a junior diplomat in Moscow. Sociable, intelligent, and charming, Herwarth was on excellent terms with many British, French, and American diplomats. Immediately after the German-Soviet Non-aggression Pact was signed, Herwarth joined the aristocratic German First Cavalry and, with his regiment, took part in the 1939 invasion of Poland, the 1940 Western blitzkrieg across the Low Countries and France, and the 1941 attack on the Soviet Union. Herwarth was particularly active in efforts to recruit discontented Soviet soldiers for the Nazi war effort. In 1944, he was one of those German officers who unsuccessfully attempted to assassinate German dictator Adolf Hitler. More fortunate than most of the conspirators, Herwarth escaped with his life, as those who were arrested did not betray him. When the war ended soon after, Herwarth's efforts stood him in good stead, as former American friends of his debriefed him and then recruited him to work on Austrian reconstruction for them. Eventually, Herwarth returned to the diplomatic service. In

1955, he became the first postwar German ambassador to Britain, a post he held for six years, and he subsequently served as German ambassador to Italy. He ended his career as head of the West German foreign office.

In June 1941, Aleksey Gorlinskiy, the son of a Soviet career military officer, obtained a degree in chemistry from Kiev University and planned to go on to become a scientist. He joined the Russian artillery as a lieutenant on 22 June 1941, the first day of Russia's war with Germany, and fought through the entire war, beginning in the Western Ukraine. He took part in the battles of Kiev, Stalingrad, and the Kursk Salient, crossed the River Dnieper, and helped to liberate the Ukraine, Romania, Poland, eastern Germany, and Czechoslovakia, finishing the war as a major. As a junior officer, Gorlinskiy was present on 25 April 1945 when American and Soviet troops met at the Elbe, vowing, in the exaltation of the moment, "that neither [they] nor [their] children nor [their] grandchildren would ever know war again" (Keyssar and Pozner 1990, 206–207). Gorlinskiy remained in the army, rising to major general before he retired. He then served on the Soviet Veterans' Committee and on the Soviet Peace Committee of Generals for Peace.

About the Documents

Both these documents are oral histories recorded by gentlemen who eventually became rather eminent, one the leading German ambassador of his generation, the other a top Soviet military figure. They fought on different sides on the Eastern Front, and each took part in bitter fighting. Each in his own way indulged in a form of special pleading, designed to place himself or causes he favored in a good light. The more august one's interviewees, the more of an occupational hazard it becomes that, in either their personal or official capacity, they will have special agendas to push and particular axes to grind.

Thanks to his efforts to overthrow Hitler and his diplomatic connections, Herwarth came out of the war rather well, largely untainted by his association with the Nazi regime. In these recollections and in his much lengthier memoirs, he essentially stated the conventional case for the professional German military, that the atrocities and excesses of Hitler's Germany were largely the work of the National Socialist Party, whereas the German armed forces merely sought to wage war according to accepted professional standards. The German army loyally did its "damned duty" against the Soviet Union, even when its leaders "never believed in ultimate victory over the Soviet Union." From a cynical perspective, one might ask why, in that case, they took so long to organize an assassination plot. It would be easy to argue that the German army was prepared to tolerate Hitler just so long as his military policies brought victory. Herwarth blamed Hitler for alienating potential Russian supporters by mounting "a reign of terror,"

allowing the SS to run wild in occupied Russia, and refusing to reverse Stalin's collective farming policies. According to Herwarth's memoirs, his own unit, the 1st Cavalry Division, made it clear in advance that they would not obey the order to shoot all Russian political commissars. The army, he claimed, ran those Russian territories under their sole jurisdiction far more humanely and efficiently, with the result that there were "no partisans whatever."

Herwarth also spoke highly of the efforts to recruit Russians into the German armed forces, a pet project of his own, minimizing the degree to which the appalling conditions Russian POWs faced impelled them to volunteer for the German army simply as a way to obtain enough to eat. Herwarth implied that only SS maltreatment of the Russian populace obviated the successful provocation of a Soviet civil war by Germany or at least the permanent detachment of large portions of Soviet territory. One cannot but feel that he tended to exaggerate the effectiveness of such efforts and by so doing to overplay the potential contribution he could have made to the war, if his advice had only been followed. He did, however, have a second motive for making much of this subject. Within a few years of the ending of World War II, the new Federal Republic of Germany (West Germany) dramatically changed its relationship with the United States and Britain, metamorphosing from a defeated enemy into a valued Cold War ally against the Soviet Union. As one of West Germany's top diplomats, Herwarth had every reason to stress his country's and his own past anti-Soviet credentials and to indulge in speculation that, but for Hitler's folly in terrorizing the Russian populace, in the early 1940s, the German military might have succeeded in backing a Russian civil war that would have destabilized Stalin's hold on power and overthrown Communist rule in the Soviet Union. He sounded this same theme in his memoirs. Simple logic might, of course, suggest that without Hitler, German forces would not have been on Russian soil in the first place, but Herwarth was not about to allow such minor caveats to overturn his fascinating exercise in speculation!

Gorlinskiy, by contrast, emphasized the extent of German atrocities in the Ukraine, not just the brutal executions of entire villages, even the children, but the conditions in concentration camps, especially for Russian prisoners, and the dehumanization of Russians in occupied territory. Gorlinskiy undoubtedly sought to position the harsh Soviet treatment of occupied Germany in the broader context of more than three years of horrific German treatment of both soldiers and civilians. He had some justification. More than 8 million Soviet soldiers died during the war and, by some estimates, close to 20 million civilians. While some of these deaths were due to Stalin's scorched earth policies and the harsh retribution he exacted on any troops suspected of disloyalty, the majority were directly due to German action.

The context in which Gorlinskiy made these remarks was also important. He prepared them for a televised "spacebridge" dialogue, using technology to bring together participants in both the United States and the Soviet Union for a dialogue on their World War II cooperation, a program later edited and aired in May 1985 to mark the fortieth anniversary of the ending of World War II in Europe. At the time, Soviet president Mikhail Gorbachev was in power and had instituted domestic policies of glasnost (openness), while seeking a dramatic improvement in Soviet relations with the United States. Both Gorlinskiy's wartime record and his prominence among Soviet generals promoting peace made him an excellent candidate to participate in such an occasion. Officials on the Soviet side unquestionably regarded this program and the book that came out of it as something of a diplomatic event, one that would permit them to set out their own view of World War II and emphasize both Soviet suffering and Russian contributions to the joint war effort against Germany. The two themes Gorlinskiy stressed for the program—German barbarities against Russia and the warm and friendly meeting between Soviet and American forces at the Elbe—were both entirely valid parts of his war experience but had been carefully chosen to encourage the further improvement of Soviet-American relations.

A) Recollections of Hans Herwarth von Bittenfeld

We soldiers already had an eerie feeling when we first marched into the Soviet Union. I was with a regiment that was half East Prussian and half Bavarian. Prussians and Bavarians alike were in awe of the size of Russia; it reached all the way to the Pacific Ocean. The troops were not at all enthusiastic about the prospects of fighting in the Soviet Union.

Once, a representative from the Propaganda Ministry visited us and gave a speech that was, in fact, quite excellent. In an attempt to prepare us for what lay ahead, he reminded us that in the Middle Ages German knights had also ridden east. We listened silently, and there was no applause. Afterwards we stood around, and the speaker said to my divisional commander, "I am actually rather disappointed. I don't see any enthusiasm here." A captain responded, "Sir, enthusiasm is not the point. But when we are ordered to fight, we do it extremely well." In a sense, this explains the tragic situation of the German front officer. We did our damned duty, but we never believed in ultimate victory over the Soviet Union.

When we marched into the Soviet Union we were initially looked upon as liberators and greeted with bread and salt. The farmers shared the little they had with us. They hoped finally to be treated as Europeans and as human beings. They expected the end of collective farming. Hitler, on the other hand, claimed this to be the best system for requisitioning

grain. Thus Hitler thought the same as Stalin on the subject of collectivization. That was the disaster. The party functionaries succeeded in driving people who were willing to cooperate with us back into the arms of Stalin.

They managed to achieve this through a reign of terror and the behavior of the SS. The SS dealt with the minorities first by murdering Jews and many Muslims. Because Muslims were circumcised, they were thought to be Jews, considered subhuman. Naturally this stupid, inhuman treatment of the population slowly eroded the good will of the people.

Interestingly enough, it was different in the southern part of the Soviet Union. There, because the North Caucasus region was under military administration, people were treated properly. The troops were ordered to behave as if they were on maneuvers in their own country. General von Köstring, the former military attaché in Moscow who was half German and half Russian, was sent to the region to ensure that a situation similar to the one in the Ukraine—where the people were driven back to Stalin—did not arise. In the North Caucasus, the collective farms were dissolved, and the troops behaved properly. The result: no partisans whatever.

We realized that the idea of transforming the war against the Soviet Union into a civil war could only succeed without Hitler. That was a tragedy. After all, at the end of the war we had 800,000 Soviet volunteers in the German army. Sometimes people maintained that all these volunteers were pressed into service. That, of course, is incorrect. Granted, there were surely a few who enlisted because they wanted out of the POW camps. But I myself saw how Russian soldiers deserted, came over to us, and said they wanted to fight on our side. Once, a Russian captain we had captured asked me where our artillery positions were. Since I can speak Russian I told him: “That is none of your business.” “It is,” he answered, “because your artillery has consistently been off target. I want to show your gunners how to aim the guns better.” This best illustrates how much hatred there was toward the Soviet Union, and it was justified hatred. There was no family in the Soviet Union which had not suffered under Stalin.

B) Reminiscences of General Aleksey Kirillovich Gorlinskiy on the Soviet Advance

This was in the Ukraine. The Germans were retreating; we were driving them out, and I remember seeing rows of gallows, the bodies of our people still hanging from them. All were in civilian clothes. Maybe they were partisans, and

maybe they didn't have any resistance connections at all but were simply the first people to get caught. I have seen even worse scenes. When we took the village of Reshetilovka, not far from the town of Poltava, it was terribly hot and we were thirsty. So we looked for a well. And we found it . . . completely filled with children's corpses. The fascists had conducted a scorched-earth policy there. All the houses were burned. When we entered villages, we generally found only chimneys standing. And then it fell upon me to liberate prisoners from concentration camps. The first such death camp was near Shepitovka. Most of the prisoners were French. Things were not so bad there. The Germans treated the French better; I certainly didn't see in this camp what I saw later in camps with our own people. In short, the first concentration camp didn't leave an especially strong impression on me. The concentration camp in Slavut left a considerably stronger impression. It was close to Shepitovka, and it was for our people. When we got there, most prisoners were dead; the Germans had machine-gunned them before retreating. Then, the camp at Terezin [Theresienstadt] in Czechoslovakia. The Germans used it as a showcase; they had even brought the Red Cross there. In 1982, I was a member of a delegation which took part in the first international conference of liberated prisoners from fascist concentration camps. It was held under the aegis of the U.S. State Department; Alexander Haig greeted us. And, you know, one old woman, knowing I had liberated Terezin, approached with a young woman, apparently her daughter, and told her, “Kneel before this man, because he is the reason I survived.”

And before Terezin, I remember, was Lignitz, in Polish territory. There were also many Frenchmen there, but there were a great many of ours. When we entered the camp, how these people did meet us! It was impossible to describe. They could barely stand on their legs, merely skin and bones, and from them I also discovered that conditions for the prisoners were unequal. They were especially terrible for the Russians, the Soviets.

You can imagine what kind of hatred our soldiers felt. And it was not simply hatred for an inhuman, sadistic enemy, it was a hatred which rallied the people and helped us fight.

I recall coming across the body of a German officer. He had a wallet, and, of course, you always checked such things for documents or papers. I found a photograph in that wallet. Apparently, this photo came from home. It showed six Soviets harnessed like oxen to a cart, and two German boys, about twelve years of age, were driving them with whips. Beside them stood adult Germans, making sure the poor bastards couldn't do anything. I gave this photograph to a correspondent who published it in a newspaper. How could such a thing not evoke hatred? Yes, we took it out on the Germans; we made them pay for what they did to us.

5.a.4. Japanese Maltreatment of Prisoners-of-War and Internees

The War in the Pacific: Japanese Treatment of Western Prisoners and Internees

After Pearl Harbor, Japanese troops swept through much of Southeast Asia and by mid-1942, had captured around 140,000 European and North American prisoners and 180,000 Chinese, Filipino, Indian, and other Asian troops. Many of the nonwhite captives were soon released, but the Japanese kept their Western prisoners until the war ended in 1945. More than 100,000 Western civilians—noncombatant men, women, and children, and medical personnel—were also interned for the duration of the war, living in camps where they were usually expected to perform some kind of work.

Japanese treatment of captives, whether prisoners of war or civilians, soon became notorious for its brutality. Although Japan had signed—but not ratified—the 1929 Geneva Convention governing conditions for prisoners of war (POWs) and in 1942, pledged to observe its spirit, this promise was not honored. The Japanese military ethos decreed that soldiers should fight to the death, so there was no real concept of POWs, who were despised as dishonorable cowards. Espe-

cially when only just captured, POWs were often subjected to torture, humiliation, and brutal treatment; after Hong Kong fell, a number of captured Canadian soldiers were tortured and killed, wounded military personnel in hospital beds were massacred, and nurses were raped repeatedly.

Prison camps provided minimal accommodation, with poor and inadequate food, clothing, and health care, and, in contravention of the Geneva Convention, grueling forced labor was demanded of POWs and sometimes of internees. Punishments were severe and often arbitrary, in many cases amounting to torture. The overall wartime mortality rate for POWs held by Japan was 26.9 percent, though for the 25,600 American prisoners alone it rose to 35.6 percent, probably due to a very high death rate on the 1942 Bataan Death March. This compared with a mortality rate of 57 percent among Soviet troops captured by German forces, who treated them as subhumans, as opposed to only 3.5 to 5.1 percent for American and British prisoners of Germany. Around one-third of German POWs held by the Soviet Union died in captivity. Savage Japanese treatment of American and European prisoners may have demonstrated a certain gleeful satisfaction that Japan had overthrown the Western colonial empires and could now humiliate their representatives. It also reflected the harsh overall ethos of the Japanese army, where offenses by soldiers generally brought severe punishments, often worse than those meted out to POWs, and superiors enforced stringent discipline upon inferiors. Many Western survivors of Japanese prison camps emerged with a profound hatred of Japan that endured until their deaths.

The Bataan Death March, April 1942

On 9 April 1942, 12,000 American and 68,000 Filipino troops on the Bataan Peninsula in the Philippines surrendered to Japan, ending a 100-day siege. The horrific 65-mile journey of the weakened survivors, mostly on foot, to board trains for Camp O'Donnell, a prisoner-of-war camp, became one of the enduring memories of the Pacific war. Most were already starving and many were ill. Japanese guards subjected the captives to random atrocities, denied them food and water, and left them for hours exposed to the blazing sun. Those who fell out were killed. The trains were made up of overcrowded and overheated boxcars with no sanitation facilities, and upon arrival, a further 7-mile march awaited the prisoners. Between 600 and 650 American soldiers and 5,000 to 10,000 Filipinos died before reaching Camp O'Donnell, followed by a further 1,600 Americans and 16,000 Filipinos who became victims of starvation, disease, or maltreatment in their first six or seven weeks in the camp.

The Burma-Thailand “Death” Railway

In defiance of the Geneva Convention, POWs held by the Japanese were generally sent to labor camps and assigned to a variety of industrial, construction, mining, and agricultural

enterprises. Although working conditions varied, they were generally poor, with food increasingly short as the war progressed, clothing inadequate, and medical facilities at best poor and often virtually nonexistent. Camps were primitive and overcrowded, with dangerously basic sanitation, and mechanical equipment conspicuous by its absence. One of the most notorious of these work projects was building the railway linking the Burmese capital, Rangoon, to Thailand's capital, Bangkok, on which 50,000 Australian, British, Dutch, and American prisoners of war and around 250,000 local Asian slave laborers worked. Perhaps one-third of the Western prisoners and almost one-half of the Asian laborers died while working on the "death railway," many from horrific tropical ulcers, cholera, dysentery, malaria, or other diseases. Working conditions were worst from February to October 1943 when Japanese officials launched a campaign to expedite completion of the railway, and those supervising its construction demanded still more work from men whose health and strength were rapidly declining.

About the Documents

All three of these documents are oral histories or reminiscences, written down or recorded as interviews many years after the event, for inclusion in compilations of similar recollections. Over the past two decades, an interesting pattern has emerged, whereby large numbers of memoirs and oral histories of wartime prisoners or internees have appeared and been published. A few came out in the years immediately after the war, but many prisoners seem to have waited for several decades before recording and publishing their memories. Often, the authors are not professional writers; some have therefore found themselves a collaborator with the necessary literary skills, whereas others have contributed reminiscences to larger collections. Part of this outpouring may simply be due to enterprising authors and publishers responding to popular interest in the subject. It does however seem as if, immediately after they were finally released, numerous prison and internment camp survivors wished simply to leave their past experiences behind them and forget them, since many were probably then too painful to remember. As they approached old age, however, some apparently reached a point where they finally wished to remember, and perhaps to come to terms with and make some sense of their experiences, as well as to put them down on record for posterity. At least one World War II historian who has made extensive use of oral histories has spoken of conducting interviews with women survivors of captivity who have finally spoken of experiences, multiple rapes by Japanese troops, for example, about which some of them had for 50 years remained silent even to their families.

All these oral histories give striking and down-to-earth portrayals of the actual human experience of imprisonment

and internment, especially the prolonged suffering that they had endured, something that was obviously etched deep on the memories of all three survivors, even though Truus Clydesdale said that she had forgotten the pain of a beating. The memoirists make no attempt to glamorize or romanticize their own behavior under sordid, oppressive, and difficult circumstances. Each was imprisoned or interned for several years, so inevitably the subject tends to recount the most memorable high and low points of that time. In all three cases, the more horrific aspects are well to the fore. Some of the details included could probably be checked up against camp records or the memories of other prisoners, but others might well have been lost for good had they not been recorded before the deaths of the protagonists. All, of course, have already been published, which may well mean that some grammatical and stylistic infelicities have been edited out, together with more mundane passages of these reminiscences.

A) Bill Nolan Recalls the Bataan Death March, April 1942

On April 10th, 1942, the Jap guards started us walking from our position at Cabcaban, going north as fast as the guards could walk. Myself with a very sore head, ears hurt, could not hear . . . very thirsty . . . no food or water. The temperature reached 95 degrees and prisoners would faint or pass out on the march. These prisoners that could not get up were shot or bayoneted to death and left along the road. Some were run over by Japanese trucks bringing Jap soldiers for the invasion of Corregidor. As these trucks passed American soldiers, they would hit and club Americans on their head and shoulders. Many fell and died under the wheels of Jap trucks. We walked from 6:00 a.m. until 6:00 or 7:00 p.m. Again no water or food. Calvin Graef, my First Sergeant, and myself both dipped water from the ditch on the side of the road.

This ditch contained water covered with green slime, dead horses, and American soldiers killed by Japs. Everyone suffered from malaria and dysentery. We had no quinine since February, '42. That night we slept on the ground on the side of the road. During these stops, Jap soldiers would strip us for our rings, watches, and pen-and-pencil sets. On dead American soldiers Japs would cut off fingers to get the rings. They took our canteens, gun belts—and left us with shirts and pants. Our helmets were knocked off and left on the road. So no hats for the rest of the march.

These conditions continued for four days until we reached San Fernando. Here we received our first cup of rice and some tea. While waiting in line for food, I passed out. When I came to, I was lying on the ground and had another large bump on the back of my head and was very dizzy.

We stayed here overnight, and the next morning at day-break, all prisoners were marched to the railway station. At

the siding were small, metal box cars. We were pushed by bayonets into those cars. About 100 prisoners in each car . . . could only stand up . . . and no room to sit down. The door was locked by the guards. Again the temperature reached 95 degrees. The metal sides of these box cars became so hot, we could not touch them. The ride lasted until dark when we unloaded. During the ride many prisoners became uncontrollable from the heat with no water or toilet facilities. Everyone had dysentery, and everyone went on the floor and over prisoners lying on the floor. These prisoners had passed out or were dead. I believe 10 or 15 men died in each box car during the eight hour trip.

B) Tex M. Offerle, American Prisoner-of-War, Recalls Working on the Burma-Thailand “Death” Railway

[Roy M. “Tex” Offerle, born in Texas in 1921, was one of 668 American soldiers of the Second Battalion captured on the Indonesian island of Java in March 1942. Recovering from amoebic dysentery, he was set to work on constructing the Burma-Thailand Railway, and sent to 18 Kilo[meter] Camp, where his elder brother Oscar, who later died of a tropical ulcer, was also working.]

Basically, 18 Kilo was like one of the many camps we were to be in the future. You’re talking about, like, maybe three, four, five thousand men in these camps, a lot of men. They had long huts made out of bamboo frames tied together with atap, which are leaves wrapped over thin pieces of bamboo about three feet long. They’d leave the walls open, and they had atap leaf roofs that were then overhanging. My brother was working in the cookhouse and then on the wood detail, cutting wood for the kitchen. Anybody related to the kitchen got a little better food. When I got there, he started bringing me some extra food, and it helped me get well fast. The quality wasn’t too good, but the quantity was fair.

The first job we had was a fill about three blocks long. It was forty meters across the top of the depression; there was a natural slope to it, which went about twenty feet deep. It took four or five thousand men working a month or two to build this fill. . . . The men worked hard because they knew they were off as soon as they moved a meter of dirt. After we got accustomed to pick-and-shovel work and carrying dirt, we would finish at three or four o’clock in the afternoon.

Well, then the Japs just gave us a larger quota. So we went to a meter-and-a-tenth, a meter-and-a-quarter, a meter-and-a-half per man per day. Later on up country, they went to two

meters of dirt. When they went to one-and-a-half meters of dirt, you’d get in about dark. Two meters of dirt would get you in at about ten or eleven o’clock at night. They eventually went to this, and by then, too, we got food that didn’t have all of your vitamins. You weren’t keeping your strength up. The men’s physical strength gradually wore down and our quotas gradually went up, which set us up for disease and sickness and a lot of the things that were to follow.

At this time, our group, which was one of the largest groups of Americans working on the railroad, hadn’t yet experienced real hardship. We were getting a little sickness, some malaria, maybe a few people hurt. From 18 Kilo we went to 80 Kilo Camp. Now, we had larger quotas to meet. We were up in a lot more jungle. Conditions were not so good. We were farther away, so supplies were harder to get up there. We got away from canteens and extra food that you could buy.

From 80 Kilo, which was a smaller camp, we went to 100 Kilo, which was a larger camp. Incidentally, we were at 85 Kilo Camp for a while—80, 85, 100. But 100 Kilo Camp seemed to be a larger camp. I believe it was in 100 Kilo Camp where we got the full brunt of the rainy season. When you talk about rainy season in Burma, you’re talking about three or four months where it comes out like you’re pouring it from a bucket, day in and day out. It’s possibly three or four hundred inches of rain in a season. Actually, creeks and rivers form, and you can almost watch vegetation grow. The rainy or monsoon season turned everything to soup or mud. They couldn’t get supplies up there easily. Then the speedup on work came. We went from one meter, to a meter-and-a-half, to two meters of dirt per day. Well, the men’s health broke down. We started getting lots of malaria, beriberi, dysentery, and tropical ulcers, because it seemed that the germ that causes tropical ulcers was more prevalent in the rainy season. We started getting a multitude of diseases.

The more people that got sick, the less the Japs had for working parties, so more sick people had to work. They’d set a quota of men everyday that had to go out, and they’d fill it. I worked all this time. I hadn’t been sick, although I lost weight. I didn’t have malaria, beriberi, or any diseases. So I worked. This *kumi* of fifty men that I was in was originally all sergeants, and it was down after the rainy season started to thirteen or fourteen men. That didn’t mean they were all dead; some of them were, but most of them were just sick. They were sick enough that if they had been in the United States, they’d have been in an isolation ward with a nurse twenty-four hours a day. Yet here they were in a bamboo hut in the rainy season eating a little rice and water stew; no medication and no one to take care of them, except our own medics and doctor who had no medicine.

This developed into a situation where we started losing men fast. The Japs would force the sick out. If they wanted a *kumi* of twenty-five to go out, and had fourteen healthy there,

that meant eleven sick had to go out. So they would come down through the sick barracks. The first time I stayed in, I had malaria and was sick as a dog. I was shaking and felt terrible and had a high fever and chills. I asked the doctor if I could stay in, and he said, 'Yes, you haven't been in, so stay in.' So here come the Japs down for extra men to go to work. Well, I got off the heavy-duty job, but they said they had to send me out on light duty. The doctor said, 'There are some men sicker than you. Can you go out on light duty?' I said, 'Well, if I have to, I will.' He said, 'Yes, you'd better go out.' These Japs raised Cain, and they started beating everybody and giving the doctors and medics a hard time. So, light duty was busting rocks with a sledgehammer—putting rocks on the roads—because they were just a sea of mud, and they were trying to fix the roads enough to get trucks up them with supplies.

C) Truus Clydesdale Recalls Muntilan Camp

[When Japanese forces invaded Indonesia in 1942, 70,000 Dutch women and children were taken prisoner. Most were interned. Truus Clydesdale, born in Aceh, Indonesia, 1929, was the eldest of four daughters of a black Dutch Indonesian Army officer who was descended from African slaves brought to the Dutch colony of Surinam, in South America, and of a Dutch mother. When the Japanese conquered Indonesia, her father was imprisoned almost immediately, dying in captivity, and his family interned in a succession of camps. In late 1944 the Clydesdale family was moved, together with the other occupants of Saninten Laan 21 camp, to Muntilan, women and children travelling for many hours without food or water in a closed train with no sanitary facilities. Truus Clydesdale later recalled her experiences in Muntilan.]

We were sorted into groups and our things were put into *gerobaks*, or carts, that were usually pulled by oxen. Now the women were harnessed up and had to pull them themselves. We walked and walked, how far I don't remember. Eventually we got to a nunnery in Muntilan and were put into large schoolrooms. Ours was room No 90 and we were jammed in there with a hundred other women and children.

Mother was always crying. She was quite unable to cope with it. She was a nightwatcher and had to walk around all night keeping watch. We knew there was torture going on in the church because we could often hear the screams. If they took you to the church you knew you were in for trouble. Women were tortured for stealing sugar. Mother had to clean up the torture rooms the next day. The poor women had let

everything go, urine, faeces and vomit. It was horrible. They used electric needles under your fingernails and also cigarette burns. They did that to me when I ate the carrots.

The worst story is about Mrs Kieboom. She was a big woman with masses of thick brown hair and had a crystal radio set hidden under her mattress. It was found in one of their searches. They called us all out into the square and we all had to sit and watch while they beat her with bamboo canes. It was hot—midday—and we just had to sit there and watch. Then they dragged her up the steps. She never stopped screaming and pleading with them to stop. All the Japs took turns beating her, one after the other. All the skin was stripped from her arms and body. At sunset she was brought on a stretcher to the toilet room next to us. It will haunt me for the rest of my life. I wanted to see her but the grille was too high so I put my little sister on my shoulder and hoisted her up so she could tell me what she saw. Mrs Kieboom lay there as though she was dead for many days and we were all quite sure she had died. All they gave her was water but amazingly she survived. If it was meant as a lesson to the rest of us, it certainly worked. We were all terrified. Once again my poor mother had to go in and clean the toilet room when Mrs Kieboom was let out. As usual, it was filthy with excreta.

[*Truus Clydesdale and her friend, Tilli, also had to work on the local Muntilan bridge.*]

We had to maintain the sides of the bridge by bringing stones up from the bed of the river in a basket. I must have been mischievous or something because I whispered to Tilli, "This is too heavy for me. When the guard isn't looking, I'm going to tip some of the stones out and just bring the little ones up to the top."

How innocent I must have been. When I came up for the second or third time with only the little stones in my basket, the guard was ready for me. He pulled off my shirt and grabbed his whip. Tilli fainted. She thought he was going to kill me. He gave me a terrible beating but strangely enough I can't remember it. I've put the pain out of my mind. I was talking about it to Tilli when I was last in Holland and we were able to laugh about it. Funny isn't it, how time smooths these things out in your mind.

5.a.5. The Greater East Asia Co-Prosperity Sphere

The Greater East Asia Co-Prosperity Sphere

From at least the 1930s, Japanese politicians sought to win over nationalist forces in Asian countries that had been colonized by European states, presenting Japan as the guardian of pan-Asian interests, seeking to drive out Western imperialists and restore Asia to solely Asian rule. In 1938, Japanese Prime Minister Konoe Fumimaro appealed for a “New Order in Greater East Asia,” to encompass Japan, Manzhouguo (Manchukuo or Manchuria), China, and Southeast Asia, a vision paralleling Adolf Hitler’s proclamation of a “new order” in Europe that would unite the continent politically and economically under German leadership. Two years later, on the traditional 2,600th anniversary of the founding of Japan, the Konoe cabinet called for the establishment of a Japanese-led “Greater East Asia Co-prosperity Sphere” in this area, which would implement political and economic integration throughout East and Southeast Asia in order to combat and repel Western imperialism. In China, they sought to attract nationalists who resented the economic concessions and legal privileges granted Westerners, though many Chinese found Japanese behavior at least as imperialist as that of their European and American rivals, and their tactics were considerably more brutal.

As Japanese forces moved into much of Southeast Asia in 1941 and 1942, they urged the leaders and peoples of the Philippines, the Dutch East Indies (present-day Indonesia), Malaya, Burma, together with those of India, the territory of

which Japanese troops never reached, to transfer their allegiance from their former imperialist overlords to Japanese-sponsored governments of national liberation. Though some Asian leaders resisted all such siren calls, others found such invitations hard to resist, if only in some cases on the purely pragmatic grounds that the Japanese now controlled their countries, and it was by no means certain that their former American, British, or Dutch overlords would ever return. The rapid Japanese victories of 1941–1942 against Western forces also did much to destroy the prestige of their defeated opponents. Nationalist leaders, among them Ba Maw and General Aung San of Burma, Soekarno of Indonesia, and Subhas Chandra Bose of India, were particularly susceptible to Japanese arguments. As Japanese troops swept brutally into his country in December 1941 and the U.S. government confessed it could send no additional reinforcements, even the normally pro-American President Manuel Quezon of the Philippines toyed with the idea of negotiating mutually acceptable peace terms with Japan. Quezon ultimately escaped to safety in Australia, but in January 1942, 32 prominent Filipino politicians who had remained behind accepted a Japanese invitation to cooperate, behavior for which Quezon himself publicly stated they should not be condemned, given the extremely difficult situation in which the Philippines found itself. In every country occupied by Japan, some politicians and many among the general population were prepared to collaborate with the new overlords, whereas others joined the resistance movements that fought against Japanese rule.

In August 1943, a pro-Japanese government headed by Ba Maw, who in 1937, had become the first Burmese premier to hold office under the British, was put in place in Burma (Myanmar). In October 1943, Japan formally established a supposedly independent Filipino government, headed by former Interior Minister Dr. José Laurel. In the same month, Bose proclaimed Azad Hind, his provisional Free Indian government-in-exile. These moves were preliminaries to a broader Japanese effort to cement the loyalties of its clients around Asia as the fortunes of war began to turn in favor of the Allies. This campaign reached its peak in early November 1943, when representatives of seven Asian nations—Japan, China, Thailand, Manzhouguo (Manchukuo), the Philippines, Burma, and Free India—met in Tokyo on the invitation of the Japanese government, to establish the Greater East Asia Co-prosperity Sphere. The conference issued a declaration that its member states would fight to the finish in the war against British and American imperialism and then establish a mutually cooperative postwar order conducive to the prosperity and stability of all.

In practice, Japanese rule usually proved to be much more oppressive even than that of Western imperialists, provoking much popular resentment and resistance. During the war, Japan subordinated the economic interests of the areas it

occupied to its own, looting them of oil, rice, rubber, tin, and other supplies. Although individual politicians and others collaborated with Japan in Malaya and Indonesia, in neither country did Japan contemplate establishing even a quasi-independent government, since, like Korea, annexed by Japan in the early twentieth century, these resource-rich areas were to be reserved for direct Japanese rule and exploitation. Even in those countries where Japan encouraged the formation of supposedly independent governments, the occupying forces denied those administrations any genuine authority and often treated the inhabitants with great severity, helping to provoke popular resistance. Many decades after the war, throughout East and Southeast Asia, Japanese rule was remembered as a brutal and humiliating interlude and still deeply resented.

Even so, the issue of collaboration was an extremely sensitive one, opening issues of imperialism and legitimacy that most were reluctant to scrutinize too closely. After the Allied victories of 1945, returning colonial overlords rarely contemplated serious reprisals against those who had collaborated with the Japanese. In Burma, Lord Mountbatten, British commander in chief for Southeast Asia, issued specific orders that only those Burmese who had participated in actual atrocities during the Japanese occupation should be punished. In the Philippines, Allied commander in chief General Douglas MacArthur and President Sergio Osmeña issued similar instructions. Nonvindictive policies were enforced in most areas liberated from Japanese rule. Extremely few were penalized for mere acquiescence in Japanese occupation, and many of those leaders who had joined Japanese-sponsored governments later enjoyed successful political careers.

About the Author

By the early 1940s, Claro M. Recto, a lawyer, poet, writer, and former Philippine Supreme Court justice, was prominent in Filipino politics. During the 1930s, he served as both minority and majority floor leader in the Philippine Senate, switching parties in the mid-1930s in nationalist protest against the economic and military terms on which the United States was prepared to grant the Philippines independence under the 1932 Hare-Hawes Cutting Act. In 1934, Recto presided over the convention that drafted the new Philippine constitution. In 1941, Recto, who had spent some years in private practice, won reelection to the Philippine Senate. In January 1942, he became one of 32 leading Filipino politicians who accepted a Japanese invitation to cooperate. From 1942 to 1943, Recto served as commissioner for education, health, and public welfare and then as minister of state for foreign affairs in the Laurel government. At the end of the war, Recto was accused of collaboration with Japan, arrested, and charged with treason. Rather than taking advantage of the subsequent amnesty proclamation of President Manuel Roxas, Recto insisted on

fighting his case in the courts, pleading not guilty and winning acquittal after proving that he had maintained connections with the underground resistance movement. He was elected twice more as senator, in 1949 and 1955, and ran unsuccessfully for the presidency in 1957.

About the Documents

In most respects, these two documents are very different, one illustrating the rhetoric, the other demonstrating the reality of Japanese occupation rule. The declaration of the Greater East Asia Congress was a formal and official public statement intended to enshrine the decisions and principles on which the participants in that meeting had reached agreement. All stated their determination to continue to fight against Western imperialism until victory was attained and Britain and the United States driven out of Asia, and their commitment to a mutually cooperative and prosperous Greater East Asian Order, the member states of which would be on good terms with the rest of the world. Like many such international declarations, most of its terms were so vague as to be virtually meaningless. Issued in Tokyo, the statement was virtually dictated by Japanese officials, who hoped that it might impel their Asian clients to remain loyal to Japan as Allied forces moved inexorably closer to Japanese-occupied territory.

Recto's purportedly "unofficial" letter, written seven months later and sent to Wachi Takazi, director general of the Japanese military administration in the Philippines, was far more interesting and remarkably frank, in that it depicted vividly and at length some of the realities of Japanese rule in the Philippines eight months after the formal grant of independence. Fundamentally, Recto was calling the Japanese bluff on the rhetorical promises enshrined in the November 1943 Greater East Asia declaration. One is, indeed, rather surprised that Recto even dared to write this letter, though the gradual Allied erosion of Japanese power and the increasingly desperate Japanese military situation in the Philippines may well have emboldened him to take this step. Recto's position epitomized the dilemmas facing those Filipino and other collaborationist politicians who saw their behavior as regrettable but necessary, in that it facilitated their ability to protect their own people against oppression. He warned that a great many Filipinos felt nothing but "distrust and hostility . . . towards the present regime." The reason for this, he explained, was above all the prevailing brutal Japanese treatment of both average and higher-class Filipinos, including collective reprisals for guerrilla activities, coupled with the near-total Japanese disregard for the supposed authority of Philippine officials, which meant that the new government had lost all credibility with the general public and was considered a mere puppet regime. As foreign minister, he found himself constantly trying to mediate between the Japanese authorities and his own people, almost, Recto stated, as if he

were an ambassador accredited to a foreign country trying to protect his nationals there.

Recto tactfully stated that Wachi's own behavior and that of other top Japanese officials had been a model of "exemplary and statesmanlike conduct," embodying the stated principles of the Greater East Asia Co-prosperity Sphere, and regretted that this attitude had not "percolated [down] to the rank and file of the Japanese soldiers and civilians in the Philippines." Politely but definitely resorting to implicit blackmail, he warned that Filipinos would not be prepared to fight enthusiastically against the Allies in the near future unless they believed that they were defending their own "real and authentic" independence. Something "concrete," not just "such high principles as Asia for the Asians or such large ideals as the establishment of the Co-Prosperity Sphere," would be required if his countrymen were to feel that they had "a real stake in the war." As a description of the flaws in Japanese rule under the Co-prosperity Sphere, Recto's letter was detailed and enlightening. His diagnosis was the more convincing in that even writing such a missive exposed him to some personal risk. Although tactful, diplomatic, and friendly in tone, its underlying message was unequivocal: unless the Japanese granted their Philippine "allies" genuine independence, at the first opportunity, the Filipinos would simply abandon them.

Primary Source

A) Joint Declaration of the Greater East Asia Congress, Tokyo, 6 November 1943

It is a basic principle for the establishment of world peace that the nations of the world each have its proper place and enjoy prosperity in common through mutual aid and assistance. The United States of America and the British Empire have, in seeking their own prosperity, oppressed other nations and peoples. Especially in East Asia, they indulged in insatiable aggression and exploitation, sought to satisfy their incredible ambition of enslaving the entire region and finally came to menace seriously the stability of East Asia. Herein lies the cause of the present war.

The countries of Greater East Asia, with a view of contributing to the cause of world peace, undertake to cooperate toward prosecuting the War of Greater East Asia to a successful conclusion, liberating their region from the yoke of British-American domination, ensuring their self-existence and self-defense and constructing a Greater East Asia in accordance with the following principles:

1. The countries of Greater East Asia, through mutual cooperation, will ensure the stability of their region and construct an order of common prosperity and well-being based upon justice.
2. The countries of Greater East Asia will ensure the fraternity of the nations in their region by respecting one another's sovereignty and independence and practicing mutual assistance and amity.
3. The countries of Greater East Asia, by respecting one another's traditions and developing the faculties of each race, will enhance the culture and civilization of Greater East Asia.
4. The countries of Greater East Asia will endeavor to accelerate their economic development through close cooperation upon a basis of reciprocity and promote thereby the general prosperity of their region.
5. The countries of Greater East Asia will cultivate friendly relations with all the countries of the world and work for the abolition of racial discrimination, the promotion of cultural intercourse throughout the world and contribute thereby to the progress of mankind.

B) Claro M. Recto to Lieutenant General Wachi Takazi, 15 June 1944

I have taken the liberty of writing to your Excellency at some length and with complete frankness on a subject which, I am sure, is as close to your heart as it is to mine; the question of improving further the relations between the Filipinos and the Japanese, enhancing Filipino faith in the Republic, and strengthening Filipino loyalty to our common cause. . . .

Permit me to go into the core of the matter at once. I think you will agree with me that in spite of the best efforts of the Philippine Government, a considerable portion of the Filipino people have not rallied as they should have to the common cause. It is deeply to be regretted that, notwithstanding the liberal policies laid down by the Tokyo Government and carried out in its larger aspects by its able representatives here, little has been accomplished, as a matter of fact, to eliminate the feeling of distrust and hostility which a considerable portion of our people continue to entertain towards the present regime. This fact requires a word of explanation lest the Japanese Government, unaware of the reasons behind the present attitude of this portion of the Philippine people, should come to regard all of them, in general, as ungrateful, unwilling or unable to appreciate Tokyo's liberal policies towards the Philippines. . . .

The explanation seems to be simple enough. It may be found, in the first place, in the psychology of the common peo-

ple, not only in this country but everywhere. Here as elsewhere the common man is less concerned with high policies, great issues or abstract principles than with matters that intimately affect him: his livelihood, his individual rights, the welfare of his family and of the small community to which he belongs. If he is thrown out of his house without any other place where to go, if his property is confiscated without what he believes to be just compensation, or if he is driven to desperation as a result of the present situation, he finds himself losing faith in the Republic and feeling aggrieved against Japan. It is then quite difficult to impress him with the display of his country's flag, with generous donations of clothing and medicine, or with such liberal policies as condonation of Army loans to the Republic, the restoration of public properties to his government, the establishment of a new Philippine currency replacing the military scrip now in use on a basis of parity with the yen, etc. These high matters of government policy interest the man in the street or the barrio folk but little at all. The real determinants of his attitude and conduct towards Japan and the Japanese continue to be the incidents of everyday life, the things that happen to him, to his family, to his friends, and to his neighbors. For the Filipino is both simple and worldly wise. He bases his judgment on the things he sees around him however seemingly unimportant they may be. A little act of kindness and consideration is worth to him incalculably more than a thousand words of propaganda.

Nor is the situation among the more enlightened classes any better. One would think that being more reasonable and less sentimental than the common masses, they would be more inclined to judge matters on a plane of high issues and principles. It is not so, however. The educated Filipino who sees the kind of treatment that is meted out to his neighbors may be less emotional and violent in his reactions, but he is nonetheless deeply affected. With him the violent emotional reaction of the common man becomes a coolly reasoned conviction. Precisely because he is educated, his sensibilities are more easily violated by acts of cruelty, discrimination, offensive behavior, and lack of consideration. Moreover, he is better able to distinguish between political sovereignty and economic independence. He understands much better the differences between word and deed, between promise and realization, between principle and action.

In view of these facts, we cannot but admit that one of the most important and pressing problems which confront the Filipino leaders today is how to convince the people of the reality of the Philippine independence in order that they may all support the government of the Republic and cooperate with the Japanese forces by living in peace, and engaging in useful and productive activities.

When independence was proclaimed in October 1943, a great many of those who doubted Japan's true intentions towards the Philippines showed a willingness to change their

attitude. They had high hopes for the newly established Republic and expected to see a material improvement in the conditions then existing, particularly in the relations between Japanese and Filipinos, and between the Japanese and the Philippine authorities. There was, nevertheless, a good portion of the Filipino people who feared that Philippine independence would not be real but was being declared merely for propaganda purposes.

From the time the Republic was established, therefore, it has been the constant endeavor of the Filipino leaders to promote and maintain its prestige in the eyes of their own people, and to have it exercise as much as possible the power and prerogatives to which the government of a sovereign state is entitled, saving only the limitations arising from the exigencies of the war situation as defined in the Pact of Alliance between the Philippines and Japan. To this end, we have appealed to our people, trying to convince them that the independence of our country is real, that Japan's intentions in sponsoring and recognizing it were sincere, and that therefore they should have faith in their Government, assisting it in the work that it is doing, and cooperating to the fullest extent with the Japanese authorities in the Philippines for the accomplishment of the noble purposes envisaged in the said Pact of Alliance.

If the Filipino leaders have not thus far been as successful in their efforts as might be desired, their failure is due to a number of causes, many of them traceable to certain practices which should have been discontinued after our independence was declared. Foremost among these is the kind of treatment to which, from the very beginning of the occupation of the Philippines, a great number of our people have been subjected. . . .

The practice, for instance, of slapping Filipinos in the face, of tying them to posts, of making them kneel in public, in the heat of the sun, and then beating them up—this upon the slightest fault, mistake or provocation, or without any other reason than failure to understand each other's language, is certain to create resentment on the part not only of the victim but also of the members of his family, his friends, and the general public. Even more serious is the practice of inflicting cruel, unusual and excessive punishment upon persons arrested on mere suspicion, during their investigation and before their guilt has been established. There have been even cases wherein, because of overcrowding in public places, such as street-cars, some Japanese, military or civilians who were inadvertently jostled or pushed, immediately slapped or beat the persons they thought guilty of pushing them.

Thousands of cases have been reported of people being either burned alive, killed at the point of the bayonet, beheaded, beaten without mercy, or otherwise subjected to various methods of physical torture, without mercy, or otherwise subjected to various methods of physical torture,

without distinction as to age or sex. Women and children below fifteen years are known to have been among those who were victims of such punishment. On many occasions, these killings and punishments were purposely done in public. In my home town, Tiaong, Tayabas, over one hundred were summarily executed during the “zonification” of the people there shortly before the inauguration of the Republic. The same thing was done in Lopez, Tayabas, where not less than this number of people were put to death as recently as March 1944, upon no evidence but the identification by a secret informer. The cases of these municipalities are merely cited as typical instances of what are common occurrences in other municipalities all over the islands. The unfortunate thing about all this is that in many cases the victims are really innocent of any crime but are punished merely upon suspicion or false denunciation by informers who harbor some private or personal grudge against them, or if they are guilty at all, do not deserve the excessive penalties inflicted upon them. Many have no fault at all except the fact that they have sons or brothers who are members of the “guerrilla” bands, or that they have given food to the latter, under threat of death or physical injuries. If they are released maimed, crippled, or sick they lament, and naturally the feeling is shared by their families and friends and by those who have knowledge of such things.

Many also are the cases wherein people have been arrested, taken for questioning, and then disappeared completely. No information is ever given to their relatives as to their whereabouts and the nature of the charges against them. While the Philippine Government justifiably feels that it has a right to intervene and ought to intervene in matters which involve the lives and welfare of its citizens, it has not even gone to that extent but has merely tried to help the people who come to it for assistance in securing information concerning those whose disappearance has been reported after having been arrested by the Japanese authorities. In many cases, however, no information whatever concerning their whereabouts or the nature of the charges against them could be obtained.

The proclamation of the independence of the Philippines and the establishment of the Government of the Republic have not minimized these occurrences. They used to be done before but they have continued and continue to be done now. Most of the towns in the provinces are still actually governed by the commanders of the local Japanese garrisons, who are in the majority of cases with only the rank of Sergeant, and who treat the municipal mayors as their subordinates even to the extent of beating them publicly, and who continue to arrest and punish people without advising either the local civil authorities or the national government. The only sign of independence is the display of the Filipino flag. Even Japanese civilians consider themselves above Philippine laws,

and Filipinos working in Japanese companies are sometimes punished summarily by their employers instead of being turned over to the appropriate Philippine authorities.

Another matter that needs to be mentioned is the practice of exacting collective responsibility for individual acts. If a “guerrilla” happens, for instance, to ride in a *carretella* [cart] with other peace-loving and law-abiding citizens who are completely unaware of the former’s identity, and that “guerrilla” is arrested, all those who, by pure accident, are riding with him are also arrested, and punished in the same way. Or when a “guerrilla” is discovered and arrested in one of the small roadside eating places (*carinderia*) in the provinces, the owner of the place and all those who happen to be eating there at the time are also arrested and punished. Similarly, entire barrios and municipalities have been placed in concentration and made to suffer for the acts of one or a few of the inhabitants there or because some “guerrillas” happened to pass by there and to exact food or other commodities of the innocent folk, who found themselves helpless because of the physical threats or coercion employed. Oftentimes there is no distinction between innocent and guilty, between old and young, or between strong and weak, to such an extent that there have been instances where women and children below fifteen have died as a result of the concentration, excessive punishments and outright executions. In fact, the innocent are usually the only ones who suffer, because the culprits manage to get out or otherwise escape punishment. . . .

One other thing which constitutes a source of mounting dissatisfaction among the people, particularly in the City of Manila, is the fact that many of them have been and are being ordered to evacuate their homes so that the same may be occupied by personnel of the Imperial Japanese Army and Navy. While in the beginning the needs of the Army and Navy for accommodations were attended to with dispatch and with as little inconvenience as possible to the house owners and tenants, the situation has come to such a point that it is no longer possible to do so without actually driving them out into the streets, with no place where they could be sheltered. . . .

The incidents and practices which I have described are the cause of constant requests for assistance received by the Philippine Government from the people concerned, and in making representations in their behalf to the Japanese authorities, the Ministry of Foreign Affairs finds itself in the strange role of an embassy trying, none too successfully, to protect its nationals in the foreign country to which it is accredited.

It is for the foregoing reasons that many Filipinos seem to have but little faith in their government today. They doubt the reality of their country’s independence. They consider it hardly anything more than display of the Filipino flag, since independence has not minimized the rigors of military rule, particularly in the provinces. Even in Manila the people

believe that independence has meaning only for those in the high council of the government, but none for the ordinary citizen. It becomes, therefore, an increasingly difficult task for the Filipino leaders to convince their people of the noble intentions of Japan in waging the present war and of the sincerity of the pronouncements of Japanese leaders that Japan came to the Philippines not as conqueror but as liberator. It is difficult for many Filipinos to conceive of Japan as it really is—as a nation with a high culture and advanced civilization—because not having been to Japan and not knowing enough of its history, literature or the spirit of its people, they have nothing on which to formulate their opinions except what they actually see and experience in the Philippines; the treatment that they receive at the hands of some Japanese, the injuries that they suffer, the personal indignities to which they are subjected, the inability of their Government to accord them adequate protection and consequent embarrassment which the Republic has to suffer. . . .

The existence of “guerrilla” elements or of outright banditry, particularly in the provinces, is not principally due to any fundamental political motive. It is doubtful whether those who are engaged in such activities are pro-American by conviction. In the first place, they have no real understanding of the basic issues involved in the present war between the United States and Japan. Nor do they feel any real attachment to the Americans with whom they never really mixed well, socially or otherwise. The main reason why many of them have turned “guerrillas” and bandits is not the desire that America should win the war, but simply because of the cruel treatment that they or their relatives, friends and countrymen had received at the hands of the Japanese and their fear that if they go out of hiding and live normal lives, they will be punished or put to death. . . .

Hundreds of cases where Filipinos were the victims of these practices have come to the attention of the Ministry of Foreign Affairs. Needless to say, many hundreds more and even thousands of similar cases have never been reported to the Philippine authorities either because the aggrieved parties were afraid of reprisals or because they thought it impossible to obtain any redress or satisfaction and, therefore, have preferred to suffer in silence. But they are matters of common knowledge and the subject of daily talks among the people.

Where innocent and law-abiding private citizens are involved the prestige of the Philippine Government suffers from the fact that these persons, their relatives and friends are thereafter convinced that this Government has neither power nor courage to intervene in behalf of its citizens. Cases involving government officials and employees are even more significant because the maltreatment of our government officials constitutes, in the eyes at least of our people, a serious reflection on the prestige and authority of the Government itself. How, in these circumstances, can we demand that our

people respect and have confidence in the Government of the Republic when they see that the only authorized representatives of this Government receive such scant consideration on the part of certain Japanese elements in the Philippines? Is it not natural for a great portion of our people to believe that this Government is only a puppet, having no independent authority of its own, seeing that it is often subject to dictation or now violent interference by the Japanese authorities?

Cases of this nature become all the more serious when they involve the arrest of high ranking authorities of the Government. Without going to the extent of claiming that such officials should be exempt from the operation of military law, it seems reasonable to propose that the arrest of all such officials be done only with the knowledge and consent of the President of the Republic of the Philippines. . . .

In calling attention to these matters, there is no intention to ignore the generous and understanding attitude which the high officials of the Imperial Japanese Army and Navy in the Philippines have consistently shown towards the Filipino people, towards their leaders, in particular. This attitude has even been marked by the utmost sympathy and consideration expressed in many concrete acts of encouragement and support in all that the government had tried and is trying to do in order to establish the Republic upon a stable and enduring foundation. In particular, Your Excellency has been instrumental in conveying effectively to the Filipinos the liberal and magnanimous policies of the Japanese Government and in interpreting to our people the high-minded principles repeatedly enunciated by Premier Hideki Tojo as constituting the basis for the establishment of the Greater East Asia Co-Prosperity Sphere. In your relations with the Filipino leaders before and since the establishment of the Republic, you have observed the most exemplary and statesmanlike conduct and have thereby won the respect and gratitude of us all who have the privilege of coming in contact with you.

On the other hand, His Excellency, the President of the Republic of the Philippines, has been equally assiduous in bringing home to the Filipino people the generous purposes of Japan in the Philippines. He has staked his political fortune and even his life in the establishment of an independent Philippines as a proud and self-respecting member of the Co-Prosperity Sphere. He has called upon his people to do their part in the establishment of the Sphere upon the enduring foundations of peace, reciprocity, and moral justice. He has tried by precept and by example to imbue the young Republic of the Philippines with the prestige and dignity befitting it as a sovereign state. Your Excellency is personally aware of the President's sincere and tireless efforts in this direction, and if I mention them now, it is only to emphasize the fact that there is an inexhaustible fountain of generous sentiments on both sides to warrant an increase in mutual sympathy and understanding.

Yet precisely because there exists such an abundance of genuine goodwill in the high councils of the Japanese Government and of the Government of the Republic, one is constrained to regret very deeply the present unsatisfactory relations between the Filipinos and the Japanese in the Philippines. Without attempting to relieve my own people of their share of the responsibility for this state of affairs, I think it only just to explain that the situation is partly due to the fact that the liberal policies of the Japanese Government have not percolated to the rank and file of the Japanese soldiers and civilians in the Philippines. While the highest officials here and in Tokyo have always treated us with the utmost tact and consideration, the conduct of those in the lower ranks leaves much to be desired. Unfortunately, it is the day-to-day relationships between the Filipino masses on the one hand, and the Japanese soldiers and civilians on the other that, in general, determine the degree of Filipino-Japanese collaboration and sympathy.

This is not to ignore the fact that the exigencies of military operations and the problems of men required by such operations do not always permit smooth relations and flawless conduct. Breaches of discipline are bound to occur. Neither do I ignore the sincere efforts of the Japanese authorities to apprehend and punish those elements whose misconduct has caused disaffection among our people. But I believe, and I think you will agree with me, that there is plenty of room for improvement on the part of both sides, and that the occasions of friction between them could be further minimized.

In view of the impending developments in the war situation, it is especially important to bring about more harmonious relations between Filipinos and Japanese and to arouse Filipino loyalty to the Republic. The problem briefly stated is this: How are we to prepare the Filipino people, mentally and spiritually, to assume their obligations under the Philippine-Japan Pact of Alliance in the event that they should be called to live up to its terms as demanded by the circumstances foreseen in the pact?

The question suggests its own remedy. Under the terms of the Pact of Alliance, the Filipino people are called upon to render the closest possible economic, political and military collaboration with Japan for the purpose of safeguarding the territorial integrity and independence of the Republic. As far as the resources of the nation is [sic] concerned these have been placed entirely at the disposal of the Japanese Government. But in order to create a united and resolute attitude among the Filipinos in support of the pact, it is necessary to convince and persuade them that they have a country to defend and an independence to safeguard. They must be made to feel that this country belongs to them, that they are master in their own land, that the independence which they have proclaimed and which Japan has recognized is real and authentic. For how, otherwise, would it be possible to induce

the Filipino people, or any people for that matter, to defend a country that they may not call their own or to safeguard an independence that does not exist?

In other words, the Filipino must be given a real stake in the war. He must be given something concrete to fight for—his land, his honor, his freedom and independence—something that will invest with living substance such high principles as Asia for the Asians or such large ideals as the establishment of the Co-Prosperity Sphere.

5.b. Jews and the Holocaust

5.b.1 American Exclusion of Jewish Refugees

Jewish Immigration to the United States

In 1933, Adolf Hitler, head of the National Socialist (Nazi) Party, became German chancellor. For over a decade, he had called publicly for the elimination of Jews from German life, claiming that they were racially inferior, socialist in sympathy, and part of an international conspiracy that sought to undermine German national power. As soon as the Nazis took office, they began to expel Jews from all government

positions, including the civil service and university teaching jobs. In September 1935, Hitler passed the notorious Nuremberg Laws, which classified Jews as subjects rather than citizens, defined Jews according to ancestry (three or four Jewish grandparents made one a Jew, except in special cases), and forbade marriage or sexual relations between Jews and non-Jews. Germany was to be an “Aryan” state, the pseudoscientific term used to define white Caucasians of non-Slav and non-Jewish origin. All Jews were subject to increasing persecution, banned from owning major businesses or employing “Aryans,” and targets for gratuitous everyday violence and humiliation. In 1938, after the Anschluss, the German annexation of Austria, persecution of Jews accelerated dramatically, as Austrian Jews were subjected to the same restrictions as their German peers and violence against German Jews rose to a climax in the November 1938 Kristallnacht (the night of broken glass), when Jewish businesses throughout the country were attacked and destroyed, synagogues burnt down, 91 Jews murdered and many others attacked, 30,000 arrested, and an additional 30,000 sent to concentration camps.

For most of the 1930s, a steady stream of Jews had left Germany for other countries, France, Britain, the United States, and South America. According to Nazi calculations, between 1933 and October 1941, almost 550,000 Jews emigrated legally from Germany, Austria, and the former Czechoslovakia. The Nazi authorities normally confiscated their possessions, and, unless they had overseas assets or wealthy relatives, they had to make a fresh start. In 1933, the League of Nations established the Office of the High Commissioner for Refugees from Germany, whose first incumbent, James G. McDonald, resigned in December 1935, accusing League member states of heartless disinterest in the plight of German Jews. After Kristallnacht, even many who had previously been reluctant to abandon everything sought to leave, or at least to send their children to safety overseas. In all countries, they encountered obstacles to immigration, as few were willing to sanction any large increases in their Jewish population. Indeed, prominent British and American Jews tried to devise schemes to settle the majority of German, Austrian, and other Jews who wished to leave the European continent outside their own countries, in Africa or Latin America, for example. Even so, during the 1930s, many thousands succeeded in leaving the European continent for Britain and, even more, the United States and Canada. Some came in as regular immigrants, others on temporary visas. At the time of Kristallnacht, between 12,000 and 15,000 Jewish refugees were already in the United States on visitor visas, and they were allowed to stay, as President Franklin D. Roosevelt expressed shock and horror over the pogrom and established the President’s Advisory Committee on Political Refugees, headed by McDonald.

Even after Kristallnacht, few countries, however, wished to relax what were often fairly rigid immigration procedures,

and the United States was no exception. At least part of the reluctance to admit Jews was due to the pervasive anti-Semitism prevalent not just throughout Europe but also in the United States, where even seemingly enlightened men and women felt little embarrassment in expressing blatantly anti-Semitic attitudes, and Jews faced a range of quiet social discrimination. Since the early twentieth century, many Americans had strongly supported immigration restriction, and in 1924, Congress passed legislation imposing separate national quotas on immigration from every other country to the United States. The quota for Germany was quite generous, and during the 1930s, substantial numbers of German Jewish refugees entered the United States, usually those who were relatively well educated and well off or had sponsors in the United States who were prepared to support them.

Congress, however, was hostile to relaxing the rules on immigration any further; indeed, the Roosevelt administration feared that it might impose tighter constraints. In 1939, a bill that would have permitted thousands of unaccompanied Jewish children to enter the United States died in committee, though the following year, several thousand—normally non-Jewish—British children whose parents sent them to the United States to escape the dangers of war were admitted with little difficulty.

As war began in Europe in September 1939, the Roosevelt administration and the State Department feared that any major influx of Jewish refugees would cause Congress to pass new immigration legislation considerably more restrictive than the 1924 act, whose constraints might prevent the government admitting selected European Jewish and non-Jewish refugees, mostly intellectuals and political leaders, whose entrance they sought to facilitate. Supposedly seeking to placate political opponents of Jewish immigration, Breckinridge Long, head of the State Department’s Visa Office from early 1940 until 1944, ordered American consular officials overseas to interpret the existing visa regulations in such a manner as routinely to block the entry of most Jewish—and many non-Jewish—refugees to the United States. From 1940 onward, only those who had particularly effective connections were likely to be admitted. Over time, the restrictions were tightened further, as any with German, Russian, or Italian relatives were subjected to stringent security tests supposed to weed out potential fifth columnists and espionage agents. Throughout the war, 90 percent of the German and Italian immigration quotas to the United States were left unfilled, a total of 190,000 places that might have been available to refugees from those countries.

About the Author

Breckinridge Long, assistant secretary of state in charge of the visa division for four years from 1940, was an affluent Missouri Democrat and aspiring politician, who had ambitions

to be a diplomat if he could not win elective office. Substantial campaign contributions smoothed his path. From 1917 to 1920, he was third assistant of secretary of state, and after making large donations to Roosevelt's 1932 presidential campaign, he became ambassador to Italy for three years, where many accused him of being too sympathetic to Benito Mussolini's Fascist regime. Long rejoined the State Department in 1940 and took over the Immigrant Visa Section. His assumption of this position undoubtedly coincided with a marked decline in Jewish immigration to the United States, even though American consulates overseas were almost besieged by desperate refugees seeking to escape. Whatever the political constraints on the Roosevelt administration, the conservative and personally anti-Semitic Long undoubtedly exercised his authority with an enthusiasm that facilitated the deaths of many refugees who might otherwise have escaped. Under Long's direction, in 1943, the State Department even blocked a plan Roosevelt supported to admit thousands of French and Rumanian Jews, whom the Germans planned to deport and send to the gas chambers. Assailed by complaints against Long, especially from the highly influential Henry Morgenthau Jr., a close Jewish friend and his secretary of the treasury, in January 1944, Roosevelt removed all responsibility for refugee problems from the State Department and established the War Refugee Board to take over the matter.

About the Documents

The two documents here differ greatly in tone but are in some ways comparable, inasmuch as they are both confidential internal memoranda discussing the policies of an organization and not intended for publication. Both, therefore, are quite frank. Long sent the first memorandum to two of his State Department colleagues, Assistant Secretary of State for Latin American Affairs Adolf A. Berle, who was also in charge of security issues, and Assistant Secretary of State for European Affairs James C. Dunn. The second, from Margaret E. Jones, a Vienna representative of the American Friends Service Committee, a Quaker group that since the mid-1930s, had worked closely with European refugees, to Clarence E. Pickett, head of that organization, detailed the impact of the new restrictive interpretation of the regulations. It also described a meeting with Long's assistant Alva Warren, who had drafted the revised instructions on the enforcement of existing visa regulations, and in July 1940, began a four-month tour of American diplomatic missions to explain to their personnel how the regulations should be implemented.

The first document sets out in some detail the future administration of U.S. visa policies. The State Department itself would decide on nonimmigrant visas, very few of which would be issued in the future, and would quietly deny admission to certain individuals and nationalities. Immigrant visas were to be blocked for some indefinite period by instructing

consular officials to "put every obstacle in the way" and raising administrative difficulties. The intention was clearly to deny entrance to as many individuals as possible. The tone of the memorandum was businesslike and unemotional; denying potential immigrants access to the United States was treated purely as an administrative problem, with no reference to the likely effects these new practices would have upon the individuals affected. The State Department's major preoccupation was that the policy not be applied in a way that might seem openly discriminatory and so provoke diplomatic difficulties and possible retaliation from Germany, Russia, or other nations.

The second document, sent by the representative of the American Friends Service Committee in Vienna to the American-based head of that organization, set out the impact of the new policies after they had been in place for around four months. The tone was far more personal, as she provided an unsparring description of the probable consequences to the refugees themselves. Jones also gave an outsider's view of the explanations provided by State Department officials, especially Warren, whom she met personally in August 1940. In the mid-1930s, the American Friends began extensive refugee work in Europe, doing what they could to help refugees, who often had little or no money or other resources, through their immediate difficulties and also to facilitate their emigration to another country. In 1947, the Friends received the Nobel Peace Prize in recognition of these and numerous other humanitarian efforts to alleviate refugees' suffering during the 1930s and 1940s. In both Vienna and Berlin, the Friends enjoyed good relations with officials at the American consulates, who were willing to discuss refugee issues fairly frankly with them. Jones' account of Warren's remarks to her suggests that, even though he corrected himself and said that all "aliens," not just "non-Aryans," that is, Jews, would be denied visas in the future, the new procedures were targeted primarily at Jews. Presenting the policy to outsiders, Warren also invoked the president's authority as its ultimate source, though this was almost certainly not true. He also suggested that priority should be given to refugees from England and Shanghai, rather than German Jews.

Jones was clearly unhappy with this switch in policy, though German mail censorship policies meant that she did not write to inform Pickett of it until she visited neutral Geneva in September. Two months later, she sent him this memorandum describing the human impact in the interim. Because the State Department was reluctant to publicize its new policy, which if known, might have generated uncomfortable protests and remonstrations, American consuls were instructed not to tell would-be immigrants at the outset that their case was hopeless but simply to drag out their applications indefinitely by repeatedly requesting additional documentation and information, putting them to considerable

trouble and expense. Jones rightly but unavailingly argued it was morally wrong “to let these tragic people go on hoping” and “that if the U.S. wants to make a new ruling due to the war, etc., that it must make it openly and give the reasons.” She also suggested that “the normal visa program for the applicants in Germany” should be restored.

Jones’ criticisms were all well-founded but also entirely ineffective. Despite protests from the American Friends Service Committee, over the next three years, the State Department would tighten still further its administration of the visa system, deliberately using bureaucratic mechanisms to exclude Jewish refugees from the United States. Her memorandum showed an appreciation of the human consequences of the State Department’s new policies, to which those who devised them remained at best entirely indifferent, and which they may even have welcomed.

A) Assistant Secretary of State Breckinridge Long, Memorandum to State Department Officials Adolf A. Berle and James Dunn, 26 June 1940

Attached is a memorandum from [Long’s assistant] Mr. [Avra] Warren. I discussed the matter with him on the basis of this memorandum. There are two possibilities and I will discuss each category briefly.

NON-IMMIGRANTS

Their entry into the United States can be made to depend upon prior authorization by the Department [of State]. This would mean that the consuls would be divested of discretion and that all requests for nonimmigrant visas (temporary visitor and transit visas) be passed upon here. It is quite feasible and can be done instantly. It will permit the Department to effectively control the immigration of persons in this category and private instructions can be given the Visa Division as to nationalities which should not be admitted as well as to individuals who are to be excluded.

This must be done for universal application and could not be done as regards Germany, for instance, or Russia, for instance, or any other one government because it would first, invite retaliation and second, would probably be a violation of some of our treaty arrangements. The retaliation clause is in connection with Germany because it could mean the closing of our offices in almost all of Europe.

IMMIGRANTS

We can delay and effectively stop for a temporary period of indefinite length the number of immigrants into the United States. We could do this by simply advising our consuls, to put every obstacle in the way and to require additional evidence and to resort to various administrative devices which

would postpone and postpone and postpone the granting of the visas. However, this could only be temporary. In order to make it more definite it would have to be done by suspension of the rules under the law by the issuance of a proclamation of emergency—which I take it we are not yet ready to proclaim.

SUMMING UP

We can effectively control non-immigrants by prohibiting the issuance of visas unless the consent of the Department to obtained in advance for universal application.

We can temporarily prevent the number of immigrants from certain localities such as Cuba, Mexico and other places of origin of German intending immigrants by simply raising administrative obstacles.

The Department will be prepared to take these two steps immediately upon the decision but emphasis must be placed on the fact that discrimination must not be practiced and with the additional thought that in case a suspension of the regulations should be proclaimed under the need of an emergency, it would be universally applicable and would affect refugees from England.

The Canadian situation and travel across that border we can handle through an exception to the general rule and so advise our consuls in Canada.

B) Margaret E. Jones, Memorandum to Clarence E. Pickett [exact date not given, but early November 1940]

RE,—VISA SITUATION IN VIENNA

Because I am deeply disturbed over present visa difficulties in Vienna, I want thee to have this memorandum for thy information.

Last July, en route from Geneva back to the Vienna Center, I stopped in Zurich and had an interview with Mr. Strom, at the U.S. Consulate. He told me of recent orders from Washington which would severely limit the number of visas ordinarily issued month by month from the various Consulates. I asked him if this was an attempt on the part of the State Department to offset any move by Congress to stop immigration entirely. Mr. Strom at once asked me with whom I had been talking to get that impression, and then said that he “did not think it was.” Later in Vienna, Mr. Hohenthal told me too

about the new stringent regulations, and was also obviously interested when I raised the same question with him. About the middle of August, the Consulate—always, as I have repeatedly said, working most cooperatively and sympathetically with me and the Quaker Center—telephoned to say that Mr. Warren of the State Dept. was visiting and wished to meet with me. Mr. Warren, Mr. Morris and Mr. Hohenthal and I talked that afternoon about the new regulations concerning emigration. Mr. Warren began by saying, “Miss Jones, you Quakers will be doing a straight relief job for the non-Aryans here from now on.” I said, “No more non-Aryans to go to the U.S.?” Warren replied—“Not just non-Aryans—but no more aliens.” Then I asked him the same question—was this an attempt to forestall Congress and prevent an out and out closing of immigration by making so severe a cut that the State Dept. could assure Congress they had the situation in hand. Mr. Warren said not Congress, but the President just did not want any more aliens coming to the U.S. and would like to have it closed especially for aliens coming from Germany. The State Dept. asked to be allowed to taper it all off gradually, and he, Warren, was touring Europe as far east as Moscow to check up with the consulates and to make plans accordingly. He explained it somewhat casually—increasing anti-Semitism in the U.S.; some refugees had already been traced to 5th column activities; the need to give visas to England and so forth. He told me that during July, 4000 visas had been granted to England,—many to English people, and many to German refugees in England, and he said that he also hoped additional visas would be granted to Shanghai, to help the refugee situation there. He told me Stuttgart had only given 3 visas during July. Vienna had issued that month about 100, but the number would be greatly reduced. I asked him what the State Dept. planned to do about reuniting families, and also about children. Warren implied that they would carefully consider cases where reuniting families was an issue, and that surely some children would be allowed to emigrate from Germany. But his whole idea was that emigration for German Jews coming from Germany was practically finished.

Thee may recall that as soon as I got to Geneva, in September, on my way home from Vienna, I wrote about this and indicated just how awful it was, because the Consulate kept encouraging people to do everything required of them, and then at the final interview decided the person would “become a public charge” and therefore could not get a visa. I now know that about 3 or 4 visas are issued each week, and that supposedly with each, the Consulate evaluates the candidate according to Mr. Warren’s instructions, “What outstanding contributions can he make to the U.S.A.?” No one can imagine what trouble the men and women must go through to finally get to the Consulate for the last interview—all sorts of severe local requirements must be met before permission to leave is given by the Nazi authorities. Each step takes weeks,

and also Marks. (This entirely apart from the heartbreaking anxiety over affidavits and steamship tickets.) With every thing in order, the candidate learns now from the Consulate that he must have a new certificate notarized (20 to 40 Marks) indicating that at least two friends can vouch that he is an upright man and not engaged in espionage activities. This in addition to the usual Police certificate, which would be sufficient. (I should think the Consulate would know, if they suspect every applicant for a visa as a potential spy, that the applicants could get anyone to sign such a statement if they wanted to do so.) Furthermore, the candidate for the visa in his final interview faces a board of Consuls, who ask questions (I was told in the Consulate in Vienna that this questioning HAD to last 40 minutes and that often the two men doing the questioning just couldn’t fill in the time!) and a stenographer takes down the answers in short hand. Now very few non-Aryans in Germany entirely trust the German members of the U.S. Consular staff, and to reply to questioning in a way which would damn the Nazi government, and to know that those replies are being taken down by a German, naturally terrifies the applicant. On the other hand, if he doesn’t say what he thinks about the Nazi gov’t, he feels that the U.S. Consuls will judge him potential 5th Column material and refuse the visa accordingly.

Perhaps I feel too strongly about this—but I know only too well what the life of the Jew in Vienna is today. I know of the terror and despair, and of the unbelievable difficulties each man and woman endures, and tries to solve, in connection with obtaining the U.S. visa. I want to say again that the Vienna Consulate has on its Visa Division staff men of ability and sympathy, who work as much as possible with the individual in mind, but they can only do what the U. S. immigration law permits. (I cannot endorse the physician at the Consulate, but his attitude is subject for another memorandum!) But it seems to me that if the U.S. wants to make a new ruling due to the war, etc., that it must make it openly and give the reasons. We cannot continue to let these tragic people go on hoping that if they comply with every requirement, if they get all the special documents required (Marks are increasingly needed by the Jews just to live), if they nerve themselves for the final interview at the Consulate, they may just possibly be the lucky ones to get visas when we know that practically no one is granted visas in Germany today. As thee knows, the whole question of affidavits is involved—irrevocable trust funds as required by the Consulate—we can’t go out to individuals in this country for this basic cooperation when we know that regardless of what we or the applicant does, he is not going to get the visa.

Thee understands that this is a confidential report for thee to have as background. I do hope that the question can be given very careful study, and a decision reached which will in some measure allay the mental suffering of so many per-

sons. We could alleviate a lot of the mental suffering, of course, by restoring the normal visa program for the applicants in Germany.

Naturally I am fully aware of the almost insuperable difficulties of travel from Germany. Greece is now closed to those who would have attempted to go via that country through the Mediterranean to Lisbon. Spain now refuses a transit visa to anyone with a “J” [for Jew] on his passport. The route via Siberia and Japan is the only one open, and it offers tremendous difficulties. But our government should make its own position absolutely clear, and I do hope the several refugee committees can get this matter satisfactorily outlined.

5.b.2. The Final Solution: The Wannsee Protocol

The Wannsee Protocol and the Final Solution

From the time the Nazis took power in Germany in 1933, all Jews who fell under their authority were subjected to ever increasing persecution, designed to make their lives unbearable and if possible, to drive them out of Germany. Nazi ideology, as expressed in Führer Adolf Hitler’s testament of faith

Mein Kampf (1924), held that Jews—defined not simply as those of the Jewish faith but also nonpracticing individuals of Jewish ancestry—were *Untermenschen* (subhumans) who were genetically ineradicably inferior to those of Aryan (white Caucasian or Teutonic) blood. Indeed, according to this perspective all races, Slavs, Latins, Asians, Arabs, and Africans, were graded according to a hierarchy, with Aryans in the top rank, and Jews at the bottom, together with gypsies.

By the beginning of 1942, most German Jews had been driven out of Germany proper and those central European areas, especially Czechoslovakia and Austria, under German rule since the late 1930s. Those who could not emigrate or escape as refugees were first confined to Jewish ghetto areas of their own cities, and then shipped eastward, usually under dreadful conditions in cramped and overcrowded railroad cars, at the mercy of the weather and without sanitation, food, or water, and forced into camps or ghettos in other cities close to the main railway lines, such as Lodz and Warsaw. There, living conditions were usually cramped, sanitation poor, and food and heating scarce, and the inhabitants easily fell victim to cold, malnutrition, and disease; some, indeed, died on the journey there. In the east, Jews from rural areas were also forced into urban ghettos. From the mid-1930s onward, many Jewish men were sent to concentration camps, labor and punishment centers where many were worked to death. In autumn 1939, it was decreed that all Jewish men must perform compulsory labor. Given these conditions, there was a high mortality rate among the Jewish population, especially children, the elderly, and other vulnerable individuals.

Even so, many survived, and German conquests, especially in the east, greatly enhanced what the Nazi regime saw as its Jewish problem. About 3 million Jews lived in Poland, two-thirds in the area under German occupation and one-third in the portion first occupied by Soviet troops and then taken over by German forces in June 1941. The Soviet Union likewise had a substantial Jewish population, many residing in the Ukraine and other western areas first invaded by Germany. Other European countries, some of them allied with Germany; some, such as France, the Netherlands, Norway, and Denmark, under German occupation; others, notably Britain, German enemies, and various neutral states, all had substantial Jewish populations. According to German calculations, which in fact substantially overstated the size of surviving Jewish populations, in January 1942, there were still 11 million Jews in Europe, the greatest numbers in Poland (2.7 million) and Russia (5 million), almost 750,000 in Hungary, 432,000 in Rumania, 865,000 in France, 160,000 in the Netherlands, 165,000 in Denmark, 330,000 in England, and smaller but still sizeable Jewish communities in almost every other European country, including Turkey. All of them the Nazis intended to eradicate, a formidable undertaking, especially given that Germany was also waging a major war and

would have to divert at least some resources from the war effort to the implementation of this initiative.

Until early 1942, the Nazi regime relied on ad hoc measures, primarily mass killings and other brutal atrocities, to reduce the numbers of Jews in the east. One of the most dramatic of these was the two-day massacre of 33,000 Ukrainian Jews at Babi Yar ravine, near Kiev, over 28–29 September 1941, but throughout the area under German occupation, thousands of smaller-scale episodes occurred. Polish and Russian partisans who offered resistance to German occupation were treated equally harshly. By the end of 1941, between 500,000 and 1 million Jews had died. German leaders nonetheless felt that such uncoordinated measures had hardly dented the problem, and a more systematic strategic approach was essential. Shooting, the most common method of execution, was moreover somewhat inefficient, and subjected those who wielded the guns to some stress.

On 31 July 1941, *Obergruppenführer* Reinhard Heydrich, head of the *Reichssicherheitshauptamt* (RSHA), the major German security and police authority, obtained authority from Reichsmarshall Hermann Göring to devise and implement an overall “final solution” to the Jewish problem. Heydrich summoned a group of German ministers, civil servants, and security officials to a conference eventually held at scenic Wannsee House, near Berlin, in January 1942. Detailed minutes were kept of this meeting, written by SS Lieutenant Colonel Adolf Eichmann, head of the RSHA Jewish section. Able-bodied male and female Jews were to be evacuated east to labor camps, to be worked to death. Since, according to crude Darwinian logic, any who survived would be the fittest of their race and hence the nucleus of a future Jewish renaissance, they would “have to be treated accordingly,” ambiguous language that undoubtedly meant killed. Jews over 65 would be sent to a special old-age camp. The administrator of the “General Government,” i.e., German-occupied Poland, volunteered those Jews under his control as the first Jewish population scheduled for evacuation under this scheme.

The Wannsee Protocol was somewhat coy about the fate of those too young, too old, or too ill to work, or for other reasons considered expendable. In December 1941, one month before the Wannsee meeting took place, an extermination camp, modeled on those established for Germany’s earlier 1939–1941 euthanasia program for those adults and children defined as physically or mentally unfit to live, was set up at Chelmo, near Lodz. In the first half of 1942, three more began operations, at Belzec, Sobibor, and Treblinka, where over the next two years, much of Poland’s Jewish population was deported. Later that year, three huge labor camps and extermination centers, established in Polish territory, supplemented them: Majdanek, Auschwitz I (first established as a concentration camp in May 1940), and Auschwitz II or

Auschwitz-Birkenau. Existing concentration camps, such as that first established at Dachau, Bavaria, in 1933, were now equipped with additional extermination facilities, gas chambers—for some reason those at Dachau were never used, though numerous deaths nonetheless occurred there—and also mass crematoria for the disposal of bodies. Others, such as Buchenwald, served as staging camps for the death camps themselves. Between 1941 and 1945, about 6 million European Jews, between 100,000 and 200,000 gypsies, perhaps 100,000 Poles, and thousands of Soviet prisoners of war, communists, homosexuals, Jehovah’s Witnesses, criminals, and others considered socially undesirable were murdered. New arrivals were separated into those unfit or unable to work, who were killed immediately, usually in large gas chambers; and those considered sufficiently able-bodied to do useful labor. Not all were gassed: some were worked to death, often finally succumbing to starvation and illness, and some fell victim to the casual brutality of camp guards and work-party supervisors.

About the Document

The minutes of the Wannsee Conference are an official document, written to record the issues discussed and decisions reached at this particular meeting. It was a businesslike gathering, summoned to decide on how best to implement a “final solution” that would eventually eliminate all European Jews, even those in neutral or enemy countries who were presumably beyond the Nazi reach at that time. Perhaps the most chilling aspect is the degree to which all present took it for granted that the elimination of all European Jews was an entirely acceptable goal that none saw fit to question. The participants concentrated on “the practical execution of the final solution,” how best to attain their objective and implement those policies they had decided on, preferably without “alarming the population” in those territories affected, but all concurred in thinking it desirable. The closest one comes to any faint sign of a bad conscience are the references to Jewish deaths, with the slightly squeamish euphemism that, of those Jews assigned to forced labor, “doubtless a large portion will be eliminated by natural causes,” a tactful intimation that many would essentially be worked to death in conditions so abysmal as to guarantee a high mortality rate. In an even more mealy-mouthed circumlocution, any survivors would “have to be treated accordingly,” a remarkably oblique intimation that they would be executed.

Some revisionist historians on the far Right, most notably David Irving, have sought to use the Wannsee memorandum as evidence that in reality, the Nazis did not intend to murder Jews en masse but simply to use them as forced laborers, and this meeting bore no relation to the contemporaneous estab-

ishment of extermination camps, most though not all of whose clientele were Jews. Given those particular passages, however, and also the subsequent remark by the administrator of the General Government (formerly Poland) that most of the estimated 2.5 million Jews in his area, whom he wished to take priority under this scheme, were in any case unfit for work, this interpretation seems remarkably strained. So, too, does Irving's suggestion that German Führer Adolf Hitler remained unaware of the establishment and operations of labor and extermination camps and the factory-style mass murders that took place in them. Admittedly, no document bearing Hitler's signature and authorizing the final solution has been located to date, but it scarcely proves that he was ignorant of these activities. Given the authoritarian nature of the Nazi regime, with fierce competition and backstabbing the rule among the highest echelons, in which every politically prominent individual within that system was liable eagerly to inform Hitler of any instance in which a rival disregarded the Führer's authority, it is inconceivable that enterprises on this scale, involving numerous high officials, could for several years have been implemented without his knowledge.

TOP SECRET

Minutes of Meeting

This meeting of top German officials with responsibility for Jews under their control was held on 20 January 1942 at Berlin, am Grossen Wannsee No. 56/58. Those present included Gauleiter Dr. Meyer and Reichsamtleiter Dr. Leibbrandt of the Ministry for the Occupied Eastern territories; Dr. Stuckart, Secretary of State of the Ministry for the Interior; Secretary of State Neumann, Plenipotentiary for the Four Year Plan; Dr. Freisler, Secretary of State of the Ministry of Justice; Dr. Bühler, Secretary of State of the Office of the General Government; Dr. Luther, Under Secretary of State of the Foreign Office; SS-Oberführer Klopfer of the Party Chancellery; Ministerialdirektor Kritzinger of the Reich Chancellery; SS-Gruppenführer Hofmann of the Race and Settlement Main Office; SS-Gruppenführer Müller and SS-Obersturmbannführer Eichmann of the Reich Main Security Office; SS-Oberführer Dr. Schöngarth of the Security Police, Security Department, Commander of the Security Police, Security Department (SD) of the General Government; SS-Sturmbannführer Dr. Lange of the Security Police, Security Department, Commander of the Security Police and the Security Department for the General-District of Latvia, in his capacity as deputy to the Commander of the Security Police and the Security Department for the Reich Commissariat "Eastland."

II.

At the beginning of the discussion Chief of the Security Police and of the SD, SS-Obergruppenführer Heydrich, reported that the Reich Marshal [Hermann Göring] had appointed him delegate for the preparations for the final solution of the Jewish question in Europe and pointed out that this discussion had been called for the purpose of clarifying fundamental questions. The wish of the Reich Marshal to have a draft sent to him concerning organizational, factual and material interests in relation to the final solution of the Jewish question in Europe makes necessary an initial common action of all central offices immediately concerned with these questions in order to bring their general activities into line. The Reichsführer-SS [Heinrich Himmler] and the Chief of the German Police (Chief of the Security Police and the SD) [Reinhard Heydrich] was entrusted with the official central handling of the final solution of the Jewish question without regard to geographic borders. The Chief of the Security Police and the SD then gave a short report of the struggle which has been carried on thus far against this enemy, the essential points being the following:

- a) the expulsion of the Jews from every sphere of life of the German people,
- b) the expulsion of the Jews from the living space of the German people.

In carrying out these efforts, an increased and planned acceleration of the emigration of the Jews from Reich territory was started, as the only possible present solution.

By order of the Reich Marshal, a Reich Central Office for Jewish Emigration was set up in January 1939 and the Chief of the Security Police and SD was entrusted with the management. Its most important tasks were

- a) to make all necessary arrangements for the preparation for an increased emigration of the Jews,
- b) to direct the flow of emigration,
- c) to speed the procedure of emigration in each individual case.

The aim of all this was to cleanse German living space of Jews in a legal manner.

All the offices realized the drawbacks of such enforced accelerated emigration. For the time being they had, however, tolerated it on account of the lack of other possible solutions of the problem.

The work concerned with emigration was, later on, not only a German problem, but also a problem with which the authorities of the countries to which the flow of emigrants was being directed would have to deal. Financial difficulties, such as the demand by various foreign governments for increasing sums of money to be presented at the time of the landing, the lack of

shipping space, increasing restriction of entry permits, or the cancelling of such, increased extraordinarily the difficulties of emigration. In spite of these difficulties, 537,000 Jews were sent out of the country between the takeover of power and the deadline of 31 October 1941. Of these

approximately 360,000 were in Germany proper on 30 January 1933
 approximately 147,000 were in Austria (Ostmark) on 15 March 1939
 approximately 30,000 were in the Protectorate of Bohemia and Moravia on 15 March 1939.

The Jews themselves, or their Jewish political organizations, financed the emigration. In order to avoid impoverished Jews remaining behind, the principle was followed that wealthy Jews have to finance the emigration of poor Jews; this was arranged by imposing a suitable tax, i.e., an emigration tax, which was used for financial arrangements in connection with the emigration of poor Jews and was imposed according to income.

Apart from the necessary Reichsmark exchange, foreign currency had to be presented at the time of landing. In order to save foreign exchange held by Germany, the foreign Jewish financial organizations were—with the help of Jewish organizations in Germany—made responsible for arranging an adequate amount of foreign currency. Up to 30 October 1941, these foreign Jews donated a total of around 9,500,000 dollars.

In the meantime the Reichsführer-SS and Chief of the German Police had prohibited emigration of Jews due to the dangers of an emigration in wartime and due to the possibilities of the East.

III.

Another possible solution of the problem has now taken the place of emigration, i.e., the evacuation of the Jews to the East, provided that the Führer gives the appropriate approval in advance.

These actions are, however, only to be considered provisional, but practical experience is already being collected which is of the greatest importance in relation to the future final solution of the Jewish question.

Approximately 11 million Jews will be involved in the final solution of the European Jewish question, distributed as follows among the individual countries:

[The document proceeds to list the number of Jews living not only in states such as France, Hungary, and Rumania already currently under German occupation or control, but also in countries at war with Germany, including Britain and Russia, allied with it, such as Italy, sympathetic but neutral, such as Spain and Portugal, and simply neutral, including Ireland, Sweden, and Switzerland.] . . .

Under proper guidance, in the course of the final solution the Jews are to be allocated for appropriate labor in the East. Able-bodied Jews, separated according to sex, will be taken in large work columns to these areas for work on roads, in the course of which action doubtless a large portion will be eliminated by natural causes.

The possible final remnant will, since it will undoubtedly consist of the most resistant portion, have to be treated accordingly, because it is the product of natural selection and would, if released, act as the seed of a new Jewish revival (see the experience of history.)

In the course of the practical execution of the final solution, Europe will be combed through from west to east. Germany proper, including the Protectorate of Bohemia and Moravia, will have to be handled first due to the housing problem and additional social and political necessities.

The evacuated Jews will first be sent, group by group, to so-called transit ghettos, from which they will be transported to the East.

SS-Obergruppenführer Heydrich went on to say that an important prerequisite for the evacuation as such is the exact definition of the persons involved.

It is not intended to evacuate Jews over 65 years old, but to send them to an old-age ghetto—Theresienstadt is being considered for this purpose.

In addition to these age groups—of the approximately 280,000 Jews in Germany proper and Austria on 31 October 1941, approximately 30% are over 65 years old—severely wounded veterans and Jews with war decorations (Iron Cross I) will be accepted in the old-age ghettos. With this expedient solution, in one fell swoop many interventions will be prevented.

The beginning of the individual larger evacuation actions will largely depend on military developments. Regarding the handling of the final solution in those European countries occupied and influenced by us, it was proposed that the appropriate expert of the Foreign Office discuss the matter with the responsible official of the Security Police and SD.

In Slovakia and Croatia the matter is no longer so difficult, since the most substantial problems in this respect have already been brought near a solution. In Rumania the government has in the meantime also appointed a commissioner for Jewish affairs. In order to settle the question in Hungary, it will soon be necessary to force an adviser for Jewish questions onto the Hungarian government.

With regard to taking up preparations for dealing with the problem in Italy, SS-Obergruppenführer Heydrich considers it opportune to contact the chief of police with a view to these problems.

In occupied and unoccupied France, the registration of Jews for evacuation will in all probability proceed without great difficulty.

Under Secretary of State Luther calls attention in this matter to the fact that in some countries, such as the Scandinavian states, difficulties will arise if this problem is dealt with thoroughly and that it will therefore be advisable to defer actions in these countries. Besides, in view of the small numbers of Jews affected, this deferral will not cause any substantial limitation.

The Foreign Office sees no great difficulties for southeast and western Europe.

SS-Gruppenführer Hofmann plans to send an expert to Hungary from the Race and Settlement Main Office for general orientation at the time when the Chief of the Security Police and SD takes up the matter there. It was decided to assign this expert from the Race and Settlement Main Office, who will not work actively, as an assistant to the police attaché.

IV.

[Intermarriages between Jews and non-Jews could give rise to problems in precisely who qualified as a Jew, and here it was proposed to follow the guidelines given in the earlier Nuremberg Laws of the 1930s, though in many cases exceptions and exemptions for meritorious conduct or the reverse were at least theoretically possible, as were forced sterilization and the forced dissolution of mixed marriages.]

With regard to the issue of the effect of the evacuation of Jews on the economy, State Secretary Neumann stated that Jews who are working in industries vital to the war effort, provided that no replacements are available, cannot be evacuated.

SS-Obergruppenführer Heydrich indicated that these Jews would not be evacuated according to the rules he had approved for carrying out the evacuations then underway.

State Secretary Dr. Bühler stated that the General Government would welcome it if the final solution of this problem could be begun in the General Government, since on the one hand transportation does not play such a large role here nor would problems of labor supply hamper this action. Jews must be removed from the territory of the General Government as quickly as possible, since it is especially here that the Jew as an epidemic carrier represents an extreme danger and on the other hand he is causing permanent chaos in the economic structure of the country through continued black market dealings. Moreover, of the approximately 2 1/2 million Jews concerned, the majority is unfit for work.

State Secretary Dr. Bühler stated further that the solution to the Jewish question in the General Government is the responsibility of the Chief of the Security Police and the SD and that his efforts would be supported by the officials of the General Government. He had only one request, to solve the Jewish question in this area as quickly as possible.

In conclusion the different types of possible solutions were discussed, during which discussion both Gauleiter Dr.

Meyer and State Secretary Dr. Bühler took the position that certain preparatory activities for the final solution should be carried out immediately in the territories in question, in which process alarming the populace must be avoided.

The meeting was closed with the request of the Chief of the Security Police and the SD to the participants that they afford him appropriate support during the carrying out of the tasks involved in the solution.

5.b.3. The United States Refuses to Bomb Auschwitz, 1944

The Allies and the Refusal to Bomb Auschwitz

Of all the Nazi extermination camps, Auschwitz was the largest and was responsible for the greatest number of deaths. It was first established in 1940 in occupied Polish territory. Over the next four years, it expanded massively, until it comprised three main camps—Auschwitz I, Auschwitz II-Birkenau, and Auschwitz III-Monowitz—plus 40 subcamps. Auschwitz I, a forced labor camp, became notorious for the gruesome medical experiments on living human subjects that took place there, many of which were supervised by the fanatical physician Dr. Josef Mengele. Auschwitz II, constructed in late 1944, was primarily an extermination camp,

disposing of Jews (including most of the Hungarian Jewish population), Poles, gypsies, and Soviet prisoners of war. The gas chambers of Auschwitz II could kill up to 6,000 people daily. It is difficult to put a precise figure on the number of deaths that occurred there, but they eventually amounted to somewhere between 1.1 and 1.6 million. Auschwitz III began with a synthetic rubber plant, constructed by the German chemical company I. G. Farben, that extended over 40 square miles and employed slave labor. Other prisoners worked on farms, in coal mines, stone quarries, fisheries, and armaments factories. Many of the best-known Holocaust survivors, including Primo Levi and Elie Wiesel, were confined in Auschwitz. On 7 October 1944, several hundred prisoners destined for the gas chambers rebelled, assisted by explosives smuggled in by women working in an armaments factory nearby, but German guards eventually suppressed the revolt and killed almost all those involved. When Soviet troops liberated Auschwitz on 27 January 1945, most of the remaining prisoners had already been evacuated to Germany, sent on forced marches and freezing trains, which caused many additional deaths among them. Only 7,000 of the sickest inmates, many of them dying, were left in the camp.

Not until mid-1944, when Jewish organizations obtained credible eyewitness reports from two escapees, were the Allied governments presented with definite proof that Auschwitz was an extermination center as opposed to a mere work camp. At that time, 400,000 Hungarian Jews were undergoing evacuation there for subsequent extermination. In early summer 1944, Jewish organizations began to press the British and French governments to dispatch airplanes to bomb either the Auschwitz-Birkenau camp itself or the complex system of railway lines centered upon it in the hope that this would close the camp or at least disrupt its operation for some appreciable time. British premier Winston Churchill apparently favored the suggestion but recognized that U.S. bomber pilots were better placed than his own to undertake what would undoubtedly be a long and hazardous mission. Debate has raged ever since as to whether such operations were militarily feasible and if undertaken, whether they would have been effective. Some historians have argued that such bombing raids would have permanently closed the facility, even though the cost of such success might have been the lives of many of the Jewish inmates, and have suggested that those American officials who chose not to authorize such missions were insensitive or indifferent to the plight of European Jews. Others, including William D. Rubinstein and John Keegan, have forcefully riposted that all any such bombing missions would have accomplished would have been the temporary disruption of extermination operations and that, in the latter's words, "Auschwitz had the capacity to be a self-sustaining killing machine, until the site itself was captured by Allied forces" (Keegan 1996, 25–26), since the labor of the

prisoners themselves would have been used to repair any damage.

About the Author

The man to whom most requests for such action were addressed was John J. McCloy, then assistant secretary of war under the venerable Henry L. Stimson. He would later become one of the most senior "wise men" of the foreign policy Establishment, the group of prominent East Coast financiers and lawyers clustered around Stimson in particular, who believed that the United States must assume a major postwar international world role; who were among the leading Cold War architects; and who helped to devise and implement such major Cold War policies as the Truman Doctrine, promising that the United States would resist the international spread of communism, the Marshall Plan for European reconstruction, and the North Atlantic Treaty Organization defense pact. McCloy, a corporate lawyer by profession, who later became chairman of Chase Manhattan, subsequently served as U.S. high commissioner in occupied Germany, wielding the supreme authority in that country for several years, and took an active role in disarmament negotiations throughout the 1960s. During World War II, McCloy served as Stimson's troubleshooter and dealt with numerous sensitive matters on his behalf. Totally determined to concentrate on winning the war as expeditiously as possible, McCloy later attracted much public opprobrium for his crucial role in urging and supervising the wartime internment of Japanese Americans, a policy he continued to defend until his death.

Another matter on which McCloy was heavily criticized, especially by liberals and Jewish organizations, was what most believed to have been his central role in repeatedly turning down requests that American airpower be used to bomb Auschwitz, a subject on which Stimson apparently accepted his recommendations. On this issue, McCloy always justified his conduct on the grounds that he was simply carrying out the dictates of President Franklin D. Roosevelt, that U.S. military resources should only be employed on ventures that would directly assist in winning the war. It should be said in McCloy's defense that, quite apart from the questionable effectiveness of any such operation, he may well have still nurtured some doubts as to whether this was a genuine extermination facility or simply a glorified concentration camp. At that time, at least one close Jewish friend of his, Supreme Court Justice Felix Frankfurter, still doubted whether the worst reports of Auschwitz were genuinely credible or whether they had been exaggerated.

More than 40 years later, however, yet another twist to this tale emerged. On occasion, McCloy was criticized for not taking the matter to Roosevelt and letting him decide. For most of his life, until 1986 when he himself was 91, McCloy steadfastly denied having consulted the president. In a private

interview that year, however, which the historian Michael Beschloss recently made public, McCloy claimed that he had indeed taken the proposal to Roosevelt, who—without consulting his own top military advisers—came down against the idea. The president rejected it on the grounds that it would be both pointlessly provocative to the Hitler regime and ineffective, since the Nazis would only move their killing operations elsewhere, and the United States would be heavily criticized for bombing the innocent inmates of the camp. McCloy himself also thought that many of those Jews urging the operation were fanatical and unrealistic as to what it would accomplish. Having been sworn to confidentiality, for many years, McCloy apparently wished to preserve his trust; then, with his own death clearly not too far distant, he perhaps wished finally to set the record straight while he still had the chance. If this account, finally told by McCloy to the son of Treasury Secretary Henry Morgenthau Jr., one of his own strongest critics on the matter, was indeed true, then Roosevelt and no one else was ultimately responsible for this still controversial decision.

About the Document

This letter, signed by John J. McCloy and most probably drafted by one of his War Department aides for his correction, approval, and signature, is an official statement of War Department policy on the question of the bombing of Auschwitz. Undoubtedly cleared with Secretary of War Stimson, his immediate superior, and, as it now transpires, probably with the president himself, it was prepared in response to repeated requests by Jewish organizations that the United States should bomb Auschwitz. Despite his own expectation that, even if bombed, the railway lines leading to Auschwitz would be swiftly repaired, John W. Pehle, chairman of the War Refugee Board, first passed on such requests to McCloy early in July 1944, when they were rejected, and did so once more in November 1944. Brief and almost curt in style, McCloy's letter went straight to the point, listing the various military reasons why the War Department had rejected those appeals. It was designed to present the strongest possible case for turning down those demands and, if possible—though McCloy cannot have been optimistic on this—to preclude any further such petitions.

McCloy's letter made no mention of the views of President Roosevelt, who may well have been reluctant to take any political criticism from Jewish organizations on the subject. It concentrated entirely on the military feasibility and value of the proposed operation, citing the difficulties involved in any such raid that would have to take place without fighter cover, due to the distances involved, and would demand the employment of extremely risky tactics. McCloy argued that all American strategic airpower was already committed to the effort to destroy German industry, and aircraft, therefore, could not be spared for a raid on Auschwitz. It was subsequently pointed

out that in summer 1944, Allied airpower targeted German synthetic oil facilities in Silesia, including one raid on 20 August in which 127 Flying Fortresses attacked the factory area of Auschwitz III, less than 5 miles away from the extermination camps, and a second such operation three weeks later. If challenged, however, McCloy would no doubt have retorted that destroying Germany's synthetic oil capacity was a military objective and therefore worth the risks involved, whereas attacking the extermination camp was not.

All McCloy's statements were probably true, and even though historians are still arguing the case, there may indeed have been ample practical justification for this decision. Yet, letters signed by government officials sometimes contain soothing if platitudinous rhetoric, including emollient statements of sympathy, for example, even when a request is rejected. In this case, such anodyne efforts to avoid hurt feelings are notably lacking, perhaps an indication of just how irritating McCloy found these reiterated and, in his view, sentimental appeals for military action he himself believed would be ill-considered, ineffective, and counterproductive.

Primary Source

John J. McCloy, Assistant Secretary of War, to John W. Pehle, Director, War Refugee Board, 18 November 1944

I refer to your letter of November 8th, in which you forwarded the report of two eye-witnesses on the notorious German concentration and extermination camps of Auschwitz and Birkenau in Upper Silesia.

The Operation Staff of the War Department has given careful consideration to your suggestion that the bombing of these camps be undertaken. In consideration of this proposal the following points were brought out:

- a. Positive destruction of these camps would necessitate precision bombing, employing heavy or medium bombardment, or attack by low flying or dive bombing aircraft, preferably the latter.
- b. The target is beyond the maximum range of medium bombardment, dive bombers and fighter bombers located in United Kingdom, France or Italy.
- c. Use of heavy bombardment from United Kingdom bases would necessitate a hazardous round trip flight unescorted of approximately 2,000 miles over enemy territory.
- d. At the present critical stage of the war in Europe, our strategic air forces are engaged in the destruction of industrial target systems vital to the dwindling war potential of the enemy, from which they should not be diverted. The positive solution to this problem is the earliest possible victory over Germany, to which end we should exert our entire means.

- e. This case does not at all parallel the Amiens mission because of the location of the concentration and extermination camps and the resulting difficulties encountered in attempting to carry out the proposed bombing.

Based on the above, as well as the most uncertain, if not dangerous effect such a bombing would have on the object to be attained, the War Department has felt that it should not, at least for the present, undertake these operations.

I know that you have been reluctant to press this activity on the War Department. We have been pressed strongly from other quarters, however, and have taken the best military opinion on its feasibility, and we believe the above conclusion is a sound one.

5.b.4. Martha Gellhorn, “Dachau,” May 1945

Dachau Concentration Camp

Not all concentration and extermination camps were sited outside Germany proper, in Poland or other occupied territory. Dachau concentration camp was first established near Munich, Bavaria, in late March 1933, six weeks after Adolf

Hitler became German chancellor, as a place to incarcerate enemies of the regime. From the inception of their rule, the Nazis used systematic terror to enforce their authority and crush dissent of any kind. By 1 May 1933, Dachau already had 1,200 inmates, and by the end of that year, almost 5,000 prisoners had been registered. Between then and 29 April 1945, when invading American forces finally liberated the camp, a further 200,000 prisoners would be registered to the camp. This total did not, however, include numerous Soviet prisoners of war and civilians assigned to the camp for “special handling,” that is, summary execution, nor those who died on various death marches to Dachau and the final evacuation march away.

Dachau was initially a concentration camp where inmates were expected to work—a sign above the main gate stated “Arbeit Macht Frei” (work sets one free)—and death was incidental, due to starvation, illness, or casual brutality by the guards. However, in late 1940, it was equipped with gas chambers and crematoria, and additional such facilities were added in 1942. To date, no concrete proof exists that these chambers were used to kill humans, as opposed to fumigating bedding, clothing, equipment, and the like to eradicate typhus-bearing lice and other vermin. Whether or not gas was used, however, many thousands of prisoners died there, on occasion killed in what amounted to massacres, the numbers sometimes outstripping the capacity of the crematoria to cope with the bodies. Thirty thousand deaths were registered in the camp, some of these the result of horrific medical experiments on prisoners. It is believed that there were many more, with some estimates going well above 200,000. As Soviet and Western troops advanced onto German-held territory, many more prisoners were evacuated to Dachau, traveling either on packed freight trains or by foot in forced marches. Many died in transit, due to the appalling conditions, but even so, Dachau camp became seriously overcrowded, and in December 1944, a typhus epidemic killed thousands of prisoners. As Allied forces approached in late April 1945, many prisoners were then evacuated from Dachau, undertaking brutal forced marches that inflicted numerous additional deaths. Almost certainly, it will never be possible to reach an incontrovertibly accurate figure for Dachau-related deaths. When American troops finally reached the camp in the war's final years, they were horrified by the number of unburied corpses stacked in piles like firewood, and the appalling state of the remaining inmates, many of whom were close to death, with some dying after liberation.

Dachau was the first major German concentration camp liberated by Western forces. Despite growing rumors ever since 1944 that Germany ran extermination camps to dispose of Jews and other enemies of the Nazi regime, American and British military leaders were horrified by this concrete evidence of the scope and scale of the killing. During World War

I, allegations of German military atrocities, especially in Belgium, were widely circulated and later found to have been substantially exaggerated, something most Allied officials still remembered 30 years later. They had some excuse, therefore, for suspecting that similar World War II rumors might likewise incorporate heavy embroidery over a kernel of truth. When faced with incontrovertible evidence, even tough, battle-hardened soldiers were revolted. The American George S. Patton Jr., notoriously a fighting general who encouraged his men to kill their enemies and take no prisoners, was not notably squeamish, but he admitted that he found Dachau so distressing and repulsive a sight that he refused to subject himself to a full tour of the camp.

Many German civilians, even those who lived close to concentration camps, insisted that they had never suspected what activities might have taken place within their fences, a confession that suggests at least a certain willing ignorance on their part. Dwight D. Eisenhower, supreme Allied commander in Europe, insisted that Germans must be confronted with the proof of the nature of the regime they had supported. Civilians from Dachau and the surrounding area were taken on compulsory tours and forced to bury the numerous corpses still littering the camp. Seeking to ensure that these atrocities could never be dismissed as merely Allied propaganda, Eisenhower also made every effort to publicize them internationally, not just within Germany. Allied forces flew in numerous war correspondents, including the famed Ed Murrow, to report directly on Dachau concentration camp.

About the Author

The American-born Martha Gellhorn was one of the leading war correspondents of the twentieth century and a lifelong friend of the liberal Eleanor Roosevelt, wife of President Franklin D. Roosevelt and a major Democratic political figure in her own right. Gellhorn began working as a journalist in 1927 and moved to France in the early 1930s, where she joined the pacifist movement. In 1937, *Collier's Weekly* sent her to report on the Spanish Civil War, which she covered from Madrid, becoming a staunch and lifelong antifascist. As the European situation deteriorated in the late 1930s, Gellhorn reported for *Collier's* from Paris, Czechoslovakia, Finland, and Germany, covering the Anschluss, the Munich crisis and the German seizure of Czechoslovakia, and the early weeks of the Finnish-Soviet Winter War, where her reports helped to generate American public support for the Finns. During World War II, she also reported from Hong Kong, Burma, Singapore, and Britain and enlisted as a stretcherbearer on a hospital ship in order to witness the D day landings. She then accompanied the Allied forces throughout their 1944–1945 campaign against Germany, including the Battle of the Bulge. When World War II ended, Gellhorn switched to the *Atlantic Monthly*, covering every

major world conflict of the next 30 years, including the Vietnam War, the 1967 Six-Day Middle Eastern War, and various Central American insurgencies. Besides nonfiction works based on her journalism, she also wrote several novels and short stories. Gellhorn never lost her liberal sympathies: in later life, she continued to condemn the Franco regime in Spain, distrusted German professions that their country had conclusively repudiated the Nazi past, and opposed American intervention in Vietnam.

About the Document

Martha Gellhorn wrote this article immediately after visiting Dachau concentration and extermination camp in May 1945, a trip encouraged and facilitated by the U.S. Army, which flew Gellhorn and other journalists there. At that time, Gellhorn was an accredited war correspondent, employed by *Collier's Weekly*, a magazine that specialized in fairly lengthy pieces and enjoyed a wide circulation in the United States. Since it was published only once a week, the magazine's slightly more leisurely deadline permitted her to escape from the incessant demands of a daily newspaper, put more time into each piece, and reflect more deeply on what she wrote. Even so, since Gellhorn produced her article within a few days of visiting Dachau, it essentially represented her spontaneous reaction to the camp, unfiltered by long years of memory.

By 1945, Gellhorn was an experienced writer, whose article graphically and concisely depicted the assorted horrors of Dachau: the jam-packed trains, skeletal survivors, medical experiments, stacks of corpses, punishment cells, crematoria, stench, starvation, and everyday routine brutality. These have since become part of the collective memory of World War II, so familiar a part of its story that they are almost clichés, so that one often describes a person who is dreadfully thin as resembling a concentration camp victim. It is worth remembering, though, that they were new to Gellhorn's readers and even to Gellhorn herself. Instances of individual brutality and atrocities occur in every war. What was different in Nazi Germany was that for many years, methods generally used—if rarely quite so savagely—to manage groups of animals had been applied to punish, exploit, and destroy human beings and applied, moreover, with an inhumanity never before seen on that scale. (Prisoners in Soviet leader Josef Stalin's labor camps may well have been treated with great brutality, but at that time, no reporters were admitted to them, and even there, the chances of survival were appreciably higher.) Gellhorn's article was matter-of-fact in the way it described Dachau, but her own sense of shock came through as she herself stated that, despite the numerous horrors she had encountered in World War II and earlier conflicts, “nowhere was there anything like this.”

Did the fact that the U.S. Army sponsored and facilitated Gellhorn's trip to Dachau compromise the integrity of her writ-

ing? At that time, Germany, though just defeated, was still a war zone, and without some kind of official assistance, no war correspondent could move freely around Germany in pursuit of stories. Journalists attached to the armed forces were normally subject to official censorship when they covered the war, as were the news outlets that carried their stories. The Allied authorities undoubtedly encouraged extensive media reportage on Dachau and other concentration camps, since, although none of the Allies had entered the war primarily to rescue European Jews, Germany's state-sponsored mistreatment of them was additional justification for such Allied policies as their insistence on unconditional surrender and the extensive bombing of major German cities. Furthermore, though most Allied military and political leaders needed relatively strong stomachs to wage World War II, the incontrovertible revelation of the nature and scope of German atrocities nonetheless genuinely disgusted and appalled them. Although the Allied authorities unquestionably welcomed Gellhorn's article and similar pieces by other journalists, she was under no obligation to them to publish anything, though *Collier's*, who employed her, might well have been disappointed had she ignored Dachau, one of the war's bigger and most horrific stories. Nor in this case did the authorities feel any great need to manage the news or suggest what would now be called suitable "spin" on the concentration camps; such efforts would have been at best superfluous, at worst counterproductive. The unadulterated impact of a tour of Dachau and interviews with the pitiable survivors was more than sufficient, and media representatives could safely be left to draw their own chilling conclusions and write whatever they pleased.

Excerpts from "Dachau," included in *The Face of War* by Martha Gellhorn

Behind the barbed wire and the electric fence, the skeletons sat in the sun and searched themselves for lice. They have no age and no faces; they all look alike and like nothing you will ever see if you are lucky. We crossed the wide, crowded, dusty compound between the prison barracks and went to the hospital. In the hall sat more of the skeletons, and from them came the smell of disease and death. They watched us but did not move; no expressions show on a face that is only yellowish, stubbly skin, stretched across bone. What had been a man dragged himself into the doctor's office; he was a Pole and he was about six feet tall and he weighed less than a hundred pounds and he wore a striped prison shirt, a pair of unlaced boots, and a blanket which he tried to hold around his legs. His eyes were large and strange and stood out from his face, and his jawbone seemed to be cutting through his skin. He had come to Dachau from Buchenwald on the last death transport. There were fifty boxcars of his dead travelling companions still

on the siding outside the camp, and for the last three days the American Army had forced Dachau civilians to bury these dead. When the transport had arrived, the German guards locked the men, women and children in the boxcars and there they slowly died of hunger and thirst and suffocation. They screamed and they tried to fight their way out; from time to time, the guards fired into the cars to stop the noise.

This man had survived; he was found under a pile of dead. Now he stood on the bones that were his legs and talked and suddenly he wept. 'Everyone is dead,' he said, and the face that was not a face twisted with pain or sorrow or horror. 'No one is left. Everyone is dead. I cannot help myself. Here I am and I am finished and cannot help myself. Everyone is dead.'

The Polish doctor who had been a prisoner here for five years said, 'In four weeks, you will be a young man again. You will be fine.'

Perhaps his body will live and take strength, but one cannot believe that his eyes will ever be like other people's eyes.

The doctor spoke with great detachment about the things he had watched in this hospital. He had watched them and there was nothing he could do to stop them. The prisoners talked in the same way—quietly, with a strange little smile as if they apologized for talking of such loathsome things to someone who lived in a real world and could hardly be expected to understand Dachau.

'The Germans made here some unusual experiments,' the doctor said. 'They wished to see how long an aviator could go without oxygen, how high in the sky he could go. So they had a closed car from which they pumped the oxygen. It is a quick death,' he said. 'It does not take more than fifteen minutes, but it is a hard death. They killed not so many people, only eight hundred in that experiment. It was found that no one can live above thirty-six-thousand feet altitude without oxygen.'

'Whom did they choose for this experiment?' I asked.

'Any prisoner,' he said, 'so long as he was healthy. They picked the strongest. The mortality was one hundred per cent, of course.'

'It is very interesting, is it not?' said another Polish doctor.

We did not look at each other. I do not know how to explain it, but aside from the terrible anger you feel, you are ashamed. You are ashamed for mankind.

'There was also the experiment of the water,' said the first doctor. 'This was to see how long pilots could survive when they were shot down over water, like the Channel, let us say. For that, the German doctors put the prisoners in great vats and they stood in water up to their necks. It was found that the human body can resist for two and a half hours in water eight degrees below zero. They killed six hundred people in this experiment. Sometimes a man had to suffer three times, for he fainted early in the experiment, and then he was revived and a few days later the experiment was again undertaken.'

‘Didn’t they scream, didn’t they cry out?’

He smiled at that question. ‘There was no use in this place for a man to scream or cry out. It was no use for any man ever.’

A colleague of the Polish doctor came in; he was the only one who knew about the malaria experiments. The German doctor, who was chief of the Army’s tropical medicine research, used Dachau as an experimental station. He was attempting to find a way to immunize German soldiers against malaria. To that end, he inoculated eleven thousand prisoners with tertiary malaria. The death rate from the malaria was not too heavy; it simply meant that these prisoners, weakened by fever, died more quickly afterward from hunger. However, in one day three men died of overdoses of Pyramidon, with which, for some unknown reason, the Germans were then experimenting. No immunization for malaria was ever found.

Down the hall, in the surgery, the Polish surgeon got out the record book to look up some data on operations performed by the SS doctors. These were castration and sterilization operations. The prisoner was forced to sign a paper beforehand, saying that he willingly undertook this self-destruction. Jews and gypsies were castrated; any foreign slave laborer who had had relations with a German woman was sterilized. The German women were sent to other concentration camps.

The Polish surgeon had only his four front upper teeth left, the others on both sides having been knocked out by a guard one day, because the guard felt like breaking teeth. This act did not seem a matter of surprise to the doctor or to anyone else. No brutality could surprise them any more. They were used to a systematic cruelty that had gone on, in this concentration camp, for twelve years.

The surgeon mentioned another experiment, really a very bad one, he said, and obviously quite useless. The guinea pigs were Polish priests. (Over two thousand priests passed through Dachau; one thousand are alive.) The German doctors injected streptococcal germs in the upper leg of the prisoners, between the muscle and the bone. An extensive abscess formed, accompanied by fever and extreme pain. The Polish doctor knew of more than a hundred cases treated this way; there may have been more. He had a record of thirty-one deaths, but it took usually from two to three months of ceaseless pain before the patient died, and all of them died after several operations performed during the last few days of their life. The operations were a further experiment, to see if a dying man could be saved; but the answer was that he could not. Some prisoners recovered entirely, because they were treated with the already known and proved antidote, but there were others who were now moving around the camp, as best they could, crippled for life.

Then, because I could listen to no more, my guide, a German Socialist who had been a prisoner in Dachau for ten and

a half years, took me across the compound to the jail. In Dachau, if you want to rest from one horror you go and see another. The jail was a long clean building with small white cells in it. Here lived the people whom the prisoners called the NN. NN stands for *Nacht und Nebel*, which means night and mist. Translated into less romantic terms, this means that the prisoners in those cells were never taken out into the sun and air. They lived in solitary confinement on water soup and a slice of bread, which was the camp diet. There was of course the danger of going mad. But one never knew what happened to them in the years of their silence. And on the Friday before the Sunday when the Americans entered Dachau, eight thousand men were removed by the SS on a final death transport. Among these were all the prisoners from the solitary cells. None of these men has been heard of since. Now in the clean empty building a woman, alone in a cell, screamed for a long time on one terrible note, was silent for a moment, and screamed again. She had gone mad in the last few days; we came too late for her.

In Dachau if a prisoner was found with a cigarette in his pocket he received twenty-five to fifty lashes with a bull whip. If he failed to stand at attention with his hat off, six feet away from any SS trooper who happened to pass, he had his hands tied behind his back and he was hung by his bound hands from a hook on the wall for an hour. If he did any other little thing which displeased the jailers he was put in the box. The box is the size of a telephone booth. It is so constructed that being in it alone a man cannot sit down, or kneel down, or of course lie down. It was usual to put four men in it together. Here they stood for three days and nights without food or water or any form of sanitation. Afterwards they went back to the sixteen hour day of labor and the diet of water soup and a slice of bread like soft gray cement.

What had killed most of these people was hunger; starvation was simply routine. A man worked those incredible hours on that diet and lived in such overcrowding as cannot be imagined, the bodies packed into airless barracks, and woke each morning weaker, waiting for his death. It is not known how many people died in this camp in the twelve years of its existence, but at least forty-five thousand are known to have died in the last three years. Last February and March, two thousand were killed in the gas chamber because, though they were too weak to work, they did not have the grace to die; so it was arranged for them.

The gas chamber is part of the crematorium. The crematorium is a brick building outside the camp compound, standing in a grove of pine trees. A Polish priest had attached himself to us and as we walked there he said, ‘I started to die twice of starvation, but I was very lucky. I got a job as a mason when we were building this crematorium, so I received a little more food, and that way I did not die.’ Then he said, ‘Have you seen our chapel, madame?’ I said I had not, and my guide

said I could not; it was within the zone where the two thousand typhus cases were more or less isolated. 'It is a pity,' the priest said. 'We finally got a chapel and we had Holy Mass there almost every Sunday. There are very beautiful murals. The man who painted them died of hunger two months ago.'

Now we were at the crematorium. 'You will put a handkerchief over your nose,' the guide said. There, suddenly, but never to be believed, were the bodies of the dead. They were everywhere. There were piles of them inside the oven room, but the SS had not had time to burn them. They were piled outside the door and alongside the building. They were all naked, and behind the crematorium the ragged clothing of the dead was neatly stacked, shirts, jackets, trousers, shoes, awaiting sterilization and further use. The clothing was handled with order, but the bodies were dumped like garbage, rotting in the sun, yellow and nothing but bones, bones grown huge because there was no flesh to cover them, hideous, terrible, agonizing bones, and the unendurable smell of death.

We have all seen a great deal now; we have seen too many wars and too much violent dying; we have seen hospitals, bloody and messy as butcher shops; we have seen the dead like bundles lying on all the roads of half the earth. But nowhere was there anything like this. Nothing about war was ever as insanely wicked as these starved and outraged, naked, nameless dead. Behind one pile of dead lay the clothed healthy bodies of the German soldiers who had been found in this camp. They were shot at once when the American Army entered. And for the first time anywhere one could look at a dead man with gladness.

Just behind the crematorium stood the fine big modern hothouses. Here the prisoners grew the flowers that the SS officers loved. Next to the hothouses were the vegetable gardens, and very rich ones too, where the starving prisoners cultivated the vitamin foods that kept the SS strong. But if a man, dying of hunger, furtively pulled up and gorged himself on a head of lettuce, he would be beaten until he was unconscious. In front of the crematorium, separated from it by a stretch of garden, stood a long row of well-built, commodious homes. The families of the SS officers lived here; their wives and children lived here quite happily, while the chimneys of the crematorium poured out unending smoke heavy with human ashes.

. . . . [T]here is a kind of shock that sets in and makes it almost unbearable to remember what you have seen. I have not talked about the women who were moved to Dachau three weeks ago from their own concentration camps. Their crime was that they were Jewish. There was a lovely girl from Budapest, who somehow was still lovely, and the woman with mad eyes who had watched her sister walk into the gas chamber at Auschwitz and had been held back and refused the right to die with her sister, and the Austrian woman who pointed out calmly that they all had only the sleazy dresses they wore

on their backs, they had never had anything more, and that they worked outdoors sixteen hours a day too in the long winters, and that they too were 'corrected,' as the Germans say, for any offense, real or imaginary.

I have not talked about how it was the day the American Army arrived, though the prisoners told me. In their joy to be free, and longing to see their friends who had come at last, many prisoners rushed to the fence and died electrocuted. There were those who died cheering, because that effort of happiness was more than their bodies could endure. There were those who died because now they had food, and they ate before they could be stopped, and it killed them. I do not know words to describe the men who have survived this horror for years, three years, five years, ten years, and whose minds are as clear and unafraid as the day they entered.

I was in Dachau when the German armies surrendered unconditionally to the Allies. The same half-naked skeleton who had been dug out of the death train shuffled back into the doctor's office. He said something in Polish; his voice was no stronger than a whisper. The Polish doctor clapped his hands gently and said, 'Bravo.' I asked what they were talking about.

'The war is over,' the doctor said. 'Germany is defeated.'

We sat in that room, in that accursed cemetery prison, and no one had anything more to say. Still, Dachau seemed to me the most suitable place in Europe to hear the news of victory. For surely this war was made to abolish Dachau, and all the other places like Dachau, and everything that Dachau stood for, and to abolish it forever.

5.c. Total War Targets Civilians

5.c.1. Dorothy L. Sayers on Attacks on Civilians

Strategic Bombing in World War II

One important technological innovation of World War II was heavy bombing attacks upon industrial cities, urban centers that normally had large civilian populations. Such raids normally had dual objectives, being designed to wear down the enemy's will to resist not just through the destruction of major industrial facilities but also by eroding popular morale through the infliction of heavy civilian casualties. In 1939, German aircraft bombed Warsaw and other Polish cities heavily, and from summer 1940 to early 1941, Adolf Hitler mounted massive air attacks on London and other major British cities. Britain retaliated with substantial raids on German industrial cities, which over time grew in size. On 30 May 1942, the Royal Air Force mounted the first "thousand-bomber raid" against Cologne and in July 1943, created the first bombing-induced firestorm in a raid on Hamburg that killed approximately 45,000 people. That year, the U.S. Eighth Air Force also began air attacks on German industrial facilities from British bases, raids that gradually increased in scale and intensity. Casualties on these raids were high until the introduction of long-range Allied escort fighters, especially the P-51 Mustang in early 1944.

Although U.S. air commanders claimed that they intended only to strike industrial targets, in practice, their bombs were not particularly accurate, and each raid normally inflicted substantial civilian casualties. The British, by contrast, overtly mounted bombing raids on major German cities, generating some friction with their American allies. Both countries collaborated, however, on a controversial three-day February 1945 firestorm raid on the historic Saxon city of Dresden, an important German military and industrial center, that inflicted perhaps 45,000 civilian casualties, and almost destroyed the town. By early 1945, most major German cities and industrial facilities had experienced major bombing raids, in which more than 700,000 German civilians died. In the Pacific, from early 1945, American bombers mounted huge incendiary raids on a total of 66 Japanese cities, almost all the major urban centers, which devastated 178 square miles of built-up territory and killed hundreds of thousands of civilians, and millions more fled to the countryside.

In 1944, Germany introduced two new weapons in supposed retaliation ("Vergeltung") for the Allied raids on German cities, the V-1 flying bomb, which came into operation in June 1944, and three months later, the V-2 rocket. The

V-1 "doodlebug" was a pilotless pulse-jet monoplane with a range of 150 miles, carrying a 1-ton warhead, launched from the Pas de Calais in France and targeted against southeastern England and London. Of 9,500 launched, many fell short or were shot down by British fighters, but approximately 1,435 hit their targets, killing around 6,284 people and causing a major exodus from London in June–July 1944. In September 1944, Allied forces captured the V-1 launch sites. Within a day, however, Germany began to use its new V-2 rocket to deliver bomb attacks on London and the surrounding area, which continued until March 1945, by which time more than 1,000 had been launched. Although highly inaccurate, the V-2, which arrived silently, was even more frightening than the V-1, which could be heard approaching and was often intercepted by Allied fighters.

About the Author

The prolific British author Dorothy L. Sayers is best known for her erudite series of classic detective stories featuring Lord Peter Wimsey. She was also a well-qualified literary scholar, familiar with several languages, including Latin, German, Italian, and French, and a committed Anglican Christian with a strong interest in theology. In the mid-1930s, she abandoned detective stories to write several plays based upon religious themes, in which issues of guilt, responsibility, and redemption featured prominently. She also translated the classic epic poem by the Italian Renaissance author Dante Alighieri, *The Divine Comedy*. A staunch believer in good and evil who strongly supported British intervention in World War II, Sayers was nonetheless familiar with the less attractive effects of conflict. Her husband, the journalist Atherton "Mac" Fleming, had been a correspondent in both the Boer War and World War I and was commissioned in the Army Service Corps in 1915, where he remained until World War I ended. Although he wrote an early guidebook for visitors to the Western Front, many of whom sought to pay their last respects at the graves of much-loved family members, Fleming never fully recovered from his war experiences, drinking heavily in later life as his career flagged and becoming financially dependent upon his wife. Sayers' early novels contained at least one character whom shellshock had reduced to a similar state, and service in World War I left her hero, Lord Peter Wimsey, functional but subject to debilitating recurrent nightmares.

About the Documents

The three documents included here were all written by Dorothy L. Sayers in response to World War II and in particular to those issues raised by the often random bombing of civilians. The first was a poem, published in both Britain and the United States in March 1944, centering on the figure of Fraülein Fehmer, her talented German music mistress at high

school, a woman who loved the music of the Polish composer Frederic Chopin and who became an “ardent Nazi” after returning to Germany sometime in the 1930s. Fehmer lived in the city of Frankfurt, one of the major targets of Allied bombing raids on Germany. She did survive the war, and after Germany was defeated, Sayers resumed contact with her and for several years, sent food parcels to her. The two letters by Sayers, the first intended for publication and the second dispatched to a leading Anglo-Catholic socialist activist in the knowledge it might well be published, were written more than a year apart, one in June 1944, when German V-1 attacks on Britain were at their height, the second in October 1945, as part of the debate over the Allied use of atomic bombs against Hiroshima and Nagasaki. All three documents were effectively contributions to the widespread debate over the morality and legitimacy of attacks against civilians in warfare generated by the German attacks on Allied cities, the massive Allied bombing raids against German urban centers and civilian targets, the German deployment of untargeted V-1 bombers, and the Allied use of atomic weapons against Japan.

Sayers was a highly educated woman who prided herself on her scholarship and logical mind. As a theologian, she was familiar with the Christian church’s doctrines on what constituted a “just war.” She was also very conscious that the “total war” mobilization that the scale of modern warfare demanded meant that the civilian population effectively contributed to the success of each country’s war effort, in her case, and probably that of Fehmer, through the taxes she paid and other activities she undertook in support of the war, and for other civilians, more directly through their often lucrative work in war industries. In her view, this made not only industrial plants but also civilian morale itself a justifiable target of war. The real test of a weapon’s legitimacy therefore became, not its destructiveness, but its effectiveness in ending the war as swiftly, and with as few unnecessary casualties, as possible. Uncertain whether Fehmer was still alive or had died in an Allied raid, Sayers was willing to share in the guilt for the decisions and actions that might have killed her former teacher and had certainly been responsible for numerous other deaths. She was prepared to accept that her own support for the war effort made her a legitimate target for V-1 bombs, which might indeed have hit her Essex home in southeastern England, and argued in October 1945, that Hiroshima and Nagasaki might have been equally valid targets for atomic bombs (or, indeed, any other type of weapon). This stance was very different from that of such convinced pacifists as Vera Brittain or Bishop George Bell of Chichester, who spoke out openly at the time against indiscriminate Allied bombing of German cities and condemned the use of atomic weapons. Although she condemned atrocities that could not “be justified by military necessity,” Sayers also took

an entirely different position from those British civilians who were eager to retaliate against Germany for its use of V-weapons, on the grounds that these were targeted indiscriminately. Sayers’ views expressed the bleak and to many unpalatable implications of the mobilization of entire populations for total war, which logically meant that the all members of those populations had become acceptable and valid targets during warfare.

Primary Source

A) “Target Area,” 1944

Our bombers were out over Germany last night, in very great strength; their main target was Frankfurt

The grim young men in the blue uniforms, professionally laconic, charting, over the inter-com, the soundings of the channel of death, have carried another basket of eggs to Fraülein Fehmer—

I do not know, of course, whether she got them.

Fraülein Fehmer,

thirty-five years ago, when I was at school, taught the piano

in a little music-room, one of a row of little music-rooms that lived in the dark passage under the stair leading to the Lower Fourth:

every music-room

distinguished by the name of a great musician;

every music-room

pouring out a jingle of private harmony

in a jangling discord with the private harmonies of its neighbours.

Fraülein Fehmer was stiffly built,

with a strong square face, lionish, slightly blunted,

as though the hand of the potter had given a gentle

push to the damp clay; she wore eye-glasses,

and a shawl round her shoulders in cold weather; her hair

was straight and dark, combed back over a pad;

she had strong square hands, grasping the keys easily

from middle C to the major third over the octave,

blunt finger-tips and wide flat knuckles; she used

a rather unorthodox

and very powerful action of the whole forearm,

so that the wires sang under her touch like bells.

When she started you on a new piece, she always

inscribed

the date neatly above it; when you made mistakes,

stumbling feverishly among the accidentals,

she would say, “Na, na!” in a strong, tart, rebuking

voice. She must be getting an old woman now,

if the grim young men in the blue uniforms

have not cancelled time for her.

Fraülein Fehmer's music-room
 was named "Chopin"; after her favourite composer;
 once or twice in the school year
 we were invited to hear her give a recital
 of Chopin, after supper. We did not grudge seating the Hall
 for Fraülein Fehmer; we recognized that her playing
 was unlike that of the other music-mistresses;
 no doubt they played well, but Fraülein Fehmer's playing
 was music. There is a particular Nocturne
 that I cannot hear to this day without thinking of her;
 when it is tendered
 by celebrated musicians over the ether
 I see the red brick walls, the games trophies,
 the rush-bottomed chairs, the rows of aspidistras
 that garnished the edge of the platform, and Fraülein
 Fehmer
 gowned in an unbecoming dark-blue silk,
 lifting the song from the strings with a squaring of her
 strong shoulders;
 the notes on the wireless are only the imperfect echo
 of that performance. Memory and association
 count for much, but there is no nostalgic glamour
 about my memories; I was timid of Fraülein Fehmer,
 and I was not happy at school;—I am sure I am right in
 thinking
 that as a pianist she was exceptional.

Some years before the war—
 this war, I mean—I suddenly had a letter
 from Fraülein Fehmer, dated from Frankfurt-am-Main.
 In the same pointed script that used to adorn my music-
 books
 she said she remembered England with much affection;
 she had heard that I was a writer; she would like to read
 something that I had written—would I send her a copy
 for old sake's sake? it cost more than she could afford
 to order a book from England; times were hard,
 it was very hard indeed for musicians to live
 in Germany nowadays; "of course," she added,
 "I am an ardent Nazi."
 She used to wear
 a shawl, as I have said, when the weather was pinching.
 Memory
 tells me it was grey. Hitler rose to power
 on the despair of the middle classes. I sent her books, and
 she thanked me;
 for a long time we exchanged polite greetings at Christmas.

*Last night our bombers
 were out in very great strength over Germany;
 Fraülein Fehmer was in the target area.*

There are so many things that one does not know—
 what, for example, becomes of ageing women
 whose skill is rooted in the wrong memories
 when death puts on his harness (he bears arms
 a *cross crampony*, sable); it may be
 that ardent Nazis are not encouraged to play
 Polish music.
 Tell me, Fraülein Fehmer,
 were you playing Chopin when the bombs went down over
 Warsaw,
 or did the Nocturne ring out for the last time
 on the last night of August?
 How much of your pittance, tapped by the tinkling
 hammers,
 arduously, out of long stretches of common time,
 went up in reek and smoke behind St. Paul's Churchyard?
 Did your grey shawl perish in Russia, frozen
 to the aching bone it wrapped, that fearful winter
 when the dead stiffened as they fell, in the ghastly road from
 Moscow?
 When the great Lancasters
 roaring out of England, making the sky boil like a cauldron,
 stooped at last upon Frankfurt from the blackness between
 the stars,
 did the old, heartbreaking melody cry to you
 Poland's agony through the crashing anger of England?
 Did we strike you, perhaps, quickly,
 tossing the soul out through rent ribs or merciful
 splitting of the skull? Or did you
 find yourself suddenly awake at midnight,
 peering from the blankets, fumbling for your glasses, to see,
 by flare-light and fire-light,
 the unexpected precipice by the bedside,
 the piano shattered aslant, with all its music
 coiling out of it in a tangle of metallic entrails,
 dust, books, ashes, splintered wood, old photographs,
 the sordid indecency of bathroom furniture
 laid open to the sky? Or are you, I wonder,
 still waiting the personal assault, the particular outrage,
 expiating the world's sin in a passion of nightly expectation
 till the unbearable is reiterated
 and the promise fulfilled?
 The death sent out
 returns; I have filled the bombs, loaded the bomb-racks,
 built the planes, equipped
 the laconic grim young men in the blue uniforms;
 for this you learned to play Chopin and I to write
 that we might exchange these messages and these replies.
 Neither of us can stop what is happening now,
 nor would if we could; the discord of private harmonies
 must be resolved in the deafening cataract of calamity;

the first to cry “Halt!” utters a cry of defeat, and makes a breach in the dam, through which the water floods over the house-tops.

This I write
with the same hand that wrote the books I sent you,
knowing that we are responsible for what we do,
knowing that all men stand convicted of blood
in the High Court, the judge with the accused.
The solidarity of mankind is a solidarity in guilt,
and all our virtues stand in need of forgiveness,
being deadly.

*Chopin and the old School Hall
were out last night over Germany, in very great strength,
taking messages to Fraülein Fehmer.*

B) Sayers to the Editor, *The News Chronicle*, 27 June 1944

If by ‘reprisals’ is meant doing something savage merely in order to ‘pay the other fellow out,’ without improving one’s own situation, then all reprisal is not merely a crime but a first-class military blunder. The object of fighting a war is to win it; irrelevant gestures fritter away energy and handicap the side that indulges in them.

In any case, why ‘reprisals’? There is nothing morally reprehensible about a bomb from a pilotless plane as such. Its critics say that it is inaccurate, and therefore, from a military point of view, inefficient; but we can hardly suppose that the Germans made it inaccurate on purpose. What do the advocates of reprisals want us to do? Squander time and material on constructing a weapon equally, or still more, inaccurate and inefficient, in order to ‘larn ‘em to be toads’? (Or would any old kind of frightfulness fill the bill such as the torture and shooting of prisoners?)

If, on the other hand, the critics are wrong, and the flying bomb is a good, useful and accurate weapon, then to manufacture and use it would not be ‘reprisal,’ but the sensible procedure called ‘learning from the enemy.’

The use of a weapon of war is to destroy (a) as many as possible (b) of the *right* people and (c) the *right* material objects (d) as expeditiously and (e) as inexpensively as possible without (f) more cruelty than is necessary to attain that end. A weapon that is slow, wasteful and indiscriminate is a

bad weapon. The proper answer to bad weapons is good weapons; and the proper answer to randomness is not more randomness but purposeful operations directed against those military objectives whose destruction does most good to ourselves and most harm to the enemy’s war potential.

C) Dorothy L. Sayers to Maurice Reckitt [founder of the *Christendom Group*], 6 October 1945

I have never been able to feel a righteous indignation about ‘indiscriminate’ bombing. I have never (to come down to a single example) understood why it would have been especially wicked for the Germans to have bombed me. I was not a combatant, nor did I manufacture arms or perform specific military duties; but I did what I could, and my money helped to finance the war effort. And when, through my representatives in Parliament, I declared war on Germany, it was surely not with the mental reservation, ‘on the understanding that nothing unpleasant happens to me.’ On what moral principle does one urge a whole people to ‘do their bit,’ and then claim that some of them should be immune from attack?

The real war crimes seem to me to be those that cannot be justified by military necessity (such as ill-treatment of prisoners, slaughter of hostages, and so forth); or those in which the destruction produced is wholly out of proportion to the military advantage gained. (I said this publicly, at the time, about doodle-bugs, so I think I have the right to say it now.) The destruction of Hiroshima by the atomic bomb may turn out to have been an error of military judgement; it might, in the end, have been better to kill more people, or different people, over a longer time, in order to produce a more really crushing kind of victory. I do not know; nor (at present) does anybody. But so long as entire nations—men, women and children—take part in the war effort, or so long as all their citizens democratically make themselves responsible for declaring war, they all share the responsibility and ought to share the risks and penalties.

What you are up against is, once more, the age of mass-produced power. The nature of machine-power is such that it makes every soul in the country a combatant. The soil and the factories fight. Moreover, organised labour now actually profits by war, on which it can rely for full employment and vastly increased earnings. The solidarity of guilt is indivisible. But the problem is not wholly one of methods of warfare, and is insoluble when tackled from that end.

5.c.2. An American Bomber Pilot: Robert S. Raymond

Aviators in World War II

In every country, fliers were high among the elite of the fighting forces. Although service in the air forces was extremely dangerous, with casualty rates of close to 10 percent among aircrew on some of the major Allied raids over Germany in 1943–1944, aviators had perhaps the most glamorous image of any in the armed forces. Their job demanded considerable training, skill, and technical ability. It also gave fliers the opportunity of engaging in something close to individual combat, where their survival depended primarily upon the exercise of their own abilities. Most fliers were young men in their twenties; anyone over thirty was considered elderly.

For both bombers and fighters, flying combat missions was a highly stressful enterprise. Whereas fighter pilots often flew alone, a bomber crew consisted of several men, including pilot, copilot, navigator, radio operator, and one or more gunners and bombardiers, all of whom had to work closely together in hazardous conditions, putting a premium on coordinated teamwork. American aircrews were normally

supposed to be rotated home after flying a tour of 25 missions and to receive a week off after every 5 missions. During the major Allied bombing raids of 1943–1944, however, the attrition rate was so high that, on average, bomber crews could expect to fly only 15 missions before being shot down. American losses in the air war in Europe were 9,949 bombers, 8,500 fighters, and 64,000 airmen killed, whereas the British Bomber Command lost 57,000 men. The most experienced crews generally had the best chances of survival; and newly trained pilots were most at risk. Though fighter airplanes were highly maneuverable, bombers, though well armed with machine guns, flew in tight formation and were vulnerable to attacks from enemy fighters and antiaircraft fire (flak) from the ground. Subzero cold and loss of oxygen, as well as enemy gunfire, could kill aircrew. Nervous breakdowns were fairly common among overstrained fliers, especially those piloting transport planes that navigated the dangerous “Hump” route over the Himalayas ferrying supplies from India to China.

About the Document

In spring 1940, Robert S. Raymond, a young American from Kansas City, volunteered to serve in the French army. During the fall of France, he was evacuated to Great Britain, where he joined the Royal Air Force and trained as a bomber pilot, flying 30 missions on Lancaster bombers. He then transferred to the U.S. Army Air Forces, still based in Britain, where he remained until the war ended, surviving the massive Allied bombing raids on German cities in 1943–1944. This letter to Betty, later his wife, written in early 1943, describes a major bombing raid over the German city of Düsseldorf from which he had just returned. Written at midnight, when Raymond, though tired, was still too keyed up to sleep, it has an immediacy rarely present in accounts written at a greater distance in time after the events they describe. Although slightly censored, it contains most of the information he wished to tell a young woman who was already a close friend. It was probably written, in part, to release the author’s tensions after a rather draining and wearing experience in which he and his crew had come uncomfortably close to death.

Raymond’s letter is largely an account of the bombing raid on Düsseldorf, a relatively easy target in that it was fairly close to Britain. As the leader of this particular raid, his aircraft had a slightly less difficult time from enemy flak than those following it, especially since Raymond, as pilot, used diversionary tactics after releasing his bombs and flares to guide the other airplanes. Nonetheless, his plane came under flak attacks all the way from Düsseldorf to the Channel coast, some of which he suspected had hit the plane (which had not yet been inspected for damage when Raymond wrote his letter); and the journey back to Britain, flying on instruments in

bad weather conditions, was hazardous. Raymond readily admitted that without his instrument training, he would have failed to return safely on this occasion, a fact that may also have been the reason why, unlike “little Griffiths” with whom he shared a room, he was unable to sleep that night. Under such conditions, an aircraft’s survival depended primarily upon the pilot and his abilities, though a dependable and competent crew was also an enormous advantage. One of the most interesting passages of Raymond’s letter is his reflection on the value of a well-trained aircrew, in his case seven men, used to working together, in enabling its members to survive the rigors and dangers of an operational tour.

Raymond did not appear to be concerned by the damage his crew and the other bombers accompanying him had wrought upon Düsseldorf or other German cities. Indeed, he took some pride in being part of a small and in some ways pampered force that could inflict such disproportionately heavy destruction upon its enemies, thereby saving many Allied soldiers’ lives. He did, however, express the hope that once the war was over, his country would turn its enormous energies and capacities from devastation to reconstruction. Like many men away at war, Raymond used his memories of home to anchor and orient himself in a very different life of combat. He finished his letter by recalling some of the everyday sounds of Kansas City, where he hoped to return once the war was over. Perhaps the experience of having escaped death only a few hours earlier made him somewhat more reflective than he might otherwise have been. Interestingly, even though writing to a young woman who might well be concerned for his safety, he did not attempt to minimize the dangers to which he was exposed on a fairly routine basis.

Robert S. Raymond to His (Future) Fiancée, 27 January 1943

Have just returned from Düsseldorf, and sitting here in my quiet room, with Griffiths sleeping peacefully, it seems incredible that I was there only 4 hours ago. Griffith’s curly blonde head is little troubled by the experience of another bombing raid, but I am not yet sleepy and shall tell you about it, for memory, particularly mine, is a transient thing, and inevitably softens the clear-cut lines of any experience, however impressive.

Düsseldorf is a great industrial city situated in the Ruhr on the Rhine River, producing great quantities of vital war materials so badly needed by the Wehrmacht on all fronts. It is vulnerable in that the great river is an outstanding landmark, enabling easy identification, and because it is less than 400 miles from England, making it possible for us to carry a much greater weight of bombs than, for instance, to Italy.

We took off under low cloud with the promise of better weather over the target and on our return. Climbed up through several cloud layers just as the sun was tinting them with the last red colours of the day, and so up over the North Sea with George flying. Some flak over the Dutch coast was sent up to our height through a solid layer of cloud, and from then on we were never entirely free from it until we had arrived within a few minutes of the target, when I remarked to Watt that, although we were quite sure of our position, it looked too quiet to be entirely healthy. But we were evidently the first to arrive, and the defenses were lying doggo in the hope that we would either pass over and not bother them or, being uncertain of our position, fail to locate the city. Neither happened; being quite sure of where we were even above the scattered cloud, we ran straight in and planted our cookie and incendiaries (more than 1000 of them) and, since, the scattered cloud below made a good photo of the result improbable, I turned away immediately.

Watt said, “Bombs gone.”

Immediately after the cookie blossomed into a great red mushroom glow and the string of incendiaries began to sprinkle on the ground, more than 50 searchlights concentrated on the place where we should have been after dropping that load, and the flak was bursting right at the apex of the searchlight cone. The ground defenses had been quietly plotting our track all the while, and now that they knew they were to be the “Target for tonight,” they threw up everything they had. I’m afraid we left our companions a hard row to hoe, but we have faced the same situation elsewhere.

Flak all the way to the coast, and finally the blessed emptiness of the lonely North Sea, where we found ice forming on our wings when we attempted to descend through the cloud, and so stayed upstairs at lower temperatures until we were over England and Price could get us the latest weather report from our Base.

An hour before we arrived the cloud ceiling was 4,000 feet and closing down rapidly. By the time we got there, it was down to 800 feet with rain falling and the air gusty and full of pockets (air currents) that tossed us around like peas in an empty sack between 300 and 1200 feet. Having just [censored] just before setting course from Base earlier in the evening, we were even more cautious than usual. Discipline in the air is absolutely essential, for only the W.A.A.F. in the control tower knows where everyone is. Reviewing the situation now, I know that six months ago under such conditions I would most certainly have been listed as missing with my Crew from this night’s operations. But somewhere during my training I learned to fly confidently by instruments alone, and only that accuracy enabled me to maintain contact and land on the flarepath as smoothly and easily in darkness as it is possible to do during the day. All members of air-crew are

trained, not born, for their jobs, and only hard work and practice enable any crew to live through an Operational tour. I've known so many who trusted to instinct, luck and fortune to carry them through. Each serves in more or less marginal situations, but eventually there can be no substitute. For that reason an Operational Crew of proven ability is a premium product and a valuable unit. They can be developed from average material, but somehow the sum of their abilities must be so integrated that the whole is something greater than the sum of its parts. And that is one of the reasons why I still enjoy flying a bomber.

Primarily, I suppose, it's based on vanity. We live a life of comparative ease and leisure, are fed, clothed, housed and paid more than others, but when the chips are down, it's up to small units of 7 men each, to do in a few hours what would otherwise cost the lives of many thousands to accomplish. Our capacity for destruction is tremendous. God grant that in the days of peace to come we shall work as hard and be as zealous to rebuild and recreate the brave new world.

Several bursts of flak were so near tonight that the Gunners still think we were hit, since we could not examine the plane adequately in the dark when we had parked it at the dispersal point, but we shall see tomorrow. . . .

My letters inevitably taper off to unconnected inconsequentialities. Just remembered some sounds I would like to hear—the long, hollow whistle of a train—you, singing—birds on a spring morning—frogs at midnight—traffic on Main Street—the smooth patter of a salesman (with the goods)—wind in a pine forest—the K.C. [Kansas City] Philharmonic—a church choir—the clatter of a mowing machine—the rustle of tall corn—the drowsy hum of bees around a hive—the crackle of a wood fire—carpenters sawing and hammering—and many others, but most of all your voice.

5.c.3. The Civilian Victims of Total War

Civilians and Total War

Governments, whether democratic or authoritarian, normally took the decision for war, but it was their own citizens and those of other countries who usually paid the heaviest price. In the twentieth century, the waging of war expanded to encompass the entire civilian population. For most of the nineteenth century after 1815, European nations had left the actual conduct of war to relatively small professional armies, who generally fought each other at some distance from the civilian populace of their home states, often engaged in colonial conflicts over territories several thousand miles away. Although these contests often wreaked destruction upon the indigenous peoples involved, they had virtually no impact upon the ordinary people of such nations as Great Britain, France, Germany, or Italy. Even when wars did break out in Europe, as with the various Italian Wars of Independence and the Franco-Prussian War of 1870–1871, these conflicts were short and fairly limited in scope. Those civilians whose homes had the misfortune to stand in the path of advancing armies were decidedly affected, often falling victim to looting and destruction, but their numbers were relatively small, and the bulk of the population could usually remain sidelined on the periphery of such wars.

In the first half of the twentieth century, the situation changed. During World War I, British and German forces each launched small-scale bombing raids on each other's cities, which killed a few hundred people, and passenger liners or merchant vessels carrying civilians in maritime areas considered to be war zones were liable to be attacked without warning. In those regions of France or Belgium or the far more fluid Eastern front and Serbia where fighting took place, millions of civilians were forced to flee before advancing enemy troops, or to evacuate areas where their own military forces intended to fight. In the course of the war Armenians were massacred and Serbs persecuted, and forced exchanges of hundreds of thousands of ethnic Greeks and Turks populations marked the conclusion of peace between those two countries in 1923. On both sides, the Russian civil war of

1918–1922 was also characterized by ferocious atrocities against both civilians and soldiers. During the Spanish Civil War, civilians again became targets, most notoriously during the devastating April 1937 bombing attack on the town of Guernica by German airplanes supporting the Nationalist forces of General Francisco Franco, an episode which prefigured the massive bombings all powers launched against enemy urban centers during World War II. Tens of thousands of Spaniards on the losing Republican side were forced into exile, becoming refugees. During the 1930s Nazi persecution also drove many Jews and dissenting Germans to flee their country. While some emigrated elsewhere, others ended up in limbo in camps for displaced persons, waiting and hoping—often fruitlessly—for eventual resettlement in another country before the fortunes of war returned them to the mercy of their original persecutors.

From 1937 to 1945, civilians in both Europe and Asia were targeted on an unprecedented scale, a development which reached its apogee in 1945 with the atomic bombings of the Japanese cities of Hiroshima and Nagasaki. Millions of Europeans became refugees, driven out of their homes and unable to return. From autumn 1940 the German Luftwaffe launched massive bombing raids against London and other major British industrial cities, which lasted until spring 1941 and continued sporadically throughout the war. In retaliation and then in the hope of bombing Germany into surrender, from early 1942 the British, eventually joined by the Americans, launched ever greater bombing raids against major German cities, which developed into fire raids in 1944 and 1945. The culmination of these was a raid that lasted two days, when during February 13–14 1945 over 1200 British and American bombers poured incendiary bombs over the German city of Dresden, whose population, swollen by numerous refugees, amounted to close to one million. It was later estimated that 35,000 Germans died in the attack, though some sources put the number closer to 100,000. From the beginning of their war on China in 1937, Japanese airplanes attacked Chinese cities. In early 1945 most major Japanese urban centers also became the target of Allied incendiary bombing raids. Hiroshima, Nagasaki, and a few others—including the ancient and beautiful city of Kyoto, ultimately removed from the list of likely nuclear weapon demonstration sites on cultural and artistic grounds, because some years earlier Secretary of War Henry L. Stimson had visited and admired it—were spared only because they were already earmarked as potential targets for the atomic bombs which were then being developed in great secrecy.

Leaders on all sides were initially cagey in admitting that they considered civilians legitimate targets. In 1940 Adolf Hitler claimed that he was only targeting British industrial plants, not the British civilian population, and any bombing

to which the latter was subjected was merely what would today be termed regrettable “collateral damage.” British Prime Minister Winston Churchill was more forthright when he subsequently stated that his government considered the destruction bombing could wreak on both workers’ housing and popular morale appropriate wartime objectives. Some British and American intellectuals and pacifists condemned heavy bombing raids against civilians on moral and humanitarian grounds, while those with stronger stomachs argued that, if these helped to shorten the war and reduce the ultimate number of casualties, then, however terrible, they were morally justified. Debate over their effectiveness was protracted. Advocates of air power within the U.S. military later argued that, even if atomic weapons had not been used, the massive bombing raids against Japanese cities would soon have forced that country to surrender, obviating the need for any U.S. invasion of the Japanese mainland. The post-war U.S. Strategic Bombing Survey, another official document, suggested that heavy bombing of German cities had failed to make the inroads in either civilian morale or manufacturing production that would have been needed to force Germany to its knees.

To the civilian victims of war, those who lost their lives, family members, or homes in these raids, such debates probably appeared somewhat academic. The novelist Dorothy L. Sayers, a firm supporter of the war against Germany, argued that since, through her elected parliamentary representatives and by paying her taxes, she had voluntarily chosen to endorse it, she had made herself a legitimate target for military attack, as, she further contended, were those workers who were receiving high wages thanks to their employment in the various war industries. Given the absence of many men at the front, small children and teenagers, women, the elderly, and refugees were often disproportionately represented among the victims of bombing raids. In all wars, the most vulnerable, the poor, and those without political influence tend to be those whose sufferings are the greatest. World War II was no exception. Bombs did not discriminate according to political outlook. While some had no doubt been ardent supporters of war, by no stretch of the imagination could many of the victims of bombing raids, especially those living under authoritarian political systems or too young to participate in democratic decisions, be said to have consciously chosen war. Although their deaths may indeed have shortened the conflict’s duration and perhaps helped to prevent even higher numbers of casualties, each death was an individual tragedy that in most cases the victim was powerless to prevent or avoid.

Much the same was often true of refugees, millions of whom died during the war itself, gunned down on the roads of France, Poland, China, and elsewhere as they fled invad-

ing forces, or starving and freezing to death in Russia, Poland, and Eastern Europe. When the war ended, around Europe 9 million people were living in camps for displaced persons. Many were Jews, concentration camp inmates, or former German slave laborers from Eastern Europe, who frequently no longer wished to return to their countries of origin, especially when these had fallen under communist rule. Often they were young people in their teens who had lost parents and other relatives, and found themselves virtually alone in the world, in some cases without passports or identification papers, leaving them stateless. As the eastern front moved into German territory when Russian troops entered East Prussia in January 1945, millions of Germans fled west before the advancing army. Some were physically expropriated from their homes, as Russia had already determined that postwar Poland would receive much of this area, and Germans were unlikely to remain welcome residents. Others feared the harsh treatment they believed Germans would almost certainly receive at the hands of incoming Russian forces, and preferred to move to areas they believed would fall under milder British or American occupation authorities. During this forcible evacuation and flight, in the depths of winter, at least one million Germans died, most of them civilians, experiencing the kind of treatment that, earlier in the war, their own forces had inflicted upon occupied countries. Even so, unlike the millions left stateless, those refugees who fled west across Germany in 1945 had lost their homes but still had a country they could call their own.

So extensive was the refugee problem that in November 1943 the Allied nations established a special agency, the United Nations Relief and Rehabilitation Administration, specifically to deal with the refugee problem. UNRRA operations extended beyond Europe to Asia, where millions of Chinese and others had fled before Japanese forces during the 1930s and early 1940s. As World War II ended, Japanese settlers and residents were in their turn expelled from China, Korea, and Southeast Asia, some officially deported and shipped out together with the remaining Japanese military forces, others making their own way home under extremely difficult conditions. Some never returned to Japan but were killed by incoming Chinese, Russian, or American forces. Occasionally, individual personal relationships mitigated the worst of such sufferings. Japanese nurses or teachers who had shown kindness to former patients or pupils were sometimes helped by them, just as, earlier in the war, their onetime Chinese or Southeast Asian servants had sometimes been willing to assist colonial employers imprisoned in Japanese internment camps. Abandoned comfort women who had been attached to the Japanese forces as prostitutes, many against their will, usually found little official succor, and often had to beg their way home. The developing Chi-

nese civil war soon generated its own crop of refugees, as Nationalist supporters fled before the growing power of the Communists.

In both Europe and Asia, many refugees owned little or nothing except the clothes they stood up in, and in the confusion of war had often lost touch with what remained of their families. UNRRA's operations continued until late 1947, when a new agency, the International Refugee Organization, took over responsibility for the 643,000 displaced persons still living in its camps, most of them individuals who, due to mental or physical health problems or other difficulties, were particularly hard to resettle. Some stories ended fairly happily, with reunions taking place against all odds, but hundreds of thousands of refugees had to abandon all roots and begin new lives in strange countries, poor, without relatives, with few if any qualifications, and having lost years of their lives. But, whatever difficulties they faced, these were still the lucky ones. The bodies of millions of others were scattered around Europe and Asia, leaving them no opportunity for any new life.

About the Documents

Of the three stories included here, not one was written by anyone especially famous or distinguished. Perhaps their saddest feature is that they were in no way unusual or atypical. Tens, even hundreds, of thousands of young people could have recounted similar tales of wartime hardship, deprivation, fear, and suffering. The most famous example is almost certainly the diary of Anne Frank, a teenage Dutch Jewish girl who spent several years in hiding with her family in Amsterdam during the war, dying in a concentration camp after their betrayal to Nazi occupation authorities. All three authors were young children or teenagers during the events they describe. Lothar Metzger was just ten during the bombing of Dresden; Shinoda Tomoko was a schoolgirl of sixteen when she experienced the incendiary raid on Tokyo; and the unidentified German girl who described her family's flight eastward flight was also in her teens. Certain themes run through all three pieces, notably the self-reliance that these young people were forced to develop, trying to help distracted parents to care for smaller siblings, locate missing children, and endure through the most horrific and basic conditions. In each case, one also has a sense of the strength of the bonds still sustaining the surviving family unit, so that family members came together in grief over the loss of Lothar Metzger's father or twin sisters or the German girl's grandparents, whose fate would always remain unknown to their families. One also notes the pathetic effort by Metzger's mother to give him a birthday treat, however small, the joy at the unexpected reunion with Metzger's elder sister, by then presumed dead,

and the relief that Shinoda Tomoko's brothers were safely away from Tokyo during the bombing raids.

Each of these reminiscences described traumatic events that had clearly—as Metzger explicitly states—affected the writer's entire life, together with that of his or her family, and were among the most significant moments of their childhood. Each described in great and harrowing detail an ordeal still remembered only too well, which had engraved itself on the writer's mind and haunted his or her dreams. Two, interestingly, were written down several decades after the events they described, and apparently in response to slightly different stimuli. Metzger produced his account for the Timewitnesses website for survivors of World War II, set up in January 1994, its mission to ensure “that the lessons of the past will be learned by a new generation.” Ensuring that nothing like the Dresden raid ever took place again was apparently one of the major objectives of Metzger's life. Shinoda Tomoko wrote down her recollections in the late 1980s or early 1990s, in response to an appeal by a leading Japanese newspaper soliciting personal accounts of the war years, in a deliberate effort to come to terms with an era of their history many Japanese had previously preferred to forget. The unidentified teenage girl apparently wrote her account of her family's flight across Germany on 9 November 1951, only six years after the events described, for inclusion in a compilation of documents published in West Germany on that flight or expulsion of Germans from beyond the Oder/Neisse line that had become the new boundary dividing East Germany from Poland.

The provenance of the final document is interesting. In the years after World War II, Germans in the new Western-oriented Federal Republic were eager to rehabilitate themselves with their former Anglo-American enemies, especially the United States, now locked in the Cold War with the Soviet Union. One means of doing so was to emphasize the cruelty and deprivation Germans experienced at Soviet hands at the end of World War II. The collection for which this account was first written may well have been compiled with just such ends in view. In the postwar period many Japanese have also sought to stress the cruelty and suffering the Allied atomic and fire bombings inflicted on defenseless civilians across the country. Yet, whether or not such ulterior motives played some part in the decision to solicit or publish such reminiscences, this does not invalidate them as historical documents. They are still horrifying testimony to the inhumanity, cruelty, and deprivation the weakest and most vulnerable in every country endured in consequence of World War II. They also bear moving witness to the courage many children and young people summoned up, however adverse the circumstances, in the effort not just to survive themselves, but to help their families struggle on against the odds and overcome hardship and catastrophe.

Primary Source

A) Lothar Metzger, May 1999, Eyewitness Account of the Firebombing of Dresden, 13–14 February 1945

It was February 13th, 1945. I lived with my mother and sisters (13, 5 and 5 months old twins) in Dresden and was looking forward to celebrating my 10th birthday February 16th. My father, a carpenter, had been a soldier since 1939 and we got his last letter in August 1944. My mother was very sad to receive her letters back with the note: “Not to be found.” We lived in a 3 room flat on the 4th floor in a working class region of our town. I remember celebrating Shrove Tuesday (February 13th) together with other children, The activities of the war in the east came nearer and nearer. Lots of soldiers went east and lots of refugees went west through our town or stayed there, also in the air raid night February 13th/14th.

About 9:30 PM the alarm was given. We children knew that sound and got up and dressed quickly, to hurry downstairs into our cellar which we used as an air raid shelter. My older sister and I carried my baby twin sisters, my mother carried a little suitcase and the bottles with milk for our babies. On the radio we heard with great horror the news: “Attention, a great air raid will come over our town!” This news I will never forget.

Some minutes later we heard a horrible noise—the bombers. There were nonstop explosions. Our cellar was filled with fire and smoke and was damaged, the lights went out and wounded people shouted dreadfully. In great fear we struggled to leave this cellar. My mother and my older sister carried the big basket in which the twins were lain. With one hand I grasped my younger sister and with the other I grasped the coat of my mother.

We did not recognize our street any more. Fire, only fire wherever we looked. Our 4th floor did not exist anymore. The broken remains of our house were burning. On the streets there were burning vehicles and carts with refugees, people, horses, all of them screaming and shouting in fear of death. I saw hurt women, children, old people searching a way through ruins and flames.

We fled into another cellar overcrowded with injured and distraught men women and children shouting, crying and praying. No light except some electric torches. And then suddenly the second raid began. This shelter was hit too, and so we fled through cellar after cellar. Many, so many, desperate people came in from the streets. It is not possible to describe! Explosion after explosion. It was beyond belief, worse than the blackest nightmare. So many people were horribly burnt and injured. It became more and more difficult to breathe. It was dark and all of us tried to leave this cellar with inconceivable panic. Dead and dying people were trampled upon, luggage was left or snatched up out of our hands by rescuers.

The basket with our twins covered with wet cloths was snatched up out of my mother's hands and we were pushed upstairs by the people behind us. We saw the burning street, the falling ruins and the terrible firestorm. My mother covered us with wet blankets and coats she found in a water tub.

We saw terrible things: cremated adults shrunk to the size of small children, pieces of arms and legs, dead people, whole families burnt to death, burning people ran to and fro, burnt coaches filled with civilian refugees, dead rescuers and soldiers, many were calling and looking for their children and families, and fire everywhere, everywhere fire, and all the time the hot wind of the firestorm threw people back into the burning houses they were trying to escape from.

I cannot forget these terrible details. I can never forget them.

Now my mother possessed only a little bag with our identity papers. The basket with the twins had disappeared and then suddenly my older sister vanished too. Although my mother looked for her immediately it was in vain. The last hours of this night we found shelter in the cellar of a hospital nearby surrounded by crying and dying people. In the next morning we looked for our sister and the twins but without success. The house where we lived was only a burning ruin. The house where our twins were left we could not go in. Soldiers said everyone was burnt to death and we never saw my two baby sisters again.

Totally exhausted, with burnt hair and badly burnt and wounded by the fire we walked to the Loschwitz bridge where we found good people who allowed us to wash, to eat and to sleep. But only a short time because suddenly the second air raid began (February 14th) and this house too was bombed and my mother's last identity papers burnt. Completely exhausted we hurried over the bridge (river Elbe) with many other homeless survivors and found another family ready to help us, because somehow their home survived this horror.

In all this tragedy I had completely forgotten my 10th birthday. But the next day my mother surprised me with a piece of sausage she begged from the "Red Cross." This was my birthday present.

In the next days and weeks we looked for my older sister but in vain. We wrote our present address on the last walls of our damaged house. In the middle of March we were evacuated to a little village near Oschatz and on March 31st, we got a letter from my sister. She was alive! In that disastrous night she lost us and with other lost children she was taken to a nearby village. Later she found our address on the wall of our house and at the beginning of April my mother brought her to our new home.

You can be sure that the horrible experiences of this night in Dresden led to confused dreams, sleepless nights and disturbed our souls, me and the rest of my family. Years later I

intensively thought the matter over, the causes, the political contexts of this night. This became very important for my whole life and my further decisions.

B) The Firebombing of Tokyo, 10 March 1945: Reminiscences of Shinoda Tomoko

We were among those surrounded by flames on 10 March 1945. My mother, older sister, and I tried to make our escape. Wherever I went, a wave of fire rushed toward me. Finally I made it to Oshiage station. There were thousands of people there. It was so hot and suffocating that I pressed my cheek to the ground. The air was cool and clean down there. I saw the legs of all sorts of people in front of me. Occasionally on my way a man I didn't know would splash ditch water from a bucket on us and urge us on, saying it was just a little further. Behind me a man sat covered with a large quilt. My back pressed against his, I waited for day to break, fearful and worried about the heat.

With the coming of the pale dawn, people started heading for home. Several military trucks came by around that time. Thinking they had come to help us, I stood up, and the man behind me toppled over. I shook him, but he was dead. They said he died from smoke and the heat of the flames.

On the way home, I thought I saw some black work gloves. When I took a closer look, they were hands that had been torn off. Many red fire trucks were burned out on the major road next to the streetcar tracks, with firemen dead on their vehicles. The dead were blackened and had shrunk to the size of children. It was impossible to tell if they were men or women.

I finally made it back to the charred remains of our house. My mother and sister were there. We hugged each other, weeping. We dug up the crockery, furniture, and food that we had buried in our yard. The rice that had been washed and in our pot was now charred, but we ate it. The tin cans of food that had been stored in the basement of the school building, which had been spared, had burst open due to the tremendous heat of the surrounding fires. I had two younger brothers in first and second grade, but they had been evacuated and were not in Tokyo, so they were safe.

C) Refugees on the Eastern Front: A Teenage Girl Describes the Flight from East Prussia, January–February 1945

On 21 January 1945 Lyck had to be evacuated. With a heavy heart my mother, my sister and I parted from my father, who had been conscripted into the Volkssturm, and from my grandparents. My grandfather intended to take as much of our movable property as possible and join a trek going in the direction of Arys.

With the last trains that were running we reached Rastenburg, where we stayed the night with relatives. Radio reports which we heard indicated that East Prussia was in a hopeless position. In the meantime, the bad news had reached us that trains to the Reich had stopped running. Now we had only one thought: to leave Rastenburg as quickly as possible. My grandmother stayed behind with her maid because she was determined to wait for her husband. We were never to see her or my grandfather again.

At the goods depot in Rastenburg we three found refuge in a goods wagon which was carrying soldiers in the direction of Königsberg. We had to leave the train at Korschen but had the good fortune to get another goods train which was full of refugees. Babies died of hunger on the way.

On 26 January 1945 we reached Bartenstein. In their fear of falling into the hands of the Russians many refugees had managed, despite the extreme cold, to attach themselves to the transport in open coal wagons. On arrival in Bartenstein many had already frozen to death.

We stayed the night in our wagon. At first light, we left the goods train and looked for lodgings in Bartenstein. A female acquaintance from Lyck joined us with her son, who had been caught out by the flight in the middle of his convalescence. It was minus 25 degrees centigrade. While we were going along we heard the dull grumble of artillery fire in the distance.

We found lodgings and rested for two days. But then the approaching artillery fire drove us out of the town of Bartenstein. With the sound of endless explosions as our own troops blew up the Wehrmacht installations in Bartenstein, we found our way out of the town amidst a headless mass of fleeing people. We soon realized that we could not make any progress along the roads. We went back to the goods depot and again had the incredible luck of finding a wagon which was only partly full. Our acquaintance got hold of a railwayman who, after much persuasion, agreed to couple this wagon onto a hospital train which was going to Braunsberg. The railwaymen looked after the refugees in a very touching way and provided them with food and drink.

On 1 February the transport arrived at Braunsberg. Here we received the latest bad news. Allenstein had fallen. Elbing was occupied by the Russians. We were in a huge trap!

The Russian planes endlessly attacked Braunsberg with bombs and gunfire. A friend of my mother's took us in. Many refugees had to camp in cellars. We stayed in Braunsberg until 10 February 1945. Every day we had to queue for food and coal. The drone of the Stalin organs [Katyusha rockets] was getting nearer and nearer. Electricity and gas had packed up. There were ten of us living in a single room. We decided to leave the town. We left our domicile in the dark with a few other fellow-sufferers and groped our way forward in a pitch black night along a road covered with human and animal corpses. Behind us was Braunsberg in flames; to the left of us—around Frauenberg—bitter fighting was going on.

Around midnight—completely filthy and muddy—we reached the little town of Passarge on the Frische Haff. We awaited the new day in a barn. Hein P., our convalescent soldier, could go no further. We had to leave them behind as we continued on foot to the Frische Haff. In the meantime, the icy cold had been replaced by constant rain. We reached the banks of the Frische Haff, paused for a few minutes and then began the walk to the opposite spit of land.

The ice was brittle and in many places we had to wade through water 25 cm. deep. We kept testing the surface in front of us with sticks. Numerous bomb craters forced us to make detours. Often one slipped and thought one had had it. Our clothes, which were soaked through, only allowed us to move clumsily. But fear of death made us forget the shivering which shook our bodies.

I saw women performing superhuman feats. As leaders of the treks they instinctively found the safest paths for their wagons. Household goods were strewn all over the ice; wounded people crept up to us with pleading gestures, hobbling on sticks; others were carried on small sledges by their comrades.

Our journey through this valley of death took us six hours. We reached the Frische Haffe. We sank into a fitful sleep in a tiny chicken coop. Our stomachs grumbled with hunger.

On the next day we walked in the direction of Danzig. On the way we saw gruesome scenes. Mothers in a fit of madness threw their children into the sea. People hanged themselves; others fell upon dead horses, cutting out bits of flesh and roasting them on open fires. Women gave birth in the wagons. Everyone thought only of himself—no one could help the sick and the weak.

In Kahlberg we placed ourselves at the disposal of the Red Cross and cared for the wounded in the Beach Hall. On 13 February 1945 we went on board a ship as nursing personnel. On the next day we reached Danzig-Neufahrwasser and disembarked.

On 15 February 1945 we were assigned accommodations in Zoppot. My mother, sister and I could barely keep upright. Nevertheless, we dragged ourselves to the goods depot in Gotenhafen where, for the third time, by a stroke of luck we

managed to get a military postal wagon to take us to Stolp (Pomerania). On 19 February as nursing personnel on a hospital train, we arrived via Hanover in Gera in Thuringia, where we were put up by relatives. It was 28 February 1945. On that day our flight from East Prussia was over.

5.c.4. The Bombings of Hiroshima and Nagasaki

The Use of Atomic Weapons against Hiroshima and Nagasaki, August 1945

In an often brutal war, where civilians frequently suffered equally with military personnel, the use of atomic bombs against the Japanese cities of Hiroshima and Nagasaki was still unique, in terms of the scale of destruction a single bomb could wreak on an entire city. On 6 August 1945, a B-29 bomber dropped an atomic bomb fueled by uranium 235 on the city of Hiroshima, which at the time probably housed about 350,000 people. By November 1945, approximately 130,000 of these were dead, either in the blast itself or in its aftermath, and in subsequent years, many more would succumb to radiation sickness. Three days later, a second bomb, one fueled by plutonium, fell on Nagasaki, the population of

which was then around 270,000. Encircling hills limited this weapon's effects, but even so, by November 1945, somewhere between 60,000 and 70,000 had lost their lives.

The magnitude of the casualties inflicted, in each case by a single bomb, meant that the decision to use such powerful weapons later generated furious controversy. President Harry S Truman and his close advisers always defended the employment of atomic weapons on the grounds that this represented the only available means to persuade the Japanese government to surrender without the huge loss of both Allied and Japanese lives that an invasion of the Japanese homeland would have entailed. Subsequent critics questioned the estimated number of American casualties, up to 1 million, cited afterwards in justification by Truman and others involved in this decision, particularly Secretary of War Henry L. Stimson. Some historians, notably Gar Alperovitz, subsequently charged that by early August 1945, American officials knew through intercepted communications that Japan was close to surrender and that they used the bomb nonetheless because they sought to demonstrate to the Soviet Union, whose relationship with both the United States and Britain was rapidly deteriorating, the extent of U.S. military power. Another potential reason for its use, cited by Alperovitz, was the American desire to preempt Soviet military intervention in the Pacific war, with the territorial and other advantages this would bring the Soviet Union. Others suggested that had the United States, instead of insisting on Japan's unconditional surrender, unequivocally stated its willingness to retain Japanese Emperor Hirohito as a figurehead national leader, his government would have capitulated before atomic weapons were used. American air force leaders wishing to prove their service's indispensability later claimed that, regardless of whether the United States employed atomic weapons, the firebombing of Japanese cities would have caused Japan's surrender without any invasion, and top naval officials urged that their economic blockade of Japan had been similarly effective.

When subjected to close analysis, such arguments are less than convincing. Stimson, Truman, and others may have exaggerated the exact number of casualties anticipated in any invasion of Japan, but they unquestionably believed these would be high and were determined to minimize further loss of American lives in the war. By June 1945, this was Truman's highest priority, regardless of any additional cost in time or money. The suggestion that Japan was in any case close to surrender is also dubious. To quote J. Samuel Walker: "The recognition that Japan was on the verge of defeat did not mean, however, that it was on the verge of surrender" (Walker 1997, 30). The Japanese military intended to fight on, in the hope of wearing down U.S. morale and the American commitment to continuing the war and perhaps obtaining better peace terms. In June 1945, military leaders had ordered

last-ditch resistance to any Allied invasion, including the use of suicide tactics where possible. Peace feelers through Soviet intermediaries proved inconclusive, as Japanese negotiators sought to obtain terms that included not only the retention of the emperor but also continued Japanese control of its own affairs without any Allied occupation. After the first successful atomic bomb test, on 25 July 1945, Truman, then attending the Potsdam Conference of Allied leaders, ordered the new weapon's use against a major Japanese target on or after 3 August. On Stimson's advice, on 26 July, the president also issued an ambiguous public warning that unless Japan surrendered immediately, it faced attack by "immeasurably greater" forces than those used against Germany, which would "mean the inevitable and complete destruction of the Japanese armed forces and just as inevitably the utter devastation of the Japanese homeland" (Potsdam Declaration, 26 July 1945). Even if Truman had been more specific regarding the probable effects of nuclear weapons, Japanese leaders would almost certainly have ignored this warning and treated it as bluff. Indeed, after Hiroshima, the die-hard Japanese cabinet faction argued that it was an isolated event, since the United States would not have been able to build more than one bomb. Only after the destruction of both Hiroshima and Nagasaki and the formal Soviet declaration of war on Japan in August 1945 did Hirohito succeed in asserting his authority and insisting that Japan surrender, no matter what the terms. Before these events, the Japanese cabinet was deadlocked. Even afterward, when Hirohito announced his decision to sue for peace, Japanese military leaders and their political supporters contemplated a coup and the emperor's possible assassination.

Available evidence suggests that in summer 1945, Truman and his closest advisers regarded nuclear armaments as weapons like any others, their employment against targets where civilians would inevitably suffer massive collateral casualties as acceptable as the use of highly destructive firebombing against Japanese or German cities. The only difference was the scale and scope of damage that each individual bomb could inflict. The fundamental assumption of Truman and most of his advisers was that having devoted enormous resources to developing atomic weapons, unless the war ended immediately, the United States had an obligation to use them. Though Truman did show some concern regarding the number of civilian casualties the Nagasaki attack might cause and gave instructions afterward—when the United States had no more bombs that were immediately operational—that no further such weapons should be used without his specific authorization, he did not countermand the orders to use the second bomb. After eight years of war in Asia and six in Europe, frequently marked by great savagery on all sides and by large-scale atrocities and oppression on

the part of the Axis in particular, sensibilities had become blunted, and Allied leaders could contemplate with equanimity measures they would once have thought unconscionable. The brutal calculus of war was such that for Truman, the preservation of American lives was a far higher priority than minimizing Japanese deaths.

For many decades, Truman's decision to employ atomic weapons continued to provoke popular and historical controversy and dissent, which intensified when scientists and the general public became more familiar with the long-term medical and genetic consequences of radiation contamination and poisoning that afflicted many of the survivors of Hiroshima and Nagasaki and even their children. Then and later, the literary critic Paul Fussell spoke for many of those young American soldiers who otherwise faced fighting and possible death or mutilation in the Pacific in applauding Truman's decision and attacking its critics. Asians from countries that suffered the rigors of Japanese invasion and occupation have also generally refrained from retrospective condemnation of Truman's actions. In 1995, a Smithsonian Museum exhibit featuring portions of the fuselage of the *Enola Gay*, the B-29 bomber that delivered the first atomic bomb, provoked enormous controversy and discussion when World War II veterans and others charged that the accompanying recorded commentary was overly critical of the actual decision to use atomic devices.

About the Documents

The first of these documents is Harry S Truman's own account, given in his memoirs, of his decision to authorize the use of atomic weapons, something he claimed never caused him to lose a single night's sleep. Truman recognized that he was essentially justifying his own conduct on one of the most controversial actions of his presidency, so this is very much an account setting out the best case in his defense. Truman emphasized that his top military advisers had informed him just how heavy American casualties were likely to be in any invasion of Japan. He stressed that his top scientific, military, and political advisers, and also British Prime Minister Winston Churchill, were all in agreement that the bomb was "a military weapon and never had any doubt that it should be used." (In fact, one or two dissenting voices were raised but not among the committee of topmost officials or the most influential of Truman's advisers.) Truman also stressed that he took great care to ensure the bomb was used legitimately, "as a weapon of war in the manner prescribed by the laws of war," and he had therefore insisted that all its targets must possess some "military importance." He described how Japan rejected the terms of the Potsdam Declaration and even after Hiroshima, refused to surrender. By relating how it took massive further conventional bombing raids, plus the use of

a second nuclear device against Nagasaki, to extract the first indication that Japan would contemplate surrender, Truman implicitly defended all these measures.

Although most of Truman's account was correct, there were, rather interestingly, certain inaccuracies. Truman implied that the Potsdam Declaration pledged that the Japanese emperor would be left in place, whereas this was not the case, even though General Douglas MacArthur, who headed the Japanese occupation authority, eventually chose to retain him. To accord with an earlier potential American casualty figure of one million publicly given by Stimson in 1947, Truman apparently inflated Marshall's estimate of American combat deaths in an invasion of Japan from 250,000 to 500,000. On other occasions, moreover, he cited different figures. It seems, too, that he never sent an explicit order to General Carl Spaatz "to continue operations as planned unless otherwise instructed," and that Spaatz simply assumed the second attack should go ahead. Human memory is often inexact and such minor mistakes are very common in memoirs and autobiographies. In this case, though, critics alleged that they apparently cast doubt upon Truman's veracity and credibility, as did an account Truman gave of a meeting with his military advisers at Potsdam on the employment of nuclear weapons that may well have never occurred. Although Truman almost certainly consciously doctored the potential casualty figures, his other errors were probably simply the product of a fallible memory. Even so, given the significance of this particular decision, Truman would have been wise to check the precision of all his facts, since even the smallest error was likely to compromise the account he gave.

The second document describes the consequences for those on the ground of the American decision to employ atomic weapons against Hiroshima. It is a straightforward account of personal experiences of the attack on Hiroshima recorded in September 1945 by a German Catholic missionary priest, normally a philosophy professor at Catholic University in Tokyo, who had been evacuated to a mission on the outskirts of Hiroshima. Siemes' narrative, recorded only a few weeks after the destruction of Hiroshima, when his memories were still fresh, is primarily factual, a careful and often gruesome description of the bomb's effect upon those victims beyond the center of impact where all were immediately destroyed. He vividly depicted his own experience of the bomb's blast and the manner in which immediately after the attack, he and other inhabitants of Hiroshima tried to understand and make sense of what exactly had happened to their city. Only in one brief paragraph at the very end did Siemes describe discussions with his colleagues over whether the use of such powerful weapons was legitimate, even in "total war," and he gave no conclusive answer but instead raised a further question, stating: "The crux of the matter is whether total war

in its present form is justifiable, even when it serves a just purpose." No moral philosopher has yet come up with a conclusive answer to Siemes' question, though it may be significant that on no occasion since August 1945 has any state ever employed nuclear weapons.

Siemes' recollections were recorded by American officials and included, apparently uncensored, as one chapter of the June 1946 report on the Hiroshima and Nagasaki bombings published by the MANHATTAN Project. Even though the full implications of radiation poisoning were not yet known, the report's authors clearly had the intellectual honesty to wish to include material illustrating the human consequences of the employment of atomic bombs. Many scientists who worked on the MANHATTAN Project later confessed to personal uneasy consciences over whether the devastation their invention had brought to Hiroshima and Nagasaki and the potential for further such destruction were morally excusable.

A) President Harry S. Truman Recalls the Decision to Drop the Atomic Bomb

A month before the test explosion of the atomic bomb the service Secretaries and the Joint Chiefs of Staff had laid their detailed plans for the defeat of Japan before me for approval. . . .

The Army plan envisaged an amphibious landing in the fall of 1945 on the island of Kyushu, the southernmost of the Japanese home islands. This would be accomplished by our Sixth Army, under the command of General Walter Krueger. The first landing would then be followed approximately four months later by a second great invasion, which would be carried out by our eighth and tenth Armies, followed by the First Army transferred from Europe, all of which would go ashore in the Kanto plains area near Tokyo. In all, it had been estimated that it would require until the late fall of 1946 to bring Japan to her knees.

This was a formidable conception, and all of us realized fully that the fighting would be fierce and the losses heavy. But it was hoped that some of Japan's forces would continue to be preoccupied in China and others would be prevented from reinforcing the home islands if Russia were to enter the war.

There was, of course, always the possibility that the Japanese might choose to surrender sooner. Our air and fleet units had begun to inflict heavy damage on industrial and urban sites in Japan proper. Except in China, the armies of the Mikado had been pushed back everywhere in relentless successions of defeats.

Acting Secretary of State Grew had spoken to me in late May about issuing a proclamation that would urge the Japa-

nese to surrender but would assure them that we would permit the emperor to remain as head of the state. Grew backed this with arguments taken from his ten years' experience as our Ambassador in Japan, and I told him that I had already given thought to this matter myself and that it seemed to me a sound idea. Grew had a draft of a proclamation with him, and I instructed him to send it by the customary channels to the Joint Chiefs and the State-War-Navy Coordinating Committee in order that we might get the opinions of all concerned before I made my decision.

On June 18 Grew reported that the proposal had met with the approval of his Cabinet colleagues and of the Joint Chiefs. The military leaders also discussed the subject with me when they reported the same day. Grew, however, favored issuing the proclamation at once, to coincide with the closing of the campaign on Okinawa, while the service chiefs were of the opinion that we should wait until we were ready to follow a Japanese refusal with the actual assault of our invasion forces.

It was my decision then that the proclamation to Japan should be issued from the forthcoming conference at Potsdam. This, I believed, would clearly demonstrate to Japan and to the world that the Allies were united in their purpose. By that time, also, we might know more about two matters of significance for our future effort: the participation of the Soviet Union and the atomic bomb. We knew that the bomb would receive its first test in mid-July. If the test of the bomb was successful, I wanted to afford Japan a clear chance to end the fighting before we made use of this newly gained power. If the test should fail, then it would be even more important to us to bring about a surrender before we had to make a physical conquest of Japan. General Marshall told me that it might cost half a million American lives to force the enemy's surrender on his home grounds.

But the test was now successful. . . .

[At Secretary of War Henry L. Stimson's suggestion, shortly after becoming president in April 1945 Truman had] set up a committee of top men and had asked them to study with great care the implications the new weapon might have for us.

Secretary Stimson headed this group as chairman, and the other members were George L. Harrison, president of the New York Life Insurance Company, who was then serving as a special assistant to the Secretary of War; James F. Byrnes, as my personal representative; Ralph A. Bard, Under Secretary of the Navy; Assistant Secretary William L. Clayton for the State Department; and three of our most renowned scientists—Dr. Vannevar Bush, president of the Carnegie Institution of Washington and Director of the Office of Scientific Research and Development; Dr. Karl T. Compton, president of the Massachusetts Institute of Technology and Chief of Field Service in the Office of Scientific Research and Development; and

Dr. James B. Conant, president of Harvard University and chairman of the National Defense Research Committee.

This committee was assisted by a group of scientists, of whom those most prominently connected with the development of the atomic bomb were Dr. Oppenheimer, Dr. Arthur H. Compton, Dr. E. O. Lawrence, and the Italian-born Dr. Enrico Fermi. The conclusions reached by these men, both in the advisory committee of scientists and in the larger committee, were brought to me by Secretary Stimson on June 1.

It was their recommendation that the bomb be used against the enemy as soon as it could be done. They recommended further that it should be used without specific warning and against a target that would clearly show its devastating strength. I had realized, of course, that an atomic bomb explosion would inflict damage and casualties beyond imagination. On the other hand, the scientific advisers of the committee reported, "We can see no acceptable alternative to direct military use." It was their conclusion that no technical demonstration such as they might propose, such as over a deserted island, would be likely to bring the war to an end. It had to be used against an enemy target.

The final decision of where and when to use the atomic bomb was up to me. Let there be no mistake about it. I regarded the bomb as a military weapon and never had any doubt that it should be used. The top military advisers to the President recommended its use, and when I talked to Churchill he unhesitatingly told me that he favored the use of the atomic bomb if it might aid to end the war.

In deciding to use this bomb I wanted to make sure that it would be used as a weapon of war in the manner prescribed by the laws of war. That meant that I wanted it dropped on a military target. I had told Stimson that the bomb should be dropped as nearly as possibly upon a war production center of prime military importance.

Stimson's staff had prepared a list of cities in Japan that might serve as targets. Kyoto, though favored by [Head of the Army Air Force] General Arnold as a center of military activity, was eliminated when Secretary Stimson pointed out that it was a cultural and religious shrine of the Japanese.

Four cities were finally recommended as targets: Hiroshima, Kokura, Niigata, and Nagasaki. They were listed in that order as targets for the first attack. The order of selection was in accordance with the military importance of these cities, but allowance would be given for weather conditions at the time of the bombing. . . .

On July 28 Radio Tokyo announced that the Japanese government would continue to fight. There was no formal reply to the joint ultimatum of the United States, the United Kingdom, and China. There was no alternative now. The bomb was scheduled to be dropped after August 3 unless Japan surrendered before that day.

On August 6, the fourth day of the journey home from Potsdam, came the historic news that shook the world. . . . Shortly afterward I called a press conference. . . . My statements on the atomic bomb . . . read in part. . . .

“We are now prepared to obliterate more rapidly and completely every productive enterprise the Japanese have above ground in any city. We shall destroy their docks, their factories, and their communications. Let there be no mistake; we shall completely destroy Japan’s power to make war.

“It was to spare the Japanese people from utter destruction that the ultimatum of July 26 was issued at Potsdam. Their leaders promptly rejected that ultimatum. If they do not now accept our terms, they may expect a rain of ruin from the air, the like of which has never been seen on this earth.” . . .

Still no surrender offer came. An order was issued to General Spaatz [commander of U.S. air forces in Asia] to continue operations as planned unless otherwise instructed. . . .

On August 9 the second atom bomb was dropped, this time on Nagasaki. We gave the Japanese three days in which to make up their minds to surrender, and the bombing would have been held off another two days had weather permitted. During those days we indicated that we meant business. On August 7 the 20th Air force sent out a bomber force of some one hundred and thirty B-29’s, and on the eighth it reported four hundred and twenty B-29’s in day and night attacks. The choice of targets for the second atom bomb was first Kokura, with Nagasaki second. The third city on the list, Niigata, had been ruled out as too distant. By the time Kokura was reached the weather had closed in, and after three runs over the spot without a glimpse of the target, with gas running short, a try was made for the second choice, Nagasaki. There, too, the weather had closed in, but an opening in the clouds gave the bombardier his chance, and Nagasaki was successfully bombed.

This second demonstration of the power of the atomic bomb apparently threw Tokyo into a panic, for the next morning brought the first indication that the Japanese Empire was ready to surrender.

B) Hiroshima by Father John A. Siemes

Up to August 6th, occasional bombs, which did no great damage, had fallen on Hiroshima. Many cities roundabout, one after the other, were destroyed, but Hiroshima itself remained protected. There were almost daily observation planes over the city but none of them dropped a bomb. The

citizens wondered why they alone had remained undisturbed for so long a time. There were fantastic rumors that the enemy had something special in mind for this city, but no one dreamed that the end would come in such a fashion as on the morning of August 6th.

August 6th began in a bright, clear, summer morning. About seven o’clock, there was an air raid alarm which we had heard almost every day and a few planes appeared over the city. No one paid any attention and at about eight o’clock, the all-clear was sounded. I am sitting in my room at the Novitiate of the Society of Jesus in Nagatsuke; during the past half year, the philosophical and theological section of our Mission had been evacuated to this place from Tokyo. The Novitiate is situated approximately two kilometers from Hiroshima, half-way up the sides of a broad valley which stretches from the town at sea level into this mountainous hinterland, and through which courses a river. From my window, I have a wonderful view down the valley to the edge of the city.

Suddenly—the time is approximately 8:14—the whole valley is filled by a garish light which resembles the magnesium light used in photography, and I am conscious of a wave of heat. I jump to the window to find out the cause of this remarkable phenomenon, but I see nothing more than that brilliant yellow light. As I make for the door, it doesn’t occur to me that the light might have something to do with enemy planes. On the way from the window, I hear a moderately loud explosion which seems to come from a distance and, at the same time, the windows are broken in with a loud crash. There has been an interval of perhaps ten seconds since the flash of light. I am sprayed by fragments of glass. The entire window frame has been forced into the room. I realize now that a bomb has burst and I am under the impression that it exploded directly over our house or in the immediate vicinity.

I am bleeding from cuts about the hands and head. I attempt to get out of the door. It has been forced outwards by the air pressure and has become jammed. I force an opening in the door by means of repeated blows with my hands and feet and come to a broad hallway from which open the various rooms. Everything is in a state of confusion. All windows are broken and all the doors are forced inwards. The bookshelves in the hallway have tumbled down. I do not note a second explosion and the fliers seem to have gone on. Most of my colleagues have been injured by fragments of glass. A few are bleeding but none has been seriously injured. All of us have been fortunate since it is now apparent that the wall of my room opposite the window has been lacerated by long fragments of glass.

We proceed to the front of the house to see where the bomb has landed. There is no evidence, however, of a bomb crater; but the southeast section of the house is very severely damaged. Not a door nor a window remains. The blast of air had

penetrated the entire house from the southeast, but the house still stands. It is constructed in a Japanese style with a wooden framework, but has been greatly strengthened by the labor of our Brother Gropper as is frequently done in Japanese homes. Only along the front of the chapel which adjoins the house, three supports have given way (it has been made in the manner of a Japanese temple, entirely out of wood.)

Down in the valley, perhaps one kilometer toward the city from us, several peasant homes are on fire and the woods on the opposite side of the valley are aflame. A few of us go over to help control the flames. While we are attempting to put things in order, a storm comes up and it begins to rain. Over the city, clouds of smoke are rising and I hear a few slight explosions. I come to the conclusion that an incendiary bomb with an especially strong explosive action has gone off down in the valley. A few of us saw three planes at great altitude over the city at the time of the explosion. I, myself, saw no aircraft whatsoever.

Perhaps a half-hour after the explosion, a procession of people begins to stream up the valley from the city. The crowd thickens continuously. A few come up the road to our house. We give them first aid and bring them into the chapel, which we have in the meantime cleaned and cleared of wreckage, and put them to rest on the straw mats which constitute the floor of Japanese houses. A few display horrible wounds of the extremities and back. The small quantity of fat which we possessed during this time of war was soon used up in the care of the burns. Father Rektor who, before taking holy orders, had studied medicine, ministers to the injured, but our bandages and drugs are soon gone. We must be content with cleansing the wounds.

More and more of the injured come to us. The least injured drag the more seriously wounded. There are wounded soldiers, and mothers carrying burned children in their arms. From the houses of the farmers in the valley comes word: "Our houses are full of wounded and dying. Can you help, at least by taking the worst cases?" The wounded come from the sections at the edge of the city. They saw the bright light, their houses collapsed and buried the inmates in their rooms. Those that were in the open suffered instantaneous burns, particularly on the lightly clothed or unclothed parts of the body. Numerous fires sprang up which soon consumed the entire district. We now conclude that the epicenter of the explosion was at the edge of the city near the Jokogawa Station, three kilometers away from us. . . .

Soon comes news that the entire city has been destroyed by the explosion and that it is on fire. . . . Father Stolte and Father Erlinghagen go down to the road which is still full of refugees and bring in the seriously injured who have sunken by the wayside, to the temporary aid station at the village school. There iodine is applied to the wounds but they are left

uncleansed. Neither ointments nor other therapeutic agents are available. Those that have been brought in are laid on the floor and no one can give them any further care. What could one do when all means are lacking? Under those circumstances, it is almost useless to bring them in. Among the passersby, there are many who are uninjured. In a purposeless, insensate manner, distraught by the magnitude of the disaster most of them rush by and none conceives the thought of organizing help on his own initiative. They are concerned only with the welfare of their own families. It became clear to us during these days that the Japanese displayed little initiative, preparedness, and organizational skill in preparation for catastrophes. They failed to carry out any rescue work when something could have been saved by a cooperative effort, and fatalistically let the catastrophe take its course. When we urged them to take part in the rescue work, they did everything willingly, but on their own initiative they did very little. . . .

[In the late afternoon, the fathers go into the city to try to assist other members of their mission who are injured.] Hurriedly, we get together two stretchers and seven of us rush toward the city. Father Rektor comes along with food and medicine. The closer we get to the city, the greater is the evidence of destruction and the more difficult it is to make our way. The houses at the edge of the city are all severely damaged. Many have collapsed or burned down. Further in, almost all of the dwellings have been damaged by fire. Where the city stood, there is a gigantic burned-out scar. We make our way along the street on the river bank among the burning and smoking ruins. Twice we are forced into the river itself by the heat and smoke at the level of the street.

Frightfully burned people beckon to us. Along the way, there are many dead and dying. On the Misasi Bridge, which leads into the inner city we are met by a long procession of soldiers who have suffered burns. They drag themselves along with the help of staves or are carried by their less severely injured comrades . . . an endless procession of the unfortunate. . . .

Finally we reach the entrance of the park. A large proportion of the populace has taken refuge there, but even the trees of the park are on fire in several places. Paths and bridges are blocked by the trunks of fallen trees and are almost impassable. We are told that a high wind, which may well have resulted from the heat of the burning city, has uprooted the large trees. It is now quite dark. Only the fires, which are still raging in some places at a distance, give out a little light.

At the far corner of the park, on the river bank itself, we at last come upon our colleagues. . . .

While they are eating the food that we have brought along, they tell us of their experiences. They were in their rooms at the Parish House—it was a quarter after eight, exactly the

time when we had heard the explosion in Nagatsuke—when came the intense light and immediately thereafter the sound of breaking windows, walls and furniture. They were showered with glass splinters and fragments of wreckage. . . . They had the same impression that we had in Nagatsuke: that the bomb had burst in their immediate vicinity. The Church, school, and all buildings in the immediate vicinity collapsed at once. Beneath the ruins of the school, the children cried for help. They were freed with great effort. Several others were also rescued from the ruins of nearby dwellings. . . . In the meantime, fires which had begun some distance away are raging even closer, so that it becomes obvious that everything would soon burn down. . . .

Beneath the wreckage of the houses along the way, many have been trapped and they scream to be rescued from the oncoming flames. They must be left to their fate. The way to the place in the city to which one desires to flee is no longer open and one must make for Asano Park. . . . In the park, we take refuge on the bank of the river. A very violent whirlwind now begins to uproot large trees, and lifts them high into the air. As it reaches the water, a waterspout forms which is approximately 100 meters high. The violence of the storm luckily passes us by. Some distance away, however, where numerous refugees have taken shelter, many are blown into the river. Almost all who are in the vicinity have been injured and have lost relatives who have been pinned under the wreckage or who have been lost sight of during the flight. There is no help for the wounded and some die. No one pays any attention to a dead man lying nearby.

The transportation of our own wounded is difficult. It is not possible to dress their wounds properly in the darkness, and they bleed again upon slight motion. As we carry them on the shaky litters in the dark over fallen trees of the park, they suffer unbearable pain as the result of the movement, and lose dangerously large quantities of blood. Our rescuing angel in this difficult situation is a Japanese Protestant pastor. He has brought up a boat and offers to take our wounded up stream to a place where progress is easier. First, we lower the litter containing Father Schiffer into the boat and two of us accompany him. We plan to bring the boat back for the Father Superior. The boat returns about one-half hour later and the pastor requests that several of us help in the rescue of two children whom he had seen in the river. We rescue them. They have severe burns. Soon they suffer chills and die in the park.

The Father Superior is conveyed in the boat in the same manner as Father Schiffer. . . . From the other side of the stream comes the whinny of horses who are threatened by the fire. We land on a sand spit which juts out from the shore. It is full of wounded who have taken refuge there. They scream for aid for they are afraid of drowning as the river may rise

with the sea, and cover the sand spit. They themselves are too weak to move. However, we must press on and finally we reach the spot where the group containing Father Schiffer is waiting.

Here a rescue party had brought a large case of fresh rice cakes but there is no one to distribute them to the numerous wounded that lie all about. We distribute them to those that are nearby and also help ourselves. The wounded call for water and we come to the aid of a few. Cries for help are heard from a distance, but we cannot approach the ruins from which they come. A group of soldiers comes along the road and their officer notices that we speak a strange language. He at once draws his sword, screamingly demands who we are and threatens to cut us down. Father Laures, Jr., seizes his arm and explains that we are German. We finally quiet him down. He thought that we might well be Americans who had parachuted down. Rumors of parachutists were being bandied about the city. . . .

On the Misasa Bridge, we meet Father Tappe and Father Luhmer, who have come to meet us from Nagatsuke. They had dug a family out of the ruins of their collapsed house some fifty meters off the road. The father of the family was already dead. They had dragged out two girls and placed them by the side of the road. Their mother was still trapped under some beams. They had planned to complete the rescue and then to press on to meet us. At the outskirts of the city, we put down the litter and leave two men to wait until those who are to come from Nagatsuke appear. The rest of us turn back to fetch the Father Superior.

Most of the ruins have now burned down. The darkness kindly hides the many forms that lie on the ground. Only occasionally in our quick progress do we hear calls for help. One of us remarks that the remarkable burned smell reminds him of incinerated corpses. The upright, squatting form which we had passed by previously is still there. . . .

About half past four in the morning, we finally arrive at the Novitiate. Our rescue expedition had taken almost twelve hours. Normally, one could go back and forth to the city in two hours. Our two wounded were now, for the first time, properly dressed. I get two hours sleep on the floor; some one else has taken my own bed. Then I read a *Mass in gratiarum actionem* [of thanks], it is the 7th of August, the anniversary of the foundation of our society. Then we bestir ourselves to bring Father Kleinsorge and other acquaintances out of the city.

We take off again with the hand cart. The bright day now reveals the frightful picture which last night's darkness had partly concealed. Where the city stood everything, as far as the eye could reach, is a waste of ashes and ruin. Only several skeletons of buildings completely burned out in the interior remain. The banks of the river are covered with dead and

wounded, and the rising waters have here and there covered some of the corpses. On the broad street in the Hakushima district, naked burned cadavers are particularly numerous. Among them are the wounded who are still alive. A few have crawled under the burnt-out autos and trams. Frightfully injured forms beckon to us and then collapse. An old woman and a girl whom she is pulling along with her fall down at our feet. We place them on our cart and wheel them to the hospital at whose entrance a dressing station has been set up. Here the wounded lie on the hard floor, row on row. Only the largest wounds are dressed. We convey another soldier and an old woman to the place but we cannot move everybody who lies exposed in the sun. It would be endless and it is questionable whether those whom we can drag to the dressing station can come out alive, because even here nothing really effective can be done. Later, we ascertain that the wounded lay for days in the burnt-out hallways of the hospital and there they died. . . .

We took under our care fifty refugees who had lost everything. The majority of them were wounded and not a few had dangerous burns. Father Rektor treated the wounds as well as he could with the few medicaments that we could, with effort, gather up. He had to confine himself in general to cleansing the wounds of purulent material. Even those with the smaller burns are very weak and all suffered from diarrhea. In the farm houses in the vicinity, almost everywhere, there are also wounded. Father Rektor made daily rounds and acted in the capacity of a painstaking physician and was a great Samaritan. Our work was, in the eyes of the people, a greater boost for Christianity than all our work during the preceding long years.

Three of the severely burned in our house died within the next few days. Suddenly the pulse and respirations ceased. It is certainly a sign of our good care that so few died. In the official aid stations and hospitals, a good third or half of those that had been brought in died. They lay about there almost without care, and a very high percentage succumbed. Everything was lacking: doctors, assistants, dressings, drugs, etc. In an aid station at a school at a nearby village, a group of soldiers for several days did nothing except to bring in and cremate the dead behind the school.

During the next few days, funeral processions passed our house from morning to night, bringing the deceased to a small valley nearby. There, in six places, the dead were burned. People brought their own wood and themselves did the cremation. Father Luhmer and Father Laures found a dead man in a nearby house who had already become bloated and who emitted a frightful odor. They brought him to this valley and incinerated him themselves. Even late at night, the little valley was lit up by the funeral pyres.

We made systematic efforts to trace our acquaintances and the families of the refugees whom we had sheltered. Fre-

quently, after the passage of several weeks, some one was found in a distant village or hospital but of many there was no news, and these were apparently dead. We were lucky to discover the mother of the two children whom we had found in the park and who had been given up for dead. After three weeks, she saw her children once again. In the great joy of the reunion were mingled the tears for those whom we shall not see again.

The magnitude of the disaster that befell Hiroshima on August 6th was only slowly pieced together in my mind. I lived through the catastrophe and saw it only in flashes, which only gradually were merged to give me a total picture. What actually happened simultaneously in the city as a whole is as follows: As a result of the explosion of the bomb at 8:15, almost the entire city was destroyed at a single blow. Only small outlying districts in the southern and eastern parts of the town escaped complete destruction. The bomb exploded over the center of the city. As a result of the blast, the small Japanese houses in a diameter of five kilometers, which comprised 99% of the city, collapsed or were blown up. Those who were in the houses were buried in the ruins. Those who were in the open sustained burns resulting from contact with the substance or rays emitted by the bomb. Where the substance struck in quantity, fires sprang up. These spread rapidly.

The heat which rose from the center created a whirlwind which was effective in spreading fire throughout the whole city. Those who had been caught beneath the ruins and who could not be freed rapidly, and those who had been caught by the flames, became casualties. As much as six kilometers from the center of the explosion, all houses were damaged and many collapsed and caught fire. Even fifteen kilometers away, windows were broken. It was rumored that the enemy fliers had spread an explosive and incendiary material over the city and then had created the explosion and ignition. A few maintained that they saw the planes drop a parachute which had carried something that exploded at a height of 1,000 meters. The newspapers called the bomb an "atomic bomb" and noted that the force of the blast had resulted from the explosion of uranium atoms, and that gamma rays had been sent out as a result of this, but no one knew anything for certain concerning the nature of the bomb.

How many people were a sacrifice to this bomb? Those who had lived through the catastrophe placed the number of dead at least 100,000. Hiroshima had a population of 400,000. Official statistics place the number who had died at 70,000 up to September 1st, not counting the missing . . . and 130,000 wounded, among them 43,500 severely wounded. Estimates made by ourselves on the basis of groups known to us show that the number of 100,000 dead is not too high. Near us there are two barracks, in each of which forty Korean workers lived.

On the day of the explosion, they were laboring on the streets of Hiroshima. Four returned alive to one barracks and sixteen to the other. 600 students of the Protestant girls' school worked in a factory, from which only thirty to forty returned. Most of the peasant families in the neighborhood lost one or more of their members who had worked at factories in the city. Our next door neighbor, Tamura, lost two children and himself suffered a large wound since, as it happened, he had been in the city on that day. The family of our reader suffered two dead, father and son; thus a family of five members suffered at least two losses, counting only the dead and severely wounded. There died the Mayor, the President of the central Japan district, the Commander of the city, a Korean prince who had been stationed in Hiroshima in the capacity of an officer, and many other high ranking officers. Of the professors of the University, thirty-two were killed or severely injured. Especially hard hit were the soldiers. The Pioneer Regiment was almost entirely wiped out. The barracks were near the center of the explosion.

Thousands of wounded who died later could doubtless have been rescued had they received proper treatment and care, but rescue work in a catastrophe of this magnitude had not been envisioned; since the whole city had been knocked out at a blow, everything which had been prepared for emergency work was lost, and no preparation had been made for rescue work in the outlying districts. Many of the wounded also died because they had been weakened by under-nourishment and consequently lacked in strength to recover. Those who had their normal strength and who received good care slowly healed the burns which had been occasioned by the bomb. There were also cases, however, whose prognosis seemed good who died suddenly. There were also some who had only small external wounds who died within a week or later, after an inflammation of the pharynx and oral cavity had taken place. We thought at first that this was the result of inhalation of the substance of the bomb. Later, a commission established the thesis that gamma rays had been given out at the time of the explosion, following which the internal organs had been injured in a manner resembling that consequent upon Roentgen irradiation. This produces a diminution in the numbers of the white corpuscles.

Only several cases are known to me personally where individuals who did not have external burns later died. Father Kleinsorge and Father Cieslik, who were near the center of the explosion, but who did not suffer burns became quite weak some fourteen days after the explosion. Up to this time small incised wounds had healed normally, but thereafter the wounds which were still unhealed became worse and are to date [in September 1945] still incompletely healed. The attending physician diagnosed it as leucopenia. There thus seems to be some truth in the statement that the radiation had

some effect on the blood. I am of the opinion, however, that their generally undernourished and weakened condition was partly responsible for these findings. It was noised about that the ruins of the city emitted deadly rays and that workers who went there to aid in the clearing died, and that the central district would be uninhabitable for some time to come. I have my doubts as to whether such talk is true and myself and others who worked in the ruined area for some hours shortly after the explosion suffered no such ill effects.

None of us in those days heard a single outburst against the Americans on the part of the Japanese, nor was there any evidence of a vengeful spirit. The Japanese suffered this terrible blow as part of the fortunes of war . . . something to be borne without complaint. During this, war, I have noted relatively little hatred toward the allies on the part of the people themselves, although the press has taken occasion to stir up such feelings. After the victories at the beginning of the war, the enemy was rather looked down upon, but when allied offensive gathered momentum and especially after the advent of the majestic B-29's, the technical skill of America became an object of wonder and admiration.

The following anecdote indicates the spirit of the Japanese: A few days after the atomic bombing, the secretary of the University came to us asserting that the Japanese were ready to destroy San Francisco by means of an equally effective bomb. It is dubious that he himself believed what he told us. He merely wanted to impress upon us foreigners that the Japanese were capable of similar discoveries. In his nationalistic pride, he talked himself into believing this. The Japanese also intimated that the principle of the new bomb was a Japanese discovery. It was only lack of raw materials, they said, which prevented its construction. In the meantime, the Germans were said to have carried the discovery to a further stage and were about to initiate such bombing. The Americans were reputed to have learned the secret from the Germans, and they had then brought the bomb to a stage of industrial completion.

We have discussed among ourselves the ethics of the use of the bomb. Some consider it in the same category as poison gas and were against its use on a civil population. Others were of the view that in total war, as carried on in Japan, there was no difference between civilians and soldiers, and that the bomb itself was an effective force tending to end the bloodshed, warning Japan to surrender and thus to avoid total destruction. It seems logical to me that he who supports total war in principle cannot complain of war against civilians. The crux of the matter is whether total war in its present form is justifiable, even when it serves a just purpose. Does it not have material and spiritual evil as its consequences which far exceed whatever good that might result? When will our moralists give us a clear answer to this question?

Section VI

The Long-Term International Impact

World War II had a permanent and massive impact on the postwar international scene. As early as August 1941, when Roosevelt drafted the Atlantic Charter, U.S. leaders had begun to promise a world based on liberal internationalist principles, promising all peoples democracy and self-determination as one of the Allied war aims. Many American officials hoped that, through advice, aid, and encouragement, their country would be able to promote benevolent political, social, and economic change around the world, converting developing and formerly colonized regions and nations into model liberal social democracies. Throughout Europe, in exchange for popular support during the war, governments promised social reforms aimed at improving the lot of the average man or woman. Many influential European intellectuals now argued that an economically and politically united continent, preferably run on social democratic welfare-state principles, was their only safeguard against further fratricidal European conflicts.

Some portents were less benign. The Soviet Union targeted a major espionage effort against its British and American allies, and in pursuit of national security sought old-fashioned spheres of influence in both Eastern Europe and Asia, which geographical and strategic considerations led the somewhat uncomfortable Roosevelt and Churchill to promise Stalin at the February 1945 Yalta Conference. Even where Japanese forces had not triumphed during the war, as in India, popular Asian nationalist movements threatened to overturn European imperial rule. In much of Asia, including China and French Indochina, anti-colonial or anti-foreign nationalism went hand-in-hand with communism, arousing apprehensions among Western leaders that, if radical nationalist groups gained power, they would turn in fraternal loyalty to the communist Soviet Union. Faced with an uncertain international situation, top U.S. military and civilian officials sought decisive and permanent enhancements of their country's strategic position, intelligence capabilities, and armed forces.

6.1. The Atlantic Charter

The Atlantic Charter, 14 August 1941

Drafted and signed while President Franklin D. Roosevelt and British Prime Minister Winston Churchill met secretly at sea in Argentia Harbor, off Placentia Bay on the Newfoundland coast, from 8 to 12 August 1941, the Atlantic Charter was issued publicly by Britain and the United States on 14 August 1941. Although—in an encounter Churchill had completely forgotten—the two men had met briefly at a London dinner in 1918 when both held less eminent government positions in their own countries, this was their first meeting as president and prime minister. In World War II, the practice began of heads of government holding “summit” meetings with each other where they could personally discuss and decide important

issues. The Atlantic Conference was the first of several such wartime gatherings of the top Allied leaders. The most frequent meetings were those between Roosevelt and Churchill, but the two men twice met with Soviet leader Josef Stalin, at Tehran in 1943 and Yalta in 1945, and once with Chinese president Jiang Jieshi (Chiang Kai-shek), at Cairo in 1943. The final such summit meeting was that at Potsdam in July 1945, attended by Stalin, when Clement Attlee replaced Churchill as British prime minister and Harry S. Truman had become president of the United States. Churchill also met at least once with Stalin on an individual basis, in Moscow in 1944.

In August 1941, Britain had been at war with Germany for two years and with Italy since June 1940, but strictly speaking, the United States was still neutral in the war. In reality, Roosevelt had so directed his country's policies that he was

serving as an undeclared ally of Britain: all German, Italian, and even Japanese assets in the United States were by this time frozen, and the U.S. government declared the entire Western Hemisphere off-limits to Axis naval vessels, took over the defense of Iceland and Greenland, exchanged surplus American destroyers for British naval bases in the Caribbean, and under the March 1941 Lend-Lease Act, furnished ever increasing amounts of war supplies to Britain on deferred payment terms. It seemed not improbable that Roosevelt, who had already launched a massive defense buildup at home, would make some minor military or naval clash between U.S. and German forces into the pretext for declaring outright war against Germany.

Besides giving Roosevelt, Churchill, and their top military advisers and other associates an extended opportunity to get to know each other, the Atlantic Conference meeting had two other functions. One was to coordinate future British and American strategy in both Europe and the Pacific. The second was to issue a statement of war objectives behind which all the nations and groups currently massed against the Axis nations could unite. For Churchill, who had previously refused to make any such proclamation on the grounds that it was premature when victory was still a distant prospect and the shape of the world at that time remained highly unclear, this was not a high priority. The Americans, however, wanted a definite joint statement of war aims, and Churchill feared that “the President will be very much upset” if the two countries could not reach agreement upon one. Anxious to placate the United States, upon whom his own country’s war effort was by now so heavily dependent, Churchill therefore yielded. Roosevelt, on his part, sought an idealistic program of liberal war aims around which he could rally American and international public opinion, thereby legitimizing and justifying his steady incremental moves toward war as part of a broader quest toward a fairer and better liberal world order that could be achieved in no other way.

The Atlantic Charter represented the first formal statement of the principles and objectives for which both original signatory powers were fighting. British officials were nonetheless concerned that the principles enunciated therein might compromise their special economic relations with the rest of the British Empire and later added a rider specifically exempting all such arrangements from the provisions of the Atlantic Charter. The Soviet Union had not been consulted at all, and before adhering to the Charter, it too later made significant reservations regarding its own rights in other territories.

About the Document

The Atlantic Charter was a formal statement, designed for international public consumption, and was also the product

of fairly hard bargaining between the two original signatory powers. As with many general international declarations, its language was not only idealistic and formal but also quite deliberately vague, in part to induce other Allied nations to endorse it, at least in principle. No exact pledges were made regarding the postwar disposition or government of any specific territory, in part because it was far too early to predict precisely what conditions would prevail when the war ended. The drafters were well aware, if only because they remembered the situation at the end of World War I, that making definite promises to any nation or group could readily become extremely contentious, delighting the potential beneficiaries but at the price of alienating those who were likely to lose out and leading every other nation or group to demand similar commitments. The signatories therefore restricted themselves to extremely broad, general, and insofar as possible noncontroversial statements of impeccably liberal principles: that they themselves sought no territorial or other aggrandizement to their own power; that international changes must “accord with the freely expressed wishes of the peoples concerned”; that all peoples should have the right to choose their own form of government; that all nations should have equal access to international trade and raw materials; that they would encourage international economic development and the improvement of all peoples’ socioeconomic conditions; that they would endeavor to facilitate the establishment of a peaceful postwar international order in which all individuals “may live out their lives in freedom from fear and want”; that they supported international freedom of the seas; and that postwar disarmament of previously “aggressi[ve]” nations would be essential.

The Atlantic Charter’s fundamental purpose was to provide a broad public statement of principles around which all those fighting the Axis could unite. Although nonbinding, it would serve to indicate the overall Allied objectives in the war. It was also intended to differentiate Allied methods and tactics from such favored Axis policies as the rule of terror, economic autarky, and the forcible annexation and economic exploitation of other nations. Even the two original signatories soon further clarified their position. One week after the Atlantic Charter was published, on 21 August 1941, Roosevelt sent the U.S. Congress a message enclosing its text, in which he stated that there could be no compromise or negotiated peace with Nazism and added an interpretive comment, essentially expanding the Atlantic Charter, to the effect that “the declaration of principles includes of necessity the world need for freedom of religion and freedom of information. No society of the world organized under the announced principles could survive without these freedoms which are a part of the whole freedom for which we strive” (Rosenman 1938–1950, vol. 10:334).

In late September 1941, representatives of those European governments—many of them from countries then under German occupation—fighting Hitler and his allies met in London and endorsed the Atlantic Charter. Churchill had already promised his Parliament that this agreement's fourth point would not be allowed to compromise the special economic relationships existing within the British Empire; nor, undoubtedly, did he interpret the third point as diluting Britain's control of its colonial empire. At the same gathering, Soviet officials likewise made significant reservations when endorsing the Atlantic Charter, stating that the Soviet Union "defends the right of every nation to the independence and territorial integrity of its country and its right to establish such a social order and to choose such a form of government as it deems opportune and necessary for the better promotion of its economic and cultural prosperity," but adding that "the practical application of these principles will necessarily adapt itself to the circumstances, needs, and historic peculiarities of particular countries" (Schlesinger 1973, vol. 2:4). The significance of these reservations would become apparent later, when Soviet leaders demanded what were in effect special tutelary rights over those east European states that Russian military forces controlled when the war ended. Stalin had no intention of allowing broad general declarations of principle to detract from his ability to pursue and protect what he perceived as his own country's national security interests.

On New Year's Day, 1942, 28 nations and groupings fighting the Axis, including the United States, Britain, and the Soviet Union, signed a "Declaration of the United Nations," pledging themselves to make no separate peace with any Axis power before victory was attained and to accept the principles of the Atlantic Charter. In no way, however, did this modify the earlier reservations some had expressed. As with many other broad international declarations of intent, the degree to which the principles enshrined in the Atlantic Charter were implemented in practice would depend primarily upon the readiness of its signatories to accept them and put them into effect. By the end of 1941, it was already apparent that some of the more influential members of the Allied coalition might well refuse to do so in full.

Primary Source

Excerpts from the Atlantic Charter, 14 August 1941

The President of the United States of America and the Prime Minister, Mr. Churchill, representing His Majesty's Government in the United Kingdom, being met together, deem it right to make known certain common principles in the national policies of their respective countries on which they base their hopes for a better future for the world.

First, their countries seek no aggrandizement, territorial or other;

Second, they desire to see no territorial changes that do not accord with the freely expressed wishes of the peoples concerned;

Third, they respect the right of all peoples to choose the form of government under which they will live; and they wish to see sovereign rights and self government restored to those who have been forcibly deprived of them;

Fourth, they will endeavor, with due respect for their existing obligations, to further the enjoyment by all States, great or small, victor or vanquished, of access, on equal terms, to the trade and to the raw materials of the world which are needed for their economic prosperity;

Fifth, they desire to bring about the fullest collaboration between all nations in the economic field with the object of securing, for all, improved labor standards, economic advancement and social security;

Sixth, after the final destruction of the Nazi tyranny, they hope to see established a peace which will afford to all nations the means of dwelling in safety within their own boundaries, and which will afford assurance that all the men in all lands may live out their lives in freedom from fear and want;

Seventh, such a peace should enable all men to traverse the high seas and oceans without hindrance;

Eighth, they believe that all of the nations of the world, for realistic as well as spiritual reasons must come to the abandonment of the use of force. Since no future peace can be maintained if land, sea or air armaments continue to be employed by nations which threaten, or may threaten, aggression outside of their frontiers, they believe, pending the establishment of a wider and permanent system of general security, that the disarmament of such nations is essential. They will likewise aid and encourage all other practicable measures which will lighten for peace-loving peoples the crushing burden of armaments.

6.2. Plans for a United Europe

World War II as a Stimulus to European Unity

World War II gave an enormous impetus to proposals for the creation of an integrated European state. At least since World War I, when some Europeans and Americans, including Jean Monnet, the future founder of the European Coal and Steel Community, thought that the wartime Allied cooperative economic machinery provided a model for the future unification of Europe, suggestions for closer union among the European nations, sometimes in collaboration with the United States, had appeared from time to time. In 1935, the British Liberal politician Lord Lothian delivered a well-publicized lecture in which he suggested that the European democracies, the British Empire and, if possible, the United States, should join together in a federal state, its implicit purpose the creation of a bloc strong enough to resist the growing strength of the increasingly coherent fascist grouping of Germany, Italy, and Japan. Although Lothian was primarily interested in forming an alliance between the United States and the British Empire, his address later became one of the inspirations for leading figures in the European federalist movement, especially the Italian intellectuals and democratic socialists Altiero Spinelli and Ernesto Rossi, who drew on Lothian's ideas when writing their own seminal manifesto on the subject in 1941, while interned on the island of Ventotene.

To many thoughtful Europeans, the outbreak of war in 1939 seemed conclusive proof that, unless European countries could moderate their nationalist tendencies through some form of economic and political federation, future wars as destructive or even more so than those that began in 1914 and 1939 were inevitable. Monnet, who spent much of the war in the United States as a representative of the Free French forces, spread this gospel among his influential American associates, winning the support of many among them for his plans for European political and economic integration. Those

he converted to his own viewpoint included the brothers John Foster Dulles, a future secretary of state, and Allen W. Dulles, later director of the Central Intelligence Agency (CIA); William J. Donovan, founder and director of the Office of Strategic Services (OSS), the wartime American overseas intelligence agency; David K. E. Bruce, head of the OSS European bureau and a future ambassador to France, West Germany, and Great Britain; John J. McCloy, assistant secretary of war from 1941 to 1945, who later served as the first civilian U.S. high commissioner in Germany; and George W. Ball, a Francophile young lawyer who would later become under-secretary of state in the administrations of Presidents John F. Kennedy and Lyndon B. Johnson. After the war, all would help to rally American support for closer European integration as one means of neutralizing the bitter internecine rivalries and suspicions that had helped to precipitate the outbreak of both world wars.

Within wartime Europe, a number of influential intellectuals made extensive efforts to publicize their belief that closer European integration would be fundamental to the postwar world. Most were noncommunists, but in many cases, they were democratic socialists who believed that any new European order must also rest firmly upon socialist principles, especially the genuine improvement of working-class living standards. This was true of the Italians Spinelli and Rossi, whose writings circulated clandestinely throughout their country. Within France, socialist resistance groups likewise affirmed their beliefs in European unity and the introduction of socialist principles. In July 1942, three moderate socialist resistance leaders in southern France—the former army officer Henri Frenay, Claude Bourdet, later a journalist and vice president of the postwar French consultative assembly, and the lawyer André Hauriou—published a manifesto intended to clarify their movement's long-term aims and to provide attractive and idealistic objectives that would inspire their members to fight on in circumstances that were often difficult and dangerous. The three men belonged to Combat, the most prominent of all early French resistance groups. They advocated not just the overthrow of German rule in France but also the rejection of the Vichy government's corporatist policies and the establishment of a new republic in France, based on socialist principles and the improvement of the "conditions of life" of the working class, together with the creation of a European federation. The three men had even broader long-term goals, perceiving European integration as a mere way station on the road to the creation of a genuine world union.

European centrists also rallied to the cause of European unification. As early as spring 1940, the highly respected French Catholic intellectual and philosopher Jacques Maritain (1882–1973), whom the fall of France shortly afterwards sent into exile in the United States, proposed European federation as the only means of preventing further European

conflicts. Only so, he thought, would it be possible both to avoid a humiliating and coercive peace settlement that would provoke further German resentment and to provide France the security it needed against future German aggression. Maritain believed that Britain and France might provide initial guidance and leadership to any European federal grouping, especially if they “purified” themselves by renouncing formal political control of their imperial possessions. He also contemplated the breakup of Germany into its original constituent states, which had only been united into one nation during the mid-nineteenth century. In part, Maritain’s proposals represented a response to German claims to represent a “new order” in Europe. Within occupied France, his later writings and lectures on the subject were published and distributed clandestinely. Maritain spent the war years in the United States, teaching at Princeton and Columbia Universities, which gave him additional opportunities to familiarize Americans with his views. Such was his prestige that from 1944 to 1948 he was liberated France’s ambassador to the Vatican. Another leading Catholic politician who took up ideas of European union was the future French Foreign Minister Robert Schuman, who came from the disputed German-French territory of Alsace-Lorraine and spent most of the war on the run, sheltering in assorted monasteries and reading extensively in theology and political thought.

Interestingly, within Germany itself, there existed a group of centrist Christian intellectuals and officials who shared many of the views expounded by Maritain and European social democrats. The “Kreisau Circle,” clustered around the aristocratic Count Helmuth James von Moltke, were liberal socialists who sought the overthrow of German Führer Adolf Hitler, a negotiated peace, and the total remaking of Germany’s political and social system on liberal and democratic lines. They developed extensive plans for postwar Germany, envisaging a Christian democratic nation in which the state would assume major economic and social functions, and power would be divided between the central and provincial governments. They also advocated the integration of the various European countries into a federal system. After 1945, much of what they suggested eventually became reality within West Germany, though unfortunately, rather few of them survived to see this development, due to their implication in the 1944 assassination plot against Hitler and their subsequent execution. However, many other supporters of European integration—French, Italian, Belgian, Dutch, and Scandinavian—survived the war and subsequently participated in the implementation of plans for closer European integration, in the late 1940s and 1950s, helping to develop the Marshall Plan, the North Atlantic Treaty Organization, the European Coal and Steel Community, and then the broader European Economic Community, the ancestor of the current European Union.

About the Documents

Both these documents were public statements intended to win broad public support for their authors’ position. In both cases, the primary audience was the population of France, many of whom were experiencing the rigors of direct German occupation, and the remainder of which was under the conservative rule of the collaborationist Vichy government. After the fall of France, Maritain’s political writings could be circulated only clandestinely within France, and if possible, this was even more true of the southern resistance journal *Combat*, in which the manifesto “Combat and Revolution” appeared. Both these documents were designed to give French people hope during a dark period and to persuade them to refuse simply to acquiesce in German hegemony over Europe and German plans for a new European order by providing alternative political goals and objectives.

The Catholic Maritain perhaps took the darker view of human nature, arguing that closer European integration, spearheaded by Britain and France, was the only alternative to further destructive wars. The three leftist (but noncommunist) resistance leaders, all of whom were fortunate enough to survive the war (though Bourdet was captured by the Gestapo in 1944 and imprisoned in Sachsenhausen and Buchenwald concentration camps), were rather more idealistic and also very general in their stated aims, envisaging “the dawn of a new civilization” that would “introduce into France a spirit of generosity, greatness and daring.” Interestingly, at this time the eight major French resistance groups were engaged in discussions intended to bring about the formation of a unified and coordinated resistance movement. Frenay, Bourdet, and Hauriou probably sought not only to hearten the morale of their own supporters, but also to provide an inspirational statement of their own position that would define their stance during these ongoing negotiations.

Primary Source

A) Jacques Maritain on European Unity, 1940

The war in which the peoples of France and Britain have been involved is a just war on their part. The peace for which they are fighting must be a just peace. That means that Europe will have to be refashioned, taking into account the real, natural and historical conditions of its component peoples; all ideas of empire and domination must give way to a spirit of cooperation, while guarding against any reawakening of aggressive powers. Only thus can we prevent the recurrence of general war every twenty-five years.

As far as one can speak today of a future peace which will have to be framed in circumstances that cannot yet be foreseen, it is vital to avoid basing the discussion on a false conception of the problem. A large section of British opinion rightly urges the need for a federal solution which would

respect the natural aspirations of the Germanic peoples as well as the other peoples of Europe, and would do away with the apparatus of humiliation and vindictive coercion that vitiated the last peace and prepared the way for Hitler. A large part of French opinion rightly insists on the need—not only for French security, but in order that a lasting European regime may be established—to prevent large-scale German rearmament and extirpate Prussian imperialism, while avoiding the political mistakes and weakness which also vitiated the last peace and prepared the way for Hitler. These two attitudes are perfectly compatible, and it would be absurd to treat them as opposites. . . .

We must not tire of repeating that sooner or later, when the present convulsions and perhaps other sufferings are over, a federal solution will be seen as the only way out for Europe, and also for Germany herself. With an imperialist Germany formed by Prussia and the Prussian spirit into an iron unity, a kind of monstrous giantism, a European federation would soon turn into a European servitude with no hope of redemption except by more savage wars. With an inorganic Europe of rival states jealously guarding all the privileges of their sovereignty, a Germany kept down by force in a state of guilt and division would inevitably devote its energy and tenacity to pressing embittered claims which would once more involve the world in ruin. What we must have, once the Hitlerian dream has been drowned in blood, is a federal solution with the assent of Europe and the German peoples delivered from Nazism and the Prussian spirit; in other words, a political plurality of German states reflecting the diversity of their cultural heritage and integrated in a European federation whose members would all agree to the diminution of sovereignty necessary for the purpose of organic institutional cooperation. No doubt there will be many a profound and terrible upheaval before we reach that goal, but we believe it is the only hope for Europe and Western civilization. . . .

Of course any ideal can be betrayed, and the idea of European federation, like any other great idea, can be ruined by egoism and blind ambition seeking to exploit it to its own advantage. Men of good will must be vigilant to avert this evil. But everything leads us to think that post-war conditions in the world will be such that any attempt to subject it to imperialist designs will be doomed to failure.

We should also note that, whereas the Prussian mind cannot conceive of a federal Europe except as a Europe enslaved to Germany, Britain is now alive to the idea of re-making Europe and France has become more aware of the interdependence of all nations. Between them these two are strong enough to raise the idea of a European federation above any imperialistic design and to make it conform to the essential purpose of cooperation and the common weal. A great deal of moral purification is here needed, and is possible. Britain

can purify her sense of empire, retaining only the idea of a free commonwealth based on political friendship; France can purify her sense of the nation state, retaining only the organic and political unity of the motherland, which will not be weakened but enhanced by entry into a federal structure. On both sides there must be acceptance of the diminution of state sovereignty required for the sake of a genuine international organization. If this surrender is conceived in the name of liberty, it will lead finally to the establishment of what may rightfully be called a new Christendom.

B) Extract from Manifesto, “Combat and Revolution”

The revolution that we bear within ourselves will be socialist because the moment has come to stop talking and take action to wrest from a powerful oligarchy the control and benefit of the economy, and to restore important sectors of the economy to the nation or, if appropriate, to communities of producers and consumers.

Contrary to Vichy’s policy, which has consolidated large-scale capitalism by the Comité d’Organisation, we want to see workers sharing in the life and profits of enterprises. We shall improve their conditions of life by pooling the benefits of technical progress.

The revolution that we bear within ourselves is more than a material revolution—it is a revolution of the mind, of youth and of the people.

The bourgeois Republic was built on narrow selfishness and on fears that were ill-concealed by the rhetoric of goodwill.

The men of the Resistance, hardened by daily trials, will introduce into France a spirit of generosity, greatness and daring.

The path of learning will be genuinely open to all, as part of their education, and will train character as well as the mind. Thus it will bring forth from the heart of the nation a genuine elite which can be constantly renewed. If an elite cannot renew itself, it dies.

We wish to bring about a harmonious synthesis between victorious individualism and a generous awareness of the community.

The revolution that we bear within is the dawn of a new civilization. That is what the worldwide civil war is about.

History teaches us that frontiers are constantly widening.

The United States of Europe—a stage on the road to world union—will soon be a living reality for which we are fighting.

Instead of a Europe which is not united but enslaved under the yoke of a power-intoxicated Germany, we and the other peoples will create a united Europe on the basis of liberty, equality, fraternity and the rule of law.

Frenchmen of town and country, we call on you to fight for the liberation of our territory from dictatorship and for economic and spiritual freedom. Join the ranks of Combat, which is fighting for France from Dunkirk to Bayonne, from Brest to Nice and in the overseas empire.

With General de Gaulle and the Fighting French forces alongside the United Nations we shall win the war and overthrow Fascism. After that we shall remake France.

6.3. Planning for the Postwar World

Wartime Demands for Reform: The Western Democracies

In many countries around the world, the wartime experience helped to radicalize politics and generate demands for postwar social reforms designed to improve the living standards

of ordinary people. One common argument within Western democracies, which even some officials in Nazi Germany employed when advocating additional social measures, was that, in return for their support for an all-out war effort, the mass of the people deserved to be rewarded with extensive social reforms designed to create a welfare state. Salient features of such plans normally included the provision of old-age pensions, sickness and unemployment benefits, free or subsidized medical care and education, and good-quality state housing. In Britain, bombing raids upon substandard slum housing in the larger urban centers, including the capital city of London, sensitized the ruling elite to just how inadequate living conditions were for large portions of the population. Representatives of the British Labour Party and trade union movement who joined the coalition government that prosecuted the war expected extensive social reforms as the price of their support. Many remembered that during World War I, British Prime Minister David Lloyd George had promised that those soldiers who fought for their country would return to a “land fit for heroes,” a pledge that evaporated as interwar Britain faced long-term unemployment and economic depression. They were determined that history should not repeat itself once World War II was over. By the early 1940s, there also existed across Europe appreciable disillusionment with the leadership offered by the traditional ruling classes, the members of which had notably failed to avert the impending war during the 1930s and many of whom had lost their moral authority by compromising or collaborating with fascism or at least expressing their readiness to do so before the war.

Demands for social reform met very different fates in the two largest Western Allies, Great Britain and the United States. In 1940, the British Minister of Labour, Ernest Bevin, a leading trade unionist, commissioned Sir William Beveridge to investigate the existing haphazard schemes of social security and prepare a report that would make recommendations as to how best to introduce a comprehensive scheme. Using a term drawn from one of U.S. President Franklin D. Roosevelt’s best-known wartime speeches, Beveridge’s 300-page report, presented in November 1942, called upon the British government to ensure “freedom from want” by implementing a comprehensive scheme of state-administered social insurance, funded by contributions from employers and employees, which would include old-age pensions, unemployment insurance, and sickness benefits. He also called for the introduction of children’s allowances for all, to ensure that large families were not economically disadvantaged, together with a range of maternity benefits; and the establishment of comprehensive health coverage for all the population. Beveridge viewed the war against want as only part of a broader attack on social evils, the others being “Disease, Ignorance, Squalor and Idleness,” the eradication of

which was the broad objective of what would soon become known as the welfare state. Beveridge did not envisage a fully socialist system in which the state would take all responsibility for individual welfare but one in which individuals would be free to supplement the basic provision guaranteed by the state, and private and public efforts would be harmonized.

The Labour Party quickly expressed its support for the Beveridge Report, which became part of the social reformist platform on which it fought and won a sweeping victory in the 1945 British general election. In the interim, the Churchill coalition government passed the 1944 National Education Act, which for the first time in Britain made education up to the age of 15 universally available for free, a major feature of Beveridge's demand that "Ignorance" should be eliminated. When the Labour government took power under Prime Minister Clement Attlee, it implemented the national insurance system and children's allowances envisaged in the Beveridge Report in 1946, introducing free milk for schoolchildren the same year, and established the British National Health System two years later, which provided medical care for all virtually free at the point of service. Funding these services required heavy rates of taxation on upper and middle-class incomes. Within a few years of the war's end, similar measures were introduced in most other Western European democracies, and in these countries, for several decades, most political parties of both Left and Right accepted the fundamental desirability of the welfare state.

Franklin D. Roosevelt's call for an Economic Bill of Rights met a very different reception. By 1938, a congressional political coalition of Republican and conservative southern Democrats had largely checked his ability to pass any further New Deal social reformist legislation. Domestic frustration was one reason why, during World War II, Roosevelt proclaimed that "Dr. Win-the-War" had replaced "Dr. New Deal." Many congressional representatives viewed the war as an ideal opportunity to eviscerate many of the New Deal programs they found most opprobrious. Roosevelt himself, however, never abandoned his commitment to additional social reforms. In 1943, the National Resources Planning Board (NRPB), a government agency charged with developing proposals to ensure continued postwar full employment and prosperity, issued two reports, *Security, Work, and Relief Policies* and *Post-War Plan and Program*, advocating a "new [economic] bill of rights" to guarantee that all Americans could enjoy good jobs, housing, food, social insurance, medical benefits, and recreational opportunities. Congressional conservatives promptly liquidated the NRPB, but the president took up its proposals, which became part of his State of the Union Address delivered at the beginning of 1944. In this address, delivered at a time when several well-publicized strikes had recently occurred and Americans were beginning to resent the demands of war, the president demanded a new

spirit of national unity in the war effort, calling for the introduction of higher taxes on war profits, legislation to permit the renegotiation of war contracts on terms less advantageous to business, the continuing stabilization of food and other prices, and the passage of a National Service Act that would apply to civilians as well as military draftees. He affirmed his belief that the United States could not withdraw from international affairs in the future. Warning that political and economic freedom were interdependent and indivisible, Roosevelt then appealed for the passage of a new "economic bill of rights," under which all Americans would be assured a productive job at reasonable pay that would promise them a decent living standard and would also have a right to "a decent home," "adequate medical care," insurance against unemployment, sickness, and old age, and "a good education." Farmers, he stated, should obtain fair prices for their crops, and businessmen protection against unfair competition and monopolies. Roosevelt called upon Congress to pass legislation to this effect, to satisfy the fighting men overseas and their families at home who were supporting the war effort.

Roosevelt's appeals for reform largely fell upon deaf ears. Many congressional representatives were deeply hostile to broad social reforms and felt that the New Deal had already gone too far in the direction of egalitarianism. The most they were willing to sanction was legislation that would benefit veterans enlisted in the armed services during the war. During the first half of 1944, the president himself, in flagging health, concentrated on the prosecution of the war and had little energy to devote to pushing his proposed Economic Bill of Rights. He did, however, put himself firmly behind the GI Bill of Rights or Servicemen's Readjustment Act, passed in mid-1944, which provided a liberal package of benefits for every returning American serviceman, including job preferences and substantial unemployment and health benefits, generous educational assistance, and subsidized loans to purchase houses or businesses. For many young American men, this was their passport to a middle-class lifestyle previously unavailable to their families. When signing this bill and on other occasions, Roosevelt repeatedly but unsuccessfully urged that such benefits should be extended to all Americans, not just veterans. The president even toyed with the idea of breaking with the conservatives in his own Democratic Party and emulating the action of his wife's uncle and his own role model, former President Theodore Roosevelt, early in the twentieth century by forming a third, progressive party under his own leadership, to act as a magnet for liberal forces. The increasing ill health that brought Roosevelt's death in April 1945 meant that he never had a chance to put any such plans into practice. Whether they would have proved effective must therefore remain a moot point. Under Roosevelt's successors, however, the United States undoubtedly followed domestic

policies considerably more conservative than those most Western European nations contemporaneously adopted.

About the Author

Beveridge, the Indian-born son of a judge in the Bengal Civil Service, trained as a lawyer but soon developed an interest in social services and unemployment insurance. In 1909, he joined the British Board of Trade and helped to establish a national system of labor exchanges for the unemployed. His ideas contributed to the passage of the National Insurance Act in 1911. During World War I, he became a civil servant and helped to mobilize and organize British manpower. From 1919 to 1937, Beveridge was director of the London School of Economics, serving on various government commissions and committees concerned with social policy. In 1937, Beveridge became master of University College, Oxford. After presenting the Beveridge Report, he entered parliament in 1944 as a Liberal, serving there until he lost his seat in the Labour landslide of 1945. In 1946, Beveridge entered the House of Lords and later served as leader of the Liberal Party. His true claim to fame, however, was as the father of the “cradle-to-the-grave” British welfare state.

About the Documents

The two excerpts included here are both taken from substantially longer official documents, each written or delivered with a specific purpose in mind. Beveridge’s report was written by an expert on the subject at the request of a government minister. Its author knew that it was likely to find a receptive audience. It was a long and detailed document of 300 pages, which discussed plans for the creation of a comprehensive British scheme of national insurance in considerable detail. Beveridge was more politically adept than many experts in that he included a brief summary of its recommendations and principles that would be readily comprehensible to the average reader—and this may well have included the majority of members of parliament—who was unlikely to wish to plough through the entire report. He realized, moreover, that, however technical many of its pages might be, his report and its implications would inevitably generate enormous publicity and media coverage. The bulk of the document, however, was devoted to the detailed technical description of a wide-ranging social insurance scheme, which referred where appropriate to the detailed findings of numerous social surveys and to the minutiae of the existing situation in Britain and of similar schemes that had been introduced in other countries. It was essentially a technical document, designed for an audience of specialized experts, the ultimate significance of which lay in the fact that, unlike many such documents, within a few years its major recommendations were actually implemented, with enormous long-term political and social consequences for Britain overall.

Roosevelt’s speech, by contrast, was designed to persuade both Congress and the American public, its ultimate audience, to throw their support behind a sweeping program of social reforms. The proposals he advocated might well have ultimately resembled the recommendations of the Beveridge Report, but Roosevelt described them in far less detail, only setting out general principles. He was delivering an address in which he sought to appeal to a general audience by describing the overall impact of the measures he proposed, rather than presenting a very detailed program the specifics of which, he knew only too well from experience, Congress was in any case likely to modify. In this case, Roosevelt’s appeal was far less effective than the Beveridge Report in winning popular support for extensive social reforms.

THREE GUIDING PRINCIPLES OF RECOMMENDATIONS

6. In proceeding from this first comprehensive survey of social insurance to the next task—of making recommendations—three guiding principles may be laid down at the outset.
7. The first principle is that any proposals for the future, while they should use to the full the experience gathered in the past, should not be restricted by consideration of sectional interests established in the obtaining of that experience. Now, when the war is abolishing landmarks of every kind, is the opportunity for using experience in a clear field. A revolutionary moment in the world’s history is a time for revolutions, not for patching.
8. The second principle is that organisation of social insurance should be treated as one part only of a comprehensive policy of social progress. Social insurance fully developed may provide income security; it is an attack upon Want. But Want is one only of five giants on the road of reconstruction and in some ways the easiest to attack. The others are Disease, Ignorance, Squalor and Idleness.
9. The third principle is that social security must be achieved by co-operation between the State and the individual. The State should offer security for service and contribution. The State in organising security should not stifle incentive, opportunity, responsibility; in establishing a national minimum, it should leave room and encouragement for voluntary action by each individual to provide more than that minimum for himself and his family.
10. The Plan for Social Security set out in this Report is built upon these principles. It uses experience but is not tied

by experience. It is put forward as a limited contribution to a wider social policy, though as something that could be achieved now without waiting for the whole of that policy. It is, first and foremost, a plan of insurance—of giving in return for contributions benefits up to subsistence level, as of right and without means test, so that individuals may build freely upon it.

THE WAY TO FREEDOM FROM WANT

11. The work of the Inter-departmental Committee began with a review of existing schemes of social insurance and allied services. The Plan for Social Security, with which that work ends, starts from a diagnosis of want—of the circumstances in which, in the years just preceding the present war families and individuals in Britain might lack the means of healthy subsistence. During those years impartial scientific authorities made social surveys of the conditions of life in a number of principal towns in Britain, including London, Liverpool, Sheffield, Plymouth, Southampton, York and Bristol. They determined the proportions of the people in each town whose means were below the standard assumed to be necessary for subsistence, and they analysed the extent and causes of that deficiency. From each of these social surveys the same broad result emerges. Of all the want shown by the surveys, from three-quarters to five-sixths, according to the precise standard chosen for want, was due to interruption or loss of earning power. Practically the whole of the remaining one-quarter to one-sixth was due to failure to relate income during earning to the size of the family. These surveys were made before the introduction of supplementary pensions had reduced the amount of poverty amongst old persons. But this does not affect the main conclusion to be drawn from these surveys: abolition of want requires a double re-distribution of income, through social insurance and by family needs.
12. Abolition of want requires, first, improvement of State insurance, that is to say provision against interruption and loss of earning power. All the principal causes of interruption or loss of earnings are now the subject of schemes of social insurance. If, in spite of these schemes, so many persons unemployed or sick or old or widowed are found to be without adequate income for subsistence according to the standards adopted in the social surveys, this means that the benefits amount to less than subsistence by those standards or do not last as long as the need, and that the assistance which supplements insurance is either insufficient in amount or available only on terms which make men unwilling to have recourse to it. None of the insurance benefits provided before the war were in fact designed with reference to the standards of the social surveys. Though unemployment benefit was not altogether out of relation to those standards, sickness and disablement benefit, old age pensions and widows' pensions were far below them, while workmen's compensation was below subsistence level for anyone who had family responsibilities or whose earnings in work were less than twice the amount needed for subsistence. To prevent interruption or destruction of earning power from leading to want, it is necessary to improve the present schemes of social insurance in three directions: by extension of scope to cover persons now excluded, by extension of purposes to cover risks now excluded, and by raising the rates of benefit.
13. Abolition of want requires, second, adjustment of incomes, in periods of earning as well as in interruption of earning, to family needs, that is to say, in one form or another it requires allowances for children. Without such allowances as part of benefit or added to it, to make provision for large families, no social insurance against interruption of earnings can be adequate. But, if children's allowances are given only when earnings are interrupted and are not given during earning also, two evils are unavoidable. First, a substantial measure of acute want will remain among the lower paid workers as the accompaniment of large families. Second, in all such cases, income will be greater during unemployment or other interruptions of work than during work.
14. By a double re-distribution of income through social insurance and children's allowances, want, as defined in the social surveys, could have been abolished in Britain before the present war. As is shown in para. 445, the income available to the British people was ample for such a purpose. The Plan for Social Security set out in Part V of this Report takes abolition of want after this war as its aim. It includes as its main method compulsory social insurance, with national assistance and voluntary insurance as subsidiary, methods. It assumes allowances for dependent children, as part of its background. The plan assumes also establishment of comprehensive health and rehabilitation services and maintenance of employment, that is to say avoidance of mass unemployment, as necessary conditions of success in social insurance. These three measures—of children's allowances, health and rehabilitation and maintenance of employment—are described as assumptions A, B and C of the plan; they fall partly within and partly without the plan extending into other fields of social policy. . . .
15. The plan is based on a diagnosis of want. It starts from facts, from the condition of the people as revealed by

social surveys between the two wars. It takes account of two other facts about the British community, arising out of past movements of the birth rate and the death rate, which should dominate planning for its future . . . The first of the two facts is the age constitution of the population, making it certain that persons past the age that is now regarded as the end of working life will be a much larger proportion of the whole community than at any time in the past. The second fact is the low reproduction rate of the British community today: unless this rate is raised very materially in the near future, a rapid and continuous decline of the population cannot be prevented. The first fact makes it necessary to seek ways of postponing the age of retirement from work rather than of hastening it. The second fact makes it imperative to give first place in social expenditure to the care of childhood and to the safeguarding of maternity.

16. The provision to be made for old age represents the largest and most growing element in any social insurance scheme. . . . Briefly, the proposal is to introduce for all citizens adequate pensions without means test by stages over a transition period of twenty years, while providing immediate assistance pensions for persons requiring them. . . .

SUMMARY OF PLAN FOR SOCIAL SECURITY

17. The main feature of the Plan for Social Security is a scheme of social insurance against interruption and destruction of earning power and for special expenditure arising at birth, marriage or death. The scheme embodies six fundamental principles: flat rate of subsistence benefit; flat rate of contribution; unification of administrative responsibility; adequacy of benefit; comprehensiveness; and classification. . . . Based on [these principles] and in combination with national assistance and voluntary insurance as subsidiary methods, the aim of the Plan for Social Security is to make want under any circumstances unnecessary.

B) Franklin D. Roosevelt on the Economic Bill of Rights, State of the Union Message to Congress, 11 January 1944

This Nation in the past two years has become an active partner in the world's greatest war against human slavery.

We have joined with like-minded people in order to defend ourselves in a world that has been gravely threatened with gangster rule.

But I do not think that any of us Americans can be content with mere survival. Sacrifices that we and our Allies are making impose upon us all a sacred obligation to see to it that out of this war we and our children will gain something better than mere survival.

We are united in determination that this war shall not be followed by another interim which leads to new disaster—that we shall not repeat the tragic errors of ostrich isolationism.

When Mr. Hull went to Moscow in October, and when I went to Cairo and Teheran in November, we knew that we were in agreement with our Allies in our common determination to fight and win this war. But there were many vital questions concerning the future peace, and they were discussed in an atmosphere of complete candor and harmony. . . .

The one supreme objective for the future, which we discussed for each nation individually, and for all the United Nations, can be summed up in one word: Security.

And that means not only physical security which provides safety from attacks by aggressors. It means also economic security, social security, moral security—in a family of nations.

In the plain down-to-earth talks that I had with the Generalissimo [Jiang Jieshi or Chiang Kai-shek] and Marshal Stalin and Prime Minister Churchill, it was abundantly clear that they are all most deeply interested in the resumption of peaceful progress by their own peoples—progress toward a better life.

All our Allies have learned by experience—bitter experience—that real development will not be possible if they are to be diverted from their purpose by repeated wars—or even threats of war.

The best interests of each nation, large and small, demand that all freedom-loving nations shall join together in a just and durable system of peace. In the present world situation, evidenced by the actions of Germany, and Italy and Japan, unquestioned military control over the disturbers of the peace is as necessary among nations as it is among citizens in any community. And an equally basic essential to peace—permanent peace—is a decent standard of living for all individual men and women and children in all nations. Freedom from fear is eternally linked with freedom from want.

There are people who burrow through our nation like unseeing moles, and attempt to spread the suspicion that if other nations are encouraged to raise their standards of living, our own American standard of living must of necessity be depressed.

The fact is the very contrary. It has been shown time and again that if the standard of living of any country goes up, so does its purchasing power—and that such a rise encourages

a better standard of living in neighboring countries with whom it trades. That is just plain common sense—and it is the kind of plain common sense that provided the basis for our discussions at Moscow, and Cairo and Teheran. . . .

The overwhelming majority of our people have met the demands of this war with magnificent courage and a great deal of understanding. They have accepted inconveniences; they have accepted hardships; they have accepted tragic sacrifices.

However, while the majority goes on about its great work without complaint, we all know that a noisy minority maintains an uproar, an uproar of demands for special favors for special groups. . . .

Such selfish agitation can be and is highly dangerous in wartime. It creates confusion. It damages morale. It hampers our national effort. It prolongs the war. . . .

If ever there was a time to subordinate individual or group selfishness to the national good, that time is now. Disunity at home, and bickering, self-seeking partisanship, stoppages of work, inflation, business as usual, politics as usual, luxury as usual—and sometimes a failure to tell the whole truth—these are the influences which can undermine the morale of the brave men ready to die at the front for us here. . . .

Therefore, in order to concentrate all of our energies, all of our resources on winning this war, and to maintain a fair and stable economy at home, I recommend that the Congress adopt:

First, (1) A realistic and simplified tax law which will tax all unreasonable profits, both individual and corporate, and reduce the ultimate cost of the war to our sons and our daughters. The tax bill now under consideration by the Congress does not begin to meet this test.

Secondly, (2) A continuation of the law for the renegotiations of war contracts which will prevent exorbitant profits and assure fair prices to the Government. For two long years I have pleaded with the Congress to take undue profits out of war.

Third, (3) A cost of food law which will enable the Government (a) to place a reasonable floor under the prices the farmer may expect for his production; and (b) to place a ceiling on the prices the consumer will have to pay for the necessary food he buys. This should apply, as I have intimated, to necessities only; and this will require public funds to carry it out. It will cost in appropriations about one percent of the present annual cost of the war.

Fourth, (4) An early re-enactment of the stabilization statute of October, 1942. This expires this year, June 30th, 1944, and if it is not extended well in advance, the country might just as well expect price chaos by summertime. We cannot have stabilization by wishful thinking. We must take positive action to maintain the integrity of the American dollar.

And fifth, (5) A national service law which, for the duration of the war, will prevent strikes, and, with certain appropriate exceptions, will make available for war production or for any other essential services every able-bodied adult in this whole Nation.

These five measures together form a just and equitable whole. I would not recommend a national service law unless the other laws were passed to keep down the cost of living, to share equitably the burdens of taxation, to hold the stabilization line, and to prevent undue profits.

The Federal Government already has the basic power to draft capital and property of all kinds for war purposes on a basis of just compensation.

And, as you know, I have for three years hesitated to recommend a national service act. Today, however, with all the experience we have behind us and with us, I am convinced of its necessity. Although I believe that we and our Allies can win the war without such a measure, I am certain that nothing less than total mobilization of all our resources of manpower and capital will guarantee an earlier victory, and reduce the toll of suffering and sorrow and blood. . . .

National service is the most democratic way to wage a war. Like selective service for the armed forces, it rests on the obligation of each citizen to serve his nation to his utmost where he is best qualified. . . .

It is our duty now to begin to lay the plans and determine the strategy. More than the winning of the war, it is time to begin plans and determine the strategy for the winning of a lasting peace and the establishment of an American standard of living higher than ever known before.

This Republic had its beginning, and grew to its present strength, under the protection of certain inalienable political rights—among them the rights of free speech, free press, free worship, trial by jury, freedom from unreasonable searches and seizures. They were our rights to life and liberty.

We have come to a clear realization of the fact, however, that true individual freedom cannot exist without economic security and independence. “Necessitous men are not free men.” People who are hungry, people who are out of a job are the stuff of which dictatorships are made.

In our day these economic truths have become accepted as self-evident. We have accepted, so to speak, a second Bill of Rights under which a new basis of security and prosperity can be established for all—regardless of station, or race or creed.

Among these are:

- The right to a useful and remunerative job in the industries or shops or farms or mines of the nation;
- The right to earn enough to provide adequate food and clothing and recreation;

- The right of farmers to raise and sell their products at a return which will give them and their families a decent living;
- The right of every business man, large and small, to trade in an atmosphere of freedom from unfair competition and domination by monopolies at home or abroad;
- The right of every family to a decent home;
- The right to adequate medical care and the opportunity to achieve and enjoy good health;
- The right to adequate protection from the economic fears of old age, and sickness, and accident and unemployment;
- And finally, the right to a good education.

All of these rights spell security. And after this war is won we must be prepared to move forward, in the implementation of these rights, to new goals of human happiness and well-being.

America's own rightful place in the world depends in large part upon how fully these and similar rights have been carried into practice for all our citizens. For unless there is security here at home there cannot be lasting peace in the world. . . .

I ask the Congress to explore the means for implementing this economic bill of rights—for it is definitely the responsibility of the Congress so to do, and the country knows it. Many of these problems are already before committees of the Congress in the form of proposed legislation. I shall from time to time communicate with the Congress with respect to these and further proposals. In the event that no adequate program of progress is evolved, I am certain that the Nation will be conscious of the fact.

Our fighting men abroad—and their families at home—expect such a program and have the right to insist on it. It is to their demands that this Government should pay heed, rather than to the whining demands of selfish pressure groups who seek to feather their nests while young Americans are dying. . . .

Each and every one of us has a solemn obligation under God to serve this Nation in its most critical hour—to keep this Nation great—to make this Nation greater in a better world.

6.4. The United States in the Middle East

United States Involvement in Iran and the Middle East During World War II

Significant U.S. commitments in the Near and Middle East were one important outcome of American involvement in World War II. Before the war, American interests in the region were primarily commercial, educational, and philanthropic. U.S.-based missionary organizations had been active in the Near East since the 1820s, founding schools, universities, and hospitals in Greece, Ottoman Turkey, Persia, Syria, Lebanon, Egypt, and Palestine. In 1919 and 1920 many such groups had unsuccessfully lobbied the United States government to act as a League of Nations mandatory in Armenia, hundreds of thousands of whose people had been subjected to genocidal Turkish attacks before and during World War I. Since colonial times American businessmen had also traded fairly extensively with the Middle East. United States interests in the area, which underwent major changes of government in the wake of World War I and the consequent breakup of the Ottoman Empire, expanded between the world wars, especially after 1933, when the Arabian American Oil Company, a Standard Oil subsidiary, launched oil exploration efforts in Saudi Arabia. By 1938 these had successfully brought to light major new oil wells, resources the United States military began to consider as representing a significant strategic asset, especially since it could be anticipated that domestic American oil supplies would suffer serious depletion over the coming decades.

The Middle East was an area where great-power interests routinely collided. Since at least the mid-nineteenth century,

Great Britain and Russia had vied for power, influence, and economic advantage in the Middle East and West-Central Asia. When World War II began, Britain possessed extensive oil interests in Iraq and Iran, and held and administered Palestine as a mandatory territory under ultimate League of Nations control. From 1882 to 1922 British forces also directly controlled Egypt, which had previously been under Ottoman rule. Although the country became nominally independent in 1922, the strategic significance to British imperial interests of the Suez Canal, which ran through Egyptian territory and cut several weeks off the sea route along which Middle Eastern oil and goods from Asia traveled to Europe, meant that British civilian and military officials retained ultimate power to direct Egyptian affairs until the end of World War II. Further east, defense of their imperial stake in India was a constant preoccupation for British policymakers, enhancing even further the value of the Suez Canal. The French also had major imperial interests in the area, with client states or colonies in Syria and Lebanon and the nearby North African territories of Libya, Algeria, Tunisia, and Morocco.

With the onset of World War II, Allied leaders rightly feared a German thrust into the Middle East and North Africa, with the objectives of seizing the region's vital oil resources and, if possible, destabilizing or overthrowing the British empire in India. France's surrender in 1940 made this prospect more likely, since France's Middle Eastern and North African territories maintained allegiance to the German-controlled Vichy government. In 1941 German forces commanded by the brilliant and inspiring General Erwin Rommel—British cryptographers intercepting German cable traffic could always tell when he was present in person at headquarters, simply because the tone and élan of enemy communications perked up so dramatically—mounted an assault from Libya against Egypt. Rommel's campaign was checked at the battle of El Alamein in November 1942, but until that date it represented a serious short- and long-term threat to Britain's strategic position.

In interwar Iran, where the old Anglo-Russian rivalry for control and power continued unabated between Britain and the Soviet Union, Shah Reza Pahlavi I, an army officer who had seized power after World War I, sought to neutralize the influence of both by playing each off against the other and also by seeking German assistance in his modernization of Iran. By mid-1941 several hundred German technicians and advisers were present in Iran, which in return supplied Germany, by now its most important trading partner, with oil and other valuable resources. In June 1941 Germany invaded the Soviet Union, which meant that Britain immediately welcomed the latter as an ally against Adolf Hitler, and the still neutral United States soon offered Germany's new opponent large quantities of Lend-Lease supplies. The Allies wished to use

routes transiting Iran to deliver these goods to the Soviet Union, and to ensure access to them, and also to deny Iranian oil to the Germans. In August 1941 British and Soviet forces therefore jointly invaded Iran. When Reza Pahlavi I refused to cooperate with them, the occupying powers forced him to abdicate, replacing him with his young son, Mohammed Reza Pahlavi, who eventually, in 1943, declared war on Germany.

The United States government, still formally neutral, did not participate in the actual invasion of Iran, but did send several missions almost immediately to Iran, their first objective to help expedite the delivery of Lend-Lease supplies to Soviet Russia. Within the U.S. State Department, moreover, the small and close-knit team of Middle Eastern experts began to develop more ambitious schemes for American involvement in the Middle East, viewing Iran as a potential test case for their country's ability to encourage democracy and social and economic reforms in developing nations, as envisaged under the Allied Atlantic Charter of August 1941. The United States could, they believed, promote beneficial social and political change in such nations, its ability to do so enhanced by the fact that it was free from the taint of imperialism and colonialism that made British intervention so unpopular. Such benevolent U.S. involvement in Iran would also check the expansion of communist Soviet influence in the north of the country. An expanded American role in Iran would further enable the United States to provide better protection for its existing oil interests in Saudi Arabia, and possibly even help it to gain a new stake in Iran's own British-dominated oil industry. As early as 1939 Shah Reza I had attempted to entice the United States into taking more interest in his country and acting as its patron against other great powers by offering oil concessions to American firms. For similar reasons a sizeable group of Iranian politicians, including the young Shah, encouraged the growing American interest in their country, which they viewed as a means of countering both British and Russian influence.

In August 1943 Secretary of State Cordell Hull recommended to President Franklin D. Roosevelt a policy of enhanced U.S. involvement in Iran, aimed at building up that country under American patronage as a model democracy on Atlantic Charter principles, guidelines Roosevelt accepted. Towards the end of the year, at the Tehran conference, Britain, the Soviet Union, and the United States all affirmed their commitment to maintaining Iran's postwar independence and territorial integrity. This switch to a pro-active United States policy toward Iran marked an important long-term turning point in American involvement in the Near and Middle East. From early 1943 assorted missions—often poorly coordinated—of American experts attempted to guide and direct the wholesale reform of the Iranian military, police, and finances, together with the political and agricul-

tural systems. Thousands of American servicemen also arrived as part of the Persian Gulf Command, established to expedite the transport of supplies to the Soviet Union via Iran.

United States relations with the Soviet Union became increasingly strained from late 1944 onward, when an Iranian offer of oil concessions in the north of the country to American companies brought Soviet protests and occupying Russian troops banned Anglo-American forces from their zone of Iran and tightened their own control over the area. The independence promised Iran under the Tehran declaration seemed increasingly in jeopardy, even more so after late 1945, when the Soviet Union backed separatist forces in establishing an independent Soviet Socialist Republic in Iran's northern province of Azerbaijan, and encouraged a similar separatist movement in Kurdistan, setting up a puppet state there in early 1946. United States and British forces withdrew on schedule in early 1946, but the Russians announced their intention of retaining at least some troops in the north of the country, precipitating one of the early crises of the developing Cold War. After complicated maneuverings between Iranian politicians and Soviet representatives, the Russians withdrew their forces in exchange for promised oil concessions in northern Iran. With the backing of American advisers, in late 1946 Iranian prime minister Qavam es-Sultanah, who had in the interim successfully negotiated with the United States a substantial package of military, economic, and cultural support, reneged on this bargain, and shortly afterwards Iranian forces successfully overturned the Azerbaijani and Kurdish republics. Although relations between the United States and Iran were often still difficult, the two soon developed a patron-client relationship, intensified when in 1953 the Central Intelligence Agency mounted a coup against the radical nationalist government of Mohammed Mossadeq and restored the young Shah to effective power. From then until the Shah's final overthrow in 1979, support for Iran would be one of the cornerstones of United States policy in the Middle East.

About the Document

This memorandum was written by John D. Jernegan, then in his early thirties, a desk officer and Middle Eastern specialist within the State Department's small and highly cohesive Near Eastern Division. Jernegan was then still only at the beginning of a lengthy diplomatic career, during which he would serve as third and then second secretary in the U.S. embassy in Tehran (1943–1946), and assistant chief and then chief of the division of Greek, Turkish, and Iranian Affairs in the crucial years from 1946 to 1949, when American Cold War policies toward all three countries were in the process of rapid evolution and development. As he grew in seniority, Jernegan subsequently became U.S. ambassador to Iraq (1958–1962) and Algeria (1965–1967), and also twice held the influ-

ential position of deputy assistant secretary of state for Near Eastern, South Asian and African Affairs (1952–1955 and 1963–1965). A career diplomat at the crucial mid-level of policymaking, for almost three decades Jernegan, one of the State Department's small number of Middle Eastern specialists, was usually closely involved in the formulation and implementation of his country's official policies toward that area.

Rather than being propelled from above by deep presidential interest, as is sometimes the case when new foreign policies are developed, the evolution of American policy toward Iran and the Middle East during World War II was largely the product of lower-level initiatives from within the State Department itself. The cohesive group of regional specialists centered in the Bureau of Near Eastern Affairs cherished ambitions to make that area a showpiece of the potential progress and benefits that that could accrue to other states by means of benign United States intervention and guidance. They displayed great—indeed, in hindsight hubristic—faith in the ability of well-meaning U.S. advisers to encourage and implement what would later be termed “nation-building” and thereby remake other countries along American lines, effectively prefiguring numerous subsequent U.S. efforts to promote such policies in developing countries in Asia, Africa, and Latin America, as well as the Middle East. Once American forces and advisers had been dispatched to Iran in 1942, the State Department's Near Eastern experts seized on the opportunity to develop a more proactive policy toward the Middle East in general, an initiative that resulted in August 1943 in presidential endorsement of a new State Department formulation of policy toward Iran.

Jernegan's memorandum represented one stage in this process. It is often said that bureaucrats never sign what they write nor write what they sign, a statement generally less true of planning documents than of the end-product of such labors. Jernegan's signature was certainly appended to this particular memorandum, which Arthur Murray, who had for many years headed the Near Eastern Bureau, passed on to his superiors in the department, Secretary of State Hull, Under Secretary of State Sumner G. Welles, and Assistant Secretaries of State Dean Acheson and Adolph A. Berle. Murray recommended that the Department's top officials accept its recommendations, which six days later they apparently did, since Jernegan subsequently noted on this memorandum: “Approved by the Secretary and Mr. Welles. 2/17/43.”

Jernegan's memorandum was an almost classic statement of the belief, which can be traced back at least to President Woodrow Wilson's Fourteen Points speech and other World War I pronouncements, of American moral exceptionalism in international affairs, an outlook which even—or perhaps particularly—when held with deep sincerity, has often provoked mingled disbelief and derision from representatives of

other nations. With unconscious condescension, Jernegan took it as self-evident that his country was morally superior to all others and, moreover, possessed a unique ability to guide less developed nations and admonish other large but less enlightened nations. He held that United States aims in Iran were at bottom entirely disinterested and that, unlike its fellow big powers and wartime allies, Britain and Soviet Russia, his country sought only the most benevolent and unselfish objectives in Iran, seeking primarily to promote democratic and stable political, social, and economic development there. While he briefly cited the importance of Iran due to “its value as a supply route to Russia, its strategic location and its vast production of petroleum products”, he viewed the country primarily as a laboratory, in the light of the Atlantic Charter, for U.S. policies toward what would later be called developing or Third World nations. Iranian leaders, in his view, perceived the United States as a disinterested and benevolent friend whose objectives toward their country were fundamentally unselfish. With a confident naïveté that in retrospect seems highly ironical, given the manner in which by the later twentieth century not just other great powers, but both the leaders and people of developing nations themselves, would come to view the United States as the effective successor of older western imperialist nations, Jernegan proclaimed that “it seem[ed] hardly possible that either [Britain or Russia] could suspect the United States of having imperialistic designs in a country so far removed from us and where we could never hope to employ military force against an adjacent Great Power.” Disinterested American advisers could, he believed, steer Iran along the path to stable, peaceful, and sustainable economic and political progress, setting a model that could be tailored and adapted to fit American policies toward other nations in similar circumstances, thereby fulfilling the aims stated in the Atlantic Charter.

When recommending in August 1943 that President Roosevelt formally adopt such guidelines for U.S. policy toward Iran, and “exert itself to see that Iran’s integrity and independence are maintained and that she becomes prosperous and stable”, Secretary Hull placed rather more emphasis than had Jernegan on the fact that, “from a more directly selfish point of view, it is to our interest that no great power be established on the Persian Gulf opposite the important American petroleum development in Saudi Arabia.” Even so, he echoed Jernegan’s faith in “the exceptionally high regard in which this country is held by the Iranian people.” (Hull to Roosevelt, 16 August 1943, *FRUS 1943* 4:379) American officials appeared blithely unconscious that deploying military, economic, and political advisers and assistance in other countries, negotiating commercial and financial concessions, and working hand-in-glove with sympathetic indigenous officials were classic tactics of both western and Russian imperialism, and that both the host countries involved and their big power

rivals were likely to perceive no essential distinctions in methods or objectives between the United States and other expansionist states. Too often, indeed, in the view of many critics the United States seemed to mount an unconvincing charade of pursuing the best interests of its allies and clients as a mere cloak for the blatant promotion of its own strategic and economic interests. The Shah’s close association with the American “Great Satan” would become one major factor contributing to his 1979 overthrow by Islamic fundamentalists and the protracted subsequent crisis when U.S. diplomats in Tehran were held hostage for more than a year. Well before the end of World War II, the American attitudes that helped to create this situation were already clearly discernible among the small coterie of diplomats directing U.S. Near and Middle Eastern policies.

“American Policy in Iran,” Memorandum by Mr. John D. Jernegan of the Division of Near Eastern Affairs, U.S. Department of State, Washington, 23 January 1943

This Government has come during the past year or more to play a relatively active part in Iranian affairs. In the past, the United States has had no important political interests in Iran and has been seriously concerned with events in that country only from time to time. Our recent activity, therefore, is rather a new departure and has arisen primarily out of our participation in the war and natural concern that political matters in all theaters of war operations should develop favorably with respect to the United Nations. Iran has been, and is, important in this connection because of its value as a supply route to Russia, its strategic location and its vast production of petroleum products. When occasion has arisen to set forth our policy, we have based it upon the foregoing considerations, and I feel that they constitute ample justification for the attitude we have adopted.

I believe, however, that it is worthwhile at this time to put down on paper certain much broader considerations which, it seems to me, should likewise impel us to follow a positive policy in Iran, not only while the prosecution of the war is still foremost in our minds but also in the period when victory is in our grasp and we come to the conclusion of the peace.

I should like to suggest that Iran constitutes a test case for the good faith of the United Nations and their ability to work out among themselves an adjustment of ambitions, rights and interests which will be fair not only to the Great Powers of our coalition but also to the small nations associated with us or brought into our sphere by circumstances. Certainly, nowhere else in the Middle East is there to be found so clearcut a conflict of interests between two of the United Nations, so ancient a tradition of rivalry, and so great a temptation for the Great Powers concerned to give precedence to

their own selfish interests over the high principles enunciated in the Atlantic Charter.

For considerably more than one hundred years, Russia has been pressing down upon Iran from the north, repeatedly threatening new annexations of territory, repeatedly attempting in one way or another to dominate Iran. Three times in the present century alone Russian troops have entered Iranian territory against the will of the Iranian people.

For the same period of time, Great Britain has opposed the Russian movement southward, fearing for her position in the Persian Gulf and Indian Ocean and especially fearful of the potential threat to India. British troops have been on Iranian soil at least twice since the turn of the century and British influence has been exerted over and over again to counter the Russian expansion.

Although Russian policy has been fundamentally aggressive and British policy fundamentally defensive in character, the result in both cases has been interference with the internal affairs of Iran, amounting at times to a virtually complete negation of Iranian sovereignty and independence. It is superfluous to point out that this has created an ingrained distrust of both powers in the Iranian people and has not been without effect upon the attitude of the other weak peoples of the Middle East.

If this were merely history, it would be of no importance. Unfortunately, there are signs that history may be in the process of repeating itself. The basic factors are unchanged: Russia is still without a warm-water port; Britain still clings to her predominant position in the Middle East and east of Suez. Even if we assume the eventual independence of India and Burma and a British withdrawal from Iraq, Palestine and Egypt, there is every reason to suppose that Britain would not welcome an advance into that area by Russia.

Once again Russian and British troops are in Iran, the former in the north, the latter in the south and center. It is true that their presence is made necessary by imperative considerations of military expediency and that their withdrawal at the conclusion of the war has been solemnly promised, but I need not recall the hundreds of instances in which the forces of a Great Power have entered the territory of a weaker nation for one purpose and have remained, indefinitely, for other purposes.

Largely because of this occupation of Iranian territory, the governmental machinery of Iran, and its economic structure, have been seriously weakened. This has become both a reason and an excuse for direct intervention by the Russian and British authorities in Iranian political matters. At the present moment, no Iranian Cabinet can survive without the direct support of the Allied powers. While it is obvious that the United Nations could not permit a hostile government to function at Tehran, it is equally obvious that the Iranian political and economic organization must be strengthened to a

point at which it will be able to function efficiently by itself, if Iran is to survive as an independent nation. It is unnecessary to point out that a political vacuum is as impossible as a physical vacuum; if Iran falls into a state of anarchy, some power must assume responsibility for its government, and it may be assumed that the first to offer themselves for this task would be one or both of the occupying powers.

Apart from the general situation in Iran, I believe we should be fully alive to the character of the present Russian occupation of the northern provinces. In Azerbaijan, the Soviet authorities have greatly restricted the operations of the Iranian civil authorities and have virtually immobilized the small Iranian military forces which they reluctantly permitted to return to the area. They have alternately encouraged and discouraged the restive Kurds, always a thorn in the flesh of the local government. More important still, they have been so successful in propagandizing the population that our Consul at Tabriz has reported that a soviet could be established overnight in Azerbaijan if the Russians gave the word. In this connection, it is well to remember that Azerbaijan is inhabited largely by a Turkish-speaking population whose cultural ties with Soviet Transcaucasia and Turkish Kurdistan are almost as strong as those with the rest of Iran. It is also the most important grain-producing area of Iran and would be a welcome addition to the food resources of Transcaucasia.

There are other items which might be mentioned: the strained relations between the Russian and British authorities in Iran; the suspicion with which the Russians appear to view every move made by the British or Americans, for example their obvious hesitancy in agreeing to our operation of the southern section of the Trans-Iranian railroad; the apparent attempt by the Russian government to weaken British influence by leaving the British to bear the brunt of Iran's economic problems; the continued refusal of the Soviet authorities in Iran to permit transportation of grain from Azerbaijan to meet the urgent needs of Tehran; the impending move by the Russians to take over control of Iranian arms plants.

On the British side, the blunt, uncompromising attitude which has characterized British policy towards Iran does not augur well for a future amicable adjustment of Anglo-Iranian relations. Nor is it reassuring to recall the recent British proposal to arrogate to the Allies power to modify the Iranian cabinet at will.

It may be that the situation outlined above represents nothing more than the inevitable result of the stress and strain of coalition warfare and that once the victory is won all parties will be glad to revert to their former positions, leaving Iranian sovereignty as intact as it was before the Anglo-Russian occupation. Both Britain and Russia have repeatedly promised to do so, and both powers, and Iran as well, have adhered to the principles of the Atlantic Charter.

I should like to submit, however, that the United States has a vital interest in seeing to it that the United Nations *do* live up to the Atlantic Charter and, consequently, in making it as easy as possible for them to do so.

What I have in mind is the situation which will arise when the war is won, or nearly won, and the time comes to think of British and Russian withdrawal from Iran, with consequent full rehabilitation of Iranian self-government. Have we not some reason to anticipate that the respective British and Russian forces may remain suspiciously eyeing each other, each proclaiming its entire willingness to withdraw as soon as the other has done so? Is it not possible that one or both powers will allege, perhaps with reason, that Iran is in such a state of confusion that she must be "protected" for a time? And is it probable that either would withdraw and allow the other to carry out this "protection"?

Carrying this thought one step further, if Russia should really harbor ambitions for expansion in Iran, is it not all too likely that she would insist upon Iran's need for Soviet guidance, and that she would violently oppose the interposition of another interested power in the role of tutor? And if Great Britain should give way on this, would not Britain all the more cling to her position in Iraq and other parts of the Middle East, as protection against a future Russian thrust toward Suez, thus checking the progress which we hope to see in the direction of independence for all Near Eastern peoples?

I think we may assume that the Iranian Government has long since thought of all the foregoing considerations and that its ever-stronger appeal for American assistance is largely based upon them. So far, we have rested our response to this appeal primarily upon our interest in winning the war. I wonder if we should not also begin, privately, to base our response upon our interest in winning the peace?

The United States, alone, is in a position to build up Iran to the point at which it will stand in need of neither British nor Russian assistance to maintain order in its own house. If we go at this task wholeheartedly, we can hope to remove any excuse for a post-war occupation, partition, or tutelage of Iran. We can work to make Iran self-reliant and prosperous, open to the trade of all nations and a threat to none. In the meantime, we can so firmly establish disinterested American advisers in Iran that no peace conference could even consider a proposal to institute a Russian or British protectorate to "recognize the predominance" of Russian or British interests. If Iran needs special assistance of a material character, we can provide it and so remove any cause for claims for compensation by other powers. We can forestall loans carrying with them control of the customs or other servitudes upon the Iranian Government. If railroads, ports, highways, public utilities, industries, are to be built, we can build them and turn them over to the Iranian people free of any strings.

I realize that objections can be raised to such a policy. Some which occur to me at the moment are: (a) it is unprecedented in our relations with the Middle East; (b) it impinges on a "sphere of influence" hitherto considered exclusively British and Russian; (c) there is no guarantee that it will succeed; (d) it might involve expenditure and loss of money; (e) if it came into public notice, it might arouse domestic criticism on the part of isolationists.

To answer these seriatim:

- a) The present war and the problems of future peace for the United States are likewise unprecedented. We have now realized, and publicly stated over and over again, that we cannot be indifferent to the welfare of any part of the world, no matter how remote, because sooner or later it will affect our own peace.
- b) The very fact that Iran has been a "sphere of influence" in dispute between two Great Powers, makes it all the more desirable that a third, disinterested, power should be called in to eliminate the dispute. Both Britain and Russia would be relieved of an anxiety and constant source of friction if each could be assured that the other would have no special position in the area, and it is not inconceivable that both would regard this assurance as worth whatever ambitions might be given up. In this connection, it seems hardly possible that either could suspect the United States of having imperialistic designs in a country so far removed from us and where we could never hope to employ military force against an adjacent Great Power.
- c) If war cannot be waged without taking risks, I submit that the same is true of the making of peace. In any case, if we try and fail, we shall have lost nothing more than if we do not make the attempt. If the ambitions of Britain and Russia, their mutual distrust, or their established interests, are so strong that they would override a purely disinterested effort on our part to improve conditions in Iran, then we may assume that peace, in that part of the world, was doomed from the beginning.
- d) The expenditures involved, even if all of them should be a total loss, would be insignificant by contrast with the cost of the present war, and infinitesimal beside the material and human cost of a failure to make a satisfactory peace throughout the world.
- e) This objection will be met with in connection with any effort by the United States to participate in a cooperative post-war settlement, and we must be prepared to accept it. In the case of Iran, it could be countered by emphasis on the humanitarian aspects and should appeal to the normal American sympathy with any-

thing savoring of assistance to the underdog. If properly presented, a policy of help for Iran might, indeed, receive the same sort of popular approval as has been accorded to our support of China.

Finally, I should like to reiterate the conviction previously expressed that if the principles of unselfish fair-dealing enunciated by the Atlantic Charter are ignored when it comes to Iran, or any other country in similar circumstances, the foundations of our peace will begin to crumble immediately. In my opinion, this is the overriding argument which should lead us to seize every opportunity to direct events in such a way that there will be no occasion for power politics or conflict of interests among the United Nations for their relations with Iran.

If this conclusion is sound, I believe that we should not only comply to the best of our ability with Iranian requests for advisers and supplies but should also take the initiative in suggesting the employment of American specialists and application of American methods in various fields; further, we should not be content merely to support or oppose British or Russian policies and demands in Iran, but should put forward positive suggestions of our own for the improvement of conditions. To this end, we should regard ourselves as at least equally responsible with the British and Russians for the solution of Iranian problems and need not, in any way, leave the initiative to them merely because they happen to be the occupying powers. Moreover, here in Washington we should actively enlist the cooperation of all appropriate agencies of the Federal Government in support of this policy, and we should not confine ourselves solely to steps whose close connection with the war effort can be clearly demonstrated. If necessary, we should make it clear to the other agencies that we regard measures to promote a satisfactory ultimate settlement in Iran as being only slightly less important than those immediately directed towards the winning of the war, and that we consider it most unwise to defer all such measures until the war is over.

6.5. Soviet Espionage During World War II

Klaus Fuchs and Atomic Espionage

Espionage activities flourished during World War II, as each side spied on its enemies and also on its then allies. Not until 1949 did United States authorities discover that during and after the war, Klaus Fuchs (1911–1988), a German-born British scientist in the joint Anglo-American program to develop an atomic bomb, had passed on vital information to the Soviet Union, which appreciably accelerated the postwar development of Soviet atomic weapons. As a young man, Fuchs joined the German Communist Party, and when Hitler and the Nazis took power in 1933 and began arresting Communists, he fled to Great Britain, as did the rest of his family. He took an undergraduate degree in physics at Bristol University, going on to study for a doctorate at Edinburgh University. In 1940 Fuchs, like all Germans resident in Britain, was interned, spending several months in a camp in Quebec, Canada. A prominent Edinburgh professor intervened on his behalf, and in 1941, he was allowed to return to his studies. Soon afterward, he was asked to work on the highly secret Birmingham-based “Tube Alloys” project, the center of British atomic bomb research. In 1943, Fuchs transferred to Columbia University in New York as the British and American governments pooled their atomic research in the Manhattan Project to develop a nuclear bomb. He eventually moved to the project's Los Alamos, New Mexico, headquarters, working in the theoretical division. Serious and intense,

Fuchs was considered an outstanding scientist and researcher who focused almost exclusively on his work. He was familiar not just with research on the atomic bomb but also with the details of work on the ongoing effort to develop the far more powerful hydrogen bomb. In 1946, Fuchs returned to Britain, where he became head of the theoretical division of the Harwell Atomic Research Facility.

In September 1945, Igor Gouzenko, a Soviet intelligence officer based in Canada, defected to the West, where his revelation of the existence of a Canadian-based Soviet spy ring resulted in almost 40 arrests. Gouzenko also claimed that a similar espionage ring existed within the British fraternity of atomic scientists. His information led to the arrest of Alan Nunn May, a British scientist and Communist Party member who confessed to passing on samples of enriched uranium to the Soviets, for which he received a 10-year prison sentence in May 1946. At that time British intelligence also interviewed Fuchs but discerned no evidence of wrongdoing.

In 1947, the U.S. Army Signal Security Agency began to have success in deciphering the so-called Venona Transcripts, a collection of many thousands of intercepted cables dispatched by Soviet KGB (State Security Committee, the Soviet security agency) operatives in the United States from 1943 onward, on which American cryptographers had already been working for several years. Together with Fuchs' own confession, these eventually revealed that almost immediately after Fuchs began work on atomic weapons, through his contacts with another member of the Communist Party, he informed the Soviet Union of the project's existence. From then until his arrest, Fuchs regularly furnished Soviet intelligence operatives with detailed scientific information that greatly facilitated Soviet endeavors to develop both atomic and hydrogen bombs. In December 1949, a British intelligence officer informed Fuchs that he had come under serious suspicion of supplying classified nuclear weapons information to the Soviet Union, charges Fuchs initially repeatedly denied but to which he finally confessed in January 1950. Fuchs' 1950 trial at the Old Bailey lasted less than two hours, as he pleaded guilty and was sentenced to 14 years in prison, the maximum applicable sentence since at the time his offenses took place, the Soviet Union was not an enemy of Great Britain, and, technically speaking, he could not therefore have committed treason. With time off for good behavior, he was released in 1959, whereupon he moved to East Germany and became deputy director of the Central Institute for Nuclear Research in Rossendorf.

Highly ideologically motivated, Fuchs was a model of the spy whose actions were due to his own political convictions, passing on classified information to another country because of his belief in its stated ideals. He was a stellar example of the fascination the Soviet Union and the Communist Party exercised upon many idealistic Western intellectuals during the

1930s and beyond, seeming, in their eyes, to embody a noble cause and the political faith of the future. The detailed technical information Fuchs provided between 1943 and 1948 probably shortened by several years, Soviet development of atomic and hydrogen bombs, an effort that Soviet president Josef Stalin made his country's highest priority after Hiroshima and Nagasaki. The revelation of Fuchs' activities in 1950 also apparently caused President Harry S Truman to accelerate the U.S. effort to build a hydrogen bomb.

The Venona Transcripts

In July 1995, the U.S. National Security Agency, a highly secretive intelligence organization that specializes in the interception of communications, for the first time, revealed that it had inherited from one of its forerunners, the U.S. Army Signal Intelligence Service (later the U.S. Army Signal Security Agency) based at Arlington Hall, Virginia, a cache of many thousands of cable messages exchanged from 1939 to 1946 between Soviet missions in the United States and the Soviet Foreign Ministry in Moscow. These included large numbers of communications between American-based KGB and GRU (military intelligence) case officers and their headquarters in Moscow. Efforts to decrypt these messages began in February 1943, and, though only a fairly small proportion was ever successfully deciphered, between then and 1980, more than 3,000 cables were decoded, an undertaking on which the National Security Agency, the Federal Bureau of Investigations, and British intelligence all collaborated. Since United States intelligence officials did not wish to alert their Soviet counterparts that they had access to these materials, on which they continued to work for decades, obtaining new leads into Soviet espionage activities in the United States, even the existence of the Venona Project was kept secret until after the Cold War ended, and evidence drawn from it was not cited in the trials of Fuchs or others, Julius and Ethel Rosenberg, convicted of spying for the Soviet Union. (In practice, since the British Kim Philby, a Soviet agent for many years, learned of its existence in 1949, Soviet intelligence agencies presumably knew after that date that American intelligence was exploiting these materials.) The Venona Project nonetheless provided an enormous amount of detailed information on Soviet espionage in the United States and Mexico, which became even more valuable when it was pooled with a comparable set of British intercepts.

In 1995, the National Security Agency began to release many of the decrypted Venona cables, which immediately became a focus of public interest. Some historians seized on them as evidence of the truth of Senator Joseph McCarthy's charges of the late 1940s and 1950s, that the Department of State and other U.S. government agencies were riddled with Soviet spies, and also as incontrovertible proof that the charges of espionage against the Rosenbergs and other

well-known figures, former State Department official Alger Hiss, for example, were well-founded. Others wished that, notwithstanding considerations of national security and the need to safeguard the information, the intercepts had been released much earlier, as they would have demonstrated how groundless were McCarthy's charges that Secretaries of State George C. Marshall and Dean Acheson were Soviet agents.

In practice, however, as the document here demonstrates, such decrypts had to be handled with care. Only a small fraction of the intelligence messages were ever deciphered, none at all for the years 1939–1941, though their bulk suggests that throughout the war, Soviet military and civilian intelligence both undertook substantial operations within the United States. The details, however, are often difficult to establish, since case officers habitually used codenames to refer to their sources and to other individuals, President Franklin D. Roosevelt, for example. The fact, moreover, that an individual was named as an informant or source did not necessarily imply that person was consciously spying for the Soviet Union. Some cables mention information given by Roosevelt's close wartime adviser Harry Hopkins, who undertook several important missions to Britain and the United States on his behalf, which some seized on as evidence that Hopkins was a covert Soviet agent. But, as historians have pointed out, it is not uncommon for top officials to slip significant information they wish to keep confidential into seemingly casual conversations with representatives of another country, in the hope and belief that this will be quietly passed on to their superiors, without necessarily featuring in the formal diplomatic record or going through regular channels. Nor is every person with whom an intelligence operative comes into contact likely to be an agent. Some are likely to be innocent individuals, journalists, for example, who were simply being pumped for interesting information in the course of a casual conversation. Lastly, when reporting to their superiors in Moscow (or elsewhere), intelligence operatives are essentially justifying their continued existence and employment. Like anyone in such a position, they are quite liable to exaggerate their successes and the value of their contacts and to minimize any failures. Especially since those now available were only decoded over many years, the interpretation of information included in such sources as the Venona cables was inevitably a painstaking enterprise demanding meticulous attention to detail.

About the Document

Although not written until fall 1949, this memorandum refers to the wartime activities of Fuchs and represents a careful attempt to correlate information that had by that time been gathered from the Venona transcripts with relevant material gleaned from other sources. It therefore provides a highly

revealing glimpse into the actual interpretation of such sources as the Venona cables and other intelligence intercepts, demonstrating why it took several years for Fuchs to be confidently identified as a Soviet agent. Since at least 1943, the Federal Bureau of Investigation had mounted extensive operations intended to uncover and counter Soviet intelligence activities within the United States. Robert J. Lamphere, then the FBI operative entrusted with liaison duties with other agencies on Soviet espionage, wrote this memorandum for Meredith Gardner, a highly trained cryptographer in the U. S. Army Signal Security Agency, in an attempt to pinpoint a Soviet source within the atomic energy project whom his handlers had code-named "Rest." Those involved had to make every effort to ensure that their identification was accurate, since not only would a wrong guess ruin an innocent man's career, it would also leave the original agent securely in place.

Lamphere later recounted how in 1948 he received through FBI channels the plain text of an 8-inch stack of messages the New York KGB office had sent to Moscow via commercial telegraph services, some of which the Venona decoders were able to correlate with encrypted messages in their own possession, speeding their efforts to decipher them. Snippets of information he had gleaned on "Rest's" background, career, movements, and family were carefully cross-referenced against available information on Fuchs, just as they were undoubtedly checked against every other British scientist involved in atomic research. So, too, was the fact that "Rest" was probably the author of at least one of the scientific documents he passed on to the Soviet Union. Captured German documents that mentioned Fuchs as a Communist Party member were also utilized. Similar methods were used to make a tentative identification of another possible contact of Fuchs' who was also involved in Soviet espionage. Lamphere's memorandum, written less than three months before British intelligence agents directly accused Fuchs of spying, was therefore the product of many months and even years of careful and painstaking decryption of the Venona transcripts, followed by equally meticulous and patient detective work to ascertain "Rest's" true identity.

Robert J. Lamphere to Meredith Gardner, "EMIL JULIUS KLAUS FUCHS aka Karl Fuchs," 26 September 1949

REST

On June 15, 1944, Rest furnished to a representative of Soviet intelligence (M.G.B.), Part III of a document now identified as MSN-12. This document dated June 6, 1944 is on file with the Atomic Energy Commission and is entitled "Fluctuations and the Efficiency of a Diffusion Plant," and Part III specifically refers to "The Effect of Fluctuations in the Flow

of N2.” The designation MSN stands for documents prepared by British scientists who were in New York City working on Atomic Energy research. The author of this document is K. Fuchs, who is actually Emil Julius Klaus Fuchs, who is usually known as Karl Fuchs. He is a top ranking British Atomic scientist.

Information available concerning Rest indicated that he was a British scientist, inasmuch as he had also furnished to the Soviet Intelligence information concerning British participation in the Atomic Energy development. It was also indicated that he had a sister in the United States. There are indications that Rest was actually the author of the document.

Emil Julius Klaus Fuchs also known as Karl Fuchs, was born December 19, 1911, at Russelsheim, Germany. His father, Emil Fuchs was born May 13, 1874, and was a professor in Germany. Emil Julius Klaus Fuchs entered the United Kingdom in 1933, and from 1941 to 1943, was a medical physicist at the University of Birmingham, England. In November 1943, he was designated by the British Government to come to the United States as a part of the British Atomic Energy Commission. He arrived at New York City on December 3, 1943, and went to Los Alamos in August 1944. While in the United States, Fuchs worked with a group of British scientists in the period of March to June 1944, on the development of diffusional operational processes working particularly with the Kellex Corporation, which was working under the Manhattan Engineering District. Fuchs left for England from Montreal, Canada on June 28, 1946.

In November 1947, Fuchs was back in the United States and visiting the Chicago Operations Office of the Atomic Energy Commission. At that time, he attended discussions regarding unclassified and declassified aspects of neutron spectroscopy. He also participated in declassification conferences which were being held between the United States, Great Britain and Canada. Fuchs is presently the senior research worker at the Atomic Energy Commission project at Harwell, England.

Fuchs has a sister, Kristal Fuchs Heineman, who prior to January 1941, resided at 55 Carver Road, Watertown, Massachusetts. From approximately 1941, until about 1945, she resided with her husband, Robert Block Heineman at 144 Lakeview Avenue, Cambridge, Massachusetts. They presently reside at 94 Lakeview Avenue, Cambridge, Massachusetts. Robert Block Heineman has been reliably reported as a member of the Communist Party, United States of America in 1947.

The address book of Israel Halperin implicated in the Canadian Espionage network contained the following: “Klaus Fuchs, Asst. to M. Born, 84 Grange Lane, University of Edinburgh, Scotland Camp (possibly comp) N.—Camp L., Internment Operations—Kristel Heineman, 55 Carvel Road, Watertown.” The phrase Camp L is encircled.

In addition to the foregoing a captured German document prepared presumably by German Counter Intelligence and which relates to Communist Party members in Germany contains the following:

“Klaus Fuchs, student of philosophy, December 29, 1911, Russelsheim, RSHA-IVA2, Gestapo Field Office Kiel.

“Gerhard Fuchs, October 30, 1909, Russelsheim, student RSHA-IVA2, Gestapo Field Office Kiel.”

It is to be noted that Gerhard Fuchs is the brother of Emil Julius Klaus Fuchs.

GUS (GOOSE)

In connection with Rest, who furnished the document MSN-12 and who is thought to be Emil Julius Klaus Fuchs, it is also known that Rest’s sister was a contact of Gus (Goose), who has presumably a scientific background. You will recall, Gus contemplated preparing a work on the production method with respect to the thermal diffusion of gases.

You will also recall, Gus, who has not been identified was also a contact of Abraham Brothman, a Consulting Engineer in New York City, who furnished espionage information to Elizabeth Bentley in 1940.

It is thought that Gus may possibly be identical with Arthur Phineas Weber, who is presently an employee of the Kellex Corporation which is engaged in work under the Atomic Energy Commission. Weber was born March 10, 1920, in Brooklyn, New York and is a chemical engineer. From 1941 to 1942, he worked with Brothman for the Hendrick Manufacturing Company. From June 1942 to June 1944, he worked with Brothman in the Chemurgy Design Corporation, and according to some information during a part of this period he was also working for the Kellex Corporation. Weber lists employment with Kellex Corporation as a chemical engineer from July 1944 to March 29, 1946, and again from April 8, 1946, to the present. It should be noted that the Kellex Corporation was closely working in 1944 with the British Scientist group which included Fuchs.

6.6. The Yalta Accords

The Yalta Conference, February 1945

World War II was fought by a coalition, the United Nations, among whom the “Big Three,” the United States, the Soviet Union, and Great Britain, carried more weight than the others. The most significant Allied decisions on wartime strategy and planning for the postwar world were reached by the leaders of the Big Three powers themselves, U.S. President Franklin D. Roosevelt, British Premier Winston Churchill, and Soviet President Josef Stalin, in a series of summit meetings, occasionally all three together, more often two at a time, which took place throughout the war.

The most controversial such meeting was that between Churchill, Stalin, and Roosevelt in the Crimea port of Yalta in February 1945, where they discussed questions relating to the future government of many states in both Europe and Asia. Hard and sometimes inconclusive bargaining took place on several issues, including the future status of Germany, Eastern Europe and the Balkans, Poland, German reparations, and the nature of the United Nations Organization. Although portions on “Liberated Europe,” Poland, and “Meetings of the Three Foreign Secretaries” were published on 13 February 1945, the remaining text of the Yalta agreements signed by the Russian, British, and American foreign ministers was not released until 24 March 1945. Churchill, Stalin, and Roosevelt themselves signed agreements on the prosecution of the war in Asia and the postwar status and rights of various Asian nations, including the Soviet Union.

From the late 1940s onward, political opponents would attack Roosevelt and Churchill for supposedly making too many concessions to the Soviet Union at Yalta at the expense of East European countries and China. By early 1945, Soviet

forces controlled most of Eastern Europe, and it was clear that Soviet officials would be primarily responsible for deciding the future of that area. Throughout the war, Stalin made it clear to his allies that he intended that Eastern Europe, a region he considered crucial to Soviet security, would come under effective Soviet control and fall within his country's sphere of influence. The decision of the Western Allies to defer opening a second front against Hitler until summer 1944 meant that when the war ended, Soviet troops would have occupied virtually all Eastern Europe as they moved gradually westward on their way to invade German territory. Although the Soviet Union adhered to the Atlantic Charter, stating that the peoples of all countries should be free to choose their own form of government, it did so with significant reservations, carefully designed to allow the Soviets to assume a hegemonic role in Eastern Europe. Twice in 30 years, German troops had invaded Russian soil, marching through Polish territory as they did so, and in World War II, several East European countries, notably Bulgaria, Hungary, and Rumania, allied themselves with Germany. Stalin was determined that the future foreign policy of those smaller East European states separating Germany and the Soviet Union should be subordinated to his own country's and that their governments should effectively look to the Soviet Union for guidance. In practice, these states would form a protective wall, or *glacis*, separating the Soviet Union from Germany. Although the Declaration on Liberated Europe the three great powers signed at Yalta promised “free elections,” verbally Stalin made it clear to Churchill and Roosevelt that he intended such elections to bring in governments that were at least acceptable to the Soviets, and the two other leaders made little demur. In October 1944, Churchill had, indeed, privately reached agreement with Stalin on the division of Eastern Europe and the Balkans into what were effectively British and Soviet spheres of influence, an accord of which he had informed Roosevelt, who had not repudiated it.

Stalin also won the assent of his allies to his intention to move Poland's frontiers westward, annexing substantial portions of what had been eastern Poland to the Soviet Union, in exchange for which Poland would receive substantial territorial compensation from what had been eastern Germany. The existing Communist-dominated Polish Provisional Government was to be expanded by the inclusion of representatives of other Polish political groups in a Polish Provisional Government of National Unity, which would then organize “free and unfettered elections.” In late summer 1944, the effective acquiescence of advancing Soviet troops in the occupying German forces' suppression of a Polish nationalist revolt in Warsaw, a decision many believed reflected Russian eagerness to eliminate all political groupings except pro-Soviet Poles within that country, had shocked many in both the

United States and Britain, which initially supported the Polish government-in-exile headed by Stanislaw Mikolajczyk. Again, the military situation meant that political arrangements within Poland ultimately depended upon Stalin's good graces, and at Yalta, Britain and the United States decided to settle for a face-saving compromise that essentially met Stalin's wishes. Although Mikolajczyk and some of his supporters were initially included in the new provisional government, in which Mikolajczyk was a vice premier, in practice, they were isolated and excluded from real power. As the Cold War intensified, in 1947, Mikolajczyk was forced into exile.

Some other controversial questions were left temporarily undecided. Within the U.S. government, Secretary of the Treasury Henry Morgenthau Jr. was the foremost advocate of those who sought to partition defeated Germany into several smaller and weaker states, as well as to destroy its industrial capacity and hence its ability to wage war in the future. Others, however, notably top War Department officials, believed that such schemes were impracticable and that the revival of the German economy was crucial to postwar European economic recovery. The foreign ministers therefore decided the matter needed further study. So, too, did the subject of whether the Allies should exact reparations from Germany, an issue on which the Western Allies, bearing in mind the problems similar efforts had generated after World War I, had reservations, whereas the Soviets were determined to extract all they could from Germany as compensation for their own sufferings and German depredations over the past four years. The principals at Yalta did, however, agree that reparations should only be exacted in kind from Germany, rather than paid in cash over a lengthy period of time. It had earlier been decided that Germany should be divided into three occupation zones, one apiece for the Soviet Union, Great Britain, and the United States, the boundaries of which had already been determined. France, a country the Western Allies now sought to restore as a great European power, was not represented at Yalta, a decision the Free French General Charles de Gaulle greatly resented. However, on the insistence of Britain and the United States, it was granted its own occupation zone, to be carved out of the territory initially allocated to those two countries.

Those at the Yalta Conference did decide to summon a meeting of all the powers allied against the Axis states, plus various neutral nations, to establish a postwar international organization to maintain peace, the United Nations. This led to the San Francisco Conference that met in April-June 1945 and hammered out the final draft of the UN Charter. Yalta also determined the manner of voting on the UN Security Council, the body on which the Big Four Allied powers plus France were permanent members with veto power, which largely controlled the United Nations. It was agreed that the Allies

would support separate United Nations representation for two Russian republics, the Ukraine and White Russia, effectively giving the Soviet Union three votes in the organization rather than one. Some general agreements were reached on United Nations trusteeship of former League of Nations mandates and territories "detached from the enemy as a result of the present war," but much was deliberately left vague, since this might affect the status of former European colonies conquered by Japan, an extremely sensitive subject for Great Britain, the extensive Asian imperial holdings of which might well be affected, together with those of France, the Netherlands, and even the United States. It was therefore made clear that the forthcoming conference would not determine which territories should fall under the trusteeship provisions.

In 1941, Japan and the Soviet Union signed a neutrality pact, which still remained in force at Yalta. Stalin had justified the continuance of this agreement throughout the war on the rather convincing grounds that the Soviet Union, desperately pressed as it was, needed to concentrate all its forces on the war with Germany. The United States and Britain both sought Soviet entry into the war against Japan once the war against Germany was over. At Yalta, Stalin pledged his country would do so two to three months after the war with Germany ended but in return demanded, and received, the same territorial and commercial concessions in northeast China that tsarist Russia had enjoyed until its defeat in the 1904-1905 Russo-Japanese War, together with the Kurile Islands and the preservation of the existing pro-Soviet status quo in Outer Mongolia. The Western Allies pledged to make every effort to obtain Chinese President Jiang Jieshi's [Chiang Kai-shek's] acquiescence in these demands, to which he eventually grudgingly assented. Churchill and Roosevelt were subsequently criticized severely for accepting Stalin's terms for Soviet entry into the war against Japan, especially since the price was paid by other nations. Some argued that the Western Allied leaders should have realized how devastating the effects of Allied firebombing of Japanese cities and the development of atomic weapons would be and that these would make Russian intervention redundant. At the time of Yalta, however, the firebombing program had not yet begun, no successful atomic bomb tests had taken place, and there was no certainty exactly when the bomb would be developed, nor whether it would work. No prudent leaders could have gambled that either firebombing or the development of atomic bombs would necessarily prove effective. Indeed, it might equally be argued that the news of Soviet intervention was one extra factor that eventually helped to persuade the Japanese emperor to prevail on his government to sue for peace in August 1945.

The Yalta agreements ultimately revealed the saliency of power politics among the Allies. The very fact that the leaders of the major Allies met repeatedly during the war, subse-

quently communicating their decisions to representatives of other nations, was evidence that among the Allies themselves, the relative military and economic power of the different states decided which carried the most weight in decision making. The Yalta conference was a rather brutal reminder that, despite the numerous statements of liberal principles issued by the Allies during the war, the postwar settlement would in large part depend on who exercised military control on the ground. However unpalatable they might find some of Stalin's demands, as pragmatic politicians, Roosevelt and Churchill had little alternative but to acquiesce in them.

About the Document

Given their controversial nature, some of the Yalta agreements were released in February 1945, with the remainder not published until almost six weeks later, on 24 March 1945. Like many official government communiqués summarizing international agreements reached among great powers, they emphasized the positive and tended diplomatically to elide any areas of dissension. Some of the most contentious issues, especially those relating to the future status and treatment of Germany, together with trials of war criminals, were reserved for future discussion by the foreign ministers of each power and subsequent decision by the top leaders themselves. There was little in the official language of these communiqués to indicate how hard-fought some of the decisions actually reached had been or the bitter attacks they would provoke in future.

Primary Source

The Yalta Accords, 11 February 1945

Washington, 24 March [1945].—The text of the agreements reached at the Crimea (Yalta) Conference between President Roosevelt, Prime Minister Churchill and Generalissimo Stalin, as released by the State Department today, follows:

PROTOCOL OF PROCEEDINGS OF CRIMEA CONFERENCE

The Crimea Conference of the heads of the Governments of the United States of America, the United Kingdom, and the Union of Soviet Socialist Republics, which took place from Feb. 4 to 11, came to the following conclusions:

I. WORLD ORGANIZATION

It was decided:

1. That a United Nations conference on the proposed world organization should be summoned for Wednesday, 25 April, 1945, and should be held in the United States of America.

2. The nations to be invited to this conference should be:
 - (a) the United Nations as they existed on 8 Feb., 1945; and
 - (b) Such of the Associated Nations as have declared war on the common enemy by 1 March, 1945. (For this purpose, by the term "Associated Nations" was meant the eight Associated Nations and Turkey.) When the conference on world organization is held, the delegates of the United Kingdom and United States of America will support a proposal to admit to original membership two Soviet Socialist Republics, i.e., the Ukraine and White Russia.
3. That the United States Government, on behalf of the three powers, should consult the Government of China and the French Provisional Government in regard to decisions taken at the present conference concerning the proposed world organization.
4. That the text of the invitation to be issued to all the nations which would take part in the United Nations conference should be as follows:

"The Government of the United States of America, on behalf of itself and of the Governments of the United Kingdom, the Union of Soviet Socialistic Republics and the Republic of China and of the Provisional Government of the French Republic invite the Government of _____ to send representatives to a conference to be held on 25 April, 1945, or soon thereafter, at San Francisco, in the United States of America, to prepare a charter for a general international organization for the maintenance of international peace and security.

"The above-named Governments suggest that the conference consider as affording a basis for such a Charter the proposals for the establishment of a general international organization which were made public last October as a result of the Dumbarton Oaks conference and which have now been supplemented by the following provisions for Section C of Chapter VI:

C. Voting

 - "1. Each member of the Security Council should have one vote.
 - "2. Decisions of the Security Council on procedural matters should be made by an affirmative vote of seven members.
 - "3. Decisions of the Security Council on all matters should be made by an affirmative vote of seven members, including the concurring votes of the permanent members; provided that, in decisions under Chapter VIII, Section A and under the second sentence of Paragraph 1 of Chapter VIII, Section C, a party to a dispute should abstain from voting.

"Further information as to arrangements will be transmitted subsequently.

“In the event that the Government of _____ desires in advance of the conference to present views or comments concerning the proposals, the Government of the United States of America will be pleased to transmit such views and comments to the other participating Governments.”

Territorial trusteeship:

It was agreed that the five nations which will have permanent seats on the Security Council should consult each other prior to the United Nations conference on the question of territorial trusteeship.

The acceptance of this recommendation is subject to its being made clear that territorial trusteeship will only apply to

- (a) existing mandates of the League of Nations;
- (b) territories detached from the enemy as a result of the present war;
- (c) any other territory which might voluntarily be placed under trusteeship; and
- (d) no discussion of actual territories is contemplated at the forthcoming United Nations conference or in the preliminary consultations, and it will be a matter for subsequent agreement which territories within the above categories will be placed under trusteeship.

[Begin first section published Feb. 13, 1945.]

II. DECLARATION OF LIBERATED EUROPE

The following declaration has been approved:

The Premier of the Union of Soviet Socialist Republics, the Prime Minister of the United Kingdom and the President of the United States of America have consulted with each other in the common interests of the people of their countries and those of liberated Europe. They jointly declare their mutual agreement to concert during the temporary period of instability in liberated Europe the policies of their three Governments in assisting the peoples liberated from the domination of Nazi Germany and the peoples of the former Axis satellite states of Europe to solve by democratic means their pressing political and economic problems.

The establishment of order in Europe and the rebuilding of national economic life must be achieved by processes which will enable the liberated peoples to destroy the last vestiges of nazism and fascism and to create democratic institutions of their own choice. This is a principle of the Atlantic Charter—the right of all people to choose the form of government under which they will live—the restoration of sovereign rights and self-government to those peoples who have been forcibly deprived to them by the aggressor nations.

To foster the conditions in which the liberated people may exercise these rights, the three governments will jointly assist the people in any European liberated state or former Axis state in Europe where, in their judgment conditions require,

- (a) to establish conditions of internal peace;
- (b) to carry out emergency relief measures for the relief of distressed peoples;
- (c) to form interim governmental authorities broadly representative of all democratic elements in the population and pledged to the earliest possible establishment through free elections of Governments responsive to the will of the people; and
- (d) to facilitate where necessary the holding of such elections.

The three Governments will consult the other United Nations and provisional authorities or other Governments in Europe when matters of direct interest to them are under consideration.

When, in the opinion of the three Governments, conditions in any European liberated state or former Axis satellite in Europe make such action necessary, they will immediately consult together on the measures necessary to discharge the joint responsibilities set forth in this declaration.

By this declaration we reaffirm our faith in the principles of the Atlantic Charter, our pledge in the Declaration by the United Nations and our determination to build in cooperation with other peace-loving nations world order, under law, dedicated to peace, security, freedom and general well-being of all mankind.

In issuing this declaration, the three powers express the hope that the Provisional Government of the French Republic may be associated with them in the procedure suggested.

[End first section published Feb. 13, 1945.]

III. DISMEMBERMENT OF GERMANY

It was agreed that Article 12 (a) of the Surrender terms for Germany should be amended to read as follows:

“The United Kingdom, the United States of America and the Union of Soviet Socialist Republics shall possess supreme authority with respect to Germany. In the exercise of such authority they will take such steps, including the complete dismemberment of Germany as they deem requisite for future peace and security.”

The study of the procedure of the dismemberment of Germany was referred to a committee consisting of Mr. Anthony Eden, Mr. John Winant, and Mr. Fedor T. Gusev. This body would consider the desirability of associating with it a French representative.

IV. ZONE OF OCCUPATION FOR THE FRENCH AND CONTROL COUNCIL FOR GERMANY.

It was agreed that a zone in Germany, to be occupied by the French forces, should be allocated to France. This zone would be formed out of the British and American zones and its extent would be settled by the British and Americans in consultation with the French Provisional Government.

It was also agreed that the French Provisional Government should be invited to become a member of the Allied Control Council for Germany.

V. REPARATION

The following protocol has been approved:

Protocol On the Talks Between the Heads of Three Governments at the Crimean Conference on the Question of the German Reparations in Kind

1. Germany must pay in kind for the losses caused by her to the Allied nations in the course of the war. Reparations are to be received in the first instance by those countries which have borne the main burden of the war, have suffered the heaviest losses and have organized victory over the enemy.
2. Reparation in kind is to be exacted from Germany in three following forms:
 - (a) Removals within two years from the surrender of Germany or the cessation of organized resistance from the national wealth of Germany located on the territory of Germany herself as well as outside her territory (equipment, machine tools, ships, rolling stock, German investments abroad, shares of industrial, transport and other enterprises in Germany, etc.), these removals to be carried out chiefly for the purpose of destroying the war potential of Germany.
 - (b) Annual deliveries of goods from current production for a period to be fixed.
 - (c) Use of German labor.
3. For the working out on the above principles of a detailed plan for exaction of reparation from Germany an Allied reparation commission will be set up in Moscow. It will consist of three representatives—one from the Union of Soviet Socialist Republics, one from the United Kingdom and one from the United States of America.
4. With regard to the fixing of the total sum of the reparation as well as the distribution of it among the countries which suffered from the German aggression, the Soviet and American delegations agreed as follows:

“The Moscow reparation commission should take in its initial studies as a basis for discussion the suggestion of the Soviet Government that the total sum of the reparation in accordance with the points (a) and (b) of the Paragraph 2 should be 22 billion dollars and that 50 per cent should go to the Union of Soviet Socialist Republics.”

The British delegation was of the opinion that, pending consideration of the reparation question by the Moscow reparation commission, no figures of reparation should be mentioned.

The above Soviet-American proposal has been passed to the Moscow reparation commission as one of the proposals to be considered by the commission.

V. MAJOR WAR CRIMINALS

The conference agreed that the question of the major war criminals should be the subject of inquiry by the three Foreign Secretaries for report in due course after the close of the conference.

[Begin second section published Feb. 13, 1945.]

VII. POLAND

The following declaration on Poland was agreed by the conference:

“A new situation has been created in Poland as a result of her complete liberation by the Red Army. This calls for the establishment of a Polish Provisional Government which can be more broadly based than was possible before the recent liberation of the western part of Poland. The Provisional Government which is now functioning in Poland should therefore be reorganized on a broader democratic basis with the inclusion of democratic leaders from Poland itself and from Poles abroad. This new Government should then be called the Polish Provisional Government of National Unity.

“[Soviet Foreign Minister] M. Molotov, [U.S. Ambassador to the Soviet Union] Mr. Harriman and [British Ambassador to the Soviet Union] Sir A. Clark Kerr are authorized as a commission to consult in the first instance in Moscow with members of the present Provisional Government and with other Polish democratic leaders from within Poland and from abroad, with a view to the reorganization of the present Government along the above lines. This Polish Provisional Government of National Unity shall be pledged to the holding of free and unfettered elections as soon as possible on the basis of universal suffrage and secret ballot. In these elections all democratic and anti-Nazi parties shall have the right to take part and to put forward candidates.

“When a Polish Provisional Government of National Unity has been properly formed in conformity with the above, the Government of the U.S.S.R., which now maintains

diplomatic relations with the present Provisional Government of Poland, and the Government of the United Kingdom and the Government of the United States of America will establish diplomatic relations with the new Polish Provisional Government of National Unity, and will exchange Ambassadors by whose reports the respective Governments will be kept informed about the situation in Poland.

“The three heads of Government consider that the eastern frontier of Poland should follow the Curzon Line with digressions from it in some regions of five to eight kilometers in favor of Poland. They recognize that Poland must receive substantial accessions in territory in the north and west. They feel that the opinion of the new Polish Provisional Government of National Unity should be sought in due course of the extent of these accessions and that the final delimitation of the western frontier of Poland should thereafter await the peace conference.”

[Provisions on Yugoslavia, Italy, Bulgaria, Southeastern Europe, Iran, Turkey, the Dardanelles Straits, and Regular Meetings of Foreign Ministers omitted.]

[End third section published Feb. 13, 1945.]

[The following agreement on the war in Asia, was signed by the three principals at the meeting, Churchill, Roosevelt, and Stalin.]

AGREEMENT REGARDING JAPAN, 11 FEBRUARY 1945

The leaders of the three great powers—the Soviet Union, the United States of America and Great Britain—have agreed that in two or three months after Germany has surrendered and the war in Europe is terminated, the Soviet Union shall enter into war against Japan on the side of the Allies on condition that:

1. The status quo in Outer Mongolia (the Mongolian People's Republic) shall be preserved.
2. The former rights of Russia violated by the treacherous attack of Japan in 1904 shall be restored, viz.:
 - (a) The southern part of Sakhalin as well as the islands adjacent to it shall be returned to the Soviet Union;
 - (b) The commercial port of Dairen shall be internationalized, the pre-eminent interests of the Soviet Union in this port being safeguarded, and the lease of Port Arthur as a naval base of the U.S.S.R. restored;
 - (c) The Chinese-Eastern Railroad and the South Manchurian Railroad, which provide an outlet to Dairen, shall be jointly operated by the establishment of a joint Soviet-Chinese company, it being understood that the pre-eminent interests of the Soviet Union shall be safeguarded and that China shall retain sovereignty in Manchuria;

3. The Kurile Islands shall be handed over to the Soviet Union.

It is understood that the agreement concerning Outer Mongolia and the ports and railroads referred to above will require concurrence of Generalissimo Chiang Kai-shek. The President will take measures in order to maintain this concurrence on advice from Marshal Stalin.

The heads of the three great powers have agreed that these claims of the Soviet Union shall be unquestionably fulfilled after Japan has been defeated.

For its part, the Soviet Union expresses its readiness to conclude with the National Government of China a pact of friendship and alliance between the U.S.S.R. and China in order to render assistance to China with its armed forces for the purpose of liberating China from the Japanese yoke.

6.7. China in Turmoil

China and Civil War

China, one of the “Big Four” major Allied powers in the coalition against the Axis, had been at war with Japan since 1937. Until well into 1945, the northeastern provinces of Manchuria and the coast were under Japanese occupation. The Chinese situation was complicated by the virtually irreconcilable rivalry between the Nationalist (Guomindang, GMD, Kuomintang, KMT) government headed by President Jiang Jieshi (Chiang Kai-shek) (1887–1975) and the Chinese Com-

unist Party (CCP) led by the charismatic Mao Zedong (Mao Tse-tung) (1893–1976). For the first half of the 1930s, Jiang had given fighting the Communists a higher priority than resisting Japanese incursions. In theory, this situation changed in late 1936, when the Manchurian warlord Zhang Xueliang (Chang Hsüeh-liang) kidnapped Jiang while the latter was visiting Xi'an and insisted that he unite with the Communist forces in opposing the Japanese. Through the Soviet-controlled Communist International (Comintern), Soviet leader Josef Stalin exerted strong pressure on the CCP to join such a united front, which Stalin believed offered the best chance of combating Japanese ambitions, which also threatened Soviet interests.

For almost a decade, Mao constantly but unavailingly challenged and protested against Stalin's instructions, on the grounds that Jiang could not be trusted and his ultimate objective remained the elimination of the Communist forces rather than the prosecution of war against Japan. Communist forces, the Eighth Route Army and the New Fourth Army, controlled most of northwestern China, and the Nationalist government the southwest, where the capital had been relocated to Chongqing (Chungking). The Communists refused to grant the Nationalists political authority in areas held by them. CCP-GMD collaboration largely broke down in late 1941, when GMD forces attacked and defeated the New Fourth Army in the lower Changjiang (Yangtze) valley, though an uneasy alliance continued until 1944.

For much of the period 1940–1945, the GMD and CCP leadership each gave considerable thought to maximizing their future advantages in the internal power struggle both expected to resume once Japan was defeated, a preoccupation that had important implications for their conduct of the war. Jiang preferred to rely on a protracted strategy of attrition against the Japanese, bolstered by airpower, a position that frustrated the American Joseph W. Stilwell (1883–1946), commander of U.S. forces in the China-Burma-India theater and chief of staff to Jiang, who urged a more active strategy of building up American-trained and equipped Chinese military forces to defeat Japanese troops on the ground. From Jiang's perspective, his preferred policies had the added advantage that they would preserve his best fighting units for the coming power struggle he anticipated with the Communists. Though Jiang was personally honest, many of his military commanders and officials within his government were extremely corrupt, which threw into relief the Spartan living conditions and austere lifestyle practiced by the Communists in those areas they controlled. Until 1945, Communist forces had few major successes against better-equipped Japanese units but concentrated on encouraging guerrilla operations and entrenching themselves in those regions where they were based. Communist morale was high: their idealistic rhetoric, attractive and charismatic leaders, and dangerous though

small-scale partisan operations all caught the popular imagination and impressed many visiting Western journalists and officials.

Tensions between GMD and CCP leaders came to a head during 1945, as the end of the war against Japan approached. In October 1944, personal difficulties with Jiang, as well as strategic disagreements, caused U.S. President Franklin D. Roosevelt to recall Stilwell to the United States and replace him with the staunchly anticommunist Major General Patrick J. Hurley, who was far more sympathetic to Jiang's position. All thought of a major Chinese offensive against Japanese forces was abandoned. Jiang now devoted his energies to attempts to bring all military forces in China under his own control. In January 1945, he announced that, for the first time since the early 1940s, the government would convene a National Assembly and restore democratic rule in China. CCP members would not, however, be eligible to participate in this meeting, which would return China to constitutional government, nor would they be included in a proposed interim coalition government, until Communist military units had been incorporated into the National Army, perhaps under the command of a suitable American (as opposed to Chinese) general. The CCP refused these conditions and accused Jiang of deliberately seeking to provoke civil war by treating Communists with contempt.

In August 1945, after the Japanese government admitted defeat, Jiang ordered that only GMD representatives could accept the surrender of Japanese troops in China. He hoped thereby to ensure that the GMD would take over all territory previously under Japanese control, together with the enemy's valuable military equipment. American airplanes and ships helped to move GMD military units to parts of China that had been under Japanese occupation. The Communists protested vehemently against these orders and when possible ignored them, with Soviet assistance, quickly moving into Manchuria, the northeastern provinces of China taken over by Japan in 1931 as the puppet state of Manzhouguo (Manchukuo), which Soviet troops liberated in August and September 1945. Despite protracted U.S. efforts to mediate the burgeoning conflict, in mid-1946, full-scale civil war began in China, which ended in 1949 with the establishment of the People's Republic of China, a Communist state headed by Mao Zedong. Jiang fled to the island of Taiwan, where for the rest of his life he headed a GMD government that still claimed to be the only legitimate representative of the Chinese people.

About the Documents

This section includes two different kinds of documents: one private, the other public. Stilwell's notes were private diary jottings, written for himself during 1944 and perhaps 1945, the period in which his longstanding differences of opinion with Jiang came to a head and eventually brought his recall to

Washington. Stilwell died of cancer in 1946, and his private papers were edited and published by the young journalist Theodore H. White, who spent much of World War II in China and came to admire both Stilwell and the Communist leadership. This book appeared in 1948, as it became increasingly clear that the Communists would be victorious in the Chinese civil war, and a group of pro-Nationalist Americans later known as the China Lobby began to attack official U.S. policy on China as having been too favorable to the Communists and insufficiently supportive of Jiang. By publishing Stilwell's personal papers, White undoubtedly intended to vindicate Stilwell's reputation and to demonstrate that the Nationalists were intrinsically a lost cause, their government so corrupt and inefficient that no amount of American aid could have ensured its victory over the Communist forces.

Stilwell's comments, admittedly written at a time of great personal bitterness against Jiang, were highly critical of the GMD president. Stilwell, a Chinese-speaker, stated that he had great admiration for the ordinary Chinese people and considerable respect for the Communists but none for Jiang. He accused Jiang of having made virtually no effort to win the war against Japan since 1938 and demonstrating no gratitude for those American supplies he received but simply complaining that Britain and the Soviet Union received far more than China. He even compared Jiang and his government to Adolf Hitler and Nazi rule in Germany. By July 1944, Stilwell had bluntly concluded that: "The cure for China's trouble is the elimination of Chiang K'ai-shek." If this were not done, he feared that no united front in China would be possible, that civil war would break out, and that the "Reds" (Communists) would win complete control of China and gravitate toward the Soviet Union. Stilwell rightly realized that if he was personally unacceptable to Jiang, he could not "operate in the China theatre." Stilwell's notes were an outlet for his frustration with Jiang, and some of his expressions may well have been exaggerated. The analysis they gave nonetheless contained considerable elements of truth and illustrated the difficulties that U.S. officials would repeatedly face in dealing with the leaders of client states who were eager to accept material aid while rejecting American political and military advice. Whether a more emollient personality than Stilwell would have been any more successful in persuading Jiang to alter his policies is highly questionable; although on better terms with Jiang, neither Hurley nor Albert Wedemeyer, who succeeded him, had any greater impact than Stilwell on the behavior of the GMD government. Stilwell's analysis—that if one attempted to reform the existing Chinese political structure, the whole edifice would probably collapse—was among his more perceptive comments.

Jiang's speech and Mao's article were both examples of political propaganda. In each case, a party leader stated his

position on an issue of great moment to his own political future and that of his party in the hope of winning public opinion to his own side. Jiang's speech was delivered to the official body charged with preparations for the national assembly that would restore constitutional government in China, to justify his position in excluding the Chinese Communists from that assembly until they were prepared to relinquish control of their own military forces to GMD representatives. Jiang affirmed the need for national unity and the legitimacy of his own party, as "the historical party of national revolution" endorsed by the prestigious Sun Yixian [Sun Yat-Sen], the father of the new China that succeeded the Manchu dynasty in 1911. The issue of military authority was one on which neither the Communists nor GMD were prepared to compromise, since it went to the heart of who would exercise ultimate power within China. Mao's article, published by the leading Communist news agency as Japanese surrender negotiations reached consummation, made it clear that Communist troops would not accept GMD instructions as to whether they might accept the surrender of Japanese and Chinese collaborationist forces but would act on their own initiative. He accused Jiang of ignoring the contributions of Communist forces to the war against Japan and of coveting Japanese weaponry because he sought to use this against the Communists in a civil war he was deliberately seeking to provoke. Mao even challenged Jiang's right to accept the enemy's surrender, charging that Communist rather than GMD armed forces had borne the brunt of the war against Japan, whereas Jiang's "policy ha[d] been to look on with folded arms and wait for victory." One of Mao's more famous sayings was that "power grows out of the barrel of a gun," a perspective that informed this article. To judge from the official statements Mao and Jiang each made on his party's position, by 1945, neither the GMD nor the Communists were prepared to compromise on any essential point, and civil war in China was therefore virtually inevitable.

[Undated Diary Note]

CHIANG K'AI-SHEK. I never heard Chiang K'ai-shek say a single thing that indicated gratitude to the President or to our country for the help we were extending to him. Invariably, when anything was promised, he would want more. Invariably, he would complain about the small amount of material that was being furnished. He would make comparisons between the huge amounts of Lend-Lease supplies going to Great Britain and Russia with the meagre trickle going to China. He would complain that the Chinese had been fighting for six or seven years and yet we gave them practi-

cally nothing. It would of course have been undiplomatic to go into the nature of the military effort Chiang Kai-shek had made since 1938. It was practically zero.

Whether or not he was grateful was a small matter. The regrettable part of it was that there was no *quid pro quo*. We did what we could, furnished what was available, without being allowed to first ask what he would do, etc. The result was that we were continuously on the defensive and he could obstruct and delay any of our plans without being penalized. . . .

[Undated Diary Note]

[I have] faith in Chinese soldiers and Chinese people; fundamentally great, democratic, misgoverned. No bars of caste or religion. . . . Honest, frugal, industrious, cheerful, independent, tolerant, friendly, courteous.

I judge Kuomintang and Kungchamtang [Communist party] by what I saw:

[KMT] Corruption, neglect, chaos, economy, taxes, words and deeds. Hoarding, black market, trading with enemy.

Communist programme . . . reduce taxes, rents, interest. Raise production, and standard of living. Participate in government. Practice what they preach. . . .

[Excerpts from an Undated Paper on the Dominant Military Doctrine of the Chinese Army]

In time of war you have to take your allies as you find them. We are fighting Germany to tear down the Nazi system—one-party government, supported by the Gestapo and headed by an unbalanced man with little education. We had plenty to say against such a system. China, our ally, was being run by a one-party government (the Kuomintang), supported by a Gestapo (Tai Li's organization) and headed by an unbalanced man with little education. This government, however, had the prestige of the possession of power—it was opposing Japan, and its titular head had been built up by propaganda in America out of all proportion to his deserts and accomplishments. We had to back the existing regime in order to have any chance of getting China to pull her weight. To change the structure during the emergency would have been next to impossible. All through the Chinese machinery of government there are interlocking ties of interest . . . family, financial, political, etc. No man, no matter how efficient, can hope for a position of authority on account of being the man best qualified for the job: he simply must have other backing. To reform such a system, it must be torn to pieces. You build a framework to grow grape-vines on: in the course of time, the vines grow all over it, twisting in and out and around and pretty soon the frame is so tightly held by the vines that if you start pulling them out, you will tear the frame to pieces. We could not risk it, we had to take the instrument as we found it and do the best we could.

But because it was expedient to back this government to get action against Japan, it was not necessarily advisable to endorse its methods and policies. We could have required some return for our help.

Chiang K'ai-shek made a great point of how badly the U.S.A. had neglected China, who had been fighting desperately for so long, while Lend-Lease materials had been poured into Great Britain and Russia by the billion. His case was that we owed him a great debt and that it was a crying shame we didn't do more to discharge it. This attitude met with sympathy in the U.S. It was true that large quantities of Lend-Lease materials were going to Russia and Great Britain. It was also true that Russia and Great Britain, particularly Russia, were making good use of this material against Germany. It was also true that there was no possible way of delivering the goods to Chiang K'ai-shek unless he made an effort on his part to break the blockade. It seemed reasonable to expect Great Britain to use the huge Indian Army for the purpose. The U.S. was fighting Germany in Europe, and Japan in the Pacific. She was supplying enormous quantities of munitions and food to all the Allies. Under the circumstances it seemed reasonable for somebody else to display a little energy in Burma.

To keep the show going, I had to overlook some of these incongruities and pretend, like the other players. If not, the critics would say it was a bum show, and we are very much afraid of the critics in our show. [This paper was never finished.]

[Notes, Probably July 1944]

SOLUTION IN CHINA

The cure for China's trouble is the elimination of Chiang K'ai-shek. The only thing that keeps the country split is his fear of losing control. He hates the Reds and will not take any chances on giving them a toehold in the government. The result is that each side watches the other and neither gives a damn about the war [against Japan]. If this condition persists, China will have civil war immediately after Japan is out. If Russia enters the war before a united front is formed in China, the Reds, being immediately accessible, will naturally gravitate to Russia's influence and control. The condition will directly affect the relations between Russia and China, and therefore indirectly those between Russia and U.S.

If we do not take action, our prestige in China will suffer seriously. China will contribute nothing to our effort against Japan, and the seed will be planted for chaos in China after the war. . . .

[Undated Notes]

Chiang K'ai-shek is the head of a one-party government supported by a Gestapo and a party secret service. He is now organizing an S.S. of 100,000 members.

[He] hates the so-called Communists. He intends to crush them by keeping any munitions furnished him and by occupying their territory as the Japs retire.

[He] will not make an effort to fight seriously. He wants to finish the war coasting, with a big supply of material, so as to perpetuate his regime. He has blocked us for three years and will continue to do so. He has failed to keep his agreements.

[He] has spoken contemptuously of American efforts and has never said one word to express gratitude for our help, except in one message to the President, in which he attacked me.

[He] is responsible for major disasters of the war. Nanking. Lan Fang. Changsha and Hengyang. Kweilin and Liuchow. Red blockade.

But [he] is the titular head of China and has marked me as *persona non grata*.

Therefore I cannot operate in the China theatre while he is in power

B) Speech by President Jiang Jieshi (Chiang Kai-Shek) before the Preparatory Commission for Constitutional Government in Chungking, 1 March 1945

You will recall that in 1936 the Government decided to summon a National Assembly on November 12, 1937 for the inauguration of constitutional government and the termination of the period of political tutelage under the Kuomintang. On July 7, 1937 Japan suddenly made war on us, and the plan had to be shelved. However, the determination of the Kuomintang to realize constitutional government remained as strong as ever. Had it not been for the recommendation of further postponement by the People's Political Council, the National Assembly would have been convened during 1940 in accordance with another Government decision. This year, on the first of January, on behalf of the Government, I announced that the National Assembly will be summoned before the close of the year, unless untoward and unexpected military developments should in the meanwhile intervene.

The Kuomintang is the historical party of national revolution; it overthrew the Manchu dynasty; it destroyed Yuan Shih-kai who would be emperor; it utterly defeated the militarists that succeeded Yuan Shih-kai; it brought about national unification; it achieved the removal of the unequal treaties; and it led the country into the eight-year-old struggle against Japan. It is we who are the party of liberation and progress. In summoning the National Assembly and returning the rule to the people in conformity with the sacred will of Dr. Sun Yat-sen, the Kuomintang is performing its historical role.

We must emerge from this war a united nation. Only a united nation can effectively perform the tasks of political and economic reconstruction to raise the lot of our toiling masses and handle the problems of external relations in a new, uncharted world. Before the Japanese invasion, we were a united nation. Today, but for the Communists and their armed forces, we are a united nation. There are no independent warlords or local governments challenging the central authority.

I have long held the conviction that the solution of the Communist question must be through political means. The Government has labored to make the settlement a political one. As the public is not well informed on our recent efforts to reach a settlement with the Communists, time has come for me to clarify the atmosphere.

As you know, negotiations with the Communists have been a perennial problem for many years. It has been our unvarying experience that no sooner is a demand met than fresh ones are raised. The latest demand of the Communists is that the Government should forthwith liquidate the Kuomintang rule, and surrender all power to a coalition of various parties. The position of the Government is that it is ready to admit other parties, including the Communist as well as non-partisan leaders, to participate in the Government without, however, relinquishment by the Kuomintang of its power of ultimate decision and final responsibility until the convocation of the National Assembly. We have even offered to include the Communists and other parties in an organ to be established along the line of what is known abroad as a "war cabinet." To go beyond this and to yield to the Communists demand would not only place the Government in open contravention of the political program of Dr. Yat-sen, but also create insurmountable practical difficulties for the country.

During the past eight years, the country has withstood all the vicissitudes of military reverses and of unbelievable privation and has ridden through the storm for the simple reason that it has been led by a stable and strong Government. The war remains to be won, the future is still fraught with peril. If the Government shirks its responsibility and surrenders its power of ultimate decision to a combination of political parties, the result would be unending friction and fears, leading to a collapse of the central authorities. Bear in mind that in such a contingency, unlike in other countries, there exists in our country at present no responsible body representing the people for government to appeal to.

I repeat, whether by accident or design, the Kuomintang has had the responsibility of leading the country during the turbulent last decade and more. It will return the supreme power to the people through the instrumentality of the National Assembly, and in the meanwhile, it will be ready to admit other parties to a share in the government, but it definitely cannot abdicate to a loose combination of parties. Such a surrender would not mean returning power to the people.

We must emerge from the war with a united army. The Communists should not keep a separate army. Here allow me to digress a little. The Chinese Communist propaganda abroad has tried to justify this private army on the ground that if it becomes incorporated in the National Army, it will be in danger of being destroyed or discriminated against. Their propaganda also magnify, out of all proportion, the actual military strength of the Communists. To you, I need hardly say that Government forces have always without exception borne the brunt of Japanese attack and will continue to do so. Today, with the wholehearted co-operation of our Allies, powerful armies are being equipped and conditioned to assume the offensive. We are synchronizing our efforts with those of our Allies in expelling Japan from the Asiatic mainland. . . .

To meet any fear the Communists may have the Government has expressed its willingness for the duration of the war to place an American general in command of the Communist forces under my over-all command as supreme commander—again if the United States Government could agree to the appointment of an American officer. The Communists have, however, rejected all those offers. If the Communists are sincere in their desire to fight the Japanese alongside us and our Allies, they have indeed been given every opportunity to do so.

No one mindful of the future of our 450,000,000 people and conscious of standing at the bar of history, would wish to plunge the country into a civil war. The Government has shown its readiness and is always ready to confer with the Communists to bring about a real and lasting settlement with them. . . .

I have explained the Government's position on the Communist problem at length, because today that is the main problem to unity and constitutional government. . . .

Upon the inauguration of constitutional government, all political parties will have legal status and enjoy equality. The Government has offered to give legal recognition to the Communist party as soon as the latter agrees to incorporate their army and local administration in the National Army and Government. The offer still stands. . . .

I am optimistic of national unification and the future of democratic government in our country. The torrent of public opinion demanding national unity and reconstruction is mounting ever stronger and will soon become an irresistible force. No individual or political party can afford to disregard this force any longer. Let all of us, regardless of party affiliations, work together for the twin objectives of our people—national unity and reconstruction.

C) “Chiang Kai-Shek Is Provoking Civil War,” 13 August 1945, by Mao Zedong

A spokesman for the Propaganda Department of the Kuomintang Central Executive Committee has made a statement describing as “a presumptuous and illegal act” the order setting a time-limit for the surrender of the enemy and the puppets, which was issued by Chu Teh, Commander-in-Chief of the Eighteenth Group Army, on August 10 from the General Headquarters in Yen-an. This comment is absolutely preposterous. Its logical implication is that it was wrong of Chu Teh to act in accordance with the Potsdam Declaration and with the enemy's declared intention of surrendering and to order his troops to effect the surrender of the enemy and the puppets, and that on the contrary it would have been right and legitimate to advise the enemy and puppets to refuse to surrender. No wonder that even before the enemy's actual surrender, Chiang Kai-shek, China's fascist ringleader, autocrat and traitor to the people, had the audacity to “order” the anti-Japanese armed forces in the Liberated Areas to “stay where they are, pending further orders,” that is, to tie their own hands and let the enemy attack them. No wonder this selfsame fascist ringleader dared to “order” the so-called underground forces (who are, in fact, puppet troops “saving the nation by a devious path” and Tai Li's secret police collaborating with the Japanese and puppets) as well as other puppet troops to “be responsible for maintaining local order,” while forbidding the anti-Japanese armed forces in the Liberated Areas to “take presumptuous action on their own” against enemy and puppet forces. This transposition of the enemy and the Chinese is in truth a confession by Chiang Kai-shek; it gives a vivid picture of his whole psychology, which is one of consistent collusion with the enemy and puppets and of liquidation of all those not of his ilk. However, the people's anti-Japanese armed forces in China's Liberated Areas will never be taken in by this venomous scheme. . . .

Both the comment by the spokesman for the Propaganda Department of the Kuomintang Central Executive Committee and Chiang Kai-shek's “orders” are from beginning to end provocations to civil war; at this moment, when attention at home and abroad is focused on Japan's unconditional surrender, their aim is to find a pretext for switching to civil war as soon as the War of Resistance ends. . . . So now they are saying that the Eighth Route Army and the New Fourth Army should not demand that the enemy and puppet troops surrender their guns. In the eight years of the War of Resistance, the Eighth Route Army and the New Fourth Army have suffered enough from the attacks and encirclements of both Chiang Kai-shek and the Japanese. And now, with the War of Resistance coming to an end, Chiang Kai-shek is hinting to the Japanese (and to his beloved puppet troops) that they

should not surrender their guns to the Eighth Route Army and the New Fourth Army but “only to me, Chiang Kai-shek.” One thing, however, Chiang Kai-shek has left unsaid, “. . . so that I can use these guns to kill the Communists and wreck the peace of China and the world.” Isn’t this the truth? What will be the result of telling the Japanese to hand over their guns to Chiang Kai-shek and telling the puppet troops to “be responsible for maintaining local order”? The result can only be that a merger of the Nanking and Chungking regimes and co-operation between Chiang Kai-shek and the puppets will take the place of “Sino-Japanese collaboration” and of co-operation between the Japanese and the puppets, and that Chiang Kai-shek’s “anti-communism and national reconstruction” will take the place of the “anti-communism and national reconstruction” of the Japanese and [the collaborationist Japanese-backed wartime President of China] Wang Ching-wei. Isn’t this a violation of the Potsdam Declaration? Can there be any doubt that the grave danger of civil war will confront the people of the whole country the moment the War of Resistance is over? We now appeal to all our fellow-countrymen and to the Allied countries to take action, together with the people of the Liberated Areas, resolutely to prevent a civil war in China, which would endanger world peace.

After all, who has the right to accept the surrender of the Japanese and puppets? Relying solely on their own efforts and the support of the people, the anti-Japanese armed forces in China’s Liberated Areas, to whom the Kuomintang government refused all supplies and recognition, have succeeded by themselves in liberating vast territories and more than 100 million people and have resisted and pinned down 56 per cent of the invading enemy troops in China and 95 per cent of the puppet troops. If not for these armed forces, the situation in China would never have been what it is today! To speak plainly, in China only the anti-Japanese armed forces of the Liberated Areas have the right to accept the surrender of the enemy and puppet troops. As for Chiang Kai-shek, his policy has been to look on with folded arms and sit around and wait for victory; indeed he has no right at all to accept the surrender of the enemy and the puppets.

We declare to all our fellow-countrymen and to the people of the whole world: The Supreme Command in Chungking cannot represent the Chinese people and those Chinese armed forces which have really fought Japan; the Chinese people demand the right of the anti-Japanese armed forces of China’s Liberated Areas under Commander-in-Chief Chu Teh to send their representatives directly in order to participate in the acceptance of Japan’s surrender and in the military control over Japan by the four Allied Powers and also to participate in the future peace conference. If this is not done, the Chinese people will deem it most improper.

6.8. Calls for Asian Independence and Revolution

Nationalism and Colonialism in French Indochina in 1945

On 2 September 1945, as French Indochina awaited the departure of the defeated Japanese forces who had entered the country in 1940 and taken it over from previously compliant Vichy French officials in March 1945, Ho Chi Minh, the country’s most prominent Communist nationalist leader, declared in the capital city of Hanoi that an independent state now existed in Vietnam. Together with the protectorates of Cambodia and Laos, the three portions of Vietnam, the French protectorates of northern Tonkin and central Annam and the outright colony of northern Tonkin, constituted the federation of French Indochina, acquired between 1884 and 1893, France’s richest overseas possession when World War II began.

Under French rule, the Vietnamese protectorates had nominally been governed by a series of puppet emperors, the most recent of whom, Bao Dai, had held his throne since 1925, deftly switching his allegiance to Japan in March 1945. Such elite acquiescence in French dominance notwithstanding, ever since the 1890s, nationalist sentiment had existed in

Vietnam. By 1945, its most prominent representative was the Communist leader best known as Ho Chi Minh (“He Who Enlightens”), who had by that time spent almost 30 years working for his country’s independence from France and was one of the founders of the Indochinese Communist Party. On the outbreak of war in September 1939, Governor General George Catroux of French Indochina promptly outlawed this organization and imprisoned several thousand suspected Communists. Some members remained at liberty, and the Sixth Plenum of the Party Central Committee met secretly near Saigon and announced the creation of a new anti-imperialist National United Front, its objective complete independence for Indochina. In summer 1940, Japanese troops moved into French Indochina and complaisant Vichy French officials collaborated with them. Although many Asian nationalists hailed the Japanese as liberators, Ho considered them just as obnoxious as the French. With Chinese assistance and funding—since Japanese control of Indochina threatened to cut off valuable shipments of war supplies—Ho returned to his country after an absence of three decades and founded the Viet Minh or Vietnam Independence League, an organization committed to combating both Japanese and French domination. Throughout the war, its guerrilla activities harassed the ruling powers persistently and imaginatively, gradually denying them control of all but the major Indochinese cities and making Ho Indochina’s most prominent nationalist leader and a popular hero.

In March 1945, Japanese forces, alarmed that Allied victories in Western Europe had galvanized the previously compliant Vichy officials into making preparations to expel their Japanese patrons and escape from their authority, formally took over Indochina. In their continuing battle against the Japanese, Ho’s forces now received enthusiastic assistance from operatives of the Office of Strategic Services, the wartime U.S. intelligence agency the representatives of which undertook a wide variety of covert missions in both the European and Pacific Theaters of war. Their cooperation encouraged Ho to believe that the United States might be willing to endorse his quest for Vietnamese independence, particularly since President Franklin D. Roosevelt, who was known to be strongly anticolonialist, had found Vichy officials’ actions in Indochina particularly distasteful. By the end of the war, Viet Minh forces controlled Tonkin, the northern portion of Vietnam. Once Japan surrendered, Ho promptly seized the occupying power’s rice stocks and distributed them to the Vietnamese population, of whom up to 2 million had already died of starvation during the war. On 16 August, he announced Vietnam’s independence, and on 25 August 1945, he persuaded Emperor Bao Dai to abdicate and hand over his powers to the Viet Minh. One week later, on 2 September, Ho formally proclaimed the new Democratic Republic of Viet-

nam, with himself as founding president and Bao Dai as “supreme adviser.”

Ho’s hopes of obtaining quick and easy Western recognition of the new state failed to materialize. By the end of September, a joint British, Indian, and French force, assisted by some captured Japanese troops, had restored French rule in Laos, Cambodia, and Tonkin, the southern portion of Vietnam, crushing a Viet Minh uprising there. Eager to restore France as a great power and increasingly fearful of international Communism, U.S. officials acquiesced in these developments. From then until his death in 1969, Ho remained determined to reunite his country, a goal only attained in 1975. Nationalist Chinese forces helped Ho to retain control of the north, but in February 1946, Chinese President Jiang Jieshi (Chiang Kai-shek) withdrew these troops in return for French concessions in Shanghai and other Chinese treaty ports. In March 1946, Ho negotiated an agreement whereby France recognized his Democratic Republic of Vietnam as a component part of the French Union and promised a plebiscite in the south to allow that area’s people to decide whether they wished to join the north. France quickly refused to honor these accords and in June 1946, announced the creation of a separate French-controlled government in southern Vietnam.

In November 1946, French troops reoccupied Hanoi and bombarded Haiphong Harbor, forcing the Viet Minh to retreat into the jungle. The Viet Minh responded with large-scale guerrilla attacks on French forces, the beginning of an eight-year struggle against French rule that ended in 1954 with the conclusive French defeat at the mountain fortress of Dienbienphu. In January 1950, Ho Chi Minh again proclaimed a Democratic Republic of Vietnam, controlling the north of the country, which won immediate recognition from the Soviet Union and the new Communist People’s Republic of China. The following month Britain and the United States recognized the French-controlled South Vietnamese government, nominally headed by Bao Dai since March 1949. From 1950 onward, French forces received increasing military and economic assistance from the United States, the beginning of an American commitment to oppose the extension of Communist rule to South Vietnam that only ended in 1975. In the 30 years it took Ho and his followers to expel both the French and their American successors, approximately 3 million Vietnamese soldiers and civilians died.

About the Author

Born Nguyễn Sinh Cung, a name that became Nguyễn Tất Thành when he was 10 years old, as a professional revolutionary, Ho Chi Minh became a man of many aliases, including Nguyen Ai Quoc and around 10 others. The son of an Indochinese imperial court functionary who resigned his

position and became a teacher to protest the emperor's acceptance of French overlordship, Ho inherited his father's nationalist outlook. As a young man, he took part in a series of tax revolts, before going overseas in 1911. Ho lived first in Great Britain, where he trained as a pastry cook, and from 1915 to 1923, in the French capital of Paris. In 1918, during World War I, Ho tried unsuccessfully to persuade the French government to grant independence to Vietnam, as the stated Allied war aims of the self-determination of nations required. Equally unavailingly, the following year, he also petitioned the Allied representatives attending the Paris Peace Conference to redress indigenous grievances and grant equal rights to all within French Indochina. After this rebuff, Ho joined the French Communist Party in 1919 and soon became a professional revolutionary, spending lengthy periods in Moscow and encouraging Communist and nationalist movements throughout much of Asia. Together with several other Indochinese militants, while living in Hong Kong in 1929, Ho founded the Indochinese Communist Party. In 1940, he returned to French Indochina, where he quickly became his country's leading nationalist political figure, spearheading a crusade to gain independence for Vietnam and unite the entire country under Communist control that would absorb all his energies until his death in 1969 and win him universal recognition as the Democratic Republic of Vietnam's first president, a position he held for life, and foremost founding father.

About the Document

Ho's formal proclamation declaring Vietnam's independence was a public document, modeled upon and even quoting directly from the U.S. Declaration of Independence drafted in 1776 by Thomas Jefferson. Its intended audience was not so much the people of Vietnam itself as the governments and influential makers of opinion in the various Western countries among the Allied powers. As the war came to an end, with the Allies formally committed to liberal war aims, including the rights of nations to choose their own governments and form of rule, Ho hoped to win Western support for the establishment of an independent Vietnam. Ho's declaration was carefully thought out and drafted, a document skillfully designed to appeal to all the ideals promulgated by the Western Allied powers before and during World War II. Almost certainly deliberately, it emphasized his movement's democratic credentials and minimized the strong Communist element in the Viet Minh's program, reflecting the fact that, whereas Ho knew he could count on almost automatic Soviet endorsement of his government, Allied support would be far more problematic. In an effort to gain French acquiescence in this goal, he even quoted the French Revolution's declaration of 1791 on the Rights of Man and the Citizen. Despite all the effort Ho devoted to this proclamation, it sig-

nally failed to fulfill its objective of winning over the United States and perhaps even Great Britain. By the time the war ended, American officials were eager to rebuild France as a great power and a potential strong European ally, and nascent Cold War considerations also made them increasingly anxious to block any further extension of Communist rule or influence, and the recognition of Ho's Democratic Republic of Vietnam would have run directly counter to both these objectives.

Like the American declaration, Ho's proclamation listed the various abuses and oppressions to which French imperialism had for many decades subjected Vietnam. More immediately, he cited French officials' pusillanimous willingness over the previous five years to knuckle under to Japanese occupation and collaborate with occupying forces, refusing Viet Minh overtures to join the resistance. Even in March 1945, he charged, French colonial officials failed to resist, but "either fled or surrendered," massacring Viet Minh political prisoners before they did so. The message was clear: the French were poltroons and turncoats who had displayed such cowardice, deserting the Allied cause, that they no longer deserved to retain control of Vietnam. By their own efforts, Ho claimed, the Vietnamese people had won back their country's independence from the occupying Japanese occupiers, before whom the French had fled in disarray, and they should now be allowed to enjoy the fruits of their anti-Fascist exertions. He appealed to the Allies to hold fast to "the principles of self-determination and equality of nations" that they had declared at the recent Tehran and San Francisco conferences. Reading this document, one receives the distinct impression that for Ho, the only real significance of World War II was its impact upon the quest for Vietnamese independence, which was his own greatest preoccupation, and the ways in which he could utilize the course and outcome of that conflict to achieve this objective.

Ho Chi Minh, Declaration of Independence of the Democratic Republic of Vietnam, 2 September 1945

"All men are created equal. They are endowed by their Creator with certain inalienable rights, among these are Life, Liberty, and the pursuit of Happiness."

This immortal statement was made in the Declaration of Independence of the United States of America in 1776. In a broader sense, this means: All the peoples on the earth are equal from birth, all the peoples have a right to live, to be happy and free.

The Declaration of the French Revolution made in 1791 on the Rights of Man and the Citizen also states: "All men are born free and with equal rights, and must always remain free and have equal rights."

Those are undeniable truths.

Nevertheless, for more than eighty years, the French imperialists, abusing the standard of Liberty, Equality, and Fraternity, have violated our Fatherland and oppressed our fellow-citizens. They have acted contrary to the ideals of humanity and justice.

In the field of politics, they have deprived our people of every democratic liberty. They have enforced inhuman laws; they have set up three distinct political regimes in the North, the Center and the South of Viet-Nam in order to wreck our national unity and prevent our people from being united.

They have built more prisons than schools. They have mercilessly slain our patriots—they have drowned our uprisings in rivers of blood.

They have fettered public opinion; they have practised obscurantism against our people.

To weaken our race they have forced us to use opium and alcohol.

In the fields of economics, they have fleeced us to the backbone, impoverished our people, and devastated our land.

They have robbed us of our rice fields, our mines, our forests, and our raw materials. They have monopolised the issuing of bank-notes and the export trade.

They have invented numerous unjustifiable taxes and reduced our people, especially our peasantry, to a state of extreme poverty.

They have hampered the prospering of our national bourgeoisie; they have mercilessly exploited our workers.

In the autumn of 1940, when the Japanese Fascists violated Indochina's territory to establish new bases in their fight against the Allies, the French imperialists went down on their bended knees and handed over our country to them.

Thus, from that date, our people were subjected to the double yoke of the French and the Japanese. Their sufferings and miseries increased. The result was that from the end of last year to the beginning of this year, from Quang Tri province to the North of Viet-Nam, more than two million of our fellow-citizens died from starvation. On March 9 [1945], the French troops were disarmed by the Japanese. The French colonialists either fled or surrendered, showing that not only were they incapable of "protecting" us, but that, in the span of five years, they had twice sold our country to the Japanese.

On several occasions before March 9, the Viet Minh League urged the French to ally themselves with it against the Japanese. Instead of agreeing to this proposal, the French colonialists so intensified their terrorist activities against the Viet Minh members that before fleeing they massacred a great number of our political prisoners detained at Yen Bay and Cao Bang.

Notwithstanding all this, our fellow-citizens have always manifested toward the French a tolerant and humane attitude. Even after the Japanese putsch of March 1945, the Viet

Minh League helped many Frenchmen to cross the frontier, rescued some of them from Japanese jails, and protected French lives and property.

From the autumn of 1940, our country had in fact ceased to be a French colony and had become a Japanese possession.

After the Japanese had surrendered to the Allies, our whole people rose to regain our national sovereignty and to found the Democratic Republic of Viet-Nam.

The truth is that we have wrested our independence from the Japanese and not from the French.

The French have fled, the Japanese have capitulated, Emperor Bao Dai has abdicated. Our people have broken the chains which for nearly a century have fettered them and have won independence for the Fatherland. Our people at the same time have overthrown the monarchic regime that has reigned supreme for dozens of centuries. In its place has been established the present Democratic Republic.

For these reasons, we, members of the Provisional Government, representing the whole Vietnamese people, declare that from now on we break off all relations of a colonial character with France; we repeal all the international obligations that France has so far subscribed to on behalf of Viet-Nam and we abolish all the special rights the French have unlawfully acquired in our Fatherland.

The whole Vietnamese people, animated by a common purpose, are determined to fight to the bitter end against any attempt by the French colonialists to reconquer their country.

We are convinced that the Allied nations which at Tehran and San Francisco have acknowledged the principles of self-determination and equality of nations, will not refuse to acknowledge the independence of Viet-Nam.

A people who have courageously opposed French domination for more than eighty years, a people who have fought side by side with the Allies against the Fascists during these last years, such a people must be free and independent.

For these reasons, we, members of the Provisional Government of the Democratic Republic of Viet-Nam, solemnly declare to the world that Viet-Nam has the right to be a free and independent country and in fact it is so already. The entire Vietnamese people are determined to mobilise all their physical and mental strength, to sacrifice their lives and property in order to safeguard their independence and liberty.

6.9. U.S. Planning for the Future

Postwar Planning for a U.S. World Role

As World War II drew to an end, influential officials within the U.S. government anticipated that their country would assume a far greater international role than ever before. Even during the war itself, the United States had been instrumental in the establishment of postwar international institutions to maintain peace and economic stability, most notably the United Nations, the International Bank for Reconstruction and Development (World Bank), and the International Monetary Fund. Prominent figures within the Roosevelt and Truman administrations, most of them drawn from the War or Navy Departments or the Office of Strategic Services, and many of whom had lived through the aftermath of World War I when the United States had eschewed any major international role, nonetheless thought such measures far from sufficient. They believed that the United States itself should be far more actively prepared to assume a much greater international role and for that purpose, should greatly enhance its permanent military and diplomatic capabilities, acquire overseas bases, upgrade scientific research and development, and acquire a serious overseas intelligence capability.

Within the military, such proposals were spearheaded by the army's chief of staff, George C. Marshall, ably seconded by General Henry H. "Hap" Arnold, head of the Army Air Forces. As a fairly young officer, Marshall had served in France during World War I, becoming the most trusted aide of General of the Army John J. Pershing, commander of the American Expeditionary Force in that war. Among Marshall's most bitter memories was the manner in which, between the wars, successive American administrations, Republican and Democratic alike, had neglected the army, running it down until by the late 1930s, it was a derisory force. In his final wartime report, Marshall put forward proposals for a "peacetime security policy" for the United States. He

envisaged a relatively small permanent standing army, buttressed by a citizen soldiery who could be called to arms in case of need. The latter he hoped to create through a program of Universal Military Training, required of all young American men. Marshall supported this scheme in part because he believed that once the war was over, American taxpayers would not be prepared to pay to support a substantial military establishment. Marshall expected the regular army to be "a strategic force, heavy in air power, partially deployed in the Pacific and the Caribbean ready to protect the Nation against a sudden hostile thrust and immediately available for emergency action wherever required." In addition, he called for the creation of substantial national stockpiles of arms, ammunition, and other military equipment, and a heavy emphasis on the promotion of scientific research and development in the defense field. Largely due to popular opposition, the United States did not introduce universal military training, but most of Marshall's other recommendations were put into effect.

In August 1945, President Harry S. Truman disbanded the Office of Strategic Services (OSS), the United States wartime intelligence agency President Franklin D. Roosevelt had created in 1942 on the urging of William J. Donovan, who became its director. Donovan was one of wartime Washington's more flamboyant characters. An Irish Catholic lawyer from Buffalo, New York, in World War I, he fought with the renowned 165th Regiment of the 42nd ("Rainbow") Division, becoming the first American soldier to win the Distinguished Service Medal, Distinguished Service Cross, and the Medal of Honor. In the late 1930s, he undertook presidential assignments investigating conditions in Asia, Europe, Latin America, and the Middle East, and when World War II began in Europe, he became a strong voice favoring American aid to the Allies and potential intervention. Throughout the war, Donovan remained convinced that the United States needed a permanent intelligence agency to conduct overseas espionage operations, a conviction he stated to Roosevelt on several occasions. Truman, who became president in April 1945, initially decided to reject Donovan's pleas, but Donovan continued to express his views to various Washington officials, including Harold D. Smith, the influential director of the Bureau of the Budget, whose endorsement that the United States could afford such an agency would undoubtedly be useful to any such enterprise. As the burgeoning Cold War developed, in January 1946, Truman began to reverse himself and issued an executive order creating a Central Intelligence Group and a National Intelligence Authority, the personnel of which attempted to centralize American postwar intelligence activities. These two bodies were disbanded when in 1947, Congress passed the National Security Act, which formally established the National Security Council (NSC) to coordinate American national security policies and,

under it, the Central Intelligence Agency (CIA). The latter body's mandate included advising the NSC on intelligence activities and making recommendations as to their coordination; correlating, evaluating, and disseminating intelligence; and performing such intelligence functions and other activities as the NSC might assign to it. Although Donovan himself was denied any position in the new organization, many of its most influential operatives, including Allen W. Dulles, director from 1953 to 1961, were drawn from the former OSS.

The establishment of the CIA and enhanced U.S. military capabilities were only part of a broader expansion of the U.S. defense and national security bureaucracy that came into effect in the years immediately after World War II. Over strong opposition from the U.S. navy, in 1947, all the armed forces were unified under the authority of a new civilian official, the Secretary of Defense, to whom all three services, the army, navy, and air force, were responsible. The new National Defense Establishment was paralleled by the creation in 1947 of the National Security Council, a body answering to the president, the function of which was to rationalize decision making on international affairs by serving as a forum where the views of the State and Defense Departments, the new Central Intelligence Agency, and the White House were all represented, and where coordinated policies could be debated and decided upon. By 1949, the United States had already entered into security alliances in Latin America and Western Europe and had acquired military bases around the world. The outbreak of the Korean War in mid-1950 brought a major increase in American military spending and commitments, the beginning of several decades of heavy defense expenditures that helped to create what President Dwight D. Eisenhower later termed "the military-industrial complex," the group of defense-related businesses with close ties to the military who had much to gain from high military budgets. More broadly, the U.S. government had created what would later be called the "national security state," a political economy and institutional bureaucracy among the most fundamental purposes of which was to meet the demands of American defense commitments.

About the Documents

Both Marshall and Donovan were presenting official documents designed to persuade their intended audience to support the policies the writer was urging. Each man had a rather different set of readers in mind and tailored his style and message to his intended recipients. Marshall's final report, much of which was drafted by subordinates within the War Department and U.S. army and then submitted for his approval, had a much larger potential audience than Donovan's letter to Smith. Marshall addressed his report in the first instance to the U.S. Congress, the support of which he needed if any of

his recommendations for a decidedly more active and well-prepared U.S. military were to become reality. More broadly, his report was also intended for consumption by the American general public, in the hopes that constituents would put pressure on senators and congressmen to pass its recommendations. Marshall also knew that his final report, or at least summaries of it, would receive wide media coverage. The whole document, therefore, was designed to be easy reading, readily comprehensible by politicians, journalists, or ordinary Americans without special military knowledge or expertise. His entire report, not just this excerpt, was clearly written, concise, down-to-earth, with graphic illustrations of the points he made, intended to demonstrate how poorly prepared militarily the United States had been from 1939 to 1941, and why this situation must not, in the interests of the country's own security, be allowed to recur. Marshall wished to emphasize that he was not urging militarism for its own sake but that he sought to avoid another future war. He deliberately stressed that if similar policies had been adopted after World War I, it was quite possible that the United States would never have found itself at war with Germany and Japan in the early 1940s. Marshall also carefully suggested that the policies he was urging were in the best American tradition, citing the desire of the first president of the United States, George Washington, to establish a large citizen army in the late eighteenth century.

Donovan, a classic insider, normally operated not by appealing to the general public but by working behind the scenes to convert influential officials to his own views. Donovan had by this time accepted that the OSS was doomed to disappear and was now concentrating his efforts on ensuring that before long it would have a successor. He undoubtedly knew that Smith was likely to show his letter and attached memorandum to others, and in what amounted to a coordinated lobbying effort, Donovan was himself sending similar missives to other prominent officials within the Truman administration. His objective was primarily to win their support for the creation of a new intelligence organization to replace the OSS, not to start a popular movement for the purpose. Donovan argued that every other major power except the United States had for many years possessed a centralized foreign intelligence service and that the United States could no longer afford to be without such an organization. Donovan made it clear that he believed any such agency should be forbidden to undertake "clandestine activities" within the United States itself. He also argued that, to avoid conflicts over turf and jurisdiction, it must be independent of every other government agency, report directly to the president, liaise with the State, War, Navy, and Treasury Departments, and take responsibility for all foreign intelligence operations and intelligence analysis. In time of war, it should work closely with the U.S. armed forces, and in theaters of war, its

operatives should be under the operational control of the military commanders in each area. Knowing that many officials have only limited time, Donovan kept his letter and memorandum short, dividing the latter into brief and easily memorized points that he hoped would lodge in the brains of busy men and convert them to his way of thinking.

A) George C. Marshall, "For the Common Defense," Extract from *Final Biennial Report to the Secretary of War*, 1 September 1945

Our present national policies require us to: Maintain occupation forces in Europe and the Pacific; prepare for a possible contribution of forces to a world security organization; maintain national security while the world remains unstable and later on a more permanent or stable basis.

These policies require manpower. Yet at the same time it is the policy of the nation to completely demobilize the wartime army as rapidly as possible. Unless hundreds of thousands of men of the wartime forces are to remain in service at home and overseas, more permanent decisions must be made.

The War Department recommends that the occupation forces and the U.S. complement in the International security force be composed as much as possible of volunteers. This can be accomplished by establishing now a new permanent basis for the regular military establishment. If this recommendation and those which I will now discuss in detail for establishing a peacetime security policy are now adopted by the Congress, demobilization can proceed uninterrupted until all men now in temporary service have returned to their homes.

FOR THE COMMON DEFENSE

To fulfill its responsibility for protecting this Nation against foreign enemies, the Army must project its planning beyond the immediate future. In this connection I feel that I have a duty, a responsibility, to present publicly at this time my conception, from a military point of view, of what is required to prevent another international catastrophe.

For years men have been concerned with individual security. Modern nations have given considerable study and effort to the establishment of social security systems for those unable or unwise enough to provide for themselves. But effective insurance against the disasters which have slaughtered millions of people and leveled their homes is long overdue.

We finish each bloody war with a feeling of acute revulsion against this savage form of human behavior, and yet on each occasion we confuse military preparedness with the causes of war and then drift almost deliberately into another catastrophe. . . .

We must start, I think, with a correction of the tragic misunderstanding that a security policy is a war policy. War has been defined by a people who have thought a lot about it—the Germans. They have started most of the recent ones. The German soldier-philosopher Clausewitz described war as a special violent form of political action. Frederic of Prussia, who left Germany the belligerent legacy which has now destroyed her, viewed war as a device to enforce his will whether he was right or wrong. He held that with an invincible offensive military force he could win any political argument. This is the doctrine Hitler carried to the verge of complete success. It is the doctrine of Japan. It is a criminal doctrine, and like other forms of crime, it has cropped up again and again since man began to live with his neighbors in communities and nations. There has long been an effort to outlaw war for exactly the same reason that man has outlawed murder. But the law prohibiting murder does not of itself prevent murder. It must be enforced. The enforcing power, however, must be maintained on a strictly democratic basis. There must not be a large standing army subject to the behest of a group of schemers. The citizen-soldier is the guarantee against such a misuse of power.

In order to establish an international system for preventing wars, peace-loving peoples of the world are demonstrating an eagerness to send their representatives to such conferences as those at Dumbarton Oaks and San Francisco with the fervent hope that they may find a practical solution. Yet, until it is proved that such a solution has been found to prevent wars, a rich nation which lays down its arms as we have done after every war in our history, will court disaster. The existence of the complex and fearful instruments of destruction now available make this a simple truth which is, in my opinion, undebatable.

So far as their ability to defend themselves and their institutions was concerned, the great democracies were sick nations when Hitler openly massed his forces to impose his will on the world. As sick as any was the United States of America. We had no field army. There were the bare skeletons of three and one-half divisions scattered in small pieces over the entire United States. It was impossible to train even these few combat troops as divisions because motor transportation and other facilities were lacking and funds for adequate maneuvers were not appropriated. The Air Forces consisted of a few partially equipped squadrons serving continental United States, Panama, Hawaii, and the Philippines; their planes were largely obsolescent and could hardly have survived a single day of modern aerial combat. We lacked modern arms and equipment. When President Roosevelt proclaimed, on 8 September 1939, that a limited emergency existed for the United States we were, in terms of available strength, not even a third-rate military power. Some colleagues had been informing the world and evidently convinc-

ing the Japanese that the young men of America would refuse to fight in defense of their country.

The German armies swept over Europe at the very moment we sought to avoid war by assuring ourselves that there could be no war. The security of the United States of America was saved by sea distance, by Allies, and by the errors of a prepared enemy. For probably the last time in the history of warfare those ocean distances were a vital factor in our defense. We may elect again to depend on others and the whim and error of potential enemies, but if we do we will be carrying the treasure and freedom of this great Nation in a paper bag.

Returning from France after the last war, with General Pershing [commander-in-chief of the American Expeditionary Force in World War I], I participated in his endeavors to persuade the Nation to establish and maintain a sound defense policy. Had his recommendations been accepted, they might have saved this country the hundreds of billions of dollars and the more than a million casualties it has cost us again to restore the peace. We might even have been spared this present world tragedy. . . .

Twice in recent history the factories and farms and people of the United States have foiled aggressor nations; conspirators against the peace would not give us a third opportunity.

Between Germany and America in 1914 and again in 1939 stood Great Britain and the USSR, France, Poland, and the other countries of Europe. Because the technique of destruction had not progressed to its present peak, these nations had to be eliminated and the Atlantic Ocean crossed by ships before our factories could be brought within the range of the enemy guns. At the close of the German war in Europe they were just on the outer fringes of the range of fire from an enemy in Europe. [German Field Marshal Hermann] Goering stated after his capture that it was a certainty that the eastern Americas would have been under rocket bombardment had Germany remained undefeated for two more years. The first attacks would have started much sooner. The technique of war has brought the United States, its homes and factories into the front line of world conflict. They escaped destructive bombardment in the second World War. They would not in a third.

It no longer appears practical to continue what we once conceived as hemispheric defense as a satisfactory basis for our security. We are now concerned with the peace of the entire world. And the peace can only be maintained by the strong.

What then must we do to remain strong and still not bankrupt ourselves on military expenditures to maintain a prohibitively expensive professional army even if one could be recruited? President Washington answered that question in recommendations to the first Congress to convene under the United States Constitution. He proposed a program for the

peacetime training of a citizen army. At that time the conception of a large professional Regular Army was considered dangerous to the liberties of the Nation. It is still so today. But the determining factor in solving this problem will inevitably be the relation between the maintenance of military power and the cost in annual appropriations. No system, even if actually adopted in the near future, can survive the political pressure to reduce the military budget if the costs are high—and professional armies are very costly.

There is now another disadvantage to a large professional standing army. Wars in the twentieth century are fought with the total resources, economic, scientific, and human of entire nations. Every specialized field of human knowledge is employed. Modern war requires the skill and knowledge of the individuals of a nation.

Obviously we cannot all put on uniforms and stand ready to repel invasion. The greatest energy in peacetime of any successful nation must be devoted to productive and gainful labor. But all Americans can, in the next generations, prepare themselves to serve their country in maintaining the peace or against the tragic hour when peace is broken, if such a misfortune again overtakes us. This is what is meant by *Universal Military Training*. It is not universal military *service*—the actual induction of men into the combatant forces. Such forces would be composed during peacetime of volunteers. The trainees would be in separate organizations maintained for training purposes only. Once trained, young men would be freed from further connection with the Army unless they chose, as they now may, to enroll in the National Guard or an organized reserve unit, or to volunteer for service in the small professional army. When the Nation is in jeopardy they could be called, just as men are now called, by a committee of local neighbors, in an order of priority and under such conditions as directed at that time by the Congress.

The concept of universal military training is not founded, as some may believe, on the principle of a mass Army. The Army has been accused of rigidly holding to this doctrine in the face of modern developments. Nothing, I think, could be farther from the fact, as the record of the mobilization for this war demonstrates. Earlier in this report I explained how we had allocated manpower to exploit American technology. Out of our entire military mobilization of 14,000,000 men, the number of infantry troops was less than 1,500,000 Army and Marine.

The remainder of our armed forces, sea, air, and ground, was largely fighting a war of machinery. Counting those engaged in war production there were probably 75 to 80,000,000 Americans directly involved in prosecution of the war. To technological warfare we devoted 98 percent of our entire effort.

Nor is it proposed now to abandon this formula which has been so amazingly successful. The harnessing of the basic

power of the universe will further spur our efforts to use brain for brawn in safeguarding the United States of America.

However, technology does not eliminate the need for men in war. The Air Forces, which were the highest developed technologically of any of our armed forces in this war, required millions of men to do their job. Every B-29 that winged over Japan was dependent on the efforts of 12 officers and 73 men in the immediate combat area alone. . . .

This war has made it clear that the security of the Nation, when challenged by an armed enemy, requires the services of virtually all able-bodied male citizens within the effective military group.

In war the Nation cannot depend on the numbers of men willing to volunteer for active service; nor can our security in peace.

In another national emergency, the existence of a substantial portion of the Nation's young manpower already trained or in process of training, would make it possible to fill out immediately the peacetime ranks of the Navy, the Regular Army, the National Guard, and the Organized Reserve. As a result our Armed Forces would be ready for almost immediately deployment to counter initial hostile moves, ready to prevent an enemy from gaining footholds from which he could launch destructive attack against our industries and our homes. By this method we would establish, for the generations to come, a national military policy: (1) which is entirely within the financial capabilities of our peacetime economy and is absolutely democratic in its nature, and (2) which places the military world and therefore the political world on notice that this vast power, linked to our tremendous resources, wealth, and production, is immediately available. There can be no question that all the nations of the world will respect our views accordingly, creating at least a probability of peace on earth and of good will among men rather than disaster upon disaster in a tormented world where the very processes of civilization itself are constantly threatened. . . .

The terms of the final peace settlement will provide a basis for determining the strength of the regular or permanent postwar military forces of the United States, air, ground, and naval, but they cannot, in my opinion, alter the necessity for a system of Universal Military Training.

The yardstick by which the size of the permanent force must be measured is maximum security with minimum cost in men, matériel, and maintenance. So far as they can foresee world conditions a decade from now, War Department planners, who have taken every conceivable factor into consideration, believe that our position will be sound if we set up machinery which will permit the mobilization of an Army of 4,000,000 men within a period of 1 year following any international crisis resulting in a national emergency for the United States.

The Regular Army must be comprised largely of a strategic force, heavy in air power, partially deployed in the Pacific and the Caribbean ready to protect the Nation against a sudden hostile thrust and immediately available for emergency action wherever required. It is obvious that another war would start with a lightning attack to take us unaware. The pace of the attack would be at supersonic speeds of rocket weapons closely followed by a striking force which would seek to exploit the initial and critical advantage. We must be sufficiently prepared against such a threat to hold the enemy at a distance until we can rapidly mobilize our strength. The Regular Army, and the National Guard, must be prepared to meet such a crisis.

Another mission of the Regular Army is to provide the security garrisons for the outlying bases. We quickly lost the Philippines, Guam, and Wake Islands at the beginning of this war and are still expending lives and wealth in recovering them.

The third mission of the permanent Army is to furnish the overhead, the higher headquarters which must keep the machine and the plans up to date for whatever national emergency we may face in the future. This overhead includes the War Department, the War College, the service schools, and the headquarters of the military area into which continental United States is subdivided to facilitate decentralized command and coordination of the peacetime military machine. This was about all we had on the eve of this war, planners and a small number of men who had little to handle in practice but sound ideas on how to employ the wartime hosts that would be gathered in the storm. Had it not been for the time the British Empire and the Soviets bought us, those plans and ideas would have been of little use.

The fourth and probably the most important mission of the Regular Army is to provide the knowledge, the expert personnel, and the installations for training the citizen-soldier upon whom, in my view, the future peace of the world largely depends. . . .

Only by universal military training can full vigor and life be instilled into the Reserve system. It creates a pool of well-trained men and officers from which the National Guard and the Organized Reserve can draw volunteers; it provides opportunities for the Guard and Reserve units to participate in corps and Army maneuvers, which are vital preparations to success in military campaigns. Without these trained men and officers, without such opportunities to develop skill through actual practice in realistic maneuvers, neither the Regular Army, the National Guard, nor the Reserve can hope to bring efficiency to their vital missions. . . .

An unbroken period of 1 year's training appears essential to the success of a sound security plan based on the concept of a citizen army.

It is possible to train individual soldiers as replacements for veteran divisions and air groups as we now do in a comparatively short period of time. The training of the unit itself cannot be accomplished at best in less than a year; air units require even more time. The principle is identical to that of coaching a football team. A halfback can quickly learn how to run with the ball, but it takes time and much practice and long hours of team scrimmage before he is proficient at carrying the ball through an opposing team. So it is with an army division or combat air group. Men learn to fire a rifle or machine gun quickly, but it takes long hours of scrimmage, which the army calls maneuver, before the firing of the rifle is coordinated with the activities of more than 14,000 other men on the team.

All men who might someday have to fight for their Nation must have this team training. The seasoned soldiers of our present superb divisions will have lived beyond the age of military usefulness. The situation will be similar in the peacetime army to that which obtained when we began to mobilize for this war and all men had to have at least a year of unit training before we had divisions even fit for shipment overseas.

The training program would be according to the standards which have made the American soldier in this war the equal of the finest fighting men. It would be kept abreast of technical developments and the resulting modification of tactics. . . .

The peacetime army must not only be prepared for immediate mobilization of an effective war army, but it must have in reserve the weapons needed for the first months of the fighting and clear-cut plans for immediately producing the tremendous additional quantities of matériel necessary in total war. We must never again face a great national crisis with ammunition lacking to serve our guns, few guns to fire, and no decisive procedures for procuring vital arms in sufficient quantities.

The necessity for continuous research into the military ramifications of man's scientific advance is now clear to all and it should not be too difficult to obtain the necessary appropriations for this purpose in peacetime. There is, however, always much reluctance to expenditure of funds for improvement of war-making instruments, particularly where there is no peacetime usefulness in the product.

The development of combat airplanes is closely allied with development of civil aeronautics; the prototypes of many of our present transport planes and those soon to come were originally bombers. Many of the aeronautical principles that helped give this Nation the greatest air force in the world grew out of commercial development and our production know-how at the start of this war was partially the fruit of peacetime commercial enterprise. Since many vital types of weapons have no commercial counterpart, the peacetime development of these weapons has been grossly neglected. Antiair-

craft weapons are a good example. The highly efficient anti-aircraft of today did not materialize until long after the fighting began. The consequent cost in time, life, and money of this failure to spend the necessary sums on such activity in peacetime has been appalling.

There is another phase of scientific research which I think has been somewhat ignored—the development of expeditious methods for the mass production of war matériel. This is of great importance since it determines how quickly we can mobilize our resources if war comes and how large and costly our reserve stocks of war matériel must be. Serious thought and planning along this line can save millions of tax dollars.

We can be certain that the next war, if there is one, will be even more total than this one. The nature of war is such that once it now begins it can end only as this one is ending, in the destruction of the vanquished, and it should be assumed that another reconversion from peace to war production will take place initially under enemy distant bombardment. Industrial mobilization plans must be founded on these assumptions and so organized that they will meet them and any other situation that may develop. Yet they must in no way retard or inhibit the course of peacetime production.

If this Nation is to remain great it must bear in mind now and in the future that war is not the choice of those who wish passionately for peace. It is the choice of those who are willing to resort to violence for political advantage. We can fortify ourselves against disaster, I am convinced, by the measures I have here outlined. In these protections we can face the future with a reasonable hope for the best and with quiet assurance that even though the worst may come, we are prepared for it.

Source: George C. Marshall, General Marshall's Report: The Winning of the War in Europe and the Pacific: Biennial Report of the Chief of Staff of the United States Army July 1, 1943 to June 30, 1945, to the Secretary of War (New York: Simon and Schuster, 1945), pp. 116–123.

B) William J. Donovan to Harold D. Smith, Director, Bureau of the Budget, 25 August 1945

It is our estimate . . . the effectiveness of OSS as a War Agency will end as of January 1, or at latest February 1946, at which time liquidation should be completed. At that point I wish to return to private life. Therefore, in considering the disposition to be made of the assets created by OSS, I speak as a private citizen concerned with the future of his country.

In our government today there is no permanent agency to take over the functions which OSS will have then ceased to perform. These functions while carried on as incident to the

war are in reality essential in the effective discharge by this nation of its responsibilities in the organization and maintenance of the peace.

Since last November I have pointed out the immediate necessity of setting up such an agency to take over valuable assets created by OSS. Among these assets was establishment for the first time in our nation's history of a foreign secret intelligence service which reported information as seen through American eyes. As an integral and inseparable part of this service there is a group of specialists to analyze and evaluate the material for presentation to those who determine national policy.

It is not easy to set up a modern intelligence system. It is more difficult to do so in time of peace than in time of war.

It is important therefore that it be done before the War Agency has disappeared so that profit may be made of its experience and "know how" in deciding how the new agency may best be conducted.

I have already submitted a plan for the establishment of a centralized system. However, the discussion of that proposal indicated the need of an agreement upon certain fundamental principles before a detailed plan is formulated. If those concerned could agree upon the principles with which such a system should be established, acceptance of a common plan would be more easily achieved.

Accordingly, I attach a statement of principles, the soundness of which I believe has been established by study and by practical experience.

Principles—The Soundness of Which It Is Believed Has Been Established by Our Own Experience and First-Hand Study of the Systems of Other Nations—Which Should Govern the Establishment of a Centralized United States Foreign Intelligence System.

The formulation of a national policy both in its political and military aspects is influenced and determined by knowledge (or ignorance) of the aims, capabilities, intentions, and policies of other nations.

All major powers except the United States have had for a long time past permanent world-wide intelligence services, reporting directly to the highest echelons of their governments. Prior to the present war, the United States had no foreign secret intelligence service. It never has had and does not now have a coordinated intelligence system.

The defects and dangers of this situation have been generally recognized. Adherence to the following would remedy this defect in peace as well as war so that American policy could be based upon information obtained through its own sources on foreign intentions, capabilities, and developments as seen and interpreted by Americans.

1. That each department of Government should have its own intelligence bureau for the collection and

processing of such informational material as it finds necessary in the actual performance of its functions and duties. Such a bureau should be under the sole control of the department head and should not be encroached upon or impaired by the functions granted any other governmental intelligence agency.

Because secret intelligence covers all fields and because of possible embarrassment, no executive department should be permitted to engage in secret intelligence but in a proper case call upon the central agency for service.

2. That in addition to the intelligence unit for each department there should be established a national centralized foreign intelligence agency which should have the authority:
 - A. To serve all departments of the Government.
 - B. To procure and obtain political, economic, psychological, sociological, military and other information which may bear upon the national interest and which has been collected by the different Governmental departments or agencies
 - C. To collect when necessary supplemental information either at its own instance or at the request of any Governmental departments or agencies.
 - D. To integrate, analyze, process, and disseminate, to authorized Governmental agencies and officials, intelligence in the form of strategic interpretive studies.
3. That such an agency should be prohibited from carrying on clandestine activities within the United States and should be forbidden the exercise of any police functions at home or abroad.
4. That since the nature of its work requires it to have status, it should be independent of any department of the government (since it is obliged to serve all and must be free of the natural bias of an operating department). It should be under a director, appointed by the President, and be administered under Presidential direction, or in the event of a General Manager being appointed, should be established in the Executive Office of the President, under his direction.
5. That subject to the approval of the President or the General Manager the policy of such a service should be determined by the Director with the advice and assistance of a Board on which the Secretaries of State, War, Navy, and Treasury should be represented.
6. That this agency, as the sole agency for secret intelligence, should be authorized, in the foreign field only, to carry on services such as espionage, counter-espionage, and those special operations (including morale and psychological) designed to anticipate and

counter any attempted penetration and subversion of our national security by enemy action.

7. That such a service have an independent budget granted directly by the Congress.
8. That such a service should have its own system of codes and should be furnished facilities by departments of Government proper and necessary for the performance of its duties.
9. That such a service should include in its staff specialties (within Governmental departments, civil and military, and in private life) professionally trained in analysis of information and possessing a high degree of linguistic, regional, or functional competence, to analyze, coordinate and evaluate incoming information, to make special intelligence reports, and to provide guidance for the collecting branches of the agency.
10. That in time of war or unlimited national emergency, all programs of such agency in areas of actual and projected military operations shall be coordinated with military plans, and shall be subject to the approval of the Joint Chiefs of Staff, or if there be consolidation of the armed services, under the supreme commander. Parts of such programs which are to be executed in the theater of military operations shall be subject to control of the military commander.
