*This encyclopedia is dedicated to my Father,
Colonel Cary S. Tucker, USAR (1906–1962),
who fought in the Pacific Theater in World War II*

About the Editors

Spencer C. Tucker, Ph.D., held the John Biggs Chair of Military History at his alma mater of the Virginia Military Institute, Lexington, for six years until his retirement from teaching in 2003. Before that, he was professor of history for thirty years at Texas Christian University, Fort Worth. He has also been a Fulbright scholar and, as an army captain, an intelligence analyst in the Pentagon. Currently the senior fellow in military history at ABC-CLIO, he has written or edited twenty-three books, including the award-winning *Encyclopedia of the Vietnam War* and the *Encyclopedia of the Korean War*, both published by ABC-CLIO.

Priscilla Mary Roberts received her Ph.D. from Cambridge University and is a lecturer in history and honorary director of the Center of American Studies at the University of Hong Kong. Dr. Roberts has received numerous research awards and was the assistant editor of the *Encyclopedia of the Korean War* published by ABC-CLIO. She spent 2003 as a visiting Fulbright scholar at the Institute for European, Russian, and Eurasian Studies at The George Washington University in Washington, D.C.

Foreword

I am a child of World War II. The *Anschluss* of Austria was Adolf Hitler's birth gift. The Führer topped that generosity the next year with the Munich Crisis, in which Prime Minister Neville Chamberlain discovered peace in our time, meaning the next eleven months. In the autumn of 1938, my parents and I lived in London, which meant that they became acquainted with gas masks and civil defense air-raid pamphlets. I must have wailed with baby deprivation when I didn't get my own gas mask, too, but there were no gas masks for infants. I have been a fan of appeasement ever since. Of course, I have no memory of the invasion of Poland, but I remember dimly being on the traditional family countryside Sunday drive (soon to be a casualty of war) when NBC told us about Pearl Harbor. My next memory is a radio report about Guadalcanal while living with my grandparents in Bloomington, Indiana. It is hard to believe that their war memories included *their* parents' tales of the Civil War, in which my paternal grandfather had lost three uncles. Guadalcanal was as far away as Antietam.

In our wartime neighborhood in Arlington, Virginia, we fought a proxy war fed by 1945 with enemy souvenirs. My father, an army "emergency" colonel, could provide nothing more interesting than Pentagon papers, but my best friends' fathers were U.S. Army Air Forces (USAAF) pilots, young lieutenant colonels who commanded B-29 squadrons in the Marianas. Colonels Doubleday and Rustow, both of whom retired as Air Force generals, deluged us with Japanese war matériel, less weapons. We subsequently fought Iwo Jima and Okinawa in the woods off South Hayes Street. I do not recall who got to die in agony for the Emperor, but I certainly know who played a heroic Marine lieutenant with a wooden submachine gun. The best my father, an Army Service Forces planner, could do was to awaken me at O-Dark-Hundred to listen to the first broadcasts about D Day. It was enough then and now.

The last year of the war is a blur—Hitler's death, FDR's death, V-E and V-J Days, the first atomic bombs. I recall that we veterans of the South Hayes Street Front were unhappy to see the war end, probably because we wanted even more Japanese souvenirs, courtesy of the USAAF's XX Bomber Command. As 1946 dawned, we were on our way back to my father's real job, teaching public administration at Columbia University. My postwar veteran's readjustment meant entering the third grade at Leonia (New Jersey) Grammar School. My posttraumatic stress syndrome probably involved sinus headaches and learning I needed glasses for infantile myopia, spoiling my BB gun marksmanship and kickball games.

World War II did not disappear from my scope, however, even when important things intruded, like the Yankees-Giants rivalry and the latest \$2 box of Britain's toy soldiers. Two of my new friends and I wrote a book for a fifth-grade project, mostly cribbed from *Compton's Encyclopedia*. Its title was "Warfare." Most of the book was about World War II, and I wrote about the war with Japan, all five pages. The word count has gone up considerably since 1948, but my interest has been unchecked for almost 60 years of living with World War II. The world has had equal difficulty putting the war behind it, its memory refreshed daily by political allusions, movies, television series, and more than 4,000 books in print in English alone. The fascination with the war reflects a great human truth: we are all children of World War II.

We are children surrounded by the ghosts of the dead of World War II. The graves of the slain stain the earth around the world, although much less so for the United States. The American cemeteries abroad hold only about half of the American wartime combat dead of 292,131 and 113,842 dead of other causes. According to policy, unique among the

belligerents, the United States brought remains back from abroad by family request for reinterment on American soil in national cemeteries like the ones at Arlington, Virginia, or Honolulu, Hawaii. Another option was burial in a private family cemetery, still with a military ceremony and a modest government headstone. For service members for whom no identifiable remains could be found, the largest American cemeteries have memorials that provide the names of the missing in action and unidentified dead, who number 78,955. The largest such memorial is at the National Cemetery of the Pacific (“the Punchbowl”), which lists the names of 18,000 missing in action, most of them airmen and sailors lost forever in the depths of the Pacific Ocean. The cemetery holds 13,000 remains. The two largest American military cemeteries in Europe—Saint-Laurent-sur-Mer, in Normandy, France, and Saint-Avoid, in Lorraine, France—contain the graves of 9,079 and 10,338, respectively, and commemorate 1,864 and 595 missing in action and unidentified dead. That I can provide statistics of reasonable certitude about American wartime losses is telling commentary on how relatively few ghosts the United States provides from the world’s most awful recorded war.

We will never know just how many people died in World War II, but the estimates are horrific and get worse all the time. When I began my life as a professional historian, the estimates of World War II deaths stood at 40 million, more than half of them civilians. The estimates have now climbed above 50 million and may be as high as 60 million. The death toll between 1937 and 1945, arbitrary dates that could be extended easily into the 1950s, has expanded because of recent revelations on the number of Soviet military deaths and the recalculation of war-related deaths throughout China. The totality and globalization of the war is most apparent in one chilling statistic: for the first time in recorded history, more civilians died from direct enemy action than military personnel. Military deaths number in excess of 20 million, civilian deaths probably 35 million. The Axis civilian deaths from bombing and the Red Army’s campaign of revenge from 1944 to 1945 number more than 3 million. Chinese and Russian civilian deaths could be 10 times as many, which explains the enduring hatred of China for Japan and Russia for Germany. By contrast, the deaths of American civilians (excluding Filipinos but not Hawaiians) number 6,200, almost all of whom were merchant seamen.

How does one account for the extent of human suffering among “the innocents” or nonmilitary dead of World War II? Since the warfare of the Napoleonic era, the “civilized” Western nations in practice, national law, and formal international treaty have tried to establish “laws for the conduct of war” or “rules of engagement” that obliged armies to spare nonresisting, nonparticipating civilians caught in the path of

warfare. The first difficulty was that the nineteenth-century codes, brought together in the Hague Convention of 1899, were based on the experiences of armies occupying hostile territory, like the Union army in the rebellious American Confederate states from 1861 to 1865 or the German army in France in 1870 and 1871. When civilians became targets, however inadvertent, of aerial bombing and maritime commerce raiding conducted by submarines in World War I, the rules grew more complex and ambiguous in application. One rationalization was that civilian war-workers in munitions factories on “the Home Front,” a new Great War usage, were no longer innocents but willing participants in the war. Another problem was a military commander’s duty to protect the lives of his men, sometimes called “military necessity.” Why should a submarine commander allow a merchant ship’s captain to get his crew and passengers into lifeboats before the ship was sunk when the ship’s wireless operator could call forth naval assistance that imperiled the submarine? The use of convoys placed escorts nearby, which made surface attacks unattractive. How could a submarine commander risk his crew to pick up survivors? It was one small step to killing enemy merchant mariners in lifeboats and in the water, either with machine guns or by abandonment, a common practice of all submarine forces in World War II.

The growing vagaries of international maritime law do not explain the genocidal nature of World War II. Virulent nationalism, infected with a peculiar brand of racism and religious discrimination, set off the waves of mass murder that characterized the war. By legal definition—regarded as moral standards in some societies—civilians and prisoners of war (POWs) are to be protected from death by the occupying or detaining power. Nazi Germany, Imperial Japan, and the Soviet Union showed how little such standards meant. The Germans still enjoy the dubious distinction of being the most genocidal belligerents of World War II. The Nazi regime divided its victims into three broad categories of exploitation and death: (1) European Jews, 6 million of whom perished as captives in the Holocaust, an exercise in genocide in which almost all European nations participated with some level of complicity; (2) Slavs, broadly defined but especially Poles and Russians, civilians and POWs, whose deaths by murder furthered the “repopulation” and enslavement of eastern Europe required by the *lebensraum* of the Thousand-Year Reich and whose deaths by starvation and disease as slave laborers underwrote the Nazi industrial war effort, numbering an estimated 12 to 15 million; and (3) prisoners of war, resistance fighters, hostages, famine victims, and conscripted laborers from western European nations who died, estimated at around 1 million. Deaths in Great Britain and for the British merchant marine numbered about 100,000. The victims of Imperial Japan were

principally other Asians (the Chinese, the Filipinos) and reached an estimated 9 million. Axis civilian deaths numbered an estimated high of 3 million, about equally divided between the fatalities of strategic bombing and the Soviet ethnic cleansing of 1944 and 1945. When deaths are measured against population, the most victimized nation was Poland, attacked and massacred by Germany and the Soviet Union after 1939; 6 million of 34 million Poles died (Jews and gentiles). One of every 3 Poles left Poland; 1 in 10 eventually returned. Only an estimated 100,000 Poles died fighting in uniform in 1939 or in the exile armed forces eventually formed in France, Great Britain, and the Soviet Union. Geographic vulnerability and appeasement politics could not be redressed by fighting heart, ample enough in the Polish armed forces and the urban guerrillas of the Warsaw ghetto uprising (1943) and the Home Army's war in the same city the next year.

The Asia-Pacific war had its horrific novelties. After 1945, Japanese political leaders, now good conservative-capitalists, cultivated the impression that Japan had been a victim of racism, goaded into war and then attacked in "a war without mercy." To save his people, another innocent victim, Emperor Hirohito, shocked by the atomic bombs that leveled Hiroshima and Nagasaki, surrendered his helpless nation. This version of Japan's war—still believed by many Japanese—served the American postwar purpose, which was to make Japan an anti-Communist bastion against Communist China and the Soviet Union. Japan's real victims—China, the Philippines, Malaya, Australia, and Vietnam—never forgot the real war. I witnessed a colonel of the People's Liberation Army thanking Brigadier General Paul W. Tibbets Jr., U.S. Air Force (Ret.), for freeing China. The Chinese colonel only regretted that the United States had chosen peace rather than dropping more atomic bombs.

The Japanese conducted their war against fellow Asians with only a little less sympathy than they showed the hated Europeans—which meant American, British, Dutch, Canadian, French, Australian, and New Zealand military personnel and civilians. Only 65 percent of the 80,000 Europeans held by Japan as POWs or civilian internees survived the war; capricious execution (mostly of Allied airmen), casual murder, and studied neglect of food and medical needs doomed Allied POWs. The Japanese treatment of fellow Asians beggars the imagination, the most egregious example being the month-long orgy of murder, torture, and rapine in Nanjing that took at least 200,000 Chinese lives. The Japanese used Asians for their varied forms of inhumane projects: army brothels, forced labor, bayonet practice, germ-warfare experiments, medical "research" that included vivisection, and the mass murder of hostages and helpless villagers.

For all its atrocious behavior, Japan escaped a reckoning worthy of its crimes against humanity. It lost the war because the United States destroyed its navy and its army and naval air forces. It is true that Japan lost close to 2 million servicemen and probably 500,000 civilians from a population of 72 million, but Germany had more than 3 million service dead and more than 2 million civilian dead from a population of 78 million. When the Asia-Pacific war ended, the Allies took custody of over 5 million overseas Japanese and returned them to Japan. The only Japanese who really paid the loser's price were those captured by the Soviets in Manchuria and Korea; of the 600,000 Japanese and Koreans taken into the Soviet Union as human reparations, only 224,000 survived to return home by 1950. The sudden Japanese surrender, motivated by a frantic effort to save the institution of the emperor, deprived the Soviets of additional revenge for their defeat at the hands of Japan in 1905. Japan may have lost its empire in 1945, but it saved its soul, however unique.

World War II marked the apogee of the military power of the nation-state, the culmination of a process of institutional development that began for Europe in the sixteenth century. To wage war effectively, Prussian General Karl von Clausewitz opined in the 1820s, a nation required the complete commitment and balanced participation of its government, its armed forces, and its people. He might have added its economy to "the holy trinity" he analyzed in *Vom Krieg*. Phrased another way, the 56 belligerent states of World War II could create and sustain an industrialized war effort that in theory left no significant portion of their population or resources untouched. Wartime participation might be voluntary or coerced—usually both—but it was complete, at least in intent. Whatever their prewar political system, the belligerents all came to look like modern Spartas, with their national life conditioned by war-waging.

The authoritarian, police-state character of Nazi Germany and the Soviet Union is familiar enough to be ignored as an example of total mobilization, but the experience of Great Britain, a paragon of individual liberty, dramatizes the depths of wartime sacrifice and dislocation, even for a nominal victor. First of all, Great Britain, with a population of 47 million, put almost 6 million men and women into the armed forces, a level of participation about the same as that of the United States. The raw demographics, however, do not do justice to the British commitment. British male deaths of World War I (900,000) and the male children the dead of the Somme would have sired meant that Great Britain had a limited manpower pool from which to draw. Conscription of able-bodied men (and some not able-bodied or young) became almost complete in theory but still

had to deal with the personnel demands of critical occupations: fishing, farming, coal mining, the merchant marine, civil defense and fire fighting, railroads, war material and munitions manufacturing, and health services. Twenty-one million Britons served in war-essential jobs. No sector was adequately staffed, even though almost all British males from teenagers to the elderly who were not in the services found a place in such organizations as the Ground Observer Corps, the Home Guard, and police and fire-fighter auxiliaries. British women filled some of the essential jobs; about half the adult female population of Great Britain took full-time jobs or joined the armed forces. The other part of the female population cared for children and the elderly and did volunteer work that supported the armed forces and the industrial workforce. Male and female, Britons worked more than 50 hours a week, endured German air attacks, and attempted to live on shrinking rations of meat, sugar, eggs, dairy products, and all sugar-dependent condiments like jam and pastries, and tea. Only fish, bread, and vegetables were available in reasonable quantities, thanks to the heroic efforts of the fishing industry and the emergency cultivation of marginal farmlands, inadequately fertilized. As American GIs flooded Great Britain in 1943 and 1944, they redistributed their own imported, ample rations to the British people, sometimes for profit, more often in charity.

There is no reason to doubt that the British war effort represented a voluntary national commitment to survival outside the Axis orbit. Yet behind the stiff upper lips and choruses of “Land of Hope and Glory,” a national government of iron will and ample authority ensured that Britons put the war effort first. The British intelligence services and police had broad powers to ferret out spies, dissenters, war profiteers, and civil criminals. The Official Secrets Act could have been written on the Continent. The British Broadcasting Corporation (BBC) and the newspapers became essentially an arm of the Churchill government. Military catastrophes—and there were many from 1940 until 1944—disappeared into a void of silence or received the special spin that the War Office and the Admiralty had perfected since the Napoleonic Wars. In such a world, Narvik became an experiment in countering amphibious operations and the pursuit of the *Bismarck* only a combat test of Royal Navy ship design. At heart a war correspondent as well as a politician, Winston Churchill needed no Josef Goebbels.

For most of the major belligerents, World War II seemed a larger repetition of the challenges of World War I, and many of the political and military leaders between 1939 and 1945 had rich experience in coping with a national mobilization for war. Churchill and Franklin D. Roosevelt had held important administrative positions in a wartime government when Hitler was a *frontsoldat* (front-line soldier) in the advanced

rank of corporal and Benito Mussolini was having a similar military experience fighting the Austrians in the Tyrol. The Anglo-American alliance profited from authoritarian leadership that remained answerable to a representative legislative branch. The Allies welcomed European exiles to their war effort, knowing the wide range of talents modern war required. Even Josef Stalin released more than a million political prisoners because he needed their services. Hitler, by contrast, killed 300,000 of his countrymen, imprisoned hundreds of thousands more, and drove thousands into the arms of his enemies.

The lessons of World War I could be interpreted in several ways, and Hitler’s “lessons” contributed to Germany’s defeat. The Nazis resisted surrendering any managerial power to their talented industrial class, and Hitler refused to embrace long war economic programs until 1943. The German civilian population received ample food supplies while the slave-labor force starved to death, a considerable drag on productivity. Albert Speer, Hitler’s favorite architect, did not take control of the German economy until it was about two years too late to win the war with superweapons or mass-produced, simpler tanks, aircraft, trucks, artillery pieces, and tactical communications. The Allies produced 10,000 fighter aircraft in 1940; the Germans did not reach that annual production until 1943. The Germans, in a heroic effort, then produced 26,000 fighters in 1944, but the Allies had already more than doubled this force with 67,000 fighters the same year. Pilot experience and gasoline supplies contributed to the Luftwaffe’s demise, but so too did Allied aircraft numbers. The Japanese made a comparable economic-strategic error in handling imported petroleum from the occupied Dutch East Indies. Unlike the British and American navies, tested by the German submarine force in World War I, the Imperial Japanese Navy did too little too late to maintain a tanker fleet and protect it with well-escorted convoys. The Indonesian wells pumped merrily away, but the actual tonnage of crude oil that reached Japan dropped by half in 1944. The U.S. Navy failed to protect the Allied tanker fleet in the Caribbean in 1942, but it then enforced convoy discipline and provided adequate escorts and air coverage. In 1943, the navy checked the U-boats’ “happy times” in creating flaming merchant ships. Time and again, the Allies faced problems like maintaining a viable industrial workforce or allocating scarce raw materials. The war managers found the appropriate technical solutions in the World War I experience, and their political leaders found ways to make their people’s economic sacrifices acceptable for World War II.

The exploitation of the means of mass communication reflected the war’s populist character. Once again, World War I—the poster war—provided precedents that World War II exploited to the fullest. No belligerent government

functioned without an office of public information. No military establishment went to war without press officers and morale officers. The Soviets called their officers commissars, the Americans public information officers. The Germans published *Signal*, the Americans *Stars and Stripes*. The civilian populations, however, received the full media blitz. The international motion picture industry went to war, producing eternal images in sound and living color (sometimes) of the wartime leaders and their causes. The newsreels that preceded commercial films brought the war news (in highly selected form) to the home front. Documentary feature films made legends of director-producers like Leni Riefenstahl, Frank Capra, Sir J. Arthur Rank, Sergei Eisenstein, and Watanabe Kunio. Radios reached even more people than movies; by 1939—as a matter of Nazi policy—70 percent of German families had radios, and they were not designed to pick up the BBC. In the United States and Great Britain, 37 million households owned radios. One-third of wartime broadcasts were war news and commentary. Public loud-speaker systems provided the same services in poorer belligerents like the Soviet Union and Japan. The war turned words and images into weapons.

World War II became so lethal because all the major belligerents, even China, had entered the industrial-electronic age by the twentieth century. Technological innovation and mass production worked hand in hand to give the armed forces a capacity for destruction on every type of battlefield that had been demonstrated in World War I and brought to higher levels of destructiveness in the 1940s. Governments and private industry collaborated to institutionalize research and development; to obtain essential raw materials to make steel and rubber; to recruit and train skilled workers; to build factories capable of mass production; and to fabricate munitions, weapons, and vehicles that filled military requirements. The war industries of World War II could even go underground, as they did in Germany and China, or move a thousand miles out of harm's way, as they did in the Soviet Union.

The technology of the war was shaped by two major developments: (1) the evolution of the internal combustion engine fed by fossil fuels, and (2) the exploitation of the electromagnetic spectrum through the development of batteries or generators tied to internal combustion engines, whether they powered aircraft, ships, or vehicles. A parallel development was the ability to make essential parts of engines and radios lighter and more durable by creating components of plastic and alloyed metals and using special wiring, optics, and crystals. The knowledge and skill to pursue these developments was international and uncontrollable. Although one or another national military establishment might become a technological pioneer—like that of the Germans in jet

engines and the Anglo-Americans in nuclear weapons—no instrument of war was beyond the technical capability of the principal belligerents, except China.

The air war dramatizes how rapidly aviation technology advanced and how radar (radio direction and ranging) influenced the battle for the skies. The first strategic bombing raids of the war (1939–1940) involved Royal Air Force bombers whose bomb loads were 4,500 to 7,000 pounds maximum and whose range (round-trip) was around 2,000 miles; the German Heinkel He-111 H-6 had similar characteristics. The last strategic bombing campaign (by the USAAF on Japan in 1945) was conducted by the B-29, which had a 5,600 mile maximum range and 20,000 pound maximum bomb load. The earliest bombing raids involved traditional navigation methods of ground sightings, compass headings, and measurements of air speed and elapsed time. The B-29s had all these options (including celestial navigation at night), but they also relied on radio navigation beacons and ground-search radar to measure speed, direction, and altitude. Radar also assisted in the location of target cities. Aerial gunners on first-generation bombers fired light machine guns with visual sights; B-29 gunners fired remote-controlled automatic cannon and machine guns. Of course, radar also made air defenses more formidable. British air early-warning radar reached out 185 miles, German radar 125 miles, Japanese radar 62 miles, and American radar 236 miles. Airborne and surface naval search radars ranged from 3 to 15 miles. The best anti-aircraft gun-laying radars could plot targets from 18 to 35 miles distant.

Naval warfare also exploited the new technologies of propulsion, navigation, target acquisition, and ordnance to make war at sea more destructive. For example, the U.S. Navy commissioned 175 *Fletcher*-class destroyers (DD 445–804), the largest single production run of a surface warship by any wartime navy. These ships weighed about 3,000 tons and carried a crew of 300, putting them on the high side of displacement and manning for World War II destroyers. They bristled with weapons designed to destroy aircraft, ships, and submarines. The five 5-inch, 38-caliber dual-purpose main battery guns were mounted in turrets fore and aft, and each gun could fire 12 shells a minute in sustained fire. The *Fletchers* mounted 10 torpedo tubes amidships for the standard Mark XIV electric-turbine-powered, 21-inch-diameter torpedo with a warhead of 600 pounds of explosive. To combat enemy submarines, the *Fletchers* had two depth-charge racks bolted to the stern; each rack carried six Mark VII 600 pound depth charges. Each destroyer also employed a K-gun or depth-charge launcher that could propel a 200 pound depth charge out to a range of over 100 yards; the normal pattern of a K-gun attack incorporated nine depth charges. As the war progressed, the depth

charges, like the hedgehog system of rocket charges, improved in sinking speed, depth, and detonation systems.

A major mission for a destroyer, probably the dominant mission in the war with Japan, was to serve as an antiaircraft platform in a carrier battle group. The main battery turret guns provided the first layer of defense. They improved their lethality by a factor of five with the deployment of the proximity fuse for shells in 1944. The proximity fuse detonated a shell by radio waves emitted and returned in the shell's nose cone; this miniature radar system gave new meaning to a near miss, as Japanese kamikaze pilots learned. The close-in defense system depended on rapid-firing automatic cannon adopted in 40 mm and 20 mm configurations that could be single, dual-mounted, or quadruple-mounted gun systems. By the end of the war, *Fletchers* had 16 of these antiaircraft artillery (AAA) stations of "pom-poms."

A *Fletcher*-class destroyer could not have fought its tridimensional naval war without the use of the electromagnetic spectrum. The AAA radar suite included the mating of three different radars to provide information on the altitude, speed, distance, and numbers of incoming aircraft up to 40,000 yards distant from the ship. The surface-search system of two radars provided coverage of up to 40,000 yards of ocean around the ship. The radars sent data to the ship's combat information center, where the gunnery director sent data to the gun captains and subordinate fire directors for the main batteries; the turret fire directors often received the same radar returns so that they could order targets engaged as soon as the central fire director assigned priorities to targets.

For antisubmarine warfare, a *Fletcher*-class destroyer employed passive and active acoustical systems to acquire targets. Hydrophone systems, either attached to a ship or deployed in the ocean's depths, listened for undersea noises like a submarine's propeller. The active radio systems—called "asdic" by the British and "sonar" by the Americans—had varied properties for beam strength, range, depth, and degrees of coverage, but the multi-transmitter systems could detect and track a submarine at only about 2 miles, thereby being most useful for target localization. When the radio beams reached out and touched something, experienced sonar operators faced the challenge of differentiating a submarine from a large whale. Electronic displays aboard the destroyer showed the direction, speed, and depth of its underwater target but only briefly and through a sea made dark with noise by the movement of the destroyer itself. Successful attacks on submarines still required a dose of good luck and tactical cunning that could be gained only by experience.

Although the Allies used aircraft (also radar equipped) to attack Axis submarines and submarines also sank sub-

marines, surface warships like the *Fletchers* broke the back of the Axis submarine force. The Germans lost 625 of 871 U-boats, and Japanese submariners went to the bottom in 74 of their 77 submarines.

The blinding acceleration of technological innovations in warfare since 1945 should not devalue the advances between 1914 and 1945, especially in the interwar period from 1919 to 1939. In a brief span of two decades, scientists, inventors, engineers, designers, and military users conceived of a variety of weapons that brought direct, immediate death and destruction to a new level of probability for soldiers and civilians alike. Atomic bombs and the B-29 bombers that carried them had entered the early development phase in the United States before Pearl Harbor, a combination of foresight, fear, and ferocity. Although J. Robert Oppenheimer was referring to the awesome fireball of his test bomb when he quoted the Hindu god Vishnu, "I am become death, destroyer of worlds," his reverie could have applied to the whole World War II arsenal.

Although World War II survives as the most destructive and geographically extensive interstate conflict in history, it also included at least 20 civil wars. These wars within a war often extended beyond 1945, filling the vacuum created by failed occupations and social upheaval. In many aspects, these civil wars repeated a similar phenomenon that followed the collapse of the German, Austro-Hungarian, and Ottoman Empires in the last stages of World War I. As the Bolsheviks had proved in 1917, a great war created the preconditions for a great revolution. The new wave of civil wars came in many forms. The civil war in Spain, from 1936 to 1939, is often interpreted as an opening phase of World War II, as is the Sino-Japanese War that began in 1937. Both of these conflicts are more accurately the first of the new civil wars that attracted foreign intervention. They set the global pattern of combining the Big War with many little wars, little only in their disaggregated nature. All the little wars produced a revolution in world affairs, the era of decolonization.

The civil wars of World War II often began in collaboration with the Axis occupations and the resistance to those occupations. The Stalinist and Nazi forms of coerced corporatism had global appeal in the chaotic 1930s. Japan enjoyed a modest reputation for its anti-European anticolonialism and for its economic dynamism and superficial modernity. The Spanish Civil War gave the world the term for internal subversion, "the Fifth Column." Norway provided the word for treacherous politician, "quisling." The collaborators were pro-Fascist, if not pro-German. Many were simple opportunists, adventurers, and minor functionaries. Some were ardent anti-Communists, the ideological glue that joined Belgians and Bulgarians; some were anti-Semitic, the paranoia that unified Frenchmen with Hungarians. Volunteers

from every western European nation joined the Waffen SS to exterminate Jews and Bolsheviks. For the Finns and Romanians, Germany was a powerful ally in their continuing war with the Soviets. The Balkans were especially complex. Mouthing memories of the Roman conquest of Thrace and Dacia, Benito Mussolini invaded Moslem Albania in 1939, to which the British responded with a partisan war mounted from Kosovo, Yugoslavia. This war created a hero, Enver Hoxha, a Communist dictator until 1983. When the patchwork monarchy of Yugoslavia came apart with a German occupation in 1941, the Slovenes and Croats used the Germans to wage war on the Serbian Chetnik ultranationalists (the Mihajlović group) and the Communist resistance movement led by Josip Broz, a Croat revolutionary known as Tito. Before the Germans abandoned Yugoslavia in September 1944, more than a million Yugoslavs had died, the majority killed by their fellow countrymen, not the Germans. The Soviets then pillaged all of Yugoslavia, Communist-held areas included.

The Europe of 1943 through 1945 became a kaleidoscope of shifting political loyalties as the German occupations began to collapse. When an Italian royalist coalition deposed Mussolini and surrendered to the Allies in September 1943, Italy split wide open. Hitler rescued Mussolini and supported a rump Fascist regime in the Po Valley. Part of the Italian army stayed with the Germans, part joined the Allies, and most of its troops became German prisoners. The resistance movement, formed by northern Communists, built a solid political base in 1944 and 1945 by killing Germans and other Italians, including devout Catholic villagers and their priests. They also killed Mussolini. The experience of the Poles followed a similar course. When the Germans destroyed the Jewish resistance and the Home Army, the exile Poles inherited the leadership of national liberation. The difficulty was that there were two Polish exile governments, the Catholic Nationalists in London and the Communists in Lublin. By 1945, there were two Polish armies, both bearing the Polish eagle. The armored division and parachute brigade in France and a two-division corps (with armor) in Italy represented the London Poles. The Communist Poles formed a nine-division force with five additional armored brigades that joined the Red Army in July 1944. When the Soviets rolled through Poland, the Communist Poles took control of Poland and held it for 45 years. The Free Poles joined Europe's 16 million "displaced persons."

As the Soviets battered their way into eastern Europe in 1944 and 1945, they ensured that native Communists, backed by a "people's" police and army, took control of Romania, Bulgaria, Poland, and Hungary. Tito kept the Soviet Union out of Yugoslavia as an extended occupier; the Albanian Communists seized power; the non-Communist

Czechs held out until 1948; and the Greek civil war flared between the royalists and Communists almost as soon as a British Commonwealth expeditionary force accepted the Germans' surrender. In France, the Resistance partisans attacked collaborators during the liberation, then held war crimes trials for the Vichyites. The same pattern appeared in Belgium, the Netherlands, and Norway.

The Middle East became a region beset by civil strife during World War II. German agents in Palestine and Iraq encouraged the Arabs to attack the Palestinian Jews, the pro-British Jordanian monarchy, and the pro-British Iraqi monarchy. A revolt actually occurred in Iraq in 1941, and terrorism and guerrilla warfare plagued Palestine. The British forces in Egypt watched the Egyptian army with care because of the pro-Axis sympathies of its officer corps. To the south, Commonwealth forces liberated Ethiopia and Somalia from the Italians, assisted by both Moslems and Coptic Christians. In the Levant, Free French colonial and British forces took Lebanon and Syria away from the Vichyites but found the Moslem nationalists unwilling to accept another French colonial government, setting the stage for the French withdrawal under duress in 1946.

Throughout Asia, the anti-imperialist resistance movements developed a two-phase strategy: (1) fight the Japanese hard enough to attract Allied money and arms, and (2) build a popular political base and native guerrilla army capable of opposing the reimposition of European colonial rule after Japan's defeat. For native Communists, active since the 1920s, the second task offered a chance to replace or challenge the native nationalists, who saw communism as a new form of Soviet or Chinese imperialism. Some Asian resistance movements reflected civil strife between a dominant ethnic majority and an oppressed minority, like the Chinese in Malaya, the Dyaks of Borneo, and the Chin, Kachen, Karen, and Shan hill tribes of Burma. Fighting the Japanese had some appeal to the partisans; fighting each other or preparing to fight each other had equal priority. In China, the Nationalists of Generalissimo Chiang Kai-shek (now Jiang Jieshi) and his Guomindang (Kuomintang) Party conducted minimal operations against the Japanese and improved their American arsenal for the continuing struggle against the Chinese Communists of Mao Zedong, building their own forces in north China. In the Philippines, *americanista* partisans, supplied by General Douglas MacArthur, vied with the Communist *hukbalahap* guerrillas for primacy on Luzon. MacArthur's massive return in 1944 and 1945 swung the balance to the *americanistas* but only temporarily, since the *hukbalahaps* fought for control of the independent Philippines (as of 1946) for years thereafter.

Elsewhere in Asia, the collapse of the Japanese Empire set off more postcolonial civil wars. In Indochina, the Communists (under Ho Chi Minh) already held the field by

default since the Japanese had crushed their rivals in a premature uprising in 1944. In Malaya, the resistance movement had formed around the Chinese minority, while the Malay Moslem elite, supported by Great Britain, patiently waited for liberation and a final confrontation with the Malaya Chinese. Modern Malaya and the modern island-state of Singapore are the products of that decades-long struggle that began in 1945. In the Dutch East Indies, the Moslem nationalists (whose most extreme members created today's abu-Sayyid terrorist group) played off collaborationism with the Japanese with guerrilla warfare for the Allies to create a resistance movement that fought a Dutch return from 1945 to 1949. More civil strife continued until the army-led nationalists replaced the charismatic President Achmet Sukarno and destroyed the Indonesian Communists in a civil war in the 1960s that killed at least half a million Indonesians. One neglected aspect of the Japanese hurried surrender—usually explained by the influence of two nuclear weapons and Soviet intervention—is the Imperial peace faction's fear of a Communist-led popular revolt in Japan.

There is no question that the movement of great armies throughout Europe in 1944 and 1945 created social destruction of unimagined proportions, which set the stage for postwar revolutionary changes. In 1945, more than 50 million Europeans found themselves severed from their original homes. Thirteen million orphans wandered across the land. The Allies appeased the Soviet Union by the forced repatriation of 6 million Soviet citizens (defined in Moscow) who had found their way to western Europe as POWs, forced laborers, or military allies of the Germans, like the Ukrainians and varied anti-Bolshevik Cossack clans. Sending these people—most often neither Russian nor Communist—back to the Soviet Union resulted in the death or imprisonment of 80 percent of the repatriates, but it also cut the “displaced persons” population of Europe. To a Europe already plagued with famine and on the brink of epidemic diseases, the Anglo-American forces brought food and medicine, distributed by the United Nations, individual governments, and private relief organizations. The Soviets not only ferreted out former Nazis in their German and Austrian occupation zones but also stripped off food supplies, factories, transportation assets, and raw materials for the USSR's reconstruction. They also imprisoned eastern Europeans who had fought in the Allied armed forces, and former partisans (no matter their politics) faced a similar fate or worse. At war's end, the Soviets had held or still held 3 million Wehrmacht POWs, most of them placed in forced-labor camps in the Urals or Siberia. Only 1 million returned to Germany by the time the last POWs were released in 1955.

Not known for his radical politics, General of the Army

Douglas MacArthur recognized the enormity of the war and its revolutionary implications for all mankind. In a post-surrender radio broadcast, MacArthur gave one of his greatest sermons: “We have had our last chance. If we do not now devise some greater and more equitable system, Armageddon will be at our door.”

The children of World War II are rapidly becoming the aging men and women of the twenty-first century. Their parents, who lived through the war as young adults, may or may not be “the greatest generation,” but they are most certainly a disappearing generation. Will the grip of World War II on the popular culture and politics of Eurasia loosen as the living memory of the war fades? It does not seem likely. Even in Japan, where historical amnesia is institutionalized in the school system, the residual remembrance will continue at the Hiroshima Peace Park, Yasukuni Shrine, and the new “Peace Museum” in Tokyo. Even if Japan still takes refuge in its self-assigned victimization, contact with other Asians (especially the Chinese) and Americans will expose the Japanese to an alternative perspective. As for the Germans, had they not renounced their Nazi past, admitted their criminality, and continued programs to compensate their victims—a process still under way—the Russians and the Jews would be at their collective throats. Yad Vashem in Jerusalem and the Holocaust Museum in Washington, D.C., will keep alive the images of German atrocities for world visitors. Russia is a nation of war memorials, mass graves, and long memories. Few Russians families who lived west of the Urals escaped the war without loss; those whom the Germans didn't kill, Stalin's work camps, factories, and military system did. The American experience—a low number of military deaths by World War II standards and virtually no civilian deaths in the continental United States—was a global anomaly. American cultural gurus—even combat veterans—suffer little embarrassment in calling World War II “the good war,” with both moral and existential meaning. Although the Eurasian nations still have collective posttraumatic stress syndrome after 60 years, the United States has finally built a real World War II memorial in Washington and recognized its World War II veterans, who had gratefully used their GI Bill benefits and faded back into the general population. Sixty years later, their children and grandchildren learn in wonderment of their perils, their courage, and their leadership—or lack thereof.

The informal, tribal communication of historical meaning will no doubt preserve the World War II memory in those societies most affected by the war, but the American people will continue to profit from the more formal written word. Although family tradition can preserve the war as a personal, human experience—as institutionalized in local muse-

ums and oral-history projects—World War II demands the continued attention of professional historians who can provide a broader vision of the war's conduct and consequences. As this encyclopedia project shows, the number of topics and international historians such a study requires continues to grow. These volumes represent a giant step forward as a ref-

erence work and should encourage more students of the war to continue the search for the effect and meaning of the modern world's most destructive war.

The Ohio State University

Preface

One might disagree as to which of the two world wars of the twentieth century made a greater impact. World War I had the larger overall influence in changing the course of events, but World War II was certainly the most wide-ranging and costly conflict in human history; it ultimately involved, to some degree, every major power and region of the world.

Wars are preventable, and World War II was no exception. It represented the triumph of inadequate leadership and narrow nationalism over internationalism. Unfortunately, little has changed in that regard. The League of Nations has given way to the United Nations, but we still live in a state of international anarchy in that each nation pursues the course of action it deems most appropriate to further its own interests. This is not the outcome that many who fought in the conflict were seeking.

This encyclopedia treats the causes, the course, and, to some extent, the effects of the war. With the exception of introductory essays, as well as the glossary of terms and the selective bibliography, all entries are arranged alphabetically. These cover the major theaters of war, the campaigns, the individual battles, the major weapons systems, the diplomatic conferences, and the key individuals on all sides of the conflict. We have also included entries on the home fronts and on the role of women in the war, and we have sought to address some of the war's historiographical controversies and major turning points.

Throughout, we have followed the system the Japanese use for expressing their personal names—that is, with the family name followed by the given name. In Chinese proper names

and locations, we use both the pinyin system and the older Wade-Giles system. The Wade-Giles system was first devised by British diplomat-linguist Thomas F. Wade in 1859 to help in pronouncing the official Mandarin and/or Putonghua. His work was slightly revised in 1912 by another British consular officer, Herbert A. Giles. This system has its defects, since many Chinese sounds have no exact counterpart in English. For the first consonant in “zero,” for example, the Wade-Giles romanization uses “ts” and/or “tz,” and for Chen Yi, both “Chen Yi” and “Chen I” are acceptable. Following the establishment of the People’s Republic of China (PRC), a new system for expressing Chinese words in the Latin alphabet was adopted in the 1970s, at the same time that the PRC devised and used simplified characters for written Chinese. Known as pinyin, this new system was intended to ensure standardized spelling, with each vowel and consonant having a counterpart in English. Still, variation in pronunciation is inevitable because of the four tones of each Chinese vowel and consonant and because of different Chinese dialects. Throughout this encyclopedia, however, we have endeavored to employ the most recent spelling forms: thus, for instance, we use “Guandong” rather than “Kwantung.”

All of us who have labored on this encyclopedia trust that it will be an asset both for scholars and for students of World War II. We hope also that it will contribute to the understanding of how wars occur and that this might help in preventing them in the future. Finally, we seek to preserve the contributions of the many who fought and died in the conflict, no matter the side.

Dr. Spencer C. Tucker

Acknowledgments

Many people contributed to this encyclopedia. I retired as holder of the John Biggs Chair in Military History at the Virginia Military Institute (VMI) in the summer of 2003, and I am grateful to a number of cadet assistants who worked with me on this project in the several years before my retirement. Alex Haseley, Daniel Cragg, Lawton Way, and above all Shelley Cox helped chase down obscure facts and bibliographical citations. I am also appreciative of assistance provided by staff members of the Preston Library at VMI, especially Lieutenant Colonel Janet Holley, for their repeated gracious assistance, even following my retirement.

Of course, I am greatly in the debt of assistant editors Jack Greene; Dr. Malcolm Muir Jr.; Dr. Priscilla Roberts; Colonel Cole Kingseed, USA (Ret.), Ph.D.; and Major General David Zabecki, USAR, Ph.D. Each brought a special expertise to the project, and their reading of the manuscript has helped improve it immeasurably. Dr. Debbie Law of the Hong Kong University Open Learning Institute read all the Chinese entries and assisted with their editing and the pinyin and Wade-Giles spellings. Rear Admiral Hirama Yoichi (Ret.), Ph.D., located Japanese authors for many entries, checked their work, and answered many inquiries.

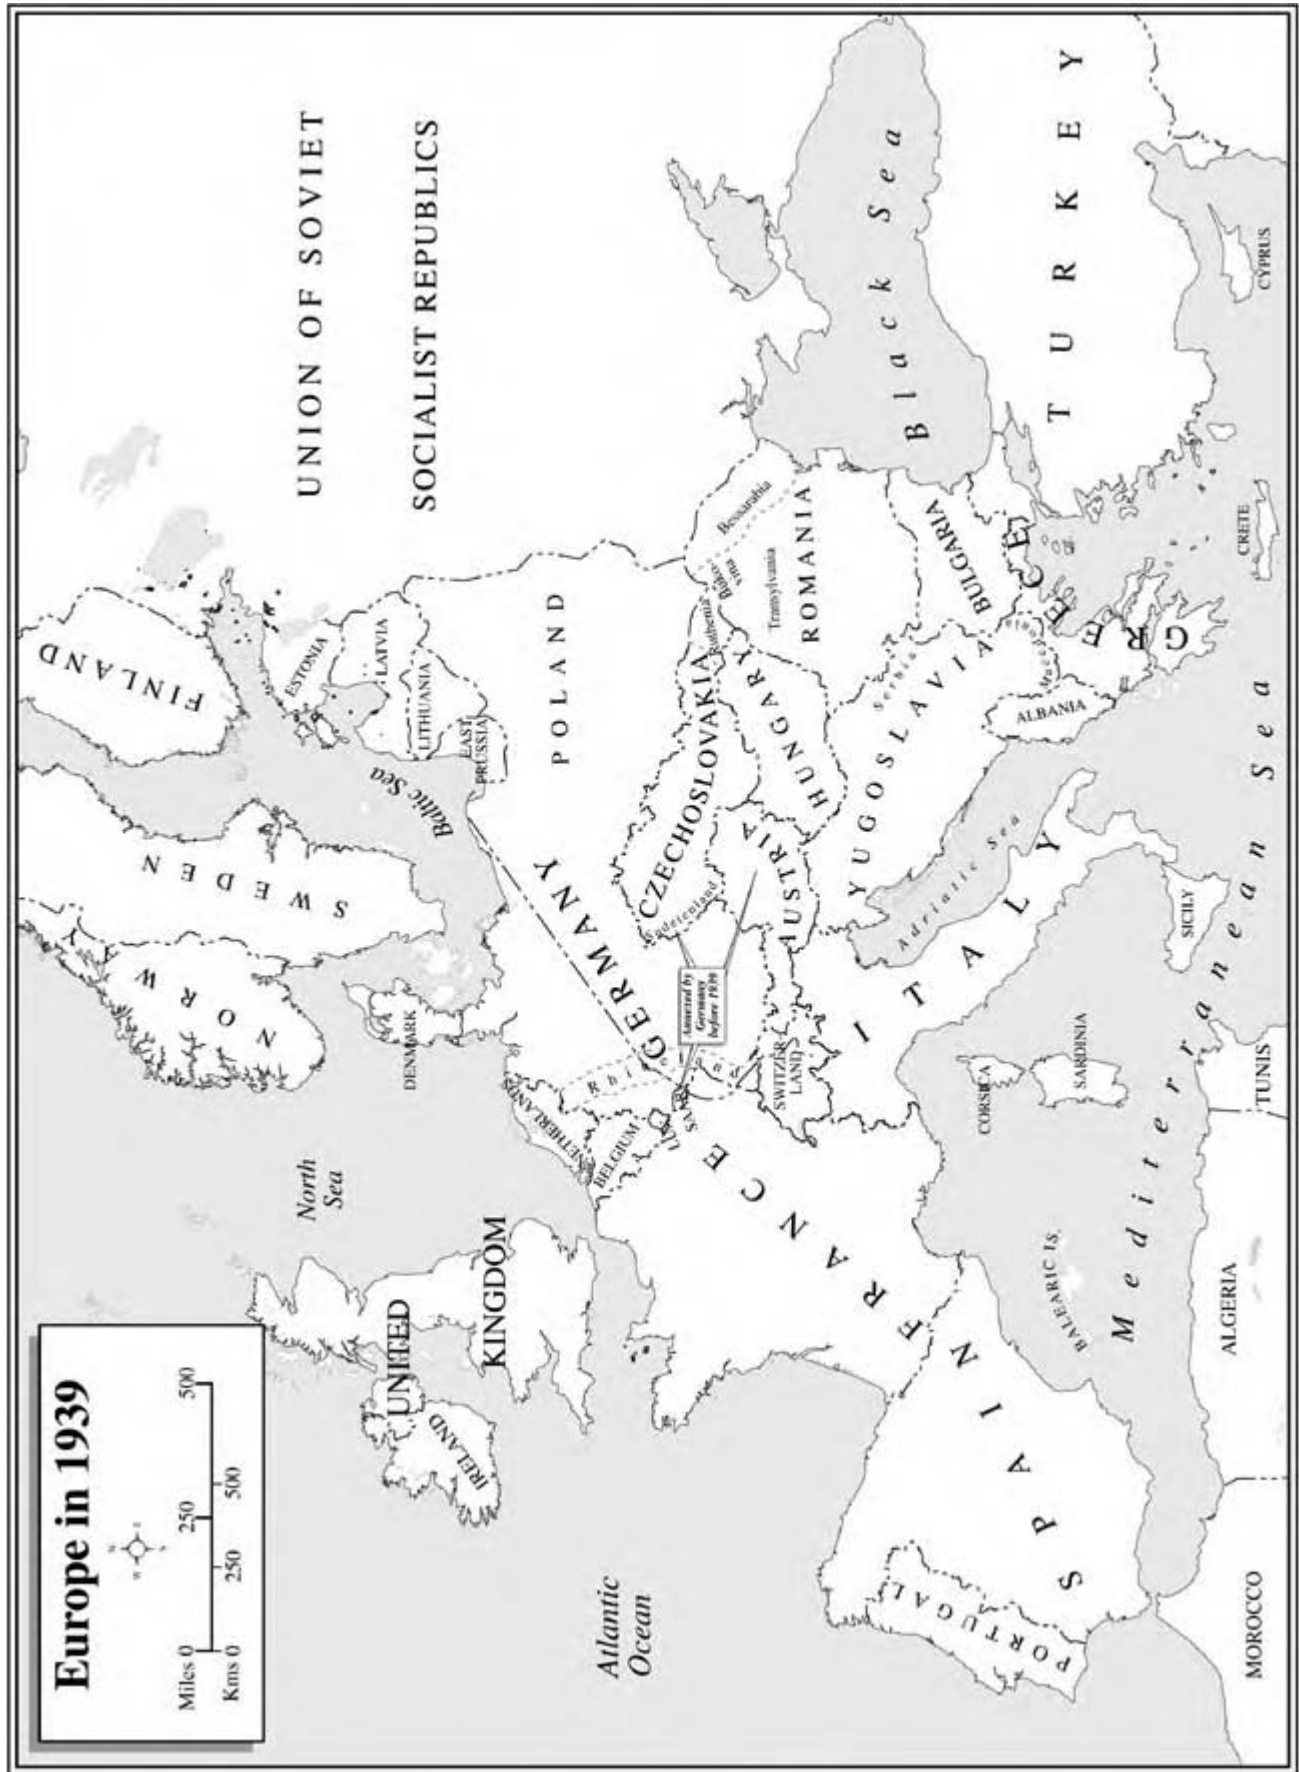

We are pleased to have a large number of foreign authors in this project, including scholars from such nations as Austria, Australia, Britain, China, France, Germany, Hungary, Italy, Japan, and Russia. We believe that these authors provide unique perspectives and, in many cases, information that is not available in other sources. This reference work has the most complete biographies of Chinese, Japanese, and Soviet individuals of any general encyclopedia of the war to appear in English.

I am also grateful to a number of contributors who took on additional tasks when others dropped out, especially Dr. Priscilla Roberts but also Drs. Timothy Dowling, Eric Osborne, and Ned Willmott. Members of the Editorial Advisory Board suggested changes to the entry list, recommended contributors, and, in most cases, wrote entries. One member of the board, Gordon Hogg, a research librarian by profession but also a linguist, has proved invaluable to this project by assisting in chasing down obscure facts, bibliographical citations, and arcane matters of language.

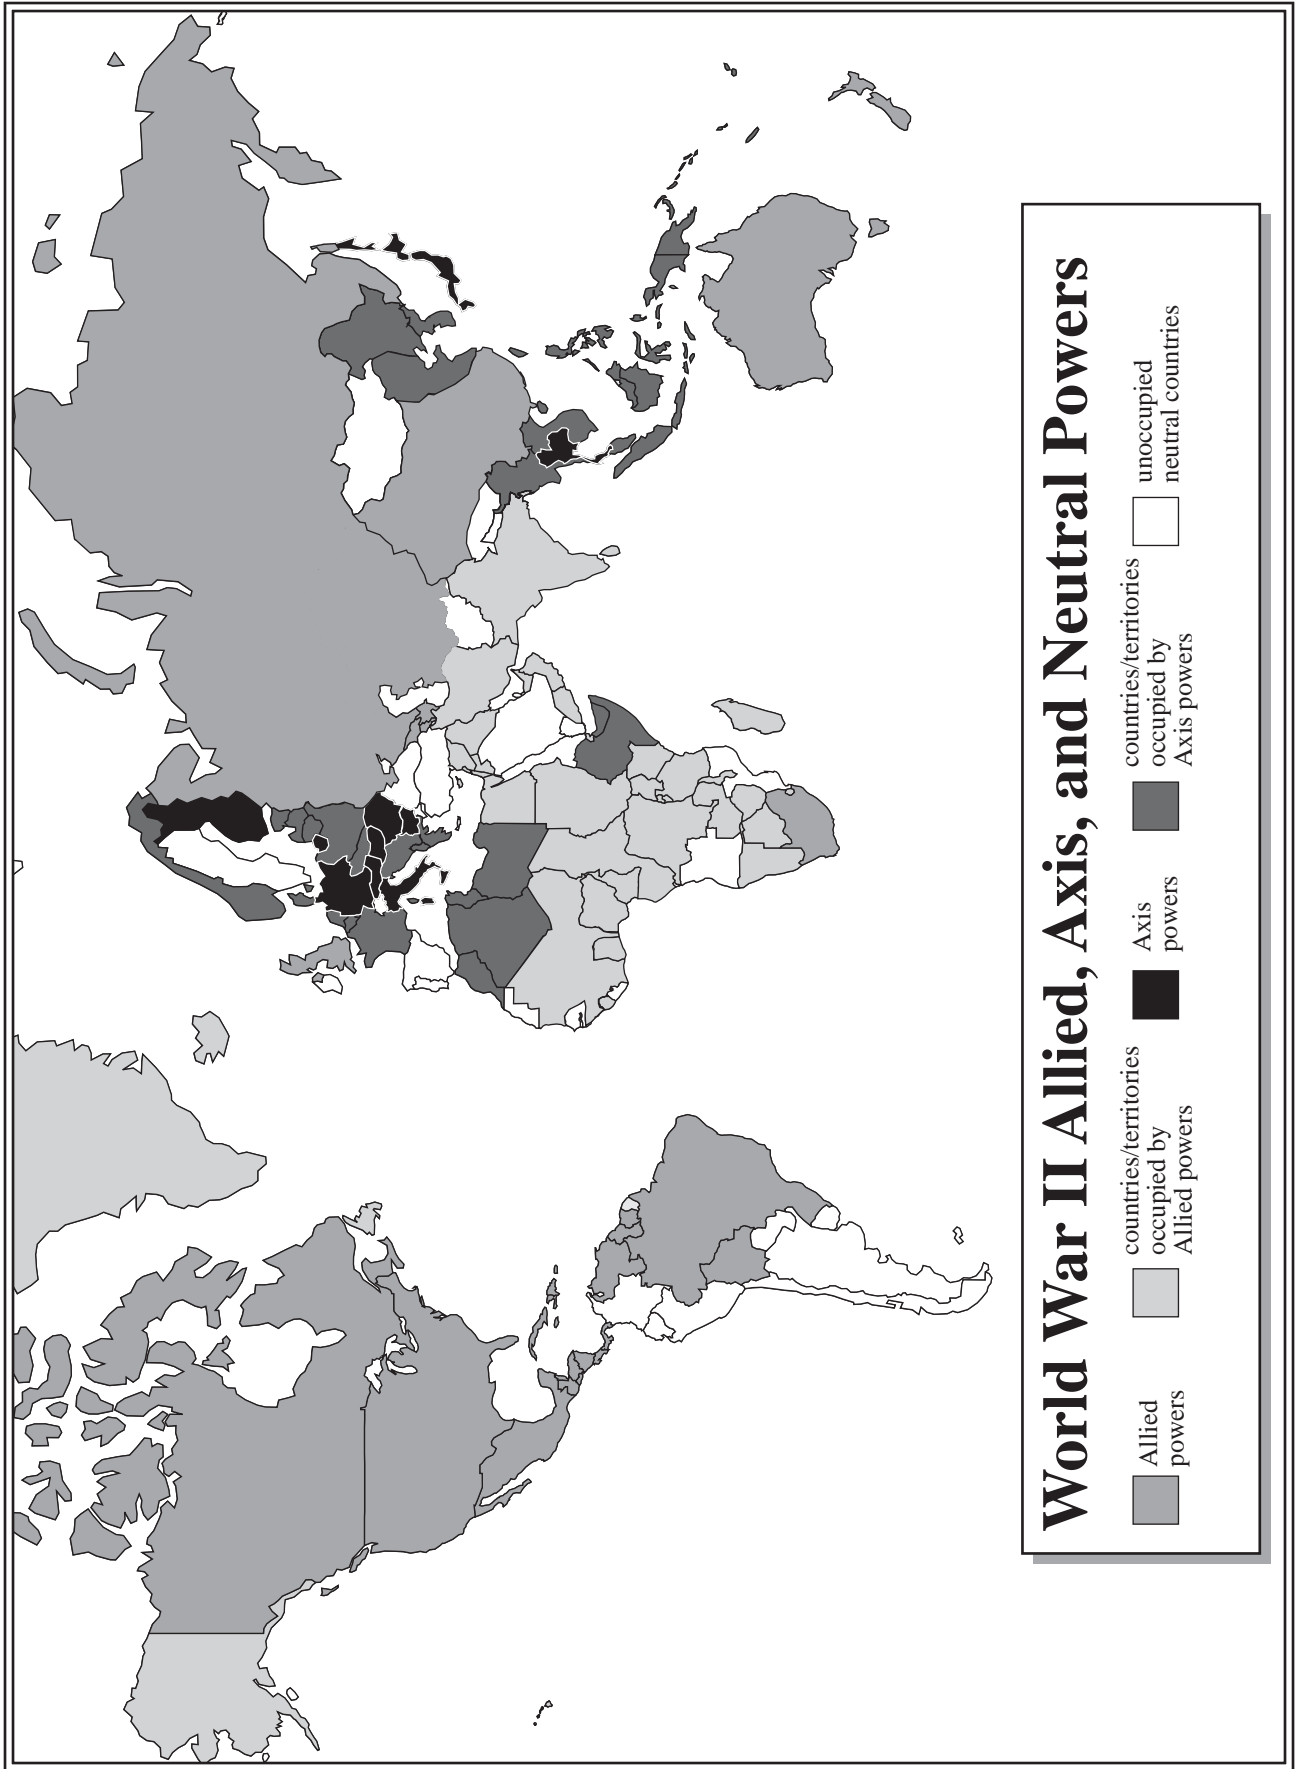

Finally, I am most especially grateful to Dr. Beverly Tucker for her forbearance in regard to my long hours in front of the computer. She is, in the end, my strongest supporter in everything I do.

General Essays

Adolf Hitler accepts the ovation of the Reichstag after announcing the annexation of Austria. This action set the stage for Hitler to annex the Czechoslovakian Sudetenland, largely inhabited by a German-speaking population. Berlin, March 1938. (National Archives)

Origins of the War

On 1 September 1939, German forces invaded Poland. Two days later, Britain and France declared war on Germany, beginning World War II. Some historians date the war from 1937, with the Japanese invasion of China; Japanese official histories, however, start with 1931, when Japan's forces overran Manchuria. But perhaps the most accurate place to begin is with the end of World War I. That conflict exacted horrible human and economic costs, destroyed the existing power structure of Europe, and toppled all the continental empires. It also sowed the seeds for a new conflict.

In January 1919, representatives of the victorious Allied, or Entente, powers met in Paris to impose peace terms on the defeated Central Powers. The centerpiece of the settlement, the Versailles Treaty, was the worst of all possible outcomes—it was too harsh to conciliate but too weak to destroy. It was also never enforced, making a renewal of the struggle almost inevitable.

The Paris peace settlement was drafted chiefly by Britain, France, and the United States. The Germans claimed they had assumed the November 1918 armistice would lead to a true negotiated peace treaty, yet in March and May 1918, when they were winning the war, their leaders had imposed a truly harsh settlement on Russia. In the Treaty of Brest-Litovsk, Russia lost most of its European territory, up to a third of its population, and three-quarters of its iron and coal production. It was also required to pay a heavy indemnity.

Far from being dictated by French Premier Georges Clemenceau, as many Americans still believe, the Paris peace settlement of 1919 was largely the work of British Prime Minister David Lloyd George and U.S. President Woodrow Wilson, who repeatedly blocked proposals advanced by Clemenceau. The irony is that the British and American leaders prevented a settlement that, although punitive, might indeed have brought actual French and Belgian security and prevented war in 1939.

The most novel creation of the conference was undoubtedly the League of Nations. Clemenceau did not place much stock in a league, but if there had to be one, he wanted mandatory membership and an independent military force. The Anglo-American league relied primarily on moral suasion; its strongest weapon was the threat of sanctions.

The most contentious issue at the peace conference—and arguably its most important matter—was that of French and Belgian security. Alsace and Lorraine were returned to France, and for security purposes, Belgium received the two small border enclaves of Eupen and Malmédy. France was granted the coal production of the Saar region for 15 years in compensation for Germany's deliberate destruction of French mines at the end of the war. The Saar itself fell under League of Nations control, with its inhabitants to decide their future at the end of the period.

A storm of controversy broke out, however, over the Rhineland, the German territory west of the Rhine River. France wanted this area to be reconstituted into one or more independent states that would maintain a permanent Allied military presence to guarantee Germany would not again strike west, but Lloyd George and Wilson saw taking the Rhineland from Germany as “an Alsace-Lorraine in reverse.” They also wished to end the Allied military presence on German soil as soon as a peace treaty was signed.

These vast differences were resolved when Clemenceau agreed to yield on the Rhineland in return for the Anglo-American Treaty of Guarantee, whereby Britain and the United States promised to come to the aid of France should Germany ever invade. The Rhineland would remain part of the new German Republic but would be permanently demilitarized, along with a 30-mile-deep belt of German territory east of the Rhine. Allied garrisons would remain for only a limited period: the British would occupy a northern zone for

5 years, the Americans a central zone for 10, and the French a southern zone for 15 years. Unfortunately for France, the pact for which it traded away national security never came into force. The U.S. Senate refused to ratify it, and the British government claimed its acceptance was contingent on American approval.

Germany lost some other territory: northern Schleswig to Denmark and a portion of Silesia and the Polish Corridor to the new state of Poland—accessions the Allies justified along ethnic lines. The Polish Corridor allowed Poland access to the sea, but it also separated East Prussia from the remainder of Germany and became a major rallying point for German nationalists. Despite these losses, German power remained largely intact; Germany was still the most powerful state in central and western Europe. Nonetheless, Germans keenly resented the territorial losses.

The Treaty of Versailles also limited Germany in terms of both the size and the nature of its military establishment. The new German army, the Reichswehr, was restricted to 100,000 men serving 12-year enlistments. It was denied heavy artillery, tanks, and military aviation, and the German General Staff was to be abolished. The navy was limited to 6 predreadnought battleships, 6 light cruisers, 12 destroyers, and no submarines. From the beginning, the Germans violated these provisions. The General Staff remained, although clandestinely; moreover, Germany maintained military equipment that was to have been destroyed, and it worked out arrangements with other states to develop new weapons and train military personnel.

Other major provisions of the settlement included Article 231, the “war guilt clause.” This provision blamed the war on Germany and its allies and was the justification for reparations, which were fixed at \$33 billion in 1920, well after Germany had signed the treaty on 28 June 1919. British economist John Maynard Keynes claimed that reparations were a perpetual mortgage on Germany’s future and that there was no way the Germans could pay them, yet Adolf Hitler’s Germany subsequently spent more in rearming than the reparations demanded. In any case, Germany, unlike France following the Franco-Prussian War in 1871, was never really forced to pay.

The breakup of the Austro-Hungarian Empire and the peace treaties following the war led to the creation of a number of new states in central Europe, most notably Poland but also Czechoslovakia and Yugoslavia. Resolving the boundaries of Poland proved difficult, especially in the east; it was not until December 1919 that a commission headed by Lord Curzon drew that line. Neither the new Polish government nor Russia recognized it, however. Romania was greatly enlarged with the addition of Transylvania, which was taken from Hungary. Hungary was, in fact, the principal loser at the peace conference, having been left with only 35 percent of its prewar area. The much reduced rump states of Austria

and Hungary were now confronted by Yugoslavia, Czechoslovakia, and Romania. The latter three, the so-called Little Entente, allied to prevent a resurgence of their former masters. They were linked with France through a treaty of mutual assistance between that nation and Czechoslovakia.

The Allied solidarity of 1918, more illusion than reality, soon disappeared. When the peace treaties were signed, the United States was already withdrawing into isolation and Britain was disengaging from the Continent. This situation left France alone among the great powers to enforce the peace settlement. Yet France was weaker in terms of population and economic strength than Germany. In effect, it was left up to the Germans themselves to decide whether they would abide by the treaty provisions, which all Germans regarded as a vengeful diktat. Moreover, the shame of the Versailles settlement was borne not by the kaiser or the army—the parties responsible for the decisions that led to the defeat—but rather by the leaders of the new democratic Weimar Republic.

The new German government deliberately adopted obstructionist policies, and by 1923, it had halted major reparations payments. French Premier Raymond Poincaré acted. He believed that if the Germans were allowed to break part of the settlement, the remainder would soon unravel. In January 1923, Poincaré sent French troops, supported by Belgian and Italian units, into the Ruhr, the industrial heart of Germany. German Chancellor Wilhelm Cuno’s government adopted a policy of passive resistance, urging the workers not to work and promising to pay their salaries. The German leaders thereby hoped to secure sufficient time for the United States and Britain to force France to depart. Although that pressure was forthcoming, Poincaré refused to back down, and the result was catastrophic inflation in Germany.

The mark had already gone from 4.2 to the dollar in July 1914 to 8.9 in January 1919. It then tumbled precipitously because of deliberate government policies. By January 1920, its value was 39.5 to the dollar and in January 1922, 191.8. Then came the French occupation of the Ruhr and Cuno’s ruinous policy. In January 1923, the value was 17,972, but by July, it was 353,412. In November, when the old mark was withdrawn in favor of a new currency, the mark’s value stood at 4.2 trillion to the dollar. The ensuing economic chaos wiped out the German middle class, and many middle-class citizens lost all faith in democracy and voted for Adolf Hitler a decade later.

Germany now agreed to pay reparations under a scaled-down schedule, and French troops withdrew from the Ruhr in 1924. Although the French generally approved of Poincaré’s action, they also noted its high financial cost and the opposition of Britain and the United States. These factors helped bring the Left to power in France in 1924, and the new government reversed Poincaré’s go-it-alone approach. The new German government of Chancellor Gustav Stresemann, moreover, announced a policy of living up to its treaty obli-

gations. Notions of “fulfillment” and “conciliation” replaced “obstruction” and led to the Locarno Pacts of 1925, by which Germany voluntarily guaranteed its western borders as final and promised not to resort to war with its neighbors and to resolve any disputes through arbitration. For at least half a decade, international calm prevailed.

By the 1930s, national boundaries were still basically those agreed to in 1919. Italy, Germany, and Japan continued to be dissatisfied with this situation, however, and in the 1930s, the economic difficulties resulting from the Great Depression enhanced popular support in those nations for politicians and military leaders who supported drastic measures, even at the risk of war, to change the situation in the “revisionist” powers’ favor. The “status quo” powers of France, Great Britain, and the United States saw no advantage in making changes, but at the same time, they were unwilling to risk war to defend the 1919 settlement. They therefore acquiesced as, step by step, the dissatisfied powers dismantled the peace settlement. From the Japanese invasion of Manchuria in 1931 to the outbreak of war in Europe in 1939, those who wanted to overturn the status quo used force—but not those who sought to maintain it.

The Western democracies seemed paralyzed, in part because of the heavy human cost of World War I. France alone had 1,397,800 citizens killed or missing in the conflict. Including the wounded, 73 percent of all French combatants had been casualties. France could not sustain another such blood-letting, and the defensive military doctrine it adopted came to be summed up in the phrase “Stingy with blood; extravagant with steel.” In 1929, France began construction of a defensive belt along the frontier from Switzerland to Belgium. Named for Minister of War André Maginot and never intended as a puncture-proof barricade, the Maginot Line nonetheless helped fix a defensive mind-set in the French military.

By the 1930s, attitudes toward World War I had changed. German people believed their nation had not lost the war militarily but had been betrayed by communists, leftists, pacifists, and Jews. Especially in Britain and the United States, many came to believe that the Central Powers had not been responsible for the war, that nothing had been gained by the conflict, and that the postwar settlement had been too hard on Germany.

In Britain, there was some sympathy in influential, upper-class circles for fascist doctrines and dictators, who were seen as opponents of communism. British Member of Parliament Winston L. S. Churchill, for example, praised Italian dictator Benito Mussolini. The British government avoided continental commitments, and its leaders embraced appeasement—the notion that meeting the more legitimate demands of the dictators would remove all need for war. Prime Minister Neville Chamberlain (who served in that post from 1937 to 1940) was the principal architect of this policy.

There was also great concern in Britain, as elsewhere, over the possible air bombardment of cities in any future war.

The United States had been one of the few powers that actually benefited from World War I. At a modest cost in terms of human casualties, it had emerged from the struggle as the world’s leading financial power. Yet Americans were dissatisfied with their involvement in European affairs; they believed they had been misled by wartime propaganda and that the arms manufacturers (the so-called merchants of death) had drawn the nation into the war to assure themselves payment for sales to the Entente side. In the 1930s, the United States adhered to rigid neutrality, and Congress passed legislation preventing the government from loaning money or selling arms to combatants in a war. Unfortunately, such legislation benefited the aggressor states, which were already well armed, and handicapped their victims. Franklin D. Roosevelt, the U.S. president from 1933 to 1945, understood the threat the aggressors posed to the world community, but most Americans eschewed international involvement.

The Soviet Union was also largely absorbed in its internal affairs. Following World War I, Russia experienced a protracted and bloody civil war as the Communist Reds, who had seized control in November 1917, fought off the Whites, who were supported by the Western Allies. When this conflict ended in 1921, efforts by the government to introduce Communist economic practices only heightened the chaos and famine. In the 1930s, Soviet leader Josef Stalin pushed both the collectivization of agriculture, which led to the deaths of millions of Soviet citizens, and the industrialization essential for modern warfare.

In foreign policy, Stalin was a revisionist who did not accept the new frontiers in eastern Europe as final. Particularly vexing to him was the new Poland, part of which had been carved from former Russian territory. Russia had also lost additional lands to Poland following its defeat in the 1920 Russo-Polish War.

After 1933 and Adolf Hitler’s accession to power, Stalin became especially disturbed over Germany, for the German Führer (leader) had clearly stated his opposition to communism and his intention of bringing large stretches of eastern Europe under German control, even by the sword. The German threat led Stalin to turn to collective security and pursue an internationalist course. In 1934, the Soviet Union joined the League of Nations.

Simultaneously, Stalin launched unprecedented purges against his own people, largely motivated by his own paranoia and desire to hold on to power. The number of victims may have been as high as 40 million, half of whom were killed. The so-called Great Terror consumed almost all the old-guard Bolshevik leadership and senior military officers. The consequences of decimating the latter group were felt in 1941 when the Germans invaded the Soviet Union.

By the late 1930s, many Western leaders distrusted the Soviet Union to the point that they hoped German strength could be directed eastward against it and that Nazism and communism would destroy one another. Thus, despite the fact that the Kremlin was willing to enter into arrangements with the West against Germany and Japan, no effective international coalition was forged.

In 1931, Japan seized Manchuria. Japan had been one of the chief beneficiaries of World War I. At little cost, it had secured the German islands north of the equator and concessions in China. Riding the crest of an ultranationalist wave, Japanese leaders sought to take advantage of the chaos of the world economic depression and the continuing upheaval in China after the 1911 Chinese Revolution to secure the natural resources their country lacked. The Japanese attempted to garner these not only in Manchuria but also in Mongolia, China proper, and South Asia.

Although Japan had many of the trappings of a democracy, it was not one. The army and navy departments were independent of the civilian authorities; from 1936 onward, the ministers of war and navy had to be serving officers, giving the military a veto over public policy because no government could be formed without its concurrence. Army leaders had little sympathy for parliamentary rule or civil government, and in the 1930s, they dominated the government and occasionally resorted to political assassinations, even of prime ministers.

On the night of 18 September 1931, Japanese staff officers of the elite Guandong (Kwantung) Army in southern Manchuria set off an explosion near the main line of the South Manchuria Railway near Mukden, an act they blamed on nearby Chinese soldiers. The Japanese military then took control of Mukden and began the conquest of all Manchuria. Tokyo had been presented with a *fait accompli* by its own military, but it supported the action.

The Japanese held that they had acted only in self-defense and demanded that the crisis be resolved through direct Sino-Japanese negotiation. China, however, took the matter to the League of Nations, the first major test for that organization. The League Council was reluctant to take tough action against Japan, and the Japanese ignored its calls to withdraw their troops and continued military operations. In February 1932, Japan proclaimed the “independence” of Manchuria in the guise of the new state of Manzhouguo (Manchukuo). A protocol that September established a Japanese protectorate over Manzhouguo. In 1934, the Japanese installed China’s last Manchu emperor—Aixinjueluo Puyi (Aisingioro P’u-i, known to Westerners as Henry Puyi), who had been deposed in 1911—as emperor of what was called Manzhouguo (the empire of the Manzhus [Manchus]).

A League of Nations investigating committee blamed Japan and concluded that only the presence of Japanese

troops kept the government of Manzhouguo in power. On 24 February 1933, the League Assembly approved the report of its committee and the Stimson Doctrine, named for U.S. Secretary of State Henry L. Stimson, of nonrecognition of Manzhouguo. Of 42 member states, only Japan voted against the move. Never before had such a universal vote of censure been passed against a sovereign state. Tokyo then gave notice of its intention to withdraw from the league.

Manzhouguo was larger than France and Germany combined, but in March, Japanese troops added to it the Province of Rehe (Jehol). Early in April, they moved against Chinese forces south of the Great Wall to within a few miles of Beijing (Peking) and Tianjin (Tientsin). In May, Chinese forces evacuated Beijing, then under the authority of pro-Japanese Chinese leaders. The latter concluded a truce with Japan that created a demilitarized zone administered by Chinese friendly to Japan.

Had the great powers been able to agree on military action, Japan would have been forced to withdraw from its conquered territory. Such a war would have been far less costly than fighting a world war later, but the world economic depression and general Western indifference to the plight of Asians precluded a sacrifice of that nature. A worldwide financial and commercial boycott in accordance with Article 16 of the League of Nations Covenant might also have forced a Japanese withdrawal, but this, too, was beyond Western resolve. Other states with similar aspirations took note.

Germany was the next to move. In January 1933, Adolf Hitler became Germany’s chancellor, by entirely legitimate means, and in October 1933, he withdrew Germany from both the League of Nations and the international disarmament conference meeting in Geneva. In July 1934, Austrian Nazis, acting with the tacit support of Berlin, attempted to seize power in Vienna in order to achieve Anschluss, or union with Germany. Ultimately, Austrian authorities put down the putschists without outside assistance, although Mussolini, who considered Austria under his influence, ordered Italian troops to the Brenner Pass.

Germany was then still largely unarmed, and Hitler expressed regret at the murder of Austrian Chancellor Engelbert Dollfuss and assured the world that Germany had no role in the failed coup. The Nazis’ unsuccessful attempt at a takeover of Austria was clearly a setback for Hitler. Secure in French support, Mussolini met with the new Austrian chancellor, Kurt von Schuschnigg, in Rome that September and announced that Italy would defend Austrian independence. A French pact with Italy rested on agreement with Yugoslavia, but on 9 October 1934 when King Alexander of Yugoslavia arrived at Marseille for discussions with the French government, Croatian terrorists assassinated him and French Foreign Minister Louis Barthou. This event was a great embarrassment for France, although Barthou’s successor, Pierre Laval, did

secure the pact with Italy. The January 1935 French-Italian accords called for joint consultation and close cooperation between the two powers in central Europe and reaffirmed the independence and territorial integrity of Austria. They also recommended a multilateral security pact for eastern Europe. In secret provisions, Italy promised to support France with its air force in the event of a German move in the Rhineland and France agreed to provide troops to aid Italy if the Germans should threaten Austria. France also transferred land to the Italian colonies of Libya and Eritrea, and Laval promised Mussolini that France would not oppose Italy's efforts to realize its colonial ambitions. Thereafter, Mussolini behaved as if he had France's approval to wage aggressive war.

Only a week later, with Hitler declaring the Saar to be his last territorial demand in Europe (the first of many such statements), Saarlanders voted nine to one to rejoin Germany. On 1 March 1935, the League Council formally returned the Saar to German control. Two weeks later, on 16 March, Hitler proclaimed the rearmament of Germany. Secret rearmament had been under way for some time, including development of an air training center at Lipetsk, a gas warfare school at Torski, and a tank school at Kazan (all in the Soviet Union), but Hitler now announced publicly that the Reich would reintroduce compulsory military service and increase its army to more than 500,000 men, moves he justified on the grounds that the Allies had not disarmed. France, Britain, and Italy all protested but did nothing further to compel Germany to observe its treaty obligations. In April 1935, Laval, Prime Minister J. Ramsay MacDonald of Britain, and Mussolini met at Stresa on Lake Maggiore and formed the so-called Stresa Front, agreeing "to oppose unilateral repudiation of treaties that may endanger the peace" (with the phrase "of Europe" being added at Mussolini's request).

On 2 May, France and the Soviet Union signed a five-year pact of mutual assistance in the event of unprovoked aggression against either power. The French rejected a military convention that would have coordinated their military response to any German aggression, however. On 16 May, the Soviet Union and Czechoslovakia signed a similar mutual-assistance pact, but the Soviet Union was not obligated to provide armed assistance unless France first fulfilled its commitments.

Britain took the first step in the appeasement of Germany, shattering the Stresa Front. On 18 June 1935, the British government signed a naval agreement with Germany that condoned the latter's violation of the Versailles Treaty. In spite of having promised Paris in February that it would take no unilateral action toward Germany, London permitted the Reich to build a surface navy of a size up to 35 percent that of Britain's own navy—in effect, a force larger than the navies of either France or Italy. It also allowed the Reich to attain 45 percent of the Royal Navy's strength in submarines, armaments that Germany was prohibited from acquiring by the

Treaty of Versailles. British leaders were unconcerned. The Royal Navy had only 50 submarines, which meant the Germans could build only 23. Moreover, the British were confident that the new technology of ASDIC, later known as sonar, would enable them to detect submarines at a range of several thousand yards. The Anglo-German Naval Agreement was, of course, another postdated German check. The conclusion of this accord was also the first occasion on which any power sanctioned Germany's misdeeds, and it won Britain the displeasure of its ally France.

On 3 October 1935, believing with some justification that he had Western support, Mussolini invaded Ethiopia (Abyssinia). Long-standing border disputes between Italian Somaliland and Ethiopia were the excuse. Mussolini's goal was to create a great Italian empire in Africa and to avenge Italy's defeat by the Ethiopians at Adowa in 1896. The outcome of the Italo-Ethiopian War was a foregone conclusion, and in May 1936, Italian forces took Addis Ababa and Mussolini proclaimed the king of Italy as the emperor of Ethiopia.

On 7 October 1935, the League of Nations condemned Italy, marking the first time it had branded a European state an aggressor. But behind the scenes, British Foreign Secretary Sir Samuel Hoare and French Foreign Minister Pierre Laval devised their infamous proposals to broker away Ethiopia to Italy in return for Italian support against Germany. Public furor swept both men from office when the deal became known.

Ultimately, the league voted to impose some economic sanctions—but not on oil, which would have brought an Italian withdrawal. In the end, even those ineffectual sanctions that had been voted for were lifted. Italy, like Japan, had gambled and won, dealing another blow to collective security.

Probably the seminal event on the road to World War II occurred in early 1936, when Hitler remilitarized the Rhineland. On 7 March 1936, some 22,000 lightly armed German troops marched into the Rhineland, defying not just the Treaty of Versailles but also the Locarno Pacts, which Germany had voluntarily negotiated. Hitler deliberately scheduled the operation to occur while France was absorbed by a bitterly contested election campaign that brought the leftist Popular Front to power.

Incredibly, France had no contingency plans for such an eventuality. French intelligence services also grossly overestimated the size of the German forces in the operation and believed Hitler's false claims that the Luftwaffe had achieved parity with the French Armée de l'Air (air force). Vainly seeking to disguise its own inaction, Paris appealed to London for support, but Foreign Secretary Anthony Eden made it clear that Britain would not fight for the Rhineland, which was, after all, German territory.

Had the French acted, their forces in all likelihood would have rolled over the Germans, which would probably have

meant the end of the Nazi regime. But as it turned out, remilitarization of the Rhineland provided Germany a buffer for the Ruhr and a springboard for invading France and Belgium. That October, it also led Belgian leaders to renounce their treaty of mutual assistance with France and seek security in neutrality.

Almost immediately after the German remilitarization of the Rhineland, another international crisis erupted, this time in Spain, where civil war began on 18 July 1936. The issue centered on whether Spain would follow the modernizing reforms of the rest of western Europe or maintain its existing structure, favored by Spanish traditionalists. When the Republicans won a narrow victory in the Spanish elections of 1936, the traditionalists, who were known as the Nationalists, took to arms.

It is probable, though by no means certain, that the Republicans would have won the civil war had Spain been left alone to decide its fate. Certainly, the conflict would have ended much sooner. But Germany and Italy intervened early, providing critical air support that allowed the airlifting of Nationalist troops and equipment across the Straits of Gibraltar from Morocco to Nationalist-held territory in Spain—in effect, the first large-scale military airlift in history.

Germany even formed an air detachment, the Kondor Legion, to fight in Spain, a key factor in the ultimate Nationalist victory. The Germans also tested their latest military equipment under combat conditions, developed new fighter tactics, and learned about the necessity of close coordination between air and ground operations, along with the value of dive-bombing. Italy also provided important naval support and sent three divisions of troops, artillery, and aircraft.

Surprisingly, the Western democracies did not support the Spanish Republic. France initially sent some arms to the Republicans, but under heavy British pressure, it reversed its stance. British leaders devised a noninterventionist policy. Although all the great powers promised to observe that policy, only the Western democracies actually did so. This agreement, which made it impossible for the Republicans to obtain the arms they needed, was probably the chief factor in their defeat.

Only the Soviet Union and Mexico assisted the Spanish Republic. Stalin apparently hoped for a protracted struggle that would entangle the Western democracies and Germany on the other side of the European continent. During the civil war, the Soviet Union sent advisers, aircraft, tanks, and artillery to Spain. Eventually, this Soviet aid permitted the Spanish Communists, who were not a significant political factor in 1936, to take over the Republican government. Finally, in March 1939, Nationalist forces, led by General Francisco Franco, entered Madrid. By April, hostilities ended.

The Western democracies emerged very poorly from the test of the Spanish Civil War. Although tens of thousands of foreign volunteers had fought in Spain, most of these for the Republic, the governments of the Western democracies had

remained aloof, and many doubted the West had any will left to defend democracy. Internationally, the major effect of the fighting in Spain was to bring Germany and Italy together. In October 1936, they agreed to cooperate in Spain, to collaborate in matters of “parallel interests,” and to work to defend “European civilization” against communism. Thus was born the Rome-Berlin Axis. Then, on 25 November, Germany and Japan signed the Anti-Comintern Pact to oppose activities of the Comintern (the Communist International), created to spread communism. On the same day, Germany and Japan also signed a secret agreement providing that if either state was the object of an unprovoked attack by the Soviet Union, the other would do nothing to assist the USSR. On 6 November 1937, Italy joined the Anti-Comintern Pact. Shortly afterward, Mussolini announced that Italy would not assist Austria against a German attempt to consummate Anschluss. Italy also withdrew from the League of Nations, and it recognized Manzhouguo as an independent state in November 1937 (as did Germany in May 1938).

Japan, meanwhile, continued to strengthen its position in the Far East, asserting its exclusive right to control China. Tokyo demanded an end to the provision of Western loans and military advisers to China and threatened the use of force if such aid continued. In 1935, Japan began encroaching on several of China’s northern provinces. The Chinese government at Nanjing (Nanking), headed by Generalissimo Jiang Jieshi (Chiang Kai-shek), initially pursued a policy of appeasement vis-à-vis the Japanese, but students and the Chinese military demanded action. The Chinese Communists declared themselves willing to cooperate with the Nationalist government and place their armies under its command if Nanjing would adopt an anti-Japanese policy. The rapid growth of anti-Japanese sentiment in China and the increasing military strength of the Nationalists alarmed Japanese military leaders, who worked to establish a pro-Japanese regime in China’s five northern provinces.

On the night of 7 July 1937, a clash occurred west of Beijing between Japanese and Chinese troops. Later that month, after Nanjing rejected an ultimatum from Tokyo, the Japanese invaded the coveted northern provinces. In a few days, they had occupied both Tianjin and Beijing, and by the end of the year, Japan had extended its control into all five Chinese provinces north of the Yellow River. In mid-December, Japan also installed a new government in Beijing. Tokyo never declared war against China, however, enabling it to evade U.S. neutrality legislation and purchase American raw materials and oil. But by the same token, this situation permitted Washington to send aid to China.

The fighting was not confined to north China, for in August 1937, the Japanese attacked the great commercial city of Shanghai. Not until November, after three months of hard fighting involving the best Nationalist troops, did the city fall.

Japanese forces then advanced up the Changjiang (Yangtze) River, and in December, they took Nanjing, where they committed widespread atrocities.

As scholars have since noted, Japan subsequently developed a collective amnesia in regard to its actions at Nanjing and its atrocities in the war through South Asia in general. (According to the Chinese, Japan has a long history and a short memory.) This Japanese evasion of responsibility stands in sharp contrast to German attempts to come to terms with the Holocaust, and it has affected Japan's relations with China and other nations in Asia right up to the present.

On 12 December 1937, while trying to clear the Changjiang River of all Western shipping, Japanese forces attacked a U.S. Navy gunboat, the *Panay*. Other American ships belonging to an oil company were also bombed and sunk, and British vessels were shelled. Strong protests from Washington and London brought profuse apologies from Tokyo. The Japanese, falsely claiming they had not realized the nationality of the ships, stated their readiness to pay compensation and give guarantees that such incidents would not be repeated. Washington and London accepted these amends, and the episode only served to convince Tokyo that it had little to fear from Western intervention.

Again, China appealed to the League of Nations, which once more condemned Japan. Again, too, the West failed to withhold critical supplies and financial credits from Japan, so once more, collective security failed. By the end of 1938, Japanese troops had taken the great commercial cities of Tianjin, Beijing, Shanghai, Nanjing, Hankou, and Guangzhou (Canton), and the Nationalists were forced to relocate their capital to the interior city of Chongqing (Chungking), which Japan bombed heavily. In desperation, the Chinese demolished the dikes on the Huang He (Hwang Ho), known to Westerners as the Yellow River, costing hundreds of thousands of lives and flooding much of northern China until 1944.

Japan was also confronting the Soviet Union. Fighting began in 1938 between Japanese and Soviet troops in the poorly defined triborder area normally referred to as Changkufeng, where Siberia, Manzhouguo, and Korea met. Although no state of war was declared, significant battles were fought, especially at Changkufeng Hill in 1938 and Nomonhan/Khalkhin Gol in 1939. The fighting ended advantageously for the Soviets. A cease-fire in September 1939 preempted a planned Japanese counterattack, and the dispute was resolved by treaty in June 1940. The fighting undoubtedly influenced Stalin's decision to sign a nonaggression pact with Germany in August 1939. It also gave Tokyo a new appreciation of Soviet fighting ability, and in 1941, it helped to influence Japanese leaders to strike not north into Siberia but against the easier targets of the European colonies in Southeast Asia.

In the West, the situation by 1938 encouraged Hitler to embark on his own territorial expansion. Mussolini was now

linked with Hitler, and France was experiencing another period of ministerial instability. In Britain, appeasement was in full force, so much so that in February 1938, Anthony Eden, a staunch proponent of collective security, resigned as foreign secretary.

Austria was Hitler's first step. In February 1938, Austrian Chancellor Schuschnigg traveled to Berchtesgaden at the Führer's insistence to meet with the German leader. Under heavy pressure, Schuschnigg agreed to appoint Austrian Nazi Arthur Seyss-Inquart as minister of the interior and other Austrian Nazis as ministers of justice and foreign affairs. On 9 March, however, in an attempt to maintain his nation's independence, Schuschnigg announced that a plebiscite on the issue of Anschluss would be held in only four days, hoping that the short interval would not allow the Nazis to mobilize effectively.

Hitler was determined that no plebiscite be held, and on 11 March, Seyss-Inquart presented Schuschnigg with an ultimatum demanding his resignation and postponement of the vote under threat of invasion by German troops, already mobilized on the border. Schuschnigg yielded, canceling the plebiscite and resigning. Seyss-Inquart then took power and belatedly invited in the German troops "to preserve order" after they had already crossed the frontier. Yet Germany's military was hardly ready for war; indeed, hundreds of German tanks and vehicles of the German Eighth Army broke down on the drive toward Vienna.

On 13 March, Berlin declared Austria to be part of the Reich, and the next day, perhaps a million Austrians gave Hitler an enthusiastic welcome to Vienna. France and Britain lodged formal protests with Berlin but did nothing more. After the war, Austrian leaders denied culpability for their association with the Third Reich by claiming that their country was actually the first victim of Nazi aggression.

The Anschluss greatly strengthened the German position in central Europe. Germany was now in direct contact with Italy, Yugoslavia, and Hungary, and it controlled virtually all the communications of southeastern Europe. Czechoslovakia was almost isolated, and its trade outlets operated at Germany's mercy. Militarily, Germany outflanked the powerful western Czech defenses. It was thus not surprising that, despite his pledges to respect the territorial integrity of Czechoslovakia, Hitler should next seek to bring that state under his control.

In Austria, Hitler had added 6 million Germans to the Reich, but another 3.5 million lived in Czechoslovakia. Germans living there had long complained about discrimination in a state that had only minority Czech, German, Slovak, Hungarian, Ukrainian, and Pole populations. In 1938, however, Czechoslovakia had the highest standard of living east of Germany and was the only remaining democracy in central Europe.

Strategically, Czechoslovakia was the keystone of Europe. It had a military alliance with France, an army of 400,000

well-trained men, and the important Skoda munitions complex at Pilsen, as well as strong fortifications in the west. Unfortunately for the Czechs, the latter were in the Erzgebirge (Ore Mountains) bordering the Bohemian bowl, where the population was almost entirely German. From the German point of view, it could now be said that Bohemia-Moravia, almost one-third German in population, protruded into the Reich. Hitler took up and enlarged the past demands of Konrad Henlein's Sudetendeutsch (Sudeten German) Party to turn legitimate complaints into a call for outright separation of the German regions from Czechoslovakia and their union with Germany.

In May 1938, during key Czechoslovakian elections, German troops massed on the border and threatened invasion. Confident of French support, the Czechs mobilized their army. Both France and the Soviet Union had stated their willingness to go to war to defend Czechoslovakia, and in the end, nothing happened. Hitler then began to construct fortifications along the German frontier in the west. Known to Germans as the West Wall, these fortifications were clearly designed to prevent France from supporting its eastern allies.

Western leaders, who believed they had just averted war, now pondered whether Czechoslovakia, which had been formed only as a consequence of the Paris Peace Conference, was worth a general European war. British Prime Minister Chamberlain concluded that it was not. In early August, he sent an emissary, Lord Runciman, to Prague as a mediator, and on 7 September, based on Runciman's suggestions, Prague offered Henlein practically everything that the Sudeten Germans demanded, short of independence.

A number of knowledgeable Germans believed that Hitler was leading their state to destruction. During August and early September 1938, several opposition emissaries traveled to London with messages from the head of the Abwehr (German military intelligence), Admiral Wilhelm Canaris, and the chief of the German General Staff, General der Artillerie (U.S. equiv. lieutenant general) Ludwig Beck. They warned London of Hitler's intentions and urged a strong British stand. Beck even pledged, prior to his resignation in mid-August, that if Britain would agree to fight for Czechoslovakia, he would stage a putsch against Hitler. Nothing came of this effort, however, as London was committed to appeasement.

By mid-September, Hitler was demanding "self-determination" for the Sudeten Germans and threatening war if it was not granted. Clearly, he was promoting a situation to justify German military intervention. France would then have to decide whether to honor its pledge to Czechoslovakia. If it chose to do so, this would bring on a general European war.

In this critical situation, Chamberlain asked Hitler for a personal meeting, and on 15 September, he flew to Germany and met with the Führer at Berchtesgaden. There, Hitler informed him that the Sudeten Germans had to be able to

unite with Germany and that he was willing to risk war to accomplish this end. London and Paris now decided to force the principle of self-determination on Prague, demanding on 19 September that the Czechs agree to an immediate transfer to Germany of those areas with populations that were more than 50 percent German. When Prague asked that the matter be referred to arbitration, as provided under the Locarno Pacts, London and Paris declared this unacceptable. The Czechs, they said, would have to accept the Anglo-French proposals or bear the consequences alone.

The British and French decision to desert Czechoslovakia resulted from many factors. The peoples of both countries dreaded a general war, especially one with air attacks, for which neither nation believed itself adequately prepared. The Germans also bluffed the British and French into believing that their Luftwaffe was much more powerful than it actually was, and both Chamberlain and French Premier Édouard Daladier feared the destruction of their capitals from the air. The Western leaders also thought they would be fighting alone. They did not believe they could count on the USSR, whose military was still reeling from Stalin's purges. It also seemed unlikely that the United States would assist, even with supplies, given its neutrality policies. Nor were the British dominions of Canada, Australia, New Zealand, and South Africa likely to support Great Britain in a war for Czechoslovakia. In France and especially in Britain, there were also those who saw Nazism as a bulwark against communism and who hoped that Hitler could be diverted eastward and enmeshed in a war with the Soviets in which communism and fascism might destroy one another.

Chamberlain, who had scant experience in foreign affairs, hoped to reconcile differences in order to prevent a general European war. He strongly believed in the sanctity of contracts and could not accept that the leader of the most powerful state in Europe was a blackmailer and a liar. But the West also suffered from a moral uncertainty. In 1919, it had touted the "self-determination of peoples," and by this standard, Germany had a right to all it had hitherto demanded. The transfer of the Sudetenland to the Reich did not seem too high a price to pay for a satisfied Germany and a peaceful Europe. Finally, Hitler stated repeatedly that, once his demands on Czechoslovakia had been satisfied, he would have no further territorial ambitions in Europe.

Under heavy British and French pressure, Czechoslovakia accepted the Anglo-French proposals. On 22 September, Chamberlain again traveled to Germany and met with Hitler, who, to Chamberlain's surprise, demanded that all Czech officials be withdrawn from the Sudeten area within 10 days and that no military, economic, or traffic establishments be damaged or removed. These demands led to the most serious international crisis in Europe since 1918. Prague informed London that Hitler's demands were absolutely unacceptable.

London and Paris agreed and decided not to pressure Prague to secure its acceptance. It thus appeared that Hitler might have to carry out his threat to use force and that a general European war might result.

Following appeals by Roosevelt and Mussolini to Hitler, the German leaders agreed to a meeting. Chamberlain, Daladier, and Mussolini then repaired to Munich to meet with Hitler on 29 September. The Soviet Union was not invited, and Czechoslovakia itself was not officially represented. There were no real negotiations, the object being to give Hitler the Sudetenland in order to avoid war.

The Munich Agreement, dated 30 September, gave the Führer everything he demanded, and early on 1 October 1938, German troops marched across the frontier. Other neighboring states joined in. Poland demanded—and received—an area around Teschen of some 400 square miles with a population of 240,000 people, only 100,000 of whom were Poles, and in November, Hungary secured some 4,800 square miles of Czechoslovakia with about 1 million people.

In retrospect, it would have been better for the West to have fought Germany in September 1938. The lineup against Germany might have included the Soviet Union and Poland, but even discounting them, the German army would have been forced to fight against France and Britain, as well as Czechoslovakia. Despite Hitler's claims to the contrary, Germany was not ready for war in September 1938. The Luftwaffe had 1,230 first-line aircraft, including 600 bombers and 400 fighters, but nearly half of them were earmarked for use in the east, leaving the rest too thinly stretched over the Reich frontier to counter any serious offensive by the French air force and the Royal Air Force (RAF). The Luftwaffe was also short of bombs. Worse, only five fighting divisions and seven reserve divisions were available to hold eight times that number of French divisions.

Britain itself was far from ready, its rearmament program having begun only the year before. France had many more artillery pieces than Germany but was weak in the air. According to one estimate, France had only 250 first-quality fighters and 350 bombers out of perhaps 1,375 front-line aircraft, but France also could have counted on 35 well-armed and well-equipped Czech divisions, backed by substantial numbers of artillery pieces and tanks and perhaps 1,600 aircraft.

Later, those responsible for the Munich debacle advanced the argument that the agreement bought a year for the Western democracies to rearm. Winston Churchill stated that British fighter squadrons equipped with modern aircraft rose from only 5 in September 1938 to 26 by July 1939 (and 47 by July 1940), but he also noted that the year "gained" by Munich left the democracies in a much worse position vis-à-vis Hitler's Germany than they had been in during the Munich crisis.

The September 1938 crisis had far-reaching international effects. Chamberlain and Daladier were received with cheers

at home, the British prime minister reporting that he believed he had brought back "peace in our time." But the agreement effectively ended the French security system, since France's eastern allies now questioned French commitments to them. Stalin, always suspicious, was further alienated from the West. He expressed the view that Chamberlain and Daladier had surrendered to Hitler in order to facilitate Germany's *Drang nach Osten* (drive to the east) and a war between Germany and the Soviet Union.

Hitler had given assurances that the Sudetenland was his last territorial demand, but events soon proved the contrary. The day after the Munich Agreement was signed, he told his aides that he would annex the remainder of Czechoslovakia at the first opportunity. Within a few months, Hitler took advantage of the Czech internal situation. In March 1939, he threw his support to the leader of the Slovak Popular Party, Jozef Tiso, who sought complete independence for Slovakia. On 14 March, Slovakia and Ruthenia declared their independence. That same day, Hitler summoned elderly Czech President Emile Hácha to Berlin, where the commander of the Luftwaffe, Hermann Göring, threatened the immediate destruction of Prague unless Moravia and Bohemia were made Reich protectorates. German bombers, he alleged, were awaiting the order to take off. Hácha signed, and on that date, 15 March, Nazi troops occupied what remained of Czechoslovakia. The Czech lands became the Protectorate of Bohemia and Moravia, and Slovakia became a vassal state of the Reich, with little more independence than Bohemia-Moravia.

Thirty-five highly trained and well-equipped Czech divisions thus disappeared from the anti-Hitler order of battle. Hitler had also eliminated what he had referred to as "that damned airfield" (meaning all of Czechoslovakia), and the output of the Skoda arms complex would now supply the Reich's legions. In Bohemia and Moravia, the Wehrmacht acquired 1,582 aircraft, 2,000 artillery pieces, and sufficient equipment to arm 20 divisions. Any increase in armaments that Britain and France achieved by March 1939 was more than counterbalanced by German gains in Czechoslovakia, which included nearly one-third of the tanks they deployed in the west in spring 1940. Between August 1938 and September 1939, Skoda produced nearly as many arms as all British arms factories combined.

Hungarian troops crossed into Ruthenia and incorporated it into Hungary. Later in March, Germany demanded from Lithuania the immediate return of Memel, with its mostly German population. Lithuania, which had received the Baltic city after World War I to gain access to the sea, had no recourse but to comply.

Hitler's seizure of the rest of Czechoslovakia demonstrated that his demands were not limited to areas with German populations but were instead determined by the need for *Lebensraum*, or living space. His repudiation of the formal

pledges given to Chamberlain at Munich did, however, serve to convince the British that they could no longer trust Hitler. Indeed, Britain and France responded with a series of guarantees to the smaller states now threatened by Germany. Clearly, Poland would be the next pressure point, as the German press orchestrated charges of the Polish government's brutality against its German minority. On 31 March, Britain and France extended a formal guarantee to support Poland in the event of a German attack. At the eleventh hour and under the worst possible circumstances—with Czechoslovakia lost and the Soviet Union alienated—Britain had changed its eastern European policy and agreed to do what the French had sought in the 1920s.

Mussolini took advantage of the general European situation to strengthen Italy's position in the Balkans. In April 1939, he sent Italian troops into Albania. King Zog fled, whereon an Albanian constituent assembly voted to offer the crown to King Victor Emmanuel III of Italy. On 13 April, Britain and France extended a guarantee to defend Greece and Romania.

The Western powers began to make belated military preparations for an inevitable war, and they worked to secure a pact with the Soviet Union. Unfortunately, the guarantee to Poland gave the Soviet Union protection on its western frontier, virtually the most it could have secured in any negotiations.

On 23 May, Hitler met with his leading generals at the Reich Chancellery. He reviewed Germany's territorial requirements and the need to resolve these by expansion eastward. War, he declared, was inevitable, and he announced that he intended to attack Poland at the first suitable opportunity.

The same month, Britain and France initiated negotiations with the Soviet Union for a mutual-assistance pact. Although negotiations continued until August, no agreement was reached. Poland, Latvia, Lithuania, and Estonia were all unwilling to allow Soviet armies within their borders, even to defend against a German attack. Many in these countries feared the Soviets more than the Germans, and Polish leaders refused to believe that Hitler would risk war with Britain and France. But due to the 1920 Russo-Polish War, Poland's eastern border extended almost to Minsk, and the Soviets believed that the French and British wished them to take the brunt of the German attack. The Poles also had an exaggerated sense of their own military power. In any case, the Anglo-French negotiators refused to sacrifice Poland and the Baltic states to Stalin as they had handed Czechoslovakia to Hitler.

While the Kremlin had been negotiating more or less openly with Britain and France, it concurrently sought an understanding with Germany, even to the point of Stalin dispatching personal emissaries to Berlin. On 10 March 1939, addressing the Eighteenth Party Congress of the Soviet Union, Stalin had said that his country did not intend to "pull

anyone else's chestnuts out of the fire." He thus signaled to Hitler his readiness to abandon collective security and negotiate an agreement with Berlin. Within a week, Hitler had annexed Bohemia and Moravia, confident that the Soviet Union would not intervene. Another consideration for Stalin was that the Soviet Union potentially faced war on two fronts, owing to the threat from Japan in the Far East. Japanese pressure on Mongolia and the Maritime Provinces may well have played a significant role in predisposing Stalin to make his pact with Hitler.

In early May 1939, Stalin gave further encouragement to Hitler when he dismissed Commissar for Foreign Affairs Maxim Litvinov and appointed Vyacheslav Molotov in his place. Litvinov was both a champion of collective security and a Jew. Hitler later said that the dismissal of Litvinov made fully evident Stalin's wish to transform its relations with Germany. Contacts begun in May culminated in the German-Soviet Non-aggression Pact signed on 23 August in Moscow by Molotov and German Foreign Minister Joachim von Ribbentrop.

The German-Soviet agreement signed that night consisted of an open, 10-year, nonaggression pact, together with two secret protocols that did not become generally known until Rudolf Hess revealed them after the war during the proceedings of the International Military Tribunal at Nuremberg. These secret arrangements, never publicly acknowledged by the Soviet Union until 1990, partitioned eastern Europe between Germany and the Soviet Union in advance of the German invasion of Poland, for which Hitler had now, in effect, received Stalin's permission. Any future territorial rearrangement of the area was to involve its division between the two powers. The Soviet sphere would include eastern Poland, the Romanian Province of Bessarabia, Estonia, Latvia, and Finland. Lithuania went to Germany. A month later, Hitler traded it to Stalin in exchange for further territorial concessions in Poland. In addition, a trade convention accompanying the pact provided that the Soviet Union would supply vast quantities of raw materials to Germany in exchange for military technology and finished goods. This economic arrangement was immensely valuable to Germany early in the war, a point that Churchill later made quite clear to Stalin. Certainly, Stalin expected that Hitler would face a protracted war in the west that would allow the Soviet Union time to rebuild its military. All indications are that Stalin welcomed the pact with Germany, whereas he regarded the subsequent wartime alliance with Britain and the United States with fear and suspicion. His position becomes understandable when one realizes that Stalin's primary concern was with the internal stability of the Soviet Union.

The nonaggression pact had the impact of a thunderbolt on the world community. Communism and Nazism, supposed to be ideological opposites on the worst possible terms,

had come together, dumbfounding a generation more versed in ideology than power politics.

On 22 August, Hitler summoned his generals and announced his intention to invade Poland. Neither Britain nor France, he said, had the leadership necessary for a life-and-death struggle: "Our enemies are little worms," he remarked, "I saw them at Munich." British and French armament did not yet amount to much. Thus, Germany had much to gain and little to lose, for the Western powers probably would not fight. In any case, Germany had to accept the risks and act with reckless resolution.

The German invasion of Poland, set for 26 August, actually occurred on 1 September, the delay caused by Italy's decision to remain neutral. Prompted by his foreign minister and son-in-law, Galeazzo Ciano, Mussolini lost faith in a German victory. Ciano proposed that Mussolini tell Hitler that Italy would enter the conflict only if Germany would agree to supply certain armaments and raw materials. On 25 August, the Germans rescinded their plans and engaged in frenzied discussions. The next day, Mussolini asked for immediate delivery of 170 million tons of industrial products and raw materials, an impossible request. Hitler then asked that Mussolini maintain a benevolent neutrality toward Germany and continue military preparations so as to fool the English and French. Mussolini agreed.

On 1 September, following false charges that Polish forces had crossed onto German soil and killed German border guards—an illusion completed by the murder of concentration camp prisoners who were then dressed in Polish military uniforms—German forces invaded Poland. On 3 September, after the expiration of ultimatums to Germany, Britain and France declared war on Germany.

Overview of World War II

World War II was the most destructive enterprise in human history. It is sobering to consider that more resources, material, and human lives (approximately 50 million dead) were expended on the war than on any other human activity. Indeed, this conflict was so all-encompassing that very few “side” wars took place simultaneously, the 1939–1940 Finnish-Soviet War (the Winter War) being one of the few exceptions.

The debate over the origins of World War I had become something of a cottage industry among historians in the 1920s and 1930s. Yet the question of origins rarely arises over World War II, except on the narrow issue of whether U.S. President Franklin D. Roosevelt had advance knowledge of the Japanese attack on Pearl Harbor. Whatever their grievances (certainly minor in comparison to the misery they inflicted on their victims), Germany and Japan are still considered the aggressors of World War II.

World War II is historically unique in that it represents if not necessarily a “crusade” of good against evil at least a struggle against almost pure evil by less evil forces. More than half a century after the end of this war, no mainstream or serious historians defend any significant aspect of Nazi Germany. Perhaps more surprisingly, there are also few if any such historians who would do likewise for militaristic Japan. In practically all previous conflicts, historians have found sufficient blame to give all belligerents a share. For example, no prominent historian takes seriously the Versailles provision that Germany was somehow completely responsible for the outbreak of World War I. German Führer Adolf Hitler and his followers have thus retained mythic status as personifications of pure evil, something not seen since the Wars of Religion of seventeenth-century Europe.

The starting date of World War II, however, can be disputed. Some scholars have gone as far back as the Japanese seizure of Manchuria in 1931. Others date its outbreak to

the opening of the full-scale Sino-Japanese War in 1937. But these were conflicts between two Asian powers, hardly global war.

The more traditional and more widely accepted date for the start of World War II is 1 September 1939, with the quick but not quite blitzkrieg (lightning) German invasion of Poland. This action brought France and Great Britain into the conflict two days later in accordance with their guarantees to Poland. (The Soviet Union’s invasion of eastern Poland on 17 September provoked no similar reaction.)

The Germans learned from their Polish Campaign and mounted a true blitzkrieg offensive against the Low Countries and France, commencing on 10 May 1940. In this blitzkrieg warfare, the tactical airpower of the German air force (the Luftwaffe) knocked out command and communications posts as integrated armor division pincers drove deeply into enemy territory, bypassing opposition strong points. When all went well, the pincers encircled the slow-moving enemy. Contrary to legend, the armored forces were simply the spearheads; the bulk of the German army was composed of foot soldiers and horses. Further, the French army and the British Expeditionary Force combined had more and usually better tanks than the Germans, and they were not too seriously inferior in the air. The sluggish Allies were simply outmaneuvered, losing France in six weeks, much to the astonishment of the so-called experts. France remains the only major industrial democracy ever to be conquered—and, also uniquely, after a single campaign. It was also the only more or less motorized nation to suffer such a fate; many French refugees fled the rapidly advancing Germans in their private cars. The Germans found that the French Routes Nationales (National Routes), designed to enable French forces to reach the frontiers, could also be used in the opposite direction by an invader. The Germans themselves relearned this military truth on their autobahns in 1945.

Germany suffered its first defeat of the war when its air offensive against Great Britain, the world's first great air campaign, was thwarted in the Battle of Britain. The margin of victory was small, for there was little to choose between the Hurricane and Spitfire fighters of the Royal Air Force (RAF) and the Luftwaffe's Bf-109 or between the contenders' pilots. The main advantages of the RAF in this battle were radar and the geographic fact that its pilots and their warplanes were shot down over Britain itself; German pilots and aircraft in a similar predicament were out of action for the duration, and they also had farther to fly from their bases. But Great Britain's greatest advantage throughout this stage of the war was its prime minister, Winston L. S. Churchill, who gave stirring voice and substance to the Allied defiance of Hitler.

Nonetheless, by the spring of 1941, Nazi Germany had conquered or dominated all of the European continent, with the exception of Switzerland, Sweden, and Vatican City. Greece, which had held off and beaten back an inept Italian offensive, finally capitulated to the German Balkan blitzkrieg in spring 1941.

Nazi Germany then turned on its erstwhile ally, the Soviet Union, on 22 June 1941, in Operation BARBAROSSA, the greatest military campaign of all time, in order to fulfill Hitler's enduring vision of crushing "Judeo-Bolshevism." (How far Hitler's ambitions of conquest ranged beyond the Soviet east is still disputed by historians.) If he had any introspective moments then, Soviet dictator Josef Stalin must have wished that he still possessed the legions of first-rate officers he had shot or slowly destroyed in the gulag in the wake of his bloody purge of the military in 1937. Stalin's own inept generalship played a major role in the early Soviet defeats, and German forces drove almost to within sight of the Kremlin's towers in December 1941 before being beaten back.

Early that same month, war erupted in the Pacific, and the conflict then became truly a world war, with Japan's coordinated combined attacks on the U.S. naval base at Pearl Harbor and on British, Dutch, and American imperial possessions. With the Soviet Union holding out precariously and the United States now a belligerent, the Axis had lost the war, even though few recognized that fact at the time. America's "great debate" as to whether and to what extent to aid Britain was silenced in a national outpouring of collective wrath against an enemy, in a manner that would not be seen again until 11 September 2001.

But Pearl Harbor was bad enough, with 2,280 Americans dead, four battleships sunk, and the remaining four battleships damaged. Much worse was to follow. As with the Germans in France, more-professional Japanese forces surprised and outfought their opponents by land, sea, and air. Almost before they knew it, British and Dutch forces in Asia, superior in numbers alone, had been routed in one of the most successful combined-arms campaigns in history. (The French

had already yielded control of their colony of Indochina, whose rice and raw materials were flowing to Japan while the Japanese military had the use of its naval and air bases until the end of the war.) The course of the Malayan-Singapore Campaign was typical. British land forces could scarcely even delay the Japanese army, Japanese fighters cleared the skies of British aircraft, and Japanese naval bombers flying from land bases quickly sank the new battleship *Prince of Wales* and the elderly battle cruiser *Repulse*. This disaster made it obvious that the aircraft carrier was the capital ship of the day. Singapore, the linchpin of imperial European power in the Orient, surrendered ignominiously on 16 February 1942.

The British hardly made a better fight of it in Burma before having to evacuate that colony. Only the Americans managed to delay the Japanese seriously, holding out on the Bataan Peninsula and then at the Corregidor fortifications until May. The end of imperialism, at least in Asia, can be dated to the capitulation of Singapore, as Asians witnessed other Asians with superior technology and professionalism completely defeat Europeans and Americans.

And yet, on Pearl Harbor's very "day of infamy," Japan actually lost the war. Its forces missed the American aircraft carriers there, as well as the oil tank farms and the machine shop complex. On that day, the Japanese killed many U.S. personnel, and they destroyed mostly obsolete aircraft and sank a handful of elderly battleships. But above all, they outraged Americans, who determined to avenge the attack so that Japan would receive no mercy in the relentless land, sea, and air war that the United States was now to wage against it. More significantly, American industrial and manpower resources vastly surpassed those Japan could bring to bear in a protracted conflict.

And yet—oddly, perhaps, in view of its own ruthless warfare and occupation—Japan was the only major belligerent to hold limited aims in World War II. Japanese leaders basically wanted the Western colonial powers out of the Pacific, to be replaced, of course, by their own Greater East Asia Coprosperity Sphere (a euphemism for "Asia for the Japanese"). No unconditional surrender demands ever issued from Tokyo. To Japan's own people, of course, the war was presented as a struggle to the death against the arrogant Anglo-Saxon imperialists.

Three days after the Pearl Harbor attack, Hitler decided to declare war on the United States, a blunder fully as deadly as his invasion of the Soviet Union and even less explicable. But the Nazi dictator, on the basis of his customary "insights," had dismissed the American soldier as worthless, and he considered U.S. industrial power vastly overrated. His decision meant the United States could not focus exclusively on Japan.

The tide would not begin to turn until the drawn-out naval-air clash in the Coral Sea (May 1942), the first naval bat-

tle in which neither side's surface ships ever came within sight of the opponent. The following month, the U.S. Navy avenged Pearl Harbor in the Battle of Midway, sinking no fewer than four Japanese carriers, again without the surface ships involved ever sighting each other. The loss of hundreds of superbly trained, combat-experienced naval aviators and their highly trained maintenance crews was as great a blow to Japan as the actual sinking of its invaluable carriers. The Americans could make up their own losses far more easily than the Japanese.

Although considered a sideshow by the Soviets, the North African Campaign was of the utmost strategic importance, and until mid-1943, it was the only continental land campaign that the Western Allies were strong enough to mount. Had North Africa, including Egypt, fallen to the Axis powers (as almost occurred several times), the Suez Canal could not have been held, and German forces could have gone through the Middle East, mobilizing Arab nationalism, threatening the area's vast oil fields, and even menacing the embattled Soviet Union itself. Not until the British commander in North Africa, General Bernard Montgomery, amassed a massive superiority in armor was German General Erwin Rommel defeated at El Alamein in October 1942 and slowly pushed back toward Tunisia. U.S. and British landings to the rear of Rommel's forces, in Algeria and Morocco, were successful, but the raw American troops received a bloody nose at Kasserine Pass. The vastly outnumbered North African Axis forces did not capitulate until May 1943. Four months earlier, the German Sixth Army had surrendered at Stalingrad, marking the resurgence of the Soviet armies. One should, nonetheless, remember that the distance between Casablanca, Morocco, and Cape Bon, Tunisia, is much the same as that from Brest-Litovsk to Stalingrad, and more Axis troops surrendered at "Tunisgrad" than at Stalingrad. (One major difference was that almost all Axis prisoners of the Western Allies survived their imprisonment, whereas fewer than one in ten of those taken at Stalingrad returned.)

By this time, U.S. production was supplying not only American military needs but also those of most of the Allies—on a scale, moreover, that was simply lavish by comparison to all other armed forces (except possibly that of the Canadians). Everything from the canned-meat product Spam to Sherman tanks and from aluminum ingots to finished aircraft crossed the oceans to the British Isles, the Soviet Union, the Free French, the Nationalist Chinese, the Fighting Poles, and others. (To this day, Soviets refer to any multidrive truck as a *studeborkii*, or Studebaker, a result of the tens of thousands of such vehicles shipped to the Soviet Union.) Moreover, quantity was not produced at the cost of quality. Although some the Allies might have had reservations in regard to Spam, the army trucks, the boots, the small arms,

and the uniforms provided by the United States were unsurpassed. (British soldiers noted with some envy that American enlisted men wore the same type of uniform material as did British officers.) The very ships that transported the bulk of this war material—the famous, mass-produced Liberty ships ("rolled out by the mile, chopped off by the yard")—could still be found on the world's oceanic trade routes decades after they were originally scheduled to be scrapped.

After the North African Campaign ended in 1943, the Allies drove the Axis forces from Sicily, and then, in September 1943, they began the interminable Italian Campaign. It is perhaps indicative of the frustrating nature of the war in Italy that the lethargic Allies allowed the campaign to begin with the escape of most Axis forces from Sicily to the Italian peninsula. The Germans were still better at this sort of thing. Winston Churchill to the contrary, Italy was no "soft underbelly"; the Germans conducted well-organized retreats from one mountainous fortified line to the next. The Italian Campaign was occasionally justified for tying down many German troops, but the truth is that it tied down far more Allied forces—British, Americans, Free French, Free Poles, Brazilians, Canadians, Indians, and British and French African colonials among them. German forces in Italy ultimately surrendered in late April 1945, only about a week before Germany itself capitulated.

The military forces of World War II's belligerents, as might be expected in so historically widespread a conflict, varied wildly. The French army in 1939, considered by "experts" the world's best, was actually a slow-moving mass that was often supplied with very good equipment and was led by aged commanders who had learned the lessons of World War I. No other such powerful army was so completely defeated in so short a period of time. The French air force and navy likewise had some excellent equipment as well as more progressive commanders than the army, but France fell before they could have any great impact on the course of battle.

It is generally agreed that the German army was superb—so superb, in fact, that some authorities would venture that the Germans traditionally have had "a genius for war." (Then again, it was hardly a sign of genius to provoke the United States into entering World War I or to invade the Soviet Union in World War II while the British Empire still fought on, before declaring war on the United States six months later.) Obviously, Germany's greatest and traditional military failing has been the denigration of the fighting ability of its opponents. But on the ground, at the operational and tactical levels, the combination of realistic training, strict discipline, and flexible command made the German army probably World War II's most formidable foe. One need only look at a map of Europe from 1939 to 1945 and calculate Germany's enemies compared to its own resources. The Luftwaffe had

superbly trained pilots, although their quality fell off drastically as the war turned against their nation. German fighters were easily the equal of any in the world, but surprisingly, given that Hitler's earlier ambitions seemingly demanded a "Ural bomber," the Luftwaffe never put a heavy, four-engine bomber into production. Germany led the world in aerodynamics, putting into squadron service the world's first jet fighter (the Me-262), with swept wings, and even a jet reconnaissance bomber (although German jet engines lagged somewhat behind those of the British). The Luftwaffe also fielded a rocket-powered interceptor, but this craft was as great a menace to its own pilots as to the enemy.

The German navy boasted some outstanding surface vessels, such as the battleship *Bismarck*, but Hitler found the sea alien, and he largely neglected Germany's surface fleet. Submarines were an entirely different matter. U-boat wolf packs decimated Allied North Atlantic shipping, and the Battle of the Atlantic was the only campaign the euphonic Churchill claimed cost him sleep. German U-boats ravaged the Atlantic coast of the United States, even ranging into Chesapeake Bay in the first months of 1942 to take advantage of inexcusable American naval unpreparedness. As in World War I, convoy was the answer to the German U-boat, a lesson that had to be learned the hard way in both conflicts.

The British army on the whole put in a mediocre performance in World War II. As with the French, although to a lesser degree, the British feared a repetition of the slaughter experienced on the World War I Western Front, and except for the elite units, they rarely showed much dash or initiative. Montgomery, the war's most famous British general, consistently refused to advance until he had great superiority in men and material over his enemy. The British Expeditionary Force fought well and hard in France in 1940 but moved sluggishly thereafter. By far the worst performance of the British army occurred in Malaya-Singapore in the opening months of the war.

For all of their commando tradition, moreover, the British undertook few guerrilla actions in any of their lost colonies. Churchill himself was moved to wonder why the sons of the men who had fought so well in World War I on the Somme, despite heavy losses, suffered so badly by comparison to the Americans still holding out on Bataan. As late as 1943, the Japanese easily repulsed a sluggish British offensive in the Burma Arakan.

This situation changed drastically when General William Slim took command of the beaten, depressed Anglo-Indian forces in Burma. His was the only sizable Allied force not to outnumber the Japanese, yet he inflicted the worst land defeat in its history on Japan and destroyed the Japanese forces in Burma. Unlike so many Allied generals, Slim led from the front in the worst climate of any battle front. He managed to switch his army's composition from jungle fighters to armored cav-

alry. Slim's only tangible advantage over his enemy was his absolute control of the air, and with this, he conducted the greatest air supply operation of the war. Although the modest Slim, from a lower-middle-class background, achieved the highest rank in the British army and then became one of Australia's most successful governor-generals, he is almost forgotten today. Yet, considering his accomplishments with limited resources and in different conditions, William Slim should be considered the finest ground commander of World War II.

The Royal Navy suffered from a preponderance of battleship admirals at the opening of the war, most notably Admiral Sir Tom Phillips, who was convinced that "well-handled" capital ships could fight off aerial attacks. He was proved emphatically and fatally wrong when Japanese torpedo-bombers rather swiftly dispatched his *Prince of Wales* and *Repulse* on the third day after the opening of war in the Pacific. The Royal Navy was also handicapped by the fact that not until 1937 did it win control of the Fleet Air Arm (FAA) from the RAF, which had little use for naval aviation and had starved the FAA of funds and attention through the years between the world wars. Although the Royal Navy's carriers were fine ships and their armored flight decks gave them a protection that the U.S. Navy envied, albeit at the cost of smaller aircraft capacity, Fleet Air Arm aircraft were so obsolete that the service had to turn to U.S. models. Even so, the FAA made history on 11 November 1940 when its obsolete Fairy Swordfish torpedo-bombers sank three Italian battleships in Taranto harbor, a feat that the Japanese observed carefully but the Americans did not. British battleships and carriers kept the vital lifeline through the Mediterranean and the Suez Canal open through the darkest days of the war, and together with the Americans and Canadians, they defeated the perilous German submarine menace in the North Atlantic. Significant surface actions of the Royal Navy included the sinking of the German battleship *Bismarck* in May 1941 by an armada of British battleships, cruisers, carriers, and warplanes and the December 1943 destruction of the pocket battleship *Scharnhorst* by the modern battleship *Duke of York*.

The Soviet army almost received its deathblow in the first months of the German invasion. Caught off balance and shorn by Stalin's maniacal purges of its best commanders (whose successors were the dictator's obedient creatures), the Soviet army suffered heavier losses than any other army in history. Yet, spurred by the bestiality of the German war of enslavement and racial extermination and by Stalin's newfound pragmatism, the Red Army was able to spring back and, at enormous cost at the hands of the more professional Germans, fight its way to Berlin.

The Red Air Force developed into one of the most effective tactical air powers of the war. (The Soviets constructed very few heavy bombers.) The Shturmovik was certainly one of the

best ground-attack aircraft of the time. The Red Navy, by contrast, apparently did little to affect the course of the war; its main triumph may have been in early 1945 when its submarines sank several large German passenger ships crammed with refugees from the east in the frigid Baltic, the worst maritime disasters in history.

The United States emerged from World War II as the only nation since the time of the Romans to be a dominant power on both land and sea, not to mention in the air. In 1945, the U.S. Air Force and Navy could have defeated any combination of enemies, and only the Soviet army could have seriously challenged the Americans on land. In 1939, the U.S. Army was about the size of that of Romania; by 1945, it had grown to some 12 million men and women.

World War II in the Pacific was the great epic of the U.S. Navy. From the ruin of Pearl Harbor, that service fought its way across the vast reaches of the Pacific Ocean to Tokyo Bay. Eventually, it had the satisfaction of watching the Japanese surrender on board a U.S. Navy battleship in that harbor. Immediately after Pearl Harbor, it was obvious that the aircraft carrier was the ideal capital ship for this war, and the United States virtually mass-produced such warships in the Essex-class. The U.S. Navy had much to learn from its enemy, as demonstrated in the Battle of Savo Island, where Japanese cruisers sank three U.S. and one Australian cruiser in the worst seagoing defeat in U.S. naval history. By the end of the war, almost all of Japan's battleships and carriers had been sunk, most by naval airpower. U.S. Navy submarines succeeded where the German navy had failed in two world wars, as absolutely unrestricted submarine warfare strangled the Japanese home islands, causing near starvation. Equally impressive, the U.S. Navy in the Pacific originated the long-range seatrains, providing American sailors with practically all their needs while they fought thousands of miles from the nearest continental American supply base.

The U.S. Marine Corps was a unique military force. Alone among the marine units of the belligerents, it had its own air and armor arms under its own tactical control. The U.S. Marines were the spearhead that stormed the Japanese-held islands of the Pacific, and the dramatic photograph of a small group of Marines raising the American flag over the bitterly contested island of Iwo Jima became an icon of the war for Americans.

The Japanese army was long on courage but shorter on individual initiative. It was a near medieval force, its men often led in wild *banzai* charges by sword-flourishing officers against machine-gun emplacements. The entire nation of Nippon was effectively mobilized against the looming Americans under the mindless slogan "Our spirit against their steel." But the history of the Japanese army will be stained for the foreseeable future by the bestial atrocities it practiced against Allied troops and civilians alike; untold numbers of

Chinese civilians, for example, were slaughtered during Japanese military campaigns in China. Only two-thirds of Allied troops unfortunate enough to fall into Japanese hands survived to the end of the war. Yet the Japanese army was probably the best light infantry force of the war, and it was certainly the only World War II army that, on numerous occasions, genuinely fulfilled that most hackneyed order "Fight on to the last man!"

The Imperial Japanese Navy and the air arms of the army and navy were superb in the early stages of the Pacific war. Both had extensive combat experience in the Chinese war as well as modern equipment. Japanese admirals were the best in their class between 1941 and 1942, and Japanese air and naval forces, along with the Japanese army itself, quickly wound up European colonial pretensions. Only the vast mobilized resources of the United States could turn the tide against Japan. And except for their complete loss of air control, only in Burma were the Japanese outfought on something like equal terms.

The aftermath of World War II proved considerably different from that of World War I, with its prevailing spirit of disillusionment. Amazingly, all of World War II's belligerents, winners and losers alike, could soon look back and realize that the destruction of the murderous, archaic, racist Axis regimes had genuinely cleared the way to a better world. All enjoyed peace and the absence of major war. Even for the Soviets, the postwar decades were infinitely better than the prewar years, although much of this measure of good fortune might be attributed simply to the death of Josef Stalin. Except for Great Britain, the British Commonwealth nations and even more so the United States emerged from the war far stronger than when they entered it after enduring a decade of the Great Depression. By the 1950s, both war-shattered Western Europe and Japan were well on their way to becoming major competitors of the United States. The uniquely sagacious and foresighted Western Allied military occupations of Germany, Japan, and Austria in many ways laid the foundations for the postwar prosperity of these former enemy nations. (For the most part, similar good fortune bypassed the less developed nations.) Within a few years, former belligerents on both sides could agree that, despite its appalling casualties and destruction, World War II had been if not perhaps "the Good War" at least something in the nature of a worthwhile war.

Legacy of the War

Across the globe, people greeted the end of World War II with a profound sense of relief. By virtually any measurement, the war had been the most devastating conflict in human history. All nations were touched by it to some degree. The war's economic cost alone has been calculated at perhaps five times that of World War I. In human terms, it claimed half again as many military lives: 15 million versus 10 million for World War I. Including civilians, between 41 and 49 million people died in the war, a figure that would have been much higher without the advent of sulfa and penicillin drugs and blood plasma transfusions.

When the war finally ended, vast stretches of Europe and parts of Asia lay in ruins. Whole populations were utterly exhausted, and many people were starving and living in makeshift shelters. Millions more had been uprooted from their homes and displaced; many of them had been transported to the Reich to work as slave laborers in German industry and agriculture. Transport—especially in parts of western and central Europe and in Japan—was at a standstill. Bridges were blown, rail lines were destroyed, and highways were cratered and blocked. Ports, particularly those in northwestern Europe and Japan, were especially hard hit, and many would have to be rebuilt. Most of the large cities of Germany and Japan were piles of rubble, their buildings mere shells.

Some countries had fared reasonably well. Damage in Britain was not too extensive, and civilian deaths were relatively slight; Denmark and Norway escaped with little destruction. The rapid Allied advance had largely spared Belgium, although the port of Antwerp had been badly damaged. The Netherlands, however, sustained considerable destruction, and portions of the population were starving. The situation in Greece was also dire, and Poland suffered horribly from the brutal German and Soviet occupation policies and armies sweeping back and forth across its territory.

Among the major powers, the USSR was the hardest hit. With 27 million of its people killed in the war, national demographics were dramatically impacted, an effect that has persisted even to the present. In 1959, Moscow announced that the ratio of males to females in the Soviet Union was 45 to 55. Aside from the catastrophic human costs, the Germans had occupied its most productive regions, and the scorched-earth policy practiced by both the Soviets and the Germans resulted in the total or partial destruction of 1,700 towns, 70,000 villages, and 6 million buildings, including 84,000 schools. The Soviet Union also lost 71 million farm animals, including 7 million horses. There was widespread destruction in such great cities as Kiev, Odessa, and Leningrad. Perhaps a quarter of the property value of the USSR was lost in the war, and tens of millions of Soviet citizens were homeless. Simply feeding the Soviet population became a staggering task. All of these factors help to explain the subsequent policies, both internal and external, of the Soviet Union.

Efforts in Europe, as well as in Asia, centered for several years on the pressing problems of providing food, housing, and employment. As it turned out, much of the damage was not as extensive as initially thought, and many machines were still operational once the rubble was removed. In one perverse sense, Germany and Japan benefited from the bombing in that they rebuilt with many of the most modern techniques and systems.

With the end of the war, the liberated nations carried out purges of fascists and collaborationists. Many of these individuals were slain without benefit of trial. In France, 8,000 to 9,000 people were so executed; subsequently, 1,500 more were sentenced to death and executed following regular court procedures. The victorious Allies were determined to bring to justice the leaders of Germany and Japan, whom they held responsible for the war. Two great trials were held, in

Nuremberg and Tokyo. Afterward, interest in bringing the guilty to justice waned, even in the cases of those responsible for wartime atrocities. Punishment varied greatly according to nation and circumstance, and it proved virtually impossible to work out acceptable formulas that might punish the guilty when so many people had, to some degree, collaborated with the occupiers.

At the end of the war, it appeared as if the idealistic, left-leaning resistance movements might realize their goals of forging new political, economic, and social institutions to bring about meaningful change. Although most people thought a return to prewar democratic structures was impossible, bright hopes for building new structures in the future were soon dashed. Resistance leaders fell to quarreling among themselves, and the fracturing of the Left, as occurred in France and Italy, made room for the return of the old but still powerful conservative elites. The political structures that ultimately emerged from the war, at least in western Europe, were little changed from those that had preceded it. In much of eastern and central Europe, where the Soviet Union now held sway, there was significant change, including land reform, although this was seldom to the real benefit of the populations involved. Soviet rule also brought widespread financial exactions in the form of reparations and the stifling of democracy.

The war did intensify the movement for European unity. Many European statesmen believed that some means had to be found to contain nationalism, especially German nationalism, and that the best vehicle for that would be the economic integration of their nations, with political unification to follow in what some called the “United States of Europe.” They believed that a Germany integrated into the European economy would not be able to act alone. Although Europe was slow in taking steps in that direction, such thinking led, a decade after the end of the war, to the European Common Market.

Asia was also greatly affected by the war. In China, the bitter prewar contest between the Chinese Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT)—and the Chinese Communist Party resumed in a protracted civil war when Nationalist leader Jiang Jieshi (Chiang Kai-shek) sent troops into Manchuria in an effort to reestablish Nationalist control of that important region. The conflict ended in 1949 with a Communist victory. To the west, British imperial India dissolved into an independent India and Pakistan.

The United States granted the Philippines delayed independence, but in other areas, such as French Indochina and the Netherlands East Indies, the colonizers endeavored to continue their control. Where the European powers sought to hold on to their empires after August 1945, there would be further bloodshed. The French government, determined to maintain the nation as a great power, insisted on retaining its empire, which led to the protracted Indo-China War. Fighting also erupted in many other places around the world, including

Malaya and the Netherlands East Indies. Even where the European powers chose to withdraw voluntarily, as Britain did in Palestine and on the Indian subcontinent, there was often heavy fighting as competing nationalities sought to fill the vacuum. Nonetheless, independence movements in Africa and Asia, stimulated by the long absence of European control during the war, gathered momentum, and over the next two decades, much of Africa and Asia became independent.

One of the supreme ironies of World War II is that Adolf Hitler had waged the conflict with the stated goal of destroying communism. In the end, he had gravely weakened Europe, and rather than eradicating his ideological adversary, he had strengthened it. In 1945, the Soviet Union was one of the two leading world powers, and its international prestige was at an all-time high. In France and Italy, powerful Communist Parties were seemingly poised to take power. The Soviet Union also established governments friendly to it in eastern and central Europe. Under the pressure of confrontation with the West, these states became openly Communist in the years after World War II. In 1948, the Communists made their last acquisition in central Europe in a coup d'état in Czechoslovakia. Communists also nearly came to power in Greece.

Indeed, far from destroying the Soviet Union and containing the United States, Germany and Japan had enhanced the international position of both. Western and Soviet differences meant that, although treaties were negotiated with some of the smaller Axis powers, there were no big-power agreements concerning the future of Germany and Japan. Germany, initially divided into four occupation zones, became two states in 1949: the western Federal Republic of Germany and the Communist German Democratic Republic. Korea also had been “temporarily” divided at the thirty-eighth parallel for the purposes of a Japanese surrender. Unlike Germany, which was reunited in 1990, Korea remained divided as of 2004—another legacy of World War II.

Despite the continued importance of secondary powers such as Britain and France, the year 1945 witnessed the emergence of a bipolar world, in which there were two superpowers: the United States and the Soviet Union. Added to the confrontational mix was the threat of nuclear war as both governments embarked on a new struggle known as the Cold War.

Aachen, Battle of (13 September–21 October 1944)

Located on the western border of Germany, the city of Aix-la-Chapelle, later Aachen, had been the capital of the Holy Roman Empire; Charlemagne was crowned emperor there in the year 800. Since German dictator Adolf Hitler considered Charlemagne to be the founder of the first German Reich, the city held special status for him. Aachen was the first major German city encountered by U.S. troops, and the five-week-long battle for it gave notice to U.S. forces that the war against the Third Reich was far from over. Lieutenant General Courtney Hodges, commander of the American First Army, had hoped to bypass Aachen from the south, quickly break through the German defenses of the West Wall (Siegfried Line), and reach the Rhine River.

In September 1944, Lieutenant General Gerhard von Schwerin's understrength 116th Panzer Division defended Aachen. Schwerin entered the city on 12 September and quickly concluded that Aachen was lost. He halted the evacuation of the city so that the population might be cared for by the Americans. Only local defense forces prevented occupation of the city on the morning of 13 September. Unaware of this fact, the commander of U.S. VII Corps, Major General J. Lawton Collins, elected to continue his attack on the Siegfried Line. Late on 15 September, however, troops of Major Gen-

eral Clarence R. Huebner's 1st Infantry Division began to surround Aachen from the south and southeast.

Hitler ordered the city evacuated, but Schwerin refused that order and was relieved of command. Up to 145,000 of the population of 160,000 fled the city. Meanwhile, the pause in Allied operations along the Siegfried Line during Operation MARKET-GARDEN allowed the Wehrmacht the chance to reinforce its West Wall defenses. By the end of September with the collapse of MARKET-GARDEN, operations around Aachen resumed.

From 7 to 20 October, elements of the U.S. VII and XIX Corps strengthened their hold around the city, now defended by the I Panzer Korps of the 116th Panzer Division, 3rd Panzergrenadier Division, and 246th Volksgrenadier Division under Colonel Gerhard Wilck.

On 8 October, U.S. forces began their attack on Aachen. On 10 October, Huebner sent a message into the city, threatening to destroy Aachen if the Germans did not surrender. When this demand was rejected, 300 P-38s and P-47s of the Ninth Tactical Air Force dropped 62 tons of bombs on Aachen on 10 October. U.S. artillery also pounded the city.

On 12 October, Wilck assumed command of some 5,000 German defenders in Aachen. The German troops, supported by assault guns and tanks (mostly Mark IVs), held their positions tenaciously. Also on 12 October, the U.S. fighter-bombers returned and dropped another 69 tons of bombs, and U.S. artillery fired 5,000 rounds.

On 13 October, troops of the 26th Infantry Regiment assaulted the city proper. The fighting was bitter, with the U.S. infantry accompanied by tanks and self-propelled artillery to knock out German armor and reduce strong points. Fighting

was house-to-house. Infantry blasted holes in the outer walls of buildings with bazookas and then cleared resistance room by room with small arms and hand grenades. Many Schutzstaffel (SS) troops died at their posts rather than surrender. When German troops west of Aachen tried to relieve the siege in hastily organized counterattacks, American artillery beat them back. Aachen was now completely surrounded, and gradually the German defensive position shrank to a small section of the western part of the city. Wilck's efforts to break out of the city on 18 and 19 October failed, and he surrendered Aachen on 21 October.

The Allied rebuff in Operation MARKET-GARDEN and German resistance at Aachen prevented a quick Allied crossing of the Rhine and bought Hitler time to strengthen his West Wall defenses, but the costs were heavy. U.S. forces took some 12,000 German prisoners, and thousands more Germans were killed. Several hundred civilians also died. U.S. losses of 3,700 men (3,200 from the 30th Infantry Division and 500 from the 1st Infantry Division) were also high, particularly among experienced riflemen. Remarkably, amidst all the

ruin and destruction, Aachen's magnificent medieval cathedral survived.

Admiralty Islands Campaign (29 February–18 May 1944)

Island group off of New Guinea seized by Allied forces in 1944. Located 200 miles north of New Guinea, the Admiralty Islands were an attractive target to the commander of the Southwest Pacific Area, General Douglas MacArthur. Seadler Harbor, an enclosed harbor formed by Manus and Los Negros Islands, and the airstrips on the islands provided a base complex to support subsequent operations against Japanese strong points in New Guinea and complete the isolation of Rabaul. The latter, a major Japanese air and naval base on New Britain Island, had been the major objective of Allied operations in the South Pacific since the summer of 1942.

MacArthur planned to invade the Admiralties in a division-size operation on 1 April 1944, but air reconnaissance in February 1944 indicated the islands were lightly defended. Ignoring the estimates of his intelligence staff that there were more than 4,000 Japanese troops in the islands who would likely put up stiff resistance, MacArthur decided to gamble and advance the landing to the end of February, even though all the forces earmarked for the operation would not be ready by that point. He planned to land a reconnaissance force on Los Negros and then rush in reinforcements faster than the Japanese could react.

The Admiralties operation began on 29 February with the landing of 1,000 assault troops from the 1st Cavalry Division at Hyane Harbor on the east coast of Los Negros. There were 2,000 Japanese on Los Negros; however, their commander had expected a landing on the other side of the island and placed only a few defenders at Hyane. The cavalrymen quickly captured Momote airfield and set up a defensive perimeter. Over the next days, aided by air support, they beat back piecemeal Japanese counterattacks. MacArthur poured in reinforcements, and by the morning of 4 March, the last Japanese counterattack had been defeated.

On 9 March, U.S. troops went ashore at Salami Plantation on the other side of Los Negros, and in 10 days of heavy fight-

The first soldiers of the U.S. 1st Cavalry Division storm ashore at Los Negros Island. (Bettmann/Corbis)

ing, the Americans secured the island. In the meantime, American troops landed on Manus Island west of Lorengau airfield, and with the seizure of the airfield on 18 March, the important part of the island was in American hands.

The last Japanese stronghold in the Admiralties, Pityilu Island, was captured on 31 March. Except for a few stragglers in the jungles of Manus, all of the Japanese defenders in the Admiralties had been wiped out. U.S. casualties were 330 killed and 1,189 wounded. MacArthur's gamble to advance the date of the Admiralties landing had paid off. The initial invaders had fought well even though outnumbered on 29 February, and once MacArthur could bring to bear all of the 1st Cavalry Division, the Japanese were doomed.

With the capture of the Admiralties, MacArthur could now extend his operations. Most important, at a time when the Joint Chiefs of Staff were deliberating future strategy in the Pacific war, the successful Admiralties operation helped

convince them to underwrite MacArthur's ambition to liberate the Philippine Islands by an offensive along the north coast of New Guinea.

Afghanistan

Afghanistan was formally nonaligned during World War II, but there were nonetheless complex diplomatic, political, and military developments of consequence in and around that country. As early as 1907, the British Committee of Imperial Defense had concluded, "The gates of India are in Afghanistan and the problem of Afghanistan dominates the situation in India." This assessment reflected the fact that the country was strategically situated between British India and Russia and of considerable interest to both in the diplomatic and political maneuvering of the nineteenth century known as "the Great Game."

Afghanistan was effectively positioned for neutrality in the years before World War II. The February 1921 Soviet-Afghanistan Treaty of mutual recognition was followed in 1926 by a formal nonaggression pact between the two countries. The government in Kabul clearly saw the Soviet Union as an effective counterweight to British power and influence in the region. The November 1921 Anglo-Afghanistan Treaty had accorded Afghanistan full and formal independence, although Britain remained the most important power in terms of immediate control over territory in South Asia, including India and what would become Pakistan.

The Afghanistan constitution, adopted in April 1923 and not replaced until 1963, declared the country to be free and independent, with a free press and free economy. Other democratic guarantees were made explicit in writing, although they were not always followed in actual practice. A constitutional monarchy governed the country, with Islam the established religion. Moderate rule dating from the 1930s was an advantage in dealing with the turmoil and uncertainty of the period.

With the approach of World War II, Afghan leaders established broader ties with Germany. In 1935, they decided to rely mainly on Germany for economic and military modernization, and the following year Germany hosted the Afghan hockey team as well as visiting senior officials as special guests at the Berlin Olympic Games. Weekly air service between Berlin and Kabul commenced in 1938. The German Todt began construction and improvements of airfields, bridges, roads, and industrial plants. German officers began training the Afghanistan military and introduced modern equipment, techniques, and weapons. In diplomatic and political terms, the government in Kabul saw Germany as a counterweight to both Britain and the Soviet Union. Meanwhile, the British government, irritated by Kabul's partnership with Germany, refused to aid Afghanistan in territorial and related disputes with the Soviet Union. Despite the British attitude, Afghan leaders generally saw Britain in positive terms.

After World War II began, developments pressed Afghanistan toward the Allied camp. The June 1941 German invasion

of the Soviet Union and the August 1941 British-Soviet invasion of Iran meant Afghanistan was virtually surrounded by Allied-controlled territory. In preparation for a possible German invasion, antitank mines were laid in the Khyber Pass, and other defensive measures were taken. At Allied insistence, Afghanistan expelled German and Italian representatives in the country and severed all ties with the Axis powers.

Africa

Africa was an important theater of operations in World War II. The continent offered war materials and important routes for air and sea communications. Essential to Allied strategic planning was control of the Suez Canal in Egypt, and during the demands of the Battle of Britain, British Prime Minister Winston L. S. Churchill had to divert scant British military resources there. Had the Axis powers taken that vital waterway, all British shipping to and from India would have been forced to detour around the Cape of Good Hope, doubling the length of the voyage.

Securing the vital oil supplies of the Middle East was another important consideration for Allied planners. From Cairo, the British Middle East Command directed operations to secure the Suez Canal and then to take the offensive against Italian forces invading from Libya and resident in East Africa.

Unlike World War I, World War II saw no fighting in southern Africa. The Union of South Africa, a British dominion, rallied to the British cause and made major contributions to the Allied war effort. The French African empire was another situation entirely. Following the defeat of France, most of the empire remained loyal to the new Vichy regime, although Chad declared early for Free French leader General Charles de Gaulle.

Allied operations occurred at Dakar and Madagascar and in the Horn of Africa in Italian East Africa, but most of the fighting took place in French North Africa and in northeast Africa. The road from Tripoli in western Libya through Benghazi and east to Alexandria, Egypt—the Benghazi Handicap—was the primary scene of fighting as Allied and Axis ground forces engaged in tactical patterns, advancing and retreating along the narrow coastal band of desert. Benito Mussolini's Italian forces invaded Egypt from Libya in September 1940. The fighting there seesawed back and forth with

An U.S. Army Air Transport Command Douglas C-47 flies over the pyramids in Egypt. Loaded with war supplies and materials, this plane was one of a fleet flying shipments from the U.S. across the Atlantic and the continent of Africa to strategic battle zones, 1943. (National Archives)

both sides increasing the stakes. Finally, with the British offensive at El Alamein and simultaneous British and U.S. landings in French North Africa, Axis forces there were caught in a vise. The continent was cleared of Axis troops in the Battle of Tunis in May 1943.

The war had tremendous influence on African nationalism, often because of the role African troops played in the war effort. General Charles de Gaulle acknowledged during the conflict that France owed a special debt of gratitude to its African empire for providing France the base and resources that enabled it to reenter the war in its final phases. It was thanks to the French colonial empire that the independent existence of France was continuously preserved. De Gaulle pledged a new relationship between metropolitan France and its colonies after the conflict.

Although Churchill was very much an imperialist, he could not override the strong anticolonial attitudes expressed by the governments of the United States and Soviet Union. U.S.

President Franklin D. Roosevelt had often declared himself opposed to European colonialism, and when he attended the Casablanca Conference in early 1943, Roosevelt denounced French imperial practices. Soviet leader Josef Stalin often denounced Western imperialism, although this stance did not prevent him from practicing it himself in the case of eastern and central Europe, nor did it keep him from requesting bases in Libya.

Nationalism found fertile ground in those African states that had been cut off from the mother countries during the war, especially in the case of the French and Belgian African possessions. Serious uprisings against French rule occurred both in Madagascar and at Sétif in Algeria. French authorities put these down with significant loss of life. Repression only temporarily quieted nationalism, which continued to feed on the lack of meaningful political reform.

After the war, Italy lost its African empire save Italian Somaliland as a mandate; Libya became independent. Nationalism

also affected the colonial African empires of Britain, Belgium, France, and Portugal. In 1945, Ethiopia, Egypt (nominally), Liberia, and the Union of South Africa were the only free states in Africa. Over the next two decades, however, most of the African states secured independence. Sometimes this occurred peacefully and sometimes with significant loss of life.

In a very real sense, World War II was a great watershed for Africa. Its outcome led to a fulfillment of the nationalism that had first washed over the continent in World War I. Unfortunately, the governments of many of the newly independent states seemed incapable of managing effectively the development of the continent's vast resources and the education of its people.

Afrika Korps

The Deutsches Afrika Korps (DAK), better known as the Afrika Korps (Africa Corps), was the name given to the initial two German armor divisions sent to Libya in 1941 as part of Operation SONNENBLUME (SUNFLOWER). Commanded by Major General Erwin Rommel, the Afrika Korps would grow and change in character as Rommel received promotions and as other commanders took over, but its legendary mystique would forever be associated with Rommel, “the Desert Fox.”

The DAK's 5th Light Division began to arrive in Libya in February 1941 (in August it was officially reconstituted as the 21st Panzer Division). Elements of the 15th Panzer Division arrived in April. At various times other units were added to, or subtracted from, the Afrika Korps. Thus at the time of Operation CRUSADER (11 November–8 December 1941), the then-nonmotorized Afrika Division was attached, as was the Italian Savona Division. At the time of the Battle of El Alamein in November 1942, the DAK consisted of the 15th and 21st Panzer Divisions, the 90th and 164th Light Motorized Infantry Divisions, the Ramcke Parachute Brigade, the Italian *Giovani Fascisti* Regiment, and assorted supporting units. During the Tunisia Campaign, the 10th Panzer Division was added.

Because North Africa was an Italian theater, the DAK was technically subordinate to the Italian High Command and thus affected by the variable winds of coalition warfare. The commanders of the DAK often exceeded their authority and could always (and frequently did) appeal directly to Berlin. The DAK was also largely dependent on supply convoys. Thus the ebb and flow of the naval war in the Mediterranean directly influenced DAK operations, especially fuel supplies. As a consequence of a deteriorating naval situation for the Axis powers in the Mediterranean, most of the officers and men arrived in or departed from Africa by air, especially after 1941.

Joining with the better-trained and better-led Italian units shipped to Libya in early 1941, the DAK went on the offensive, advancing quickly to the Egyptian border and laying siege to Tobruk. It would be involved in British Operations BREVITY, BATTLEAXE, and CRUSADER and in the Battles of Gazala and El Alamein. It formed the core of Axis forces in the retreat across Libya to Tunisia and in the ensuing battles there including Kasserine Pass and El Guettar. The DAK ended the war serving under Italy's best general, Marshal Giovanni Messe, who commanded the First Italian Army. The DAK's last commander, General Hans Cramer, surrendered with the DAK on 13 May 1943.

More than 1 million Axis soldiers served in Africa, and 260,000 of them were German. Although the wisdom of sending German forces to Africa may be questioned, certainly the major mistake Adolf Hitler made was in not sending sufficient resources early. Lieutenant General Wilhelm Ritter von Thoma's study, prepared for Hitler before the dispatch of the DAK, recommended that Germany send four divisions or none to North Africa. This recommendation was based on the difficulty of supplying forces in North Africa and on all that would be required to conquer Egypt in conjunction with Italian forces. Had four divisions been sent at the beginning, Rommel in all probability would have secured the Suez Canal, and his victory would have had a major impact on the course of the war. But Hitler only made a halfhearted effort in a theater he always considered to be secondary. The majority of German forces arrived during the Tunisia Campaign, and only a small percentage of them belonged to the DAK.

In the North African fighting, 18,594 Germans died, with another 3,400 missing in action and presumed lost. Approximately 101,784 Germans became prisoners following the Allied conquest of Tunisia.

Ainsworth, Walden Lee “Pug” (1886–1960)

U.S. Navy admiral. Born on 10 November 1886 in Minneapolis, Minnesota, Walden Ainsworth graduated from the University of Minnesota in 1905 and the U.S. Naval Academy in 1910. Ainsworth participated in navy operations against Veracruz, Mexico, in 1914. During World War I, Ainsworth served on transports as a gunnery officer. Commissioned an ensign in 1919, Ainsworth was an ordnance

specialist for two years ashore before returning to sea as an executive officer of a transport. Ainsworth was then an inspector of ordnance at Pittsburgh, Pennsylvania. He was an instructor at the Naval Academy (1928–1931), and he served at the New York Navy Yard. He was then stationed in the Panama Canal Zone (1934–1935) and graduated from the Naval War College before returning to sea as executive officer of the battleship *Mississippi*. He headed the Naval Reserve Officers' Training Corps (ROTC) unit at Tulane University from 1938 to 1940.

Promoted to captain, Ainsworth commanded Destroyer Squadron 2 in the Atlantic in 1940 and 1941 and then was assigned to Vice Admiral William F. Halsey's staff. At the end of 1941, Ainsworth took command of the battleship *Mississippi*. Promoted to rear admiral (July 1942), Ainsworth became commander, Destroyers, Pacific Fleet. He took a leading role in the Solomon Islands Campaign, commanding the bombardment of the Japanese airfield at Munda during 4–5 January 1943, long considered a textbook operation.

As commander of Cruiser Division 9 (January 1943–October 1944), Ainsworth commanded three cruisers and five destroyers escorting the U.S. invasion force to New Georgia. He fought in the Battle of Kula Gulf (5–6 July 1943), for which he was awarded the Navy Cross. He also fought in the Battle of Kolombangara (12–13 July 1943) and saw action in the Marianas, Guam, Leyte Gulf, and Peleliu. Ainsworth then commanded Cruisers and Destroyers, Pacific Fleet (October 1944–July 1945).

After the war, Ainsworth commanded the Fifth Naval District (August 1945–December 1948) until his retirement as a vice admiral. He died on 7 August 1960 in Bethesda, Maryland. The destroyer escort *Ainsworth* was named for him.

Airborne Forces, Allied

The concept of airborne forces originated in 1918 during World War I when Colonel William Mitchell, director of U.S. air operations in France, proposed landing part of the U.S. 1st Division behind German lines in the Metz sector of the Western Front. Thus was born the idea of parachuting or air-landing troops behind enemy lines to create a new flank, what would be known as *vertical envelopment*. The concept was put into action in the 1930s.

The U.S. Army carried out some small-scale experiments at Kelly and Brooks Fields in 1928 and 1929, and in 1936 the Soviets demonstrated a full-blown parachute landing during Red Army maneuvers. Some 1,500 men were dropped in the exercise. One observer—Major General A. P. Wavell—commented that the previous year vehicles had also been landed by aircraft.

During World War II, the Soviets maintained an airborne corps and numerous Guards Airborne Divisions. These troops, although elite, were never used for strategic purposes. However, on several occasions the Soviets dropped parachute troops behind German lines to aid partisan operations and to disrupt German lines of communication. Ominously for the paratroopers, there were no operations in which drives of ground troops were coordinated with parachute

operations to relieve these troops once they had been committed to battle.

British reaction to the reports from the Soviet Union was one of mild interest only, although some antiparachutist exercises took place in Eastern Command, in which Lieutenant Colonel F. A. M. Browning (commanding the 2nd Battalion of the Grenadier Guards) took part. Browning was later, as Lieutenant General Sir Frederick Browning, to command all British airborne forces in World War II. The matter then rested until the Germans showed how effective parachute and air-landing troops were when they carried out their spectacular landings in 1940 in Norway, Denmark, and the Netherlands.

Although manpower demands in Britain in 1940 were such that it should have been impossible to raise a parachute force of any significance, nevertheless at the urging of Prime Minister Winston L. S. Churchill, by August 1940, 500 men were undergoing training as parachutists. Fulfillment of Churchill's order that the number be increased to 5,000 had to await additional equipment and aircraft.

Gliderborne troops were part of the plan, and various gliders were under consideration as troop-carrying aircraft. Inevitably such a new branch of infantry was beset with problems, mainly of supply, and there was also a body of resistance to the concept itself in the regular units of the British army. This attitude often led battalions to post their least effective men to such new units merely to get rid of them; the best men were jealously guarded by their commanding officers.

The War Office (representing the British army) and the Air Ministry (representing the Royal Air Force [RAF]) had to agree on aircraft. However, because Bomber Command was becoming aggressively conservative of aircraft, the only plane initially available for training and operations was the Whitley bomber. Aircraft stocks available to airborne forces were initially severely limited until a supply of Douglas C-47 and DC-3 Dakota (Skytrain in U.S. service) aircraft was established, whereon the parachute troops found their perfect drop aircraft. Gliders were also developed, and the American Hamilcar design could carry a light tank.

Progress in developing airborne forces was slow; Royal Air Force objections were constant, in view of the pressure on the RAF to carry the continental war to Germany by means of the strategic bombing campaign. There is no doubt, however, that once the United States came into the war, the situation eased enormously, and equipment became readily available from the United States that Britain was unable to manufacture.

To provide more men for the airborne forces, the War Office decided in 1941 that whole battalions were to be transferred en masse, even though extra training would be needed to bring many men up to the standards of fitness for airborne troops. At the same time, the Central Landing Establishment became the main training center for airborne forces. The 1st Parachute Brigade was established under the command of

U.S. Army Brigadier General Anthony C. McAuliffe, artillery commander of the 101st Airborne Division, gives various glider pilots last minute instructions before the take-off on D plus 1 in Operation MARKET-GARDEN, England, 18 September, 1944. (National Archives)

Brigadier General R. N. Gale, consisting of four parachute battalions. Initially three battalions were formed, which exist to this day in the British army as 1st, 2nd, and 3rd Battalions, Parachute Regiment.

The Glider Pilot Regiment, also formed in 1941, was based at Haddenham, near Oxford, having moved from Ringway (now Manchester Airport). Pilots were recruited from among army and RAF volunteers, but they were part of the army once trained. Airborne forces are infantry, but they have to be fitter than the average soldier, and so training was rigorous. Troops were trained to endure in the cold, in wet weather, and in heat. They had to be fit to withstand the impact of the landing and to fight alone with light weapons and without support for some days.

The airborne concept at that time was twofold: to raid, in which case troops would be extracted by land or sea after the operation (such as the attack on the German radar station at Bruneval in northern France) or to land at the rear of the enemy to capture a strategic target. Two examples of the lat-

ter are the Orne bridge landing on D day in June 1944 and Operation MARKET-GARDEN (MARKET was the airborne portion) the following September when the 1st Airborne Division tried to capture the bridges across the Rhine at Arnhem in Holland.

Airborne forces were regarded, justifiably, as an elite force, but they were a force of considerable strength by the end of the war. Despite the losses suffered at Arnhem, where the 2nd Battalion of the 1st Parachute Regiment held the northern end of the road bridge for four days against two German Schutzstaffel (SS) panzer divisions, the 1st Airborne Division was again up to strength for the Rhine crossing operation in March 1945.

British airborne forces were also engaged in the Far East, and the 44th Indian Airborne Division came into being there. In the Pacific Theater, airborne operations were on a smaller scale than in Europe because the jungle limited the ability to drop large numbers of troops.

The first U.S. airborne division was the 82nd, a conversion of the 82nd Infantry (all-American) Division, formed in

Long, twin lines of C-47 transport planes are loaded with men and equipment at an airfield in England from which they took off for Holland in Operation MARKET-GARDEN on 17 September, 1944. The C-47's carried paratroopers of the First Allied Airborne Army. (National Archives)

March 1942. Major General Omar N. Bradley commanded the division, with Brigadier General Matthew B. Ridgway as his assistant. Ridgway was appointed divisional commander as a major general in June 1942, and the division became the 82nd Airborne Division that August. The 82nd went to North Africa in April 1943, just as German resistance in the theater was ending. It took part in operations in Sicily and Normandy, and under the command of Major General James M. Gavin, it participated in Operation MARKET in the Nijmegen-Arnhem area and also in the Ardennes Offensive.

The 101st Airborne Division was activated in August 1942 with a nucleus of officers and men from the 82nd Division. The 101st was commanded by Major General William C. Lee, one of the originators of U.S. airborne forces. The division left for England in September 1943. Lee had a heart attack in the spring of 1944, and the division was taken over by Major General Maxwell D. Taylor, who led it through D day and Operation MARKET, when it secured the bridge at Eindhoven. The division distinguished itself in the defense of Bastogne during the German Ardennes Offensive.

Three other U.S. airborne divisions were established: the 11th, which served in the Pacific and jumped into Corregidor Island and fought in the Battle of Manila; the 17th, which was rapidly moved to Europe for the German Ardennes Offensive

and then jumped in the Rhine Crossing with the British 6th Airborne Division; and the 13th, which, although it arrived in France in January 1945, never saw action.

Cooperation between British and U.S. airborne forces was very close. When the U.S. 101st Airborne arrived in England, it was installed in a camp close to the training area for the British 6th Airborne Division, which had prepared much of the camp in advance. Training and operational techniques were almost identical, and there were common exercises and shoots to create close bonds among troops. There were also frequent personnel exchanges to cement friendship. Similar arrangements were made between the U.S. 82nd Airborne and the British 1st Airborne Division.

Parachute training in the United States was centered at Fort Benning, Georgia, and in 1943, some 48,000 volunteers started training, with 30,000 qualifying as paratroopers. Of those rejected, some were kept for training as air-landing troops. In Britain, Polish troops were also trained as parachutists to form the Polish 1st Parachute Brigade, which fought at Arnhem in Operation MARKET. Contingents from France, Norway, Holland, and Belgium were also trained, many of whom served operationally in the Special Air Service Brigade.

One great contribution made by the United States to the common good was the formation and transfer to England of

the U.S. Troop Carrier Command. As noted previously, transport aircraft shortages had bedeviled airborne forces' training and operations from the outset. The arrival of seemingly endless streams of C-47 aircraft (known to the British as the DC-3 or Dakota) was a major help. Further, the Royal Air Force in 1944 had nine squadrons of aircraft, or a total of 180 planes, dedicated to airborne forces.

The British Commonwealth also raised parachute units. Australian paratroopers (1st Australian Parachute Battalion) served in the Far East, and the Canadian 1st Parachute Battalion served in Europe.

Several small-scale operations had been carried out before 1943 with mixed success, but the big date for airborne forces was 6 June 1944. Plans for D day required the flanks of the invasion beaches to be secured in advance, and only airborne forces could guarantee this objective. In Britain for the invasion were two British airborne divisions (1st and 6th) and two American airborne divisions (82nd and 101st). The plan was to use all the available airborne and gliderborne troops in the initial stages of the operation. Unfortunately, even in June 1944, transport aircraft available were insufficient for all troops to be dropped at once. All aircraft were organized in a common pool, so that either British or American troops could be moved by mainly American aircraft. This was another fine example of the cooperation that existed at all levels within the Allied airborne forces.

Operation OVERLORD began for the paratroopers and gliders in the dark of the early morning of 6 June. To the west, American paratroopers dropped at the base of the Cotentin Peninsula to secure the forward areas of what were to be Omaha and Utah Beaches. Despite many dispersal problems, the troops managed to link up and were soon in action, denying the Germans the ability to move against the beachheads. The troops fought with great gallantry despite their weakened strength (caused by air transport problems), and by the end of the day, contact had been established with the shipborne forces from the beachheads.

In the east, Britain's 6th Airborne Division was tasked with controlling the left flank of the British invasion beaches. Perhaps the most startling operation (for the Germans) was the coup de main attack by gliderborne air-landing troops of 11th Battalion, Oxford and Buckinghamshire Light Infantry, who landed so close to their target that they were able to capture bridges over the Caen Canal and the River Orne. On a larger scale, the 3rd Parachute Brigade was ordered to take out the Merville Battery, which posed a threat to the invasion beaches. The 9th Parachute Battalion, which planned to attack with 700 men, was so spread out on landing that only 150 men were available. With virtually no support, however, the men attacked the battery and captured it. The battalion lost 65 men and captured 22 Germans; the remainder of the German force of 200 were either killed or wounded.

The essence of airborne forces is morale; training inculcates a feeling of superiority among the men, and their distinctive headgear and equipment marks them as men apart. All Allied parachute and glider troops in the war were of a high standard, and their fighting record bears this out. Even when things went wrong, as often happened when troops were dropped from aircraft, the men made every effort to link up and to carry out the task they had been given.

Airborne Forces, Axis

An initial German airborne force was formed in the spring of 1936 as an experiment after German observers had watched Soviet airborne troops in an exercise. Set up at Stendhal, the force was made up of men from the General Göring Regiment of the Luftwaffe. Within a year of the establishment of the first parachute regiment, the Schutzstaffel (SS) was also training a platoon, and the army was evaluating parachute troops. Luftwaffe commander Hermann Göring, however, ensured that air force troops only were to form the parachute force.

The first German exercises took place in the autumn of 1937, followed later that year by the first use of cargo gliders. Expansion was rapid, and in 1938, Generalmajor (U.S. equiv. brigadier general) Kurt Student was organizing the first airborne German division to take part in the "liberation" of the Sudetenland of Czechoslovakia. This 7th Flieger (Parachute) Division had two parachute battalions, one airborne infantry battalion and an airborne infantry regiment, three airborne SS battalions, and airborne artillery and medical troops. The division was not needed in 1938, and it was decided that the 7th Parachute Division would be all-parachute, whereas the 22nd Infantry Division would be gliderborne.

In the April 1940 German invasion of Norway, a parachute battalion dropped on Stavanger airfield and secured it in 35 minutes. On 10 May 1940, Germany captured bridges and an airfield in Holland, while gliderborne troops attacked and

This Junkers JU.52/3M was employed by the German Air Force as a military transport and to drop paratroopers. (Museum of Flight/Corbis)

captured Fort Eben Emael in Belgium, which opened the German route into the Low Countries during the invasion of France. Airborne operations had proved their worth, so much so that the British immediately began to form their own parachute units.

These successes encouraged the German High Command to expand its airborne assets. It formed XI Flieger Korps, which included three parachute regiments of three battalions each plus parachute signals; medical, artillery, antiaircraft, antitank, machine gun, and engineer battalions; and the necessary supply troops. These troops were originally seen as the spearhead of the invasion of Britain, but that operation never took place.

The Germans next employed paratroops in their 1941 Balkan Campaign to capture the island of Crete. Student saw this as the forerunner of other more ambitious airborne operations. The largest airborne operation to that point in history, it involved 9,000 men and 530 Junkers Ju-52 transport aircraft flying from Greece. Thanks to Allied ULTRA intercepts, the defenders knew the drop zones in advance. Although by rushing in reinforcements the Germans were able to secure their objectives, they paid a heavy price. They sustained 6,700 casualties (3,000 killed) and lost some 200 transport aircraft in the operation. Student wanted to go on and try to take Malta, but Hitler refused. Crete was the graveyard of the German airborne forces; henceforth they fought as elite ground

troops only, whose fighting abilities were recognized by all who met them in battle.

The Italians started early in their evaluation of airborne forces. Their first experiments occurred in 1927, when 9 men dropped on Cinisello airfield. Some 250 paratroops then began training and took part in a training drop at Gefara in Libya. A training center was set up at Tarquinia in central Italy, and in April 1941, Italian paratroops captured the island of Cephalonia, off the west coast of Greece. Although a small number of parachute troops continued thereafter, the planned Italian assault on Malta never took place, and Italian paratroops fought in a ground role for the rest of the war.

The Japanese began parachute training in 1940 with four training centers in the Japanese home islands. In autumn 1941, they were joined by about 100 German instructors, and soon there were nine training centers and 14,000–15,000 men under training. Both the Japanese army and navy had paratroops, all of whom were ready for operations at the start of the war.

Japanese army paratroops numbered about 6,000 men and were known as raiding units. They were divided into parachute and gliderborne units. Their first operation in February 1942 was to capture Menado airfield in the Celebes Islands. They then attacked the airfield and oil refineries at Palembang. Although the Japanese managed to capture the airfield, the refineries were destroyed before they could take

them over. A week later the Japanese successfully struck Timor in coordination with seaborne troops.

Operations after this were mainly tactical, especially an assault on Leyte in December 1944. This attack was virtually a total failure. However, Allied intelligence summaries noted that the Japanese parachute troops were part of a well-organized, well-trained force that could have proved extremely effective had the emphasis in the Pacific war not been on manpower and ships to capture the many islands of this area.

Aircraft, Bombers

Aircraft designed to attack enemy targets including troop concentrations, installations, and shipping. During the 1930s, bomber designs underwent something of a revolution; performance increased to the point that many bombers were faster than the fighters in service. The prevailing wisdom was that “the bomber will always get through.” It was assumed that the bomber would be fast enough to evade most defending fighters and that defensive armament could deal with any that did intercept. The bomber was therefore seen as something of a terror weapon. Events in the Spanish Civil War, including the German bombing of Guernica, and early German experience in World War II tended to reinforce this view.

At the start of the war, most combat aircraft were not equipped with self-sealing fuel tanks, and most did not have adequate protective armor. However, operational experience during 1939 and early 1940 led the European powers to retrofit their aircraft with armor and self-sealing fuel tanks. Some aircraft designers took this to extremes: for example, about 15 percent of the weight of the Russian I1-2 Shturmovik (1941) was armor plate. On the other hand, many Japanese aircraft had no protection of any sort until very late in the war; they were known to their crews as “flying cigarette lighters” and were very easy to shoot down.

Other changes also affected bomber capabilities. The Germans embraced dive-bombing, and all their bombers had to

be able to dive-bomb. The necessary structural changes greatly added to the bombers’ weight and decreased bomb loads. The flying weight of the Ju-88, for example, went from 6 to 12 tons, sharply reducing both its speed and bomb-carrying capacity.

Defensive armament of the majority of bombers in service at the start of the war was inadequate in terms of the number and caliber of weapons and/or their field of fire. This situation came about partly because of the assumption that interceptions at 300-plus mph were difficult and would therefore be rare. The early B-17Cs, for example, were quite vulnerable because their few defensive weapons had several blind spots and were single manually aimed weapons. Later B-17Es had much better defensive armament deployed as multiple weapons in power turrets, making them much more difficult to shoot down. An alternative tactic was to dispense with all defensive weapons and rely on speed and performance to evade the defenses. The De Havilland Mosquito, which carried out many pinpoint attacks from 1942 onward, epitomized this approach.

The following text describes the most significant bombers employed by both sides during World War II. (See also Table 1.)

Germany

The Heinkel He-111 entered service in 1935, and the B model served with distinction in the Spanish Civil War, where it was fast enough to fly unescorted. Nearly 1,000 He-111s were in service at the start of the war; they formed a significant part of the Luftwaffe’s medium bomber strength early in the conflict, although they were roughly handled during the Battle of Britain in spite of carrying nearly 600 lb of armor. Later versions had better defensive armament and were used in various roles, including torpedo bombing. Approximately 7,450 He-111s were built before production ended in 1944.

The prototype Junkers Ju-87 Stuka dive-bomber flew in 1935, entering service with the Luftwaffe in spring 1937. Examples sent to Spain with the Kondor Legion in 1938 were able to demonstrate highly accurate bombing under conditions of air superiority. Stukas were highly effective in the invasions of Poland in 1939 and France in 1940. During the Battle of Britain, they suffered such heavy losses from opposing British fighters that they were withdrawn from operations partway through the campaign. However, they continued to serve in the Mediterranean Theater and on the Eastern Front against the Soviet Union in dive-bombing and close ground-support roles. A total of 5,709 Ju-87s of all versions were built.

The Junkers Ju-88, one of the most effective and adaptable German aircraft of the war, entered Luftwaffe service in September 1939. The Ju-88 had good performance for a bomber, particularly the later versions, which were used as night fighters. Specialized variants were also produced for dive-

The Junkers JU-87 Stuka dive bomber virtually ruled the skies in World War II until the 1940 Battle of Britain, but continued to perform useful service on the Eastern Front. (Bettmann/Corbis)

bombing, antishipping, reconnaissance, and training. Ju-88C fighter variants were used in daylight during the Battle of Britain, but they were unable to cope with attacks by modern British single-engine fighters. A total of 14,980 Ju-88s were built, 10,774 of which were bomber variants.

Italy

The principal Italian bomber, and one of the most capable Italian aircraft of the war, was the trimotor Savoia-Marchetti SM.79 Sparviero (Sparrow). The Italians used it as a bomber, torpedo-bomber, and reconnaissance aircraft. Originally designed by Alessandro Marchetti as a high-speed, eight-passenger transport, it had retractable landing gear. The SM.79 entered service in 1936 and first saw service in the Spanish Civil War. A total of 1,217 were produced during World War II. Reconverted to military transports after the war, Sparvieros served with the Italian air force until 1952.

The CANT Z.1007 Allione (Kingfisher) was Italy's second-most-important bomber of the war. Entering production in 1939, it was both a medium conventional bomber and a torpedo-bomber. It was of largely wooden construction with weak defensive armament. It appeared both in single- and twin-rudder configurations without differing designations and often in the same squadron. The CANT Z.1007 was

widely used all over the Mediterranean Theater. Of good design and easy to fly, it was nonetheless poorly defended and suffered heavy losses from Royal Air Force (RAF) fighters. CANT Z.1007s continued in service until the end of the war on both sides after the Italian surrender of 1943. A total of 560 were built.

The Italians had only one 4-engine bomber, the Piaggio P.108. Designed by Giovanni Casiraghi, it entered service in May 1941 and was only intermittently used. It had a crew of 6, a maximum speed of 261 mph, and a range of 2,190 mi. Armed with 8 machine guns, it could carry 7,700 lb of bombs. Only 33 were produced, however, 8 of which went to the Germans for use as transports.

Japan

The Mitsubishi Ki-21 medium bomber ("Sally" in Allied designation) was the winner of a 1936 bomber design competition run by the Japanese army air force. It entered service in 1937 as the Ki-21-Ia and was replaced shortly afterward by the Ki-21-Ic, which had additional armament and defensive armor as a result of combat experience in China. The Ki-21 was the standard Japanese air force bomber at the end of 1941 and was encountered throughout the Pacific and the Far East. When production ended in 1944, 2,064 had been built by Mitsubishi and Nakajima, as well as about 500 transport versions by Mitsubishi.

The Mitsubishi G4M medium bomber ("Betty") entered service with the Japanese army early in 1941 and was involved in pre-World War II operations in China. It was designed in great secrecy during 1938–1939 to have the maximum possible range at the expense of protection for the crew and vital components, and it was mainly used in the bomber and torpedo-bomber roles. G4M1s were mainly responsible for sinking the British battleship *Prince of Wales* and battle cruiser *Repulse* off Malaya in December 1941. The G4M had an extraordinary range, but more than 1,100 gallons of fuel in unprotected tanks made the aircraft extremely vulnerable to enemy fire. The G4M2 appeared in 1943 and was the major production model, with more-powerful engines and even more fuel. Losses of the aircraft continued to be very heavy, and Mitsubishi finally introduced the G4M3 model late in 1943 with a redesigned wing and protected fuel tanks. A total of 2,479 aircraft in the G4M series were built.

Great Britain

The Bristol Blenheim was developed from the private-venture Bristol 142, and the short-nosed Mk I entered service as a light bomber in March 1937, although some were completed as fighters. The Blenheim was an effective bomber, but lacking adequate defensive armament and armor, it was vulnerable to fighter attack. The most numerous versions were the long-nosed Mk IV and V, but their performance suffered from significant weight growth, the Mark V in particular suffering

An Italian Savoia Marchetti SM-79 bomber. (Corbis)

heavy losses. The Blenheim nevertheless filled an important capability gap in time of need, and it was exported to Finland, Romania, Turkey, and Yugoslavia. A total of 5,213 Blenheims of all versions were built.

The Vickers Wellington entered service with the RAF late in 1938 and (with the Whitley and Hampden) bore the brunt of the RAF bomber offensive for the first two years of the war. Its light but strong geodetic structure enabled it to carry a respectable bomb load, and it could withstand a significant amount of battle damage. The Wellington was one of the first monoplane bombers to be fitted with power turrets, but (in common with all early World War II bombers) it was vulnerable to fighter attack when flown unescorted in daylight. The Wellington was mainly employed as a medium bomber, although some were used for maritime reconnaissance, torpedo-bombing, minelaying, and transport duties. Wellingtons were in production throughout the war, 11,461 being built up to October 1945.

The Handley Page Hampden entered RAF service late in 1938. Of imaginative design, it delivered a reasonable per-

formance on only average engine power, but the cramped fuselage caused crew fatigue, and the defensive field of fire was very limited. Hampdens were used as medium bombers and minelayers until late 1942, and they served as torpedo-bombers and maritime reconnaissance aircraft until the latter part of 1943. A total of 1,430 Hampdens and variants were built.

The Short Stirling, the first of the RAF's four-engine "heavies" to see combat, entered service in late 1940. It was built to specification B.12/36, which unfortunately specified that the wingspan should be less than 100 ft to fit in a standard hangar; this compromised the aircraft's altitude capability to the extent that attacks on Italy required British pilots to fly through the Alps rather than over them. However, the Stirling was outstandingly maneuverable for such a large aircraft. It was used as a bomber, minelayer, glider tug/transport, and (with 100 Group) an electronic countermeasures aircraft. A total of 2,381 Stirlings were built.

The Handley Page Halifax I entered service early in 1941 and was found to be a good bomber, but it lacked adequate

defensive armament. The Halifax B.II had a dorsal gun turret but suffered from weight growth and a tendency to spin when fully loaded. Later B.IIs underwent a weight- and drag-reduction program and had larger fins fitted to correct these faults. The B.III version was the most numerous, using more powerful Bristol Hercules engines in place of the Merlins. Although the Halifax’s main role was as a bomber, it was also employed as a transport, glider tug, and maritime reconnaissance aircraft. A total of 6,176 Halifaxes were built.

The Avro Lancaster was a successful development of the Rolls-Royce Vulture-powered Manchester, entering operational service with the RAF in early 1942. The Lancaster remained in service until the end of the war and rapidly became the primary strategic bomber for the RAF. It lost fewer aircraft per ton of bombs dropped than either the Halifax or Stirling. The Lancaster had a large bomb bay and was designed to take 4,000 lb bombs; successive modifications enabled it to carry 8,000 lb and 12,000 lb weapons, and the B.I (special) carried a single 22,000 lb “Grand Slam” armor-piercing bomb. The Lancaster participated in several special operations, including the Dambusters raid in May 1943, when specially adapted Lancasters of 617 Squadron attacked dams in the Rhine valley using a skipping bomb designed by Barnes Wallis. A total of 7,366 Lancasters were built.

The De Havilland Mosquito was constructed largely from a plywood/balsa sandwich and was designed to be fast enough to outrun enemy fighters. It had excellent handling characteristics. It began operations with the RAF in the bomber role early in 1942 and quickly demonstrated that it could carry out extremely accurate attacks, including the daring low-level attack on the Gestapo headquarters in Oslo, Norway, in late 1942. Mosquitoes originally equipped the RAF’s pathfinder force, and they were able to roam across Germany largely unmolested. Operationally, the Mosquito had by far the lowest loss rate of any aircraft in Bomber Command (about 0.6 percent), as its speed enabled it to avoid most interception and its structure tended to absorb cannon hits. A total of 6,439 Mosquitoes of all marks were built.

Soviet Union

The Ilyushin Il-4 was the most widely used Soviet medium bomber of the war. Initially designed as the DB-3 in 1935, it entered service in that form in 1938. The updated DB-3F was redesignated Il-4 in 1940, and many examples were built. Following the Soviet entry into the war, a force of Soviet Navy Il-4s carried out the first Soviet attack on Berlin in August 1941. As a result of shortages of strategic materials, parts of the airframe including the outer wing panels were redesigned to use wood instead of metal. The Il-4 was a maneuverable aircraft

in spite of its size, and approximately 5,000 were built up to 1944.

The Petlyakov Pe-2 entered service early in 1941. It was originally designed as a fighter and therefore had unusually responsive controls for a bomber. It turned out to be one of the most versatile aircraft produced by the USSR in the war, being used as a heavy fighter, light bomber, dive-bomber, ground-attack, and reconnaissance aircraft. More than 11,000 Pe-2s were built.

The Ilyushin Il-2 Shturmovik was probably one of the most effective ground-attack aircraft of World War II, entering service on the Soviet Front in mid-1941. Initial versions were single-seaters, but the higher-performance Il-2m3 introduced in mid-1942 had a gunner and was highly effective in aerial combat at low altitude, even against single-seat German fighters. Later versions of the Il-2m3 had a more powerful engine and a 37 mm cannon against German Panther and Tiger tanks. The Shturmovik was remarkably tough; about 15 percent of its empty weight was armor plate that protected the engine, fuel systems, and crew, and it had few weak points. Approximately 35,000 Shturmoviks were built.

United States

The Boeing B-17 Flying Fortress was designed in 1934 and sold to Congress as a U.S. Army Air Corps requirement for an offshore antishipping bomber. The B-17B entered service late in 1939; it was fast and had a high operational ceiling, but the initial versions were not particularly capable. The B-17E, which entered service early in 1942, had much-improved defensive armament, including a tail gun turret, and the B-17G (late 1943) introduced an additional chin turret, which was later fitted to some F models. The B-17 E, F, and G models formed the mainstay of the U.S. heavy day-bomber force in Europe and remained in service until the end of the war. There were 8,685 B-17s built.

The Consolidated B-24 Liberator heavy bomber was designed with a high aspect-ratio wing that, together with its Davis high-lift airfoil, gave very good range/payload performance. The first Liberators entered service with RAF Coastal Command in mid-1941, and the type went on to serve with the U.S. Army Air Forces (USAAF) and U.S. Navy. USAAF B-24s conducted the ill-fated raid on the Ploesti oil field on 1 August 1943. The Liberator developed a reputation for fragility in the European Theater and was prone to catch fire when hit, but its long range made it the preeminent strategic bomber in the Pacific Theater. The B-24 was employed as a reconnaissance, antisubmarine, and transport aircraft as well as in its primary strategic bombing role, and it was produced in greater quantities than any other American aircraft, 18,188 being built up to May 1945.

The Douglas Aircraft Company built the A-20 attack bomber as a private venture, albeit with the help of U.S. Army Air Corps technicians at the specification stage. It entered service early in 1940 with the French Armée de l'Air, outstanding orders being transferred to the RAF when France capitulated to the Germans. The A-20 (designated Boston or Havoc, depending on the role) was an excellent airplane. Fast, docile, and pleasant to fly, it had a commendably low loss rate. It was very adaptable and was produced in both solid-nose and transparent-nose versions. Used in many roles including low-level attack, strafing, torpedo-bombing, reconnaissance, and night fighting, it remained in frontline service until the end of hostilities. A total of 7,385 variants were built.

North American was awarded a contract to build the B-25 Mitchell without the usual prototypes, relying instead on experience with the NA-40 design and feedback from the Army Air Corps. Self-sealing fuel tanks and armor protection were incorporated on the production line following combat reports from Europe. The Mitchell had good handling characteristics and was probably the best all-around medium bomber of the war. The B-25 achieved lasting fame when 16 of them attacked Tokyo in April 1942, flying from the carrier *Hornet*. The Mitchell was adapted to multiple missions including ground strafing, torpedo-bombing, antisubmarine work, and reconnaissance, mounting a variety of main armament including up to 18 0.5-inch machine guns in the B-25J and a 75 mm cannon in the B-25H. Mitchells were used by most Allied air forces, and approximately 11,000 were built.

The Boeing B-29 Superfortress, the heaviest bomber of the war, evolved from a 1940 Army Air Corps requirement for a "hemisphere defense weapon." The resulting XB-29, which first flew late in 1942, had several innovative design features including a pressurized fuselage and remote-controlled gun turrets. The B-29 entered service in the first half of 1944 and mounted increasingly heavy attacks against the Japanese mainland from bases in the Mariana Islands. Operationally, the B-29 was successful largely as a result of its speed and altitude capabilities. B-29s forced the Japanese surrender following attacks with atomic bombs on Hiroshima and Nagasaki during August 1945. A total of 3,970 were built.

The Douglas A-26 Invader was a worthy successor to the Douglas A-20 Havoc. It entered service late in 1944. The A-26B had a solid attack nose carrying six .50 caliber machine guns, and the A-26C had a more conventional transparent nose for a bombardier. The A-26 was fast and well armed, and it had a very low loss rate (about 0.6 percent), even allowing for low enemy fighter activity toward the end of the war. A total of 2,446 Invaders were built, and they continued to serve for many years after the war.

A U.S. Army Air Forces Consolidated B-24 Liberator bomber. (Corbis)

The Martin B-26 Marauder entered service early in 1942 and initially gained a reputation as a difficult aircraft to fly, partly because of its weight and high landing and takeoff speeds. Certainly it required skill and practice to master. In later models (B-26F onward), the wing incidence was increased to reduce the landing and takeoff speeds. The B-26 could absorb a lot of damage and was an effective bomber; its final combat loss rate was less than 1 percent. A total of 5,157 Marauders were built.

Aircraft, Fighters

Aircraft designed to shoot down other aircraft. World War II was a period of transition for fighters; by 1945 aircraft weight, armament, and performance had increased dramatically, and jet fighters were approaching the speed of sound.

Throughout the 1920s and early 1930s, most air forces were equipped with biplane fighters that were little more advanced than their twin-gunned ancestors that had fought on the Western Front in World War I. By the mid-1930s, aero-engine design and airframe construction techniques had advanced dramatically, and newer prototypes were appearing with stressed-skin construction, retractable undercarriages, and top speeds of over 300 mph. These aircraft entered service in the late 1930s, just in time for World War II.

Many of these new designs had flush-fitting cockpit canopies (e.g., Bf-109, Spitfire), partly for reasons of aerodynamic efficiency but also because it was thought (incorrectly) that the classic World War I dogfight would be impossible at speeds of over 300 mph. Visibility from the cockpit turned out to be very important; about 80 percent of pilots shot down during the war never saw their attackers. Bulged cockpit hoods were fitted to some fighters to alleviate the problem, but later aircraft were fitted with clear Perspex canopies that gave unrestricted rearward vision.

Most fighters are defined by performance and maneuverability. Of the two, performance was probably more important during World War II. A speed advantage over an opponent (ignoring surprise attacks and tactical advantage) enabled a fighter to dictate the terms on which combat was joined and also enabled an easy escape if the fight was not going well. Comparisons tend to be problematic since performance varied dramatically with altitude; an aircraft that had a significant advantage against an opponent at sea level could find the position dramatically reversed at 30,000 ft. In any case, in-service improvements could change performance characteristics, and new aircraft usually had the latest equipment and engine variants, further complicating the issue.

Maneuverability is essentially a measure of the ability of an aircraft to change direction and is dictated to a large extent by the wing loading of the aircraft. Some lightly loaded aircraft (particularly the early Japanese fighters) were capable of remarkably tight turns, but the ability of the aircraft to roll and establish the turn also played a part. Some fighters, such as the Focke-Wulf FW 190, had an excellent rate of roll that to some extent compensated for their average rate of turn. An aircraft's handling qualities degrade to a greater or lesser extent as the weight inevitably increases with each new version, and heavier aircraft tend to be less agile than lighter ones. Twin-engine aircraft are particularly disadvantaged in roll as more mass is distributed around the centerline than with a single-engine aircraft.

Many early fighters had tactical limitations because of control difficulties. There is a relationship between the size and shape of a control surface and the effort required to move it; it becomes progressively more difficult to deflect as speed increases and may in some cases exceed the ability of the pilot to apply sufficient force. For example, the Messerschmitt Bf-109 had very heavy stick forces at normal speeds; Spitfires had metal-covered ailerons fitted late in 1940 to make high-speed rolls easier; and the Mitsubishi Zero had (in common with most other Japanese fighters) huge control surfaces that gave outstanding agility below about 200 mph (as with the F4U Corsair and Tempest) but almost none above 300 mph. Much later in the war, new designs had spring-tabs fitted on control surfaces to balance the extra air resistance at high speeds.

In 1939 few, if any, aircraft had self-sealing fuel tanks or armor. Operational experience in the European Theater showed that aircraft were very vulnerable unless so equipped, and in 1940 crash programs were instituted to retrofit fuel tank liners and armor plate to most aircraft. This added weight reduced performance slightly, but most air arms were prepared to accept the price. However, the Japanese army and navy were not. As a result, most Japanese aircraft, which were lightly constructed anyway, were extremely vulnerable even to machine-gun fire, and cannon hits caused immediate and catastrophic damage. The use of armor and other protection on bombers had already obliged designers to fit heavier weapons, and continuing development encouraged the adoption of cannon. The Messerschmitt Me-262 was probably the ultimate World War II bomber-killer with four 30 mm cannon, only three hits from which were usually required to down a four-engine bomber.

The increased performance of fighters brought compressibility effects into play. As speeds increased at high altitude, airflow over parts of the structure could reach the speed of sound (Mach 1.0) even in quite shallow dives, leading to buffeting, nose-down trim changes, and eventually loss of control of the aircraft. Recovery from the dive was difficult, and reducing power usually led to the nose dropping further! Sometimes the only solution was to wait until the aircraft reached warmer air at lower altitudes and the local speed of sound increased above the critical value. These effects were not well understood at the time and caused tactical limitations to some aircraft: the Lockheed P-38 ran into serious compressibility effects above Mach 0.68, and the Messerschmitt Me-262 could reach its limit of Mach 0.83 only in a very shallow dive.

World War II was a fascinating period for fighter development; the following aircraft were the most significant fighters of the conflict. (See also Table 1.)

Germany

The Messerschmitt Bf-109 entered service in its earliest form (Bf-109B) in 1937 and remained in service throughout the war. It continued to be modified during the conflict. It received progressively more powerful engines, and in common with many other aircraft, its handling qualities and maneuverability degraded with successive versions. The Bf-109 could not turn tightly (although the 109E and 109F models were better than commonly supposed), but it was a very effective fighter when handled correctly, possessing excellent dive and zoom climb capabilities. The later versions in particular were better at high altitude, but the controls became very stiff at high speeds, and visibility from the cockpit was poor. Approximately 35,000 examples were built.

The Messerschmitt Bf-110 was designed as a long-range escort fighter, entering service with the Luftwaffe in 1939. It

* Weight is normal takeoff weight unless specified otherwise.

† Combat ceiling is the maximum height at which the aircraft would fight and maneuver. The service ceiling would typically be 2,000 or 3,000 ft higher than this.

‡ Range is maximum flyable distance on internal fuel, including reserves. Combat radius would typically be 30 percent to 35 percent of this value.

had a useful top speed and was well armed, but it could not meet contemporary single-engine fighters on equal terms. It was not a success as an escort fighter, but it was first used as a fighter-bomber during the Battle of Britain, and from 1943 the Bf-110 G-4 enjoyed much success as a radar-equipped night fighter. Approximately 6,150 were built.

The Focke-Wulf FW-190A entered service in mid-1941 and became one of the best low- and medium-altitude fighters of the war. It had light and effective controls and possibly the best rate of roll of any World War II fighter, attaining 160 degrees per second at about 260 mph. It was superior to the contemporary Spitfire Mk V in all areas except turning circle and was generally regarded as a strong and rugged aircraft. The 190F and 190G were similar to the 190A, but they had extra armor for ground-attack missions, and the 190D had a 2,240 hp Junkers Jumo liquid-cooled engine for better high-altitude performance. A total of 20,001 Focke-Wulf FW 190s were built.

Italy

The Fiat CR-42 entered service with the Italian air force in 1939 and was exported to Belgium, Sweden, and Hungary. It was a highly maneuverable fighter with (for a biplane) good dive acceleration. However, it was lightly armed and quite vulnerable to enemy fire and was not really capable of taking on modern fighters on equal terms. A total of 1,781 were built.

The Macchi Mc 200 first entered service during 1940. A well-built and extremely maneuverable fighter with finger-light controls, it could outturn most of its opponents. It was, however, lightly armed with only two machine guns. The Macchi Mc 202 was a Mc 200 airframe with a license-built Daimler-Benz DB601 engine. It was probably the most effective Italian fighter of the war, retaining most of its predecessor's maneuverability, and was able to meet the Spitfire Mk V on at least equal terms. A total of 2,251 Mc 200 and Mc 202 aircraft were built.

Japan

The Nakajima Ki.43 (“Oscar” by the Allied identification system) entered service late in 1941 and was highly maneuverable but not particularly fast (304 mph at 13,120 ft). It had extremely sensitive controls that unfortunately stiffened significantly at speed. Allied fighters found that they could not turn with the Oscar but could outdive and outzoom it. Its armament was weak; pilot armor and self-sealing tanks were introduced with the more powerful Ki.43-IIa late in 1942, but the Oscar remained vulnerable to enemy fire. It continued to undergo development throughout the Pacific war, 5,751 examples being built.

The Kawasaki Ki.45 (“Nick”) was designed to a 1937 specification for a long-range escort fighter and entered service early in 1942. The Ki.45 was increasingly used as a night fighter from early 1944 using two 12.7 mm or 20 mm weapons firing obliquely upward. It was relatively successful against U.S. B-29 night raids, and it later became the first Japanese army air force type to be used on a kamikaze mission. A total of 1,701 were built.

The Nakajima Ki.44 interceptor (“Tōjō”) first appeared in service late in 1942, although some of the 10 prototypes were evaluated on operations during 1941 and early 1942. The Tōjō was reasonably maneuverable with a good climb, but its high takeoff and landing speeds made it unpopular with pilots. The Ki.44-IIc appeared in mid-1943; armed with two 40 mm cannon and two machine guns, it was quite effective against high-flying U.S. B-24 and later B-29 bombers. A total of 1,233 were built.

The Kawasaki Ki.61 (“Tony”) appeared early in 1943 and was the only Japanese fighter powered by a liquid-cooled engine to see operational service. It carried self-sealing fuel tanks and armor and was more maneuverable than were heavier opponents. Its dive characteristics were also very good indeed, comparable to the best U.S. fighters. The Ki.61 was one of very few Japanese fighters able to engage the U.S. B-29 bombers at high altitude. A total of 3,078 Ki.61s were built. Engine production was slow and the power plant gave problems in service, so early in 1945 many Ki.61 airframes were reengined with a 1,500 hp Mitsubishi Ha 112 radial to produce the Ki.100. Only 272 were built by war’s end, but it was the best Japanese fighter during the conflict.

The Kawanishi N1K1-J (“George”) evolved from a float-plane and was one of the best fighters of the Pacific Theater. Entering service early in 1944, it had automatic combat flaps and was outstandingly maneuverable, its pilots coming to regard even the F6F Hellcat as an easy kill. Its climb rate was, however, relatively poor for an interceptor, and the engine was unreliable. The later N1K2-J was redesigned to simplify production, and limited numbers entered service early in 1945. A total of 1,435 aircraft of the N1K series were built.

The Nakajima Ki.84 (“Frank”) was one of the best Japanese fighters of the war. It entered service late in 1944. The Ki.84 could outmaneuver and outclimb late-model P-51 and P-47 fighters and had excellent maneuverability. It was well armed, strong, and well protected, and it was easy for novice pilots to fly. Production examples were beset with manufacturing faults and engine difficulties, causing performance to suffer, particularly at high altitude. A total of 3,470 Ki.84 aircraft were built.

France

The Dewoitine D.520 was designed as a private venture and entered service with the French air force in 1940. It was probably the most effective French-designed fighter of the war, shooting down 100-plus enemy aircraft in exchange for 54 losses during the Battle of France. After the fall of France, the D.520 continued in Vichy French service and was encountered by the Allies in Vichy North Africa. A total of 905 were built.

Great Britain

The Hawker Hurricane entered service in 1937 and was the first monoplane fighter of the Royal Air Force (RAF), serving on all fronts. The Hurricane Mk I was the major RAF fighter during the Battle of Britain. On paper it was average, but it had hidden strengths; it was an excellent gun platform and was more maneuverable than the Spitfire. Its controls did not stiffen appreciably at high speed, and it was very strong, being able to withstand maneuvers that would literally pull the wings off its contemporaries. Later versions (MK IID, Mk IV) were mainly built as fighter-bombers. A total of 14,233 Hurricanes were built.

The Supermarine Spitfire was a very advanced design when the Mk I entered service in 1938, and it was able to accept progressively more powerful engines and heavier armament as the war progressed, with only a slight reduction in handling qualities. The “Spit” was fast and very maneuverable and was widely regarded as a pilot’s aircraft. In performance terms, it was usually considered superior to its direct opponents, although the FW-190 gave Spitfire Mk V pilots a hard time until the Mk IX redressed the balance in mid-1942. The Spitfire was continuously updated and revised with many specialist high- and low-altitude versions, and the late-war marks had a particularly impressive performance. It remained in production until after the war. A total of 20,351 were built.

The Bristol Beaufighter was designed as a private venture using components from the Beaufort torpedo-bomber. The Mk IF entered service as a radar-equipped night fighter late in 1940. It operated successfully in Europe, the Western Desert, the Mediterranean, the Far East, and the Pacific as a night fighter, long-range fighter, ground-attack aircraft, and

A Royal Air Force Supermarine Spitfire fighter over the English countryside in 1939. (Bettmann/Corbis)

torpedo-bomber. It was a big, heavy aircraft with a good performance at low level and a very heavy armament. A total of 5,562 Beaufighters were built.

The Hawker Typhoon was rushed into service late in 1941 to combat the German FW-190 menace, but it suffered from teething troubles. Its performance at low altitude was very good, particularly its acceleration and dive, but its performance above about 20,000 ft was poor because of its thick wing. The Typhoon was used later in the war as a ground-attack aircraft. The Hawker Tempest appeared early in 1944 and was an aerodynamically cleaner Typhoon with a thinner, laminar-flow wing. The Tempest was very fast and was one of the best late-war fighters. It could be maneuvered easily at high speed and had outstanding dive acceleration and zoom climb capabilities. It was, however, not easy to fly to its limits. A total of 3,300 Typhoons and 800 Tempests were built.

The De Havilland Mosquito was conceived as a bomber but was also produced in radar-equipped night-fighter and fighter-bomber versions. The NF.II entered service with the RAF in May 1942 and was very successful on night-intruder missions; Mosquito night fighters were used over Germany from late 1944 onward and seriously hampered German night-fighter operations. A total of 1,053 Mosquito night

fighters of all versions were built; the most numerous fighter version was the FB.VI, of which 2,718 were built.

Soviet Union

The Polikarpov I-16 Rata entered service late in 1934, the first of the new generation of monoplane fighters. More than 450 machines were operationally tested in the Spanish Civil War, and I-16s bore the brunt of the initial German assault on the Soviet Union. The Rata was marginally stable at best but was outstandingly maneuverable; it had a very good zoom climb but poor diving characteristics. Approximately 20,000 were built, the type remaining in service until 1943.

The Yakovlev series of fighters began with the Yak-1 in early 1942. It was fast at low altitude, but both the Yak-1 and the more powerful Yak-7 were slightly short on range. The Yak-9 appeared late in 1942 with a more powerful engine and particularly effective ailerons; it was capable of outturning all its opponents at low altitude. The Yak-3 was a specialized low-altitude fighter, entering service early in 1944. It had excellent performance below about 10,000 ft and was the preferred mount of the Normandie-Niemen Groupe de Chasse. Approximately 30,000 Yak fighters were produced, of which 16,700 were Yak-9s.

The Lavochkin La-5 was a very successful adaptation of the problematic LaGG-3 airframe to take a 1,330 hp Shvetsov M-82 radial engine. The La-5 entered service late in 1942 and was an immediate success as a highly maneuverable low-altitude fighter. The more powerful La-5FN appeared in mid-1943; it was faster and lighter with improved controls that gave better handling qualities. It is thought that about 15,000 Lavochkin fighters were built, although the total may well have been nearer 20,000.

United States

The Curtiss P-40 entered service in 1940. The aircraft was based on the Curtiss P-36, which was itself a reasonable fighter; French P-36 variants (Hawk 75A) accounted for approximately 70 percent of French air force kills during the Battle of France. The P-40 had reasonable dive acceleration but a poor ceiling and climb. It was average in most departments, its major attribute being that it was available in numbers when required. It was, however, continuously developed until December 1944, when the last of 13,738 P-40s, a P-40N, rolled off the production line.

The Bell P-39 Airacobra entered service in 1941. It was fast at low altitudes and pleasant to fly, but its performance fell away above 12,000 ft. Together with the P-40, the P-39 bore the brunt of the early fighting in the Pacific until later U.S. types appeared. The P-39 was rejected by the RAF but was used with some success as a low-altitude fighter by the Soviet Union, which took more than half the production total of 9,558 machines.

A U.S. Curtiss P-40 Warhawk Fighter. (Corel)

The P-39 was used by at least 20 Soviet aces, including Aleksandr Pokryshkin (59 kills) and Grigorii Rechkalov (56 kills).

The Lockheed P-38 Lightning entered service in numbers early in 1942 and was possibly the ultimate long-range tactical fighter of the war. Its long range and twin engines made it the primary U.S. Army Air Corps fighter in the Pacific Theater. Not as maneuverable as a single-engine fighter, it was fast with very effective armament and an outstanding zoom climb. Compressibility problems handicapped diving maneuvers, however. A total of 9,923 Lightnings were built.

The North American P-51 Mustang was one of the most successful fighters of World War II. Offered to the British Air Purchasing Commission in April 1940 as an alternative to the Curtiss P-40, the P-51A entered service early in 1942. Using the same Allison engine as in the P-40, it was appreciably faster than the P-40 because of its laminar-flow wing and efficient cooling system. It had an excellent dive and zoom climb and was quite maneuverable, but it lacked performance at high altitude. The Mustang's performance was transformed by the substitution of a 1,620 hp Rolls-Royce Merlin engine in the P-51B, increasing the ceiling by nearly 10,000 ft and providing a marked performance advantage over Luftwaffe piston-engine fighters, particularly above 20,000 ft. A total of 15,686 P-51s were built.

The Republic P-47 Thunderbolt was designed for high-altitude combat and was the heaviest single-engine fighter of the war. Entering service early in 1943, the P-47B was at its best at high speed and altitude. Maneuverability was quite good at high speed, but it became ponderous at lower speeds. Although its climb rate was poor, it had exceptional dive acceleration and was very rugged. The major production model was the P-47D, which had provision for bombs and rockets and was a very effective ground-attack aircraft. A total of 15,683 Thunderbolts were built.

Aircraft, Gliders

A glider is an aircraft without an engine that is most often released into flight by an aerial tow aircraft. During World War II, both the Axis and Allied militaries developed gliders to transport troops, supplies, and equipment into battle. This technique had been discussed prior to the war but never implemented. These motorless aircraft would crash-land behind enemy lines, often at night, and the men aboard them would then become infantrymen on the ground.

The Germans were first to recognize the potential of gliders in the war, in large part because of extensive pre-World War II scientific research and sport use of them. The Germans embraced gliding because it did not violate military prohibitions in the 1919 Treaty of Versailles. Soaring clubs, which developed in other countries as well, increased interest in gliding worldwide. Sport gliders used air currents to climb and soar for extended periods, while military gliders descended on release from aerial tows.

By the late 1930s, Germany had developed a military glider, the DFS-230. Built of plywood, steel, and fabric, it had a wingspan of 68 ft 5.5 inches, length of 36 ft 10.5 inches, and height of 8 ft 11.75 inches. It weighed 1,896 lb empty and had a maximum weight loaded with troops and cargo of 4,630 lb. A total of 1,022 were produced. This glider was designed to mount a machine gun, which the crew could use for defense. DFS-230 gliders were employed in the invasion of Belgium and the Netherlands in May 1940, especially in securing Fort Eben Emael, which was the key to securing Belgium. The Germans also used gliders in the invasion of Crete and during fighting in the Soviet Union at Stalingrad.

The Gotha 242 glider was larger than the DFS-230 and could carry more troops. It had a wingspan of 80 ft 4.5 inches, length of 51 ft 10 inches, and height of 14 ft 4.5 inches. It weighed 7,056 lb empty and 13,665 lb fully loaded. A total of 1,528 were built. Some were launched by rockets, but most were simply towed by aircraft. Approximately 1,500 Go-242s were produced, of which 133 which adapted into Go-244s, which had twin engines. The huge Messerschmitt Me-321 glider had a wingspan of 180 ft 5.5 inches, length of 92 ft 4.25

A U.S. Waco CG-4A glider with a Griswold Corey nose skid, under tow. (Corbis)

inches, and height of 33 ft 3.4 inches. It weighed 27,432 lb empty and 75,852 lb fully loaded. It could perform level flight after rocket-assisted takeoff. A total of 200 were built. The Me-321 could transport 200 troops but was difficult to launch, and most were transformed into the six-engine Me-323.

Great Britain was the first Allied nation to deploy gliders. The Air Ministry's Glider Committee encouraged the use of the Hotspur to transport soldiers in late 1940. The Hotspur had a wingspan of 61 ft 11 inches, length of 39 ft 4 inches, and height of 10 ft 10 inches. It weighed 1,661 lb empty and 3,598 lb fully loaded. The Hotspur was designed to transport 2 crewmen and 6 soldiers. A total of 1,015 were built.

In 1941, the British developed the Horsa. It had a wingspan of 88 ft, length of 68 ft, and height of 20 ft 3 inches. It weighed 8,370 lb empty and 15,750 lb fully loaded. It was capable of carrying 2 crewmen and 25–28 passengers or 2 trucks. In all, Britain manufactured some 5,000 Horsas. They were employed in Operations OVERLORD and MARKET-GARDEN.

The largest Allied glider was the British Hamilcar. With a wingspan of 110 ft, length of 68 ft 6 inches, and height of 20 ft 3 inches, it weighed 18,000 lb empty and 36,000 lb fully loaded. It could transport 40 troops, a light tank, or artillery pieces. A total of 412 were built. It was employed during Operation OVERLORD.

The Soviet Union introduced the A-7 glider in 1939. It had a wingspan of 62 ft 2 inches and length of 37 ft 7 inches. It weighed 2,000 lb empty and carried a pilot and eight passengers. A total of 400 were manufactured. The Soviets, however, had few aircraft available for glider tows, and following the German invasion of the Soviet Union, their priority was with other weaponry. They used the A-7 chiefly to transport supplies to partisans working behind German lines.

The U.S. Navy explored the possibility of military applications for gliders as early as the 1930s. In February 1941, Chief of the Army Air Corps Major General Henry H. Arnold ordered that specifications be drawn up for military gliders. The Waco Aircraft Company in Troy, Ohio, received the first U.S. government contract to build training gliders, and the army began organizing a glider training program. Constructed of plywood and canvas with a skeleton of steel tubing, the Waco CG-4A had a wingspan of 83 ft 6 inches, length of 48 ft 4 inches, and height of 12 ft 7 inches. Its empty weight was 3,300 lb, and its loaded weight was 7,500 lb. It could carry 15 troops or 3,800 lb of cargo, including artillery pieces, a bulldozer, or a jeep. The Ford Motor Company plant at Kingsford, Michigan, manufactured most of the U.S. gliders, although 15 other companies also produced the Waco. In all 13,908 Wacos were built, making it the most heavily produced glider of the entire war by any power.

Because the gliders were so fragile, soldiers dubbed them “canvas coffins.” Men and cargo were loaded through the wide, hinged nose section, which could be quickly opened.

Moving at an airspeed of 110–150 mph at an altitude of several thousand feet, C-47s towed the gliders with a 300 ft rope toward a designated landing zone and then descended to release the glider several hundred feet above ground. En route to the release point, the glidermen and plane crew communicated with each other either by a telephone wire secured around the towline or via two-way radios. This glider duty was hazardous indeed; sometimes gliders were released prematurely and did not reach the landing zones, and on occasion gliders collided as they approached their destination.

The U.S. 11th, 13th, 17th, 82nd, and 101st Airborne Divisions were equipped with two glider infantry regiments, a glider artillery battalion, and glider support units. U.S. gliders were sent to North Africa in 1942 and participated in the July 1943 Sicily invasion, accompanied by British gliders. High casualties sustained in that operation led General Dwight D. Eisenhower to question the organization of airborne divisions and to threaten to disband glider units. A review board of officers convinced the military authorities to retain them, however. Improvements were made in structural reinforcement of the glider and personnel training.

By mid-1944, gliders had become essential elements of Allied invasion forces. Occasionally they were used to transport wounded to hospitals. During Operation NEPTUNE, U.S. glidermen with the 82nd and 101st Airborne Divisions flew across the English Channel in 2,100 gliders to participate in the D day attack. Many gliders and crews were lost during that mission. New gliders were manufactured for Operation MARKET-GARDEN, the assault on the Germans in the Netherlands, three months later.

Initially, the military did not distribute hazardous-duty pay to glidermen. These soldiers also did not qualify for wing insignia worn by parachutists. Some of the men created posters; one read: “Join the Glider Troops! No Jump Pay. No Flight Pay. But Never A Dull Moment.” By July 1944, glider wings were authorized for glider soldiers, and they received hazardous-duty pay. Also in 1944, the modified Waco CG-15A appeared, offering improved crash absorption. The Waco CG-18A could carry 30 soldiers and was deployed during the 1945 Rhine campaign.

Gliders were also used in the Pacific and China-Burma-India Theaters. The final U.S. glider mission of the war occurred on Luzon Island, the Philippines, in June 1945. In July, IX Troop Carrier Command Commander Brigadier General Paul L. Williams issued an order to grant an Air Medal to Normandy glider pilot veterans. Gliders were gradually phased out of military inventories after the war, although the Soviets retained them through the 1950s.

Aircraft, Jet and Rocket

See Jet and Rocket Aircraft.

Aircraft, Naval

Most naval aircraft fall into one of four main classifications: spotters, patrol aircraft, land-based attack aircraft, and carrier-based aircraft. Battleships and cruisers usually carried catapult-launched spotter aircraft to correct gunfire against enemy vessels or shore targets. Most spotter aircraft tended to be relatively slow floatplanes (e.g., Mitsubishi F1M2 [“Pete” in the Allied identification system] and Vought OS2U Kingfisher), as the design parameters were restricted by the launch and recovery mechanism. These aircraft were also very useful in search and rescue missions.

Patrol aircraft were designed to keep track of enemy ships and (in some cases) to attack small vessels such as submarines. The major performance requirements for patrol aircraft were range and endurance; the sea covers a vast area and an enemy fleet occupied a relatively tiny part of it, so the ability to search large areas and remain on station for a long time was important. Flying boats were widely used as patrol aircraft (e.g., the Consolidated PBY Catalina, Kawanishi H8K, and Short Sunderland), but land-based patrollers with longer ranges (e.g., Lockheed Hudson, Ventura, and Consolidated B-24 Liberator) were used toward the latter part of the war, initially to patrol colder areas such as the Aleutians and Iceland, where flying boats found operation difficult.

Land-based attack aircraft were employed by most combatants and were sometimes successful, provided that they employed specialist antiship attack techniques. Torpedo-bombing was probably the most effective form of attack, but results varied depending on the efficiency of the weapon. American torpedoes suffered from problems and were largely ineffective until the second half of 1943, whereas the Japanese 18-inch “Long Lance” torpedo was extremely effective with a large warhead. Italian, German, and British torpedoes were all moderately effective. Dive-bombing and skip-bombing were also effective, but attacks by high-level bombers were universally unsuccessful against moving ships, as the target had plenty of time to take avoiding action.

Great Britain employed purpose-designed torpedo attack aircraft (the Beaufort and Beaufighter). The United States mainly used conversions of existing aircraft as torpedo carriers (the B-25 Mitchell and B-26 Marauder), but it usually employed skip-bombing in preference to torpedoes. Medium bombers were also used as torpedo-aircraft by Japan (the GM-4 “Betty”), Germany (He-111H), Italy (SM.79), and the Soviet Union (Ilyushin DB-3T/Il-4). German and Japanese bombers were particularly effective.

The following two types of specialist torpedo-bombers were widely used during World War II.

1. The Italian Savoia-Marchetti S.M.79, originally designed as a commercial transport, was adapted to use as a bomber when its excellent performance became known. The SM.79-I entered service in 1936 and was used with some success during the Spanish Civil War. The more powerful SM.79-II was employed throughout World War II in the Mediterranean Theater as a torpedo-bomber (carrying two 17.7-inch torpedoes), medium bomber, reconnaissance aircraft, close-support aircraft, and transport/training aircraft. A total of 1,330 were built between 1936 and 1944.
2. The Bristol Beaufort was the standard British land-based torpedo-bomber until it was replaced by the Bristol Beaufighter TF.X in 1943. Entering service late in 1939, the Beaufort was also used for bombing and minelaying operations. It was reasonably successful, although occasionally let down by malfunctioning torpedoes. A total of 1,429 were built in the United Kingdom, and 700 were built under license in Australia.

Flying an aircraft off and onto an aircraft carrier places many more stresses and strains on the aircraft's structure than comparable activities on land. As a consequence, carrier-based aircraft were generally heavier and more robust—and thus slower and less maneuverable (at least in theory)—than their land-based counterparts. Parts of their structure usually folded to allow the aircraft to be taken below

to the hangar, further increasing the weight. On top of that, landing characteristics had to be superior, which required a light wing loading, large flaps, good stall behavior, and a compliant undercarriage. Combining all of these characteristics in a single aircraft was not easy; many of the aircraft that served on carrier decks during World War II had flaws.

Of the major combatants, only the United States, Japan, and Great Britain had aircraft carriers, and each had a different approach to design of carrier-based aircraft (see Tables 1, 2, and 3 for carrier-based attack aircraft, fighters, and bombers respectively).

United States

In 1941, the United States had several large carriers and well-organized carrier operational procedures; it used scout/dive-bombers (SBD Dauntless), torpedo/level-bombers (TBD-1 Devastator), and fighters (F4F Wildcat). Generally speaking, U.S. carrier aircraft were rugged and quite suitable for maritime use. The Douglas TBD-1 Devastator carrier-based torpedo-bomber entered service late in 1937 and was obsolescent when the United States entered the war. Its combat career was

terminated by the Battle of Midway when it proved to be vulnerable to fighter attack while unescorted. A total of 129 TBD-1s were built.

The Douglas SBD Dauntless entered service with the U.S. Marine Corps in mid-1940 and with the U.S. Navy later in 1940. It was the standard navy carrierborne dive-bomber in December 1941 when Pearl Harbor was attacked. Operationally, the Dauntless was very successful and could absorb a lot of battle damage, having the lowest attrition rate of any U.S. carrier aircraft in the Pacific Theater. It played a major part in the 1942 Battles of the Coral Sea and Midway and later flew off escort carriers on antisubmarine and close-support missions. A total of 5,936 Dauntless were built.

The Grumman F4F Wildcat entered service with the Royal Navy late in 1940, and it became operational with the Marine Corps and U.S. Navy at the beginning of 1941. The F4F-3 was the standard navy shipboard fighter when the United States entered the war, and it was generally inferior to the Japanese A6M2 Zero in performance and maneuverability. However, the F4F was very rugged and had good dive performance, giving a good account of itself when using the correct tactics.

The motion of its props causes an “aura” to form around this U.S. Navy Grumman F6F Hellcat on the carrier Yorktown. Rapid change of pressure and drop in temperature create condensation. Rotating with the blades, the halo moves aft, giving depth and perspective. November 1943. (National Archives)

U.S. Navy Grumman TBF Avenger torpedo bombers flying in formation over Norfolk, Virginia. September 1942. (National Archives)

Later in the war, the Wildcat gave sterling service on escort carriers. Approximately 8,000 Wildcats were built.

The Grumman TBF Avenger first flew in August 1941 and became the standard navy carrier-based torpedo-bomber. It entered service in mid-1942 in time for the Battle of Midway. It could take a lot of punishment and, although it was not very maneuverable, it was easy to land on deck. A total of 9,836 Avengers were built; most served with the U.S. Navy, but 958 were supplied to the British navy.

The Curtiss SB2 Helldiver was the most successful carrier-based dive-bomber in U.S. Navy service, in spite of its handling faults and a reputation for structural weakness. Entering service early in 1943, its first major action was the Rabaul Campaign in November 1943, and it took part in almost every major naval/air action during the remainder of the war. The navy was the major user of the Helldiver, although some were flown by the Marine Corps and the British Royal Navy. A total of 7,200 Helldivers were built in the United States and Canada.

The Vought F4U Corsair entered service with the Marine Corps early in 1943; it was not an easy aircraft to deck-land and was initially rejected by the U.S. Navy in favor of the Hellcat.

The gull-winged F4U operated from land bases in the Pacific and flew off Royal Navy carriers from late 1943. The Corsair was a very good fighter, convincingly superior in performance to the Mitsubishi Zero and much better than the P-51B Mustang below about 20,000 ft. Eventually the Corsair matured into a reasonable deck-landing aircraft, and it began to supplant the F6F Hellcat as the standard U.S. Navy carrier fighter by the end of the war. It saw extensive service after the war and continued in production until 1952. A total of 12,571 were built.

The Grumman F6F Hellcat entered service early in 1943. It was the most successful carrier-based fighter of the war, accounting for 76 percent of the total enemy aircraft destroyed by U.S. Navy carrier pilots. It was extremely rugged and had much better speed and dive capabilities than the Mitsubishi Zero, which it could normally beat in an even fight. Many of the U.S. Navy aces flew Hellcats. The Hellcat was also employed with some success at night; approximately 1,300 of the 12,272 produced were dedicated radar-equipped night-fighter versions.

Japan

The Imperial Japanese Navy (IJN) had several carriers at the start of the war, the air groups of which were weighted toward attack aircraft rather than fighters. Its aircraft were lightly built and had very long range, but this advantage was usually purchased at the expense of vulnerability to enemy fire. The skill of Japanese aviators tended to exaggerate the effectiveness of the IJN's aircraft, and pilot quality fell off as experienced crews were shot down during the Midway and Solomon Islands Campaigns.

The Nakajima B5N ("Kate" in the Allied designator system) first entered service in 1937 as a carrier-based attack bomber, with the B5N2 torpedo-bomber appearing in 1940. The B5N had good handling and deck-landing characteristics and was operationally very successful in the early part of the war. Large numbers of the B5N participated in the Mariana Islands campaign, and it was employed as a suicide aircraft toward the end of the war. Approximately 1,200 B5Ns were built.

The Aichi D3A ("Val") carrier-based dive-bomber entered service in mid-1940, and it was the standard Japanese navy dive-bomber when Japan entered the war. It was a good bomber, capable of putting up a creditable fight after dropping its bomb load. It participated in the attack on Pearl Harbor and the major Pacific campaigns including Santa Cruz, Midway, and the Solomon Islands. Increasing losses during the second half of the war took their toll, and the D3A was used on suicide missions later in the war. Approximately 1,495 D3As were built.

When it first appeared in mid-1940, the Mitsubishi A6M Zero was the first carrier-based fighter capable of beating its land-based counterparts. It was well armed and had truly exceptional maneuverability below about 220 mph, and its

capabilities came as an unpleasant shock to U.S. and British forces. It achieved this exceptional performance at the expense of resistance to enemy fire, with a light structure and no armor or self-sealing tanks. Its Achilles heel was the stiffness of its controls at high speed, the control response being almost nil at indicated airspeed over 300 mph. The Zero was developed throughout the war, a total of 10,449 being built.

The Nakajima B6N (“Jill”) carrier-based torpedo-bomber entered service late in 1943 and was intended to replace the B5N, but the initial B6N1 was plagued with engine troubles. The B6N2 with a Mitsubishi engine was the major production model, appearing early in 1944. Overall, it was better than its predecessor but not particularly easy to deck-land. It participated in the Marianas Campaign and was encountered throughout the Pacific until the end of the war. A total of 1,268 were built.

The Yokosuka D4Y (“Judy”) reconnaissance/dive-bomber entered service on Japanese carriers early in 1943 and was very fast for a bomber. Initially assigned to reconnaissance units, it was intended to replace the D3A, but it was insufficiently armed and protected and suffered from structural weakness in dives. In common with most other Japanese aircraft, it was used for kamikaze attacks, and a D4Y carried out the last kamikaze attack of the war on 15 August 1945. A total of 2,819 D4Ys were built.

Great Britain

During the 1930s, Great Britain had a limited number of air assets with which to patrol a far-flung empire; the Admiralty

was therefore obliged to buy multirole aircraft and accept the inevitable compromises in performance. The Royal Navy entered the war with low-performing aircraft, and its efforts to introduce better aircraft were compromised by conflicts in engine supply. In 1943 it was only too pleased to have the use of F4U Corsairs that were surplus to the requirements of the U.S. Navy.

The Fairey Swordfish carrier-based torpedo/spotter/reconnaissance aircraft entered service late in 1936 and participated in the night raid on Taranto, the battle of Cape Matapan, and the sinking of the *Bismarck*. It was very slow but was astonishingly agile with excellent flying qualities. Very easy to deck-land, it was a natural choice for use on Atlantic convoy escort carriers. It remained in service until mid-1945, outlasting its replacement (the Fairey Albacore). A total of 2,391 Swordfish were built.

The Blackburn Skua came on line late in 1938 as a carrier-based fighter/dive-bomber. It was not easy to deck-land and had poor stall characteristics, but it was an effective dive-bomber, sinking the German cruiser *Königsberg* in Bergen harbor during the Norwegian Campaign. A total of 190 were built.

The Fairey Albacore carrier-based torpedo/dive-bomber/reconnaissance aircraft entered service as a replacement for the Swordfish early in 1940 and took part in many of the Middle East operations, including the Battles of Cape Matapan and El Alamein and the Allied landings at Sicily and Salerno. The Albacore had only a slightly better performance than the Swordfish and few redeeming features, and its

service with the Royal Navy ended late in 1943. A total of 800 were built.

The two-seat Fairey Fulmar carrier fighter entered service in mid-1940 and was principally designed to combat unescorted bombers and maritime patrol aircraft. It had adequate range, but it was underpowered and its performance was insufficient to deal with contemporary fighters. Nevertheless, it filled a gap until better aircraft became available. A total of 600 were built.

The Hawker Sea Hurricane was first used on catapult-armed merchantmen (CAM) ships during early 1941. Many were conversions of existing land-based fighters. Sea Hurricanes were operational on carriers from late 1941; they were maneuverable and well armed but usually had a lower performance than their adversaries. Approximately 800 Sea Hurricanes were built or converted.

The Supermarine Seafire was an adaptation of the land-based Supermarine Spitfire VB fighter. When it appeared in mid-1942, it was the fastest operational carrier fighter in the world, but it was difficult to deck-land and was not sufficiently robust for use at sea. Later versions were very effective at low altitude, the Seafire LIIC having an outstanding climb and roll performance. Approximately 1,900 were built or converted before the end of the war.

The Fairey Barracuda carrier-based dive/torpedo-bomber entered service early in 1943. It was usually used as a dive-bomber and was not popular with its crews; its performance was mediocre and its defensive armament was poor. It was, however, a reasonably good dive-bomber and was easy to deck-land. A total of 1,718 were built.

war matériel because they had begun military production much earlier than the Allies, the combined industrial potential of the Allies far exceeded that of the Axis nations. Even though Axis aircraft production increased during the course of the war, it paled in comparison to that of the Allies, especially the United States. To the extent that World War II was a total war that depended on industrial output, the Allied advantage in manpower and industry ultimately proved decisive, and aircraft production is a key indicator of that advantage (see Table 1).

Axis Powers

Although Germany had entered the war in September 1939 as the world's leading air power, with 4,840 frontline aircraft and an aircraft industry producing 1,000 airplanes a month, the Luftwaffe's arsenal had serious defects. For one, Germany had never developed a satisfactory long-range bomber, in part because the German military's focus on blitzkrieg (lightning war) emphasized production of medium-range bombers and ground-attack aircraft, which had proven so successful in the Spanish Civil War. Germany's defeat in the Battle of Britain revealed the flaw of this policy from a strategic standpoint, as aircraft such as Heinkel He-111, Dornier Do-17, and Junkers Ju-87 proved ineffective against a technologically well-equipped enemy force. Likewise, Germany's lack of long-range bombers prevented it from conducting long-range air operations at sea or striking Soviet manufacturing centers relocated deep within the Soviet Union. Despite the damage inflicted by the Allied air campaign, the German armaments industry, ably led by Fritz Todt and Albert Speer, not only managed to increase production from 8,295 aircraft in 1939 to 39,807 in 1944 but also introduced the world's first jet fighter, the Messerschmitt Me-262, in the second half of 1944. These successes, however, proved to be too little and too late to make a difference, and the Allies had air supremacy in the last two years of the war.

As with Germany, Japan entered the war with a powerful air arm, which included some 2,900 combat-ready aircraft on 7 December 1941. Yet, Japan's attack on Pearl Harbor was in part a desperate gamble designed to cripple the United States to purchase time for Japan to build a defensive perimeter before U.S. industrial might reached heights that Japan knew it could never equal. Indeed, Japanese industry produced just 5,088 aircraft in 1941, compared with 26,277 for the United States. Failure to destroy the U.S. carriers in the surprise attack on Pearl Harbor ranks as a clear strategic mistake for Japan. Once it lost the Battle of Midway in early June 1942, Japan was forced into a defensive war in which it could not compete with the American war machine. Despite Allied attacks that crippled its shipping industry and weakened its industrial infrastructure, Japan still managed to produce 28,180 aircraft in 1944, a testament to the perseverance of its

Aircraft, Production of

Key aspect of World War II industrial production that tipped the scales of the air war decisively away from the Axis powers in favor of the Allies. Although Germany and Japan had entered the war with initial advantages of aircraft and other

workers on the home front. That the United States produced 96,318 aircraft during the same year is a testament to the futility of Japan's challenge to American industrial might.

Although Benito Mussolini had built a powerful Italian air force in the late 1920s and early 1930s, by the beginning of World War II in September 1939, Italy's air force had become largely obsolete. This decline was in part a reflection of Italy's weak economy. When Italy joined the war on 10 June 1940, barely half of its 3,296 aircraft were of combat quality. While assistance from Germany (particularly in supplying aircraft engines) allowed the Italian aircraft industry to make modest increases from 2,142 aircraft produced in 1940 to 3,503 aircraft in 1941, Italy's weak industrial sector could not withstand the impact of the Allied bombing campaign, and production dropped to 2,818 aircraft in 1942 and just 967 aircraft by the time Italy surrendered in September 1943.

Allied Powers

Although Germany enjoyed a great lead in the number of its combat-ready aircraft at the start of the war, Great Britain had

an advantage in that its industry was in the process of introducing aircraft (such as the Hawker Hurricane and Supermarine Spitfire) more technologically advanced than their German counterparts. This qualitative advantage would prove critical to defeating Germany in the Battle of Britain. Secure from the threat of German invasion, British industry succeeded not only in increasing productive capacity with each passing year of the war but also in introducing aircraft such as the Handley Page Halifax and Avro Lancaster that played a critical role in the Allied bombing campaign against Germany. Great Britain's highest annual production total reached 26,461 aircraft in 1944, compared with 39,807 aircraft for Germany that year. Nevertheless, Great Britain's overall production of 131,550 aircraft during the war exceeded that of Germany, which produced 119,331 aircraft.

The Soviet Union possessed large numbers of aircraft at the outbreak of the war, but most of these were inferior to their German counterparts. Making matters worse, when Germany launched its invasion of the Soviet Union on 22 June 1941, it destroyed 1,200 Soviet aircraft in the first nine hours

Long lines of A-20 attack bombers roll ceaselessly off the assembly line, night and day, through the Douglas Aircraft plant at Long Beach, California, ca. October 1942. (Franklin D. Roosevelt Library (NLFDR))

of the attack. The Soviet Union managed not only to sustain this loss but to recover, because of its monumental efforts to transfer industries eastward beyond the reach of the German army and air force. In the first three months after the German invasion, the Soviet Union relocated 1,523 factories. The primary production line for the Yakovlev Yak-1, for example, was moved more than 1,000 miles and returned to production in less than six weeks. The success of these efforts allowed the Soviet Union to exceed German production for each year of the war, including 1941, for a total of 159,261 Soviet aircraft compared with 119,331 German aircraft.

In 1939, the U.S. economy was still suffering from the Great Depression, with 8.9 million registered unemployed workers. However, the success of the German blitzkrieg against western Europe in 1940 spurred the American war machine into action. The Burke-Wadsworth Act of 16 September 1940 introduced peacetime conscription for the first time in American history, and massive military spending got the American economy

working again. Unlike Germany and Japan, the United States not only had a large population base and natural resources that could be mobilized for production but also enjoyed an industrial infrastructure far removed from its enemies. By 1944, a total of 18.7 million Americans, approximately 50 percent of whom were women, had entered the American workforce. Of all of their industrial achievements, none was more spectacular than aircraft production. From just 5,856 aircraft produced in 1939, the United States would reach the staggering total of 96,318 produced in 1944—almost one-third more than that produced by Germany and Japan combined for that year. For the war years as a whole, the United States would produce 324,750 aircraft, compared with a total of 206,773 for Germany, Japan, and Italy. The U.S. output, combined with the output of the British and the Soviet Union, gave the Allies an advantage greater than three to one, with 615,561 aircraft. With such an advantage, it is little wonder that the Allies won the war in the air.

Aircraft, Reconnaissance and Auxiliary

Aircraft the purpose of which is to provide support for land, sea, and air forces. From the beginning of military aviation, including the use of balloons during the French Revolutionary wars, air reconnaissance of enemy positions and movements has been crucial not only for defense against attack but also in preparation for offensive action. Just as improvements in aviation technology during the 1920s and 1930s greatly expanded the capabilities of fighters and bombers by the beginning of World War II, the same was true of reconnaissance and auxiliary aircraft. High-altitude photo reconnaissance was crucial to successful planning for military invasions such as the Normandy landings, and long-range reconnaissance was crucial for naval operations in the Atlantic and Pacific.

Three main types of reconnaissance and auxiliary aircraft were used during World War II: land-based aircraft, float-planes, or flying boats designed to conduct reconnaissance missions; army cooperation aircraft designed for multipurpose roles such as liaison or tactical support; and training aircraft designed to train pilots and crewmen for service.

In addition to aircraft specially designed for reconnaissance or auxiliary service, numerous bombers and fighters were either converted to take on these roles or were relegated to these purposes after becoming obsolete in their intended roles. Such aircraft include the following: France's Bloch 131 and Latécoère Laté 298; Germany's Arado Ar 234 Blitz, Junkers Ju-86, Ju-88, and Ju-188 and the Messerschmitt Me-210; Great Britain's De Havilland Mosquito, Fairey Swordfish, Supermarine Spitfire, and Vickers Wellington; Italy's Cant Z. 506 Airone and Savoia-Marchetti S.M.79; Japan's Yokosuka D4Y Suisei; Poland's PZL P.23 Karas; the Soviet Union's Petlyakov Pe-2; and the U.S. Lockheed Hudson, Martin Maryland, and North American P-51 Mustang.

The following text describes the most significant aircraft employed primarily for reconnaissance and auxiliary purposes by both sides during the war (see also Table 1).

Germany

Entering service in September 1940, the twin-engine, three-seat Focke-Wulf Fw-189 Uhu served as the primary tactical reconnaissance aircraft of the German army, especially on the Eastern Front. Although its maximum range of 584 miles limited it to tactical reconnaissance, its rugged construction enabled it to absorb a heavy amount of punishment from anti-aircraft fire, and its armament of three to four 7.9 mm machine guns afforded protection from Soviet fighters. These qualities also allowed it to provide close support for German troops on the ground. A total of 894 were produced.

Introduced in August 1939, the single-engine, two-seat Arado Ar. 196 proved to be one of the most versatile reconnaissance seaplanes in the German navy's arsenal. Designed as a catapult-launched aircraft, it was carried onboard Germany's major capital ships to provide reconnaissance at sea. It also conducted coastal and maritime patrol, antisubmarine hunting, and convoy escort operations in the North Sea, the English Channel, and the Bay of Biscay while operating out of coastal bases. A total of 546 were produced.

Germany relied on three primary flying boats for reconnaissance and auxiliary purposes during World War II. Originally designed for passenger service by Hamburger Flugzeugbau, the three-engine, six-seat Blohm und Voss Bv-138, of which 279 were constructed, entered military service in late 1940. With a maximum range of 2,500 miles, the Bv-138 was capable of remaining aloft for up to 18 hours, enabling it to conduct long-range patrols in the North Atlantic, where it reported the positions of Allied convoys to German U-boats. Designed prior to the war as a trans-Atlantic mail carrier, the twin-engine, four- or five-seat Dornier Do-18, of which 152 were constructed, was quickly adopted for military use when Germany began its rearmament program and was used primarily in the Baltic and North Sea for maritime patrol and air-sea rescue operations. Larger, faster, and possessing greater range than the Do-18, the three-engine, six-seat Dornier Do-24, of which 294 were constructed, entered service in 1937. In addition to maritime patrol and air-sea rescue operations, it also served as a transport and troop evacuation aircraft.

The two-seat Fieseler Fi-156 Storch and Henschel Hs-126 were small light aircraft that served effectively as army cooperation and utility aircraft. Noted for its short takeoff and landing (STOL) capabilities—it required just 213 ft for takeoff and just 61 ft for landing roll—the Fi-156 Storch (Stork) served as a liaison and staff transport, air ambulance, and tactical reconnaissance aircraft. It was also used in the daring German rescue of Benito Mussolini in September 1943. A

total of 2,834 were produced by war's end. The Hs-126 had proved its usefulness in the Kondor Legion in the Spanish Civil War in tactical reconnaissance, as an artillery spotter, and for strafing enemy positions. It continued in these roles in the early stages of World War II until it was withdrawn from frontline service by early 1943. A total of 803 were produced.

Introduced in 1939, the two-seat Arado Ar-96 served as the Luftwaffe's primary trainer throughout the war. Its

unarmed version served as a basic trainer, while its armed version (with a single 7.9 mm machine gun) served as an advanced trainer. It also performed other auxiliary roles, such as liaison transport, glider towing, and reconnaissance. A total of 11,546 were produced.

Great Britain

Designed in 1935, the twin-engine Avro Anson entered service with the Royal Air Force (RAF) in 1936 as an armed

A German Blohm und Voss Bv.138B reconnaissance bomber seaplane. (Museum of Flight/Corbis)

coastal patrol aircraft. While it continued in that role until 1941, it was as an air crew trainer that it made its primary contribution to the British war effort, training navigators, radio operators, and air gun operators. One variant, the Mk.X, was used for transporting freight or up to eight passengers. A total of 10,996 were produced until 1952, and it remained in service until 1968.

The four-engine Short Sunderland was a maritime patrol and antisubmarine flying boat with a maximum range of 2,690 miles. Nicknamed the “Flying Porcupine” because it came equipped with eight .303 caliber machine guns, the Sunderland was more than capable of defending itself. In addition to its reconnaissance and antisubmarine roles, it was also used for transport and air-sea rescue operations and played an important role in successfully evacuating forces from Norway, Greece, and Crete. A total of 749 were constructed and it remained in service with the RAF until 1959.

First introduced in 1935 by Australia, where it was known as the Seagull V and intended as a maritime patrol and anti-submarine aircraft, the single-engine Supermarine Walrus entered British service in 1936 as an amphibious biplane used for search and air-sea rescue operations. Capable of operating in rough seas, it successfully rescued as many as 5,000 downed pilots around Britain and another 2,500 in the Mediterranean. A total of 771 Walrus aircraft were constructed.

Introduced originally as a passenger liner (the D.H.89 Dragon Rapide), the twin-engine De Havilland Dominie served primarily as a radio and navigator trainer and as a communications aircraft. With the outbreak of the war, civilian versions were pressed into military service in an effort to supply the British Expeditionary Force in France. A total of 730 of all varieties were constructed.

The De Havilland Tiger Moth, a single-engine, open-air-cockpit biplane, served as one of the primary trainers for Allied pilots who flew in World War II. In addition to the 8,796 trainers produced, 420 radio-operated, wooden-constructed versions, known as queen bee drones, were manufactured to serve as anti-aircraft gunnery targets.

Italy

Introduced in 1934, the single-engine, four- to five-seat Cant Z. 501 Gabbiano served as Italy’s only flying boat during World War II. Intended as an armed reconnaissance/ maritime patrol aircraft, the wooden-constructed Gabbiano had set numerous long-distance records in the mid-1930s. With Italy’s entry into the war, however, they quickly proved to be extremely vulnerable to enemy fire, so they were relegated primarily to coastal patrol service. By the time Italy surrendered in September 1943, only 40 remained out of the 445 that had been produced.

A Royal Air Force Supermarine Pegasus VI Walrus reconnaissance aircraft. (Corbis)

Introduced in 1941, the twin-engine Fiat R.S. 14 was originally designed as a coastal reconnaissance floatplane. Although its performance soon proved to be far better than that of the Cant Z.506 and Savoia-Marchetti SM.79, allowing it to be used as a torpedo-bomber, it came too late in the war to allow mass production. As a result, only 187 were produced.

Japan

In addition to transporting troops and supplies, the four-engine Kawanishi H6K and four-engine Kawanishi H8K flying boats also served important roles as long-range reconnaissance aircraft, with the former having a maximum range of 4,210 miles and the latter having a maximum range of 4,460 miles.

Japan relied on three primary reconnaissance floatplanes during the war. The three-seat Aichi E13A, of which 1,418 were produced, was Japan's most widely used floatplane of the war. Entering service in early 1941, it was employed for the reconnaissance leading up to the attack on Pearl Harbor, and it participated in every major campaign in the Pacific Theater, performing not only reconnaissance but also air-sea rescue, liaison transport, and coastal patrol operations.

Introduced in January 1944 as a replacement for the E13A, the two-seat Aichi E16A Zuiun offered far greater performance capabilities but came too late in the war to make a significant difference, primarily because Japan's worsening industrial position limited production to just 256 aircraft. Based on a 1936 design that underwent several modifications, the two-seat Mitsubishi F1M biplane, of which 1,118 were produced, proved to be one of the most versatile reconnaissance aircraft in Japan's arsenal. Operating from both ship and water bases, it served in a variety of roles throughout the Pacific, including coastal patrol, convoy escort, antisubmarine, and air-sea rescue duties, and it was even capable of serving as a dive-bomber and interceptor.

The three-seat Nakajima C6N Saiun, of which 463 were produced, was one of the few World War II reconnaissance aircraft specifically designed for operating from carriers. With a maximum speed of 379 mph, a maximum range of 3,300 miles, and service ceiling of 34,236 ft, the C6N proved virtually immune from Allied interception. Unfortunately for Japan, it did not become available for service until the Mariana Islands Campaign in the summer of 1944.

A Japanese Aichi Eiga Zuiun naval reconnaissance and dive bomber with the Allied code name “Paul.” The U.S. Navy insignia was placed on the aircraft after its capture. (Museum of Flight/Corbis)

The twin-engine, two-seat Mitsubishi Ki-46, of which 1,742 were produced, served as Japan’s primary strategic reconnaissance aircraft of the war. Entering service in March 1941, the Ki-46 was one of the top-performing aircraft of its type in the war with a service ceiling of 35,170 ft, a range of 2,485 miles, and a maximum speed of 375 mph.

Although the two-seat Tachikawa Ki-36 served as an effective army cooperation aircraft against the Chinese when it entered service in November 1938, it proved to be vulnerable against better-equipped Allied forces after the outbreak of war in the Pacific. The Ki-55 was an advanced trainer version that became available in 1940. Both were later used as suicide aircraft toward the end of the war. A total of 2,723 of both types were constructed.

Soviet Union

When it entered service in 1928, the two- to three-seat Polikarpov U-2/Po2 biplane was intended as a basic trainer. By the time of the German invasion of the Soviet Union in June 1941, approximately 13,000 had already been constructed for both military and civil use. The U-2/Po2 performed a wide variety of roles besides training, such as tactical reconnaissance, air ambulance, night artillery spotting, and close ground support. One version, the U-2GN, was equipped with loudspeakers and used for propaganda purposes. Production continued in the

Soviet Union until 1948 and in Poland until 1953; more than 33,000 were ultimately produced.

The five-seat Beriev MBR-2 (Be-2) flying boat was first introduced in 1931 for coastal patrol service. Incorporating a wooden hull and metal wings and utilizing a single pusher engine, it proved to be one of the most versatile flying boats of its time. In addition to its reconnaissance role, it was used in air-sea rescue, light transport service, and minelaying operations. More than 1,500 of all varieties were produced.

United States

The single-seat Lockheed F-4 and F-5 Lightning were modified versions of the Lockheed P-38 Lightning, which had cameras and clear panels installed in place of its guns in the nose section. First deployed in the Pacific in early 1942, they proved to be one of the most widely used photoreconnaissance aircraft of the war. Of the 1,400 employed during the war, 500 were new and the remaining were converted from existing stocks of P-38s.

Designed to operate from land or catapulted from a ship, the two-seat Vought OS2U Kingfisher, of which 1,519 were produced, first entered service in August 1940 and served as the U.S. Navy’s primary observation aircraft in every theater of the war. In addition to its reconnaissance duties, it performed air-sea rescue, antisubmarine patrol, and liaison transport missions.

A U.S. Navy Vought-Sikorsky OS2U-2 Kingfisher scout plane in 1941. (Museum of Flight/Corbis)

Entering service in 1936, the twin-engine, seven- to nine-crew Consolidated PB2Y Catalina proved to be the most widely used flying boat of World War II; a total of 3,290 were produced in the United States, Canada, and the Soviet Union. With a maximum range of 3,100 miles, the Catalina served on all fronts of the war primarily for long-range maritime reconnaissance. Other duties included air-sea rescue, minelaying, and transport.

The two- to three-seat Grumman J2F Duck, of which 641 were produced, was an amphibious biplane that entered service in 1936 with the U.S. Navy and the U.S. Coast Guard as a coastal patrol aircraft. After Pearl Harbor, the Duck was pressed into a variety of roles in both the European and Pacific Theaters, including air-sea rescue, target towing, coastal patrol, and maritime reconnaissance.

Utilizing a three-tiered system of training—primary, basic, and advanced—for its pilots, the United States relied on training aircraft that corresponded to each level. The two-seat Boeing-Stearman Kaydet, of which approximately 10,000 were constructed, was an open-air biplane that served the U.S. Army Air Forces (USAAF) and U.S. Navy as a primary trainer throughout the war. The two-seat Vultee Valiant, of which a total of 11,525 were produced, served as the most important basic trainer for the USAAF and the U.S. Navy. Finally, the two-seat North American AT-6 Texan/Harvard, of which over 17,500 were produced in the United States and Canada, served as the most important Allied advanced trainer of World War II.

Other prominent American auxiliary aircraft included the Cessna AT-17/UC-78 Bobcat, which was used as an advanced trainer and light utility transport; the Piper L-4 Grasshopper, which was used as an artillery spotter, trainer, and liaison transport; and the Beechcraft Kansan, a military version of the Beechcraft Model 18 that served as a navigation, bombing, and gunnery trainer.

Aircraft, Transports

Aircraft the primary purpose of which is to transport personnel and supplies. Although fighters, bombers, and reconnaissance aircraft played major roles in World War I, the technology of the time did not allow aircraft to play a mean-

ingful role in transporting troops and supplies. By the early 1930s, however, improvements in aircraft design and, more important, aircraft engines had resulted in the emergence of civil aircraft, such as the Douglas DC-3, for commercial passenger service. Military planners were quick to note these developments, which raised the prospect of rapidly deploying large numbers of men and a large amount of supplies to the battle zone, including behind enemy lines. By the outbreak of World War II, most of the powers that would become involved in the war had either already developed military variants of these civil aircraft or had introduced specially designed military transport aircraft.

Two main types of transport aircraft were used during the war: large multiengine, land-based aircraft or flying boats designed to move many troops or supplies (some of these also served in bombing and reconnaissance roles); and assault or transport gliders designed to be towed, then released, so they could glide silently to a landing behind enemy lines.

The following are the most significant aircraft employed primarily for transport by both sides during World War II (see also Table 1).

Germany

Designed originally in 1930 as a three-engine passenger carrier for Deutsche Lufthansa, the Junkers Ju-52/3m served as the primary transport aircraft of the German army in World War II. Including the approximately 200 civil models constructed prior to the war, a total of 4,800 Ju-52/3ms were built by the end of 1944. It made its military debut as a bomber and troop transport during the Spanish Civil War. Successive versions of the Ju-52/3m incorporated more-powerful engines that provided greater load capacity (approximately twice its empty weight of 12,600–14,300 lb) and interchangeable wheel, ski, or float landing gear that allowed it to operate in a variety of conditions. In addition to its transport duties, it served as a bomber, air ambulance, glider tug, and paratrooper transport.

Intended as a replacement for the Ju-52/3m, the Junkers Ju-252 Herkules relied on the same three-engine configuration as the Ju-52/3m but featured improved interior and exterior designs and more powerful engines, which not only made it faster and capable of bearing heavier loads but also gave it a range as much as twice that of the Ju-52/3m. Unfortunately for Germany, shortages of resources and manpower forced the Luftwaffe to limit production of the all-metal Ju-252 to just 15 aircraft. A mixed-wood and tube-steel version, the Ju-352 entered service in 1944, but it came too late in the war to make a difference. Just 45 of the Ju-352s were constructed.

Originally designed for Deutsche Lufthansa to serve as a trans-Atlantic flying boat, the six-engine Blohm und Voss Bv-222 Viking was the largest flying boat, and the largest aircraft of any kind, to serve in World War II. Although only 13 were pro-

duced, the Bv-222, which could carry up to 110 troops in addition to its 11-man crew, played an important role in transporting troops in the Mediterranean and North African Campaigns.

Germany employed three types of gliders as transports during World War II: the DFS-230, the Gotha Go-242, and the Messerschmitt Me-321 Gigant. Entering service in 1938, the DFS 230 could carry 8 airborne troops and proved to be the standard assault glider used by the Germany army during the war, with approximately 1,500 being constructed. Introduced in late 1941, the Gotha Go-242 could carry up to 23 airborne troops or the equivalent weight in supplies. As one of the largest aircraft of the war, the Messerschmitt Me-321 Gigant was capable of carrying up to 120 troops, 21,500 lb of freight, or 60 wounded soldiers. The Go-242 and Me-321 served primarily on the Eastern Front to bring food and supplies to German soldiers. Powered versions, the Go-244 and Me-323, were also developed for transport service.

Great Britain

Although the twin-engine Bristol Bombay was designed as a troop transport carrier in 1931, the economic conditions of the Great Depression delayed production until early 1939. While only 51 were produced, the Bristol Bombay, which was capable of carrying up to 24 troops or a payload of 7,200 lb, saw significant action for the Royal Air Force (RAF) during the first half of the war, ferrying troops and supplies across the English Channel in 1940, evacuating British forces from Crete in 1941, and dropping paratroopers behind enemy lines in North Africa.

Originally intended as a bomber, the Armstrong Whitworth Albemarle was instead converted to transport service. A total of 310 were used as transports for special operations, such as dropping paratroopers behind enemy lines. An additional 247 served as the standard tug for the Airspeed Horsa assault glider, seeing action in the invasion of Sicily in 1943 and the D day landings in June 1944. At least 10 were shipped to the Soviet Union.

Great Britain produced two primary transport gliders during the war: the Airspeed Horsa and the General Aircraft Hamilcar. The Horsa came in two varieties: the Mk.1, which was configured for carrying up to 25 troops; and the Mk.2, which could carry up to 7,000 lb of freight and featured a hinged nose section for easier loading and unloading. Approximately 3,800 of the Horsa gliders were constructed. The Hamilcar was the largest Allied glider of the war and was capable of carrying a payload of 17,500 lb. It first saw action in the D day landings and proved immensely significant because it could provide heavy equipment, such as the British Tetrarch Mk.IV tank, to airborne troops operating behind enemy lines.

Other British aircraft used in a transport role included those that also served as bombers or reconnaissance aircraft,

Table 1
Transport Aircraft, All Powers

Aircraft	Year of Introduction	Engine	Span	Length	Maximum speed (mph)	Ceiling (ft)	Range (mi)	Weight (loaded) (lb)
Airspeed Horsa	1941	None	88 ft	67 ft	150 mph	NA	NA	15,500 lb

such as the Handley Page Halifax, the Short Stirling, and Vickers Warwick.

Italy

Although Italy relied on several aircraft for transport duties, such as the Caproni CA 309-316, the Piaggio P.108, and the Savoia-Marchetti S.M.81 Pipistrello, their primary role was as bombers or reconnaissance aircraft. The Savoia-Marchetti S.M.75 and the Savoia-Marchetti S.M.82 Canguru were exceptions. The S.M.75 had originally been designed for passenger service for Ala Littoria in 1937. Requisitioned for military service when Italy entered the war in June 1940, the S.M.75 could carry up to 30 troops and saw action throughout the Mediterranean until the end of the war. A total of 98 were constructed. The three-engine S.M.82 proved to be one of the best heavy transports available to the Axis powers. It was capable of carrying up to 40 fully equipped troops or almost 9,000 lb of freight. Of approximately 400 S.M.82s constructed between 1941 and 1943, at least 50 entered service with the Luftwaffe in the Baltic area of the Eastern Front. Those that survived the war continued in service with the Italian air force into the 1950s.

Japan

Although Japan employed a variety of multipurpose aircraft, such as the Nakajima G5N Shinzan and the Tachikawa Ki-54, for transporting troops and supplies, it relied prima-

rily on four main transport aircraft during World War II: the Kawanishi H6K flying boat, the Kawanishi H8K flying boat, the Kawasaki Ki-56, and the Mitsubishi Ki-57.

When Japan entered the war, the four-engine Kawanishi H6K served as the navy's primary long-range flying boat. Although used at first primarily for long-range reconnaissance, it was soon relegated to transport duty because of its vulnerability to Allied fighters. Capable of carrying up to 18 troops in addition to its crew, the H6K remained in production until 1943. Of the 217 constructed, 139 were designed exclusively for transport.

The four-engine Kawanishi H8K entered service in early 1942 and gradually replaced the Kawanishi H6K. While it also served in a variety of roles, its transport version, the H8K2-L, of which 36 were built, could carry up to 64 passengers. With a cruising speed of 185 mph and a range of up to 4,460 miles, it was well-suited for the Pacific Theater, and its heavy armament afforded better protection than the H6K.

Ironically, Japan's primary light transport aircraft, the twin-engine Kawasaki Ki-56, was a military version of a license-built American plane, the Lockheed 14 Electra. It was capable of carrying a payload of up to 5,290 lb or 14 passengers and had a range of approximately 3,300 miles. A total of 121 were constructed between 1941 and 1943.

Originally intended for passenger service with Nippon Koku KK, the twin-engine Mitsubishi Ki-57 was quickly

A U.S. Army Air Forces Curtiss-Wright C-46 military transport. (Corbis)

adapted for service with both the Japanese army and navy beginning in 1940. After Japan entered the war, the original production series, of which 101 were built, was modified by adding more powerful engines. Between 1942 and early 1945, 406 of the new version (Ki-57-II) were constructed. These were capable of carrying a crew of 4 and up to 11 passengers or a cargo of approximately 7,000 lb to a range of up to 1,835 miles.

Soviet Union

While the Soviet Union relied heavily on American aircraft, such as license-built Douglas C-47 Skytrains, for transport purposes, the four-engine Tupolev TB-3 (ANT-6), originally designed in the early 1930s as a heavy bomber, had been converted primarily for troop and freight transport by the time the Soviet Union entered World War II. Later versions fitted with four 1,200 hp engines were capable of carrying more than 12,000 lb of cargo. In addition to carrying airborne troops and supplies, it also served as a glider tug. Some were

even modified to carry a tank or truck between their undercarriage legs.

United States

Of all the powers in World War II, the United States had by far the largest number and variety of transport aircraft, in part because it was conducting simultaneous campaigns in the European and Pacific Theaters.

Without question, the twin-engine Douglas C-47 Skytrain was the most famous transport aircraft of World War II. As the DC-3, it had revolutionized civil air travel before the war. Once the United States entered the war, the Skytrain went into full-scale military production; 10,665 were produced by war's end, including 4,878 in 1944 alone. Of its variants, the C-47 Skytrain (known as the Dakota in British service), accounted for more than 9,000 of the total produced, approximately 1,800 of which were loaned to Great Britain through Lend-Lease. An additional 2,500 were constructed on license by the Soviet Union as the Lisunov Li-2. Even the Japanese built 485

as the Nakajima L2D through a 1938 license. With a range of 1,500 miles and capable of carrying 28 troops or a cargo of 10,000 lb, it saw service in every theater of the war.

The four-engine Consolidated Liberator Transport C-87 was a transport version of the Consolidated B-24 Liberator bomber. A total of 287 C-87s were produced and served with the U.S. Army Air Forces (USAAF) and the RAF as a transport and a tanker. As a transport, it was capable of carrying up to 25 passengers and up to 10,000 lb of freight. As a tanker, it could carry up to 2,400 gallons of fuel, which proved useful in a variety of theaters, but especially in support of Boeing B-29 Superfortresses operating in China.

Originally designed in 1936 as the CW-20 (a 36-passenger pressurized airliner), the twin-engine Curtiss C-46 Commando entered service in 1942 after undergoing extensive modifications for military service. These included the installation of a large cargo door, a strengthened floor, and folding troop seats. It was capable of carrying up to 50 troops, 33 wounded soldiers, and up to 10,000 lb of cargo. These characteristics, combined with its excellent climbing ability, made it ideally suited for flying over the Himalayas ("the Hump") from India to China. A total of 3,341 were produced.

As with the Douglas C-47 Skytrain, the Douglas C-54 Skymaster was originally designed for passenger airliner service as the DC-4. After Pearl Harbor, the U.S. military quickly adopted it, with the first C-54 Skymaster entering service in February 1942. With a maximum range of 3,900 miles, Skymasters flew almost 80,000 trans-Atlantic flights during the course of the war with a loss of just three aircraft. It was capable of carrying 50 troops or 28,000 lb of cargo. It would remain in service until 1974 and is famous for its role in the Berlin Airlift of 1948.

The Waco CG-4A Hadrian proved to be one of the most effective transport gliders produced in the war. Designed for mass production, the Hadrian featured fabric-covered wooden wings and a steel tube fuselage, which was easily replicated by the 15 firms involved in constructing the 13,910 Hadrians produced during the war. Its most notable feature was a hinged nose section that raised upward and allowed cargo to be loaded directly into the cabin. It was capable of carrying 15 troops or 3,800 lb of cargo, which could include a jeep or 75 mm howitzer and its crew. It proved effective in landings in Sicily, the D day invasion, and the Rhine crossings, and it would have been an integral part of an Allied invasion of the Japanese mainland had the atomic bomb not ended the war.

Other successful U.S. transport aircraft of the war included the following three aircraft: the twin-engine Lockheed Lodestar, of which 625 were produced, was a military version of the civil Lockheed Model 14 Super Electra; the twin-engine Beechcraft C-45 Expeditor, of which 1,391 were

built, was a military version of the civil Beechcraft Model 18 light transport; and the Martin PBM Mariner Flying Boat, of which 1,405 were produced, served in a variety of roles besides transport, including antisubmarine warfare, air-sea rescue, and maritime patrol.

Aircraft Carriers

Ships capable of launching and recovering fixed-wing aircraft. Almost without exception, the aircraft carriers commissioned by combatant navies during World War II owed their origins to designs developed between the two world wars. Furthermore, since this warship type itself was so new, most of the first generation of semiexperimental vessels remained in frontline service at the outbreak of hostilities. These included the British carriers *Eagle* (converted from an incomplete ex-Chilean battleship into a flush-deck carrier with an offset island) and *Hermes* (the first vessel constructed as a carrier from the keel up, also flush-decked with an island) and the similar Japanese carrier *Hosho*.

Provisions of the 1922 Washington Treaty also had freed large U.S., British, French, and Japanese hulls for conversion into carriers. The United States and France converted two battle cruisers and a battleship, respectively, into the flush-deck carriers *Lexington*, *Saratoga*, and *Béarn*. British and Japanese concepts emphasizing rapid aircraft launching led both navies to develop designs incorporating multiple flight deck levels to permit several aircraft to fly off simultaneously. Britain rebuilt the *Furious* (which had served as a fleet carrier since 1917 in two earlier guises) with a three-quarter-length flush deck and a forward flying-off deck at a lower level, and it similarly converted two near-sister ships, the *Courageous* and the *Glorious*. Japan took this idea still further and configured a battleship and a battle cruiser, the *Kaga* and the

The U.S. Navy aircraft carrier *Lexington*. Commissioned in 1927, it was lost in the May 1942 Battle of the Coral Sea. (The Mariners' Museum/Corbis)

Akagi, as carriers with two forward flying-off decks beneath the main deck. Both navies learned through experience that efficient deck-handling procedures were more effective in increasing launch rates. Japan subsequently rebuilt its two carriers with conventional flush decks and greatly enlarged air groups, but the British ships still served unaltered in the front line at the outbreak of war.

Operational experience with these large converted carriers had a profound influence on subsequent carrier doctrine and designs. Their speed allowed them to operate with the battle fleet, and their size and aircraft capacity gave commanders invaluable opportunities to appreciate the importance of efficient deck-handling procedures, rapid launch and recovery, and concentrated mass attacks. They also served as development platforms for crucial operational equipment, including effective arresting gear using transverse wires, safety crash barriers, hydraulic catapults, and fast elevators to move aircraft between the hangar and the flight deck.

During the 1930s, Japan and the United States added new carriers to their fleets. Although constrained by provisions of the 1922 Washington Treaty, both navies evolved effective designs that became the basis for later construction. Their first treaty vessels, the Japanese *Ryujō* and the U.S. Navy's *Ranger*, were not entirely satisfactory but formed the bases for the two ships of the *Soryū*-class and the three-vessel *Yorktown*-class, respectively. They were ships that combined large flight decks, substantial air groups of 60–80 aircraft, strong defensive armament (for the period), high speed, and long range in vessels suitable for extended oceanic operations.

Britain was a latecomer to new-carrier construction in the 1930s. The *Ark Royal*, commissioned in 1939, incorporated internal hangars, an enclosed bow, and a flight deck that was also the vessel's principal strength deck—all features that characterized subsequent British carrier designs—and embarked a similar size air group to those of its American and Japanese contemporaries.

The large fleet carriers commissioned by Britain, Japan, and the United States during World War II derived from their earlier 1930s designs. Japan commissioned two ships of the enlarged Shokaku-class in 1941 with greater offensive and defensive capabilities, followed by the *Taiho*, a variant incorporating an armored flight deck (although at the cost of a reduced air group). In 1942–1943, Japan laid down the six-ship Unryu-class, which was derived directly from the *Soryu*, although only two of these vessels entered service. The United States standardized on the Essex-class, an expansion of the Yorktown-class. No fewer than 32 units were ordered, of which 24 were completed to serve as the backbone of U.S. carrier forces from 1943. They combined a powerful offensive air group of as many as 100 aircraft, substantially augmented defensive armament, long range, and high speed in hulls the size of which conferred great adaptability to changing operational requirements.

The six British wartime carriers of the *Illustrious* type introduced armor protection for both flight decks and hangar sides. Incorporating this feature into the basic *Ark Royal* design produced vessels that proved very effective in the confined waters of the Mediterranean and in the face of kamikaze attack, but it also incurred severe penalties. Air-group capacity was slashed substantially (the original design accommodated only 36 aircraft; modified to carry 54, it still fell short of the *Ark Royal's* embarked 72 machines), hangars were cramped, and it proved very difficult and expensive to upgrade these ships postwar.

Both the U.S. Navy and the British Royal Navy developed a third generation of carrier designs from their wartime experience. These emphasized the importance of large air groups, efficient layout for fast aircraft operation, and strong defensive features—both passive in the form of armor at hangar and flight-deck level and active by means of very large batteries of automatic anti-aircraft guns. None of these carriers served during World War II. The U.S. Navy commissioned the three ships of the Midway-class just after the war, but the Royal Navy's Malta-class was canceled, although two vessels of the intermediate *Audacious*-class entered service postwar as the *Ark Royal* and *Eagle*.

Both Britain and the United States studied small austere carrier designs before World War II, but only the Royal Navy seriously considered vessels for trade protection (the U.S. Navy's XCV projects envisaged second-line fleet duties). In 1935–1936, the British Naval Staff agreed on sufficiently firm requirements to earmark five specific merchant vessels for conversion should war break out. Nevertheless, no action was taken until December 1940, when work began to create Britain's first escort carrier, the *Audacity*, commissioned in June 1941.

U.S. Navy planning for austere mercantile conversions began in October 1940, resulting in the completion of the *Long Island*, its first escort carrier, also in June 1941. The *Long Island*

was converted from a completed diesel C-3 cargo ship, the *Mormacmail*, but 45 subsequent conversions used partially completed hulls and steam turbines rather than the mechanically unreliable diesel plants featured in the first five U.S.-built escort carriers. More than half of these vessels went to Britain under Lend-Lease, and all 50 were in service before the end of 1943.

The United States also converted four fleet tankers into escort carriers. These larger twin-shaft turbine vessels were very successful, but a general shortage of tanker hulls prevented further conversions. Nevertheless, they formed the basis for the U.S. Navy's first purpose-designed escort carriers, the 19 Commencement Bay-class vessels. These were the only escort carriers to continue to operate postwar, since their size and speed suited them for the larger antisubmarine warfare aircraft then entering service.

The 50 Casablanca-class ships, however, formed the bulk of the U.S. Navy escort carrier force, even though they were outside the mainstream of U.S. Navy design. All came from the Kaiser Vancouver yard and were commissioned within one year starting in July 1943. Their design was by Gibbs and Cox, and their construction was under the auspices of the Maritime Commission. Shortages of both turbines and diesels forced the use of reciprocating machinery, but the ships were faster and more maneuverable than the original C-3 conversions, had longer flight decks, and had larger hangars than even the Sangamon-class converted tankers.

Other than the *Audacity*, Britain completed only five escort carriers of its own, all conversions from mercantile hulls. They were similar to contemporary American C-3 conversions, although generally somewhat larger. Thirty-eight of these, transferred under Lend-Lease, formed the core of the Royal Navy's escort carrier force throughout the war.

Escort carriers, initially conceived as platforms providing air cover for convoys, soon expanded their activities into a wide variety of tasks. In the U.S. Navy, escort carriers formed the core of specialized antisubmarine hunter-killer groups, provided close air support for landings, served as replenishment carriers and aircraft transports, and operated as training flight decks. In addition, during 1942 the Sangamons took on fleet carrier assignments to compensate for shortages of first-line vessels.

The Royal Navy employed its escort carriers in much the same way. Its own shortage of large carriers, however, and its operational responsibilities within more confined waters led it to assign escort carriers additional frontline duties. The small carriers operated in strike roles either within a larger force or as autonomous units in the East Indies, the Aegean, and off the Norwegian coast, including in the attacks on the German battleship *Tirpitz*. Escort carriers also provided night-fighter coverage for the British Pacific Fleet.

To circumvent 1922 Washington Treaty quantitative limitations, Japan designed several fast naval auxiliaries and passenger liners for quick conversion into carriers. Beginning in

1940, conversions from five auxiliaries and three liners joined the Combined Fleet as frontline light fleet carriers. Japan also completed several mercantile conversions similar in capability to the British and American escort carriers. However, unlike the Allied vessels, these were designed and usually were deployed as integral components of Japan's main carrier force. In addition, Japan converted one Yamato-class battleship hull, the *Shinano*, into a huge carrier that never entered operational service, and it commenced conversion of an incomplete cruiser as a light fleet carrier.

The United States, too, deployed converted warships—the nine Independence-class light fleet carriers based on Cleveland-class cruiser hulls formed an integral part of the fast carrier force from early 1943. Although conceived as first-line units, their design owed much to plans for the escort carriers, and their operational limitations made them suitable only for emergency service.

Britain also appreciated the need for smaller, less sophisticated carriers that could enter service more quickly, but it chose to construct new vessels rather than convert existing hulls. The design was similar to that of the larger fleet carriers, but the carrier was unarmored. Britain also deliberately conformed to mercantile rather than naval standards, since the Admiralty contemplated selling these vessels for conversion into passenger liners or fast cargo ships after the war, an interesting reversal of procedures! Four of this Colossus-class of light fleet carriers served with the British Pacific Fleet late in 1945, and they joined six sister ships to form the core of British carrier power into the later 1950s, since they proved very economical to operate.

France's converted carrier *Béarn* remained its only example throughout the war, serving mainly as an aircraft transport because of its low speed. France began building a pair of new carriers, the *Joffre* and the *Painlevé*, just before war began, but the fall of France in 1940 terminated construction. The final design incorporated a flight deck offset to port to minimize superstructure intrusion, a feature that has reappeared in several designs in recent years.

Before and during the war, Germany undertook some carrier construction. Its prewar design, the *Graf Zeppelin*, reached an advanced stage of construction by 1940, but subsequent reductions in priority, design changes, and disputes among the Kriegsmarine, the Luftwaffe, and the Reichs Luft Ministerium (Reich Air Ministry) over provision of aircraft and aircrew combined to prevent carrier completion before the war's end. A similar fate befell several conversion projects from merchant vessels and warships.

Italy evinced little interest in aircraft carriers before the war, subscribing to the position that geography would permit shore-based aircraft to provide entirely sufficient air cover and offensive strike potential for its fleet. Wartime experience led to a change in this view, and the Italian navy began two

conversions from mercantile hulls to create the fleet's first carriers. The *Aquila* was a sophisticated nearly total reconstruction of the liner *Roma* that was virtually complete when Italy surrendered in 1943. The Italians sabotaged the *Aquila* to prevent its use by Germany, and the ship subsequently was seriously damaged by Allied bombing and an attack using "chariots" (manned torpedoes) at Genoa. The hulk was scrapped after the war. Conversion of the liner *Augustus* into the *Sparviero*, a more austere vessel similar to Allied escort carriers, began in 1941, but she, too, was never completed.

Air power at sea came of age during World War II. The combination of unprecedented striking power (both in volume of ordnance and range of delivery), mobility, and flexibility of use transformed the aircraft carrier into the world's major fleets' new capital ship, a position it retains today.

Aisingioro P'u-i

See Aixinjueluo Puyi.

Aixinjueluo Puyi (Aisingioro P'u-i) (1906–1967)

Last emperor of China, more commonly remembered as the puppet ruler of Japanese-controlled Manchouguo (Manchukuo, formerly Manchuria) from 1932 to 1945. Born in Beijing (Peking) in Hebei (Hopeh) on 14 January 1906 and nicknamed Henry by his English tutor (he was known to westerners as Henry Puyi), Aixinjueluo Puyi (Aisingioro P'u-i) ascended the throne in December 1908, at age three, as Xuan Tong (Hsuan T'ung). During the Chinese Revolution of 1911–1912, the emperor's mother negotiated frantically with General Yuan Shikai (Yuan Shih-k'ai) for a settlement that would guarantee their lives and financial security. Ignoring

Aixinjueluo Puyi, pictured here in 1934. (The illustrated London News Picture Library)

the claims to the throne of Sun Yixian (Sun Yat-sen), Puyi abdicated in favor of Yuan, who was authorized to create a provisional republic and to establish national unity by embracing all anti-imperial forces.

Briefly restored in 1917 by the intrigues of warlord politics, Puyi was again deposed, and he finally sought refuge in the Japanese concession in Tianjin (Tientsin) in Hebei Province by 1924. In July 1931 his brother visited Japan and met with various rightist politicians. Shortly after the 1931 Mukden (Shenyang) Incident in Liaoning, representatives of the Guandong (Kwantung) Army visited Puyi to discuss the future of Manchuria, assuring him that they were merely interested in helping the people of Manchuria establish an independent nation. The Japanese military was vague about whether the new state would be a monarchy or a republic. Negotiations continued through the fall and winter of 1931–1932, and Puyi finally agreed to be smuggled to Manchuria by sea and to accept the title chief executive of the state of Manzhouguo. Tokyo belatedly recognized the army's creation in August 1932.

In 1934 the Guandong Army allowed Puyi to mount the throne as emperor of Manzhouguo (Manchoutikuo), the Manzhu (Manchu Empire), wearing imperial dragon robes

sent from the museum in Beijing. As “emperor,” Puyi served the Greater East Asia Co-prosperity Sphere loyally until 1945, including making a state visit to Tokyo.

When Soviet forces invaded Manzhouguo in August 1945, Puyi was dethroned and imprisoned. Released to Mao Zedong's (Mao Tse-tung's) China in 1950, Puyi was again imprisoned and subjected to reeducation programs until his “rehabilitation” in 1959. He spent his final years as a gardener in Beijing's botanical gardens until his death from cancer on 17 October 1967.

Alam Halfa, Battle of (31 August–7 September 1942)

North African battle between German Field Marshal Erwin Rommel's Afrika Korps and British Lieutenant General Bernard Law Montgomery's Eighth Army. Fearful that he would permanently lose the initiative to the Eighth Army after his advance was halted at the First Battle of El Alamein in July 1942, Rommel reorganized with the intention of resuming his advance toward Suez. Meanwhile, Montgomery assumed command of the British Eighth Army on 13 August and began planning for the offensive, all the while expecting Rommel to attack first.

Late on the evening of 30 August, Rommel attempted, as at Gazala, to get around Eighth Army's left flank although his force was weak in armor. With diversionary attacks designed to hold British forces along the coast, Rommel ordered the Afrika Korps east and south of Alam Halfa Ridge with the aim of swinging north to the Mediterranean coast behind Montgomery and enveloping the Eighth Army.

The Eighth Army had established a defense in depth, including strong positions on the Alam Halfa and Ruweisat Ridges, and Montgomery rejected any withdrawal. The 10th Armored Division, 22nd Armored Brigade, and 44th Division defended Alam Halfa, while the 7th Armored Division was south of the ridge. Montgomery ordered his armored units to

defend from their current positions rather than advancing to meet Rommel's panzers.

Slowed by British minefields and fuel shortages, Rommel's tanks did not reach Alam Halfa until the evening of 31 August. Daylight brought vicious Desert Air Force attacks against the Axis advance, and the 7th Armored Division's placement forced Rommel to swing north prematurely, into the teeth of a tank brigade on Alam Halfa Ridge. Fuel shortages prevented the Afrika Korps from outflanking Alam Halfa to the east, forcing Rommel onto the defensive there.

On 1 September, after a flank assault on the 22nd Armored Brigade failed and having suffered severe losses, Rommel

“I have become death, shatterer of worlds”

—Julius Robert Oppenheimer quoting the *Bhagavad Gita*

ordered his forces to retire to their original positions. The withdrawal, which began the next day, exposed the Afrika Korps to further devastating British aerial attacks. Rommel repulsed a counterattack by the 2nd New Zealand Division on the evening of 3 September, and Montgomery believed that he lacked the resources

to force a general Axis withdrawal, so he decided not to press his advantage for the time being. Certainly Rommel's past successes made Montgomery wary of pushing too far forward.

Montgomery had fought his first battle as commander of Eighth Army with great skill. Rommel now had no choice but to go on the defensive. He established positions between the Mediterranean and the Qattara Depression as both sides prepared for the Eighth Army's upcoming offensive: the Second Battle of El Alamein.

cient plutonium for several fission bombs, but scientists were unsure of the reliability of the implosion technique required to initiate a chain reaction and an explosion. Small-scale experiments were unrevealing, since nothing below critical mass can explode. Thus, Major General Leslie R. Groves, overall director of the MANHATTAN Project, authorized a full-scale test (known as Trinity) of the implosion technique. The Jornada del Muerto (Dead Man's Trail) near Alamogordo, New Mexico, was chosen as ground zero for the explosion. Isolated and ringed by peaks, the site helped to preserve secrecy and contain radioactive fallout, the effects of which were not yet then fully known.

Secured on top of a 100-ft steel tower, the device exploded at 5:30 A.M. on 16 July 1945. With a predicted minimal yield of 500 tons of trinitrotoluene (TNT) and an optimal yield of 5,000 tons if all parts functioned synergistically, the device actually produced a yield of 20,000 tons of TNT. Accompanied by a powerful shock wave and an awesome roar, the device vaporized the tower, creating a crater 400 yards in diameter. A mushroom cloud rose to 41,000 ft; the explosion was heard from 100 miles away, and the light produced was seen from 200 miles. To allay concerns of local residents, army officials reported that an ammunition dump had blown up.

Scientists were awestruck by the power of the explosion. Julius Robert Oppenheimer famously recalled the god Vishnu's line from the *Bhagavad Gita*: “I have become death, shatterer of worlds.” Groves predicted, “The war's over.” A report was quickly passed to President Harry S Truman at Potsdam, whose negotiating stance with Josef Stalin hardened considerably based on the stunning results of the Trinity test.

The Trinity test site is located on White Sands Missile Range. It is open to the public twice a year: the first Saturday in April and the first Saturday in October.

Albania, Role in the War

During World War II, Albania was the springboard for the Italian invasion of Greece and the scene of anti-Axis guerrilla warfare. Having dominated Albania politically and economically for some time, Italian dictator Benito Mussolini planned a formal annexation of Albania in the spring of 1939. Italian troops invaded the small mountainous country on 7 April 1939 and met only light resistance, although a small force led by Colonel Abas Kupa held the Italians at Durazzo for 36 hours, sufficient time for Albanian King Zog and his family to escape. On 16 April 1939, King Victor Emmanuel III of Italy accepted the Albanian crown, and a profascist government was installed. Britain, still hoping to prevent an alliance between Mussolini and Adolf Hitler, acceded to the annexation, but the Greeks prepared to resist an inevitable Italian invasion of their own country, which occurred on 28 October 1940.

Already, earlier in 1940, Britain's Special Operations Executive (SOE) had attempted to create a united-front movement under Abas Kupa and to stimulate a revolt against the Italians in northern Albania. The effort began well, but it faltered after the German conquest of Yugoslavia in April 1941 and the subsequent transfer of Kosovo Province from Yugoslavia to Albania. However, as Axis fortunes waned in 1943, Albanian resistance revived.

In the mountains of southern Albania, the Communists, encouraged by Tito (Josip Broz), leader of the Yugoslav Partisans, coalesced under Enver Hoxha. Liberal landowners and intellectuals formed the Balli Kombetar (National Front) resistance movement. In central and northern Albania, Abas Kupa and various tribal leaders also formed resistance groups. SOE agents Colonel Neil McLean and Major David Smiley were sent into southern Albania, and they subsequently recommended that the British provide aid to both Hoxha's partisans and the Balli Kombetar.

The disintegration of the Italian forces in Albania following the overthrow of Mussolini in September 1943 provided the Albanian guerrillas with arms and other supplies captured from or abandoned by the Italians. The Germans quickly sent in troops to clear out the remaining Italian forces, savagely repressed the local population, and "restored Albanian independence." The Germans created a government under Mehdi Frasheri, but it was able to control only the main towns and coastal plain. The rest of Albania descended into chaos as various guerrilla chieftains fought for power.

The British Balkan Air Force headquarters at Bari controlled the support to anti-Axis guerrillas in the Balkans and was decidedly pro-Partisan, in both Albania and Yugoslavia. The British hoped to use all of the Albanian resistance forces to harass the German withdrawal from Greece, which began in September 1944. But when Hoxha's Communists attacked the Balli Kombetar and Abas Kupa instead, the British cut

off aid to the non-Communist resistance groups, thereby ensuring their defeat. Kupa and the Balli Kombetar leaders were evacuated to Italy with the McLean SOE mission, and the Communists were left to take over Albania. With Yugoslav support, Hoxha seized power on 29 November 1944, and the People's Republic of Albania was recognized by the Allies. Albanians subsequently developed anti-Western views and supported an isolated Stalinist regime for nearly half a century.

Aleutian Islands Campaign (1942–1943)

Military campaign for a 1,100-mile-long chain of U.S. islands stretching west from Alaska in the Bering Sea toward northern Japan. Though the Aleutians had a negligible population, no useful resources, and extreme climatic conditions that made them unsuitable for major military staging bases, they were nonetheless the scene of bitter fighting between the United States and Canada on the one hand and Japan on the other.

On 7 June 1942, elements of Japanese Vice Admiral Hoshigaya Boshiro's Northern Naval Task Force seized the Aleutian islands of Attu and Kiska. The Japanese aim was twofold: to support Japan's advance on Midway Island by luring U.S. forces away from there, and to gain bases in the Aleutians to deter U.S. attacks on the Japanese Kurile Islands. By May 1943 the Japanese had more than 2,500 men on Attu and more than 5,400 on Kiska.

This Japanese foothold on U.S. soil triggered a substantial response from the United States and Canada, which together would eventually commit more than 100,000 troops to this remote region. Rear Admiral Robert A. Theobald commanded Task Force 8, an array of sea, air, and land units charged with expelling the Japanese from the Aleutians. Theobald intended to interdict Japanese lines of communication into Attu and Kiska by isolating the Aleutian waters and engaging Japanese transports and warships where possible.

Initially, the Allies employed submarine attacks in the western Aleutians. When Rear Admiral Thomas C. Kinkaid replaced Theobald in January 1943, he doubled the effort to interdict Japanese supply convoys. On 26 March 1943, a small U.S. Navy task force intercepted and defeated a larger Japanese force of cruisers, destroyers, and transports in the Bat-

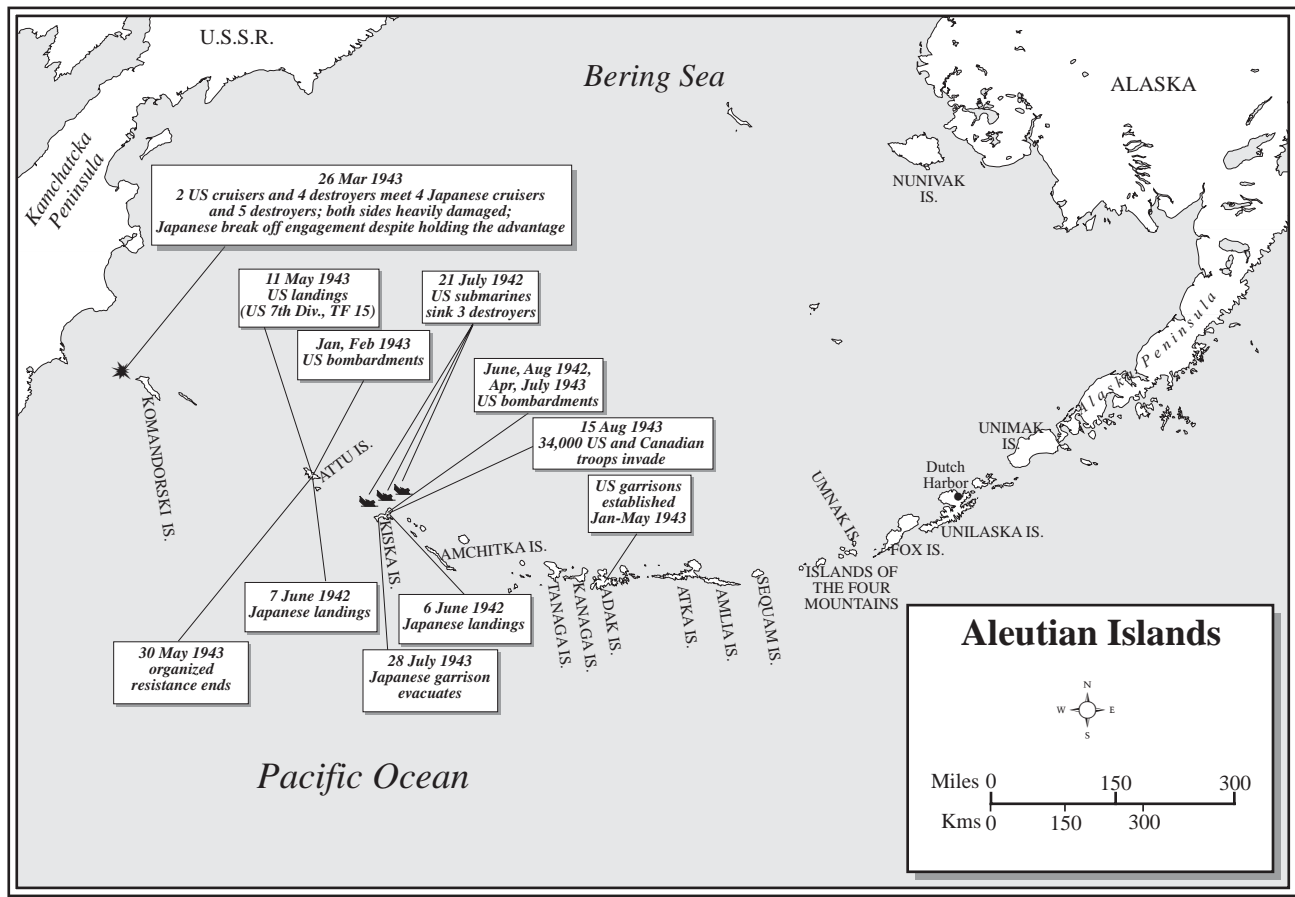

Attu, Aleutian Island, 4 June 1943. U.S. soldiers firing mortar shells over a ridge into a Japanese position. (Library of Congress)

tle of the Komandorski Islands. This action ended further Japanese surface resupply efforts.

Along with naval interdiction, U.S. and Canadian aircraft harassed the Japanese from bases in Alaska and the eastern Aleutians. In August 1942, U.S. forces established an airfield on Adak Island, from which bombers could strike Japanese in the western Aleutians. By September, Allied aircraft bombed targets on Kiska nearly every day for three weeks. The Japanese were forced to rely on submarines as the most dependable conveyance to ferry minimal subsistence supplies. By April 1943, the Allies had succeeded in tightening an air-sea noose around the Japanese bases.

Even so, U.S. commanders determined that an invasion of Attu and Kiska was necessary. One consideration focused on unpredictable weather, especially fog, which could cloak naval activity and allow the Japanese to reclaim control of the seas. The U.S. 7th Infantry Division was designated as the landing force, and it received amphibious warfare training at Fort Ord, California, until April when it deployed north for operations. Attu was chosen as the first objective, because intelligence estimated Japanese troops there to be only 500 men, considerably fewer than on Kiska.

The 7th Division landed on Attu on 11 May 1943 with almost 11,000 men. At first, U.S. commanders thought they had surprised the Japanese when they met no resistance at the shoreline. However, as American troops traversed through mushy tundra and ascended mountains ranging more than

2,000 to 3,000 ft above sea level, they discovered more than 2,500 Japanese waiting in trenches along ridgelines, using the inhospitable terrain to their advantage. The supply-starved Japanese troops conducted a stubborn defense that exacted a heavy toll on the U.S. force. After 19 days of attrition defense, the Japanese conducted a final banzai suicide attack with more than 600 soldiers, many of whom blew themselves up with grenades rather than surrender. U.S. losses were 561 killed and 1,136 wounded. Only 28 Japanese were taken prisoner.

After the loss of Attu, the Japanese decided to evacuate the 5,400 troops remaining on Kiska. On the night of 28 July, while U.S. ships were off refueling in foggy weather, two Japanese cruisers and six destroyers, entered Kiska harbor and in one hour evacuated their troops from the island. Not knowing about the evacuation, on 16 August the Allies conducted the planned amphibious assault on Kiska with more than 34,000 U.S. and Canadian troops. It took the Allies several days to realize the Japanese had departed, but the operation cost some 300 casualties from friendly fire and Japanese booby traps.

The campaign in the Aleutians was an indecisive one that challenged both Japanese and Allied planners. In the end, the Allies removed the Japanese from the two islands, but at great cost in resources committed and for only questionable gain.

Alexander, Sir Harold Rupert Leofric George (First Earl Alexander of Tunis) (1891–1969)

British army general. Born on 10 December 1891 in London, Harold Alexander was educated at Harrow and Sandhurst and commissioned in the Irish Guards in 1911. He served on the Western Front during World War I and rose to command a battalion and, temporarily, a brigade, ending the war a lieutenant colonel. Following the war he helped organize military

forces in Latvia in 1919. He then graduated from the Staff College at Camberley and the Imperial Defence College and held staff assignments, first at the War Office and then in the Northern Command. From 1934 to 1938, he commanded the Nowshera Brigade of the Northern Command in India as a brigadier general. On his return to Britain in 1938, he was advanced to major general and received command of the 1st Division.

Alexander's division was sent to France, where he distinguished himself during the Battle for France by commanding the British rear guard to Dunkerque, I Corps, and the Dunkerque perimeter. Promoted to lieutenant general in December 1940, Alexander had charge of Southern Command in Britain. In February 1942, Alexander received command of British forces in Burma. Recalled to Europe, that July he became commander of British forces in the Middle East. There he worked well with Eighth Army Commander General Bernard Law Montgomery as well as other Allied leaders. He

undoubtedly played a key role in building up British forces for the Battle of El Alamein in October 1942.

Alexander attended the Casablanca Conference in January 1943, after which he became deputy supreme commander of Allied forces in North Africa and commander of the 18th Army Group. Alexander initially had a low opinion of U.S. Army generals and thought that American forces were poorly trained. He realized that cooperation with the Americans was vital but gave greater latitude to British commanders.

Appointed commander in chief of 15th Army Group for the invasion of Sicily in July 1943, Alexander failed to maintain adequate control over his subordinates, Montgomery and U.S. Major General George S. Patton Jr., each of whom sought the preeminent role. Alexander then directed the Allied invasion of Italy in September. Again the command was hindered by rivalries between his subordinates and grandstanding by Lieutenant General Mark W. Clark. His command in Italy, however, brought Alexander promotion

to field marshal in November 1944 and elevation to the position of supreme Allied commander in the Mediterranean.

On 1 May 1945, German forces in Italy surrendered unconditionally, and that October, Alexander handed over his Italian command. In January 1946 he was named Viscount Alexander of Tunis. Not a great general, Alexander was nonetheless regarded as an excellent strategist who never lost a battle.

From 1946 to 1952, Alexander was the appointed governor general of Canada. Named Earl Alexander of Tunis in January 1952, he served from February 1952 to October 1954 as minister of defense in Britain. Alexander died in Slough, England, on 16 June 1969.

Allied Military Tribunals after the War

Following the conclusion of World War II, leading figures of the German and Japanese governments and armed forces were prosecuted on war crimes charges. The trials of the principal figures took place at Nuremberg in Germany and Tokyo in Japan.

In August 1945, representatives of the British, French, U.S., and Soviet governments, meeting in London, signed an agreement that created the International Military Tribunal and set ground rules for the trial. To avoid using words such as *law* or *code*, the document was named *The London Charter of the International Military Tribunal*. It combined elements of Anglo-American and continental European law. Defendants' rights and the rules of evidence differed in several ways from those in American courtrooms.

The four nations issued indictments against 24 persons and 6 organizations in October 1945. The counts of the charges were as follows: (1) conspiracy to wage aggressive war; (2) waging aggressive war, or crimes against peace; (3)

war crimes; and (4) crimes against humanity. Of 22 defendants, 3 were acquitted, 12 were sentenced to death, and the remainder received prison terms. At the conclusion of this trial, 6 Nazi organizations were charged: the Sturmabteilungen (SA), the Reichsregierung (cabinet of the Reich), the General Staff and High Command of the German armed forces, the Schutzstaffel (SS, bodyguard units), the Gestapo, and the Corps of the Political Leaders of the Nazi Party. The first organization was not convicted, and the next two had so few members that the Allies decided simply to deal with the individuals who had belonged to these organizations. The last three organizations were found guilty, making it possible later to convict individuals on the basis of them having belonged to these organizations.

On 9 December 1946, the so-called Doctors' Trial opened, conducted by the Allies. It dealt with individuals associated with the Nazi euthanasia program. A total of 23 individuals were indicted for their involvement. On 20 August 1947, the court proclaimed 16 of them guilty; 7 were sentenced to death and executed on 2 June 1948. In secondary trials before that, 22 of 31 doctors charged were found guilty and sentenced to death at Buchenwald, the concentration camp where many of their crimes were committed.

The Allied occupying powers also conducted individual war crimes trials in their zones of occupation. The Americans were by far the most fervent in their pursuit of justice, scheduling more than 169,000 trials. Although fewer were actually held, the Americans did sentence 9,000 Germans to prison terms, and others were fined. The British and French were not greatly interested in prosecuting war criminals; the British held 2,296 trials in their zone. The Soviets Union was perhaps the least interested in such legal proceedings.

Trials continued under the Federal Republic of Germany but with little punishment for the guilty. Alfred Krupp served only three years in prison for conscripting slave labor in his industrial enterprises, and on his release his empire was restored to him. The chemical firm of I. G. Farben was not broken up. From 1975 to 1981 the government prosecuted 15 individuals associated with the Majdanek concentration camp. Only 1 person was found guilty of murder, and 5 were acquitted.

In January 1946, General Douglas MacArthur approved a charter to inaugurate the International Military Tribunal for the Far East (IMTFE), which was dominated by the United States. On 3 May 1946, the IMTFE opened with the trial of 28 of 80 Class A Japanese war criminals at Tokyo. The hearings covered crimes that occurred between 1928 and the Japanese surrender in August 1945. The indictments were based on the concept of war crimes that had been stipulated at Nuremberg—that is, crimes against peace, crimes against humanity, war crimes, and aggressive war. However, in the Tokyo proceedings, there was no assumption of collective guilt as

in the case of Germany, and thus no organizations were charged. Of the 28 defendants, 19 were professional military men and 9 were civilians. The prosecution team was made up of justices from 11 Allied nations: Australia, Canada, China, France, Great Britain, India, the Netherlands, New Zealand, the Philippines, the Soviet Union, and the United States. Indictments accused the defendants of promoting a plan of conquest and the commission of both war crimes and crimes against humanity.

On 4 November 1948, the sentences were meted out: 2 defendants had died; 1 was considered insane; 7 were sentenced to death; 16 were sentenced to life imprisonment; and the rest were given jail terms. Japanese Emperor Hirohito, in whose name so many war crimes had been committed, was not charged. A second group of 23 men and a third group of 19 men were never brought to trial, and the men were released in 1947 and 1948, respectively. All those sentenced to prison were released over the next several years. No trials of the infamous Japanese Unit 731, which would have been akin to the Doctors' Trial in Germany, were conducted. Prosecution was not pursued because of a bargain struck by the U.S. government to drop prosecution in return for all information on experiments in germ and biological warfare on human guinea pigs, including U.S. prisoners of war.

The British carried out minor war crimes trials of Japanese nationals in Southeast Asia, and other countries also held war crimes trials for individuals guilty of these offenses in their national territories. In China, there were trials in 10 locations.

Alsace Campaign (November 1944–January 1945)

Allied campaign to capture Alsace from German forces. Formidable barriers to the east and west protected the plains of Alsace from invasion; to the east was the Rhine River and to the west the Vosges Mountains. The two primary gaps in the Vosges were the Belfort Gap and the Saverne Gap, with the former

defying capture by the German army both in 1870 and 1914. The vaunted Wehrmacht did what past German armies failed to do when Panzer Group Guderian penetrated the Belfort Gap in the French Campaign of 1940. German forces occupied Alsace until the Allied campaign of winter 1944–1945.

The Alsace Campaign was a joint American-French campaign to capture Alsace and reach the Rhine River. Lieutenant General Jacob Devers, commander of the Allied 6th Army Group, exercised overall control of the campaign. His forces consisted of the U.S. Seventh Army under Lieutenant General Alexander Patch and the First French Army under General Jean de Lattre de Tassigny. The VI and XV Corps made up the Seventh Army, and the First French Army consisted of the I and II Corps. Opposing was the German Nineteenth Army under General der Infanterie (U.S. equiv. lieutenant general) Freidrich Wiese. His army consisted of eight infantry divisions, six of which would be nearly destroyed in the campaign. Wiese's most reliable unit was the 11th Panzer Division (known as the Ghost Division for its fighting on the Eastern Front against the Soviet Union).

Ultimate control of the German forces, however, was in the hands of Army Group G Commander General der Panzertruppen (U.S. equiv. lieutenant general) Hermann Balck. Supreme Headquarters, Allied Expeditionary Forces (SHAEF) had low expectations for the campaign in Alsace; its attention was more clearly focused on the battles to the north involving the 12th and 21st Army Groups. General Devers was to clear the Germans from his front and secure crossings over the Rhine River. In the 6th Army Group zone, General Patch's XV Corps, commanded by Major General Wade Haislip, held the left, or northern, flank and was linked up with Lieutenant General George S. Patton's Third Army of the 12th Army Group. Next in line was the VI Corps under Major General Edward Brooks, who took over when Lieutenant General Lucian Truscott was reassigned. Holding the southern flank was the First French Army; this was also the southern flank of the entire Allied line.

The campaign in Alsace was to begin in coordination with the fighting to the north. The XV Corps was to jump off on 13 November 1944 and capture Sarrebourg and the Saverne Gap, then exploit its gains eastward while at the same time protecting Patton's flank. (Patton's offensive started on 8 November.) The VI Corps was scheduled to begin its campaign two days after the XV Corps started, or 15 November. It would attack in a northeasterly direction, break out onto the Alsatian plains, capture Strasbourg, and secure the west bank of the Rhine. Farther south, the First French Army was to commence operations on 13 November. The I and II Corps would force the Belfort Gap, capture the city of Belfort, and exploit its success. There was ample opportunity for spectacular success.

The XV Corps attacked in a snowstorm on 13 November with the 79th and 44th Divisions and the French 2nd Armored

French troops in Alsace, 1944. (Hulton-Deutsch Collection/Corbis)

Division. The 79th Division captured Sarrebourg on 21 November and advanced so quickly that General Patch directed XV Corps to capture Strasbourg if it could get there before VI Corps. On 23 November, elements of the French 2nd Armored Division liberated Strasbourg, capital of Alsace. The VI Corps began its attack on 15 November with the 3rd, 36th, 100th, and 103rd Divisions and achieved similar success. Crossing the Meurthe River, the 100th Division penetrated the German “Winter Line” on 19 November, a position that quickly crumbled. The attack in the First French Army sector began on 13 November. The French troops successfully breached the Belfort Gap, and elements of the 1st Armored Division of I Corps reached the Rhine on 19 November, the first Allied troops in the 6th Army Group zone to do so.

In the midst of this success in the 6th Army Group zone, Generals Dwight D. Eisenhower and Omar N. Bradley met with Devers and Patch on 24 November. The result was an order for the Seventh Army to turn northward and attack the West Wall (the series of fortifications protecting Germany’s western frontier) along with Patton’s Third Army. The XV and VI Corps, minus

two divisions, were subsequently turned northward while the First French Army and the 3rd and 36th Divisions focused their attention on German troops around the city of Colmar.

The attack northward began on 5 December, with the XV Corps on the left and the VI Corps on the right. After 10 days of heavy fighting, elements of the VI Corps entered Germany on 15 December. The 100th Division’s effort around the French city Bitche was so fierce that it was given the sobriquet “Sons of Bitche.” The Seventh Army offensive was halted on 20 December to enable it to cooperate with the Allied defense in the Ardennes.

The German troops in the 6th Army Group front planned an offensive for late December 1944, known as Operation NORDWIND. Just before midnight on New Year’s Eve, the onslaught commenced. Through much of January 1945, the attack forced Allied troops to give ground. Eisenhower even toyed with the idea of abandoning Strasbourg, but General Charles de Gaulle vehemently opposed such a plan. The city was held, and by 25 January, the German offensive petered out and the German forces withdrew.

With the German attack defeated, the only Wehrmacht troops remaining in Alsace were located around Colmar. The First French Army was assigned the responsibility of reducing the Colmar pocket, and it began this task on 20 January 1945. The I Corps attacked the southern flank of the pocket, while the II Corps assaulted the northern flank. The plan was for the two forces to meet at the Rhine, enveloping the pocket. On 2 February, the city of Colmar was captured, and by 5 February, German resistance ended. The campaign in Alsace was over. Although overshadowed by the 12th and 21st Army Groups to the north, General Devers's 6th Army Group had contributed an important accomplishment.

Altmark Incident (16 February 1940)

World War II British navy seizure of a German merchant ship within Norwegian territorial waters. The *Altmark* was a supply ship serving the German pocket battleship *Graf Spee* in the South Atlantic. She also became a prison ship, taking aboard survivors from the nine ships sunk by the *Graf Spee*. Since the outbreak of war, ships of the Royal Navy had been searching for the *Graf Spee* and her supply ships. On 13 December 1939, in the Battle of Río de la Plata, British cruisers located the *Graf Spee* and damaged her. Believing that the British had assembled a superior force, the *Graf Spee*'s captain then scuttled her. The *Altmark*, which had refueled the pocket battleship just prior to her last fight, departed the South Atlantic in late January 1940 for Hamburg. Commanded by Captain Heinrich Dau, she reached the Norwegian coast on 12 February 1940.

On 14 February, the *Altmark* entered Norwegian territorial waters at Trondheim. Although Norwegian naval vessels twice stopped the *Altmark*, Dau hid his ship's guns below and

claimed he had no prisoners on board. He resisted any effort to search his vessel on the grounds that she was a German naval ship, immune to search. Despite misgivings and suspecting the nature of the cargo, the Norwegians allowed the *Altmark* to proceed. Norwegian officials did not want to create an incident that might be used to precipitate a German invasion of their neutral country. Word of events, however, reached the British Embassy at Oslo, and the naval attaché there informed the British Admiralty of the situation. On 16 February 1940, after British planes had located the *Altmark*, Captain Philip Vian's destroyer flotilla cornered the *Altmark* near Jössing fjord within Norwegian territorial waters. The Norwegian gunboat *Skarv* hampered the British Navy's efforts to force *Altmark* to sea, and the German supply ship then slipped into the fjord.

In London, meanwhile, the War Cabinet met concerning the situation and the reports that the *Altmark* had on board some 300 British seamen, who were in fact being held below deck in difficult conditions. First Lord of the Admiralty Winston L. S. Churchill personally authorized the boarding and search of the *Altmark* and liberation of her prisoners.

At 11:00 P.M. on 16 February, Vian's flagship, the destroyer *Cossack*, entered the fjord. *Altmark* tried to ram the destroyer, but expert British ship handling saved *Cossack* from damage. As the two ships brushed together, some of the boarding party leaped across to the German ship. *Cossack* then again closed, the remainder of the boarding party followed, and *Cossack* backed clear. In a brief fight, 7 *Altmark* crew members were killed and 299 British prisoners were freed.

The *Altmark* incident was definitely an infringement of Norway's neutrality by Britain. Neutral countries could no longer be certain of their inviolability in this war. This incident caused Hitler on 19 February to order an acceleration in his plans to invade Norway, Operation WESERÜBUNG. After they had conquered Norway, the Germans erected a commemorative marker at Jössing fjord reading (in German), "Here on 16 February 1940 the *Altmark* was attacked by British sea-pirates."

tee was established in July 1940 as the presidential election approached. Both Republicans and Democrats nominated pro-Allied candidates, and some prominent Americans were convinced that the United States was in grave danger of being needlessly and foolishly drawn into World War II. The organization's founders included several Midwestern businessmen, including Robert E. Wood of Sears, Roebuck and Robert Douglas Stuart of Quaker Oats, who provided much of the organization's financial support.

Most America First members were Midwestern Republicans, many from the party's conservative wing. Some, though, such as Governor Philip La Follette of Wisconsin and Senator Gerald P. Nye, were political liberals or even radicals. America First also included a contingent of liberal Democrats, such as Chester Bowles and Kingman Brewster of Connecticut, and the radical historian Charles A. Beard. Colonel Charles A. Lindbergh, the famed aviator, was its most celebrated member, and former President Herbert Hoover, although he held aloof so as not to compromise his efforts to feed children in occupied Western Europe, sympathized strongly with the group's stance.

America First members generally united around the belief that the European crisis did not threaten the security of the United States sufficiently to justify American intervention. They also believed that American involvement in war would be highly detrimental to the United States domestically. While supporting measures to strengthen U.S. defenses, they generally opposed, albeit with little success—especially after President Franklin D. Roosevelt's electoral victory in November 1940—many measures the administration introduced. The latter included the establishment of Selective Service (September 1940), the 1940 Destroyers-for-Bases deal, Lend-Lease (March 1941 military aid program to various nations), and the administration's aggressive naval policies against Germany in the Atlantic. America First members opposed these on the grounds that they were moving the United States ever closer to war with Germany. After Pearl Harbor, America First members, despite lingering private misgivings over past administration policies, largely rallied around the wartime president. On 22 April 1942, the organization was officially dissolved.

Amphibious Warfare

The projection of sea-based ground forces onto land. Amphibious warfare was more widely conducted in World War II than in any previous conflict and on a greater scale than ever before or since.

Involving all aspects of naval and military operations—from mine warfare to air and ground combat—amphibious operations are the most complex and risky of all military endeavors. The basic principles had been established in World War I and the postwar period, but the lessons were largely ignored by most military leaders except those in the Soviet Union, the U.S. Marine Corps (USMC), and Germany's Landungspionieren (Landing Pioneers). The Royal Navy concluded that the British Gallipoli operation had demonstrated a successful amphibious assault was impossible in modern war.

Meanwhile, the Japanese navy and army developed separate procedures, forces, and equipment to conduct amphibious operations, and they had the good fortune to carry out their early assaults against undefended beaches in the late 1930s in China and in the early campaigns of the Pacific war. The German navy had no interest in amphibious operations before the war, but ironically, Germany initiated the war's first large-scale amphibious operation when it invaded Norway in April 1940. It was the Allies, however, who demonstrated true mastery of the amphibious art. In the end, they landed more than 4 million troops in five major amphibious assaults, dozens of tactical landings, and countless raids

along German-occupied coasts of Europe. Amphibious operations provided the western Allies with their only means of taking the ground war to the European Axis countries. In the Pacific Theater, there was no Allied victory without amphibious warfare.

Amphibious operations come in three levels—strategic, operational, and tactical—depending on the intended objectives. The Allied landings in France, the Philippines, and Italy and the planned invasion of Japan represent strategic landings intended to have a decisive impact on the war. The North African landings (Operation TORCH), the German assaults on the Dodecanese Islands, and most of the Allied assaults in the Pacific were operational-level landings that supported a specific campaign, each part of an overall strategic effort. Soviet landings and most Allied commando raids were tactical-level operations against limited objectives, although some had a strategic impact (capturing German codes, radars, and so on). The Dunkerque and Crete evacuations are difficult to categorize, but most observers would describe them as operational-level efforts.

Amphibious operations also fall into four types: raids, assaults, evacuations, and administrative (noncombat) landings. The first of these is the most dangerous since it generally occurs in an area of enemy superiority and involves elements of both an assault and an evacuation. An administrative landing is the safest, being conducted in a benign environment with no enemy ground, air, or naval forces present. Assaults and evacuations face varying levels of risk, depending on the defender's strength and support. The German invasion of Norway is an example of an assault, although most of its troops landed under circumstances approaching that of an administrative landing. Britain's Dunkerque evacuation was the war's first major combat evacuation, while Germany's naval evacuation of its forces from the Baltic at the end of the war was the conflict's largest such operation.

The phases of amphibious operations evolved as the war progressed. In 1939 the German army was the only service to recognize the need to rehearse landings and procedures for a specific landing. By 1943, every major military leader realized the necessity to practice for a specific landing. Then, as today, amphibious operations were broken down into five phases: (1) planning, (2) embarkation, (3) rehearsal, (4) movement to the objective area, and (5) the assault. Soviet doctrine added a sixth phase, the landing of the follow-on army forces.

Necessarily, the Japanese military was much interested in amphibious warfare in the 1930s. The Japanese pioneered development of ramp front-end landing craft, later copied by other countries including the United States. The Imperial Japanese Army used amphibious landings to outflank British forces in Malaya and to invade the Philippines and other Pacific islands. In Malaya and the Philippines, the army used its own ships and land-based aircraft to support the opera-

A Water Buffalo, loaded with Marines, churns through the sea bound for beaches of Tinian Island in the Marianas, July 1944. (Still Picture Records LICON, Special Media Archives Services Division (NWCS-S), National Archives)

tions, receiving little or no assistance from the navy other than to have its navy's ships attack those of enemy naval forces. The Japanese navy had its own specialized naval landing troops to execute its amphibious assaults on Wake and other Pacific islands. The assault on the Netherlands East Indies was the only time Japan's two services cooperated in the execution of an amphibious invasion, and there, as in Malaya, the landing beaches were not defended. In cases where the beaches were defended, the Japanese suffered heavy losses, as at Wake.

The Soviet Union had a specialized amphibious force of naval infantry at war's start, but they lacked equipment and training. They were expected to land on the beach using ships' boats or other improvised transport. Soviet doctrine called for naval infantry to conduct amphibious raids and support the army's landing by seizing and holding the beachhead while conventional forces disembarked behind them. Although this approach economized on the number of troops requiring specialized amphibious assault training, it proved costly in combat, as any delays in the follow-on landing left the naval infantry dangerously exposed to counterattack. As a result, Soviet naval infantry suffered heavy casualties in their

amphibious assaults but one can argue they led the Allied way in these operations. On 23 September 1941, the Soviet Black Sea Fleet conducted the Allies' first amphibious assault, when Captain Sergei Gorshkov landed a naval infantry regiment against the coastal flanks of the Romanian army besieging Odessa. The action eliminated the Romanian threat to the city's harbor. In fact, amphibious raids and assaults figured prominently in Soviet naval operations along Germany's Black and Arctic Sea flanks, with the Soviets conducting more than 150 amphibious raids and assaults during the war.

However, there was little to no cross-fertilization of ideas or lessons learned among the Allies regarding amphibious landings, particularly between the European and Pacific Theaters. This lack was largely because of antipathy and parochialism among service leaders, but the primary contributing factor was the differing military challenges posed by the Japanese and European Axis countries. The Japanese army had few mechanized units, no heavy tanks, and little artillery, but it was much better at camouflage and improvised defenses than the Germans or Italians. The Germans, conversely, rapidly reinforced their beach defenders with heavily mechanized ("mech-heavy") forces and heavy

artillery, and they employed more extensive minefields and beach obstacles than did the Japanese. These differences shaped Allied doctrine and tactics in their respective theaters.

Prime Minister Winston L. S. Churchill forced Britain to develop an amphibious warfare capability with the formation of Combined Operations Command. Beginning in June 1940, this organization conducted amphibious commando raids along the coasts of German-occupied Europe. Gradually, such amphibious raids became more effective as lessons were learned, expertise expanded, and training improved. But, Britain's assault tactics and equipment were driven primarily by lessons learned from the unsuccessful Dieppe raid in August 1942. The beach obstacles, extensive minefield belts, and overlapping antitank and artillery fire proved devastating, suggesting to the British a need for specialized vehicles and equipment. Those "funnies" were ready by the 1944 Normandy landings, but not in time for the earlier Allied landings in North Africa and Italy.

The U.S. Army, present in only a limited capacity at Dieppe, saw little requirement for specialized amphibious equipment, other than landing craft, but it did see a need to remove beach obstacles and isolate the beachhead from enemy reinforcement. The smaller land areas and lack of a mech-heavy counterattack threat obviated the need to isolate Pacific assault beaches from reinforcements. Hence, airborne operations were not endemic to Pacific Theater amphibious assaults, although they were planned for the invasion of Japan.

Operation TORCH in North Africa in November 1942 was the western Allies' first amphibious assault against a defended beach in the European Theater, albeit not a heavily contested one; but it provided the foundations for American amphibious warfare doctrine in Europe. The TORCH landings saw the first employment of underwater demolition teams (UDTs) and the specialized amphibious landing ships that were so critical to getting forces ashore quickly. The tank landing ships were particularly important since they enabled tanks to land directly on the assault beach. Although many mistakes were made in planning and execution of TORCH, it established the basic foundations for all future Allied assaults in the west. All subsequent landings were preceded by special forces, such as UDT and commandos, to remove obstacles and seize key terrain and defensive features before the main assault force approached the beach. Operation TORCH also exposed the need to rehearse the actual landings well in advance of the assault to ensure a smooth and rapid disembarkation. Additional lessons about air and naval support were gained from the Sicily and Salerno landings. More significantly, procedures and equipment were developed to accelerate the pace of force buildup ashore. That it was a successful effort can best be measured by the success of the Normandy landings, which placed six divisions ashore in less than 24 hours and nearly 1 million men and their equipment in France in less than a week—a phenomenal accomplishment.

The almost disastrous Tarawa landing was the pivotal experience that shaped the Navy–Marine Corps team's amphibious warfare doctrine. The failure to chart and survey the offshore waters meant that hundreds of Marines had to wade half a mile in shoulder-deep water under heavy Japanese fire. Casualties in the first wave amounted to more than 85 percent killed or wounded. Naval air and gunfire support was poorly planned and coordinated, leaving the Marines to win by sheer force of will and superior combat cohesion ashore. All subsequent landings enjoyed extensive pre-assault UDT beach surveys. Fire-support plans were refined, and pre-assault advanced-force operations became more extensive and powerful. Firepower for the assaulting troops was substantially increased in terms of automatic weapons, demolitions, and flamethrowers. After Tarawa, as in Europe after Sicily, amphibious assaults in the Pacific enjoyed extensive pre-assault rehearsals and practice landings. Unlike in Europe, the Marines developed specialized amphibious vehicles and equipment to facilitate their movement ashore and to provide some armored-vehicle support to the first landing wave.

Germany did not generate a capacity to land troops against determined opposition until well into 1942. By then, Germany's strategic situation precluded such operations, except in very limited and special circumstances. However, amphibious operations were critical to the Allied war effort. They enabled the Soviets to threaten the Axis powers' extreme flanks throughout the Eastern Campaign. Thus the Soviets were able to divert Axis forces away from the front and facilitate Soviet offensive efforts in the war's final two years. The western Allies could never have contributed to Germany's defeat nor beaten Japan had they not mastered amphibious operations, the most complex of all military activities. The war firmly established the amphibious operations procedures that are used by all Western nations to this day.

Anami Korechika (1887–1945)

Japanese army general and army minister. Born in Oita on 21 February 1887, Anami Korechika graduated from Military Academy in 1905. He was military aide to Emperor Hirohito from 1926 to 1932. Promoted to colonel in 1930, he commanded the Imperial Guards Regiment during 1933–1934, and he headed the Tokyo Military Preparatory School from 1934 to 1936. He was promoted to major general in 1935 and to lieutenant general in 1938, when he took command of the 109th Division. During 1940–1941, he was vice minister of war. Anami commanded the Eleventh Army in central China from April 1941 to July 1942. He next headed the Second Army in Manchuria and was promoted to full general in 1943.

In December 1944, Anami became inspector general of army aviation. Highly regarded within the army, in April 1945 he became army minister in the government of Prime Minister Suzuki Kantarō. Anami was one of those who urged that Japan continue the war. Even after the atomic bombing of Hiroshima on 6 August 1945 and the Soviet Union's declaration of war on Japan two days later, Anami continued to urge Emperor Hirohito to remain in the war. Anami believed that Japan could negotiate more satisfactory terms if it could inflict heavy losses on Allied forces invading the Japanese home islands. Foreign minister Tōgō Shigenori and Minister of the Navy Admiral Yonai Mitsumasa opposed Anami's position. In any case, Emperor Hirohito decided to accept the Potsdam Declaration and surrender. Anami and other hawks in the army plotted a military coup d'état, but Anami finally agreed to accept the surrender, and this development led to collapse of plans for a coup. Anami committed suicide in Tokyo on 15 August 1945, shortly before Hirohito's broadcast to the Japanese people.

Anders, Władysław (1892–1970)

Polish army general. Born to a peasant family in Błonie near Warsaw on 11 August 1892, Władysław Anders graduated from Saint Petersburg Military Academy in 1917. He served in the Polish Army Corps during World War I and, during the Poznan Rising of 1918–1919, as chief of staff in the Poznan army. He commanded a cavalry regiment during the Russo-Polish War of 1919–1920 and studied from 1921 to 1923 at the École

Supérieure de Guerre in Paris. An opponent of Józef Piłsudski's coup d'état in 1926, Anders became a general only in 1930.

In September 1939, when Germany invaded Poland, Anders commanded the Nowogródek Cavalry Brigade of the Polish "Modlin" army at the East Prussian border. During his brigade's subsequent withdrawal to southeastern Poland, the Soviet Union invaded Poland from the east and Anders was captured.

Imprisoned in Moscow's Lubyanka Prison, Anders was released following an understanding between the Polish government-in-exile and the Soviet Union. On 30 July 1941, General Władysław Sikorski and the Soviet ambassador to Great Britain, Ivan Majskij, agreed to restore diplomatic relations and form a Polish army on Soviet territory. That army was to be composed of Polish soldiers detained in the Soviet Union since 1939. Anders was appointed its commander in chief with the rank of lieutenant general.

Establishing his first headquarters at Buzuluk on the Volga, Anders continued to insist on the liberation of Polish prisoners withheld by Soviet authorities, but he had only limited success. In 1942 he was allowed to move his army to Yangi-Yul near Tashkent and then to Pahlevi in Persia, where his troops were no longer subordinate to the Soviet Supreme Command. Linking up with the British in Iran, Anders's newly formed II Polish Corps was transferred to North Africa and Italy. There it fought as a part of the British Eighth Army at Monte Cassino in May 1944. Its victory helped open the way to Rome for the Allies.

In the last stages of the war, Anders commanded all Polish forces in the west. After the war, he refused to return to Communist-ruled Poland and became a prominent member of the Polish émigré community. Anders died in London on 12 May 1970.

Anderson, Sir Kenneth Arthur Noel (1891–1959)

British army general. Born in India on 25 December 1891, Kenneth Anderson was commissioned in the British army on graduation from Sandhurst in 1911. He served in India and was a captain by 1915. In 1916, Anderson was badly wounded

in fighting at the Somme in France. In 1917, he took part in campaigns in Palestine and Syria.

Anderson attended the Army Staff College at Camberley, commanded a regiment on the Northwest Frontier of India, and served in Palestine from 1930 to 1932. Promoted to colonel in 1934, he commanded the 11th Infantry Brigade as part of the 3rd Infantry Division of the British Expeditionary Force (BEF) in France at the beginning of World War II. Toward the end of the withdrawal to Dunkerque, he took command of the 3rd Division. Promoted to major general, he held a variety of posts in the United Kingdom during the next two years, culminating in heading the Eastern Command.

In autumn 1942, Anderson became the senior British officer in Lieutenant General Dwight D. Eisenhower's U.S. headquarters in London. Although unpopular with many U.S. officers, Anderson was well liked by Eisenhower. Anderson commanded the Eastern Task Force in the Allied invasion of North Africa, Operation TORCH. Anderson's units landed at Algiers, although in respect to French sensibilities, an American, Major General Charles Ryder, commanded the actual landing. Anderson took over the day after the landing, and on 11 November 1942, he became head of the newly constituted British First Army and was concurrently promoted to lieutenant general. Anderson's acerbic nature and dour personality tinged with pessimism did not suit him for command of an Allied force.

Ordered to quickly advance eastward to Tunis, 500 miles away, Anderson had only four brigades at his disposal. Rugged terrain, poor weather, stiffening Axis defenses, and lack of transportation thwarted his offensive, which was stopped 12 miles short of its goal. In January 1943, Eisenhower added to Anderson's command the French XIX Corps and Major General Lloyd Fredenhall's U.S. II Corps. Field Marshal Erwin Rommel and General Hans Jürgen von Arnim then launched a series of counterattacks, most notably at Kasserine Pass during 14–22 February, that threw the Allied armies into disarray. Although there were efforts to replace Anderson, he remained in command of First Army, and his troops entered Tunis in May 1943.

Anderson returned to Britain to take over the British Second Army headquarters in June 1943 and began to plan for the invasion of France. In January 1944, however, Anderson was shifted to Eastern Command. From January 1945 to October 1946, Anderson headed the East Africa Command. During 1947–1952, he was governor and commander in chief of Gibraltar. Promoted to full general in 1949, he retired in 1952. Anderson died at Gibraltar on 29 April 1959.

Andrews, Frank Maxwell (1884–1943)

U.S. Army Air Forces general. Born in Nashville, Tennessee, on 3 February 1884, Frank Andrews graduated from the U.S. Military Academy in 1906 and was commissioned in the cavalry. He then held routine assignments in the American West, Hawaii, and the Philippines. When the United States entered World War I in 1917, Andrews transferred to the Signal Corps, and in 1918 he qualified as a military aviator, although too late to see active service in France. In mid-1920, Andrews succeeded Brigadier General William Mitchell as the Air Service officer of the American Army of Occupation in Germany.

Returning to the United States in 1923, Andrews then commanded the 1st Pursuit Group. He established several speed and altitude records until transferred to staff assignments. In March 1935, Andrews was promoted to temporary brigadier general and assigned to command General Headquarters (GHQ), Air Force. The new organization placed for the first time all the U.S. Army's air-strike elements under a single commander. He became a strong advocate of the four-engine strategic bomber that became the Boeing B-17 Flying Fortress, and he was certainly one of the leading architects of American military air power in the years before World War II. Andrews molded GHQ, Air Force into the offensive combat arm that became the model for the U.S. Army Air Forces in World War II. GHQ, Air Force was also the model of the Air Force's post-Cold War Air Combat Command.

In 1937, Andrews clashed seriously with elements in the Army General Staff when he forcefully advocated an air force as an independent service during testimony before the House Military Affairs Committee. In 1939, he was reassigned to an insignificant staff position at Fort Sam Houston, Texas, and reduced from his temporary rank of major general to his permanent rank of colonel. But just a few months later, General George C. Marshall became chief of staff of the U.S. Army; Marshall brought Andrews back to Washington and made him assistant chief of staff of the army for training and operations. Andrews was the first aviator to hold that key general staff position.

In 1941, Andrews took over the Caribbean Defense Command, becoming the first American air officer to command a

U.S. Army Lieutenant General Frank M. Andrews. (Corbis)

theater. In November 1942, he assumed command of U.S. forces in the Middle East. On 5 February 1943, Andrews became the supreme commander of U.S. forces in the European Theater of Operations (ETO). Three months later, on 3 May, Lieutenant General Andrews died at the controls of a B-24 bomber while attempting a landing at Kaldadarnes, Iceland, during poor visibility.

Andrews's appointment to command the ETO was a tacit recognition that the majority of American forces in Europe at the time were air rather than ground units. However, many contemporary observers at the time of his death considered him rather than Dwight Eisenhower the leading candidate for supreme Allied command of the invasion of the Continent. Andrews had the total confidence of General Marshall, and he possessed an almost ideal balance of intellect, character, courage, and military skill. Andrews Air Force Base in Maryland was later named for him.

Animals

During the war, animals fulfilled unique military support roles that humans and machines could not perform. Probably more horses were employed in the war than any other animal. Several were used as cavalry or dragoons by some powers in the war, but chiefly horses were used for transport—to pull artillery or transport supplies. The German army, often thought as being highly mechanized, in fact relied on large numbers of horses: a German infantry division of 1939 required between 4,000 and 6,000 horses, and even the panzer divisions used them. As late as 1944, an estimated 85 percent of German infantry divisions were horse drawn, with very few vehicles. Millions of horses were employed, and died, during the German invasion of the Soviet Union. The Japanese also used horses in Burma, and the Chinese soldiers often traded ponies captured from the Japanese to the Americans.

Many horses were killed for their meat in the Soviet Union and also elsewhere, as in the case of the 26th Cavalry's mounts in the Philippines. After the war, animals deemed in poor shape were destroyed, and their meat was distributed to the local population. Many healthy horses, mules, and oxen that had been captured were sent to countries to help develop agricultural programs for reconstruction.

Mules were also invaluable as pack animals during the conflict, and they saw service on many fronts. Mules could carry one-third of their half-ton weight. The military prized mules for being steady on their hooves despite rocky conditions and for their ability to follow trails even when paths seemed non-existent. U.S. forces employed mules first in North Africa at the end of 1942 and the next year in Sicily and Italy, where they proved particularly useful in mountainous terrain.

Most U.S. military mules were assigned to the China-Burma-India Theater, however. Shipped to the war zones via Liberty ships, mules were then sent on to base camps via the railroads. Mules transported artillery, crew-served weapons, and ammunition. Mules were distributed among transportation, demolition, communication, and reconnaissance platoons, and some were selected for use by medics and for casualty evacuation.

Mules could often be cantankerous, especially when being loaded into aircraft to fly from India over “the Hump” to China. Mules sometimes kicked soldiers and expressed fear when encountering elephants. Because mules could alert an enemy that Allied troops were approaching, veterinarians sometimes surgically removed their vocal cords to silence them.

U.S. Marine Raiders and their dogs, which were used for scouting and running messages, starting off for the jungle front lines on Bougainville, 1943. (National Archives)

Elephants proved useful to Allied and Japanese troops in the China-Burma-India Theater. Elephants could perform heavy work equivalent to that of a dozen people. Elephants were employed to transport supplies and to load cargo planes. One elephant, called Elmer, was often featured in the press and was shown lifting 55-gal fuel drums with his trunk to adjacent airplanes. Elephants were also used to string communication lines, especially in swampy locations where vehicles could not navigate.

Pigeons, cared for by various signal corps, carried messages between units and were essential during periods when radio silence was imposed. Thousands of soldiers, many of them pigeon fanciers, worked in the U.S. Army Pigeon Service, tending to some 54,000 pigeons. The British, Canadians, and Australians also organized pigeon units. Some Allied pigeons were trained to fly messages at night in an attempt to evade enemy fire. The Axis powers also used bird messengers.

Pigeons accompanied ground troops and were also deployed from submarines and seaplanes. Paratroopers often carried pigeons on their jumps. Pigeons flew hundreds of miles over land or water from behind enemy lines to their lofts. Equipped with small cameras, pigeons provided images of enemy troops and ships so officers could determine targets for future air raids. Messages carried by pigeon alerted offi-

cers to downed aircraft, grounded ships, and the need for plasma supplies. News pigeons carried timely dispatches from the front written by war correspondents.

War pigeons faced death not only from enemy weapons but also because of disease and birds of prey. Because of difficult jungle climates and high humidity, the militaries bred pigeons in those areas so that the offspring would be accustomed to tropical conditions. Pigeons were essential in some areas where jungle often prevented line and wireless communications from being effective. Many World War II pigeons received ranks and service awards. Some were buried with military honors, while others were mounted for display in museums.

Both Allied and Axis forces mobilized war dogs. British handlers and dogs prepared at the War Dogs Training Schools. The Soviets trained sledge dogs and placed mines on dogs that crawled underneath tanks prior to detonation. After the Japanese attack on Pearl Harbor, dog fanciers in the United States discussed the idea of establishing a system to identify and train war dogs for the military. World War I veteran Harry I. Caesar and poodle breeder Alene Erlanger communicated with quartermaster general Major General Edmund B. Gregory to form Dogs for Defense. This group encouraged patriotic Americans to donate dogs of suitable size and temperament for military service. Newspaper advertisements, posters, and movie reels promoted U.S. war dogs. Regional and state Dogs for Defense representatives recruited and evaluated the animals. Many people donated their dogs because they could not afford to feed them during the war. In any case, donors were not allowed any information as to the disposition of the dogs.

American Kennel Club dog shows sponsored war dog exhibitions and war dog classes to raise funds and identify dogs with qualities the military sought. War dogs were featured at the prestigious Westminster Kennel Club Dog Show. Throughout the country, war dog demonstrations and rallies were held, with themes such as “Back the Attack.” On the home front, war dogs guarded prisoner-of-war camps and defended industries from saboteurs. Other breeds, such as beagles, were used to assist in the rehabilitation of wounded veterans.

German-born trainers such as Willy Necker introduced effective training regimens at American war dog training and reception centers. Such facilities were distributed throughout the United States, with significant sites located at Front Royal, Virginia; San Carlos, California; and Fort Robinson, Nebraska. Necker left no doubt about his allegiance, teaching one dog to place its paw over its snout whenever it heard the name “Hitler.”

U.S. Marine war dog platoons trained at Camp Lejeune, North Carolina, and Camp Pendleton, California. Their mission was to locate enemy forces, mines, and booby traps. These dogs, mostly Doberman pinschers, guarded soldiers on patrol and alerted them to approaching enemy soldiers. The Marine dogs also transported supplies and messages. Each Marine division had an attached war dog platoon.

Germany mobilized an estimated 200,000 war dogs. Japan trained war dogs at Nanjing (Nanking) in China, and it had 25,000 trained before its attack on Pearl Harbor. The Japanese used black dogs for night service and white dogs to serve in snow.

After their service was completed, American war dogs were shipped to war dog centers for training to readjust to civilian life before returning to their families. Even after war dogs returned home, their owners did not know where their pets had served. War dog handlers formed closed attachments to their charges, and they often asked the dogs' owners if they could keep the dogs with which they had served. Heroic animals were often praised in newspaper accounts. Chips, perhaps the war's most famous dog, who helped capture Italian soldiers, gained notoriety for biting General Dwight D. Eisenhower. Newspapers reported awards presented to Chips and his handlers.

World War II motivated strange uses of animals. Camels provided the power for mills used to mix mortar. Mice in the Soviet Union chewed through German tank engine wires; the Germans responded by procuring cats to eat the mice. Canaries and mice helped soldiers determine whether poisonous gases were present in tunnels. Among the more bizarre use of animals was a U.S. Army Air Forces plan to place incendiary bombs on bats, which would then be released to fly in kamikaze-style raids against Japanese military sites. Millions of animals and birds served in the war, and numerous memoirs around the world testify to their contributions.

(German acronym for *Flugzeug* [aircraft] *Abwehr* [defense] *Kanonen* [cannon]; the British knew antiaircraft artillery as "ack-ack"). The Americans used these two terms and also "Triple A." In the latter half of the 1930s, new equipment appeared in antiaircraft units around the world. Countries adopted slightly larger-caliber and more-effective guns with higher rates of fire.

Introduced in 1935, the German 88 mm gun became perhaps the most feared artillery weapon of the war. Widely used as a tank gun, it was also a powerful antitank gun and a coast defense and antiaircraft weapon. With a practical ceiling of 35,000 ft, the 88 posed a great threat to enemy bombers. A 105 mm gun also saw widespread use, and in 1942, with Allied bombing intensified, Germany fielded a 128 mm gun as an interim system (pending development of a superheavy 150 mm gun, which, however, never entered service). Lighter German antiaircraft guns ranged from 20 mm to 55 mm. Germany used 20 mm and 37 mm antiaircraft guns in a variety of configurations on several motorized platforms. The effectiveness of German antiaircraft defenses was reduced by a lack of precision radar control (RPC) systems and the fact that its antiaircraft projectiles lacked proximity fuses. The Italians also used a wide range of antiaircraft guns up to 90 mm in size.

Beginning in 1938, the British produced a 3.7-inch gun, which many came to believe was their best gun of the war. It had a ceiling of 28,000 ft. Its effectiveness was greatly increased by the introduction of RPC in 1944. This combination of radar, predictors, and proximity-fused ammunition gave it a high rate of success against German V-1 flying bombs. The U.S. Army began to replace its 3-inch gun with a 90 mm gun in 1940.

The Soviets also employed a wide range of antiaircraft weapons. They reproduced both the Swedish Bofors 25 mm and 40 mm guns, retooling the latter to fire a 37 mm projectile. The largest Soviet field antiaircraft weapon was the 76.2 mm gun; for home defense the Soviets relied on the 85 mm gun. Produced in large numbers, it was the principal Soviet antiaircraft gun of the war. As was the case with the smaller 76.2 mm gun, the 85 mm piece saw widespread service as main tank armament. The Soviets claimed that antiaircraft guns shot down 2,800 Axis aircraft, 40 percent of the total downed.

Operating on the generally held belief in the 1930s that bombers would always get through, the British focused their aviation efforts on developing a strategic bomber force at the expense of air defense. At war's outbreak, antiaircraft artillery was directed by predictors that followed the path of aircraft mechanically; they were useless at night or in poor visibility. Although all major powers experimented with new detection devices, the British made the primary strides in the field of operational radar. This interception device established the height, course, and speed of enemy aircraft. Throwing up shell barrages through which aircraft flew was no more

Antiaircraft Artillery (AAA) and Employment

Antiaircraft artillery (AAA) is ground defense against aircraft. The Germans knew antiaircraft fire by the term *flak*

Antiaircraft Bofors gun on a mound overlooking the beach in Algeria with a U.S. anti-aircraft artillery crew in position, 1943. (Library of Congress)

successful as a tactic in World War II than it had been in World War I, but ground-fire threats increased substantially when the speed and height of a bomber stream could be ascertained by radar.

In the autumn of 1939, Britain still had only 540 anti-aircraft guns larger than 50 mm. During the Battle of Britain, anti-aircraft artillery took second place to fighter aircraft. Most sources place the number of aircraft shot down by anti-aircraft artillery at fewer than 300 of the nearly 1,800 Luftwaffe planes destroyed. Yet ground fire forced aircraft to higher elevations, unnerved aircrews, and diminished bombing accuracy.

Flak was the principal defense against night attack. Night fighters were still being developed, although the requisite technology would evolve rapidly. Artillery sighting was largely visual until October 1940, when the British began to equip their forces with gun-laying radar, which increased the accuracy of artillery fire in all weather.

Reliance in Britain on lesser-trained territorial forces for anti-aircraft defense foreshadowed personnel difficulties the Axis powers would later encounter in the war. Experienced men usually deployed to distant fronts or to sea, and so air defense depended on women, those too old to qualify for military service, or the physically restricted. During the war about 70,000 women served in British anti-aircraft units.

When the Royal Air Force (RAF) and U.S. Army Air Forces (USAAF) strategic bombing campaigns gained impetus in 1942, German flak posed a serious threat. Aircraft coming in below 8,000 ft often suffered grievous losses from ground fire. Damage from flak continued to rise in the air war, and gunfire from the ground shot down more Allied bombers than did fighter aircraft.

Technological developments moved at a staggering pace as the fighting continued. By 1941, German flak units began deploying incendiary shells, gun-laying radar, and grooved projectiles that fragmented into small pieces, causing dread-

ful damage to aircraft. By 1943, most antiaircraft artillery shells had been converted from powder to mechanical fuses. Flashless propellants augmented the efficiency of the guns, as did automatic fuse-setters that improved accuracy and amplified the rate of fire two or three times. Use of electric predictors became fairly common. In 1944, the Germans introduced double fuses, both contact and timed, that boosted the efficacy of guns severalfold. By then, the Allies were customarily installing the U.S. Navy–developed proximity fuses in their shells, a technology the Germans never successfully employed.

For all that, the Germans put to trial several innovative antiaircraft techniques, such as squeeze-bore and sabot mechanisms designed primarily to increase the muzzle velocity of guns. During the course of the war, Germany developed four types of flak rockets, some guided, some not. The effect of flak rockets was in the main psychological, though, since German forces lacked operational proximity fuses, and radio-controlled guidance systems were rudimentary and subject to degradation.

In several urban areas, such as Berlin, Vienna, and the “flak alley” around Köln, Germany constructed large flak towers to serve as gun platforms. Some covered an entire city block and were more than 130 ft high (corresponding in size to a 13-story building) with reinforced concrete walls up to 8 ft thick. Batteries sited on the roofs mounted heavy antiaircraft artillery and multiple-barreled pom-pom cannon in the structures’ turreted corners.

As the war progressed and Allied air raids occurred almost daily, German antiaircraft defenses faced challenges in growing measure. The quality of flak personnel plummeted as youngsters, women, disabled veterans, foreigners, and even prisoners of war serviced the artillery. At war’s end, nearly half of all German gun crews were auxiliaries or civilians. Ammunition shortages manifested themselves in a big way in 1944, necessitating firing restrictions during air raids. Shortages would eventually reduce firing potential by more than one-half.

Nonetheless, German flak units caused about one-third of Allied aircraft losses and inflicted at least two-thirds of total aircraft damage through 1944. As German fighter protection became weaker, antiaircraft artillery invariably took on a larger role, continuing to impair Allied aircraft and to degrade bombing accuracy. According to U.S. reports, the USAAF lost 18,418 aircraft in European combat, 7,821 of them downed by flak. Follow-on studies credited antiaircraft artillery for as much as 40 percent of bombing errors.

After the June 1944 Allied invasion of Europe, Germany launched its V-1 buzz-bomb campaign in earnest. These low-altitude weapons, flying at nearly 400 mph, were tricky to locate and even harder to down. Fighters had little time to spot and destroy a buzz bomb. Antiaircraft artillery constituted the final line of defense against the V-1s.

Increasing motorization of land forces fostered a need for self-propelled antiaircraft artillery. Although U.S. ground forces used the .50 caliber Browning machine gun in various configurations for basic air defense, these were frequently mounted with the 37 mm antiaircraft gun, so the latter could aim with the Browning’s tracer fire. After 1943, the army’s chief heavy antiaircraft artillery piece, the 90 mm gun, was often mounted on a multipurpose carriage for antiaircraft or field artillery use. In early 1944, the army adopted the 120 mm antiaircraft stratosphere gun, which was nearly twice the size and weight of the 90 mm fieldpiece.

Beginning in 1940, the U.S. Navy devoted considerable attention to improving its antiaircraft defenses. Experience showed that 20 mm cannon of Swiss design were many times more effective against aircraft than machine guns. By 1945, the navy had deployed about 13,000 20-mm artillery tubes aboard ship and had inflicted nearly one-third of all Japanese aircraft losses with these weapons. In due course, the navy deployed some 5,000 40-mm guns of Swedish design in single, dual, and quad mounts. Also widely used shipboard was the 5-inch/38-caliber dual-purpose—that is, antiaircraft and antiship—gun, and some 3,000 were eventually mounted on ships. Proximity fuses in the 5-inch weapon greatly increased antiaircraft effectiveness.

Throughout the war, technological constraints and manufacturing hindrances beset Japanese antiaircraft-artillery capabilities. In 1941, the Japanese deployed just 300 guns in defense of the home islands, and by 1945, even in the face of the American air onslaught, Japan had only 2,000 guns earmarked for homeland defense. The standard Japanese antiaircraft gun throughout the war was the 75 mm type that first saw service in the 1920s. In the Japanese navy, the 25 mm was the standard light antiaircraft gun, and the 5-inch was the standard heavy. Some 500 heavy artillery pieces were committed to the defense of Tokyo by 1944, but fire control and radar capabilities for most weaponry remained inadequate.

Compared with that of the Germans, Japanese flak was far less effective against Allied air attack. During the entire war, Japanese antiaircraft artillery was credited with destroying just 1,524 American aircraft. Japanese naval vessels, perennially lacking in shipboard antiaircraft defense, suffered accordingly.

In sum, during the war, flak was often quite lethal and cost-effective, downing many enemy aircraft and complicating air missions. It made low-altitude bombing and strafing operations a risky business. Evolving technology—above all, radar—increased gun efficacy exponentially.

Anti-Comintern Pact (25 November 1936)

Formal alliance between Germany and Japan. Signed in Berlin on 25 November 1936, the Anti-Comintern Pact was ostensibly a response to the activities of the Communist International (the Comintern), the Soviet organization that claimed leadership of the world socialist movement. Nominally intended to oppose the existence and expansion of international communism, the agreement was really a diplomatic tool directed at achieving other goals.

German Special Ambassador Plenipotentiary Joachim von Ribbentrop first proposed such an agreement in 1935, but the Foreign Office and the army opposed it. Since World War I, the Germans had worked to develop a close relationship with China. This pact would nullify these efforts, as Japan and China were at loggerheads over the Japanese takeover of Manchuria. Nevertheless, Adolf Hitler's approval ended discussion. Hitler hoped that the pact would pressure Great Britain not to interfere with Germany's military buildup and his plans for eastward expansion. In any case, British leaders were concerned about the escalating Japanese threat to their interests in the Far East.

Developed from conversations between Ribbentrop and Japanese military attaché Major General Hiroshi Ōshima, the pact was Hitler's effort to tie Japan to Germany. Japanese leaders saw it as an important step toward finding an ally in an increasingly hostile world. Alienated from the West by its takeover of Manchuria, Japan was also involved in armed clashes with Soviet forces in the Far East. The Japanese hoped that a pact with Germany would strengthen its position vis-à-vis the Soviet Union. Thus, the wording of the pact was more important to the Japanese than to the Germans.

On the same day, Germany and Japan signed another agreement providing that in case of an unprovoked attack by the Soviet Union against Germany or Japan, the two nations would consult on what measures to take "to safeguard [their] common interests," and in any case they would do nothing to assist the Soviet Union. They also agreed that neither nation would make any political treaties with the Soviet Union. Germany also recognized Manzhouguo (Manchukuo), the Japanese puppet regime in Manchuria.

Germany later employed the Anti-Comintern Pact as a litmus test to determine the loyalty of minor allies. Italy adhered

to the pact on 6 November 1937. The pact was renewed in 1941 with 11 other countries as signatories.

To many observers, the pact symbolized Germany's resurgence as the most powerful country in Europe. The threat of global cooperation between Germany and Japan directly imperiled the overextended empires of France and Great Britain. However, the pact, much like Germany's actual capabilities, was more illusion than reality. Both signatories failed to cooperate, and only rarely did one even inform the other of its intentions. An even greater indication of the pact's worthlessness was Hitler's breaking of its terms when he signed the German-Soviet Non-aggression Pact in August 1939.

Antisubmarine Warfare

The effectiveness of submarine attacks made the development of antisubmarine warfare tactics one of the most important challenges for both sides during World War II. At the beginning of the war, both the Allied and Axis powers underestimated the potential impact of submarine warfare. The British were confident that ASDIC (for Allied Submarine Detection Investigating Committee), later known as *sonar* (*sound navigation ranging*), would enable them to detect submarines out to a range of several thousand yards and that they would thus be able to sink German submarines at will. Then too, in September 1939 Germany had few submarines. On 1 September 1939, commander of German submarines Kommodore (commodore) Karl Dönitz had available but 57 submarines, of which 27 were oceangoing types.

Nonetheless, submarines quickly emerged as potent weapons in the European Theater because of the domination of the British surface navy and improvements in both weapons and tactics. During the first two months of the war, U-boats were able to sink 67 Allied naval and merchant vessels. Italian submarines also participated in this effort, in the course of the war sinking a half million tons of Allied Atlantic

HISTORIOGRAPHICAL CONTROVERSY
Axis Cooperation, Myth and Reality

The United States and Great Britain formed one of the closest and most effective alliances in history during World War II, and both cooperated reasonably well with their other principal ally, the Soviet Union. In sharp contrast, the three major Axis powers—Germany, Italy, and Japan—failed to coordinate their efforts and often failed to communicate their intentions to one another. This lack of cooperation actually mirrored the fractious relationships of their own armed services. The Japanese army and navy refused to share resources, technology, or merchant shipping with each other. The German armed forces also hoarded scarce resources, and the German and Italian air forces only grudgingly supported their navies.

What might better Axis cooperation have accomplished? Obviously, geographic separation and their differing objectives and enemies limited the extent of Axis cooperation, but the three powers might have helped one another much more than they did. Perhaps the major issue was the failure of the three states to develop common goals and objectives. If Japan had joined Germany in a full-scale invasion of the Soviet Union, the Axis powers might have won the war.

Simply communicating their plans and objectives would have made a tremendous difference. Germany never informed Italy in advance of its invasion of France and the Low Countries, nor did Italy inform Germany beforehand of its invasion of Greece. Japan did not inform either of its planned attack on Pearl Harbor. Germany might have positioned U-boats off the American coast to go into action immediately after the United States entered the war. Japanese submarines might have entered the Battle of the At-

lantic and made Allied merchant shipping their primary targets.

Even aggressive patrols and military demonstrations along the Manchurian border by Japan's Kwantung Army could have tied down Soviet forces and prevented the transfer of some of the 40 Soviet divisions that spearheaded the 1941 winter counteroffensive. Italy, as a prewar German study suggested, would have helped Germany immeasurably by remaining neutral and serving as a conduit for critical imports. Once it entered the war, however, Adolf Hitler needed to work Italy into his plans and reward its efforts. Early and more significant German support of Italy's offensive in North Africa (support, however, that Italy did not want) against Egypt might well have paid handsome dividends, securing the Suez Canal and Middle Eastern oil, as would have greater Luftwaffe support of the Italian navy.

Honest reporting of their military operations would also have assisted the Axis war efforts. The Japanese government informed neither its citizens nor its allies of its defeat at Midway, and Germany continued to expect significant naval victories from Japan. Similarly, the Germans concealed the magnitude of their defeats on the Soviet front, and Japan continued to expect a Soviet collapse long after that possibility had disappeared. All three failed to share intelligence, technology, and experience. Germany would have benefited from Japanese torpedoes and experience in naval combat and aviation, and Japan from German advances in rocketry, jet aircraft, radar, and armored warfare. Some of this occurred, of course, but nothing that matched the scale of cooperation that developed between the Allied powers.

The months immediately following Japan's entry into the war offered the greatest opportunity for coordinated Axis attacks. Instead of scattering its efforts at divergent points across the Pacific, a Japanese land and naval offensive might well have seized Ceylon and India and from there threatened Egypt and the Persian Gulf while the Afrika Korps drove into Egypt. There existed a real opportunity to overrun the Middle East and India before the United States could build up its military resources in a significant way.

Still, better cooperation would not have solved the mismatch between the Axis powers' goals and capabilities, their overwhelming lack of resources and industrial capacity next to the Allies, or Japan's vulnerability to submarine attack.

A TURNING POINT?

Black May

The defeat of German U-boats in the North Atlantic was called by Germany "Black May." The climactic convoy battles of March 1943 had given a first hint that Allied antisubmarine forces were finally gaining the upper hand in the battle for the North Atlantic sea lines of communication. By early 1943, the fully mobilized American shipyards were producing vast numbers of escort vessels in addition to building more merchant ships than were being sunk. Modern long-range naval patrol aircraft such as the B-24 Liberator and escort carrier-based aircraft were closing the dreaded air gap: the last refuge of the wolf packs from Allied air power in the North Atlantic. At the same time, Allied signals intelligence was reading the German U-boat cipher Triton almost continuously and with minimal delay.

On 26 April 1943, the Allies suffered a rare blackout in their ability to read the German cipher, just as 53 U-boats regrouped for an assault on the convoy routes. Miraculously, two eastbound convoys, SC.128 and HX.236, escaped destruction. However, ONS.5, a weather-beaten westbound convoy of 30 merchant ships escorted by seven warships, stumbled into the middle of the wolf packs on 4 May. During the next 48 hours, the U-boats sank 12 ships, but at an unacceptable cost: escort vessels sank six U-boats, and long-range air patrols claimed three others. Radar in aircraft and escort vessels played a decisive role in giving the numerically overmatched escorts a tactical edge in the battle.

Commander of the German U-boat arm Admiral Karl Dönitz was aware of the tilting balance, but he urged his U-boat commanders not to relent. Yet many U-boats failed to reach their areas of operation. The determined antisubmarine offensive in the Bay of Biscay by aircraft of the Royal Air Force Coastal Command destroyed six U-boats during May and forced seven others to return to base.

During the second week of May, the ragged survivors of the North Atlantic wolf packs, which had operated against convoys ONS.5 and SL.128, regrouped and deployed against HX.237 and SC.129. Only three merchantmen were sunk at the expense of the same number of U-boats. In addition to radar, the contribution of the small escort carrier *Biter*, which had provided air cover for HX.237 and SC.129, was vital in denying the German submarines tactical freedom on the surface near the convoys. When the U-boats renewed their attacks against convoy SC.130 between 15 and 20 May, escort vessels sank two U-boats, and shore-based aircraft claimed three others. SC.130 suffered no casualties. The U-boat offensive failed entirely against HX.239, a convoy with a rather generous organic air cover provided by escort carriers USS *Bogue* and HMS *Archer*. Not a single U-boat managed to close with the convoy, and on 23 May one U-boat fell victim to the rockets of one of the *Archer's* aircraft. The following day, Dönitz recognized the futility of the enterprise and canceled all further operations in

the North Atlantic. By the third week in May, more than 33 U-boats had been sunk and almost the same number had been damaged, nearly all in convoy battles in the North Atlantic or during transit through the Bay of Biscay.

The month went down in German naval annals as "Black May," with losses reaching 40 U-boats. At the end of May 1943, the British Naval Staff noted with satisfaction the cessation of U-boat activity. SC.130 was the last North Atlantic convoy to be seriously menaced during the war.

shipping. Allied losses continued to climb, and at the peak of the Battle of the Atlantic in March 1943, U-boats sank 96 ships in only 20 days. Meanwhile, after overcoming deficiencies in armament and strategy, U.S. Navy submarines extracted a significant toll on Japanese shipping in the Pacific Theater. By the end of the war, U.S. submarines had accounted for 57 percent of all Japanese naval and merchant losses.

Initially, the main tactics and weapons used in antisubmarine efforts by both sides during the war were those that had been developed and honed during World War I. Soon

after the outbreak of World War II, the British reintroduced the convoy system. This had proved successful in World War I, and it minimized losses during World War II. For instance, at the outbreak of World War II, ships traveling in convoys between North America and Great Britain suffered only 2 percent losses until the Germans developed improved tactics. The *Rudeltaktik* (wolf tactic, which the Allies referred to as the wolf pack) developed by Dönitz involved simultaneous attacks at night by many submarines. It diminished the effectiveness of the convoy system, which was in any case ini-

U.S. Navy sailors load hedgehog bomb projectors used in antisubmarine warfare. (Corbis)

tially hampered by a lack of escort ships. Not until 1943 could the Allies deploy sufficient numbers of escorts to optimize the convoy system, which worked best with a ratio of at least one escort for every three merchant ships.

One exception to the convoy system in the Atlantic was the use of fast liners to carry troops. Ships such as the *Queen Elizabeth* and *Queen Mary* were able to travel at more than 26 knots and literally outrun U-boats. Throughout the war, the superliners sailed without escorts and ultimately without casualties. Concurrently, in the Pacific, U.S. submarine success was partly attributable to Japan's failure—prompted by its own glaring lack of escort vessels—to use convoys, which left Japanese merchant and naval ships vulnerable to submarine attack. In December 1941, the Japanese had only four Shimushu or Type A-class ships, their only purpose-built escort warships, and they were not equipped with hydrophones until the autumn of 1942, when the Royal Navy had some 2,100 vessels of all types equipped with sonar.

British defenses of the vital Atlantic trade routes were strengthened in May 1941 when the U.S. Navy began escorting convoys between the United States and Iceland. Then, in June 1941, Canada created the Canadian Escort Force for the same purpose. The Royal Canadian Navy (RCN) played a key role in the Battle of the Atlantic. Comprising only 6 destroyers and 5 minesweepers at the beginning of the war, the RCN grew by war's end to include 2 light carriers, 2 light cruisers, 15 destroyers, 60 frigates, 118 corvettes, and many other vessels. Virtually all these ships were committed to the Battle of the Atlantic.

Antisubmarine weapons existed in two broad forms: passive and active. Passive weapons included underwater mines and impediments, such as submarine nets, designed to prevent submarines from traveling in certain areas. Underwater contact mines exploded when they touched a hull; magnetic mines exploded when a ship or submarine was in their vicinity. Mines could be placed at a variety of depths to make them more effective.

To protect their ships against torpedoes, the Allied powers developed several countermeasures. One of the most successful was the “noisemaker.” Towed behind a ship, it could disable advanced acoustic torpedoes. Another was the degausser, which discharged an electronic current at regular intervals through a cable around the hull of a ship. The current helped to reduce the ship’s magnetic field, reducing its vulnerability to magnetic torpedoes.

Active antisubmarine weapons included depth charges, torpedoes, aerial bombs, and other explosive devices designed to rupture the hull of a submarine and sink it. The depth charge was a waterproof bomb that could be set to explode at a particular depth. The charge did not have to come into contact with a submarine to be effective; its concussion could breach a submarine’s hull.

Depth charges improved during the course of the war. Such weapons could be either rolled off the stern of a ship or fired at specific areas. Weapons such as the “hedgehog,” when fired from a ship, delivered several smaller charges over a broad area. Depth charges and torpedoes could also be delivered by aircraft. As the war progressed, the crews of Allied planes and ships became more adept at developing patterns to enhance the effectiveness of depth-charge runs.

Key to the success of a surface attack on submarines was the escorting ships’ ability to use their superior speed to keep enemy submarines contained within a certain area and then to deliver successive depth-charge attacks. Submarines usually have a smaller turning ratio than escort vessels, so containment of the submarine was especially important to a successful attack.

Antisubmarine weapons were most commonly deployed by escort ships and airplanes. The escorts were usually small, lightly armed, fast craft ranging from destroyers and corvettes to frigates and small motor launches. Some merchant ships were also equipped with depth charges or other antisubmarine weapons. Aircraft proved especially useful in antisubmarine warfare. They could spot submarines from long distances and either attack the submarines themselves or report a submarine’s presence to surface units. Aircraft could also use a variety of weapons to attack the submarine. However, because of the Battle of Britain and the subsequent concentration on strategic bombing, British and U.S. air commanders were reluctant to allocate aircraft for antisubmarine roles. Large flying boats and later the long-range Consolidated B-24 Liberator equipped with radar proved critical in closing the mid-Atlantic gap, a wide area in the central Atlantic that had lacked air protection.

In 1943, the German navy began equipping U-boats with significant antiaircraft defenses, including machine guns and rapid-fire 20 mm and 37 mm cannon. These German antiaircraft defenses were subsequently overcome as the Allies began to deploy additional long-range bombers. During one

week-long period in the summer of 1943, Allied aircraft sank nine U-boats in the Bay of Biscay alone.

The increased use of aircraft along the coasts of the United States and Great Britain reduced the number of submarine attacks in these regions, but the air gap remained without air protection. To improve the convoys’ chances, the British modified ships into escort carriers—merchant or naval ships that had the capability to launch one or more aircraft.

Critical in antisubmarine warfare was the ability to locate the submarine and therefore render its stealth meaningless. In the immediate aftermath of World War I, sonar (known as ASDIC by the British) was developed. Sonar devices sent out sound pulses and then ranged underwater using the echoes. Using detection devices and direction finders, the Allies were able to detect and attack submarines before they came in range of the merchant vessels. Ships could also be fitted with hydrophones or other listening devices that detected the sounds emitted by a submarine. Although the Germans endeavored to develop rubber sheathing for their U-boats, sonar remained the most important detection device in anti-submarine warfare.

Surface radar could also be used to detect submarines, since the subs had to surface periodically to recharge their electric batteries. British Coastal Command aircraft were also equipped with lightweight 10 cm radar developed by the Massachusetts Institute of Technology radiation laboratory; working with Royal Navy corvettes, such aircraft played a key role in the Battle of the Atlantic. Radar enabled Allied aircraft or surface ships to locate Axis submarines and attack them, even at night. The widespread installation of radar in Allied aircraft brought increasing numbers of U-boat “kills.” In response, the U-boats began using their own acoustic detection devices, called Biscay crosses, to warn of approaching planes. However, the devices often did not provide the U-boat crews sufficient time to react before an attack.

Even before the United States entered the war, Washington and London had initiated a variety of cooperative programs to protect merchant ships. German successes added urgency to these efforts, which led to establishment of the Anglo-American integrated convoy system. As a result of the Allied Convoy Conference in 1943, lines of control over convoys were split: the United States controlled the Central and South Atlantic, and Canada and Great Britain controlled the northern convoy routes.

In May 1943, U.S. chief of naval operations Admiral Ernest King created the Tenth Fleet. Although it did not have ships attached to it, the Tenth Fleet maintained the submarine tracking room (covertly classified as *unit F-21*), which used radar and sonar reports and cryptologic intelligence—of immense importance in this campaign—to plot the movement of Axis submarines in the Atlantic and Pacific.

F-21 coordinated U.S. antisubmarine efforts with the British tracking section at the Admiralty in London and with a much smaller unit attached to the Canadian naval command.

The combination of aircraft, better intelligence, increased use of radar and sonar, and improved coordination and tactics led to massive losses among the German U-boat force. By 1943, Allied antisubmarine efforts were sinking, on average, one dozen U-boats a month. By the summer of 1943, the Battle of the Atlantic was being won. In 1943 and 1944, the Allies sank 478 U-boats, and Allied merchant losses were dramatically reduced.

Aircraft proved vital in antisubmarine warfare; they could deflect German bomber attacks against the Allied convoys and do battle with surfaced submarines. In order to provide fighter protection, the British equipped several merchantmen with a forward catapult that held a modified Hurricane fighter. After launch and intercept, the fighter would try to make landfall or else would land in the water.

A more satisfactory solution was to fit a flight deck to the hull of a merchant ship. The German cargo/passenger ship *Hannover*, taken in March 1940, was converted into the first escort carrier, the *Audacity*, and entered service in June 1941 carrying six fighters. Additional escort carriers soon appeared in the form of U.S.-built conversions in the Avenger-class. They entered service with the Royal Navy in the first half of 1942. Designed to carry 15 aircraft each, the escort carriers proved invaluable. Unlike their British counterparts, U.S. captains of escort carriers (CVEs, “Jeep” carriers) ultimately enjoyed complete freedom of action to mount hunt-and-kill missions. Teams composed of an escort carrier and half a dozen destroyers or new destroyer escorts sank 53 U-boats and captured 1; the teams may have been the single most important U.S. contribution to the war against the U-boats.

German U-boats succeeded in shattering a special convoy designated “TM I” (Tanker, Trinidad-Gibraltar) that sailed from Trinidad for Gibraltar at the end of December 1942 and incurred 77 percent losses. This led British Prime Minister Winston L. S. Churchill and U.S. President Franklin D. Roosevelt to concentrate on the U-boat menace during their meeting at Casablanca in January 1943. Churchill urged that priority be given to the Battle of the Atlantic, and the Allied leaders decided to provide for the effort additional convoy escorts, aircraft assets (including the VLR Consolidated B-24 Liberator, which was to be based at Newfoundland for the first time to close the Greenland air gap), and escort carriers. Unfortunately, nearly three months passed before these available assets were diverted to the battle.

Carrier-based aircraft were essential in closing the mid-Atlantic gap, and long-range aircraft flying from Britain also were important, although the preoccupation of the Royal Air Force (RAF) with strategic bombing meant that Coastal Com-

mand possessed few long-range aircraft. Only grudgingly did Bomber Command’s Air Marshal Arthur Harris make such air assets available. The U.S. Consolidated PBY Catalina and PB2Y Coronado and the British Short Sunderland flying boats proved invaluable, as did long-range B-24 Liberator and British Lancaster bombers.

In August 1944, RAF Bomber Command Squadron 617 (the “Dam Busters”) mounted attacks with special “tallboy” bombs against the concrete-reinforced U-boat pens of the Bay of Biscay. These raids were highly effective, and in the last year of the war, 57 U-boats were destroyed by bombing, compared with only 5 destroyed by bombers in the previous five years. This shows what might have been accomplished had the bombers been directed against the submarines earlier. Indeed, after March 1943, aircraft were probably the chief factor in the defeat of the U-boats. Between March 1943 and May 1945, a total of 590 U-boats were destroyed, compared with only 194 in the previous three and one-half years of war. Of the 590 destroyed, 290 were by air power, 174 by ships, and the remainder through a combination of the two or from other causes.

A combination of factors brought the Allies victory in the Battle of the Atlantic. The convoy system was important, but so too was technology, primarily the 10 cm radar sets, sonar, improved depth charges, rockets fired from aircraft, and forward-thrown shipborne antisubmarine “hedgehogs” or “mousetraps” (small depth charges known to the British as *squids*). The high-intensity Leigh light on aircraft illuminated the sea at night. Radio detection equipment was vital, and long-range aviation helped narrow the so-called “black hole” in the central Atlantic. Intelligence also played a role, chiefly ULTRA intercepts of U-boat communications that guided aircraft to the submarines. The hunter-killer groups operating independently of the convoys also carried the war to the submarines. It is true, however, that Allied and interservice cooperation was far too long in coming.

In the Pacific Campaign, use of submarines turned out to be decisive, but this time it was the Allies—specifically U.S. submarines—that carried the war to the Japanese. Allied success came in part because the Japanese never developed effective antisubmarine techniques. The Japanese also failed to use their own submarines effectively. Although they developed some fine, large, long-range types, the Japanese never really deployed their submarines against Allied merchant ships. The Imperial Japanese Navy subscribed to the doctrine that submarines were an ancillary weapon of the main battle fleet. The ineffectiveness of U.S. submarines early in the Pacific because of a faulty torpedo only reinforced the Japanese attitude that submarines were not a key weapons system. The Japanese often used their own submarines as long-range transports and supply vessels, and some Japanese submarines carried aircraft. In addition, design problems

(the Japanese submarines were large and easily detectable) further minimized Japanese submarines' effectiveness.

Because they lacked radar detection and avoidance systems, Japanese submarines were especially vulnerable to antisubmarine efforts. The Japanese only deployed 190 submarines during the course of the war, and the Allies sank 129 of them. For their part, Japanese submarines only sank 184 merchant vessels during the entire war, and they made no effort to attack Allied transport and supply convoys from the mainland United States. The most significant danger to Allied merchant shipping in the Pacific actually came from the handful of German U-boats and raiders that operated in the area or from Japanese air units. In the Pacific Theater, the Allies also successfully employed the antisubmarine tactics developed in the Atlantic Campaign to further minimize merchant losses.

Ineffective Japanese antisubmarine warfare techniques led to the lowest percentage of losses for U.S. submarines of any of the submarine forces of the major powers during the war. It was not until the end of 1943 that the Japanese navy established its first escort squadron and not until 1944 that significant air units began to engage in antisubmarine patrols. It was a case of too little, too late. The first Japanese depth charges, which used a time fuse rather than a pressure-activated detonation device, were also ineffective. More significantly, the Japanese lacked antisubmarine sonar and lightweight radar sets. These considerations and the loss of so many Japanese aircraft in combat reduced the effectiveness of Japan's antisubmarine patrols. Finally, U.S. submarines could detect Japanese radar emissions.

Antisubmarine warfare came into its own in World War II. It was certainly a key factor in the war at sea, at least in the Atlantic Theater.

Antitank Guns and Warfare

The evolution of antitank (AT) warfare in World War II was a continual trade-off between technology and tactical doctrine. At the start of the war, most armies believed that the tank itself was the most effective AT weapon. In the earliest days of the fighting, however, it became clear that the smaller-caliber guns on most tanks were ineffective against opposing armor. The light, towed antitank guns that were supposed to be the backup system were even more ineffective. Thus, field artillery firing in the direct-fire mode became the primary antitank system in 1941 and 1942 on the Eastern Front and in North Africa. Field artillery was only able to return to its primary direct-support mission in late 1942 after large numbers of heavier AT guns had been fielded. Infantry armed with AT rifles were supposed to be the third line of defense. These, too, proved mostly worthless and were quickly replaced with projector-type weapons, such as the U.S. bazooka, the British PIAT, and the German Panzerfaust.

For a good 10 years before the war, German doctrine recognized that high-velocity, flat-trajectory antiaircraft guns could be used in an antitank role in emergency situations. In North Africa, the Germans quickly discovered that their 88 mm flak guns were devastatingly effective against British tanks. The Soviets, meanwhile, also believed that the enemy's infantry, rather than its tanks, should be the primary target of Soviet tanks. In 1942, therefore, the Soviets revived the German World War I practice and assigned an antitank role to all artillery weapons. By the final two years of the war, Soviet gun production rates widely outmatched that of the Germans, and the balance tipped in favor of the Soviets.

Most armies used field artillery crews to man antitank units. As the war progressed, antitank guns became larger and more powerful, and many were mounted on self-propelled (SP) carriages to give them mobility equal to the tank. The Germans on the Eastern Front pioneered the use of SP antitank guns in an offensive role. The Soviets also developed a wide range of SP weapons. As the war progressed, the distinctions blurred among the Soviet Union's field, assault, and antitank SP guns. Almost all American SP antitank guns were turret-mounted, but the Germans and especially the Soviets favored turretless vehicles. They were simpler and cheaper to build, and the lack of a turret produced a lower profile that made the vehicles smaller targets.

The Soviets spent the first two years of the war on the defensive, and as a result they mastered defensive AT tactics. At Stalingrad, they deployed four sets of antitank belts to a depth of 6.2 miles. Soviet tanks only counterattacked after all forms of their artillery had stopped the German tank attack. The tactics the Soviets developed at Stalingrad were refined

A U.S. infantry antitank crew fires on Germans who machine-gunned their vehicle, somewhere in Holland, 4 November 1944. (National Archives)

and applied with devastating effect later in the Battle of Kursk, the graveyard of the German panzers.

The U.S. Army organized AT guns into tank-destroyer (TD) battalions. In 1942, a TD battalion had three companies of three platoons of four guns each, either towed or self-propelled. American SP tank destroyers did not do well in North Africa. The operational area was too vast for the guns to mass effectively, and the terrain was too open for the SP vehicles to find good defensive hull-down positions. Many American commanders shifted to the British system of towed antitank guns, but these proved far less effective when combat operations later moved to Western Europe. In that more restricted terrain, the towed guns moved too slowly, and they were too close to the ground to shoot over the hedgerows. By July 1944, the U.S. Army started reequipping all TD battalions with SP guns, but some units still had towed guns by the time of the Battle of the Bulge.

As World War II progressed, the balance shifted back and forth between heavier and more powerful AT guns and

thicker and heavier tank armor. Tank designers were faced with the challenge of developing tanks with guns powerful enough to defeat enemy armor, yet with armor strong enough to resist the fire from enemy tanks and AT guns. Larger guns produced more recoil, which required a larger and heavier turret. That combined with stronger armor added to the overall weight of the tank, decreasing the tank's mobility and creating a larger target. Most World War II tanks had heavier armor on the front and sides, where the tank was more likely to be attacked.

Tanks can be defeated in differing degrees, with correspondingly different results. In a mobility kill, a tank becomes immobilized because of damage to its treads or drive train. Many mobility kills resulted when a tank hit a mine. An immobilized tank can still fire, but it can no longer maneuver. The advantage from the attacker's standpoint is that the tank becomes more vulnerable to subsequent attack. A firepower kill happens when the tank's main gun system can no longer fire. Although the tank has almost no combat power at that

point, it still has the mobility to withdraw from the action, where it can be repaired and placed back into service. A total kill results when the tank is completely destroyed and the crew is killed or severely wounded. In some situations, a trained tank crew may be more difficult to replace than the tank itself.

There are two basic categories of AT projectiles, kinetic energy and chemical energy. A kinetic energy round is a solid-shot projectile that depends on weight and velocity to penetrate and defeat opposing armor. As weight and velocity increase, so does penetrating power. The distance to the target is also a factor. As the round travels farther, its velocity and penetrating power decrease accordingly. The German 88 mm PAK 43 could penetrate 207 mm of armor at a range of 1,640 ft but only 159 mm at a range of 6,562 ft.

The angle of impact also affects a round's penetrating power. At a 30-degree angle of impact, the penetrating power of the PAK 43 at 1,640 ft dropped to 182 mm. Thus, beginning with World War II, most tanks have had sloped armored fronts. The earlier kinetic energy rounds also had a tendency to ricochet off the sloped surfaces. The solution to that problem was a special soft nose cap that allowed the round to stick to the armor surface just long enough for penetration to begin.

Tapering the bore of the gun also could increase the velocity of a kinetic energy round. The squeeze-bore guns fired a round with a plastic driving band that wore away as the round moved forward through the bore. As the bore narrowed, the pressure behind the round increased, which in turn increased muzzle velocity. As the round left the gun's muzzle, the remnants of the driving band fell away. The Germans used this technique on their smaller 42 mm and 75 mm PAK 41 anti-tank guns, but technical factors limited the effectiveness of the squeeze-bore technique in larger calibers.

Dense and heavy material such as tungsten made the best kinetic-energy rounds. But at 1.4 times the density of steel, a projectile made completely from tungsten would have been too hard and too heavy for the bore of the gun to survive more than a handful of firings. In 1944, the British solved that problem with the introduction of the armor-piercing discarding sabot (APDS) round. A relatively small but heavy main projectile was encased completely in a plastic casing that fell away as soon as the round left the muzzle. This system had the advantage of placing the pressure produced by a large-bore gun behind a smaller projectile. The result was greater velocity and penetrating power. The APDS remains the primary AT round today.

Chemical-energy rounds defeat armor through a blast effect. The effectiveness of the round depends on its size, composition, and physical configuration rather than on its velocity. Chemical-energy rounds tend to travel more slowly and have a more arched trajectory than kinetic energy rounds. Thus, their aiming is far more dependent on an accurate estimate of the range to the target.

Chemical-energy projectiles that produce a uniformly distributed blast effect, such as conventional high-explosive (HE) field artillery rounds, were effective against tanks only in the very early days of World War II. But as the war progressed and armor got heavier and stronger, riveted tank hull construction gave way first to welding and then to whole casting. In response, rounds known as hollow-charge or shaped-charge rounds were developed based on the so-called Monroe Effect. In a hollow-charge round, the explosive material is configured in the shape of a recessed cone, with the base of the cone toward the front of the round. The surface of the inverted cone is lined with light retaining metal such as copper. When the round first hits the target, the explosive is detonated from the rear of the round forward. The hollow cone has the effect of focusing the entire force of the blast onto a small spot on the tank's skin exactly opposite the apex of the cone. The result is a very hot and very concentrated jet of gas that punches its way through the tank's armor and sends red-hot fragments into the tank's interior. The tank crew is killed by its own armor. The shaped-charge chemical-energy rounds were designated "high-explosive antitank" (HEAT).

When a HEAT projectile is fired from a conventional gun tube, the stabilizing spin imparted by the bore's rifling tends to degrade the round's penetrating power. That led to the development of fin-stabilized projectiles fired from smooth-bore launchers, such as the bazooka and Panzerfaust. These close-range infantry weapons proved relatively effective. The HEAT warheads did not depend on velocity, so they could be fired from relatively light weapons. HEAT projectiles do depend on warhead weight, however, and in these weapons, that was limited to what an infantryman could carry.

No single system stood out in World War II as the premier tank killer, although certain systems predominated at certain times and in certain theaters. Overall for the war, some 30 percent of British tanks that were knocked out fell victim to anti-tank guns, 25 percent were knocked out by enemy tanks, 22 percent hit mines, 20 percent fell victim to artillery indirect fire and air attack, and the rest were knocked out by infantry AT weapons. In North Africa, Axis AT guns accounted for 40 percent of the British tanks knocked out, whereas in Italy it was only 16 percent. Throughout the war, German tanks were generally better armed and more powerful than their British and American counterparts. That meant that Allied tanks destroyed far fewer panzers than the other way around.

Antonescu, Ion (1882–1946)

Romanian marshal and dictator. Born in Pitești on 14 June 1882 to an aristocratic military family, Ion Antonescu graduated from Romanian military schools in Craiova (1902) and Iași (1904). A cavalry lieutenant during the 1907 Peasant Revolt, he fought in the Second Balkan War and was an operations officer during World War I. From 1922 to 1927, he was military attaché in Paris, Brussels, and London. He was chief of the Army General Staff in 1933 and 1934.

As with most others among the nationalistic Romanian military elite, Antonescu favored British and French political influence. However, he closely monitored both the Third Reich's ascendancy and the looming Soviet Union in his vigilance regarding Romanian territorial integrity, pragmatically preparing for a German accommodation should such a choice become necessary. As minister of defense, Antonescu became embroiled in and frustrated by the corrupt governing vicissitudes of King Carol II, especially after 1937. Protesting Carol's February 1938 establishment of the Royal Dictatorship and his suppression of the fascistic Legion of Saint Michael (the Iron Guard), Antonescu defended the Iron Guard's leaders in court and was briefly jailed and outposted to Chisinau (Kishinev) near the Soviet border.

Following the Soviet Union's occupation of Bessarabia and the ceding of Transylvania to Hungary in summer 1940, in September Carol was coerced into naming Antonescu head of the troubled government before abdicating under pressure in favor of his son Michael, 19. Antonescu's title, Conducator, was the Romanian equivalent of Duce or Führer, and he used his broad powers to oust the Iron Guard from government in January 1941. That June, he assigned 14 Romanian divisions to Germany's invasion of the Soviet Union, Operation BARBAROSSA. For reclaiming Romanian lands from the Soviets, Antonescu was proclaimed marshal by figurehead King Michael I on 23 August 1941. Antonescu continued to supply the German war effort with troops (ultimately, Romania lost substantially more men than Italy) in exchange for German military favor, but on the home front he sought to temper his ally's overbearing appetite for Romania's oil and agricultural bounty.

In coming to terms with Romania's "Jewish question," Antonescu—like Benito Mussolini in Italy—preferred his

Romanian premier Ion Antonescu, on a visit to Munich in July 1941 with Adolf Hitler. Six days later Germany declared war on the USSR, with Romania on the German side. (Hulton-Deutsch Collection/Corbis)

own solution to anything dictated by Berlin, employing policies that (officially) allowed Jews to emigrate in exchange for payment or to face deportation to Romanian-administered work camps in the Ukrainian region of Transnistria. Nonetheless, Antonescu's regime was responsible for the deaths of more than 250,000 Romanian and Ukrainian Jews and Gypsies as a result of its "romanization" policies during 1940–1944, despite its refusal to join Germany's "final solution" outright.

Antonescu was deposed by coup-installed King Michael on 23 August 1944 and was turned over to the occupying Soviet forces. His war crimes show trial, held in Bucharest on 4–17 May 1946, led to the death sentence, and he was executed there on 1 June 1946.

Antonov, Alexei Innokentievich (1896–1962)

Soviet general. Born the son of a tsarist artillery officer in Grodno, Belorussia, on 15 September 1896, Alexei Antonov attended the Pavlovsky Military School in Petrograd. He was commissioned as an ensign in the Russian army in 1916 during World War I and was wounded in the last great Russian offensive of 1917. In 1918, Antonov joined the Red Army and had his first experience with staff work as chief of staff of a brigade in the Russian Civil War. He graduated from the Frunze Military Academy in 1931 and was then posted to the Kharkov Military District. In 1937, he graduated from the General Staff Academy, and from 1938 to 1940 he was a lecturer at the Frunze Military Academy.

Antonov held numerous staff positions during World War II. Following the German invasion of the Soviet Union in June 1941, he was promoted to major general and became chief of staff of the Kiev Military District. He was chief of staff of the Southern Army Group from August 1941 to July 1942. In December 1941, he was promoted to lieutenant general. During 1942, he was chief of staff first of the North Caucasian Army Group, then of the Transcaucasian Army Group. Appointed chief of operations of the General Staff in December 1942, after April 1943 Antonov was also deputy chief of the General Staff and was thus at the center of events for the remainder of the war. Antonov was promoted to general of the army in August 1943, a rank he held for the remaining two decades of his military career.

Because chief of the General Staff Aleksandr Vasilevsky was absent so frequently, Antonov acted in that role much of the time. A meticulous planner, he helped to orchestrate the major Soviet offensives of the war, including Operation BAGRATION, the encirclement of the German salient in Belorussia and East Prussia that brought the Red Army to the river Elbe.

In February 1945, Antonov replaced Vasilevsky as chief of the Soviet General Staff. He was a member of the Soviet delegation to both the Yalta and Potsdam Conferences. Demoted in 1946 to first deputy chief of the General Staff and then to first deputy commander of the Transcaucasus Military District, Antonov became commander of that same military district in 1950. In April 1954, he was again first deputy chief of the General Staff, and in 1955, he also assumed the post of chief of staff of Warsaw Pact forces. He held these posts until his death in Moscow on 16 June 1962.

Antwerp, Battle of (4 September–2 October 1944)

Western Front battle for the key Belgian port of Antwerp. Its port facilities mark Antwerp as an important strategic city in Europe. Antwerp is about 54 miles from the open sea connected by the Scheldt River, which is fairly narrow below the city and then broadens into a wide estuary. The southern bank of the estuary is formed by the European mainland. The northern side is formed by the South Beveland Peninsula and Walcheren Island, which is connected to the peninsula by a narrow causeway. The port had 600 hydraulic and electric cranes as well as numerous floating cranes, loading bridges, and floating grain elevators. Its clearance facilities included extensive marshaling yards and excellent linkage with the Belgian network of railroads and navigable waterways. It was essential for the Anglo-American forces to secure Antwerp as a supply port in order to sustain their offensive.

The British Second Army took Brussels on 3 September and then managed to cover the 60 miles to Antwerp on 4 September. The British 11th Armoured Division entered the city to find that the port was relatively intact, largely because of activities of the Belgian Resistance. Commander Major General George Philip Roberts of the 11th Armored Division ordered a pause for two days, neglecting to order his troops to secure the bridges over the Albert Canal on the northern edge of the city. Indeed, the whole XXX Corps then paused for a three-day rest to refit and refuel. Had the bridges been secured on 4 September, the way would have been open to the eastern base of the South Beveland Peninsula some 17 miles distant. This would have trapped the remaining units of Generaloberst (U.S. equiv. full general) Gustav von Zagen's Fifteenth Army of some 100,000 men in a pocket. By 6 September, however, German resistance had rallied to permit the British only a small bridgehead that was subsequently destroyed.

The German Fifteenth Army was sealed off in the Calais-Flanders region in what was known as the "Breskens pocket." On 4 September, von Zagen ordered an evacuation across the estuary, in which the troops were ferried to Walcheren. By the time the evacuation was completed on 23 September, the Germans had managed to extract some 86,000 men, 616 guns,

British soldiers lay down covering fire as others dash across a bridge in Antwerp, Belgium, September 1944. (Bettmann/Corbis)

6,200 vehicles, and 6,000 horses. Had the Beveland Peninsula been cut off, the evacuation would have taken a different route, a 12-hour journey to reach safety, and allowed for more Allied interference.

Field Marshal Bernard Montgomery did not bring the full force of his 21st Army Group to bear on clearing the surrounding countryside to allow traffic on the Scheldt River. Indeed, he did not even order the First Canadian Army to clear the Scheldt estuary until late September, even while that force was still tasked with clearing the Channel ports. Not until 16 October did Montgomery order that the Scheldt be cleared with the utmost vigor, irrespective of casualties. The port itself did not open for traffic until 26 November.

Most scholars believe Montgomery's failure at Antwerp influenced his concern that the maximum amount of force and effort be applied in the subsequent Operation MARKET-GARDEN. The Battle of Antwerp was a lost opportunity for the Allies to open a major port early, trap a large German force, and potentially end the war sooner.

Anzio, Battle of (22 January–25 May 1944)

Allied amphibious operation in Italy from January to May 1944. The idea for an invasion of mainland Italy emerged from the British, most notably Prime Minister Winston L. S. Churchill. The Americans opposed the operation for fear that it might weaken preparations for Operation OVERLORD, the cross-Channel invasion of France. At the August 1943 Quebec Conference, the Americans argued that an invasion of southern France should be the main Mediterranean operation. Nevertheless, the Americans agreed to an Italian Campaign in exchange for a firm British commitment to invade Normandy in 1944.

On 3 September 1943, General Bernard Montgomery's Eighth Army landed at the Italian toe, forcing the surrender of the Italian army. Six days later, American forces under Lieutenant General Mark W. Clark landed at Salerno approx-

imately 30 miles south of Naples. General Albert Kesselring retired his German forces to a position north of Naples known as the Gustav Line. This formidable defensive position took advantage of the Apennine Mountains as well as the Garigliano and Rapido Rivers. The line's western end, closer to Rome, was anchored by the impressive mountain abbey of Monte Cassino. Four separate attempts to break the German line failed as the Allies could not fully employ their overwhelming naval, armor, and air advantages in the rocky terrain of central Italy.

The failure of frontal assaults on the Gustav Line led to Allied plans for an amphibious operation near the town of Anzio on the Tyrrhenian Sea approximately halfway between the Gustav Line and Rome. Anzio had excellent beaches and was near the main highway that connected the Italian capital to the Gustav Line. A successful amphibious attack there could force the Germans to abandon the Gustav Line and surrender Rome. It might also dislodge Germany from all of Italy.

The Anzio assault was British in conception but chiefly American in execution. Most Americans, including operational commander Major General John Lucas, were not optimistic about the assault's chances. Churchill appealed

personally to President Franklin D. Roosevelt to keep sufficient shipping in the Mediterranean to make the assault possible and to increase troop strength from 24,000 to 100,000 men. The timing for Anzio had to be moved forward in order that the landing craft might then be sent to England for OVERLORD rehearsals.

Even though Lucas believed his men were not ready, the landing went ahead as scheduled on 22 January 1944. The Americans achieved tactical surprise and met little resistance. By midnight, 36,000 men and 3,200 vehicles were ashore at the cost of only 13 Allied dead.

Because of the hurried and muddled planning, American leaders had only prepared for a fight on the beaches. Once troops were ashore, confusion reigned. The Americans made no effort to seize the Alban Hills overlooking Anzio. Lucas apparently assumed that Clark, once he had broken the Gustav Line, would move north and take the hills. Clark, for his part, seems to have counted on Lucas to seize the hills and thus divert German resources away from the Gustav Line. In any case, the delay allowed Kesselring to move reserves from Rome to the Alban Hills and pin the Americans down without weakening the Gustav Line.

The Germans now had 125,000 men against the 100,000 Americans and British on the Anzio beachhead. The Germans were strong enough to hold the invaders on the beach, but they lacked the artillery or air support needed to destroy the Allied position. Anzio settled into stalemate. By March, the Americans had a new, more aggressive commander in Lieutenant General Lucian Truscott, but Anzio remained a standoff.

On 17 May, Polish and Free French contingents broke the Gustav Line in costly frontal assaults that the Anzio attack was supposed to have rendered unnecessary. These assaults forced German troops at Anzio to relocate to the Caesar Line north of Rome. On 25 May, Allied forces from Anzio and the Gustav Line linked up. They entered Rome on 4 June, just two days before D day.

Critics argue that the Allied campaigns in Italy were an unnecessary sideshow. Defenders claim that Anzio taught the United States and Britain a crucial lesson in amphibious warfare: get off the beaches as quickly as possible and drive inland.

Arakan, First Campaign (October 1942–May 1943)

First British offensive to regain land lost to the Japanese in Burma. In January 1942, Japanese forces drove into Burma (Myanmar) from Thailand to sever Allied lines of communication into China, gain a dominant position in Southeast Asia, and threaten British India. By May, British forces—along with allied Indian, Burmese, and Chinese units—were being pushed north and east into China and north and west into India. In June, the British-controlled forces were holding along the Indian border forward of Ledo, Imphal, and Chittagong, where they began to rebuild and refit their battered forces. In July, commander of the British Eastern Army Lieutenant General N. M. Irwin began planning for an offensive operation against Arakan, a northwest coastal province of Burma bordering southwestern India (now Bangladesh) and separated from the rest of Burma by mountainous jungle terrain.

The offensive was to begin in the late fall and was designed to clear elements of Japanese Lieutenant General Takeuchi Hiroshi's 55th Division from the Mayu Peninsula and Akyab Island. In December, Major General W. L. Lloyd's 14th Indian Division conducted a two-pronged assault down the peninsula. Initially successful, the British were in striking distance of Akyab when General Iida Shōjirō, commander of the Japanese Fifteenth Army, reinforced and strengthened the defensive positions near Donbaik and Rathedaung. The British then reinforced the stalled 15th Indian Division with five additional infantry brigades and a troop of tanks. The March 1943 assault on Donbaik failed, and the Japanese quickly then began a counteroffensive that drove Japanese forces back up the peninsula. The 55th Division struck from Akyab, while other Japanese units worked their way over the supposedly impassable mountains to hit the British left flank and rear areas during 13–17 March.

In early April, Major General C. E. N. Lomax relieved Lloyd with the mission of stemming the Japanese attack. British Lieutenant General William Slim, commander of XV Corps, and his staff were redeployed from Ranchi to Chittagong, although Slim did not receive command of the operation until mid-April. The 26th Division headquarters deployed to relieve the staff of the 14th Division when ordered. Fighting on the Mayu Peninsula raged as Japanese units took full advantage of their proven jungle warfare tactics to outmaneuver and cut off British units at multiple points. Lomax attempted to entrap the rapidly advancing Japanese forces; however, although his plan was sound, the battle-weary

British forces were overcome and were again forced to retreat, having suffered significant losses of transport and equipment. The Japanese reoccupied Arakan on 12 May. British forces were finally able to disengage and establish a stable defensive position near Cox's Bazaar. The first campaign for the Arakan area was over; the British offensive to regain Burmese territory had failed, and the reputation of Japanese forces as unmatched jungle fighters continued to grow.

Arakan, Second Campaign (December 1943–July 1944)

Allied Burma Theater Campaign. Arakan is the northwest coastal province of Burma bordering southwestern India (now Bangladesh); it is separated from the rest of Burma by mountainous jungle terrain. In early 1944, Allied forces in the China-Burma-India Theater were preparing to go on the offensive. U.S. Army Lieutenant General Joseph Stilwell, chief of staff of the Nationalist Chinese Army, planned to direct Merrill's Marauders and Chinese forces against Myitkyina in northern Burma, supported by British Brigadier General Orde Wingate's Chindits. At the same time, Lieutenant General William Slim's British forces would attack from Assam to regain control of the Irrawaddy Valley. An Allied attack in the south by the British XV Corps would secure the Arakan region by again moving down the Mayu Peninsula toward Akyab. Similar in design to the 1942–1943 operation, which had ended in a major British defeat, this offensive had a different result.

In late 1943, three divisions of the British XV Corps were ready to move into the Arakan. The 81st West African Division deployed into the Kaladan Valley to the east of the Mayu Peninsula. The 5th and 7th Indian Divisions relieved the 26th Indian Division forward of Chittagong. A brigade of tanks, the 25th Dragoons, moved forward to provide additional offensive punch. The 55th Japanese Infantry Division, supported by units of the Indian National Army, was defending the Arakan. These formations were later reinforced with elements of the 54th Division. The British aim was to move down the coast of Burma, take the island of Akyab, and prepare to continue the offensive, supporting the overall campaign to retake Burma.

In late December 1943, the Second Arakan Campaign began with the 7th Indian Division attacking on the eastern

side of the peninsula and the 5th Indian Division attacking in the west to secure the port of Maungdaw. The initial British objective was to secure the Japanese fortifications guarding the Maungdaw-Buthidaung road that crossed the mountainous spine of the peninsula. The British secured land routes, airfields, and coastal ports to support the offensive, as there was little doubt that the Japanese would counterattack. To forestall this, the British 26th and 36th Indian Divisions were alerted for movement to the Arakan.

The British advance was halted by Lieutenant General Hanaya Tadashi's 55th Division, which was dug in along a mountain spur extending west to the sea near Maungdaw. This Japanese position blocked land access to Akyab. For nearly two months, the British tried without success to break the Japanese defenses, which Burma Area Army commander Lieutenant General Kawabe Masakazu reinforced with the 54th Division. In early February 1944, the 55th Division counterattacked. One element attacked to fix the 5th and 7th Indian Divisions in place, while a second smaller force moved against the 81st, and a third force infiltrated into the XV Corps and attacked the rear area. Designed to cut off supplies and destroy the British divisions when they retreated, this was the identical strategy the Japanese had used successfully in the same area a year earlier.

The Japanese plan was stymied when General Slim refused to authorize a withdrawal and the Allied units dug in. Resupply efforts by air were successful, and the units held. The Japanese then found themselves encircled by the Indian 26th and British 36th Divisions, which came forward, while at the same time the two frontline British divisions reestablished contact with the Japanese. Although the 81st Division was not able to hold in Kaladan, in the Mayu area British units went on the offensive.

In fierce fighting, the British XV Corps drove through the Maungdaw position. Fighting continued through May, but with the British about to continue on to Akyab, they were obliged to break off the attack to send reinforcements to the Imphal area. Nonetheless, for the first time in Burma, British forces had met and decisively defeated a major Japanese attack. With victory in the Arakan, the tide had decisively turned in Burma.

ARCADIA Conference (22 December 1941–14 January 1942)

Post–Pearl Harbor conference, held between U.S. President Franklin D. Roosevelt and British Prime Minister Winston L. S. Churchill and their staffs. This meeting, code-named *ARCADIA*, was held in Washington, D.C., from 22 December 1941 to 14 January 1942. It came only two weeks after the Japanese attack on Pearl Harbor and U.S. entry into the war. Its purpose was to hammer out joint strategy and cooperative agreements to achieve victory over the Axis powers.

Roosevelt was determined that direction of the Allied war effort would be from the U.S. capital, and the meeting was designed to underscore that end. Churchill saw the meeting as a means of bringing about full U.S. commitment to the war effort. Members of the British delegation entered the talks believing they would show the Americans how things should be run. It did not work out that way. There were sometimes heated exchanges during the meetings. The British delegation was appalled by the lack of organization and procedure on the U.S. side.

The U.S. representatives to the talks sought to establish a council similar to World War I's Supreme Allied War Coun-

cil with many participants, which the British opposed. At a meeting early Christmas Day, U.S. Army Chief of Staff George C. Marshall made a strong appeal for unity of command of the South Pacific area. The British concurred, but the issue then arose of which entity the American-British-Dutch-Australian commander (General Archibald Wavell) should report to. This led to heated debate and ultimately to the decision that the authority would be the American military chiefs in Washington with representatives of the British chiefs, but leaving the authority of both intact. Roosevelt approved this decision on 1 January, which led to establishment of the Combined Chiefs of Staff, involving the military chiefs from the British and U.S. sides. This also created, without executive order, the Joint Chiefs of Staff, the U.S. component of the Combined Chiefs of Staff. In effect, the Americans had won and the war would be run from Washington.

Toward the end of the conference, Roosevelt and Churchill agreed to set up an agency for munitions allocation with equal bodies in Washington and London. Marshall strongly opposed this, insisting there be only one entity. Roosevelt agreed, and the U.S. position prevailed. The establishment of the Combined Chiefs of Staff marked the beginning of perhaps the closest-ever collaboration between two sovereign nations at war.

The conferees at ARCADIA also discussed the possibility of an invasion of North Africa, General Douglas MacArthur's appeal for assistance to the Philippines, and the issue of Lend-Lease aid to the Soviet Union. The two nations also agreed that U.S. troops would be sent to Iceland and Northern Ireland. The ARCADIA conference also led to agreement on the epochal Declaration of the United Nations, signed on 1 January 1942 by representatives of 26 countries. The declaration called for the overthrow of the Axis powers and peace on the basis of the Atlantic Charter. But perhaps the chief result of ARCADIA was that it ensured the war would be run from Washington rather than London.

British Army military police escort SS Obersturmbanner Führer Herbert Kappler to trial in November 1946. Kappler ordered the World War II Ardeatine Massacre in which 335 civilians were executed in retaliation for a partisan bomb that killed 44 German policemen and 10 Italians that March. (Corbis)

Ardeatine Massacre (24 March 1944)

Atrocity committed by the Germans in Italy, a reprisal for Italian partisan bombing in Rome. On 23 March 1944, the Communist-led Gruppi Azione Patriotica (GAP, Patriotic Action Group), commanded by Carlo Salinari, exploded a bomb in the Via Rasella in the center of Rome just as a group of 156 Schutzstaffel (SS) policemen were marching by. The survivors of the bomb blast were then attacked with automatic weapons and grenades. Perhaps as many as 42 German policemen were killed outright, as were 10 Italian civilians. Another 60 Germans were badly wounded.

In retaliation, the German High Command in Berlin ordered the immediate execution of 50 Italians for each German killed in the Via Rasella incident. The German commander in chief in Italy, Field Marshal Albert Kesselring, reduced the number to 10 Italians for each German and directed that those to be executed should be prisoners already under sentence of death. Sufficient condemned prisoners were not located, however, and SS-Obersturmbannführer Herbert Kappler, Nazi police chief of Rome, ordered additional arrests. The details of the operation were arranged by SS-Hauptsturmführer Erich Priebke.

In all, 335 Italians, 75 of whom were Jews and most of whom had no connection with the Via Rasella bombing, were taken from various Roman prisons and transported to the caves on the Fosse Ardeatine (Via Ardeatine) in the southern part of Rome near the catacombs of Saint Calixtus. There they were shot to death in groups of five and buried in the caves. Most of the victims were killed by a single shot to the head, but some were no doubt buried alive when the caves were dynamited. Among the Italians executed were several women and two 14-year-old boys.

In postwar trials, Field Marshal Kesselring; Lieutenant General Kurt Maeltzer, German commandant of the city of Rome; and Colonel General Eberhard von Mackensen, German Fourteenth Army commander were all tried and sentenced to death for their parts in the Ardeatine massacre. The sentences of all three were later commuted to terms of imprisonment. Through a quirk in Italian law, Kappler, the principal perpetrator of the massacre, could not be sentenced to death but was imprisoned. He escaped from a prison hospital in 1977 and died in Germany the following year. Priebke was extradited from Argentina to Italy in 1995; he was eventually convicted and was sentenced to life in prison in 1998.

The Ardeatine massacre has become a symbol of German wartime atrocities in Italy, and the historical realities have been obscured by myth and conjecture. For example, the actual number of Germans killed in the Via Rasella and whether or not Adolf Hitler actually issued a *Führerbefehl* (Führer order) for the reprisal are still unclear. It has also been alleged that the Via Rasella bombing was planned by the Communist-led GAP specifically to provoke a reprisal that would fall most heavily on the many non-Communist antifascists in German prisons. Only three of the Ardeatine victims were Communists, one of whom was Antonello Trombadori, who until 2 February 1944 had commanded the GAP.

Ardennes Offensive (Battle of the Bulge) (16 December 1944–16 January 1945)

Largest land battle on the Western Front during World War II and the largest engagement ever fought by the U.S. Army. In early December 1944, Supreme Allied Commander General Dwight D. Eisenhower planned major offensives in the northern and southern sectors of the Western Front. To ensure sufficient power for these offensives, he left his 80-mile-wide central sector in the Ardennes lightly defended by Major General Troy Middleton's VIII Corps of the 4th, 28th, and 106th Infantry Divisions; the 9th Armored Division (less Combat Command B); and the two-squadron 14th Cavalry Group. The Allies used this area for new commands to gain experience and to train replacements. The rugged Ardennes terrain and presumed light German force gave Eisenhower reason to deploy fewer troops there. Further, the Allies saw no tactical or strategic objectives in the area.

Neither the 9th Armored nor the 106th had experienced combat, and the 28th and 4th were absorbing thousands of replacements after suffering massive casualties in fighting in the Hürtgen Forest. From south to north on the Corps front were the 4th and part of the 9th Armored, the 28th on a 25-mile front, and the 106th holding 1 of almost 16 miles. The 14th Cavalry screened a 5-mile sector between Major General J. Lawton Collins's VII Corps to the south and Major General Leonard T. Gerow's V Corps to the north.

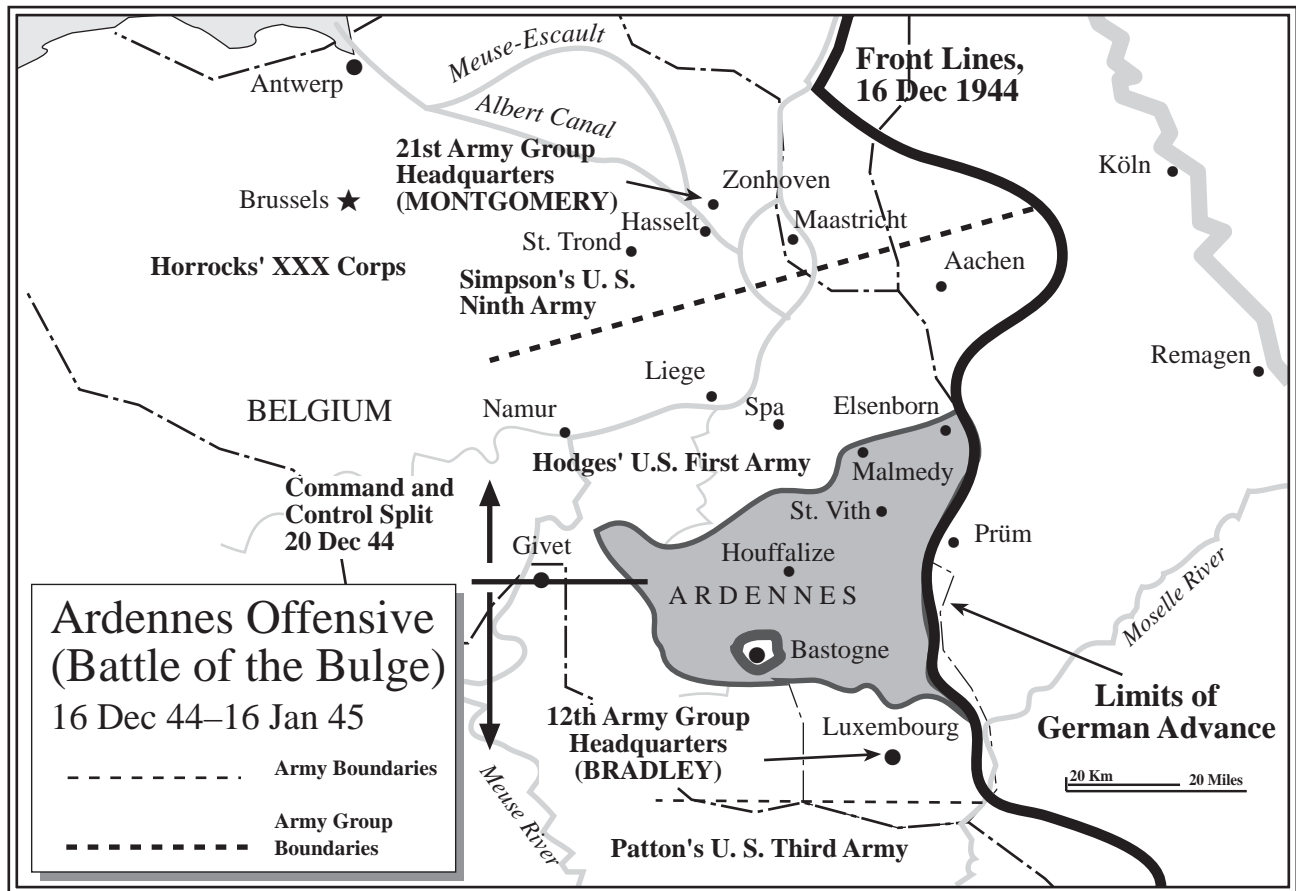

With the Eastern Front largely static and with the Allies gaining ground in the west, German leader Adolf Hitler meanwhile prepared a massive counteroffensive into this lightly defended area to retake the port of Antwerp. He hoped thereby at a minimum to purchase three or four additional months to deal with the advancing Soviets. Field Marshal Gerd von Rundstedt, German commander in the West, thought Hitler's plan too ambitious and tried to dissuade him, as did other high-ranking officers, to no avail. Preparations for the offensive began in September 1944 with strict security and no radio communication. As a consequence, Allied code-breaking did not learn of the German plans. Other information that might have given Allied commanders pause was ignored.

Early on the morning of 16 December, Field Marshal Walther Model's Army Group B mounted the attack. Bad weather prevented Allied air intervention. Attacking German forces included General der Panzertruppen (U.S. equiv. lieutenant general) Hasso-Eccard von Manteuffel's Fifth Panzer Army, Generaloberst (U.S. equiv. full general) Josef "Sepp" Dietrich's Sixth Panzer Army, and General der Panzertruppen Erich Brandenburger's Seventh Army. Army Group B numbered 250,000 men, 1,900 artillery pieces, and 970 tanks and assault guns and was supported by 2,000 aircraft.

In the north, the 99th Division of V Corps stopped the 12th, 277th, and 326th Volksgrenadier Divisions (VGD). But the 14th Cavalry was forced back, and elements of the 3rd Parachute Division (Sixth Panzer Army and 18th VGD [Fifth Panzer Army]) made headway against the 106th Division. The 28th's northern regiment, the 112th, held against elements of the 116th Panzer Division and 560th VGD (Fifth Panzer Army). The 110th Infantry Regiment in the center—hit by the 2nd Panzer Lehr Division, elements of the 116th Panzer Division, and the 26th VGD (Seventh Army)—was decimated. Small, isolated fragments of U.S. forces were surrounded and destroyed. In the south, the hard-pressed 109th held back the 352nd VGD and 5th Parachute Division (Seventh Army). Elements of the 9th Armored and 4th Divisions south of the 28th stopped the 276th and 282nd VGD (Seventh Army).

German forces soon created a bulge in the Allied lines, which gave the battle its name. Ultimately it was 50 miles wide and 70 miles deep. Eisenhower correctly assessed the offensive as a major German effort and immediately ordered the 82nd and 101st Airborne Divisions up from rest areas in France. Traveling by cattle truck, the 101st arrived in the vicinity of the key road hub of Bastogne, Belgium, at midnight on 18 December.

The day of 19 December was pivotal. Eisenhower also sent the 7th and 10th Armored Divisions to support VII Corps. Combat Command R (CCR), 9th Armored Division; Combat Command B (CCB), 10th Armored Division; the 755th Armored Field Artillery Battalion; 705th Tank Destroyer Bat-

talion; and remnants of the 28th Infantry Division joined the 101st. Major General Maxwell D. Taylor, commanding the 101st, was not with the division, which was then commanded by Assistant Division Commander Brigadier General Anthony C. McAuliffe.

Both the 28th and 106th had been destroyed by 19 December, but these two U.S. divisions had irretrievably set back the German timetable. The Germans surrounded and forced the surrender of the 106th's 422nd and 423rd Infantry Regiments, but the 424th extricated itself and withdrew west of the Our River. CCB, 9th Armored Division and the 7th Armored Division under Brigadier General Robert W. Hasbrouk came in on the 424th's north flank. The 112th Infantry of the 28th Division bolstered its south. This diverse force under Hasbrouk defended Saint Vith until 21 December and then withdrew to new positions, which it defended for two more days before withdrawing through elements of the 82nd Airborne and 3rd Armored Divisions.

Also on 19 December, Field Marshal Bernard L. Montgomery, commanding the 21st Army group, on his own initiative deployed his XXX Corps (43rd, 51st, and 53rd Infantry and the Guards Armored Divisions) into positions between Namur and Brussels, blocking further German advance. Meanwhile, the 1st Schutzstaffel (SS) Panzer Division spear-

head under Lieutenant Colonel Joachim Peiper was slowed, then halted by U.S. troops.

From 19 December until it was relieved on 26 December, the 101st, aided by armor, artillery, and other miscellaneous units, defended Bastogne against determined attacks by the Panzer Lehr, 26th VGD, and elements of the 15th Panzer Grenadier Division. When called on to surrender, McAuliffe replied, "Nuts!" The U.S. stands at Saint Vith and Bastogne ruined German hope that their counteroffensive would succeed. From 18 December on, German rear areas had been chaotic. The road net, inadequate to support the German offensive, was jammed with traffic, denying the front badly needed reinforcements, supplies, and ammunition.

On 22 December, Major General John Milliken's U.S. III Corps of the 26th and 80th Infantry and 4th Armored Divisions (from Lieutenant General George S. Patton's Third Army) attacked to the north to relieve Bastogne. That same day, too, a thaw set in, slowing tank movements. By 22 December, the Sixth Panzer Army wallowed in mud and rain, the Fifth Panzer Army was hampered by fog and snow, and supply lines were assailed by continuous snow. Clearing weather permitted Allied aircraft to inflict heavy losses (especially on German armor) and to further snarl German traffic and resupply efforts throughout the Bulge. Fighting contin-

American soldiers of the 289th Infantry Regiment march to cut off the St. Vith-Houffalize road in Belgium in January 1945. The Battle of the Bulge in the Ardennes forest of Belgium was Hitler's last offensive and the largest land battle on the Western Front. (National Archives)

ued until late January, when the Germans were finally forced back to their original positions.

For the Allies, the Ardennes Campaign was a classic example of a tactical defeat but a strategic victory. The brief delays by the 28th and 106th Divisions, the stands at Saint Vith and Bastogne and on the German flanks, and the snarled traffic in the rear (compounded by Allied air attacks) all bought valuable time. This allowed the Allies to strategically reallocate and realign troops to contain and then destroy the German salient. Both sides sustained heavy casualties in the battle: for the Germans some 100,000 men (almost one-third of those engaged), 700 tanks, and 1,600 aircraft; for the Allies (mostly American, of whom 700,000 were ultimately engaged) 90,000

men, 300 tanks, and 300 aircraft. The difference was that the United States could replace its losses, but Germany could not. Hitler's gamble was an irretrievable disaster. It delayed Eisenhower's campaign by five weeks, but it also devoured already slim German reserves of personnel, tanks, guns, fuel, and ammunition. Germany surrendered four months later.

Armaments Production

Armaments production in each combatant nation, like other economic aspects of the war effort, was intimately tied to each nation's decisions about grand strategy and the use of military force. Governments analyzed their economic resources and potential industrial mobilization, and they considered how noneconomic factors such as political tradition, cultural institutions, or the limits of state power would modify or restrict those plans. The resulting policies, which Alan Milward calls *strategic synthesis*, allowed governments to distribute finite resources among the civilian economy, war production, and the armed forces in a more or less rational manner. Put another way, although munitions production was theoretically unlimited, competing demands on resources meant armament creation was often constrained in ways that could not be overcome. The different national limitations on armament expansion help explain why the Allies dominated munitions production during the period 1939–1945.

Limits on armaments production in Nazi Germany were initially political, with the regime explicitly refusing to mobilize the economy too deeply. The Nazis endeavored to prevent a repetition of the experience of World War I, when Imperial Germany suffered political unrest and eventual revolution trying to wage total war. Given Germany's weaker economic position and resources vis-à-vis its opponents, Adolf Hitler deliberately planned to avoid a long war of industrial attrition. Instead, he planned to wage short, intense campaigns with the limited military forces under development since 1936. Hitler's guiding strategic concept was to defeat his enemies quickly and avoid military stalemate on the battlefield. The Italian and Japanese war efforts took a similar approach, mainly owing to their inability to compete with Britain and the United States in war production. Indeed, the small size of the Japanese and Italian economies and the drain on Japan of the Sino-Japanese War precluded a major mobilization effort in any case.

The initial Axis strategies called for a high initial investment in modern military equipment; a readiness to conduct short, opportunistic campaigns; and the careful avoidance of

long-term economic mobilization. Unfortunately for the Axis powers, the course of the war quickly rendered these plans obsolete.

The western Allied strategic synthesis was also based on the wartime experience of 1914–1918, although different lessons were drawn from that Pyrrhic victory. Although the war itself was viewed as a political and economic disaster, the concept of mass industrial mobilization was taken for granted. By investing in technologically intensive and financially costly—but manpower-saving—armament programs, the western democracies hoped to avoid the mass bloodletting of World War I. Future wars, their leaders believed, would be won by industrial might invested in such programs as the Maginot Line or four-engine bombers, not by running infantry against enemy trench lines. In contrast to the Axis strategy, the Allied strategy was slow to develop, as it took time to gather resources and mobilize industry for war.

As with the western democracies, the Soviet Union also intended to wage machine war on a grand scale, although with a significantly heavier reliance on manpower. Formed out of the experience of the 1919–1920 Russian Civil War, Soviet strategic thinking planned on mass warfare in part because party leaders saw no separation of war, politics, and society. In addition, the policy took advantage of the great resource and manpower reserves available in the Soviet Union. Despite the extreme social and economic disruption caused by industrial and agricultural five-year plans in the 1930s, the experienced and hardened Soviet bureaucracy was confident of a massive industrial response to any future conflict.

Viewed in these terms, there were four main centers of armaments production during World War II: the western democracies (after 1940, only the United States and British Commonwealth), the European Axis (Germany and Italy), the Soviet Union, and Japan. These economic spheres were in no way equal, however; the Axis powers were at a severe disadvantage. In 1938, for example, the Allied gross domestic product (GDP) was 2.4 times the size of the GDPs of Axis nations. This ratio is meaningless, however, if such economic power is not translated into combat-ready munitions.

In 1939–1941, the Axis nations enjoyed a significant armaments advantage, as their rearmament programs had started earlier and had concentrated on frontline aircraft, vehicles, and other equipment. In contrast, the western democracies and the Soviet Union were still heavily engaged in long-range rearmament programs at the outbreak of war. The British and the French were building aircraft factories and capital ships in 1940, for example, while the Russians were still focused on engineering, machine tools, and factory construction. Before the fall of France in June 1940, U.S. armament expenditure was quite low, and the munitions industry was backlogged with European orders for machine tools and aircraft. From an

Conversion of a Chevrolet Motor automobile plant in Detroit, Michigan, to armament production: A giant overhead crane moves a 6D Bliss press, weighing 17 tons, from a plant being entirely cleared for outright conversion to armament production. Set up in another of the automobile factory's buildings, this press formed door trim panels for 4×4 and 6×6 army trucks. (Library of Congress)

armament perspective, the Allies were trailing behind the Axis in the production of actual combat power despite economic superiority, which partly explains the military success of the German and Japanese offensives through 1941. Allied fortunes were then at a low point as entire countries and colonies fell under Axis control, and the Allied GDP ratio over the Axis fell to 2:1 at the end of the year.

From 1942 on, however, the ratio moved steadily against the Axis powers, particularly as the Allies began coordinating armaments production on a massive scale. During 1942, the United States, Britain, and Canada agreed to pool their resources and allocate the production of munitions on a combined basis. The governing idea was to take advantage of each nation's manufacturing potential, covering any shortfall in other areas through imports from other Allied countries. The British, for example, dedicated a higher proportion of national income to war production than they could normally support (over 54 percent), covering the resulting gap in the

civilian economy with imports from North America. Indeed, it was the ability of the western Allies to trade via the world's oceans, despite the challenge by German U-boats, that allowed the combined production process to work.

By 1944, an immense quantitative mobilization drive nearly doubled the 1938 GDP in the United States (with 42 percent of national income dedicated to the war), steadily increasing the Allied production ratio to 3.3:1 over Germany and Italy and to almost 10:1 over Japan. Combat armament production in the United States alone equaled 50 percent of total world munitions output, with the British adding another 15 percent. Although partly a function of mass production methods, another key to Allied success was the advanced level of economic development in Britain and North America. Well-established transport and other advantages gave the western Allied labor force a 1.4:1 productivity advantage over German workers. The combination led to Allied dominance in the output of a whole range of weapons (see Table 1).

In contrast to the western Allies, the Soviet Union struggled against difficult odds. Although the USSR was much larger than Germany in both area and population, Soviet economic production before the war was only equal to that of Germany, primarily owing to more primitive infrastructure and more primitive machine technology. Following a 25 percent collapse in GDP after the German invasion in summer 1941, the Soviets labored under tremendous pressure to match Axis ground armament production. Over a two-year period, almost half the Soviet economy was shifted from civilian to military efforts, with almost 60 percent of national income allocated to the war in 1943. The ability of the Soviet government to mobilize resources and people proved astonishing, and as noted by Richard Overy, it was this genius for industrial management that allowed the Soviets to pull even with Germany by the end of that year. Despite the accompanying suffering and privation—what Overy called “an exceptional, brutal form of total war”—Soviet workers, helped by Lend-Lease aid from the United States, provided the Red Army with sufficient material to eventually destroy the German armies on the Eastern Front.

Although the German economy was increasingly mobilized for war after 1939, Germany’s prewar notion of limited mobilization restricted centralized control of industrial production. Bureaucratic inertia, the resistance of industry to state control, and a dislike of mass production methods placed Germany in a dangerous position by 1941. Hopes for a quick end to the war were finally dashed that winter, and the German government embarked on a more systematic approach to economic mobilization. The ad hoc style of the past was more or less abandoned, although the mobilization program did not truly get under way until after the German defeat at Stalingrad. Between 1943 and 1944, the proportion of Germany’s national wealth dedicated to the war effort increased from 52 percent to almost 75 percent, which is revealed in the production figures in Table 1. Despite these gains, however, the smaller European industrial base and difficulties extracting resources from conquered territories meant that German war production could simply not keep pace with the Allies. Germany was beset by enemy armies and heavily bombed from the air, and its economy collapsed in 1945.

In comparison with the larger powers, both the Japanese and the Italians fell woefully short in armaments production. Starting with major disadvantages in resources, transportation, and population, neither country was able to mobilize for a long war of industrial attrition. The disruption of imports, confusion in domestic resource allocations, and the loss of overseas supplies such as fuel, coal, and iron ore led to mobilization failures and declining armaments production. Indeed, labor and resource problems meant Italy was never able to commit more than 23 percent of its GDP to the war effort. Japan fared a little better, dramatically raising the low 1941 ratio (27 percent of GDP) in a massive last-ditch mobilization effort (76 percent of GDP dedicated to military outlays in 1944) before economic collapse helped end the war a year later.

The central core of Allied armaments production superiority was resource and industrial mobilization. Firmly rooted in prewar strategic thinking, the Allies refused to be derailed by Axis success during 1940–1941 and continued to plan for a long war of industrial attrition. Though their efforts were improvised and wasteful, the western Allies and the Soviet Union gathered resources from around the world, mobilized workers and industrial plant on a massive scale, and achieved a steady increase in armaments production. The Axis powers, smaller in size and resources even at the height of their conquests, could not match this effort, and this failure helped bring about their defeat.

Armored Personnel Carriers

German military exercises in 1934 showed that in order to keep up with the now-faster tanks, infantry needed to be motorized. Trucks were sufficiently fast on roads, but they were not at all mobile in open country. Also, troops to be carried needed better protection. Consequently, armored half-tracks and fully tracked vehicles were developed to carry infantry; these came to be known as armored personnel carriers (APCs).

The Germans, with their strategy of rapid deployment of armored and mechanized forces (what came to be called later the blitzkrieg, or lightning war), were the first to develop these kinds of troop carriers with their SdKfz (Sonderkraftfahrzeug,

or special motor vehicle) 250 and Hanomag 251 series. Preliminary trials had begun as early as 1926, and in 1939 the German army issued a call for an armored vehicle that could carry half a platoon (four men). Demag built the D7 chassis based on the SdKfz 10, and Buessing-NAG developed an armored body. Production began in June 1941. The SdKfz 250 was 4.77 m long, weighed 6 tons, and could achieve a cross-country speed of up to 37 mph and a road speed of 42 mph. In 1943, the production process was simplified, reducing the main armor from 19 complex plates to 9 straight plates. The new version entered production in October 1943. The larger SdKfz 251/1 became the standard vehicle to equip German Armored Infantry Panzergrenadier units and could carry 12 men. It had a cross-country speed of up to 30 mph and a road speed of more than 35 mph; its road range was just under 200 miles.

Both the SdKfz 250 and SdKfz 251 came in various subtypes. The SdKfz 250 had 12 main variants; the 251 had a total of 16. Usually, the vehicles were equipped with one or two machine guns, but some also carried guns or mortars and were used as tank hunters or self-propelled artillery. These half-tracks were produced at least until 1944. In theory, all tank divisions operated together with armored infantry divisions in APCs from the summer of 1942 onward, but the reality was quite different.

Despite having started the trend, the German army was never as mechanized as the American or British forces. The United States produced the well-known M2 and M3 half-tracks, which were used by all the Allies including the Soviet Union. Although less sophisticated than their German counterparts, these vehicles were produced in much greater numbers. The engine was in the conventional truck position, the transmission being led forward toward the driven front wheels and backward to the track drive wheels through a transfer box. The track suspension had four road wheels, and the tracks had continuous steel bands with metal crosspieces driven by drive wheels that were elevated and to the front.

The M-2 design originated in the four-wheel-drive Scout Car M.3A1 with the rear wheels being substituted through tracks. This led to the Car, Half Track, M-2 which could carry 10 men. It had two machine guns and a 147 hp engine that provided a road speed of 40 mph and cross-country speed of up to 33 mph. It had a 6.35 mm armored hull with 12.72 mm frontal protection. The M-3 was slightly elongated and had room for 13 men. It, too, came with various modifications, such as the antitank gun motor carriage M-3, a personnel carrier that also mounted a 75 mm gun. To meet demand, the International Harvester Company was tasked with producing the M-5 and M-9 series, which were similar to the M-2 and M-3. But even the combined production of the various American factories could not keep up with orders.

During the last stages of the war, self-propelled guns such as the M-7 Priest howitzer motor carriage and the Canadian Ram Mk I (adopted from the U.S. M-3) and the U.S. M-4

Sherman medium tanks were converted to APCs by having their guns or turrets and top decking removed. This meant that the upper bodies of people in the vehicles were visible and vulnerable and that a grenade or shell landing in the open compartment could kill all inside.

The best-known Japanese APCs were the half-tracked Type 1 (known as the Ho-Ha) and the tracked Type 1 (Ho-Ki). The Ho-Ha was similar to the German SdKfz 251 but was somewhat larger. Powered by a 134 hp 6-cylinder engine and weighing 7 tons, it provided room for 15 men protected by armor up to 8 mm thick. The Ho-Ki weighed half a ton less and had 6 mm all-around protection, but it also provided no overhead protection for the rear, troop-carrying compartment. It had a top (road) speed of 25 mph.

During the war, APCs were used extensively in Europe and North Africa. The jungles of the Pacific Theater were less favorable for mechanized combat, so APCs were not used there as much, although the U.S. Marine Corps did employ large numbers of armored amphibious vehicles (known as amphtracs) to deploy troops, equipment, and supplies in Pacific Theater amphibious operations.

Armored Warfare

Several of the belligerents used both tanks and armored cars in combat in World War I, but it was in World War II that the potential for mobility, firepower, and protection of tanks and other armored fighting vehicles came into its own. In World War I, armored vehicles supported infantry; in World War II, the tank became the centerpiece of armored warfare.

As World War II began, the structure of armored forces depended much on the philosophy driving a country's mechanization efforts. Germany had been particularly active in spite of treaty restrictions. Working secretly with the Soviet Union as early as 1922, Germany led the world in the development of an all-arms armored fighting force, with the role of other weapons subordinated to the requirements of tanks. An important part of emerging German armor doctrine was that offensive tanks should detour around the strong points of enemy defense.

Meanwhile, as late as the end of the 1930s, the British General Staff believed that breakthroughs would be accomplished by infantry supported by tanks and that tank units would be used only to exploit success. In France, although there was a move toward mechanization, most tanks were in separate tank battalions designed to support infantry. In the United States, progress was limited by both budgets and branch jealousy. Tanks were assigned to the infantry, and mechanization of the cavalry was slow. Having learned with the Germans the value of integrated mechanized arms, the Soviet army, initially developing a combined-arms armored force along with Germany, took a giant step backward with Josef Stalin's purge of most senior army officers. When war came, Germany's success in Poland and later in France brought widespread realization of the effectiveness of all-arms armored warfare.

During World War II, armored forces played a role in every theater, but the impact of armored warfare was most evident in Poland in 1939, in France in 1940, on the Eastern Front, in North Africa, and in Western Europe during 1944 and 1945. Difficult terrain limited the importance of armored forces in other theaters.

The German invasion of Poland on 1 September 1939 and its blitzkrieg tactics opened the eyes of the world. Germany attacked with a force of 54 divisions, 6 of them armored and 4 mechanized. With 3,195 tanks, as well as a supporting fleet of 1,538 combat aircraft, in a matter of a few weeks the German army overwhelmed Polish defenses. Learning from operations in Poland, the German army assigned each armored (panzer) division its own air force element. The Germans also learned that truck-mounted infantry could not accompany tanks cross-country or survive even infantry fire. Accompanying infantry required cross-country mobility and some armor protection.

In 1940, save for the Soviet Union, France had the strongest armored force in the world, but France failed to learn from German experience. Most French tanks remained dispersed among infantry formations. The British had created an armored division, but it was never deployed to France, where only one armored brigade joined the British Expeditionary Force (BEF). The Allied defensive strategy in the west was based on an assumption that Germany would attack through the Low Countries, and forces were deployed to meet that expectation. On 10 May 1940, however, Germany struck through the Ardennes toward the Meuse near Sedan, planning to then swing northwest in a wide arc toward the coast.

In spite of the superior armor and firepower of many British and French tanks, the combined-arms attack of the German panzer divisions, well supported by close air support, reached the English Channel by the end of May. By early June, following the evacuation of the BEF and some French

forces from Dunkerque, the German army turned its forces south. By the end of June, Germany had defeated France. German armored forces—employed in mass, using surprise, aiming at weak points, and well supported by aircraft—had enjoyed rapid success.

Following the defeat of France, British leaders realized the necessity of building an armored force sufficient to counter German armor, especially as the war had then extended into North Africa when Italy attacked Egypt. British Prime Minister Winston L. S. Churchill directed a British goal of 10 armored divisions by the end of 1941. The government quickly ordered 4,000 tanks from a variety of sources.

The focus of armored warfare next shifted to North Africa, where on 13 September 1940, Italian forces in Libya launched an offensive against British forces in Egypt. The weak British forces, including only one tank battalion and totaling 36,000 men, were pushed back, but the Italian force was exhausted after a 60-mile advance. By December the British were able to launch a successful counterattack, using speed and surprise, with a force that included the 7th Armored Division (only the second to form) and the well-trained Indian 4th Infantry Division. The Italian force was shattered. However, to save his ally from defeat in Libya, Adolf Hitler organized and dispatched the Afrika Korps under Lieutenant General Erwin Rommel. Outmaneuvering the British, Rommel drove them back to Egypt. Through 1941 and most of 1942, the war in the African desert swung back and forth.

German tanks were superior to British tanks, even when the British received tanks from the United States, but British tanks outnumbered German tanks. Rommel also used anti-tank guns as an integral part of his operations, especially the powerful 88 mm antiaircraft gun in a new role as a highly effective antitank gun. Logistics for both sides were difficult, particularly for Germany and Italy, given Britain's nearly complete control of the Mediterranean. Armored combat in Africa was characterized by rapid movement over long distances and close-in violent fighting when forces met.

Meanwhile, both the Soviet Union and the United States used the experiences of combat in France to rethink their armored forces. The Soviets stopped considering tanks to be useful solely for infantry support, and they started a rapid buildup of armored and mechanized units built on the German pattern. In the United States, the Armored Force was created in July 1940; it placed all armored units under one command. New tanks were designed, and production increased. Two all-arms armored divisions were formed, with three more soon to follow. Ambitious plans of the Armored Force, however, were greatly reduced by the commander of Army Ground Forces Lieutenant General Leslie J. McNair, who believed that infantry and artillery would be the key to success. The army planned for only about 10 percent of its divisions to be armored. Each corps

would also have a group of tank battalions for infantry division support.

On 22 June 1941, Germany attacked the Soviet Union. The scale of armored warfare in this theater would dwarf other armored operations. The Germans attacked with 3,200 tanks; the Soviets defended with 20,000. But Germany planned to use the same blitzkrieg tactics of deep armored thrusts that had been successful in France, and it could select the points of attack. Although the attack was led by 25 panzer divisions, it is worth noting that the invading army also included 750,000 horses.

Within weeks, the Soviets had been driven back 200–400 miles; they suffered massive losses as units were surrounded and captured. By mid-July, however, the Soviet defenders began to employ special tactics to repel the invaders. If a German armored spearhead broke through the lines, the Soviets, instead of retreating, closed in on both flanks to try to halt the flow, while other units took up defensive positions to the rear. Large reserve armored units would then attack the German flanks. In addition, the Soviets set up antitank guns and sowed large minefields along expected axes of German advance.

Nevertheless, it was August before the German advance slowed. On 19 November, the Soviets were able to launch a counteroffensive. Inexperienced in the use of mass tank offensive operations, Soviet commanders often failed in their attacks, but by the end of 1941 the Germans were on the defensive. By mid-January 1942, tactical defeats suffered by the Germans threatened to develop into a strategic disaster. Creating and holding a series of strong points, the Germans were able to stabilize the front by March. Several weeks of muddy conditions then held both armies in place. By then, the Soviets had realized any continued offensive would require large massed armored formations, which they created in the form of armored and mechanized corps.

Germany was able to launch offensives in the summers of 1942 and 1943, but the relative strength of the two combatants was changing. On 4 July 1943, German forces, having concentrated most of their Eastern Front armor, attacked the 50-mile-deep Kursk salient, hoping to eliminate it and to cripple Soviet offensive capability. The Soviets were aware of the German plans and prepared a defense in depth marked by an intricate system of minefields and antitank defenses. In the greatest tank battle of all time, the Soviets yielded ground skillfully and launched strong counterattacks. By 23 July, the Soviets had defeated the German offensive.

Each winter, the Soviets countered German attacks with offensives aided by their adaptability to winter and their massive armies. Germany was losing tanks and experienced tank crews at an alarming rate. Meanwhile, the Soviets were able to increase their armor strength substantially because of their own huge ordnance industry and using aid from the United States.

From 1942 to 1945, the Soviets manufactured some 30,000 tanks and self-propelled guns, and the U.S. provided 7,056 tanks. The Soviet T-34 medium tank and the IS-2 heavy tank also proved to be more than a match for most German tanks.

Although the Soviets for the most part did not accomplish the breakthroughs typical of German offensives, they were able to conduct a war of attrition. Overall, the Soviet Union, with its unending miles of difficult terrain, its huge population, its massive defense industry, and its terrible winters proved to be too much for the German military machine. By the spring of 1945, the Soviet army had reached the river Elbe and joined hands with U.S. forces.

Meanwhile, U.S. forces were also conducting successful armored operations. Indeed, the U.S. Army was the most highly mechanized military force to that point in history. On 8 November 1942, the United States committed its new Armored Force to battle with successful landings in North Africa. Moving east rapidly, the inexperienced American force was bloodied at the first major battle with the Germans at Kasserine Pass. Recovering, the Americans soon combined with British forces to encircle the Axis forces in Tunis and defeat them there by 13 May 1943. U.S. armor units continued to gain experience in Sicily and Italy, but terrain there made it impractical to use large armored forces. Besides, the Allies now placed their emphasis on building up a force to invade northwestern Europe.

The June 1944 landings on Normandy were accomplished by infantry, although a few tanks rigged as amphibians contributed to the effort. After a firm lodgement had been achieved, large armored forces could be committed. In late July, the highly mobile U.S. Third Army broke out of Normandy. Within a month, the Allies had advanced to the line of the Seine River and liberated Paris. Advancing on a broad front, by mid-September Allied forces had cleared Belgium and northern France. Although the Germans did not offer significant organized resistance, their Panther and Tiger tanks took a toll on the lighter and lesser-gunned—but more numerous—Allied tanks, especially the M-4 Sherman medium. Indeed, the United States did not have a heavy tank, the M-26, in combat until early 1945.

In a winter offensive, the Allies attacked the German West Wall on a broad front with the aim of breaking through to the Ruhr industrial district. Gathering his armored forces for a counteroffensive, on 16 December Adolf Hitler surprised the Allies with a mobile attack through the Ardennes. The Germans lacked the means to exploit their initial breakthrough, and within a month, they were stopped. By March 1945, Allied forces had encircled and defeated German forces west of the Rhine and had crossed the river. Capitalizing on its highly mobile armored divisions and on weakening German defense, Allied forces then drove across Germany, which surrendered on 8 May.

Clearly, in the 1930s, Germany had seized the initiative in the development of armored forces and the implementation of armored warfare. Its blitzkrieg tactics were highly successful until attrition and logistics problems began to play a part (particularly on the East European Front) and the Allies caught up in fielding effective armored forces. Whereas the Soviets defeated the German forces by overwhelming them, tactics played a greater part in the West. There the concepts of armored breakthroughs and exploitation were effective, especially in the American Third Army led by Lieutenant General George S. Patton Jr.

Tanks and other armored vehicles were used effectively in other theaters of the war, but in those areas they usually were used as infantry support rather than as highly mobile maneuver forces. Nevertheless, they played an important role in many Pacific campaigns.

From 1939 to 1945, Germany produced some 53,700 tanks, peaking at 22,100 in 1944. During the same period, Japan produced only 4,572, and Italy manufactured 3,054 through August 1943. Great Britain produced 28,296 tanks during the course of the war. The Soviet Union manufactured more tanks than any other power—105,232, more than 40,000 of which were T-34 tank variants. By December 1945, the United States had produced 88,479 tanks in 17 different plants. Production figures for supporting armored vehicle were similarly impressive. Clearly, armored warfare had come of age.

Arnauld de la Perière, Lothar von (1886–1942)

German navy admiral. Born in Posen (today Poznan, Poland) in 1886, Lothar von Arnauld de la Perière entered the Imperial German Navy in 1903 and was commissioned in 1906. He became a torpedo specialist. Following sea duty, in 1913 Arnaud became adjutant to chief of the naval staff Admiral Hugo von Pohl. He then spent time in Britain acquiring language skills until the outbreak of World War I.

Returning to Germany, Arnaud volunteered for the Imperial Naval Air Service (Zeppelins), but he was recalled by von Pohl. He then volunteered for U-boat service, and on completing submarine school, in October 1915 he took command of the *U-35* based at Pola on the Adriatic. From November 1915 to March 1918, Arnaud completed 14 cruises with the Pola Flotilla. During one cruise alone in 1916, he sank 54 ships totaling more than 90,150 tons. In March 1918, Arnaud took command of the *U-139* in the Atlantic. During his wartime total of 16 patrols, Arnauld sank 196 ships totaling 455,716 tons. This record stands unsurpassed in both world wars and indeed all history.

Retained in the German navy following World War I, Arnauld filled staff billets and commanded the light cruiser *Emden* from 1928 to 1930. He left the navy in 1931 as a captain and subsequently taught at the Turkish Naval Academy from 1932 to 1938. Recalled to the German navy at the start of World War II, Arnauld subsequently served as naval commander in Belgium, the Netherlands, Brittany, and western France. Promoted to vice admiral and named Admiral Southeast, he died in a plane crash at Le Bourget airport in Paris on 24 February 1942 en route to take up his new command.

Arnim, Hans Jürgen Dieter von (1889–1962)

German army general. Born at Ernsdorf on 4 April 1889, Hans von Arnim was commissioned in the German army in October 1909. During World War I, he saw service on both the Western and Eastern Fronts and won promotion to captain in January 1917.

German General Jürgen von Arnim, 1945. (Corbis)

Arnim continued in the Reichswehr after the war, and in 1935 he took command of the 69th Infantry Regiment. Advanced to Generalmajor (U.S. equiv. brigadier general) in January 1938, von Arnim took charge of an Army Service Depot at Schweidnitz in Silesia during 1938 and 1939.

Following the outbreak of World War II, on 12 September 1939 von Arnim took command of the 52nd Infantry Division. He was promoted to Generalleutnant (U.S. equiv. major general) in December 1939. In October 1940, he shifted to head the 17th Panzer Division and led it in Operation BARBAROSSA, the German invasion of the Soviet Union.

Assigned to Major General Heinz Guderian's 2nd Panzer Group, von Arnim proved his mettle as a panzer commander. Seriously wounded near Schklov on 27 June 1941, von Arnim did not return to action until September and participated in the encirclement of Kiev later that month. His forces then took the important railway junction of Bryansk. Shortly after the victory at Bryansk, von Arnim was promoted to General der Panzertruppen (U.S. equiv. lieutenant general) effective in October 1941. He then commanded the XXXIX Motorized Corps, which became a panzer corps in July 1942, and saw action at Tikhvin and Cholm. Arnim was promoted to Generaloberst (U.S. equiv. full general) in December 1942 and assumed command of the Fifth Panzer Army in Tunisia.

Following meetings with Adolf Hitler, Arnim assumed command of Axis forces in Tunisia on 9 December 1942. His performance in this role has drawn criticism from historians. Arnim and Field Marshal Erwin Rommel often worked at cross-purposes, and Arnim failed to take advantage of Rommel’s victories at Kasserine and Tebersa. Arnim’s own attack by the Fifth Panzer Army in February 1943 toward Medjez el Bat and Beja failed, even though he won a series of tactical victories. Following those events, Arnim received command of Army Group Africa on 9 March 1943.

British forces took Arnim prisoner on 12 May 1943. Incarcerated in an English country house at Hampshire until his release in 1947, Arnim then took up residence in Bad Wildungen, Germany, where he died on 1 September 1962.

Arnold, Henry Harley “Hap” (1886–1950)

U.S. Army Air Forces (USAAF) general who led the USAAF and its predecessor, the Army Air Corps, throughout the war. Born on 25 June 1886 in Gladwyne, Pennsylvania, Henry Harley “Hap” Arnold graduated from the U.S. Military Academy in 1907 and was commissioned in the infantry. He transferred into the aeronautical division of the Signal Corps in 1911 and received his pilot’s certificate after training with Orville Wright. In 1912, Arnold set a world altitude record and won the first Mackay Trophy for aviation.

During World War I, Arnold served on the army staff in Washington, rising to the rank of colonel and overseeing all aviation training. After the war, Arnold reverted to his permanent rank of captain. During the 1920s, he held a variety

of assignments. He supported Colonel William Mitchell at the latter's court-martial, although this was not well received by his superiors. Arnold wrote or cowrote five books on aviation, won a second Mackay Trophy, and continued to rise in the Army Air Corps. He became its assistant chief as a brigadier general in 1935. Three years later he became chief of the Army Air Corps as a major general after the death of Major General Oscar Westover in a plane crash.

Arnold proved particularly adept at improving the readiness of his service and expanding its resources, even with tight interwar budgets. Promoted to lieutenant general in December 1941, he was designated commanding general of the U.S. Army Air Forces in the March 1942 War Department reorganization, which raised the air arm to equal status with the Army Ground Forces and Army Service Forces. Because the British had a chief of air staff, Arnold was included on the British-American Combined Chiefs of Staff as well as the U.S. Joint Chiefs of Staff. Although he was not a major player in their decisions, he was a loyal supporter of U.S. Army Chief of Staff George C. Marshall, who repaid Arnold after the war by supporting the establishment of an independent U.S. Air Force. Arnold was promoted to general in March 1943 and became one of four five-star generals of the army in December 1944.

During the war, Arnold built an organization that reached a peak of approximately 2.5 million personnel and more than 63,000 aircraft. He was a fine judge of people and selected the best men as his advisers, staff, and field commanders. Arnold also established an emphasis on technological research and development that his service retains today. Although he was not really involved in day-to-day combat operations, his authority to relieve the field commanders who really did run the war gave him leverage to influence their actions. Poor health limited his effectiveness late in the war, especially after a fourth heart attack in January 1945.

Arnold was a proponent of precision bombing, but his pressure for more raids despite bad weather led to increased use of less accurate radar-directed bombardments in Europe, and his demand for increased efficiency in Japan inspired the fire raids there. His main goals were to make the largest possible contribution to winning the war and to ensure that the USAAF received credit for the win through proper publicity.

Although Arnold retired in June 1946, his goal of an independent U.S. air service was realized the next year by his successor, General Carl Spaatz. In May 1949, Arnold was named the first general of the U.S. Air Force. Arnold truly deserves the title "Father of the United States Air Force." He died at Sonoma, California, on 15 January 1950.

Art and the War

Although imagery of World War II is often thought of in terms of its haunting photographic legacy, thousands of other pictorial records were created by artists who depicted the war as it unfolded around them. Artists served as high-profile correspondents throughout much of the war, vividly documenting its conflicts in drawings, watercolors, and paintings executed on the spot and often under harrowing conditions.

An important precedent for European artists had been set by Pablo Picasso's mural-sized painting, *Guernica* (1937), named after a Basque town bombed by the German Kondor Legion during the Spanish Civil War. In *Guernica*, distended forms and disfigured characters were blown up large and linked to a vast panorama of brutality. The painting, which extended Picasso's fragmented Cubist pictorial language into the political arena, was all the more powerful for its ability to express an idyllic world shattered by the sweeping acts of anonymous warfare.

The warring powers linked art to propagandistic rhetoric. Perhaps the most unusual coupling of art and propaganda can be traced to Adolf Hitler's imagined lineage of the Germanic people from the Greek civilization of antiquity. The revival of severe forms of Greek classicism, along with a "volkish" art and architecture (art and architecture "of the people"), would result in Germany in the most spectacular public rejection of modernism in the twentieth century.

As early as 1933, the Nazi Party had stormed the legendary Bauhaus (academy of arts founded in 1919) in Dessau and padlocked its doors. In 1937, the Nazis ordered museums to be purged of artwork that they considered to have a corrosive effect on the morals of the German people. The targets of Nazi aggression were some of the greatest works of the avant-garde—the lyrical abstractions of Wassily Kandinsky; the raw energetic forms of Ernst Ludwig Kirchner and Die Brücke; the antimilitaristic sentiments and nihilistic acts of George Grosz, Otto Dix, and Berlin Dada. Particularly scorned were the works of Jewish artists who expressed their spirituality in their work, such as Marc Chagall, who had already lived through the Russian pogroms in the century's first decade. Many of the works of the artists in Nazi disfavor were

simply destroyed, and 650 were selected from the thousands purged from the museums for a special exhibition *Entartete Kunst (Degenerate Art)* which traveled to a dozen cities in Germany and Austria. In the exhibition, paintings were poorly displayed, often at crooked angles, and sculptures were crowded together in piles; instead of didactic labels, graffiti scrawled on the walls ridiculed the objects and their makers. More than three million people attended this exhibition and a companion to it, *Degenerate Music*.

The U.S. Army Corps of Engineers sent eight artists to document the experiences of American combat troops in Europe. In late 1942, a second War Art Unit was created. A War Art Advisory Committee led by muralist George Biddle and composed of museum directors, curators, and even writer John Steinbeck identified artists for the special unit. Of the 42 individuals selected by the committee, 23 were already on active military duty. Although the first artists were sent to the Pacific Theater, shortly thereafter official artists were deployed to cover the various theaters. By 1943, each branch of the military had assembled its own art unit to commemorate its contribution—by land, air, or sea.

Military artists were first and foremost soldiers who assumed the additional duties of documenting the war's events with the tools of the artist. The images they generated

run the gamut from portraying soldiers' and sailors' everyday routines to stirring portrayals of troops in the heat of battle. Such artists participated in the events they recorded, and at times they had to take up weapons with their fellows. When the opportunity arose, they would take out their sketchbooks and drawing instruments to make sketches and jot down notations. Such sketches matured into full drawings or were translated into paint once the combat artists had the opportunity and resources to accomplish it. Soldier-artists also served as illustrators for military publications such as the U.S. Army magazine *Yank*, which was created for the troops. Although civilian artists did not serve in combat, they accompanied the troops on dangerous missions and put their lives in harm's way; at least one civilian artist died when his transport crashed on the way to India.

When a failure by Congress to appropriate funds threatened to eliminate the army's War Art Unit shortly after its inauguration, the contracts of 17 of the 19 civilian artists were taken over by publisher Henry R. Luce's *Life* magazine. The magazine profiled war artists such as Fletcher Martin, Floyd Davis, Tom Lea, Paul Sample, and Rubin Kadish, and photographs of the artists sketching in airplane cockpits or painting on aircraft carriers often appeared next to their works.

Life also ran several contests on the theme of art in the armed services and featured soldiers' work in subsequent multipage spreads. The magazine quickly became the vehicle by which the images moved beyond their original function as reportage to achieve acclaim as works of art in their own right. *Life* sponsored exhibitions of war art at populist venues such as state fairs and at venerable institutions such as the National Gallery in Washington, D.C., and the Metropolitan Museum of Art in New York. It was by examining the objects firsthand—hurried pencil sketches and pen-and-ink scrawls, watercolors and oils put down on wrapping paper and pasteboard from packing boxes—that the public could fully grasp their immediacy, ponder the obstacles the artists had to overcome to record each scene, and be convinced of the soldiers' patriotic duty to make the art.

A second source of funding for the U.S. civilian art contracts came from Abbott Laboratories, a pharmaceutical company in Chicago that provided medical supplies to the troops. The company had an established record of patronage of the arts, and its director of advertising, Charles Downs, realized the power of images to rally the support of the public. Working with the Associated American Artists group in New York, Abbott Laboratories recruited a dozen artists to be sent overseas and successfully lobbied the War Department to provide the artists with the same degree of support given to photographers and filmmakers in terms of housing, transportation, and security clearance. Many of the artists, such as Thomas Hart Benton, Reginald Marsh, and John Stuart Curry, had worked on large-scale mural projects sponsored

by the Works Projects Administration during the Great Depression years. Abbott Laboratories commissioned thematic sets of images, oftentimes showcasing their own products, although the stated mission of the project was to create permanent collections that were later donated to the military branches. Abbott also sponsored traveling exhibitions of these works to university galleries and museums across the country.

Although even the Museum of Modern Art in New York complied with the public's appetite for war pictures by sending art supplies to the front and mounting exhibitions from the battlefield, a small but vocal group of artists protested these images as sanitized portrayals of war—or worse, products of the American propaganda machine. Some were critical of the civilian component of the art units and those who traveled as artist-correspondents, charging that they played no direct role in the war effort.

Artists who served in the war designed camouflage patterns or condensed information into strategic charts and maps; their skills directly contributed to the war effort. Some artists objected to the lack of psychological or philosophical commentary in the images themselves, arguing that works of art should offer information beyond that of a photograph and should give a truer sense of the atrocities faced by the soldiers who were battling for freedom. The large community of European exiles gathered in New York City during the early 1940s created a more ambivalent body of images that speaks of the emotional and psychological complexities of a world at war. Paintings by Max Ernst or the Chilean artist Roberto Matta, often nightmarish plunges into landscapes ruled by irrational forces, were executed in expressionist or surrealist styles.

After the war, U.S. soldiers who had worked in the art units or as artist-correspondents, as well as those who had interest in but no actual background in the arts, were offered the opportunity to pursue formal art training through the GI Bill. It created a generation of college-educated artists who sought to distance themselves from their experiences on the battlefield. Because of the association of conservative pictorial styles with Nazi propaganda and international outrage over Hitler's extreme forms of censorship, postwar art would attempt to break from the past altogether by experimenting with nonobjective styles that would be difficult for any party or platform to co-opt.

Artillery Doctrine

Artillery and fire-support tactics in World War II owed more to the lessons of World War I than to the theories of mechanized warfare that evolved between the wars. Between 1914 and 1918, artillery went through a series of radical changes, altering forever the face of modern warfare. Most of the artillery innovations of 1914–1918 are still very much with us today, albeit in far more refined technological forms.

Major changes that occurred in World War I had an especially profound influence on the way World War II was fought. The most important change was the perfection of indirect fire, as opposed to direct fire. Indirect fire techniques had been developed before 1914, but during World War I they were standardized and became the norm rather than the exception for artillery combat. Firing an artillery piece by direct fire required the crew to be able to see the target and to aim at it directly, either through open iron or optical sights. Firing using this method limited the range at which guns could engage targets and required the guns to be far forward and exposed to enemy fire. Indirect fire is a system in which a gun can be fired at targets the gun crew cannot see. The gun crew instead aims the piece by sighting on a reference point.

Initially, indirect fire required a forward observer who could see the target and had some means of communication to transmit corrections back to the guns. After the first shot was fired, the observer would make successive corrections until the fall of shot was adjusted onto the target. Near the end of World War I, however, several armies had mastered the technique of firing without observer corrections. Using the correct current weather data and accurate ballistics data about the ammunition and the guns, the necessary adjustments could be mathematically predicted—hence the name *predicted fire* for the technique.

Indirect fire combined with predicted fire had several extremely significant consequences for war fighting. First, it was no longer necessary to physically mass guns on the ground to produce massed fire effects on a target. Guns at diverse points on the battlefield could all fire simultaneously on the same target. The second major consequence was the introduction of depth to combat operations. The ability to engage targets beyond visual range transformed the conducting of warfare from a linear, two-dimensional problem to a three-dimensional problem. The advent of combat aircraft also added significantly to three-dimensional warfare.

These changes came to dominate combat operations in the final years of World War I, but they were not fully developed

This British Army 25 pounder was part of an eight gun battery which fired 4000 rounds in just over 15 hours. Firing was continuous and water was used to keep the guns cool. (Photo by Keystone/Getty Images)

by the time the war ended. Two major constraining factors were the relatively primitive mobility and communications technologies of the day, which limited the effectiveness of the new fire-support capabilities. Between the wars, the technologies of battlefield transportation and communications made great advances, which contributed significantly to the fact that the stagnation of the trench warfare of World War I was not repeated in World War II.

Germany

Germany led the world in the development of artillery tactics during World War I. Between 1916 and 1918, Colonel Georg Bruchmüller pioneered many of the most important artillery tactical methods: neutralization and suppressive fires, as opposed to simple destructive fires; performance of specific tactical missions by specially trained artillery groups, including infantry support, counterbattery, and deep attack; and fire preparations organized into phases to accomplish specific tactical objectives. In early 1918, Bruchmüller championed the work of Captain Eric Pulkowski, who developed a

technique of meteorological corrections—still in use today, albeit computerized—that made accurate predicted fire both possible and practical.

Ironically, Germany in the interwar years all but abandoned most of the artillery lessons it had taught the rest of the world during World War I. German artillery had been so devastating that the Versailles Treaty only allowed the postwar German army 284 artillery pieces, none larger than 105 mm. As late as 1936, three years after Adolf Hitler came to power, the German army still had only 284 guns. An army not allowed any significant amount of artillery, then, focused on developing alternative tactics centered on the tank, which in theory was supposed to provide its own close fire support. This in turn led the Germans to conclude that even if they had adequate artillery, the guns and especially their ammunition supply would not be able to keep pace with the tanks.

The Germans did recognize that even a massive tank force would sometimes encounter stiff opposition that would slow the momentum of the advance. In such situations, the additional required fire support would come from the air. By 1940,

the Germans had developed an impressively sophisticated air-to-ground coordination system that was capable of concentrating as many as 2,700 aircraft over a critical sector. As successful as this system was in France, the Germans did recognize that their panzer forces would still benefit by the addition of highly mobile, organic fire-support assets. At that point they started to develop and field a limited number of self-propelled assault, antitank, and field guns.

The German system of relying primarily on air power for fire support worked fairly well in France. As the war progressed, though, the Germans came to realize that their approach was subject to flaws in three critical areas: mass, weather, and air superiority. When the German army invaded the Soviet Union, the operational theater was so vast and Soviet ground forces were spread so widely that the Luftwaffe could not be overhead everywhere it was needed at one time. The weather in the Soviet Union also severely restricted Luftwaffe operations. But conventional field artillery is practically impervious to weather conditions, and the massively gunned Red Army almost always had adequate fire support. Finally, as the war progressed and attrition sharply affected the Luftwaffe, the Germans lost air superiority. The real importance of the Combined Bomber Offensive mounted by the western Allies was not so much its effect on Germany's industrial base, but rather the steady attrition of Luftwaffe fighters and pilots. By late 1944 and 1945, Germany no longer controlled the air over its own territory, let alone over the battlefields in France or the Eastern Front.

Again abandoning lessons it had taught the world in 1918, the German army of World War II rarely emphasized the massing of artillery above the divisional level. It failed to provide artillery concentrations at the corps, army, or army group levels. The Soviets, though, considered artillery at those levels to be decisive. By 1944, the Germans had come to fully recognize their critical error with respect to artillery, and they desperately tried to recreate the fire-support structure and assets that had served them so well in 1918. By then, however, it was too little, too late.

Japan

The Japanese army believed that the immediate and close support of the infantry attack was the primary mission of field artillery. Secondary artillery missions included destroying the enemy's supporting infantry weapons, destroying obstacles in the way of the infantry advance, and interdicting enemy lines of communication. Counterbattery work had the lowest priority.

The Japanese stressed the importance of keeping their guns well forward, often placing firing positions within a few hundred yards of an enemy's forward positions. Command posts were sited right next to the guns so the battery could be controlled by voice command. But the fire and observation conditions of Asian jungles created special problems for close

infantry support. The terrain often made it difficult or impossible to track accurately the positions of the infantry units. The requirement to fire over trees almost always meant that the fall of shot would be too far forward of the infantry. The solution to that problem was to position the guns on the flanks of the attacking infantry.

Under Japanese doctrine, artillery was oriented primarily to the offense. Before an attack, standard Japanese artillery preparation lasted between one and two hours. The preparation was conducted in three phases of roughly equal duration: (1) range adjustment; (2) obstacle destruction; and (3) fire on the enemy's forward positions. As the infantry began its attack, the mission of the artillery shifted to direct support. In defensive situations, the main weight of the Japanese guns would be echeloned 1 to 1.2 miles behind the main line of resistance. As the enemy massed for the attack, the defending artillery would fire a counterpreparation. Once the enemy attack started, the mission of the artillery was to break up the momentum of the assault with a series of standing barrages.

As with the Germans, the Japanese throughout World War II suffered from too little artillery and inadequate organization and control at the higher echelons. Artillery in small units was allocated directly to the tactical-level infantry units, which left almost no fire-support assets for centralized command and control at the divisional level and up. By 1944 the Japanese, too, had come to recognize the gravity of these shortcomings, and they moved to correct the problems. But, as with their German allies, it was too little and too late.

France

The French were slow to modernize their artillery following World War I. Throughout the interwar years, all French tactical thinking was either woefully outdated or too heavily influenced by a defensive orientation. The French believed that massive firepower was the key to victory. They took this idea to its extreme limit and also rejected mobility. They came to regard "weight of metal" as the decisive factor in any defense or attack. This, of course, led to the massive defensive system of the Maginot Line, which sought to replicate on a grand scale the fixed fortifications of Verdun, which had held out in 1916.

The French put all their interwar artillery efforts into artillery in fortresses, largely ignoring mobile field artillery. In the early 1930s, the French did experiment with a mechanized division, but French field artillery was not even motorized until 1934. Throughout the 1920s and 1930s, French tactical doctrine emphasized that the mission of artillery was (1) to destroy any obstacles in the path of the infantry, (2) to accompany the infantry by fire, and (3) to strike at the enemy artillery's capability to hit the friendly infantry. The emphasis on these missions, however, was always within a framework of counterpreparations and defensive fires.

Just prior to the start of World War II, a French artillery preparation had three primary targets: the enemy's infantry, the enemy's known antitank weapons, and the enemy's suspected antitank weapons. Counterbattery fire against the enemy's guns had almost completely fallen out of the French doctrine. The French believed that modern technology and mechanization made counterbattery fires impractical, if not impossible. Finally, the French failed to provide any real doctrine for coordinating artillery with air support and air defense. A result of this failure was that two French divisional artilleries were cut off and then routed at Sedan in May 1940 before the German ground forces had even crossed the Meuse.

United States

As early as the mid-1920s, the U.S. Army started to abandon many of the hard-learned artillery lessons of World War I, and the focus of ground tactics shifted back to an infantry-centered world. Right up to the start of World War II, the U.S. Army neglected the requirements of artillery command and control above the divisional level and almost totally ignored corps-level artillery. What passed for corps-level artillery was little more than a holding pool for units and guns not otherwise assigned to a division. According to the doctrine, corps artillery was supposed to be responsible for counterbattery fire. But even as late as May 1943, the Field Artillery School at Fort Sill, Oklahoma, was still recommending that corps artillery units be parceled out to the divisions during operations.

The U.S. Army, however, did not go quite as far as the British, French, or even the Germans in abandoning the artillery lessons of World War I. The American penchant for technical solutions prevailed, and Fort Sill experimented with various forms of fire control techniques, including aerial observation. By 1934, Fort Sill had developed the first battalion Fire Direction Center, which could simultaneously control and mass the guns of all three of an artillery battalion's batteries. In 1940, Fort Sill introduced the graphical firing table, a specialized artillery slide rule that greatly speeded the calculation of the firing solution. In April 1941, Fort Sill demonstrated for U.S. Army Chief of Staff General George C. Marshall a divisional shoot, controlling and massing against a single target the fires of four separate battalions, totaling 12 batteries.

In the late 1930s, Brigadier General Lesley J. McNair was the assistant school commandant at Fort Sill. McNair had commanded a field artillery brigade in France during World War I. Later, as commander of U.S. Army Ground Forces, he became the chief architect of the U.S. military buildup going into World War II. McNair was a strong believer in flexible massed fires. He championed the development of longer-range guns and supported all initiatives to centralize artillery command and control systems. Under his direction, the

number of nondivisional medium and heavy artillery battalions in the U.S. Army nearly doubled between 1942 and 1944.

U.S. Army doctrine in World War II identified two primary field artillery missions: (1) supporting the ground-gaining (infantry, cavalry, armored) units by either neutralizing or destruction fires; and (2) giving depth to combat by counterbattery fire, by fire on enemy reserves, by restricting movement in enemy rear areas, and by disrupting enemy command and control systems.

As the war progressed, the U.S. Army's logistical advantage became increasingly decisive, and the American tactical experience mirrored that of the other Allies. At the corps level, the emphasis increased on command, joint operations, and airpower. Joint operations and airpower were especially important in the Far East, where amphibious operations and jungle terrain made it almost impossible to mass artillery on the ground.

British Commonwealth

The British army had (and still has) a somewhat different approach to artillery command and control. In almost all other armies, the forward observers (FO), who accompanied the infantry and requested—and, if necessary, adjusted—the supporting fires, were junior officers, usually lieutenants. The more senior artillery officers remained in command of the guns or in the command posts of the artillery battalions or the divisional artillery headquarters. The British attached their more senior officers to the command post of the supported maneuver unit. Thus, a British infantry company would have a captain as an FO—or forward observation officer (FOO), as the British called them. The supported infantry battalion commander would have an artillery major as his artillery adviser.

The idea behind the British system is that the senior and more experienced officers would better understand the overall tactical situation. Whereas a lieutenant FO in most armies could only request fires, a British FOO had the authority to order the fires. The British believed this system produced quicker and more responsive fire support. The system depended heavily on radio communication, which was widespread and effective in the British army from 1940 forward.

As with the Germans, the British had rejected most of the artillery lessons of World War I. Great Britain entered World War II with a tactical doctrine that de-emphasized artillery, based on the theory that tanks could operate independently without much support from the other arms. Unlike the Germans, the British did not have an air force structured to provide air-to-ground support for emergencies. Unlike the Luftwaffe, the Royal Air Force before World War II concentrated on building up its bomber forces. The lack of air support for their ground troops cost the British dearly in the campaign for France in 1940.

The British approach to mobile tactics did work well against the Italians at the start of the campaign in North Africa. But once the Germans entered that fight, the British were at a severe disadvantage against the German combined-arms tactics and organizations. Too often, the British tried to attack German positions without adequate artillery preparation and paid a high price. And at the same time, the British had difficulty establishing an effective defense built on fire and maneuver.

What made the British situation even more difficult during the early fighting in North Africa was the fact that they were forced to use most of their field artillery in an antitank role, which left little for infantry support. By 1942, the British were pouring new antitank guns and more field artillery into North Africa, which then allowed them to develop new tactical methods.

General Bernard Montgomery was the primary architect of the new British approach. Montgomery stressed the steady buildup of a superior firepower ratio and the use of artillery to produce shock action in coordination with the other arms. The two main tactical techniques to achieve this were the creeping barrage and the timed concentration. These techniques had been developed in World War I, but in World War II they were far more sophisticated and effective because of better communications and predicted rather than observed and adjusted fire. At El Alamein, for example, 1,000 British guns produced a massive shock effect by firing more than 1.2 million shells at plotted German targets without having to telegraph the attack by first adjusting the fall of shot. The British also developed a standard fire mission they called the “72-gun battery,” which concentrated all the guns of a division on a single target.

Soviet Union

Virtually alone among the world’s major armies, the Red Army following World War I intensely studied the artillery lessons of that war and diligently applied them during the interwar years. In the 1920s, Soviet Chief of Artillery Lieutenant General Yuri Shedeiman personally translated from German into Russian the books written by Colonel Georg Bruchmüller about his artillery innovations during World War I. Reflecting their faith in massed firepower, the Soviets by the 1920s had built their army into a combined-arms force with artillery as a major component at all levels.

In 1941, the Soviets initiated a major reorganization of their artillery. The number of guns in a division was reduced by almost two-thirds, but the number of mortars increased by the same proportion. The objective was to make the divisions more mobile. The Soviets grouped their heavier artillery pieces into artillery reserve units, which then could be massed at the decisive point of any battle. Following these reorganizations, Soviet leader Josef Stalin in 1942 directed

that artillery should be concentrated to support a breakthrough in a designated sector and that more mobile artillery had to be developed to support the armored units that would exploit the breakthrough.

In late 1942, the Soviets organized their artillery reserve units into artillery divisions. With the exception of one artillery division with which the Germans experimented briefly, the Soviets were the only ones to field such organizations in World War II. By the end of the war, the Red Army had some 90 artillery divisions, about the same number of total divisions in the U.S. Army. In 1943, the Soviets began grouping their artillery divisions into breakthrough artillery corps of two or more artillery divisions and one rocket launcher division. The Soviets believed in holding artillery in reserve—directly the opposite of the American belief that artillery is never held in reserve. At the start of the war, some 8 percent of the Red Army’s artillery was in the High Command Artillery Reserve. By the end of the war, this percentage had risen to 35 percent.

On the defensive for the first part of the war, the Soviets drew the following conclusions about fire support in defensive operations: (1) artillery, not aircraft, was the superior form of fire support in the defense, (2) the antitank plan should be the basis for determining the overall deployment of forces, (3) all guns should be capable of direct fire, (4) an artillery reserve was essential, (5) armor should counterattack only after a tank attack had been stopped by artillery, (6) artillery must be sited in depth in prepared positions, and (7) indirect fire was only effective when massed and centrally commanded.

USSR attack doctrine grew out of Soviet experiences launching counterattacks from the defensive. By the time the Red Army went on the offensive in the final years of World War II, its artillery had three primary missions: (1) preparation of the attack; (2) support of the attack, principally through a creeping barrage or fixed concentrations; and (3) accompaniment of the maneuver forces. Accompanying fire was the primary mission of the divisional artillery units, more often than not through close-range direct fire. As a result, divisional artillery units generally suffered 10 times the casualty rates of nondivisional units.

The Soviet system worked for the USSR, but it did have its drawbacks. Operations required a methodical buildup of overwhelming force, which in turn required periods of stability. That meant that operations on the Eastern Front went through cycles of long periods of buildup, followed by brief surges of steamrollerlike momentum. The Soviets ultimately had the manpower and the resources to succeed with this approach on the operational level, but during the interim periods the Germans often were able to achieve stunning tactical successes because of their more flexible organization and doctrine. In the end, however, the Soviets succeeded. In

so doing, they proved that conventional artillery—the “god of war,” as Stalin called it—was in fact a decisive element at the operational level of war.

Artillery Types

Firepower and maneuver are the two primary elements of land combat power. From the late Middle Ages to the early years of the twentieth century, artillery was the only significant source of land-based firepower. Even after the appearance in World War I of machine guns, tanks, and ground-attack aircraft, artillery still remained the major source of firepower on the battlefield. Throughout history, firepower and mobility technology have been in a constant tug of war with each other. Rarely has one achieved a significant advantage over the other; but whenever that has happened, the results have been devastating.

During World War I, firepower technology far outstripped mobility technology. During the years between the Franco-Prussian War (1870–1871) and the start of World War I in 1914, there was vast technological improvement for artillery and infantry weapons, particularly the machine gun. The result was previously unimaginable levels of battlefield firepower. Battlefield mobility, however, was still primarily a matter of human and animal muscle, as it had been for thousands of years. Thus, firepower had become mechanized by 1914, mobility had not, and the result was trench warfare. By World War II, mobility technology had caught up, and the balance was restored.

Artillery pieces are broadly classified by the ballistic performance of the projectiles they shoot. The three basic categories of cannon, or tube, artillery have not changed in the past 300 years, although individual technologies have advanced considerably. Guns fire projectiles at a very high velocity and on a relatively flat trajectory. They have the greatest range and tend to be the heaviest of artillery pieces. Mortars are generally light weapons that fire a relatively light

projectile at low muzzle velocities and short ranges but at high angles of fire—above 45 degrees. Howitzers are extremely versatile weapons, capable of firing at both high and low angles. The muzzle velocity and range of a howitzer are less than those of a gun of comparable size, but a howitzer is far more accurate. A howitzer also can fire a heavier shell than can a gun of the same weight. Most armies in World War II had both guns and howitzers in their arsenals. Although they were technically artillery pieces, mortars were considered infantry weapons by almost all armies.

All forms of artillery through the start of the nineteenth century were the same smooth-bore, muzzle-loading, black-powder mechanisms that had been in use for hundreds of years. They had poor mobility, and the gun crews engaged their targets by direct fire—that is, the gunner had to see and directly aim at the target, just as if he was firing a large rifle. In the last half of the nineteenth century, artillery made several technological leaps in areas such as improved metallurgical and manufacturing techniques, rifled bores, breech-loading mechanisms, fire-control instruments, and, most importantly, recoil mechanisms.

Modern recoil mechanisms, introduced at the very end of the nineteenth century, allowed the artillery piece to hold its position on the ground as each round was fired. That, in turn, meant that the piece did not have to be reaimed after each round, which produced far more rapid rates of fire. The result was vastly improved accuracy and repeatability, which—combined with modern optics and fire control techniques—made indirect fire possible. Indirect fire is the technique of accurately firing at targets that the gun crew cannot see directly. That important advance extended the effective depth of artillery fire, which in turn led to the very concept of deep battle. The first artillery piece with modern fire control and recoil systems was the French *Canon de 75 mle 1897* (75 mm gun, model 1897), widely known as the “French 75.”

Through World War I, all field artillery was horse-drawn. In the interwar years, the horse gave way to the truck as the artillery prime mover in the British and U.S. armies. Many armies, including those of Germany, Japan, Italy, and the USSR, relied heavily on horses until the very end of World War II. Self-propelled (SP) artillery—guns mounted on a wheeled or tracked carriage—also appeared shortly after the end of World War I, when the British Birch Gun was introduced. By the end of World War II, almost all armies had SP guns and howitzers.

According to an old maxim of the British Royal Artillery, the real weapon of the artillery is the projectile—the gun is merely the means of sending a projectile to the target. During World War II the standard artillery projectile was high-explosive (HE), producing both blast and fragmentation effects. The blast was employed primarily against fortifications and fragmentation was used against personnel. Smoke rounds

were used to obscure enemy visibility on the battlefield, and illumination rounds were utilized to enhance friendly visibility at night. In the early years of the war, most armies were forced to use their field artillery in an antitank role, which required the guns to fire special armor-piercing (AP) and high-explosive antitank (HEAT) rounds. During World War I, most armies had developed and used a wide array of chemical rounds that produced various combinations of lethal and nonlethal, persistent and nonpersistent effects. Although all sides still had these chemical rounds in their arsenals during World War II, they were not employed.

The fuse is perhaps the most critical element of an artillery round. The point-detonating (PD) fuse triggers the round as soon as it touches the ground, producing a surface burst. Most PD fuses could be set on “delay” to allow the round to penetrate into the ground and produce a subsurface burst. The concrete-piercing fuse is a variation of the delay fuse that allows an artillery projectile to burrow into the wall of a bunker or fortification before exploding. The mechanical time fuse was used to produce an air burst, which rained fragments on the target below. This was generally the most effective means of attacking troops in the open. The time fuse, however, required a high degree of skill on the part of the forward observer and the fire direction center personnel to get the time of flight and the height of burst just right. Near the end of World War II, the U.S. Army introduced the proximity fuse, adapted from naval anti-aircraft artillery for field artillery work. Also called the variable-time fuse, it contained a small radar transmitter and receiver that produced a perfect 66-ft height of burst every time. The “funny fuse,” as Lieutenant General George S. Patton called it, was first used by U.S. artillerymen with devastating effect during the German Ardennes offensive in December 1944.

United States

The U.S. Army classified its field artillery guns and howitzers into three basic categories by weight: light, medium, and heavy. Light guns, used for direct support, were found only in divisional artillery. The airborne divisions and the 10th Mountain Division were armed with the 75 mm M-1A1 pack howitzer. It was designed for easy disassembly, which allowed it to be dropped from the air or transported by six mules. The 75 mm pack howitzer was widely used in Italy and in the jungles of the Pacific, where its transportability was its most important feature.

The workhorse of most infantry divisional artillery was the 105 mm M-2A1 howitzer, the most widely used artillery piece in history. It was accurate and reliable, and it could withstand a great deal of punishment and mishandling. It was first developed in the 1920s as a weapon capable of being towed by a team of six horses, and the design was approved in March 1940.

The M-2A1 was towed by a two-and-a-half ton truck, which also carried the gun’s crew and its basic load of ammunition. The armored divisions used the M-2A1’s tube and gun carriage on a one of several self-propelled mounts. The standard was the M-7B1, which was mounted on a Sherman tank chassis. In 1945, these guns began to be replaced by the M-37, which was mounted on a Chaffee tank chassis.

In 1943, the army introduced a lightened version of the M-2A1 with a shortened barrel to give airborne units more firepower than the 75 mm pack howitzer delivered. The M-3 howitzer was not a successful design, however. After World War II, the M-2A1 was modified somewhat to become the M-101A1. That version remained in service with the U.S. Army through the Korean and Vietnam Wars. More than 10,200 M-2A1s or M-101A1s were built and supplied to some 45 different armies between 1940 and 1953.

The 155 mm M-1A1 towed howitzer was the standard American medium artillery piece used by the general support battalions of almost all the infantry divisions. It was a successful and popular design, although heavy and somewhat difficult to handle. The cannoneers on the gun crews called these weapons “pigs”—short for pig iron. A self-propelled version of the 155 mm howitzer mounted on a Chaffee tank chassis was designated the M-41, but only about 100 were ever built.

The most widely used American heavy gun was the 155 mm M-1 towed gun, which is not to be confused with the 155 mm M-1A1 towed howitzer. The 155 mm gun was two-and-a-half times as heavy as the 155 mm howitzer and could shoot a shell of the same weight (95 lb) 60 percent farther. The 155 mm gun had a 19-ft barrel and was nicknamed the “long Tom” by all sides. One self-propelled version was the M-12, based on a modified Grant tank chassis. The M-40 version was based on a modified Sherman tank chassis.

The 8-inch M-2 towed howitzer used the same carriage as the 155 mm M-1 towed gun. Whereas the bore sizes of all other U.S. Army artillery pieces were designated in millimeters, this one was designated in inches because it originally was adopted from a U.S. Navy design. Despite its relatively short barrel, the 8 inch had the reputation of being the most accurate artillery piece ever invented. It remained in service in the U.S. Army into the 1960s and in the British Army into the 1970s. After World War II, the U.S. Army also mounted the 8 inch on a self-propelled carriage, and that version remained in service until just after the 1991 Gulf War.

The heaviest U.S. artillery piece was a 240 mm M-1 towed howitzer called the “black dragon.” Towed by a 38-ton M-6 tractor, it had surprisingly good mobility for a gun weighing almost 21 tons. Once the gun arrived in a firing position, it took the gun crew about two hours to place the piece into action. The 240 mm howitzer saw extensive service in the Italian Campaign.

France

At the start of the war the French army still had large numbers of the World War I-era 75 mm guns in service. One of them, the French 75, had been the world's first truly modern artillery piece, featuring a hydraulic recoil mechanism and a screw-type breechblock that allowed a high rate of fire. Between the wars, the French had tried to modernize the weapon, updating it with pneumatic tires and a split trail. The Germans captured thousands of these guns from the French in 1940 and incorporated them into lower-priority Wehrmacht units. The Germans also modified the French 75 as an antitank gun for service on the Eastern Front.

In 1939, the French still had more than 1,000 105-mm and 3,000 155-mm World War I-vintage artillery pieces in service. These obsolete weapons were a detriment in 1940. The standard French 105 mm gun was the *Canon de 105 mle 1913 Schneider*. The French also still had in service 450 *Canon de*

155 Grand Puissance Filloux (Can 155 GPF). Despite the age of these weapons from an earlier war, the Germans placed many of the captured weapons into service with their own units—an indicator of Germany's overall weakness in field artillery.

The French did have some small numbers of modern light field guns, including the *Canon de 105 mle 1934-S* the *Canon de 105 court mle 1935-B*, and the *Canon de 105 L mle 1936 Schneider*. Only 159 of the M-1936 guns were in service in 1940. The Germans used those captured pieces primarily for coastal defense. Of even more value to the Germans was the *Can 155 GPF* (the updated version of the *Can 155 GPF-T*), which had a carriage designed for motor transport.

Soviet Union

Unlike most other countries, the Soviets read the lessons of World War I as requiring more artillery rather than less. In 1937, the Red Army had an inventory of 9,200 field and heavy

guns, more than twice that of the German army and triple that of the French. When Germany attacked in June 1941, the Soviet artillery arsenal stood at 67,000 tubes (artillery pieces). Throughout the war, Soviet artillery designs were more reliable, durable, and effective than those of virtually all other armies. Soviet army guns generally had longer ranges and greater lethality. The Soviets also developed innovative mass-production techniques that produced large numbers of relatively inexpensive guns. Through their system of design evolution, they repeatedly combined the successful features of various existing designs and could introduce improved models in a very short period of time.

Unlike most other armies, the Soviet army did not put much effort into developing increasingly powerful antitank guns. Soviet field artillery pieces generally fired at a higher velocity than those of most other armies, and experience in the Spanish Civil War convinced the Soviets that if they were provided with the proper ammunition, field guns were the best weapons against tanks. With the USSR's overwhelming tube superiority over Germany, Soviet field guns could be used effectively to mass indirect fires against distant targets and then quickly switch to a direct-fire point defense against tanks when the situation required. In 1941 and 1942, most German tank losses were to fire from towed field guns.

The Red Army suffered huge equipment losses in the early period following the German attack in 1941. In the first five months of the war, the Soviets lost upward of 20,000 guns. But this loss quickly led to a surge in mass production of modern, standardized weapons. The basic divisional support gun was the 76.2 mm M1942 ZIS-3, a long-barreled gun with a split trail. By the end of the war, variants on the same design had been introduced in 85 mm and 100 mm types. With a range of nearly 13 miles, the latter outranged all comparable divisional support guns. The 100 mm version also was mounted on the SU-100 SP assault gun. Soviet medium artillery included the excellent 122 mm M-1931/37 A-19 and the 152 mm M-1937 ML-20 and M-1943 D-1.

Massed artillery was the basis of the defense of Moscow in the winter of 1941. According to Soviet reports, artillery destroyed more than 1,400 German tanks between 16 November and 10 December alone. The Soviets relied on the same tactics in the Battle of Stalingrad. At Kursk on 5 July 1943, the Red Army fired a counterpreparation with 3,000 guns against the assembling German attack force. It was a dramatic demonstration of the power of massed artillery to disrupt an armored attack before it could be launched. As the war wound into its final years and Soviet production continued to swell the Red Army's arsenal, artillery preparations became more and more massive. During the offensive to cross the Vistula and Oder Rivers in January 1945, the Soviets massed 7,600 guns and mortars along the 21-mile breakthrough sector alone, with 33,500 tubes deployed across the entire front.

The Germans were better-armed with artillery than the Soviets in just one area. In 1944, a typical panzer division had some 70 SP guns with calibers up to 150 mm. A Soviet tank corps of the same period had only 20 76-mm SP guns. Despite their overwhelming number of tubes, only about 30 percent of the Soviet guns were larger than 100 mm. The maximum effective range of most of the smaller guns was only about 3.1 miles. Much beyond that range, Soviet gunners had great difficulty supporting the advance of the maneuver units. Thus, the Soviet's large numbers of massed but relatively immobile guns were effective in creating the conditions for successful breakthroughs but ineffective in supporting and sustaining those breakthroughs.

British Commonwealth

By 1939, the British army was the first fully motorized army in the world. All British field guns were towed by a four-wheel-drive truck that also carried the gun crew and the ammunition. The primary British close-support gun was the 25-pounder, which fired a 3.45-inch round. Initially designed in 1930, the 25-pounder had a box trail and an innovative central firing platform that allowed the crew to traverse the gun a full 360 degrees.

The earliest version, the MK-1, was based on the modified carriage of a World War I-vintage gun. The MK-1s saw service in France in 1940. The MK-2, with a carriage specifically designed for the 25-pounder, was introduced in 1940 and saw service in Norway. When firing special armor-piercing ammunition, the 25-pounder was pressed into service as an effective antitank gun during the early years of the war. In 1943, the Australian army introduced a lightweight version of the 25-pounder for jungle operations. The British also mounted it on a Valentine tank chassis to produce a self-propelled version known as "the Bishop." A far more successful design called "the Sexton" mounted the 25-pounder on a Canadian Ram tank. The Royal Artillery also used the American 105 mm M-7 SP howitzer, a system known as "the Priest."

At the start of the war, British medium artillery consisted of World War I-vintage guns, including the 6-inch gun, 6-inch howitzer, and the 60-pounder. These were soon replaced by the 4.5-inch and 5.5-inch guns, which used the same chassis. The 5.5-inch gun was first developed in the 1930s, and its final version was approved in August 1939. It fired a 100 lb shell. The 4.5-inch gun first saw service in North Africa in 1942. Both guns were grouped together in medium field artillery regiments.

Early British heavy artillery also consisted mostly of World War I weapons, including the 8-inch, 9.2-inch, 12-inch, and 18-inch howitzers and 6-inch and 9.2-inch guns. All of these weapons were too heavy and cumbersome for modern mobile warfare, and the British lost most of them in France in 1940. Although the British did start the work to design and develop

more modern heavy artillery, they suspended those efforts when the United States entered the war. The British instead adopted the American towed 155 mm gun and towed 8-inch howitzer.

Germany

The Germans had four categories of artillery: the *Kanone* (cannon), the *Haubitze* (field howitzer), the *Moerser* (a heavy howitzer firing at high angle only), and the *Werfer* (mortar). Generically, all artillery pieces were called *Geschuetze* (guns). The three primary calibers of German field artillery were 75 mm, 105 mm, and 150 mm. (The Germans used centimeters to designate their weapons—7.5 cm, 10.5 cm, and 15 cm.) Almost from the start of the war, the Germans recognized that 75 mm guns were ineffective for modern warfare. Those guns, including ones captured from the French, were issued only to low-priority units.

The towed 10.5 cm *leichte Feldhaubitze 18* (le FH 18) was the principal German close-support gun. Designed at the end of World War I, it remained a capable weapon throughout World War II. The main problems were that the Germans

never had enough of them, and in almost all units right up until the end of the war they were drawn by horses. On the Eastern Front, the le FH 18 was an effective antitank weapon when armed with the proper ammunition. A self-propelled version for the panzer divisions called the *Wespe* (Wasp) was mounted on a PzKpfw-II tank chassis.

The heavier artillery at the divisional level included a gun (the 10 cm s K 18) and a medium field howitzer (the 15 cm *Schwere Feldhaubitze 18* [s FH 18]). The SP version of the s FH 18, called the *Hummel* (Bumblebee), was mounted on a PzKpfw-IV tank chassis. At the corps and field army echelons, the most common heavy support guns were the 17 cm K 18 gun and the 21 cm *Moerser 18* (Mrs 18) heavy howitzer. Both weapons had a common carriage.

In most World War II armies, the organic fire support for infantry units came from mortars. The Germans did have effective mortars at both company and battalion levels, but on the basis of their experiences from World War I, they also fielded infantry guns right up until the end of the war. The two basic types were the 7.5 cm *leichtes Infantriegeschuetz 18*,

Large German coast defense gun. (Corbis)

designed late in World War I, and the heavier 15 cm *schweres Infantriegeschuetz 33*. The latter was actually too heavy for an infantry gun.

The Germans did produce several SP versions of their field and antitank guns, and they also produced a self-propelled weapon called an assault gun that was more like a turretless tank. Whereas the SP field and antitank guns consisted mostly of standard towed guns mounted on various tank chassis, many of the SP assault guns had no towed equivalent. The 7.5 cm *Sturmkanone 40* (Stu. K. 40) fired a 15 lb shell approximately 4 miles; the 10.5 cm *Sturmhaubitze 42* (Stu. H. 42) fired a 33 lb projectile 4.8 miles; and the 15 cm Stu. H. 43 fired a 95 lb shell only 2.8 miles from a barrel that was only about 6 ft long.

German artillerymen were tactically skilled, and their guns were generally technically advanced. The main problems were that the Germans did not have nearly enough of them, and the mobility of the guns they did have was generally poor. Initially, the Luftwaffe provided the close fire support for the fast-moving panzer divisions on the Eastern Front. But when the Germans found that the Luftwaffe could not be everywhere at once across the vast expanses of the east, especially in bad weather, they found themselves woefully outgunned by the Soviets.

Italy

As with most other European armies, the Italians entered World War II with many obsolescent artillery pieces in service. Italy had, however, started a rearmament program in the 1920s, ahead of most other nations. The Italians entered the war, then, with several modern artillery designs, but none in great numbers. As the war progressed, even the more modern Italian guns quickly became outclassed by British and American guns, whose development had started much later, in the 1930s.

The 75 mm *Cannone da 75/32 modello 37* was initially developed in the 1920s, but it never entered full production. The 75 mm *Obice da 75/18 modello 35* howitzer was another good design, but the Italians only had 68 in service by September 1942. The Italians started the war with more than 900 of the obsolete 149 mm *Cannone da 149/35* in service. Based on a turn-of-the-century design and lacking a modern recoil system, the gun had to be relaid after every round. It was supposed to be replaced in 1940 by the 149 mm *Cannone da 149/40*, but that weapon, too, never went into mass production.

Two of the better Italian designs were kept in production and service by the Germans after Italy surrendered in 1943. By 1942, only 147 of the *Obice da 149/19* howitzers were in service and only 20 of the heavy 210 mm *Obice da 210/22 modello 35*, which was an accurate and mobile piece for its heavy caliber.

Japan

The Japanese came late to artillery. Most Japanese had never seen a cannon before the arrival of Admiral Matthew Perry in

1853. The Japanese army manufactured its first artillery piece only in 1905, and up through World War II almost all Japanese artillery was based on European designs. Japanese guns, however, were lighter, and they had a greater range than comparable European designs of the same caliber. Japanese designers achieved the weight savings at the expense of the strength of the tubes, trails, and especially the recoil systems. As a result, these weapons suffered from an overall lack of ruggedness and high failure rates that proved costly in light of the heavy firing that was necessary during sustained combat.

Throughout the war, the Japanese had both horse-drawn and motorized artillery units. Whereas the U.S. Army and most European armies moved between the wars from 75 mm to 105 mm as the standard caliber for direct support of infantry, the Japanese stayed with 75 mm throughout World War II. The standard divisional support gun was the 75 mm type-90. It was introduced in 1930, but many units entered the war still equipped with the older type-38. The type-90 had a high muzzle velocity, which made it especially effective in an antitank role. The 75 mm type-94 mountain gun was also widely used in the jungle as pack artillery. Weighing just 1,181 lb, it could be carried by 18 men and assembled and laid for firing in about 10 minutes. As with the Germans, the Japanese also had an infantry gun. The 70 mm type-92 battalion gun weighed only 450 lb, but its range was only about one-third that of the type-94 mountain gun.

Japanese general support guns included the 105 mm type-91 howitzer and the 105 mm type-92 gun, introduced in 1931 and 1932 respectively. Both guns fire the same basic projectile, but the far heavier type-92-gun had almost twice the range. With a range of 11.3 miles, the type-92 could throw a 35 lb shell farther than most other artillery pieces of World War II. The Japanese medium artillery battalions were armed with either the 149 mm type-96 howitzer or the 149 mm type-89 gun. Despite weighing almost three times as much as the 105 mm type-92 gun, the 150 mm type-89 gun had a range only 0.9 mile greater. The largest Japanese artillery piece of the war was the 240 mm type-45 howitzer. An elderly pre-World War I design, it was most effective as a coastal defense gun.

With Japan's overwhelming emphasis on the infantry attack, the Japanese entered World War II without adequate industrial resources for large-scale artillery production and maintenance. Their production facilities were not tooled for standardized production and the mass production of interchangeable parts. Thus, the Japanese army was always chronically short of artillery, and it had trouble keeping what it did have in service.

Atlantic, Battle of the

The Battle of the Atlantic was the longest campaign of World War II. In it, the German navy tried to sever the Allied sea lines of communication along which supplies necessary to fight the war were sent to Great Britain. To carry out the battle, the Germans employed a few surface raiders, but principally they used U-boats.

At the beginning of the war, the German navy possessed not the 300 U-boats deemed necessary by Kommodore (commodore) Karl Dönitz (he was promoted to rear admiral in October 1939), but 57 boats, of which only 27 were of types that could reach the Atlantic from their home bases. Although an extensive building program was immediately begun, only in the second half of 1941 did U-boat numbers begin to rise.

On the Allied side, British navy leaders were at first confident that their ASDIC (for Allied Submarine Detection Investigating Committee) location device would enable their escort vessels to defend the supply convoys against the submerged attackers, so that shipping losses might be limited until the building of new merchant ships by Britain, Canada, and the United States might settle the balance. However, Dönitz planned to concentrate groups of U-boats (called “wolf packs” by the Allies) against the convoys and to jointly attack them on the surface at night. It took time, however, before the battles of the convoys really began. The Battle of the Atlantic became a running match between numbers of German U-boats and the development of their weapons against the Allied merchant ships, their sea and air escorts (with improving detection equipment), and new weapons.

Naval Casualties During Battle of the Atlantic

The Battle of the Atlantic may be subdivided into eight phases. During the first of these, from September 1939 to June 1940, a small number of U-boats, seldom more than 10 at a time, made individual cruises west of the British Isles and into the Bay of Biscay to intercept Allied merchant ships. Generally, these operated independently because the convoy system, which the British Admiralty had planned before the war, was slow to take shape. Thus the U-boats found targets, attacking at first according to prize rules by identifying the ship and providing for the safety of its crew. However, when Britain armed its merchant ships, increasingly the German submarines struck without warning. Dönitz's plan to counter the convoy with group or “pack” operations of U-boats—also developed and tested before the war—was put on trial in October and November 1939 and in February 1940. The results confirmed the possibility of vectoring a group of U-boats to a convoy by radio signals from whichever U-boat first sighted the convoy. However, at this time, the insufficient numbers of U-boats available and frequent torpedo failures prevented real successes.

The German conquest of Norway and western France provided the U-boats with new bases much closer to the main operational area off the Western Approaches and brought about a second phase from July 1940 to May 1941. In this phase, the U-boats, operated in groups or wolf packs, were directed by radio signals from the shore against the convoys, in which was now concentrated most of the maritime traffic to and from Great Britain. Even if the number of U-boats in the operational area still did not rise to more than 10 at a time, a peak of efficacy was attained in terms of the relationship between tonnage sunk and U-boat days at sea. This was made possible partly by the weakness of the convoy escort groups because the Royal Navy held back destroyers to guard against an expected German invasion of Britain. In addition, British

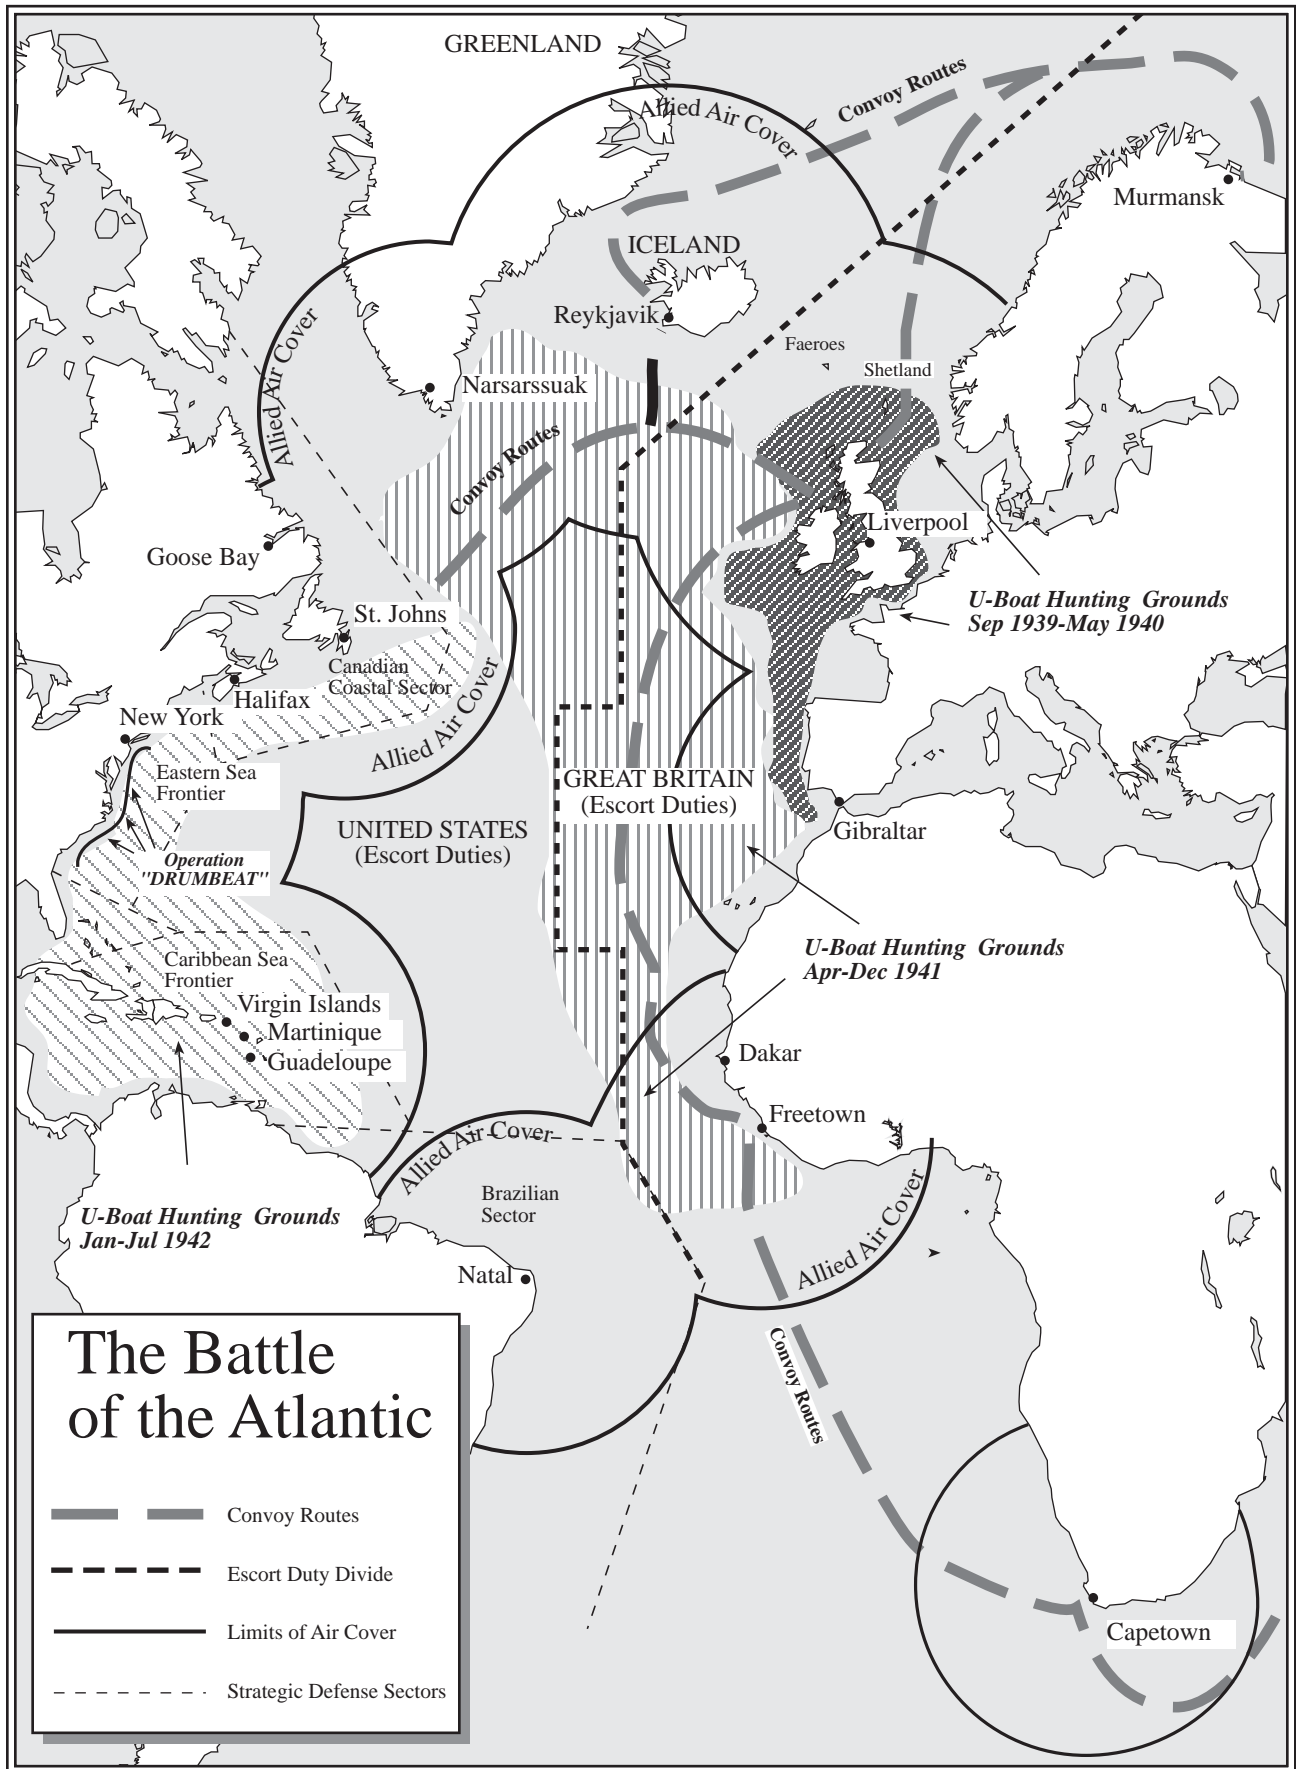

Officers on the bridge of a U.S. destroyer, escorting a large convoy of ships, keep a sharp lookout for attacking submarines, ca. 1942. (Library of Congress)

merchant shipping losses were greatly augmented during this phase by the operations of German surface warships in the north and central Atlantic; by armed merchant raiders in the Atlantic, Pacific, and Indian Oceans; by the attacks of German long-range bombers against the Western Approaches; and by heavy German air attacks against British harbors. The Germans were also aided by Italian submarines based at Bordeaux and sent into the Atlantic, the numbers of which in early 1941 actually surpassed the number of German U-boats.

In late 1940 and spring 1941, when the danger of an invasion of the British Isles had receded, London released destroyers for antisubmarine operations and redeployed Coastal Command aircraft to support the convoys off the Western Approaches. Thus, in the third phase of the Battle of the Atlantic, from May to December 1941, the U-boats were forced to operate at greater distances from shore. Long lines of U-boats patrolled across the convoy routes in an effort to intercept supply ships. This in turn forced the British in June to begin escorting their convoys along the whole route from Newfoundland to the Western Approaches and—when the

U-boats began to cruise off West Africa—the route from Freetown to Gibraltar and the United Kingdom as well.

In March 1941, the Allies captured cipher materials from a German patrol vessel. Then, on 7 May 1941, the Royal Navy succeeded in capturing the German Arctic meteorological vessel *München* and seizing her Enigma machine intact. Settings secured from this encoding machine enabled the Royal Navy to read June U-boat radio traffic practically currently. On 9 May during a convoy battle, the British destroyer *Bulldog* captured the German submarine *U-110* and secured the settings for the high-grade officer-only German naval signals. The capture on 28 June of a second German weather ship, *Lauenburg*, enabled British decryption operations at Bletchley Park (BP) to read July German home-waters radio traffic currently. This led to interception of German supply ships in the Atlantic and cessation of German surface ship operations in the Atlantic. Beginning in August 1941, BP operatives could decrypt signals between the commander of U-boats and his U-boats at sea. The Allies were thus able to reroute convoys and save perhaps 1.5 million gross tons of shipping.

The Battle of the Atlantic

-  Convoy Routes
-  Escort Duty Divide
-  Limits of Air Cover
-  Strategic Defense Sectors

During this third phase, the U.S. Atlantic Fleet was first involved in the battle.

The entry of the United States into the war after the Japanese attack on Pearl Harbor ushered in the fourth phase of the battle, presenting the U-boats with a second golden opportunity from January to July 1942. Attacking unescorted individual ships off the U.S. East Coast, in the Gulf of Mexico, and in the Caribbean, German U-boats sank greater tonnages than during any other period of the war.

But sightings and sinkings off the U.S. East Coast dropped off sharply after the introduction of the interlocking convoy system there, and Dönitz found operations by individual U-boats in such distant waters uneconomical. Thus, in July 1942, he switched the U-boats back to the North Atlantic convoy route. This began the fifth phase, which lasted until May 1943. Now came the decisive period of the conflict between the U-boat groups and the convoys with their sea and air escorts. Increasingly, the battle was influenced by technical innovations. Most important in this regard were efforts on both sides in the field of signals intelligence.

On 1 February 1942, the Germans had introduced their new M-4 cipher machine, leading to a blackout in decryption that lasted until the end of December 1942. This accomplishment was of limited influence during the fourth phase, because the German U-boats operated individually according to their given orders, and there was no great signal traffic in the operational areas. And when the convoy battles began again, the Germans could at first decrypt Allied convoy signals.

But when Bletchley Park was able to decrypt German signals anew, rerouting of the convoys again became possible, although this was at first limited by rising numbers of German U-boats in patrol lines. In March 1943, the U-boats achieved their greatest successes against the convoys, and the entire convoy system—the backbone of the Allied strategy against “Fortress Europe”—seemed in jeopardy. Now Allied decryption allowed the dispatch of additional surface and air escorts to support threatened convoys. This development, in connection with the introduction of new weapons and high-frequency direction finding, led to the collapse of the U-boat offensive against the convoys only eight weeks later, in May 1943.

This collapse came as a surprise to Dönitz. Allied success in this regard could be attributed mainly to the provision of centimetric radar equipment for the sea and air escorts and the closing of the air gap in the North Atlantic. In a sixth (intermediate) phase from June to August 1943, the U-boats were sent to distant areas where the antisubmarine forces were weak, while the Allied air forces tried to block the U-boat transit routes across the Bay of Biscay.

The change to a new Allied convoy cipher in June, which the German decryption service could not break, made it more difficult for the U-boats to locate the convoys in what was the seventh phase from September 1943 to June 1944. During this

time, the German U-boat command tried to deploy new weapons (acoustic torpedoes and increased anti-aircraft armament) and new equipment (radar warning sets) to force again a decision with the convoys, first in the North Atlantic and then on the Gibraltar routes. After short-lived success, these operations failed and tapered off as the Germans tried to pin down Allied forces until new, revolutionary U-boat types became available for operational deployment.

The final, eighth phase, from June 1944 to May 1945, began with the Allied invasion of Normandy. The U-boats, now equipped with “snorkel” breathing masts, endeavored to carry out attacks against individual supply ships in the shallow waters of the English Channel and in British and Canadian coastal waters. The U-boats’ mission was to pin down Allied supply traffic and antisubmarine forces to prevent the deployment of warships in offensive roles against German-occupied areas. But construction of the new U-boats (of which the Allies received information by decrypting reports sent to Tokyo by the Japanese embassy in Berlin) was delayed by the Allied bombing offensive, and the German land defenses collapsed before sufficient numbers of these boats were ready.

The Battle of the Atlantic lasted without interruption for 69 months, during which time German U-boats sank 2,850 Allied and neutral merchant ships, 2,520 of them in the Atlantic and Indian Oceans. The U-boats also sank many warships, from aircraft carriers to destroyers, frigates, corvettes and other antisubmarine vessels. The Germans lost in turn one large battleship, one pocket battleship, some armed merchant raiders, and 650 U-boats, 522 of them in the Atlantic and Indian Oceans.

The Allied victory in the Battle of the Atlantic resulted from the vastly superior resources on the Allied side in shipbuilding and aircraft production (the ability to replace lost ships and aircraft) and from superior antisubmarine detection equipment and weapons. Allied signals intelligence was critical to the victory.

Atlantic Charter (14 August 1941)

First face-to-face meeting between U.S. President Franklin D. Roosevelt and British Prime Minister Winston L. S. Churchill; the basis for the United Nations Declaration. Arranged by Roosevelt, the Atlantic Charter meeting took place in Placentia Bay, Newfoundland. Roosevelt had put out on the presidential yacht *Potomac* under cover of having a vacation, and he then transferred secretly to the cruiser *Augusta*. Churchill traveled across the Atlantic on the battleship *Prince of Wales*. The two leaders and their staffs (including all service chiefs of each side) met aboard these ships beginning on 9 August for four days. Topics of discussion included Lend-Lease aid, common defense issues, and a strong joint policy against Japanese expansion in the Far East. Almost as an afterthought, the meetings produced a press release on 14 August 1941 that came to be known as the Atlantic Charter.

The Atlantic Charter had eight main points: (1) the eschewing by the two heads of government of any territorial aggrandizement for their own countries; (2) opposition to territorial changes without the freely expressed consent of the peoples involved—in other words, self-determination of peoples; (3) the right of all peoples to choose their own forms of government and determination to restore freedom to those peoples who had been deprived of it; (4) free access for all nations to the world's trade raw materials; (5) international cooperation to improve living standards and to ensure economic prosperity and social security; (6) a lasting peace that would allow peoples everywhere to “live out their lives in freedom from fear and want”; (7) freedom of the seas; and (8) disarmament of the aggressor states “pending the establishment of a wider and permanent system of general security.”

Although there was no formally signed copy of the Atlantic Charter, just the press release containing the eight guiding principles, these principles had the same appeal as President Woodrow Wilson's Fourteen Points of 1918. Certainly the talks strengthened the bonds between the United States and Britain. Isolationists in the United States denounced the

Winston Churchill and Franklin Roosevelt stand together on the HMS *Prince of Wales*, 14 August 1941. The meeting aboard the British ship led to the Atlantic Charter. (Corel)

charter for the determination it expressed to bring about “the final destruction of the Nazi tyranny.” The government of the Soviet Union later announced its support for the charter's principles, but even at this early stage in the war, there were sharp differences between the Anglo-Saxon powers and the Soviet Union over what the postwar world should look like. Nonetheless, the Atlantic Charter subsequently formed the basis of the United Nations Declaration.

Atlantic Wall

German defenses along the European coast, last of the great defensive lines to be built (1941–1944). As German plans to invade Britain faded late in 1940, it became increasingly clear to the German High Command that thousands of miles of European coast had to be defended from Allied invasion. Heavily protected from the beginning were the German submarine bases in France, the occupied Channel Islands, and the Dover-Calais narrow point in the English Channel. Following the June 1941 invasion of Russia and the U.S. entry into the war in December 1941, Germany went on the defensive in the west. Formal work on the Atlantic Wall began in May 1942.

There never was a continuous “wall” per se; that would have been impossible to build or man. What was built was a series of defended zones—artillery and infantry positions overlooking likely invasion beaches and ports. Rivalries and different designs among army and navy units and civilian construction battalions often held up progress, as did strategic arguments about the comparative value of fixed defenses versus mobile reserves. And so did Allied bombardment of transport of construction materials. Nevertheless, the three-year effort by Germany was massive, soaking up huge quantities of men, money, and material.

Thousands of emplacements were built along the coast of France, with lesser facilities in the Low Countries, Denmark, and along the Norwegian coast. Where possible existing fortifications and weapons were used. Highlights of the wall were the often-extensive artillery batteries built into extensive steel-reinforced cement casemates designed to deflect air attacks. A typical position might include four separate 8-inch gun casemates (which, while protecting the gun and its crew, also limited the weapon’s field of fire) plus one or more observation and combat-direction posts, all built close to the coastline. The largest positions might feature mobile 14-inch railway-mounted artillery or huge turret-mounted guns. Some of the latter, installed in massive emplacements built near the French coast, could shell England directly across the Channel. Among German defenses were scores of smaller emplacements for machine guns, observation, personnel, command posts, and minefields. Some were camouflaged to look like houses or other structures, and most were built at least partly built into the ground for further protection. A large number of so-called “standard” bunker designs were employed, although each service had its own set of standards. Extensive propaganda made the wall appear impregnable to attack from the sea.

When placed in command of German beach defenses in October 1943, Erwin Rommel made the high-tide mark into the main line of defense, adding obstacles and intervening

emplacements covering possible landing points. There were a half million beach obstacles along the English Channel alone, many armed with mines.

In the end the stupendous construction project was largely for naught. Although two-thirds of a planned 15,000 emplacements were completed, few of them fired in anger. D day was hardly hindered by the several emplacements in Normandy (some were shelled from the sea; others were taken by paratroopers or special ranger attacks, as at Point du Hoc), and the rest of the coastal forts were generally captured from behind by advancing Allied forces. Extensive remains of the Atlantic Wall exist to this day.

Atomic Bomb, Decision to Employ

Although there were extensive consultations about the employment of the atomic bomb, discussions always focused on how to use the new weapon, not whether to use it. The primary aim of Allied decision-makers was to achieve the unconditional surrender of Japan as quickly as possible at the lowest cost in lives, and everyone of importance assumed that if the MANHATTAN Project could produce a workable weapon, that weapon would be expended against an enemy target.

It could be argued that the decision to use the atomic bomb was actually made on 6 December 1941, when the first money was approved to fund its development. At the time, American leaders assumed the new invention would be a legitimate weapon in the war, and they never questioned that assumption afterward.

Although President Franklin D. Roosevelt’s key advisers on the project concluded in May 1943 that the first operational bomb should be dropped on Japan, the choice of targets really did not receive systematic attention until two years later. A special Target Committee for the MANHATTAN Project

began meeting in April 1945, and by the next month it had selected a shortlist of cities including Kyoto and Hiroshima. On 31 May, a blue-ribbon Interim Committee appointed by Secretary of War Henry L. Stimson began meeting to discuss how best to use the new weapon. A suggestion made at lunch to try a warning and noncombat demonstration was quickly rejected for many practical reasons, and the committee recommended that the bomb be dropped without warning on a target that would make the largest possible psychological impression on as many inhabitants as possible.

Eventually, military planners came up with a target list of Hiroshima, Kokura, Kyoto, and Nigata. Stimson persuaded the planners to substitute Nagasaki for the shrine city of Kyoto and then presented the list to President Harry S Truman in late July. Truman approved the directive without consulting anyone else and wrote in his diary that the bomb would be used between 25 July and 10 August. The new weapon offered the possibility of ending the war sooner, and he had no compelling reason not to employ it. Despite some historians' claims to the contrary, there was no reliable evidence of any imminent Japanese collapse or surrender. Although some leaders did perceive a display of the atomic bomb's power as a potential tool to intimidate the Soviet Union in the future, this was a secondary benefit of its employment and not a factor in operational decisions.

No single government document shows Truman's decision to use the bomb, but there were two relevant military directives from the Joint Chiefs to the U.S. Army Air Forces. The first, to General Henry "Hap" Arnold on 24 July, designated the four possible targets. The next day, a similar order to General Carl Spaatz, who was commanding strategic air forces in the Pacific, added a date: "after about 3 August 1945." That document also directed that other bombs were to be delivered against targets as soon as they were ready. On the basis of these orders, Spaatz selected Hiroshima and then Kokura to be the targets for the first and second atomic missions. (Cloud cover on the day of the second raid caused the shift to the secondary target of Nagasaki.)

Some critics have questioned why there was not more deliberation about whether to use the terrible new weapon. The main concern for decision-makers was to win the war quickly while avoiding a bloody invasion or losing public support for unconditional surrender. Under the conditions in 1945, which had already produced fire raids that had killed far more Japanese civilians than did the attacks on Hiroshima and Nagasaki, no U.S. president or general could have failed to employ the atomic bomb.

Attlee, Clement Richard (First Earl Attlee and Viscount Prestwood) (1883–1967)

British politician, leader of the Labour Party and deputy leader of the House of Commons, and prime minister. Born 3 January 1883 in the Putney part of London, Clement Attlee was educated at University College, Oxford. He initially practiced law, but after working with the poor in London's East Side, he joined the Labour Party in 1907, living in a settlement house until 1922 (except during World War I). He served as a lecturer at the London School of Economics. During World War I, Attlee rose to the rank of major and served at Gallipoli and in the Middle East and later on the Western Front.

Elected to Parliament in October 1922, Attlee and held various minor posts in Labour and national governments. He became the head of the Labour Party in 1935 as a compromise candidate, a middle-of-the-road democratic socialist. Attlee and a growing proportion of his party agreed with Winston L. S. Churchill's call for faster rearmament in the face of the threat from Nazi Germany.

Refusing to serve under Neville Chamberlain, Attlee helped to bring about Winston Churchill's government during the crisis of May 1940, when Chamberlain was forced to resign. On 10 May, Churchill named Attlee Lord Privy Seal (he served to 1942) and deputy leader of the House of Commons (effectively deputy prime minister), a position he held from 1942 to 1945. Attlee often chaired cabinet sessions during Churchill's constant travels, and he remained loyal to Churchill throughout the war.

British Labor Party leader Clement Attlee. (Hulton-Deutsch Collection/Corbis)

Attlee worked closely with fellow Labourite Aneurin Bevin to develop the 1943 white paper on postwar social plans. He was renowned for his ability to remain calm in a crisis, to outline major positions in few words, and to make hard decisions. Pressed by his party, however, he led Labour out of the national coalition in May 1945 after the defeat of Germany (there had not been a general election for a decade). This led to national elections at which Labour won a resounding victory, and Attlee became prime minister on 26 July 1945. He replaced Churchill as the British representative for the remainder of the Potsdam Conference.

Attlee presided until October 1951 over creation of the British welfare state with its nationalization of health services, steel, coal, railways, and civil aviation. He supervised the granting of independence to India and Pakistan on 14 August 1947, a key step in converting the British Empire to the Commonwealth of Nations. On retiring as party leader, he was made an earl in 1955. He spoke often in the House of Lords against Britain becoming part of the Common Market. Attlee died in Westminster, London, on 8 October 1967.

**Auchinleck, Sir Claude John Eyre
(1884–1981)**

British Army general. Born at Aldershot, England, on 21 June 1884, Claude Auchinleck was known as “the Auk.” He graduated from Sandhurst (1902) and saw extensive service in India and Tibet (1904–1912), the Middle East (in often appalling conditions, 1914–1919), and India again (1929–1940), rising to the rank of major general.

Auchinleck returned to England in January 1940, expecting to prepare British units for action in France. Instead, he was sent on 7 May 1940 to command British forces in Narvik in the disastrous Norwegian Campaign, which suffered from lack of air cover and adequate forces and equipment. Just after Britain’s evacuation of Norway, on 14 June 1940 Auchinleck took over Southern Command to prepare for a possible German invasion. In this role, he worked effectively to improve the Home Guard. As fears of invasion receded, Auchinleck was promoted to general and sent to India as commander in chief on 21 November 1940 to control pressures for independence while overseeing training of Indian units for Allied use elsewhere.

Auchinleck was called by Winston L. S. Churchill to take the same role in the critical Middle East Theater (21 June 1941), replacing Archibald Wavell. While in Egypt, Auchinleck came under constant pressure from Churchill to undertake aggressive action against Lieutenant General Erwin Rommel’s Afrika Korps. He argued, however, that he had to first train his force and overcome the difficulties of having inadequate supplies and armaments. Auchinleck began his offensive, Operation CRUSADER, on Libya in November 1941, but it suffered from the lack of a strong Eighth Army commander in Lieutenant General Alan Cunningham. Auchinleck replaced Cunningham with Major General Neil Ritchie, and for a time the offensive went well. But Rommel struck back, leading to the fall of Tobruk on 21 June 1942, when more than 30,000 men were taken prisoner.

Auchinleck then took direct control of the Eighth Army and stabilized his line at the First Battle of El Alamein later that month, thus saving Egypt. However, Churchill, still impatient for success from a more aggressive commander,

British General Claude Auchinleck. (Hulton Archive/Getty Images)

relieved him of his command on 5 August 1942. Damning reports from Lieutenant General Bernard Montgomery about Auchinleck surely eased the skids.

Turning down a proffered command in Syria and Iraq, Auchinleck returned to India as commander in chief of the army there (18 June 1943–14 August 1947). Auchinleck was made a field marshal in June 1946, refusing a peerage a year later (he did not wish to be honored for helping to divide India and Pakistan, a result he abhorred). He retired in 1967 to live in Marrakesh, Morocco, and died there on 23 March 1981.

Auphan, Paul Gabriel (1894–1982)

French Navy admiral. Born on 4 November 1894 at Alès, Gard, France, Paul Auphan entered the French Naval Academy in 1911. He served in the World War I Dardanelles Campaign and in a submarine. Between the wars he commanded submarines, destroyers, a cruiser, and a naval school ship. He was deputy commander of the Naval Academy at Brest and studied at the Naval War College. He was promoted to rear admiral in March 1931. As a vice admiral in 1936, he commanded the French Mediterranean Squadron (1936–1938) before becoming maritime prefect at Toulon. Known for administrative rather than seagoing skills, in September 1939 Auphan, a protégé of Admiral Jean Darlan, French Navy commander in chief, became naval deputy chief of staff. The day before Franco-German armistice negotiations began in June 1940, Darlan and Auphan promised the British that they would never permit Hitler to control the French fleet, even if this meant scuttling it.

In July 1940 after the armistice, Auphan became director of the French merchant marine. In September 1941, he was named chief of the general naval staff, a position to which in April 1942 he added that of secretary of the navy in the Vichy government. Auphan's defenders later claimed he only accepted these posts to ensure the fleet's continued freedom from German control.

Both before and after the November 1942 Allied invasion of North Africa, Auphan and former French supreme commander General Maxime Weygand pressed Marshal Henri Pétain, head of the Vichy government, to support the Allies openly. After the Allied landings on 8 November 1942, Auphan and Weygand urged Pétain to accept the North African cease-fire with the Allies that Darlan, then in Algiers, had negotiated. At the insistence of collaborationist Vichy French Premier Pierre Laval, Pétain initially condemned Darlan's negotiated cease-fire, but Auphan persuaded Pétain to reverse this stand. On 10 November 1942, Auphan sent a telegram legitimizing Darlan's accord with U.S. Army Lieutenant General Mark W. Clark. Auphan hoped to arrest Laval, but he could not obtain Pétain's authorization and was the only minister to advocate a cease-fire agreement for all North Africa. On 11 November, Auphan ordered Admiral Jean de Laborde at Toulon to destroy the French fleet should German forces threaten the port. With Pétain's approval, on 13 November Auphan cabled Resident General Charles Noguès of Morocco to transfer to Darlan command of all North Africa. On 18 November, Auphan resigned to protest Laval's assumption of full governmental powers.

On 18 August 1944, Pétain empowered Auphan to negotiate the transfer of power to the Free French leader Charles de Gaulle, a development that de Gaulle completely ignored. In September 1944, the new French government revoked Auphan's pension, and in August 1946 the French High Court sentenced him to lifetime imprisonment and forced labor for treason, including for having commanded the Toulon fleet's destruction. Released in January 1955, Auphan was rehabilitated in November 1956. He subsequently published extensively in naval and political history. Auphan died at Versailles (Yvelines) on 6 April 1982.

Australia, Air Force

The Royal Australian Air Force (RAAF) played an important role in the Allied war effort. At the beginning of the conflict, the RAAF was a small, ill-equipped, but well-trained force of 3,489 personnel and 146 mostly obsolete aircraft. These included Anson bombers, flying boats, and the Australian Wirraway, essentially a training aircraft that proved totally inadequate as a fighter. When the war began in September 1939, one squadron was en route to Great Britain to secure new aircraft. The Australian government released this squadron to serve with the Royal Air Force (RAF), which it did for the remainder of the war under the auspices of RAF Coastal Command. In this role, the Australian squadron was responsible for sinking six submarines. Other squadrons served under the RAF in the Middle East and in the Italian Campaigns. Although there were 17 formal RAAF squadrons

during the war, Australian pilots served in more than 200 individual Commonwealth squadrons.

To facilitate air training, representatives of the Commonwealth established the Empire Air Training Scheme. This brought potential pilots to Australia for initial training and then sent them to Canada for final flight school and dispatch to Great Britain to serve in the RAF. The RAAF established several flight schools in Australia for a program that eventually trained some 37,000 pilots.

The initial deployment of RAAF assets was to support the war in Europe. The entry of Japan into World War II in December 1941 led to a redeployment of Australian squadrons to the Pacific. Japanese military advances and Japan's air raid on Darwin on 19 February 1942 increased pressure for better air defense over Australia. Beginning in 1942, U.S. air units were dispatched to Australia to bolster the RAAF. On 17 April 1942, all RAAF squadrons in the Pacific were placed under the auspices of Allied Air Forces Headquarters, part of U.S. General Douglas MacArthur's Southwestern Pacific Theater command.

The RAAF participated in almost every major campaign of the Pacific Theater. Four RAAF squadrons, two with Hudson bombers and two flying obsolete Brewster Buffalo fight-

ers, fought in the 1941–1942 Malaya Campaign. Later, elements of these squadrons were withdrawn to the Netherlands Indies and finally back to Australia. Two other RAAF squadrons fought in the Netherlands Indies before being relocated to Australia. RAAF units distinguished themselves in the defense of Milne Bay in September 1942.

Early deficiencies in aircraft were overcome with the addition of P-40 Kittyhawk and Spitfire fighters. The RAAF played an important role in supporting ground operations and in attacking Japanese shipping, including during the Battle of the Bismarck Sea. It also assisted in long-range minelaying operations throughout the war. The RAAF also provided wireless units to its troops who participated in the invasion of the Philippines. By the end of the war, the RAAF numbered 131,662 personnel and 3,187 aircraft.

Australia, Army

The Australian Army contributed to Allied successes in North Africa and the Middle East and in the Pacific Theater. During the 1930s, the army had been drastically reduced because of financial pressures. The Australian government hoped that in an emergency, it could rely instead on reserve or territorial forces. However, by statute, these forces could not be deployed overseas. On the eve of World War II, the army did expand its reserve component and embark on a program of improving coastal defenses.

When Australia declared war on Germany on 3 September 1939, the army numbered 82,800 men, but this included 80,000 poorly trained volunteer militia. The regular army was basically a small cadre force of officers, noncommissioned officers, and support staff. After New Zealand offered to raise a division to serve with Commonwealth forces in the European Theater, the Australian government announced its intention to do the same, and later it pledged to raise a corps. Given the high casualties sustained by Australian forces in World War I, the government extended conscription only for home defense. This meant that forces would have to be recruited for service abroad. The army grew to four divisions—the 6th, 7th, 8th, and 9th—that were formed into the

Second Australian Imperial Force (the first having served in World War I). The Imperial Staff decided to send this force to the Middle East for training prior to deployment in France. The first of the Second Australian Imperial Force, the 6th Division, departed Australia in January 1940. Some of the division, which became the nucleus of the 9th Division, went to Britain. In effect, Australia then fielded two separate armies: one in the Middle East and the other for the defense of Australia and its mandate of New Guinea.

With the fall of France in June 1940, the 6th, 7th, and 9th Divisions made up a corps in the Middle East under the command of Lieutenant General Sir Thomas A. Blamey. Recalled to Australia in March 1942, Blamey became both commander of the Australian army and commander of land forces, Southwest Pacific Area.

In North Africa, Australian forces took part in the early victories against Italian forces there. Part of the 6th Division was detached to join the British Expeditionary Force, which had been dispatched to Greece, and it was caught up in the defeats both in Greece and in Crete during the spring of 1941. The 7th Division fought in Syria, and the 9th Division helped defend Tobruk.

Amid increased anxieties about Japanese intentions, additional Australian troops were dispatched to bolster Commonwealth garrisons throughout the Pacific. In August 1941, two brigades of the 8th Division and two squadrons of Royal Australian Air Force aircraft had been sent to reinforce Singapore, where the men were then taken prisoner. With the entry of Japan into the war in December 1941, the Australian government secured the release of two of its divisions from the Middle East. A third division remained there and played a key role in the Allied victory at the Battle of El Alamein in November 1942, after which it, too, returned to the Pacific. In March 1942, much of the 7th Division was redeployed to Colombo. Part of the 7th was also sent to Java in the Netherlands East Indies, where it was captured by Japanese forces. Land forces in Australia itself consisted of an armored division with but few tanks and seven militia divisions. Australia appealed to the United States for military aid, and it also passed legislation that allowed reserve units to be deployed anywhere in the Pacific south of the equator.

In March 1942, the Southwest Pacific Command was formed under General Douglas MacArthur but with General Blamey as commander of land forces. The agreement gave MacArthur complete control of the Australian army, a fact that rankled many Australian officers and politicians—especially as the imperious MacArthur often excluded Australian officers from planning, gave the Australians little credit for their contributions, and generally viewed Australia as a base for American operations. Blamey and MacArthur often disagreed over strategy and over MacArthur's belief that the Australian general was too cautious. MacArthur's forces ini-

tially consisted of the seven militia divisions, the 6th and 7th Australian Divisions, and the U.S. 41st Infantry Division in April 1942, followed by the 32nd Infantry Division and other units.

Meanwhile, the main thrust of the Australian land effort centered on the defense of Port Moresby and on a domestic buildup to counter a possible Japanese invasion. From July 1942 to January 1943, the Australians and Americans were locked in combat with the Japanese in Papua and New Guinea. In late August 1942, Japanese forces landed at Milne Bay at the eastern edge of Papua. Australian forces, not greatly superior to the Japanese, contained the landing and forced the Japanese to withdraw. This event, a great psychological lift for the Allies and humiliation for the Japanese, proved that the Allies could defeat the Japanese in jungle warfare.

Although Australia faced significant manpower shortages, its troops continued to support Allied operations in New Guinea, Papua, and Guadalcanal. The Australians were given the task of clearing the Japanese from New Guinea. Australian forces also took part in operations on New Britain and in

Borneo in 1945. The Australian army launched its largest amphibious invasion of the war on 1 July 1945 when troops landed at Balikpapan as part of the effort to recapture Brunei. During the war, 691,400 men and 35,800 women served in the Australian army, which suffered (including prisoners of war recovered) 19,351 casualties in the war in Europe and 42,224 in the war in the Pacific. For the two theaters combined, total casualties were 18,713 dead, 22,116 wounded, and 20,746 prisoners of war recovered.

Australia, Navy

The Royal Australian Navy (RAN) played an integral part in the Allied war effort in both the Mediterranean and Pacific Theaters. At the beginning of World War II in September 1939, the RAN had declined in strength to two heavy cruisers (the *Australia* and the *Canberra*) mounting 8-inch guns, four light cruisers (the *Adelaide*, the *Hobart*, the *Perth*, and the *Sydney*) mounting 6-inch guns, five old destroyers, and two sloops. Its primary missions were coastal defense and protection of trade.

When the war began, the Australian government immediately started work to build up naval strength. In all, the RAN requisitioned 200 civilian vessels for military use, mainly for coastal defense, transport, and search and rescue missions. Several small vessels were also converted into minesweepers. The government also ordered construction of several warships, including 3 destroyers, 6 frigates, 56 corvettes, and 35 motor launches. By the end of the war, the RAN had 337 vessels in service (and an additional 600 in the naval auxiliary) with 39,650 personnel.

At the beginning of the war, the Australian government sent its five destroyers into the Mediterranean to assist the British there. The *Perth* went to the East Indian station, and the *Australia* and the *Canberra* helped escort Australian troop convoys to Egypt. The RAN also converted three liners into armed merchant cruisers for Royal Navy use, two of them manned by Australian personnel. Two others were commissioned in the RAN. All were sent to the China station. After Italy entered the war, the Australian government sent the *Sydney* to the Mediterranean, where she sank an Italian destroyer and helped to sink an Italian cruiser. In December 1940, the *Sydney* was replaced in the Mediterranean by the *Perth*. Other naval units were also sent, and Australian ships took part in all the big Mediterranean battles, including that in Cape Matapan. Australian ships also participated in the hunt for the German battleship *Bismarck* and performed Atlantic convoy duty. Some 10 percent of the Royal Navy's total antisubmarine ships were from the RAN. Later in the war, eight RAN ships supported the Allied invasion of Sicily in July 1943.

The first real blow to the RAN came in November 1941 when the *Sydney* was sunk off Western Australia by a German armed merchant cruiser. After Japan entered the war in December 1941, nearly all Australian ships were withdrawn to the Pacific Theater either to Singapore or to Australia. The cruiser *Perth* was sunk in the Battle of Sunda Strait in Febru-

ary 1942. The Japanese air raid on Darwin, also in February, and the midget submarine attack in May on Sydney Harbor underscored the need for increased naval strength. By the end of 1942, the Japanese had sunk 30 ships in Australian waters through air, naval, or submarine attack.

For the rest of the war, RAN ships in the Pacific undertook several duties. They engaged in antisubmarine and convoy protection missions and were credited with sinking six Axis submarines and escorting some 1,100 convoys. The RAN also laid some 10,000 defensive mines around Australia and New Zealand and engaged in minesweeping operations throughout the Pacific. RAN ships also fought in the major battles of the theater, including the Battle of the Coral Sea, the Solomon Island Campaign (the cruiser *Canberra* was sunk in the Battle of Savo Island), and the Battle of Leyte Gulf. They also supported operations in Borneo and Burma and the Australian landings at Taraken, Brunei, and Balikpapan in 1945. In all, 45,800 men and 3,100 women served in the Royal Australian Navy during the war.

Australia, Role in War

Australia played an important role in Allied operations in all theaters of World War II. Although its population was only about 7 million people, Australia covered 3 million square miles of territory and was strategically located in the Southwest Pacific. The war, however, caught Australians unprepared. As with the other Commonwealth nations, Australia followed Britain's lead, and Prime Minister Robert Menzies announced a declaration of war on Germany on 3 September 1939.

The exuberance that had marked the nation's entry into war in 1914 was sadly lacking in 1939. Australians remem-

bered the heavy losses sustained in World War I. Many had suffered in the Great Depression, and ties with Britain had grown weaker. Initially, the nation's war effort was directed at supporting Britain in the European Theater of Operations, but after Japan's entry into the war, Australia became the principal Allied staging point in the Pacific, and during the conflict Australians served in virtually every theater of war.

With 10 percent of its population unemployed, Australia could easily raise men for the war effort, but weapons and equipment were in desperately short supply. In 1939, Australian defense spending was only 1 percent of its gross national product (GNP); not until 1942 did the level of Australian defense spending approach that of the other warring powers. In 1943–1944, Australia was spending 37 percent of GNP on the war effort, in large part from higher taxes and the sale of low-interest government bonds.

During the course of the war, the Australian economy shifted over to military production, and real industrial expansion was achieved. For example, during the war Australia produced 3,486 aircraft. Although new defense spending was concentrated on production of equipment including

guns, ammunition, aircraft, and ships, measures were also put in place to increase the reserves. The government introduced conscription, but only for home service, which included assignments to Papua and the mandate of New Guinea. As part of the mobilization for war, industrialist Essington Lewis was placed in charge of the production of munitions, and newspaper publisher Keith Murdoch headed propaganda.

In October 1941, the Labour Party took power; John Curtin was prime minister until his death in July 1945. Labour would govern Australia for the remainder of the war. The generally ambivalent popular attitude toward the war changed when Japan joined the conflict in December 1941. The widespread rapid early Japanese victories raised the possibility that Australia itself might be invaded. This led to more government controls over the economy, including the right for the government to order men and women to work in any occupation. Wages and prices were controlled, and rationing was introduced. The government also increased efforts at civilian defense and the improvement of coastal defenses. An even greater blow for Australians was the February 1942 fall of

Singapore and the loss of two brigades of the Australian 8th Division there. The Japanese raid on Darwin later that month—the first time since the arrival of Europeans in Australia that Australians had been killed on their own soil by an invader—caused great anxiety.

Curtin then called for the return of Australian troops and naval assets from the Mediterranean Theater. Gradually most of these forces were released, but British Prime Minister Winston L. S. Churchill was loathe to see so many fine fighting men lost at once from the North African Theater, and he called on Washington to take up the slack. The United States then became Australia's chief ally. Many thousands of U.S. servicemen arrived in Australia (eventually some 10,000 Australian women married U.S. military personnel). This influx required construction of bases and facilities, creating an acute labor shortage and necessitating the discharge of some personnel from the Australia armed forces. Italian prisoners of war were also pressed into labor service.

The labor shortage was also the result of the extensive Australian armaments program, which included an indigenous tank—the excellent medium cruiser Sentinel—that entered production in 1943, and a large shipbuilding program that produced three destroyers and 56 corvettes in addition to some 30,000 small craft and amphibious vehicles. Australian shipyards also repaired or refitted thousands of Australian and Allied ships. To alleviate labor shortages, women's auxiliary units were created for each branch of the military, and large numbers of women went to work in industrial occupations.

In March 1942, the Australian government agreed to the formation of the Southwest Pacific Command with American General Douglas MacArthur as commander in chief and General Sir Thomas Blamey as the commander of land forces. Australia became the principal logistics base for Allied military actions, particularly in the campaigns in New Guinea and the Solomon Islands. The Australian conscripts proved an embarrassment for the government; under pressure from MacArthur, who believed Americans were doing an unfair share of the fighting, the Curtin government secured in February 1943 what became known as the Militia Bill. It permitted deployment of conscripts overseas, although this was to be limited to the Southwest Pacific Area. In August 1943, the Australian Labour Party scored a resounding election victory.

Tensions developed (largely behind the scenes) between MacArthur and the Australian government and armed forces, especially given MacArthur's tendency to take credit himself for any successes and blame others for anything that went wrong. His disparaging attitude toward Australians notwithstanding, Australians distinguished themselves in every theater of war, including North Africa and the Mediterranean and also with the Royal Australian Air Force in Bomber Command. Australian troops scored important successes on the ground in New Guinea and Papua, and they also

helped garrison Allied island conquests. In 1945, Australian troops led the invasions of Borneo and Tarakan. They were also in garrison on New Britain Island. The July 1945 invasion of Balikpapan was marked the largest amphibious operation undertaken by Australian forces during the war.

By the end of the fighting, 993,000 Australian men and women had served in the army, air force, and navy, and more than half of them had been deployed overseas. In addition, the nation had suffered 27,073 military dead (including prisoners of war who died in captivity) and 23,467 wounded.

World War II had a profound effect on the Australian nation. During the conflict, Australia established formal diplomatic ties with many more nations, and after the conflict it took pride in its place as a principal Pacific power. The war also enhanced Australian relations with the United States at the expense of existing ties with Great Britain.

Austria

Austria emerged from World War I diminished and impoverished, a shadow of its former self. Once the anchor of the great multinational Hapsburg Empire, the Federal Republic of Austria became a small (32,500-square-mile) state with an overwhelmingly German population of some 7 million people in 1938. Forbidden by the 1919 Treaty of Saint Germain to unite with Germany, Austria was nonetheless drawn inexorably toward its aggressive neighbor. After years of political upheaval and economic hardship, Austrians could not shake the impossible urge to pursue contradictory courses: to foster self-determination and Austrian national-

Nazi banner with swastika being hung in the plaza in front of the Schloss Esterházy in Eisenstadt, Austria. (Library of Congress)

ism and to pursue *Anschluss*, union with Germany (despite the treaty prohibition).

Adolf Hitler's accession to power in 1933 put great pressure on Austria's social, political, and economic stability. Hitler was determined to bring the land of his birth into a greater German Reich. He undoubtedly realized that the annexation of Austria would have international repercussions, and thus he worked to achieve the annexation indirectly. Because the Austrian Nazis took their orders from Hitler, a political victory by that party in Austria would bring about the de facto union of the two states. To achieve this end, Hitler's government began spending considerable sums on propaganda in Austria, including leaflets and radio broadcasts from stations in Bavaria. Berlin also applied major economic pressure, cutting off German tourism (an important source of revenue in Austria) by imposing severe limits on the amount of currency that might be taken out of Germany to that state. Meanwhile, the worldwide economic depression hit the Austrian economy hard.

With armed groups forming in Austria and the threat looming of civil war between the militias of the Christian Socialists and the Social Democrats, Chancellor Engelbert Dollfuss, himself a nominal Christian Socialist, on 12 Febru-

ary 1934 moved against the Social Democrats, outlawing the party, arresting its leaders, and proclaiming martial law. In March the Austrian Parliament—without opportunity to debate and with more than half its members, including Social Democrats, absent—approved a new constitution submitted to it by Dollfuss. It established an authoritarian corporate state that abolished both universal suffrage and political representation of the people.

On 25 July 1934, a small group of Austrian Nazis seized the government radio station and announced that the government had fallen. Another group seized the chancellery, mortally wounding Dollfuss, who had refused to flee, and holding other cabinet ministers captive. The plot was poorly organized, however, and soon collapsed. Within a few days, the Austrian government had put it down without outside assistance, and on 29 July a new cabinet was formed under Kurt Schuschnigg, a Christian Socialist colleague of Dollfuss. A dozen leaders of the putsch were eventually executed, and hundreds more were sentenced to prison.

The events in Austria had repercussions abroad. Italian dictator Benito Mussolini, who considered Austria under his sway, ordered troops to the Brenner Pass. Hitler had initially expressed pleasure at the putsch, but when news arrived of its failure he washed his hands of it. There was in fact little he could have done, as Germany—still largely unarmed—was in no position to oppose Italy. Hitler expressed regret at the Dollfuss murder, recalled his ambassador (who had promised the putschists asylum), and assured the world that Germany had no role in the failed coup. The attempted Nazi takeover of Austria was clearly a setback for Hitler. Nevertheless, the coup attempt had made emphatically clear Austria's dependence on outside support for the maintenance of its independence.

Schuschnigg attempted to continue the Dollfuss agenda, especially the cultivation of relationships with Italy and Hungary. He also endeavored to improve relations with Hitler, but at the same time he contemplated the restoration of the Austrian ruling house of the Hapsburgs, which Hitler vehemently opposed. By 1938, the international situation had dramatically changed for Austria, as Mussolini had become a confederate of Hitler in the Axis alliance. In consequence Schuschnigg, while he pursued an alliance with Czechoslovakia, had little choice but to mend fences with Hitler. On 12 February 1938, he traveled to Berchtesgaden at Hitler's insistence to meet with the German leader. Under heavy pressure, Schuschnigg agreed to appoint Austrian Nazi Arthur Seyss-Inquart as minister of the interior and other Austrian Nazis as ministers of justice and foreign affairs.

On 9 March, however, in an attempt to maintain his nation's independence, Schuschnigg announced a plebiscite on the issue of *Anschluss* to be held in only four days, hoping that the short interval would not allow the Nazis to mobilize

effectively. Hitler was determined that no plebiscite be held, and on 11 March Seyss-Inquart presented Schuschnigg with an ultimatum, demanding his resignation and postponement of the vote under threat of invasion by German troops, which were already mobilized on the border. Schuschnigg gave in, canceling the plebiscite and resigning. Seyss-Inquart then took power and invited in the German troops (which had actually already crossed the frontier) “to preserve order.”

Had it been ordered to fight, the small Austrian army might have given a good account of itself. Germany would have won, of course, but its military was hardly ready for war and a battle might have dispelled some rampant myths about the German military. Indeed, hundreds of German tanks and vehicles of the German Eighth Army broke down on the drive toward Vienna.

On 12 March, Hitler returned to his boyhood home of Linz, Austria, and on the next day Berlin declared Austria to be part of the Reich. On 14 March, perhaps a million Austrians gave Hitler an enthusiastic welcome to Vienna. France and Britain lodged formal protests with Berlin, but that was the extent of their reaction.

The consummation of *Anschluss* greatly strengthened Germany’s position in Central Europe. Germany was now in direct contact with Italy, Yugoslavia, and Hungary, and it controlled virtually all of the communications of southeastern Europe. Czechoslovakia was almost isolated, and its trade outlets were at the mercy of Germany. Militarily, Germany outflanked the powerful western Czech defenses. It was thus not surprising that, despite Hitler’s pledges to respect the territorial integrity of Czechoslovakia, he should next seek to bring that state under his control.

The Austrian army was soon absorbed into the Wehrmacht and the Waffen-Schutzstaffel (Waffen-SS). Austria eventually contributed three army corps and additional military assets (a total of some 800,000 military personnel) to the Axis effort, and the country suffered roughly 400,000 military and civilian casualties during the war.

A great many Austrians enthusiastically supported the Nazi cause. Although Austrians comprised but 6 percent of the population of Hitler’s Reich, they furnished 14 percent of SS members and 40 percent of those involved in the Nazi extermination efforts. Anti-Semitism was rife in Austria, and actions against the Jews (who had been prominent in the professions in Vienna, in particular) were applauded by a significant sector of the population, unlike in Berlin.

Austrians who had welcomed the incorporation of their country into the Reich soon discovered to their dismay that German interests dominated much of Austria’s economy and that the inhabitants of the Ostmark (as Austria was now known, its medieval name having been revived) were often treated more as a conquered people subject to intense scrutiny and discrimination. This says nothing of the experi-

ences endured by minorities and Jews who came in for special, and horrific, treatment.

Resistance groups formed around the old political factions—socialists, monarchists, nationalists—and soon developed contact with the Allies. In-country resistance and the work of Austrians abroad limited the extent to which Austria remained identified with Nazi Germany. In the 1943 Moscow Declaration, the Allies recognized Austria as the first victim of Hitler’s aggression, a view that Austrian politicians did their utmost after the war to nurture.

Austria experienced air attacks beginning in 1943, and the attacks escalated as the Allies moved eastward in 1944. When Germany’s military situation crumbled in the spring of 1945, Allied armies converged on Austria. The Red Army entered Austria at the end of March and liberated Vienna in mid-April. At the end of April, a provisional government established under Soviet direction nullified the *Anschluss*. The Allied powers—the Soviet Union, the United States, Britain, and France—each set up occupation zones in Austria and pursued their own interests in the icy atmosphere that followed Germany’s surrender. In October 1945, the Allies formally recognized Austria’s provisional government. The Allied military occupation of Austria did not end until the Treaty of Belvedere in 1955.

Aviation, Ground-Attack

Ground-attack aviation is the dedicated use of combat aircraft to attack ground combat units and their supporting echelons on or near the front lines to support friendly ground forces. By the end of World War I, the practice of supporting infantry ground attack with aircraft was gaining acceptance. Air attacks increasingly were employed both in immediate support of ground operations at the front but also upon rear-echelon enemy units.

During the interwar period, military theory and doctrine bifurcated, and two distinct schools of thought developed about the proper use of air power. One school, following the precepts of Italian theorist Giulio Douhet, advocated concentration on strategic bombing by heavy, self-defending “battle planes” on targets far behind the battle lines, with the intent of collapsing an enemy nation’s will to continue the fight. Most British and U.S. air power advocates supported this concept.

The second school of thought, generally adhered to by the Soviet Union, France, and Germany, advocated air power in direct support to ground maneuver operations. In this vision

of air power, aircraft primarily attacked targets on the front lines or behind the front, which might extend as much as 150 miles. These theorists saw air forces as working in direct support of ground forces, enabling the latter to move farther in the attack or to yield less terrain in the defense.

Each school drove aircraft design in particular directions. Thus, the United States and Great Britain came up with four-engine “strategic” bombers such as the American Boeing B-17 Flying Fortress (Douhet’s self-defending “battle plane”) and the British Avro Lancaster. The Germans, however, concentrated on fast fighters such as the Me-109 to secure air superiority over the battlefield for fast medium-sized dual-engine bombers such as the Heinkel He-111 and the Dornier Do-17. The Germans, having learned from U.S. Marine Corps operations, also embraced dive-bombing, developing their important single-engine Junkers Ju-87 Stuka, which could deliver its ordnance with great accuracy and proved vital during the war’s early campaigns. The Luftwaffe was essentially intended for close air support, geared to ground operations.

The multiple German blitzkriegs against Poland (1939), Norway (1940), and France (1940) demonstrated the great importance of the ground-attack school of thought. Luftwaffe units, working in close coordination with advancing columns

of German infantry and armor, were a key element in allowing those columns to cut through opposing forces with seeming ease. We now know that German air-to-ground coordination was far from perfect and that several German troops became casualties of friendly fire.

First with the British in fighting in eastern North Africa and then with the Americans in French North Africa, the western Allies developed their own system of close air support. Almost immediately, the Americans discovered that their own system of command and control for ground-attack operations, developed before the war, was inefficient and could not keep pace with rapidly shifting operations on the ground. Capitalizing on their great strength of being able to adapt to changed circumstances, the Americans jettisoned their own doctrine nearly wholesale and adopted a modified version of the British system. Thereafter their efficiency in ground-attack operations increased markedly.

At the same time, the Soviet air force, which had suffered heavily in the German invasion of the Soviet Union beginning in June 1941, perfected its own system of ground support aviation. The USSR developed some highly successful ground-attack fighters and fighter-bombers in the Yakovlev Yak-4 and especially the Ilyushin Il-2 Sturmovik. Flying low and employing rockets, Sturmoviks were efficient tank killers. Sturmoviks, purpose-built for the ground-attack role, were heavily armored at crucial points to protect against German antiaircraft fire. The Il-2 was perhaps the best ground-attack aircraft of the war. In testimony to its success, the Sturmovik remained in production until 1955; the Soviets produced some 36,000 of them.

Simultaneously, the western Allies began to specialize—in use if not in design—their own aircraft. Both Great Britain and the United States entered the war with credible, if not outstanding, medium bombers such as the North American B-25 Mitchell and the British Bristol Blenheim. The British added other aircraft, including the versatile De Havilland Mosquito, while the Americans produced excellent fighters in the ground-attack role, such as the Vought F4U Corsair, the twin-engine Lockheed P-38 Lightning, the Republic P-47 Thunderbolt, and the North American P-51 Mustang. The P-38, P-47, and P-51 were originally designed as bomber escorts or classic conventional pursuit planes (hence the *P* in the nomenclature). The P-51 Mustang, a superb aircraft, may have been the best all-around fighter of the war, but the P-38 and P-47 each had characteristics that made them more suited to lower-level work and the rigors of close air support. For the Thunderbolt, it was the fact that the aircraft could absorb significant damage and continue flying. Its air-cooled engine was less susceptible to failure from damage than was the Mustang engine, and ground-attack work generally meant taking ground fire while flying at low altitude. The

Lightning had twin engines on twin booms with a pod for the pilot slung between them, and it combined decent range with the heavy punch of five .50 caliber machine guns that fired straight ahead from the central pod. (The guns of most conventional aircraft were aimed inward to a single point.) This gave it lethal accuracy; the dual air-cooled engines gave the pilot a decent chance to make it home, even if one engine was shut down. On the British side was the Hawker Typhoon, an underappreciated contender for the title of best ground-attack aircraft of the war.

The air-ground team for the western Allies in the European Theater of Operations truly came into its own in the summer of 1944 during the Allied push across France. The penultimate display of this was the complete linkage between Lieutenant General George S. Patton's Third Army, the widest-ranging and fastest-moving element of the Allied sweep across France, and Major General Elwood "Pete" Quesada's IX Tactical Fighter Command. Patton, with no forces to spare to cover his right flank, committed the security of that increasingly open and vulnerable edge wholly to the air units under Quesada's command.

Ground-attack aviation was also important in the Pacific Theater, although it was perhaps marginally less effective in jungle terrain. U.S. air power proved vital in the struggle for Guadalcanal, for example; both the Japanese and the Americans saw control of Henderson Field as the key to the campaign. Overwhelming air support proved immensely important to Allied forces in the subsequent island-hopping campaigns in the Southwest Pacific along the New Guinea coast and at Bougainville. The introduction of napalm in 1944 gave another potent weapon to close air support fighters such as the F4U Corsair—the combination was used to great effect in the Philippines, the Marianas, and on Okinawa. Ground-attack aviation, which began in World War I, came into its own in World War II.

Aviation, Naval

On 14 November 1910, flying a Curtiss pusher aircraft, American Eugene B. Ely made the first flight from a ship, the USS *Birmingham*, at Hampton Roads, Virginia. On 18 January 1911, he landed the same Curtiss pusher on the USS *Pennsylvania* in San Francisco Bay for the first landing of a plane on a ship. Britain's Royal Navy later conducted similar tests.

The world's major navies developed four major roles for naval aircraft: reconnaissance, spotting for naval gunnery, attacking enemy fleet and shore installations, and defending the fleet from enemy aircraft. Navies first relied on seaplanes and land-based aircraft, but during World War I Britain began conversion of several ships into aircraft carriers. This undertaking came to include the battle cruisers *Furious*, *Courageous*, and *Glorious*, all of which served in World War II. The U.S. Navy commissioned its first aircraft carrier, the *Langley*, in 1922; in the same year Japan commissioned its first carrier, the *Hosho*.

Following World War I, the world's navies deployed catapult-launched seaplanes on their battleships and cruisers for reconnaissance and spotting. Many navies considered building aircraft carriers, but only Great Britain, Japan, and the United States built them in significant numbers. During the 1920s and 1930s, aviators in all three of these navies solved the many technical problems of carrier operations despite low budgets, some opposition, and the Washington and London treaties that limited the size, number, and armament of the carriers. Large new aircraft carriers joined the three navies' fleets in the late 1930s and early 1940s.

Each nation developed a force suited to its particular needs. The United States and Japan planned for operations across the vast and relatively empty stretches of the Pacific Ocean, where land air bases would be few. Both nations developed long-range seaplanes, such as the U.S. PBV Catalina, to extend their search range, although only the Japanese navy developed land-based bombers to support its carrier aircraft. Japan also sought to maximize the number of planes on its aircraft carriers. Limited by the size of the carriers' internal hangars, Japan's larger carriers generally carried between 70 and 80 planes. In U.S. carriers planes were parked on the decks, and hangars were used only for repair and maintenance. This enabled the United States to bring as many as 100 planes into battle. The U.S. Navy also took better advantage of folded-wing airplanes to fit large complements on its carriers. Keeping planes on deck also substantially increased the pace of flight operations on the American carriers, allowing planes to be launched at a much higher rate than that from the Japanese or British ships.

Britain planned for war in Europe, where its fleet was likely to confront land-based air power. For that reason, the British

favored heavily armored aircraft carriers with armored flight decks capable of withstanding 500-lb bombs. Although this scale of protection reduced the British aircraft complement to half that of comparably sized American aircraft carriers, it paid off repeatedly during the war, when British aircraft carriers survived damage that would likely have sunk a U.S. or Japanese carrier. On 10 January 1941, while protecting a convoy bound from Alexandria to Malta, the *Illustrious* survived hits by 500 lb and 1,000 lb bombs and then survived further damage while under repair at Malta. Later in the war, several British carriers withstood hits from Japanese kamikaze aircraft with minimal damage.

Unlike the case in Japan or the United States, the Royal Air Force, rather than the navy, had authority over naval aviation. This divided leadership slowed innovation, and the Royal Navy entered the war with obsolete aircraft. Typical of this was its Fairey Swordfish biplane torpedo-bomber.

Japan developed its aviators into an elite strike force, selecting only 100 new aviators each year from its rigorous training program. In 1941, they flew the best naval aircraft in the world: the Mitsubishi A6M2 Reisen ("Zero") fighter—so named because it entered service in 1940, the Japanese year 5700, and was henceforth known as the type 0 (Reisen or Zero)—the Aichi D3A "Val" dive-bomber, and the B5N "Kate" torpedo-bomber. These aircraft sacrificed protection for speed and maneuverability, and they considerably outperformed and outranged U.S. naval aircraft. Japanese fleets sent their search planes out to almost 600 miles, compared with 350 miles for the U.S. Navy, and their strike aircraft had a combat radius of 300 miles, compared with 200 miles for most American aircraft.

The Zero established a deadly combat reputation, and Americans flying Grumman F4F Wildcats could only best it with careful tactics and teamwork. The U.S. Douglas SBD Dauntless proved an excellent dive-bomber and served through much of the war, but the obsolete TBD Devastator torpedo-bomber was slow and vulnerable. The U.S. Navy replaced it as soon as it could with the more modern TBF Avenger following the great carrier battles of 1942.

During the first two years of war, aircraft did little to fulfill the promises of prewar aviation advocates. German aircraft rarely hit British warships during the 1940 Norwegian Campaign, and the German battle cruisers *Gneisenau* and *Scharnhorst* sank Britain's aircraft carrier *Glorious* with gunfire. In November 1940, British carrier aircraft surprised Italian battleships docked at Taranto and torpedoed three of them, but this proved little to critics, who argued that battleships at sea would evade bombs and torpedoes and devastate attacking aircraft with their heavy defensive armament.

Critics were also unimpressed by the battering by land-based aircraft that British carriers sustained while escorting

Aerial view of SB2C in upper landing circle showing USS *Yorktown*, below, July 1944. (U.S. Navy, National Archives)

convoys through the Mediterranean. However, carrier aircraft proved critical in bringing the German battleship *Bismarck* to battle. On 16 May 1941, torpedoes dropped by the *Swordfish*, which had been launched from the *Ark Royal*, jammed the *Bismarck*'s rudder. Yet it required the heavy guns of British battleships to actually sink the ship. Similarly, Japan's brilliantly conceived and executed attack on Pearl Harbor proved only that bases and stationary ships were vulnerable to surprise air attack. Three days later, though, Japanese navy G4M land-based bombers located and sank the newest British battleship, the *Prince of Wales*, and the battle cruiser *Repulse* in an hour-long battle off the coast of Malaya. The British warships shot down only 3 of 129 attacking aircraft. Aircraft would often dominate future sea battles.

Japanese and U.S. aircraft carriers engaged each other in battles in 1942. The first of these, the Battle of the Coral Sea, ended with roughly equal losses for both sides. At Midway, though, Japan lost four carriers and sank only one U.S. carrier, the *Yorktown*. There followed a series of grueling battles around Guadalcanal in which both navies suffered heavily. Aircraft carriers, loaded with fuel and ordnance, proved particularly vulnerable to even minor damage, and few survived

the first year of war in the Pacific. The United States lost five of its seven carriers in these battles, and the sixth suffered heavy damage. Japan suffered similar losses to its carrier fleet; more than 400 of the 765 airmen who attacked Pearl Harbor had died in battle by the end of 1942, in part the consequence of a poor Japanese pilot replacement/ training system.

In a desperate effort to replace lost aircraft carriers, the United States and Japan converted light cruisers into small aircraft carriers, such as the U.S. 33-aircraft *Independence*, which joined the fleet in June 1943. Japan also added partial flight decks to two battleships, allowing them to launch but not recover planes, and it converted a Yamato-class battleship to an aircraft carrier, the 64,800-ton *Shinano*. Yet U.S. industry easily won the naval building race. Japan completed three carriers in 1943 and four in 1944–1945; the United States completed 17 of its large Essex-class carriers during the war and more than 60 smaller carriers. By mid-1944, the United States was launching a large aircraft carrier every month.

U.S. carrier operations became increasingly sophisticated after the 1942 battles. Improving radar, which by early 1944 could detect even low-flying aircraft, and new control and communications systems allowed American fighters to intercept

attacking aircraft with great success. New ships, increasing anti-aircraft armament, and the proximity fuse considerably improved fleet defense. Radar-equipped TBF Avengers proved adept at locating targets at sea and in the air, allowing the U.S. Navy to intercept attacking aircraft at night. Whereas the Japanese navy continued to rely on its prewar aircraft designs, the United States developed several new airplanes, which began joining the fleet in 1943. These included the excellent F6F Hellcat and F4U Corsair, which completely outclassed Japan's Zero in combat.

U.S. aircraft also joined the British Royal Navy—first Wildcats and later Corsairs, Hellcats, and Avengers. By 1943, the United States was supplying most of the Royal Navy's aircraft. U.S. industry also churned out dozens of small escort carriers for both its own navy and the British navy. Carrying two dozen aircraft, these "baby flattops" provided continuous air cover for convoys crossing the Atlantic. Other escort carriers formed the core of antisubmarine hunter-killer groups that prowled the ocean in search of German U-boats and reinforced convoys under attack. Combined with land-based air power, the escort carriers proved the answer to the threat from Germany's U-boats and, in mid-1943, turned the tide of the Battle of the Atlantic. They also provided vital air support for numerous amphibious invasions.

A series of U.S. carrier raids and air offensives further wore down Japanese air strength in the Pacific during 1943. By November, when the United States invaded Tarawa and began its drive across the Central Pacific, 11 U.S. carriers faced only 6 Japanese carriers. U.S. Navy carriers, supported by an enormous fleet train and logistical system, raided throughout the Pacific. They isolated Japanese-held islands before invasion, protected amphibious landings, and provided close air support for the invading soldiers and Marines. American training and combat performance continued to improve, and an excellent submarine and seaplane rescue service saved the lives of many American pilots shot down during these missions.

The Japanese carrier fleet, rebuilt from the 1942 battles and supported by land-based planes, confronted a far larger U.S. fleet in June 1944 in the Battle of the Philippine Sea. The result was the "great Marianas turkey shoot," as the better-trained and better-equipped Americans shot down scores of poorly trained Japanese pilots who failed to press home their attacks and often missed their targets. Japan lost 475 planes and almost as many pilots; the United States lost only 100 planes and 16 pilots. Japanese naval air power never recovered from this defeat.

In the Battle of Leyte Gulf in October 1944, Japan used 1 heavy aircraft carrier and 3 light carriers (with a total of only

116 planes on board) as a diversion to draw away the U.S. battle fleet so Japanese battleships and cruisers could attack the landing beaches. Instead of the superbly trained pilots who attacked Pearl Harbor, Japan relied on the kamikazes, whose suicidal attacks sank dozens of U.S. ships. In the Battle for Okinawa, the kamikazes inflicted more casualties on the U.S. Navy than it had sustained in all of its other wars combined. But the Japanese were unable to stem the U.S. Navy advance across the Pacific. Throughout the Pacific, from the Mariana Islands to the Philippines, Iwo Jima, and Okinawa, U.S. naval aircraft smashed Japanese defenses, destroyed Japanese aircraft, supported invasions, sank Japanese ships, and raided Japanese positions.

By 1945, four British aircraft carriers operated in the Pacific, and these joined more than a dozen American carriers in launching a series of devastating air attacks on Japanese positions in July and August. All told, 1,000 U.S. and 250 British carrier aircraft destroyed more than 3,000 Japanese aircraft in the air and on the ground, adding to the damage B-29 bombers had already inflicted on Japan's home islands. New aircraft carriers continued to join the U.S. fleet, although the first of large 47,000-ton Midway-class battle carriers were not commissioned until September 1945, after the end of the war. Of Japan's carriers, only the old, experimental *Hosho* survived the war. Japan's fortunes in the Pacific war had risen and then sunk with its aircraft carriers.

B

Babi Yar Massacre (29–30 September 1941)

German mass shooting of Soviet Jews outside Kiev, Ukraine. Following the German army's invasion of the Soviet Union on 22 June 1941, four *Shutzstaffel Einsatzgruppen* (SS mobile killing squads) entered Soviet territory, their task being the physical annihilation of Communist Party functionaries, Red Army commissars, the physically and mentally handicapped, partisans, and Jews.

As the Wehrmacht drove ever deeper into the Soviet Union, the *Einsatzgruppen* followed, rounding up and slaughtering their intended victims in mass shootings. Consequently, by the time of their disbanding in 1943, when the war on the Eastern Front swung irreversibly in favor of the Red Army, the *Einsatzgruppen*—with the assistance of the German army and a host of enthusiastic collaborators from the Latvian, Lithuanian, and Ukrainian populations—had committed a multitude of unspeakable atrocities and murdered an estimated 1.5 million Soviet Jews and others.

Among the numerous *Einsatzgruppen* crimes, the slaughter of Jews at Babi Yar in late September 1941—perpetrated by SS Colonel Paul Blobel's *Sonderkommando 4a*, a subunit of Otto Rasch's *Einsatzgruppe C*—was arguably the most notorious. On 19 September 1941, units of the German Army Group South occupied Kiev, the capital of Soviet Ukraine. In the days immediately following, a series of explosions rocked the city, destroying German field headquarters, burning more than one-third of a square mile of the Kiev city center, and leaving some 10,000 residents homeless. Although these explosions were likely the work of the Soviet political police, or NKVD, the Germans saw in them a convenient justifica-

tion to massacre the city's Jews, a task Blobel's *Sonderkommando* would have carried out regardless.

After discussions between Blobel, Rasch, and Major General Kurt Eberhard, the German field commander in Kiev, the latter ordered the city's Jews to assemble with their possessions—including money, valuables, and warm clothing—near the Jewish cemetery no later than 7:00 A.M. on Monday, 29 September. The posted order indicated that the Jews were to be resettled and warned that failure to comply would be punishable by death.

Once assembled, Kiev's Jews were marched to Babi Yar, a partially wooded ravine just outside the city. There, the Germans, following the procedure used by *Einsatzgruppen* since the mass shootings of Soviet Jews began in late June, forced the Jews to strip, dispossessed them of their belongings, and shot them to death in groups of 30 to 40 people. In the course of two gruesome days, Blobel's men, relying exclusively on automatic weapons, murdered 33,771 innocent men, women, and children. Subsequently, they reported that the Jews had offered no resistance and until the last minute had believed they were to be resettled.

During the months that followed the initial Babi Yar massacre, the Germans periodically used the ravine as a murder site, killing several thousand more Jews there, plus an untold number of Gypsies and Soviet prisoners of war. In July 1943, with Soviet forces having seized the military initiative and advancing rapidly, the Germans launched Operation *AKTION 1005* to eradicate evidence of their crimes in the Soviet Union. Blobel, who had been released from his duties as commander of *Sonderkommando 4a* in early 1942 and transferred to Berlin, returned to Kiev, where he oversaw efforts to obliterate

Nazi SS Special Commanders prepare to execute Kiev Jews during the Babi Yar Massacre in Ukraine, 29–30 September 1941 (Photo by Hulton Archive/Getty Images).

traces of the executions at Babi Yar. Throughout August and September, Blobel's men and conscripted concentration camp inmates reopened the mass grave, crushed bones, and cremated the remains of the dead. Despite the Germans' efforts to hide their crimes, significant evidence of the massacres remained and was discovered by Soviet forces following the liberation of Kiev in November 1943.

The Babi Yar massacre of late September 1941 was not the largest German "special action" against the Jews. In October 1941, the Germans and their Romanian allies murdered an estimated 50,000 at Odessa. Nonetheless, more than any other, Babi Yar has come to symbolize an aspect of the Holocaust—mass shootings—that is invariably overshadowed by the horrors of Auschwitz and the other death camps.

Badoglio, Pietro (1871–1956)

Italian army marshal who helped Italy switch allegiance from the Axis to the Allied powers in World War II. Born in Grazzano Monferrato (later renamed Grazzano Badoglio), Italy, on 28 September 1871, Pietro Badoglio entered the Italian military in 1890 as an artillery officer and participated in the campaigns in Abyssinia between 1896 and 1897 and Tripolitania (Libya) from 1911 to 1912. A captain at the beginning of World War I, he rose to lieutenant general in August 1917 and commanded XXVII Corps in the October–November 1917 Battle of Caporetto. His deployment and poor handling of his corps opened a gap in the Italian lines and facilitated the Austro-German advance. Some information on this situation was suppressed, and Badoglio's career did not suffer. Indeed, Badoglio became deputy to the chief of staff of the Italian army, General Armando Diaz.

From November 1919 to February 1921, Badoglio was army chief of staff. In 1924 and 1925, the anti-Fascist Badoglio

Italian Marshal Pietro Badoglio. (Hulton-Deutsch Collection/Corbis)

was ambassador to Brazil, but in May 1925, he returned to Italy as chief of the General Staff and was promoted to field marshal in June 1926.

From 1928 to 1933, Badoglio was governor of Italian North Africa, and during that period, he oversaw the suppression of the Senussi Rebellion. In November 1935, he assumed command of Italian forces in Ethiopia, completing the conquest of that country; he was rewarded with the title of duke of Addis Ababa and named viceroy there in May 1936. In November 1939, Badoglio was again chief of staff of the Italian armed forces, a post he held until he was forced to resign on 4 December 1940 following the failure of Italian forces in Greece.

After Benito Mussolini's arrest in July 1943, King Victor Emmanuel III selected Badoglio as head of the Italian government and commander of the armed forces. Badoglio then dissolved the Fascist Party and many of its institutions, released political prisoners, and failed to enforce the anti-Semitic legislation. He also helped engineer Italy's change from the Axis to the Allied side as a cobelligerent, a move carried out secretly on 3 September 1943. When the German

army took over much of Italy, Badoglio, the king, and other members of the government managed to flee Rome on the night of 8–9 September and make their way to Brindisi, where they set up a government in cooperation with the Allies. On 29 September 1943, Badoglio formally surrendered Italy, and on 13 October 1943, Italy declared war on Germany. Following the liberation of Rome, Badoglio stepped down, on 5 June 1944. He died at his family home in Grazzano Badoglio on 1 November 1956.

Bäer, Heinrich (1913–1957)

German air force officer and World War II ace. Born in Sommerfeld, Germany, on 25 March 1913, Heinrich "Pritzel" Bäer joined the Luftwaffe in 1937 and began World War II as an Umteroffizier (U.S. equiv. corporal). Within a year, he had both attained the rank of sergeant and qualified as a non-commissioned fighter pilot. During this time, he was stationed with Jagdgeschwader (Fighter Group) 51.

On 25 September 1939, Bäer scored his first confirmed victory (kill). During the 1940 battle for France, he earned a battlefield commission as a lieutenant. He then fought in the Battle of Britain, raising his total kills to 27.

Transferring to the Soviet Front in 1941, Oberleutnant (U.S. equiv. first lieutenant) Bäer continued to score victories in aerial combat. He obtained 96 kills in this campaign, including 6 against Soviet pilots in a single day. Once shot down behind Soviet lines, Bäer made his way back to German-held territory. He was hospitalized with a spinal injury but rejoined his unit shortly thereafter.

In the spring of 1942, newly appointed Hauptmann (U.S. equiv. major) Bäer was assigned as commander of JG-77 in the North African Campaign, flying from Sicily. In January 1945, Bäer took command of JG-1, a jet fighter training unit. He was then transferred to JG-3, where he scored his two-hundredth career victory. His final assignment of the war was with JV-44, Generalleutnant (U.S. equiv. major general) Adolf Galland's "Expert Squadron." Flying the Me-262 jet, Bäer had 220 career

victories in more than 1,000 combat missions. His total of 16 victories in the Me-262 remains the record for a jet aircraft.

Heinrich Bäer completed his military service as a lieutenant colonel. He died in an airplane crash in Brunswick, Germany, while demonstrating the capabilities of a light plane on 28 April 1957.

Balbo, Italo (1896–1940)

Italian air marshal who argued against fighting the Allies in World War II. Born in Qartesana, Italy, on 6 June 1896, Italo Balbo joined the army in 1915 when Italy entered World War I and fought as a lieutenant in the Alpini. Balbo joined the Fascist Party in 1921 and was a leader of the 1922 Fascist March on Rome. One of the more brutal commanders of the anti-Socialist Fascist militia, he became a top adviser to Benito Mussolini. After Mussolini became premier, Balbo held various cabinet posts before becoming minister of aviation in 1929, in which position he worked to make Italy a major air power. Balbo personally led a number of transatlantic flights to North and South America that captured public attention in Italy and abroad. But the Italian air force, despite setting numerous air records, was largely a paper tiger and had few modern aircraft.

Promoted to Italy's first air marshal in 1933, Balbo came to be seen as a political threat by Mussolini, who, in January 1934, appointed him governor and commander in chief of Italian forces in Libya. There, Balbo worked against the policy of Italian domination advocated by others, instead favoring a degree of assimilation for the Arab and Berber populations.

Balbo criticized Italy's alliance with Germany. At a Fascist Grand Council meeting on 7 December 1939, he raised the possibility of Italy fighting on the side of France and Britain. He continued to speak out, even to the British ambassador, against Italy going to war with the Allies.

After Italy declared war in June 1940, Balbo accepted command of Italian forces in North Africa. But on 28 June, his plane was shot down near Tobruk by Italian anti-aircraft fire, and he was killed. A British air raid had just taken place, and Balbo's plane was downed while attempting to land after it failed to give the proper identification signal. Rumors had it,

however, that Mussolini had ordered his death. Il Duce later remarked that Balbo was “the only one capable of killing me.”

Balkans Theater

The Balkan Peninsula lies between the Black Sea and the Sea of Marmara to the east, the Mediterranean Sea to the south, the Ionian Sea to the southwest, and the Adriatic Sea to the west. The northern boundary of the Balkans is generally considered to be formed by the Sava and Danube Rivers. In 1939, there were six states south of that line: Albania, Greece, Bul-

German paratroopers capturing British soldiers during the invasion of Crete, 1941. (Bettmann/Corbis)

garia, European Turkey, most of Yugoslavia, and southeastern Romania.

With the exception of Turkey—which remained neutral—the Axis powers of Germany and Italy gained the allegiance of some of the Balkan states and then invaded and conquered the remainder in 1940 and 1941. This move ensured that the Axis powers had control over the eastern side of the Mediterranean, and it provided the security on the southern flank that was a prerequisite to a German invasion of the Soviet Union. With the rapid collapse of France between May and June 1940, Soviet leader Josef Stalin moved swiftly to secure gains promised him under the August 1939 Soviet-German pact. The Red Army occupied Lithuania, Latvia, and Estonia. This development was expected, but Adolf Hitler professed himself surprised by the subsequent Soviet moves in the Balkans.

In late June 1940, Stalin ordered the annexation of the Romanian provinces of Bessarabia and northern Bukovina. Bessarabia had been assigned to the Soviet sphere under the nonaggression pact, but northern Bukovina had not. Also, unlike Bessarabia, Bukovina had never been part of Imperial Russia, and it was the gateway to the Romanian oil fields at Ploesti, vital to the German war machine.

Italy also sought to take advantage of the defeat of France as well as Britain's weakness by opening new fronts in Africa and in Greece. In April 1939, Italian dictator Benito Mussolini had ordered Italian forces to seize Albania. Then, on 28 Octo-

ber 1940, he sent his army into Greece from Albania, without informing Hitler in advance. Hitler most certainly knew of the Italian plans but did not act to restrain his ally, nor did he reproach him. Mussolini's decision, taken on short notice and against the advice of his military leaders, had immense repercussions. Not only did the Greeks contain the Italians, they also drove them back and began their own counterinvasion of Albania. That winter, the campaign became deadlocked, which caused Hitler to consider sending in German troops to rescue the Italians.

Meanwhile, Hitler acted aggressively in the Balkans to counter the Soviet moves and shore up his southern flank before the German invasion of the Soviet Union. In November 1940, he forced both Hungary and Romania to join the Axis powers and accept German troops. Bulgaria followed suit at the beginning of March 1941. Hitler took advantage of irredentist sentiment but also used hardball tactics to secure the allegiance of these countries. He pressured Yugoslavia, and in late March, under German threats, Prince Regent Paul reluctantly agreed to join the Axis powers.

Early in March 1941, meanwhile, honoring the pledge to defend Greece, British Prime Minister Winston L. S. Churchill dispatched to that country two infantry divisions and an armored brigade. He hoped thereby to forestall a German invasion, but this step also forced the British Middle East commander, General Sir Archibald Wavell, to halt his offensive against the Italians in North Africa.

On March 27, elements in the Yugoslavian army carried out a coup in Belgrade that overthrew Paul and repudiated the German alliance. This move was motivated, above all, by popular sentiment among the Serbs against the alliance. Furious at the turn of events, Hitler ordered German forces to invade Yugoslavia. Marshal Wilhelm List's Twelfth Army and Generaloberst (U.S. equiv. full general) Edwald von Kleist's 1st Panzer Group, positioned in Hungary and Romania for the forthcoming invasion of the Soviet Union, now shifted to southwestern Romania and Bulgaria.

The German invasion of Yugoslavia began on 6 April 1941 with a Luftwaffe attack on Belgrade that claimed 17,000 lives. Eleven German infantry divisions and four tank divisions invaded from the north, east, and southeast. Other Axis troops, including the Third Hungarian Army, took part, but Hungarian Premier Pál Teleki committed suicide rather than dishonor himself by participating in the invasion of neighboring Yugoslavia. The invasion was conducted so swiftly that the million-man Yugoslav army was never completely mobilized. Yugoslavia surrendered unconditionally on 17 April.

Simultaneous with their move into Yugoslavia, the Germans came to the aid of the hard-pressed Italians by invading Greece. This move caught the Greeks with 15 divisions in Albania and only 3 divisions and border forces in Macedonia, where the Germans attacked. Also, the scratch British Expeditionary

Force (BEF) in Greece was woefully unprepared to deal with German armor and the Luftwaffe, and between 26 and 30 April, it precipitously evacuated Greece. Many of the roughly 50,000 troops taken off were then landed on Crete. During the evacuation of Greece, British naval units were savaged by the Luftwaffe, with the Royal Navy losing more than two dozen ships to German air attack; many other vessels were badly damaged.

In May 1941, the Germans continued their push south by occupying the island of Crete in the eastern Mediterranean in the first airborne invasion in history. The invasion turned out to be the graveyard of German paratroop forces. Hitler saw the action only as a cover for his planned invasion of the Soviet Union, securing the German southern flank against British air assault and helping to protect the vital oil fields of Ploesti. The German invasion, conducted by parachutists and mountain troops carried to the island by transport aircraft, began on 20 May and was soon decided in favor of the attackers. Again, the Royal Navy suffered heavy losses, although it did turn back a German seaborne landing effort. Churchill's decision to try to hold Crete, unprepared and bereft of Royal Air Force (RAF) fighter support, ignored reality. But Hitler, by his aggressive Balkan moves, barred Soviet expansion there and secured protection against a possible British air attack from the south. These goals accomplished, he was ready to move against the Soviet Union.

From the very beginning of the Axis occupation, the Balkans were a theater for guerrilla warfare until the Red Army invaded in August 1944. In both Greece and Yugoslavia, there were Communist and non-Communist resistance groups, which often fought among themselves as well as against their Greek and Italian occupiers. In Greece, the lead was taken by the National People's Liberation Army (ELAS), which came to be dominated by the Communists, and the National Republican Greek League (EDES). In Yugoslavia, the Chetniks were led by former army officers. Soon, a rival resistance group, known as the Partisans, came to the fore, dominated by the Communists. As in Greece, these two groups would become bitter enemies, even to the point of fighting one another. Ultimately, the British, who oversaw Allied aid to the Yugoslav resistance, decided to back only the Partisans, a decision that helped bring Josip Broz (Tito) to power in Yugoslavia after the war. The Yugoslav resistance largely freed the country from German control.

When Italy left the war in September 1943, Germany had to provide the occupying forces on its own, severely straining resources in men and material. The Allies also conducted a number of commando raids in the Balkans, including the German-occupied islands of the eastern Mediterranean.

In late August 1944, the Red Army's 2nd and 3rd Ukrainian Fronts launched an offensive in Romania against Army Group Südukraine. Romania and Bulgaria soon capitulated and then switched sides, declaring war on Germany. In the case of Romania, these events occurred on 23 August and 4 September, and for Bulgaria, they took place on 25 August and 8 December 1944. In Greece, the Communists made three attempts to seize power: the first came during the 1943–1944 Axis occupation in anticipation of an early end to the war; the second occurred in Athens in December 1944; and the third effort came in the form of a bloody and prolonged civil war from 1946 to 1949. World War II in the Balkans was extremely costly in terms of human casualties, both directly—in actual military losses and civilian casualties resulting from warfare—and indirectly, stemming from shortages of food and other necessities.

In the immediate postwar period, the alignment of the Balkans actually worked out by and large along the lines of the agreement made between Churchill and Stalin at Moscow in October 1944. The Soviet Union dominated Romania and Bulgaria, whereas Greece ended up in the Western camp. Yugoslavia, which was to have been a fifty-fifty arrangement, freed itself from Moscow's grip in 1949.

Banten Bay, Battle of (28 February 1942)

Naval battle in the Pacific Theater, also known as the Battle of Sunda Strait. On 27 February 1942, the American-British-Dutch-Australian (ABDA) Command failed to block a Japanese invasion of Java in the Battle of Java Sea, and the surviving ABDA warships retreated to Java. The following day, at around 1:30 P.M., the cruisers USS *Houston* and HMAS *Perth*, together with the destroyer HMNS *Evertsen*, reached Batavia's port of Tanjong Priok. Resupply proved difficult, and only ammunition for the cruisers' secondary guns and 300 tons of fuel, half of the *Perth's* needs, were secured. Also, the *Houston's* number 3 turret was damaged, and the crews were exhausted. Nonetheless, the ABDA naval commander, Dutch Admiral Conrad Helfrich, ordered his warships to rendezvous at Tjilatjap on Java's south coast for another sortie against the Japanese.

At 7:00 P.M., the cruisers, commanded by Captain Hec Waller of the *Perth*, steamed west into Sunda Strait but without the *Evertsen*, which was still getting up steam. Two hours earlier, ABDA aircraft had spotted the Japanese approaching Banten Bay, but this information failed to reach ABDA's naval commanders.

At 11:06 P.M., Waller's force encountered the Japanese Western Attack Force near the entrance to Banten Bay. Rear Admiral Kurita Takeo had overall command of the Japanese force covering the invasion. His ships included the heavy cruisers *Suzuya* and *Kumano*, the aircraft carrier *Ryujo*, and destroyers situated about 20 miles north of Banten Bay to protect against an Allied attack from that direction. Just outside the bay were the cruisers *Mogami* and *Mikuma* and a destroyer. Inside the bay were the light cruisers *Natori* and *Yuri*, eight destroyers, and a minelayer protecting 58 Japanese merchantmen that were disembarking troops onto the shore.

Unaware that he was caught between these two Japanese forces, Waller led the *Perth* and *Houston* into the bay to attack the Japanese troop transports. His ships fired at multiple targets while steaming in a 5-mile circle around the bay. Meanwhile, the cruisers of the Japanese covering force came up, which led to some confusion when the two Japanese naval forces fired on each other. In the confusion, the *Houston* and *Perth* were about to escape into the Sunda Strait when a Japanese torpedo struck the latter at 12:05 A.M. Three additional torpedoes finished her off. The *Houston* took a Japanese torpedo hit at 12:15 A.M. but continued to return fire in a gallant effort. Heavy Japanese shelling and additional torpedoes sank the *Houston* by 12:45 A.M.

In the battle, the *Perth* lost 353 crewmen, and of her 320 survivors, 100 died while being held as prisoners of war (POWs). The *Houston* lost 655 crew; of her 368 survivors, 76 died while POWs. Japanese losses, some self-inflicted, included the transports *Sakura Maru*, *Horai Maru*, and *Ryujo Maru* and the minesweeper *W2*, all of which were sunk. The cruiser *Mikuma* and destroyer *Harukaze* were both damaged. Japanese personnel losses are unknown. The Japanese Western Attack Force had crushed Allied opposition and could now expand the beachhead without fear of opposition.

BARBAROSSA, Operation (22 June 1941)

German invasion of the Soviet Union that opened World War II on the Eastern Front, commencing the largest, most bitterly contested, and bloodiest campaign of the war. Adolf Hitler's objective for Operation BARBAROSSA was simple: he sought to crush the Soviet Union in one swift blow. With the USSR defeated and its vast resources at his disposal, surely Britain would have to sue for peace. So confident was he of victory that he made no effort to coordinate the invasion with his Japanese ally. Hitler predicted a quick victory in a campaign of, at most, three months.

German success hinged on the speed of advance of 154 German and satellite divisions deployed in three army

groups: Army Group North in East Prussia, under Field Marshal Wilhelm von Leeb; Army Group Center in northern Poland, commanded by Field Marshal Fedor von Bock; and Army Group South in southern Poland and Romania under Field Marshal Karl Gerd von Rundstedt. Army Group North consisted of 3 panzer, 3 motorized, and 24 infantry divisions supported by the Luftflotte 1 and joined by Finnish forces. Farther north, German General Nikolaus von Falkenhorst's Norway Army would carry out an offensive against Murmansk in order to sever its supply route to Leningrad. Within Army Group Center were 9 panzer, 7 motorized, and 34 infantry divisions, with the Luftflotte 2 in support. Marshal von Rundstedt's Army Group South consisted of 5 panzer, 3 motorized, and 35 infantry divisions, along with 3 Italian divisions, 2 Romanian armies, and Hungarian and Slovak units. Luftflotte 4 provided air support.

Meeting this onslaught were 170 Soviet divisions organized into three "strategic axes" (commanding multiple fronts, the equivalent of army groups)—Northern, Central, and Southern or Ukrainian—that would come to be commanded by Marshals Kliment E. Voroshilov, Semen K. Timoshenko, and Semen M. Budenny, respectively. Voroshilov's fronts were responsible for the defense of Leningrad, Karelia, and the recently acquired Baltic states. Timoshenko's fronts protected the approaches to Smolensk and Moscow. And those of Budenny guarded the Ukraine. For the most part, these forces were largely unmechanized and were arrayed in three linear defensive echelons, the first as far as 30 miles from the border and the last as much as 180 miles back.

The German plan called for three phases in which they hoped to achieve three broad objectives: the destruction of Soviet armed forces; the capture of political and industrial centers; and the occupation of coal, iron, and agricultural centers in the Ukraine and Caucasus. Phase one called for Nazi ground forces, supported by air, to drive deep into Soviet territory and encircle and destroy Soviet forces west of the Dvina-Dnieper Line while disrupting supply lines and creating maximum chaos. Phase two objectives were the seizure of Leningrad, Moscow, and the Ukraine to prevent political-military direction and economic support to the Red Army. In Phase three, the Wehrmacht was to advance to and hold the Volga-Archangel Line.

Initial Soviet defensive plans differed, but the primary defense in all was to position the bulk of forces along the perceived path of any German attack. The differences in the plans came from disagreements over the exact direction of the assumed main thrust. One concept held that the principal German attack would occur in the north, whereas another prepared for the main attack in the south, into the Ukraine. For whatever reasons, none considered the center of the front toward Moscow as primary. Soviet leader Josef Stalin believed the assault would be launched toward the Ukraine and Cau-

A TURNING POINT?

German Invasion of the Soviet Union

On 22 June 1941, the German army began Operation BARBAROSSA, the invasion of the Soviet Union. This event dramatically altered the course of the war. No longer fighting Germany virtually alone, Great Britain now had a formidable ally. Nearly four years later, Soviet troops captured Berlin and Germany was defeated. Was Adolf Hitler's decision to invade the Soviet Union an irrational act? Was BARBAROSSA doomed to failure from the start? Based on the final result, it appears so, but in 1941, many knowledgeable military and political officials believed otherwise.

Even before World War II, Nazi Germany and the Communist Soviet Union were bitter ideological enemies. When the two powers signed the Soviet-German Non-aggression Pact on 23 August 1939, it took most observers by surprise, but this agreement in fact benefited both sides. Germany was free to invade Poland, and the Soviet Union gained both territory and time to rearm. The unexpectedly swift German victory over France in 1940 left Hitler in control of Western Europe. Although Germany lost the Battle of Britain that summer and Hitler indefi-

nately postponed a sea invasion of that country (Operation SEA LION) in September, he still had a large, experienced, and undefeated army. In December, Hitler issued Directive No. 21 to "crush Soviet Russia in a quick campaign before the end of the war against England."

In October 1940, Germany's ally Italy invaded Greece. The invasion went poorly, and Britain sent troops to Greece. At the same time, a coup in Yugoslavia led that nation to repudiate its recently signed alliance with Germany. A furious Hitler ordered his army and air force into both Yugoslavia and Greece and then on to Crete.

He next turned his attention to the invasion of the Soviet Union. German overconfidence, based on the quick defeat of France, led Hitler to conclude that the Soviet Union might be defeated in six weeks. Soviet leader Josef Stalin's purges of the officer class and the mediocre performance of the Red Army in the 1940 Russo-Finnish War seemed to support Hitler's conclusion that "all you have to do is kick in the door and the whole rotten structure will crumble to the ground."

BARBAROSSA began late because of German delays in assembling the requisite forces for the invasion, the Balkan Campaign, and, above all, inclement weather. The invaders needed a period of dry weather to use their tanks effectively. BARBAROSSA began on 22 June, five weeks after the planned starting date of 15 May. Employing a force of 3.6 million men, nearly 3,000 tanks, and more than 2,700 aircraft, the Germans made dramatic, rapid gains. Early on, the attackers destroyed much of the Red Air Force and then encircled and captured vast Soviet ground formations. A logistical pause of one week in August grew to four weeks, which meant that the German drives on Leningrad and Moscow were seriously impeded by the onset of autumnal rains, mud, and winter weather. In October, the Germans began Operation TAI-FUN (TYPHOON) to take Moscow. They never reached the Soviet capital, and in December, Soviet Siberian reinforcements hurled them back. The Germans still held the military initiative, having conquered much of the western Soviet Union and taken 3 million Soviet prisoners of war in little more than six months of fighting. Despite this

casus because of the agricultural and mineral resources there. Consequently, final General Staff plans were developed for the Red Army to defend against a southern main thrust.

Whatever the direction of any German attack, Stalin counted on a repeat of the stalemate of the Western Front of 1914 to 1918 or at least a campaign lasting a year or more. Soviet planning estimated that any war between Germany and the USSR would last a minimum of three years. Critical to ensuring the ability of the Soviet Union to fight a protracted war would be denial of the eastern Ukraine to the Germans, which is why so much Soviet armor was positioned forward in June 1941.

Stalin refused to believe Soviet intelligence reports that German forces were massing on the western approaches to the USSR. He also rejected Western warnings with detailed information of the impending Germany attack. He received a reported 100 Western warnings but dismissed them all as efforts by the Western powers to involve the Soviet Union in the war. The German ambassador to the Soviet Union, Count Friedrich von Schulenberg, who opposed war between Germany and the

Soviet Union, even informed an astonished Vladimir Dekanozov, the Soviet ambassador to Germany, that Germany would invade. Reportedly, Stalin informed the Politburo that "disinformation has now reached ambassadorial level."

Although Stalin had utilized the respite of the Soviet-German Non-aggression Pact period to improve war stocks and develop military industries, he ultimately resisted fully mobilizing the Red Army for fear that doing so would provoke Hitler. These factors, plus the self-inflicted decapitation of the Soviet armed forces in the 1937 purges that liquidated 40 to 50 percent of the senior officer corps, left the Red Army unable to prevent the Wehrmacht from achieving tremendous initial victories.

Hitler had ordered that preparations for the invasion of the Soviet Union be complete by May 15, but the assault did not actually occur until June 22, almost the very day that Napoleon Bonaparte had begun his invasion of Russia in 1812. Heavy spring rains in eastern Europe were the most important factor in the delay, as the panzers needed dry, hard

success, however, they had failed to achieve the quick victory that Hitler had sought and instead found themselves bogged down in a long campaign of attrition.

BARBAROSSA may have failed because rainy weather and the need to assemble the resources involved delayed its start by more than a month. Further, the Germans were unprepared for the harsh Russian winter. There are other reasons as well: the Soviet landmass was considerable; the Soviets were able to relocate industry to the east; Soviet resources were vastly superior to those of the Germans in terms of sheer numbers of soldiers, tanks, and aircraft; and German racial policies toward the Soviet population were utterly self-defeating. Repeated poor strategic and operational decisions by Hitler and his generals, massive matériel support from Stalin's Western allies in the form of Lend-Lease assistance, and Soviet pluck and adaptiveness eventually canceled the remarkable early German gains. Despite these advantages, it would take the Red Army nearly three years to liberate what the German armed forces conquered in six months of 1941.

In retrospect, attacking the Soviet Union while Great Britain was undefeated appears to have been a major mistake. There were alternatives. One was to keep up the pressure on Britain via U-boat and

aircraft attacks in an attempt to starve that nation into submission. Another was to make a major effort in the Mediterranean Theater. Both Reichsmarschall (Reich Marshal) Hermann Göring, commander of the German air force, and Grand Admiral Erich Raeder, commander of the German navy, argued for a Mediterranean strategy. They presented plans to Hitler for a series of operations to bring Spain into the war on the German side; seize Gibraltar and Malta; and then conquer Egypt, take the Suez Canal, and capture the Middle East oil fields. Thereafter, the Soviet Union could be invaded from the Middle East, if necessary.

Hitler rejected this course of action. Aside from the "nuisance" air attacks of the Blitz and the U-boat campaign in the Battle of the Atlantic, he never maintained the pressure on Britain. He did bolster the Axis effort in North Africa in the creation of the Afrika Korps (Africa Corps), but there, too, he never made a major effort. Even a few additional divisions for General Erwin Rommel might have given the Axis control of the Suez Canal. But instead, Hitler merely found a new way in which to deplete his strength and especially his limited air transport. His concentration on the Soviet Union was based largely on ideological rather than sound

strategic reasoning. Ultimately, although Operation BARBAROSSA seriously crippled the Soviet Union, the campaign ended in the defeat of Germany.

ground for an advance across a country with few roads. Also, it took more time than anticipated to assemble the invasion force of more than 3 million men, the largest in history. Motor transport had to be allocated, and the Luftwaffe was also slow to build forward airfields. Moreover, units taking part in the campaign in the Balkans had to be relocated and refitted.

Despite all the German preparations, there was a great disparity in military hardware. The Luftwaffe, still waging operations against Britain and also supporting the Afrika Korps (Africa Corps) in North Africa, was forced to keep 1,150 combat aircraft in these theaters. Thus, only 2,770 combat aircraft were available against the Soviet Union. Arrayed against them were 18,570 Soviet aircraft, 8,154 of which were initially in the west and the bulk of them tactical aircraft of sturdy basic designs, including the excellent Ilyushin Il-2 Shturmovik ground-attack aircraft.

Germany deployed some 6,000 tanks, the Soviets 23,140 (10,394 in the west)—and even in 1941, the Soviets possessed some of the best tanks of the war. Their BT-series and

T-26 were superior in armor, firepower, and maneuverability to the German light PzKpfw I and II and could destroy any German tank. Similarly, the Soviet T-34 medium tank and KV-1 heavy tank were superior to the PzKpfw III and IV and indeed any German tank in June 1941.

The German attack began at 3:00 A.M. on 22 June 1941, the longest day of the year, with only two hours of total darkness. Soviet forces were taken completely by surprise. German panzer and mechanized divisions easily broke through the defenses and were deep into Soviet territory by nightfall. Striking Soviet air forces within range, the Luftwaffe, in one day's operation for all practical purposes, gained air supremacy over the operational area. Army Group North took Kaunas in one day and reached the Dvina River after four days, then rolled into Riga on 29 June. Not until they reached new Soviet defensive positions south of Pskov on 8 July did the Germans encounter stiff resistance.

The progress of Army Group South was slowed by numerous natural obstacles, which allowed Soviet forces to withdraw

Soviet tanks roll towards the battle front on 22 June 1941 the first day of Operation BARBAROSSA. (Hulton-Deutsch Collection/Corbis)

in a more orderly manner and even to counterattack occasionally. The southern army group advanced along three lines: the Lublin-Kovel-Lutsk-Zhitomir-Kiev line; the Przemysl-L'viv (Lvov)-Vinnitsia-Dnieper River line; and a third line from Romania to Odessa and Dnepropetrovsk. Soviet forces avoided German encirclement attempts in this southern zone until Uman, where, in early August, over 100,000 men were encircled and surrendered, along with 300 tanks and 800 pieces of heavy artillery.

The most spectacular results were achieved by Army Group Center. It reached the Dnieper River by 6 July, where it encountered increased Soviet resistance. Before arriving there, however, one column took Vilnius on 24 June and then headed for Minsk, where it joined the second column that had come from Brest-Litovsk. On 27 June, the two columns met to surround a large number of Soviet troops around Grodno and Bialystok, provoking the surrender of 320,000 men, 3,000 tanks, and 2,000 pieces of heavy artillery. Even with stiffening resistance, Soviet forces could not prevent the Germans from crossing the Dnieper on 9 July and seizing Smolensk on 16 July, where they captured another 300,000 prisoners.

Phase one of BARBAROSSA seemed a success. Despite increased resistance, Wehrmacht forces appeared to have

open roads to Leningrad, Moscow, and Kiev after capturing nearly a million Soviet troops and killing countless others. Phase two of the German plan, however, proved more difficult to achieve for several reasons. Soviet defenses were stiffening because the initial shock of invasion had worn off and an additional 5 million men in reserve forces had been mobilized and thrown into the breach. In addition, Hitler and his generals had been debating the best course of action for phase two, and the objectives continued to change. The generals believed the army should concentrate on securing Moscow because it was the Soviet capital and a vital communication and industrial center. It offered, they believed, the best chance to destroy the Soviet armies. Hitler, however, at first thought the priority should be the seizure of Leningrad and a linkup with the Finns; then, the Germans and Finns together should clear the Baltic and open a sea line of communications. But by mid-August, Hitler had changed his mind and directed the main effort to focus on the Ukraine and Caucasus in order to gain the resources of those regions, relegating both Leningrad and Moscow to secondary priority. He even directed the other two army groups to yield forces to reinforce Army Group South.

Phase two finally began with an assault on Kiev, which fell to the Germans on 19 September and netted 650,000

additional prisoners. Then, fall rain and mud slowed the German advance in the south. Movement toward Leningrad also slowed, partly because of increased Soviet resistance but also because Hitler conceived a new plan. This plan, known as Operation *TAIFUN* (Typhoon), called for Leningrad to be encircled, put under siege, and starved into submission; the Crimea, the Donbass, and the Caucasus were to be taken for the coal and oil resources that would be gained for Germany's use.

The new plan accorded the highest priority to the encirclement and capture of Moscow. Previously transferred panzer forces were now to revert to Army Group Center, and operations were to commence on 30 September. In the drive on Moscow, the Germans took Orel on 3 October, and 17 days later, around Vyazma and Bryansk, they captured 665,000 Soviet prisoners. But again, fall rains and mud, increasing Soviet resistance as the Germans neared the capital, and an early drop in temperature to well below zero ground the German advance to a halt.

Some success was had elsewhere. Leningrad was nearly surrounded, and the Crimea was taken along with Odessa, Karkov, and Rostov-on-Don, but these achievements were short-lived when, along the entire front, the Soviets opened their first major counteroffensive in early December 1941.

Because the strategic objective did not change, it can be argued that Operation *BARBAROSSA* continued for the entire period of Germany's strategic advance, from the surprise attack on 22 June 1941 until the assault that stalled before Moscow in November. However, the commencement of Operation *TAIFUN*, with its change of operational focus and main objectives, technically ended Operation *BARBAROSSA*.

Barents Sea, Battle of

See Convoy PQ 17.

Barkhorn, Gerhard (1919–1983)

German air force officer and fighter pilot, the second-highest-scoring ace of World War II, with 301 victories. Born in Königsberg, East Prussia, on 20 March 1919, Gerhard Barkhorn joined the Luftwaffe in March 1938. On completion of his pilot training, he was posted to Staffel 3 (squadron), Jagdgeschwader (fighter wing) 2 (3.JG-2) in October 1939. In August 1940, he was transferred to JG-52 for the Battle of Britain. Barkhorn did not score his first victory until his one hundred and twentieth mission, on 1 July 1941. Within a year, his total stood at 60, and he was awarded the Knight's Cross and, six months later, in January 1943, the Oakleaves. On 23 January 1944, Barkhorn became the first Luftwaffe fighter pilot to have flown 1,000 combat missions and the second to reach 250 victories. For the latter feat, he was awarded the Swords to his Knight's Cross.

During his career, Barkhorn entered combat over 1,100 times. He was shot down nine times, bailed out once, and was wounded twice. On 31 May 1944, with 273 victories, he was well on his way to becoming the leading ace in the Luftwaffe when he was severely wounded in a dogfight. The four months he spent in the hospital allowed another JG-52 ace, Erich Hartmann, to surpass his record. Barkhorn scored his three hundred and first—and final—victory on 5 January 1945.

Barkhorn ended his wartime career as a major flying the Me-262 jet in JV-44, Major General Adolf Galland's "Squadron of Experts." Injuries from a crash landing took Barkhorn out of combat permanently on 21 April 1945. At the end of the war, he surrendered to the Americans and was held prisoner until September 1945.

Barkhorn's postwar career included service in the Federal Republic of Germany's air force from 1956 until his retirement as a major general in 1976. On 6 January 1983, he and his wife, Christl, were involved in a serious automobile accident near Köln (Cologne). Christl died at the scene, and Barkhorn died in the hospital in Köln on 8 January 1983.

Bastico, Ettore (1876–1972)

Italian army field marshal who was appointed governor of Libya in 1941. Born in Bologna on 9 April 1876, Ettore Bastico joined the army in 1896 and served in the elite Bersaglieri (light infantry). In 1912, he was posted to Libya, where he took part in pacification operations. Promoted to colonel during World War I and general in 1927, Bastico commanded a division and then a corps during the invasion of Ethiopia. A close friend of Italian dictator Benito Mussolini, Bastico was dispatched to Spain in April 1937 to head the Italian expeditionary force supporting the Nationalist side in the Spanish Civil War. Although he scored one of the few Italian victories at Santander in August, he was relieved of his post in October because of conflicts with the Nationalist leader General Francisco Franco. Nevertheless, in 1938, he received command of Second Army, stationed on the border with Yugoslavia, and in December 1940, he was appointed governor of the Dodecanese Islands.

In July 1941, Bastico became governor of Libya. Although he was, in theory, the superior of the Afrika Korps (Africa Corps) commander Erwin Rommel, he and Rommel immediately developed a contentious relationship over issues involving the command and control of the Axis forces in North Africa. Rommel's repeated rebuffs of Bastico's attempts to rein him in, as well as his increasingly ill disguised contempt for the Italian army, led to a series of heated exchanges between the two, with Rommel referring to Bastico as "Bombastico." Nevertheless, the Axis forces were able to cooperate sufficiently to force the surrender of Tobruk in June 1942. As a result, both Rommel and Bastico were promoted to field marshal.

After the surrender of Tobruk in June 1942, Rommel as usual disregarded Bastico's cautious directives and invaded Egypt. Consequently, the Axis forces became overstretched, thus setting the stage for the decisive British counteroffensive at El Alamein in October 1942. In the wake of the Axis defeat, Bastico was relieved of command in February 1943.

Ettore Bastico retired from the army in 1947. He also wrote a three-volume study of the evolution of warfare. He died in Rome on 2 December 1972.

Bastogne, Battle for (19 December 1944–9 January 1945)

Key battle within the German Ardennes Offensive (Battle of the Bulge). Bastogne, Belgium, was an important communications hub; seven main roads, a railroad line, and several minor roads met there. Bastogne and the Ardennes area had been liberated by elements of the U.S. First Army in September 1944. By December, following failed Allied attempts to invade Germany, lines in the west had solidified along the German West Wall (Siegfried Line). As the Allies prepared their next move, Adolf Hitler put in motion a counteroffensive in the Ardennes with the goal of destroying Allied units and recapturing the port of Antwerp. At the very least, Hitler expected to buy time to deal with the Soviets. German success in what was known as Operation WATCH ON THE RHINE depended on total surprise and a rapid capture of Bastogne and the Allied fuel depots and communications routes between it and Saint Vith.

The German offensive, which opened early on 16 December, caught the Americans completely by surprise. General Heinrich von Lüttwitz's XLVII Panzer Corps, the spearhead of the southern German thrust, made for Bastogne, some 20 miles from the German line of attack. The Germans expected to occupy it no later than 18 December, but the poor state of the roads and misinformation provided by Belgians delayed their arrival. Meanwhile, Supreme Allied Commander General Dwight D. Eisenhower correctly concluded that this was a major German offensive rather than a spoiling attack and ordered up reinforcements, including the 101st Airborne Division. Traveling in cattle trucks, the 101st arrived at Bastogne near midnight on the 18 December. The first American units to reach the city, however, were elements of the 10th Armored Division, which had arrived there a few hours earlier.

Major General Fritz Bayerlein's Panzer Lehr Division reached Bastogne just after midnight on 19 December. It attacked immediately, as Bayerlein was aware from radio intercepts that the 101st Airborne was on the way. The Americans beat back the German attack but were under constant German pressure from that point and were completely encircled in a 6-mile-diameter pocket by the evening of 21 December. The Germans now brought up supplies and reinforcements.

On 22 December, four German soldiers, one carrying a white flag, walked toward an American outpost near Bastogne. They carried an ultimatum addressed to "the U.S.A.

Infantrymen attached to the 4th Armored Division fire at German troops during the American advance to relieve the pressure on surrounded airborne troops in Bastogne, Belgium. 27 December 1944. (National Archives)

commander of the encircled city of Bastogne.” The message urged Brigadier General Anthony McAuliffe, in command of the division in the absence of Major General Maxwell D. Taylor, to save his troops with an “honorable surrender.” McAuliffe’s response to the Germans was memorable: “To the German Commander: Nuts. The American commander.”

Even though the Germans pressed their offensive all around Bastogne, they failed to take the city. The Allied forces did not break, and Lieutenant General George S. Patton’s Third Army was rushing to relieve Bastogne from the south. Patton told an unbelieving Eisenhower that he could wheel his army 90 degrees and strike north into the bulge with three divisions in only two days. He accomplished this feat in one of most memorable mass maneuvers of that or any war.

On 23 December, the weather cleared, freezing the ground and making it passable for armor. Allied planes filled the skies, and transports dropped resupplies to the defenders of

Bastogne, then down to only 10 rounds per gun. On Christmas Day, 2nd Armored Division gunners had a “turkey shoot” near the Meuse, destroying 82 German tanks. On 26 December, Lieutenant Colonel Creighton Abrams’s 37th Tank Battalion of the 4th Armored Division broke through the German lines, lifting the siege of Bastogne.

The battle now expanded as both sides poured in reinforcements. Fifth Panzer Army made Bastogne its principal effort, as the planned German drive on Antwerp turned into a struggle for Bastogne. Meanwhile, the Americans brought up significant amounts of artillery and armor. Allied aircraft also attacked the German armor without letup, destroying large numbers of tanks. The last major German attack on the city occurred on 4 January. Other smaller attacks took place until 8 January, with the battle ending the next day. The fight for the city had claimed about 2,700 American and 3,000 German casualties; Bastogne itself lost 782 Belgian civilians.

Bataan, Battle of (1942)

Key battle of the failed American defense of the Philippine Islands between 1941 and 1942. Bataan is a peninsula on the big island of Luzon; it is some 25 miles long and roughly 20 miles wide and extends south into Manila Bay. The peninsula figured prominently in General Douglas MacArthur's plans for defending the Philippines against a Japanese invasion. The original plan called for U.S. and Philippine forces to withdraw into the Bataan Peninsula and there fight an extended defensive battle until reinforcements arrived from the United States.

MacArthur changed this plan prior to the U.S. entry into the war following the 7 December 1941 attack on Pearl Harbor. He believed that, even with his mobilizing Philippine army and promised reinforcements from the United States, he could defend the entire Philippine Islands against a Japanese invasion. But when elements of Lieutenant General Homma Masaharu's Fourteenth Army landed at Lingayen Gulf on 22 December, it became apparent that MacArthur's new plan would not work. Japanese forces quickly broke through MacArthur's lines north and south of Manila, forcing him to fall back on the original plan but not in orderly fashion. Vast quantities of supplies were lost in the process. By the end of December, more than 67,500 Filipino and 12,500 U.S. troops, as well as 26,000 civilians, were in the Bataan Peninsula. The shortage of supplies put everyone on half rations. Malnutrition, dysentery, and malaria were soon commonplace, with many soldiers unable to fight.

Still, U.S. and Filipino troops put up a stout defense. They lost their main line of defense in late January 1942, but at their secondary line, they stopped Homma's forces by mid-February. The defenders bravely fought on, halting two

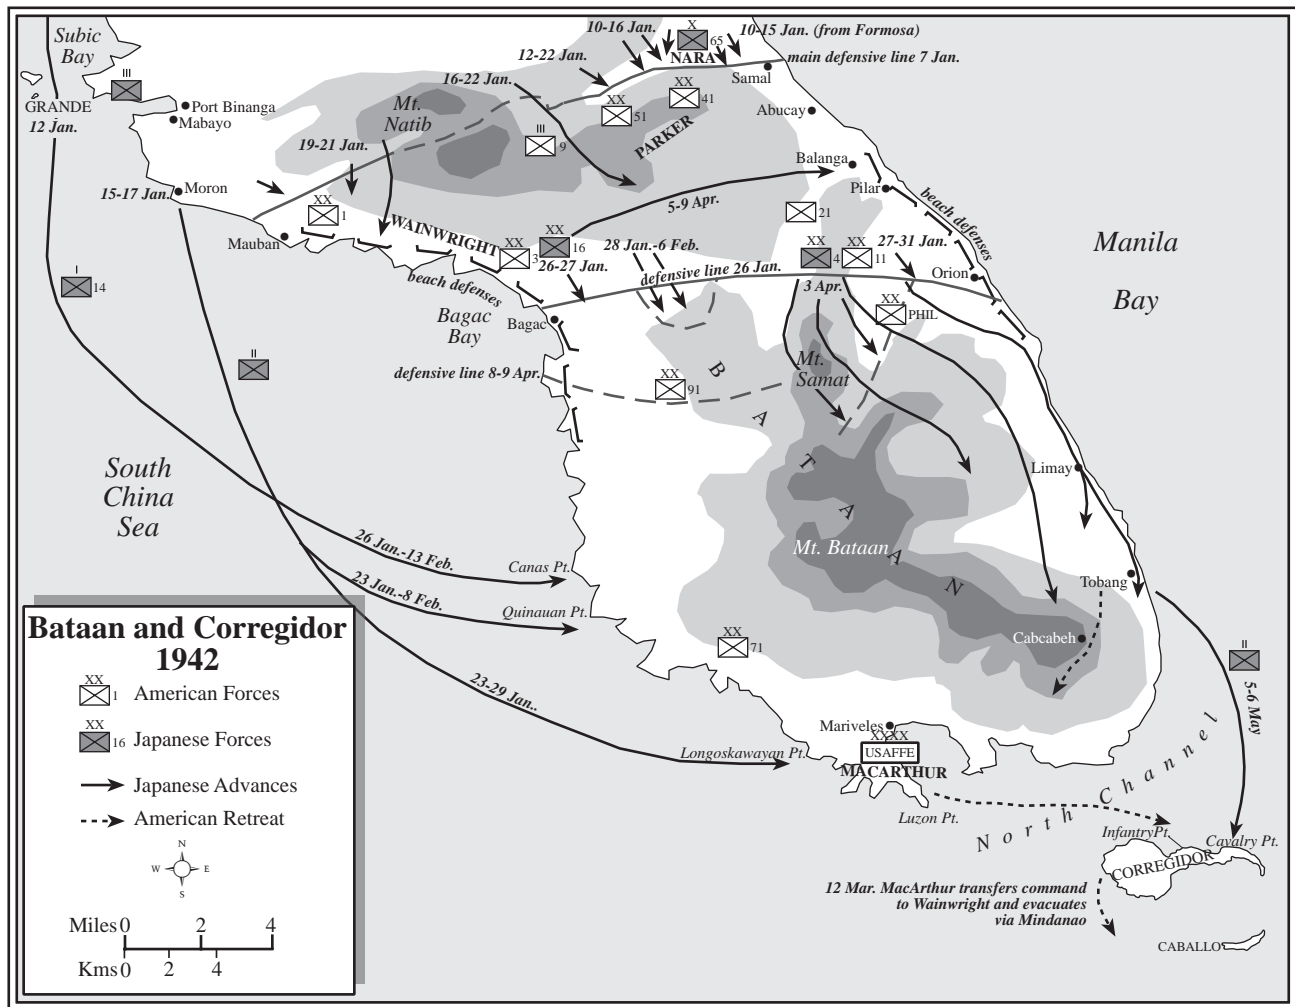

Newspapers of 9 April 1942 displayed at a newsstand at a corner drugstore in a Japanese-American neighborhood in Hayward, California. (Library of Congress)

battalion-sized Japanese landings in late January and early February.

Meanwhile, most of Homma's best troops were diverted to the Netherlands East Indies; with more than 2,700 dead, 4,000 wounded, and 13,000 sick, Homma was temporarily unable to mount additional attacks. MacArthur used this pause to shore up his defensive positions, but the realization that no relief force was coming from the United States caused bitter disappointment. The Americans and Filipinos called themselves the "Battling Bastards of Bataan." And in the wake of U.S. defeats at Pearl Harbor, Guam, and Wake Island, as well as the British defeat at Singapore, the resistance that was mounted in Bataan boosted morale on the American home front.

President Franklin D. Roosevelt ordered MacArthur to leave the Philippines on 11 March, and command of U.S.-Filipino forces fell to Major General Jonathan Wainwright. He inherited a hopeless cause. Homma received reinforcements, and his troops finally broke through the American-Filipino lines on 3 April. MacArthur ordered Wainwright not to surrender, but the U.S. ground forces commander, Major General Edward P. King Jr., realizing that the cause was hopeless, decided to end the fight and capitulated on 9 April.

More than 20,000 Americans and Filipinos perished in the campaign, and roughly 2,000 escaped to the nearby island of Corregidor and fought on until they in turn were forced to surrender on 5 May. The 76,000 prisoners of war of the battle for Bataan—some 64,000 Filipino soldiers and 12,000 Americans—then were forced to endure what came to be known as the Bataan Death March as they were moved into captivity. They had succeeded, however, in delaying the Japanese conquest of the Philippines for 148 days and briefly

inspiring the Allied cause during the dark early days of U.S. participation in World War II.

the Philippines. On 3 April 1942, Japanese General Homma Masaharu launched a new offensive against the Bataan defenders. The U.S. Far Eastern commander, General Douglas MacArthur, had ordered the troops to continue to fight, but six days later, with his men worn down by the strain of constant combat, disease, and starvation, Major General Edward P. King, commander of the forces on Bataan, ordered them to surrender. The troops had been on half rations since January.

Homma had decided that he would hold the prisoners at Camp O'Donnell, 100 miles away. The Japanese forced the prisoners to march 52 miles from Mariveles to San Fernando, Pampanga, in order to be transported by rail to Capas, Tarlac. They would then walk another 8 miles to Camp O'Donnell. King expressed concern about his men being able to make this trip and asked that trucks transport them to their final location. Homma rejected the request.

The trek began on 10 April 1942 and lasted for over a week. The march is remembered for its sheer brutality, but before it even began, each prisoner was searched, and anyone found to possess a Japanese souvenir was executed on the spot.

Bataan Death March (April 1942)

Forced march of 12,000 U.S. soldiers and 64,000 Filipino troops after the Japanese captured the Bataan Peninsula in

The start of the Bataan Death March. (1945, from a Japanese photograph taken in 1942, Library of Congress)

Allied soldiers were, for the most part, denied food and water by their guards until the completion of their journey. The only food that some received was a bit of rancid rice. The prisoners of war were given only a few hours of rest each night in crowded conditions. One of the worst forms of punishment inflicted on the captives was known as the sun treatment, in which the prisoner, denied any water, was forced to sit in the scalding Philippine sun without the protection of a helmet. Prisoners were beaten, kicked, and killed for falling behind or violating the smallest rule.

Between 7,000 and 10,000 of the prisoners died before reaching Camp O'Donnell. The Japanese had failed to take into consideration both the poor health of their captives and their numbers. Although a few of the prisoners escaped into the jungle, most were physically unable even to make the attempt. A number were murdered at random by their guards.

Many who survived the march died in the overcrowded, suffocating boxcars on the rail trip to Capas. In the two

months after reaching the camp, 1,600 Americans and 16,000 Filipinos died of starvation, disease, and maltreatment. The cruelty of the march became well known, and U.S. commanders used the story of the Bataan Death March to motivate their troops in subsequent fighting against the Japanese.

Battle Cruisers (All Powers)

Large armored cruisers that incorporated the speed and generally the armor of a cruiser but with the armament of a battleship. The original concept for this vessel was the work of the Italian naval constructor Colonel Vittorio Cuniberti in the early twentieth century. The first power to fully endorse Cuniberti's ideas was Great Britain, through the work of First Sea Lord Admiral Sir John Fisher, who viewed the vessel as one capable of performing the duties of cruisers and battleships. Germany and Japan built these vessels in tandem with the British in the years before and during World War I (the United States began six as a result of the 1916 naval building program but finished none). Each country pursued its own designs, the Germans placing more emphasis on armor than their British rivals. In the 1916 Battle of Jutland, poor armor protection contributed to the destruction of three British battle cruisers, whereas the Germans lost only one. The Washington Naval Treaty of 1922 discontinued construction of battle cruisers, and many of the surviving units were scrapped.

By the outbreak of World War II, two nations retained some of their World War I-era battle cruisers. The British maintained the two ships of the *Renown*-class. As built, the *Renown* and *Repulse* measured 794' (oa) \times 90' and displaced 30,835 tons at full load. They were protected by an armor belt with a maximum thickness of 6 inches. They mounted a primary armament of 6 \times 15-inch guns as well as 17 \times 4-inch guns (following a major refit, the *Renown* substituted 20 \times 4.5-inch guns for her 4-inchers). Their engines produced a maximum speed of 30 knots. The British also operated the battle cruiser *Hood*, completed in 1920 to a World War I design, which displaced 45,200 tons fully loaded on a hull that measured 860' (oa) \times 104' and was protected by armor with a maximum thickness of 12 inches. She was armed with 8 \times 15-inch guns and 12 \times 5.5-inch weapons. Her engines could produce a speed of 31 knots. The Japanese also retained their battle cruisers from World War I. These were the four ships of the *Kongo*-class. They measured 704' (oa) \times 92' and originally displaced 32,200 tons fully loaded. The ships were rebuilt between the wars to be both faster and better protected. Belt armor with a maximum thickness of 8 inches protected their hulls. They were armed with 8 \times 14-inch guns and 14 \times 6-inch weapons and could travel at a maximum speed of 27.5 knots. After reconstruction between 1927 and 1931, these four vessels were reclassified as battleships.

France built two battle cruisers in the interwar period—the two ships of the *Dunkerque*-class completed in 1937 and

1938. The *Dunkerque* and *Strasbourg* displaced 35,500 tons fully loaded, measured 703'9" (oa) \times 102', and were protected by belt armor of a maximum thickness of 9.75 inches. They were armed with 8 \times 13-inch and 16 \times 5.1-inch guns. Their maximum speed was 29.5 knots.

Finally, the United States ordered six battle cruisers, of the *Alaska*-class, during World War II but constructed only two. Completed in 1944, the *Alaska* and *Guam* displaced 34,253 tons fully loaded on hulls that measured 808'6" (oa) \times 91'1" and were protected by armor 9 inches in thickness. Their armament comprised 9 \times 12-inch guns and 12 \times 5-inch guns. These ships could steam at a maximum speed of 33 knots.

In World War II, battle cruisers were employed in a variety of duties that included surface action, shore bombardment, antiaircraft fire support to protect aircraft carriers, and occasional service as convoy escorts, in the case of the Allies in the Battle of the Atlantic. The majority of these ships were lost in the war. Surface action claimed the British battle cruiser *Hood* when design deficiencies in its armor resulted in a magazine explosion while the vessel was engaged with the German battleship *Bismarck*. The British vessel *Repulse* succumbed to Japanese air attacks off Malaya. All four of the Japanese battle cruisers were sunk by air, surface, or submarine attacks. Finally, both the French battle cruisers were scuttled to prevent their capture by the Germans.

Only the U.S. *Alaska*-class ships and the British *Renown* survived the war, but these ships were scrapped after the conflict—the *Renown* in 1948 and the *Alaska* and *Guam* in 1961.

Battleships

Large, complex war vessels that have the primary mission of establishing control of the seas. Battleships were the toughest warships built. Despite yielding pride of place to the

U.S. Navy battleship *West Virginia*, February 1939. She was commissioned in 1921 and was among the most modern of the U.S. pre-World War II battleships. The *West Virginia* was struck by seven torpedoes in the Japanese attack on Pearl Harbor, but was repaired. (National Archives)

aircraft carrier as the principal sea-control and power-projection warship, battleships remained useful throughout World War II in carrying out a wide array of tasks.

The major naval powers continued to build battleships into World War II. The construction of these capital ships was only arrested under the pressure to construct submarines, antisubmarine warships, landing craft, and aircraft carriers. Italy and Germany launched new battleships as late as 1939 and 1940. Germany's *Bismarck* and *Tirpitz* were 41,700 tons, mounted 8 × 15-inch guns, and were capable of making a speed of 29 knots. Italy's *Vittorio Veneto*, *Italia*, *Roma*, and *Impero* (the latter never finished) displaced 40,700 tons, mounted 9 × 15-inch guns, and were capable of 30 knots.

The vulnerability of the battleship to aerial attack was finally demonstrated on 11 November 1940, when three Italian battleships were sunk at anchor in Taranto harbor by elderly British Swordfish torped-bombers from the carrier *Illustrious*. It took only four days, 7 to 10 December 1941, for the Japanese navy to emphasize that the battleship was no longer the capital ship of the world's navies. Building on the Taranto example, Japanese naval airpower practically destroyed the U.S. Navy's Pacific battleship fleet at Pearl Har-

bor on 7 December 1941. Even after that carnage, there were still those who argued that a well-handled battleship, under way and with good antiaircraft protection, could beat off an aerial assault. They were proven incorrect on 10 December, when the new Royal Navy battleship *Prince of Wales* (36,700 tons, 10 × 14-inch guns, 29 knots) and the elderly battle cruiser *Repulse* (17,300 tons, 6 × 15-inch guns, and 32 knots), under way and defended by an array of antiaircraft guns, were sunk in short order by Japanese naval warplanes.

Yet those four days in December simply confirmed a trend that was already in effect; by that time, no nation was building any new battleships. In November 1941, the Royal Navy had begun the *Vanguard* (44,500 tons, 8 × 15-inch guns, and 30 knots), but this battleship was not completely new, having been constructed to put to use the 15-inch guns and turrets off-loaded from two cruisers that had been converted to aircraft carriers following World War I. The *Vanguard*, leisurely constructed, was not commissioned until 1946, but the French battleship *Jean Bart*, finished in 1955, was the world's last battleship to be completed.

Nonetheless, battleships were still so valued during World War II that all of the capital ships from World War I and the

immediate interwar era that had escaped the scrapping frenzy of the 1920s were pressed into combat service. For example, the Royal Navy's *Queen Elizabeth*-class ships, all but one of which (the *Queen Elizabeth* [27,500 tons, 8 × 15-inch guns, 23 knots]) had fought at Jutland, saw hard service in this new war. Only the Royal Navy, however, could boast of battleships that had fired their main batteries in battleship-to-battleship clashes in both world wars. Most of the later World War I-era battleships that survived into World War II had been extensively modernized in the 1930s to protect them against air and submarine attacks, and in all cases, they were converted to oil-fired propulsion. Although the main armament remained remarkably constant, virtually all World War I-era battleships were extensively rebuilt to afford much greater elevations for the main batteries. In terms of both dollars and time, the cost entailed in rebuilding these vessels usually exceeded the original cost of construction.

Construction of the battleships that served in World War II had, with the exception of the *Vanguard*, been started before their nations had opened hostilities. (The last two units of the U.S. ultimate *Iowa*-class were indeed started six months after Pearl Harbor, but the *Illinois* and *Kentucky* [48,000 tons, 9 × 16-inch guns, and design speed of 32.5 knots] were never completed.)

Battleship duties in World War II were not all that different from those in World War I: convoy escort and battleship-to-battleship clashes, although shore bombardment received far greater emphasis. As in World War I, there was only one battleship-to-battleship fleet action and but few battleship-to-battleship clashes. Among the latter category, the Royal Navy battle cruiser *Hood* (42,700 tons, 8 × 15-inch guns, 31 knots) and battleships *Barham* (same statistics as the *Queen Elizabeth*) and *Resolution* (28,000 tons, 8 × 15-inch guns, 24 knots) attacked the stationary French *Bretagne* and *Provence* (both 22,200 tons, 10 × 13.4-inch guns, 20 knots), and *Dunkerque* and *Strasbourg* (both 26,500 tons, 8 × 13-inch guns, and 29.5 knots) at Mers-el-Kébir (Oran, Algeria) on 8 July 1940. Their 15-inch shells nearly sank the *Dunkerque* but caused only slight damage to the *Strasbourg*. The *Resolution* also engaged in a gunnery duel with the 95 percent completed *Richelieu* but to no significant effect. The *Prince of Wales*, *King George V* (same as the *Prince of Wales*), and *Rodney* (33,300 tons, 9 × 16-inch guns, 23 knots) participated in the sinking of the powerful German battleship *Bismarck* in 1941; in November 1942, the U.S. Navy's *Washington* (37,500 tons, 9 × 16-inch guns, 28 knots) sank the Japanese battleship/battle cruiser *Kirishima* (27,500 tons, 8 × 14-inch guns, 27.5 knots). The *South Dakota* suffered some moderate damage in the same action. Also in November 1942, the *Massachusetts* (38,000 tons, 9 × 16-inch guns, 27.5 knots) hit the uncompleted and anchored French *Jean Bart* (38,500 tons, 8 × 15-inch guns, 32 knots) with five 16-inch shells at Casablanca, and in December 1943, the Royal

Navy's new *Duke of York* (same characteristics as the *Prince of Wales*) sank the German *Scharnhorst* (31,900 tons, 9 × 11-inch guns, 32 knots) off North Cape, Norway.

The only battleship fleet action of World War II took place on 25 October 1944, at Surigao Strait, near Leyte, Philippines, when the elderly U.S. battleships *West Virginia* (31,800 tons, 8 × 16-inch guns, 21 knots), *California*, *Mississippi*, *Tennessee*, and *Pennsylvania* (all 32,000–32,300 tons, 12 × 14-inch guns, 21 knots), and *Maryland* (31,500 tons, 8 × 16-inch guns, 21 knots), with seven U.S. and one Australian cruisers and a destroyer flotilla, sank the elderly Japanese battleships *Fuso* (30,600 tons, 12 × 14-inch guns, 22.5 knots) by destroyer torpedoes and *Yamashiro* by gunfire and destroyer torpedoes. The *West Virginia* inflicted the most damage, with her 16-inch guns directed by the Mk 8 gunfire control radar.

Surprisingly, the Japanese navy, the killer of battleships, was also the most battleship-minded of any navy engaged in World War II. Although the Japanese built the largest battleships in history (the *Yamato*-class), both completed units (the *Yamato* and *Musashi* [62,300 tons, 9 × 18.1-inch guns, 27 knots]) were sunk by U.S. naval airpower. Perhaps the most impressive battleships from World War II are those of the U.S. Navy's *Iowa*-class. These magnificent warships have an unmatched battle history, having fought in World War II, Korea, Vietnam (the *New Jersey* only [48,100 tons, 9 × 16-inch guns, 32.5 knots]), and the Gulf War. All four units easily reached 30-plus knots during their reactivation in the 1980s.

Throughout World War II, the battleships performed magnificently in a shore bombardment role. They also served effectively as anti-aircraft platforms for the aircraft carriers and as fast oilers for the destroyers. After the war, U.S. *Iowa*-class battleships rendered excellent service during the Korean, Vietnam, and Gulf Wars. Eight battleships of World War II remain in existence as museum pieces, and all are American: the *Texas* (27,000 tons, 10 × 14-inch guns, 21 knots), which also served in World War I; the *Massachusetts* and *North Carolina* (same characteristics as the *Washington*); the *Alabama* (same as the *Massachusetts*); and the *Iowa*, *New Jersey*, *Missouri*, and *Wisconsin*, with the *Iowa* and *Wisconsin* (the latter the world's last completed extant battleship) also classed as in reserve (ships that can be recalled to duty).

Beck, Ludwig (1880–1944)

German army general who was involved in attempts to overthrow Adolf Hitler. Born in Biebrich, Germany, on 29 June 1880, Ludwig Beck joined the army in 1898 and as a lieutenant attended the Kriegsakademie (War Academy) in Berlin from 1908 to 1911. Promoted to captain in 1913, he qualified as a General Staff officer the same year and served in a variety of staff and command positions during World War I on the Western Front.

Beck continued in the postwar Reichswehr, rising to command of the 1st Cavalry Division. Promoted to Generalmajor (U.S. equiv. brigadier general) in February 1931 and Generalleutnant (U.S. equiv. major general) in December 1932, he was appointed, in October 1933, chief of the Truppenamt (Troop Office), the thinly disguised covert General Staff prohibited to the Germans under the Versailles Treaty. In 1933, Beck was the primary author of *Truppenfuehrung* (Unit Command), which remained the principal war-fighting manual of the German army until 1945. The body of doctrine in that manual profoundly influenced the conduct of combined-arms warfare for the remainder of the twentieth century.

In March 1935, the Truppenamt was redesignated General Staff of the Army, and in May, Beck was promoted to General der Artillery (U.S. equiv. lieutenant general). He presided over the expansion of the revived General Staff and the development of war plans based on a defensive strategy. His peers considered him a master military planner. He clearly understood that any future war would necessarily become a multi-front conflict, which Germany could not win. As late as 1935, however, Beck continued to believe the officer corps of the German army could keep the National Socialists under control. But as Adolf Hitler continued the push to invade Czechoslovakia in 1938, Beck opposed him openly, writing a series of memoranda describing the inherent dangers in the policy of aggression.

He attempted to mobilize other generals to oppose Hitler's policies, but he failed to gain the support of the army commander in chief, General Walther von Brauchitsch. In August 1938, Beck retired from the army and was promoted to Generaloberst (U.S. equiv. full general). He then organized a covert opposition group of active and retired officers and

Generaloberst Ludwig Beck was chief of staff of the German army before the war. He opposed and deeply despised Nazi leader Adolf Hitler. (Hulton Archive by Getty Images)

other conservatives, maintaining contact with other democratic opposition movements. Beck also contacted London in an attempt to secure British and French support for a coup against Hitler. British Prime Minister Neville Chamberlain declined to support such a move. Shortly before the 1940 invasion of the west, Beck's group tried to warn Belgium.

By 1943, Beck had become convinced that the only way to save Germany was to assassinate Hitler. His group tried several times, culminating in Colonel Claus von Stauffenberg's bomb attempt on 20 July 1944. If Stauffenberg had succeeded, the conspirators planned to use the Home Army to establish martial law, seize the radio stations, and arrest the key Nazi and Schutzstaffel (SS) leaders. As the head of the planned interim government pending free elections, however, Beck refused to agree to the systematic summary execution of party and SS leaders to secure success.

When the conspirators learned that Stauffenberg had failed, Beck nonetheless insisted on continuing the putsch, called Operation VALKYRIE, saying that Germany deserved the attempt.

The attempt was unsuccessful. Arrested in the Bendlerstrasse in Berlin, Beck was offered the privilege of shooting himself. When two tries only rendered him unconscious, a sergeant shot Beck in the neck, ending his life on the night of 20–21 July 1944.

Despite being unfairly and inaccurately painted by Heinz Guderian as a rigid and unimaginative opponent of armored warfare, Beck helped rebuild the German military into an efficient war-fighting machine. In his early opposition as a general to Hitler's policy of aggression and in his later active opposition as a private citizen, Ludwig Beck proved that during the Third Reich, true German patriotism was incompatible with Nazism.

Belgium, Air Service

Formed in March 1920 as part of the Belgian army, the Belgian air force had fewer than 250 aircraft in May 1940, including 90 fighters, 12 bombers, and 120 reconnaissance aircraft. Of this total, only 50 were relatively modern. Belgium produced some of its own planes, including the Renard R-31 reconnaissance aircraft, but most of its aircraft were acquired from Britain and the United States.

Belgian air bases lacked space to disperse the aircraft, and 53 planes were destroyed on the ground by the Luftwaffe on the morning of 10 May 1940, at the beginning of the German invasion of Belgium. Two days later, the Belgians had only between 70 and 80 aircraft remaining. These planes, along with many Dutch aircraft, were incorporated into British and French units. In addition to providing ground support for Allied units, Belgian bombers also carried out one bombing mission in which two squadrons of nine Battle bombers were

sent to destroy bridges across the Albert Canal. Although the strike was successful in hitting the targets, the light bombs the planes carried proved ineffective, and six aircraft were lost. This action was the only independent mission carried out by Belgian aircraft during the campaign. Some Belgian air force units participated in the remainder of the campaign for France, in the Battle of Britain, and in the Western Front Campaign of 1944 and 1945.

Belgium, Army

In 1936, Belgium renounced its 1919 treaty of alliance with France and reasserted its traditional neutrality. As a consequence, Belgian forces did not carry out any joint maneuvers with their potential French and British allies before the war.

Belgium mobilized its armed forces beginning on 25 August 1939. With the outbreak of the war, the government immediately reaffirmed the nation's neutrality, retaining the right to strengthen its military to prevent attack. Belgian King Leopold III acted as commander in chief of the armed forces, which consisted of an army of 18 infantry divisions, 2 partly motorized divisions, and 2 motorized cavalry divisions in May 1940. In all, the army numbered some 600,000 men. Although impressive on paper, the army suffered from serious weaknesses. Both its men and officers were poorly trained and equipped. Further, the army had virtually no antiaircraft artillery and only 54 tanks (42 British Carden-Loyd M1934s and 12 French Renault AMC-35s). The navy consisted of only a few small coastal defense vessels.

In hopes of remaining neutral, King Leopold had prevented significant military coordination with the French and British military staffs. Although British and French forces did come to the aid of Belgium when it was invaded by German forces on 10 May 1940, the Germans breached the initial Belgian defensive line along the Albert Canal that same day. King Leopold then withdrew the bulk of his forces to a line east of Brussels. British and French troops reinforced the new line, but the German strike through the Ardennes flanked it. Soon, the Allies were forced to abandon Brussels and the surrounding area.

By 24 May, the Belgian army had regrouped in western Flanders, where it was again supported by both French and British forces. The only major battle of the campaign occurred there, on 24–25 May, with Belgian forces again unable to hold off the superior German forces. On 28 May, King Leopold surrendered his army. In addressing the House of Commons on 4 June concerning the Belgian defeat, British Prime Minister Winston L. S. Churchill said that the surrender was given “suddenly, without prior consultation, with the least possible notice” and that this action had “exposed our whole flank and means of retreat.” Although Leopold’s decision was definitely not the cause of the German victory, it rendered the British military position untenable and led to the evacuation of the British Expeditionary Force at Dunkerque.

In the 18 days of fighting during the campaign, the Belgian army nonetheless fought bravely, with limited resources. Belgian casualties amounted to some 7,500 killed and 15,850 wounded. An additional 2,000 who had been taken as prisoners of war died in German captivity. Some Belgian soldiers and airmen managed to escape to Britain, where they formed the Independent Belgian Brigade and operated under the British for the remainder of the war.

Belgium, Role in the War

At the beginning of World War II in September 1939, Belgium was a constitutional monarchy of some 8.2 million people sharply divided along linguistic lines: the Dutch-speaking Flemish provinces in the north and the French-speaking Walloon area of the south and Flanders. The capital, Brussels, was a Walloon preserve, and French speakers dominated the political, economic, and intellectual life of the nation. In the decades before the war, the Flemish areas were beginning to assert themselves, and a Flemish nationalist party, the Vlammsch National Verbond (VNV) held 17 seats in Parliament.

Belgium followed a neutralist foreign policy. The nation had secured its independence from the Kingdom of the Netherlands in 1830, and its neutrality and territorial

integrity had been guaranteed by an international treaty signed by the major powers in 1839. The German government’s decision to violate that neutrality in August 1914 at the beginning of World War I brought Britain into the war. Occupied by the German army between 1914 and 1918, Belgium had then allied itself with France. With the increase in tensions in Europe, Belgium again sought refuge in neutrality in 1936. King Leopold III and the tripartite government of the Socialist, Catholic, and Liberal Parties renounced the French alliance. The government, however, proclaimed Belgium’s right to maintain a military establishment to protect the nation from attack. This policy of armed neutrality found broad support among the Belgian people.

In September 1939, when World War II began, Belgian Premier Hubert Pierlot, leader of the Catholic Party, reiterated the government’s resolve to remain neutral, and the government deployed the army along both the German and French borders. Belgians knew the true threat was from Germany, and the government reinforced the frontier with Germany following invasion alerts in November 1939 and January 1940. In the latter case, a German military aircraft had landed in Belgium by mistake, and its passenger was found to be carrying the entire German plan to invade the west, including Belgium.

The German invasion of 10 May 1940 thus did not catch the Belgian government by surprise, and some limited military plans had been made with Britain and France to prepare for that eventuality. Nonetheless, the Belgian military was quickly overwhelmed by the German troops. Although there had been some coordination with the French and British, there were no prepared positions for the latter, and the military situation rapidly deteriorated. On 25 May, King Leopold and his chief ministers met in Wynendaele and agreed on the need to end the military campaign in their country as quickly as possible. Leopold decided to remain in Belgium and share the fate of his countrypeople, whereas the ministers insisted that the government go to France, with whatever military forces could be withdrawn, to continue the fight against Germany. Both parties did what they believed to be appropriate.

King Leopold surrendered the Belgian army unconditionally on 28 May, without coordinating this decision with the very allies who had come to the rescue of his country. This decision produced an immediate 30-mile gap between the British Expeditionary Force and the North Sea that rendered the British military position untenable and forced its evacuation from the port of Dunkerque. Having taken this decision, Leopold then repaired to his palace at Laeken outside Brussels, where he remained under self-imposed isolation for the next four years before being removed to Germany in June 1944.

Leopold’s ministers, meanwhile, fled to France, where they held a session of the Belgian Parliament in Limoges on 31 May

and criticized the king's actions. When France itself fell to the German army in late June, the Belgian parliamentary representatives abandoned their effort to support the Allies and sought a rapprochement with the king, which he then rejected. He—and most Belgians, for that matter—believed that the war was, in effect, over and that Germany had won. These parliamentarians then set up a Belgian government-in-exile in London. Belgian soldiers who escaped their country to Britain later formed the Independent Belgian Brigade, which operated under British command. Most of the 100 ships of the Belgian merchant marine evaded capture and, in accordance with a July 1940 agreement, operated under British control.

Following the surrender, German authorities promptly established an occupation government in Belgium. The German enclaves of Eupen, Malmédy, and Saint Vith, assigned to Belgium in the settlement following World War I, were promptly reintegrated into the Reich. A German army administration (Militärverwaltungschef), nominally headed by General Ludwig von Falkenhausen, ruled Belgium. Eggert Reeder, president of the military administration, was the real decision-maker and also oversaw German authorities in Belgium, such as the Schutzstaffel (SS) and the Foreign Ministry. Reeder's priorities included advancing the position of the "Germanic" Flemish population at the expense of the francophone Walloons (in accordance with a July 1940 order from Hitler), ensuring that Belgian industry was harnessed for the war machine of the Reich, and administering Belgium with as little German manpower as possible. On 10 May 1940, the Belgian Parliament had passed a law allowing civil servants to administer the country in the absence of the political leaders, and the senior members of each department, the *secrétaires-généraux* (principal administrative officers), thus became the administrators of Belgium. Reeder worked through these officials in a system of indirect German rule, and although there were conflicts, the *secrétaires-généraux* agreed to maintain law and order and the nation's industrial and agricultural production.

Some Belgian elites were able to use this time of turmoil to enhance their own positions. The Comité Galopin, a small group of influential bankers and industrialists, controlled the economy and ensured that Belgium provided Germany with the essential materials it required while maintaining their own interests. Many Belgians suffered terribly during the German occupation, however. The dislocation of the fighting and German requisitions led to a severe food shortage, and perhaps a fifth of the population was starving by the fall of 1940. King Leopold was able to convince the Germans to scale back their requisitions of food. He was also able to win some exemptions for women, war orphans, and children of war prisoners among those Belgians deported from the country to work in the Reich. Resistance to the Germans, only sporadic at first, grew with the

addition of the Communists after the German invasion of the Soviet Union and as the overall German military situation deteriorated. Relations between these resistance groups and the government-in-exile in London were sometimes strained.

As in other countries occupied by the Germans, some people collaborated actively and were appointed to positions of influence as a result. The Germans also recruited an SS formation under Léon Degrelle for service on the Eastern Front. For most Belgians, however, the occupation produced a sense of solidarity against the occupier as they struggled to secure food, clothing, and shelter and as they lived with the ever present risk of deportation to work in the Reich.

Belgium remained under German occupation until September 1944, when Allied troops arrived and rapidly liberated the country, with the Belgian Parliament returning to Brussels. The sole feat of resistance by arms was the liberation of the port of Antwerp and the prevention of its destruction by the German military, itself an important step. Some German forces remained on islands at the mouth of the Scheldt River until 28 November 1944, from which they were able to prevent the Allies from using the port. On 16 December, on Hitler's orders, German forces launched what became the Battle of the Ardennes (Battle of the Bulge), the goal of which was to take back Antwerp. During the course of the fighting, the Germans reoccupied part of Belgium, but in January 1945, Allied troops were again able to clear all Belgium of German control.

Belgium was fortunate in that the rapid German advance in 1940 and retreat in 1944 had left its cities and countryside relatively unscathed. Antwerp, the least bomb-damaged port in the Channel area, became a major Allied base in the closing campaigns of the war and was the target of a substantial number of German V-2 rockets in early 1945. The Belgian government took reprisals against collaborators, convicting some 53,000 men and women of assisting the enemy.

Shortly after V-E Day, King Leopold and members of the royal family were freed outside Strobl, Austria, by U.S. troops. The king became the center of political turmoil for having surrendered the army and for his refusal to go abroad with his ministers in order to support a government-in-exile. He was also suspected of having both German sympathies and authoritarian preferences. Then, too, he had compounded his unpopularity by his wartime remarriage to a commoner. Leopold's brother, Prince Charles, the count of Flanders, assumed the title of regent. A referendum in March 1950 gave Leopold a 58 percent favorable vote, but his return led to a major crisis, and he relinquished control of affairs to his son, Baudouin, who became king in 1951.

Belgium Campaign (10–28 May 1940)

A key element of the German invasion of western Europe. Belgium had proclaimed its neutrality and sought to avoid involvement in World War II, but to invade and defeat France swiftly, the Germans needed to secure Belgium. When Germany invaded Poland in September 1939, thereby initiating World War II, Belgium declared a state of armed neutrality. Prime Minister Hubert Pierlot resolved to defend the country against all invaders and deployed the army along both the French and the German borders.

Still, Belgians knew the real danger lay to the east, and they had begun mobilizing their armed forces on 25 August 1939. By May 1940, their country fielded an army of more than 600,000 men organized into 22 divisions: 18 infantry divisions, 2 partially motorized Chasseurs Ardennais divisions, and 2 motorized cavalry divisions. Unfortunately for Belgium, this sizable force was hardly equipped to defeat a German invasion. The Belgians possessed few anti-aircraft guns and had only 42 light and 12 medium tanks. Their air service had only 184 operational aircraft. Thus, Belgium had no hope of winning a prolonged land campaign with Germany without outside assistance.

German Colonel General Fedor von Bock's Army Group B operated against Belgium and the Netherlands. The Germans committed Colonel General Walther von Reichenau's Sixth Army, with 17 infantry and 2 tank divisions, to the initial invasion of Belgium. It was to drive southwest. Meanwhile, General of Artillery (Lieutenant General) Georg von Küchler's Eighteenth Army of 11 divisions (9 infantry and 1 each of cavalry and tanks) was expected to subdue the Netherlands quickly and then drive south to join the fighting in Belgium.

Although Belgian intelligence accurately forecast the German attack that occurred on 10 May 1940, no one anticipated the audacious German attack on the fortress of Eben Emael in the first hours of the fighting. Eben Emael was a series of concrete and steel emplacements north of Liège that guarded bridges over the Albert Canal at Briedgen, Veldwezelt, and

German soldiers raise the Nazi flag at the Royal Castle at Lacken after the German invasion of Belgium in 1940. (Hulton-Deutsch Collection/Corbis)

Vroenhoven. Garrisoned by more than 700 men, the fortress was crucial to Belgian defensive plans because the only hope of slowing the German panzers lay in keeping them east of the canal. German army planners took special notice of Eben Emael for that very reason, and at 5:25 A.M. on 10 May 1940, they sent 78 specially trained men of the Koch Assault Detachment in gliders to crash-land on top of the fortress. The attackers employed hollow charges to destroy the key gun turrets and bunkers. At the same time, German paratroopers captured the major bridges. Troops of the 223rd Infantry Division followed close behind and took the rest of the Belgian position the next day. In less than 24 hours, the Germans had breached the key Belgian defensive line on the Albert Canal.

Fighting bravely, the Belgians fell back to the Dyle Line east of Brussels, with King Leopold III in personal command. The British and French had planned to send their own forces into Belgium in the event of a German invasion, but there had been little prior coordination between Britain, France, and neutral Belgium. On 12 May, however, elements of the British Expeditionary Force (BEF) and General Georges Blanchard's

French First Army began joining the Belgian defenders, and by 15 May, the Allies had some 35 divisions in the Namur-Antwerp area.

As Reichenau's Sixth Army probed the Dyle Line, Georg von Küchler's Eighteenth Army turned south from the Netherlands after the surrender of that country to the Germans on 15 May. This move threatened the Allied left flank. At the same time and to the south, the hammer blow of Colonel General (Karl) Gerd von Rundstedt's Army Group A, heavy in tanks, was driving west and then north through the Ardennes Forest. The overall German plan, Operation SICHELSCHNITT (the cut of the sickle), worked to perfection.

On 25 May, King Leopold III met with his ministers at the chateau of Wynendaele to discuss the possibility of surrender. His ministers wanted to flee to Great Britain and continue the war on the Allied side, but Leopold, despite a pledge to the British and French not to surrender unilaterally, believed that the campaign was lost and that he should end the fighting to save bloodshed and then remain to share the fate of his people. Leopold indeed took this step, surrendering the Belgian armed forces on 28 May. This step exposed the left flank of the British-French line and ended any Allied hopes of hold-

ing part of Flanders. British Prime Minister Winston L. S. Churchill then ordered the British navy to evacuate British forces at Dunkerque.

The 18 days of the Belgian Campaign cost the nation some 7,500 troops killed in action and 15,850 wounded. And at least 2,000 Belgian prisoners of war died in German captivity. The country remained under German occupation for the next four years.

Belorussia Offensive (22 June–29 August 1944)

Massive Soviet offensive in Belorussia, code-named *BAGRATION*, commencing exactly three years after the German invasion of the USSR. The Soviet offensive, timed in part to meet Soviet leader Josef Stalin's pledge at the Tehran Conference for an operation to prevent the transfer of German forces to the west to meet the Allied invasion of Normandy, resulted in the most calamitous defeat of German forces in the war.

By the beginning of 1944, the Red Army clearly held the initiative on the Eastern Front. The campaign opened in January with offensives at Leningrad and the Ukraine. The Leningrad offensive broke the German siege and ended with Soviet forces on the Estonian border. The Ukrainian offensive ended after nearly all of the Ukraine had been regained and after a southern salient had been created that nearly reached L'viv (Lvov), with the Red Army threatening the borders of Poland and Czechoslovakia. In the process, these offensives destroyed five German armies, causing well over a million German casualties and untold equipment losses, and put pressure on Finland and Romania, Germany's allies.

Because of these successes, particularly in the Ukraine, German leader Adolf Hitler believed the Soviet summer offensive would continue from the Ukraine. The Soviets needed favorable terrain for mechanized operations, and two options seemed the most advantageous for them. First, they could push west from Ukraine and then south, removing Romania and its resources from German reach. Second and most likely they could push west and then north toward the Baltic to cut off both Army Group Center in the Belorussian "bulge" and Army Group North along the Baltic coast. A direct thrust in the north seemed possible but provided less strategic advantage, and an attack into Belorussia against Army Group Center seemed least likely because of the poor road network and the restrictive terrain in the forests and the Pripet marshes.

The Soviets considered roughly the same options and chose the Belorussian thrust primarily because the others would leave large German forces on the Soviet flanks and because an assault straight into Belorussia would free the Soviet territory that remained occupied. In many respects, Operation *BAGRATION* was the reverse of Operation *BARBAROSSA*, fought over many of the same battlefields.

Arrayed against Field Marshal Ernst Busch's Army Group Center were four Soviet fronts (army group equivalents). From north to south were the 1st Baltic Front and the 3rd, 2nd, and 1st Belorussian Fronts, commanded by Generals Ivan Bagramyan, Ivan Chernyakhovsky, Georgii Zakharov, and Konstantin Rokossovsky, respectively. In addition,

Soviet leader Josef Stalin appointed two veteran commanders as Stavka (Soviet High Command) special representatives—Marshal Georgii Zhukov overseeing the 1st and 2nd Belorussian Fronts and Marshal Aleksandr Vasilevsky coordinating operations of the 1st Baltic and 3rd Belorussian Fronts. The Soviet fronts counted 168 divisions, plus a large Belorussian partisan movement. Army Group Center numbered only 54 divisions.

German intelligence keyed on identifying main thrusts by the location of Soviet tank armies, of which there were six in 1944. However, Soviet air supremacy and their own shortage of assets denied the Germans long-range aerial reconnaissance. German military intelligence was forced to rely on signals intercepts, and Soviet deception focused on disguising heavy reinforcements moving into Belorussia and tank concentrations behind the front lines.

Operation *BAGRATION* began on 22 June with Soviet battalion- and company-sized infantry raids along the front probing for weaknesses while several divisions conducted major attacks to seize openings in the line. Between 23 and 28 June, the Red Army broke through German lines in six places and encircled large German forces at Vitebsk and Bobruisk, taking 20,000 prisoners. On 3 July, the Soviets, striking from two directions, entered Minsk, the Belorussian capital, capturing nearly 100,000 Germans east of the city.

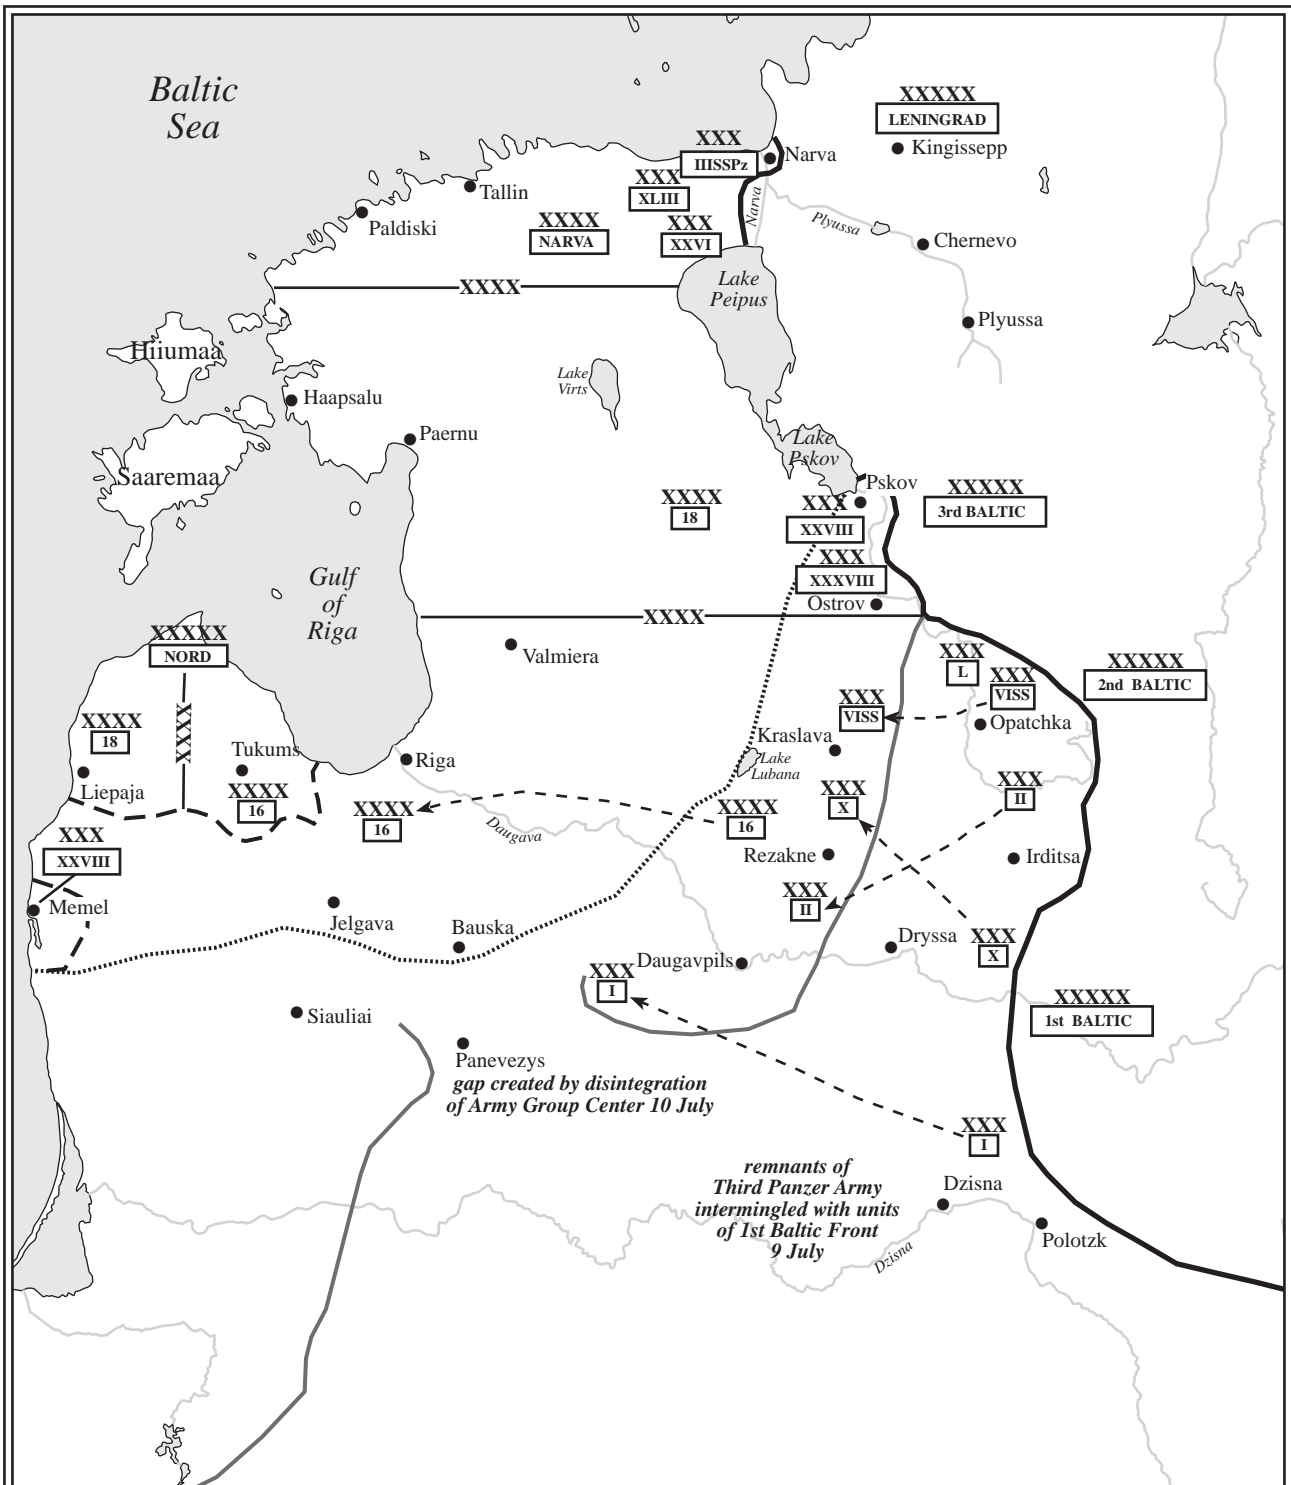

After five weeks, the Red Army had advanced almost 360 miles while destroying Army Group Center. The operation ended inside Poland on the Vistula River. Between 23 June to 29 August 1944, along a more than 600-mile-wide front, the Soviets defeated Army Group Center and advanced from 300 to 360 miles. In the process, the Soviets destroyed 17 German divisions and 3 brigades; 50 German divisions lost over half their strength. The German army High Command's official figure of losses was about 300,000 men, or 44 percent of those engaged, but this number may be low. Soviet losses were also high, with more than 178,000 dead and missing (8 percent of the total force involved) and more than 587,000 sick and wounded.

The advance into Belorussia led to advances in other sectors of the front, the Ukraine, and Estonia and Latvia where Army Group North's link to other German forces was temporarily cut. Operation *BAGRATION* was one of the greatest Soviet victories of the war and one from which German forces could never recover.

Beneš, Eduard (1884–1948)

Czech statesman who helped establish the independent state of Czechoslovakia. Born on 28 May 1884 at Kozlany, Bohemia, Eduard Beneš studied at Charles University in Prague, the Sorbonne in Paris, and the University of Dijon, where he earned a doctorate in law in 1908. In 1909, Beneš was appointed professor of economics at the Prague Academy of Commerce, and in 1912, he became a professor of sociology at the University of Prague. There, he met Tomáš G. Masaryk and came to embrace his social and political philosophies. As one of the leaders of the Czech nationalist movement against Austria, Beneš went abroad during World War I, first to Paris, where he worked as a journalist to promote the cause of Czech independence. That same year, he joined the Czechoslovakian National Council, recognized by the Allies in 1918 as the provisional government of Czechoslovakia.

On his return to Prague at the end of the war, Beneš became the first foreign minister of the new state. From 1918 to 1935, he worked to strengthen the security of Czechoslovakia, the cornerstone of which was a 1924 alliance with France. In addition, he worked to cooperate with Romania and Yugoslavia, with the three states signing collective security arrangements that led to the so-called Little Entente. Beneš was also a tireless advocate of the League of Nations, serving as League Council chairman five times. He secured a mutual security pact with the Soviet Union in 1935.

In December 1935, Beneš succeeded Masaryk on the latter's resignation as president of Czechoslovakia. The one intractable problem he could not solve was that of the minorities in his nation. The Czechs were not even a majority of the population of the state, and there were serious problems with the Ukrainians, the Slovaks, and especially the Germans.

Eduard Beneš, president of Czechoslovakia (1935–1938, 1945–1948).

Adolf Hitler pushed the demands of the latter from relief of grievances into annexation by the Reich of those areas in which Germans were a majority. Beneš and his government went as far as they could without actually ceding territory, but at the September 1938 Munich Conference, the British and French agreed to Hitler's dismemberment of Czechoslovakia. A week later, Beneš resigned and went into exile in France.

Beneš became president of the Czechoslovakian government-in-exile in London in July 1940. He hoped to make his country a bridge between the East and the West, and he signed a 20-year treaty of alliance with the Soviet Union in 1943. He returned to Prague on 16 May 1945, stopping first in Moscow to confer with Josef Stalin.

Beneš was reelected president in 1946, but his hopes of nonalignment ran afoul of the Cold War. The Soviets staged a coup d'état in Prague in February 1948, and Beneš was forced to accept Communist control. Rather than agree to a new constitution that would legalize the Communist seizure of power, he resigned on 7 June 1948. He died in Sezimovo Ústí, Bohemia, on 3 September 1948.

Berlin, Air Battle of (November 1943–March 1944)

Between November 1943 and March 1944, the Royal Air Force (RAF) Bomber Command conducted 16 raids on the German capital in an attempt to defeat Germany by destroying Berlin. This effort was the third in a series of campaigns in 1943, with the first levied against German industrial production in the Ruhr Valley from April to July and the second launched against the city of Hamburg late in July.

The largest city in Germany, Berlin covered nearly 900 square miles. Attacking it not only would strike at the seat of power in the Third Reich but also would cripple a major industrial base for the German armed forces. Factories in Berlin contributed one-third of the Reich's electrical components as well as one-quarter of the army's tanks and half its field artillery.

Bolstered by the success of recent air raids, in particular the attack on Hamburg, Air Chief Marshal Sir Arthur "Bomber" Harris believed he could do the same with Berlin and force a German surrender. If he could get the Americans to join in, he expected losses to be between 400 and 500 aircraft. However, because of its own recent heavy losses over Germany, the U.S. Army Eighth Air Force would not be able to participate. Despite this setback, Harris received approval in early November 1943 from Prime Minister Winston L. S. Churchill to begin the bomber offensive. He employed the RAF's new Avro Lancaster heavy bomber, as this four-engine aircraft had the requisite range to strike targets deep in German territory. The first raid, the largest battle Bomber Command had yet fought, occurred on the night of 18–19 November.

Attacking heavily defended Berlin was not an easy task. The city was ringed with a flak belt 40 miles wide and a searchlight band over 60 miles across. The defense centered on 24 128-mm anti-aircraft guns grouped in eight-gun batteries on flak towers. Additionally, the city's extensive subway system

provided underground shelter for the civilians. Only the Ruhr region was more heavily defended.

The British employed Window—strips of foil dropped from aircraft to jam German radar. To counter this, the Germans organized groups of single-engine fighters to attack the bombers as they were caught in searchlights. The Germans called this new tactic *Wilde Sau* (Wild Boar), and the technique helped them until they could develop effective radar. By early 1944, German night-fighter aircraft—primarily Ju-88s, FW-190s, and Bf-109s—were successfully employing bomber-intercept tactics with the help of SN2, an aircraft-based, air-to-air radar that would cause Bomber Command's losses to approach 9 percent for a single raid. To make matters worse for the British, many bombs did not come close to their desired targets, as chronically poor weather over Berlin forced pathfinders to mark targets blindly, relying exclusively on H2S radar; this problem was exacerbated by the fact that the number of experienced pathfinder radar operators dwindled as casualties mounted during the campaign.

The Battle of Berlin came to an end in March 1944 when the bombers passed under the control of the Supreme Allied Command to prepare for the Normandy Invasion. During the offensive, Bomber Command flew 9,111 sorties to the "Big City" and dropped 31,000 tons of bombs. Bomber Command lost 497 aircraft—5.5 percent of the force employed—and more than 3,500 British aircrew were killed or captured. On the German side, nearly 10,000 civilians were killed, and 27 percent of the built-up area of Berlin was destroyed. Harris's goal of defeating Germany was not, however, realized.

Berlin, Land Battle for (31 March–2 May 1945)

Berlin, capital of the Reich, was vital to the German war effort. Adolf Hitler spent little time there during the war, but the city was the administrative center of the new German empire and powerhouse of the war effort, the greatest industrial and commercial city in Europe. Berlin was also a vital communi-

cations and transportation hub and a key production center, particularly for electrical products and armaments.

In August 1940, after the bombing of London, Bomber Command of the Royal Air Force (RAF) raided Berlin, but the city enjoyed a respite thereafter until March 1943; then there was another pause. The battle for the city began in earnest in November 1943 with the first in a long series of punishing Allied air raids, with particularly severe attacks in March 1944. Somehow, Berliners managed to carry on amid the ruins.

Hitler returned to Berlin from the Alderhorst (Eagle's Nest), his retreat at Ziegenberg, by train on 16 January 1945, and as the war drew to a close, the city became the ultimate prize, at least for the Soviets. Josef Stalin wanted it desperately. So did British Prime Minister Winston L. S. Churchill, but he was overruled by U.S. leaders, who showed little interest in capturing the city, particularly after agreements setting up the postwar occupation placed Berlin deep within the Soviet zone. The supreme commander of Allied forces in the west, General Dwight D. Eisenhower, who was in any case distracted by a phantom Nazi Alpine "National Redoubt," said he had no

interest in the capital. High casualty estimates for taking the city (Lieutenant General Omar Bradley posited a cost of 100,000 men) also deterred Eisenhower. Thus, although U.S. forces, including the 82nd Airborne Division, were readied for such an assault, the task was left to the Soviets.

Stalin concealed the U.S. ambivalence concerning Berlin from his front commanders, Generals Ivan S. Konev and Georgii K. Zhukov. By early February, Zhukov's 1st Belorussian Front and Konev's 1st Ukrainian Front had completed the initial phase of their advance into Germany. Zhukov's troops were across the Oder River, 100 miles from Berlin. The Soviets had surrounded large German troop concentrations at Breslau and Posen. Meanwhile, Soviet forces carried out a horrible revenge on eastern Germany, in which tens of thousands of civilians were murdered. Total casualties ranged into the millions.

Zhukov might then have pushed on to the capital in another several weeks had not Stalin ordered a halt, necessary because of logistical problems resulting from the vast distances the Soviet forces had covered to that point. Mean-

HISTORIOGRAPHICAL CONTROVERSY

Eisenhower and Berlin

In the midst of the Cold War, with Germany divided and memories of wartime cooperation between the Western powers and the Soviet Union nearly forgotten, many historians questioned whether Supreme Allied Commander General Dwight D. Eisenhower had been correct in choosing not to race Soviet forces to capture Berlin in April 1945. The detractors argued that conquest of the city by the Western Allies would have provided a useful bargaining chip with the Soviets and might have kept them out of Central Europe and thereby changed the course of history. According to this view, there might have been no Berlin crisis in 1948, no Berlin Wall erected in 1961, and no divided Germany. Proponents of the idea criticized Eisenhower for naively focusing on military goals rather than the more important long-term political and diplomatic aspirations.

Chester Wilmot began the debate in 1952 with *The Struggle for Europe*, in which he argued that British forces could have taken Berlin if Eisenhower had unleashed them in early April 1945. Quite predictably, British Field Marshal Bernard Montgomery echoed similar sentiments in his 1958 memoirs and suggested that Eisenhower had forgotten that winning the war militarily hardly mattered if the Allies lost it politically. John Toland in *The Last Hundred Days* (1965) and Cornelius Ryan in *The Last Battle* (1966) offered similar appraisals, although they added that any drive on

Berlin would have encountered strenuous resistance in the city's suburbs.

Eisenhower's defenders, by contrast, claimed that no other decision was practical. By late January 1945, Soviet forces were only 35 miles east of Berlin, whereas Eisenhower's armies were hundreds of miles to the west. The Soviets then regrouped and resupplied their forces for two months while the Allies closed from the west, but even in April, the Red Army had much stronger units in proximity to Berlin than either the Americans or the British. Led by Walter Bedell Smith in *Eisenhower's Six Great Decisions* (1956) and supported by Stephen Ambrose in *Eisenhower and Berlin, 1945: The Decision to Halt at the Elbe* (1967), Eisenhower's supporters also argued that he had to worry about the supposed National Redoubt (an imagined German stronghold in the Alps) in southern Germany, the 100,000 casualties that General Omar N. Bradley estimated it would cost to capture the city, and the fact that Allied agreements regarding the postwar division of Germany placed a jointly occupied Berlin well within the Soviet zone of control. How, they asked, could Eisenhower have defended losing 100,000 men for territory he knew the United States would turn over to the Soviet Union as soon as the war ended?

Since the end of the Cold War, the debate has softened considerably, and most historians now view the Soviet capture of Berlin on 2 May 1945 as the logical mili-

tary conclusion to the war in Europe. U.S. units may have been only 48 miles from Berlin when Eisenhower finally ordered them to halt on 15 April, but the odds on their seizing the city in force in advance of the Soviets were extremely long. In that sense, a bold U.S. or British dash for Berlin was militarily unnecessary, and in light of Allied agreements regarding the postwar division of Germany, it would have been politically foolhardy as well.

while, Konev's forces threatened the German capital from the southeast. In defense of Berlin, Hitler had only the remnants of his Third Panzer and Ninth Armies, now constituting Army Group Vistula. In March, however, he ordered that the city be held "to the last man and the last shot."

On 8 March, alarmed by the American crossing of the Rhine the day before, Stalin summoned Zhukov to Moscow to discuss an offensive against Berlin. The now rapid progress of the Western Allies eastward set off alarm bells in Moscow, and Stavka (the Soviet High Command) rushed

plans for an offensive to take the German capital. On 31 March, Stalin ordered the offensive to begin. Zhukov would make the principal drive on Berlin, while Konev supported him on the left flank and Marshal Konstantin Rokossovsky's 2nd Belorussian Front on the lower Oder moved on Zhukov's right flank. Altogether, the three fronts had some 1.5 million troops, 6,250 armored vehicles, and 7,500 aircraft. Opposing them, the German Ninth Army and Third Panzer Army had only 24 understrength divisions, with 754 tanks and few aircraft.

Zhukov's frontal assaults on Berlin's defenses from the east failed. On 18 April, Stalin ordered him to go around Berlin from the north, while Konev encircled the city from the south. Hitler, meanwhile, ordered his Ninth Army to stand fast on the Oder, thus facilitating Konev's move.

On 20 April, Hitler's birthday, Konev's tanks reached Jüterbog, the airfield and key ammunition depot south of Berlin. That same day, Hitler allowed those of his entourage who wished to do so to leave the city. He pledged to stay.

The Soviets completed the encirclement of the city on 25 April. Also on that day, Soviet and U.S. forces met on the Elbe River. Hitler attempted to organize the Ninth Army as a relief force for Berlin, but it, too, was surrounded and soon destroyed. Although Lieutenant General Walther Wenck's Twelfth Army tried to relieve the city from the west, it was too weak to accomplish the task. Meanwhile, the defense of Berlin itself fell to miscellaneous German troops unfortunate enough to be pushed back there and by old men and boys hastily pressed into service for the daunting task. On 30 April, with the defenders' ammunition nearly depleted and the defenses fast crumbling and as Soviet troops took the Reichstag (Parliament) building, Hitler committed suicide. On 2 May, Lieutenant General Hans Krebs, chief of the German General Staff, surrendered Berlin.

Given their country's suffering in the war, Soviet soldiers hardly needed encouragement to destroy the German capital, the symbol of Nazism. They also committed widespread atrocities in the city both during and after its fall. Bradley's estimate of the cost of taking Berlin was, in fact, low. According to one source, the "Berlin Strategic Offensive" from April 16 to May 8, involving the 1st Belorussian, 2nd Belorussian, and 1st Ukrainian Fronts, produced a staggering total of 352,475 Soviet casualties (including 78,291 dead)—an average of 15,325 a day.

What is remarkable is how Berlin came back. It survived the destruction of the war and the building of the Berlin Wall in 1961, which divided the city into east and west portions. Today, it is once again the capital of a united, powerful, but this time peaceful German state.

Bernadotte of Wisborg, Folke (Count) (1895–1948)

Swedish diplomat and Red Cross official who worked on behalf of prisoners of war. Folke Bernadotte was born in Stockholm, Sweden, on 2 January 1895; his father was a brother of King Gustav V. Although hemophilia limited his activities, Bernadotte served in the Swedish army from 1918 to 1930. His skills were diplomatic rather than military, and he also worked closely with the Swedish Red Cross, of which he became a vice president, organizing prisoner-of-war exchanges.

Bernadotte was also a vice president of the Swedish Boy Scouts, and during World War II, he integrated that organization into neutral Sweden's defense network. He traveled extensively on behalf of the Swedish Red Cross, arranging exchanges of thousands of British and German prisoners in 1943 and 1944, and between 1944 and 1945, he concluded an agreement with Germany whereby Scandinavian prisoners would be transferred to the Neuengamme camp near Hamburg.

Bernadotte visited Berlin in February 1945 to finalize the details of this arrangement with Heinrich Himmler, head of the Schutzstaffel (SS). At that time, Himmler expressed interest in negotiating surrender terms with the Western Allies, under which the Germans would spare those Jews still alive in

Count Folke Bernadotte of Sweden. (Bettmann/Corbis)

concentration camps in exchange for Allied concessions. (Bernadotte has sometimes been criticized for a lack of concern about rescuing Jews, but this charge is based on a faked letter purportedly sent from him to Himmler.) In April 1945, Himmler met again with Bernadotte, suggesting that Germany would surrender in the west to Britain, France, and the United States, in exchange for their assistance against the Soviet Union in the east. Bernadotte relayed these suggestions to British Prime Minister Winston L. S. Churchill, who passed them on to U.S. President Harry S. Truman, only to have them promptly rejected.

Bernadotte became president of the Swedish Red Cross in 1946. In May 1948, the United Nations appointed him to mediate peace in Palestine. Just four months later, however, on 17 September 1948, terrorists from the Jewish Stern Gang assassinated him in Jerusalem.

**“Big Week” Air Battle
(20–25 February 1944)**

Name later given by the press to air combat over Germany in Operation ARGUMENT, a series of intensive Allied air strikes at the end of February 1944 against the German aircraft industry’s final-assembly plants, ball-bearing factories, and facilities producing aircraft components. The Allies initiated the operation in order to reduce the effectiveness of Luftwaffe fighters against Allied bombers over Germany and to prepare for the invasion of Normandy. Although the Luftwaffe still maintained significant numbers of aircraft, it could not long

The aircraft factory at Obertraubling, Germany following a raid on 22 February 1944 by planes of the U.S. Fifteenth Air Force. Unfinished ME-109 jet fighters lie among the debris. (Corbis)

survive both sustained losses in the air and attacks on its production facilities.

A period of clear weather allowed the Allies to begin the campaign. Bomber Command of the Royal Air Force (RAF) joined in for nighttime raids, but the bulk of the attacks were made by the U.S. Army Air Forces (USAAF) in daylight operations. Between 20 and 25 February 1944, some 1,000 bombers and 900 fighters of the U.S. Eighth Army Air Force carried out 13 major attacks against 15 centers of the German aviation industry. In the last four days of the offensive, Fifteenth Air Force, headquartered at Foggia, Italy, joined in.

As the commander of U.S. Strategic Air Forces in Europe, Lieutenant General Carl Spaatz, had predicted, the German fighters contested the raids. Between 20 and 25 February, the Eighth and Fifteenth Air Forces flew a combined total of 3,800 sorties and dropped almost 10,000 tons of bombs. USAAF losses were heavy, with 226 bombers shot down (6 percent of the force engaged). Fighters from other Allied countries flew 3,673 sorties, with only 28 fighters lost (less than 1 percent). The USAAF claimed more than 600 German fighter aircraft were shot down. In the operation, the P-51 Mustang fighter played a notable role; German fighters were no match for it, especially as many were weighed down by heavy armaments designed to destroy the Allied bombers. In the months ahead, the Allied bombers switched over to a concentration on German oil-production facilities.

German fighter losses for the entire month of February came to 2,121, with another 2,115 destroyed in March. Clearly, the days of the Luftwaffe were numbered. “Big Week” was a major defeat for the Luftwaffe and claimed many of its best pilots. This reduction in German air strength was an essential prelude to the successful Normandy Invasion in June 1944.

Bismarck, Sortie and Sinking of (May 1941)

The sinking of the *Bismarck* occurred at the height of German battleship operations in the Atlantic Ocean. The commander of the German navy, Grand Admiral Erich Raeder, expected the new battleship *Bismarck*, which was to be available in the spring of 1941, to provide an opportunity to test the navy’s

The German Navy battleship *Bismarck* shortly before she was sunk.
(Photo by Keystone/Getty Images)

“battle group” strategy in support of a war on commerce. Repairs to the battleships *Gneisenau* and *Scharnhorst* forced delays, and the naval command decided to send the *Bismarck* and the heavy cruiser *Prinz Eugen* to sea as soon as possible to attack shipping in the North Atlantic in Operation RHINE EXERCISE. Raeder was determined to demonstrate the value of the battleships to the war effort, and the *Bismarck* was rushed into action with an incomplete antiaircraft control system and equipment scavenged from other ships.

Vice Admiral Günther Lütjens, the fleet commander and task force leader, opposed the “piecemeal approach” and advocated delaying the mission until the other battleships were available, including the *Tirpitz*. His pessimism played a key role in his decisions over the course of the operation.

British intelligence, including ULTRA, alerted the Royal Navy that a major German naval operation was under way, and aircraft spotted the two ships in Bergen on 21 May 1941. The British took countermeasures to patrol the Iceland-Faroes passage and the Denmark Strait to block the German breakout into the Atlantic. On 23 May, the British cruisers *Norfolk* and *Suffolk* spotted the two German raiders in the

Denmark Strait. The persistence of the British cruisers in shadowing the German ships led Lütjens to conclude that the British possessed new radar.

Off Iceland at about 5:55 A.M. on 24 May, in the Iceland Battle or the Battle of the Denmark Strait, British Rear Admiral Lancelot E. Holland's battle cruiser *Hood* and battleship *Prince of Wales* engaged the *Bismarck*. The *Hood* was hit in her magazines by the German battleship's fourth salvo and blew up. Only 3 of her 1,419 crewmen survived. The *Prince of Wales* took seven hits (four from the *Bismarck*) and was damaged.

Although the *Bismarck* had received only three hits, the ship was leaking oil, and her speed was also reduced from flooding in the forward compartments. At about 4:00 P.M., Lütjens detached the *Prinz Eugen* in a vain effort to draw the British off while the *Bismarck* made for the French port of Saint-Nazaire to carry out repairs. In the early morning of 25 May, the *Bismarck* managed to elude her pursuers, but Lütjens was unaware of this in spite of reports from Naval Command Group West. When Lütjens broke radio silence, these messages were picked up by Allied high-frequency direction-finding (HF/DF) receivers. Increased German radio traffic along the French coast suggested that the destination of the *Bismarck* was a French port, which was later confirmed by a British intercept of a Luftwaffe signal. The chief British ships that had been chasing the *Bismarck* in the wrong direction now altered course. In the meantime, Force H with the aircraft carrier *Ark Royal* had departed Gibraltar to provide air reconnaissance off the French west coast.

On 26 May, Swordfish torpedo-bombers from the *Ark Royal* and Coastal Command's patrol bomber (PBY) aircraft regained contact with the *Bismarck*. Late in the day, Swordfish from the *Ark Royal* attacked, and a lucky torpedo hit jammed the German battleship's twin rudder system, making her unable to maneuver. With no air cover or help from the U-boats or other ships available, the fatalistic Lütjens, remembering the reaction to the scuttling of the *Graf Spee* and Raeder's orders to fight to the last shell, radioed the hopelessness of the situation.

At 8:45 A.M. on 27 May, the British battleships *King George V* and *Rodney* opened fire. By 10:00, although hit by hundreds of shells, the *Bismarck* remained afloat. As the heavy cruiser *Dorsetshire* closed to fire torpedoes, the Germans scuttled their ship. Three torpedoes then struck, and the *Bismarck* went down. Reports of German submarines in the area halted British efforts to rescue German survivors. Only 110 of the crew of 2,300 survived. Lütjens was not among them.

A furious Adolf Hitler regarded the sinking of the *Bismarck* as a major loss of prestige and ordered that no more battleship operations be undertaken without his permission. The major German ships were now relegated to the defense of Norway, leaving the brunt of Germany's naval war to the U-boats.

Bismarck Sea, Battle of (2–5 March 1943)

Southwestern Pacific naval battle. As General Douglas MacArthur's troops fought to expel the Japanese from New Guinea, it fell to the U.S. Army Air Forces (USAAF) to interdict Japanese resupply efforts. When Lieutenant General George C. Kenney assumed command of Fifth Air Force in the Pacific in August 1942, he found many of his units operating obsolescent aircraft and using ineffective tactics. Kenney quickly devised two important new tactics. First was the development of skip-bombing, in which medium bombers—A-20 Havocs and B-25 Mitchells—attacked Japanese ships from low altitude and literally "skipped" bombs into the sides of their targets. The bombs used time-delayed fuses so that the explosions would occur either within the ships, should they penetrate the hulls, or below their waterlines, as the bombs sank after hitting the hulls. Second, crews installed additional forward-firing .50 caliber machine guns in medium bombers, designed to either sink small vessels or suppress antiaircraft fire. Also, several squadrons of the Royal Australian Air Force were available to supplement the Fifth Air Force.

In January 1943, Allied forces undertook a major offensive along the New Guinea coast. In response, the Japanese sent additional resources via convoys across the Bismarck Sea. On the night of 28 February 1943, a large Japanese force under Rear Admiral Kimura Masatomi, consisting of eight transports and eight destroyers left Rabaul with 6,900 troops of the 51st Division, bound for Lae, New Guinea.

The Japanese recognized the threat posed by Allied airpower, but Lae was too important to lose. Some 100 fighters (40 navy and 60 army) provided air cover for the convoy. Kenney knew of the Japanese activity through signals intelligence and reconnaissance flights. American B-24s first sighted the Japanese formation on 1 March, but eight B-17s sent to attack it failed to locate the Japanese force because of cloud cover. The following day, another B-24 reacquired the target, and eight B-17s attacked with 1,000-pound demolition bombs, sinking one transport and damaging another. Two of the Japanese destroyers rescued approximately 950 men and rushed ahead to Lae, returning to the convoy early the next morning.

On 3 March, the largest Allied air effort yet seen in the theater assembled to attack the Japanese when the convoy came within range of the medium bombers. At 10:00 A.M., B-17s bombed the convoy to disrupt its formation. Shortly thereafter, Australian Beaufighters, followed by heavily armed B-25s and A-20s, attacked the convoy from an altitude of 500 feet or less, while P-38s engaged Japanese escort fighters. Out of 47 bombs dropped by the attackers, 28 reportedly found their targets. Allied aircraft repeated their assault that afternoon but with less success, as the weather began to interfere.

By the end of the day, all of the Japanese transports and three destroyers had sunk. A fourth destroyer was heavily damaged and was sunk by Allied aircraft the next day. The remaining destroyers collected as many survivors as possible and returned to Rabaul. Over the next few days, aircraft and patrol

torpedo (PT) boats patrolled the area, strafing and bombing any remaining Japanese: this was to prevent any enemy troops from reaching land, where they would pose a threat because they would not surrender. Additionally, Allied pilots sought retribution against Japanese flyers who had machine-gunned an American crew parachuting from their stricken B-17.

The month went down in German naval annals as "Black May," with the loss of 40 U-boats.

In the battle, the Japanese lost some 60 aircraft, 12 ships, and some 3,700 men. The Allied cost was 3 fighters, 1 B-17, and 1 B-25. MacArthur described the victory as "the decisive aerial engagement" in the Southwest Pacific Theater. After the battle, Japanese transports never again sailed within range of Allied airpower. Without reinforcement, the Japanese lost Lae to Australian troops some seven months later.

"Black May" (May 1943)

Defeat of the German U-boats in the North Atlantic. The climactic convoy battles of March 1943 had given a first hint that Allied antisubmarine forces were finally gaining the upper hand in the battle for the North Atlantic sea lines of communication. By early 1943, the fully mobilized American shipyards were producing vast numbers of escort vessels in addition to building more merchant ships than were being sunk by U-boats. Modern, long-range naval patrol aircraft, such as the B-24 Liberator, and escort carrier-based aircraft were closing the dreaded air gap, the wolf packs' last refuge from Allied airpower in the North Atlantic. At the same time, Allied signals intelligence was reading the German U-boat cipher Triton almost continuously and with minimal delay.

On 26 April, the Allies suffered a rare blackout in their ability to read the German cipher, just as 53 U-boats regrouped for an assault on the convoy routes. Miraculously, two eastbound convoys, SC.128 and HX.236, escaped destruction, but ONS.5, a weather-beaten, westbound slow convoy of 30 merchant ships escorted by 7 warships stumbled into the middle of the wolf packs on 4 May. During the next 48 hours, the U-boats sank 12 ships but at an unacceptable cost: escort vessels sank 6 U-boats, and long-range air patrols claimed 3 others. Radar in aircraft and escort vessels had played a decisive role in giving the numerically overmatched escorts a tactical edge in the battle.

The commander of the German U-boat arm, Admiral Karl Dönitz, was aware of the tilting balance, but he urged his U-boat commanders not to relent. Yet many of the vessels did not even reach their areas of operations. The determined antisubmarine offensive in the Bay of Biscay by aircraft of the Royal Air Force Coastal Command destroyed 6 U-boats during May and forced 7 others to return to base.

In the second week of May, the ragged survivors of the North Atlantic wolf packs, which had operated against Convoys ONS.5 and SL.128, regrouped and deployed against HX.237 and SC.129. Only 3 merchantmen were sunk, at the expense of the same number of U-boats. In addition to radar, the small escort carrier *Biter*, which had provided air cover for HX.237 as well as for SC.129, was vital in denying the German submarines tactical freedom on the surface near the convoys. When the U-boats renewed their attacks against Convoy SC.130 between 15 and 20 May, escort vessels sank 2 U-boats, and shore-based aircraft claimed 3 others. SC.130 suffered no casualties. The U-boat offensive failed entirely against HX.239, a convoy with a rather generous organic air cover (aircraft attached to the convoy) provided by the escort carriers USS *Bogue* and HMS *Archer*. Not a single U-boat managed to close with the convoy, and on 23 May, a U-boat

fell victim to the rockets of one of the *Archer's* aircraft. The following day, Dönitz recognized the futility of the enterprise and canceled all further operations in the North Atlantic. During the month to that point, more than 33 U-boats had been sunk and almost the same number had been damaged, nearly all of them in convoy battles in the North Atlantic or during transit through the Bay of Biscay. The month went down in German naval annuals as “Black May,” with the loss of 40 U-boats. At the end of May 1943, the British Naval Staff noted with satisfaction the cessation of U-boat activity. SC.130 was the last North Atlantic convoy to be seriously menaced during the war.

Blamey, Sir Thomas Albert (1884–1951)

Australian army general, commander in chief of the Australian army during much of World War II, and the first Australian field marshal. Born on 24 January 1884 in Wagga-Wagga, Australia, Thomas Blamey secured a commission through competitive examination in 1906. He made captain in 1910 and attended staff college in India between 1911 and 1913.

During World War I, Blamey served as a staff officer in Egypt, at Gallipoli, and on the Western Front. He rose to the rank of brigadier general in 1918. Following the war, he served on the Imperial General Staff. In 1925, Blamey retired from the regular army and became chief police commissioner in Victoria, Australia, while remaining a general in the militia.

Blamey resigned his police position in 1936 following a minor scandal in which he lied under oath to protect the reputations of two women who were victims of robbery. Shortly after the beginning of World War II, he rejoined the regular army, was promoted to lieutenant general, and was assigned command of I Corps. Serving in Egypt in 1940 under General Archibald P. Wavell, he oversaw the evacuation of Australian troops from Greece following the German invasion of that country in April 1941. Promoted to full general in September 1941, Blamey became commander in chief of Australian forces in March 1942.

British General Sir Thomas Blamey. (Corbis)

Under orders from General Douglas MacArthur, who was concerned about the Japanese occupation of Buna in Papua and a possible invasion of Australia, Blamey took personal command of the ground forces and led them in the recapture of Buna in January 1943. He also held personal command in September 1943 in a campaign that took the city of Lae and liberated the eastern New Guinea coast. Following these actions, Blamey found himself relegated to a background role as MacArthur assumed more control of Allied armies in the theater.

As the Allies island-hopped closer to Japan, Blamey undertook operations against isolated Japanese troops in islands bypassed by MacArthur. These actions, bereft of significant naval and air support, proved costly and were criticized by many as unnecessary, but Blamey believed that it was in Australia's interest that these occupied islands be freed. At the end of the war, he signed the Japanese surrender document as the Australian representative. Discharged in January 1946, he was promoted to field marshal in June 1950. Blamey died at Melbourne on 27 May 1951.

Bletchley Park

Secret British decrypting center. Just prior to the beginning of World War II, the British Government Code and Cypher School (GC&CS) purchased a Victorian mansion known as Bletchley Park (BP, also called Station X or War Station), located some 50 miles north of London in Bedfordshire. British code-breakers, some of them veterans of World War I, began moving to Bletchley Park in August 1939. The staff, headed by Alistair Dennison, soon numbered 150 people. Thereafter, BP grew very rapidly. By late 1942, BP personnel numbered around 3,500, a figure that would expand to 10,000 by 1945. BP's overseas stations were the Combined Bureau, Middle East; the Wireless Experimental Centre at Delhi; and the Far East Combined Bureau. Each had its own outposts.

The personnel at Bletchley Park were a mix of mathematicians, cryptographers, engineers, and eccentrics. Among them was Alan Turing, regarded as the father of the modern computer. There were also members of the various British military services, as well as foreign military personnel. At BP, they continued the work begun by the Poles in reading German signals traffic and unlocking the secrets of the German Enigma encoding machine.

To house the growing staff, "temporary" wooden huts were built on the garden grounds. These were numbered, and different types of analysis were conducted in each. Hut 3 decrypted German army and air force codes, Hut 6 focused on German army and air force Enigma cryptanalysis, Hut 4 worked on German naval translating and processing, and Hut 8 handled German navy Enigma cryptanalysis. Others worked on Italian and Japanese codes. The intelligence produced by BP was code-named the **ULTRA** secret.

By 1940, Bletchley Park had come up with additional devices that, given time, could sort through the possible variations of an encoded text. Careless German practices, mostly in the Luftwaffe, gave the electromechanical devices called "bombs" a head start and greatly shortened the delay between receiving and decoding messages. The changeable settings of the Enigma machine meant that most messages

could not be read in real time, but the information was nonetheless invaluable.

The staff at BP was ultimately able to provide an important advantage to the Allies in the war. The Axis powers never learned of the success of the Allied decrypting operations, and the activities at Bletchley Park remained unknown to the public until 1974, when Group Captain F. W. Winterbotham revealed them in his book entitled *The Ultra Secret*.

Blitz, The (August 1940–May 1941)

English term for Germany's sustained night air attacks on British cities, chiefly London, from August 1940 to mid-May 1941. The term *Blitz* is taken from the German word *blitzkrieg* (lightning war). Early in the war, the British government undertook preparations to deal with air attacks, especially in London.

The Blitz began as the daylight Battle of Britain, for control of the air over the island, was reaching a climax. The Germans hoped at first to drive the Royal Air Force (RAF) from the skies, and then they sought to destroy the RAF by hitting factories and ground installations; finally, they turned to terrorizing the civilian population by bombing cities. This thrust was, in effect, triggered on the night of 24–25 August when German bombers, which were supposed to target an oil depot at Thameshaven, struck London instead. The German bombers had hardly retired when British Prime Minister Winston L. S. Churchill ordered a retaliatory strike on Berlin. On 5 September, German leader Adolf Hitler issued a directive calling for "disruptive attacks on the population and air defenses of major British cities, including London, by day and night." Such bombing could not have significant military value and was intended primarily to destroy civilian morale.

On 7 September 1940, the German Luftwaffe carried out a major raid that devastated the London's East End. The bombers returned over the next two days, and more than 1,000 people were killed. From the beginning to the middle of November, London was the target. The intensity of raids varied, but with good weather and a full moon, they were mas-

Uniformed woman leads group of boys through bomb-damaged residential area in London during the “Blitz,” 1941. (Library of Congress)

sive. On 15 October, for instance, 538 tons of bombs fell on the city.

British authorities had rejected both the idea of building deep shelters and the concept of using the Underground (subway), for fear of creating a bunker mentality: some actually worried that people would refuse to return to the surface. Londoners forced the issue on 8 September when crowds pushed their way into the subway’s Liverpool Street Station for refuge. The authorities capitulated, and by Christmas, 200,000 bunks were available in the Underground, with that many more ready for installation. A decision to build deep shelters was taken in October, but the Blitz was over before the first was completed. Nonetheless, by February 1941, some 92 percent of Londoners could be sheltered in a combination of public and private facilities.

Initially, the shelters were dismal places. Overcrowding was the rule, and sanitation was primitive at best. In mid-November 1940, the government instituted a food train to supply the hungry and thirsty citizens below ground, and

communities began developing. People returned to the same shelter night after night and slept in the same bunks. Sing-alongs were organized, and professional entertainment was often provided. The authenticity of this sort of camaraderie has been questioned, and some scholars have referred to the “myth of the Blitz.” Certainly, the camaraderie has been exaggerated at times, but Londoners seem to have known that a brave front was expected of them, and they made real efforts to live up to the expectation. The cheerful endurance and determination that was initially claimed and then later rejected as myth was, in fact, real. Of course, it was not universal or without cracks, but Londoners by and large kept daily routines in place with humor and mutual support. Predictions of disruptions proved mostly false. Initial class discontent because working-class areas in the East End were the first targets disappeared as the Germans pounded the rest of the city.

Life was not easy in London during that period. In the first six weeks of major raids, some 16,000 houses were destroyed

and another 60,000 badly damaged, with the result that 300,000 people needed places to stay. By the end of the Blitz, one in six Londoners had been rendered homeless. Many historical sites were also damaged, including Buckingham Palace. Most sites, however, survived and proved to be symbols of defiance. The king and queen remained in London, and Big Ben, despite sustaining some damage, struck every hour. London also got some respite as raids were directed against other cities. There was a major attack on Birmingham on 25 October 1940, and on 14 November, the city of Coventry was hit with a level of intensity beyond all previous efforts. Liverpool, Southampton, Birmingham, and Bristol were also struck.

London passed the Christmas of 1940 in comparative tranquility, and precautions were relaxed. Then, on 29 December, the great fire raid came. It was not the biggest raid ever, but the Christmas complacency among Londoners resulted in a slowed response, and enormous damage ensued. After another respite, March and April 1941 saw the skies again filled with German raiders. The worst nights were 16 and 19 April, which left 2,000 people dead and 148,000 homes damaged. Providers such as the Londoners' Meal Service, which was operating 170 canteens, were strained. Once again, however, there was a relative pause—and again, precautions waned. On 10 May, crowds flooded into London for a football championship match, only to be joined by German raiders. The attack was the worst raid of the war, with more than 3,000 dead or seriously injured, 250,000 books burned at the British Museum, and pilots reporting the glow of fires visible as far away as 160 miles. It was also the last major raid of the Blitz. The British—and Londoners in particular—still had to face occasional raids and the V-1 and V-2 terror weapons at the end of the war, but for the Germans, strategic and tactical plans no longer included massive assaults from the air. Of course, as time passed, their ability to make them also waned.

One of the lessons of the Blitz was that, contrary to German expectations and intent, bombing the civilian population often strengthened its morale and determination, a lesson the Allies themselves failed to learn in their strikes against civilian targets in Germany.

Blitzkrieg

The so-called *blitzkrieg* (lightning war) doctrine is one of the most enduring myths of World War II. In the early years of the war, however, the swift and stunning German successes in Poland in 1939 and France in 1940 came to be interpreted in the West as the result of some sort of revolutionary new military doctrine that relied on combined-arms operations, with ground and air forces working together as a well-oiled military machine.

Military doctrine has been defined as the fundamental principles by which military forces guide their actions in support of national objectives. But what became known popularly as *blitzkrieg* was not a set of fundamental principles, nor was it written down as an authoritative document. Rather, the term *blitzkrieg* was created for public consumption. It did appear occasionally in the military literature between 1936 and 1940, but the German writers generally used it in reference to a short war, as opposed to the drawn-out trench warfare of World War I. The term became fixed in the public mind after articles appeared in *Time* magazine, one on 25 September 1939 about Germany's invasion of Poland and another on 27 May 1940 about the fall of France.

Immediately following World War I, the leaders of the much reduced German army studied the causes of the defeat in 1918 and concluded that a lack of traditional mobile, maneuverable forces and tactics had resulted in the war of attrition that eventually doomed Imperial Germany on the battlefield. Unlike the French, who determined that better defenses would be the key to winning the next war and hence built the Maginot Line, the Germans concluded that the next war would be of short duration and won by maneuver warfare in the classical sense.

The German field service regulations of 1921, *Führung und Gefecht der verbundenen Waffen* (Command and Combat of the Combined Arms), together with the updated version of 1934, *Truppenführung* (Unit Command), were infantry-oriented documents that cast tank and air assets strictly in an infantry-support role. Although *Truppenführung*, which remained the official doctrine for the German army through 1945, emphasized traditional German thinking on mobility, it did allow for decentralization of control, and it provided considerable latitude for force structure changes. It was also not tied rigidly to specific operational concepts, to the exclusion of all others. Rather than an inflexible tactical cookbook, the manual was a philosophical treatment of the conduct of operations and leadership.

During the interwar years, the German mobility advocates enthusiastically read the works of the leading mobile warfare theorists of the time, J. F. C. Fuller, Charles de Gaulle, and Basil

German motorized detachment riding through the remains of a Polish town during the blitzkrieg of September 1939. (Library of Congress)

Liddell Hart. Younger German officers aggressively advanced the argument that a tank force could alter the outcome of battles. Many of the older officers resisted the notion that the tank could be a decisive combat arm, remembering the grave difficulties armored units experienced in World War I.

After Adolf Hitler came to power in Germany in 1933, he quickly made it clear he intended to rearm the nation, and he was interested in the iconoclastic ideas of the younger officers. In June 1934, Colonel Heinz Guderian became the chief of staff of the newly formed Motorized Troop Command. A little more than a year later, the Germans fielded an experimental panzer division. In October 1935, while still only a colonel, Guderian assumed command of one of the three new panzer divisions. He immediately set out to convince the traditionally infantry-oriented German General Staff to accept the concepts of armored warfare. Although Guderian received only limited support from some of his superiors, Hitler encouraged him and his aggressive concepts.

Meanwhile, the fledgling German air force also underwent important changes. Prior to the German intervention in the Spanish Civil War, most Luftwaffe officers saw airpower in the same terms as their peers in most other air forces of the period. The two most essential missions were conducting

long-range strategic bombing and achieving air superiority over the battlefield; the ground-support mission was largely ignored. But the successes of German air-ground operations during the Spanish Civil War convinced a number of high-ranking Luftwaffe officers to reconsider ground support. General Ernst Udet, in charge of Luftwaffe development after 1936, pushed through the development of a dive-bomber, the Ju-87 Stuka. The aircraft was extremely accurate, very mobile, and designed specifically to support ground forces. It became the plane that added the critical air dimension to mobile operations.

The Polish Campaign of 1939 was executed in very short order and had all the outward appearances of a dazzling success of German arms. But the so-called *blitzkrieg* doctrine was never used in that campaign. Rather than being committed in mass, the panzer units were allocated to the various field armies. The Luftwaffe was primarily concerned with establishing air superiority and striking deep at Polish lines of communications. Tank maintenance was a severe problem, and too often, the German system of resupply was unequal to the required tasks. But in the end, Germany crushed Poland very quickly, and that success obscured the serious operational, tactical, and technical problems the Wehrmacht experienced.

Between the end of the Polish Campaign and the start of the attack in the west against France and Britain in May 1940, the German army made some significant changes. The panzer divisions were organized into corps. The number of tanks in the German army increased only slightly, but the number of tanks per division decreased, and thus, the number of panzer divisions grew. Out of necessity rather than doctrinal design, the panzer divisions became combined-arms units, with a balance between tanks, infantry, artillery, engineers, and other arms. Tactical air, especially the Stuka, became an important element in the combined-arms mix because Germany was woefully short of field artillery.

The Germans did not go into France planning for a rapid and overwhelming victory. But they achieved one because of a combination of luck; better leadership and training; superior concentration of forces; and correspondingly poor French leadership, training, and tactics. At first, the Germans were stunned by their success, but they soon fell victim to their own propaganda and began to believe in the myth of *blitzkrieg*.

In June 1941, the Germans invaded the Soviet Union, this time anticipating a rapid campaign. They did not mobilize their economy for the invasion, nor did they accumulate the necessary stockpiles or provide adequately for the long lines of communications or winter conditions. Drawing the wrong lessons from the French Campaign, they believed that their use of tactical airpower had been so successful that it more than compensated for their severe shortage of artillery. That

approach may have worked against the poorly deployed French and British, but against the artillery-oriented Soviets, it was a recipe for disaster. The Germans learned quickly that the Luftwaffe could not be everywhere at the same time over the vast expanses of the eastern battlefields, especially with the onset of poor weather. The Soviets, with their abundant conventional field artillery, seldom lacked direct fire support.

The term *blitzkrieg* described a set of results, unique to a specific place and a specific time. The coordinated use of mobility, communications, and combined arms was not a revolution in military affairs, as it has often been portrayed, but rather a natural evolution of military doctrine that was clearly identifiable in the closing months of World War I. The myth of *blitzkrieg*, however, did obscure serious flaws in the German war machine, including supply, transport, maintenance, artillery, and intelligence. That circumstance proved progressively costly to the Germans as the war advanced and the Allies grew stronger and as the mechanized battlefield became increasingly lethal.

Bock, Fedor von (1880–1945)

German army field marshal and commander on the Eastern Front in 1941 and 1942. Born into an old noble Prussian family at Küstrin, Germany, on 3 December 1880, Fedor von Bock joined the army in 1898. During World War I, he became a major and won the Pour le Mérite.

After the war, Bock remained in the army. Adolf Hitler did not purge him, despite his well-known adherence to the former monarchy. Promoted to colonel general, Bock participated in the German invasions of Poland and France as commander of Army Groups North and B, respectively. He was shocked by the Schutzstaffel (SS) treatment of Jews in Poland, but he decided against making an official protest. In July 1940, he was one of 12 new field marshals created by Hitler.

German Field Marshal Fedor von Bock. (Corbis)

During the invasion of the Soviet Union (Operation BARBAROSSA), Bock's Army Group Center had the task of capturing Moscow. In July 1941, his forces took Minsk, and three weeks later, they reached Smolensk. When Bock was only 225 miles from Moscow, Hitler decided to divert some of his forces to Leningrad and Kiev. Bock was not able to resume his advance before October, and bad weather forced a halt in December 1941. Hitler then dismissed him, but after only a month's rest, he was again sent to the Eastern Front to command Army Group South.

In the 1942 summer offensive, Hitler instructed Bock to destroy Soviet forces west of the Don River, to reach the Volga, and to secure the Caucasus oil fields. Bock enjoyed initial success at Voronezh, but after his progress slowed, Hitler replaced him with General Maximilian von Weichs on 15 July 1942. Bock never returned to command. In 1944, his nephew, Henning von Tresckow, approached him about the possibility of joining the July plot against Hitler. Bock refused as he had in 1941 after being confronted with SS atrocities in the Soviet Union. As an old-style Prussian officer, he was unable to break his oath of office, but he did not pass his knowledge about the plot to overthrow the Führer on to the Gestapo.

Bock continued to press for a return to military service, but his efforts were in vain. He and his wife were killed as the result of an Allied air raid in Schleswig-Holstein on 3 May 1945, during which a fighter pilot fired on their car. Bock died the following day.

Bohr, Niels Henrik David (1885–1962)

Nobel Prize-winning Danish atomic physicist. Born in Copenhagen on 18 November 1885, Niels Bohr earned a doctorate in physics from Copenhagen University in 1911. He then studied in Britain, at Cambridge and Manchester, under the leading physicists J. J. Thompson and Ernest Rutherford. By 1913, Bohr's work on the development of quantum theory was internationally acclaimed. Returning to Copenhagen, he speedily made that university a leading international center of theoretical physics, attracting distinguished scientists from around the world. In 1922, a Nobel Prize recognized his work on quantum theory and atomic structure.

In 1938 and 1939, Bohr visited the United States, warning American scientists that he believed German experiments

Niels Bohr, Danish atomic physicist and 1922 Nobel Prize winner. (Corbis)

proved that the atom could be split and, by implication, that the opponents of Nazi Germany must develop atomic weapons before Germany did so. After Hitler occupied Denmark in 1940, Bohr refused German requests for his scientific collaboration and was active in the anti-Nazi resistance. (In the late 1990s, Michael Frayn's acclaimed play *Copenhagen* provoked a well-publicized historical debate over Bohr's part in dissuading his former student, German scientist Werner Heisenberg, from pressing ahead with a German nuclear bomb project.)

British Secret Service operatives helped Bohr to escape to the United States in 1943, where he joined the MANHATTAN Project's laboratory at Los Alamos, New Mexico, working under its director, his old scientific associate J. Robert Oppenheimer. There, he contributed materially to the secret program developing atomic weapons. With the 1945 atomic explosions over Hiroshima and Nagasaki, Bohr hoped that the bomb's destructive potential might eventually force nations to abandon war as unacceptably devastating, a view that influenced Oppenheimer.

When the war ended, Bohr returned to Copenhagen to resume his scientific work. He campaigned for the open exchange of ideas and people among nations as a means of controlling nuclear weapons. One Soviet general has alleged that Bohr deliberately assisted a Soviet physicist with vital atomic information. Bohr died in Copenhagen on 18 November 1962.

Bonhoeffer, Dietrich (1906–1945)

German theologian and Abwehr counterspy. Born on 4 February 1906, in Breslau, Silesia, Dietrich Bonhoeffer was the son of the prominent neurologist and psychiatrist Karl Bonhoeffer and studied theology at Tübingen, Rome, and Berlin between 1923 and 1927. From 1930 to 1931, he attended classes taught by Reinhold Niebuhr at Union Theological Seminary in New

York City. In 1931, Bonhoeffer began teaching theology at Berlin and was ordained a Lutheran minister. From July 1933 until April 1935, he served two German parishes in London.

After Adolf Hitler came to power in 1933, Bonhoeffer rejected his government's efforts to create a united national Protestant church, the German Christians, that would synthesize National Socialism and Christianity. Instead, he urged evangelical Christians to join the Confessional Church, which opposed Nazism. Bonhoeffer returned to Germany to lead a Confessional Church seminary at Finkenwalde, which was closed by the authorities in October 1937.

In 1938, Bonhoeffer's brother-in-law Hans von Dohnanyi introduced him to Major General Hans Oster, Colonel General Ludwig Beck, and Admiral Wilhelm Canaris of the Abwehr. Bonhoeffer then decided to offer active resistance to the regime, and by 1939, he had become a double agent in Canaris's counterespionage service. As an Abwehr counterspy, he maintained links abroad and held to his pacifist principles.

In Stockholm in 1943, Bonhoeffer secretly saw Anglican Bishop George Bell of Chichester, England, for the Abwehr. This meeting failed to gain Allied support for the German resistance. Bonhoeffer also participated in Abwehr Operation SEVEN to spirit Jews out of Germany.

Arrested by the Gestapo on 5 April 1943 on charges of conspiring to overthrow the regime, Bonhoeffer was held at the Tegel, Buchenwald, and Flossenburg concentration camps. He was hanged at Flossenburg on 9 April 1945. Many Christians consider him to be a martyr.

Bór-Komorowski, Tadeusz (1895–1966)

Polish army general and commander of the armed underground movement in Poland. Born in Chorobrów, a village in the Brzeżany district of Austrian Poland, on 1 June 1895, Tadeusz Bór-Komorowski joined the Austro-Hungarian army in 1913 and studied at the Military Academy in Vienna. Until 1918, he fought on the Russian and Italian Fronts, attaining the rank of second lieutenant. After 1918, he served in the Polish army, mostly commanding cavalry units, and he was promoted to colonel in 1933.

Komorowski was supervising a cavalry training center in the Polish Corridor (the territory separating East Prussia from the rest of Germany) at the time of the September 1939 German invasion of Poland. Although his unit was forced to surrender at the end of September, Komorowski avoided capture and joined the underground *Związek Walki Zbrojnej* (ZWZ, Union for Armed Struggle) in Kraków.

In May 1940, the commander in Chief of Polish armed forces in exile, General Władysław Sikorski, sent Komorowski to Warsaw as a brigadier general and deputy commander to General Stefan Rowecki, then leader of the ZWZ. When the Gestapo arrested Rowecki in 1943, Komorowski replaced him, under the pseudonym *Bór*, as commander of the armed underground movement, which had become the *Armia Krajowa* (AK, Home Army) in 1942.

On Komorowski's orders, given with the approval of the government-in-exile's delegate in Poland, the Home Army rose against the German occupation in Warsaw on 1 August 1944. Although the Germans were hard-pressed to put down this Polish effort to retake Warsaw, the uprising ended in utter defeat for the Poles after two months of heavy fighting.

After his promotion to commander in chief of the Polish armed forces on 30 September, Komorowski was captured by the Germans in October 1944. Liberated by the U.S. Army on 5 May 1945, he emigrated to London and resigned as commander in chief in 1946. As prime minister of the Polish government-in-exile from 1947 to 1949, Komorowski remained a prominent member of the Polish émigré community until he died in England on 24 August 1966.

Bormann, Martin Ludwig (1900–1945)

German official who was head of the Chancellery and Adolf Hitler's private secretary. Born in Halberstadt, Germany, on 17 June 1900, Martin Bormann served in the German army at the end of World War I. He then joined the *Freikorps*, but in 1924, he was sentenced to a year in prison for committing a vengeance murder.

Martin Bormann, Nazi Party secretary and private secretary to Adolf Hitler. (Corbis)

After his release, Bormann joined the National Socialist Party and was attached to the *Sturmabteilungen* (SA, Storm Troops) Supreme Command. From July 1933, he was the chief of staff in the office of Deputy Führer Rudolf Hess. Diligent and efficient, Bormann began his rise to power. He secured Hitler's trust by running his villa, the *Berghof*, at Berchtesgaden. He then began taking over Hess's duties and made himself indispensable to Hitler.

In May 1941, Hess flew to Scotland. Hitler then abolished the Office of Deputy Führer and renamed it the Party Chancellery, choosing Bormann as its head. In April 1943, Bormann was appointed secretary to the Führer. He wrote down all of Hitler's commands, translating them into firm orders, and he controlled access to the Führer. He proved himself a master of intrigue and manipulation. He was virtually Hitler's deputy and, some would argue, the second most powerful man in the Reich.

Skillfully steering Hitler into approving his own schemes, Bormann acquired the inside track for displacing dangerous rivals. Always a guardian of Nazi orthodoxy, he strengthened the Nazi Party and increased his grip on domestic policy. He

advocated radical measures when it came to the treatment of Jews, the conquered peoples, and prisoners of war.

In October 1944, Bormann became executive head of the Volkssturm (militia). He signed Hitler's last will and testament and was present when the Führer committed suicide in the Chancellery bunker on 30 April 1945. Bormann then left the bunker. Most likely, he was killed trying to cross the Soviet lines. Doubts, however, persisted, and numerous sightings of Bormann were reported. He was sentenced to death in absentia at the Nuremberg war crimes trials. Bormann was pronounced dead in 1973 after his remains were found in Berlin and identified.

Bougainville Campaign (1 November 1943–15 August 1945)

One of the northern Solomon Islands, Bougainville is approximately 130 miles long and 48 miles across at its widest point. The Allies established and held a bridgehead there beginning in November 1943, in order to help neutralize the nearby Japanese base at Rabaul on New Britain Island.

On 1 November 1943, Allied forces, organized into the I Marine Amphibious Corps under Lieutenant General Alexander A. Vandergrift (after 9 November, under Major General Roy S. Geiger), landed at Empress Augusta Bay about midway up the west coast of Bougainville. Japanese Lieutenant General Hyakutake Haruyoshi's Seventeenth Army defended the island. During the next days, in the Battle of Empress Augusta Bay, U.S. Navy forces turned back an attempt by a Japanese task force to attack the landing force, while Allied air units secured aerial supremacy over Bougainville. Later that month, American destroyers intercepted a Japanese task force bringing reinforcements to nearby Buin Island in the Battle of Cape St. George, sinking two Japanese destroyers and a destroyer transport and halting further Japanese shipment of reinforcements to the Solomon Islands.

Initially, Hyakutake, who had 40,000 troops and 20,000 naval personnel, put up little resistance in the belief that the U.S. landing was a ruse. Moreover, he was hindered in organizing a counterattack by the island's rugged terrain. During the next weeks, the invading Marines expanded their perimeter to the ridges overlooking the bay and established a strong defensive position while construction units built airfields to assist in the defense of the bridgehead and to attack Rabaul. In December 1943, the Marines were withdrawn, and defense of the bridgehead was entrusted to the U.S. Army XIV Corps, commanded by Major General Oscar W. Griswold.

In March 1944, Hyakutake finally launched a major offensive to destroy the bridgehead, hurling 15,000 men against the 60,000 Americans defenders. Fierce battles took place at the "Creeks" area and Hill 700 in the middle of the perimeter and at Hill 260 on the east side. The American positions were too strong, however, and by the end of the month, the Japanese had been repelled, having lost 5,000 killed and another 5,000 wounded.

By this time, Rabaul had been effectively neutralized, and thereafter, Bougainville, which had provided vital air bases for the victory, became a backwater. The Japanese, cut off from outside aid, were content to be contained, and Griswold saw no need to undertake an offensive against them as long as the bridgehead was secure. U.S. forces engaged only in aggressive patrolling to keep the Japanese off balance. At the end of 1944, the Australian I Corps, commanded by Lieutenant General Sir Stanley Savige, replaced the Americans in the bridgehead. Unlike the Americans, the Australians were not content to be garrison troops, and in early 1945, Savige launched an offensive to wipe out the remaining Japanese. Although they were handicapped by disease, starvation, and supply shortages, the Japanese resisted in sustained fighting until the end of the war, losing 18,000 dead to all causes; the Australians suffered 516 killed and 1,572 wounded. Of the 60,000 Japanese on Bougainville when the Americans landed, only 21,000 remained to surrender in August 1945.

Bradley, Omar Nelson (1893–1981)

U.S. Army general and commander of 12th Army Group. Born in Clark, Missouri, on 12 February 1893, Omar Bradley secured an appointment to the U.S. Military Academy in 1911. He graduated in 1915, a member of what would become known as the “class the stars fell on,” and was commissioned a second lieutenant of infantry.

Assigned to the 14th Infantry Regiment in Spokane, Washington, Bradley saw service along the Mexican border during the 1916 crisis that followed Pancho Villa’s raid on Columbus, New Mexico. Like his classmate Dwight D. Eisenhower, Bradley missed combat in World War I. During the interwar period, his career followed a familiar pattern, with a number of troop commands interspersed with assignments at various military schools, including West Point. His most significant assignment was as chief of the Weapons Section

during Colonel George C. Marshall’s tenure as deputy commandant at the Infantry School at Fort Benning, Georgia.

Bradley graduated from the Army War College in 1934. Following service in General Marshall’s secretariat of the General Staff between 1939 and 1941, he was promoted to brigadier general in February 1941 and assigned command of the Infantry School. Promotion to major general followed in February 1942, and Bradley successively commanded the 82nd Infantry Division and the 28th National Guard Division. In February 1943, Marshall dispatched him to North Africa, where General Eisenhower assigned him as deputy commander of Lieutenant General George S. Patton’s II Corps in the wake of the Kasserine Pass debacle. When Patton assumed command of Seventh Army, Bradley took command of II Corps and led it with great distinction both in Tunisia and in Sicily.

In October 1943, Bradley assumed command of First Army and transferred to England to prepare for the cross-Channel invasion. He commanded U.S. ground forces on D day in

General Omar Bradley, 1950. (Library of Congress)

Operation OVERLORD and during the ensuing Normandy Campaign. On 26 July, First Army broke the German lines outside Saint-Lô in Operation COBRA, Bradley's operational masterpiece. On 1 August 1944, he assumed command of 12th Army Group, which then encompassed General Courtney Hodges's First Army and General George Patton's Third Army.

During the subsequent drive across France, Bradley performed well but not spectacularly. His failure to close the Falaise-Argentan gap reflected poorly on his ability as a strategist and undoubtedly extended the war in the west. When Hitler launched the Ardennes counteroffensive, Bradley was slow to react, but in the subsequent campaign, he renewed Marshall's and Eisenhower's confidence by carefully orchestrating the advance of the American armies on Field Marshal Bernard L. Montgomery's right flank. By war's end, Bradley had clearly emerged as Eisenhower's most trusted military adviser. As 12th Army Group grew to include four separate armies, the largest purely American military force in history, Bradley was promoted to full general in March 1945, on the eve of Germany's capitulation.

Following the war, Bradley headed the Veterans' Administration, and in February 1948, he succeeded Eisenhower as army chief of staff. In this post, he championed the continued unification of the nation's armed forces. One year later, he became the first chairman of the Joint Chiefs of Staff and was subsequently promoted to the five-star rank of General of the Army in September 1950. During the Korean War, Bradley supported President Harry S Truman's relief of General Douglas MacArthur and opposed expansion of the war. Bradley retired from active military service in August 1953 to become chairman of the board of Bulova Watch Corporation. During the Vietnam War, he served as an adviser to President Lyndon Johnson. Bradley died on 8 April 1981, in Washington, D.C.

Brauchitsch, Heinrich Alfred Hermann Walther von (1881–1948)

German army field marshal who became chief of staff of the army in 1938. Born in Berlin on 4 October 1881, Heinrich Alfred Hermann Walther von Brauchitsch entered the 3rd Guards Field Artillery Regiment in 1901. He was promoted to captain in 1904, and between 1910 and 1912, he studied at the War Academy and served as a General Staff officer in Berlin. During World War I, he continued as a staff officer in several divisions and then a corps.

Brauchitsch remained in the Reichswehr after the war. In 1921, he commanded an artillery battery, and the next year, he served as a staff officer in the Truppenamt (the secret General Staff), organizing maneuvers to test the employment of motorized troops supported by aircraft. In 1925, as a lieutenant colonel, he commanded a battalion of the 6th Artillery Regiment. Following additional staff work, he was promoted to colonel in 1928. Two years later, he was made General-major (U.S. equiv. brigadier general) and became a department head in the Truppenamt. In 1932, he was inspector of

German General Walther von Brauchitsch. (Hulton Archive/Getty Images)

artillery, and a year later, he was promoted to Generalleutnant (U.S. equiv. major general) and took command of both the Königsberg Military District and the 1st Division. In 1935, he commanded the I Army Corps at Königsberg, and in April 1936, he was advanced to General der Artillery (U.S. equiv. lieutenant general). Brauchitsch was responsible for developing the 88 mm gun, one of the best artillery pieces of World War II, as both an antitank and antiaircraft weapon.

In 1938, when General Werner von Fritsch resigned as chief of staff of the army, Adolf Hitler promoted Brauchitsch to Generaloberst (U.S. equiv. full general) and appointed him to succeed Fritsch. He was an enthusiastic National Socialist, but he opposed Hitler's plans for territorial expansion, although not with the passion of his predecessor. Brauchitsch also believed strongly that the military should maintain a neutral stance in politics, and he felt bound by his soldier's oath to obey Hitler as commander in chief.

Brauchitsch coordinated the early German victories in World War II, in Poland, France and the Low Countries, and the Balkans. He opposed the stop order during the campaign for France that allowed the British Expeditionary Force (BEF) to escape at Dunkerque. Hitler raised Brauchitsch to field

marshal in July 1940, but the German invasion of the Soviet Union, Operation BARBAROSSA, increased tensions between the two men. The general believed Moscow should be the primary target, whereas the Führer ordered a shift toward Leningrad in the north and the Donets Basin in the south. Brauchitsch also opposed Hitler's stand-fast order calling on the army to hold fast in the face of the Soviet counter-offensive, believing the army should withdraw to more easily defended positions. Ultimately, Hitler went so far as to blame Brauchitsch for the failure of the 1941 offensive in the Soviet Union.

On 9 December 1941, Hitler dismissed the general and assumed the post of commander of the army himself. Brauchitsch retired from the army 10 days later. Listed as a major war criminal and in poor health, he testified at the International War Crimes Tribunal at Nuremberg. He died in a British military hospital at Hamburg-Barmbeck while awaiting trial, on 18 October 1948.

Braun, Wernher von (1912–1977)

German physicist and rocket scientist who relocated to the United States and helped develop the U.S. space program. Born in Wirsitz, Posen, Germany (now Poland), on 23 March 1912, Wernher von Braun decided as a teenager to become a physicist and pioneer in space rocketry. After graduating from the Berlin Institute of Technology in 1932, he earned a doctorate in physics from the University of Berlin, concentrating on developing liquid-fueled rocket engines.

In 1932, the German military began funding von Braun's work, and after heading a team of 80 engineers building rockets in Kummersdorf, he took over a new, custom-designed facility at Peenemünde in the Baltic, the remoteness of which allowed long-range rocket testing. By 1943, von Braun's team had successfully developed several rockets—the A-2, A-3, and A-4, the last capable of reaching Britain. Von Braun made no secret of his interest in sending rockets to explore space rather than using them as weapons, leading the German Schutzstaffel (SS) and Gestapo to arrest him for frivolous indulgence.

German physicist and rocket scientist Wernher von Braun, with globe. (Photo taken between 1950 and 1970, Library of Congress)

In 1943, as an Allied victory seemed increasingly likely, Adolf Hitler ordered von Braun's group to develop the A-4 as a "weapon of vengeance" to shower explosives on London. Von Braun's colleagues argued that, without him, they could not accomplish this task, so he was freed. The first operational V-2 ("Vengeance") rocket was launched in September 1944.

In early 1945, fearing for his group members' personal safety and the program's future, von Braun stole a train, forged travel documents, and led his production team to surrender to U.S. military representatives in western Germany. The Americans seized V-2s, spare parts, and scientific documents from the Peenemunde and Nordhausen facilities and gave von Braun and 126 of his scientists visas for the United States. The group initially settled at Fort Bliss, Texas, but transferred to Huntsville, Alabama, in 1950, where they shared their knowledge with American scientists and laid the foundations of the U.S. rocketry and space-exploration programs.

Von Braun's well-publicized suggestions that the United States build a space station and launch manned missions to the moon contributed to the establishment of the National Aeronautics and Space Administration in 1958, Skylab, and the Apollo space program during the 1960s. Von Braun retired in 1972, and he died at Alexandria, Virginia, on 16 June 1977.

Brereton, Lewis Hyde (1890–1967)

U.S. Army Air Forces and U.S. Air Force general who served in numerous theaters and campaigns during World War II. Born on 21 July 1890 in Pittsburgh, Pennsylvania, Lewis Brereton attended St. John's College in Annapolis, Maryland, for two years before entering the U.S. Naval Academy, where he graduated in 1911. He then gave up his ensign's commission to secure a commission as a second lieutenant in the U.S. Army coastal artillery.

In 1912, Brereton transferred to the Aviation Section of the Signal Corps and became a pilot the following year. When the United States entered World War I in April 1917, he was among the first aviators of the American Expeditionary Forces (AEF) in France. As commander of the 12th Aero Squadron between March and October 1918, he shot down four German planes and earned the Distinguished Service Cross.

Following occupation duty in Germany, Brereton served as air attaché in Paris from 1919 to 1922. He next was an instructor at Kelly Field, Texas, and Langley Field, Virginia, and commanded the 2nd Bombardment Group. He graduated from the Command and General Staff School in 1927 and then held a succession of assignments. Promoted to temporary brigadier general in 1940, he commanded the 17th Bombardment Wing at Savannah, Georgia. The next year, he advanced to major general and commanded the Third Air Force at Tampa, Florida.

In November 1941, Brereton took command of the Far Eastern Air Force in the Philippines. General Douglas MacArthur refused him permission to launch an immediate strike on Formosa following the Japanese attack on Pearl Harbor, and as a result, nearly half of his planes were destroyed in the Japanese attack of 8 December 1941. Following the fall of the Philippines, Brereton took command of Tenth Air Force in India.

In June 1942, he went to Cairo to command the Middle East Air Force, later designated the Ninth Air Force. He planned the air strikes against the oil refineries of Ploesti, Romania, in August 1943. One year later, as a lieutenant general, Brereton took command of the First Allied Airborne Army, which participated in Operation MARKET-GARDEN, the unsuccessful Allied invasion of the Netherlands. In December 1944, during the Battle of the Bulge, Brereton's planes dropped supplies to the encircled 101st Airborne Division at Bastogne, Belgium, and in March 1945, they dropped troops near Wesel, Germany, in Operation VARSITY to secure a bridgehead over the Rhine.

After the war, Brereton again commanded the Third Air Force at Tampa, Florida. He transferred to the U.S. Air Force in 1947 and was a member of the Military Liaison Committee of the Atomic Energy Commission before retiring in 1948. Brereton published his memoirs in 1946. He died in Washington, D.C., on 19 July 1967.

Britain, Battle of (10 July–30 September 1940)

A series of individual engagements between the German Luftwaffe and the British Royal Air Force (RAF) between 10 July and 30 September 1940. The battle was first given its name by Prime Minister Winston L. S. Churchill during a speech in the British Parliament on 18 June 1940.

Adolf Hitler assigned the Luftwaffe the task of eliminating the RAF and winning control of the skies over Britain, an essential precondition to the German invasion of England (Operation SEA LION). There were additional reasons for the attack as well. Hitler did not particularly want a war with the British and had publicly appealed for an end to the conflict, only to be rebuffed on each occasion. He nevertheless hoped that if the Luftwaffe were to inflict sufficient damage, the British would be forced to sue for peace. Thus, plans went forward, but Hitler expressly forbade Luftwaffe attacks on civilian targets and on London in particular.

The British frantically worked to prepare for a German invasion, although their army had abandoned most of its equipment in France during the Dunkerque evacuation. They did what they could, removing signposts and such; a blackout had been observed from very early in the war. The Germans were expected to attack in strength by parachute, and there was a certain amount of hysteria about fifth columnists (covert enemy sympathizers) and spies. The British also experimented with means of setting the sea on fire, and Bomber Command secretly trained crews in the use of poison gas.

German plans called for the Luftwaffe to establish air superiority over southern England between 8 August and 15 September. To accomplish this, it had to achieve a highly favorable kill ratio in the air or destroy RAF Fighter Command's infrastructure on the ground, while keeping a sufficiently large fighter force intact to protect the German invasion fleet. Although leaders of the Luftwaffe were confident of defeating the RAF in the air, they were concerned about attrition among German aircraft.

Reichsmarschall (Reich Marshal) Hermann Göring had three Luftflotten available to prosecute the battle (for summary see Table 1). Luftflotte 2, based in Belgium and commanded by Feldmarschall (field marshal) Albert Kesselring, was the largest with 1,206 aircraft, over half of them fighters. General Hugo Sperrle headed Luftflotte 3, with 1,042 aircraft, in France, and Feldmarschall Hans-Jürgen Stumpff commanded Luftflotte 5, based in Norway, with only 155 offensive aircraft.

RAF Fighter Command, headed by Air Chief Marshal Hugh Dowding, was organized into four fighter groups with a total of 754 single-seat aircraft (for summary see Table 2). Air Vice Marshal Sir Quintin Brand commanded 10 Group, covering the southwestern United Kingdom. It bordered 11 Group, headed by Air Vice Marshal Keith Park, which was in the southeast and thus likely to bear the brunt of the German attack. Air Vice Marshal Trafford L. Leigh-Mallory commanded 12 Group in the Midlands, and Air Vice Marshal Richard Saul headed 13 Group, covering northern England and Scotland. Of the four group commanders, Keith Park was probably the most capable.

A significant advantage held by Dowding was that his force had the world's only integrated air defense system. Based on the telephone and teleprinter network, it was very resilient, merging inputs from radar stations and observer corps, filtering friendly or "doubtful" contacts, and devolving responsibility to group and sector levels. Group headquarters (HQs) allocated raids to sectors, which then scrambled fighters and guided them by radio to intercept the attacking aircraft. The system was the product of years of careful thought, and it enabled Dowding to make the most effective use of his scarce resources. The Luftwaffe was, of course, aware that some sort of fighter-direction system was in use but had no idea of its scope or capabilities.

A TURNING POINT? Battle of Britain

The Battle of Britain had important ramifications for the course of World War II. The most immediate of those that aided the Allied cause were the dividends that accrued from the fact that Germany had suffered its first major defeat in the war. The British triumph gave hope to the peoples of occupied countries in Europe and helped feed partisan resistance against German occupation forces. More important, this battle helped convince many in the neutral United States to favor offering greater assistance to Britain. Increasing popular support assisted President Franklin D. Roosevelt in securing passage of the March 1941 Lend-Lease Act, which provided vital war supplies to Britain and to other countries fighting the Axis powers.

In military terms, the Battle of Britain had a tremendous impact on Germany's war effort. The Luftwaffe never fully recovered from its losses in the battle, as Britain then surpassed Germany in aircraft production. Also, because Britain remained in the war, Germany now had to spread its military resources even more thinly, including assisting Italy in combatting British forces in the Mediterranean. Rather than the quick conclusion

of the war that German leader Adolf Hitler and commander of the Luftwaffe Reichsmarschall (Reich Marshal) Hermann Göring had believed was inevitable, the Germans faced a protracted conflict that placed great strain on their limited military resources.

This situation became far worse for Germany with the June 1941 commencement of Operation BARBAROSSA, the German invasion of the Soviet Union. The Battle of Britain played a role even before the opening of hostilities between the Germans and the Soviets. Hitler's decision to conquer the Soviet Union was based on his long-held belief in the need to secure Lebensraum (living space) for the German people, but he also expressed the opinion that a German defeat of the Soviet Union would in turn force Great Britain to surrender. Ultimately, BARBAROSSA resulted in a protracted two-front war in Europe. Following the entry of the United States into the conflict as an Allied power, U.S. military might, as well as substantial American material and military resources provided to Britain and the Soviet Union, presented the Germans with a war that they could not win, for Allied resources far surpassed those available to Germany.

The June 1944 Allied landing in Normandy was the final proof of the importance of the Battle of Britain. This amphibious assault on Hitler's Europe was made possible only because Britain remained a secure base for the assembly of the vast armada needed for the operation. In many respects, the 1940 struggle for mastery of the skies over Britain had changed the entire outcome of World War II in Europe.

In terms of aircraft, the German Messerschmitt Bf-109 and the British Supermarine Spitfire were quite evenly matched; the British Hurricane had a lower performance but was more maneuverable. Both RAF fighters benefited from the introduction of constant-speed propellers and 100-octane fuel during the battle. The Bf-110 was shown to be inferior to single-engined fighters, and the German Junkers Ju-87 Stuka dive-bomber was so vulnerable that it was withdrawn partway through the Battle of Britain. The RAF, however, had much to learn about fighter tactics. The Luftwaffe was using flexible, open formations that had worked well in Spain and earlier in the war. Many RAF squadrons were still using close formations that allowed little tactical flexibility.

About 80 percent of the RAF pilots were British, and roughly 10 percent were from Commonwealth countries, the bulk of them New Zealanders and Canadians, with some Aus-

tralian, South African, and Rhodesian. In June 1940, 1 Squadron of the Royal Canadian Air Force (RCAF) arrived with its own Hurricanes. Most of the remaining 10 percent were pilots who had escaped from occupied Europe (Poles, Czechs, Belgians, Free French), and complete squadrons of Czechs (the 310 and 312 Squadrons) and Poles (the 302 and 303 Squadrons) were formed as the battle progressed. There were probably about 11 American pilots, but since some of them pretended to be Canadian in order to circumvent U.S. neutrality, it is difficult to be sure.

Beginning on 4 July 1940, a few isolated engagements took place between British and German fighters, and on 10 July, the Germans began the actual battle by mounting their first bombing raid against a convoy in the English Channel. The British had one ship sunk and one Hurricane lost; the Germans lost two Dornier Do-17s, two Bf-109s, and a Messer-

schmitt Bf-110. Over the next few weeks, the Luftwaffe mounted repeated raids on convoys and coastal targets and attempted to engage British fighters en masse with fighter sweeps, but RAF controllers carefully avoided fighter-versus-fighter combat. Early in the battle, German harbors and shipping became RAF Bomber Command's priority targets; many minelaying and antishipping sorties were made against the massing invasion barges.

On 12 August, the Luftwaffe attacked and temporarily disabled radar stations at Dover, Pevensey, and Rye, and the Ventnor station was out of action for three days, although a dummy signal was sent out while repairs were made. The following day was designated "Alder Tag" (Eagle Day) and

marked the beginning of the German attack on Fighter Command. The Germans' plan for multiple raids was handicapped by bad weather and poor communications. Some of their bombers attacked without escorts and were lucky to escape with relatively few losses. There was very heavy fighting on 15 August, with the Luftwaffe flying over 2,000 sorties against airfields and aircraft factories. Luftflotte 5 attacked from Norway for the first and last time and was badly mauled. The Luftwaffe lost a total of 75 aircraft in exchange for 34 RAF fighters.

Both sides inevitably overestimated the amount of damage they were inflicting and overinflated claims for propaganda purposes. The Germans believed that the RAF was down to 300 fighters, partly because they had badly underestimated

the production rate of British aircraft. In fact, Dowding still had about 600 fighters. However, the high sortie rate (RAF pilots sometimes flew five missions daily) was beginning to take its toll on the aircrews of both sides, and cases of combat fatigue were becoming more common.

Bad weather between 16 and 19 August offered some respite for the defenders. The Germans then heavily escorted subsequent bombing raids in a bid to wear down the last few British fighters. The RAF's 11 Group suffered determined attacks on several airfields, and a dispute broke out between Park, who used squadron-sized attacks, and Leigh-Mallory, who favored use of a "big wing" of five squadrons to deal a crushing blow to the enemy. However, the big wing took so long to assemble that it only contacted the Germans at full strength on three occasions, and the large number of fighters involved led to exaggerated claims that gave a misleading impression of its effectiveness.

Toward the end of August, Dowding was beginning to run out of pilots, in spite of transfers from other commands and the length of the pilot training course being cut. The Poles of 303 Squadron were declared operational and quickly became the squadron in Fighter Command with the highest kill-to-loss ratio, 14-to-1.

Following the inadvertent jettisoning of German bombs over London and subsequent night raids by the RAF on Berlin, the Luftwaffe shifted its focus to London on 7 September. With hindsight, this decision can be seen as a mistake, but the prevailing view in the Luftwaffe was that the RAF had taken heavy damage and had few fighters left. On 15 September, the Luftwaffe launched a large attack protected by many escorts that were progressively engaged by Park's fighters as the force approached London, where the bombers were confronted by Leigh-Mallory's big wing. Many aircraft were

shot down on both sides; the RAF claimed 185 kills, but the Luftwaffe actually lost 56 aircraft against 28 RAF fighters.

On 27 September, Germany's Operation SEA LION was postponed indefinitely. At Benito Mussolini's insistence, however, units of the Italian Regia Aeronautica (the Italian air force) arrived in Belgium in mid-September and began training for attacks in England. They were, however, equipped with obsolete and obsolescent aircraft, and on their only daylight raid, on 11 November 1940, nearly half of the attacking force of two dozen aircraft were shot down, with no loss to the RAF. German daylight raids continued during October but tailed off through November as the emphasis gradually shifted to night attacks.

The Luftwaffe had effectively blunted itself on the most sophisticated air defense system in the world and was never again to be as strong relative to its opponents. In the Battle of Britain, the Luftwaffe had 2,698 experienced aircrew killed or captured, resulting in a shortfall that the German training machine was poorly equipped to make up. The RAF lost 544 fighter pilots and over 1,100 bomber aircrew, but it learned several important lessons and built up a cadre of experienced fighter units.

Brooke, Sir Alan Francis (First Viscount Alanbrooke) (1883–1963)

British army general and chief of the Imperial General Staff from December 1941 to January 1946. Born 23 July 1883 in Bagnères de Bigorre, France, Alan Brooke graduated from the Royal Artillery School at Woolwich and was commissioned in the Royal Artillery in December 1902. He served in Ireland and India in the years before World War I. On World War I's Western Front, he rose from captain to lieutenant colonel.

Field Marshal Sir Alan Brooke, Chief of the British Imperial Staff during WWII. (Getty Images)

Between the wars, Brooke was an instructor at the Staff College (1923–1926), commandant of the School of Artillery (1929–1932), and inspector of artillery as a major general by 1935. Early on, it was clear his was one of the strongest intellects in the British army.

On the eve of war (31 August 1939), Brooke was appointed commander of II Corps of the British Expeditionary Force (BEF) in France, a position that lasted until his evacuation with many of his troops at the end of May 1940. He briefly returned to France from 12 to 18 June 1940, this time as nominal commander of the BEF. He became commander of the Home Forces on 19 July 1940, working to improve readiness for the expected German invasion.

Brooke was named chief of the Imperial General Staff (IGS) on 25 December 1941 and held the post until 25 January 1946, serving concurrently (from March 1942) as chairman of the Chiefs of Staff Committee. He was constantly in meetings, including all summit conferences from 1942 through 1945 concerned with the strategic direction of the war. He held off the American desire for a premature cross-Channel invasion while supporting action in North Africa and Italy to spread and destroy German forces prior to an invasion of France.

Brooke's feelings toward Prime Minister Winston L. S. Churchill varied from admiration to exasperation. Churchill's penchant for late-night meetings, his impetuosity or interference in military affairs, and his focus on detail at the expense of broader strategic thinking constantly tried his patience. Brooke's diaries, first published in highly edited fashion in the mid-1950s (and only made available in their full form in 2001), include some of the first postwar criticism of Churchill. Brooke grew to hate the meetings of the Combined Chiefs of Staff for the constant wrangling that arose—especially given his dim view of the strategic thinking of U.S. military leaders, especially Generals George C. Marshall and Dwight D. Eisenhower. A firm supporter of General Bernard Montgomery, he had little patience for those he believed to be of limited abilities.

Promoted to field marshal in January 1944, Brooke was created a baron (becoming Lord Alanbrooke of Brookborough in September 1945) and a viscount (in January 1946) and was knighted later in 1946. He died on 17 June 1963 at Ferney Close, England.

B-29 Raids against Japan (June 1944–August 1945)

The attacks on Japan by the B-29 Superfortresses of the Twentieth Air Force, part of the U.S. Army Air Forces (USAAF), began in June 1944 and were key components in the series of shocks that produced the Japanese surrender in August 1945. The bombers burned down cities, mined waterways, destroyed major industrial targets, and eventually dropped two atomic bombs.

Planning for the use of the long-range B-29s against Japan did not begin until early 1943. Operation MATTERHORN,

launching these heavy bombers from China, was finally approved at the Cairo Conference in December 1943, and the Combined Chiefs of Staff there also supported basing in the Mariana Islands. In April 1944, General Henry "Hap" Arnold established the Twentieth Air Force, to be commanded out of Washington so he could keep the B-29s under his control. The first aircraft were rushed to the Far East that month.

Primary bases for the XX Bomber Command of the Twentieth Air Force were located in India, with forward operating fields in China. Results were disappointing, even after Arnold sent his best problem-solver and combat commander, Major General Curtis LeMay, to take over the troubled unit. Facilities were austere, supply lines were long, crew training was inadequate, and the hastily fielded B-29s suffered from a host of technical problems, especially with their engines. In 10 months of operations, the XX Bomber Command delivered fewer than 1,000 tons of bombs to Japan, all against targets in Kyushu.

The USAAF had greater hopes for the XXI Bomber Command based in the Marianas, which launched its first attack on Japan in late November. This unit had better logistics and more secure airfields, and it was closer to Japan than the XX Bomber Command. Arnold expected Brigadier General Haywood Hansell, one of the architects of precision-bombing doctrine, to exert decisive airpower against Japan's homeland fortress and prove the worth of an independent air service. But Hansell was unable to put his theories into effective practice. In addition to the same problems faced in MATTERHORN, the XXI Bomber Command ran into a combination of cloud cover and jet stream winds over targets that rendered high-altitude precision bombing almost impossible.

In January 1945, a frustrated Arnold decided to consolidate all B-29s in the Marianas under LeMay, who reorganized the staff, instituted new training, and improved maintenance. After a month of ineffective precision attacks, however, LeMay, on his own initiative, shifted tactics as well. He adopted low-level, night, area, incendiary attacks, designed to cripple key targets by burning down the cities around them and to destroy the Japanese ability and will to carry on the war. The first raid on Tokyo on the night of 9–10 March was a spectacular success militarily, killing more than 90,000 people and incinerating 16 square miles. By the end of the war, B-29s had burned out 178 square miles in some 66 cities and killed many hundreds of thousands of people.

The Superfortresses also performed other missions against the enemy home islands. A psychological warfare campaign to drive panicked civilians out of targeted cities caused over 8 million Japanese to flee to the countryside. Mines dropped in waterways during the last five months of the war sank or damaged over 1 million tons of scarce shipping. And of course, B-29s from the 509th Composite Bomb Group dropped two atomic bombs. Japanese leaders and

Formation of B-29s releasing incendiary bombs over Japan in June 1945. (Library of Congress)

postwar bombing evaluations acknowledged that the B-29s made a significant contribution to ending the war.

Buckner, Simon Bolivar, Jr. (1886–1945)

U.S. Army general and head of the Alaska Defense Command from 1940 to 1944. Born near Munfordville, Kentucky, on 18 July 1886, Simon Buckner Jr. was the son of a Confederate army general and governor of Kentucky. He graduated from the U.S. Military Academy in 1908 and was commissioned a second lieutenant of infantry. Assignment to the Aviation Section of the Signal Corps kept him in the United States

Major General Simon Bolivar Buckner Jr., commanding general of the Alaska Defense Command, at his headquarters in Alaska, awarding the distinguished service medal to Colonel Benjamin B. Talley, engineering officer who planned and supervised the construction of all army installations in Alaska, 1943. (Library of Congress)

during World War I but made him one of the most air-minded of the army's ground officers. Buckner was an instructor in tactics at West Point between 1919 and 1923. He then completed the Advanced Infantry Course. After graduating from the Command and General Staff School in 1925, he continued there as an instructor from 1925 to 1928. He graduated from the Army War College in 1927, where he would also be an instructor between 1929 and 1932. Buckner returned to West Point as an instructor, and from 1933 to 1936, he was commandant of cadets.

Promoted to colonel in 1937, Buckner commanded the 66th Infantry Regiment in 1937 and 1938. He was then on duty with the Civilian Conservation Corps in Alabama between 1938 and 1939, before serving as chief of staff of the 6th Infantry Division in 1939 and 1940. Buckner was promoted to brigadier general in October 1940 and to major general in August 1941. Between 1940 and 1944, he headed the Alaska Defense Command. His primary responsibility was the construction of defense facilities, but units of his command cooperated with the navy in evicting the Japanese from two of the Aleutian Islands, Attu and Kiska.

A month after being promoted to lieutenant general in May 1943, Buckner went to Hawaii to organize the new Tenth Army. He headed an army review panel that investigated the intraservice dispute over Marine Lieutenant General Holland M. Smith's relief of Army Major General Ralph Smith on Saipan. Buckner commanded the main landings on Okinawa in April 1945. Citing logistical difficulties, he rejected navy pleas that he mount a subsidiary landing on the south end of the island.

On 18 June 1945, just three days before organized Japanese resistance ended, Buckner was killed by a coral fragment sent flying by the explosion of a Japanese shell. He was the highest-ranking American officer killed by enemy fire during the war.

Budenny, Semen Mikhailovich (1883–1973)

Marshal of the Soviet Union and commander of the Red Army Cavalry. Born on 25 April 1883 on a farm near Platoskaya,

Marshal of the Soviet Union Semen Mikhaylovich Budenny. (Hulton-Deutsch Collection/Corbis)

Russia, on the Don River, Semen Budenny entered the tsarist army at age 20 and served as a dragoon in the 1904–1905 Russo-Japanese War. In 1907, he attended cavalry school, graduating with the rank of sergeant. Returning to his regiment, he served as a platoon sergeant during World War I.

In the Russian Civil War in 1918, Budenny joined a partisan cavalry regiment that grew to a brigade and then a division. Given brigade command, he showed great talent as a cavalry commander at the Battle of Tsaritsyn. During the war, Budenny distinguished himself against the best opposing White (counterrevolutionary forces) cavalry generals, and he ended the civil war in command of a cavalry army. Assigned to support the Western Front, he and Kliment Voroshilov—encouraged by political officer Josef Stalin—refused to obey front commander General Mikhail Tukhachevsky's orders, which led to the 1921 defeat of the Red Army in Poland.

Budenny was appointed deputy commander of Cavalry Forces in 1923. When that post was abolished in 1924, Stalin secured Budenny's appointment as inspector of the cavalry. Despite this relatively modest post, he was one of five generals appointed marshal of the Soviet Union in 1935.

During the 1937 military purges, Budenny headed the Moscow Military District and served on the tribunal that con-

demned his colleagues to death. But poor troop performance during the Finnish-Soviet War (1939–1940, Winter War) exposed Budenny's outdated training views, causing his removal from district command and appointment to the honorific post of deputy defense commissar. He held this post when the Germans attacked in 1941.

Given command of the strategic Southern Axis, Budenny became responsible for Kiev, which Stalin ordered not to be surrendered. When it became apparent that the city would fall, Budenny recommended its abandonment, resulting in his relief and transfer to command the Reserve Front behind Moscow.

Unable to organize an effective defense when the German army launched its advance on Moscow, Budenny was replaced by General Georgii Zhukov. In spring 1942, Budenny took command of the strategic North Caucasus Axis but was relieved after the Germans crushed the Crimean Front and raced into the Caucasus. In January 1943, Stalin appointed Budenny commander of the Red Army Cavalry. He held that post until 1953. Budenny died in Moscow on 26 October 1973.

Bulgaria, Air Service

As a defeated Central Power in World War I, Bulgaria was forbidden under the Treaty of Neuilly to maintain an air force. In 1936, however, it illegally reconstituted its air force with German biplanes, adding Polish fighters and German Messerschmitt Bf-109E fighters after 1938. Simultaneous domestic production at the Bulgarian national aircraft factory, Darjavna Aeroplanna Rabotilnitza (DAR), augmented the force. After Bulgaria's declaration of war on Great Britain and the United States in December 1941, the Royal Bulgarian Air Force was further increased through Germany's contribution of a number of ex-Czechoslovakian aircraft. Bulgaria entered the war with 228 fighters, dive-bombers, and medium bombers of German, Polish, and Czechoslovakian design, together with DAR dive-bombers and reconnaissance aircraft.

The Bulgarian air force was largely inactive until mid-1943, when the U.S. Army Air Forces (USAAF) conducted their first major bombing raid on the Axis-held oil fields of Ploesti,

Romania. The Bulgarians' attempt to engage the U.S. B-24 bombers clearly showed that their air arm was hopelessly obsolete. Most of the fighters could not catch the bombers, and Bulgarian aircraft shot down only 2 B-24s. The Germans then provided the Bulgarians with 120 French Dewoitine D.520 fighters and additional Messerschmitt aircraft.

These additional planes did little to improve the effectiveness of the Bulgarian air force. Between December 1943 and January 1944, Allied bombers sortied virtually unmolested over Bulgaria, and their defensive cover of P-38 fighters shot down 39 Bulgarian fighters with negligible losses of their own. Introduction of the superior P-51 Mustang fighter further reduced the effectiveness of Bulgarian air defenses.

After it was invaded and occupied by the Soviet Union in September 1944, Bulgaria switched sides in the war. Royal Bulgarian Air Force units then provided ground support for the Red Army in Yugoslavia and Hungary.

Bulgaria, Navy

Bulgaria has never maintained a large navy, but the diminutive size of its naval force by the late 1930s was also the product of treaty restrictions stemming from the country's defeat in World War I and the difficult economic conditions Bulgaria faced during the interwar years. The core of the navy consisted of four obsolete Drski-class torpedo boats. Launched in 1907, they displaced 98 tons, were capable of 26 knots, and mounted 3 × 17.7-inch torpedo tubes. The remaining naval unit, the torpedo gunboat *Nadiejda*, was built in 1898 and displaced 715 tons. She was armed with 2 × 3.9-inch guns and two torpedo tubes and had a maximum speed of 17 knots.

This force was augmented after 1937 when Bulgaria entered into a military assistance agreement with Germany, which eventually yielded five motor torpedo boats of the 1939 Lurssen design. These vessels displaced 57.6 tons at full load and were armed with two torpedo tubes and a 20 mm anti-aircraft gun. Their engines could produce a maximum speed of 37.1 knots. On Bulgaria's entry into World War II in March 1941, Germany also supplied three formerly Dutch motor torpedo boats.

The Bulgarian navy saw little action in World War II. Its principal action came in October 1941, when it and the Romanian navy mined Bulgarian coastal waters. Up until

the time Bulgaria was driven from the war and occupied by the Soviet army in September 1944, the navy's chief duties were escorting coastal vessels in the Black Sea and patrolling the Danube River.

Bulgaria, Role in the War

In 1940, Bulgaria had a population of 6,341,000 people. It was ruled by both a tsar and a popularly elected parliament. Tsar Boris III dominated the nation's foreign policy and was

largely responsible for the nation's neutrality on the outbreak of World War II in September 1939. Boris hoped that peace might be quickly achieved in Europe, and he also took note of the fact that although the Bulgarian people were largely pro-Soviet, the officers of the army were pro-German.

The weakness of Boris's policy, however, was the popular desire to attain additional territory in the Balkans. In World War I, Bulgaria had joined the Central Powers in an attempt to recoup territorial losses from the Second Balkan War. The country's defeat in that conflict led to a peace settlement that had further reduced Bulgarian territory. By 1940, the nation remained the only former Central Power that had not regained some of the land lost through the World War I peace treaties. Popular sentiment to redress this situation was high. Germany partially fulfilled these territorial ambitions on 7 September 1940 through the Treaty of Craiova, which granted the area of the southern Dobruja region to Bulgaria.

German interest in Bulgaria was the product of the increased strategic importance of the country. By late 1940, German plans

Tsar Boris III, King of Bulgaria and Adolf Hitler. (Corbis)

for the invasion of Greece and those for the conquest of the Soviet Union rendered Bulgaria much more significant to the Axis cause. On 1 March 1941, Sofia entered into an agreement whereby Bulgaria joined the Tripartite Powers and allowed German troops to move through Bulgarian territory. Unlike governments in other regions of eastern Europe, however, the government of Bulgaria remained autonomous.

Sofia stayed noncommitted militarily until 13 December, when it declared war on the United States and Great Britain; the country never declared war on the Soviet Union. Bulgaria's military participation in World War II was limited to the Balkans and centered on the acquisition of territory. Bulgarian troops did not take an active part in Germany's invasion and conquest of Yugoslavia or Greece, but the army did occupy both the Yugoslav and Greek portions of Macedonia and most of western Thrace.

Beyond these actions, Bulgaria contributed little to the Axis cause and often opposed German requests in both the military and civilian sectors. Military operations were confined to garrison duties in Macedonia and Thrace, despite Berlin's attempts to persuade Sofia to commit troops against the Soviet Union. Boris and his government also compromised little on the issue of the Jews, who formed about 1 percent of the nation's population. By the end of the war, most of Bulgaria's Jews had escaped extermination, although the government had confined them to labor camps to appease Berlin. Boris's opposition to German authority increased after the defeat of Italy, which led him to seek a withdrawal from the war.

Bulgarian fortunes declined after 28 August 1943 with the death of Tsar Boris III. His successor, Simeon II, was a child, and the regency that governed in his stead was less effective than Boris had been. Political unrest was compounded by popular instability due to declining Axis fortunes and a weakening of the Bulgarian home front. On 19 November 1943, Sofia experienced its first heavy attack by Allied bombers, and by late 1943, food and consumer goods were in short supply.

Support for a coalition known as the Fatherland Front and composed partially of Communists subsequently began to rise, as the Soviet Red Army marched toward Bulgaria's northern border in the spring of 1944. Efforts by Sofia to secure a peace settlement with the Americans or the British failed. Amid mounting Soviet pressure for a Bulgarian declaration of war against Germany, a new government acceded to Soviet demands on 8 September after Moscow had declared war on Bulgaria three days earlier. Red Army troops subsequently occupied the country and appointed members of the Fatherland Front to the government.

The new government, eager to please Moscow, committed 450,000 Bulgarian troops to the Red Army for operations in Yugoslavia and Hungary, at a cost of 32,000 killed and wounded. As operations unfolded, Communist officials in

Bulgaria began the process of firmly fixing the country in the Soviet sphere of influence.

Buna, Battle of (16 November 1942–22 January 1943)

Key battle in New Guinea in the Kokoda Trail Campaign. In July 1942, Japanese Major General Horii Tomitaro's South Seas Detachment landed at Buna on the northern coast of Papua, New Guinea. During the next weeks, the force moved south on the Kokoda Trail over the Owen Stanley Mountains toward Port Moresby on the southern coast of New Guinea, from which point they could reach Queensland, Australia, by air. Opposed by Australian and local Papuan forces, the Japanese offensive stalled some 30 miles short of Port Moresby, and during September and October, the remaining Japanese retreated back to Buna. There, the Japanese carved out a fortified zone approximately 16 miles long and 7 miles deep. It was manned by 8,000 troops occupying well-camouflaged bunkers and trenches, most in strong points at Gona and Buna villages and Sanananda Point.

Meanwhile, General Douglas MacArthur, commander of the Southwest Pacific Area, was determined to seize Buna as part of the Allied design to neutralize the Japanese base at Rabaul on New Britain Island. During the fall of 1942, troops from the Australian 7th Division and the U.S. 32nd Infantry Division moved by land and airlift to the Buna area. Because of the reluctance of Allied naval commanders to risk exposing their heavy ships to air attack or the treacherous reefs, MacArthur's divisions had no naval gun support and no transports to carry heavy artillery or tanks. Thus, for fire support, these troops had to depend on aircraft, which proved ineffective, and light guns and mortars, the shells of which bounced off the log walls of the Japanese bunkers.

The Allied attack began on 16 November. The Australians made some limited progress in their assaults on Gona and

The bodies of three U.S. soldiers lying on the beach at Buna, New Guinea, killed in fighting for Buna Gona. (Hulton Archive by Getty Images)

Sanananda. But at Buna, the 32nd Infantry Division faced a tactical nightmare and was stopped in its tracks. Lacking sufficient men, forced to cross nearly impassable swamps and jungles, and encountering murderous machine-gun fire, the division made no headway over the next two weeks despite suffering heavy casualties. High humidity and temperatures as well as jungle diseases added to the hardship.

Convinced the troubles at Buna were the result of poor leadership in the 32nd Infantry Division rather than a lack of proper weapons or the strength of the Japanese positions, MacArthur relieved its commander and turned the battle over to the I Corps commander, Major General Robert L. Eichelberger. Many men in the 32nd believed that MacArthur had done little to support them and did not understand the situation at the front. A resourceful commander committed to the welfare of his men, Eichelberger led from the front and came to be regarded as one of the best Allied commanders in the Pacific. He restored Allied morale and improved the logistical situation. In early December, U.S. engineers were able to open an airfield near Buna, significantly improving the Allied supply situation. The Australians moved in some artillery by air, and they also managed to move in light tanks by coastal barges. The tanks, although few in number, proved invaluable. The fighting was bitter, but on 9 December, the Australians took Gona. The more heavily fortified Buna resisted U.S. pressure, but on 14 December, the Americans took Buna

Village. By 2 January 1943, all of the Japanese in the American sector had been eliminated, and on 22 January, the Australians wiped out the last Japanese pocket at Sanananda.

The cost of the Buna operation was high. Almost all of the Japanese defenders were killed, and on the Allied side, the Australians lost 2,000 dead and wounded and the Americans 2,400. Another 2,900 Americans were hospitalized as a result of disease. Yet for the Allies, Buna was a significant victory, for it provided airfields to support additional offenses in New Guinea and also taught valuable lessons about Japanese tactics and jungle fighting.

Burma Road

Important route by which the Western Allies sent supplies to China. The Burma Road followed an ancient trail that such legendary warriors and adventurers as Kublai Khan and Marco Polo as well as anonymous spice and tea traders had traveled. In the early twentieth century, Chinese laborers transformed the path into a road. The route was further improved between 1937 and 1938 during the Sino-Japanese War. The completed Burma Road stretched approximately 700 miles from Lashio in Burma, then a British colony, to Kunming, capital of China's southwestern Yunnan Province. Chinese troops shipped military supplies from the Irrawaddy River ports at Rangoon on the railroad to Lashio for transportation to China via the Burma Road. When Japanese forces occupied Indochina and China's coastal areas, the interior Burma route became more heavily traveled.

A look at the Burma Road. (Franklin D. Roosevelt Library (NLFDR))

The narrow, twisting Burma Road crossed through jungle, plateaus, mountainous terrain as high as 11,000 feet above sea level, gorges, rivers, and valleys. Steep grades and plummeting drops challenged those who traveled it.

Allied transportation of military supplies from Burma via the road was disrupted when Japanese forces seized its southern end in April 1942. Hoping to delay a Japanese invasion, Chinese troops destroyed the Salween River Bridge and 25 miles of the adjacent Burma Road passing through the river's canyon. China was now isolated from Allied aid and faced perhaps its gravest crisis of the entire war. The United States responded by initiating cargo flights over the Himalayas; however, the cargo capacity of such flights "over the Hump" was severely limited, and the Western Allies feared that China might use its lack of military supplies as the excuse to conclude a separate peace with Japan. By September, Allied forces gained control of some of the region, and Colonel Leo Dawson of the U.S. Army Corps of Engineers had command of road reconstruction. He directed a large group of Chinese engineers and approximately 30,000 local laborers.

In December 1942, U.S. combat engineers began building a road from Ledo in Assam, India, to Burma as an alternate route to bypass the Japanese-controlled sections. As of autumn 1943, Major General Lewis A. Pick directed work on the Ledo Road. By the next summer, builders connected the Ledo and Burma Roads at Mongyu, Burma, and military transport expanded. The two roads, known collectively as the Stilwell Road, were 1,079 miles in length.

Ultimately, some 28,000 U.S. and British engineers and 35,000 Burmese, Chinese, and other ethnic laborers surveyed, cleared, cut rock, widened, and repaired the Burma Road and built bridges. They also built a pipeline paralleling the road. Monsoon winds and the rainy season caused muddy conditions, and workers were plagued by red ants and mosquitoes that transmitted malaria. The strenuous work resulted in more than 1,000 deaths.

The previously Japanese-held parts of the Burma Road were reopened by mid-January 1945, with Pick leading a convoy. By August 1945, 120,000 tons of material and 25,000 vehicles had been transported on the Burma Road.

Following World War II and the Chinese Civil War, parts of the Burma Road fell into disrepair. The road was also altered by the building of more direct routes, and in places, it was improved with easier grades. In some spots, it was widened to as many as six lanes.

Burma Theater (1941–1945)

As part of Japan's southern offensive in the aftermath of its 7 December 1941 attack on Pearl Harbor, its forces landed on the Kra isthmus and moved down Malaysia to take the great British naval base of Singapore. Thereafter, Japan repositioned forces used in the attack on Malaysia and moved into Burma to threaten the British in India. The location and topography of Burma helped determine that it would be a minor theater of action in World War II. As with much of Southeast Asia, the country features mountains and rivers running mostly north and south, and thus, it presented difficult topographical barriers for the Japanese forces advancing from east to west and for the British seeking to move from west to east. Terrain, climate, and disease remained formidable obstacles in the China-Burma-India Theater of War (CBI).

Despite these problems, the Japanese sought to secure Burma in order to cut the so-called Burma Road and further the isolation of China and to bring about an end to the Sino-Japanese War, as well as to stir up nationalist opposition to the British in India. The British government, meanwhile, wanted to keep China in the war and contain Japanese military forces sufficiently to the east to prevent them from encouraging Indian nationalist sentiment.

On 8 December 1941, Japanese Lieutenant General Iida Shōjirō sent the 33rd and 55th Divisions that comprised his Fifteenth Army into Thailand. Then, on 20 January 1942, Iida's reinforced divisions, with air support, crossed into Burma, driving west toward Moulmein and Tavoy. The Japanese had some success in mobilizing Burmese nationalists (notably Aung San) to their cause, promising them independence from British rule. Some uprisings occurred against the British.

The British defenders, initially commanded by Lieutenant General Thomas Hutton, believed the difficult terrain would limit the Japanese to roads and cleared areas. The British suffered early and serious defeats because of this mistaken preconception. On 30–31 January 1942, the Japanese drove Hutton's ill-equipped force—equivalent to two understrength

divisions of British, Indian, and Burmese troops—from Moulmein, inflicting heavy casualties in the process. The faster-moving Japanese then forded the Salween River and outflanked the British left. In the 18–23 February Battle of the Sittang, they nearly surrounded Hutton's entire force, destroying 12 British battalions and virtually all heavy equipment.

On 5 March 1942, Lieutenant General Sir Harold Alexander arrived in Rangoon and took command from Hutton but without markedly different results. Reinforcements from India restored British strength to two small divisions, but Alexander knew he could not hold back the Japanese, and on 7 March, after hard fighting, he abandoned Rangoon and vast storehouses of supplies to the advancing Japanese; Alexander himself barely evaded capture. The Japanese occupied Rangoon the next day.

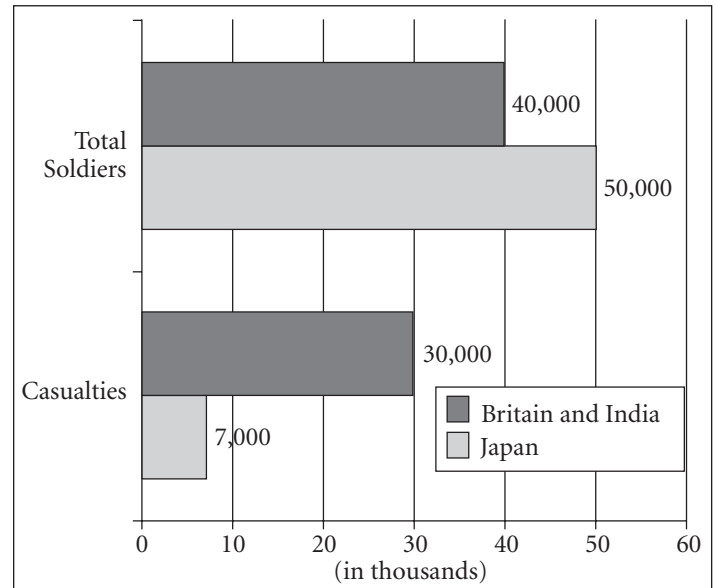

At that point, the understrength Nationalist Chinese Fifth and Sixth Armies, nominally commanded by U.S. Lieutenant General Joseph Stilwell, entered northern Burma along the Burma Road to help the retreating British. The British held the right (southern) side of a rough defensive line across Burma; the two Chinese armies held the center and left. Major General William Slim, who arrived in Burma in mid-March, took command of the Burma Corps, as the British units were titled. Slim turned out to be one of the top field commanders of the war. However, the British continued to move along roads, and the Japanese continued to move through jungle trails and thus were able to outflank and defeat them.

General Iida made plans to attack first at Yenangaung. He intended to occupy the Chinese Fifth Army, leave the Sixth Army to the east alone, and then mass against the Burma Corps at Yenangaung to secure the oil fields there.

On 21 March 1942, the Japanese struck the Fifth Army at Toungoo, cutting off the entire Chinese 200th Division. Chinese counterattacks under Stilwell, supported by Slim's British troops, allowed the 200th Division to fight its way free. Allied forces were slowly driven back, however. Although both Chinese armies at times fought well, they and the British did not cooperate effectively. Both sides were then reinforced, leading to a temporary pause in the fighting. The addition of part of the Chinese Fifty-Sixth Army permitted Stilwell to strengthen his defense of the Rangoon-Mandalay Railroad. Slim and Stilwell now laid plans for a counteroffensive, but Iida had also been reinforced, in the form of two additional divisions freed up by the surrender of Singapore.

The Japanese struck first, attacking the Burma Corps, defending Yenangaung, and holding elsewhere. In the ensuing Battle of Yenangaung (10–19 April 1942), the Japanese temporarily trapped the 1st Burma Division, but British counterattacks, assisted by pressure from the Chinese 38th Division on the Japanese flank, allowed the 1st Division to escape. At this point, the Japanese 56th Division surprised the Chinese Sixth Army in the Loikaw-Taunggyi area and defeated it. On

Casualty Rates in Burma Theater by May 1942

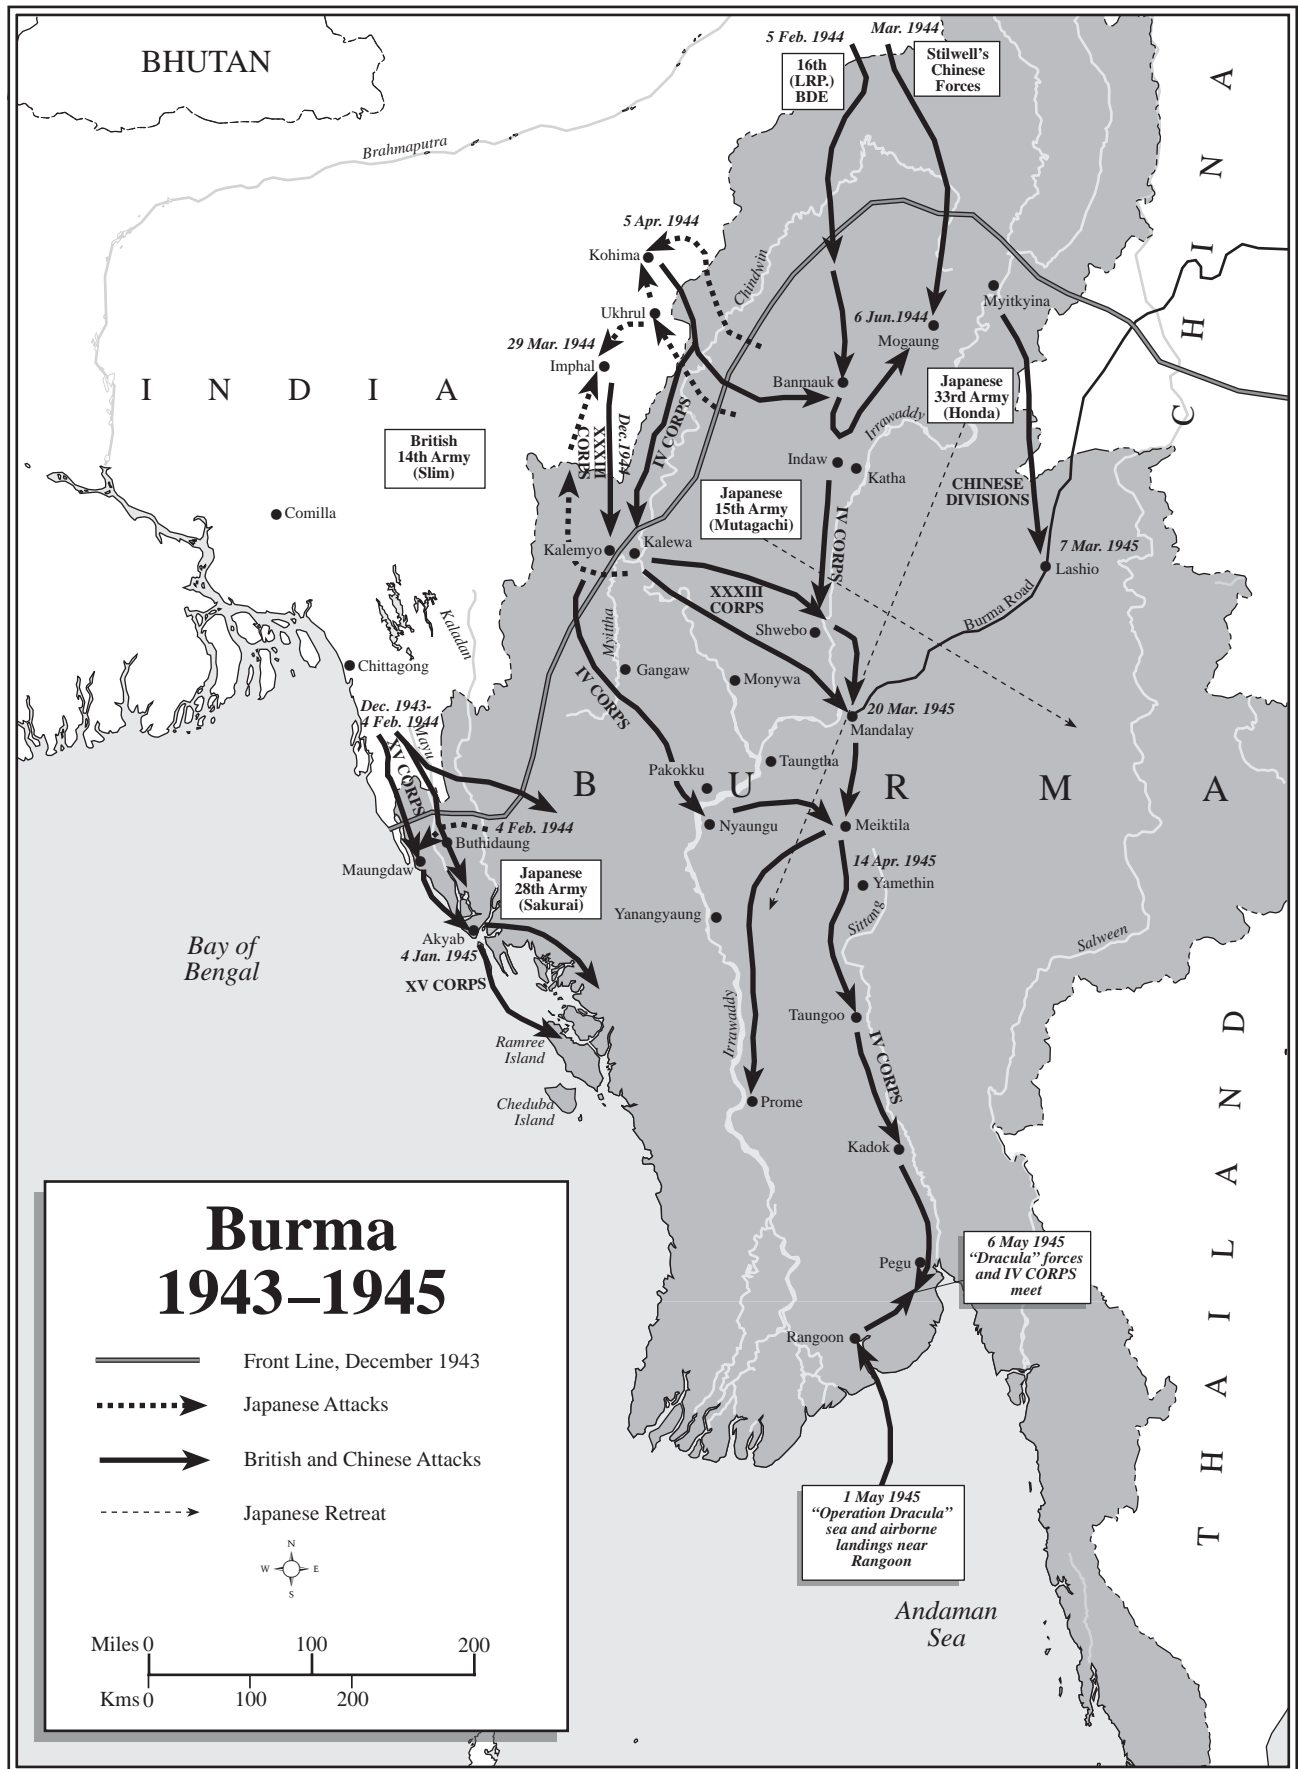

29 April, troops of the Japanese 56th Division entered Lashio and cut the Burma Road to China. Alexander now ordered his troops to withdraw across the Irrawaddy River.

General Slim continued to retreat under heavy Japanese pressure until he reached the Indian border and Imphal, with the Japanese pursuit halting at the Chindwin River. Meanwhile, the Chinese Sixth Army largely disintegrated under Japanese attacks, and other Chinese forces withdrew into Yunnan.

The rainy season beginning in May brought a welcome lull in operations for both sides. The Japanese now occupied four-fifths of Burma and needed time to organize their vast gains there and elsewhere, and the British wanted the respite to prepare a defense of eastern India. The cost of the fighting had been high, particularly for the British. A Japanese army of 50,000 men had beaten 40,000 British and Indian troops and inflicted on them some 30,000 casualties. The Japanese had also defeated 95,000 Nationalist Chinese troops, and only Major General Sun Li-jen's 38th Division withdrew as a fighting unit. At the same time, the Japanese had suffered only some 7,000 casualties themselves.

Allied air support had been largely ineffective. Colonel Claire Chennault's American Volunteer Group (AVG, the Flying Tigers) and Royal Air Force (RAF) fighters did what they could, claiming a high kill ratio against Japanese aircraft. But a surprise Japanese raid on Magwe on 21 March 1941 destroyed most British and American planes there and forced the RAF to withdraw to airfields in India. Although the RAF and Flying Tigers continued to try to assist the withdrawing Allied troops, ground-air communications were poor, and the long distance from their airfields and thus the limited time over target rendered their efforts largely ineffective. The

arrival of long-range Spitfires for the RAF helped somewhat. And in June 1942, with land resupply to China through Burma no longer possible, Stilwell, now commanding the China-Burma-India Theater, began aerial resupply by transport aircraft flying from airfields in northeastern India to Kunming. The planes were forced to fly over the eastern Himalayas, known to the American pilots as “the Hump.”

General Archibald Wavell, now commanding in India, worked to prepare defenses against a possible Japanese invasion of that country from Burma. Wavell realized that it would be a year or more until he would have trained troops and sufficient matériel to assume the offensive, but at the same time, he worried about the effects of inaction on British, Indian, and Burmese morale. As a consequence, he decided to conduct a limited offensive action during the 1942–1943 dry season. Accordingly, in December 1942, the British launched a counterattack by the 14th Indian Division of Indian and British units against Arakan, the northwest coastal province of Burma and an area largely separated from the rest of the country by rugged mountains. Although the Japanese there were badly outnumbered, the 14th Division moved too slowly, allowing the Japanese time to build up their strength and to fortify. Iida rushed in reinforcements, and in March 1943, troops of the Japanese 55th Division went on the offensive and worked their way over the mountains to hit the British in the flank and force their troops back to India by May. The British had again been proven wrong in their assumption that the Japanese would stick to existing roadways.

Meanwhile, Brigadier General Orde Wingate secured Wavell’s approval to try “long-range penetration attacks” with his 77th Indian Brigade, known later as the Chindits (their emblem was a *chintse*, a mythical Burmese beast resembling a lion, and they operated beyond the Chindwin River). This move was a British effort to try to beat the Japanese at their own game in using infiltration tactics. The Chindits would operate deep behind enemy lines in an effort to damage Japanese communications, destroy supplies, and sow confusion. The force of 3,000 Chindits would rely entirely on aerial resupply for food, clothing, medicines, and arms.

The first Chindit raid began with a crossing of the Chindwin River in February 1943. The force managed to cut sections of the Mandalay-Myitkyina and Mandalay-Lashio railroads, and in mid-March, they crossed the Irrawaddy River. This latter move brought major Japanese reaction, forcing a Chindit withdrawal in April. Newspapers in the Allied countries claimed a great victory, but in reality, the raid had been a failure militarily. The damage to Japanese troops and positions was slight, and the raiders lost half of their force.

Although the British fared poorly on land, the Royal Navy continued to control the Indian Ocean, which was immensely important for the long supply lines to the Middle East and to the Soviet Union. Meanwhile, to secure the loyalty of Indian

nationalists, the British held out the promise of eventual sovereignty after the war. The major Allied problems in the Burma Theater remained the nearly complete lack of cooperation between the British and Chinese strategists, the inability to cope with Japanese tactics, and inadequate resources and supplies for a fighting front far down the Allied priority list.

Stilwell now mounted a drive into northern Burma. In February 1943, he committed the American-trained reconstituted Chinese 38th Division in upper Assam on the Burma-India border, where U.S., Chinese, and Indian engineers were building a road from Ledo. The 38th Division drove the few Japanese from the area. In late October, having secured the reluctant support of General Wavell and the agreement of Chinese Nationalist leader Jiang Jieshi (Chiang Kai-shek) to employ his forces to reopen a land route to China, Stilwell committed the 38th Division south into the Hukawng Valley, where it was resupplied entirely by air. At the same time, the Chinese 22nd Division moved up from Ramgarh to Ledo. Meanwhile, Stilwell pushed construction of the road from Ledo.

In late November, Japanese forces struck the 38th and subjected it to punishing attacks, completely cutting off some of its units. U.S. aerial resupply prevented the Japanese from overrunning the troops, however. At the end of December, Stilwell arrived, along with light artillery, and the Chinese then counterattacked, driving the Japanese from the Hukawng Valley.

During January and February 1944, there was stalemate in the Hukawng Valley. Japanese Major General Tanaka Shinichi’s 18th Division halted the advance of the Chinese 38th and 22nd Divisions. The Chinese resumed their advance in late February.

Much of the rest of Burma had remained quiet throughout 1943. In a considerable engineering feat, the Japanese built a 250-mile-long railroad across Burma, in the process employing as slave labor British prisoners captured at Singapore and some American captives. The Japanese utilized the railroad to mass supplies for an attack on eastern India. On 1 August 1943, they also granted Burma its “independence,” although this step did not resonate sufficiently with the Japanese-installed Burmese government to enable Japan to exploit fully Burmese rice and petroleum resources.

The Japanese reorganized their forces in Burma, which were under the overall command of the Southern Resources Area commander, Field Marshal Count Terauchi Hisaichi, in Saigon. In March 1943, Lieutenant General Kawabe Masakazu had assumed command from General Iida of the six Japanese divisions in Burma. Kawabe had direct supervision of the two divisions in southwest Burma; the other four Japanese divisions were in the north under Lieutenant General Mutaguchi Renya. Kawabe directed Mutaguchi to invade eastern India with three of his divisions, and toward that end, the Japanese amassed some 100,000 troops. The Japanese intended to seize the Imphal-Kohima Plain of Manipur, the

A Chinese machine gun crew in their gun pit in the Burmese jungle. (Library of Congress)

logical British staging area for an invasion of Burma from central India. Their second major goal was to take and hold the rail line into Assam that passed through Manipur. Along it flowed most of the supplies that were ferried into China, as well as those destined for Stilwell's divisions in north Burma.

On the night of 3 February 1944, the Japanese attacked in the south, and once again, they surprised the British with the size and speed of the assault. But the now experienced British and Indian troops held their positions even when surrounded and did not surrender their supply dumps, which the Japanese needed to support their advance. British and U.S. aircraft flew supplies to the defenders in Imphal, and other aircraft strafed the Japanese. General Slim also organized a relief column, drove it to Imphal, and broke the siege after 88 days on 22 June. After desperate fighting by both sides, the Japanese, short of supplies and facing the onset of the monsoon season, called off the attack, and Fifteenth Army began to withdraw.

In October 1943, Vice Admiral Lord Louis Mountbatten had taken up his post as commander of the new South-East Asia Command, although command ambiguities remained. He and Slim agreed that British forces could not do much

until the next dry season, although they were willing to organize some spoiling attacks to take pressure off a larger offensive sought by General Stilwell for his Chinese units. Wingate, now a major general and enjoying British Prime Minister Winston L. S. Churchill's full support, planned a second and even more audacious raid for his Chindits that would include three brigades supported logistically by the U.S. Army Air Forces. The operation involved 25,000 men, of whom 3,000 were Americans. Led briefly by Brigadier General Frank Merrill, the U.S. force was known as Merrill's Marauders.

The March 1944 raid began with high promise, but the whole venture was doomed from the start because its success rested on the active participation of Chinese divisions. These forces were being husbanded by Jiang Jieshi, who drove his chief of staff, Stilwell (also commanding all U.S. forces in the CBI), to distraction. In secret instructions to his generals, Jiang sharply limited Chinese military involvement, which in any case proved to be ineffectual. Another factor that contributed to the failure of the raid was the death of Wingate in a plane crash in India on 24 March, whereon Stilwell controlled operations. Wingate and Stilwell were much alike—

both eccentric and dynamic—but they seldom disclosed their intentions, and as a result, there were serious failures in planning and staff work. Stilwell, in fact, disliked the British and did not use the Chindits effectively. Nor did he understand the difficulties facing guerrilla forces while dependent on aerial resupply but operating as conventional units.

The Japanese, heavily outnumbered in the air and lacking other modern weapons, fought back with considerable tenacity. Finally, the monsoon rains that began in mid-May slowed the offensive and brought more malaria. By June, the chief Allied enemies were not the Japanese but exhaustion, malnutrition, and disease. Although the raid inflicted 50,000 Japanese casualties against only 17,000 for the British, Allied forces were obliged to withdraw from Burma in July. Since it was ultimately unsuccessful, the 1944 Burma Campaign has remained a controversial subject. Unfortunately for all involved, it had no practical effect on the outcome of the war.

The lack of Chinese support in this operation displeased U.S. leaders, who had hoped that Nationalist armies would tie down the Japanese forces. Jiang, however, seemed more preoccupied with building up his own strength so that he could do battle with his domestic opposition, the Chinese Communists, after the war. Washington's realization that it could not count on Jiang to fight the Japanese resulted in increased support for forces under Admiral Chester Nimitz in the central Pacific and General Douglas MacArthur in the southwest Pacific.

As the Japanese offensive ended, the Allies began their own offensive in October 1944, with the British largely in support of a Chinese attack. Stilwell employed five American-trained and American-equipped Chinese divisions to take Myitkyana. Opposing them was the Japanese Thirty-Third Army, composed of three depleted divisions commanded by Lieutenant General Honda Masaki. Stilwell hoped to be able to trap the Thirty-Third Army between the five divisions in Burma and the Y-Force in Yunnan. However, Stilwell's poor relationship with Jiang and the situation in China after the Japanese attacked to remove the threat of U.S. strategic bombers there led Jiang to demand that Washington replace Stilwell. This change occurred on 18 October, with Stilwell succeeded by Lieutenant General Daniel Sultan. Jiang's recall of two of the Chinese divisions from Burma to help stop the Japanese offensive in south China brought the Chinese offensive against the Japanese in Burma to a halt in December.

By fall 1944, the Allied position in Burma had improved considerably and the Japanese position had weakened, reflecting the relative fortunes of each side in the larger conflict. General Slim followed up his successful relief of Imphal, and in October, the British crossed the Chindwin River. The new Japanese commander in Burma, Lieutenant General Kimura Heitaro, had 10 divisions. He wanted to let the British advance in the center and outrun their supplies; then, he

would counterattack to cut off and surround the British. This approach set the stage for the climactic battles of 1945.

In December 1944, the Allies assumed the offensive in the south (assisted by landing craft no longer needed for the invasions of France), in the center, and from China in the north. The southern advance required crossing many rivers and canals, and the going was naturally rather slow, although the Anglo-Indian forces regained the port of Akyab and Ramree Island as Kimura withdrew. Meanwhile, two Chinese divisions advanced into north Burma, reopened the Burma Road against negligible Japanese resistance, and seized Lashio in early March.

The chief battle took place in central Burma. Slim figured out Kimura's plan, and with great fanfare, he dispatched forces to cross the Irrawaddy River while sending several divisions quietly to the south to outflank the Japanese, cut their line of communications and retreat, and possibly take the entire Japanese force defending central Burma. Advancing on a 140-mile front, the British captured Meiktila on 4 March. They took Mandalay two weeks later, while repulsing a simultaneous Japanese counterattack against Meiktila.

Slim sought to gain Rangoon while the roads and rice paddies were still sunbaked, dry, and hard. On 3 May, a combined amphibious, land, and airborne attack recaptured the capital city, and the fighting largely came to an end. Most Japanese troops fled to neighboring Thailand.

Byrnes, James Francis (1879–1972)

U.S. politician, wartime "assistant president" to Franklin D. Roosevelt, and secretary of state from 1945 to 1947. Born on 2 May 1879, in Charleston, South Carolina, the son of Irish

immigrants, James Byrnes studied for the law. After qualifying as a lawyer, he won election to Congress in 1910, and in 1930, he became a senator for North Carolina. A longtime friend of President Roosevelt, Byrnes used his considerable negotiating talents to steer New Deal legislation through Congress from 1933 onward. In 1941, Roosevelt appointed him to the Supreme Court.

Sixteen months later, in 1942, Byrnes left the bench to head the new Office of Economic Stabilization. The following year, he became director of the Office of War Mobilization (from 1944, the Office of War Mobilization and Reconversion). In domestic policy, Byrnes, often called the “assistant president,” exercised powers second only to those of Roosevelt himself. Responsible for coordinating all domestic war agencies and federal government departments, he worked closely with both Congress and the bureaucracy to devise the most efficient arrangements to implement the war effort.

Passed over as Roosevelt’s vice presidential running mate in 1944, Byrnes, already considered a hard-liner on the Soviet Union, attended the February 1945 Yalta Conference of the “Big Three” Allied leaders. Returning to Washington, he successfully lobbied Congress to support the outcome of Yalta, deliberately glossing over outstanding contentious issues dividing the Soviet Union and its allies. Still disappointed over the 1944 election, he resigned in March 1945.

On Roosevelt’s death one month later, Vice President Harry S Truman became president. Truman immediately appointed Byrnes as head of a top-secret committee on the employment of atomic weapons, then in their final stage of development, whose existence Byrnes recommended be kept secret even from U.S. allies until their first use in combat. He believed U.S. possession of the bomb would make Soviet behavior more malleable.

In June 1945, Truman made him secretary of state. Attending the July 1945 Potsdam Conference, Byrnes hoped the speedy employment of atomic weapons against Japan

would prevent the Soviet Union from entering the Pacific war and enhancing its influence in Asia. He also helped to reach a compromise agreement on German reparations. Returning to Washington, he took part in drafting the Japanese surrender agreement in August, implicitly agreeing to retain the emperor. As Soviet-U.S. relations became more strained after the war, Byrnes sought for several months to negotiate compromise solutions, traveling extensively to meet with other foreign ministers outside the United States. In early 1946, political complaints that he was too conciliatory led Byrnes to assume a harsher rhetorical stance toward the Soviet Union. Even so, at the end of the year, Truman—increasingly irked by Byrnes’s policies, his secretive diplomacy, and his condescending attitude—made George C. Marshall secretary in his stead.

Byrnes returned to South Carolina and wrote his memoirs. In 1948, he broke with Truman over the issue of civil rights; subsequently, he served two terms, from 1951 to 1955, as governor of South Carolina, defending segregationist policies. Byrnes died in Columbia, South Carolina, on 9 April 1972.

C

Cairo Conference (23–26 November and 3–7 December 1943)

Code-named *SEXTANT*, this two-part conference was held in Cairo, Egypt, to discuss military strategy; the primary participants were U.S. President Franklin D. Roosevelt and British Prime Minister Winston L. S. Churchill. The meetings in Cairo took place before and after a conference bringing together Roosevelt, Churchill, and Soviet leader Josef Stalin at Tehran. The Tehran Conference (code-named *EUREKA*) proved necessary after Stalin refused to attend *SEXTANT* because a Chinese delegation, headed by Jiang Jieshi (Chiang Kai-shek), was to participate; since the Soviet Union was not then at war with Japan, Stalin did not want to attend or allow any other Soviet representative to take part in *SEXTANT*. Churchill had had doubts about a meeting with Jiang, too, for he regarded China as a sideshow until the war in Europe was won, but Roosevelt hoped to see China as a fourth great power after the war. In addition to large U.S., British, and Chinese delegations, Lord Louis Mountbatten, supreme commander of the Allied Southeast Asia Command, attended *SEXTANT* with his own delegation.

Roosevelt traveled across the Atlantic on the battleship *Iowa* and met with General Dwight D. Eisenhower in Algeria before flying on to Cairo, where he met with Jiang. At the Cairo Conference, Roosevelt, Churchill, and Jiang restated their determination to fight on until the war was won. Jiang pressed for an amphibious operation in the Bay of Bengal to coincide with Chinese participation in the fighting in Burma. Roosevelt initially agreed to this plan but was forced to withdraw his pledge following discussions at Tehran.

The Allied leaders announced in the Cairo Declaration that after the war, Japan would be reduced to the territories it held before World War I. China would regain Manchuria, the Pescadores Islands, and Formosa, and Korea would, “in due course,” be restored to independence. In the meantime, a joint U.S., Chinese, and Soviet trusteeship would hold sway in Korea, an arrangement that might last for 40 years. The mandated Japanese islands would, in all probability, pass to U.S. control, and it was implied that the USSR would regain South Sakhalin Island (lost in the Russo-Japanese War) and secure the Kuriles (which had never been Soviet territory). Stalin also wanted a warm-water port for the Soviet Union, probably at Dairen, Manchuria.

The second part of *SEXTANT*, which followed the Tehran Conference, included discussions with President Ismet İnönü of Turkey in an effort to draw his country into the war on the Allied side. In addition, Roosevelt informed Churchill of his decision to appoint General Eisenhower to command the Normandy Invasion.

Calabria, Battle of (9 July 1940)

Mediterranean air and naval battle fought between the British and Italians off the Calabrian coast of Italy; the Italians and Germans know it as the Battle of Punta Stilo. Beginning on the evening of 6 July 1940, the Italians dispatched a large convoy from Naples to Benghazi. At the same time, the British commander in the Mediterranean, Vice Admiral Andrew B. Cunningham, sent two small convoys with numerous civilians on board from Malta to Alexandria. On 7 July, the Italians learned of the British ship movements and immediately sent naval units from several bases to sea. Vice Admiral Inigo Campioni had command, concentrating the ships in the Ionian Sea. Campioni had the modernized but small battleships *Cesare* and *Cavour*, with

12.6-inch guns; 6 heavy and 10 light cruisers; and 41 destroyers and torpedo boats. Also at sea but scattered throughout the Mediterranean were 25 Italian submarines.

Cunningham planned to cover the convoys with his naval force at Alexandria, consisting of the battleships *Warspite*, *Malaya*, and the unmodernized *Royal Sovereign*, all armed with 15-inch guns; the aircraft carrier *Eagle*; 5 light cruisers; and 23 destroyers. Vice Admiral Sir James Somerville sortied from Gibraltar with Force H as a feint, which resulted in the loss of a destroyer to an Italian submarine and some minor splinter damage from high-altitude bombing.

Following the safe arrival of the Italian convoy at Benghazi, Campioni decided to try to intercept the British convoy and its escorts steaming from Alexandria. He hoped that by the time of the naval encounter, the Italian air force would have been able to damage the British ships as they approached the Italian coast. Indeed, more than 100 Italian

aircraft conducted attacks on the British vessels, but the high-level bombing did little damage: all but one bomb missed. The bomb that hit its target damaged the light cruiser *Gloucester*, and a near miss damaged the *Eagle* sufficiently to keep her from participating in the subsequent air attack on Taranto. The Italian planes also carried out several attacks in error on their own warships, again with no result.

Meanwhile, Cunningham was maneuvering to position his own ships so as to block the Italian ships from returning to Taranto. The *Eagle* launched several air attacks. Although not hitting any Italian ships, these attacks disrupted their movement, and British fighters did shoot down and chase off Italian reconnaissance aircraft. As a consequence, by the morning of 9 July, the Italians were not cognizant of the exact location of the British ships, whereas the British had fairly reliable information on the location of the Italian vessels.

The battle opened on the afternoon of 9 July as the two fleets at last came into contact, and it lasted nearly two hours. The fight was initially a long-range cruiser gunnery duel, resulting in no damage to either side, although the British salvo spreads tended to be much tighter than those of the Italians.

As the Italian battleships came into action, they were opposed by Cunningham's flagship, the *Warspite*, the fastest of the three British battleships. In the ensuing action, three British 6-inch-shell hits on the Italian heavy cruiser *Bolzano* and one 15-inch-shell hit on the *Cesare* slowed both and compelled the Italian main force to retire. The fact that three British battleships had outgunned the entire Italian fleet deeply affected Italian tactics.

As the Italian main force pulled back, both sides ordered their destroyers forward. At long range, the Italians fired torpedoes through their smoke screens but registered no hits. The ships in the Italian fleet then retired to their home ports. The Germans later criticized the Italians for not having launched night torpedo attacks with their numerous destroyers.

On 10 July, the *Eagle* mounted an air strike on Augusta, Italy. An Italian destroyer was sunk but was later raised and repaired, and an oiler was damaged. Meanwhile, the British Malta convoys arrived safely at Alexandria.

The Battle of Calabria raised British morale, for the Royal Navy had successfully engaged a numerically superior enemy force close to its own coast. The Italians' failure could be traced to poor coordination between their air and naval assets, although this situation steadily improved in the course of the war. The Italians also came to realize the ineffectiveness of high-altitude bombing against warships maneuvering at high speed and firing back. The Battle of Calabria demonstrated the fallacy of the decision made by Italian dictator Benito Mussolini and his navy to completely embrace land-based aviation at the expense of aircraft car-

riers. Thereafter, Italian naval leaders were reluctant to commit major naval units beyond the range of their land-based aircraft.

Camouflage

The disguising of military personnel, equipment, or installations. With technical advances in long-range aviation and aerial photography, as well as optical sights for weapons systems, camouflage became a regular feature of World War II. It was applied to individual soldiers, to their equipment (such as tanks and warships), and to industrial facilities and airfields.

Camouflage, also called protective concealment, attempts to disguise an object that is in plain sight in order to hide it from something or someone. If an object cannot be concealed—often something large, such as an airfield or a warship—camouflage may succeed merely by preventing an enemy from identifying the object. Camouflaging is normally accomplished by applying disruptive or blending paint or material to the object.

Modern camouflage techniques can be traced back to the French Army's Camouflage Division, established in 1915, when the army gave artists the responsibility for concealing airfields. The term *camouflage* comes from the French word *camoufler*, meaning "to blind or veil."

During World War II, aircraft were often camouflaged, in direct contrast with the practice in World War I, attributed particularly to Germany, of painting some aircraft in bright colors in order to intimidate opposing aviators. World War II aircraft tended to be painted in graduated color schemes, with darker shades on top growing progressively lighter toward the plane's undersection.

This technique served two purposes. The indistinct boundary between colors aided in obscuring the aircraft's silhouette and shape, leaving an opposing pilot unsure if a superior type of plane was about to be engaged. This scheme also allowed for a degree of camouflage both while the plane was in the air and when it was on the ground, particularly when a lightly painted aircraft belly was viewed against a

Not one but two soldiers. The sniper on the left is wearing regular fatigues, and the one on the right is in full battle dress disguised as though he were part of the terrain, ca. 1942. (Library of Congress)

light sky or when the green aspect of the same airplane parked on a grass field was seen from above.

Airfields themselves were camouflaged to avoid enemy air strikes. An advanced airfield, for example, might be obscured by having camouflage netting extend a wheat field onto one of the runways and having another runway appear as a football field delineated by steel-wool “ditches.” Troops might even play sports on the airfield to help deceive enemy reconnaissance.

Although the aim was to avoid detection, obscuring clear identification often might suffice. For instance, the multi-angular paint scheme in varying shades of gray that was applied to many naval vessels during the war served to confuse an enemy’s determination of the vessels’ speed and bearing, rather than to render them invisible. By diminishing torpedo or gunfire accuracy, a ship had a greater chance to avoid being hit.

Army vehicles, routinely painted green, brown, or gray to blend in with fields or urban areas, often had their camouflage augmented by their crews. Camouflage netting was used to break up the distinctive outlines of many vehicles, such that a parked tank might appear like a small tree. Netting, however, worked best with stationary vehicles, artillery pieces, and logistics sites. If used on other equipment or when a vehicle was moving, nets interfered with movement and vision, and they got in the way of effective tank fire.

Deception planners went to great lengths to create mock airfields and ports, complete with phony ships, planes, tanks, and personnel. Camouflage was incorporated into these plans; for example, simulated equipment was camouflaged to make it appear more authentic. Occasionally, such camouflage would intentionally be poorly applied: if it was too effective, the enemy might not have seen the phony equipment at all, negating the deception effort. False sites

drew many German air strikes during the 1940 Battle of Britain.

A form of electronic camouflage was required as radar and radio interception expertise advanced. This type of camouflage normally took the form of maintaining radio silence to avoid detection. However, in the absence of stealth technology, it was easier to deceive radars through electronic camouflage than to conceal the target. In 1944, for example, German radars were tricked into believing Calais was the target of Operation OVERLORD when small, towed barges with electronic emitters gave off the radar reflection of approaching 20,000-ton amphibious ships.

British Prime Minister Winston L. S. Churchill, always interested in military gadgetry, was a great supporter of camouflage efforts, though his efforts in this field met with varying degrees of success. For instance, attempts to deny the Germans navigation landmarks by concealing inland lakes with coal dust failed: the dust blew to the edges and outlined the lakes, making them even more prominent. Churchill also insisted that factories be concealed with smoke, a technique that depended largely on wind conditions and adversely affected the workers involved. The Germans also frequently used smoke in an effort to obscure the targets of Allied air raids.

As the war progressed, increasingly technical reconnaissance and surveillance efforts and subsequent countermeasures forced intelligence staffs to confirm reports through more than one information source in their attempts to defeat complex camouflage problems.

Canada, Air Force

Canada had virtually no air force before World War II, but it developed one quickly. When the war began in Europe in September 1939, the Canadian government agreed to help train Royal Air Force (RAF) pilots, leading to the development of the British Commonwealth Air Training Plan. Through it, some 130,000 pilots and aircrew from Canada, Britain, and other Allied nations were trained at Canadian

Hawker Hurricane and its Royal Canadian Air Force groundcrew, 1943. (Corel)

airfields built or enlarged with British and, later, American assistance. The Royal Canadian Air Force (RCAF) itself grew to over 250,000 personnel.

Thousands of Canadian pilots and aircrew served in the RAF, often in fighter or bomber squadrons composed entirely of Canadians. Ultimately, the RCAF sent 48 squadrons and 94,000 personnel overseas. In the European Theater, RCAF squadrons fought in the Battle of Britain, in Malta, in the campaigns of the Western Desert, and over Europe. In the Pacific Theater, two Canadian transport squadrons served in Burma and a squadron of Consolidated PBY Catalina patrol bombers was based at Ceylon. The RCAF also provided air defense for Canada and assisted in the defense of U.S. installations in Alaska.

In June 1941, the RCAF formed its first bomber squadron. Its Number 6 Group of eight squadrons was formed in Britain in January 1943, flying Wellington bombers from Yorkshire and then Lancaster and Halifax bombers. The group flew 41,000 sorties and dropped 126,000 tons of bombs, one-eighth of Bomber Command's total. It suffered 3,500 dead. In all, 17,101 Canadian aircrew died in the war, some 40 percent of Canada's total war dead.

RCAF pilots also played an important role in ferrying American-built aircraft to the British Isles. Air Commodore N. R. Anderson of the RCAF had lobbied for the ferrying of aircraft in April 1940, arguing that it would save valuable shipping space. The idea languished until the British minister of war production, Lord Beaverbrook, gave it his support and insisted on an experimental flight. This flight took place in November 1940, when a group of Hudsons crossed the Atlantic from Newfoundland without loss. Regular transfers continued, slowly at first because of a shortage of pilots and navigators but gaining momentum when increasing numbers of graduates of the Air Training Plan became available. Ultimately, the RCAF delivered more than 9,000 two- and four-engine aircraft to Britain in this manner. Subsequently, the RCAF also supplied Lend-Lease aircraft to the Soviet Union from airfields in northwest Canada. Many of the routes developed in this activity became the first routes of Trans-Canada Airlines after the war.

Canada, Army

Surmounting serious difficulties, Canada raised a substantial army that earned distinction in heavy fighting during World War II. In July 1939, the Permanent Active Militia, as it was then styled, was a minuscule force of 4,261 soldiers. Reserves, most of them untrained, numbered 51,418. But by 1943, a prodigious effort produced six infantry divisions, two armored divisions, two armored brigades, two army artillery groups, an immense logistics organization, and the Canadian Women's Army Corps—a remarkable achievement for a nation of 11.5 million people.

Initially, the Liberal government of Prime Minister Mackenzie King pursued a strategy that emphasized industrial and agricultural production, air and naval forces, and a small expeditionary ground force of two divisions. This strategy reflected the fundamental antagonism between English and Scottish Protestant Canadians and French Roman Catholic Canadians, with the French minority constituting a quarter of the population. Efforts to impose conscription in 1917, during World War I, sparked serious rioting, proved unenforceable in French communities, and pushed Canada to the brink of civil war. Understandably, the Canadian government in World War II was unwilling to risk such a crisis again. The conflict was sharpened by English and Scottish domination of the armed forces and officer corps.

This limited strategy was shattered by the German conquest of France in June 1940. All Canadian resources were mobilized for total war by the sweeping National Resources Mobilization Act of 17 June 1940. But compulsory military service was restricted to service in Canada; overseas service remained voluntary. Three infantry divisions were stationed on the coasts of Canada. Many French Canadians were willing to defend Canada, but few were willing to fight for Great Britain. Four French Canadian infantry regiments did have sufficient volunteers for overseas service, however.

In July 1940, then Major General Henry Crerar assumed the post of chief of the General Staff. A capable administrator, he organized the framework within which a vastly expanded Canadian army swiftly emerged. By December 1940, two Canadian infantry divisions formed the Canadian Corps in England. In June 1943, the Canadian army in England numbered three infantry divisions, two armored divisions, and two armored brigades.

The Canadian army was organized on the British model, and much of its equipment was also British. Rugged and accurate, the 7.7 mm Lee Enfield No. 4 was the standard bolt-action rifle. Adapted by Enfield from a Czech design, the low-recoil and very accurate Bren 7.7 mm light machine gun

proved effective. By 1942, 60 percent of all Bren guns were manufactured in Canada. The 87.6 mm howitzer—rugged, easily handled, and versatile—and the 140 mm gun, introduced in 1942, were the major artillery weapons. The Canadians did employ the U.S. M-4 Sherman as their tank.

The Canadian army had to contend with serious difficulties. Undermanning was a constant problem, with Canadian units rarely at their established strength, a consequence of the voluntary system. Training suffered from the rapid pace of expansion and the lack of experience among senior officers. In addition, training in unit-level maneuvers was poor, and the army was slow to develop a common system of tactics.

An early tragedy of the war involved the Canadian garrison in Hong Kong. Caught up in the sweep of the opening Japanese offensive, 1,975 soldiers waged a forlorn defense in December 1941, suffering 800 casualties and the death of their commander. The Canadians also sustained heavy losses in the 19 August 1942 raid on the French seaport of Dieppe. A total of 4,963 Canadians from the 2nd Division took part and encountered well-planned German defenses. Only 2,110 of these men returned to England; 65 percent of the Canadian troops were killed or wounded and/or taken as prisoners.

On 10 July 1943, 1st Canadian Infantry Division and 1st Army Tank Brigade were committed to the invasion of Sicily, operating as part of the British Eighth Army. On 3 September, the Canadians crossed the Straits of Messina to Italy and fought their way up the Adriatic coast. In November, they were joined by the 5th Armoured Division and formed the I Canadian Corps. Initially, the corps was led by General Crerar, but he returned to England and assumed command of First Army in March 1944. The Canadian First Army fought within the framework of 21st Army Group, commanded by Field Marshal Bernard L. Montgomery. The able Lieutenant General E. L. M. Burns then took command of Canadian forces in Italy.

In the heavy and often frustrating fighting of the Italian Campaign, the Canadians acquitted themselves well. In May 1944, Canadian forces in the Liri Valley participated in the Allied offensive that broke through the Gustav Line. In August 1944, a Canadian thrust near the Adriatic created an opportunity to move into the Po River valley, but the British moved too slowly, and the chance was lost.

In the Normandy Invasion of 6 June 1944, the Canadian 3rd Infantry Division and 2nd Armoured Brigade landed on Juno beach as part of the British Second Army. Joined by the 2nd Infantry and 4th Armoured Division, they formed the Canadian II Corps on 11 July, commanded by Lieutenant General Guy Simonds. He had led both infantry and armored divisions in Italy. On 23 July 1944, the Canadian First Army was activated, led by General Crerar. It also included British I Corps and the Free Polish 1st Armoured Division.

The Battle for Normandy was a crucible of fire for the Canadians. They and the British were deployed in the eastern sector of the beachhead, terrain reasonably favorable for German armored operations. To thwart offensives in this area, most German armor fought the British and Canadians. Canadian forces proved well trained and skilled in combat and played a key role in the defeat of a formidable German opponent. In Lieutenant General Guy Simonds, the Canadian army found an outstanding leader who showed himself to be an innovative and exacting commander. Crerar and Simonds were good partners, with Crerar the manager and Simonds the battlefield leader.

After Normandy, First Army proceeded along the French coast taking seaports. On 4 September 1944, the British 11th Armoured Division captured the vital port of Antwerp, with the Belgian Resistance saving all its port facilities and docks from German destruction. However, Antwerp could only be reached by the 45-mile-long Scheldt estuary, and swift action was imperative to prevent German deployment of defenses along the Scheldt. At this critical juncture, British Field Marshal Montgomery halted his forces, preferring to concentrate his troops for a thrust into northern Germany, Operation MARKET-GARDEN. This decision gave the Germans time to establish strong defenses along the Scheldt and at its mouth.

After the British defeat at Arnhem in late September, the strategic focus returned to ousting German forces from the Scheldt and opening Antwerp. This daunting task fell heavily on the Canadian First Army. On 26 September, Crerar had departed to England for treatment of complications from dysentery, and Simonds assumed his command.

The Scheldt Campaign was a nightmare, fought on sodden mud flatlands bereft of cover and intersected by canals and dikes ideally suited for defense. Montgomery assigned the Canadians the lowest priority for supplies, and only a direct and explicit order on 9 October from General Dwight D. Eisenhower to clear the Scheldt compelled Montgomery to furnish the Canadians (including their British corps) the supplies they needed. Throughout October, bitter fighting raged as Canadian and British soldiers slowly overcame tenacious German resistance. Amphibious tanks and tracked amphibious landing vehicles proved useful. Equipped for amphibious operations, the 52nd Lowland Scottish Division joined the Canadians in this battle.

The assault on Walcheren Island was the climax of the campaign. Commanding the mouth of the Scheldt estuary,

The Battle for Normandy was a crucible of fire for the Canadians.

A Canadian soldier receives attention from a medical orderly next to a burning overturned German tank amid heavy rubble, while Allied forces attempt to trap the German Seventh Army in nearby Falaise, France. (Library of Congress)

Walcheren's defenses included heavy coastal artillery. Royal Marines and Commandos joined Scots and Canadians to capture Walcheren on 9 November. Minesweepers cleared the channel, and Antwerp was finally opened on 28 November 1944. The Scheldt Campaign cost the Allies 12,873 casualties, half of them Canadian.

In December, a shortage of infantry replacements compelled the Canadian government to extend conscription for overseas service to troops already in home service. This move aroused a furor, but only 16,000 of 63,000 eligible soldiers were sent overseas. When Crerar returned to lead First Army, he was entrusted with an Allied force of 475,000 men dedicated to winning control of the Rhineland. In a series of massive operations in February and March 1945, Crerar demonstrated his skill in logistics. German forces were eliminated between the Maas and Rhine Rivers, a loss of more than 90,000 men. In the closing months of the war,

I Canadian Corps was transferred from Italy to the Netherlands and completed the liberation of the latter.

The Canadian army made a substantial contribution to the Allied victory. The men of this overwhelmingly volunteer force had fought with courage and tenacity in many hard battles. But they also paid a heavy price, for 22,917 Canadians were killed and 52,679 wounded.

Canada, Navy

At the outbreak of World War II, the Royal Canadian Navy (RCN) had only 6 destroyers and 5 minesweepers. By 1945, it had grown to include 2 light carriers, 2 light cruisers, 15 destroyers, 60 frigates, 118 corvettes, and many other ships. The third-largest Allied fleet, the Canadian navy mustered a total of 363 vessels, most of which were built in Canadian shipyards. From 3,165 men in 1939, the RCN expanded to 89,000 men and 6,700 women by 1945.

In the gale-swept seas of the North Atlantic, the Canadian fleet played a crucial role in the long struggle against German submarines. Having expanded so rapidly, the RCN suffered from poor training and a dearth of advanced equipment. Early in 1943, Canadian corvettes and frigates were sent to English bases, where they were fitted with new radar, sonar, and high-frequency direction-finding detection gear. In addition, the crews underwent intensive training in anti-submarine tactics and warfare. Of particular value was the Western Approaches Tactical Unit established in Liverpool in February 1942, which trained escort captains and commanders in a common doctrine of convoy defense. Practical training was provided by exercises against Royal Navy submarines. As a result, by mid-1943, the Canadians fought much more effectively in the Atlantic arena.

They organized the massive convoys that set out from Nova Scotia and Newfoundland. As radio interception and the breaking of German codes assumed major roles in the war against the submarines, the RCN Operational Intelligence Centre proved a key Canadian capability. And by 1944, most close escort in the North Atlantic was performed by the Canadian fleet. In all, the RCN provided eight mid-Atlantic support groups and escorted more than 25,000 merchant ships laden with 180 million tons of cargo from North America to Great Britain.

Built to a British design stressing mass production, the *Flower*-class corvette was the mainstay of the escort fleet. Displacing 1,245 tons at full load, the vessel was armed with a 4-inch gun and 40 (later 70) depth charges. The *Flower*-class ships proved to be miserable seaboats, however, taking

on water and rolling furiously, and at 16.5 knots, they were too slow for offensive operations.

A far more effective escort was the *River*-class frigate, weighing 1,920 tons at full load. The *River*-class vessel could make 21 knots and mounted two 4-inch guns, a Hedgehog mortar, and 126 (later 150) depth charges.

The Canadian navy was also active in surface warfare operations. The RCN secured four large British *Tribal*-class destroyers that proved especially effective in Canadian service. At full load, the *Tribals* weighed 2,519 tons and easily made 36 knots. Formidably armed in terms of guns, they mounted 6 × 4.7-inch cannon, 2 × 4-inch dual-purpose guns, and 4 × 40-mm antiaircraft weapons. Four torpedo tubes were also fitted. Canadian *Tribals* saw heavy action, especially in spring 1944 in the English Channel against German destroyers and heavy torpedo boats (900-plus tons). In the course of these battles, the *Athabaskan* was lost on 29 April 1944.

The RCN played a considerable part in the Normandy Invasion. Ten thousand sailors and 109 warships participated in Operation NEPTUNE and landed 45,000 troops on the beaches. The Canadian array included 15 destroyers, 11 frigates, 19 corvettes, 16 minesweepers, and 30 landing craft.

In the course of the war, 2,024 men of the RCN were killed and 24 ships were sunk. At the same time, however, the Canadian navy played an important role in the Allied victory by destroying or capturing 42 surface warships and helping to sink 33 submarines.

Canada, Role in the War

Arguably the greatest contributor, militarily and economically, of the “small” Allied powers in World War II, Canada put 10 percent of its population—slightly over 1 million men and women—into uniform and provided the fourth-largest output of war matériel.

Canada entered the war superficially united, but French Canadian support was lukewarm, and the specter of overseas conscription, which had been so divisive in World

Production of 500-pound bombs in Canada. (Library of Congress)

War I, loomed. Since Canada's military contribution could not be decisive, conscription remained a political issue, and its potential for wrecking national unity could not be overestimated.

Prewar isolationism had left Canada virtually disarmed, but when Canadian leaders declared war a week after Britain had (a pointed display of their country's status as a completely self-governing dominion), they were confident that a military effort on the scale of World War I would be unnecessary. This time, Ottawa promised to match commitments to resources and make the economic sinews of war, not expeditionary forces, its priority. Predictably, this "limited liabilities" policy did not survive the defeat of France. Thereafter, for Canada, it would be total war.

On the economic front, after some faltering steps, the results were magnificent. Underutilized capacity, the country's bane during the depression, aided the government in its task of mobilizing the war economy. Coming up with the staggering sums to pay for it all proved an equal challenge. American neutrality—and Britain's precarious economic

and financial position—greatly complicated Ottawa's task, a situation finally resolved by the Hyde Park agreement signed with the United States in April 1941. By 1944, the gross national product (GNP) had more than doubled, with 50 percent of that figure being war production. Although foodstuffs and vital raw materials such as nickel and aluminum dominated Canada's wartime exports to the United States and Britain, the production of armaments—including close to 1 million motor vehicles—was also very significant. Sound management and the advantages of virtual economic integration with the United States ensured that Canada, alone among the Allies, avoided having to seek Lend-Lease assistance; it even launched its own generous Mutual Assistance Program, with Britain the chief beneficiary.

Given these very significant contributions to the common cause, Canadian officials aspired to play a role in Allied decision making. Canada more than earned its appointment to the Combined Food and Production and Resources Boards in 1943, but when it came to grand military strategy, vague hopes of "sitting at the table" went unfulfilled. Grace-

fully, if somewhat reluctantly, Ottawa accepted its status as a junior partner.

From the outset, Prime Minister Mackenzie King's focus had been to help Britain, an approach the great majority of Canadians embraced. Doing so necessitated close cooperation—especially economic cooperation—with the United States. The presumption that Canada could serve as a linchpin between Washington and London was a Canadian conceit, although certainly, a neutral United States could materially assist Britain by helping Canada. Once the United States entered the war, however, direct engagement with the British rendered Canada's erstwhile diplomatic role superfluous. For reasons of mutual benefit, Canadian-American ties deepened steadily. As leading Canadian historian J. L. Granatstein has aptly concluded, "Britain's weakness forced Canada into the arms of the United States," but it generally went willingly and certainly profitably. With a war to win, few Canadians worried about the long-term implications of this shift in regard to their sovereignty.

In military terms, Canada boasted the fourth-largest air force and third-largest navy among the Allies by 1945, as well as an expeditionary force of nearly six divisions. In keeping with the country's "Atlanticist" orientation, Ottawa committed virtually the entire force to Europe. It is scarcely an exaggeration to say the Pacific war, save for some panic after Pearl Harbor, hardly touched the Canadian consciousness.

Nationalism dictated that the government follow a "Canadianization" policy whereby the armed forces would, as far as possible, fight in recognizable national units under national command. At the same time, the English Canadian majority's undiminished emotional attachment to Britain, not to mention practical considerations, guaranteed that these forces would operate under overall British command and fight in British campaigns—in other words, the military-political relationship formalized in 1917 and 1918 would continue. Unfortunately, Canadianization would prove a mixed blessing. On one hand, it satisfied (and encouraged) national pride and unquestionably aided the voluntary enlistment system. On the other, the limited availability of experienced Canadian commanders—and, particularly in the Royal Canadian Navy (RCN) and Royal Canadian Air Force (RCAF), the inability of domestic industry to produce technically sophisticated armaments in a timely fashion—exacerbated the enormous growing pains experienced by the rapidly expanding armed forces. Finally, until mid-1943, nationalism also dictated that the army not be split up, a decision that denied the army necessary combat experience.

Canada's military role was that of willing subordinate. Building armed forces in wartime guarantees a steep learning curve, and Canada's experience in the war bears this out. In 1939, the Canadian regular forces numbered 10,000. At peak

strength in 1944, 780,000 Canadians were in uniform: 80,000 in the RCN, 210,000 in the RCAF, and the remainder in the army. The achievements of the army in Italy, Normandy, the Scheldt, and the liberation of Holland; of the RCAF's administration of the British Commonwealth Air Training Plan as well as participation in 6 Group and throughout RAF Bomber Command; and of the RCN in convoy operations in the Battle of the Atlantic all materially contributed to the Allied victory, at a cost of 42,000 Canadian dead.

Canada's role in the war, both militarily and economically, was far more significant than non-Canadians have credited over the years. That said, the major impact of Canadian participation was on Canada itself. The war rebuilt the Canadian economy, witnessed the implementation of overdue socioeconomic reforms, and greatly strengthened the sense of nationhood and national self-confidence. Isolationism gave way to internationalism, and the country emerged from the conflict well placed to do more than its share in the immediate post-war years to rebuild and defend Western Europe.

Canaris, Wilhelm Franz (1887–1945)

German navy admiral and head of German military intelligence during World War II. Born in Aplerbeck, Westphalia, Germany, on 1 January 1887, Wilhelm Franz Canaris entered the German navy in 1905. Serving aboard the cruiser *Dresden* off the South American coast at the beginning of World War I, he established an intelligence network to track Allied movements. On 14 March 1915, the British attacked the *Dresden* at Valparaiso, Chile, but Canaris escaped Chilean internment and returned to Europe in October. From November 1915 until October 1916, he was in Spain

Admiral Wilhelm Canaris, head of German military intelligence (*Abwehr*) during WWII. (Hulton Archive/Getty Images)

on an intelligence mission. In April 1918, he became a U-boat commander in the Mediterranean.

After the war, Canaris, an ardent conservative and nationalist, was active in covert operations to rebuild the German military, working in Japan with German designers to build submarines. He then resumed his naval career, increasingly in intelligence activities. Promoted to captain in 1931, he took command of the battleship *Schlesien* the next year. He was named to head military intelligence—the *Abwehrabteilung* (*Abwehr*)—in January 1935 and was promoted to Konteradmiral (U.S. equiv. rear admiral) in April. One of his first successes was to convince Adolf Hitler to intervene on the side of the Nationalists in the Spanish Civil War in July 1936.

The Fritsch Affair in 1938, when untruthful allegations of homosexual activities destroyed the career of Colonel General Werner von Fritsch, disillusioned Canaris, and shortly thereafter, the *Abwehr* became tied to anti-Nazi elements in Germany. Canaris opposed Hitler's policies, predicting they would lead to war and inevitable defeat. Despite the admiral's reticence, Hitler personally liked him, and the *Abwehr* did provide much useful information, all of which gave Canaris

some protection as he aided a limited number of Jews and covertly undermined German attempts to involve Spain in the war. He was promoted to full admiral in January 1940.

Canaris resisted Reinhard Heydrich's efforts to take over the *Abwehr*, but his position was threatened when Heydrich uncovered evidence that he had committed treason. Heydrich's assassination in May 1942 provided a brief reprieve for the admiral, and it was not until February 1944 that Hitler removed him from his post. Shortly thereafter, he was placed on the navy's inactive list; he lived under a loose but comfortable house arrest at Burg Lauenstein until June, when Hitler recalled him to Berlin as head of mercantile warfare.

Implicated in the July 1944 bomb plot against Hitler (though he did not take an active role), Canaris was arrested afterward. Initially, there was no evidence against him, but discovery of his secret diaries led to his trial and conviction. Canaris was hanged at Flossenbürg Prison on 9 April 1945.

Cape Esperance, Battle of (11–12 October 1942)

Second of five surface actions fought off Guadalcanal. The battle occurred 8 miles west-northwest of Savo Island as both U.S. and Japanese forces maneuvered to protect their own reinforcements moving toward Guadalcanal.

Rear Admiral Norman Scott led Task Force 64, consisting of two heavy cruisers, two light cruisers, and five destroyers. Scott's mission was to protect transports carrying the U.S. Army's 164th Infantry Regiment to Guadalcanal by searching for and attacking Japanese ships. Scott's crews had just undergone three hard weeks of night training, and the admiral was fully prepared to engage in a night action, in which the Japanese had hitherto enjoyed superiority. Scott had developed simple tactics and rehearsed them, keeping his crews at station from dusk to dawn. His ships operated in a single column, with destroyers forward and aft of his cruisers.

Japanese Rear Admiral Goto Aritomo commanded a bombardment group, Cruiser Division 6, composed of three heavy cruisers and two destroyers. It protected Rear Admiral Joshima Takagi's two seaplane carriers and six destroyers, transporting some 700 men and artillery belonging to Lieu-

tenant General Hyakutake Haruyashi's Seventeenth Army to Guadalcanal. Goto planned to shell Henderson Field to neutralize the U.S. air threat while Joshima landed the reinforcements off the northwestern cape of Guadalcanal.

American aircraft tracked Goto's force as he approached, although communication fumbles aboard the U.S. ships nearly rendered that advantage moot. Goto and Joshima did not expect opposition, and preoccupied with navigation and preparations for the Henderson Field bombardment, they ignored indications that U.S. vessels were nearby. Lacking radar, the Japanese blundered into the Americans. Their lookouts did spot the American ships and identify them as enemy, but Goto believed they were friendly and flashed recognition signals.

At 11:25 P.M. on 11 October, U.S. radar from the light cruiser *Helena* first picked up the Japanese, but Scott, on the flagship heavy cruiser *San Francisco*, did not learn of this before he ordered his ships to turn at 11:30. Eight minutes later, while his formation was still in some mild disorder from the turn, Scott received his first radar warning. Fortunately for him and the Americans, the turn inadvertently allowed the U.S. ships to cross the T of Goto's approaching ships. The Americans opened fire at 11:46 P.M. at less than 5,000 yards. Surprise was total. Goto believed that Joshima's ships were shooting at him.

American 8-inch, 6-inch, and 5-inch guns pounded the Japanese ships. Among the casualties was Goto, who was mortally wounded. Before his death, he ordered his force to withdraw, and a running gunfire duel followed. The heavy cruiser *Furutaka* and the destroyer *Fubuki* were sent to the bottom. The heavy cruiser *Aoba* was badly damaged and would require four months to repair. In an associated action on 12 October, Henderson Field aircraft sank the destroyers *Murakumo* and *Natsugumo*, which were searching for survivors. On the American side, the destroyer *Duncan* was sunk, the cruiser *Boise* was heavily damaged, the cruiser *Salt Lake City* was lightly damaged, and the destroyer *Farenholt* was damaged. Meanwhile, Henderson Field had been spared Japanese shelling, and American morale soared, especially as some on the U.S. side put Japanese losses at up to three cruisers, five destroyers, and a transport.

Despite their tactical defeat, the Japanese did land their troops and supplies safely, as did the Americans on 13 October. Because Japanese torpedoes had not been successfully employed in the Battle of Cape Esperance, the Americans discounted their effectiveness. U.S. Navy leaders also incorrectly concluded that using the single-column formation and gunfire was the way to fight at night. This approach slighted the destroyers' main battery, the torpedo, and effectively tied the destroyers to the cruisers' apron strings. The Americans deployed this way in another night action on 13 November, much to their chagrin.

Cape Matapan, Battle of (28 March 1941)

Naval battle between the British and Italians in the eastern Mediterranean Sea. Despite its crippling fuel shortages and at the urging of its German allies, the Italian navy set out on 26 March 1941 to attack British convoys around Crete. Under Vice Admiral Angelo Iachino, the force included the battleship *Vittorio Veneto*; the heavy cruisers *Trieste*, *Trento*, *Bolzano*, *Zara*, *Fiume*, and *Pola*; the light cruisers *Luigi di Savoia* and *Garibaldi*; and 17 destroyers. On 27 March, combined Royal Navy forces under Vice Admiral Andrew B. Cunningham (Force A) and Vice Admiral Henry D. Pridham-Wippell (Force B), alerted by key radio intercepts to the Italian movements, steamed from Alexandria and the Aegean, respectively, in search of the Italian force.

With neither side entirely certain of the other's precise order of battle or position, despite aerial reconnaissance, elements on each side sighted their opponents south of Crete on the morning of 28 March, and they exchanged fire off the island of Gaudo. When he learned of the presence of an aircraft carrier (the HMS *Formidable*) from his radio decrypters, Iachino reasoned that a more powerful British force lay beyond the several cruisers currently engaged by his flagship, *Vittorio Veneto*. Having lost the advantage of surprise—and now expecting imminent air attacks—he turned the Italian force northwest toward home.

In steady pursuit behind him followed Cunningham's Royal Navy task force, composed of the *Formidable* and the battleships *Warspite*, *Valiant*, and *Barham*, together with 4 cruisers and 13 destroyers, bolstered by British aircraft operating from nearby shore bases. The Italian force received little useful air cover from its own air force or its German allies and suffered accordingly. Despite withering antiaircraft fire from *Vittorio Veneto* and escorting ships,

attacking British planes managed to torpedo the battleship at midafternoon on 28 March.

Cunningham judged that the progress of the Italian force, now drawn in around its wounded flagship, would likely be slow, and he plotted it at about 12 knots. But despite having shipped 4,000 tons of water and making way on only two of four propellers, the *Vittorio Veneto* worked up to a speed of 19 knots and thus moved its formation farther along than expected on the run toward home waters.

With night falling, however, Iachino received the unwelcome news that the heavy cruiser *Pola* had been stopped dead by an aerial torpedo attack. Believing that the British were still some 170 miles astern, he instructed the cruisers *Zara* and *Fiume* (with four destroyers) to turn back and tend to their sister ship. In fact, from a distance of less than 50 miles, Cunningham was closing as fast as his flagship, the old battleship HMS *Warspite*, and her sister ships *Valiant* and *Barham* could make way.

By 8:30 P.M., radar sets aboard the vanguard cruisers *Ajax* and *Orion* had picked up the derelict *Pola*, about 6 miles distant; it was presumed to be the *Vittorio Veneto*. As the main British force drew closer and prepared to attack the *Pola*, an in-line formation of six more unknown ships (the *Zara*, *Fiume*, and their escorts) was suddenly detected at 10:25 P.M. at 4,000 yards, which shifted the British targeting and drew a wall of concentrated fire from the British battleships' main and secondary batteries at nearly point-blank range. The *Zara* and *Fiume* were reduced to flaming wrecks within several minutes; the *Fiume*, along with the destroyers *Alfieri* and *Carducci*, sank within an hour. The *Zara* and *Pola* remained afloat until early the following morning, finally dispatched by scuttling charges and by torpedoes from British destroyers. Some 40 miles ahead, the main body of the Italian force pressed onward, arriving in Taranto on the afternoon of 29 March after evading the renewed chase given by Cunningham.

Using radar, which the Italians still lacked, and vastly superior air cover to great advantage, Cunningham had, in the Battle of Cape Matapan, established Royal Navy primacy in the Mediterranean. The loss of five valuable warships and 2,300 lives would call Iachino's judgment into question, and the Italian navy would not again venture from its harbors in force until the first Battle of Sirte Gulf in December 1941.

Cape St. George, Battle of (25 November 1943)

Naval battle in the Pacific Theater. This final surface action in the Solomons area was brought on by Japan's attempt to reinforce its garrison at Buka in northern Bougainville on the night of 24–25 November 1943. The transport group under Captain Kagawa Kiyoto was made up of three destroyer-transport: the *Amagiri*, *Uzuki*, and *Yugiri*—with the destroyers *Onami* and *Makinami* as escorts.

The Allies had long been reading the Japanese naval code, however, and Captain Arleigh Burke and the 23rd Destroyer Squadron of five destroyers arrived just after midnight and took up station athwart the direct Buka-Rabaul route to intercept the Japanese on their return trip. The night was dark, with low-hanging clouds that produced occasional rainsqualls. The sea was calm.

Burke's plan was for his division—the *Charles F. Ausburne* (flag), *Claxton*, and *Dyson*—to launch a torpedo attack while Commander B. L. Austin's division of the *Converse* and *Spence* covered with its guns; then the two squadrons would reverse roles. The action unfolded nearly as Burke had hoped. At 1:40 A.M. on 25 November, the two unsuspecting Japanese escorts appeared, and Burke, closing the range quickly, launched 15 torpedoes at 1:56, then turned hard right to avoid any Japanese torpedoes coming his way. None did. Both Japanese escorting destroyers were mortally stricken. The *Onami* went down quickly; the *Makinami* somehow managed to stay afloat until the *Converse* and *Spence* could sink her with gunfire.

Burke then set out in pursuit of the three transports that had turned north and were trying to make good their escape to Rabaul. In the running fight, the Japanese spread out. Burke went after the *Yugiri* and at 3:28 A.M. sank her with gunfire.

Burke continued the chase until 4:04 A.M., and then, with only two hours of darkness remaining to shield him from the Japanese air bases at Rabaul, he turned for home. He had fought a near perfect action, sinking three enemy destroyers at no cost except for the oil and munitions expended. For the Japanese, however, the battle rang down the curtain on the costly war of attrition they had tried to wage in the Solomons. Their misfortunes continued; in mid-May, they lost the submarines *I-176* and *I-16* while they were attempting to supply the Buka garrison.

Capra, Frank (1897–1991)

Hollywood filmmaker who produced a series of inspirational movies during the war years. Born on 19 May 1897, at Bisacquino, Sicily, Frank Capra immigrated to the United States with his family in 1903. After a stint in the army during World War I, he made a career as a director, emphasizing stories of ordinary Americans who overcame corruption, greed, or cynicism. His films included *Mr. Deeds Goes to Town* (1936), *Mr. Smith Goes to Washington* (1939), and *Meet John Doe* (1941).

When the United States entered World War II, Capra was making *Arsenic and Old Lace*. Putting the project on hold until 1944, he rejoined the army as a major and was assigned to the Morale Branch in February 1942. The army's chief of

staff, General George C. Marshall, ordered Capra to “make a series of documented, factual-information films—the first in our history—that will explain to our boys in the Army why we are fighting, and the principles for which we are fighting.” After studying Leni Riefenstahl’s *Triumph of the Will* and other German propaganda films, Capra produced a series of seven movies entitled *Why We Fight*. The first of these documentaries was released in October 1942. The films were shown not only to the troops but also in war plants starting in April 1943 and then to the general public by the end of May 1943. They were designed to be educational, inspirational, and recreational. Each examined what was seen as a totalitarian conspiracy to take over the free world.

After the last of these movies, subtitled *War Comes to America*, was released in 1945, Capra returned to civilian life to form Liberty Films. He continued to make movies until 1961. Capra died in La Quinta, California, on 3 September 1991.

Caroline Islands Campaign (15 February–25 November 1944)

A series of air attacks, naval bombardments, and amphibious assaults during the U.S. Navy's 1944 drive across the Central Pacific. A chain of 680 islands, islets, and atolls stretching across the Pacific between the Marianas and New Guinea, the Caroline Islands were part of the German Empire prior to World War I. In the peace settlement following the war, the victorious powers gave Japan the Marshall Islands and all of the Marianas save Guam.

These acquisitions dramatically increased Japanese power in the Pacific and created a potential major problem for the United States, as the Carolines straddled the searoutes between Hawaii and both the Philippines and China. Indeed, Japanese control of the Carolines caused so much concern that it spurred development of the amphibious warfare doctrine of the U.S. Marine Corps during the interwar period, a process that accelerated after Japan fortified Ponape, Truk, Yap, and Peleliu in the 1930s.

Following the entry of the United States into World War II in 1941, Japanese units in the Solomons and Gilberts were gradually destroyed or isolated by U.S. forces pushing across the Central Pacific. Kwajalein Atoll fell on 7 February 1944, and U.S. Fifth Fleet forces under Admiral Raymond A. Spruance accelerated preparations to capture Eniwetok Atoll as part of an overall plan approved by the Combined Chiefs of Staff in December 1943. The plan called for the seizure of key islands in the Marianas as bases to support a strategic bombing campaign against Japan and for selected attacks to support the South Pacific forces of General Douglas MacArthur.

To cover the Eniwetok landings, however, certain bases in the Carolines first had to be neutralized. Between 15 and 26 February 1944, B-24 Liberator bombers from Major General Willis H. Hale's Seventh Army Air Force struck Ponape. The Eniwetok landings took place on 17 February, and on that day and the next, aircraft carriers from Vice Admiral Marc A. Mitscher's Task Force 58 launched more than 30 raids on Truk, which served as the major forward Japanese fleet anchorage and base in the Central Pacific. Each of the raids included at least 150 planes, and together, they destroyed more than 250 Japanese aircraft and some 200,000 tons of ships, including 2 light cruisers, 1 destroyer,

2 submarine tenders, 1 aircraft ferry, 6 tankers, and 17 merchant ships.

Eniwetok fell on 22 February, and Mitscher's airmen carried out more attacks on Truk on 29 and 30 April. Those attacks, combined with significant shore bombardment by Spruance's battleships, destroyed another 100 Japanese planes. The cumulative effect was so great that the Joint Chiefs of Staff (JCS) chose to bypass Truk and move westward, isolating the substantial Japanese garrison there.

Between June and August, U.S. forces fought the Battle of the Philippine Sea and seized Saipan, Tinian, and Guam in the Marianas, then continued west to attack the Philippines. To cover the initial Philippine landings on Mindanao and Morotai, U.S. planners intended to capture both Peleliu and Yap in the Carolines for use as air bases and forward staging areas. Those plans changed, however, following the September 1944 raids on the Philippines by Mitscher's Task Force 38 of Admiral William F. Halsey's Third Fleet. Halsey found Japanese defenses so weak that he recommended bypassing Morotai, Mindanao, Yap, and Peleliu and moving ahead with the attack on Leyte in October. The JCS agreed but decided to launch the landings on Peleliu and Morotai anyway because the troops for those attacks were already embarked.

Morotai fell on 15 September, the same day that Marines of the 1st Division landed on Peleliu and began one of the most grueling and perhaps unnecessary campaigns of the war. For the first time, the Japanese chose not to defend the beaches of an island under assault. Instead, the 5,300 defenders burrowed into the coral and prepared a main line of defense well inland. They counterattacked frequently; made use of underground tunnels, bunkers, and caves; and fought a battle of attrition in heat that sometimes reached more than 120 degrees. By the time the Peleliu Campaign ended on 25 November, more than 1,950 U.S. troops had been killed, and a regiment of the Army's 81st Division had been brought in as reinforcements. Whether the island needed to be taken and whether it materially aided the capture of the Philippines is extremely doubtful.

And yet, if Peleliu was a mistake, U.S. forces compensated by performing brilliantly throughout the rest of the Carolines. A regimental combat team of the 81st Division took Ulithi Atoll on 23 September, and in less than two weeks, the U.S. Navy was utilizing its splendid large anchorage for attacks against Formosa. The rest of the 81st Division took Angaur (in Palau, near Peleliu) from 1,600 Japanese defenders on 23 October, and with that, the Caroline Campaign came to a close.

Although no decisive battles were fought during the campaign, it was a vital stepping stone toward victory in the Battle of the Philippine Sea and in the conquest of the Marianas and the Philippines. Ulithi became the major U.S. forward fleet anchorage for the duration of the war and played a critical role in the eventual defeat of Japan. Moreover, the strat-

egy of island-hopping reached maturity in the Carolines, as did the evolution of the U.S. Navy’s fast-attack carrier groups and the concept of refueling and replenishing at sea. In these and other subtle ways, the campaign played an integral if underappreciated role in the final outcome of the war. One measure of the success of the U.S. strategy may be found in the experience of the British naval squadron that returned to raid Truk in June 1945. By then, that island had been so pummeled by U.S. attacks and its garrison so emaciated by isolation and lack of supplies that the British had no targets worthy of the name. Truk was little more than a prison for its defenders.

Carpet Bombing

The tactical application of strategic area bombing, originally used to direct a “carpet” of bombs to obliterate a target.

Carpet bombing was first employed by the Germans at Guernica in April 1937 during the Spanish Civil War, in what they called “a controlled vivisectional experiment in modern bombing tactics.”

By 1944, Allied carpet bombing involved heavy bombers dropping thousands of tons of relatively small bombs in an effective preparatory assault prior to a land attack. In this sense, the tactic was first utilized against Monte Cassino, Italy, on 15 February 1944. Waves of heavy and medium bombers dropped 435.5 tons of high explosives and reduced the local abbey to ruins. Ironically, the Germans, who had not previously garrisoned the abbey, now moved into the rubble and strengthened their defensive lines.

Following the June 1944 Normandy Invasion, Allied planners envisioned using fleets of bombers to blow holes in the German defenses, through which Allied armor and mechan-

U.S. bombers dropped 4,169 tons of bombs as part of the effort to support the breakout from Normandy.

nized forces could then pour. The British tried using heavy bombers in close-air support during Operation CHARNWOOD in early July. The attempt failed largely because of poor target selection and the fact that the bombing ended hours before the British ground attack, allowing the Germans to

reorganize their defense. In Operation GOODWOOD in mid-July 1944, British and American bombers tried again. After the carpet bombing, Allied ground forces met with initial success, but they foundered against a German antitank gun line that had not been a major target during the bombardment.

Operation COBRA on 24–25 July 1944 was another such effort and the most significant example of carpet bombing. U.S. bombers dropped 4,169 tons of bombs on the Saint-Lô area as part of the effort to support the breakout from Normandy. The bombers struck a box that was 7,000 yards wide and 2,000 yards deep. During the first day, many of the bombs fell short, hitting U.S. frontline troops and inflicting hundreds of friendly casualties. Among the dead was Lieutenant General Lesley J. McNair, chief of staff of Army Ground Forces. The second day’s attacks were highly successful, helping Lieutenant General Omar N. Bradley’s forces to break out from the bocage, or hedgerow, country.

The use of strategic bombers for tactical missions such as carpet bombing met with strong resistance from leaders of the U.S. Army Air Forces (USAAF), who believed that army ground commanders were misusing airpower. They argued that the effects achieved at the tactical level were slight compared to those that could be achieved at the strategic level. However, the lack of priority afforded to tactical-strike sup-

port and interdiction finally forced the hand of the ground commanders. Beginning in April 1944 and lasting until September, General Dwight D. Eisenhower was given the authority to control the use of the USAAF’s strategic bombers.

Although the sight of an armada of bombers was awe-inspiring and the simultaneous impact of hundreds of bombs was similar to an earthquake, the actual effect on tactical operations was mixed. The bombers lacked precision, and their bombs produced craters and rubble that impeded a rapid advance by attacking forces. The destruction of Caen in July 1944, for instance, was so complete that wheeled and tracked vehicles could not make it through the bombed areas. Although carpet bombing in support of offensive operations raised the morale of attacking ground troops, it was a poor substitute for effective tactical air support.

Carrier Raids, U.S. (January–March 1942)

The series of offensive strikes initiated by U.S. naval forces of the Pacific Fleet almost immediately after the Japanese surprise attack on its base at Pearl Harbor. Despite the slim resources available following the Pearl Harbor attack, the newly appointed commander in chief of the Pacific Fleet, Admiral Chester W. Nimitz, and the commander in chief of the U.S. Fleet, Admiral Ernest J. King, agreed that a passive defense was out of the question. King directed Nimitz to guard the important Hawaii–Midway–Johnston Island triangle in the eastern Pacific and to protect the vital sea line of communications from Hawaii via Line Islands, Samoa, and Fiji to New Zealand and Australia.

Almost immediately, Nimitz began to plan for carrier raids against Japanese holdings in the Gilbert and Marshall Islands in an effort to take some pressure off the American-British-Dutch-Australian Command (ABDACOM, more commonly known as ABDA), whose area included Burma, Malaya, the Dutch East Indies, western New Guinea, northern Australia, and, nominally, the Philippines. In planning the raids, Admiral Nimitz found his thinking in opposition to that of many of his senior subor-

dinates in the Pacific Fleet, who considered the use of carrier forces against heavily defended land bases much too risky unless complete surprise could be assured. Siding with Nimitz, however, was Vice Admiral William F. “Bull” Halsey, the fleet’s senior carrier admiral, who offered to lead the attacks.

The first offensive raid was planned against the Japanese outpost on Wake Island at the end of January 1942. Vice Admiral Wilson E. Brown’s Task Force 11, formed around the carrier *Lexington*, was assigned the mission until the Japanese torpedoed the oiler attached to his group and the mission was scrubbed. On 25 January, Admiral Halsey’s Task Force 8, centered on the carrier *Enterprise*, raided Japanese bases at Kwajalein, Wotje, and Taroa in the northern Marshall Islands while Task Force 17, formed around the carrier *Yorktown* and commanded by Rear Admiral Frank Jack Fletcher, struck at bases in the southern Marshalls. Although they were mere pinpricks in terms of the damage and delay they caused the Japanese offensive, the raids raised morale in the fleet and provided the carrier air groups with valuable practice.

On 24 February 1942, Halsey’s task force, now redesignated Task Force 16, sailed back into the fight with a raid on

Wake Island. From there, he moved on to strike Marcus Island, barely 1,000 miles from the Japanese home islands. At the same time, Admiral Brown’s Task Force 11 was sent south to attack the recently captured Japanese base at Rabaul on the island of New Britain, northeast of New Guinea. While still at a considerable distance from Rabaul, Brown’s task force was spotted by Japanese air patrols and subsequently attacked by Japanese bombers without fighter protection. In the ensuing fight, the *Lexington*’s fighters nearly wiped out the attacking bombers, while only sustaining light losses themselves.

Brown withdrew temporarily and requested support in the attack on Rabaul from Nimitz and was quickly joined by Fletcher’s task force. By the time it arrived, however, more lucrative targets appeared nearer at hand when, on 8 March, the Japanese landed forces at Lae and Salamaua on the eastern peninsula of New Guinea. Sailing into the Gulf of Papua on the opposite side of the peninsula on 10 March, Brown and Fletcher launched 104 aircraft and sent them over the rugged Owen Stanley Mountains. The aircraft emerged undetected to find unprotected Japanese ships unloading troops and supplies at the two locations. The attacking

Americans sank a large minesweeper, a transport, and a converted light cruiser. Nine other ships were damaged before they could escape to the open sea. Only one U.S. plane and one aviator were lost. This attack was the greatest U.S. naval success in the war to that point, but even more important, it convinced the Japanese that successful operations against New Guinea would require the protection of aircraft carriers.

Although the actual destruction of Japanese assets was minimal, these carrier raids led the Japanese High Command to make several momentous decisions. The Naval General Staff feared that Australia would become a major base from which Allied counteroffensives could be launched and decided that it should be attacked and seized. The Army General Staff, staggered by the great distances involved in the attack, countered with a proposal to capture Port Moresby in southeastern New Guinea and use it for attacks on

“We came, we listened, and we were conquered.”

—Major General Albert Wedemeyer at the Casablanca Conference

northern Australia to check Allied advances from that direction. This decision led to the Battle of the Coral Sea in May 1942.

The most dramatic American carrier operation early in the war came on 18 April 1942, when 16 U.S. Army Air Forces (USAAF) B-25 bombers lifted off the deck of the carrier *Hornet*, part of Halsey’s Task Force 16, and attacked Tokyo,

Nagoya, Osaka, and Kobe. Known as the Doolittle raid for the commander of the B-25s, Lieutenant Colonel James H. Doolittle, the attack did little physical damage but caused psychological shock among the Japanese leadership.

Jarred by these raids, members of the Imperial Naval Staff concluded that something had to be done about the American carrier threat. As a result, they suspended operations in the southeastern region (the Bismarcks, Solomons, eastern New Guinea, Papua, New Caledonia, Fiji, and Samoa), pulled air assets back to defend the Japanese home islands, and threw their support to the Combined Fleet’s Admiral Yamamoto Isoroku’s previously unpopular plan to seize the island of Midway.

Casablanca Conference (14–24 January 1943)

Important U.S.-British strategic planning conference held in Morocco. Following the successful Allied landings in North Africa and the breakout of the British Eighth Army at El Alamein, British Prime Minister Winston L. S. Churchill and U.S. President Franklin D. Roosevelt and the Combined Chiefs of Staff met at Casablanca, Morocco, between 14 and 24 January 1943. Soviet leader Josef Stalin was invited but declined to attend, citing the pressure of military operations.

The principal topic of discussion at the conference—which was code-named *SYMBOL* and took place in a hotel complex in Anfa, a suburb of Casablanca—was strategic military options once North Africa had been cleared of Axis troops. The British, who arrived at the meetings far better prepared than the Americans, made a strong case for invasions of Sicily and then the Italian peninsula. The Americans, who preferred concentration on a cross-Channel invasion of France, reluctantly acceded. “We came, we listened, and we were conquered,” remarked Major General Albert Wedemeyer, one U.S. attendee.

The Allied leaders at Casablanca took another important step in deciding to launch a combined bomber offensive against Germany. On the day the conference opened, the survivors of a special convoy from Trinidad arrived at Gibraltar. The convoy’s devastating losses to German U-boats—77 percent—forced the two Allied leaders to assign priority to winning the Battle of the Atlantic. They agreed to divert to that struggle additional convoy escorts, escort carriers, and aircraft assets (including the VLR [very long range] Consolidated B-24 Liberator, which would, for the first time, be based at Newfoundland to close the Greenland air gap).

But the Casablanca Conference is chiefly remembered for Roosevelt’s surprise announcement that the Allies would insist on “unconditional surrender.” Churchill, who had not been informed that the announcement would be made,

HISTORIOGRAPHICAL CONTROVERSY

Unconditional Surrender—A Hindrance to Allied Victory?

On 16 January 1943, at the close of the Casablanca Conference, U.S. President Franklin D. Roosevelt informed the press that peace would be achieved only with the total elimination of German and Japanese military power, which would necessitate the unconditional surrender of Germany, Italy, and Japan. Roosevelt was thinking of the end of World War I, when an armistice concluded hostilities, allowing German leaders to say that their nation had not been defeated militarily. The British—and Prime Minister Winston L. S. Churchill, in particular—did not appear comfortable with Roosevelt's remarks, although Churchill immediately announced his support publicly. He later said that he would not have used those words. He remained convinced that such an absolute and categorical expression of policy would stiffen Axis resolve. Certainly, the Allied demand for unconditional surrender became a handy propaganda instrument for the Axis powers.

Over the years, some have argued that the insistence on unconditional surrender actually prolonged the war. B. H. Liddell Hart, for example, asserted that the demand for unconditional surrender strengthened German resolve and was skillfully exploited by Joseph Goebbels's Propaganda Ministry, especially when it could be coupled with alleged scenarios such as the "Morgenthau Plan" to convert postwar Germany into a primarily agricultural and pastoral country. According to Liddell Hart, implacable German resistance in the last two years of the war was, in part, the consequence of the unconditional surrender policy.

Albert Speer, Germany's minister of armaments, lent credence to the argument that demands for unconditional surrender hardened German resistance. He suggested that Adolf Hitler entertained no illusions about the seriousness of the Allied position on Germany's surrender and that the Führer realized the Nazis had burned all their diplomatic bridges. He repeatedly told his cohorts that there was no turning back. This information implies that the Germans might otherwise have overthrown the Hitler regime, but it is doubtful that many Germans would have been attracted to this course by Allied assurances of moderation. Hugh R. Trevor-Roper dismissed the controversy as "much ado about nothing." Terms could only be made with holders of power or alternative power brokers. Some German military leaders might have been ready to bargain with the Allies, but conditions that included abolition of the Wehrmacht would probably not have been acceptable to them. In fact, German military opposition to Hitler failed, and the German democratic opposition was badly fragmented and often a will-o'-the-wisp. To be sure, Allied leaders were in concurrence on the point that the war would have to end with Axis surrender. Historian Gerhard Weinberg noted that the difference between surrender and unconditional surrender was merely a matter of nuance.

The demand for unconditional surrender had another advantage for the Western leaders. Both the British and U.S. governments sought to assure the Soviet

Union that they were in the conflict for the duration and hence would not consider an arrangement with the Germans at Moscow's expense. In emphasizing the diplomatic aspects of the unconditional surrender policy, Vojtech Mastny suggested that the latter was, in part, intended to reassure the Kremlin. Stalin displayed substantial skepticism, in public at least, about the British and American determination to remain in the war and assumed that, given the chance, they would negotiate with Germany behind his back. After all, he himself had approached the Germans on several occasions about a deal. Until the winter of 1943, Stalin portrayed the war as an exclusively Russian-German conflict that, by implication, could be settled in a mutually advantageous manner between two belligerents.

nonetheless immediately supported it. Some have charged that this decision needlessly prolonged the war by preventing negotiations with factions in the German resistance to Adolf Hitler that might have led them to topple his regime. Certainly, the declaration was a windfall for the German propaganda machine. In making the announcement, Roosevelt had in mind World War I and the way the German Right had

utilized the November 1918 armistice to spread the myth that Germany had not been defeated militarily. That outcome had been a powerful assist in Hitler's rise to power.

Another aspect of the Casablanca Conference concerned relations with the French. General Charles de Gaulle, leader of the Free French, was not informed of the meeting beforehand; Churchill simply ordered him to Morocco, which was

The unconditional surrender announcement at the Casablanca Conference at Casablanca, French Morocco, Africa. President Franklin Roosevelt, with Prime Minister Winston Churchill at his side, addressing the assembled war correspondents. (Library of Congress)

then still a French protectorate. Roosevelt and Churchill pushed de Gaulle into a partnership with General Henri Giraud, who had been spirited out of France by submarine. De Gaulle, already upset because Britain had undermined the French position in Syria and Lebanon, was eventually able to elbow the politically inept and equally stubborn Giraud into the shadows. However, the whole affair affected de Gaulle's attitude toward Britain and the United States.

Cash-and-Carry (November 1939)

U.S. program to allow states that were victims of aggression to purchase arms to fight the Axis powers. In July 1936, civil war broke out in Spain, and a year later, the Sino-Japanese War began. Then, in May 1937, the U.S. Congress passed the Neutrality Act, which committed the nation to "permanent neutrality." The act revamped existing neutrality legislation to include a prohibition on the sale of arms or munitions to either side in a civil war as well as a declared war between states. Travel by U.S. citizens on belligerent ships was made illegal, no longer just cautioned against as something undertaken at the passenger's risk. Well aware of the financial impact of trade, Congress provided that the president would draw up a list of certain strategic raw materials, such as oil,

that were to be paid for on delivery and then transported on ships belonging to the belligerent power. Thus was born the phrase *cash-and-carry*. These provisions were to last for two years.

In September 1939, Germany invaded Poland, beginning World War II. Public sentiment in the United States demanded that the country stay out of the conflict, but it also generally favored assistance to the states fighting Germany and Japan. In any case, the cash-and-carry provisions of the 1937 act had expired in May 1939, with the consequence that U.S. merchant vessels were free to sail into the war zones, albeit with the possibility that they would be sunk and the United States drawn into war. At the same time, the Western democracies could not purchase arms in the United States.

On 27 October 1939, the U.S. Senate voted 63 to 31 to repeal the embargo on arms to belligerents, and a week later, the House of Representatives followed suit, with a majority of 61 votes. Under the November 1939 act, cash-and-carry remained in effect. The United States could sell war materials to belligerents provided that they could pay cash for the goods and transport them in their own vessels. This act was, in fact, a compromise: the noninterventionists yielded on the arms embargo in order to secure the provision preventing U.S. ships from sailing into the war zones, and the repealists accepted the latter in order to secure an end to the ban on arms sales.

The terms of the act were intentionally crafted to favor the Atlantic sea powers that possessed merchant and naval forces to transport the material. To remain within the legal bounds of American neutrality, cash-and-carry was extended to all belligerents, both Axis and Allied, that could meet the specific requirements of the act. Japan was thus able to take advantage of its provisions—until the U.S. government embargoed war goods and froze Japanese assets in 1941, precipitating Tokyo's decision to launch an attack on the United States.

British Prime Minister Neville Chamberlain informed U.S. President Franklin D. Roosevelt that he thought the November 1939 act would have a “devastating effect upon German morale,” but that was hardly the case, as U.S. factories were only just beginning to produce quantities of weapons. The act also opened up the dilemma of how to allot the few weapons that were being produced. U.S. rearmament was barely under way at that point, and the armed services would have to compete with the Western democracies for American weapons. Many Americans also opposed the act because it provided assistance to the Soviet Union, and the legislation became an issue in the 1940 presidential campaign.

Cassino/Rapido River, Battles of (1944)

A series of engagements between the Allies and Germans for control of Monte Cassino, a massif strategically located at the entrance of the Liri Valley in Italy. The site of a Benedictine abbey established in A.D.529, Monte Cassino formed an important part of the German Gustav Line, a set of defensive positions stretching across the Italian peninsula and blocking the Allied approach to Rome.

Following up on the Allied success on Sicily in July and August 1943 (Operation HUSKY), the American Fifth Army landed at Salerno, a city on the western coast of Italy, on 9 September 1943 (Operation AVALANCHE) and began to push north. With rugged mountain ranges, heavy rains, and stiff German resistance barring the advance, Allied progress was slow. In late 1943, having broken through the Volturno Line (a German defensive line anchored on the Volturno River), the Allies found themselves up against the Gustav Line. To force the German commander, Field Marshal Albert Kesselring, to fight in two directions (west and south), the Fifth Army's commander, Lieutenant General Mark Clark, planned Operation SHINGLE, an amphibious landing at Anzio/Nettuno, north of and behind the Gustav Line. By landing at Anzio/Nettuno with a corps, Clark believed it would be possible to turn Colonel General Heinrich von Vietinghoff's Tenth Army out of the Gustav Line, thus opening the Liri Valley and the routes to Rome.

To prepare for the landing of Major General John Lucas's American VI Corps and its subsequent linkup with Fifth Army, Clark ordered attacks by the British X Corps and the U.S. II Corps. In order to seize key heights to protect the southern flank of II Corps as it began its attack up the Liri Valley, Lieutenant General Richard McCreery's X Corps assaulted across the Garigliano River on 17 January 1944. Failing to cross the river, the British attacked once more two days later but did not achieve their objectives. As a result, Major General Geoffrey Keyes's II Corps would assault across the Rapido River with its left flank exposed.

Keyes's plan to attack across the Rapido River and into the Liri Valley was simple. The 36th Infantry Division would move forward, with two regiments abreast, roughly 3 miles downstream from the town of Cassino; the 34th Infantry Division would attack with three regiments abreast north of Cassino. Beginning their strike on 20 January, the Americans

The town of Cassino burns during tremendous allied air assault, 15 March 1944. (Photo by Keystone/Getty Images)

immediately encountered stiff resistance from General der Panzertruppen (U.S. equiv. lieutenant general) Fridolin von Senger und Etterlin's German XIV Corps.

Throughout the night of 20 January, the Americans struggled to find their way through minefields, cross the river in rubber rafts and canvas boats, and erect footbridges. Sunrise the next morning exposed the Americans to accurate German artillery and rocket fire. Concerned with his losses, the 36th Infantry Division commander, Major General Fred Walker, prevailed on Keyes to delay a renewed effort until after dark. Attacking again on the evening of 21 January, the 36th Infantry Division suffered heavy losses without establishing a lodgment on the far side of the Rapido. Against Keyes's wishes, Clark authorized Walker to halt the attack on the morning of 22 January.

With the 36th Infantry Division stalled, Clark now intended to envelop Cassino from the north. Attacking on 25 January with the 34th Infantry Division and units of General Alphonse Juin's French Expeditionary Corps, the Allies soon ground to a halt. Once again, the soggy ground, a strong current, and determined German resistance frus-

trated Clark's efforts to capture Cassino. Over the next several days, the 34th Infantry Division, including the Nisei 100th Infantry Battalion, inched its way up and over the heights north of Cassino but was unable to capture the abbey or the town. By 11 February, the II Corps attack was spent, and the task for opening the Liri Valley fell to Lieutenant General Bernard Freyberg's New Zealand II Corps.

Believing the only way to capture Cassino was to eliminate the abbey from the commanding heights above the town, Freyberg received permission to bomb it, and on 15 February, waves of bombers dropped 435.5 tons of high explosives, reducing the abbey to ruins. Although the Germans had not previously garrisoned the abbey, its destruction allowed them to position troops amid the rubble and to strengthen their lines. Launching Operation AVENGER on 15 February, Freyberg's subordinates, facing the same problems as the Americans had earlier, fought with little success to capture Monte Cassino. Frustrated by his lack of progress, Freyberg ordered a halt to AVENGER after three days of fighting.

Freyberg set the next attack for 24 February. Called Operation DICKENS, the attack comprised two infantry divisions

and a tank regiment. Believing a direct approach would prove more effective, Freyberg planned to attack frontally into the town of Cassino, but heavy rains delayed the operation until 15 March. Following the Italian Campaign's first massive carpet bombing, Freyberg's troops engaged in heavy fighting within the town and on the surrounding heights. For the next 10 days, II New Zealand Corps fought in close combat amid the ruins of Cassino with little effect. Because Freyberg failed to commit his reserves in a decisive manner, his conduct of the operation resulted in the heavy casualties he had hoped to avoid. By 24 March, the II New Zealand Corps attacks had halted, with the Germans still in possession of portions of Cassino and the abbey's ruins.

By mid-April, the Polish II Corps, commanded by Lieutenant General Władysław Anders, began to move into the line opposite Cassino. As part of an Allied deception plan, activity along the Gustav Line almost completely ceased. On 11 May, the Allies attacked with Fifth Army and the British Eighth Army, and although the offensive caught the Germans by surprise, casualties among the Poles were still high. Fifth Army's progress south of Cassino in the Liri Valley, however, rendered Monte Cassino unimportant to the Germans' defense. On the evening of 17 May, the defenders withdrew, and the next day, the Polish II Corps occupied Monte Cassino, completing a four-month battle for the heights. Casualties for the Allies numbered some 120,000; the Germans suffered almost 130,000.

Casualties

World War II exacted a heavy toll on the combatant nations and the world community as a whole. Although figures vary widely based on the source employed, perhaps 50 million servicemen and civilians were killed in the course of the conflict. World War II is thus the most destructive war in human history (see Table 1).

American casualties aboard a landing craft being removed from Munda Point, New Georgia Island, July 1944. (National Archives)

In terms of combat losses for the principal Allied powers, the Soviet Union had 8,668,400 military personnel killed. The majority of these were in the army, as the Soviets bore the brunt of the fighting on land against Germany. By the end of the war, the Chinese had 1,324,516 soldiers killed, a number of whom became casualties as early as the 1937 Japanese invasion. The United States, Great Britain, and France suffered far fewer losses, although in relative terms, given their smaller populations, the impact was still high. Of these powers, Great Britain's armed forces had 397,762 men killed. This figure includes losses incurred by imperial and Commonwealth forces: Canada sustained 37,476 deaths, India 24,338, Australia 23,365, New Zealand 10,033, and South Africa 6,840. The United States suffered 292,129 battle deaths, and the French lost 213,324 servicemen. The latter figure includes Free French forces.

Smaller Allied powers also lost heavily in comparison to their populations. Poland had 320,000 killed, and Greece lost 73,700. The Netherlands lost 6,238 servicemen. Belgium's armed forces lost 7,760 men. The dead of Norway totaled 4,780, and Denmark's losses were 4,339, a figure that includes merchant sailors in the service of other Allied navies.

Table 1
Casualty Figures for World War II

	Battle Deaths	Wounded	Missing in Action	Civilian Dead
Allied Powers				
Australia	23,365	39,803	32,393	—
Belgium	7,760	14,000	—	76,000
Canada	37,476	53,174	10,888	—
China	1,324,516	1,762,006	115,248	1,000,000
Denmark	4,339	—	—	1,800
France	213,324	400,000	—	350,000
Great Britain	397,762	348,403	90,188	92,673
Greece	73,700	47,000	—	325,000
India	24,338	64,354	91,243	—
Netherlands	6,238	2,860	—	200,000
New Zealand	10,033	19,314	10,582	—
Norway	4,780	—	—	7,000
Poland	320,000	530,000	420,760	3,000,000
South Africa	6,840	14,363	16,430	—
Soviet Union	8,668,400	14,685,593	4,559,000	14,012,000
United States	292,129	670,846	139,709	6,000
Axis Powers				
Bulgaria	10,000	21,878	—	10,000

Sources: Data from Bullock, Alan, *Hitler and Stalin: Parallel Lives*, New York: Alfred A. Knopf, 1992; Dupuy, Richard Ernest, *World War II: A Compact History*, New York: Hawthorn Books, 1969; Keegan, John, *The Second World War*, New York: Penguin, 1989; Keegan, John, ed., *The Times Atlas of the Second World War*, New York: Harper and Row, 1989; Krivosheev, G. F., *Soviet Casualties and Combat Losses in the Twentieth Century*, London: Greenhill Books, 1993; and Sorge, Martin K., *The Other Price of Hitler's War: German Military and Civilian Losses Resulting from World War II*, New York: Greenwood, 1986.

The principal Axis powers had significantly fewer casualties than did the Soviet Union, but their populations were also much smaller. Germany, which waged a two-front war, suffered the most, with 2,049,872 dead. Japan sustained 1,506,000 deaths, and Italy lost 259,732 men. This number includes some 17,500 men killed in battle after that nation declared itself a cobelligerent of the Allies.

The other Axis powers endured heavy losses as well. Romania suffered greatly with 300,000 deaths, most of these incurred while the country was an Axis power but a small number being deaths suffered after it joined the Allies late in the war. Hungary lost 147,435 men, and Finland's dead numbered 79,047 soldiers, sailors, and airmen. Bulgaria, initially an Axis power, suffered 10,000 deaths, with some

of these individuals being in the service of the Allies late in the war.

Civilian deaths greatly increased the human toll, as the age of total warfare embraced the civilian sector, too. Including battle deaths, total Soviet deaths in the war may have reached 27 million. Germany was second in terms of civilian losses. Most of these were the result of Allied bombing raids, which claimed the lives of some 410,000 civilians. Air attacks on the home fronts of other nations also carried a heavy cost. In Japan, about 500,000 people lost their lives, whereas Great Britain suffered 92,673 deaths.

Adding to civilian figures were atrocities committed against civilians. Chief among these was the Holocaust, the German campaign to exterminate Europe's Jewish popula-

tion. The Holocaust claimed an estimated 6 million Jews. Half of this number were Polish citizens, and some 1.2 million came from the Soviet Union. Hungary's figure for Jewish deaths was 450,000, and Romania's total reached 300,000. The Baltic states lost 228,000 of their citizens. Germany itself sent 210,000 of its own people to their deaths.

The aftermath of World War II claimed additional victims. Some of these losses were the result of efforts by the Soviet Union and other Eastern and Central European governments to drive out their German minorities. Perhaps 2 million of the 14 million ethnic Germans who had been living in Eastern Europe died in the course of this expulsion. The final legacy of the war was an estimated 11 million people displaced by the conflict, some of whom perished from simple lack of food or shelter.

In addition to the death totals, large numbers of people were wounded, many of them seriously. These casualties, too, imposed a heavy financial toll on all combatant states after the war. Finally, it should be noted that death tolls in the war would have been much higher save for new miracle drugs and blood plasma.

CATAPULT, Operation (July 1940)

Operation carried out by the British navy, beginning on 3 July 1940, to neutralize, seize, and if necessary destroy French navy warships, which the British feared would fall into German hands. In 1940, the French navy was the second most powerful in Europe and had many modern warships. With the defeat of France and the German capture of its Atlantic ports, a number of French warships ended up in British harbors; by 3 July, these included the old battleships *Courbet* and *Paris*, a super destroyer leader, two destroyers, six torpedo boats (called light destroyers by the French), and numerous other small warships. Many more vessels remained in French ports, however.

When the French entered into armistice talks with the Germans, Prime Minister Winston L. S. Churchill and the War Cabinet became concerned over the final disposition of

the French fleet. Although the French navy commander, Admiral Jean Darlan, had promised the British government that France would scuttle the fleet rather than see it fall into German hands, Britain's leaders were not certain that would be the case. And with the threat of a German invasion of Britain looming, Churchill was determined to secure the French fleet. Such a dramatic action on the part of his nation would also demonstrate to the Americans that Britain was determined to continue in the war.

The armistice terms did indeed allow the French government to retain control of the fleet, but it was to be disarmed, mostly at the French navy base of Toulon and also at colonial French ports. At that time, a majority of the French ships were in North Africa, at the ports of Mers-el-Kébir, Oran, Algiers, Bizerte, Alexandria, or elsewhere overseas. The almost completed and powerful battleships *Richelieu* and *Jean Bart* had escaped France and were at Dakar and Casablanca, respectively. At Mers-el-Kébir, there were the two fast battleships *Dunkerque* and *Strasbourg*; the two older, modernized battleships *Provence* and *Bretagne*; the seaplane tender *Commandant Teste*; and some large destroyers and miscellaneous warships. Oran served as base to seven destroyers, and Algiers had six modern light cruisers.

Over some opposition and at Churchill's insistence, the War Cabinet approved Operation CATAPULT to carry out the "simultaneous seizure, control or effective disablement or destruction of all the accessible French Fleet." French naval commanders were offered a series of options: they could join Britain and continue the fight, they could sail their ships to a neutral port and be disarmed there, or they could scuttle their ships. If French commanders rejected these options, the British naval commanders were under orders to open fire and sink the French ships themselves.

The plan, which unfolded on 3 July, met with considerable success in those areas under British control. At Portsmouth, the British seized the old French battleship *Courbet*, along with other small vessels. At Plymouth, they secured the battleship *Paris*, two destroyers, a torpedo boat, and three sloops. There, also, they took the *Surcouf*, the world's largest submarine. Three submarines and other craft were secured from the ports of Falmouth and Dundee. In their home ports, the British secured almost 200 small warships, including minesweepers, tugs, submarine chasers, and trawlers. The vessels were taken at a cost of three sailors killed, two British and one French. Later, 3,000 of the ships' 12,000 officers and sailors joined the Free French. Also seized were French merchant ships and their crews.

CATAPULT was also successful in the West Indies. Prolonged talks involving the British, French, and Americans led to the internment of the aircraft carrier *Béarn* and two light cruisers at Martinique. At Alexandria, Vice Admiral Sir Andrew Cunningham negotiated with Vice Admiral René Émile Godfroy,

French ship being scuttled at Toulon, 27 November 1942. (Photo by Keystone/Getty Images)

who commanded a French squadron consisting of the rebuilt World War I-era battleship *Lorraine*; the heavy cruisers *Duquesne*, *Tourville*, and *Suffren*; the light cruiser *Duguay-Trouin*; three destroyers; and one submarine. In deft negotiations, Cunningham managed to secure an agreement that the French ships would be disarmed and their fuel emptied. Some of the sailors were also repatriated to France.

The operation was not so effective farther west in the Mediterranean. At Mers-el-Kébir, the French refused to yield and fought a battle with Vice Admiral James Somerville's newly formed Force H from Gibraltar. In the action, the French battleship *Bretagne* blew up and sank. The *Provence* was also badly damaged and beached herself; the battleship *Dunkerque* ran aground. In this battle, 1,297 French seamen died; another 351 were wounded. Later, on 5 July, the *Strasbourg*, *Commandant Teste*, and a few destroyers broke free and escaped. There was also fighting at Dakar, where a small British squadron built around the tiny aircraft carrier *Hermes* damaged the battleship *Richelieu* on 8 July.

Because of CATAPULT, the Vichy French government severed diplomatic relations with Britain. The German govern-

ment also lifted demobilization requirements for the French fleet and elements of its air force, and the French then mounted several largely ineffectual air strikes against Gibraltar. On 26 July, London declared a blockade of metropolitan France and French North Africa, although it was never heavily enforced.

Those who had opposed CATAPULT believed it would drive a wedge between the two former allies; they also expected France to honor its pledge to Britain to scuttle the fleet if necessary. In these beliefs, they were quite correct. Despite their sharp animosity toward Britain for launching CATAPULT—an animosity that lingers to this day—the French honored their pledge. In November 1942, following the Allied landings in North Africa (Operation TORCH), the French scuttled their ships when the Germans tried to secure them at Toulon. Operation CATAPULT was one of the most tragic aspects of the war.

Catholic Church and the War

The Catholic Church's record in World War II, particularly its assistance to Jews and resistance to the Holocaust or lack thereof, has generated intense controversy. Individual Catholics certainly acted with considerable bravery in opposing Nazi agendas. Archbishop Galen of Münster condemned Germany's euthanasia program in 1941, which led Adolf Hitler to suspend mass killings (although so-called mercy killings continued on a smaller scale). Other Catholics hid Jews and served bravely in the Resistance in France or as chaplains at the front (more than 3,000 in the U.S. Army alone). Yet the Vatican refused to issue official statements condemning the Holocaust. Meanwhile, in an exercise in bad timing, the Vatican extended diplomatic relations to Japan early in 1942, at the high tide of Japanese aggression in Asia and the Pacific.

In part, nationalist loyalties constrained the Vatican and proved more powerful, if not more resilient, than supranational Catholicism. In the Nazi puppet state of Croatia, Franciscan monks and ultranationalist priests lent their moral authority to the murder of tens of thousands of Jews and Orthodox Serbians in 1941. A few bloodthirsty priests even joined in the killing. Meanwhile, anti-Bolshevism drove many European priests to support the Nazi "crusade" against the Soviet Union, and traditional expressions of biblical anti-Semitism and consistent opposition to Zionism tended to inhibit sympathy for Jews.

Ultimately, Pope Pius XII was responsible for exercising and enforcing the church's moral authority, and evidence indicates he was a Germanophile. As a cardinal, he had negotiated the 1933 concordat between the Vatican and Nazi Germany that gave the Holy See tighter control over independent-minded German Catholics. It also gave Hitler important international recognition and a freer hand in Germany, as it led to the dissolution of Germany's Catholic Center Party.

In the invasion of Poland in September 1939, the Nazis revealed their murderous nature. Polish priests were either murdered or deported to concentration camps. In the Warthegau region alone, the Nazis killed more than 300 priests. Apparently concluding that official condemnations

would goad the Nazis to further excesses, Pius XII remained silent. And after failing to protest the mass murders of priests, it was not surprising that the pope, who knew of the mass murders of the Jews by mid-1942, nevertheless refused to condemn these crimes officially.

Pius XII was too cautious, and his well-intentioned attempts at behind-the-scenes diplomacy proved ineffectual. Critics have cited his reluctance to identify the Jews as victims (he preferred the pusillanimous term *unfortunate people*) to suggest that he was an uncaring anti-Semite. Such accusations are unjust, however. Guided more by concerns about the preservation of the church hierarchy and the physical survival of Rome, Pius XII failed to lead morally and speak authoritatively. Exaggerated caution, not anti-Semitism, accounted for his reluctance to remonstrate against Nazi war crimes.

In March 1998, John Paul II issued a document entitled "We Remember: A Reflection on the Shoah." Although it called for Catholics to repent if they had known about the Holocaust yet failed to act, this document absolved Pius XII of blame and praised him for resolute diplomacy that reputedly led to the salvation of hundreds of thousands of Jews. Controversy nevertheless continues today on whether Pius XII should be beatified and made a saint or vilified as "Hitler's pope." Yet a middle ground does exist between hagiographers, on the one hand, and scandalous and carping caricaturists, on the other.

Caucasus Campaign (22 July 1942–February 1943)

German campaign, dubbed Operation EDELWEISS, to capture the rich Caspian oil fields. Although the offensive was unsuccessful, the territory taken in this operation represented the farthest points to the east and south reached by the German army during the war.

The great German summer offensive, Operation BLAU (BLUE), opened on 28 June. General Erich von Manstein had

argued for a concentration in the center of the front. He believed that Soviet leader Josef Stalin would commit all available resources to save Moscow and that this approach offered the best chance of destroying the Red Army; it would also result in a more compact front. Adolf Hitler rejected this sound approach and instead divided his resources. In the north, he would push to take Leningrad, still under siege, and link up with the Finns. But the main effort would be Operation *BLAU* to the south, in which the Caucasus oil fields located near the cities of Baku, Maikop, and Grozny would be the ultimate prize. Securing these areas would severely cripple Soviet military operations, while at the same time aiding those of Germany.

Hitler ordered Field Marshal Fedor von Bock's Army Group South to move east from around Kursk and take Voronezh, which fell to the Germans on 6 July. Hitler then reorganized his southern forces into Army Groups A and B. Field Marshal Siegmund List commanded Army Group A, the southern formation; General Maximilian von Weichs had charge of the northern formation, Army Group B.

Hitler's original plan was for Army Groups A and B to cooperate in a great effort to secure the Don and Donets Valleys and capture the cities of Rostov and Stalingrad. The two could then move southeast to take the oil fields. The Germans expected to be aided in their efforts there by the fact that most of the region was inhabited by non-Russian nationalities, such as the Chechens, whose loyalty to the Soviet government was suspect.

On 13 July, Hitler ordered a change of plans, now demanding that Stalingrad, a major industrial center and key crossing point on the Volga River, and the Caucasus be captured simultaneously. This demand placed further strains on already inadequate German resources, especially logistical support. The twin objectives also meant that a gap would inevitably appear between the two German army groups, enabling most Soviet troops caught in the Don River bend to escape eastward.

On 22 July, Army Group A's First Panzer and Seventeenth Armies assaulted Rostov. Within two days, they had captured the city. A few days later, the Germans established a bridgehead across the Don River at Bataysk, and Hitler then issued Führer Directive 45, initiating *EDELWEISS*. He believed that the Red Army was close to defeat and that the advance into the Caucasus should proceed without waiting until the Don was cleared and Stalingrad had fallen. The operation would be a case of strategic overreach.

Securing the mountain passes of the Caucasus region between the Black and Caspian Seas was crucial in any operation to take the oil fields. To accomplish this task, Army Group A had special troops trained for Alpine operations, including Seventeenth Army's XLIX Mountain Corps. Sup-

porting Army Group A's eastern flank was Army Group B's Fourth Panzer Army.

At the end of July, List had at his disposal 10 infantry divisions as well as 3 Panzer and 2 motorized divisions, along with a half dozen Romanian and Slovak divisions. Hitler expected List to conquer an area the size of France with this force. Despite these scant German and allied forces, the Soviets had only scattered units available to oppose the German advance. On 28 July, the Soviets created the North Caucasus Front, commanded by Marshal Semen Budenny, and Stalin ordered his forces to stand in place and not retreat. But even reprisals failed to stem the Soviet withdrawal before Army Group A's rapid advance, which had all the characteristics of a blitzkrieg. Indeed, the chief obstacles to the German advance were logistical, created by the vast distances involved and terrain problems. The Germans used aerial resupply where possible and also horses and camels to press their advance.

By 9 August, the 5th SS Panzer Division had taken the first of the Caucasus oil fields at Maykop. To the west, infantry and mountain formations of the Seventeenth Army had made slower progress, but on 9 August, they took Krasnodar, capital of the rich agricultural Kuban region. They then moved in a broad advance into the Caucasus Mountains, with the goal of taking the Black Sea ports of Novorossiysk, Tuapse, and Sukhumi. Soviet forces, meanwhile, continued to fall back into the Caucasus. As Budenny's North Caucasus Front prepared to defend the Black Sea ports, the Soviets sabotaged the oil fields, removing much of the equipment and destroying the wellheads. So successful was this effort that there would be no significant oil production from the region until after the war.

By the end of August, the German advance had slowed to a crawl. For the Seventeenth Army, the problems were terrain and a stiffening Soviet resistance. Bitter fighting occurred in Novorossiysk, beginning on 18 August when the Germans threw six divisions against the city. It fell on 6 September, although the Soviets managed to evacuate their defending marine infantry by sea.

To the east, the advance of the First Panzer Army, pushing toward the oil fields at Grozny, also slowed. Problems there were largely logistical, with a serious shortage of fuel impeding forward movement. In addition, Hitler was gradually siphoning off First Army's strength, including two divisions, some of its artillery, and most of its air support (diverted north to the cauldron of Stalingrad). Weather now became a factor, with the first snowfall in the mountains on 12 September. Displeased with the progress of his forces in the Caucasus and despite List's objections, Hitler assumed personal control of Army Group A on 10 September and sacked List.

Hitler's plan was far too ambitious for the assets committed. The weather had become a critical concern, as did continuing German logistical problems. The Soviets, meanwhile, were able to feed additional resources into the fight. On 14 October, the Germans suspended offensive operations in the Caucasus, except for the Seventeenth Army efforts on the Terek River and around Tuapse. The Germans took Tuapse several days later but then called a halt to offensive operations on 4 November.

Events at Stalingrad now took precedence. By the end of November, Soviet forces had encircled the German Sixth Army at Stalingrad, and Soviet successes there placed the Axis forces in the Caucasus in an untenable situation. Then, on 29 November, the Soviet Transcaucasus Front launched an offensive of its own along the Terek. The Germans repulsed this attack, but on 22 December, German forces began a withdrawal from positions along the Terek River. At the end of December, with the situation to the north growing more precarious daily, Hitler reluctantly ordered Army Group A to withdraw. This movement began in early January, with Soviet forces unable seriously to disrupt it. By early February, German forces had withdrawn to the Taman Peninsula, from which Hitler hoped to renew his Caucasus offensive in the spring. In October 1943, however, German forces there were withdrawn across Kerch Strait into the Crimea.

Germany's Caucasus Campaign turned out to be a costly and unsuccessful gamble. Ultimately, by splitting his resources between Stalingrad and the Caucasus, Hitler got neither.

Censorship

The practice of suppressing and/or manipulating information and news, often by a government agency. Every nation involved in World War II applied censorship to some degree. But exactly what was censored and how it was censored varied from country to country. Totalitarian Germany and the Soviet Union generally manipulated the news by completely controlling the newspapers and radio stations: citizens normally knew only what their governments decided they should know. German Minister of Propaganda Joseph Goebbels, for example, rigidly controlled the flow of news to the German people. The governments of Italy and Japan held similar powers and used them frequently, but there were also surprising instances when newspapers were able to criticize those governments without severe repercussions. Still, the Japanese people at large knew nothing about their navy's great defeat in the June 1942 Battle of Midway. In Great Britain, the wartime government preferred to enforce censorship through prior restraint by creating a detailed censorship code and having government employees enforce it by carefully reviewing the contents of all news before it could be published or broadcast. Most of the Commonwealth nations followed suit, creating censorship codes and enforcing them as Britain did.

The U.S. system of wartime censorship also employed written censorship codes, but the government enforced these codes in a less intrusive way. This unique system of "voluntary self-censorship" was created just after Pearl Harbor. President Franklin D. Roosevelt decided that American censorship should begin with separate spheres for military information and domestic news. Thus, the U.S. Army and Navy kept control of their information by such traditional expedients as editing the mail of military personnel (the extent varied widely from unit to unit) and issuing very general press releases. In the field, the army and navy required American correspondents to agree to specific rules or be banned from combat theaters. Military censors also reviewed the copy written by correspondents, which had to be approved before it could be transmitted to their home offices.

For the most part, correspondents accepted military censorship without protest. At one point, virtually the entire press corps in Sicily voluntarily suppressed the story about Lieutenant General George S. Patton slapping two soldiers. Writer John Steinbeck, who spent about five months in Europe as a war correspondent, remembered that he and his colleagues censored themselves more vigorously than did the military censors.

CBI

See China-Burma-India Theater.

Page of notebook of Robert C. Miller, United Press correspondent, which had parts blacked out when passing through Naval censorship, 1942. (Library of Congress)

For domestic news, Roosevelt created the Office of Censorship. This body was similar to the Creel Committee of World War I, which had developed a general censorship code that the media then pledged to follow. However, knowing how American reporters and editors had resented George Creel's heavy-handed approach, Roosevelt shrewdly selected Byron Price, lead editor of the Associated Press, to head his new office. Price, in consultation with a censorship operating board composed of representatives of several federal agencies, handled the press fairly by applying the new censorship codes for the press and for radio news in a consistent manner.

Neither of the codes was very long, and the details were deliberately somewhat vague. Price preferred to ask editors to guide their own actions by asking themselves, "Is this information I would like to have if I were the enemy?" This appeal to patriotism worked well, for throughout the war, editors tended to censor their agencies' stories so heavily that Price's staff and the volunteer monitors who reviewed local newspaper stories for the office often suggested that deleted information could be returned to the text.

The most serious challenge to censorship came in June 1942, when Stanley Johnston, a reporter for the *Chicago Tribune*, gained access to a confidential navy communiqué based on the navy's ability to read Japan's naval codes. From this information, Johnston wrote a story revealing that the U.S. Navy had advance information about the

Japanese attack on Midway. This scoop, which the *Chicago Tribune* published without submitting it to Price's censors, threatened to expose U.S. code-breaking operations. Outraged at the harm this could have done to the war in the Pacific, the Department of Justice prepared a case against the newspaper for violating the Espionage Act. In the end, however, the government dropped the matter, partly because the story had not contravened the existing censorship code but largely because a public trial would only further jeopardize the code-breaking secret. Fortunately for the Allies, the Japanese apparently were not aware of the story.

The censorship code was then revised and reissued with greater restrictions. The main impact of the incident seems to have made most editors even more cooperative in censoring their own stories. By 1944, a few reporters had picked up gleanings about the purpose of the top-secret MANHATTAN Project, yet all of them kept quiet about the knowledge that America was building an atomic bomb. The fact that one of these reporters was the notorious whistle-blower Drew Pearson only underscores how readily the media accepted the need for wartime censorship.

Throughout the war, most of the Office of Censorship's 15,000 employees were not battling with the press but instead were monitoring the vast amount of mail, cables, and telephone calls that went overseas, seeking to keep information from falling into the wrong hands. As had the media, American citizens accepted this censorship without great protest. Indeed, few Americans seemed to complain about censorship at all, which was very different from the way they grouched about rationing, taxes, shortages, or many of the other restrictions that the war had placed on their freedoms.

Even after 1945, there was remarkably little criticism of wartime censorship, in marked contrast to the complaints that followed the war in Britain and elsewhere. These attitudes shed light on popular American views of the emergency in the early months after Pearl Harbor. They also suggest that Byron Price had been right when he told President Roosevelt that he would get more cooperation from Americans by asking them to help him rather than telling them what to do.

Central Pacific Campaign

The U.S. Navy's overarching strategy for defeating the Japanese by making a thrust through the Central Pacific had its roots in a long-standing concept for a maritime war with Japan. WAR PLAN ORANGE dated to 1898, and though modified many times, the basic scheme remained consistent. PLAN ORANGE called for marshaling the main battle fleet in the eastern Pacific, then steaming to the Philippines, where a decisive Mahanian-style battle fleet engagement would occur. Simultaneously, the navy would relieve the beleaguered Philippine army garrison. Faced with catastrophic defeat and total American command of the sea, Japan would presumably surrender.

The successful Japanese strike on Pearl Harbor completely disrupted PLAN ORANGE and the Central Pacific thrust. With all Pacific Fleet battleships sunk or damaged and only five aircraft carriers available in the Pacific, the navy was in no condition to execute PLAN ORANGE, defeat the Imperial Japanese Navy in a decisive battle for command of the sea, or even reinforce or evacuate the Philippine defenders. Consequently, for almost two years, the navy engaged in peripheral operations against the Japanese defensive perimeter, supporting the Marines and the army in the Solomon Islands and New Guinea and repelling Japanese main strike forces at the Battles of the Coral Sea and Midway.

By mid-1943, with *Essex*-class fleet carriers coming on line from the "two ocean" Naval Expansion Act of 1940 and fast battleships of the *North Carolina*- and *South Dakota*-classes for antiaircraft support and shore bombardment, the commander in chief of the Pacific Fleet, Admiral Chester Nimitz, stood ready to launch the Central Pacific assault against the Japanese Empire.

The dual-pronged Pacific strategy that emerged in 1943 represented a compromise between the services. The ABC Conference (between Britain, Canada, and the United States in March 1941) established Pacific operational areas, which the Joint Chiefs of Staff reconfirmed in March 1942. The agreement gave the navy operational control over the Central and South Pacific areas; the army had responsibility for the southwest Pacific. The army area commander, General Douglas MacArthur, advocated an advance up the New Guinea coast along the New Guinea-Mindanao axis to isolate the Japanese base at Rabaul and drive to the Philippines. The navy, meanwhile, pressed for a Central Pacific thrust. In March 1943, the Joint Chiefs agreed on a compromise plan whereby both services would advance along their preferred routes while simultaneously supporting each other. The results of this dual-pronged strategy

formed from compromise were devastating for Imperial Japan.

To face two simultaneous threats, the Japanese, unable to concentrate against a single-threat axis, had to stretch their air, naval, and ground forces perilously thin. By adopting a "leap-frogging" operational mode in both the Central and southwest Pacific, U.S. forces could attack strategic points, such as islands with airfields, while simply bypassing and isolating large Japanese garrisons, such as Truk and Rabaul. These latter then withered on the vine.

Another component of the Central Pacific strategy was the submarine offensive against Japanese shipping. This offensive further reduced Japan's capability to reinforce and sustain isolated garrisons as U.S. forces advanced key island by key island, beginning with Operation GALVANIC against the Gilbert Islands in November 1943. In the interwar years, the Marine Corps had made great strides in amphibious operations, and Guadalcanal had been a useful test of amphibious doctrine. Nimitz and his chief of staff, Vice Admiral Raymond Spruance, had originally conceived of the first thrust going against the Marshall Islands; however, the Gilberts were closer to Hawaii and within range of land-based air cover.

The Central Pacific thrust offered a number of advantages. The many islands and atolls provided a target-rich environment that prevented the Japanese from determining the precise route of advance and forced them to defend all points. The size of the islands and atolls discouraged the establishment of large garrisons. The long distances between islands mitigated mutual support, and American carrier airpower inhibited supply and reinforcement. Further, the line of communications from Pearl Harbor and the mainland United States would be shorter than that to the southwest Pacific. The Central Pacific also offered a more healthful climate than the jungles of New Guinea. And an advance through the Central Pacific would cut off and isolate Japanese forces in the South Pacific.

There were, of course, some disadvantages to a Central Pacific thrust. These included the requirement for overwhelming naval and air superiority, which could not be achieved until late 1943 and necessitated the defeat of the main Japanese battle fleet (which occurred in the Battle of Midway). The U.S. plan would also rely on successful amphibious operations, which had not been totally proven.

Operation GALVANIC commenced in late autumn 1943 with landings on Tarawa Atoll (the primary objective being Betio, with its airfield) and Makin Atoll. The joint army, navy, and marine force employed overpowering numbers, with more than 200 ships and 35,000 troops under Rear Admiral Richmond K. Turner, commander of V Amphibious Force. Task Forces 52 and 53 assaulted the atolls on 20

November 1943. Six fleet carriers and five light carriers, escorted by six battleships, provided overwhelming firepower, naval gunfire support, and air cover. Additionally, several hundred army, navy, and marine aircraft participated from the base at Ellice Island. Despite Japanese air attacks from the Marshalls, the air threat proved negligible. On Tarawa, strong fortifications, bunkers, hidden obstacles, and barbed wire slowed the advance—a prelude to future Japanese defensive schemes—and with orders to fight to the last man, the garrison staunchly resisted. Very few Japanese survived, another indicator of the bitter struggle unfolding in the Central Pacific Campaign. U.S. forces suffered a 17 percent casualty rate and encountered other problems as well, including faulty beach and surf intelligence, the inability of landing craft to negotiate shallow atoll waters, inadequate landing craft, too little advance shore bombardment, and poor communications. The Gilberts experience provid-

ed many valuable lessons for the U.S. Navy and Marines on how to conduct future operations.

The Marshall Islands were next. Despite a dearth of transports, Operation *FLINTLOCK* finally commenced on 31 January 1944. Eniwetok and Kwajalein (the world's largest coral atoll) succumbed to overwhelming force and the pounding from Vice Admiral Marc Mitscher's Fast Carrier Task Force 58. The Americans had learned from the Gilberts experience, and casualties among the assaulting forces were much lighter. With the capture of the Marshalls by March, 10 weeks ahead of the established timetable, the navy bypassed several heavily fortified Japanese-held islands and turned its attention to the Mariana Archipelago.

The assault on the Marianas, Operation *FORAGER*, aimed at taking Guam, Saipan, and Tinian Islands. From these bases, the Japanese home islands would be within striking distance of the B-29 Superfortress heavy bombers. The assault on

Saipan commenced on 13 June 1944, with landings on 16 June. Determined to halt the advance by interdicting the supporting naval forces, Vice Admiral Ozawa Jisaburo mounted an assault on the Americans in the Battle of the Philippine Sea. However, the assault, which commenced on 19 June, turned into disaster as the better-trained and better-equipped U.S. Navy pilots decimated the inexperienced Japanese airmen in what came to be called the “great Marianas turkey shoot.” Ozawa lost 325 of 375 attacking aircraft; Japanese naval airpower disappeared in a day, never to play any significant role in the war thereafter except in desperate suicide attacks in the last months.

Saipan was taken by 13 July. The Marines landed on Tinian on 24 July and secured it on 2 August. Guam, the last of the major islands, was struck on 21 July and was finally declared secured on 10 August.

With the loss of the Marianas, the Japanese defensive perimeter had been decisively breached. U.S. strategic bombing of the Japanese home islands now began in earnest and ended in the atomic bomb attacks launched from Tinian a year later. From the Marianas, the two prongs of the Pacific strategy came together again with the invasion of the Philippines in October 1944.

Tenacious Japanese defenders and their fortifications did cause heavy American casualties, and the difficulties inherent in staging such massive invasion efforts presented formidable challenges to U.S. operations. Nonetheless, the Central Pacific Campaign succeeded decisively. The Imperial Japanese Navy’s hitherto deadly air arm had been utterly destroyed, and the stage was set for the final Allied thrust through the Philippines, Iwo Jima, and Okinawa and on toward the Japanese home islands.

Chaffee, Adna Romanza, Jr. (1884–1941)

U.S. Army general, regarded as the father of the armored branch. Born in Junction City, Kansas, on 23 September 1884, the son of the second chief of staff of the U.S. Army, Adna Chaffee graduated from the U.S. Military Academy in 1906.

Chaffee was commissioned in the cavalry and served with the 15th Cavalry Regiment in Cuba until 1907. Between 1907 and 1911, he was assigned to the Mounted Services School at Fort Riley, Kansas. There, he commanded the mounted detachment supporting students and staff at the Army War College. After attending the French Cavalry School at Saumur (1911–1912), Chaffee returned to teaching at Fort Riley. In 1914 and 1915, he served with the 7th Cavalry Regiment in the Philippines. Chaffee was then assigned to West Point, where he was senior cavalry instructor for the Tactical Department until 1917.

Following the U.S. entry into World War I, Chaffee attended the staff school at Langres, France, and then was an instructor there. Thereafter, he was assigned as a staff officer with the 81st Division and fought with it in the St.-Mihiel and Meuse-Argonne offensives. He ended the war as a temporary colonel.

Following occupation duty in Germany as a staff officer of III Corps, Chaffee reverted to his permanent rank of captain in 1919. He was then an instructor at the Command and General Staff School at Fort Leavenworth, Kansas. He was promoted to major in 1920. After various assignments, he served as the G-3 of the 1st Cavalry Division at Fort Bliss, Texas, between 1921 and 1924. Chaffee graduated from the Army War College in 1925, and from then until 1927, he commanded a squadron of the 3rd Cavalry Regiment. He next served on the War Department General Staff. Promoted to lieutenant colonel in 1929, he was charged with developing mechanized and armored forces for the army. A staunch supporter of mechanized warfare, Chaffee was probably the leading proponent of a separate armored force. In 1931, he joined the new 1st Cavalry Regiment (Mechanized) at Fort Knox, Kentucky, as its executive officer.

Between 1934 and 1938, Chaffee was chief of the Budget and Legislative Planning Branch of the War Department. He then returned to Fort Knox to command the 1st Cavalry Regiment. In November 1938, he was promoted to brigadier general and received command of the 7th Mechanized Brigade, which he led during the maneuvers at Plattsburgh, New York, in 1939 and in Louisiana in 1940, both of which had significant impact on U.S. Army mechanized doctrine.

Chaffee received command of the new Armored Force in June 1940 and thus had charge of the development of the 1st and 2nd Armored Divisions. In October 1940, he took com-

mand of the I Armored Corps as a major general, but by that point, he was already ill from cancer. The disease took his life in Boston, Massachusetts, on 22 August 1941. In 1945, the army named its new light tank, the M-24, in his honor.

Chamberlain, Arthur Neville (1869–1940)

British politician, leader of the Conservative Party, and prime minister from 1937 to 1940. The son of a distinguished political family, Neville Chamberlain was born on 18 March 1869 in Birmingham, England, and graduated from Mason College, Birmingham. He administered a family plantation in the Bahamas and later ran a metals business, becoming lord mayor of Birmingham in 1915. He was elected to Parliament in December 1918 and achieved cabinet rank quickly, serving as minister of health (1923, 1924–1929, and 1931) and becoming an important reformer in that post. After serving as chancellor of the exchequer (1923–1924, 1931–1937), he was clearly in line to be prime minister.

Chamberlain assumed that post on the retirement of Stanley Baldwin on 28 May 1937. Intellectually arrogant and convinced his opinions were correct in all things, he rarely sought advice from a generally weak cabinet, listening only to his confidant, Sir Horace Wilson. He was woefully ignorant of foreign affairs, and his policy through most of the 1930s was to cut defense spending while appeasing those who appeared to pose threats. In April 1938, he abandoned Royal Navy bases in Ireland. Until his final weeks in office, however, he enjoyed strong support in Parliament and from the establishment British press.

Chamberlain is remembered most for his dogged efforts to appease Adolf Hitler in order to avoid war, culminating in the shameful Munich Agreement of 30 September 1938, which gave the Sudeten portion of Czechoslovakia to Germany (without any Czech participation in the decision) to avert a threatened German invasion. At home, Chamberlain was widely praised for bringing “peace in our time.” He ignored the tiny parliamentary minority led by Winston L. S. Churchill, who argued that Britain had to rearm. And he virtually forced Anthony Eden to resign as foreign secretary on 19 February 1938 when they disagreed about discus-

Neville Chamberlain served as prime minister of Great Britain during 1937–1940. He is most remembered for his pursuit of appeasement. (Hilton Archive by Getty Images)

sions with the Italian government. He only reluctantly repudiated appeasement when Germany occupied the remainder of Czechoslovakia on 10 March 1939.

Finally pushed hard by members of his own cabinet, Chamberlain issued an ultimatum to Hitler after Germany’s invasion of Poland on 1 September 1939. Receiving no answer, he took his nation to war two days later and directed Britain’s effort for the first eight months of the conflict. His War Cabinet now included Churchill, back as first lord of the Admiralty. Although much of the period passed as the so-called Phony War, April and May 1940 saw Germany’s disastrous invasion and occupation of Norway and Denmark and its invasion of the Low Countries and France.

By then, Chamberlain had lost his support in the House of Commons, and after several days of emotional debate, he was replaced by Churchill on 10 May 1940, with a multiparty national government. Chamberlain became lord president of the council (he remained head of the party) and a member of the War Cabinet until 30 September 1940, when he resigned due to ill health. He died of cancer on 9 November 1940, in Heckfield, England.

Channel Dash (11–13 February 1942)

Passage of the German battleships *Scharnhorst* and *Gneisenau* and the heavy cruiser *Prinz Eugen* through the English Channel from Brest, France, to Wilhelmshaven, Germany, in February 1942. In March 1941, the *Scharnhorst* and *Gneisenau* had arrived at Brest, on the French Atlantic coast, after a commerce-raiding voyage, and they were joined by the *Prinz Eugen* in June 1941. Though vulnerable to British bombing, the ships constituted a standing threat to Allied convoys in the Atlantic. However, by late 1941, Adolf Hitler was convinced that the British were planning to invade Norway, and against the advice of his naval commanders, he demanded that the *Scharnhorst*, *Gneisenau*, and *Prinz Eugen* return to Germany for deployment in Norwegian waters.

In early 1942, when British intelligence strongly suggested a possible German breakout and passage through the Straits of Dover, preparations for aerial and naval attacks, already under way for nearly a year, were accelerated. The British assumed that the German ships would transit the narrowest part of the Channel at night, but the Germans planned Operation CERBERUS to conceal the ships' departure from Brest and to run the straits in daylight, counting on surprise to prevent a timely British concentration of adequate resistance.

Exceptional cooperation between German naval and air commands combined with failures in British technology and communications to bring the Germans almost complete success. At 10:45 P.M. on 11 February, the three big ships and an escort of six destroyers, with Vice Admiral Otto Cili-

ax commanding, cleared Brest harbor. Not until 11:09 A.M. on 12 February, when the Germans were less than an hour from the straits and had been reinforced by torpedo boat squadrons from French ports, did the British identify the ships. By noon, the German vessels were in the Dover narrows, and although attacked by British coastal artillery, torpedo boats, and the Fleet Air Arm, they passed through unscathed. Later attacks along the Belgian and Dutch coasts by destroyers and by Royal Air Force fighters and bombers were no more successful. Although the *Gneisenau* struck one mine and the *Scharnhorst* hit two (the second one seriously slowing her and separating her from the rest of the flotilla), all the German ships were safely in the Elbe estuary by 10:30 A.M. on 13 February.

Amid German euphoria and British humiliation, thoughtful minds on both sides realized that this German tactical success in the Channel represented a self-inflicted strategic defeat in the Atlantic. Even the sense of victory was short-lived, for the mine damage to the *Scharnhorst* took six months to repair, the *Prinz Eugen* was torpedoed on 23 February by a British submarine in the North Sea, and the *Gneisenau* was irreparably damaged during air raids on Kiel on 26 and 27 February.

Chemical Weapons and Warfare

Poison gas had been utilized with considerable effect by the major belligerents in World War I. In the course of the conflict, the combatants had deployed about 113,000 tons of chemicals, and some estimates indicate over 1 million soldiers were injured by poison gas during the war, 10 percent of them fatally.

In the interwar period, the major powers discussed outlawing the use of poison gas, but they also continued to pro-

A supervisor inspects mustard gas warheads at an unidentified U.S. arsenal. President Roosevelt made it clear that the United States would only employ the gas in retaliation to use of chemical warfare by the Axis Powers. (Bettmann/Corbis)

duce it. Prior to World War II, more than 40 nations signed the Geneva Protocol of 1925 banning the offensive use of chemical weapons in warfare. All of the main combatants in World War II save the United States and Japan ratified the protocol, which went into force in August 1928. Although the United States had first proposed the treaty, isolationist sentiment blocked its ratification in the Senate. Japan feared giving away any advantage in case of a conflict with the far more populous China. The signatory powers, however, reserved the right to utilize chemical weapons in a retaliatory attack and to employ them against a country that had not signed the protocol.

Chemical weapons are categorized by their effects on human beings, animals, and plants. Lung irritants, such as phosgene, make victims choke or suffocate, with symptoms usually delayed for several hours after contact. Vesicants, such as mustard gas, cause the skin to blister and the eyes to swell, sometimes with loss of sight. The symptoms of vesicants can be delayed up to 48 hours. Lacrimators are tear gases, such as chloracetophenone and brombenzylcyanide, which irritate the eyes and cause difficulty with breathing.

The warring powers also produced irritant smoke (such as sneezing gases or adamsite), screening smokes, and incendi-

aries. A new and very deadly chemical agent, nerve gas, was developed during the war. Nerve gases take effect quickly, producing symptoms in 10 to 30 minutes, depending on whether they are inhaled or absorbed through the skin.

Chemical weapons can be launched in a variety of forms: through shells and bombs that explode and disperse the chemicals into the air in drops or small particles, from containers with vaporized solids that infiltrate the air as a smoke, and through liquids released from airplanes as drops or mist. Chemical weapons can be more useful than conventional weapons, since their effects are longer lasting, sometimes persisting for days or weeks. The most desirable chemical agents have many of the same characteristics in common. They are effective in small concentrations, difficult to protect against, quickly and cheaply manufactured, made from easily obtainable raw materials, heavier than air, easily and safely transportable, effective against multiple parts of the body, and not easily detectable.

Three of the most common means used to deploy chemical agents by the end of World War I were the portable gas cylinder, the Livens Projector, and the chemical mortar. But these delivery systems were obsolete by the time of World War II, given the greater mobility of infantry troops. Accordingly, the size of chemical mortars was increased as was their range (to 1,400 yards), and the Livens Projector was replaced by 100 mm caliber, mobile rocket launchers. During the interwar years, governments also experimented with using airplanes to deliver chemical weapons, through cluster bombs and spraying. By the time World War II began, aerial bombardment with chemical weapons was the most common deployment mechanism. It is also possible to deploy chemical weapons, particularly mustard gas, in land mines and grenades. German leaders debated the feasibility of combining missiles and chemical weapons, but production of such mechanisms did not occur.

In stark contrast to the situation in World War I, chemical weapons were used only sparingly in World War II. The major powers were reluctant to employ them. This was, in part, because they were convinced that their opponents had extensive stockpiles of poison gases and because their own populations were not adequately prepared to withstand a retaliatory attack. They also did not wish to be the first to violate the Geneva Protocol. Several key leaders were hesitant to authorize the use of chemical weapons. Adolf Hitler, who had been gassed at Ypres in 1918, had a strong aversion to the use of gas as an offensive weapon, and President Franklin D. Roosevelt also opposed the use of chemical weapons. For the European powers in particular, the threat of retribution against cities and large-scale civilian suffering was a major deterrent. The shipping of chemical weapons and equipping friendly troops for chemical attacks also presented logistical difficulties. Lastly, fighting in World War II, marked as it was

by rapid movement, was dramatically different from the trench warfare of the previous conflict. Early in the war, the Axis powers scored a succession of quick victories and did not need to resort to poison gas.

The fate of the SS *John Harvey* illustrated the difficulty of shipping poison gas. The ship sailed from the United States to Italy in 1943, carrying 2,000 bombs loaded with mustard gas. Each bomb held 60 to 70 pounds of the gas. The ship docked at Bari on 28 November 1943. Four days later, German aircraft attacked the port. Their 20-minute assault sank 17 ships and badly damaged 8 others. Racked by explosions, the *John Harvey* sank, and some of the mustard gas in the bombs in her hold was released. It mixed with the oil and smoke and rolled across the water. More than 1,000 Allied soldiers and Italian civilians died as a result, and hundreds were blinded, some permanently. The death rate was particularly high because no one knew of the cargo until several weeks had passed.

Yet such difficulties did not preclude the use of poison gas in the war. The Italians, for example, utilized mustard gas and tear gas grenades in their 1935–1936 conquest of Ethiopia. They employed it to protect their flanks by saturating the ground on either side of the advancing columns. They also targeted Ethiopian communications centers and employed mustard gas against Ethiopian military personnel. In fact, the Italians deployed more than 700 tons of gas against the local population, either as bombs (each container contained about 44 pounds) or sprayed from aircraft. Their use of chemical weapons was indiscriminate, targeting both military and civilian areas. One-third of all Ethiopian military casualties in this conflict resulted from exposure to chemical agents.

The Italian decision to employ chemical weapons on a large scale in Ethiopia prompted other nations to renew their production of such weapons and to plan for protecting their armed forces and civilian populations. France began production at a phosgene facility at Clamency in 1936. The U.S. government reopened mustard gas and phosgene plants in New Jersey the following year. The Soviet Union opened three new chemical weapons production plants. And in November 1938, after the Munich Conference, the British government issued tens of thousands of gas masks to civilians and mandated a minimum level of production of 300 tons of mustard gas per week, with 2,000 tons held in reserve.

At the beginning of World War II, Germany held a commanding lead in the stockpiling of chemical weapons, but its government officials did not know this. German stockpiles in 1939 are estimated at 10,000 tons, as compared with 500 tons in Great Britain, 1,000 tons in the United States, and 2,000 tons in Japan.

During World War II in the European Theater, chemical weapons were never deliberately employed on a large scale. In June 1940, British Prime Minister Winston L. S. Churchill

discussed with his cabinet the idea of using poison gas to repel a German invasion of either Great Britain or Ireland. Although many of the senior military staff opposed this notion, the cabinet approved it. The British government also considered the use of poison gas to combat the German V-1 and V-2 rockets later in the war. By 1944, Germany's production capacity was 10,000 tons of poison gas per month; in addition, myriad delivery systems were available, including grenades filled with hydrogen cyanide and machine guns capable of firing bullets faced with tabun or sarin. The Luftwaffe had more than 480,000 gas bombs, ranging in size from 33 to 1,650 pounds.

In the Pacific Theater, the Japanese were also involved in massive production of poison gas and had been since the later portion of World War I. By 1937, Japan was daily producing up to 2 tons of lewisite, a virulent form of mustard gas. In their invasion and occupation of China from 1937 to 1945, the Japanese employed a wide variety of poison gases, including phosgene, hydrogen cyanide, mustard gas, and Lewisite. Since the Chinese population, both military and civilian, was completely unprotected against chemical warfare, the effects were devastating.

The Japanese deployed the chemicals weapons by aerial bombardment and artillery shells. They also designed rockets capable of holding 10.5 quarts of a chemical agent and traveling up to 2 miles; flamethrowers that propelled hydrogen cyanide; and a handheld antitank weapon that employed hydrogen cyanide. The Japanese also utilized gas grenades during the Imphal Campaign in 1944. The United States considered using poison gas during the invasion of Iwo Jima and the proposed invasion of the Japanese home islands, but the former was never ordered and the latter proved unnecessary.

The deadliest form of chemical warfare at that time, nerve gas, was never used in battle. A German scientist, Gerhard Schrader, employed by I. G. Farben in 1936, discovered tabun while he was trying to create a more powerful insecticide. Tabun can be absorbed directly into the body and is colorless and odorless. It stops the nervous system from producing a key enzyme, acetylcholinesterase, that allows contracting muscles to relax. If this enzyme is not active, important muscles, such as the heart, contract and begin to spasm. As all the body's muscles contract, the person suffocates. Tabun is 100 to 1,000 times more deadly than chlorine gas and 10 to 100 times more deadly than mustard or phosgene gas. Later, Schrader discovered a second and even more toxic nerve gas, which he named sarin. It is almost 10 times more lethal than tabun. In 1944, a still more deadly nerve gas, soman, was discovered, but it was never mass-produced during the war. Great Britain also manufactured sarin and soman.

Germany's leaders chose not to deploy tabun, since they lacked the ability to protect their own population against

this nerve gas and no known antidote existed. The Germans did test their nerve gases on unwilling inmates of concentration and prisoner-of-war camps. At the Natzweiler concentration camp, tests with both mustard and phosgene gases were also conducted on unwilling prisoners. Germany moved its storage of nerve gas in 1944 in anticipation of Allied advances in the west, but their production facility in Silesia fell into Soviet hands.

The German government also used a poison gas, namely, Zyklon B, against prisoners in concentration camps and in its killing centers in Poland. Zyklon B was developed in the 1930s by Deesch, a subsidiary of I. G. Farben that was experimenting with more powerful insecticides. Zyklon B, also known as Prussic acid, is hydrogen cyanide—a powerful, toxic, volatile, and colorless liquid. In order to transport the gas, it was absorbed by wood circles or small cubes because of its great volatility.

Zyklon B was dropped into gas chambers and caused suffocation, as well as feelings of fear and dizziness and vomiting. The Germans constructed gas chambers to use Zyklon B in their camps at Auschwitz, Buchenwald, Sachsenhausen, Neuengamme, Majdanek, Mauthausen, Stutthof, Lüblin, Gross-Rosen, Ravensbrück, and Treblinka. In Auschwitz alone, more than 2.5 million people were murdered through the use of Zyklon B between May 1940 and December 1943. At other concentration camps and killing centers, prisoners were killed by carbon monoxide poisoning.

By 1945, the major combatants as a group had stockpiled more than 500,000 tons of chemical weapons, led by the United States with 110,000 tons. This amount was five times the total amount of gas employed in World War I. Although poison gases were never used in large-scale attacks during World War II, the threat was present throughout the conflict. Given their deadly nature, the updated deployment systems, and the large stockpiles, chemical weapons could have played an enormous role in World War II.

Ch'en I

See Chen Yi.

Ch'en Yi

See Chen Yi.

Chen Yi (Ch'en Yi/Ch'en I) (1901–1972)

Chinese military leader and People's Republic of China marshal. Born in Lezhi (Lochih), Sichuan (Szechuan) Province, to a well-to-do family on 16 August 1901, Chen Yi (Ch'en Yi/Ch'en I) studied at both Shanghai University and Beijing (Peking) College of Law and Commerce before traveling to France in 1919 on a work-study program. During his stay in France, he met Zhou Enlai (Chou En-lai) and became politically active. In 1921, he was deported from France for involvement in protests by Chinese exchange students. On his return to China, Chen joined the Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT)—in 1921 and the Communist Party in 1923, which were then loosely allied in the struggle to reunify China. Following study at the Sino-French University of Beijing between 1923 and 1925, Chen became a political instructor at the Huangpu (Whampoa) Military Academy in 1925. He then served on the staff of General Ye Ting's (Yeh T'ing) 24th Division at the beginning of the Northern Expedition, the Nationalist-led reunification campaign launched in the summer of 1926.

In 1927, the alliance between the Communists and Nationalists collapsed, and civil war ensued. Chen participated in the abortive Communist Nanchang Uprising of Jiangxi (Kiangsi) Province in August 1927. In January 1929, he joined Zhu De (Chu Teh) in the Communist enclave of Jiangxi and commanded the 12th Division of the Red IV Corps fighting Nationalist forces under Jiang Jieshi (Chiang Kai-shek). He did not join Mao Zedong (Mao Tse-tung) in the epic Long March of 1934 and 1935 but instead stayed behind to organize guerrilla forces in south-central China, which eventually became part of the New Fourth Army.

Following the outbreak of war with Japan in 1937, he fought with the New Fourth Army against the Japanese along the Changjiang (Yangtze) River. After the Japanese inflicted a sharp defeat on the New Fourth Army in January 1941, Chen, who had been a sector commander, took command of the entire army. From that point until 1945, his New Fourth Army greatly expanded the area of Communist

control in central China by conducting a highly effective guerrilla campaign characterized by rapid maneuver.

After Japan's surrender, Chen was formally assigned command of the New Fourth Army. In the 1946–1949 Chinese Civil War, he encircled the Nationalist 2nd and 7th Army Groups, destroying them in the Huai-Hai Campaign between November 1948 and January 1949; after that, he advanced to take Nanjing (Nanking) in Jiangsu (Kiangsu) Province in April and both Wuhan in Hubei (Hupeh) Province and Shanghai in Jiangsu Province in May. Chen was then mayor of Shanghai and commander of the East China Military Region (1949–1956) and vice premier (1956). He was promoted to marshal of the People's Liberation Army in 1955 and served as China's foreign minister from 1956 to 1968. Attacked by Red Guards during the Cultural Revolution, he died in Beijing on 6 January 1972.

Chennault, Claire Lee (1893–1958)

U.S. Army Air Forces general and leader of the Flying Tigers. Born in Commerce, Texas, on 6 September 1893, Claire Chennault was raised in rural Louisiana. He taught English and business at a number of southern colleges until August 1917, when he became a second lieutenant in the army reserve. He remained in the United States during World War I, transferring to the Signal Corps and completing pilot training in 1920.

An accomplished airman, Chennault then held a number of assignments, among them command of the 19th Pursuit Squadron in Hawaii between 1923 and 1926. He developed into an outspoken advocate of fighter aircraft in a period when prevailing military thought subscribed to the doctrines espoused by Italian airpower theorist Giulio Douhet and their underlying assumption that “the bomber will always get through.” While serving as an instructor at the Air Corps Tactical School in 1935, Chennault wrote *The Role of Defensive Pursuit*, an important but controversial book at the time because it pointed out the need for fighter aircraft. In 1937, the army removed him from flying status because of a serious hearing loss and forced him into medical retirement as a captain.

In May 1937, Chennault went to China as aviation adviser to the Nationalist government of Jiang Jieshi (Chiang Kai-shek). When the Japanese attacked China that September, he became a colonel in the Chinese air force and began testing his tactical theories. In late 1940, Chennault was allowed to recruit American military pilots for service in China, despite the strong opposition of the State, War, and Navy Departments. His American Volunteer Group (AVG), popularly known as the Flying Tigers, consisted of some 200 ground crew and 100 pilots flying semiobsolete Curtiss P-40B fighters. The AVG entered combat for the first time on 20 December 1941. By the time the unit disbanded in July 1942, it claimed 296 Japanese aircraft shot down, with only 12 of its own planes and 4 of its pilots lost.

In April 1942, Chennault was recalled to active duty with the U.S. Army as a colonel. A few months later, he was promoted to brigadier general and put in command of the newly formed China Air Task Force (CATF), a subordinate command of the U.S. Tenth Air Force in India. In March 1943, the CATF became the Fourteenth Air Force, with Chennault promoted to major general.

The CATF and the Fourteenth Air Force were economy-of-force organizations in a tertiary theater and therefore always operated on a shoestring. Utilizing Chennault's theories, however, both organizations achieved combat effectiveness far out of proportion to their size and resources. By 1945, the Fourteenth Air Force had destroyed some 2,600 Japanese aircraft and thousands of tons of supplies.

During his time in China, Chennault conducted a long-running and public feud with Lieutenant General Joseph Stilwell, the equally stubborn and irascible U.S. commander of the China-Burma-India Theater. Chennault engineered Jiang's demand for Stilwell's recall, but Chennault himself was removed from command and forced into retirement for a second time on 1 August 1945.

After the war, Chennault remained in China. He established and operated the Civil Air Transport (CAT) airline, which supported Jiang's Nationalist government in its civil war with Mao Zedong (Mao Tse-tung) and his Communists forces. In 1950, Chennault sold his interest in CAT to the Central Intelligence Agency, but he remained the chairman of the airline's board until 1955. He died at Walter Reed Army Hospital in Washington, D.C., on 27 July 1958. Only days before his death, Chennault was promoted to lieutenant general.

Children and the War

During World War II, millions of men and women around the world served in the armed forces of their respective nations. Millions of others contributed to the war effort by maintaining vital services and laboring in war-related industries. And children went to war as well. Even those far

Chinese soldier, age 10, with heavy pack, who is a member of a Chinese division boarding planes at the North Airstrip, Myitkyina, Burma, bound for China, 5 December 1944. (National Archives)

removed from the fighting were affected by the war. They collected scrap metal and other materials that would be vital to the war effort, participated in austerity programs, left school to work on farms, grew vegetables in urban plots, and suffered from the same shortages and wartime prohibitions as did their parents.

In many lands, children experienced the horrors of war firsthand, both as combatants and victims. Children were the most vulnerable part of the population, and many perished from starvation, malnutrition, or disease. Others fell victim to Nazi Germany's euthanasia programs. Some 1.2 million Jewish children throughout Europe died in the Holocaust.

Many children perished as a direct result of Soviet policies as well. Polish authorities estimated that about 140,000 Polish children were uprooted from their homes in the Soviet-occupied portion of Poland. Of these, perhaps 40,000 simply disappeared. In the Far East, Chinese children suffered along with their parents in the Japanese reprisal campaigns. Children were also the innocent victims of the indiscriminate bombing of cities conducted by both sides, beginning with German air attacks on Warsaw and ending with the atomic bombs dropped by the United States on Hiroshima and

English children in a bomb dugout. (British Information Service, Library of Congress)

Nagasaki. To avoid such bombings, many children in most nations under air attack were sent into the countryside to live with relatives or even with strangers. A number were also sent abroad, separated from their parents for years and, in many cases, forever; examples include the British children sent to North America and the Finnish children sent to Sweden.

In the Soviet Union, children helped patrol their neighborhoods at night to make certain that blackouts were being enforced. They filled sandbags and water buckets to prepare against incendiary bomb attacks and were enlisted to help in constructing antitank defenses before Moscow in the summer of 1941. Children were also actual combatants. They fought with partisan units in the Soviet Union and in Yugoslavia, among other nations. They also helped collect intelligence on Axis occupying forces. And in the last desperate fighting of World War II in Europe, Adolf Hitler pressed many young German boys into the army.

After the war, conditions were desperate in many parts of the world. In Vietnam, perhaps a million people perished in famine, including many children. Conditions were equally desperate in other states. Large numbers of people were displaced by the war, left homeless and hungry. There were perhaps 13 million abandoned European children at the end of World War II. Poland claimed a million orphans and France 250,000.

Adults were changed by the war, but so were the children who survived it. As they aged, their childhood experiences remained a reference point for their adult lives and served as a benchmark with which to measure future generations.

with Japan for almost four years. Beginning in 1932, trainers, pilots, and aircraft from the United States, Italy, Germany, and the Soviet Union had all played a part in building the Nationalist Chinese air element and the small air arms of several Chinese warlords. In July 1937, the CAF had three air groups, with a mix of U.S. and Italian fighters and bombers. Fewer than 100 of the more than 600 aircraft in the Chinese inventory were combat ready, however, and pilots had varying levels of competence and experience. Available forces immediately went into action to support the Nationalist army units in their defense of Shanghai, Jiangsu (Kiangsu) Province, in early August and to assist in the fighting withdrawal of Chinese forces into central China. From 1937 until the German invasion of the USSR in June 1941, the Soviets were the major supplier of aircraft, pilots, and trainers to China. The CAF was decimated in the late 1930s by the well-trained and well-equipped Japanese forces.

In April 1937, retired U.S. Army Air Corps officer Claire Chennault arrived in China to serve as an aviation adviser to the Nationalist government of Jiang Jieshi (Chiang Kai-shek). Chennault organized and led the American Volunteer Group (AVG) of the CAF, known as the Flying Tigers. In September 1941, Washington dispatched the American Military Mission to China (AMMISCA) to “advise and assist” in rebuilding the Nationalist forces. Providing aircraft to the CAF and its AVG was a high priority, and the creation of a Chinese military capable of taking the war to the Japanese was the mission of Lieutenant General Joseph Stilwell. Prior to the general’s arrival in Asia in March 1942, Washington had decided to try to build up and maintain a CAF of 500 operational aircraft, including the Lockheed P-38 Lightning; the Curtiss P-40 Warhawk; the Republic P-43 Lancer; the Vultee P-66 Vanguard; and later, the North American P-51 Mustang fighters and the North American B-25 Mitchell and Consolidated B-24 Liberator bombers. With the closing of the land line of communication through Burma, the United States also promised the Chinese Curtiss C-46 Commando and C-47 Skytrain transport aircraft. From 1941 to V-J Day, Washington allocated 1,568 U.S. aircraft for China.

When the line of communication with Burma closed, everything had to be flown over “the Hump” (the Himalayas) to bases in southwestern China. Chennault, who rose to major general commanding the U.S. Fourteenth Air Force in March 1943, wanted to concentrate air assets on the destruction of Japanese air forces in China and build a bomber force capable of hitting critical targets in eastern China and the Japanese home islands. The United States also continued training the CAF and supplying equipment and aircraft to it and to its logistic arm, the China National Aviation Corporation. However, the U.S. Tenth and Fourteenth Air Forces required most aircraft delivered to the China-Burma-India

China, Air Force

In December 1941, at the beginning of the Pacific war, the Nationalist China Air Force (CAF) had already been at war

Theater simply to keep the air bridge open and to support Allied offensives in Burma.

At the end of the war, U.S. aircraft were transferred to the CAF. When the Chinese Civil War began, Jiang's Nationalist forces had a competent air arm of nearly 500 aircraft and more than 5,000 trained pilots, aircrew, and maintenance personnel.

China, Army

The armed forces of China before and during World War II reflected the deep political divisions of that nation. Each major faction maintained its own military organization. In addition to conventional forces controlled by the principal political factions in the country, various warlords had their own regional forces, the loyalties of which shifted according to the circumstances of the moment. Alongside these, at the local level, village defense forces struggled to protect their inhabitants against bandit gangs that roamed large stretches of the countryside.

Civil war between the Nationalists and Communists and the Nationalists and warlords had been raging intermittently in China since 1927. Following the Japanese takeover of Manchuria and incursions into north China, these two factions arranged an uneasy truce, but underlying the Chinese military effort during the war was the realization of the prominent role played by the military in Chinese politics. Then too, by the end of 1942, Chinese leaders, including Nationalist leader Jiang Jieshi (Chiang Kai-shek) and Communist leader Mao Zedong (Mao Tse-tung), believed that the United States and its allies would defeat Japan. Given this belief and their own ardent conviction that a powerful military establishment would be essential in winning the postwar political struggle for power that was bound to follow, they planned (or rather, did not plan) their military moves accordingly. This approach meant, for the most part, avoiding contact with powerful Japanese forces, much to the exasperation of such individuals as Jiang's army commander, U.S. Army Lieutenant General Joseph W. Stilwell.

The Nationalist Army

The army had always been central to the power of the Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT). The National Military Council (NMC) controlled the military establishment; Jiang was its chairman, with complete power over the NMC, and as such, he directed all Nationalist military forces. At the beginning of the war, these numbered about 1.5 million men.

In the 1930s, the German government had sent military advisers to China to help train the Nationalist Army. In consequence, the Nationalist Central Armies were patterned more or less along German lines. Throughout the period, these were the best trained of the Nationalist forces, although still inferior to Japanese or Western forces. At the beginning of the Sino-Japanese War in 1937, the Central Armies numbered about 300,000 men. Included in this body was “the Generalissimo's Own,” a force of some 80,000 men: armed with German weapons, it was the elite force of Jiang's military establishment. In addition to these relatively well-trained formations, there were some 1.2 million men in other units of indifferent training and capability. Though Nationalist senior leaders were often corrupt and not well educated, the middle ranks—trained at the Huangpu (Whampoa) Military Academy in Guangzhou (Canton), Guangdong (Kwangtung) Province—were capable. Most Nationalist soldiers, however, were conscripts, dragooned into service, and of low quality.

In the summer of 1941, the United States extended Lend-Lease aid to the Nationalist government, although the bulk of the early assistance went toward improving transport to China over the Burma Road from India. This route was cut off when the Japanese invaded Burma in force in early 1942, and it was not reopened until 1945. In the meantime, much of the U.S. military aid to China was flown in over the Himalayas (“the Hump”). Tonnages by air gradually increased, but heated arguments occurred over the allocation of these still inadequate resources. Not until January 1945 was the Ledo Road (later known as the Stilwell Road) opened to China.

By the end of the war, the Nationalist Army numbered some 300 divisions. Although each supposedly had 10,000 men, some were seriously undermanned. Much military assistance, in the pipeline, continued to flow into China after the war, and the bulk of this ended up in Nationalist hands. The result was an army that was large in size and relatively well equipped but of limited capability and with indifferent leadership and inadequate training.

Chinese Communist Army

According to the agreement whereby the Nationalists and Communists would make common cause against the Japanese, Chinese Communist forces in north China came to be

Camouflaged Chinese soldiers repel a charge by Japanese troops along the Salween River near Burma, June 1943. (Franklin D. Roosevelt Library (NLFDR))

designated the Eighth Route Army, authorized to a strength of three divisions. In 1938, the Nationalists also authorized formation of the smaller New Fourth Army in the lower Changjiang (Yangtze) River region.

The Chinese Communists refused to allow any Nationalist political authority in areas they controlled and denied the Nationalist side their military resources. Communist military forces were controlled by the Military Affairs Committee, which was responsible to the Communist Party Central Committee. Through the war, Mao chaired this committee.

Although the Communists' equipment was not on a par with that available to the Nationalists, their military leadership and training were both superior, and their morale was significantly higher. Unlike the Nationalist forces, in which many of the men taken into the service were removed to other areas and forcibly kept there, Communist forces remained in their own areas and were seen by the people as a positive force, even helping them with crops and looking after their welfare.

Meanwhile, Communist forces grew far beyond the numbers authorized by the Nationalists, although little expansion occurred after midwar, both because the Communists endeavored to improve the quality of their forces and because of Japanese "pacification" campaigns and Nationalist military actions. Nonetheless, at the end of the war, Mao could claim an army of about 1 million men, with reserves and local-level militia forces numbering an additional 2 million.

Collaborationist Armed Forces

The Japanese also organized collaborationist armed forces in the areas of China occupied by their troops. These highly unreliable forces were drawn from a variety of sources under a wide range of motivations. Some local commanders obeyed whichever side seemed ascendant at the moment. Nominally at least, many of these forces belonged to the Nationalist side. In the early 1940s, collaborationist forces might have numbered some 900,000 men.

Nationalist forces suffered most heavily in the first year of fighting the Japanese, especially in three months of struggle for Shanghai and the subsequent effort to defend Nanjing (Nanking) in Jiangsu (Kiangsu) Province. The Chinese lost perhaps a million dead, wounded, or missing in the first year of the war alone. The Nationalists then withdrew into the interior, relocating the capital to Chongqing (Chungking) in Sichuan (Szechwan). The Chinese then transformed the war into a struggle of attrition, which Japanese forces, despite their superior mobility, could not win.

Although the Communist forces conducted operations against the Japanese rear areas and some large-scale conventional offensives, the brunt of the fighting that then occurred was borne by the Nationalist Army and warlord forces loyal to Jiang. In the eight years of fighting through 1945, the Nationalists suffered more than 3 million casualties, while inflicting up to 2 million casualties on the Japanese. They were never able to gain a decisive victory over their antagonist, but the Chinese tied down significant numbers of Japanese forces until the end of the war.

In January 1941, the Chinese united front was severely damaged when the Nationalists attacked the Communist New Fourth Army. Open war now broke out between the Nationalists and the Communists. The fighting in China was henceforth a three-way contest. The Nationalists were no longer able to launch major offensives against the Japanese, but they were in a relatively secure position in central China. The Communists had also been weakened in fighting against the Nationalists and the Japanese, but they maintained control of large areas in north-central China. The Japanese, with a great expenditure of troops and material, were only in control of the line of communications and were dangerously overextended in China even as they widened the war by attacking the United States.

Aside from grudgingly providing a small portion of their troops to General Stilwell to assist in the Allied recapture of Burma, Nationalist forces did not conduct any major actions from 1942 until forced to defend against Japan's August 1944 ICHI-GŌ Offensive. That offensive was precipitated by the establishment of U.S. air bases from which the United States could conduct strategic bombing raids on the Japanese home islands. The real battles for the Nationalist and Communist forces came in 1945 over Manchuria and marked the beginning of the Chinese Civil War.

China, Civil War in (1945–1949)

Interneine conflict between China's governing Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT)—and supporters of the Chinese Communist Party (CCP), which began immediately after World War II and brought the establishment of the People's Republic of China (PRC).

The roots of the Chinese Civil War went back as far as the late 1920s. After the foundation of the CCP in 1921, the Soviet Comintern (Communist International) advised its members to collaborate with other political groups supporting the Chinese Revolution, especially the GMD. The Guomindang had been founded by Sun Yixian (Sun Yat-sen), the revered revolutionary leader who was elected provisional president of the new Republic of China in 1911. After Sun's death in 1925, military leader Jiang Jieshi (Chiang Kai-shek) won power within the GMD and began to eliminate all potential rivals. In 1926, Jiang, alarmed by abortive but bloody Communist uprisings in several industrial cities, began to purge Communist Party members from the Guomindang institutions in which they had previously been prominent and to suppress them elsewhere. In mid-1927, he made the Communist base in Jiangxi (Kiangsi) Province of south-central China the new target of the Northern Expedition he had launched the previous year against northern warlords, and he suppressed several further Communist insurrections.

Led by Mao Zedong (Mao Tse-tung) and fortified by several former GMD military units whose commanders defected to the Communists, this rural base developed into the Jiangxi Soviet Republic, whose military forces numbered 200,000 by 1933. Chinese Communists also mounted several further urban and rural insurrections, and Jiang regarded them as the greatest threat to his government—even more serious a threat than the Japanese troops who established the client state of Manzhouguo (Manchukuo) in Manchuria in 1932 and who constantly sought to enhance Japan's influence in north China. Between 1930 and 1934, Jiang waged annual campaigns against the Ruijin (Juichin) base in Jiangxi. In the last of these campaigns, he succeeded in forcing Communist supporters to retreat 6,000 miles to the remote northwestern province of Shaanxi (Shensi) in the famous Long March.

In 1935 and 1936, Jiang ordered troops commanded by his loyal ally, Manchurian warlord Zhang Xueliang (Chang Hsüeh-liang), to attack and, he hoped, eliminate the few

thousand remaining Communists. The soldiers rejected his orders, arguing that all Chinese should unite to fight the Japanese, not each other. In the December 1936 Xi'an (Sian) Incident, Zhang kidnaped Jiang and forced him to form a united anti-Japanese front with the Communists. The GMD-CCP relationship remained strained, as Communists developed their own military forces—the Eighth Route Army, commanded by Zhu De (Chu Teh), and the New Fourth Army, under Lin Biao (Lin Piao)—and retained control of northern Shaanxi.

The following year, a minor clash between Chinese and Japanese troops at the Lugouqiao (Lukouch'iao) Marco Polo Bridge, near Beijing (Peking) in Hebei (Hopeh) Province, quickly escalated into full-scale warfare between the two countries. Over the following 18 months, Jiang gradually retreated to Chongqing (Chungking) in the far southwestern province of Sichuan (Szechwan), abandoning northern and eastern China to protracted Japanese occupation. The Communists controlled northwestern China. For three months in late 1940, the Communists launched the “Hundred Regiments” Campaign against Japan, but their eventual defeat by the better-equipped Japanese convinced them to switch to tactics of establishing guerrilla bases behind Japanese lines in north and central China. This policy provoked ferocious Japanese reprisals against Communists and civilians alike, but it proved effective in disrupting Japanese control and in enhancing both the Communists' reputation as dedicated opponents of Japanese rule and their postwar political position. It did not suffice, however, to defeat Japanese rule.

By 1940, Mao was already making plans for a postwar Communist government of China. By this time, both sides anticipated a fierce postwar struggle for power and sought to position themselves advantageously for it. In late 1941, GMD forces attacked and defeated the Communist New Fourth Army in the lower Changjiang (Yangtze) Valley, an episode marking the fundamental breakdown of CCP-GMD collaboration, though an uneasy alliance continued until 1944. GMD forces possessed superior equipment and funding, but Jiang's abandonment of much of China to Japanese rule and his reliance on a protracted strategy of attrition, together with the corruption that characterized many top officials of his regime, eroded his hold on popular loyalties. Communist morale was high: their idealistic rhetoric, the spartan living conditions at their Yan'an (Yenan) base in Shaanxi, their attractive and charismatic leaders, and their dangerous though small-scale partisan operations all caught the popular imagination and impressed many visiting Western journalists and officials.

The war ended in August 1945 with Japanese occupation forces still in place throughout China. CCP membership had reached 1.2 million people, plus military forces of 900,000, and the Communists controlled an area whose population

numbered 90 million. In Manchuria, despite Jiang's objections, entering Soviet forces facilitated the surrender of Japanese troops and equipment to Communist units. U.S. leaders, especially Ambassador Patrick J. Hurley in late 1945, sought to strengthen Jiang's regime; to promote reform from within; and to encourage Nationalist-Communist reconciliation and the formation of a coalition government in which Communists would have some influence, albeit as junior partners.

The most sustained such effort was the 13-month (December 1945–January 1947) mission to China of the former U.S. Army chief of staff, General George C. Marshall. In January 1946, he arranged a temporary cease-fire in the developing civil war; it was broken later that spring when, as Soviet units withdrew, GMD forces attacked Chinese Communist troops in Manchuria, winning control of that region in late May. That same month, the Communists rechristened their military forces the People's Liberation Army (PLA). It proved impossible to devise any further agreements acceptable to both sides.

Full-scale civil war resumed on 26 June 1946, when Nationalist units launched an offensive against Communist-held areas in Hubei (Hupeh) and Henan (Honan) Provinces. The United States continued to provide massive loans and quantities of military hardware to the GMD government but prudently refused to commit American troops. As the Cold War rapidly developed, Soviet and American officials clearly backed different parties in the evolving Chinese Civil War, but neither was prepared to run great risks to assist its favored candidate.

By 1947, as inflation and corruption both ran rampant, Chinese businesspeople and the middle class began to desert the GMD, and many fled overseas. As they had against the Japanese, the Communists frequently employed guerrilla tactics against Nationalist forces. Their introduction of land reform persuaded many peasants to support them. These tactics supplemented the full-scale military campaigns they soon had the strength to launch. In mid-May 1947, Lin and the New Fourth Army opened a major offensive in northeastern China, and six weeks later, another large army, commanded by Liu Bocheng (Liu Po-ch'eng), moved southwest across the Huang He (Hwang Ho) (known to Westerners as the Yellow River) into Shandong (Shantung) Province. In September 1948, Lin began a massive campaign in Manchuria, capturing Shenyang (Mukden) in Liaoning Province in November shortly after 300,000 GMD troops surrendered to him. In north-central China, the Communist Huai River Campaign ended victoriously on 10 January 1949 after PLA troops surrounded 66 regiments, representing one-third of the existing GMD military forces. In January 1949, the GMD government fled to Taiwan, and that same month, Beijing, China's symbolic capital, fell to

Lin's troops. The southern city of Guangzhou (Canton) in Guangdong (Kwangtung) fell the following October, as Communist forces gradually consolidated their hold over the entire country. On 1 October 1949, Mao proclaimed the new People's Republic of China.

The Chinese Civil War and American support of the GMD government—which, even after its move to Taiwan, continued until the 1970s—left a lasting legacy of distrust and suspicion that divided the United States and mainland China for several decades. American officials viewed the establishment in China of a Communist government sympathetic to the Soviet Union as a major Cold War defeat, a perception enhanced by China's November 1950 intervention in the Korean War. For at least two decades, Chinese leaders in turn regarded the United States as their country's most significant international adversary, a perspective that only began to change after President Richard Nixon moved to reopen relations with China in the early 1970s.

China, Eastern Campaign (April–November 1944)

Japanese offensive in China during World War II. In late 1943, the Japanese High Command decided to launch its first major offensive in China since 1939. There were several goals. One was to seize the airfields in eastern China that were being used by the U.S. Fourteenth Air Force to attack shipping on the Changjiang (Yangtze) River and along the China coast, especially since these airfields potentially could be used by long-range Boeing B-29 bombers against the Japanese homeland. A second goal was to capture the Hunan-Kwangsi, Canton-Hankow, and Peking-Hankow railroad lines in order to secure the land transportation link

between the Japanese stronghold in northern China and Japanese forces in Southeast Asia. A third goal was to destroy several large bodies of Chinese Nationalist troops and further the deterioration of the regime of Nationalist Generalissimo Chiang Kai-shek, perhaps even to the point of collapse.

The offensive, code-named ICHI-GŌ (Operation NUMBER ONE), began on 17 April 1944 when 100,000 troops from the North China Area Army pushed south along the Peking-Hankow railroad. Spearheaded by tanks, the Japanese easily brushed aside the poorly equipped Chinese, many of whom were provincial troops commanded by generals who once had been opponents of Chiang. By June, the Japanese had gained control of the railroad and dispersed more than 300,000 Chinese, at a loss of 1,000 of their own dead. Having long experienced onerous taxation, conscription, and mismanagement by Chiang's regime, many peasants aided the Japanese and even attacked groups of retreating Chinese.

The second phase of the campaign began at the end of May when 250,000 troops from the China Expeditionary Army moved south across the Changjiang River. Over the next weeks, despite heavy bombing by Fourteenth Air Force pilots, the advancing Japanese seized the vital rail centers of Changsha and, after a fierce 47-day siege, Hengyang. Following a lull in which they regrouped their forces into the Sixth Area Army, the Japanese resumed the offensive in late August. By the end of November, they had forced the evacuation of many Allied airfields and joined up with other units that had driven north from Canton and Indochina to complete the corridor between northern China and Southeast Asia. The Japanese successes sent a wave of panic through Nationalist China, and for a time, Allied leaders feared the Japanese would drive to the west and take Chungking, the Nationalist capital. The Japanese, however, had no plans to advance to Chungking. Their supply line was overextended, and they were increasingly concerned about a possible U.S. threat to the China coast.

Their 1944 Eastern Campaign was a major victory for the Japanese. They occupied an area inhabited by 100 million people and took control of most of the Nationalists' granary and industrial base, devastating their economy. In addition, the Japanese gained the railroad connection they had sought, inflicted 700,000 casualties on the Chinese, and weakened the U.S. air war in China. Even more important for the long term, the campaign demonstrated the weaknesses of Chiang's ability to wage war, costing him badly needed popular support in his ongoing struggle with the Chinese Communists.

China, Navy

In the 1920s, Germany assisted the Nationalist government of China in establishing a naval academy at Mamei in Fujian (Fukien) Province, and in 1927, the Nationalist leaders also set up the Chinese Naval General Headquarters. However, the vast bulk of resources went into the army and air forces. When war with Japan began in July 1937, the Nationalist

navy consisted of a few old gunboats, some small coastal vessels, and river craft. The navy also maintained a few naval stations inland on the major rivers and a facility that manufactured mines and naval explosives.

The Japanese quickly destroyed the larger Chinese naval craft during and after the August 1937 Battle of Shanghai in Jiangsu (Kiangsu) Province. Nonetheless, throughout the war, elements of the Chinese navy conducted sabotage attacks against Japanese ships and shore bases in China.

In early 1942, the U.S. Navy sent to China a small detachment known as the Sino-American Cooperative Organization (SACO) or the “Rice Paddy Navy,” under the joint command of Nationalist General Dai Li (Tai Li) and U.S. Navy Captain Milton E. “Mary” Miles. Its mission was to establish and man weather stations and communications facilities, gather intelligence, and conduct sabotage and guerrilla operations in the coastal areas and along the inland rivers of China. In 1943, Miles was promoted to commodore and assigned as commander, Naval Group China.

At the end of the war, there was a significant interservice battle over the type of navy China should maintain, who would control it, and how it would be equipped. Disputes slowed the effort to build a postwar Nationalist navy. In any case, however, Nationalist leaders did not see maritime forces as critical in the coming battle with the Communists.

China, Role in War

China, one of the four major Allied powers of World War II, fought Japan alone for four years and throughout the war tied down over a million Japanese troops. The war strengthened the position of the Chinese Communists and helped to precipitate the eventual downfall of the governing Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT)—of President Jiang Jieshi (Chiang Kai-shek).

For China, war began in July 1937, when long-standing hostilities with Japan, provoked by the latter country's effective annexation of Manchuria in 1931 and a continuing series of territorial, economic, and political incursions in other areas, caused a small skirmish near the Lugouqiao (Lukou-ch'iao) Marco Polo Bridge, close to Beijing (Peking) in Hebei (Hopeh) Province, to escalate into full-scale warfare. The Chinese invariably called the conflict "the War of Resistance against Japanese Aggression." Until December 1941, when China formally declared war on Japan and thereby aligned itself with the Western Allies after the Japanese attack on Pearl Harbor, Japan dismissively referred to the Chinese conflict as the "China Incident"; after that date, it became part of the "Greater East Asia War."

For much of the 1930s, the Chinese Nationalist government effectively acquiesced in Japanese demands. Although President Jiang believed that war with Japan would probably become inevitable in time, he sought to defer this until, with the help of German military advisers, he had successfully modernized China's armed forces. In the early 1930s, his first priority was to eliminate the GMD's major political rival—the Chinese Communist Party (CCP) led by the

charismatic and innovative Mao Zedong (Mao Tse-tung), against whose forces Jiang mounted annual campaigns every year from 1930 to 1935. Only after December 1936—when another leading Chinese politician, the Manchurian warlord Zhang Xueliang (Chang Hsueh-liang), captured Jiang and made his release conditional on the formation of a united Nationalist-Communist anti-Japanese front—did Jiang reluctantly and temporarily renounce his deeply rooted anti-Communist hostility.

The two camps never trusted each other, and political factionalism within the GMD also continued throughout the war, hampering Jiang's freedom of action and his ability to wage effective warfare against Japanese forces. Communist and GMD forces remained essentially separate, mounting independent operations. From late 1938 onward, the GMD government, headed by Jiang and based in Chongqing (Chungking) in Sichuan (Szechwan) Province, controlled southwest China. The Communists held sway over northwest China from their base in Yan'an (Yenan) in Shaanxi (Shensi) Province.

In its early stages, China's war with Japan was one of rapid movement and military disaster. In late July 1937, Japanese troops took over the entire Beijing-Tianjin (Tientsin) area of north China. They inflicted a series of major defeats on Jiang's military, wiping out most of his modernized units and, over the following 18 months, successively taking Shanghai and Nanjing (Nanking), Guangzhou (Canton), and Wuhan, China's provisional capital after Nanjing fell. Chinese troops had occasional triumphs—notably, the April 1938 Battle of Taierzhuang (Hsieh Chan T'ai-Erh-Chuang)—but these were rarely followed up. Japanese leaders assumed Jiang would sue for peace before the end of 1938, but to their frustration, he refused to do so.

Jiang adopted a strategy of "trading space for time," based on the assumption that by retreating, the Chinese could force the Japanese to overextend themselves, making them vulnerable to a lengthy war of attrition. This prediction proved substantially correct, as by 1940, Japanese forces were bogged down in an inconclusive war in mainland China, occupying vast tracts of territory without fully controlling them. Even so and despite the scorched-earth policy Jiang followed, the regions he ceded to Japanese rule—from March 1940 exercised through the puppet regime of renegade Chinese politician Wang Jingwei (Wang Ching-wei)—included most of China's leading cities, its major industrial areas, and its most fertile and densely populated agricultural regions. Jiang's early, dogged resistance to Japanese invasion won him great national prestige, but his subsequent protracted abandonment of most of northern and eastern China to Japanese occupation eventually damaged his standing and weakened his authority.

From 1931 onward, Jiang sought assistance against Japan from Western powers and the League of Nations, but

Japanese troops enter Tianjin (Tientsin), China. (Bettmann/Corbis)

effectual aid was rarely forthcoming. The league restricted itself to nonrecognition of Manzhouguo (Manchukuo) and moral condemnation of Japan's policies, together with the imposition of limited economic sanctions on Japan—restrictions that only some of its member states observed. In 1938, the U.S. government extended limited economic assistance to China, making a loan against its tung oil supplies.

By the late 1930s, the growing demands of Germany and Italy in Europe preoccupied most Western nations, and the Sino-Japanese War remained a distant sideshow, albeit one with implications for the European powers' colonial positions in Asia. In summer 1940, the German conquest of most of western Europe brought Japanese demands that Britain, France, and the Netherlands forbid the sale or transit of war supplies to China through their Asian colonies; France's Vichy government was also forced to open air bases in Indochina to Japanese warplanes. In autumn 1940, Japan formally joined Germany and Italy in the Tripartite

Alliance of the Axis powers. These actions brought additional U.S. economic and military assistance for China, including the dispatch of American warplanes, and in 1941, President Franklin D. Roosevelt drastically tightened economic sanctions on Japan and repeatedly demanded the withdrawal of Japanese troops from China.

When Japan attacked American forces at Pearl Harbor on 7 December 1941, simultaneously declaring war on Great Britain and swiftly annexing British, Dutch, and American territories in East and Southeast Asia, China finally formally declared war on Japan. Chiang was named supreme commander of the Allied China Theater, receiving substantial amounts of military aid under the American Lend-Lease program. Even so—and despite his Western-educated wife's skillful dissemination in the United States of an image of China as a heroic, democratic, and modernizing state—Chiang's relations with other Allied leaders were poor.

Jiang's single-minded focus on Chinese interests, regardless of the impact on the broader Allied coalition, annoyed Roosevelt and British Prime Minister Winston L. S. Churchill. Nonetheless, it sometimes paid dividends. At the 1943 Cairo Conference, Allied leaders agreed that China should regain all territories annexed by Japan since 1895. Jiang also sought to end foreign extraterritorial privileges and concessions in China and, less successfully, to regain the British colony of Hong Kong. And at the autumn 1944 Dumbarton Oaks meeting, China was one of the five great powers awarded permanent Security Council seats in the new United Nations. At the February 1945 Yalta Conference, however, Roosevelt, Churchill, and Soviet leader Josef Stalin agreed (in Jiang's absence) that, in return for joining the war against Japan from which it had remained aloof, the Soviet Union should regain the special rights tsarist Russia had exercised in Manchuria before 1905.

The continuing Chinese inability or reluctance to mount an aggressive campaign against the Japanese occupiers irritated British and American officials, especially U.S. Lieutenant General Joseph W. Stilwell, American commander of the China-Burma-India Theater and Jiang's chief of staff. Stilwell hoped to modernize the Chinese army and lead it in such a venture—an undertaking Jiang opposed as impractical, probably motivated in part by fears that this would weaken his own control of the Chinese military and his postwar position vis-à-vis the Chinese Communists. Over Jiang's opposition, Stilwell also sought to supply weapons to all anti-Japanese forces in China, including the Communists. Ultimately, at Jiang's insistence, Roosevelt withdrew Stilwell in 1944. Many Allied officials and journalists also deplored the pervasive corruption of the Nationalist regime that Jiang, though personally honest, tolerated.

Such shortcomings among the Nationalists enhanced the image of the Chinese Communists. Since 1937, they had supposedly been Jiang's partners against Japan, even though both the Nationalists and Communists believed that civil war was ultimately inevitable and sought to strengthen themselves for the anticipated confrontation. The Communists' Eighth Route Army, created in 1937, and the New Fourth Army built up by Lin Biao (Lin Piao) fought largely behind Japanese lines in central China and the northern Hebei and Shanxi (Shensi) Provinces, working closely with local guerrilla and partisan forces and building up bases that would potentially enhance the postwar Communist position. Communist forces adopted this strategy after their defeat in the "Hundred Regiments" Campaign of August to November 1940, in which Japanese rail and road networks in north China were attacked. CCP-GMD cooperation largely ceased after the 1941 New Fourth Army Incident, when Nationalist troops attacked and defeated that unit in the lower Chanjiang (Yangtze) Valley.

Despite the Chinese Communists' undoubted ruthlessness, their reputation far surpassed that of the Guomindang government. Idealistic young students and intellectuals flocked to join the Communists. Their selfless dedication and austere lifestyle and the charm and ability of their top leaders, especially Zhou Enlai (Chou En-lai), later China's premier, impressed Western journalists and officials who visited their Yan'an base, including the young diplomats of the 1944 U.S. "Dixie Mission." Nonetheless, despite their disillusionment with GMD leaders, senior American officials never endorsed the Chinese Communists.

When the war ended in August 1945, Japanese troops were still in occupation throughout China. In Manchuria, despite objections from Jiang, Soviet forces turned over to Communist Chinese units arms and equipment captured from the Japanese. American leaders, especially Ambassador Patrick J. Hurley in late 1945, were concerned about Communist inroads in China and sought to strengthen Jiang's regime, to promote reform, and to encourage GMD-CCP reconciliation and the formation of a coalition government in which Communists would have limited influence. Between December 1945 and January 1947, the former U.S. Army chief of staff, General George C. Marshall, was in China endeavoring to secure an accommodation between the two sides. In January 1946, he arranged a temporary cease-fire, but it was broken later that spring when, as Soviet forces withdrew, GMD forces attacked Chinese Communist troops in Manchuria. No further agreement acceptable to both sides could be brokered, and civil war continued until the Communists secured military victory. The GMD government retreated to the island of Taiwan, and on 1 October 1949, Mao proclaimed the new People's Republic of China. From then onward, China would play a major role in the Cold War that succeeded and grew out of World War II.

China-Burma-India (CBI) Theater

General geographic reference for the immersion of East Asia, Southeast Asia, and South Asia in the war against Japan. China-Burma-India (CBI) also refers to an Allied military command structure in the Pacific Theater that was established early in the war. At the December 1941 ARCADIA Conference in Quebec, British Prime Minister Winston L. S. Churchill and U.S. President Franklin D. Roosevelt agreed to set up the American-British-Dutch-Australian Command (ABDA) under General Sir Archibald Wavell in India. Separate from but nominally equal to the ABDA was the China Theater under Generalissimo Jiang Jieshi (Chiang Kai-shek) as supreme commander, in recognition of China's role in fighting Japan since at least the start of the Sino-Japanese War in 1937. Lieutenant General Joseph Stilwell, who had more experience in China than any other senior U.S. Army officer and spoke Chinese fluently, became the senior Allied officer in the region. His two titles were "commanding general of the United States Army Forces in the Chinese Theater of Operations, Burma, and India" and "chief of staff to the Supreme Commander of the Chinese Theater" (Jiang Jieshi). The chain of command was confusing because American forces in China came under the authority of Wavell's ABDA Command. Wavell also commanded forces in Burma, whereas Stilwell was to have direct command of Chinese forces committed to Burma (initially, three armies of up to 100,000 men). From the beginning, Stilwell and Jiang did not get along, and Stilwell was repeatedly handicapped by Jiang's interference in military matters.

In February, following the loss of most of the Netherlands East Indies, the ABDA Command was done away with. From that point forward, the Pacific became an American responsibility, with the British assuming authority from Singapore to Suez. Jiang continued to control the China Theater, and Wavell, headquartered in India, had authority over India and Burma. At the same time, Stilwell formed a new headquarters, the American Armed Forces: China, Burma, and India. The command included the small prewar U.S.

military advisory group and Major General Claire Chenault's American Volunteer Group (AVG, known as the Flying Tigers), later a part of Tenth Army Air Force.

This command structure continued until the August 1943 Quebec Conference, when Churchill and Roosevelt agreed on the establishment of the more integrated South-East Asia Command (SEAC), with British Admiral Lord Louis Mountbatten as commander and Stilwell as his deputy. Operations in Burma were separated from those in India, now under command of General Claude Auchinleck, commander in chief there since June 1943.

Designed to improve Allied military operations in the region, the new command structure did not achieve that end. Conflicts and different goals remained, with Jiang being the chief problem in Allied cooperation. But the British and Americans also had different priorities. The British were mainly concerned with the defense of India and preventing the Japanese military from exerting an influence on growing Indian nationalism. London saw defeating the Japanese in Burma as the chief means to bring about that end, rather than as a means to channel supplies to China. British military efforts in Burma would thus ebb and flow. The United States was primarily interested in building up China's military strength, and Burma would be a chief route for these supplies to reach China; indeed, President Roosevelt saw China taking its rightful place as a major world power at war's end. U.S. military planners also saw China as a potential location for heavy bombers to be used in the strategic bombing of Japan. These conflicting views were exacerbated by the personalities involved. Stilwell continued to feud with Jiang, and he also held that the British were more interested in defending their Asian empire than in fighting Japan. Stilwell wanted to recover Burma, and he worked hard to improve the fighting ability of those Chinese army units he could influence. The only way to get substantial military heavy equipment to China—which was essential if its fighting ability was to improve dramatically—was by way of Burma, and so construction of the so-called Ledo Road there became imperative. In the meantime, the United States undertook a massive logistical air supply operation to China from bases in India over "the Hump" of the Himalaya Mountains, the highest in the world. The ubiquitous C-47 (DC-3) aircraft was the workhorse for much of this campaign.

Construction of the 478-mile-long Ledo Road to connect the old Burma Road from Ledo, India, to Bhamo, Burma, took 25 months. The new road ran through jungles, over mountains, and across 10 rivers. U.S. Army Brigadier General Lewis A. Pick had charge of this vast project, one of the major engineering accomplishments of the war.

Meanwhile, Jiang refused to yield operational command of the growing Chinese military establishment to General Stilwell. Jiang saw the Chinese forces as much as a means to

defeat the Communists in China after the war as to destroy the Japanese forces in the current conflict. Stilwell fervently believed that, properly trained and equipped, Chinese soldiers could be the equal of any in the world, but all of his efforts to eradicate corruption, weed out ineffective leaders, and end political interference in the Chinese military were rebuffed by Jiang. The Chinese Nationalist leader repeatedly promised reforms but delivered only sufficient compliance to keep up the flow of U.S. military aid.

General Chennault and airpower advocates believed that Japan might be bombed into submission from bases in eastern China. Stilwell dismissed such views and pointed out that the Japanese could simply carry out an offensive to wipe out the bases. Nonetheless, the first production B-29 Superfortresses were sent to China from India, and an ambitious base-construction program was undertaken. Although a few air bombing missions were carried out, the Japanese responded by mounting a great ground offensive, the ICHI-gō Campaign, in mid-1944, during which all the bases were captured without significant Chinese ground resistance. The B-29s were shifted from CBI to the Marianas in the Central Pacific. Roosevelt now applied heavy pressure on Jiang to carry out the reforms advocated by Stilwell and place an American general, preferably Stilwell, in command of the Chinese army. Frustrated by its inability to turn China into a major theater of war, the United States increasingly used its massive naval strength to invest in the highly productive “leap-frogging” strategy of securing important islands as stepping stones toward Japan across the Central Pacific. As a result, China was more and more marginalized and downgraded to a minor theater of war, chiefly important for its role in tying down a million Japanese troops.

Stilwell, now at wit's end, reached an impasse with Jiang and was recalled to Washington in October 1944. He was replaced by U.S. Army Major General Albert Wedemeyer, a far more tractable individual bent on getting along with Jiang. The demands for reforms in the Chinese military came to an end. In effect, CBI ended in October 1944 when it was divided into two spheres of command, India-Burma and China. Stilwell's deputy, General Daniel L. Sultan, became the commander of U.S. forces in India-Burma and directed the Allied military effort in northern Burma.

The CBI featured unique air, guerrilla, and logistical operations. Among innovative military and air tactics originating in the CBI was the establishment of Long-Range Penetration Groups, more popularly known as Wingate's Chindits and Merrill's Mairauders. Utilizing air assets, British and U.S. commanders projected ground troops far behind Japanese lines, their communication and supply provided by air. Here and elsewhere, guerrilla operations were developed and intelligence and insurgency operations

carried out. William Donovan and the Office of Strategic Services were active in the theater.

Finally, the CBI was a major scene of postwar confrontation. Early in the war, Japan had conquered and overrun much of China and most of the European and U.S. colonies in the Pacific. The arrival of Japanese forces in Indochina was a great blow to French influence, and the defeat of the British at Singapore had an even more powerful impact on British prestige. President Roosevelt envisioned the end of colonization after the war, but with the arrival of the Soviet threat, new U.S. President Harry S. Truman was less sympathetic. Although the Philippines, India, Burma, and some other states gained independence just after the war, the process of decolonization was actually delayed in some areas, resulting in costly wars in the Netherlands East Indies and French Indochina. As for China, American efforts by Roosevelt's inept ambassador to China, Patrick J. Hurley, to mediate between the Chinese Nationalists and Communists came to naught; that vast country soon disintegrated into civil war. The United States, which had already committed to Jiang, found itself unable to adopt a neutral stance and paid the price in influence when the civil war ended in a Communist victory in 1949.

Chindits

Name applied to irregular forces raised by British Brigadier General Orde Wingate for special operations in Burma in 1943 and 1944. The term, selected by Wingate himself, was derived from the Burmese word *Chinthe*, the name of a mythical, griffinlike creature, stone effigies of which guard the entrance to Burmese temples.

In early 1942, Wingate was transferred to India at the request of General Archibald Wavell, who commanded Allied forces in the Far East. Wavell had known Wingate since service in Palestine and respected his innovative thinking, especially in the use of irregular forces. Wingate

was tasked to apply this ability against the Japanese in Burma, who had seemed invincible up to that time. To accomplish this mission, he developed the concept of long-range penetration operations, which consisted of semi-independent guerrilla forces operating deep in the rear of Japanese forces. These forces would be resupplied by air.

Under cover as 77th Brigade, Wingate formed what he called the “Chindits” out of disparate elements of Gurkhas, the Burma Rifles, and British units, and he conducted strenuous training in central India through 1942. On 16 February 1943, this force of about 3,000 men with 1,000 pack animals crossed the Chindwin River into northern Burma, thereby launching the first Chindit operation (Operation LONGCLOTH). The force was organized into six columns, the nucleus of

Chindits (members of General Orde Wingate's Allied commando force) moving through jungle in Burma. (Hulton Archive by Getty Images)

each being an infantry company, and given the objectives of disrupting communications (notably, by cutting the Myitkyina-Mandalay railway line) and creating general havoc through ambushes and other small-unit operations. LONGCLOTH, which ended in late April, achieved mixed success and took heavy casualties. Only 70 percent of those who had crossed the Chindwin in February returned, and of these, only about 28 percent would be fit for future active service.

Nevertheless, in a theater where all had been doom and gloom previously, the campaign's limited achievements were widely heralded. British Prime Minister Winston L. S. Churchill, in particular, seized on the publicity and promised Wingate his personal support for future operations, even taking him along to the Quebec (QUADRANT) Conference in August 1943. Plans now commenced for a larger, more ambitious campaign. Using the cover of 3rd Indian Division, six brigades and a U.S. air contingent were trained for an operation that was to be coordinated with a push south from northern Assam by a joint Sino-American force under General Joseph Stilwell. Wingate expanded his concept to include "strongholds," semipermanent bases from which operations could be conducted. Each was to be built around an airstrip and include other support facilities.

On 5 March 1944, the second Chindit operation (Operation THURSDAY) began. One brigade having already begun to move by foot into the area of operations the previous month, two additional brigades, preceded by glider-borne pathfinder teams, were flown into strongholds deep inside Burma. The remaining brigades were held in reserve. Once again, there were some successes. The railway line was again interrupted, the town of Mogaung was briefly captured, and the Japanese response appeared generally confused. Unfortunately, Wingate was killed in a plane crash on 24 March. Without his inspired, if unorthodox, leadership, the operation slowly began to lose momentum. Eventually, it would collapse from both exhaustion and outside intervention.

In early April, the Chindits were put under Stilwell's operational control. Stilwell distrusted the Chindit concept (and the British), and despite their specialized training, the Chindits were turned into regular infantry formations. In August, they were withdrawn from combat and at the beginning of 1945 disbanded.

In concrete terms, the achievements of the Chindits seemed small and their cost-effectiveness questionable. However, Japanese Fifteenth Army commander General Mutaguchi Renya would write after the war that Chindit operations, especially Operation THURSDAY, were an important reason why his forces were unable to invade India. In any case, the Chindits served as a morale booster at a critical time and were a pioneering concept for special operations brought to fruition by a determined and imaginative Wingate in the face of significant opposition.

Choltitz, Dietrich von (1894–1966)

German army general who commanded the Greater Paris area in 1944. Born on 9 November 1894, in Wiesegefährlich, Upper Silesia, Germany, Dietrich von Choltitz was a fourth-generation professional soldier. A page in the Saxon court, he was educated at various cadet schools and began his military career as a senior officer cadet in the 107th Infantry Regiment in 1914; he fought in that unit during World War I as a company commander and adjutant. Choltitz served in the cavalry in the 1920s and early 1930s and then transferred to the air-transportable 16th Infantry Regiment of the 22nd Infantry—later, air-landing—Division. He was promoted to major in 1937 and to lieutenant colonel in April 1938. He took command of the 3rd Battalion of the 16th Regiment on 1 September 1939 and the entire regiment 10 days later.

Choltitz's regiment fought in Poland in September 1939, and he was with the element that attacked Rotterdam in May 1940. He was promoted to colonel in April 1941. His regiment participated as a part of the Eleventh Army of Army Group South in Operation BARBAROSSA, the invasion of the Soviet Union, in actions along the Prut, Dniester, and Bug Rivers and in the assault on the fortress of Sevastopol in the autumn of 1941, where it suffered heavy losses. Choltitz was involved in the summer 1942 assault on the fortress and on 28 June 1942 his men crossed North Bay in rubber boats and helped lead a surprise attack in the rear of the fortress city, which surrendered on 2 July 1942.

Choltitz took command of the 260th Infantry Division in August 1942. He remained engaged in southern Russia and held a variety of positions, some of them only briefly. He was deputy commander of the crack XLVIII Panzer Corps in November 1942, acting commander of XVII Corps (December 1942–March 1943), commander of the 11th Panzer Division (March–May 1943), and again acting commander again of the XLVIII Panzer Corps (May–August 1943).

German General Dietrich von Choltitz surrenders the city of Paris to Allied forces in August 1944. Choltitz disobeyed Hitler's orders to burn Paris rather than hand it over to the Allies. (Corbis)

On 12 June 1944, General der Artillerie (U.S. equiv. lieutenant general) Erich Marcks, commanding the LXXXIV Corps of Colonel General Friedrich Dollman's Seventh Army in the Cotentin Peninsula of Normandy, was mortally wounded in an attack by an Allied fighter bomber. On 15 June, Choltitz arrived to replace Marcks. Units of the command were hard hit by the Saint-Lô carpet bombing of 25 July 1944, and much of the command was destroyed. Choltitz made maximum use of the limited resources at hand to slow the American advance. Field Marshal Günther von Kluge, however, unjustly sacked him on 28 July 1944 for the Normandy debacle.

Adolf Hitler promptly reassigned Choltitz, promoting him to General der Infanterie (U.S. equiv. lieutenant general) and appointing him commander of the Greater Paris area on 7 August 1944. Choltitz had few available resources to stop the advance of the Western Allies, however, and he resolutely refused to allow aircraft and artillery attacks in defense of Paris. Receiving orders from Hitler on 23 August

to begin demolishing parts of the city, he refused and ensured a relatively orderly turnover of the city, with little damage to its public buildings and monuments, via negotiations with the French Resistance. Swedish Consul General Raoul Nordling served as one intermediary. Choltitz formally surrendered on 25 August 1944 and became a prisoner of war. Three days later, Field Marshal Walther Model asked the president of the Reich Military Tribunal to open criminal charges against Choltitz.

While in captivity, Choltitz contributed two monographs to the German Military History Program. Following his release in April 1947, he retired in Baden-Baden. Choltitz wrote a short monograph entitled *Brennt Paris? (Is Paris Burning?)*, published in 1950. He also published his memoirs, *Soldat unter Soldaten (Soldier among Soldiers)*, in 1951. Choltitz died in Baden-Baden on 5 November 1966, probably better remembered in France than in Germany.

Chuikov, Vasily Ivanovich (1900–1982)

Marshal of the Soviet Union who took the surrender of Germany's Berlin garrison in 1945. Born in the village of Serebryanye Prudy in the Moscow region on 12 February 1900, Vasily Chuikov left home and became a mechanic at age 14. He joined the Red Army four years later. By 1919, he had risen to command a regiment, and during the Russian Civil War, he fought in Siberia and in the western Ukraine. He also fought in the 1920 Russo-Polish War. Chuikov graduated from the Frunze Military Academy in 1925 and was assigned to China two years later, fighting in the battle for the Chinese Eastern Railroad in 1929. He served in the Special Red Banner Far Eastern Army until 1932 and managed to survive the purge of the officers in the Far East in the late 1930s.

Chuikov served in the Soviet invasions of Poland (1939) and Finland (1939–1940), commanding Fourth and Ninth Armies, respectively. He was promoted to lieutenant general in June 1940 and returned to China for a third tour, serving as a military attaché beginning in December 1940. But he was recalled in March 1942 to become deputy commander and then commander of the newly formed Sixty-Fourth Army (22 July 1942). A protégé of Georgii Zhukov, Chuikov then took command of Sixty-Second Army on the west bank of the Volga at Stalingrad, which he defended at tremendous

Marshal of the Soviet Union, Vasily Chuikov. (Hulton Archive/Getty Images)

cost. His determination was a major factor in enabling the Soviets to hold until they could mount a counteroffensive.

Assigned to the Southwestern Front in March 1943, the Sixty-Second Army was redesignated the Eighth Guards Army. Chuikov led his troops in spearheading the liberation of Ukraine and Belorussia from German forces and was promoted to colonel general in October 1943. In mid-1944, Eighth Guards Army was transferred to Konstantin Rokossovsky's 1st Belorussian Front. The unit then distinguished itself in operations in eastern Poland, taking Lublin and Lodz. The Vistula-Oder operation between January and February 1945 opened the way to Berlin, and Chuikov's tanks spearheaded the final assault on Berlin in a front-wide night attack; on 2 May 1945, Chuikov's headquarters took the surrender of the German Berlin garrison on behalf of the Red Army High Command.

Chuikov was promoted to General of the Army after V-E Day and served as deputy commander and then commander of Soviet occupation forces in eastern Germany (1946–1953). Promoted to marshal of the Soviet Union in 1955, he served as commander of the Kiev Military District (1953–1960) and as commander of Soviet Ground Forces (1960–1964). He was chief of civil defense from 1961 to 1972, after which he served

in the general inspectorate of the Ministry of Defense. Chuikov died in Moscow on 18 March 1981.

Churchill, Sir Winston L. S. (1874–1965)

British political leader, cabinet minister, and prime minister and minister of defense, from 1940 to 1945. Born at Blenheim Palace, Oxfordshire, on 30 November 1874, Winston Leonard Spencer Churchill was the eldest son of Lord Randolph Churchill, third son of the duke of Marlborough and a rising Conservative politician, and his wife, Jennie Jerome, an American heiress. Educated at Harrow and the Royal Military Academy, Sandhurst, from 1895 to 1899, Churchill held a commission in the British army. He visited Cuba on leave and saw active service on the Afghan frontier and in the Sudan, where he took part in the Battle of Omdurman. Captured by South African forces in 1899 while reporting on the Boer War as a journalist, he made a dramatic escape from Pretoria and went to Durban, winning early popular fame.

Churchill emulated his father—who attained the position of chancellor of the exchequer before resignation, illness, and premature death cut short his political career—by entering politics in 1900 as a Unionist member of Parliament. In 1904, his party's partial conversion to protectionism caused him to join the Liberals, who made him president of the Board of Trade (1908–1910) and home secretary (1910–1911) after they returned to power.

As first lord of the Admiralty (1911–1915), Churchill enthusiastically backed the campaign of First Sea Lord John "Jackie" Fisher to modernize the British navy with faster battleships and more efficient administration. One of the few initial cabinet supporters of British intervention in World War I, Churchill soon took the blame for the disastrous 1915 Dardanelles expedition against Turkey, which prompted his resignation. He spent the six months up to

May 1916 on active service on the Western Front but regained high political office in July 1917, when Prime Minister David Lloyd George made him minister of munitions in his coalition government.

In December 1918, Churchill moved to the War Office, where he unsuccessfully advocated forceful Allied action against Russia, in the hope of eliminating that country's new Bolshevik government. In late 1920, he became colonial secretary. Two years after Lloyd George's 1922 defeat, Churchill returned to the Conservatives, who made him chancellor of the exchequer in November 1924, a post he held for five years. He reluctantly acquiesced in Britain's return to the gold standard, and his determination to suppress the 1926 General Strike won him the lasting enmity of much of the labor movement.

By 1928, Churchill believed that the postwar peace settlement represented only a truce between wars, a view forcefully set forth in his book *The Aftermath* (1928). When Labour won the 1929 election, Churchill lost office, but he soon began campaigning eloquently for a major British rearmament initiative, especially the massive enhancement of British airpower, to enable the country to face a revived Italian or German military threat. From 1932 onward, he sounded this theme eloquently in Parliament, but Conservative leaders remained unsympathetic to his pleas. Throughout the 1930s, although Churchill held no cabinet position, he nonetheless continued to the campaign for rearmament. He also became perhaps the most visible and vocal critic of the appeasement policies of the successive governments of Prime Ministers Stanley Baldwin and Neville Chamberlain, who effectively tolerated German rearmament, Chancellor Adolf Hitler's deliberate contravention of the provisions of the Treaty of Versailles, and Germany's and Italy's territorial demands on their neighbors.

When Britain declared war on Germany in September 1939, Churchill resumed his old position as first lord of the Admiralty. Despite the German attacks on the British aircraft carrier *Courageous* and the battleship *Royal Oak*, as well as the responsibility he himself bore for the Allied disaster in Norway during April and May 1940, he succeeded Chamberlain as prime minister on 10 May 1940, the day Germany launched an invasion of France and the Low Countries. Over the next three months, repeated disasters afflicted Britain, as German troops rapidly overran the Low Countries and France, forcing the British Expeditionary Force to withdraw in disarray that June from the Dunkerque beaches of northern France, abandoning most of its equipment. Throughout the summer of 1940, during the Battle of Britain, German airplanes fiercely attacked British air bases, an apparent prelude to a full-scale cross-Channel invasion.

Churchill responded vigorously to crisis. Although he was 65, he still possessed abundant and unflagging energy; his

Prime Minister Winston Churchill of Great Britain, giving victory sign.
(The Illustrated London News Picture Library)

vitality was fueled by his habit of an afternoon siesta, after which he normally worked until two or three the next morning. His fondness for sometimes fanciful and questionable strategic plans often exasperated his closest advisers, as did his attachment to romantic individual ventures—such as those launched by the Special Operations Executive intelligence agency, whose creation he backed enthusiastically. Even so, Churchill was an outstanding war leader. On taking office, he delivered a series of rousing and eloquent speeches, affirming Britain's determination to continue fighting even without allies and voicing his conviction of ultimate triumph. Churchill also followed a demanding schedule of morale-boosting personal visits to British cities, factories, bomb targets, and military installations, which he continued throughout the war.

Besides rallying the British people to endure military defeat in France and the bombing campaign Germany soon launched against Britain's industrial cities, Churchill's speeches, which caught the international imagination, were designed to convince the political leaders and people of the United States—the only quarter from which Britain might

anticipate effective assistance—of his country's commitment to the war. U.S. President Franklin D. Roosevelt responded by negotiating the “destroyers-for-bases” deal of August 1940, whereby the United States transferred 50 World War I–vintage destroyers to Britain in exchange for naval basing rights in British Caribbean Islands and North America.

Since the war began, Britain had purchased war supplies in the United States on a “cash-and-carry” basis. By December 1940, British resources were running low, and Churchill addressed a letter to Roosevelt, who had just won reelection, requesting that he provide more extensive U.S. aid to Britain. Roosevelt responded by devising the Lend-Lease Act that was passed by Congress the following spring, which authorized the president to provide assistance to countries at war whose endeavors enhanced U.S. national security. In August 1941, Churchill and Roosevelt met for the first time at sea, in Placentia Bay off the Newfoundland coast, and agreed to endorse a common set of liberal war aims—the Atlantic Charter—and to coordinate their two countries' military strategies. Churchill also agreed to allow British scientists to pool their expertise in nuclear physics with their American counterparts in the MANHATTAN Project, a largely U.S.-financed effort to build an atomic bomb; the project reached fruition in summer 1945.

Churchill was relieved by Japan's December 1941 attack on the American naval base of Pearl Harbor, Hawaii, and the subsequent German and Italian declarations of war on the United States because these actions finally brought the United States fully into the war and, from his perspective, guaranteed an ultimate Allied victory. In the interim, as 1942 progressed, he needed all his talents to sustain British resolution through various disasters, including Japan's conquest of Hong Kong, Malaya, Singapore, and Burma and British defeats in North Africa.

After Germany invaded the USSR in June 1941, Churchill also welcomed the Soviet Union as an ally, though his relations with Soviet leader Josef Stalin were never as close as those with Roosevelt. Churchill made repeated visits to the United States and met Roosevelt at other venues. In addition, all three leaders gathered at major international summit conferences at Tehran in November 1943 and Yalta in February 1945, and Churchill also met Stalin separately on several occasions. He traveled abroad more than any of the other Allied leaders, often at substantial personal risk.

Stalin resented the Anglo-American failure to open a second front in Europe until June 1944, a decision due in considerable part to Churchill's fear that, if Britain and the United States launched an invasion of western Europe too soon, the campaign would degenerate into bloody trench warfare resembling that between 1914 and 1918. Meeting Roosevelt in May 1943 in Washington, he finally succumbed

to American pressure to open the second front the following summer. Churchill also resented intensifying U.S. pressure for the phasing out of British colonial rule, a prospect made increasingly probable by Britain's growing international weakness.

As the war proceeded and Soviet forces began to push back German troops, Churchill feared that the Soviet Union would dominate postwar Eastern Europe. Soviet support for Communist guerrillas in occupied countries and for the Soviet-backed Lublin government in Poland reinforced his apprehensions. In October 1944, he negotiated an informal agreement with Stalin whereby the two leaders delineated their countries' respective spheres of influence in Eastern Europe. At the February 1945 Yalta Conference, Churchill and Roosevelt both acquiesced in effective Soviet domination of most of that region. The three leaders also agreed to divide Germany into three separate occupation zones, to be administered by their occupying military forces but ultimately to be reunited as one state. In April 1945, Churchill unavailingly urged American military commanders to disregard their existing understandings with Soviet forces and take Berlin, the symbolically important German capital. Despite the creation of the United Nations in 1945, Churchill hoped that close Anglo-American understanding would be the bedrock of the international world order, a perspective intensified by his continuing fears of Germany.

In July 1945, the British electorate voted Churchill out of office while he was attending a meeting at Potsdam, replacing his administration with a reformist Labour government. Churchill was still, however, honored as "the greatest living Englishman" and the war's most towering figure. He used his prestige to rally American elite and public opinion in favor of taking a stronger line against Soviet expansionism in Europe and elsewhere, a position he advanced to enormous publicity in his famous March 1946 "Iron Curtain" speech at Fulton, Missouri. Churchill's six best-selling volumes of memoirs, *The Second World War*, presented a somewhat roseate view of Anglo-American wartime cooperation, and they were carefully designed to promote the continuing alliance between the two countries, which had become his most cherished objective. From 1951 to 1955, Churchill served again as Conservative prime minister. Declining health eventually forced him to resign from office. A House of Commons man to the core, he consistently refused the peerage to which his services entitled him. Churchill died in London on 24 January 1965. For many, his death marked the symbolic final passing of Great Britain's imperial age. Churchill received the first state funeral for any British commoner since the death of the duke of Wellington over a century before. An idiosyncratic political maverick whose pre-1939 record was, at best, mixed, Churchill rose to the occasion to become the greatest

British war leader since the earl of Chatham in the eighteenth century.

Churchill-Stalin Meeting (TOLSTOY, 9–10 October 1944)

Meeting in Moscow that determined spheres of influence in eastern Europe. Concerned particularly about issues involving postwar Poland, Greece, and the Balkans, Winston L. S. Churchill originated this meeting, code-named TOLSTOY. Josef Stalin would not travel from the Soviet Union, so on 27 September 1944, Churchill asked him to receive a small British delegation to discuss these and related issues, including the entry of the Soviet Union into the war against Japan.

Facing imminent national U.S. elections, President Franklin D. Roosevelt could not attend. (Churchill had just seen him in Quebec but informed him about this proposal only two days *after* sending his note to Stalin.) Roosevelt saw the meeting as a preliminary for the forthcoming summit at Yalta and asked that U.S. Ambassador Averell Harriman observe, although in the end, Harriman was not present for some crucial two-man talks.

Stalin agreed to the meeting, and Churchill, Foreign Minister Anthony Eden, and Chief of the Imperial General Staff General Alan Brooke flew to Moscow, where they stayed

from 9 to 18 October 1944. British Ambassador Clark Kerr also joined the delegation.

Churchill's primary concern was to gain freedom of action in the difficult Greek political situation, which teetered on civil war. This he proceeded to get. During dinner conversation with Stalin, he produced a half sheet of paper (terming it a "naughty document") and wrote out proposed spheres of postwar influence: Romania, 90 percent Soviet; Greece, 90 percent British; Yugoslavia and Hungary, both to be evenly divided between the USSR and the Western Allies; and Bulgaria, 75 percent Soviet. Stalin checked and approved the page and gave it back to Churchill. Though the numbers may seem somewhat arbitrary at first glance (with the exception of those for Greece, where the issue was very much in doubt), they merely reflected the reality of a surging Red Army and understated it in regard to both Yugoslavia and Hungary. Although Soviet Foreign Minister Vyacheslav Molotov and Eden dickered about some of the percentages the next day, nothing was changed. All parties present concurred that they were guidelines for discussion and nothing more.

Churchill and Stalin agreed to put off decisions about Poland until Roosevelt could be present. Still, there was considerable argument over the "London" versus "Lublin" Poles and how they might share power after the war. The head of the London Poles, Stanislaw Mikołajczyk, joined the conference briefly but disagreed with Lublin's representatives and with most of what was proposed as to border adjustments and governance.

Extensive discussions of military plans also took place, and regular reports were sent to Roosevelt in Washington by Churchill and Harriman and to the War Cabinet in London by Churchill. The meeting laid some of the groundwork for the subsequent Yalta Conference, but it also cleared the way for firm British action in Athens in December 1944, designed to put down Greek Communist guerrillas. The Soviets, true to the TOLSTOY discussions, did not intervene.

Ciano, Galeazzo (Conte di Cortellazo) (1903–1944)

Italian diplomat and foreign minister under Benito Mussolini. Born at Livorno (Leghorn), Italy, on 18 March 1903, Galeazzo Ciano was the son of World War I naval hero Admiral Costanzo Ciano. Dabbling in theatrical criticism and journalism and earning a law degree by 1925, he was propelled by his father (by then a prominent Fascist) into the foreign service of Italy's new regime. Posted to South America and then Asia, the young socialite found diplomatic life and its connections most agreeable, particularly when his 1929 posting to the Holy See returned him to Rome, where he met and married (in April 1930) Edda Mussolini, Il Duce's daughter.

In June 1933, Ciano was the delegate to the World Monetary and Economic Conference in London, and by June 1935, he was made minister for press and propaganda, a position he left two months later to lead a bomber squadron in the Ethiopian War. Less than a month after Ciano's return to Italy, on 9 June 1936, Mussolini appointed him foreign minister, a move that made both men targets of disapproval from near and far. Loyal Fascists decried the elevation of an opportunistic nepotist, whereas the diplomatic corps in Italy and beyond expected only the worst from a ministry formed in Ciano's dilligentist image.

Ciano's foreign ministry undertook a mix of standard Fascist foreign policy initiatives (such as Italy's withdrawal from the League of Nations, Balkan incursions, and military intervention in the Spanish Civil War) with proposals for regional alliances that sought to curb Germany's hegemony by linking Italy with, variously, Austria, Czechoslovakia, Hungary, and Yugoslavia. Ciano's diaries reveal his antipathy for Germany and detail his September 1939 forging of a "nonbelligerency" policy designed to forestall Italy's entry into the war.

With the Italian declaration of war on 10 June 1940, Ciano resumed bomber pilot duty over Greece, repatriating in April 1941 to find his minister's portfolio reduced to mere courier status. Eventually, he was fired in a February 1943 cabinet shift, and after participating in the Fascist Grand Council's no-confidence vote on Mussolini's rule on 25 July 1943, he unsuccessfully sought asylum in Spain. Cynically (or guilelessly) arranging his family's passage to Germany instead that August, Ciano, not surprisingly, was made a prisoner of Il Duce's new Italian Social Republic after the September 1943 armistice. Receiving no mercy from Mussolini despite Edda Ciano's pleas, he was tried and condemned on a charge of treason and was executed by a firing squad at Verona on 11 January 1944.

Clark, Mark Wayne (1896–1984)

U.S. Army general who received the surrender of German forces in Italy. Born at Madison Barracks, New York, on 1 May 1896, Clark graduated from the U.S. Military Academy in 1917 and was wounded during action in France in 1918. He graduated from the Infantry School in 1925, the Command and General Staff School in 1935, and the Army War College in 1937.

Made a brigadier general in August 1941, Clark was working on army expansion when the war began. He was promoted to major general as chief of staff of Army Ground Forces the following April. He rose to lieutenant general in November 1942 and was named deputy supreme com-

mander for the Allied invasion of North Africa, Operation TORCH, under Lieutenant General Dwight D. Eisenhower. Clark met secretly with Vichy French officials in October 1942 prior to the Allied invasion to seek their cooperation, and he negotiated a cease-fire with the French authorities two days after the landings.

Given command of Fifth Army, Clark led the invading U.S. troops at Salerno, Italy, in September 1943. However, Fifth Army's slow advance up the western side of the Italian peninsula led to harsh criticism of Clark's abilities. His troops suffered heavy casualties in the attempt to penetrate the Gustav Line, and the bombing of the monastery on Monte Cassino plagued his reputation; heavy casualties at the Rapido River prompted a Senate investigation. The Anzio landings in January 1944 did little to speed up Fifth Army's advance, and the assault failed to lead, as was hoped, to a quick capture of Rome. Fifth Army finally liberated Rome on 4 June 1944, but Clark was roundly criticized for his determination that U.S. troops be the first to liberate the Eternal City, which allowed the German Tenth Army to escape encirclement and reach the Gothic Line to the north.

As the cross-Channel invasion of France became the chief focus of Allied efforts in Europe, the Italian theater gradually became secondary. In December 1944, Clark succeeded Sir

Lieutenant General Mark Clark, commander of the U.S. Fifth Army in Italy. (Library of Congress)

Harold Alexander as commander of the multinational 15th Army Group, and in March 1945, he became the U.S. Army's youngest full general. He led the Allied offensive that breached the Gothic Line, crossed the Po River, and entered Austria just as the war in Europe ended. On 4 May 1945, he personally received the surrender of all German forces in Italy.

After the war, Clark commanded U.S. occupation forces in Austria (1945–1947), Sixth Army (1947–1949), and Army Field Forces (1949–1952). He succeeded General Matthew Ridgway as commander of U.S. forces in the Far East and of United Nations Forces in Korea (May 1952–October 1953) and chafed at restrictions placed on his command. Clark wrote two memoirs, *Calculated Risk* (1950) and *From the Danube to the Yalu* (1954). On his retirement from the army in 1954, he served as president of The Citadel (1954–1960). He died in Charleston, South Carolina, on 17 April 1984.

Clay, Lucius DuBignon (1897–1978)

U.S. Army general who served as military governor in Germany. Born on 23 April 1897 at Marietta, Georgia, Lucius Clay graduated from the U.S. Military Academy in 1918 as an army engineer. He was an instructor at West Point between 1924 and 1928. He also served on General Douglas MacArthur's staff (1937); had charge of the construction of the Red River Dam near Denison, Texas (1938–1940); and headed the Civil Aeronautics Authority Defense Airport Program (1940–1941). In the latter position, he oversaw the expansion and improvement of 277 airports and the construction of 197 new ones.

In March 1942, Clay was promoted to brigadier general (the youngest in the army) and appointed assistant chief of staff for matériel. Rising to major general that December, he oversaw both military procurement and production. In November 1944, General Dwight D. Eisenhower called him to Europe to take on the herculean task of rejuvenating for Allied supply the French port of Cherbourg, which the Ger-

U.S. Army Major Lucius Clay. (Library of Congress)

mans had destroyed. On leave from the army, he was next deputy chief of the Office of War Mobilization and Reconstruction in Washington (December 1944 to April 1945).

Clay returned to Europe at the end of the war as a lieutenant general and Eisenhower's civilian affairs deputy, and in March 1947, he became U.S. military governor in Germany. In that position, he played a key role in rebuilding western Germany. When the Soviet Union imposed a blockade of Berlin in 1948, Clay recommended the Western Allies attempt an airlift, which President Harry S Truman approved. Days after the blockade ended in May 1949, Clay retired. He was one of the few occupying generals to have a street named after him (Clay Allee in Berlin). Clay was then chairman of the board of the Continental Can Corporation, although he carried out several special governmental assignments as well. He died in Chatham, Massachusetts, on 16 April 1978.

COBRA, Operation (25–31 July 1944)

U.S. Army breakout from the Normandy Peninsula in July 1944. The success of the Allied invasion of 6 June 1944 dissipated to frustration when the tenacious German defense of the Cotentin Peninsula stifled efforts to expand beyond the initial beachheads. The supreme commander of the Allied Expeditionary Forces, General Dwight D. Eisenhower, had grown impatient with the disrupted timetable as General Sir Bernard L. Montgomery failed to take Caen and Lieutenant General Omar N. Bradley's First U.S. Army remained stalled in the *bocage*, or hedgerow, country. To break the deadlock, two offensive plans were developed. Operation GOODWOOD, led by British Lieutenant General Miles C. Dempsey, would fix the German attention on British forces as they moved to capture Caen. Meanwhile, Bradley developed Operation COBRA, a mobile ground attack to break out of the Cotentin Peninsula, drive west into Brittany, and culminate in a wide sweep to the southeast to stretch German defenses to the breaking point.

Tactical command for COBRA fell to aggressive VII Corps commander Major General J. Lawton Collins. Collins would have six divisions and almost 100,000 men for the attack. The plan hinged on a concentrated strike by heavy bombers to destroy a significant portion of the German lines. After the bombardment, an overwhelming ground attack by the U.S. 9th, 4th, and 30th Infantry Divisions would penetrate the disrupted German defenses and hold open a corridor for the exploiting mobile divisions. Opposing Collins was the German LXXXIV Corps, which had experienced heavy fighting and had many understrength units, such as the Panzer Lehr Division, which could muster only 3,200 troops along a 3-mile front.

A key element in the COBRA plan was to locate a point of penetration where there were sufficient parallel roads in the direction of the attack to allow follow-on forces into the breach. The most controversial aspect of the operation was the "carpet bombing" by strategic bombers. Bradley desig-

nated a rectangular target box 2,500 yards wide and over 7,000 yards long, and his IX Tactical Air commander, Major General Elwood "Pete" Quesada, met with Air Chief Marshal Sir Trafford Leigh-Mallory to coordinate the air attack. However, the competing needs for dropping maximum bomb tonnage, maintaining tactical positions for the infantry, and placing 1,500 bombers in the milewide corridor in a single hour could not be entirely reconciled.

COBRA was scheduled for 24 July, but overcast skies led Leigh-Mallory to call off the carpet bombing. Unfortunately, Eighth Air Force bombers were already in flight, and they approached the target from a perpendicular direction, causing bombs to fall short of the target and into the 30th Infantry Division, killing 25 and wounding 131. The attack postponed and the surprise lost, an infuriated Bradley was told that another attack would follow the next day.

On 25 July, bombers dropped 4,400 tons of bombs. The Germans, alerted from the previous attack, had dug in. Despite this, the Panzer Lehr Division was left in shambles, with 70 percent of its soldiers suffering shock and several battalion command posts destroyed. The Americans, in exposed positions and ready to move, suffered in "shorts" (bombs that fell short of their targets, landing on friendly forces) another 111 men killed, almost 500 wounded, and psychological trauma for 200 more. Among the U.S. dead was Lieutenant General Lesley J. McNair, commander of Army Ground Forces, who was visiting the front to observe the attack.

In spite of this tragedy, VII Corps immediately attacked, although strong pockets of German resistance limited the advance to only a mile or two. The next day, Collins made a bold decision to commit his armored and motorized forces, even though no U.S. unit had reached its planned objectives. The disrupted German command-and-control network failed to react when U.S. armored divisions sliced through the lines on 26 July. The next day, Collins's mobile units exploited their success deeper into the German rear areas, which led Bradley to order VIII Corps through the breach to seize Avranches.

According to the plan, once forces moved toward Brittany, the Third U.S. Army, commanded by Lieutenant General George S. Patton Jr., would be activated. To facilitate this transition, Bradley gave Patton immediate command of the VIII Corps, which he drove hard to capture Avranches on 31 July and mark the end of COBRA. In just six days, the entire German Front collapsed, enabling the Allies to carry out their own operational blitzkrieg deep into France.

Cochran, Jacqueline (ca. 1906–1980)

American aviatrix who commanded the Women Airforce Service Pilots (WASP). Abandoned at birth, Jackie Cochran was born sometime between 1905 and 1908 near Muscogee, Florida. Growing up with a foster family in extreme poverty in Florida and Georgia, she received only two years of formal education. She worked at a variety of jobs in various settings, from cotton mills to beauty parlors. In 1932, Cochran earned her pilot's license, and in 1934, she won her first air race. She married Keith Odom, a wealthy businessman, in 1936. Two years later, Cochran was the first woman to win the Bendix Trophy and was recognized as the leading female pilot in the world.

When the United States entered World War II, Cochran attempted to change the U.S. Army Air Corps policy of not allowing women pilots to fly its planes. Seeing that the matter was hopeless, she took a group of women pilots to England to fly with the Royal Air Force's Air Transport Auxiliary. During her absence, the Air Transport Command organized the Women's Auxiliary Ferrying Squadron (WAFS), a civilian command for women to ferry aircraft throughout the contiguous United States. Nancy Harkness Love took command of the unit.

Cochran returned to the United States, angry that the WAFS had been formed without her. As a peace offering, the chief of staff of the U.S. Army Air Forces (USAAF), General Henry H. Arnold, authorized Cochran to organize, in November 1942, the Women's Flying Training Detachment (WFTD) to train future ferry pilots. In August 1943, the two women's groups were merged under Cochran's command and renamed the Women's Air Force Service Pilots. Seeing this as a chance for women to prove themselves as military pilots, Cochran pushed for missions beyond simple ferrying. In addition to ferrying every type of military aircraft in the U.S. inventory, the WASPs performed flight checks, towed anti-aircraft targets, trained male pilots, and worked as test pilots.

Despite Cochran's efforts to secure military status for the unit—and Arnold's support for that designation—Congress failed to approve it, and the women remained civilians throughout the war and did not secure veteran's status until 1978. In 1945, Cochran was awarded the Distinguished Service Medal.

Following the war, Cochran continued to fly. In 1953, she became the first woman to break the sound barrier, and she also campaigned for female astronauts. In 1960, she was the

Jackie Cochran, center, pushed the WASPs beyond simple ferrying of aircraft. (Library of Congress)

first woman to launch from and land on an aircraft carrier. Awarded the Legion of Merit by the U.S. Air Force in 1970, she was the first woman enshrined in the Aviation Hall of Fame, in 1971. By the time of her death in Indio, California, on 9 August 1980, Cochran held more aviation records and "firsts" than any other aviator.

Cold War, Origins and Early Course of

Even before World War II ended in Europe, there were ominous signs portending future difficult relations between the Soviet Union and the United States. In what Washington and London regarded as a clear violation of their pledges at

Yalta, the Soviets refused to allow the establishment of genuinely democratic governments in Poland and in other parts of eastern and central Europe liberated by the Red Army. There was also sharp disagreement between the Western Allied powers and the Soviet Union over the occupation and future governance of Germany and Japan. From these uneasy beginnings, the “Cold War” (the phrase was coined by Truman administration adviser Bernard Baruch in 1947) began soon after the end of World War II. The Cold War was the single most momentous development of the postwar world, and it dominated international relations around the globe for nearly half a century.

The Cold War’s roots can be traced back to the years before World War II. Following the Bolshevik seizure of power in Russia in November 1917, the Western Allies, including the United States, had supported the White forces that sought to overthrow the new regime. They and Japan even dispatched expeditionary forces to Russia. Although these troops were soon withdrawn, much ill will had been sown. On its side, Moscow did its best to undermine democratic governments and bring about Communist revolutions in Germany, Hungary, and elsewhere.

The Soviet Union remained largely an outlaw state, and in the 1930s, international events occurred largely as if it did not exist. The mistrust between the West and the Soviets prevented the formation of an effective coalition against Germany before the outbreak of World War II. Soviet dictator Josef Stalin had no love for either the Fascist or the Western nations, and he was prepared to deal with whichever side could offer him the most. Soviet security, rather than ideology, was his motivation.

The Western governments were dismayed when, on 23 August 1939, the Soviet and German governments signed a nonaggression pact in Moscow that allowed German leader Adolf Hitler to begin World War II without fear of Soviet intervention. Stalin, for his part, gained space (which France and Britain had been unwilling to grant) and time with which to rebuild his military, which he had devastated in the Great Purges of the late 1930s. The Western governments were even more dismayed when they learned of secret protocols in the pact that awarded eastern Poland and the Baltic states to the Soviet Union. Between September 1939 and June 1941, Germany gained much from the agreement with the Soviet Union. The secret provisions also included a trade agreement that was of the greatest advantage to Germany in fighting Britain and France.

Nonetheless, immediately following the German invasion of the Soviet Union in June 1941, Stalin called on Britain to open a “second front” in order to draw off some of the German ground and air forces overrunning the western part of his country. From June 1941, Germany consistently committed three-quarters or more of its ground strength on the

Eastern Front. Stalin claimed to be deeply frustrated and suspicious that the Western Allies were so slow to invade Europe and instead fought only on the periphery—first in an invasion of French North Africa in November 1942, then Sicily in July 1943, and finally Italy in September 1943—with the invasion of France not occurring until June 1944. Stalin claimed his Western allies were content to watch from the sidelines as the USSR “fought to the last Russian.” Throughout the war, he took massive amounts of Lend-Lease aid, but he never came to trust the United States and Britain as much as he had trusted Hitler; indeed, he regarded the leaders of these Western powers with the deepest suspicion.

Distrust deepened over the postwar fate of Poland. Twice in the twentieth century, Poland had served as an invasion route to Soviet territory, and Stalin was determined to secure Soviet hegemony over that country. He demanded the eastern half of prewar Poland, which had, in any case, been awarded to Russia by the Curzon Commission set up by the Paris Peace Conference following World War I (the so-called Curzon Line). He also recognized an exile regime of pro-Soviet Poles, known as the Lublin government, rather than the legitimate Polish government-in-exile in Britain, called the London Poles. Stalin was well aware of the weaknesses and vulnerability of his own society. As the West had used the new states of eastern Europe as a *cordon sanitaire* (buffer zone) after World War I to prevent the spread of Bolshevism, so Stalin was determined to use the Soviet occupation of these same states as a buffer against the Western powers and the spread of their ideas into his empire.

British Prime Minister Winston L. S. Churchill was comfortable with the world of power politics and was more willing to bargain with the Soviet Union, trading primacy in one country for that in another. But domestic politics and international diplomacy mixed uneasily in the United States, and the Roosevelt administration was influenced by the votes of millions of Polish Americans. Indeed, U.S. President Harry S. Truman, who took office in April on Franklin D. Roosevelt’s death, informed Soviet Foreign Minister Vyacheslav Molotov that Poland had become a symbol of American foreign policy. Stalin refused to see the logic in this approach, protesting that he had not insisted on the postwar fate of North Africa or Belgium—why, then, should America insist on the postwar fate of Poland? Although Stalin did agree to broadly “representative governments” and “free and unfettered elections” in the case of Poland and other states in Eastern and Central Europe, such phrases were merely window dressing that could be interpreted as the Soviets wished.

The real stumbling block was the future of Germany. At the Potsdam Conference in July 1945, Stalin spelled out the heavy reparations he expected to extract from Germany. He was also determined that Germany would never again

threaten the Soviet Union. His wartime partners in the West were concerned about destabilizing the most powerful economy in Europe and about having to pay the cost of the reparations themselves, albeit indirectly. They wanted a unified Germany with a true democratic government. Meanwhile, since the Allies could not agree on the amount of reparations, the Soviets began dismantling factories and portable items in their occupation zone and shipping them back to the Soviet Union.

There were divisive Asian issues as well. At Yalta, Stalin had agreed to join the war against Japan two to three months after the end of the war in Europe. In return, the Soviet Union was to receive south Sakhalin Island and the Kuriles (which had never been Soviet territory). At Potsdam, Stalin reiterated his pledge of Soviet intervention in the war against Japan, but he sought a zone of occupation in Japan proper, which Truman refused. The Red Army subsequently overran Manchuria and occupied the northern half of the Korean Peninsula (agreed to by the Allies for the purposes of taking the Japanese surrender, which U.S. forces took in southern Korea). But the government established in North Korea, led by veteran Communist Kim Il-sung, refused to allow free elections and rebuffed efforts to reunify the two Koreas.

In Manchuria, Soviet forces stripped the province of its industry, sending the factories back to the USSR. Some Western observers were also convinced the Soviet Union was supporting the Communist guerrillas of Mao Zedong (Mao Tse-tung) in the resumption of the Chinese Civil War, although that was, in fact, not the case. Soviet troops did turn over much captured Japanese equipment to Mao's forces.

In February 1946 from Moscow, U.S. Chargé d'Affaires George Kennan sent to his superiors in Washington what became known as the "Long Telegram" (of 8,000 words), explaining the factors behind the conduct for Soviet foreign policy. Kennan urged that the United States should seek to "contain" the Soviet Union from further expansion. Soon thereafter, on 5 March 1946, Churchill, by then the former British prime minister, spoke at Westminster College in Fulton, Missouri, and declared that "from Stettin in the Baltic to Trieste in the Adriatic, an iron curtain has descended across the continent." Churchill called for Anglo-American cooperation to withstand Soviet expansionism, but his appeal failed to draw a U.S. policy response.

In early 1947, the British government informed a surprised Truman administration that it was no longer able to bear the burden of shoring up the Greek and Turkish governments. Truman stepped into the breach, and on 12 March, he asked the U.S. Congress for \$400 million to help the Greek government resist communist guerrillas and the Turkish government to withstand Soviet pressure to secure unfettered access through the Dardanelles. Truman's call

for U.S. aid to free peoples seeking to resist outside or internal pressures came to be known as the Truman Doctrine.

At the same time, the economic situation in Europe continued to deteriorate. Europe had not recovered from the devastation of the war, and the harsh 1946–1947 winter was particularly damaging. Relief costs, borne chiefly by the United States, were high, and there appeared to be no end in sight. On 3 June 1947, in a speech at Harvard University, Secretary of State George C. Marshall described the difficult situation and made clear that the United States had much to lose if the European economy collapsed. He called on Congress to fund a vast economic aid package, based on recovery plans submitted by the European governments. This program became known as the Marshall Plan. Immensely successful, it helped Europe recover, improved the ability of Western European countries to resist communism, and, not incidentally, helped the American economy prosper. The plan was deliberately designed to force European cooperation, and the Soviet Union rejected this program; it refused to participate and denied permission for its Eastern European satellites as well. The Soviet Union would form its own feeble counterpart, the Molotov Plan. Clearly, two mutually antagonistic blocs were forming.

Meanwhile, with the Allies unable to cooperate, the situation in Germany worsened. To cut financial costs, the British and American governments combined their occupation zones economically in what became known as Bizonia (the French later merged their zone, making it Trizonia). Also, because a common currency for all four zones was merely underwriting the Soviets, the three Western governments moved to establish a separate occupation currency. They also promised free elections. The Soviets viewed these moves as threatening and walked out of the Allied Control Council meeting in early 1948. In April, claiming technical reasons, they temporarily closed surface access routes to the western occupation zones in Berlin to military traffic. When this did not result in a change of Anglo-American policy toward Germany, the Soviets instituted a complete blockade of surface access routes into the city. The Truman administration responded with the Berlin Airlift and flew in not only food and medical supplies, for example, but also fuel to heat homes and factories. In May 1949, the Soviets ended the blockade, but the division of Germany into eastern and western halves seemed complete.

As the Berlin blockade drew to a close, the final chapter was taking place in the long Chinese Civil War. The uneasy wartime truce between the Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT)—and the Communists was broken in 1947 when Nationalist leader Jiang Jieshi (Chiang Kai-shek) attempted to secure Manchuria. Despite massive amounts of U.S. aid, the Nationalists were defeated and fled to Taiwan (Formosa) in 1949 as Commu-

nist leader Mao Zedong (Mao Tse-tung) announced the establishment of the People's Republic of China on 1 October 1949. The situation also seemed to worsen when the Soviet Union detonated an atomic device in August 1949, ending the U.S. nuclear monopoly.

Then, on June 25, 1950, the Cold War turned hot as North Korean forces, supported by the Soviet Union and China, invaded South Korea. The Truman administration responded. In what Truman said was the most difficult decision he had to make as president, he authorized U.S. forces to intervene. At that point, the Cold War became enshrined in American foreign policy, and in November 1950, the Truman administration approved a national security policy statement (NSC 68/4) calling for a real policy of containment. Opposing what it perceived to be Soviet expansionism and aggression became a defining characteristic of U.S. foreign policy until the collapse of the Soviet Union in 1991.

Collaboration

Literally “cooperation” or “unity of effort” but interpreted during World War II to mean working actively with the enemy, implying treasonable activity. The issue is a complex one, for collaboration could run from selling the occupier agricultural produce to rounding up Jews and actively

assisting in the prosecution of military activities. Collaboration could be military, political, economic, social, or cultural. In any case, such activities implied treason (in varying degree, of course) on the part of the collaborator. One point that must be made, however, is that one side’s “collaborator” was the other side’s “ally,” “loyalist,” or “assistant.” Collaboration with enemy occupying forces occurred on both sides during the war.

Western and Northern Europe

France presents a complicated picture. Following their defeat of France, the Germans dictated armistice terms that saw them occupy about two-thirds of the country to the north and west. The French were allowed to establish an “independent” government in the remainder of the country, with its capital at Vichy. The term *collaboration* was actually first used in the course of a meeting between Vichy head of state Marshal Henri Philippe Pétain and German leader Adolf Hitler at Montoire-sur-Loire on 24 October 1940. Pétain and his supporters concluded that Germany had won the war and that, for the foreseeable future, that nation would dominate the Continent. The marshal therefore informed the French people that he accepted “in principle” the idea of “collaboration” with Germany.

Despite Pétain’s pronouncement, the French population was bitterly divided, and a small minority at first rallied to the Resistance led by young Brigadier General Charles de Gaulle in London (he had been condemned to death in absentia by the Vichy government as a traitor). Germany had very direct sources of pressure on Vichy, including heavy “administration costs” that amounted to more than 60 percent of French national income, control over traffic across the armistice demarcation line, possession of a million French prisoners of war (POWs), and exploitation of the press.

Following the Allied invasion of French North Africa, the Germans occupied the remainder of France. While de Gaulle established his position in North Africa and the French Empire in general, Vichy Premier Pierre Laval became increasingly open about collaborating with Germany within continental France, including active participation in the rounding up and deportation of Jews and the hunting down of partisans by the Milice, the 30,000-man-strong Vichy militia force. Meanwhile, as the fortunes of war shifted, de Gaulle’s influence in France grew.

Certainly, a large number of French men and women collaborated with the Nazi regime, and many made sizable fortunes in the process. In addition, little was done after the war to punish such war profiteers. The carefully nurtured myth in postwar France of a nation of resisters was totally false, although thousands of French men and women did risk their all for the Allied cause.

German Führer, Adolf Hitler (center left) and Italian Dictator, Benito Mussolini (center right). (Library of Congress)

Occupation arrangements varied in other western European countries. Belgium experienced a rather harsh German military rule, whereas the Netherlands and Norway had civil administrations, and Denmark was able to retain sovereignty until August 1943. After the war, the Belgian government punished, in varying degree, some 53,000 men and women adjudged to have collaborated with the German occupiers.

Vidkun Quisling of Norway was one of the most notorious collaborators, his name becoming synonymous with the term *traitor*. In February 1942, Quisling became minister president of Norway, but his effort to Nazify his country was ardently resisted by most of the population. Anton Mussert was his Dutch counterpart and founder of the Netherlands Nazi Party. The party membership was 30,000 at the start of the war, increasing to a peak of 50,000.

Eastern Europe

Although Poles prided themselves after the war on offering little collaboration with the hated German and Soviet occupiers, collaboration did take place in their country. In the General Government set up by the Germans, units of Polish

police operated under German command, as did Jewish police in the ghettos established by the Germans. Even during the Holocaust, the Germans discovered those individuals who would collaborate in the concentration camps—the Kapos, or trustees, who worked for the German guards in the Sonderkommando. When Soviet forces invaded eastern Poland, they mobilized large numbers of Poles to fight for them against Germany; many Poles regarded these soldiers as collaborators.

In the rest of central and eastern Europe, experiences varied. Bulgaria, nominally an Axis power, hardly participated in the war. Its government did send troops to occupy Thrace and Macedonia in Greece, but it steadfastly rejected Hitler's demands that it dispatch troops to the Eastern Front. Hungary and Romania both supplied troops for the German invasion of the Soviet Union, suffering heavy losses in the process. They also actively participated in rounding up Jews to be sent to the extermination camps. In both Greece and Yugoslavia, there was active resistance to the Germans, although the government of newly independent Croatia, carved from Yugoslavia, was highly supportive of Berlin and its policies.

The Soviet Union

Many inhabitants of the eastern portions of the Soviet Union, such as the Baltic states and Ukraine, openly welcomed the German army as their liberator and collaborated fully with it, until they discovered that German occupation policies were even more repressive than Soviet rule had been. In 1943 alone, as Soviet troops moved westward, the Soviet secret police, or NKVD, arrested more than 931,000 people for questioning. Hundreds of thousands of Soviet minorities—most notably the Crimean Tartars but also Turks and Chechens, among others—were simply deported en masse to the eastern USSR as a consequence of their wartime collaboration with the Germans. General Andrei Vlasov, a Hero of the Soviet Union, agreed to head the German-sponsored Russian Liberation Army, although Hitler refused to allow it any real function. Hundreds of thousands of Soviet prisoners worked in the German army in nonmilitary roles, as cooks, drivers, and the like. Much of their motivation came from the simple desire to stay alive, as millions of Soviet soldiers perished from starvation in German POW camps.

One tragic episode following the war resulted from the decision by the Western powers to hand over to the USSR millions of Soviet citizens, many of whom had lived in the West for decades and had played no wartime collaborative role. Nonetheless, they were shipped off to work at hard labor in the gulags.

Far East

In the Far East, Japan's occupation of its conquered territories was generally quite harsh. Paradoxically, as the war dragged on, Japan encouraged independence from colonial rule in some areas, especially in those lands that had been European or U.S. colonies. A notable example of the latter was the Netherlands East Indies, where indigenous peoples were treated comparatively well, in contrast to Europeans, and where the postwar independence movement was effectively encouraged. There as elsewhere, there was considerable popular support for Tokyo's efforts to eliminate the influence of the European colonial masters. One component of the Japanese theme of a "Greater East Asia Co-prosperity Sphere" was to grant independence to Asian states. But the phrase *Asia for the Asians* actually meant that Asian peoples were to be subordinate to Japan.

In French Indochina, the Japanese allowed the French colonial administration to remain in place for purposes of expediency, for Indochina could thus be held with fewer Japanese troops. In March 1945, however, with the war almost certainly lost for Japan, the French plotted to liberate Indochina themselves. The Japanese then took control and granted Vietnam its "independence." The Vietminh, diehard Vietnamese nationalists led by Ho Chi Minh, reject-

ed collaboration, fought both the French and the Japanese, and appealed to Washington for support.

Much to the surprise of the Japanese, most Filipinos remained loyal to the United States. But under heavy Japanese pressure, the Philippine government did accept the principle of collaboration and even declared war on the United States. Following the liberation of the islands, however, few Filipino collaborators were punished, and the Philippines received independence. Burma had its share of collaborators. A number of Burmese regarded the Japanese as liberators, and the Burmese Independence Army actively fought on their side.

Throughout its long occupation of much of China, Japan sought collaborators. Wang Jingwei (Ching-wei), a founding father of the Nationalist Party, grew disillusioned with Nationalist leader Jiang Jieshi (Chiang Kai-shek) and his failure to make peace with the Japanese. In March 1940, the Japanese installed Wang as head of the puppet Reorganized Nationalist Government in Nanjing (Nanking). However, Wang's hopes of presenting himself as a credible alternative to Jiang were dashed on the rocks of Japanese military domination. Wang died in Japan in November 1944 while undergoing medical treatment.

After the Allied victories in Europe and the Pacific in spring 1945, collaborators were variously punished. Many individuals were simply executed on the spot by soldiers and civilians. In France, women who had fraternized with the Germans had their heads shaved, among other indignities. Some key political leaders, such as Quisling, were tried and executed. In France, the aged Marshal Pétain was tried and sentenced to death, but de Gaulle remitted that sentence in recognition of his World War I services, and the marshal spent the remainder of his life in prison.

Collins, Joseph Lawton (1896–1987)

U.S. Army general who executed Operation COBRA. Born on 1 May 1896 in New Orleans, Louisiana, Joseph Collins graduated from the U.S. Military Academy in 1917. Although he did not take part in combat in World War I, he commanded a battalion during the occupation of Germany between 1919 and 1921.

Collins was then an instructor at West Point (1921–1925) and at the Infantry School at Fort Benning, Georgia (1925–1931). He also served in the Philippines and was an instructor at the Army War College (1938–1941). Shortly after the Japanese attack on Pearl Harbor, Colonel Collins was named chief of staff of the Hawaiian Department and made a brigadier general. In May 1942, he was promoted to major general and took command of the 25th Division, which relieved the 1st Marine Division on Guadalcanal in December 1942. Collins earned the nickname “Lightning Joe” from his men for his aggressiveness on Guadalcanal.

Collins then led the 25th Division during the successful operations on New Georgia in the summer of 1943. Transferring to Europe in January 1944, he received command of VII Corps, the post he held for the remainder of the war. On D day, spearheaded by its 4th Division, VII Corps landed on Utah Beach. It seized the vital port of Cherbourg on 27 June. VII Corps is probably best remembered for Operation COBRA, the breakout from the Normandy beachhead at Saint-Lô on 25 July, an operation largely planned by Lieutenant General Omar N. Bradley but executed by Collins. VII Corps then repelled the German counterattack at Mortain, which led to the creation of the Falaise-Argentan pocket.

Collins led VII Corps at Aachen; at the Battle of the Bulge, where the corps held the northern shoulder of the bulge; at Cologne; in the Ruhr pocket; and, as the war ended, in the Harz Mountains. In April 1945, he was promoted to lieutenant general. One of the war’s best corps commanders, Collins is remembered as an officer who led from the front and enjoyed the full confidence of General Dwight D. Eisenhower and Omar Bradley.

Collins served as vice chief of staff of the army from 1947 to 1949. Promoted to full general, he was the U.S. Army chief of staff from 1949 to 1953 and special representative to the Republic of Vietnam between 1954 and 1955. Collins retired from the army in March 1956. He died in Washington, D.C., on 12 September 1987.

Colmar Pocket, Battle for the (20 January–9 February 1945)

Colmar pocket was the German bridgehead west of the Rhine River and south of the city of Strasbourg, held by Colonel General Friedrich Wiese’s Nineteenth Army of eight divisions (some 50,000 men). On 7 January 1945, the Germans launched a major attack out of the Colmar pocket, gaining very little ground. But the Allies wanted to remove the pocket, and the task was assigned to General Jean de Lattre de Tassigny’s First French Army of 6th Army Group.

On 20 January, de Lattre’s troops attacked the Colmar pocket. The French I Corps led off by attacking the southern flank. On the night of 22–23 January, II Corps assaulted the

northern flank. The objective was to envelop the pocket by converging on Neuf-Brisach and the Rhine Bridge at Breisach. Deep snow along with German mines, machine guns, tanks, and artillery kept the attacks from gaining much ground.

The U.S. 3rd Infantry Division, which was attached to the French, then crossed the Fecht and Ill Rivers. The Germans counterattacked, but the 3rd held them off and reinforced its bridgehead. Severe shortages of French troops led to the eventual attachment to the operation of the entire U.S. XXI Corps, composed of the 3rd, 28th, and 75th Infantry Divisions. Major General Frank Milburn commanded XXI Corps.

Milburn's XXI Corps took over the right of the French II Corps zone and the main effort to envelop the Colmar pocket from the north. The II Corps guarded its left, clearing that area to the Rhine.

The attack continued. The 28th Division arrived at Colmar on 2 February, and the 75th entered the outskirts of Neuf-

Brisach in the rear of the pocket. The U.S. 12th Armored Division was then added to the attack. On 3 February, it drove south through the 28th. Pockets of German resistance held up one arm of the attack, but the other, driving down the main road, captured Rouffach on 5 February. Other task forces surrounded the town and met the 4th Moroccan Division from the I Corps. This maneuver split the pocket.

On 5 February, leading elements of the U.S. 3rd Division arrived outside the walled town of Neuf-Brisach. Early the next morning, as the Americans prepared to attack the city, they encountered a Frenchman who took them to a 60-foot tunnel that led into the town from the dry moat. An American platoon entered through this tunnel and found only 76 German soldiers, who surrendered without a fight. Before leaving the town, their officers had told them to fight to the finish.

French forces finished off the pocket on 9 February. In the entire operation, the Allies had sustained about 18,000

casualties and the Germans between 22,000 and 36,000. Only the 708th Volksgrenadier Division, evacuating the pocket on 3 February, escaped reasonably intact. The German 2nd Mountain Division had 1,000 battle casualties and 4,700 men taken as prisoners. Only 500 members of the German 198th Infantry Division and 400 men of the German 338th Infantry Division managed to escape. The Germans also abandoned 55 armored vehicles and 66 field pieces.

Combat Fatigue

Combat fatigue—also known as battle fatigue, war neurosis, exhaustion, or shell shock—is a variable group of symptoms including excessive fatigue, an exaggerated startle response, tremors, violence, nightmares, delusions, hallucinations, withdrawal, and catatonia. Herodotus described combat-induced mental illness in the Athenian army during the Battle of Marathon in 490 B.C., but the diagnosis was relatively infrequent prior to the twentieth century. The Russians established the first military psychiatric service during the Russo-Japanese War. The problem became widespread in World War I, during which it was termed *shell shock* under the mistaken theory that explosive concussions caused small brain hemorrhages leading to cerebral dysfunction. By World War II, it was widely understood that the symptoms were psychiatric in nature, were similar to traumatic neuroses seen in the civilian population, and were not caused by identifiable anatomic brain damage.

In spite of an early British emphasis on battlefield psychiatry and an American attempt to exclude men with psychiatric illness from military service, mental illness remained a major cause of combat disability, with about 30 percent of Allied combat zone casualties being psychiatric. Although physicians in World War I had learned that treatment close to the front lines made it possible to return a number of psychiatrically disabled soldiers to combat, the lesson was forgotten. Early in World War II, patients with combat fatigue were routinely evacuated to rehabilitation hospitals, and most were discharged. As manpower became scarce, more of these men were placed in pioneer or labor details in the rear area, but few returned to combat.

Captain Frederick R. Hanson, an American neurologist and neurosurgeon who had joined the Canadian army early in the war and participated in the landing at Dieppe, transferred to the U.S. Army and developed what became a successful and widely employed treatment for what the British now termed *exhaustion* or *combat fatigue*. The essential parts of the regimen included sedation, brief periods of rest, and treatment in a facility close to the front, where the patients and staff continued to wear combat clothing. Hanson realized that treating these patients as if they were mentally ill and physically separating them from their units made it unlikely that they would return to duty. Using his treatment protocols, the British and American armies were able to return 70 to 80 percent of combat fatigue victims to their units, and only 15 to 20 percent of patients requiring evacuation to the zone of the interior were psychiatric.

Shortly after the Italian invasion, the U.S. Army established the post of division psychiatrist, and Hanson produced a manual for internists so nonpsychiatrists could use his methods. As the war went on, Allied military psychiatrists became convinced that no soldier was immune from combat fatigue. They hypothesized that any man subject to continuous combat for a long enough time would become nonfunctional and estimated that 200 days of constant action was about the maximum a soldier could be expected to tolerate. The British adopted a system of unit rotation to give their men regular periods of rest and were able to stretch the tolerable period to close to 400 days, but the Americans, except in the U.S. Army Air Forces, adopted a more haphazard approach of rotating individuals with the longest periods of service rather than entire units. It was not until later wars that regular unit rotation became standard.

Military physicians, mindful of the heavy clinical and financial burden of long-term psychiatric illness after World War I, correctly warned that the true cost of combat fatigue would not become evident until after the soldiers returned to civilian life.

planning and conduct of World War II. The ground work for military collaboration developed at least a year and a half before the United States was drawn into the war. The U.S. Navy Department established a permanent observer mission in London to discuss naval cooperation and information exchange. U.S. Army observers only went to London on special missions until the War Department set up permanent liaison in the spring of 1941. In early 1941, agreements called for the exchange of military missions, and the British established its Joint Staff Mission, representing the British chiefs.

The Combined Chiefs of Staff (CCS) was formally established by the two powers in January 1942 shortly after the ARCADIA Conference made the Anglo-American alliance a fact. The organization was to consist of the British chiefs of staff and their opposite numbers in the United States. But since there were no opposite numbers established in the United States at that point, the U.S. Joint Chiefs of Staff (JCS) was formed, consisting of the army chief of staff, General George C. Marshall; the deputy army chief of staff for air and commanding general of the army air forces, Lieutenant General Henry H. Arnold; the chief of naval operations, Admiral Harold R. Stark, and the commander in chief of the U.S. Fleet, Admiral Ernest J. King. In March 1942, Stark's and King's positions were combined under King, and Stark went on to command

U.S. Naval Forces in Europe, headquartered in London. In July, President Franklin D. Roosevelt, acting in his capacity as commander in chief of the armed forces, brought out of retirement the former chief of naval operations, Admiral William D. Leahy, and appointed him chief of staff to the president.

The British Chiefs of Staff (BCS) organization included the chief of the Imperial General Staff, General Sir Alan Brooke; the first sea lord, Admiral Sir Dudley Pound; and the chief of the air staff, Air Chief Marshal Sir Charles Portal. These men met with their American counterparts only at infrequent military-political conferences, but in the interim, they were represented at the permanent body in Washington by the Joint Staff Mission. The original members of that mission were Lieutenant General Sir Colville Wemyss, Admiral Sir Charles Little, and Air Marshal A. T. Harris. In addition, Field Marshal Sir John Dill sat as a member of the Combined Chiefs representing Prime Minister Winston L. S. Churchill.

The CCS were to formulate and execute policies and plans related to the strategic conduct of the war, to include war requirements, allocation of munitions, and transportation requirements. Combined planning was done by the staffs of the JCS and BCS, the Joint Planning Staff—patterned after the British design—and the Joint Planners. Actual planning of the respective national staffs would work its way through the JCS or BCS for coordination by the Combined Planners, the CCS planning staff, which was more a coordinating than an originating body. This system worked surprisingly well during the war, as the United States and Britain closely integrated their war efforts.

Commando Order (18 October 1942)

Order issued by German leader Adolf Hitler to counter British commando raids. On 18 October 1942, Hitler issued

order 003833/42g.Kdos.OWK/Wst, known historically as the Commando Order. In addition to this order, a directive from army headquarters (Number 551781/42G.K) stated that only commanders of units involved were to see the Commando Order. The order was issued in 12 copies only, and headquarters required that in no circumstances was it to fall into Allied hands and that both documents were to be destroyed immediately following their reading and comprehension.

Hitler claimed that the Allied commando raids were a violation of the Geneva Convention, and he ordered, "From now on all enemies on so-called commando missions in Europe or Africa challenged by German troops, even if they are in uniform, whether armed or unarmed, in battle or in flight, are to be slaughtered to the last man." In his supplementary directive, he explained to his commanders the reason for the order. Because of Allied successes, Hitler noted,

I have been compelled to issue strict orders for the destruction of enemy sabotage troops and to declare noncompliance with these orders severely punishable. . . . It must be made clear to the enemy that all sabotage troops will be exterminated, without exception, to the last man.

This means that their chance of escaping with their lives is nil. . . . Under no circumstances can [they] expect to be treated according to the rule of the Geneva Convention. . . . If it should become necessary for reasons of interrogation to initially spare one man or two, then they are to be shot immediately after interrogation.

Despite Hitler's order, Allied commando raids persisted until the end of the war.

Commandos/Rangers

Specialized, highly skilled, elite troops. Rangers were often the first to fight, and generally conducted raids and other specialized tasks, frequently in advance of an amphibious assault. But because of their training, commando troops were often employed in patrolling and sniping after a landing and on occasion served as bodyguards for prominent figures. All rangers and commandos were trained in

infantry skills as well as close-quarter battle techniques. They were adept with rifles, knives, grenades, and blunt instruments. Their fitness was paramount, and they were conditioned through long training to make their way across many miles of terrain to reach their objectives. They were self-reliant, resourceful, and aggressive.

Britain formed its first commandos in southern England in June 1940, just after the evacuation of the British Expeditionary Force from France. A designated British commando unit was the equivalent of a battalion and consisted of 10 troops of 50 men each. On formation and during their initial training, the first commando troops were given a ration allowance and billeted in local houses, where they were responsible for their own discipline and were made to rely on their initiative and self-motivation. In October 1940, Number 3 Commando, with a total of 475 officers and men, moved to the Combined Training Centre at Inverary in Scotland. Other commando units were also forming at the time.

The first British commando operation took place in March 1941 against German installations on the Lofoten Islands of Norway. Later commandos raided South Vaagso, also in Norway, and they conducted operations against the Channel Islands, were landed by submarine off Sicily before Operation HUSKY, and were responsible for many other operations against German coastal installations. Commandos were again in the forefront of the landings in France in Normandy in June 1944, and they took on an infantry role as they advanced inland, despite the fact that commando troops were not line infantry but special forces. On 6 June 1944, commandos mounted an attack on the German battery at Merville overlooking the invasion beaches; the battery was destroyed.

When the United States entered World War II, Brigadier General Lucian Truscott, U.S. Army liaison to the British General Staff, convinced Army Chief of Staff General George C. Marshall of the need for an American commando unit. On 26 May 1942, the army authorized formation of the 1st Ranger Battalion, which was activated on 19 June. During the war, the United States formed six ranger battalions. The first through fifth served in the North African and European Theaters, whereas the sixth served in the Pacific.

For training, the U.S. 1st Ranger Battalion was sent to the British Army Command's Training Centre in Scotland. For several weeks, the American rangers were tested to their limits by the Commando Centre trainers. Eighty-five percent of those who began the course graduated.

On 19 August 1942, 50 American rangers were added to a British and Canadian commando raid on the French port city of Dieppe. Three rangers died and five were captured, but the Americans won high praise for their efforts. Rangers subsequently took part in raids on Norway while attached to British commandos units. They also fought in Sicily and

British commandos who landed in Normandy on 6 June set out to capture a German gun site protected by snipers. (Hulton Archive by Getty Images)

participated in the landings in Italy at Salerno and Anzio. As raiding forces, they were only lightly equipped, but they were subsequently employed as infantry troops nonetheless. The 1st and 3rd Battalions led the attack on Cisterna but were almost wiped out. The remaining 4th Battalion took heavy casualties while trying to rescue the first two. Of 1,500 men in the three battalions, only 449 remained.

During the Allied invasion of France, the U.S. 2nd Ranger Battalion landed on the west flank of Omaha Beach with A Company of the 116th Infantry Regiment and moved up to the village of Vierville-sur-Mer to secure the coastal road to Pointe du Hoc, destroying the German positions and radar station along the way. Meanwhile, the 5th Ranger Battalion received the important task of disabling a battery of six 15 cm German coastal artillery pieces at Pointe du Hoc. These guns would be capable of hitting almost any Allied ship supporting the U.S. landing. The rangers successfully scaled the cliffs, but much to their surprise, they found that the

German artillery had already been removed from Pointe du Hoc. The rangers then pushed inland, destroying some of the pieces behind the beaches.

A joint U.S.-Canadian brigade-sized unit, known as the First Special Service Force, also took part in the Aleutian Campaign, in the fighting in Italy, and in the August 1944 landings in southern France. In subsequent European fighting, rangers continued to lead the way and were some of the first units to counter the German Ardennes Offensive in December 1944. In 1945, ranger units established bridgeheads across the Rhine River into the heart of Germany.

Elite formations also served in the Pacific Theater. During the Quebec Conference of August 1943, U.S. President Franklin D. Roosevelt and British Prime Minister Winston L. S. Churchill agreed to have a U.S. ground unit spearhead the Chinese army with a long-range penetration mission behind Japanese lines in Burma. Its goal would be to destroy Japanese communications and supply lines and to play

havoc with Japanese forces while an attempt was made to reopen the Burma Road.

A presidential call for volunteers for “a dangerous and hazardous mission” elicited some 2,900 volunteers. Officially designated as the 5307th Composite Unit (Provisional)—code-named *GALAHAD*—the unit later became popularly known as Merrill’s Marauders after its commander, Brigadier General Frank Merrill. Organized into combat teams, two to each battalion, the Marauder volunteers came from various theaters of operation. Some came from state-side cadres; some from the jungles of Panama and Trinidad; and the remainder were veterans of campaigns in Guadalcanal, New Georgia, and New Guinea. In India, some Signal Corps and Air Corps personnel were added, as well as pack troops with mules.

Following training, undertaken in great secrecy in the jungles of India, about 600 men were detached as a rear-echelon headquarters to remain in India to handle the soon to be vital airdrop link between the six Marauder combat teams (400 men to a team) and the Air Transport Command. In units designated by color-coded names—Red, White, Blue, Green, Orange, and Khaki—the remaining 2,400 Marauders began their march up the Ledo Road and over the outlying ranges of the Himalaya Mountains into Burma.

The Marauders, with no tanks or heavy artillery support, moved overland some 1,000 miles through extremely dense and almost impenetrable jungles and came out with glory. In 5 major and 30 minor engagements, they defeated units of the veteran Japanese 18th Division, the conquerors of Singapore and Malaya who vastly outnumbered them. Moving in the rear of the main Japanese forces, they disrupted supply and communication lines and climaxed their operations with the capture of Myitkyina Airfield, the only all-weather airfield in Burma. The unit was consolidated with the 475th Infantry on 10 August 1944.

The 6th Ranger Battalion was activated at Port Moresby, New Guinea, in September 1944. Commanded by Colonel Henry “Hank” Mucci, it was the first American force to return to the Philippines. Its mission was to destroy Japanese coastal defense guns, radio, and radar stations on the islands of Dinegat and Suluan off Leyte. Landing three days in advance of the main Sixth Army invasion force on 17–18 October 1944, the 6th Battalion swiftly killed or captured some of the Japanese defenders and destroyed all their communications. The unit took part in the U.S. landings on Luzon, and several behind-the-lines patrols, penetrations, and small unit raids served to prime the rangers for what was to become universally known as one of the most daring raids in U.S. military history.

On 30 January 1945 in the Cabanatuan raid—led in person by Colonel Mucci—C Company, supported by a platoon

from F Company, struck 30 miles behind Japanese lines to rescue some 500 emaciated and sickly prisoners of war, many of them survivors of the Bataan Death March. The rangers, aided by Filipino guerrillas, killed over 200 members of the Japanese garrison, evaded two Japanese regiments, and reached the safety of American lines the following day. Intelligence reports had indicated the Japanese were planning to kill the prisoners as they withdrew toward Manila. Effective reconnaissance work by Filipino scouts contributed to the success of the raid.

Later commanded by Colonel Robert Garrett, the 6th Battalion played an important role in the capture of Manila and Appari. At the end of the war, it was preparing to take part in the invasion of Japan. The unit received the Presidential Unit Citation and the Philippine Presidential Citation. It was inactivated on 30 December 1945, in Kyoto, Japan. It and other elite units from the World War II era gave rise to the special forces of today’s military establishments.

Commissar Order (13 May 1941)

Order issued to the German army by Adolf Hitler on 6 June 1941, two weeks before the start of Operation *BARBAROSSA*, the German invasion of the Soviet Union. In early March 1941, Hitler addressed his generals and informed them of what would later be known as the “Commissar Order.” It called on the German military to execute any captured Soviet commissars, the Communist Party officials assigned to military units. This order contravened all international conventions governing the treatment of prisoners of war. In remarks to his commanders, Hitler justified his order on the grounds that the commissars were “the bearers of ideologies directly opposed to National Socialism.” He also said that German soldiers guilty of breaking international law would be “excused.” Although Field Marshal Erich von Manstein and some other German generals refused to obey the order, it was widely carried out.

Committee to Defend America by Aiding the Allies (1940–1941)

The most prominent pro-Allied lobbying organization in the United States prior to American intervention in World War II. Established in May 1940 at the prompting of President Franklin D. Roosevelt, the Committee to Defend America (CDA) was a private organization dedicated to assisting Britain and France by providing American support, both moral and material. The committee developed from an earlier 1939 lobbying group that had helped to bring about changes in American neutrality legislation permitting Allied purchases in the United States. Headed by William Allen White, a prominent Kansas journalist, the CDA's organizing committee included Clark Eichelberger and Frank Boudreau, Thomas W. Lamont, and Frederic R. Coudert. White requested 650 prominent Americans to join and form local committee chapters, and eventually, around 600 such groups existed nationwide, their estimated membership totaling between 6,000 and 20,000 people.

Some CDA members favored outright intervention in the war, but publicly, the organization sought only to aid the Allies, short of going to war—a circumspect stance that was made particularly politic in the bitterly fought 1940 presidential election, in which foreign affairs and peace were major issues. As interventionists became more prominent within the organization, White resigned in January 1941, and in November, Eichelberger succeeded him.

Supposedly “one step ahead” of the Roosevelt administration, CDA leaders worked closely with pro-Allied officials, including Roosevelt, Secretary of War Henry Lewis Stimson, and Secretary of the Navy Frank Knox. Indeed, measures that CDA representatives proposed to the government—for example, increased American naval protection for convoys bound for Britain, enhanced material aid, and extended wartime protective zones—often originated within the administration. These tactics enabled the government to claim it was responding to popular pressure. CDA officials also rallied popular and

congressional support for government initiatives, including the 1940 destroyers-for-bases deal with Britain, the introduction of Selective Service conscription, and 1941 Lend-Lease legislation. By mid-1941, with the election past, Roosevelt increasingly took executive action on foreign issues, which decreased the CDA's significance. After Pearl Harbor, the CDA disbanded. Eichelberger and other CDA activists subsequently campaigned prominently for the creation of the United Nations.

COMPASS, Operation (7 December 1940–7 February 1941)

British campaign against Italian forces in North Africa. On 13 September 1940, three months after Italy entered World War II, Italian dictator Benito Mussolini ordered the commander of Italian forces in Libya, Marshal Rodolfo Graziani, to invade Egypt with General Mario Berti's Tenth Army. Graziani's nine ill-equipped divisions of 250,000 men vastly outnumbered the 36,000 British, New Zealand, and Indian troops of Lieutenant General Richard O'Connor's Western Desert Force (WDF) in Egypt. But Graziani made no attempt to advance after crossing the Egyptian-Libyan border and instead settled in a chain of fortified camps around Sidi Barrani. The British commander in chief, General Archibald Wavell, therefore conceived a plan to throw Graziani off balance while he dealt with the Italians in East Africa. Because of a shortage of transport in particular, Wavell envisaged not a sustained offensive but a swift, large-scale raid lasting no more than five days.

Operation COMPASS began on 7 December with a two-day, 70-mile march by British forces across the desert. After passing through a gap between the Italian camps, Major General Noel Beresford-Peirse's 4th Indian Division stormed Nibeiwa camp from the rear, with 50 Matilda infantry tanks of the 7th Royal Tank Regiment at the spearhead. The British surprised the Italian garrison and took 4,000 prisoners, almost without loss.

British forces also stormed Tummar East and West camps that same day, and overran the camps around Sidi Barrani the next day. On the third day, Major General Michael Creagh's 7th Armoured Division—the famous Desert Rats—swept

westward to the coast beyond Buq Buq and cut the Italian line of retreat. In three days, the British captured 40,000 Italian troops and 400 guns; the remnants of the Italian army took refuge in Bardia, the first town inside Libya, and were rapidly surrounded.

These astonishing results were unforeseen and caused immense problems. The Indian 4th Division was recalled for dispatch to Sudan, as previously planned, leading to the unusual spectacle of British troops withdrawing eastward just as the Italians fled west. The Australian 6th Division, commanded by Major General Iven Mackay, was transferred from Palestine, but the shortage of trucks and the need to feed and evacuate huge numbers of prisoners led to a three-week delay before the operation could be resumed. The ingenious development of field supply dumps in the desert alleviated the problems of transporting supplies across long distances, but the operation's success was only possible because of the capture of large numbers of Italian trucks.

Generale di Corpo (U.S. equiv. lieutenant general) d'Armata Annibale "Electric Whiskers" Bergonzoli signaled to Mussolini, "In Bardia we are and here we stay." The Australian infantry, supported by British battleship gunfire support, began the assault on 3 January 1941. After three days, the Italian garrison of 45,000 men surrendered, with 462 guns and 129 tanks. The Matilda tanks, which were almost invulnerable to the Italian guns, were again the key to the rapid success, and the Australian commander claimed that each tank was worth an entire infantry battalion.

Even before the fighting concluded, 7th Armoured Division drove west to encircle and isolate Tobruk, which was attacked on 21 January. Although just 16 of the precious Matildas were still running, they once again made the vital penetration, and the fortress fell the next day, yielding 30,000 Italian prisoners, 236 guns, and 87 tanks.

Tobruk's large port allowed supplies to be delivered by sea direct from Alexandria, and O'Connor intended to allow XIII Corps, as the WDF was known from 1 January 1941, to recuperate. On 3 February, however, intelligence revealed that the Italians were preparing to abandon Cyrenaica and withdraw beyond the El Algeila bottleneck. O'Connor immediately planned a daring initiative and sent his depleted tanks from Mechili across almost 100 miles of the roughest country in North Africa in just 33 hours to cut off the fleeing Italians at Beda Fomm late on 5 February. In a fitting climax, the miniscule British force of no more than 3,000 men and 39 Cruiser tanks held off Italian attempts to break out until the morning of 7 February when, completely demoralized, 20,000 Italians surrendered, with 216 guns and 120 tanks.

In a scant 10 weeks, the Commonwealth force of two divisions advanced more than 700 miles and captured 130,000 Italian prisoners, more than 380 tanks, 845 guns, and well over 3,000 vehicles at the relatively slight cost of 500 killed,

1,373 wounded, and 55 missing. O'Connor far exceeded all expectations, but he was confident that he could continue his advance to Tripoli and completely clear Africa of all Italian forces. Historians have since argued that a golden opportunity to finish the war in Africa was wasted, but recent research has shown that, without an operational port at Benghazi to maintain an advance, supply difficulties would have proven impossible. Nevertheless, British Prime Minister Winston L. S. Churchill had already directed Wavell to halt the advance at Benghazi in favor of the campaign in Greece and leave only a minimum force to hold Cyrenaica against the recently arrived German general Erwin Rommel.

Concentration Camps, German (1933–1945)

Concentration camps are most often associated with Nazi Germany, but the modern concentration camp is generally thought to have originated with Spanish General Valeriano Weyler y Nicolau in 1896 during the Cuban insurrection against Spain. Weyler sought to concentrate the civilian population near army installations, isolating these *reconcentrados* from the guerrillas. In Cuba at that time—and also in the Philippines during the 1899–1902 Philippine-American War and in South Africa during the 1899–1902 Boer War—large numbers of civilians died in such camps as a consequence of overcrowding, disease, and inadequate supplies.

During World War II, Germany established a number of different types of concentration camps. They may be grouped as penal, transit, labor, or extermination centers. Most served more than one purpose; that is, they were typically both penal and labor. But all of the camps saw brutality and merciless loss of life, whether as the result of disease, starvation, torture, exposure to the elements, forced labor, medical experiments, or outright execution. All major camps had subcamps that were sources of slave labor. Collectively, the camps numbered in the thousands.

The Nazis opened their first concentration camp at Dachau, near Munich, in March 1933, only two months after

Adolf Hitler came to power. This camp was the model for the many others to follow. It operated continuously until April 1945, when the U.S. Army liberated the inmates. Originally intended for the temporary detention of political prisoners, the camps became permanent institutions manned by the Schutzstaffel (SS) Totenkopfverbände (Death's Head detachments). In these camps, the more sadistic guards, of whom there was no shortage in the SS, were more or less free to inflict indescribable cruelties on the inmates without fear of disciplinary action. The camp system gradually evolved from penal camps to the infamous death mills of Auschwitz, Belzec, Chelmno, Maidanek, Sobibor, and Treblinka.

At first, the camps housed political enemies. Foremost were Communists and Social Democrats. Jews were initially targeted insofar as they belonged to these other groups, but they were considered “spoilers of German blood” and quickly became the primary victims. In time, Gypsies, Jehovah's Witnesses, homosexuals, and the mentally ill all fell prey to the Nazis and their collaborators. By 1939, seven large camps existed, with numerous subcamps. These seven large camps were Dachau, Sachsenhausen, Buchenwald, Neuengamme, Flossenbürg, Mauthausen, and Ravensbrück. As the war spread, forced labor became more and more a part of war production, and prisoner exploitation expanded. In the end, the camps stretched from the Pyrenees to eastern Europe, and literally millions of people had perished in them. Some camps, notably Drancy in France and Westerbork in the Netherlands, were primarily transit facilities, where Jews were herded together for onward shipment via railroad to the dreadful death mills.

No one will ever know just how much the people in the surrounding communities knew about the internal workings of the camps, but the Nazis had accomplices wherever camps existed. There were penal, work, or transit camps in all countries occupied by or allied with Germany. In western and eastern Europe, including the Baltic states, indigenous troops augmented the SS in the camps. In southern Europe, local forces operated their own camps or executed their victims rather than ship them to the death mills of eastern Europe. One glaring case was the Jasenovac camp operated by the Nazi puppet of Croatia. There, the Croatian Fascists, the Ustaše, killed tens of thousands of Serbs, Jews, Gypsies, and political enemies.

All the camps were very much alike. In them, the guards did whatever they could to strip every bit of human dignity from the inmates. Those who could do so were forced to work at hard manual labor 11 to 12 hours a day. Those who could not were encouraged to die. The sign over the camp gate reading *Arbeit macht Frei* (work brings freedom) meant the work of slave labor and freedom only in the release of death.

On arrival at a concentration camp, men and women were segregated and taken off for “medical inspection.” There, they were forced to strip naked and were deloused. Heads were shorn, the hair retained to use for manufacturing mattresses and upholstering furniture. Following a cursory medical inspection, those pronounced fit to work were given clothes, had numbers tattooed on their arms, and were assigned to barracks where they would exist until they became too weak to work any longer. Those judged unfit to work were taken off in another direction to be executed.

For those who passed the medical inspection, life in the camp was defined by deliberate degradation, with every effort expended to break them physically, mentally, and morally. Barracks were so overcrowded that there often was not enough room for everyone to lie down at once. Buckets were frequently the only sanitary facilities provided, and there were never enough of these. Barracks were unheated, and in many, there was no cover provided, even in winter.

At dawn each morning, men and women lined up in front of their respective barracks for roll call, standing in their thin rags even in winter. This dreaded *zählappell* (roll call) occurred at 3:00 A.M. and was repeated 5:00 P.M. It lasted for hours each time, until the guards could make an official and complete count. Every form of disease was present in the camps, with little or no medical treatment provided. Nourishment was totally inadequate. Breakfast usually consisted of a cup of ersatz coffee and a small portion of stale or moldy bread. Lunch was typically a cup of poorly fortified soup. And dinner routinely consisted of a small serving of bread, perhaps some potatoes or cabbage, and putrid tea.

Punishment in the camps was frequent and brutal, and it often occurred without justification: it had to be especially horrific if it was to exceed the brutality of daily life in the camps. Regulations in some camps required that beating with an axe handle was to be restricted to 25 blows at a time and that a week had to pass before a second beating could be given, but the guards seem not to have paid much attention to such rules. Often, the inmates were assembled to witness punishments and executions, and prisoners were sometimes placed in solitary confinement in total darkness in cells where they could neither stand nor sit nor lie for days or weeks. At Buchenwald, Belsen, and elsewhere, medical experiments were carried out on unwilling victims, who, if they survived, were often maimed for life. Such experiments

The Nazis opened their first concentration camp at Dachau, only two months after Adolf Hitler came to power in 1933.

Inmates of the Ampfing concentration camp in Germany liberated by U.S. Third Army Signal Corps. (U.S. Army, Library of Congress)

investigated, among other things, the effects of rapid compression and decompression, how much cold and exposure a person could stand before he died, and how best to revive a victim of freezing.

A number of German industries—such as I. G. Farben, the giant chemical firm that also manufactured the Zyklon B gas employed in the death camps—were attracted to Auschwitz and other camps with the promise of cheap slave labor. At Auschwitz, I. G. Farben built an enormous factory to process synthetic oil and rubber in order to take advantage of the slave labor available. This facility was the largest plant in the entire I. G. system, and it was built largely by slave labor. Work was physically exhausting, and beatings for any breach of the rules were common. I. G. claimed it provided a “special diet” for its workers, which nonetheless resulted in a weight loss of six to nine pounds a week for the prisoners. Death usually came after three months. As an I. G. physician’s report noted, “The prisoners were condemned to burn up their own body weight while working and, providing no infection occurred, finally died of exhaustion.” Slave labor became a consumable raw material. At least 25,000 people were worked to death at I. G. Auschwitz.

All inmates had to wear insignia (colored triangles) revealing the reason for their incarceration. There were variations, but typically, Jews wore two superimposed triangles that formed a yellow star. Common criminals wore green. Political prisoners had red. Persons considered asocial (e.g., Gypsies and vagrants) wore black. Homosexuals wore pink and Jehovah’s Witnesses purple.

Prisoners had to observe a definite hierarchy of prisoner officials, as well as the SS guards. The average prisoner had to answer to fellow prisoners at work or in the barracks. The most despised fellow prisoner was the Kapo, typically a heavy-handed supervisor willing to beat prisoners for the slightest infraction. The prisoners’ work assignments and records were in the hands of other prisoners known as scribes and elders. These prisoner officials could make an inmate’s life miserable—or even end it. Likewise, they could make life somewhat easier, and it often behooved ordinary prisoners to make note of this situation. Prisoner officials received better treatment in exchange for their cooperation. But comforts were rare indeed for the victims of this brutal process. The Nazi concentration camp system took the lives of millions and was the principal instrument of the Holocaust.

Conolly, Richard Lansing (1892–1962)

U.S. Navy admiral who commanded forces in almost all of the largest amphibious operations of the war. Born in Waukegan, Illinois, on 26 April 1892, Richard Conolly was commissioned in the navy on his graduation from the U.S. Naval Academy in 1914. He served in destroyers in the Atlantic, winning the Navy Cross for his part in rescuing a transport vessel damaged by a German submarine attack. Between the wars, Conolly earned a master of science degree at Columbia University, served as an instructor at the Naval Academy, and captained several destroyers.

From 1939 to 1942, Conolly served in the Pacific Theater, successively commanding 6th and 7th Destroyer Squadrons and providing the destroyer screen for the April 1942 raid on Tokyo. Promoted to rear admiral in July 1942, he spent several months on the staff of the chief of naval operations and commander in chief of the U.S. Fleet, Admiral Ernest J. King.

From March to October 1943, Conolly served with the Atlantic Fleet Amphibious Force and took part in the invasions of Sicily, where he earned the nickname “Close-in Conolly” for the naval fire support his ships provided the ground forces. That September, he commanded the amphibious component that landed the British 46th Division at Salerno, Italy. Again, he used his destroyers and cruisers to provide close gunfire support.

Conolly then transferred to the Pacific, using his amphibious landing expertise in operations at Kwajalein, Wake, and Marcus Islands. In 1944 and 1945, he commanded Group 3 of the Pacific Fleet Amphibious Force, leading the July 1944 landing on Guam and the January 1945 landing on Lingayen Gulf (Leyte), and Okinawa. He participated in six of the seven largest amphibious operations of World War II, missing only Normandy.

Conolly was the U.S. naval representative at the 1946 Paris Peace Conference. Promoted to full admiral, he subsequently commanded the Twelfth Fleet for four months and then U.S. Naval Forces, Eastern Atlantic and Mediterranean Fleet from 1947 to 1950. He then spent three years at Newport, Rhode Island, as president of the Naval War College. Conolly retired in November 1953 to become president of

Long Island University, where he remained until he and his wife died in a commercial air crash at La Guardia Airport in New York, on 1 March 1962.

Conscientious Objector (CO)

An individual who seeks exemption from military service based on matters of conscience; in this regard, the conscientious objector (CO) differs from the “draft dodger.” The first COs were members of small Protestant religious denominations, notably the Mennonites. Although their members were not forced to bear arms, even by Germany and Russia, such groups were generally taxed or required to perform alternative service. During World War I, a number of the democratic nations made provisions for conscientious objection. In Britain, preference was accorded on religious grounds, but CO status was also extended to those who opposed the war on political and ethical grounds. This generous government view was, however, often tempered by local boards, which chose to interpret the law more narrowly.

Perhaps surprisingly, given the rampant pacifism of the 1920s that followed the great bloodletting of World War I, COs were too few in number in World War II to have any impact on the war effort of their respective countries. The Axis states refused to recognize CO status, as did the Soviet Union and many others of the warring states.

Conscientious objector status was most honored in North America, Australia, New Zealand, the United Kingdom, the Netherlands, and the Scandinavian states. In the United Kingdom during World War II, CO status was granted on a more fair basis than it had been in World War I. Unconditional exemptions were granted to 6.1 percent of COs there, and alternate service was allowed in civilian jobs.

Conscientious Objectors in Britain and U.S.

Fewer than 10 percent of British COs were jailed, compared to 33 percent in World War I. The United Kingdom had 60,000 COs, or 1.2 percent of the number drafted, compared with 0.125 percent in World War I.

The United States also widened its interpretation of CO status in World War II. At the time Congress was about to vote on the Selective Service Act in 1940, there was uncertainty about how the draft would treat men who wanted to be exempted from military service on grounds of conscientious objection. A third of all Americans had indicated in polls that they favored either jailing COs or forcing them to fight in combat units, but Congress instead adopted a plan conceived by religious groups and known as Civilian Public Service (CPS).

The exact details of the CPS program were not worked out until early 1942, but it put COs to work on a variety of domestic tasks. Representatives of the Society of Friends (Quakers), the Brethren, and the Mennonites supervised those in CPS, and the costs of the program were paid by these three church organizations at the rate of \$35 per month for each CO. CPS members sometimes received a few dollars a month for expenses from church groups but were otherwise not paid. Those seeking to obtain CO status had to file a special document, Form 47, along with their draft information. Local draft boards could and often did reject these requests, but an appeals procedure existed for such cases.

In all, about 37,000 American men obtained CO status. Most were Quakers, Mennonites, and Brethren. There were also Jehovah's Witnesses, socialists, communists, and others who professed pacifism. An additional 6,000 men who either did not receive CO status or turned it down were prosecuted for refusing to be inducted into the military and served some time in prison.

In many parts of the country, COs took up tasks that previously were assigned to members of the New Deal's Civilian Conservation Corps, such as reforestation, road building, and repairing drought damage. Other COs performed excel-

Conscientious objectors work at Wyeth, Oregon during World War II. (Bettmann/Corbis)

lent service in mental hospitals. A few volunteered as guinea pigs for medical research, and some valuable advances in battling malaria and other tropical diseases came from these experiments. Although Major General Louis Hershey, head of the Selective Service, testified before Congress that, overall, COs were making valuable contributions in the nation, they generally were not welcome in most localities.

Some COs did enter the military and served overseas in noncombat roles, including the dangerous job of combat medic. Among them was Desmond Doss, a CO who declined a chance to be in the CPS program and entered the U.S. Army as a medic. Private First Class Doss landed on Okinawa with the 77th Infantry Division. There, on 2 May 1945, he pulled as many as 70 wounded soldiers off an escarpment while under heavy fire, for which he was awarded the Medal of Honor.

After the war ended, COs returned to civilian life, and their wartime status was generally forgotten. The CPS program,

however, served as the model for subsequent objector programs during the Korean and Vietnam conflicts.

Continuation War

See Finnish-Soviet War (25 June 1941–4 September 1944).

Convoy PQ 17 (27 June–7 July 1943)

Disastrous Allied Arctic convoy to Murmansk in the USSR. From August 1941 through May 1945, the Western Allies sent some 4 million tons of supplies to the northern Soviet Union via the Arctic. A total of 811 ships in convoy sailed east, of which 58 were sunk. A large percentage of these losses occurred in one convoy, PQ 17. It sailed from Iceland on 27 June 1942, with 36 merchantmen protected by 4 corvettes, 2 antiaircraft ships, and 4 antisubmarine trawlers. At the same time, eastbound Convoy QP 13, made up of 35 merchantmen, sailed from Kola Inlet. British Rear Admiral L. H. K. Hamilton commanded a covering force to protect both convoys, consisting of 2 British and 2 U.S. heavy cruisers, plus 1 British and 2 American destroyers. En route, British Commander J. E. Broome joined them with 6 destroyers to provide additional protection. Distant cover was provided by the Home Fleet under Admiral Sir John Tovey. He commanded a mixed British and U.S. force, consisting of 2 battleships, 1 aircraft carrier, 2 cruisers, and 14 destroyers.

Tovey was under strict orders to steer clear of the German airfields in northern Norway, where the Luftwaffe had massed 103 bombers, 42 torpedo-bombers, 20 dive-bombers, and 89 reconnaissance aircraft to block any convoy's passage. The Germans also had 10 U-boats on station, so their tactical reconnaissance advantage was formidable. The Allies hoped to trump this with strategic intelligence gleaned through ULTRA decrypts; however, a change in German Enigma cipher settings on 3 July led to an intelligence blackout. Political pressure from Washington and Moscow compelled leaders to insist that the convoy proceed, and it sailed blindly into a German trap.

The British first sea lord, Admiral of the Fleet Sir Dudley Pound, agonized over the choices of action available to him. He could not recall the convoy, and he would not allow the Home Fleet to close with it and risk an overwhelming German air and submarine attack. Allied intelligence also assumed that German navy surface units in Norway would attempt an attack. These forces consisted of the battleship *Tirpitz*, the pocket battleships *Scheer* and *Lützow*, the heavy cruiser *Hipper*, 10 fleet destroyers, and 2 oceangoing torpedo boats.

Even before PQ 17 sailed, Pound informed Tovey that if he believed a German surface attack was imminent, he would order the convoy to scatter. Tovey pointed out in no uncertain terms to Pound that this was contrary to all recent British experience. In any case, at 9:00 P.M. on 4 July, Pound, incorrectly assuming that the Germans' big ships were on their way to intercept the convoy and would reach it early the next day, began sending signals ordering PQ 17 to scatter and its cruisers and fleet destroyers to withdraw toward

the Home Fleet, as they were too weak to face the German squadron that he believed to be at sea. Although scattering was the logical precaution when a convoy was under surface attack, it was a suicidal move when made against aircraft and submarines.

Of the 34 merchant ships still with the convoy when the order to scatter was given, only 13 reached Murmansk. The Allies had suffered one of their worst maritime defeats of the war, the tragedy of which was deepened by the fact that it need not have happened. Convoys to Murmansk were then suspended for the summer, as perpetual Arctic daylight and German strength made them untenable.

Convoys, Allied

Organized groups of merchant vessels escorted by warships to defend against Axis attack. As a result of its experience in the latter stages of World War I, Britain was quick to set up the conveying of merchant vessels at the beginning of World War II. There was some initial hesitation because of the feared detrimental effect convoys could have on the efficient employment of shipping, but that would change after the liner *Athena* was torpedoed and sunk on 3 September 1939, indicating that Germany had commenced an unrestricted campaign of submarine warfare against merchant vessels. The first convoy—eight tankers sailing from Gibraltar to the Persian Gulf via the Cape of Good Hope—actually departed on 2 September with a cruiser escort for fear of a possible Italian entry into the war. Regular east coast convoys between the Firth of Forth and the River Thames started on 6 September, as did outbound transatlantic convoys from Liverpool two days later.

Operational convoys were set up to cover the movement of merchant vessels chartered by the government to transport and supply the British Expeditionary Force (BEF) across the English Channel. Subsequent convoys carried troops to Norway and supported operations in North Africa, the Mediterranean, the Middle East, the Far East, and all the other theaters of operations.

A special category of convoys included the series that carried cargo and war materials to the Soviet Union and the

smaller series that ran to resupply the island of Malta. These operations were unusual in that, in addition to the strong naval close escorts that normally covered convoys, they often also featured substantial distant cover by heavy units of the main fleet. Between August 1941 and May 1945, 42 convoys were undertaken to the northern USSR, and there were 36 return convoys. A total of 835 ships sailed outbound, losing 60 of their number; 710 returned, with a loss of 37 ships. The Malta convoys included a series of major fleet operations from both the eastern and western ends of the Mediterranean to assist the passage of supplies for the island. Between November 1940 and August 1942, 82 merchant ships took part in these convoys, of which 29 were sunk, and there were substantial losses among their naval escorts as well.

Trade convoys were required for regular commercial traffic on those passages most at risk of air or submarine attack. The initial series operated along the east coast, from London down the English Channel, and outbound from the west coast across the Atlantic and to Gibraltar. The east coast convoys and those to Gibraltar were escorted throughout their passage, whereas escorts accompanied those outbound into the Atlantic only until they were just beyond the

expected operating area of German submarines. At that point, the convoy dispersed, each ship proceeding individually to its destination. Depending on their destination, some vessels might detach from an outbound convoy prior to its dispersal. Inbound convoys assembled at Halifax, Gibraltar, Freetown, and—for a short period—at Kingston, Jamaica. These convoys were escorted by cruiser or armed merchant cruisers until they reached the limit of U-boat operations, where antisubmarine escorts took over. A heavily escorted convoy series also operated between Scotland and Bergen, Norway, commencing in November 1939.

The end of the so-called Phony War in May 1940, with the invasion of France and the Low Countries, brought major changes to the convoy system. The German attack on Denmark and Norway in April 1940 abruptly ended the Norwegian convoys, and the collapse of France in June brought even more substantial changes. From French bases, German aircraft operated against shipping in the Channel and far into the Atlantic, and the operational range of the U-boats increased dramatically. Convoys along the Channel accommodated local traffic only, and all oceanic traffic from the east coast now sailed north around Scotland. A series of interlocking convoys running both clockwise and counter-

Convoy of Allied trucks moving through the ruins of Valognes, France, 1944. (Library of Congress)

clockwise provided escort for all coastal shipping. To accommodate the need for more transatlantic convoys, a second series of slower convoys originating from Sydney, Cape Breton, Nova Scotia, was initiated. The increased threat of attack led to the provision of escort throughout the voyage for all convoys to and from Freetown. Finally, Italy's simultaneous entry into the war terminated all commercial traffic in the Mediterranean save for very heavily escorted operational convoys to carry supplies into Malta.

The dispersal point for westbound transatlantic convoys and the pickup point for escort groups meeting eastbound shipping gradually moved westward as the range of the escorts was increased. In mid-1941, the United States imposed its "neutrality zone" on the western Atlantic and began escorting British convoys in conjunction with Royal Canadian Navy escorts, operating from Argentia in Newfoundland. North Atlantic convoys now were escorted throughout their passage by antisubmarine vessels.

The German declaration of war on the United States on 10 December 1941 brought a major westward expansion of U-boat operations against shipping. A disastrous period followed while the U.S. Navy struggled to secure the escorts and crews required to convoy the enormous volume of merchant traffic along the East Coast of the United States; it also struggled with the very concept of convoy itself. Nevertheless, by mid-1942, an elaborate and comprehensive system of interlocking convoy routes and sailings was established for the East Coast of North America and in the Caribbean. As the commander of German submarines Admiral Karl Dönitz became aware that the convoy system had been extended to a specific area, he shifted U-boat operations to another area where unescorted traffic still operated. Consequently, the scope of the U.S. Navy's convoy system gradually expanded to encompass almost all traffic between Rio de Janeiro and Halifax.

Landing operations in North Africa and the Mediterranean brought about some changes. Apart from the signif-

icant number of operational troop convoys, the opening of the Mediterranean introduced a series of convoy routes within that sea, and a British shortage of fuel oil also led to a series of fast tanker convoys between the Caribbean and the United Kingdom. In 1944, Allied military successes in France began to allow a gradual reduction in the scope of convoy. The reduction occurred because U-boats were forced to make more extended passages to their patrol areas as their home ports moved farther from the Atlantic and because German aircraft no longer had quick access to British coastal waters. All these trade convoys sailed at regular intervals, regardless of the number of ships waiting at the departure port. Changes in the interval or convoy cycle could be made but only after careful consideration of the impact on the efficiency of the limited escort force and on trade patterns.

Efficient use of both escorts and shipping required that the employment of convoy be extended or contracted in response to perceived threat levels. Because the U-boats' maximum surface speed was about 16 knots in ideal conditions and much less in the open ocean, ships capable of 15 knots or more sailed independently. Between November 1940 and June 1941, this minimum was lowered arbitrarily to 13 knots, and losses among vessels sailing independently almost tripled; the upper speed limit was then reinstated. For oceanic convoys, a minimum speed of 7.5 knots soon became the norm, with slower vessels obliged to proceed independently. Ships in coastal convoys, however, could be appreciably slower.

To make the danger zone as a convoy passed a submarine as small as possible, the standard convoy formation, except while transiting cleared channels through minefields, was always a broad front. The most common formation had from 6 to 12 columns in the convoy, each with up to 6 ships. Some of the very large convoys that ran during the spring of 1944, when a shortage of escorts forced planners to consolidate convoys, had as many as 19 columns with 9 or 10 ships each, but this was far in excess of the normal size. Ships in each column steamed at 400-yard intervals until mid-1943, when the growing number of less experienced captains forced an increase to 600 or even 800 yards. Columns were initially spaced 600 yards apart during daylight and 1,000 yards apart at night, but scientific analysis determined that the wider spacing was preferable from a "hit statistic" perspective, and later convoys standardized on the broader spacing. Early in the war, smaller convoys of no more than 35 ships were considered easier to protect, but again, analysis demonstrated that larger convoys made more efficient use of available escorts, so the convoy size increased to 60 ships or more.

Convoy most certainly diminished the efficient use of shipping assets to some extent, and the simultaneous arrival

of large numbers of vessels caused significant bottlenecks in the unloading process. Nevertheless, there can be no doubt as to the efficacy of convoy in protecting merchant vessels from attack during World War II, as the dramatic reduction of sinkings after the introduction of convoy on the East Coast of the United States demonstrated.

Convoys, Axis

When war began in September 1939, Germany essentially abandoned any attempt to maintain its oceanic trade. Those vessels beyond easy reach of the homeland endeavored to reach neutral ports, where they were interned, and closer vessels broke for home, with the navy providing cover for those carrying important cargoes.

Norwegian and Swedish ore traffic was the most important sector in Germany's European trade, and securing it became the principal focus of the navy's trade protection efforts throughout the war. After the successful German invasion of Norway, the navy introduced the convoy of merchant shipping along the Norwegian coast late in 1940. Convoys generally were small—three to six ships—and escorted by a few torpedo boats, trawlers, and light craft. British submarines and aircraft were the principal threats. As the war progressed and British air attacks became more effective, the Germans added defensive coastal antiaircraft batteries and antiaircraft escorts. In addition to ever increasing strikes by shore-based Royal Air Force Coastal Command aircraft, the Royal Navy mounted periodic carrier strikes against German coastal shipping in 1942 and 1943, culminating over the next two years with more concentrated assaults using escort carriers that came close to paralyzing this traffic.

When war with the Soviet Union began, the Soviet navy's Northern Fleet submarines initiated attacks on German shipping around northern Norway and were soon joined by British submarines operating from Kola Bay. Joint operations continued until 1944, when the British crews were sent home and the submarines were turned over to the Soviet navy. Substantial numbers of Soviet naval aircraft also joined the attack against German convoys from 1943. This assault against the northern Norwegian convoys cost the Germans some 500,000 tons of shipping, a relatively small amount considering annual traffic was well in excess of 6 million tons.

War with the Soviet Union also brought the threat of attack on the Swedish ore traffic, primarily by Soviet submarines at first. The Germans endeavored to keep shipping within Swedish territorial waters as far as possible, escorting vessels for the final leg of their passage behind the protection of defensive minefields and net barriers. During 1942 and 1943, Soviet submarines succeeded in sinking only about 20 ships for a total of some 40,000 tons of shipping, out of over 1,900 vessels in convoy representing well over 5.6 million tons of shipping. During 1944, the Soviet army's advances and the defeat of Finland meant that aircraft played a greater role in antishipping operations, but German losses remained relatively light. The collapse of German positions on the Baltic coast early in 1945 required the evacuation by sea of more than 2 million troops and others. Despite some spectacular successes (the sinking of the *Wilhelm Gustloff* and *General Steuben* with but 1,200 survivors from the more than 9,000 passengers aboard, for example), Soviet attacks were remarkably ineffective; the Germans lost only about 20 ships with a total of some 100,000 tons of shipping.

The Italian navy began convoying traffic carrying supplies to its forces in Libya almost as soon as it entered the war, for British submarines and aircraft immediately began an interdiction campaign. The navy's responsibilities expanded as Italy undertook campaigns in Yugoslavia and Greece in 1941 and increased still further when Germany took on a larger role in the Balkans and North Africa. During 1941, Italy also began convoying shipping along the Libyan coast. Italian convoys generally were small—three to six merchant vessels, with two or three escorting destroyers or torpedo boats. As British surface forces operating from Malta began attacking Libya-bound shipping, the Italian navy had to deploy heavier covering forces, often including cruisers and eventually battleships, to support particularly valuable convoys. In this struggle over shipping, the British possessed two great advantages: radar, which vastly enhanced the night-attack capabilities of its aircraft and surface ships, and signals intelligence, especially ULTRA, which consistently gave them advance convoy routing information.

Axis fortunes in this campaign fluctuated greatly. From mid-1941, Axis forces in North Africa required approxi-

mately 100,000 tons of supplies each month. But in March 1942, for example, only 47,588 tons got through, whereas in April, 150,389, tons arrived. Overall, the Italian navy succeeded in bringing about 80 percent of all convoyed shipping through to its destination.

Despite its direct experience of successful convoy operations by its destroyers in the Mediterranean during World War I, the Imperial Japanese Navy was very slow to introduce convoying of merchant shipping after the Pacific war began. The navy possessed very few suitable escort vessels at the outbreak of war, which reflected the overwhelming emphasis it placed on planning for the decisive fleet action that was the centerpiece of its operational strategy. Japan's response to the burgeoning unrestricted submarine campaign conducted by the United States against its shipping was to increase aggressive surface and air patrols and continue to eschew defensive convoy of its traffic. Not until the later part of 1944, by which date its merchant fleet had been devastated by American submarines, did the navy begin limited convoy, especially of the crucial tankers carrying fuel from the Dutch East Indies, but by then it was too late.

Convoys SC.122 and HX.229, Battle of (14–20 March 1943)

Largest North Atlantic convoy battle of World War II. March 1943 was the high-water mark of the German U-boat campaign against Allied convoys in the North Atlantic. Between 10 and 20 March, Allied signals intelligence suffered a temporary blackout in its operations against the German U-boat cipher Triton. At the same time, the German signals intelligence service was able to decipher the rerouting instructions for two eastbound convoys: SC.122 and HX.229.

The German U-boat command had an unprecedented concentration of U-boats in the North Atlantic at that time, and on 14 March, it set about forming three large packs from boats that had been operating against the convoys

SC.121 and HX.228. Groups Raubgraf (8 boats) and Stürmer (18 boats) were to operate against SC.122, and group Dränger (11 boats) was deployed against HX.229.

On 16 March, the first U-boat made contact with HX.229. Both convoys were sailing close to each other, and HX.229 was closing on the slower SC.122, which had already passed the Raubgraf patrol line undetected. The Raubgraf boats, as well as 11 boats of the Stürmer group, were thus deployed against HX.229 in the mistaken belief that it was SC.122. Inadequately defended by only 2 destroyers and 2 corvettes, HX.229 suffered a heavy mauling by the packs during the night of 16–17 March. The same night, U-boats of the Stürmer group made contact with SC.122. Realizing that the two convoys were about to merge, the German U-boat command committed the remainder of its 40 available U-boats within range to the battle. Throughout 17 March, long-range B-24 Liberator bombers from Iceland and SC.122 escorts with high-frequency direction-finding (HF/DF) equipment succeeded in fending off the contact-keeping boats. Only 1 U-boat managed to close for an attack, sinking 2 ships out of SC.122 on that day.

On 18 March, air cover provided by the Liberators of the Number 120 Squadron again prevented 21 of the 30 U-boats deployed against HX.229 from reaching the scene, and again, only 1 U-boat succeeded in closing for a daylight attack. A reinforcement of the surface escort group prevented serious losses during the night of 18–19 March, in which the U-boats claimed only 2 further ships before intensified air cover, now flying out of the British Isles, forced them to desist. Two U-boats were damaged and 1 was sunk before Grossadmiral (grand admiral) Karl Dönitz called off the operation on 20 March.

The tally of 21 Allied ships sunk, totaling 141,000 tons of shipping, as well as 1 destroyer lost during this largest convoy battle of the war was impressive, yet it was also deceptive. It had been achieved primarily because the sheer numbers of U-boats had saturated the convoy defenses. Nevertheless, only 16 of the 40 U-boats deployed against both convoys had actually been able to make contact, and owing to the diligence of the convoys' hard-pressed air and sea escorts, only 9 succeeded in torpedoing ships. Of the 39 U-boats that survived the battle, 16 subsequently required more than 40 days of maintenance due to damage sustained during the battle. Committing virtually all available North Atlantic boats to four convoys—SC.121, SC.122, HX.228, and HX.229—also meant that the other four eastbound North Atlantic convoys in March 1943 made their passage entirely unmolested.

Coral Sea, Battle of the (7–8 May 1942)

World War II battle fought by U.S. Pacific Fleet and Japanese carrier forces as the United States attempted to prevent a Japanese landing at Port Moresby on New Guinea. The Battle of the Coral Sea was the first naval engagement in history in which two fleets fought without opposing surface ships making visual contact.

Following their successful attack on Pearl Harbor and early military triumphs, Japanese leaders were reluctant to continue with their original strategy of shifting to a defensive posture. They feared the adverse impact this might exert on their forces' fighting spirit and believed that it would work to Japan's disadvantage by allowing the Western powers time to regain their strength.

Japanese naval leaders in particular were anxious to occupy the Hawaiian Islands and Australia, the two chief points from which U.S. forces might mount offensive operations. U.S. carriers were operating out of Pearl Harbor, still the headquarters of the U.S. Pacific Fleet. If Japanese forces could take the Hawaiian Islands, it would be virtually impossible for the U.S. Navy to conduct long-range Pacific naval operations. Also, securing the islands to the north and east of Australia—the Solomons, New Caledonia, and Samoa—would enable the Japanese to establish bases to cut the Allied lifeline from the United States to Australia. Japanese long-range bombers would then be able to strike targets in Australia itself, preparatory to an invasion and occupation of that continent.

The Japanese army was not enthusiastic about either proposal. Most of its assets were tied down in China, and the Guandong (Kwantung) Army continued to garrison Manchuria. Invading Australia and occupying even the populated areas would require significant military resources that the army could not spare. The Army Ministry and General Staff in Tokyo therefore advocated holding the gains already achieved in the southern advance and shifting resources to China. The army formally vetoed the navy plan in early April 1942, but in effect, it was dead by the end of January. Japanese navy leaders hoped, however, that a

success either eastward toward Pearl Harbor or southwest toward Australia might overcome army opposition.

Admiral Yamamoto Isoroku and the Combined Fleet Staff favored taking Midway Island, 1,100 miles west of Pearl Harbor, as a preliminary step before invading Hawaii. Yamamoto expected this move would provoke a strong U.S. naval reaction, enabling him to set a trap for and destroy the U.S. aircraft carriers. The Japanese Naval Staff, however, preferred the southeasterly drive to isolate Australia. By the end of March, the Japanese had already advanced from Rabaul into the Solomon Islands and along the northern coast of New Guinea. The Japanese Imperial General Staff searched for a strategy to follow up their successes. Initially, the Naval General Staff favored assaulting Australia, fearing an Allied buildup there could lead to a counteroffensive against the Japanese defensive perimeter. The army rejected an Australian operation because of long distances, insufficient troops, and inadequate transportation. In January 1942, both agreed on a less demanding joint invasion of Lae and Salamaua in New Guinea; the seizure of Tulagi in the

Solomons; and the capture of the Australian base of Port Moresby in Papua, New Guinea.

On 8 March 1942, American carriers, sent to beleaguer the Japanese base at Rabaul northeast of New Guinea, interdicted Japanese landing operations at Lae and Salamaua on the Papuan peninsula of eastern New Guinea. Two carrier task forces, one built around the carrier *Lexington* under Vice Admiral Wilson E. Brown and Rear Admiral Frank Jack Fletcher's task force centered on the carrier *Yorktown*, sailed into the Gulf of Papua on the opposite side of the peninsula. Together, on the morning of 10 March, they sent 104 aircraft across the high Owen Stanley Mountains to emerge undetected and find Japanese ships discharging troops and supplies at the two villages. The attacking American aircraft sank three Japanese ships, including the converted light cruiser *Kongo Maru*, at a cost of only one plane and one aviator lost.

The action caught the Japanese operational commander, Vice Admiral Inouye Shigeyoshi, by surprise and convinced him that conquest of New Guinea would have to be postponed until he could secure fleet carriers for protection.

That opportunity came only after the return of the carriers from the Japanese raids into the Indian Ocean.

In early April 1942, the attention of the Imperial Naval General Staff was on southeast operations (seizure of strategic points in New Guinea, New Caledonia, the Fiji Islands, and Samoa) to isolate Australia. However, the April 1942 (Doolittle) raid on Tokyo refocused their attention on the destruction of the U.S. carriers and forced an earlier date for the Tulagi and Port Moresby operations, with the New Caledonia, Fiji, and Samoa operations to follow after Midway.

Admiral Inouye, commanding the Fourth Fleet and Operation MO, as it was designated, broke his forces into five groups: two invasion groups to land army and naval forces at Tulagi and Port Moresby; a support group to establish a seaplane base in the Louisiade Archipelago off New Guinea; a small covering group with the light carrier *Shoho*; and the main striking force of two fleet carriers, *Shokaku* and *Zuikaku*, plus escorts. This striking force, commanded by Vice Admiral Takagi Takeo, was to support both landings and protect the entire force from American carriers.

At Pearl Harbor, Admiral Chester W. Nimitz, commander of the U.S. Pacific Fleet, determined from intercepts that the Japanese would probably attack Port Moresby on 3 May, and on 29 April, he ordered Rear Admiral Frank Jack Fletcher, commanding the *Yorktown* group, to operate in the vicinity of the Coral Sea beginning on 1 May. Rear Admiral Aubrey Fitch's *Lexington* group and the American-British-Dutch-Australian Command (ABDACOM) combined naval force of two Australian cruisers, the American heavy cruiser *Chicago*, and two U.S. destroyers under Rear Admiral John Crace, of the Royal Navy, were also placed under Fletcher's tactical command. The two carrier groups and Crace's force formed Task Force 17 (TF 17) when they rendezvoused on 1 May some 250 miles off the New Hebrides. While the *Lexington's* group refueled, Fletcher sailed the *Yorktown's* group north on 2 May to reconnoiter, having received reports of approaching Japanese naval forces.

On 3 May, the Japanese Tulagi invasion group began landing forces without opposition. Learning of the landings, Fletcher decided to strike Tulagi the next morning without

The Battle of the Coral Sea—fires rage on the U.S. Navy aircraft carrier *Lexington*. (Library of Congress)

waiting for the *Lexington* to join him. He sent his fleet oiler and its escorts to inform Fitch and Crace of his change of plans and to order them to join him 300 miles south of Guadalcanal on 5 May. The *Yorktown* then closed on Tulagi undetected on 4 May and launched three air strikes that met little resistance. Admiral Takagi's carrier striking force had been delayed and was nowhere near Tulagi. Inexperienced as they were, the American attackers were ineffective, only damaging a destroyer to the point that she had to beached and sinking three small minesweepers and four landing barges. They also shot up some grounded aircraft. However, even this small success was enough to send the rest of the Tulagi force steaming back to Rabaul.

Withdrawing southward, Fletcher rejoined Fitch and Crace as scheduled on 5 May. TF 17 then moved northwest, expecting to catch Japanese forces as they emerged from the Jomard Passage into the Coral Sea. Although sightings were made by both sides on 6 May, essentially ineffective reconnaissance led to little significant action by either.

Before dawn on 7 May, the opposing fleet carriers passed within 70 miles of each other. At dawn, both sides sent out search planes over the Coral Sea. The Japanese sighting of an American "carrier and cruiser" led to the sinking of the destroyer *Sims* and the severe mauling of the oiler *Neosho*. At about the same time, an American scout reported two Japanese carriers north of the Louisiades. After the *Lexington* and *Yorktown* launched their aircraft, Fletcher discovered that his forces had been sighted by a Japanese scout plane. The action prompted by the American sighting turned out to be a wild goose chase, but the *Lexington* and *Yorktown* pilots stumbled on the light carrier *Shoho* and sank her.

Early the next morning, the two carrier forces found each other. The American planes concentrated their attack on the fleet carrier *Shokaku* but hit her with just three bombs, causing only modest damage. The fleet carrier *Zuikaku* escaped attack by hiding in a rainsquall. The *Shokaku*'s damage was sufficient to prevent launch-and-recovery operations, and when the Americans withdrew, she turned north toward Japan.

Meanwhile, planes from the *Shokaku* and *Zuikaku* found the *Lexington* and *Yorktown*. Diving out of the sun, torpedo planes hit the *Lexington* twice on the port side, and dive-bombers scored two minor hits. The *Yorktown* was hit by only one bomb, which did no major damage. Confident they had sunk the *Saratoga*, the *Lexington*'s sister ship, and the *Yorktown*, the Japanese pilots withdrew. Neither ship sank, however, until gasoline vapors aboard the *Lexington* reignited fires that eventually became uncontrollable; as a result, she was abandoned, with Fletcher ordering her scuttled by torpedoes from a nearby destroyer.

Both sides hailed their achievements in the Coral Sea and scored themselves a win. Tactically, the Japanese came out ahead. The Americans were hurt most by the loss of the *Lex-*

ington, one of its largest carriers, whereas the Japanese lost only the light carrier *Shoho* and suffered severe damage to the large carrier *Shokaku*. However, though the Japanese scored a tactical win, the Americans had finally blunted a Japanese offensive thrust, preventing the occupation of Port Moresby and thus winning the strategic victory. In addition, significant losses in aircraft, aircrew, and repairs to the *Shokaku* prevented both Japanese carriers from taking part in the critical Battle of Midway a month later.

Corregidor, Battle of (April–May 1942)

Known officially as Fort Mills, Corregidor was the final bastion of U.S. and Filipino forces in the Philippines. The largest of the islands off the entrance to Manila Bay at 2.74 square miles, Corregidor is shaped like a tadpole. The island's chief installations included the post headquarters, a huge barracks, and coastal batteries. Contained within the tail of the island was a vast underground network known as Malinta Tunnel, which measured 1,400 feet in length and 30 feet in width, with 25 400-foot laterals branching from it. The tunnel was the administrative and operational heart of the island fortress. Kindley Airfield was situated on the extremity of the tail on the second-highest point of the island. The island also had batteries with an array of 18 12-inch and 10-inch coastal guns and 24 12-inch mortars, plus antiaircraft guns and machine-gun positions. Almost all of the armament on the island was obsolete in 1942, but as long as the troops on Corregidor held the island, they could effectively keep the Japanese fleet from using Manila Bay. This was the basic mission of the troops on Corregidor in War Plan Orange.

Surrender of American troops at Corregidor, Philippine Islands, May 1942. (Still Picture Records LICON, Special Media Archives Services Division (NWCS-S), National Archives)

On the departure of General Douglas MacArthur and his staff to Australia, Major General Jonathan M. Wainwright assumed command of these forces from 12 March 1942. The Japanese had bombed and shelled the island constantly since February, but they did so with growing intensity starting in April. For 27 days, from 9 April to 6 May, the Japanese daily increased the shelling. By 5 May, the beach

defenses had been destroyed, the huge seacoast guns had been silenced, and the anti-aircraft batteries had been reduced to scrap. All wire communication had been destroyed, and every attempt to restore it was in vain. Even the geography of Corregidor had changed; the island lay scorched, leafless, and covered in the dust of thousands of explosions.

By the beginning of May, the 9,400 men on Corregidor knew a Japanese attack was imminent. The island's defenders had sustained 600 casualties since 9 April, and those men who had not been injured were beginning to succumb to malnutrition and malaria. General Wainwright wrote on 4 May that there was only enough water to last for four days and that the fortress' power supply would only hold out for one week at most.

Late in the night of 5 May, the long-awaited Japanese attack began, following a particularly intense artillery bombardment directed against the tail end of the island. Shortly before 10:00 P.M., as Japanese landing craft steamed toward the eastern end of the island, an order went out for all able-bodied troops to resist the landing.

The fight for Corregidor lasted only 10 hours. Japanese troops cut across the island, then turned west toward Malinta Tunnel. Most of the fighting during the night and the early morning of 6 May took place at Battery Denver, on a ridge near the east entrance of the tunnel. U.S. troops, including coast artillerymen and a battalion of 500 sailors, fought bravely. At 8:00 A.M., after the Japanese had taken tanks and artillery ashore for a frontal assault, General Wainwright committed the last of his reserves on the island. The final blow to the defenders came when the Japanese sent three tanks into the action. The first sight of armor panicked the defenders and caused some to flee from the lines.

By 10:00 A.M., the situation was critical, with the defenders having no means of stopping the Japanese tanks. Already, 600 to 800 U.S. troops had been killed and another 1,000 wounded. Every reserve had been thrown into the battle, and the Japanese had destroyed all defensive artillery. The Japanese were planning to mount an attack on the other side of the island and would reach Malinta Tunnel, with its 1,000 wounded, in a few hours. Fearing a slaughter, Wainwright decided to surrender. By 12:00 noon on 6 May, all weaponry larger than .45 caliber had been destroyed; all codes, radio equipment, and classified materials had been burned; and the surrender message had been broadcast to the Japanese. The U.S. flag was lowered and burned, and a white flag was hoisted. Wainwright then communicated to President Franklin D. Roosevelt that he had made the decision to surrender. It had taken the Japanese five months to seize the island, instead of the two months they had originally estimated. U.S. forces retook Corregidor in February 1945.

Counterintelligence

Organized activities initiated to counter an opponent's intelligence operations. Counterintelligence operations may include blocking an enemy's sources of information, deceiving the enemy, and working to prevent enemy sabotage and the gathering of intelligence information.

When World War II began, electronic warfare had matured considerably since the end of World War I. In 1939, unlike in 1914, many nations had functioning cryptological departments, and virtually all nations during the war broke codes of the other side. Circumstances in 1939 varied widely, however. Great Britain, for example, had a solid organization, centered on the Government Code and Cypher School at Bletchley Park. Such operations played key roles in counterintelligence on both sides.

Communications technology did not solve all counterintelligence issues, as the British discovered soon after the fall of France in 1940 when an influx of refugees from the Continent began arriving on their shores. Before long, an average of 700 aliens were entering the country per month, and the Travel Section of MI-5 (Security Service) knew that each person needed to be interrogated so that spies could be identified before they could do much harm. A pedestrian approach was required. Near the Clapham Junction Railway Station was the empty Royal Victoria Patriotic School (RVPS), built to educate the children of Crimean War veterans. The students of RVPS and the nearby Emanuel School, an old and excellent London public school, had been evacuated to the country for the duration of the war. The RVPS, later known as the London Reception Center (LRC), became MI-5's principal interrogating facility. Some 33,000 aliens were inspected at LRC during the war, but only three enemy agents were passed through undetected. The agent at large for the longest period, from November 1940 to April 1941, was Dutch parachutist Engleburtus Fukken. He was found dead in a Cambridgeshire air-raid shelter, a suicide. In the early days, a proven German agent might be hanged at the RVPS, next to the faculty common room. Eventually, after 27 July 1940, those aliens held at the LRC were sent to Ham in west London for further study and interrogation. Under the command of Colonel R. W. G. "Tin Eye" Stephens, Camp 020 was the interrogation center of last resort. It should be remembered that 020 functioned in 1940 under fear of the planned German invasion of the British Isles, Operation SEA LION.

As the war progressed, more and more German agents arrived, not via the refugee route but by parachute or coastal

Lieutenant Commander Ewen Montagu, who proposed Operation MINCEMEAT. (Bettmann/Corbis)

landing at night from German small craft or even U-boats. On capture—and MI-5 was good at that—these persons could not claim to be refugees. Some did not wait for apprehension but turned themselves in and volunteered to work for the Allies. Under the chairmanship of Sir John Masterman, an Oxford don who had the distinction of spending all of World War I interned in Germany, the XX (Doublecross) Committee came into being to develop a deception plan to utilize these possible double agents. Composed of representatives of MI-5, MI-6 (Secret Intelligence Service), the Special Operations Executive (SOE), and other organizations, the committee set up a phony radio situation that fed doctored information mixed with some real facts back to German controllers. The ruse became more successful than most members of the XX Committee ever thought it would or could be.

The Germans were also active in counterintelligence operations, one of which worked specifically against SOE. ENGLANDSPIEL was a German operation set up in the Netherlands by Major Herman Giske of the Abwehr and Colonel Josef Schreide of the Reichssicherheitshauptamt (RSHA, the Reich Main Security Office) to break up British espionage rings in Holland. The Abwehr, the military secret service under Admiral Wilhelm Canaris, contained many anti-Nazi elements. The RSHA, which was anything but anti-Nazi, was under Schutzstaffel (SS) chief Heinrich Himmler. The two organizations did not greatly appreciate each other. ENGLANDSPIEL worked something like the XX Committee in reverse. The Germans “turned” several SOE parachutists who then asked SOE to send monetary, material, and human assistance to the espionage rings in Holland. That

the British did. ENGLANDSPIEL lasted until two agents escaped from Haaren Prison and made their way to Switzerland; they then exposed the German operation. The operation had ended by the beginning of April 1944, but it had been quite successful. The British carried out 190 aircraft drops of people and equipment. Of 54 captured agents, 47 were executed. The Germans took 3,000 Sten guns, 5,000 revolvers, 2,000 hand grenades, 500,000 rounds of ammunition, 75 radio transmitters, and 500,000 Dutch guilders. ENGLANDSPIEL was probably the greatest Allied espionage defeat of World War II.

Mention must also be made of the Germans’ deception plan for Operation BARBAROSSA, their 22 June 1941 attack on the Soviet Union. For such a momentous military action, there was virtually no attempt at deception. The Abwehr and other organizations merely stated that the transfer of troops from west to east was (1) intended to aid Italy’s faltering campaign against the Greeks, and (2) a deception for British consumption designed to signal that Operation SEALION had been abandoned. Soviet leader Josef Stalin received as many as 100 warnings and ignored all of them, dismissing them as deliberate Allied disinformation.

The Western Allies also had a great success in Operation MINCEMEAT, their unique deception campaign preceding the Sicily landings in July 1943. This operation was developed to convince the Germans that the Greek islands and Sardinia were the next Allied targets after North Africa, instead of the more logical Sicily. Lieutenant Commander Ewen Montagu (1901–1985), British navy liaison to the XX Committee, proposed disguising a dead body as a British officer and floating it ashore in Spain, with appropriate evidence on the body. The corpse selected was that of a man (as yet unidentified) who had died of pneumonia, which produced symptoms similar to a death by drowning. The plan worked to perfection, causing the Germans to shift their assets to Greece and Sardinia. In 1953, Montagu revealed the whole saga in his book *The Man Who Never Was*, a best-seller later made into a successful motion picture.

The most significant Allied deception of the entire war was Operation FORTITUDE, which had two aspects. FORTITUDE NORTH was designed to convince Adolf Hitler that the Allies were planning to invade Norway from Scotland. FORTITUDE SOUTH was to convince Hitler that the main Allied invasion of France would come through the Pas de Calais area. By October 1943, the Germans had seriously begun to strengthen their West Wall defenses, and the Pas de Calais was the shortest route across the English Channel. The Allies wanted as many German divisions as possible around the Pas de Calais and in Norway, to be kept there as long as possible so that they themselves might consolidate their lodgment in Normandy. The Allies therefore created a fictitious army and “stationed” it in southeastern England. Identified as

the 1st Army Group (FUSAG), it was equipped with every material object Shepperton Movie Studios could devise, including inflatable rubber tanks, trucks, artillery, and landing craft, all suitably camouflaged. Movie-type sets abounded, and an oil storage facility and large dock were built near Dover. As the crowning touch, U.S. Lieutenant General George S. Patton, whom the Germans expected to command any Allied invasion of the Continent, was placed in command.

Although the primary emphasis on the bogus performances was the Pas de Calais, Norway got its share of the focus as well. The British Fourth Army, commanded by General Sir Andrew Thorne, was a force of 350,000 fictitious soldiers “assembled” in Scotland. It, too, had the false rubber and cardboard creations that characterized the operation in the south. The British increased aerial reconnaissance of the Norwegian coast, released portions of the Grand Fleet from Scapa Flow for a cruise along the Norwegian coast, and made electric plaintext and coded inquiries about bridges and snow levels in Norway. FORTITUDE NORTH ultimately tied down some 400,000 German troops.

German controllers contacted their spies in Britain, not realizing that all were under XX Committee control. The Germans naturally wanted their agents to ferret out any information available about the expected invasion of the Continent. Their two best people—Dusko Popov, code-named TRICYCLE, and Juan Pujol, code-named GARBO—had been under XX Committee control for some time, and they simply substantiated, if not enhanced, the deception. GARBO’s material was directly accessed by Hitler’s personal intelligence staff, and the agent actually received medals from both sides during the war.

Meanwhile, the SOE and its U.S. counterpart, the Office of Strategic Services (OSS), as well as French partisans scheduled various tasks for D day: a bridge blowing, railway cuttings, pylon and wire destruction, and more. The deception plan worked out better than expected. Hitler held German units in place along the Pas de Calais. Indeed, some were still there a month after the Normandy landings.

Crerar, Henry Duncan Graham (1888–1965)

Canadian general and commander of the First Canadian Army in northwest Europe between 1944 and 1945. Born on 28 April 1888, at Hamilton, Ontario, Henry Crerar served with distinction in the artillery during World War I, ending the war as counterbattery staff officer for the Canadian Corps. During the interwar years, he remained in the small Permanent Force (regular army), primarily in staff appointments, and attended both the British Staff College (1923–1924) and Imperial Defence College (1934–1935).

A brigadier at the war’s outset, Crerar was promoted to major general in January 1940 and appointed chief of the Canadian General Staff six months later. In that capacity, he played a central role in dispatching two ill-trained Canadian battalions to Hong Kong—and Japanese captivity—in 1941, but he also built up a solid training establishment. Crerar, promoted to lieutenant general in November 1941, was ambitious, ruthless, and jealous of rivals. Posted overseas to command I Canadian Corps that year, he spent much of his time intriguing against Lieutenant General Andrew McNaughton and had a major role in planning the disastrous Dieppe raid. He subsequently commanded I Canadian Corps in Italy from November 1943 until he was recalled to England in March 1944 to lead the First Canadian Army in the Normandy Invasion. With that appointment, Harry Crerar had reached the pinnacle for a Canadian officer.

Although historians have acknowledged his obvious administrative abilities, the excessively cautious and uninspiring Crerar was, at best, a pedestrian field commander. Field Marshal Bernard Montgomery, under whose command he served in the campaign in northwest Europe, had little confidence in him. His bitter rivalry with the abler Lieutenant General Guy Simonds was unjustified on any military grounds, and there is little doubt, for this and other reasons, that the latter would have replaced him had the war

The commanders of British & Canadian forces in France, Field Marshal Bernard Montgomery and Lieutenant General Henry Crerar (right), plan strategy. (Corbis)

continued much longer. Operation VERITABLE, the assault on the Reichswald region in Germany in February 1945, was Crerar's battlefield masterpiece, characterized by thorough preparation and the accumulation of vast resources.

Crerar deserves much credit for effectively representing Canadian interests in Allied councils and for building an overseas headquarters. He retired from the army in 1946 and died in Ottawa on 1 April 1965.

Crete, Battle of (May 1941)

Largest airborne assault of the war up to May 1941. This German victory, however, also marked the end of major German airborne operations. Between 20 and 26 April 1941, British forces evacuated Greece. Crete had become a vital British base for logistical use, and many of the troops evacuated from Greece were landed there.

This fact alone would have made the island a target for the Germans, but there were other good reasons for a German assault. Crete was a key to the Aegean Sea. It could be used as an air base for attacking British positions in North Africa and for protecting Axis Mediterranean shipping, especially oil supplies. It might even become a stepping stone on the route to the Suez Canal. More important, Adolf Hitler saw its capture as necessary to secure his vital southern flank against air attack (especially on the oil fields of Ploesti) before he launched Operation BARBAROSSA, the invasion of the Soviet Union.

Lord Louis Mountbatten waves to the crews of the remaining ships of the fifth flotilla from the bridge of the *Kipling* as she enters Alexandra Harbor the day after the Battle of Crete. (Hulton Archive by Getty Images)

British Major General Bernard Freyberg commanded the British corps on Crete, centered on the 2nd New Zealand Division. The Allied garrison numbered some 27,550 men and was, in fact, a mixed group of British, Australian, New Zealander, and Greek forces. Most had only recently arrived, and the defenders were hardly a cohesive force. Equipment—even basic weaponry—was in short supply. Air support was provided by several dozen aircraft only. Unlike the Germans, the British did not have air bases within fighter range of the island, which left the Luftwaffe free to operate virtually unopposed, especially since the defenders had few anti-aircraft guns.

The German plan for the invasion, code-named Operation MERKUR (MERCURY), centered on parachute drops on the three main airfields of Máleme, Hēráklion, and Rétimo. The Germans planned to hold these and local beaches, especially Suda Bay, until reinforced. Freyberg had been alerted by ULTRA intercepts as to the German invasion plans, and he established defensive positions at these obvious targets, but lack of transport meant his divided forces could not provide

support for one another. The ULTRA information also worked against the defenders, as Freyberg did not know that the naval assault was only a small one, easily turned back by the Royal Navy, and he therefore allocated considerable assets to protect against that threat—assets that would have been used to far better purpose to defend the vital airfields.

On 20 May 1941, the Germans launched MERKUR. The operation ultimately involved some 22,000 soldiers—paratroops and mountain forces—and was supported by more than 500 combat aircraft, 700 transport planes, and 80 gliders. The Royal Navy halted the seaborne invasion. Airborne forces at Rétimo were crushed by the few tanks available to the British, and the landings at Hēráklion were also defeated. The key to the battle, however, proved to be at Máleme and nearby Canea and Suda.

Luftwaffe bombing at Máleme was particularly effective, and the attackers arrived before the defenders had regained their equilibrium. The British were also surprised by the use of gliders, which landed significant numbers of troops. The fight-

ing was desperate and in some doubt for a time, but the Germans were able to bring in just enough resources to beat off the British counterattacks; the Luftwaffe then ferried in additional supplies to the German troops. Suda Bay became untenable for the British, and the Germans began to land reinforcements. On 24 May, Freyberg informed London that German seaborne landings could not be stopped without completely unacceptable naval losses that would put the entire eastern Mediterranean at risk. Three days later, with the Germans expanding their area of control and Italian troops landing at Sitia on the eastern end of the island, the British ordered an evacuation.

The Royal Navy was able to evacuate almost 18,000 men, at a cost of 2,011 casualties. In naval operations around Crete, however, the Royal Navy lost three cruisers and six destroyers and had a number of additional ships significantly damaged, including an aircraft carrier. Allied personnel losses were 1,742 dead, 2,225 wounded, and 11,370 captured. The Germans won a victory but at high cost. They lost 220 aircraft and had another 150 damaged, and their casualties totaled some 6,700 (3,300 dead), although certain British sources reported much higher totals.

The German attack on Crete was audacious and innovative. Hitler, however, refused pleas by Generalleutnant (U.S. equiv. major general) Kurt Student that the airborne forces next assault Malta; indeed, he removed Student from command of operations on Crete during the battle. In effect, the Battle of Crete was Germany's last real airborne operation of the war, for the German forces that participated were used as elite infantry thereafter. Ironically, the Allies then embraced paratroop operations.

was defeated and subsequently evacuated from Greece between 24 and 30 April 1941, many of these troops were then relocated to the Greek island of Crete. Adolf Hitler's decision to send forces to conquer the island in order to shore up his southern flank prior to invading the Soviet Union led to an epic confrontation between airpower and seapower.

Allied radio intercepts and ULTRA intelligence revealed the broad outlines of the German plan, which consisted of airborne assaults and a sea invasion. They did not reveal the relative strength of these attacks, however. Particularly serious for the British forces was the lack of air assets. By 18 May, German air attacks on Crete had left the defenders with only a dozen aircraft, and Britain's one aircraft carrier, the *Formidable*, began the battle with only four serviceable planes. While patrolling the island to prevent a German seaborne landing, Royal Navy sailors, exhausted from their role in the evacuation from Greece, were exposed to the full weight of the Luftwaffe's 700 combat aircraft operating from bases in Greece, as well as occasional Italian air strikes.

The German assault on Crete, Operation MERKUR (MERCURY) began on 20 May. German air superiority forced the Royal Navy's warships to retire south of Crete during the day, and the defenders rarely managed to put more than a dozen planes in the air at any one time. Long-range bombing of the Luftwaffe's bases in Greece by British aircraft based in Malta and Egypt failed to affect German air operations in any material way.

On the night of 21–22 May, British warships intercepted two lightly escorted troop convoys, each composed of 20 small, overloaded coastal vessels packed with troops and escorted by a single Italian torpedo boat. In one-sided engagements, British cruisers and destroyers sank 10 ships in one convoy and 2 in the other. Only the British squadron's need to retire south before daybreak to protect it from Axis air attack saved the second convoy from total destruction. The surviving ships of both convoys returned to Greece. Some 400 German soldiers were lost in this effort, and Germany thereafter relied entirely on air supply and reinforcement in its invasion.

Despite the best efforts of the Royal Navy and the defenders on the ground, it became impossible to defend the island once German troops had captured Málème Airfield. On 26 May, with the situation hopeless, island commander Major General Bernard Freyberg ordered an evacuation. Once again, the Royal Navy rushed to rescue Commonwealth and Allied soldiers (wags said that BEF stood for "Back Every Fortnight").

The long distances involved and the Luftwaffe's complete control of the air made the evacuation particularly difficult, but the British commander in the Mediterranean, Admiral Andrew B. Cunningham, ordered his ships to continue the

Crete, Naval Operations Off (21 May–1 June 1941)

British naval activity first to defend and then to evacuate the island of Crete. After the British Expeditionary Force (BEF)

evacuation regardless of cost. Despite constant German air attack, they managed to evacuate almost 18,000 of Crete's 32,000 defenders, but the Royal Navy suffered very high losses itself in the process. In the weeklong operation, German air attacks sank three cruisers, six destroyers, and several smaller vessels and inflicted serious damage on the *Formidable*, the battleships *Barham* and *Warspite*, three cruisers, and numerous other warships. Few British warships escaped without damage, and some 2,000 British sailors died, along with a similar number of evacuated soldiers. In the course of the fight, many ships completely exhausted their antiaircraft ammunition. The Luftwaffe lost only a few dozen aircraft.

Crimea Campaign (April–May 1944)

Two-month campaign in April and May 1944 that resulted in the Soviet liberation of the Crimean Peninsula, an area that dominates the northern Black Sea and is connected with Ukraine by the 4-mile-wide Perekop isthmus. As Soviet operations around Kursk drew to an end, Generals of the Army Fedor I. Tolbukhin and Rodion Malinovsky received instructions to prepare an offensive for mid-August 1943 to clear the Donets Basin region of German troops.

By the winter of 1943, German Army Groups South and A (together numbering 93 divisions) still held a line along the Dnieper River. The German Seventeenth Army held the Crimea but had been isolated from other Wehrmacht units north of it since October. The isolation of the Seventeenth Army was accomplished by Major General Nikolai I. Trufarov as commander of the Soviet Fifty-First Army of Tolbukhin's 4th Ukrainian Front, which was at Perekop and along the Sivash, and General of the Army Andrei Yeremenko's Independent Coastal Army in Kerch. Indeed, the plight of German forces in the south was such that Army Groups South and A had to be reformed. On 5 April 1944, they were redesignated as Army Groups North Ukraine and South Ukraine, respectively.

Malinovsky's 3rd Ukrainian Front recaptured Nikolaiev on 28 March and then drove toward Odessa, which it retook on 10 April. Meanwhile, on 22 March, Romanian dictator General Ion Antonescu had flown to Berlin in an effort to persuade Adolf Hitler to allow his Romanian forces to withdraw from the Crimea. As might have been expected, the mission was futile. Hitler was determined to hold the Crimea, for in Soviet hands, it would serve as a base from which Soviet aircraft could attack the Romanian oil fields at Ploesti.

Tolbukhin's 4th Ukrainian Front was assigned the task of destroying Colonel General Erwin Jänecke's Seventeenth Army, a mixed force of 11 German and Romanian divisions, totaling some 150,000 men. In March, Tolbukhin had been summoned to meet with Soviet dictator Josef Stalin and the chief of the General Staff, Marshal Aleksandr Vasilevsky, to discuss the plan. The Crimean operation would involve the 4th Ukrainian Front, the Independent Coastal Army, the Azov Flotilla, and the Black Sea Fleet. Tolbukhin would attack across the Perekop isthmus and through the Sivash lagoon using Lieutenant General Georgii F. Zakharov's Second Guards Army and Lieutenant General Iakov G. Kreizer's Fifty-First Army. Follow-up attacks would target Simferopol and Sevastopol. Simultaneously, General Yeremenko would establish a bridgehead on the Kerch Peninsula and block the German escape route as well as German attempts to reinforce against Tolbukhin. Colonel General T. T. Khryukin's Eighth Air Army would support Tolbukhin, and Colonel General Konstantin A. Vershinin's Fourth Air Army would back Yeremenko. In all, the operation would involve 450,000 Soviet personnel.

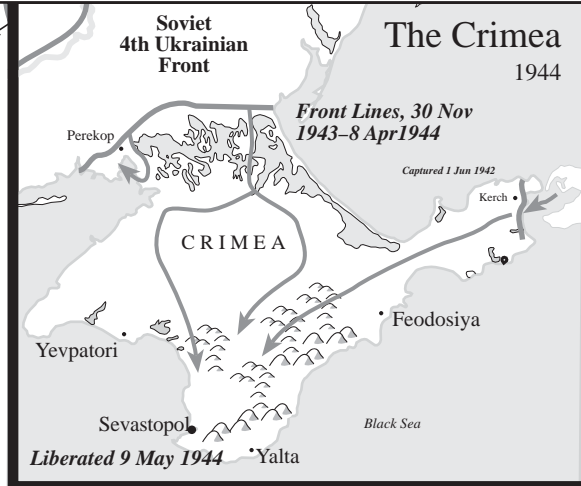

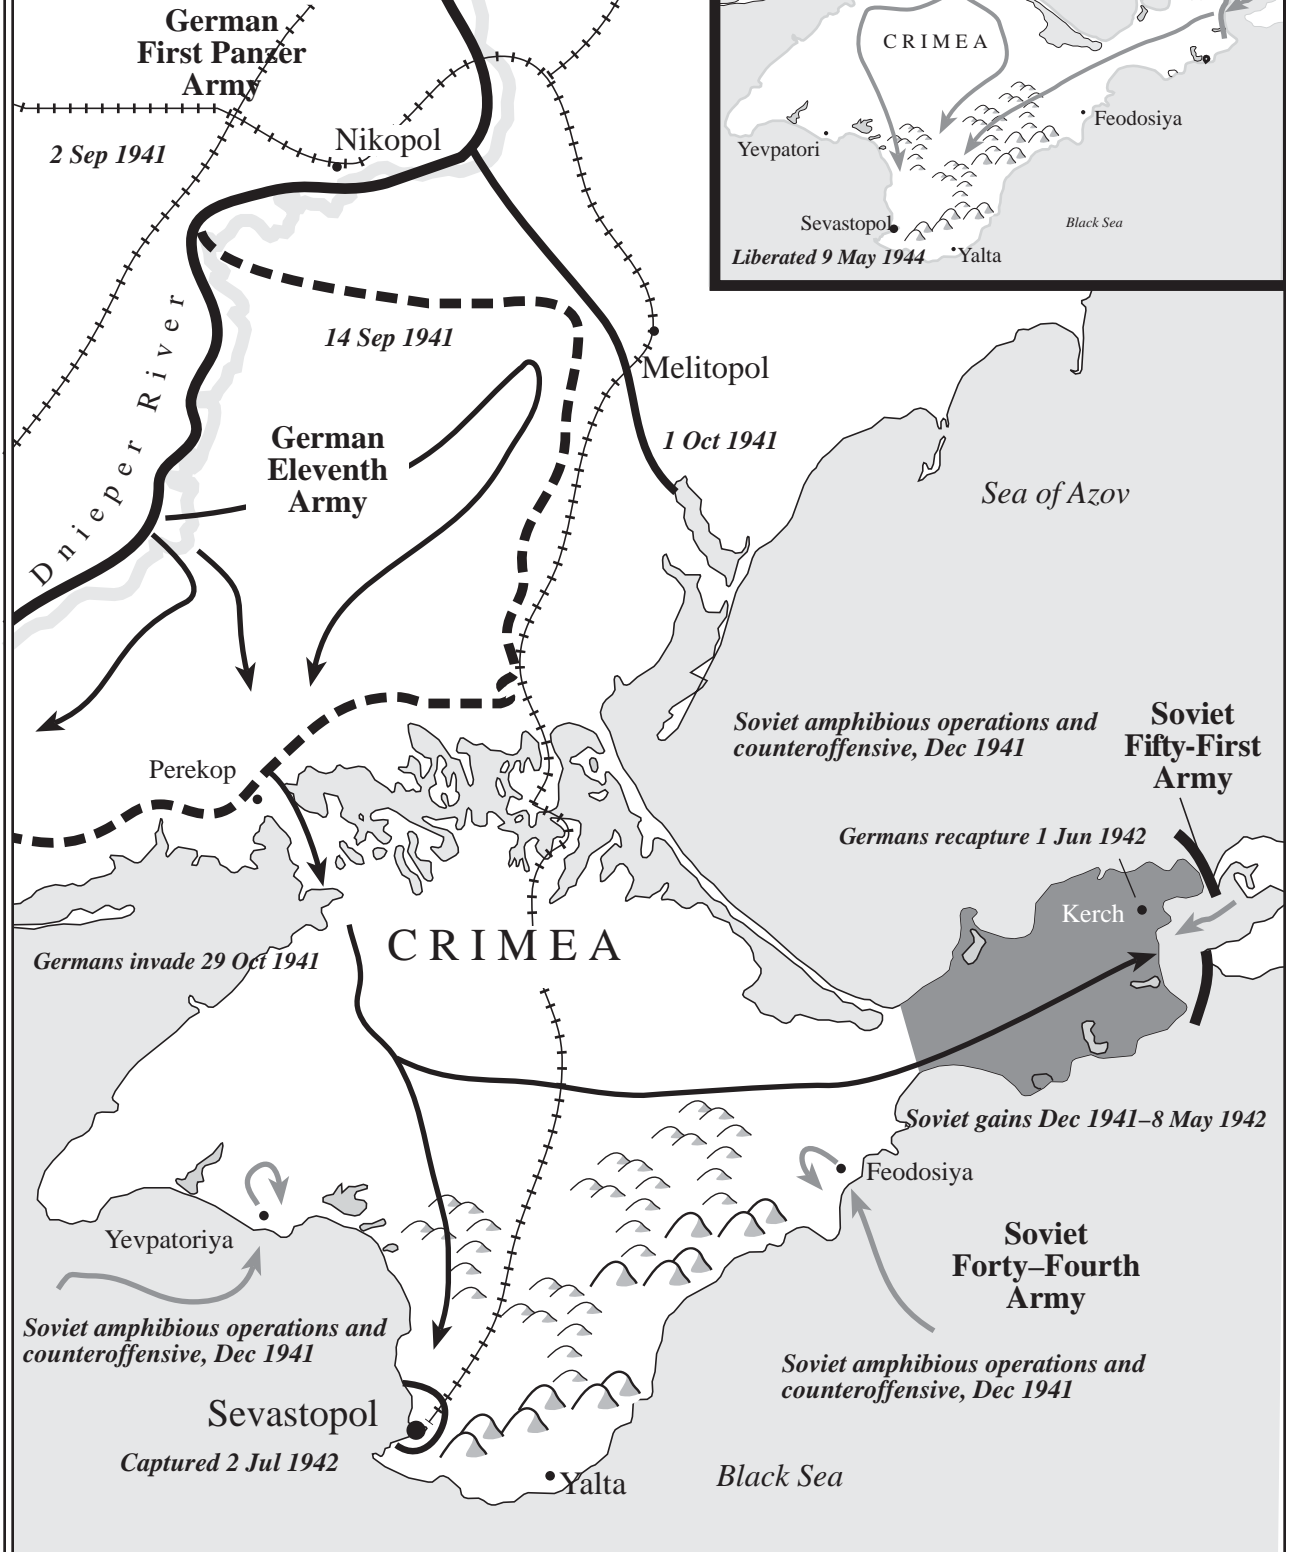

On 8 April, Tolbukhin's artillery opened the attack at Perekop, followed by an artillery barrage at Sivash. Soviet engineers, working waist-deep in icy water, constructed a pontoon bridge. The next day, Yeremenko attacked from Kerch. On 11 April, Soviet forces reached the railroad junction at Dzhankoy, behind the Perekop isthmus.

On 12 April, Jänecke ordered his divisions to retreat toward Sevastopol from two prepared lines of defense stretching some 20 miles. This step occurred without Hitler's formal approval. Jänecke's forces reached Sevastopol in surprisingly good order, and he hoped to hold there until his forces could be evacuated by sea. By 13 April, Tolbukhin's troops had captured Simferopol, and Yeremenko had secured Feodosia and Yalta.

In the meantime, from 18 April, the Soviets built up their forces and artillery in preparation to storm the fortress defenses of Sevastopol, which stretched some 25 miles. These preparations were completed by 5 May, the starting date of the final battle to liberate the Crimea. At the end of April, Hitler had decided that Sevastopol had to be held, but its defenses were much weaker than they had been in 1941 when the Germans had attacked there. Also, Jänecke had only five weak divisions and little equipment. Because of

Jänecke's repeated requests that his forces be evacuated, Hitler replaced him on 2 May with General der Infanterie (U.S. equiv. lieutenant general) Karl Allmendinger.

On 5 May, the Soviet Second Guards Army attacked from north of Sevastopol via the Belbel Valley. This attack was, however, diversionary; the main Soviet attack occurred on 7 May, pitting the Fifty-First Army and the Independent Coastal Army against Sapun Ridge separating Sevastopol from the Inkerman Valley. Soviet forces broke through the German lines, forcing the defenders from the old English cemetery. The Germans then retreated to the Chersonese subpeninsula.

Only on 9 May, with both the city and harbor in Soviet hands, did Hitler authorize an evacuation. The remnants of the German-Romanian force attempted to hold a dock at Kherson. However, any German hopes for a final evacuation by sea were dashed by Soviet air and naval operations. Consequently, on 13 May, the remaining Axis troops surrendered to the Red Army. Soviet authorities put total German losses in the Crimea Campaign at 50,000 killed (most all of them Germans) and 61,000 taken prisoner (30,000 of them at Chersonese). The Germans admitted to having 60,000 men lost; regardless, another German army had been destroyed.

Cruisers

Class of warships that in the World War II era possessed moderate armor and armament and were capable of high speed. These vessels were the successors of the eighteenth-century frigates in the age of sail. Frigates were primarily employed as reconnaissance ships for the main battle fleet. They also served in commerce protection, commerce raiding, surface combat against enemy vessels of similar strength, and blockades. Technological innovations in the mid-nineteenth century, such as steam power and iron

armor, led to the development of the first modern cruiser, the U.S. Navy's *Wampanoag*, commissioned in 1867. By World War I, the major naval powers of the world had produced six different types of cruisers, charged with the tasks formerly assigned to frigates. They also were given a new task that resulted from technological change—protecting the capital ships of the fleet from torpedo attack. These warships were primarily armored cruisers, protected cruisers, light cruisers, and scouts. Also in production was the battle cruiser—a warship that incorporated battleship armament on a cruiser-sized hull and was capable of high speed. This vessel, however, was viewed largely as a capital ship rather than a cruiser. The final type was the armed merchant cruiser, a civilian-owned merchant ship or passenger liner converted to carry weapons in time of war.

In the years immediately following World War I, most of the armored, protected, and scout cruisers were considered obsolete and scrapped. The major maritime powers, primarily Great Britain, also largely discarded battle cruisers because their light armor did not adequately protect them against heavily armed enemy warships. Britain kept three (the *Hood*, *Renown*, and *Repulse*; the *Tiger* was discarded in 1930), whereas Japan had four *Kongo*-class ships.

The interwar years produced many of the cruisers that participated in World War II. Military and diplomatic developments directly affected their design, although technologically, they were almost the same as those of World War I. Many naval officials viewed the continued construction of cruisers as a dubious endeavor, partly because of the increasing ability of aircraft to perform reconnaissance, the primary duty of cruisers up to that time. Construction, however, did not diminish, as the major maritime powers still desired a warship that was capable of protecting trade routes and providing support for amphibious operations—a relatively new role that had surfaced in World War I. These vessels also proliferated as part of a new, worldwide naval arms race.

Following World War I, the great powers attempted through international agreements to prevent an arms race in warships, which many politicians believed had been a factor in the tensions that had led to war. The resulting 1922 Washington Naval Conference produced the situation that diplomats had sought to avoid when it placed restrictions on the tonnage of cruisers but not on the numbers allowed to each naval power. The nations that signed the 1922 agreement tried to correct this problem at the 1930 London Conference, which separated cruisers into two basic types: those mounting 8-inch guns and those with 6-inch or smaller guns. Building ratios between the signatory powers based on total tonnage of cruisers restricted the numbers of each type, and a clause from the Washington Treaty, stating that no warship could displace more than 10,000 tons or carry

guns larger than 8 inches, governed their size. Even so, cruisers continued to be the largest surface warships built, as restrictions on battleship construction that had been set out at the Washington Naval Conference remained in place.

The 8-inch-gunned cruisers, known as “heavy cruisers,” were built primarily in the years before the 1930 London Conference because most of the world's major maritime powers had already built up to the tonnage limit set for these ships by the Washington agreement. Although the United States and France managed to produce some vessels that were well-balanced designs, the majority were generally unsatisfactory, as armor was sacrificed in order to meet the 10,000-ton restriction of the Washington Treaty. An example of this imbalance was the American heavy cruiser *Portland*. This vessel measured 610' × 66', displaced 10,258 tons, and mounted a primary armament of 9 × 8-inch guns. She had a maximum speed of 32.5 knots, but the ship's armor protection consisted of a belt only 2.5 inches thick and an armored deck that was 2.5 inches deep. This armor was generally effective only against opposing destroyers armed with 5-inch guns. Larger shells could easily penetrate the protection.

Japan and Italy, each of which had signed one or both of the treaties, built heavy cruisers that solved this problem of protection through subverting the terms of the agreements. Germany, which was restricted by the Treaty of Versailles, also built heavy cruisers that violated its agreement: the heavy cruisers of the Prinz Eugen-class and the more powerful Deutschland-class. The latter class of ships mounted 6 × 11-inch guns and displaced 11,700 tons, in contravention of the 10,000-ton limit set out in the treaty.

The naval powers also produced large numbers of 6-inch-gunned, light cruisers, particularly after the 1930 London Conference as each built up to the construction limit for the type. Many of these vessels also suffered from inadequate armor protection as a result of the restrictions of the naval treaties. An example was the British light cruiser *Arethusa*, which measured 506' × 51' and displaced 5,270 tons. She mounted 6 × 6-inch guns and was protected primarily by an armored belt with a maximum thickness of 3 inches that only covered her machinery and ammunition spaces.

These vessels were charged with the same duties as the cruisers of the World War I era, with the notable exception of reconnaissance, as airplanes now fulfilled that role. For the cruisers, reconnaissance duty was replaced by a new task, resulting from the threat posed by airplanes to surface warships. Most interwar cruisers, particularly light cruisers, were built with large batteries of antiaircraft guns to protect battleships and aircraft carriers against enemy aerial attack. Some light cruiser designs were also purpose-built for this specific role. In 1937, Great Britain built the first units of the *Dido*-class, which became known as antiaircraft cruisers.

The HMS *Cumberland*, a British heavy cruiser. (Corbis)

These vessels mounted 10×5.25 -inch guns in dual-purpose turrets that could either be trained on surface targets or elevated to an extreme angle for use against aircraft.

By the beginning of 1940, four months after the start of World War II, interwar cruiser construction, in combination with some battle cruisers retained from World War I, had created a large world cruiser force. Great Britain maintained 3 battle cruisers, 18 heavy cruisers, and 50 light cruisers; the United States had 18 heavy and 19 light cruisers; Japan operated 4 battle cruisers (by then rebuilt and reclassified as battleships), 28 heavy cruisers, and 38 light cruisers; Italy had 7 heavy cruisers and 12 light cruisers; France maintained 2 battle cruisers, 10 heavy cruisers, and 7 light cruisers; Germany operated 2 battle cruisers, 6 heavy cruisers, and 6 light cruisers; and the Soviet Union possessed 9 light cruisers. These numbers were augmented by wartime construction.

Cruisers in World War II fulfilled all of the roles that naval officials in the interwar years believed to be important. These ships were particularly valuable on the outbreak of the war in Europe in September 1939. The German navy, being much smaller than it had been in World War I, was not powerful enough to face the British Royal Navy in open combat. As a result, it was given the task of waging a com-

merce war on Great Britain's overseas trade routes in an effort to deny that country war materials and supplies. British cruisers were consequently used to protect against these raiders. This situation resulted in the 13 December 1939 Battle of Río de la Plata (River Plate), the first naval engagement between German and Allied warships in the conflict. The battle pitted the German pocket battleship *Admiral Graf Spee* against one British heavy cruiser and two light cruisers. As a result of the encounter, the German vessel retreated to Montevideo, Uruguay, where its commander scuttled his ship rather than renew battle. British cruisers also served in the 1941 hunt for the German battleship *Bismarck* and heavy cruiser *Prinz Eugen*, which had been dispatched into the Atlantic to prey on shipping. Although commerce warfare by surface warships declined somewhat after the sinking of the *Bismarck* due to Adolf Hitler's loss of confidence in the navy, British cruisers continued to guard merchant convoys in the Atlantic Ocean against the occasional sortie of German warships.

In June 1940, with Italy's entry into the war, this duty expanded to the Mediterranean. British cruisers guarded against Italian cruisers attempting to disrupt supply lines that led through the Mediterranean Sea to the British home

islands. Allied cruisers also performed commerce protection duties in the Arctic Ocean following Germany's invasion of the Soviet Union in 1941. Armed merchant cruisers on the Allied side were involved in blockade duty as well from the opening days of the war in the Atlantic. However, this effort was not very effective because after occupying Norway and France in 1940, the Germans had access to goods beyond those from the Soviet Union.

Cruisers also provided gunfire support for amphibious invasions not only in the Atlantic, Mediterranean, and Arctic Theaters but also in the Pacific Ocean, following the U.S. entry into the war in December 1941. Germany employed cruisers in the 1940 invasion of Norway, and the Allies utilized them during the 1942 amphibious assault in North Africa and the invasions of Sicily and Italy in 1943. They were also used to bombard and to direct fire during the 1944 invasion of Normandy, France, in Operation OVERLORD. The role of cruisers in supporting amphibious invasions proved particularly important in the Pacific, where mostly American cruisers bombarded Japanese island possessions in preparation for the landing of amphibious forces.

Arguably the greatest use of cruisers in the Pacific Theater was in their new role as antiaircraft protection for battleships and aircraft carriers. Throughout the conflict, cruisers received upgrades to their antiaircraft weaponry, as a response to the extreme threat of air attack. New anti-aircraft light cruisers augmented this force. Allied cruisers provided vital cover in operations across the Pacific Theater: in the 1945 battle for Okinawa, for instance, cruisers formed part of the defensive screen to prevent Japanese suicide aircraft, known as kamikazes, from crashing into Allied ships.

The valuable duties performed by cruisers in World War II resulted in a heavy toll of ships sunk. Japan lost 39 light and heavy cruisers. Great Britain had 27 vessels sunk, and Italy and the United States lost 13 and 12, respectively. France lost 10 cruisers, the majority scuttled in order to prevent their capture by the Germans following the surrender of France in 1940. And the Germans lost 7 cruisers, the majority of these sunk early in the war in commerce raiding or during the invasion of Norway.

CRUSADER, Operation (18 November–30 December 1941)

The failure of Operations BREVITY and BATTLEAXE, the British efforts in Libya during the summer of 1941 to relieve the siege of Tobruk, spurred British Prime Minister Winston L. S. Churchill's determination to gain a decisive victory over General Erwin Rommel in North Africa. Disregarding advice to improve the defense of the Far East, particularly the British garrison in Singapore, Churchill rushed reinforcements to Egypt.

By November 1941, Lieutenant General Alan Cunningham's Eighth Army was significantly stronger than Rommel's Panzer Gruppe Afrika in every category. It had more than 700 tanks plus 500 in reserve and in shipment, as compared with Rommel's 174 German and 146 obsolete Italian tanks; it also had almost 700 aircraft, against 120 German and 200 Italian aircraft on Rommel's side. Moreover, Rommel had not received any German reinforcements, and the Italian infantry divisions that had been transferred to Africa lacked any inherent transport of their own, which seriously restricted their movement in desert conditions. Rommel had, however, received large numbers of 50 mm antitank guns, which significantly improved his antitank capability. He had carefully husbanded all his supplies and planned to launch another offensive to capture Tobruk, but he was preempted by General Claude Auchinleck, commander in chief for the Middle East, who launched Operation CRUSADER on 18 November.

Auchinleck planned for Lieutenant General A. R. Godwin-Austin's XIII Corps to pin down the Axis outposts on the Egyptian frontier at Bardia and Sollum, while Lieutenant General Willoughby Norrie's XXX Corps, comprising the mobile armored regiments, would sweep south of these fortified positions through the desert "to seek and destroy" Rommel's armored force. Auchinleck firmly believed that the backbone of Rommel's army had to be destroyed before Eighth Army linked up with the Tobruk garrison, which itself would break out from the fortress. From the outset, therefore, the two corps would be operating independently.

A huge storm the night before the attack turned the desert into a quagmire and grounded Luftwaffe reconnaissance flights. The element of surprise was soon wasted, however, as the British attack became disjointed and the armored brigades became involved in piecemeal battles. The majority of the fighting took place around the escarpment of Sidi Rezegh, with the Italian-built road on which Rommel's supplies were transported at the bottom and a German airfield on top. But in a repeat of the summer offensives, the British again failed to combine their armor in a concentrated blow.

The first phase of the battle, from 18 to 23 November, saw hard, confused fighting in which British and German tank formations were habitually intermingled in the highly fluid battle and often found themselves behind what would have been the enemy's lines had they existed. Events culminated on Sunday, 23 November, aptly known in the German calendar as Totensonntag, or "Sunday of the Dead"—the name by which the Germans remember this battle. Up until that day, Rommel's skillful tactics had decimated the attacking British force, which had just 70 tanks remaining in the end. But in a concentrated attack launched by Rommel on 23 November, he lost 70 of his remaining 160 tanks.

At the end of this phase of the battle, Rommel believed that the British armor had been smashed and was spread in disorganized chaos across the desert. But despite the fact that he was thus far victorious on the battlefield, he knew that the British were able to sustain greater losses because

they had a large reserve from which they could replenish their strength. He therefore decided to exploit the British confusion by striking at their vulnerability—their supplies and lines of communication. By launching a lightning thrust to the frontier, he also planned to strike at the morale and the confidence of the British troops and their commanders, as he had successfully done in the past.

Generalleutnant (U.S. equiv. major general) Ludwig Cruewell, commander of Deutsches Afrika Korps, suggested that it would be better to reorganize and salvage the vast stocks of German and British matériel abandoned on the battlefield. But on 24 November, ignoring this sound advice, Rommel personally led the deep thrust with the mobile 15th, 21st, and Ariete Armored Divisions to the frontier and into the rear of the Eighth Army; he hoped this action would cause panic, result in the capture British supplies, and relieve his garrisons on the border. Rommel's "dash for the wire" very nearly succeeded, as he almost overran the two main British supply dumps and created a stampede among the British. Cunningham pessimistically sought permission to withdraw from the battle, but Auchinleck held command with a firm grip and replaced him as commander of Eighth Army with Major General Neil Ritchie on 26 November.

Rommel managed to link up again with his forces surrounding Tobruk, and he inflicted additional heavy losses on XIII Corps, which itself had advanced in an attempt to relieve Tobruk. But his losses and the strain on his supplies became too great, and on 7 December, he began to with-

draw. Ultimately, he had to abandon his garrisons in the frontier outposts at Bardia and Sollum, with the loss of 14,000 troops, yet he withdrew with as much skill as he had shown on the battlefield and escaped, with his army still intact, from Cyrenaica back to El Algeila, where he had started nine months earlier.

For the first time in the war, the British had defeated the German army. They achieved much success in the battle, finally raising the siege of Tobruk and inflicting 33,000 casualties at a cost of only 18,000 British and Commonwealth casualties. But most of the Axis losses were Italian troops or German administrative staff who surrendered in mid-January in the border posts, whereas the British casualties were predominantly highly experienced, desert veterans who could not be easily replaced. Moreover, the British had failed in their principal objective of destroying Rommel's armored forces, and he was again recuperating on secure supply lines while the British attempted to prepare for the next offensive over extremely long lines of communication.

The concurrent resurgence of Axis naval power in the central Mediterranean enabled the Italians to send more supplies and reinforcements to Rommel. With additional tanks and fuel, he launched an attack on 21 January 1942, and the next day, his force, which now included more Italian divisions, was renamed Panzer Armee Afrika. Rommel's probing raid again precipitated a hasty British withdrawal, and he recaptured Benghazi, but his forces were still too weak to advance beyond the British defensive positions on the Gazala Line, which ran from Gazala (35 miles west of Tobruk) and 50 miles southward into the desert to Bir Hacheim. There, both sides paused, recuperating and preparing for the next round of the "Benghazi Handicap" in the North African Campaign.

Cunningham, Sir Alan Gordon (1887–1983)

British army general who served as a commander in Operation CRUSADER. Born on 1 May 1887 in Dublin, Alan Cunningham was the younger brother of a future admiral, Andrew Browne Cunningham. He was commissioned in the army on graduation from Sandhurst in 1906. Decorated for his service in World War I as a member of the Royal Horse Artillery, Cunningham was a General Staff officer at the Straits Settlements in Southeast Asia between 1919 and 1921. As a brigadier general, he commanded the 1st Division of the Royal Artillery from December 1937 until September 1938, when he took command of the 5th Antiaircraft Division.

For most of 1940, Cunningham commanded, in succession, the 66th, 9th, and 51st Infantry Divisions in Britain before assuming command of forces in Kenya in October. He was assigned the task of conquering Italian Somalia from the south with his 11th and 12th African Divisions and the 1st South African Division. Cunningham invaded Somalia in January, taking Kismayu on 14 February and Mogadishu on 25 February 1941. He then drove northward to Harar and on to the capital of Addis Ababa, which fell on 6 April. Cooperating with General William Platt's forces from the Sudan, he pinned the Italian forces at Amba Alagi and forced their surrender. The campaign was a great success for Cunningham, who was then transferred to command the British Eighth Army in Egypt on 10 September 1941.

Beginning on 18 November, Eighth Army launched Operation CRUSADER, General Claude Auchinleck's offensive to relieve the siege of Tobruk. With scant time to prepare and as a stranger to armored warfare, Cunningham found himself outmaneuvered by the Afrika Korps (Africa Corps) commander, General Erwin Rommel, at Sidi Rezegh, 20 miles from Tobruk. In what became known as the Battle of Totensonntag, British forces suffered heavy losses, and Cunningham himself was forced to evacuate by plane. On 26 November, Auchinleck relieved him and replaced him with General Neil M. Ritchie.

Cunningham then commanded the Staff College at Camberley (1942–1943) and the Eastern Command (1944–1945). Promoted to full general, he retired in October 1946. Between 1945 and 1948, he served as the last British high commissioner to Palestine and Transjordan. Knighted on his return to Britain, Cunningham died on 30 January 1983.

Cunningham, Sir Andrew Browne (First Viscount Cunningham of Hyndhope) (1883–1963)

British Admiral of the Fleet and first sea lord from 1943 through 1945. Born in Dublin on 7 January 1883, Andrew Cunningham enrolled at Stubbington House near Portsmouth to prepare for entry into the Royal Navy. Rated a midshipman in 1898, he saw action with the Naval Brigade in the 1899–1902 South African War. Although he later served in a variety of warships, he was happiest in destroyers and torpedo boats. In 1911, Cunningham took command of the destroyer *Scorpion*, remaining with her until early 1918 and spending most of World War I in the Mediterranean, the theater that became inseparably identified with his career. Promoted to captain in 1920, he thereafter held staff posi-

tions in the Baltic, Mediterranean, and West Indies. After being made rear admiral in 1934, he commanded the destroyer flotilla in the British Mediterranean Fleet from 1934 to 1936. He then commanded the battle cruisers squadron and was second in command of the Mediterranean Fleet in 1937 and 1938. From September 1938 until June 1939, he was deputy naval chief of staff. Promoted to vice admiral and universally called “ABC,” Cunningham became commander of the Mediterranean Fleet in June 1939.

The collapse of France militarily and Italy’s entry as an Axis belligerent in June 1940 prompted his first significant actions in World War II—the peaceful neutralization of the French fleet at Alexandria and an engagement with the Italians on 9 July 1940 off Calabria; in the latter, he pursued a powerful force returning from North Africa into Italian home waters, damaging its flagship. Four months later, on 11 November 1940, with his fleet strengthened by the addition of the carrier *Illustrious*, Cunningham launched a night air attack on the Italian base at Taranto, sinking three battleships, two of which were later raised and repaired. On 28 March 1941, he fought the Italians off Cape Matapan, sinking three heavy cruisers and two destroyers and damaging a battleship. Soon afterward, however, British armies in Greece and Crete required evacuation, and Cunningham’s full support of them brought severe losses to his ships from German air attacks.

In June 1942, Cunningham became the Admiralty’s representative to the Combined Chiefs of Staff in Washington. Promoted to Admiral of the Fleet, he became Allied naval commander in chief in the Mediterranean in October 1942. Cunningham oversaw Operation TORCH, the Allied landings in North Africa in November 1942, and the Allied assaults on Sicily in April 1943 and at Salerno five months later, followed by Italy’s surrender and internment of the Italian fleet at Malta.

When First Sea Lord Sir Dudley Pound died in October 1943, Cunningham succeeded him, serving in the post for the rest of the war. Often at odds with Prime Minister Winston L. S. Churchill, he also faced growing American naval dominance and a very different war in the Pacific. Ennobled in September 1945, he retired in June 1946, recognized as one of the last British admirals in the Nelson tradition. Cunningham died in London on 12 June 1963.

Curtin, John Joseph (1885–1945)

Australian politician and prime minister from 1941 to 1945. Born at Creswick, Victoria, Australia, on 8 January 1885, John Joseph Curtin became a printer and trade union activist. During World War I, he was imprisoned for his activities as secretary of the Anti-conscription League. In 1917, Curtin switched to journalism, editing the Perth-

based weekly *Westralian Worker*. Eleven years later, he was elected as the Labour member of Parliament for the seat of Fremantle, a position he held with only one break, between 1931 and 1934, until his death; he also became head of the Labour Party in 1935.

In the internationally crisis-ridden late 1930s, Curtin's party split over foreign policy, but he favored extensive rearmament and moving closer to the United States for protection. When World War II began, he refused to join the coalition government headed by Sir Robert Menzies but pledged his party's support for war. On 3 October 1941, Curtin became prime minister; he remained in that post until his death almost four years later. He emphasized his country's growing autonomy from Britain by making a separate Australian declaration of war on Japan following that country's attack on Pearl Harbor. Curtin infuriated both Winston L. S. Churchill and Franklin D. Roosevelt by refusing to allow Australian troops returning from the Middle

East to divert to Burma. He called for greater Australian reliance on the United States and, from spring 1942, worked closely with the U.S. commander in the South Pacific, General Douglas MacArthur, in demanding more British and U.S. resources for the Pacific Theater. Curtin nonetheless resented Australia's exclusion from many critical wartime decisions, and he sought to develop a Commonwealth secretariat. A heavy smoker, Curtin died of lung congestion at Canberra, Australia, on 5 July 1945.

Czechoslovakia

In 1938, the Republic of Czechoslovakia had the highest standard of living and was the only democracy in central Europe. It also had an intractable minorities problem that made it vulnerable to neighboring states, especially Germany. Czechoslovakia numbered about 15 million people in all, but only about 7 million—not even a majority of the population—were Czechs. Three million were Germans, 2.5 million were Slovaks, and 1 million were Hungarians. In addition, there were about a half million Ukrainians living in Ruthenia and also a number of Poles.

Czechoslovakia had been formed at the end of World War I from a union of Bohemia and Moravia, which had long been part of Austria, and Slovakia, which had been part of Hungary. The 1919 Paris Peace Conference awarded it Ruthenia, in order to provide a land connection with Romania. With Romania and Yugoslavia, Czechoslovakia formed the so-called Little Entente. In addition, the Czechs had a firm alliance with France as well as one of Europe's most important arms-manufacturing centers in the Skoda Works at Pilsen, and it had an excellent, 400,000-man army. These facts, however, counted for little when the French and British, under heavy pressure from German leader Adolf Hitler at the September 1938 Munich Conference, forced the Czech government headed by President Eduard Beneš to yield the Sudetenland, with a largely German population, to

Germany. This area contained the natural defenses of the new state. Hungary and Poland also seized territory.

Then, on 15 March 1939, Hitler broke his pledge to respect what remained of Czechoslovakia and gathered the remainder of the state into the Reich. Acquiring it was a tremendous boost to the Germans militarily, for thirty-five highly trained and well-equipped Czech divisions disappeared from the anti-Hitler order of battle. Hitler had also eliminated the threat from what he had referred to as "that damned airfield," and the output of the Skoda arms complex would now supply the Reich's legions. In Bohemia and Moravia, the Wehrmacht absorbed 1,582 aircraft, 2,000 artillery pieces, and sufficient equipment to arm 20 divisions. Indeed, any increase in armaments that Britain and France achieved by March 1939 was more than counterbalanced by German gains in Czechoslovakia. There, the Germans secured nearly a third of the tanks they deployed in the west in spring 1940, and between August 1938 and September 1939, Skoda produced nearly as many arms as all British arms factories combined.

The Germans organized their new acquisition as the Protectorate of Bohemia-Moravia. The Slovak lands became the Republic of Slovakia, a vassal state of Germany ruled by the Slovak People's Party, which was headed by Roman Catholic priest Monseigneur Jozef Tiso. Slovakia had declared its independence from the remainder of Czechoslovakia on 14 March. The eastern province of Ruthenia (Trans-Carpatho-Ukraine) was ceded to Hungary.

The Germans immediately disbanded the Czech military, allowing President Emile Hácha only a small ceremonial guard. Although long-term German plans for the protectorate included the removal of the Slavic population and its replacement by Germans, initial German occupation policies were much more lenient than in the remainder of central and eastern Europe, inspired by the goal of exploiting Czech industry and resources without inciting revolt. The initial occupation period was peaceful. This fact is explained by several factors: the area's proximity to the Reich proper, disillusionment with the West following the Munich Agreement, lenient German policies, and the lack of coordinated Czech resistance. Student protests against German rule in October 1939 on the anniversary of the independence of Czechoslovakia did, however, bring closure of the universities and the execution of nine students.

On 16 April 1940, Baron Konstantin Hermann Karl Neurath became Reich protector of Bohemia-Moravia, after the departure of the military governor, Generaloberst (U.S. equiv. full general) Johannes von Blaskowitz. However, Berlin became dissatisfied with Neurath's lack of harsh measures to curb protests, and on 27 September 1941, he was replaced by the head of the Reich Security Office, Reinhard Heydrich. The latter declared martial law and carried

German troops entering Waldhaeusl in Czechoslovakia, 3 October 1938. (Hulton Archive)

out a series of arrests that destroyed the leadership of the student protesters and other Czech national opposition.

On 27 March 1942, a group of British-trained Czech commandos ambushed Heydrich's car in Prague and mortally wounded him; he died on 4 June. The Gestapo then instituted a wave of terror during a period of martial law that lasted until July and included the destruction of the villages of Lidice and Lezaky and the deaths of most of their inhabitants. On 20 August 1943, Wilhelm Frick was appointed Reich protector. However, Hans Frank, Reich minister of state for Bohemia and Moravia, exercised real authority. The level of active Czech resistance remained relatively low and consisted chiefly of providing intelligence information.

President Beneš had gone abroad in October 1938, and he established a Czech government-in-exile, first in Paris and then in London. In the summer of 1942, he secured official British and Free French repudiation of the 1938 Munich Agreement. But Beneš stressed accommodation with the

Soviet Union, and he traveled to Moscow to sign a formal treaty of alliance with the Soviets on 18 July 1941. He sought a democratic, independent Czechoslovakia that would be a bridge between East and West.

During the war, the Czech government-in-exile contributed an armored brigade to the Allied cause—some 5,000 men who fought with British forces in the Normandy Campaign. Czech pilots participated in the 1940 Battle of Britain, and four Czech squadrons (three fighter and one bomber) served with the Royal Air Force during the war. Czech military units were also formed on Soviet territory, including, by the summer of 1943, the 1st Czechoslovak Parachute Brigade of some 2,500 men. The 2nd Czechoslovak Parachute Brigade was formed in 1944, and it participated in an uprising in Slovakia against the government there in August 1944. Czech military units in the Soviet Union ultimately established the I Czechoslovakian Corps, which distinguished itself in the fighting to cross the Carpathian Mountains. The Soviets also formed the 1st

Czechoslovakian Fighter Regiment, which evolved into the 1st Czechoslovakian Air Division by the end of the war.

On 5 May 1945, a general uprising occurred in Bohemia and Moravia against the Germans, centered on a rising in the city of Prague as Soviet Marshal Ivan Konev's 1st Ukrainian Front approached from the east and U.S. Lieutenant General George S. Patton's Third Army drove on the capital from the west. The Czech government-in-exile appealed to Supreme Commander of Allied Expeditionary Forces General Dwight D. Eisenhower for assistance, but he refused to allow Patton to intercede. The Germans reinforced with two divisions, but they had no tanks or artillery and were halted by General Andrei Vlasov's 1st Division, which had deserted from the Germans. On 9 May, Vlasov's troops cleared the remaining Germans from Prague, taking some 10,000 prisoners. The next day, Konev's troops entered the city. The Germans formally surrendered on 11 May. During the war, an estimated 350,000 people in the protectorate died as a result of the German occupation.

Meanwhile, Tiso's Slovak People's Party ruled Slovakia. Tiso's wartime independent Slovak government was dominated by fascist, anti-Czech, anti-Semitic elements, represented by personalities such as Karol Sidor and Alexander Mach, who were supported by a paramilitary organization known as the Hlinka Guards. The war stimulated economic growth in Slovakia, and on 24 November 1940, Slovakia signed the Anti-Comintern and Tripartite Pacts. Its military commitment to the Axis was two divisions, comprising some 50,000 men. Slovakia adopted a resettlement program for its

Jewish population in August 1940, and it enacted a Nuremberg-type Jewish code on 10 September 1941. An uprising by Slovaks against the Tiso government was crushed by German military intervention in the form of 40,000 troops by October, the Soviets being unable to provide military assistance to the resistance. At the end of the war, Tiso's government retreated with German forces into Austria in April 1945, and Tiso surrendered there to U.S. forces on 8 May 1945. Beneš's cherished hopes of an independent democratic Czechoslovakia after the war were not realized. In 1948, the Communists seized power in the country.

DAK

See Afrika Korps.

Dakar, Attack on (23–25 September 1940)

Vichy-held West African port. Following the defeat of France by the Germans in June 1940, the new Vichy government assumed control of most of the French colonial empire. In late August, Free French leader General Charles de Gaulle convinced French Equatorial Africa to continue the fight against Germany under his leadership. De Gaulle next turned to French West Africa and its capital, Dakar. Located in the most westerly part of Africa, Dakar boasted an excellent deep-water port and was equidistant from Europe and Brazil. The British feared that the Germans might pressure the Vichy French to allow them to use Dakar as a base from which to launch air and

naval attacks against British shipping. De Gaulle pushed for an attack—eager to expand his power base in Africa, to show himself a key Allied figure, and to encourage other Vichy-held African territories to rally to his cause. The resulting joint British–Free French plan was named Operation *MENACE*.

Previously, on 8 July, British aircraft flying from the carrier *Hermes* had attacked and immobilized the modern French battleship *Richelieu* at Dakar. This operation followed the British attack on the French fleet at Mers-el-Kébir in Algeria on 3–4 July and gave ample warning to the Vichy French forces that the British were willing to attack their former allies. Despite this aggressive move, both British Prime Minister Winston L. S. Churchill and de Gaulle hoped for a bloodless victory at Dakar.

Operation *MENACE* involved 23 warships, including the battleships *Barham* and *Resolution*, the aircraft carrier *Ark Royal*, 4 cruisers, and 11 destroyers. These warships escorted 11 transports carrying 7,900 men, 3,600 of whom were Free French. The Allies hoped that the authorities at Dakar would rally to the Free French. Failing that, the French troops would go ashore; the British troops were to be employed only in an emergency.

Operation *MENACE* was plagued with problems from the beginning. The Allies lacked a clear picture of the strength of the Dakar defenses, which were to include three Vichy French cruisers and three destroyers. These ships arrived at Dakar just in advance of the Allied ships.

On 23 September, the French administrator at Dakar, Pierre Boisson, refused to talk to the Free French negotiators. The negotiators went ashore, and the French coastal batteries at Dakar opened fire on the Allied ships. The Allied ships

Soldiers in the ruins of a government building after an air attack at Dakar. (Hulton-Deutsch Collection/Corbis)

returned fire. Over the next several days, the exchange of fire included both the French shore batteries and ships, especially the 15-inch guns of the immobilized *Richelieu*. The Vichy submarine *Beveziers* damaged the battleship *Resolution* with a torpedo, and several other British ships were hit by shell fire. The lack of adequate naval support combined with foggy conditions led the Allies to abandon the operation on 25 September.

The failure of Operation *MENACE* was a blow to British and Free French prestige and demonstrated British inexperience in combined operations. It also revealed the hatred felt by many French for the British and severely damaged the relationship between de Gaulle and Churchill. In addition, it profited the Vichy French government, which trumpeted it as a great naval victory. On 24 and 25 September, in response to the Dakar attack, Vichy bombers carried out three raids against Gibraltar—dropping some 600 tons of bombs, sinking a destroyer, and damaging the battle cruiser *Renown* and a submarine, but causing little damage to shore facilities. As a result of *MENACE*, Adolf Hitler saw some utility in Vichy France's assistance. He also had proof that Vichy would defend French Africa against the Free French. Admiral Jean F. Darlan then entered into talks with the Germans to allow them to use French air bases in Syria.

Daladier, Édouard (1884–1970)

French politician and premier. Born on 18 June 1884, at Carpentras (Vaucluse), Édouard Daladier was educated at the École Normale and at the Sorbonne before becoming a history teacher at the Lycée Condorcet in Paris. He served in the French army during World War I and fought at Verdun.

In 1919, Daladier was elected to the Chamber of Deputies from the Vaucluse as a Radical Socialist. He was minister of colonies in 1924 and premier from January to October 1933. Daladier formed another cabinet in January 1934 but resigned the next month over the Stavisky Scandal.

Daladier helped bring the Radicals into the leftist Popular Front coalition with the Socialists and Communists for the 1936 national elections. On the collapse of the Popular Front, he again became premier in April 1938. Under heavy pressure from British Prime Minister Neville Chamberlain and despite France's treaty obligations to Czechoslovakia, Daladier agreed at the September 1938 Munich Conference to Adolf Hitler's demands for the cession of the Sudetenland to Germany. Unlike Chamberlain, he had no illusions that the agreement had secured peace.

Daladier then did what he could to prepare France for war. On the German invasion of Poland in September 1939, he led France into war against Germany. Angered by the German-Soviet Non-aggression Pact of 23 August 1939, he reacted by outlawing the Communist Party and arresting its leaders. Daladier was criticized for France's military inaction during the so-called "Phony War" and its failure to assist Finland in Finland's war against the Soviet Union. He was forced to resign on 20 March 1940 and was replaced by Paul Reynaud. Daladier remained in the cabinet, however, as minister of war until the defeat of France in June 1940.

On 21 June 1940, Daladier and other cabinet ministers sailed from Bordeaux for North Africa in an effort to set up a

Édouard Daladier, French premier (1933, 1934, 1938–1940). (Hulton Archive/Getty Images)

government in exile, but new chief of state General Henri Pétain ordered them arrested. Daladier was among those brought to trial at Riom in 1942 by the Vichy government on charges of having caused the French defeat. The trial was suspended, but Daladier remained in custody. In 1943 he was removed as a prisoner to Germany. Released in April 1945, Daladier was one of the few leaders of the Third Republic to continue in politics during the Fourth Republic. Reelected a deputy, he served in the National Assembly from 1946 until 1958. Daladier died at Paris on 10 October 1970.

Darby, William O. (1911–1945)

U.S. Army officer credited with creation of the elite force the Rangers. Born on 9 February 1911 at Fort Smith, Arkansas, William Darby graduated from the U.S. Military Academy at West Point in 1933 and was commissioned a second lieutenant of field artillery. Over the next seven years, he held several routine assignments and was promoted to captain in October 1940. He then commanded an artillery battery of the 99th Field Artillery Regiment (1941–1942).

In June 1942, Brigadier General Lucian K. Truscott Jr. selected Darby to put together an elite force similar to the British commandos. The name "Rangers" derived from the force of the same name led by Major Robert Rogers during the French and Indian War. Promoted to temporary major,

Lieutenant Colonel William O. Darby (right) congratulated by Lieutenant General George S. Patton. Gela, Sicily, August 1943. (Photo by Bob Landry/Time Life Pictures/Getty Images)

Darby trained his men at Achnacarry, Scotland, under the guidance of British commandos. The Rangers were seen as elite troops to be employed on hit-and-run commando raids. A charismatic person, Darby believed in leadership by example from the front. Officially, Darby commanded only the 1st Ranger Battalion, but he also trained and led the 3rd and 4th Battalions. In December 1943, Darby was promoted to colonel and given command of all three battalions.

Darby's Rangers, as his force came to be known, were first employed in combat during the ill-fated August 1942 raid on Dieppe. In November 1942, six companies performed well in Operation TORCH, the Allied invasion of French North Africa then under Vichy control. The companies also participated in Operation HUSKY, the invasion of Sicily. In the invasion of Italy at Salerno, four U.S. Ranger battalions and the 41st British Commandos secured the coast at Maiori. After the destruction of the 1st and 3rd Battalions at Anzio, Darby was assigned to the Operations Division of the War Department's General Staff.

Darby returned to Italy in March 1945 and managed to secure a posting as executive officer of the 10th Mountain Division. On 30 April 1945, only a week before the end of the war in Europe, Darby was struck and killed in northern Italy by a German shell fragment. Darby was posthumously promoted to brigadier general.

Darlan, Jean Louis Xavier François (1881–1942)

French navy admiral. Born on 7 August 1881 in Nérac (Lot-et-Garonne), France, Jean Darlan graduated from the École Navale in 1902. A specialist in naval gunnery, he served in the Far East on cruisers and then in the Mediterranean. Promoted to commander in 1912, he was then an instructor on the training cruiser *Jeanne d'Arc*. During World War I, he commanded heavy naval artillery on land. He was promoted to commander in July 1918 and took charge of the Rhine Flotilla.

Promoted to captain in August 1920, Darlan was assigned to the Far East, where he commanded cruisers. He was advanced to rear admiral in November 1929 and played an important role in the reorganization of the navy. He next commanded naval forces in Algeria and then a cruiser divi-

sion in the Mediterranean. Promoted to vice admiral in December 1932, he took charge of the Atlantic Squadron during 1934–1936. He was then chief of the French naval staff.

Darlan was promoted to admiral of the fleet in June 1939 and took command of the French Navy. Following the June 1940 defeat of France, he joined the Vichy government of Marshal Henri Philippe Pétain as navy minister. In February 1941 he also became vice premier and minister of the interior, and in August 1941 he was made minister of defense. He was also Pétain's designated successor.

Darlan was an Anglophobe, especially after Operation CATAPULT and the killing of French sailors at Mers-el-Kébir. He hoped to win concessions for France through military agreements with the Germans. His May 1941 meeting with Adolf Hitler led to an agreement with German ambassador Otto Abetz. In the so-called Paris Protocols, France granted major concessions to Germany in Africa and the Middle East, but the Germans gave little in return.

By April 1942, rival Pierre Laval forced Darlan to relinquish his cabinet posts, save that of commander of the armed forces. Darlan traveled frequently to North Africa and was in Algiers when, on 8 November, the Allies invaded in Operation TORCH. Darlan agreed to cooperate with the Allies and to order a cease-fire on 10 November in return for recognition of his authority. The deal was confirmed on 11 November

French Navy Admiral Jean Darlan. (Corbis)

with U.S. Major General Mark Clark and Ambassador Robert Murphy. President Franklin D. Roosevelt approved the agreement, although some Allied leaders denounced it as an “immoral act” that gained little.

Many people including Allied leaders wanted to see Darlan removed, and on 24 December 1942, 20-year-old French royalist Fernand Bonnier broke into Darlan’s office and shot him twice with a pistol. Darlan died two hours later. Bonnier was captured, tried, and executed two days afterward. The assassination of Darlan is shrouded in mystery and has been variously attributed to the United States, Britain, the Free French, French monarchists, and even the Germans.

Darwin, Raid on (19 February 1942)

First direct Japanese attack against Australia during the war. Into early 1942, Japanese forces moved inexorably down through the Philippines and Malay Peninsula and into the Netherlands East Indies. To secure Java and protect landings at Timor, the Japanese High Command decided to attack Darwin, a port city on Australia’s north coast used by the Allies to ferry aircraft, troops, and equipment to the East Indies. Commander Fuchida Mitsuo planned the raid, centered on the four aircraft carriers of Vice Admiral Nagumo Chūichi’s First Air Fleet and a covering force of two battleships and three heavy cruisers under Vice Admiral Kondō Nobutake. It was the most powerful Japanese strike force since the attack on Pearl Harbor.

In two waves on 19 February 1942, the Japanese carriers in the Timor Sea launched approximately 188 aircraft against Darwin. Fifty-four land-based bombers joined them. A U.S. Navy PBV Catalina radioed a warning of the first wave but was then shot down. News reached Darwin just as 10 U.S. Army Air Forces (USAAF) P-40s of 33rd Squadron returned following an aborted attempt to reinforce Java. Five P-40s remained airborne to face the Japanese. The remaining 5 attempted to take off just as the Japanese planes arrived at about 10:00 A.M. Japanese Zeros claimed 9 of the P-40s in the air; the survivor landed with severe damage. The second raid

Aftermath of attacks by Japanese bombers during their first raid on Darwin, 10 February 1942. (Bettmann/Corbis)

occurred 2 hours later. In all, the Japanese destroyed approximately 18 Allied aircraft and demolished air base facilities. The Japanese sank 8 ships, including the U.S. destroyer *Peary*, and damaged a further 9. Wharves and jetties suffered extensive damage, and 18 Allied aircraft were destroyed. The human toll was also high: some 500–600 people were killed or wounded. The Japanese accomplished all this at a cost of only 10 aircraft. This raid succeeded in its objective of assisting the Japanese conquest of the Dutch East Indies. Japanese attacks on Darwin continued during the next several months.

Davis, Benjamin Oliver, Jr. (1912–2002)

U.S. Air Force general. Born on 18 December 1912 in Washington D.C., Benjamin Oliver Davis Jr. was the son of Benjamin O. Davis, the first U.S. African American active-duty general officer. The younger Davis attended Western Reserve University and the University of Chicago. He then secured an appointment to the U.S. Military Academy at West Point, where he endured four years of isolation because of racial discrimination. He graduated in 1936 and was commissioned a second lieutenant of infantry. In July 1941 as a captain, Davis was one of the first members of a new pilot training program for African Americans at Tuskegee, Alabama. He completed training in March 1942. Tuskegee graduates formed the basis for Lieutenant Colonel Davis's 99th Pursuit Squadron, which flew P-40s. Following four months of combat in the Mediterranean Theater, Davis returned to the United States to assume command of the 332nd Fighter Group with P-51s, which he led in Italy in January 1944. Davis flew 60 missions and won promotion to colonel in March 1944.

After the war, Davis returned to the United States to command the racially troubled 477th Composite Group at Godman Field, Kentucky. In 1949, Davis attended the Air War College, and he was then assigned to Washington, D.C., as deputy chief of operations in the Fighter Branch. In October 1954, Davis was promoted to brigadier general, the first African American U.S. Air Force officer to hold that rank. He served as vice commander, Thirteenth Air Force, and then headed Twelfth Air Force in Germany from 1957 to 1959. Promoted to major general in June 1959, Davis returned to Washington in July 1961 as director of Manpower and Organization. In April 1965, Davis was promoted to lieutenant general and became chief of staff of U.S. forces in Korea and the United Nations Command. He then became deputy commander of the U.S. Strike Command.

Davis retired in February 1970. In 1971 he became assistant director of the Department of Transportation to establish the Sky Marshals program until 1975. He then served on various corporate boards. Promoted to general on the retired list in December 1998, Davis died at Washington, D.C., on 4 July 2002.

Brigadier General Benjamin O. Davis Sr. watches a Signal Corps crew erect poles in France, 8 August 1944. (National Archives)

Davis, Benjamin Oliver, Sr. (1877–1970)

U.S. Army general and first African American general in the U.S. military. Born 1 July 1877 in Washington D.C., Benjamin O. Davis enrolled at Howard University in 1897 but left school the next year to join the Eighth U.S. Volunteer Regiment. As a lieutenant during the Spanish-American War, he saw no action, but in 1899 he enlisted as a private in the regular army. Davis was commissioned a second lieutenant in the 10th U.S. Cavalry in 1901. He was military attaché to Liberia (1909–1911), professor of military science at Wilberforce University (1906–1911, 1915–1917, 1929–1930, and 1937–1938), supply officer for the 9th Cavalry in the Philippines (1917–1920), instructor with the Ohio National Guard (1924–1928), and professor of military science at Tuskegee Institute (1921–1924 and 1931–1937).

At the beginning of World War II, Davis was one of only two African American officers in the combatant arms of the U.S. Army. The other was his son, Benjamin O. Davis Jr. In October 1940, on the recommendation of President Franklin D. Roosevelt, Davis was promoted to brigadier general. He was the first African American to obtain the rank in U.S. military history.

Davis retired from the army in 1941 but was recalled to active duty as an assistant to the Inspector General of the Army, serving in the European Theater of Operations as an adviser on race relations. At the same time, he fought to end segregation and discrimination within the armed forces. Davis remained in the Inspector General's office until his final retirement in 1948. He continued to speak for desegregation in the military, which was achieved when President Harry S Truman ordered full integration of the U.S. armed forces.

In the years following his retirement from the military, Davis served on numerous civilian boards and the Battle Monuments Commission. He died in Chicago on 26 November 1970.

leader Benito Mussolini, who replaced him in November 1935 with his rival Pietro Badoglio. De Bono demanded and received promotion to marshal immediately thereafter.

Serving ignominiously in largely ceremonial or honorary posts for the remainder of his career, De Bono soured on Mussolini, decrying Italian-German war plans, and eventually joined in the Fascist Grand Council's July 1943 ouster of Il Duce, for which he was arrested by the German occupation 4 October 1943. Tried at Verona, the old general was sentenced to death with, among others, Mussolini's son-in-law Galeazzo Ciano, whom he joined before a firing squad on 11 January 1944.

De Bono, Emilio (1866–1944)

Italian marshal and government figure. Born on 16 March 1866 at Cassano d'Adda, Emilio De Bono graduated from military schools in nearby Milan and in 1883 began a long army career, which is chronicled in many diaries. A self-styled "warrior," De Bono sought challenging commands in the 1911–1912 Italo-Turkish War and during World War I. He was promoted to major general and twice decorated for valor in 1916. Friction with a superior led to an inactive posting in Albania until he was recalled to corps command in Italy. He turned back an Austrian attack at Grappa in 1918.

Restive after the war, De Bono, who had never evinced attention to or interest in politics, was tempted by the bombast of Gabriele D'Annunzio's nationalistic expedition to occupy Fiume in 1919 to join that campaign. However, ambivalent careerist instincts held him in check. Still lacking any warrior role or prospects, by 1921 De Bono settled for membership in the Fascist Party as a vehicle for self-promotion. Although his military skills were pivotal in organizing the October 1922 March on Rome, they did not advance him politically despite his appointments as chief of public security in November 1922 and commander of the Fascist militia in January 1923.

After his perceived failure to prevent the June 1924 murder of socialist leader Giacomo Matteotti by the militia, De Bono was indicted but refused to implicate his superiors. Acquitted in 1925 and rewarded with the governorship of Tripolitania, by 1928 De Bono was planning the eventual war with Ethiopia. He had some success early in that war, including a victory at Adowa, but his recalcitrant pace irked Italian

de Gaulle, Charles (1890–1970)

French Army general, leader of Free French Forces, and the president of France. Born on 22 November 1890 in Lille, Charles de Gaulle demonstrated from an early age a keen interest in the military. He graduated from the French Military Academy of Saint-Cyr in 1913 and was commissioned a lieutenant in the army.

De Gaulle's first posting was with Colonel Henri P. Pétain's 33rd Infantry Regiment. During World War I, de Gaulle was promoted to captain, and he demonstrated a high degree of leadership and courage. Wounded twice, he was captured by the Germans at Verdun in March 1916 after being wounded a third time. Later he received the Legion of Honor for this action. Despite five escape attempts, he remained a prisoner of war until the end of the war.

After the war, de Gaulle returned to teach history at Saint-Cyr, and in 1920 he was part of the French military mission to Poland. He returned to France to study and teach at the École de Guerre. De Gaulle then served as an aide to French army commander Marshal Pétain, but the two had a falling-out, apparently because Pétain wanted de Gaulle to ghost-write his memoirs. De Gaulle also became an important proponent of the new theories of high-speed warfare centered on tanks. In his 1934 book *Vers l'armée de métier* (published in English as *The Army of the Future*), de Gaulle proposed formation of six completely mechanized and motorized divisions with their own organic artillery and air support.

General Charles de Gaulle. (Library of Congress)

Another book, *Le fil de l'épée* (*The Edge of the Sword*) revealed much about de Gaulle's concept of leadership and his belief that a true leader should follow his conscience regardless of the circumstances.

Promoted to major and then to lieutenant colonel, de Gaulle served in the Rhineland occupation forces, in the Middle East, and on the National Defense Council. Although he was advanced to colonel in 1937 and had important political friends such as future premiere Paul Reynaud, de Gaulle's views placed him very much on the outside of the military establishment.

When World War II began, de Gaulle commanded a tank brigade. His warnings about the German use of tanks in Poland fell on deaf ears in the French High Command. De Gaulle commanded the 4th French Tank Division in the 1940 Battle for France. Although the division was still in formation, he secured one of the few French successes of that campaign. Promoted to brigadier general on 1 June 1940, five days later de Gaulle was appointed undersecretary of defense in the Reynaud government. De Gaulle urged Reynaud to fight on, even in a redoubt in the Brittany Peninsula or removing the armed forces to North Africa. De Gaulle's resolve won the admiration of British Prime Minister Winston L. S. Churchill.

De Gaulle and Jean Monnet visited London and suggested to Churchill a plan for an indissoluble Anglo-French union that the French government had rejected. Returning to Bordeaux from the mission to London, de Gaulle learned that the defeatists had won and France would sue for peace. On 17 June, he departed France on a British aircraft bound for England. The next day, this youngest general in the French army appealed to his countrymen over the British Broadcasting Corporation (BBC) to continue the fight against Germany. From this point forward, de Gaulle was the most prominent figure in the French Resistance. With Churchill's support and because no prominent French politicians had escaped abroad, de Gaulle then set up a French government-in-exile in London and began organizing armed forces to fight for the liberation of his country. The Pétain government at Vichy declared de Gaulle a traitor and condemned him to death in absentia.

Initially, de Gaulle's position was at best tenuous. Most French citizens did not recognize his legitimacy, and relations with the British and Americans were at times difficult. De Gaulle insisted on being treated as head of state of a major power, whereas American leaders, especially President Franklin D. Roosevelt, and even Churchill persisted in treating him as an auxiliary and often did not consult with him at all on major decisions.

The British attack on the French fleet at Mers-el-Kébir further undermined de Gaulle's credibility. Relations with the United States were not helped by a Free French effort to secure Saint-Pierre and Miquelon off Canada. The United States recognized the Vichy government and continued to pursue a two-France policy even after the United States entered the war in December 1941.

Over time, de Gaulle solidified his position as leader of the Resistance in France. Bitter over British moves in Syria and Lebanon and not informed in advance of the U.S.-British invasion of French North Africa, de Gaulle established his headquarters in Algiers in 1943, where he beat back a British-French effort to replace him with General Henri Giraud. His agent, Jean Moulin, secured the fusion of Resistance groups within France. The French Resistance rendered invaluable service to the British and Americans in the June 1944 Normandy Invasion, and French forces actually liberated Paris that August.

De Gaulle then returned to Paris and established a provisional government there. Full U.S. diplomatic recognition came only with the creation of the new government. De Gaulle secured for France an occupation zone in Germany and a key role in postwar Europe. But with the return of peace the former political parties reappeared, and hopes for a fresh beginning faded. De Gaulle's calls for a new constitutional arrangement with a strong presidency were rejected, and he resigned in January 1946 to write his memoirs.

A revolt among European settlers and the French Army in Algeria, who feared a sellout there to the Algerian nationalists,

brought de Gaulle back to power in 1958. A new constitution tailor-made for de Gaulle established the Fifth Republic. De Gaulle's preservation of democracy was his greatest service to his country, but he also brought an end to the Algerian War, and he worked out a close entente with Konrad Adenauer's Federal Republic of Germany. De Gaulle was also controversial, removing France from the North Atlantic Treaty Organization's military command, creating an independent nuclear strike force, encouraging Quebec to secede from Canada, and lecturing the United States on a wide variety of issues. He remained president until 1969, when he again resigned to write a new set of memoirs. Unarguably France's greatest twentieth-century statesman, Charles de Gaulle died at his estate of Colombey-les-Deux-Églises on 9 November 1970.

Deception

Deception is a long-established and often essential element of warfare. It consists of actions designed to deliberately mislead enemy decision-makers as to one's capabilities, intentions, and operations. Deception causes the enemy to take specific actions that will contribute to the accomplishment of the friendly mission and weaken the enemy's strategic or tactical position. All major participants carried out deception operations during World War II.

Deception supports military operations by causing adversaries to misallocate resources in time, place, quantity, or effectiveness. A deceptive operation generally appears to be real to make the enemy believe that pretended hostile activities are genuine. By inducing a false sense of danger in one area, an enemy is forced to strengthen defenses there, weakening them where the real assault is intended to occur.

Deception theorists cite these overarching principles: the decision-maker is the target, the deception must cause a specific action (simply having an enemy believe something is not sufficient), centralized control avoids self-confusion and conflict with other friendly operations, security is required so that the enemy does not discover the ruse, timeliness is key as an enemy requires time to collect and analyze the deception-supporting signs, and friendly intelligence must confirm the desired enemy actions. Finally, integrating the deception with an actual operation adds credibility and enemy uncertainty.

A cover operation is a form of deception that leads the enemy to decide genuine hostile activities are harmless. Cover induces a false sense of security by disguising the preparations for the real attack, so that when it comes the enemy will be taken by surprise. A rumor campaign suggesting to the enemy that troops embarking to invade a tropical country are in fact bound for the Arctic is a simple example of a cover operation.

At the other end of the complexity spectrum, a deceptive plan may involve months of careful preparation and the movement of thousands of troops, hundreds of aircraft, and scores of warships—all to convince an enemy that a major assault is being mounted. For example, if an enemy believes an amphibious assault is planned against beachhead A, gathering ships within striking distance of beachhead A will reinforce this perception, while the ships are also within range of the true objective at beachhead B. A cover plan may be on the same scale, designed to conceal real preparations for a massive assault.

Preparations for the Normandy Invasion were surrounded by an extensive and detailed deception operation plan. The overall deception scheme, known as BODYGUARD, consisted of 36 subordinate plans designed to convince Adolf Hitler that the Allies were going to continue with peripheral attacks until at least July 1944, beyond the actual invasion date. The key sub-operation FORTITUDE SOUTH was intended to draw attention away from NEPTUNE, the actual Normandy Invasion. Operation FORTITUDE NORTH suggested an invasion of Norway by combined American, British Commonwealth, and Soviet forces, which kept 27 German divisions in Norway and idle. Once it became obvious that France, not Scandinavia, was the objective, Operation FORTITUDE SOUTH was designed to convince the Germans that the Allied invasion of northern France would come in the Pas de Calais area. This required the creation of a fictitious 1st Army Group in the Dover region under

Lieutenant General George S. Patton, with sham radio traffic, dummy equipment, and supporting hearsay evidence.

Operationally, the deception included more actual aerial bombardment of Calais than the of actual target. Little was beyond the scope of the deception planners. On one occasion before the Normandy Invasion, for example, Lieutenant Clifton James, a British Army Pay Corps officer who bore a striking resemblance to General Bernard Montgomery, met with troops in Gibraltar and Algeria so that German intelligence would believe the real field marshal was in the Mediterranean instead of in London.

Large-scale defensive decoys were also employed during the war, particularly in Britain during the 1940 Battle of Britain and thereafter. These decoys fell under the purview of the Air Ministry's Colonel J. F. Turner under the anonymous name "Colonel Turner's Department" or CTD. Thirty-six daytime airfield decoys called "K sites," with mowed runways, wood and canvas aircraft, and dummy trenches, each a decoy for a particular Royal Air Force (RAF) station, were completed by the summer of 1940. However, a German reconnaissance plane shot down in October 1941 contained a map that identified 50 percent of the decoy sites, and they were all subsequently closed by June 1942.

In tandem with K sites, nighttime Q sites were constructed using deceptive airfield lighting that was occasionally augmented by hand-moved lights to simulate taxiing aircraft. Q sites proved much more successful. Eventually, 171 Q sites were constructed throughout Britain, with 359 of 717 Luftwaffe bomber attacks targeting these decoys by 1942. The success of the Q sites led to variations: QL sites (*L* for lighting) simulated the presence of marshaling yards, naval installations, armament factories, and so on. Various devices emitted sparks to resemble electric train flashes; orange lights shone down onto sand, conjuring furnace glows; doors opened and closed. QF sites (*F* for fire) were created in response to the knowledge that a fire in the target area often drew more bombers to it. Thus, several important factories were provided with their own deceptive decoy installation. "Oil QF," an effort to protect oil reserves by simulating a refinery fire, foundered under the combined difficulties of excessive oil consumption (up to 2,500 gal of oil per hour were needed to keep the fires going realistically) and lack of support by the oil companies, which believed the decoys would attract bombers.

After the German raid on Coventry, large urban decoys called "Starfish sites" appeared. These were the war's largest and most sophisticated decoys. Assorted fire-producing decoys were produced, soaked variously with boiling oil, paraffin, or creosote to create convincing fire effects. Depending on the fires' color and intensity, burning houses, factories, and power stations were accurately simulated. The Starfish sites were immediately successful, and by January 1943 more than 200 had been built. By June 1944, British

decoy sites had drawn 730 attacks that otherwise would have killed British people or destroyed valuable infrastructure.

The Soviets routinely emphasized deception in military operations and often in political operations. The military staffs incorporated the complementary concepts of *maskirovka* (deception and camouflage) and *khitrost* (cunning and stratagem) into all planning levels. Although deception had been doctrinally accepted since the early 1920s, the shock of the rapid German advance to the outskirts of Moscow and Leningrad painfully reinforced its practical utility.

The Soviets crudely but successfully hid the creation and deployment of three small armies during their Moscow counteroffensive, although this was due more to poor German intelligence and bad weather than skillful deception operations. However, the Soviets soon learned the requirements of integrating tactical deception (such as having individual tank units adhere to radio silence) with operational deception (such as moving several units to an unexpected front, creating new corps to attack where no Soviet formations had been reported). By 1944, deception planning had evolved so that strategic capabilities were possible. For example, by conducting numerous operations toward western Ukraine, the Soviets habituated the Germans into believing that the USSR's strategic axis was through Ukraine into southern Poland and Romania. Spring 1944 saw an elaborate *maskirovka* operation that concealed the redeployment of actual forces while surreptitiously creating forces for the major offensive through Byelorussia, progressing against German Army Group North and eventually dislocating the entire front. By this point, Soviet use of secrecy, ruses, and disinformation provided the USSR with an operational advantage for the remainder of the war. Even when the Germans did detect the deception, it was usually too late to counter the Soviet moves.

Deception was not limited to the European Theater. The Japanese supported their initial strategic campaign through deception. Before the Japanese attack on Pearl Harbor, Allied military attachés and other sources were shown only antiquated aircraft and were intentionally misinformed regarding pilot proficiency at night flying and shallow-water torpedo attacks. The depicted incompetencies readily reinforced preconceptions that western attachés and intelligence analysts held regarding the Japanese.

Early Japanese parachute operations, such as the capture of Menado airfield on the Celebes on 11 January 1942, succeeded superbly, but these actions informed the Allies of Japanese paratroop procedures and allowed the Allies to develop ways to counter Japan's weaker airborne forces. The Japanese responded with deception. Thus, the Japanese 21 February airborne assault on Timor commenced with a feigned paratroop assault several miles from the actual drop zones. With the Dutch defenders reacting to the deceptive

attack, the main body of paratroops easily secured and held the Allied communications lines.

The United States routinely used deception in the Pacific Theater. For example, before the United States attacked Tinian Island on 24 July 1944, two dozen warships of Carrier Task Force 58 targeted Tinian Town and nearby road junctions with naval gunfire. This misled the Japanese as to the actual amphibious sites, allowing the assault ashore with greatly reduced casualties. Such deception operations played a major role in World War II.

Declaration on Liberated Europe (February 1945)

Declaration issued by leaders of the United States, Great Britain, and the Soviet Union—the “Big Three”—during the February 1945 Yalta Conference. At Yalta, the bargaining position of the western Allies was weak. They had recently suffered a major embarrassment in the German Ardennes Offensive (Battle of the Bulge), and the Soviet armies were poised to drive on Berlin. Soviet leader Josef Stalin seemed to hold all the cards, at least as far as eastern and central Europe were concerned. Soviet troops occupied most of that territory, including Poland. Stalin sought to secure control of a belt of East European satellite states, both to provide security against another German invasion and to protect a severely wounded Soviet Union against the West and its influences.

British Prime Minister Winston L. S. Churchill pointed out at Yalta that the United Kingdom had gone to war to defend Poland, and U.S. President Franklin D. Roosevelt was influenced by the Atlantic Charter and the United Nations Declaration but also by a large Polish constituency at home. Roosevelt pressed Stalin to agree to applying the Atlantic Charter to the limited area of “liberated Europe.” This, of course, excluded both the British Empire and the Soviet Union.

Stalin agreed to the resulting Declaration on Liberated Europe. It affirmed the right of all peoples “to choose the gov-

ernment under which they will live” and called for the “restoration of sovereign rights and self-government” to peoples who had been occupied by the “aggressor nations.” The Big Three pledged that in the liberated nations, they would work to restore internal peace, relieve distress, form governments that were “broadly representative of all democratic elements in the population,” and ensure that there would be “free elections” that were “broadly representative of all democratic elements in the population” as soon as possible. But such lofty phrases were subject to different interpretations.

No institutional arrangement was established to enforce the ideas embodied in the declaration. As it transpired, the Soviets chose to regard “democratic elements” as meaning all Communist and pro-Communist factions and “free elections” as excluding all those they regarded to be fascists. The result was Soviet control over much of eastern and central Europe—at first indirect and, with the development of the Cold War, direct. The Soviet Union did pay a price for the declaration in the court of world opinion, as Stalin’s promises to respect human rights were proven utterly false

Dempsey, Miles Christopher (1896–1969)

British army general. Born in New Brighton, Cheshire, on 15 December 1896, Miles Dempsey graduated from the Royal Military College at Sandhurst in 1915. He saw action on the Western Front and in Iraq in World War I. He served at Sandhurst from 1923 to 1927. Dempsey was then on the staff of the War Office from 1932 to 1934 and at Aldershot from 1934 to 1936. He was promoted to lieutenant colonel in 1938.

In 1940, Dempsey commanded the 13th Infantry Brigade (Royal Berkshires) in France as an acting brigadier general, leading it with distinction during the retreat to and evacuation from Dunkerque. Dempsey then helped train new British forces, was promoted to major general in January 1941, and

General of the British Army Miles Dempsey. (Corbis)

received command of the 42nd Armoured Division. In December 1942, at the request of Lieutenant General Bernard Montgomery, Dempsey took command of XIII Corps of the British Eighth Army and was advanced to lieutenant general. Dempsey helped plan Operation HUSKY and the invasion of Sicily, and he then commanded his corps in the assault. Dempsey also directed the assault crossing to Italy of the 1st Canadian Infantry and 5th Canadian Armoured Divisions.

By January 1944, Dempsey had returned to Britain to command the British Second Army, and, with his staff he helped develop the OVERLORD plan for the invasion of northern France. In the fall of 1944, the Second Army participated in the breakout from the Normandy beachhead, raced through France and Belgium, liberated Brussels and Antwerp, and penetrated into Holland in Operation MARKET-GARDEN. Dempsey had opposed the Eindhoven-Arnhem route, preferring instead an offensive closer to the First Army near Aachen. King George VI knighted him for his role in MARKET-GARDEN. In March 1945, the Second Army crossed the Rhine and then pushed to the Baltic. Dempsey personally took the surrender of Hamburg on 3 May 1945.

Dempsey kept close control of his subordinates, often placing his tactical headquarters close to theirs and keeping reserves under his own control in the early phases of a battle. He sought to avoid high casualties, arranging the maximum fire support and emphasizing the use of tactical air power. Many scholars consider Dempsey's influence in the war to be minimal, dismissing him as Montgomery's cipher. Dempsey's introverted nature and his shunning of both publicity and self-promotion aid this impression. The close working relationship between Montgomery and Dempsey obscures the authorship of operational decisions, as does their shared tendency to rely on verbal orders. They worked together for so long that they thought along similar lines and anticipated each other's reactions and decisions. During the Normandy Campaign, Dempsey is credited mainly with the decision and planning of operation GOODWOOD.

In August 1945, Dempsey succeeded General Sir William Slim as commander of the Fourteenth Army for the reoccupation of Singapore and Malaya. He followed Slim again as commander in chief of Allied Land Forces in Southeast Asia. Dempsey was promoted to full general on leaving that post and was commander in chief in the Middle East in 1946 and 1947. He then retired at his own request in July 1947 and entered the private sector. Dempsey died in Yattendon, Berkshire, on 5 June 1969.

Denmark, Role in War

The small nation of Denmark with a population of some 5 million people had since 1815 sought security in neutrality, and indeed the country was neutral during World War I. As additional insurance, it signed a nonaggression pact with Germany in the spring of 1939. Although Denmark's chief trading partner was Great Britain, which received Danish exports of dairy products, it was clear that Denmark lay within Germany's sphere of influence. Its conquest by Germany was a natural extension of Operation WESERÜBUNG, Adolf Hitler's plan to take Norway in April 1940. German occupation of Denmark was essential if Germany was to control Norway.

At the time of the German invasion, Denmark had an army of 14,000 men, 8,000 of whom had been recently drafted. The small navy had only 3,000 men and 2 coast defense warships (built in 1906 and 1918). The air force, split between the army and navy, had 50 obsolete aircraft. The German invasion, mounted before dawn on 9 April 1940, was over in only 2 hours. The government ordered a cease-fire after the occupation of Copenhagen, leaving insufficient time for the government or King Frederik IX to get abroad.

Germany initially employed a soft approach in Denmark, reaching an accord with the Danish government wherein most governmental functions remained under Danish control. Denmark provided important military bases to Germany and exported essential foodstuffs, such as dairy products and meat, to Germany. Indeed, these latter amounted to some 10 percent of German requirements. This arrangement worked well for three years, 1940–1943, with only sporadic resistance. The official Danish policy was to collaborate with Germany to the extent necessary, a policy supported by most of the population.

Danish collaboration was predicated on the assumption that the Germans would honor their pledge not to interfere in Danish internal affairs, but time and again the Germans broke the agreement, demanding certain military equipment and insisting on the removal of specific government officials. The Germans also demanded that Denmark make a greater contribution to the German war effort, and Danish authorities urged some 100,000 of Denmark's citizens to work in Germany to prevent them from being conscripted.

Following the German invasion of the Soviet Union, the Germans forced the Danish government to ban the Communist Party and accept German recruitment of a Danish Free Corps to fight on the Eastern Front. In November 1941, Germany insisted that Denmark join the Anti-Comintern Pact.

There were Danes who took up cause against Germany from the beginning. On the German conquest of Denmark, 232 Danish merchant ships were at sea with some 6,000 seamen. Most of the latter helped to crew ships in the Atlantic and Arctic convoys. Ultimately, 1,500 of these men lost their lives, and 60 percent of the fleet was lost. By 1944, Danes formed the crews of two British minesweepers. Another thousand Danish nationals served with various Allied forces fighting the Axis powers.

In 1940, a Danish Council was formed in London, which in 1942 became the Free Danish Movement. Henrik Kauffmann, Danish ambassador to the United States, disassociated himself from the Danish government and signed a treaty in 1941 granting the United States military bases in Greenland. British forces also occupied the Faeroe Islands, another Danish possession, in April 1940. In May 1940, the Allies also occupied Iceland, which declared itself independent in 1944.

In the spring of 1942, Berlin appointed Werner Best as Reich commissioner for occupied Denmark. A hard-line Ger-

Cheering Danes gather in Copenhagen around British soldiers, one of whom has climbed on the hood of a military vehicle, following the liberation of the city, May 1945. (Library of Congress)

man officer Generalleutnant (U.S. equiv. major general) Hermann Hanneken took command of German troops in Denmark and was encouraged by Hitler "to rule with an iron hand." Such actions infuriated the Danes and led to an uprising in August 1943. The changing German military fortunes, British radio broadcasts, and the Danish illegal press all helped shift public opinion away from collaboration to support for resistance. The occupying Germans did not confiscate radio sets, and many Danes listened to the British Broadcasting Corporation (BBC) daily. The August demonstration and associated strikes demanded an end to collaboration. Attempts by Danish authorities to crush the demonstrations ended in fatalities and were unsuccessful. There were also violent clashes between Danes and German soldiers in some provincial cities. Consequently, the Germans declared a state of emergency on 29 August, arrested most members of the Danish military, and in effect took over rule of the country.

In September 1943, the Gestapo arrived in Denmark and initiated a Nazi reign of terror that lasted to the end of the war. Some 6,000 Danes were sent to concentration camps, and hundreds more were executed outright. Many Danes sought refuge in Sweden. The Danish Freedom Council became the de facto clandestine government, an underground army was formed, and more than 2,000 acts of sabotage were carried

out, some 30 percent of these in Copenhagen. The Danish Freedom Council divided the nation into six regions, exercising central authority through its Command Committee. By the end of the war, the Danish Resistance numbered about 40,000 people. The sabotage acts had little effect on the German war effort, although news of them had a positive psychological impact on the Danish population as proof that Denmark was no longer collaborating with Germany.

Danes of all walks of life actively resisted German efforts to round up Jews. Although Best ordered the arrest of all Jews in Denmark, more than 7,000 escaped the Nazi net; 5,500 were transported to Sweden by boat. Only 472 were caught and sent to Theresienstadt. Danes did not forget those who had been sent there; they regularly sent packages of foodstuffs and clothes, and only 52 of the Jews there perished.

The Germans surrendered Denmark on 4 May, and the Danish Resistance took control of the country the next day. On 5 May, a company of the British 13th Airborne Battalion arrived in Copenhagen by plane along with Major General R. H. Dewing, head of the Supreme Headquarters, Allied Expeditionary Forces (SHAEF) mission to Denmark. British infantry troops marched into Denmark on 7 May. The following day, troops from the British 1st Parachute Brigade took the formal surrender of all German forces. When the German commander on the island of Bornholm refused to surrender, Soviet aircraft on 7 and 8 May bombed the towns of Rønne and Neks, causing great damage but few deaths. On 9 May, Soviet ships arrived at Rønne, and the Germans there surrendered. However, Soviet troops occupied the island until April 1946. Following the war, the Danish government ordered the arrest and punishment of some 34,000 Nazi collaborators.

After the war, the Danes would have preferred establishing a league of armed neutrality with Norway and Sweden, but they reluctantly followed Norway into the North Atlantic Treaty Organization (NATO). In 1951, the Danes agreed without particular enthusiasm to having U.S. naval and air bases in Greenland. Whatever hesitancy the new Danish policy might have indicated, it was a major switch from prewar neutrality and the feeling that no amount of military preparation on their part would deter their much more powerful neighbors.

Denmark Campaign (9 April 1940)

Code-named Operation WESERÜBUNG SUD (WESER EXERCISE SOUTH), the German invasion of Denmark began at approximately 4:15 A.M. on 9 April 1940. It formed an integral part of the much larger German assault on Norway (Operation WESERÜBUNG) that began the same day. German units quickly overran the Danish Peninsula, abrogating a nonaggression pact signed between Germany and Denmark in May 1939.

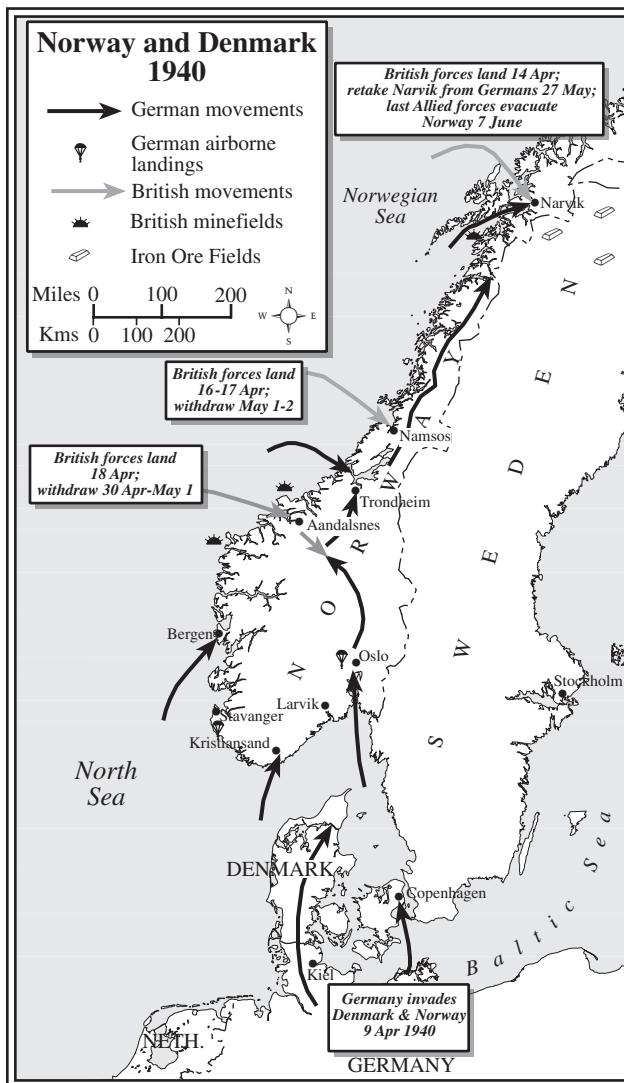

Although Danish intelligence learned of the German plans to invade as early as 4 April, the accounts were contradictory, and in any case were not believed. Certainly, the Danes had no chance whatsoever of defeating the German invaders. The poorly trained and inadequately equipped Danish army numbered only some 14,000 men, 8,000 of whom had enlisted within 8 weeks prior to the German attack. The Danish navy consisted of just 2 small vessels and approximately 3,000 men. The navy surrendered without going on alert, allowing a German troopship to arrive at Copenhagen. The Air Force had only 50 obsolete planes and a handful of pilots, no match for the vaunted Luftwaffe.

On 9 April, German seaborne forces moved into the capital of Copenhagen and secured the city by 6:00 A.M. Meanwhile, German paratroopers conducted the first airborne operation of the war when they seized the undefended fortress of Madnesø and, shortly thereafter, the airport at Aalborg in north Jutland. At the same time, German army units raced across the Jutland Peninsula in motorized columns. Although Danish Army units briefly contested the Germans in north Schleswig, the outcome was never in doubt.

German minister to Denmark Cecil von Renthe-Fink presented an ultimatum to the Danish government, demanding surrender and threatening the destruction of Copenhagen by Luftwaffe squadrons already en route if it refused. There was absolutely no chance of victory over the Germans, and eager to avoid further loss of life, King Frederik IX and Premier Thorvald Stauning believed they had no choice but to order surrender at 7:20 A.M. The campaign for Denmark was over. Danish casualties amounted to 26 dead and 23 wounded; the Germans lost 20 dead and wounded.

The German invasion provided the excuse for the Allied occupation of Iceland, which belonged to Denmark. Allied possession of strategically located Iceland proved vital in the Battle of the Atlantic. German forces occupied Denmark until the end of the war in May 1945.

Depth Charges

Explosive devices designed to sink a submarine by detonating in its vicinity when triggered by water pressure, by the target's magnetic or acoustic signature, or by a variety of timers. From 1916 until 1943, well into World War II, the depth charge was the principal antisubmarine weapon of all navies,

after which more sophisticated weapons with greater range came to the fore.

In 1939, most navies used weapons similar to the British Type D Mark III (which entered service in 1916). The Mark III had a charge of approximately 200 lb and a sink rate of 6–10 ft per second and was triggered hydrostatically to explode at depths between 25 and 300 ft. Such charges had a lethal radius of 20 ft, and exploding at 40 ft, they could force a submarine to surface. Antisubmarine vessels discharged depth charges from roll-off racks and mortars (throwers) that projected them some 40 yards to the side. At the beginning of the war, the normal procedure for antisubmarine attacks was to use depth charges in patterns of five—three dropped in a line using gravity from the roll-off racks at the stern and two fired (one to each side) by throwers to produce a diamond-shaped pattern intended to bracket the target submarine.

Development during World War II concentrated on four main areas: larger charges, faster sink rates, greater fused depths, and more effective patterns. More powerful explosives such as Minol and Torpex, which were 50 percent more effective than TNT, replaced guncotton, and charges also increased in size. The U.S. and British navies introduced weapons with 600-lb explosive charges in 1941. In 1942, the Royal Navy introduced the massive Mark X weapon with a 2,000-lb charge. It was so large it was fired from 21-inch torpedo tubes retained on destroyers and escorts for this specific purpose. Sink rates rose to 22–50 ft per second, either by adding weights to conventional charges (“heavy charges”) or by streamlining the cases. Modified fuses also allowed depth charges to explode deeper, doubling the maximum depth to 600 ft (at 50-ft intervals). The modified Mark X* sank faster because one buoyancy chamber was deleted and could be fused to explode down to 900 ft, while the Mark X** (which did not enter operational service) could be set to explode as deep as 1,200 ft.

Equally important were more effective dropping patterns. Modified casings resulted in more reliable and predictable underwater trajectories, newer projectors increased surface ranges to 150 yards, and mathematical analysis generated patterns having greater kill probabilities. First, the addition of another thrower on each beam allow use of a 7-charge pattern in the form of a hexagon, increasing the danger zone. Mixing standard and heavy charges created a new, highly effective 10-charge pattern that layered two diamond-shaped 5-charge patterns one above the other. The final development was a 3-layer 14-charge pattern using 4 throwers on each side and 6 charges dropped from the stern racks. Operational experience, however, demonstrated that, although the pattern was theoretically much more lethal than the 10-charge pattern, in practice the explosion of the first charges countermanded the later charges and rendered them ineffective.

Sailors on the deck of the U.S. Coast Guard cutter *Spencer* watch the explosion of a depth charge that resulted in the 17 April 1943 sinking of U-175. (Still Picture Records LICON, Special Media Archives Services Division (NWCS-S), National Archives at College Park)

Therefore, the antisubmarine force reverted to the 10-charge pattern and replaced the additional throwers with stowage for extra charges.

Air-dropped depth charges played an important role during and after World War II. First designs were modifications of existing surface types, which limited their efficacy, since their weight reduced the number that could be carried and they were also subject to restrictions on dropping height and speed. The purpose-designed types that followed were lighter and less subject to dropping restrictions. Scientific analysis of attack camera records contributed mightily to the effectiveness of air-dropped depth charges. Scientists learned that charges were dropped too low and with depth fuse settings that were too deep to be effective. The ultimate fuse setting for aerial depth charges of 25 ft and new bomb sights and tactics transformed the weapons' effectiveness.

During 1944, newer weapons such as Hedgehog, Squid, and homing torpedoes surpassed depth charges in killing submarines. Nevertheless, the depth charge was still an important antisubmarine weapon until after the war's end.

Destroyers

Small warships that are lightly armed and protected and capable of high speed. The destroyer originated in connection with the self-propelled torpedo, which was introduced in the late 1860s, and the consequent construction in the following decade of torpedo boats to carry the new weapon. These small, inexpensive warships offered the potential to destroy battleships, which were the most powerful and most costly vessels afloat. Most naval powers of the age, as they based their fleet strength on the battleship, endeavored to devise a defense against the torpedo boat. In 1893, Great Britain produced an answer in the *Havock*, the first modern torpedo-boat destroyer. Torpedo-boat destroyers were essentially enlarged torpedo boats that carried light guns and torpedoes. They were to hunt down and destroy enemy torpedo boats before the latter could launch their weapons against the capital ships of a battle fleet. Development in all maritime nations yielded vast improvements over the first torpedo-boat destroyers. By World War I, there were more of these warships (known by this time simply as destroyers) than of any other ship type in the world's navies.

The role of destroyers changed because of their increasing design capabilities in the years before World War I and from wartime experience. Destroyers became superior in all respects to the torpedo boats they were designed to destroy. As a result, naval powers in the prewar years largely discontinued the production of torpedo boats in favor of destroyers. The destroyer assumed the offensive role of torpedo boat while retaining the role of defending against torpedo attacks launched by enemy destroyers. World War I added extensively to the duties of these vessels. By the end of that conflict, destroyers had acted not only in the roles envisioned for their type, but also as surface combatants and bombardment ships in amphibious operations. More important than these uses, however, was their use by Great Britain, France, and later the United States as escorts for merchant convoys to defend against submarine attack. Destroyers were particularly effective in this capacity after the wartime introduction of depth charges and underwater listening devices such as hydrophones and sonar.

World War I demonstrated the importance of destroyers, and the same basic types continued during the interwar years. Great Britain had such large numbers of the craft that fresh designs were not initiated immediately after the close of the war in 1918. However, destroyer construction in Italy led France to respond, as French politicians and naval officials viewed Italy as France's principal naval competitor in the Mediterranean. In 1923, France built large vessels that began a trend toward "superdestroyers" in the world's navies. Great Britain and Japan returned to destroyer pro-

Destroyers Lost by Combatants in World War II

duction in the late 1920s; the United States did not initiate new construction until the early part of the next decade. Germany, although restricted by the Treaty of Versailles after World War I, began building new vessels at the same time as the United States.

This destroyer construction took place in an era of naval disarmament as the world's great powers sought to limit production as a means to prevent future wars. Unlike most other warships, few restrictions were put on the design and number of destroyers during the naval disarmament talks of the period. The 1930 London Conference limited destroyers to a maximum displacement of 1,850 tons and their guns to 5 inches or smaller, but these stipulations meant little. Until the late 1930s, the largest and most heavily armed designs met these requirements, and the limit was increasingly ignored after 1934 when the Japanese withdrew from the Washington Treaty and declared that they would not support future arms limitations discussions.

The American Somers-class is an example of destroyer design in the years immediately before the outbreak of World War II. Completed in 1937, the *Somers* measured 381' × 36' 11" and displaced 2,047 tons. She had exceptionally heavy armament: 8 × 5-inch guns, 8 × 1.1-inch guns, 2 × .5-inch weapons, and 12 × 21-inch torpedo tubes. The *Somers* had no armor protection and could steam at a maximum speed of 37 knots. Destroyers belonging to other naval powers loosely approximated the size, displacement, and armament of this vessel. France remained the exception as it continued to design destroyers that sometimes dwarfed those of other nations. The *Mogador*, launched in 1937, measured 451' 1" × 41' 7", displaced 2,884 tons, and carried no armor protection. It was armed primarily with 8 × 5.5-inch guns and 10 × 21.7-inch torpedo tubes and was capable of 39 knots. Despite the increase in the size and armament of destroyers, they were in most respects technologically the same as their World War I predecessors, although in some destroyer classes the largest

guns were mounted in gun houses rather than open mounts to provide protection for crews. A further difference from the past was the incorporation of anti-aircraft guns to fend off air attack.

By 1940, as during World War I, destroyers were the most numerous warships in the world's navies. Great Britain operated 247 destroyers of varying types and ages. The United States counted 149, and Japan had 116. Italy operated 90 destroyers. The other naval powers of the world also possessed large fleets: France maintained 66; the Soviet Union had 62; and Germany, through a naval policy that had violated the Treaty of Versailles, possessed 37.

World War II proved the continued importance of destroyers and introduced a new vital duty, convoy escort.

World War II proved the continued importance of the roles destroyers had performed in the previous world conflict and introduced a new vital duty. In the Atlantic Theater, the primary task of British and Canadian destroyers was as

convoy escort to guard against attack of merchant vessels by German submarines. This effort proved so important that the destroyer formed the basis for one of the first diplomatic agreements between Great Britain and the United States during the war. The 1940 Destroyers-Bases Deal transferred 50 aging World War I-era American destroyers to Great Britain in return for basing rights in the Western Hemisphere. Throughout the war, destroyers fought and helped to win the Battle of the Atlantic. Despite heavy losses in merchant vessels, ultimate Allied success in this effort allowed Great Britain to continue in the war. In addition, it enabled the transport of American troops to the European and Mediterranean Theaters after 1941.

Destroyers were also used as surface combatants, support for amphibious operations, troop transports, and resupply ships. An example in the Atlantic Theater of the first three of these roles is Germany's April 1940 invasion of Norway. Destroyers not only bombarded areas earmarked for the landing of troops, but they also attempted to fend off attacks from opposing British warships, and they transported a portion of the German ground force. The same roles existed for destroyers in the Mediterranean, where Allied vessels bombarded enemy positions during Operation TORCH, the November 1942 Allied invasion of North Africa. British vessels also acted as resupply ships for both the Allied troops in North Africa and the garrison on Malta, the principal British outpost in the Mediterranean.

These same roles were prevalent in the Pacific Theater, involving largely the forces of the United States and Japan. The Japanese used the destroyers both as surface combatants and as resupply vessels. Destroyers armed with the Long Lance torpedo were a key element of Japanese tactical operations and proved their effectiveness, especially in early night actions. The best example of a resupply effort was the famous Tokyo Express, which resupplied Japanese troops during the 1942–1943 contest for Guadalcanal. Destroyers were well suited for this resupply role as they were fast enough to make the voyage to Guadalcanal and depart still under cover of darkness. Early U.S. deficiencies in night-fighting were overcome, and American destroyers soon matched their Japanese counterparts in surface combat. In the August 1943 Battle of Vella Gulf, American destroyers sank three Japanese destroyers with no losses. The Japanese also used destroyers to protect convoys that supplied the home islands with war matériel.

In addition, use of destroyers in an anti-aircraft role was widespread in the Pacific Theater. Both the Japanese and the United States sought ways to effectively defend their most important capital ships, the aircraft carriers. Destroyers partly filled the need for anti-aircraft defense. This critical duty was reflected in the significant increase in the anti-aircraft gun batteries of both Japanese and American destroyers during the war. The 12 Japanese Akitsuki-class vessels, launched between 1941 and 1944, mounted only 4 × 25-mm guns in addition to their primary armament of 8 × 3.9-inch guns, which could be used against surface targets or elevated and used against aircraft. By the end of the war, the complement of 25 mm guns had risen to 40–51 each for the surviving ships of the class. American destroyers showed the same shift to greater anti-aircraft armament over the course of the war based on combat experience. By 1944, the 58 vessels of the Allen M. Sumner-class mounted a primary armament of 6 × 5-inch guns that could be used for surface combat or against aircraft and a smaller battery of 12 × 40-mm guns specifically devoted to anti-aircraft defense.

The large number of critical roles performed by the destroyers and their consequent frequent use led to wartime construction that yielded an additional 633 destroyers among the principal naval combatants. The vast majority of these vessels were produced in the United States and Great Britain, which completed 392 and 165 ships, respectively. An example of wartime construction is the 150-ship U.S. Navy Fletcher-class. Launched between 1942 and 1944, these vessels measured 376' 5" × 39' 7", displaced 2,325 tons, and were protected by light side and deck armor. They were armed with 5 × 5-inch guns, 4 × 1.1-inch weapons, 4 × 20-mm guns for anti-aircraft defense, and 10 × 21-inch torpedo tubes. They could make 38 knots.

The necessity for vessels to fulfill convoy escort roles also led to the production of a new type of destroyer that was

USS *Cassin*, one of the three destroyers sunk at Pearl Harbor, during the Japanese attack of 7 December 1941. (Hulton Archive)

cheaper and faster to build. Known as the destroyer escort, this ship was an essentially smaller, less capable destroyer with greater antisubmarine warfare capability. An example is the American TE-class escort, which measured 306' × 37' and displaced 1,432 tons. These were armed with 3 × 3-inch guns and an assortment of antisubmarine weaponry.

During the war, the belligerent powers constructed 915 destroyer escorts. The United States and Great Britain accounted for the majority of this production with 499 and 349 ships, respectively. The design of both the destroyers and destroyer escorts of the Allies and Germany and Italy benefited from the incorporation of radar, which was retrofitted to vessels produced before the war.

World War II exacted a heavy toll in terms of destroyers lost. By the end of the conflict, the belligerents had suffered a combined loss of 490 destroyers of varying types: among these, Japan lost 147; Great Britain suffered 133 sunk, largely in the Battle of the Atlantic; Italy lost 69 vessels; the United States counted 68 destroyers sunk; the Soviet Union lost 26; and France lost 14.

Destroyers-Bases Deal (2 September 1940)

An agreement between U.S. President Franklin D. Roosevelt and British Prime Minister Winston L. S. Churchill in 1940

that provided Great Britain with World War I–vintage U.S. destroyers, in return giving the United States access to British bases in North America and the Caribbean.

Following the evacuation of the British Expeditionary Force from Dunkerque, Britain was virtually naked militarily, and the nation now awaited a German attack. When Churchill appealed to Roosevelt for military assistance, the U.S. reaction was immediate and extraordinary. Within days, 600 freight cars were on their way to U.S. ports filled with military equipment to be loaded aboard British merchant ships. These included half a million rifles and 900 old 75 mm field guns.

On 15 June, Churchill directly appealed to Roosevelt for 35 old U.S. destroyers. With Germany controlling both the Channel ports and Norway, Britain faced the prospect of defending against German invasion with but 68 destroyers fit for service, a stark contrast to the 433 destroyers possessed by the Royal Navy in 1918. Britain's shipping lanes were even more vulnerable to German submarines with the fall of France, and Italy's entry into the war had made the Mediterranean an area of difficult passage. As Churchill put it to Roosevelt, "We must ask therefore as a matter of life or death to be reinforced with these destroyers." Over the next days and weeks, as the number of these British warships continued to dwindle, Churchill's appeal grew to 50–60 destroyers. Roosevelt's insistence on proceeding with the aid went against the advice of Army Chief of Staff General George C. Marshall and Chief of Naval Operations Admiral Harold Stark, who believed that Britain was doomed and that such a step would strip America bare militarily before new production could materialize.

With American public opinion strongly against U.S. intervention, Roosevelt masked the transfer in a deal announced in an executive order on 3 September 1940 that was not subject to congressional approval. Britain received 50 World War I–vintage destroyers from the United States, in return granting the United States rights of 99-year leases to British bases in North America and the Caribbean Islands. The United States claimed that the agreement did not violate American neutrality because the British were providing access to naval bases and facilities deemed essential for American defense, including those in Newfoundland, Bermuda, British Guiana, Jamaica, Saint Lucia, and Trinidad. The Roosevelt administration maintained that the deal was an important step in ensuring national security and preventing the spread of the European war to the Americas.

Actually, the United States got far more than it gave. The destroyers were in wretched condition; some barely made it across the Atlantic. But the deal gave a tremendous boost to British morale at a critical juncture, and Churchill viewed this as another step by the United States toward outright participation. Privately, German leader Adolf Hitler saw this in much the same light. Anxious to unleash Japan in Asia to

occupy the United States, he ordered talks opened with Japan that culminated in the Tripartite Pact of 27 September. The long war, a clash involving continents that would give advantage to nations with superior sea power, drew closer to realization. One of the destroyers, HMS *Campbeltown* (formerly the USS *Buchanan*) played a major role in the British destruction of the dry dock at Saint Nazaire, France, on 28 March 1942.

Devers, Jacob Loucks (1887–1979)

U.S. Army general. Born on 8 September 1887 in York, Pennsylvania, Jacob Devers graduated from the U.S. Military Academy, West Point, in 1909 and was commissioned a second lieutenant of artillery. In 1912, he returned to West Point as an instructor.

During World War I, Devers was at Fort Sill, Oklahoma. In 1919, he served in the occupation of Germany and attended the French Artillery School at Treves before again teaching at West Point. Devers graduated from the General Staff College (1925) and the Army War College (1933). From 1936 to 1939 he was at West Point, where he was advanced to colonel.

After World War II began in Europe in 1939, Army Chief of Staff General George C. Marshall ordered Devers to place the Panama Canal Zone on a wartime footing. The next year, Devers was promoted to brigadier general. Following staff duty in Washington, he commanded the 9th Infantry Division at Fort Bragg, North Carolina. Supervising the rapid expansion of this base, he earned promotion to major general.

Known for his ability to train troops, Devers in July 1941 took command of the Armored Force at Fort Knox, Kentucky, and there he supervised the rapid expansion of U.S. armored forces. He soon became an enthusiastic advocate of mobile combined-arms warfare. Devers was promoted to lieutenant general in September 1942.

In May 1943, Devers took charge of U.S. Army ground forces in the European Theater of Operations (ETOUSA). He supervised the rapid U.S. buildup in Britain and hoped to lead the cross-Channel invasion. Instead, he was sent at the end of 1943 to the Mediterranean as deputy supreme Allied com-

Lieutenant General Jacob L. Devers, deputy commander in the Mediterranean Theatre, inspects a Punjab regiment 28 April 1944. (Hulton Archive)

mander there, replacing General Dwight D. Eisenhower. On 15 September 1944, Devers finally received the combat command he had long sought: the Sixth Army Group of 23 divisions, consisting of Lieutenant General Alexander Patch's Seventh Army and General Jean de Lattre de Tassigny's First French Army, which had invaded southern France in Operation DRAGOON. In March 1945, Devers was promoted to general and that same month his Sixth Army Group crossed the Rhine and drove into southern Germany and Austria, where he accepted the surrender of German forces on 6 May.

Devers commanded U.S. Army Ground Forces from 1945 to 1949 and retired in September 1949. He died in Washington, D.C., on 15 October 1979.

Dewey, Thomas Edmund (1902–1971)

U.S. politician and twice Republican Party candidate for president. Born on 24 March 1902 in Owosso, Michigan, Thomas Dewey graduated from the University of Michigan in 1923, received his law degree from Columbia University in 1925, and in 1926 was admitted to the New York bar. Dewey launched his government career five years later as chief assistant to the U.S. attorney for the southern district of New York. Dewey became U.S. attorney for the southern district of New York in 1935. Between 1935 and 1937, he garnered national attention as special prosecutor in an investigation of organized crime in New York, securing 72 convictions out of 73 prosecutions of long-established racketeers.

Dewey was district attorney of New York County in 1937 and 1938. Unsuccessful as the Republican candidate for governor of New York in 1938, Dewey won the state office for three successive terms beginning in 1942. As governor, he earned a reputation for political moderation and administrative efficiency, putting the state on a pay-as-you-go basis for capital building, reorganizing departments, and establishing the first state agency to eliminate racial and religious discrimination in employment.

The Republican nominee for U.S. president in 1944, Dewey was not able to overcome the enormous prestige of incumbent President Franklin D. Roosevelt, nor had he been expected to. Dewey refused to make an issue of the Pearl Harbor disaster of December 1941, but he charged the Democrats with inefficiencies in rearmament, an antibusiness stance, extravagance, and corruption. He also condemned Roosevelt's support of the Soviet Union. Roosevelt won the 1944 election with 25,606,585 popular votes and 432 electoral votes to Dewey's 22,321,018 popular votes and 99 electoral votes.

Dewey ran again for the presidency in 1948 against Roosevelt's successor, incumbent Harry S Truman. Although the pollsters predicted victory for Dewey, Truman won. Dewey then returned to private law practice. He died on 16 March 1971 in Bal Harbor, Florida.

Dieppe Raid (19 August 1942)

First major European amphibious operation of World War II. On 19 August 1942, a landing force of 5,000 Canadian and 1,000 British troops plus a token force of 60 U.S. Army Rangers raided the German-held French port of Dieppe on the English Channel. The raid, which was undertaken at the instigation of Chief of Combined Operations Lord Louis Mountbatten, was launched as a demonstration to the Soviet Union of Allied resolve and as a rehearsal for a subsequent major cross-Channel invasion. An assault, even a small one, could demonstrate to the people of occupied Europe that they were not forgotten and that eventual liberation was on the way.

Dieppe was selected because it was within range of fighter support from Britain and because wide beaches adjacent to the

town provided good prospects for landing troops. German defenses were formidable. They included coastal artillery, an offshore minefield, nearby airfields, and the close proximity of troops who could rapidly reinforce the city's garrison.

Operation JUBILEE, as the raid was called, began before dawn on 19 August and ran into trouble early. The assault boats were discovered as they approached the landing site, and they then were fired on by five armed German trawlers. All hope for surprise was lost as the German defenders established a deadly crossfire on the beach in the predawn darkness. By 9:00 A.M. carnage reigned supreme, and the British commanders decided to withdraw the surviving troops. Allied destroyers escorted the rescue boats in under murderous German fire to extract the survivors.

By early afternoon, the rescue boats were headed back to England with the remnants of the Dieppe raiders, leaving 24 officers and 3,164 men behind who had been either killed or captured. The overall Allied personnel casualty rate was more than 40 percent, the highest of the war for any major offensive involving all three services. The Canadians suffered the worst; with 4,963 men, they made up 80 percent of the attackers, and

Allied soldiers stand guard over blindfolded German prisoners captured during the raid on Dieppe, France, in August 1942. (Library of Congress)

3,367 were casualties (907 killed). Some Canadians have called it the worst military disaster in their history. During the battle, 33 landing craft and 30 tanks were lost. Additionally, a destroyer was sunk by the Germans during the evacuation effort. The British lost 106 aircraft shot down; the Germans lost only 48.

The lessons of the failed operation, however bitter, were very important—both on the general points of how difficult it is to capture a defended port and how crucial is a preliminary bombardment to the more detailed lessons relating to equipment for beach landings. Equipment, organization, and command structure were all found sadly deficient. However, historians differ concerning the impact of these lessons on the planning and preparation for the subsequent North African landing in November 1942 and later Allied invasion of Normandy in June 1944. In any case, the Dieppe raid did bury the myth that a cross-Channel invasion would be possible in 1942, and it cast grave doubts for the success of such an operation even in 1943. It did not intimidate the Germans or cause them to transfer forces from the Eastern Front. Quite the contrary, it starkly demonstrated the pathetic state of Allied preparations to open a second front. The Dieppe raid was more than a political setback. Its most telling consequence was to dissuade Prime Minister Winston L. S. Churchill and the British chiefs of staff from any commitment to cross-Channel operations.

In early 1940, Dietrich received command of the Leibstandarte SS Adolf Hitler (LSSAH), which became a panzer-grenadier division in 1942. With it he took part in the invasions of France, Greece, and the Soviet Union. When the western Allies landed in Normandy in June 1944, Dietrich commanded the 1st SS Panzer Corps, and in September Hitler gave him command of the Sixth SS Panzer Army. Dietrich was awarded the Reich's highest decoration, the Diamonds to the Iron Cross, and in August 1944 he was promoted to the rank of Oberstgruppenführer. His army played an important part in the December 1944 Ardennes Offensive, but it was unable to realize Hitler's far-reaching expectations.

Dietrich then fought on the Eastern Front. His last offensive, which was in Hungary during March 1945, failed. Dietrich, to that point the prototype of the National Socialist soldier, lost Hitler's confidence because he questioned Hitler's directives and ordered the retreat of his exhausted troops.

After the war, Dietrich was found guilty of being responsible for the execution of U.S. prisoners of war (the Malmédy trial) and was sentenced to 25 years' imprisonment. Dietrich served only 10 years, but he was later arrested again and charged for murders committed in 1934. He was sentenced to only 18 months in prison. Dietrich died at Ludwigsburg on 21 April 1966.

Dietrich, Josef "Sepp" (1892–1966)

German Schutzstaffel (SS) general and commander of Leibstandarte, a bodyguard unit responsible for Adolf Hitler's personal safety. Born on 28 May 1892 in Hawangen, Bavaria, Josef Dietrich volunteered for the army in 1914 and became a crewman in one of Germany's first tanks. After the war, Dietrich was active in the Freikorps before joining the National Socialist Party and the SS in 1928. He was selected as one of Hitler's bodyguards and was in charge of the buildup of the Leibstandarte. In the Blood Purge of July 1934, Dietrich led an execution squad in the elimination of the leadership of the Sturmabteilung (SA, Storm Troopers).

Dill, Sir John Greer (1881–1944)

British Army field marshal, chief of the Imperial General Staff (IGS), and member of the Combined Chiefs of Staff (CCS). Born in Belfast, Ireland, on 25 December 1881, Dill was commissioned in the British army on graduation from the Royal Military Academy at Sandhurst in 1901. He fought in the latter stages of the 1899–1902 South African (Boer) War.

On the outbreak of World War I, Dill was a student at the Staff College of Camberley. He then held staff positions with units on the Western Front, but he also saw action and was wounded. Considered an exceptional staff officer, Dill was transferred to the operations branch, general headquarters,

Gen. Josef Dietrich, former commander of the Sixth SS Panzer Army (11); Gen. Fritz Kraemer, chief of staff to Dietrich (33); and Lt. Gen. Herman Priess, former commanding general of the I SS Panzer Corps of the Sixth Panzer Army (45) and others on trial at Dachau for the massacre of American troops at Malmédy, Belgium. (Bettman/Corbis)

and he ended the war as the head of that branch and a temporary brigadier general.

Dill served in a variety of posts after the war. In 1930 he was promoted to major general, and the next year he was appointed to head the Staff College. In 1934, he became director of operations and intelligence at the War Office. At the outset of World War II, Dill received command of I Corps but did not see action. In April 1940, he was appointed vice chief of the Imperial General Staff and succeeded Field Marshal Sir Edmund Ironside as CIGS in late May 1940. His term as CIGS was a rough one. He presided during the British military withdrawal from continental Europe and the Battle of Britain, when the United Kingdom seemed on the brink of destruction. He never got along well with Prime Minister Winston L. S. Churchill, who regarded him as too cautious. In November, the government announced that Dill would retire the next month when he reached age 60 and would be named governor-designate of Bombay, India. In recognition of his

services, he was promoted to field marshal. This was done to make room for General Alan Brooke to become CIGS. As CIGS, Brooke was Dill's staunch supporter and friend. He convinced Churchill in a meeting on 11 December 1941 that Dill should accompany the prime minister to the United States and then remain for duty with the British Joint Staff Mission.

As the Combined Chiefs of Staff were formed in January 1942, Dill became the available man to chair the British Joint Staff Mission in Washington, a new strategic organization charged with coordinating British and American strategy and logistics within the CCS. Despite his poor health, Dill soon found his way into the hearts and minds of his American colleagues, and he succeeded in a demanding assignment. He got along well with U.S. President Franklin D. Roosevelt and Army Chief of Staff General George C. Marshall. Dill became the resilient link—and the buffer—between two nations joined in a sometimes uneasy partnership at war.

Dill died in Washington on 4 November 1944 and was buried in Arlington National Cemetery, the only foreign officer ever afforded that distinction. The U.S. Congress honored him with a joint resolution in December 1944. On 1 November 1950, a magnificent equestrian statue of Dill was dedicated in Arlington Cemetery. He was awarded the American Distinguished Service Medal posthumously and had been knighted in 1937 by his own nation.

Displaced Persons (DPs)

The term *displaced person* (DP) was often used for refugees who at the end of the war in Europe were living outside their prewar national boundaries and needed assistance. In 1942, Great Britain and the United States solicited support from the other Allied powers for help in dealing with the expected masses of slave laborers, prisoners of war, and political prisoners in Germany and its conquered territories. These efforts culminated in November 1943 when 44 nations signed the Agreement for United Nations Relief and Rehabilitation Administration (UNRRA), the first international organization created to help to wartime refugees. As the United States would be contributing about 40 percent of UNRRA's budget, an American, former New York governor Herbert Lehman, became its first director.

UNRRA planned to provide DPs with housing, food, clothing, and other necessities until each person could be "repatriated" to his or her home nation. This did not take into account the fact that many DPs, especially Jews and ethnic Germans from eastern Europe, could not safely return home. Others, particularly Poles and Czechs, did not want to return to home nations occupied by the Soviet army. The estimated two-year time frame for UNRRA to carry out its tasks was also wildly optimistic.

UNRRA field teams for dealing with DPs were made up of multinational groups of about a dozen men and women per team. They were selected for language skills and backgrounds

in administration, social work, medicine, or various mechanical abilities. In 1944, these teams began to assume administration of refugee camps that Allied military forces had established in North Africa and Italy. Teams had to rely on the Allied military for additional personnel, transportation, and assistance in enforcing the UNRRA regulations at the camps. Some local commanders were quite helpful; others were indifferent or even hostile to UNRRA. This problem lessened somewhat when the Supreme Headquarters, Allied Expeditionary Forces (SHAEF) named U.S. Major General Allen Gullion, former provost marshal general of the army and an efficient organizer, as the head of its own displaced persons branch.

By the end of the war in Europe, SHAEF and UNRRA had identified more than 10 million refugees in and around Germany. Others in Soviet-controlled areas were never accurately counted. Most DPs, primarily the former prisoners of war and slave laborers from western Europe, were repatriated before the end of 1945. But nearly 800,000 others remained and were housed in DP camps across occupied Germany.

DP camps were built from German army barracks, depots, and even some former concentration camps. In some areas, neighborhoods and entire villages became "DP towns." UNRRA organized most camps by nationality, having learned that mixed camps too often led to violence. Since DPs were permitted to move freely, over time camps took on specific national and cultural identities. This ethnic concentration was reinforced by the practice of allowing each camp to elect a governing council and maintain its own police force.

UNRRA and the military enforced occupation regulations against black marketing and the like. Throughout 1946, the DP population fluctuated; many Poles and others returned to their home countries. There were still several hundred facilities housing DPs in 1947, when the International Refugee Organization replaced UNRRA as the administrator of refugee matters. Conditions in the camps were crowded, an average of 100 sq ft or less of space allotted to families of five or more people. Food remained scarce, and daily diets in the camps seldom exceeded 2,000 calories and were often less. Packages of food from America and the International Red Cross helped somewhat. As the Cold War intensified, DP populations grew again when individuals and families fled Poland and the other eastern European nations for the west.

Finding permanent homes for these masses of men, women, and children taxed the energies of Europe and the world well into the 1950s. At first, nations such as Belgium, Australia, and Canada accepted only single men who were willing to work in mining, forestry, and other heavy-labor jobs. Great Britain, albeit with some reluctance, permitted Jewish survivors of the Holocaust into Palestine and made room at home for Polish soldiers who had fought with the United Kingdom during the war.

German displaced persons, carrying their few belongings as they wait in Berlin's Anhalter Station to leave the German capital in 1945. (Library of Congress)

The United States moved slowly in passing legislation to accept DP immigrants. The resulting 1948 law had long waiting periods, quotas, and other restrictions similar to those of the 1930s, but through it increasing numbers of former DPs came to the United States. Ethnic Germans obtained a plurality of American visas because they received considerable help from American church groups. Ultimately, more than 580,000 DPs settled in the United States between 1949 and 1957—more than half of the total number of DPs who went to some 113 countries by the end of the 1950s. The last DP camp closed in 1957. Those who had not found a home elsewhere, mostly the old and infirm, then became the responsibility of the government of the Federal Republic of Germany.

The DP program was an extraordinary experiment in international cooperation to salvage wrecked lives. At the camps, many refugees received the first decent treatment they had known in years. Some were able to take advantage

of educational opportunities and learn new trades that increased their chances for immigration. Most of these men, women, and children eventually found new homes somewhere in the world. But it took far longer to achieve this than the originators of the program had expected, and by then new struggles had been ignited in the Middle East and in Korea that produced new refugee populations. These made it clear that the world had not seen the end of the problem of displaced persons.

Dixie Mission to Yan'an (Yenan) (July 1944–March 1947)

U.S. Army Observer Group sent to Yan'an (Yenan), China, to establish a liaison with Chinese Communist forces. The Dixie Mission began in July 1944 when a nine-man U.S. Army team flew to the headquarters of Chinese Communist leader Mao Zedong (Mao Tse-tung) at Yan'an in Shaanxi (Shensi) Province in north central China. Colonel David D. Barrett, a "China hand" who had studied the language and served as a military attaché to China, headed the mission, which would continue through 1947. It included officer and enlisted personnel from all three services as well as representatives of the U.S. State Department. Barrett's mission was to collect information about Japanese and their "puppet" Chinese forces order of battle and operations. He was also to determine the extent of the Communist military effort in the war against Japan and to coordinate the search and rescue of downed Allied pilots in Communist-controlled areas.

A U.S. military mission to the Communists had first been suggested in mid-1943. Lieutenant General Joseph Stilwell's political adviser, John Paton Davies, believed strongly that U.S. advisers to Mao's headquarters could make a difference by coordinating with Chinese Communists who were fighting the Japanese. Davies drew parallels to the effort of the Allies to assist the Partisans of Tito (Josip Broz) in Yugoslavia. Fearing that American supplies and equipment would be diverted to the Communists and that U.S. leadership might develop a more favorable view of the Chinese Communist movement and operations in the territories held by them, Generalissimo Jiang Jieshi (Chiang Kai-shek) strongly opposed the mission to Yan'an. For the next year, the United States continued to pressure Jiang to allow this mission to go forward, but not until after the June 1944 visit of U.S. Vice President Henry A. Wallace could sufficient pressure be exerted on Jiang to allow the liaison mission to begin.

Communist official representative to the national government at Chongqing (Chungking) Zhou Enlai (Chou En-lai), who saw potential in a future collaboration between the United States and the Red Army in the fight against the Japanese, supported an increase in American presence and the liaison effort. By August 1944, Barrett and a team that eventually numbered more than 20 people, including State Department officials John S. Service and Raymond P. Ludden, began to meet with the most senior political and military leadership of the Communist movement and to gather information about the Japanese and their allies as well as the Chinese Communists. The mission also provided the opportunity in November for Major General Patrick J. Hurley, in his capacity as a special emissary of U.S. President Franklin D. Roosevelt, to

begin an effort to get the two Chinese factions to focus their efforts on fighting the Japanese rather than each other. During the course of the mission, the Dixie group secured the rescue and return of more than 100 American pilots.

The mission served perhaps its most important function after the war as a bridge between the United States and the Chinese Communists. A mission headed by General George C. Marshall brought the two sides to the negotiating table in an effort to secure a solution to the infighting in China that had been going on for decades. The collapse of the Marshall mission in January 1947 led to the end of the observer mission.

Dodecanese Islands

The islands of the southern Aegean Sea off the southwest coast of Anatolia were known through much of their history as the eastern or southern Sporades ("scattered"). The islands include Rhodes, Karpathos, Kassos, Haliki, Kastellorizo (Castlerosso), Alimia, Tilos, Symi (Simi), Nissyros, Kos (Cos), Pserimos, Astypalea, Kalymnos, Telendhos, Leros, Lipsi, Patmos, Arki, and Agathonissi. Early in the twentieth century, the Young Turks revoked the historic privileges enjoyed by the islanders, who were part of the Ottoman Empire. Twelve islands (*dhodkeka nisia*) joined in a failed protest against the loss of these privileges, and the name of *Dodecanese* stuck as a term for all these islands, even though they exceeded 12 in number.

In 1912, as a consequence of the Italo-Turkish War, the Dodecanese Islands passed to Italian control. In 1941, the Germans joined their Italian allies in garrisoning the islands, which were inhabited chiefly by Greeks. The Italians had

naval and air bases on Rhodes, the strategic key to the area. There was also an airfield on Kos, a seaplane base and naval batteries at Leros, and an air base on Scarpanto.

When Italy surrendered on 8 September 1943, the Dodecanese were occupied by two poorly equipped Italian divisions totaling 37,000 men; Italian morale was very low. The Germans had one division of 7,000 men, which was well equipped with tanks and artillery. The local Greek population was excited at the prospect of liberation by the Allied powers.

British Prime Minister Winston L. S. Churchill ordered that operations be conducted against the Dodecanese Islands. He believed that success there would open the way to the Dardanelles and the Balkans. He also sought to induce Turkey to join the war and to remove the stain of Britain's defeat in World War I at Gallipoli. The original plan for an invasion of the Dodecanese, prepared by the Middle East Command, was known as Operation MANDIBLES, but it was subsequently renamed Operation ACCOLADE. Churchill appealed to President Franklin D. Roosevelt and to General Dwight D. Eisenhower for aid to liberate the Dodecanese. The Americans, who were preparing a landing on the Italian peninsula at Salerno, rebuffed him. Roosevelt also suspected that the British hoped to open a new front in the Balkans. Coincidentally, the Combined Chiefs of Staff meeting in Quebec ordered most of the landing ships in the Middle East to the Indian Ocean, which starved the operation of needed assets.

When Italy surrendered on 8 September 1943, three British operatives led by Major Lord George Jellicoe parachuted onto Rhodes. They contacted Italian authorities there and urged them to take the Germans prisoner. However, Admiral Inigo Campioni, commander of Italian forces in the Aegean, hesitated. The Germans, meanwhile, acted swiftly and soon subdued the Italians.

The British nonetheless proceeded with some landings, and by October 1943—with a force of 5,000 men and a small flotilla—they secured several islands, among them Kos, Samos, Patmos, and Leros. They were not able, however, either to gain air superiority or take Rhodes, and as long as the Germans were secure at Rhodes, the British could not hold the Dodecanese.

On 3 October 1943, the Germans went on the offensive, attacking Kos. Heavy bombing of the island by Stuka aircraft reduced the British defenses, and soon the British force there surrendered. Churchill refused to consider a withdrawal, instead ordering that Leros and Samos be held at all costs. Indeed, the British reinforced Leros. On 12 November, the Germans attacked Leros with overwhelming force, taking it four days later. The British troops remaining in the Dodecanese then withdrew.

Among British units involved were the Long Range Desert Group, the Special Boat Squadron, the Raiding Forces' Lev-

ant Schooner Flotilla, the King's Own, the Royal Irish Fusiliers, and the Durham Light Infantry. The Greek navy provided 7 destroyers to assist the more numerous British vessels. In the offensive, the British lost 4 cruisers damaged and 2 submarines, 6 destroyers, and 10 small coastal vessels and minesweepers sunk. The Royal Air Force flew 3,746 sorties and lost 113 aircraft out of 288 involved. The British army lost in all about 4,800 men, while the Italians lost 5,350. German casualties totaled some 1,184 men, 35,000 tons of shipping (between late September and late November 1943), and 15 small landing craft and ferries. The operation failed as a consequence of Campioni's hesitation, German aggressiveness, noncooperation by the Americans, and the inadequacy of British resources. Holding the islands, however, stretched German resources, ultimately tying down some 60,000 Germans who might have been better employed elsewhere.

After the war, the British governed the Dodecanese until 1947. The islands were then turned over to Greece.

Dönitz, Karl (1891–1980)

German navy admiral who commanded the U-boats and later the full Kriegsmarine and then succeeded Adolf Hitler as head of the Third Reich. Born in Gruenau-bei-Berlin on 16 September 1891, Karl Dönitz joined the German navy in 1910. During World War I, he served on the cruiser *Breslau*, but he transferred to U-boats in 1916, commanding several submarines in the Mediterranean. In October 1918, his *U-68* attacked an Allied convoy, sinking one of the ships. His sub-

marine was forced to the surface when it developed mechanical problems, and Dönitz was taken prisoner.

Dönitz continued in the navy after World War I. He held a variety of shore and sea assignments including command of a torpedo-boat flotilla, during which he experimented with tactics he would later develop into the *Rudeltaktik* (wolfpack) concept. German Chancellor Adolf Hitler named Dönitz commander of the fledgling German submarine force in 1935. Kapitän zue See und Kommodore (captain and commodore) Dönitz sought to build additional submarines to expand the fleet to 300 boats, a number he believed would be decisive in winning the next war. Dönitz's passionate advocacy of submarines led to friction between him and the commander of the navy, Grand Admiral Erich Raeder, who preferred to allocate scarce naval resources to a long-range program of conventional large surface ships. Their differences became moot when World War II began before either type was fully ready for decisive employment.

Promoted to Konteradmiral (U.S. equiv. rear admiral) in October 1939, Dönitz struggled to overcome the problems of insufficient numbers of U-boats and ineffective torpedoes,

difficulties that nearly wrecked his operations. To combat Allied convoys, Dönitz implemented wolf pack tactics: centralized control over groups of U-boats that struck Allied convoys at night in surface attacks. In January 1943, Hitler, frustrated by the performance of his surface navy, removed Raeder and replaced him with Dönitz as head of the navy. Dönitz endeavored to continue the U-boat war, but during "Black May" in 1943, his U-boats were essentially defeated through Allied antisubmarine countermeasures including aircraft, convoys, searchlights, radar, sonar, and the ability to read Germany's encoded radio messages.

Unlike virtually all other senior German military officers, Dönitz managed to retain Hitler's confidence and favor. Dönitz's final military success was the evacuation of hundreds of thousands of Germans from the Baltic states by sea. As the Allied armies entered Germany on 15 April 1945, Hitler appointed Dönitz as commander of all forces in northern Germany. On 30 April, the day that Hitler committed suicide, Dönitz was informed that Hitler had appointed him to serve as president of the Reich and supreme commander of the armed forces. Dönitz then led the crumbling Third Reich, hoping to

delay Soviet advances to allow millions of German troops and civilians to flee westward to British and U.S. lines to avoid falling into Soviet hands. Dönitz surrendered Germany unconditionally to Allied representatives on 7 May 1945.

The British arrested Dönitz on 23 May. Tried by the International War Crimes Tribunal at Nuremberg, Dönitz was found guilty of crimes against peace and violation of the rules of war and was sentenced to 10 years in Spandau Prison. He was released in 1956 and later wrote several books about his career and about submarine warfare. Unrepentant about his role in the war, Dönitz died in Aumuhle, Federal Republic of Germany, on 24 December 1980.

Director of the OSS, William Joseph Donovan. (Library of Congress)

Donovan, William Joseph (1883–1959)

Head of the U.S. Office of Strategic Services (OSS). Born on 1 January 1883, in Buffalo, New York, William Donovan graduated from Columbia University with a law degree in 1907 and afterward practiced law in Buffalo. He also served as a captain in the New York National Guard. He was stationed along the Mexican border in 1916 when the guard was called up to assist in the unsuccessful effort to capture notorious Mexican bandit and revolutionary leader Pancho Villa.

After the United States entered World War I, Donovan was sent to Europe with the American Expeditionary Forces (AEF). As a major, he commanded 1st Battalion of the 69th New York Infantry Regiment in the 45th Infantry Division. Donovan took part in the September 1918 Saint Mihiel offensive. Then a lieutenant colonel, he was wounded but refused evacuation and stayed to lead his men. His actions brought him the Medal of Honor and the nickname of “Wild Bill.”

After the war, Donovan returned to Buffalo to practice law. From 1924 to 1929, he was an assistant U.S. attorney general. He ran unsuccessfully for state political office and in 1929 moved to New York City. Much interested in international affairs, Donovan undertook several overseas missions for the Rockefeller Foundation and the Franklin D. Roosevelt administration. Donovan tried to convince Roosevelt and others that the United States needed an intelligence-gathering organization similar to that run by the British. His

efforts finally led to his appointment in July 1941 as head of the Office of Coordinator of Information, which after the Japanese attack on Pearl Harbor became the Office of Strategic Services (OSS). It gathered intelligence, conducted propaganda and sabotage, and assisted partisans.

After World War II, Donovan lobbied President Harry S Truman to set up a permanent intelligence organization. Truman initially rejected this step, but the coming of the Cold War led in 1947 to the formation of the Central Intelligence Agency, loosely modeled on the OSS. Donovan’s hope of heading the CIA was not realized, although he briefly returned to government service as ambassador to Thailand during 1953 and 1954. Donovan died on 8 February 1959 at Walter Reed Army Medical Center, Washington, D.C.

Doolittle, James Harold "Jimmy" (1896–1993)

U.S. Army Air Forces (later Air Force) general. Born on 14 December 1896 in Alameda, California, James Doolittle grew up in Nome, Alaska. He attended Los Angeles Community College and the University of California, but he left school following the entry of the United States into World War I and enlisted as a flying cadet in the Signal Corps Reserve. He attended flight school, became a pilot, and was commissioned a second lieutenant. He then served as a flight-gunner instructor at Rockwell Field in San Diego, California. His request for assignment to France was denied because of the armistice of November 1918.

In 1920, Doolittle secured a Regular Army commission, and on 4 September 1922, he made the first transcontinental flight in less than 24 hours. He then studied at the Massachusetts Institute of Technology, where he received master's and Ph.D. degrees in aeronautical engineering. A leader in advances in both military and civilian aviation, Doolittle helped develop horizontal and directional gyroscopes and pioneered instrument flying.

Doolittle gained prominence through stunt flying, racing, and demonstrating aircraft. In 1930, he left the army to become aviation manager for Shell Oil, where he helped develop new high-octane aviation fuels that greatly benefited the United States in World War II. He won the Harmon (1930) and Bendix (1931) trophies, and in 1932 he broke the world airspeed record.

In July 1940, Doolittle returned to the army as a major. Following U.S. entry into World War II, in January 1942 he was promoted to lieutenant colonel. On 18 April 1942, Doolittle commanded the first American air strike on the Japanese mainland. The raid was a great fillip for U.S. morale, and for it he was awarded the Medal of Honor and promoted to brigadier general.

In July 1942, Doolittle took command of the Twelfth Air Force in England, which he led in Operation TORCH in North Africa. In November 1943, he was given command of the Fifteenth Air Force in the Mediterranean Theater, directing it in raids against German-held Europe. In January 1944, he assumed command of the Eighth Air Force in the European Theater, and that March he was promoted to temporary lieutenant general. On Germany's surrender in May 1945, Doolittle moved with the Eighth Air Force to Okinawa, although the Eighth arrived in the Pacific Theater too late to see much action.

In May 1946, Doolittle returned to the civilian sector as a vice president for Shell Oil, and later he became its director. He also served on the National Advisory Committee for Aeronautics, the Air Force Science Advisory Board, and the Presi-

Major General James "Jimmy" Doolittle, who led the audacious April 1942 bombing raid on Japan. (Hulton Archive)

dent's Science Advisory Committee. In June 1985 by act of Congress Doolittle was promoted to general on the retired list. He died on 27 September 1993 in Pebble Beach, California.

Douglas, William Sholto (First Baron Douglas of Kirtleside) (1893–1969)

British air chief marshal. Born on 23 December 1893 at Headington, Oxfordshire, William Douglas was raised in London. He attended Oxford University but left to join the Royal Field Artillery at the start of World War I. Douglas soon transferred

to the Royal Flying Corps, where he qualified as a fighter pilot. By the end of the war he rose to squadron commander.

In 1919, Douglas left the military to become a test pilot with the Handley Page Aircraft Company. He was dissatisfied with civilian life and returned to the Royal Air Force (RAF) in 1920 as a squadron commander. He attended the Imperial Defense College. In 1936, Douglas was named director of staff studies at the Air Ministry; he was the only fighter pilot on the senior staff. Advanced to air vice marshal, in 1938 he became assistant chief of the air staff with responsibility for training.

Douglas was a leading critic of the tactics employed by head of Fighter Command Air Chief Marshal Hugh Dowding. On 25 November 1940, Douglas succeeded Dowding as head of Fighter Command as air marshal. Among his innovations was the Big Wing concept of large formations of fighters employed in massive sweeps. He also encouraged development of night-fighting equipment and techniques. Although his new tactics enjoyed some success, critics complained that they left much of the British homeland unprotected.

In December 1942, Douglas was promoted to air chief marshal and assigned to the Middle East Air Force (MEAF)

as deputy to Air Marshal Arthur Tedder. With the reorganization of Allied air forces in April 1943, Douglas assumed command of the MEAF. During the June 1944 Allied landings in Normandy, Douglas was chief of Coastal Command and commander of British Expeditionary Air Force with the mission of securing control of the English Channel.

With the return of peace, Douglas commanded the British Air Forces of Occupation and was knighted. Promoted to marshal of the RAF, in June 1946 he followed Field Marshal Bernard Montgomery as commander of British forces in Europe and military governor of the British occupation zone in Germany.

Douglas retired from active duty in 1948 and was awarded a peerage as First Baron Douglas of Kirtleside. He assumed a seat in the House of Lords and served on the boards of the two British state airlines. After completing two autobiographies, William Sholto Douglas died in Northampton on 29 October 1969.

Douhet, Giulio (1869–1930)

Italian air force general and pioneer of strategic air doctrine. Born on 30 May 1869 in Caserta, Italy, Giulio Douhet was commissioned in the Italian Army in 1892. An early advocate of military aviation, he led Italy's first air bombardment unit during the Italo-Turkish War (1911–1912). During World War I, his unbridled criticism of Italy's General Staff led to Douhet's court-martial and dismissal. Recalled to active service after the defeat at Caporetto, which vindicated much of his comment, he took charge of the Central Aeronautical Bureau (1918). After the war he retired and in 1921 he wrote *Il dominio dell'aria* (*Command of the Air*), a seminal work on airpower strategy. That same year he became a brigadier general. A strong supporter of fascism, Douhet won appointment in 1922 from Benito Mussolini as chief of Italy's aviation program.

Having witnessed Italy's costly and futile World War I campaigns on the Isonzo and the bitterness of land combat in the Alps, Douhet argued that strategic bombing attacks by heavily armed and armored "battleplanes" promised quick and decisive victories in future wars. Such a thrusting and offensive-minded approach conformed well to fascist beliefs. The fascist Douhet believed that civilian populations would panic under sustained attack; the seemingly inherent fragility of democracies proved a seductive chimera to him.

Disregarding the legality and morality of sneak attacks or the utility of graduated approaches to warfare, Douhet called for all-out preemptive air strikes to destroy an enemy's air force and bases, followed by concerted attacks on industry and civilians. A combination of high-explosive, incendiary, and poison-gas bombs, Douhet concluded, would generate psychological uproar and social chaos, fatally weakening the enemy's will to resist.

In arguing that airpower was inherently offensive and uniquely efficacious, Douhet dismissed friendly escort planes as superfluous, enemy interceptors as ineffectual, and interservice cooperation as unnecessary since battleplanes would render navies and armies obsolete. Results of the Allied Combined Bomber Offensive, however, proved Douhet wrong. He had exaggerated the destructive power and accuracy of bombing, the ability of bombers to fight their way unescorted to targets, and the fragility of democratic popula-

tions, who proved resilient under attack. Nevertheless, Douhet's call for independent air forces and offensive-minded strategic bombing proved influential, especially in Britain and the United States.

Douhet died in Rome on 15 February 1930.

Dowding, Sir Hugh Caswall Tremenheere (First Baron Dowding) (1882–1970)

British air force marshal. Born 24 April 1882 in Moffat, Scotland, Hugh Dowding was educated at Winchester and the Royal Military Academy, Woolwich. Commissioned a second lieutenant of artillery in 1900, he then served in India and the Far East. He attended the Royal Staff College, Camberley (1910–1912), and learned to fly. Dowding was dubbed "Stuffy" for his seemingly aloof manner. He switched to the Flying Corps in 1914, rose to become a squadron commander in World War I, and was promoted to brigadier general.

After the war and command of No. 1 Group in south England (1922–1925), Dowding served in the Middle East. Promoted to vice air marshal in 1929 and air marshal in 1933, Dowding from 1930 to 1936 was a member of the Air Council, which was concerned with supply and research (including fighter aircraft design and planning for radar installations). He became the first chief of Fighter Command in July 1936 and worked from his Bentley Priory headquarters to integrate fighter pilots, radar, and ground control facilities. Scheduled for retirement in June 1939, Dowding stayed on when his designated successor was injured.

Air Chief Marshal Dowding's fighter aircraft were heavily outnumbered by the German Luftwaffe when active fighting began in France and the Low Countries on 10 May 1940. Dowding stoutly resisted calls by the French and Prime Minister Winston L. S. Churchill to send additional fighter squadrons to support the doomed Allied effort to halt the German invasion, knowing they would soon be needed for the defense of Britain itself. Thus when the Battle of Britain

British Air Chief Marshal Sir Hugh Dowding. (Library of Congress)

began in earnest in July 1940, he was able to maintain the narrow margin of air superiority over the British Isles that prevented implementation of the planned German invasion, Operation SEA LION.

Dowding tried to overcome a growing conflict between his two most important commanders, Keith Park at 11th Fighter Command Group in the southwest of England and Trafford Leigh-Mallory at 12th in the Midlands. Leigh-Mallory favored the Big Wing concept of using fighters to overpower the Germans, whereas Park and Dowding insisted on smaller group formations and more flexible tactics. At the same time, Luftwaffe attacks on British airfields, radar, and manufacturing centers were taking a growing toll on the thinly spread defense forces. Dowding was fortunate when Adolf Hitler turned the Luftwaffe against London (and thus away from the Royal Air Force [RAF] ground facilities) in reprisal for an RAF bombing raid on Berlin. By the end of October the battle was largely over, won by Dowding's "few" for "so many."

Dowding was now well past normal retirement age. He was relieved of command (in a poorly handled fashion, at which he felt understandably aggrieved) in November 1940 and replaced by Sholto Douglas. Dowding retired in 1942 and

was made a baron the next year. He died at Tunbridge Wells, England, on 15 February 1970.

DOWNFALL, Operation

U.S. plan for the invasion of Japan. On 25 May 1945, the Joint Chiefs of Staff in Washington provided a general outline of a plan to invade Japan but left the details to the two Pacific Theater commanders, General Douglas MacArthur and Admiral Chester W. Nimitz. MacArthur issued his plan, code-named DOWNFALL, three days later. It foresaw two operations. The first, to be initiated following "extensive air preparation," had the codename OLYMPIC. It consisted of a landing on southern part of the island of Kyushu by the 14 to 17 U.S. divisions already available in the Pacific Theater. The second invasion, code-named CORONET, would begin with a landing on the main island of Honshu and have as its objective the capture of Tokyo and the Yokohama areas as a base for further operations.

X day, the invasion of Kyushu, Operation OLYMPIC, was scheduled for 1 November 1945 and was to involve some 766,700 men lifted in 1,315 amphibious vessels. Sixth Army would be the principal ground element. For the invasion of southern Kyushu, MacArthur envisioned four corps of three divisions each. The follow-on force would add another two divisions. Three other divisions would be the strategic reserve. Nimitz saw aircraft carriers as the principal naval strike weapon and envisioned using 16 fleet and 6 light carriers of the U.S. Navy and 6 fleet and 4 light carriers of the British Pacific Fleet, both embarking some 1,914 aircraft. Once southern Kyushu was secured, MacArthur planned to turn it into a gigantic naval and air base for 40 air groups with approximately 2,800 aircraft.

Both OLYMPIC and CORONET faced daunting problems. The invasion of Kyushu was predicated on the assumption that the invaders would encounter only three Japanese divisions in southern Kyushu and three more in the northern part of the island. Yet ULTRA signal intercepts by early summer 1945 revealed that the Japanese were substantially reinforcing Kyushu. MacArthur dismissed out of hand intelligence esti-

mates based on ULTRA intercepts of a higher Japanese troop strength on Kyushu. He claimed such evidence was “erroneous” and suggested that the Japanese had managed to hoodwink ULTRA. Historian Edward Drea has pointed out that MacArthur routinely dismissed ULTRA evidence that “failed to accord with his own preconceived strategic vision.” The last estimate by MacArthur’s intelligence chief, Lieutenant General Charles Willoughby, of Japanese troop strength on Kyushu was 195,000 men (up from an initial estimate of 137,400), whereas actual Japanese strength was 287,000.

Y day, the invasion of Honshu in Operation CORONET, was scheduled for 1 March 1946. MacArthur planned to command CORONET in person. The invading force would consist of the Eighth and Tenth Armies with a total of 14 divisions, 3 of which would be Marines. The First Army of 10 divisions from Europe would be the follow-on force. MacArthur planned to hold one airborne division of his own, presumably the 11th, in strategic reserve, augmented by a corps of three divisions deployed from Europe. In all, CORONET was projected to involve 1,036,000 personnel. As the date for the projected invasions drew closer, plans changed. For example, the Tenth Army, formed for the conquest of Okinawa, was dropped from CORONET and replaced by the First Army.

Estimates of casualties from the invasions, had they gone forward, vary considerably. Historian Ray Skates has concluded that Operation OLYMPIC alone would have taken two months and resulted in 75,000 to 100,000 U.S. casualties. This estimate, which approximates the figure presented by MacArthur based on casualties taken in the securing of Luzon in the Philippines, may have been low. Others then and since have postulated a much higher figure on the basis of the Battle of Okinawa, in which 130,000 Japanese defenders inflicted some 66,000 casualties on attacking American forces, not counting Allied naval personnel losses to kamikazes. In addition to the much higher troop strength on Kyushu than on Okinawa, Japanese authorities were assembling thousands of kamikaze aircraft and water craft and mobilizing the civilian population for a fanatical defense. It would seem logical that the Japanese would have fought even more fiercely for their home islands than they did for Okinawa. Although heavy U.S. losses would not have affected the ultimate outcome of the war, they might have brought some modification in U.S. conditions for peace.

MacArthur’s revised plan of 15 August for CORONET also would have faced problems. It called for an assaulting force of 20 divisions, including 2 armored and 3 Marine. Five divisions would be in immediate reserve, with 3 others in the Philippines in strategic reserve. The total troop commitment came to 1,171,646 men. But even this revised plan faced problems. The assault would be beyond the range of most land-based aircraft, and MacArthur estimated defending forces of

7 army divisions, 160,000 naval troops, and supporting units and civilian volunteers. But the contemporary Joint Intelligence Committee estimated actual Japanese forces at perhaps double that figure, or 560,000 men.

In any case, MacArthur’s plans were never tested. Operation DOWNFALL proved unnecessary, for on 15 August 1945 Emperor Hirohito announced to the Japanese people the decision to surrender.

DRAGOON, Operation (15 August 1944)

Allied amphibious operation in southern France originally intended to support and coincide with the June 1944 invasion of northern France—Operation OVERLORD—although it could not be mounted until 15 August 1944. Operation DRAGOON had its genesis under the code name ANVIL during strategic planning in 1942 as the Allies considered operations to invade continental Europe. Tied to operation SLEDGEHAMMER, the cross-Channel plan for 1942, ANVIL was to be a diversionary attack on the Mediterranean coast of France to either draw German forces there or, at a minimum, hold those

Allied troops landing in the southern French town of Saint-Tropez during Operation DRAGOON, August 1944. (AFP/Getty Images)

already there so they could not reinforce the defense against an attack on the Channel coast.

Operation DRAGOON was also entangled in European strategic discussions related to Allied planning: the direct route across the Channel pressed by the Americans, or the peripheral approach through North Africa and southern Europe urged by the British. When British Eighth Army forces were defeated in June 1942 in the Battle of Gazala in Libya and their forces at Tobruk were forced to surrender, pressure built to act against the immediate threat, and the western Allies decided on Operation GYMNAST (later renamed TORCH,) the Allied assault on North Africa. This decision canceled SLEDGEHAMMER and delayed planning and consideration for operation ROUNDUP, the autumn 1943 cross-Channel operation with which ANVIL was still loosely associated.

Debate continued between the Americans and British over the timing and even the feasibility of a cross-Channel attack into northwest France, to which ANVIL always was linked. As operations first in Sicily and then in Italy evolved from TORCH and Operation ROUNDUP gave way to OVERLORD, debate continued as the British pressed to reinforce Italian operations at the expense of ANVIL and delay OVERLORD. Finally, at Com-

bined Chiefs of Staff discussions in the Cairo Conference in late November 1943 in preparation for the Allied Conference in Tehran, the decision was made to take Soviet views into account.

At Tehran, Soviet leader Josef Stalin came down in favor of a cross-Channel attack against Germany in northwest France. Stalin believed that ANVIL, considered a diversionary attack in southern France by the western Allies, was an integral part of the overall pincer movement against German forces. When British Prime Minister Winston L. S. Churchill suggested that operations in the eastern Mediterranean might take immediate pressure off the Soviets even if it meant delaying OVERLORD, Stalin replied that it was not worth scattering British and American forces. Before leaving Tehran, the Allies committed themselves to mounting OVERLORD with a supporting operation against southern France during May 1944. The problem then became how to conduct both OVERLORD and ANVIL with the resources available.

As planning for OVERLORD and ANVIL proceeded, it became apparent that the limiting factor would be the shortage of landing craft. Seizing the opportunity, the British again pushed for cancellation of ANVIL, not only to provide landing craft for

OVERLORD but to divert manpower to the Italian Campaign, which had bogged down. So severe was the landing-craft shortage that Supreme Commander, Allied Expeditionary Forces General Dwight D. Eisenhower found himself in favor of at least postponing ANVIL until after OVERLORD. This weakened the U.S. argument that ANVIL was necessary to divert German troops away from Normandy's beaches, but the British argument for needing additional forces in Italy evaporated with the Allied liberation of Rome. The Americans still argued they required the major Mediterranean port of Marseille to bring resources ashore for the drive against Germany.

On 10 August, the British reluctantly agreed to give ANVIL the go-ahead. Renamed because of security problems, DRAGON (Churchill said the name was apt because he had been dragooned into agreeing to it) began five days later on 15 August 1944. Vice Admiral H. Kent Hewitt, commander of the Eighth Fleet, had charge of the landing, and four naval task forces supported the invasion. Participating ships included 5 battleships (the *Lorraine*, *Ramilles*, *Texas*, *Nevada*, and *Arkansas*), 24 cruisers, 7 escort carriers, and numerous smaller ships from the British, U.S., French, and Greek navies. A total of 881 ships took part, along with 1,370 landing craft. In the skies, 4,056 Allied aircraft provided support.

At dawn, contingents of three American divisions—the 3rd, 45th, and 36th—and a French armor task force came ashore on beaches between Saint-Tropez and Cannes on the French Riviera, while a combined British and American airborne task force landed to seize bridges and cut roads inland. U.S. Seventh Army commander Lieutenant General Alexander M. Patch Jr. led the Allied force. Major General Lucian Truscott Jr., VI Corps commander, was the ground force commander. Seven Free French divisions under General Jean de Lattre de Tassigny came ashore the next day and headed west to seize the ports of Toulon and Marseille.

Although DRAGON was dwarfed by the Normandy Invasion two months earlier, the Allies nonetheless ultimately landed 250,000 American and French ground troops. German forces in southern France amounted to no more than 210,000 troops in eight and two-thirds divisions, and these were mostly second-rate formations. By the end of the first day, all three Allied divisions had secured their beachheads, and 86,000 men, 12,000 vehicles, and 46,000 tons of supplies had come ashore.

By 17 August, the Allied advance had reached 20 miles inland. Facing the possibility of substantial Germany army units being trapped in France, German leader Adolf Hitler ordered Army Group G commander General Johannes Blaskowitz to withdraw, leaving sufficient troops behind to deny the major ports to the Allies. The most serious fighting took place at the two ports of Toulon and Marseille, but within two weeks on 28 August, both fell to the French divisions of General de Tassigny's newly designated First French Army.

Operation DRAGON cost the Allies more than 13,000 casualties (more than half of them American) but resulted in a 400-mile advance that liberated virtually all of southern France. It also hurried the introduction of Free French troops into combat and opened additional ports for supporting the drive across France into Germany. It also netted 79,000 German prisoners and sped the collapse of the Third Reich.

Dresden, Air Attack on (13–15 February 1945)

Allied strategic bombing raid against the German city of Dresden. This operation, conducted 13–15 February 1945, has become the most commonly evoked image to illustrate the excesses and horror of conventional bombing of cities. The firestorm caused by Royal Air Force (RAF) Bomber Command on the night of 13 February rivaled that of the raid on Hamburg of 27 July 1943. The immediate controversy about the raid contributed to the end of Allied strategic bombing. Cold War rhetoric and sensationalist presentations in history books and movies have clouded the facts ever since.

At the Yalta Conference on 4 February 1945, the Soviets asked for Allied air attacks on communication centers to prevent the shifting of German troops to the Eastern Front. They specifically mentioned Berlin and Leipzig, but Allied planners also identified Dresden and Chemnitz as appropriate objectives to meet Soviet needs. On 8 February, Supreme Headquarters, Allied Expeditionary Forces (SHAEF) instructed RAF Bomber Command and the U.S. Strategic Air Forces to prepare an attack on Dresden because of its importance in relation to movements of military forces to the Eastern Front. Contrary to later reports,

View of the wreckage of Dresden, Germany, after it was firebombed by the Allies in 1945. The bombing, which targeted the civilian population, was one of the most devastating aerial raids in history. (Library of Congress)

Dresden did contain many important industrial and transportation targets, and it was defended, although many of its guns had been sent east to fight the Soviets. The allocation of effort was also shaped by the prodding of British Prime Minister Winston L. S. Churchill, although he later tried to distance himself from the operation and the atmosphere engendered by the pursuit of Operation THUNDERCLAP. The latter was a British plan to break German morale with a massive Allied assault on the German capital, Berlin, and refugee centers. The attack on Berlin was conducted on 3 February over the protests of U.S. Eighth Air Force Commander James Doolittle. Other Americans in the U.S. Strategic Air Forces headquarters and in Washington were also uneasy over concentrating on cities such as Dresden, but that did not stop the operation.

The operation opened on the night of 13 February with two separate British raids. The first blow was delivered by 244 Lancasters dropping more than 800 tons of bombs. This attack was moderately successful. The inhabitants of the city were surprised with a second attack three hours later, this time by 529 Lancasters delivering a further 1,800 tons of bombs. The

concentrated accuracy of the bombing against so many wooden structures and during ideal weather conditions produced a terrible conflagration. The smoke and flames made aiming very difficult the next day for the more than 300 American B-17s attempting to drop another 700 tons of bombs on the city's marshaling yards. Obscuration of the target area was even worse for a similar attack on 15 February.

When news of the destruction of Dresden reached Britain, there was considerable public outcry over the destruction of such a beautiful city when the war seemed to be virtually won. American air leaders were worried by similar reactions in the United States, especially after careless remarks by a SHAEF briefing officer inspired such nationwide newspaper headlines as "Terror Bombing Gets Allied Approval as Step to Speed Victory." Secretary of War Henry Stimson ordered an investigation of the "unnecessary" destruction but was satisfied by the resulting report explaining the background of the operation. Public reaction in the United States was muted. The controversy contributed to the Allied decision to suspend strategic bombing in April.

The casualty figures reported by German fire and police services ranged between 25,000 and 35,000 dead. However, thousands more were missing, and there were many unidentified refugees in the city. It is probable that the death total approached the 45,000 killed in the bombing of Hamburg in July–August 1943. Some careless historians, encouraged by Soviet and East German propaganda, promulgated figures as high as 250,000. Although David Irving later recanted his claim of 135,000 dead, one can still find that number cited in many history books.

Public impressions of the excesses of Dresden were reinforced by Kurt Vonnegut's novel *Slaughterhouse Five* and the movie it inspired. More than 50 years later, when critics of U.S. air operations against Iraq or Yugoslavia needed a metaphor to condemn conventional bombing attacks on cities, almost invariably they cited Dresden in 1945.

Driscoll, Agnes Meyer (1889–1971)

U.S. cryptographer. Born in Geneseo, Illinois, on 24 July 1889, Agnes Meyer graduated from Ohio State University in 1911 with a triple bachelor's degree in mathematics, languages, and music. She taught math and music in Amarillo, Texas, at the Lowry Philips Military Academy from 1911 to 1917. She enlisted in the U.S. Navy as a chief yeoman, serving from July 1917 to September 1919. Meyer's fluency in German, French, and Japanese and her mathematical skills proved invaluable to the process of cryptography, and she was asked to remain in the Code and Signal section of the Department of Naval Communication as a civilian clerk.

From 1921 to 1922, Meyer worked at the Riverham Laboratories in Chicago in the Cipher Department and probably attended training at the "Black Chamber" at New York Laboratories. She helped to invent a cipher machine in 1922 with U.S. Navy Lieutenant William Gresham, for which she was later paid \$15,000. During 1923 and 1924, Meyer acted as liaison to the navy and technical adviser to the Hebern Electrical Code Company. When that company went bankrupt, she returned to the Cryptographic Research Desk (OP-20-G) under U.S. Navy Lieutenant Lawrence Safford. Meyer married lawyer Michael Bernard Driscoll in 1924.

Driscoll, known as "Miss Aggie," was the instructor who trained many of the U.S. Navy's top cryptanalysts. She also excelled at breaking Japanese ciphers, in 1925 accomplishing the initial solution of the "Red Book" codes used for Japanese fleet maneuvers until 1930. In 1931, she used IBM machines to crack the "Blue Book," a breakthrough that revealed Japanese battleship speed in 1936 as well as the identities of two Pacific Fleet moles working for the Japanese, Harry Thompson and John Farnsworth.

In 1940, Driscoll's recognition that the Japanese code JN-25 was generated by a machine (M-1) gave the U.S. a head start in building its own decryption machine (M-3). Although briefly assigned to the Enigma codes, Driscoll concentrated on Japanese cipher traffic throughout World War II, providing crucial information in the days leading to the Battle of Midway and training most of the U.S. Navy's cryptographers.

Driscoll moved to the Armed Forces Security Agency in 1949 and to the National Security Agency in 1957, from which she retired in 1959. She died in Fairfax, Virginia, on 16 September 1971.

Drum, Hugh Aloysius (1879–1951)

U.S. Army general. Born 19 September 1879 at Fort Brady, Michigan, Hugh Drum was attending Boston College at the time his father, an army captain, was killed in the 1898 Spanish-American War. Drum left school that year and joined the army. He was commissioned from the ranks and served in the Philippines.

Drum graduated from the General Staff College at Fort Leavenworth, Kansas, in 1912 and then saw service on the Mexican border. In May 1917, he joined General John J. Pershing's staff in the American Expeditionary Forces (AEF) in France, assigned to the Operations Division. In July 1918, Pershing named Drum, then a major, chief of staff of the nascent American First Army. For his outstanding performance, Drum was advanced to temporary brigadier general.

U.S. Army General Hugh A. Drum (Time Life Pictures/Getty Images)

After the war, Drum reverted back to his regular grade as major. In 1922, he was promoted to permanent brigadier general. He then commanded an infantry brigade and the 1st Infantry Division (1927–1930). Instructor general of the army in 1930 and 1931, he was promoted to major general in December 1931. Drum commanded the First Army from 1931 to 1933. He was deputy chief of staff of the army (1933–1935) and then commanded both the Hawaiian Department (1935–1937) and the Second Army (1937–1938). He next resumed command of the First Army, which was headquartered on Governor's Island, New York. He was advanced to lieutenant general in August 1939. Drum was the peacetime army's highest-ranking officer, and as such he expected to have field command of the army if the United States entered World War II. Offered the post of adviser to the Nationalist government of China, he declined (the post ultimately went to Lieutenant General Joseph Stilwell). His refusal and his criticism of his superiors, notably of Generals George C. Marshall and Lesley J. McNair, led to Drum remaining on Governor's Island and his retirement from the army in October 1943.

After his retirement, Drum headed the New York National Guard until 1948. He was also president of the Empire State Corporation, which owned and operated the Empire State Building, and he served as military adviser to Thomas E. Dewey during Dewey's 1944 presidential campaign. Drum died in New York City on 3 October 1951.

DRUMBEAT, Operation (13 January–19 July 1942)

German U-boat offensive conducted off the U.S. East Coast, in the Caribbean, in the Gulf of Mexico, and off Brazil.

Commander of German U-boats Vizeadmiral (vice admiral) Karl Dönitz welcomed the entry of the United States into the war in December 1941 as an opportunity to widen the U-boat offensive in the Atlantic. In planning Operation PAUKENSCHLAG (DRUMBEAT), Dönitz intended to operate against the United States and into the Caribbean larger Type IX U-boats with greater operational range. He would employ shorter-range Type VII U-boats off Newfoundland and Nova Scotia, which were much closer to his U-boat bases. Dönitz requested 12 Type IX boats from the Naval War Command for the oper-

ation but was informed on 10 December that he would have only 6. Although submarine construction had accelerated, there were still too few U-boats available. Bad weather in the Baltic had also disrupted U-boat training, and the Naval War Command insisted on maintaining a large number of U-boats in the Mediterranean to assist Axis operations in North Africa. In the end, Type IX vessel *U-128* was not ready at the start of the operation, so Dönitz had less than half the force he had requested.

Operation DRUMBEAT began with only five Type IX U-boats from the Gulf of Saint Lawrence to Cape Hatteras, North Carolina. Seven Type VII U-boats went to Newfoundland and Nova Scotia. All were in place by mid-January 1942, and DRUMBEAT never involved more than a dozen German submarines at any one time. To keep the Americans off balance, a month after DRUMBEAT was launched Dönitz switched its focus to the Caribbean, where several Italian submarines joined operations.

The first victim of DRUMBEAT, the British freighter *Cyclops*, fell victim to *U-123*, a Type IX boat, on 12 January 1942. Other sinkings quickly followed. The United States was totally unprepared for the U-boat attacks. Coastal cities were ablaze with lights at night, silhouetting the merchant ships plying the coast and making them easy targets. There were also few escort vessels available, and merchant ships sailed independently in the hundreds because Chief of Naval Operations Ernest King refused to institute a convoy system, believing that an inadequately protected convoy system was worse than none. All this meant that through April 1942, German submarines sank 216 vessels aggregating 1.2 million tons in the North Atlantic, the vast majority of these in waters for which the U.S. Navy was responsible.

This so-called “second happy time” or “the American turkey shoot” for German submarines finally came to an end through a mandatory blackout of coastal U.S. cities, the instigation of convoys and antisubmarine training schools, the relocation of air assets to antisubmarine duties, and the addition of antisubmarine warships. Not only did merchant shipping losses drop off, but increasing numbers of U-boats were sunk.

On 19 July 1942, Dönitz withdrew his last two U-boats from the East Coast of the United States, relocating his submarine assets back to the mid-Atlantic and signaling an end to the campaign. American unpreparedness had come at a high price. Operation DRUMBEAT was arguably Germany's most successful submarine operation of the entire war, resulting in the sinking of some 3 million tons of shipping. Undoubtedly, Dönitz would have enjoyed even greater success had he been able to employ more U-boats at the offset of the campaign.

Dumbarton Oaks Conference (21 August–7 October 1944)

Conference held in Washington, D.C., to decide on specifics in connection with the creation of a postwar international security organization. In the last half of 1944, as the Allies began to anticipate victory in the relatively near future, representatives of 39 nations met in the U.S. capital to devise detailed plans for creation of the United Nations, a security

organization the assorted states opposing the Axis powers had committed themselves to forming. In recognition of the fact that the Soviet Union had not yet entered the Far Eastern war against Japan, the conference took place in two stages. From 21 August to 28 September 1944, Soviet delegates attended, but for the final 10 days, 28 September to 7 October, the Soviets left the gathering, yielding their place to a Chinese delegation.

The Big Three Allied powers—the United States, the Soviet Union, and Great Britain—dominated the conference as they did the wartime coalition. This was reflected in the blueprint for the new United Nations that the meeting produced. The draft proposals were heavily influenced by the view of U.S. President Franklin D. Roosevelt, which British Prime Minister Winston L. S. Churchill and Soviet Premier Josef Stalin effectively shared, that agreement among the Big Four Allied powers (“the four policemen”) must be the foundation of postwar international security. In obeisance to international public opinion and to adhere to their more idealistic pronouncements about the rights of all nations and peoples to

Chinese delegation standing with other delegates at the Dumbarton Oaks Conference in Washington, D.C. (Time Life Pictures/Getty Images)

determine their own governments, the conferees nonetheless decided on a scheme that showed some respect for more idealistic visions of a world in which all powers, great and small, enjoyed equal status and protection.

After lengthy deliberations, the Dumbarton Oaks delegates agreed to create a bipartite United Nations organization modeled on the earlier League of Nations but reserving ultimate authority to the dominant Allied states. All member states were entitled to representation in the General Assembly, which would debate, discuss, and vote on issues that came before it. Executive authority rested with the 11-member Security Council, which had 5 permanent members: Great Britain, France, the United States, the Soviet Union, and China. The remaining Security Council representatives, selected from among other member states of the United Nations, served two-year terms in rotation. The 5 permanent Security Council members therefore enjoyed far greater continuity of power and could effectively dominate the new organization, and their position was enhanced by the organization's dependence on their financial contributions. Besides providing an international security mechanism to mediate and settle disputes among member states, the United Nations was also expected to promote international cooperation on economic, social, and humanitarian issues.

The Dumbarton Oaks conference left several important issues still unsettled, largely because these were so sensitive that they were deferred for personal decision by the Big Three leaders, Roosevelt, Stalin, and Churchill. Among such matters were Soviet requests for independent representation in the General Assembly for Byelorussia and the Ukraine and a Soviet suggestion that each separate permanent Security Council member should enjoy veto power over any United Nations decision. Dumbarton Oaks also neglected to establish appropriate mechanisms to administer former League of Nations mandatory territories and those areas seized from the Axis powers, an omission likewise repaired at Yalta, where the Big Three agreed to establish a trusteeship system for the purpose. Existing colonies of Allied nations fell outside this mechanism's purview unless the imperial power itself chose to hand the colonies over to United Nations administration.

From May to July 1945, the Allies held another conference at San Francisco, which drafted the actual charter of the United Nations. Although this gathering made some minor modifications granting slightly more power to small nations, the Dumbarton Oaks conference had already effectually settled the fundamental operational structure of the new international organization.

Dunkerque (Dunkirk), Evacuation of (Operation DYNAMO, 26 May–4 June 1940)

Extraction of the British Expeditionary Force (BEF) and some French forces from the English Channel port of Dunkerque, France. After the German invasion of France and the Low Countries and the rapid collapse of Allied forces, contingency planning was begun in Britain on 19 May 1940 under the supervision of Vice Admiral Bertram Ramsay, naval commander of Dover, for the possible evacuation of British forces from France. By 25 May, the Germans had already taken the French port of Boulogne, leaving only Dunkerque and Calais among the Channel ports from which an evacuation might be attempted. Calais fell the next day. Naval planners hoped they might be able to extract 40,000 members of the BEF, but in Operation DYNAMO they actually evacuated 364,628 troops, of whom 224,686 were British.

On 26 May, as the German armored thrust from the south was closing in on Dunkerque, commander of German army Group A General Karl Gerd von Rundstedt ordered it halted, believing the panzers were overextended. Hitler made this into a hard-and-fast order and kept the panzers in place until 29 May to allow the German infantry to join them. Hitler's stop order was critical, allowing the BEF to escape and Britain to continue in the war. Head of the Luftwaffe Marshal Hermann Göring, who believed the German air force had not received sufficient credit for its role in the war to date, then secured Hitler's permission to destroy the British forces on the ground with his dive-bombers. He even requested that the panzers be moved back several miles.

As it turned out, the dive-bombing was not effective; the German bombs burrowed deep into the soft sand before exploding. Meanwhile, Operation DYNAMO began. All manner of vessels, many of them manned by civilian volunteers, participated in the evacuation. Royal Air Force (RAF) fighter pilots flying from bases in southern England did what they could to protect the evacuation and disrupt the Luftwaffe, and they probably made the evacuation possible.

British prisoners at Dunkerque, France, 1940. (Still Picture Records LICON, Special Media Archives Services Division (NWCS-S), National Archives)

Among the evacuation ships, British and French destroyers rescued the most men, but they were also the chief targets for Luftwaffe attacks. By the fourth day of the evacuation, 10 destroyers had been sunk or put out of action. This led the Admiralty to take the difficult decision to remove all of its modern destroyers from the operation. The same reasoning limited the number of fighter aircraft that were available. In addition, head of Fighter Command Air Marshal Hugh Dowding refused to sacrifice valuable aircraft in a battle already lost, believing the planes would soon be required for the defense of Britain, which was certain to be the next target.

The Dunkerque evacuation was assisted by bad weather and fires from burning equipment on the beaches that inhibited Luftwaffe operations. The BEF lost more than 2,000 men during DYNAMO itself. RAF Fighter Command lost 106 aircraft and 80 pilots, and Bomber Command lost an additional 76 aircraft. Of 693 British vessels of all types that took part in the operation, one-third (226) were sunk, including 6 destroyers; 19 other destroyers were put out of action. Other nations also participated; France provided the most vessels (119), and Belgium, Norway, Poland, and the Netherlands also provided assistance. The other Allies lost 17 of their 168 vessels taking part. The BEF lost 30,000 men, including prisoners, to the Germans, and it was forced to abandon virtually all of its equipment in France. The 50,000-man French First Army had played a key role, holding the advancing Germans from the beaches and allowing the British to get away. The French contested every bit of ground, and ultimately between 30,000 and 40,000 men of their troops were forced to surrender.

The evacuation of Dunkerque was hardly a victory, but it did sweep away the half-heartedness that had marked the British war effort to that point. It also elevated the stature of Prime Minister Winston L. S. Churchill, who in a speech to Parliament on 4 June as the last British troops were being evacuated vowed that come what may, Britain would continue the fight.

E

Eaker, Ira Clarence (1896–1987)

U.S. Army Air Forces general who assumed command of the Mediterranean Allied Air Forces (MAAF) in 1944. Born on 13 April 1896 at Field Creek, Texas, into modest circumstances, Ira Eaker graduated from Southeastern State Normal School in Durant, Oklahoma, in 1917 and enlisted in the army. He completed officer training camp and was commissioned a second lieutenant in 1918. He then transferred to the Signal Corps and underwent aviation training. From 1919 to 1922, he was stationed in the Philippines.

In 1923, Eaker received permission from the army to attend law school. He studied law at Columbia University while also serving as post adjutant at Mitchell Field, Long Island, New York. In 1926, he was selected as 1 of 10 pilots to fly on a goodwill tour of South America.

Eaker took a leading role in the development of a long-range bomber for the army. In 1928, he made a record-breaking flight from Texas to the Panama Canal Zone in the new P-12. During these early years, he also became friends with Henry “Hap” Arnold and Carl A. “Tooey” Spaatz. In January 1929, Captain Eaker flew in the Fokker C-2A *Question Mark* with Major Spaatz, mission commander, Second Lieutenant Elwood Quesada, and two others to set a world endurance record. The next year, Eaker piloted the first transcontinental flight to be refueled in the air.

From 1933 to 1935, Eaker commanded the 34th Pursuit Squadron. Promoted to major in 1935, he graduated from the Air Corps Tactical School, Maxwell Field, Alabama, in 1936 and from the Command and General Staff School, Fort Leavenworth, Kansas, in 1937. As a colonel, he commanded the

20th Pursuit Group from 1940 to 1941. He was then sent to England to report on the Royal Air Force.

In February 1942, Eaker was promoted to brigadier general and sent back to England to command VIII Bomber Command of Lieutenant General Spaatz’s Eighth Air Force and was soon conducting strategic bombing of German-occupied France. On 17 August 1942, he led the first mission in person, against Rouen, France. The attempt to conduct daylight precision bombing did not go as well as hoped, but Eaker’s B-17s struck vital targets. Promoted to temporary major general, he took command of Eighth Air Force in December and directed attacks against Schweinfurt and Regensburg in August 1943. Publicity over high casualty rates in such raids, caused by a lack of long-range fighter protection, led to his reassignment. Promoted to temporary lieutenant general, Eaker took command of the Mediterranean Allied Air Forces, consisting of the U.S. Twelfth and Fifteenth Air Forces, in January 1944. He led MAAF with great success in a variety of missions.

At the end of the war, Eaker returned to Washington to become deputy commander of the U.S. Army Air Forces. He retired in August 1947 after helping to plan the formation of an independent air force. He was then a consultant for Douglas Aircraft, and in 1972, he became president of the U.S. Strategic Institute. Eaker remained active in the promotion of airpower through numerous books and lectures. In 1985, he was promoted to full general on the retired list by an act of Congress. Eaker died on 6 August 1987, at Andrews Air Force Base, Maryland.

East Africa Campaign (January–May 1941)

British Commonwealth campaign to defeat Italian forces in East Africa. Italian East Africa was formed after the 1936 Italian conquest of Abyssinia (Ethiopia), which combined with the colonies of Eritrea and Italian Somaliland into a single entity. When Italy entered the war on 10 June 1940, the governor-general of Italian East Africa, Amedeo Umberto di Savoia, Duca d'Aosta, commanded some 350,000 troops, vastly outnumbering the 40,000 British levies from among the local population. Aosta captured British outposts on the bor-

ders of Sudan and Kenya, and in August, he occupied British Somaliland, the first British colony to fall into Axis hands.

Brigadier General William J. Slim's counterattack from Sudan on 6 November was beaten back, but Aosta was demoralized by a lack of supplies and Italian defeats in the Western Desert. He was also occupied suppressing Abyssinian rebels, known as the Patriots. At the moment of Britain's greatest weakness, he failed to take the initiative and unwisely adopted a defensive posture.

On 19 January 1941, Major General William Platt launched an offensive into Eritrea with the 4th and 5th Indian Divisions, aided by ULTRA intelligence from broken Italian army and air force codes. Platt captured Keren on 27 March after hard fighting, in what proved to be the decisive battle of the campaign. He entered Massawa on 8 April. There, the Italians scuttled one destroyer, and five others sortied into the Red Sea for an attack on Port Sudan. In the ensuing actions, the Italians had four of their destroyers sunk; the fifth was scuttled.

Meanwhile, on 11 February, Lieutenant General Alan Cunningham drove into Italian Somaliland from Kenya using the 11th and 12th African and 1st South African Divisions with startling success. After capturing Mogadishu, the capital of Italian Somaliland, on 25 February, he struck north and took Harar in Abyssinia on 26 March. A small force from Aden also captured Berbera on 16 March and quickly reoccupied British Somaliland with little opposition, to shorten the supply line, and then joined with Cunningham's force to capture Addis Ababa on 6 April. In just eight weeks, Cunningham's troops had advanced over 1,700 miles and defeated the majority of Aosta's troops, at a cost of 501 casualties.

Even more spectacular were the achievements of Lieutenant Colonel Orde Wingate, who commanded a group of 1,600 Patriots that he christened "Gideon Force." Through a combination of brilliant guerrilla tactics, great daring, and sheer bluff, he defeated the Italian army at Debra Markos on 6 April and returned Emperor Haile Selassie to his capital, Addis Ababa, on 5 May. British troops pressed Aosta's forces into a diminishing mountainous retreat at Amba Alagi until he finally surrendered on 16 May, ending Italian resistance in that theater, apart from two isolated pockets that were rounded up in November 1941.

The campaign in East Africa was important because, for the first time, a country occupied by the Axis had been liberated, another 230,000 Italian and colonial troops were captured, and British forces were released for vital operations in the Western Desert. It was also the first campaign in which ULTRA and the code-breakers at Bletchley Park played a decisive role, providing an invaluable lesson on the effective contribution that intelligence could make to the successful outcome of an operation. Success in East Africa also had an important strategic consequence, since U.S. President Franklin D. Roosevelt was able to declare, on 11 April, that the Red Sea and the Gulf of Aden were no longer war zones.

U.S. ships were thus able to deliver supplies directly to Suez, relieving the burden on British shipping.

Eastern Front

On 22 June 1941, German forces invaded the Soviet Union in Operation BARBAROSSA. The two states then became locked in a death struggle raging on a front of more than 1,800 miles, involving millions of men and thousands of tanks, artillery pieces, and aircraft and resulting in the deaths of many millions of combatants and civilians.

In the fall of 1940, following the Luftwaffe's failure to drive the Royal Air Force from the skies over Britain, Adolf Hitler ordered plans drawn up for an invasion of the Soviet Union. He postulated a quick, three-month-long campaign. "You have only to kick in the door," he told Field Marshal Karl Gerd von Rundstedt, "and the whole rotten structure will come tumbling down." Defeat the Soviet Union, he reasoned, and Britain would have to sue for peace.

Overconfidence marked German planning. The Germans had little accurate intelligence on the Soviet Union, including few adequate maps. They also had little concern for the impact on the fighting of winter weather and little understanding of the influence of the great distances and how these would render blitzkrieg, at least as it was practiced in Poland in 1939 and against France and the Low Countries in 1940, wholly impractical.

German resources were certainly inadequate for the task that lay ahead, and in the Soviet Union, Hitler's strategic overreach at last caught up with him. On 22 June 1941, the German army deployed 205 divisions, but 60 of these were in garrison or fighting elsewhere: 38 in France, 12 in Norway, 1 in Denmark, 7 in the Balkans, and 2 in North Africa. This left just 145 divisions available for operations in the east. The Germans invaded the Soviet Union with 102 infantry divisions, 14 motorized divisions, 1 cavalry division, and 19 armored divisions. In addition, they deployed 9 divisions to maintain lines of communication as the invasion progressed. There was virtually no strategic reserve. Finland, Romania, and Hungary supplied perhaps 705,000 men in 37 divisions.

The disparity in military hardware was even more striking. The Luftwaffe, still waging operations against Britain and also supporting the Afrika Korps (Africa Corps) in North Africa, was forced to keep 1,150 combat aircraft in these theaters, leaving only 2,770 combat aircraft available for use against the Soviet Union. By contrast, the Soviets had 18,570 aircraft, 8,154 of which were initially in the west. The bulk of these were tactical aircraft. Germany had some 6,000 tanks, the Soviets 23,140 (10,394 in the west), and even in 1941, the Soviets possessed some of the best tanks of the war. Their T-34 was the top tank in the world in 1941.

The German invasion plan called for three axes of advance. Field Marshal Gerd von Rundstedt's Army Group South of four armies (one Romanian) and one panzer group would drive on Kiev and the Dnieper in order to destroy Soviet armies between the Pripet Marshes and the Black Sea. Field Marshal Fedor von Bock's Army Group Center of two armies and two panzer groups was to strike east, taking Smolensk and Moscow. Field Marshal Wilhelm Ritter von Leeb's Army Group North of two armies and one panzer group would thrust north, capture Leningrad, and pin the Soviet forces there against the Baltic Sea. Finland would act in concert with the Germans, reentering the war to reoccupy the Karelian isthmus and threatening Leningrad from the north. Farther north, German Colonel Nikolaus von Falkenhorst's Norway Army would carry out an offensive against Murmansk in order to sever its supply route to Leningrad.

Hitler had intended to invade in May, but circumstances caused him to put off the attack until late June. In the spring of 1941, German forces invaded Yugoslavia, went to the rescue of Italian troops in Greece, and drove British forces from Crete. In the process, Hitler secured his southern flank against the possibility of Allied air strikes during the German invasion of the Soviet Union. Historians have argued about the impact of this on delaying the invasion of the Soviet Union. In any case, rainy weather and appalling road conditions in the western USSR imposed delay. The tanks required firm, dry ground.

The invasion began at 3:00 A.M. on 22 June 1941, the longest day of the year, with only two hours of total darkness. The Germans and their allies moved into the Soviet Union along a 2,000-mile front and achieved complete surprise. The bulk of the Red Army's western forces were in forward positions, where they were cut off and surrounded. On the first day alone, 1,200 Soviet aircraft were destroyed, most of them

"You only have to kick in the door and the whole rotten structure will come tumbling down."

—Adolf Hitler

on the ground. Within two days, 2,000 Soviet aircraft had been lost. Within five days, the Germans had captured or destroyed 2,500 Soviet tanks. And within three weeks, the Soviets had lost 3,500 tanks, 6,000 aircraft, and 2 million men, including a significant percentage of the officer corps.

Army Group North broke through frontier defenses, wheeled left to trap and destroy many Soviet divisions against the Baltic, and appeared to have an open route to Leningrad. Meanwhile, Army Group Center, with the bulk of German tanks, attacked north of the Pripet Marshes, completed two huge encirclements, and destroyed vast amounts of Soviet war matériel while taking hundreds of thousands of prisoners. But unexpectedly strong Soviet defenses slowed the advance of Army Group South to Kiev, the Crimea, and the Caucasus.

This development revealed a great problem in German invasion planning. The chief of the General Staff, Colonel General Franz Halder, and many senior generals wanted to concentrate German resources in the center for a drive on Moscow, with supporting movements to the north and south. A thrust there would mean a shorter front, and its advocates believed that Moscow was so important that Soviet dictator Josef Stalin would commit many troops to its defense and thus make it easier for the German army to locate and destroy the remaining Soviet military formations before the onset of winter. But Hitler was fixated on taking Leningrad and, more important, the vast resources of the Ukraine. The compromise solution was to make a decision after the pause in August to refit and rest.

German military intelligence, meanwhile, underestimated Soviet military strength. In December 1940, it had estimated 150 Soviet divisions in the western USSR; by June 1941, that estimate had grown to 175; and now, in late summer, German intelligence concluded the Soviets still had 250 divisions, despite huge losses in the fighting. Moreover, Soviet soldiers did not give up when surrounded. Nazi racism and German violence made them realize that capture meant death, and so, many Soviet troops fought to the last bullet and attempted to break free rather than surrender. And the vast distances and onset of a severe winter posed tremendous logistical challenges for German army planners because their army had only a small mechanized/motorized force and largely relied on human and animal muscle power. While leaders at home prepared for the Soviet collapse, troops on the front lines gained a grudging respect for their Soviet adversaries.

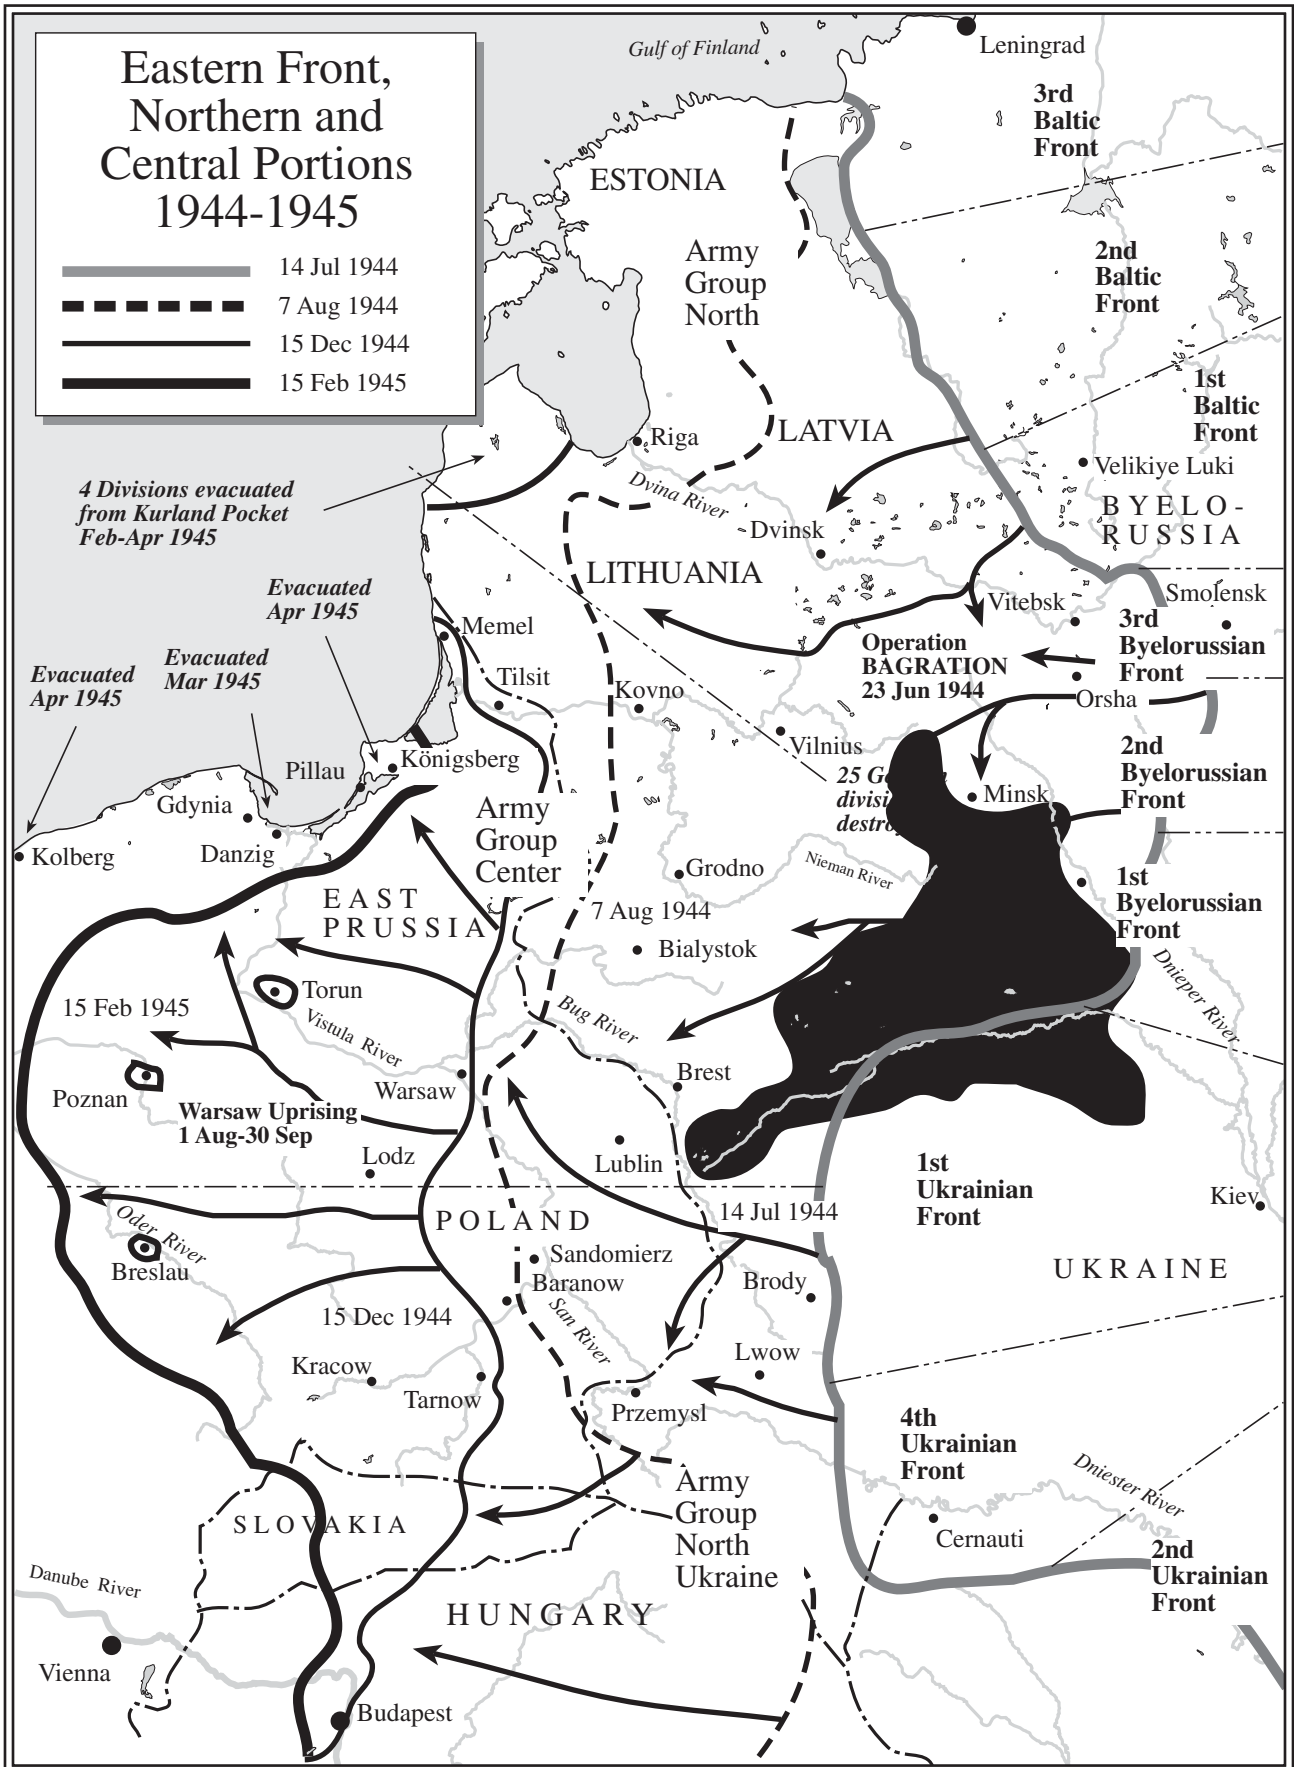

In August, the Germans paused, and Hitler ordered the tank units of Army Group Center to help with the attack on Leningrad and to complete the encirclement of Soviet forces defending Kiev. Finally, in October, Army Group Center began Operation *TYPHOON*, the attack on Moscow. By November, it had come close to success, but few tanks were still operational. There was little fuel, and the men lacked winter clothing in one of the coldest Soviet winters of the twentieth century.

During the fall campaigning, Stalin prepared to defend Moscow. While troops defended a series of lines on the way to the capital, Moscow's citizens were organized to construct antitank ditches and concentric defenses. Secure in the information that Japan would not take advantage of Soviet weakness and intended to move into South Asia, the Red Army brought divisions from Asia and, having studied German tactics, prepared a counterblow against Army Group Center. On 5 December 1941, the Soviet attack began, stunning the tired, cold, and hungry German troops. Some German generals wanted to retreat all the way to the preinvasion borders, but Hitler insisted the troops remain in place, and his resoluteness and the limited capacity of Soviet logistics helped stem the Soviet winter offensive. Then came the spring thaw and a temporary lull in the fighting.

The relative force ratio had changed in a year of fighting. A summer, fall, and winter had weakened the German army to the point that it no longer had the striking power it possessed a year before. Meanwhile, the Red Army, encouraged by its winter victories, was preparing to take the offensive in 1942.

Hitler believed the Soviet state could not afford another year of manpower losses like those in 1941. He believed that if German forces could drive a wedge between the Dnieper and Don Rivers, using the Volga River as a shoulder, they could interrupt Soviet supplies moving up that great and broad transit way and fight their way to Soviet oil resources in the Caucasus region and the Caspian Sea. The German army's High Command estimated it would need 80 new divisions to replace losses and to provide the striking power for a summer offensive, but Germany could only supply 55 divisions. Hitler promised 80 divisions and obtained troop contributions from reluctant Romanian, Hungarian, and Italian allies, but it was unclear how these troops would perform in the desperate fighting conditions of the Eastern Front. To meet the requirements for mechanized equipment, the German army refitted Czech tanks taken in 1938 and French tanks seized in 1940. Consequently, the German supply system had to carry spare parts for literally hundreds of truck models and tens of tank models, greatly complicating logistics. The Soviets had no such problems. Finally, the panzer units had to move fast enough to fight around defenders and once again surround and capture huge numbers of Soviet troops. Otherwise, the Germans would have to travel as much as 1,200 miles from the offensive's jumping-off point to reach the most productive oil-producing area around Baku.

The Soviets struck first. The Red Army launched an attack in the southern front that coincidentally exposed its flank to Germans massed for the drive to the southeast. Stalin initially refused to end the attack, and losses were heavy. The German summer offensive that finally began in late June 1942 never captured the vast numbers of Soviet soldiers as in 1941.

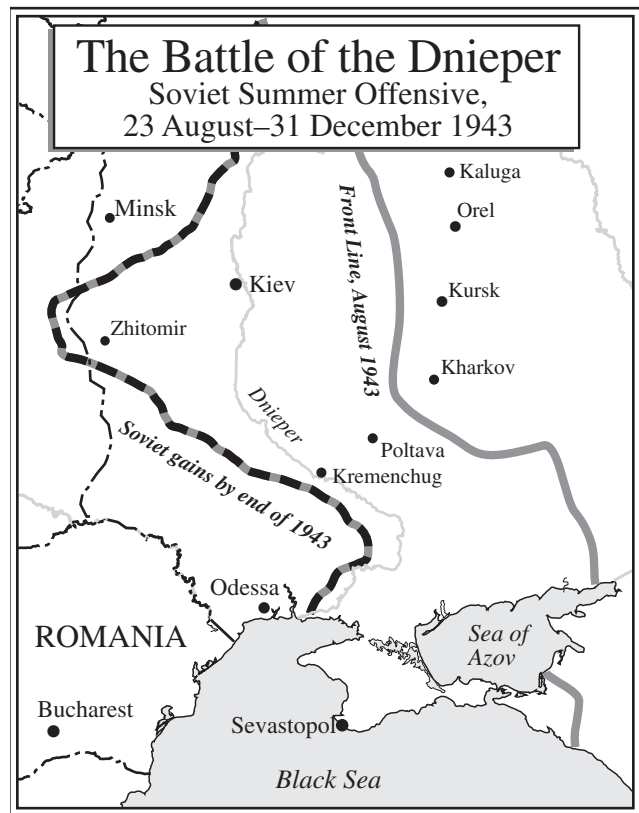

Moreover, Hitler kept reassigning units and thereby violating the principles of mass and economy of force. He sent key elements of the Eighteenth Army on the Crimean Peninsula north to Leningrad; he routed and rerouted the Fourth Panzer Army; and by September, when it was clear that Germany could not achieve its overarching goal of seizing the Soviet oil fields, he ordered the Sixth Army to batter its way against three defending armies into Stalingrad.

The desperate battle for control of Stalingrad, a major industrial city on the Volga, captured the world's imagination. Stalin was as determined to hold his namesake city as Hitler was to take it. The fighting was a block-by-block, house-by-house, and room-by-room affair, with the Soviets sometimes defending from across the river. As Lieutenant General Vasily I. Chuikov's Sixty-Second Army held, the Soviets prepared a massive counterstroke, building up armies of troops and many tanks and artillery pieces against the weakly defended flanks held by Romanian and Hungarian troops. On 19 November, in Operation URANUS, the Soviets attacked and quickly broke through. Within days, the Soviet pincers met at Kalach, and more than 300,000 German troops were trapped. The German commander, Field Marshal Friedrich Paulus, did not attempt to break out, and Field Marshal Erich von Manstein failed to break through and relieve Sixth Army. With only three divisions, Manstein managed to get within 35 miles of the trapped Sixth Army but could move no farther. German troops held on until the end of January, when 90,000 survivors marched off into captivity. The long battle did at least provide time for the Germans to extricate forces that had penetrated deep into the Caucasus.

The Soviets then followed this great victory with a winter offensive, but eventually, their goals outran their logistical capacity, and there was the typical pause forced by the spring thaw in 1943. As summer approached, Hitler approved a plan to pinch off a huge bulge in German lines north of Kharkov near Kursk, destroy Soviet armies trapped there, and restore the balance on the Eastern Front.

The Germans postponed the attack on the Kursk salient, Operation CITADEL, again and again into May, June, and eventually early July. Hitler wanted more of the new models of heavy German tanks, especially the Tiger, but as Germany delayed, the Soviets acted, bringing up reinforcements and constructing extensive, deep defenses, including wide belts of minefields, that were up to 60 miles deep. They also positioned reserve armies on the shoulders of the bulge and additional tanks and artillery behind them. Finally, on 5 July, the long-awaited attack began. Although German units made little progress in the north, the attacking force from the south bludgeoned its way forward. But on 10 July, British and American forces invaded Sicily, clearly threatening to drive Italy from the war. This invasion forced Hitler to end the offensive at Kursk—the greatest tank battle in history.

Within a few weeks, the Soviets began their late summer offensive in the south, which they followed up with a winter offensive that drove German forces out of the eastern Ukraine and trapped German troops on the Crimea. As the spring mud in 1944 brought the usual pause in operations, the German lines stretched from near Leningrad in the north, and along the southern edge of Army Group Center, the lines curved inward. The Soviets achieved a great tactical surprise, as they fooled the Germans into expecting a summer attack against positions in the Ukraine. The Soviets then repositioned their tanks and artillery and prepared for a massive offensive against Army Group Center in Operation BAGRATION, which would coincide with the Allied invasion of France. On 20 July 1944, the Soviets struck, and within weeks, they had largely destroyed Army Group Center. The Soviets followed this up with attacks to end the siege of Leningrad and to expel German troops from all Soviet territory. Pausing in the center before Warsaw—which allowed the Germans to destroy the Polish underground army that had joined the fighting—Soviet forces moved into the Balkans, as Romania and Bulgaria desperately sought to avoid Soviet vengeance.

The end was drawing near, and the Soviets continued to advance. One axis aimed at Berlin while the other struck through Hungary. By January 1945, the Soviets had secured most of East Prussia, and in the south, they were at the gates of Budapest. In April, they brought up supplies and reserve

troops for the final drive into Germany proper. The Germans conducted a desperate defense of Berlin, using old men and young boys, and the Soviets took huge casualties as Marshal Georgii Zhukov and Colonel General Ivan Konev fought for the honor of liberating the city. In late April, Soviet and American troops met at Torgau on the Elbe, and several days later, Soviet forces occupied Berlin while Hitler committed suicide in his underground bunker. Finally, on 7 May 1945, Germany signed a surrender document that went into effect on all fronts the next day. The Eastern Front had absorbed the lion's share of German military resources from 1941 onward, and the Soviet ability to stave off defeat and then achieve victory there was critical to the war's outcome.

Eastern Solomons, Battle of the (22–25 August 1942)

Naval battle fought off Guadalcanal. Henderson Field, captured by the Marines following their surprise landing on Guadalcanal on 7 August, was the only U.S. air base in the Solomon Island chain. The Japanese were determined to retake the field, and they subjected the Marines to ground attacks and to frequent night bombardment from destroyers offshore. Japanese Admiral Yamamoto Isoroku devised Operation KA, a plan to land reinforcements on Guadalcanal and at the same time eliminate the defending U.S. carriers. As in the Battle of Midway, however, Japanese forces failed to concentrate on a single objective.

On 19 August, the Japanese launched a major ground attack against Henderson Field but failed to take it. The next day, Rear Admiral Raizo Tanaka dispatched to Guadalcanal a convoy from Rabaul with 1,500 reinforcements, escorted by

the light cruiser *Jintsu* and six destroyers. To provide air cover for the landing, Yamamoto ordered Admiral Kondō Nobutake to steam from Truk with a task force centered on the fleet carriers *Shokaku* and *Zuikaku* and the light cruiser *Ryujo*. Also on 20 August, the Marines at Henderson Field received 31 aircraft from the escort carrier *Long Island*.

Although the Japanese had changed their codes after Midway, their radio traffic indicated something was in the offing, and on 21 August, Admiral Chester Nimitz, commander in chief of U.S. forces in the Pacific (CINCPAC), ordered Vice Admiral Frank Fletcher, commanding the *Wasp*, *Saratoga*, and *Enterprise* task forces, to contest the Japanese. On 22 August, U.S. patrol bomber (PBY) Catalina aircraft spotted Japanese submarines, prompting an air strike from the *Saratoga*, which failed to locate the Japanese fleet. The following day, Nimitz received faulty intelligence indicating that the Japanese attack force remained at Truk, and Fletcher released the *Wasp* to refuel.

On 24 August, a PBY spotted the Japanese light carrier *Ryujo*, and Scout Bomber Douglas (SBD) dive-bombers from the *Enterprise* reported 15 Zeros and six Kate torpedo planes from the carrier headed toward Guadalcanal. The *Saratoga* then launched a strike on the *Ryujo*. The American SBDs located the carrier and scored three hits, setting her on fire. During the attack, a PBY located the main Japanese task force, centered on the *Shokaku* and *Zuikaku* under Vice Admiral Nagumo Chūichi. Fletcher then ordered the planes attacking the *Ryujo* to strike instead the larger Japanese carriers, but this message never reached the attacking aircraft, which went on to sink the *Ryujo*. They also badly damaged the Japanese heavy cruiser *Tone*, a specially modified aircraft cruiser armed with 8 × 8-inch guns and carrying eight seaplanes.

Meanwhile, U.S. radar revealed the incoming strike of aircraft from the *Shokaku* and *Zuikaku*, heading toward the American carriers. The *Enterprise* and *Saratoga* were operating independently, and the Japanese first located the *Enterprise*, which launched its F-4 Wildcat fighters in defense. Soon, 30 Japanese Val dive-bombers began attacks on the *Enterprise*. Their bombs pierced her flight deck in three places, seriously damaging her. Fires soon raged below deck, and the crew of the *Enterprise* fought valiantly to save their ship. The *Saratoga* escaped, in part thanks to highly effective antiaircraft fire provided by the battleship *North Carolina*.

On 25 August, Tanaka's convoy bound for Guadalcanal came under attack by U.S. B-17 bombers from Espiritu Santo and aircraft from Henderson Field. U.S. dive-bombers scored two hits on one of the transports, which later sank. For the first time in the campaign, the B-17s also scored a hit on a Japanese escorting destroyer and sank it. The convoy, far from its objective and vulnerable, now returned to Rabaul.

The Battle of the Eastern Solomons was a U.S. victory, securing, for the time being, the American position on Guadalcanal. The Japanese lost 1 light carrier, 1 light cruiser, and 1 transport

Explosion resulting from a Japanese bomb striking the flight deck of the U.S. Navy aircraft carrier *Enterprise* during the battle of the Eastern Solomons on 24 August 1942. The photographer was killed while taking this picture. (National Archives)

along with 75 aircraft, and the United States lost 25 planes. The *Enterprise* returned to Pearl Harbor and was repaired within a month. Fletcher was slightly wounded, and Nimitz selected Vice Admiral William Halsey to replace him. One of the great “what-ifs” of the Pacific war involves Yamamoto’s failure to employ the giant battleship *Yamato* off Guadalcanal. She was available, and her guns might have made a difference in the fight for Henderson Field, but Yamamoto was unwilling to risk such a powerful national symbol.

Eben Emael (10–11 May 1940)

Belgian frontier fort and site of a German special operation to seize the Belgian frontier defenses at the opening of Germany’s campaign in the west on 10 May 1940. FALL GELB (Operation YELLOW) involved three army groups poised to split the British, Belgian, and French forces and gain the Channel coastline for continuing operations against Great Britain.

Eben Emael was a reinforced, concrete-and-steel bunker system located on the Albert Canal at its junction with the Meuse River north of Liège, Belgium, and about 3 miles south

of Maastricht in the Netherlands. The fort's plateau top was wedge-shaped, 1,100 yards long on its north-south axis, and 800 yards wide across the southern baseline. The entrance was at the southwest corner at casemate number 3. The fort guarded the bridges over the canal and the routes to the interior of the Low Countries and France beyond. At the time of the attack on 10 May, about 700 soldiers manned the fortress bunkers, which were designed for a detachment of 1,200. Belgian regular army officer Major Jean Fritz Lucien Jottrand had command. The garrison of Fort Eben Emael had been alerted to activity across the German border shortly after midnight on 9–10 May, but it took several hours to put things in order. Alerts were common, and the troops were quartered in villages near the fort.

The Germans, already skilled in assault tactics from their World War I experiences, had developed special teams to reduce fortifications. The secret operation against the fort, code-named GRANITE, had Adolf Hitler's personal interest. Captain S. A. Koch, an officer in Major General Kurt Student's airborne forces, was chosen to lead the attack. Artillery preparations cratered the ground around the fort to provide cover for the advancing German troops, and they suppressed the fire of the fort's guns.

The glider attack was to occur at the same time as other events on the ground, but flight problems required the Ju-52 tow planes to penetrate Dutch airspace to get to the required release altitude. The Dutch were alerted and began anti-aircraft fire.

On the early morning of 10 May, 10 DFS-230 gliders, each carrying a squad of seven or eight men, landed silently on top of the fort. Lieutenant Rudolf Witzig's command glider had prematurely disconnected and landed in a field near Köln (Cologne). Sergeant Helmut Wenzel took charge, until Witzig's arrival at 6:30 A.M.

The assault force used shaped-charge explosives to penetrate the casemates and cupolas. Throughout the afternoon and night of 10 May, the Germans and Belgians fought inside the dank passageways of the fort. Rubber assault boats and the employment of flamethrowers helped the attack group to cross the canal and close on the fort. While the engineers of the assault detachment kept the bunker garrison occupied, Captain Koch's other airborne forces attacked the bridges over the Albert Canal. The next day, a German division arrived to complete the capture of the remaining bridges and forts. Lieutenant Witzig's assault force suffered only 26 casualties in its successful mission. Major Jottrand and his captured Belgian soldiers, after resisting for just over one day, were marched off to a prison camp in Germany to sit out the war. Vital bridges at Veldwezelt and Vroenhoven were also secured, and the German Sixth Army was able to advance. Its tanks took Liège the next day.

Eden, Sir Robert Anthony (First Earl of Avon) (1897–1977)

British politician and foreign secretary who served as a cabinet minister during World War II. Born in Windlestone, England, on 12 June 1897, Eden served in France during World War I, rising to brigade-major, and then took a degree in Oriental languages at Cambridge. He entered Parliament in 1924 and became Stanley Baldwin's foreign secretary at age 38 in December 1935. A staunch supporter of the League of Nations, Eden resigned in February 1938 in disagreement

over Neville Chamberlain's appeasement of Benito Mussolini's policies.

With the outbreak of war, Eden returned to Chamberlain's cabinet as Dominions secretary (3 September 1939) and helped to develop the Empire Air Training Scheme that trained thousands of pilots and aircrew in Canada and Africa. When Winston L. S. Churchill became prime minister, he named Eden war minister (10 May 1940); shortly thereafter came the disastrous British Expeditionary Force (BEF) and its Dunkerque evacuation, as well as British setbacks in the Middle East.

Eden again became foreign secretary (on 23 December 1940) and attended virtually all the Allied wartime conferences. Patient and urbane, he was a superior diplomat who effectively represented British interests to the other Allies—especially the often difficult Charles de Gaulle, whose Free French cause Eden often defended. Churchill appointed Eden leader of the House of Commons in November 1942, a role he played well but at a cost to his health. Churchill also named Eden, by now part of his inner circle, as his designated successor in the event of his own death. Eden worked hard on the formation of the United Nations, and he left office only when the Labour Party won the British elections (27 July 1945). However, he retained his own seat in the House of Commons

Eden served a third time as foreign secretary in Churchill's second government (1951–1955) but never fully recovered from abdominal surgery in 1953. He was knighted in 1954, and on Churchill's retirement, he served as prime minister (6 April 1955–9 January 1957), resigning after the mishandled Suez Crisis. He was made the earl of Avon in 1961 and died on 14 January 1977, in Alvediston, England.

Egypt

Strategically located in northeast Africa, Egypt was vital to the British effort in World War II to protect the Suez Canal and lines of communication to Middle East oil fields. In 1939, Egypt had a population of about 16 million people.

The British had taken control of Egypt in 1882 to secure the Suez Canal. Supposedly, they had intervened to “restore order,” but the British stayed. London ended its protectorate in 1922 and granted Egypt independence as a constitutional monarchy with adult male suffrage, but it did not relinquish authority in key areas. Great Britain retained control over defense, imperial communications (the Suez Canal), protection of foreign interests and minorities, and the Sudan. In August 1936, the same year King Farouk came to the throne, Britain signed a treaty with Egypt whereby it retained the right to defend the Suez Canal until the Egyptian army could do so. The Egyptian government also agreed that, in the event of war, it would grant full use of Egyptian facilities to the British.

Throughout World War II, Port Said and Alexandria remained major British bases for operations in the eastern Mediterranean. As headquarters of the Middle East Supply Center, the Egyptian capital of Cairo was the transit point for half a million British and Commonwealth troops. Cairo was also the headquarters of the Middle East Command, and the city remained a haven for agents and spies. Egyptian nationalists were active, with many Egyptians, including Farouk and Prime Minister Ali Mahir, hoping for an Axis military victory in the war and full independence for Egypt.

Although Farouk was the constitutional monarch, British Ambassador Miles Lampson exercised real power. At the beginning of the war, the British insisted on the imposition of martial law and strict censorship and the arrest of German nationals. The Egyptian government ended diplomatic relations with Germany, but Egypt did not declare war against Germany or, later, Italy. Only reluctantly did Ali Mahir allow the confiscation of Italian property in Egypt. He also refused permission for border guards to fire on Italian troops. In June 1940, the British insisted that Farouk replace Ali Mahir. His replacement was Hasan Sabri, a moderate.

On 17 September 1940, Italian forces invaded Egypt. Despite a pledge that it would declare war if this happened, the Egyptian government merely declared a state of nonbelligerency. In November 1940, Prime Minister Sabri died and was replaced by Husayn Sirry, who headed a coalition government. Axis air attacks on Cairo in June 1941 killed some 600 people, but Egyptian sentiment remained heavily anti-British. That winter, conditions in Egypt worsened with severe shortages of many goods, including food. Bread riots occurred in Cairo in January 1942. With General Erwin Rom-

A column of Axis prisoners captured in Libya nearing the massive walls of the Citadel of Cairo, showing the Mohamed Ali Mosque (above) and the Mosque of Sultan Hassan. (Library of Congress)

mel's forces closing on Cairo, nationalist demonstrations in the capital occurred in favor of an Axis victory, and Sirry resigned in early February. The British then insisted that Farouk appoint as prime minister Mustafa Nahas, the pro-British head of the Wafd nationalist party. When Farouk hesitated, British armored cars and troops surrounded the palace, and Lampson demanded his abdication. Farouk then acquiesced, and Nahas formed a government.

Throughout 1942, pro-Axis sentiment remained strong, even among the elites and the Egyptian army. Following the November 1942 Battle of El Alamein, both the Axis threat to Egypt and British authority subsided. Despite Farouk's repeated efforts to remove him from office, Nahas remained as prime minister until October 1944, when the British allowed Farouk to replace him with Saadist leader Ahmad Mahir. The new prime minister secured Egyptian declarations of war against Germany and Japan, but he was assassinated shortly thereafter, in February 1945. The declarations of war were formally proclaimed on 26 February 1945, allowing Egypt to become a founding member of the United Nations.

As elsewhere in Africa and the Middle East, World War II heightened nationalism and anticolonialism. Following Farouk's abdication in 1952, the last British troops departed

the country in 1954. Egypt did not gain its full sovereignty, however, until 1956 and the Suez debacle.

Eichelberger, Robert Lawrence (1886–1961)

U.S. Army general and commander of the Eighth Army in the Pacific Theater. Born 9 March 1886 in Urbana, Ohio, Robert Eichelberger attended Ohio State University for two years before attending the U.S. Military Academy, where he graduated in 1909. He served in a variety of assignments before becoming assistant chief of staff of the Siberian Expeditionary Force (1918–1919), where he was promoted to temporary lieutenant colonel.

Eichelberger served in the Philippines and in China and then on the War Department General Staff (1921–1924). He graduated from the Command and General Staff School (1926) and the Army War College (1930). Eichelberger then served at West Point (1931–1935), where he was promoted to lieutenant colonel (1934). He became secretary to the General Staff (1935–1938), and after being made colonel (1938), he commanded the 30th Infantry Regiment. Promoted to brigadier general, he was appointed superintendent of West Point (1940).

In March 1942, Eichelberger became a temporary major general and took command of the 77th Infantry Division. He commanded XI Corps and then I Corps, in Australia. He led I Corps in New Guinea in September 1942. Promoted to temporary lieutenant general the next month, he directed the successful assault of Buna-Gona (November 1942–January 1943) and then operations in New Guinea and New Britain (January 1943–July 1944).

Eichelberger took command of Eighth Army in September 1944 and led it to Leyte Island in the Philippines that December. He directed operations on Luzon (January–April 1945), including the liberation of Manila, and his forces also liberated the southern Philippine Islands, including Mindanao. He was entrusted with command of all Philippine operations in July. His Eighth Army carried out 14 major and 24 smaller landings.

U.S. Army Brigadier General Robert Eichelberger. (Library of Congress)

Between 1945 and 1948, Eichelberger commanded Eighth Army in Japan. He returned to the United States in September 1948 and retired from the army. Two years later, he published a book entitled *Our Jungle Road to Tokyo*. During the Korean War, he was briefly a special adviser in the Far East. He was promoted to full general in July 1954 and died in Asheville, North Carolina, on 26 September 1961.

Eichmann, Karl Adolf (1906–1962)

German Schutzstaffel (SS) lieutenant colonel and key figure in the destruction of European Jewry during World War II. Born on 19 March 1906 in Solingen in the Rhineland, Germany, Karl Adolf Eichmann moved with his family to Linz, Austria, in 1914.

He left the Linz Higher Institute for Electro-Technical Studies after two years and became a salesman. In 1932, he joined the Austrian National Socialist movement, but he fled to Germany in 1934 when it was outlawed. Sent to Berlin, he joined the SS Sicherheitsdienst (Security Service, SD) and was assigned to its Jewish Office. There, he became the Nazi expert on Jewish affairs and handled negotiations concerning the emigration of German Jews to Palestine, which he visited briefly in 1937. Following the Anschluss (union) with Austria and absorption of Bohemia and Moravia, he headed the Office for Jewish Emigration.

With the beginning of World War II, Eichmann transferred to the Gestapo and created the Reich Central Emigration Office to handle the relocation of European Jews to Poland. That office was then combined with the Jewish Affairs Office to form Department IV-A-4B, known as the Dienststelle Eichmann (Eichmann Authority). He helped organize the Wannsee Conference of January 1942 that developed the mechanics of the “final solution” and was put in charge of the transportation of Jews to the death camps of Poland. Eichmann later told an associate that he would “die happily with the certainty of having killed almost six million Jews.”

After the war, Eichmann lived in various places under aliases until he escaped to Argentina, where he lived and worked near Buenos Aires in obscurity under the name Ricardo Klement. On 11 May 1960, Israeli Secret Services captured him and smuggled him from the country illegally to stand trial in Israel. Eichmann claimed he was only following orders

Adolf Eichmann, on trial in Jerusalem, during trial cross-examination, standing in booth in front of microphones between two officers in courtroom. (Library of Congress)

and in any case could be accused only “of aiding and abetting” the annihilation of the Jews, not killing them. Found guilty by an Israeli court on 15 December 1961, he was sentenced to death. Unrepentant, he was hanged at Ramleh Prison on 31 May 1962. His body was then cremated and the ashes scattered.

Einstein, Albert (1879–1955)

Physicist, Nobel laureate, and pacifist who urged the United States to begin research into the feasibility of constructing atomic bombs. Born in Ulm, Germany, on 14 March 1879, Albert Einstein renounced German citizenship in 1896 and became a Swiss citizen in 1901. While working as a patent clerk, he developed his special theory of relativity and the famous equation $E = mc^2$ that demonstrated the equivalency of mass and energy. With the rise of Nazism and Jewish persecution, he left Berlin in 1933 for the Institute of Advanced Study in Princeton, New Jersey.

In 1939, leading physicists, including Hungarian émigrés Leo Szilard and Eugene P. Wigner as well as Italian expatriate Enrico Fermi, concluded that Germany was working on an atomic bomb. Szilard approached Einstein with a letter for President Franklin D. Roosevelt, urging that the U.S. government begin an atomic bomb project of its own to deter Adolf Hitler (assuming German efforts succeeded).

Einstein was apotheosized as perhaps the world’s greatest physicist since Isaac Newton, and his signature on this letter carried considerable weight and authority. Dated 2 August 1939, it warned that it was now likely that scientists would establish and sustain a chain reaction in uranium, which could lead to the construction of “extremely powerful bombs of a new type.” Einstein urged the president to form a partnership among government officials, industry specialists, and scientists to conduct feasibility studies; he also recommended securing supplies of uranium ore.

Alexander Sachs, economist and presidential confidant, delivered the letter on 11 October 1939. Sufficiently alarmed by Sachs’s précis of its contents, Roosevelt appointed the Uranium Committee to begin preliminary studies, which

Albert Einstein. (Corbis)

became the basis for the MANHATTAN Project organized in 1942 to build atomic bombs.

Einstein’s letter served as the catalyst for the MANHATTAN Project, but Einstein himself was excluded from the project. His pacifism, Zionism, and a supposedly lackadaisical attitude regarding military secrecy made him suspect to army intelligence. After the war, he campaigned unsuccessfully for a “world government” consisting of the United States, Great Britain, and the Soviet Union that would restrict further development and construction of atomic weapons. Einstein died in Princeton, New Jersey, on 18 April 1955.

Eisenhower, Dwight D. (1890–1969)

U.S. Army general and supreme commander, Allied Expeditionary Forces, European Theater of Operations (ETO). Born in Denison, Texas, on 14 October 1890, Dwight David “Ike” Eisenhower grew up in Abilene, Kansas. Graduating from the U.S. Military Academy in 1915 as a member of the “class the stars fell on,” he was commissioned a second lieutenant of infantry. His first posting after West Point was Fort Sam Houston, Texas.

Eisenhower commanded the fledgling tank corps training center at Camp Colt outside Gettysburg, Pennsylvania, during World War I. Following service in Panama, he graduated first in his class at the Command and General Staff School, Fort Leavenworth, Kansas, in 1926. He also graduated from the Army War College in 1928. During the inter-war period, Eisenhower served under a number of the

army’s finest officers, including Generals Fox Conner, John J. Pershing, and Douglas A. MacArthur. Following his return from the Philippines in 1939, he served successively as chief of staff of the 3rd Infantry Division, IX Corps, and Third Army, where he was promoted to temporary brigadier general in October 1941 and captured Army Chief of Staff General George C. Marshall’s attention for his contributions to Third Army’s “victory” in the Texas-Louisiana war maneuvers of 1941.

Summoned to the War Department in the aftermath of the Japanese attack on Pearl Harbor, Eisenhower headed the War Plans Division and then the Operations Division of the General Staff before being promoted to major general in April 1942. Marshall then appointed Eisenhower commanding general of the European Theater of Operations, in June 1942. Promotion to lieutenant general followed in July 1942. His appointment was met with great skepticism from senior British military officers because of his lack of command experience.

Dwight D. Eisenhower talking to American paratroopers in England prior to the Normandy Invasion. (Library of Congress)

Eisenhower commanded Allied forces in Operation TORCH in November 1942 (the invasion of northwest Africa) and in Operation HUSKY in July 1943 (the invasion of Sicily). In the interim, he was promoted to full general in February 1943. The efficient operation of his headquarters—Allied Forces Headquarters—became a model of Allied harmony and led to increased responsibilities in the Mediterranean Theater of Operations. In September 1943, his forces invaded the Italian mainland. Eisenhower's generalship during this phase of the war has long been subject to controversy, but his adept management of diverse personalities and his emphasis on Allied harmony led to his appointment as supreme commander, Allied Expeditionary Forces for the invasion of northwest Europe.

As commander of Operation OVERLORD, the Normandy Invasion on 6 June 1944, Eisenhower headed the largest Allied force in history. Following the expansion of the lodgment area, he took direct command of the land battle on 1 September 1944. As the Allied forces advanced along a broad front toward the German border, he frequently encountered opposition from senior Allied generals over command arrangements and logistical support. He displayed increasing brilliance as a coalition commander, but his operational decisions remained controversial. His support of British Field Marshal Bernard L. Montgomery's abortive Operation MARKET-GARDEN is evidence of his unflinching emphasis on Allied harmony in the campaign in northwest Europe. In mid-December 1944, Eisenhower was promoted to General of the Army as his forces stood poised to strike into the heartland of Germany.

When Adolf Hitler launched the Ardennes counteroffensive on 16 December 1944, it was Eisenhower, among senior Allied commanders, who first recognized the scope and intensity of Germany's attack. Marshaling forces to stem the German advance, he defeated Hitler's last offensive in the west. By March 1945, his armies had crossed the Rhine River and encircled the Ruhr industrial area of Germany. As Soviet armies stood on the outskirts of Berlin, Eisenhower decided to seek the destruction of Germany's armed forces throughout southern Germany and not to launch a direct attack toward the German capital. On 7 May 1945, the mission of the Allied Expeditionary Forces was fulfilled as he accepted the unconditional surrender of Germany's armed forces.

Following the war, Eisenhower succeeded General Marshall as army chief of staff. In February 1948, he retired from the military and assumed the presidency of Columbia University, before being recalled to active field duty by President Harry S. Truman in 1950 to become supreme Allied commander, Europe in the newly formed North Atlantic Treaty Organization (NATO). In 1952, Eisenhower resigned from active military service and accepted the Republican Party's nomination for president. Elected by a wide majority in 1952

and again in 1956, he stressed nuclear over conventional forces, supported expanded U.S. military commitments overseas, and warned of the dangers of a military-industrial complex. He left office in 1961 as one of this nation's most popular chief executives, his two administrations marked by unheralded peace and prosperity. In 1961, Eisenhower retired to his farm in Gettysburg, Pennsylvania. He died in Washington, D.C., on 28 March 1969.

El Alamein, Battle of (23 October–4 November 1942)

Major Allied victory against German and Italian forces in Egypt. By the fall of 1942, there were signs that the war in North Africa was turning in favor of the British. Axis forces under Field Marshal Erwin Rommel had failed to break through the British lines at Ruwiesat Ridge in July and Alam Halfa Ridge in September. British Eighth Army commander Lieutenant General Bernard Montgomery gradually built up his strength to strike an offensive blow. Although Prime Minister Winston L. S. Churchill repeatedly pressed for an earlier attack, Montgomery set the operation, code-named LIGHT-FOOT, to begin on the night of 23–24 October, under a full moon. General Sir Alan Brooke, chief of the Imperial General Staff, and General Harold Alexander, British commander in chief in North Africa, managed to placate Churchill.

By late October, Montgomery's Eighth Army numbered 195,000 men and had 1,029 tanks (including 300 U.S.-built M-4 Sherman mediums), 2,311 artillery pieces, and some 750 aircraft. Ranged against them were 104,000 Axis troops (50,000 Germans and 54,000 Italians), 489 tanks, 1,219 guns, and 675 aircraft. The Germans had, however, faced worse odds and won in North Africa. Rommel's defense was based on some

General Erwin Rommel in the desert at El Alamein, with his troops. (Library of Congress)

450,000 mines laid from the sea to the Qattara Depression, including corridors designed to funnel attackers into traps, although the Afrika Korps (Africa Corps) commander had no confidence he could hold against a determined British attack.

Montgomery planned to feint an attack to the south while Lieutenant General Sir Oliver Leese's XXX Corps delivered the major blow in the north against the strength of the Axis positions. Indeed, the elaborate British deception efforts convinced Axis intelligence that the main blow would occur in the south.

Montgomery planned to use armor to blast his way through the German positions and then carry out an envelopment of Axis forces. However, his own armor commanders, particularly General Herbert Lumsden of X Corps, thought that this was a misuse of tanks. Montgomery adapted his plan so that the armor would cover an initial infantry attack and then seize defensive ground. The infantry would "crumble" the German line, and when panzers moved forward to assist, the British armor would strike.

The attack began at 9:40 P.M. on 23 October 1942, almost totally surprising the Germans (Rommel was in Germany at the time, recuperating from an illness). British air attacks and

artillery fire from 1,000 guns disrupted Axis communications and rained down on a 6-mile-wide front in the Axis lines near the Mediterranean coast. Then, XXX Corps began its attack in the north, while Lieutenant General Sir Brian Horrocks's XXX Corps began the southern attack near the Qattara Depression to fix German forces there.

XXX Corps opened two corridors through the Axis minefields, and Lumsden's X Armoured Corps then moved through them. Italian forces holding this sector fought well, however, and 15th Panzer Division's counterattack almost halted the British advance. Montgomery found that reports of progress had been overly optimistic. The commanders of his armored divisions feared that crossing the key Miteiriya Ridge would expose their tanks to the deadly fire of German 88 mm anti-tank guns, and they had not moved. Meanwhile, the Germans were extending and reinforcing their minefields. An angry Montgomery now halted the southern thrust and concentrated his resources in the north. He also stated that he would relieve commanders who failed to advance. Progress resulted, and by late afternoon on 24 October, the 1st Armoured Division reported one of its brigades on and around Kidney Hill, part of Miteiriya Ridge. Once again, however, reports were overly

optimistic, and the 7th Armoured Division bogged down entirely at Himeirat. Meanwhile, General der Panzertruppen (U.S. equiv. lieutenant general) Georg Stumme, Rommel's temporary replacement as German commander, died of a heart attack while visiting the front earlier that day.

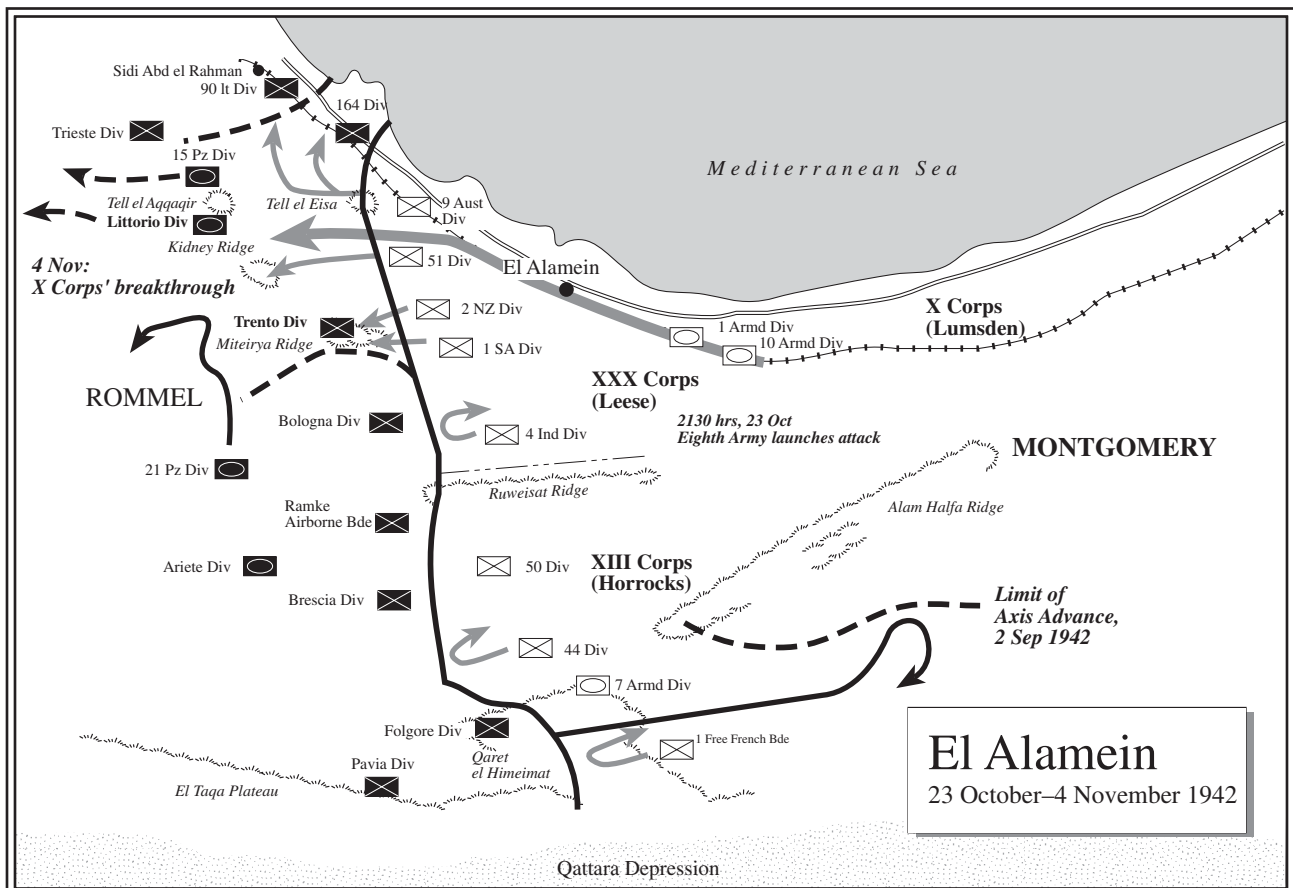

Montgomery was awakened at 2:00 A.M. on 25 October with the bad news and quickly saw his whole plan was threatened. With British forces holding only part of Kidney Hill to the north and making no progress at Himeimat in the south, the Germans would have little reason to launch counterattacks, and thus, the British armor would have no chance to destroy the panzers. Montgomery's infantry, although more successful than the armor, was also taking heavy casualties, and only his Australian division had replacements. Montgomery began to revise his plan again—the first of several changes made over the next few days. Ultimate success came, in part, from his flexibility during the battle.

The first effort was on the British far right at midnight on 25 October, but although the Australian infantry did very well, the 1st Armoured Division again failed to move beyond Kidney Hill. This time, the problems were map reading and failure to coordinate with the artillery. Thus far, Rommel, who had returned earlier on 25 October, continued to hold his ground,

which was what Montgomery wanted. Then, because of casualties, Montgomery shifted the offensive burden to Lumsden's X Corps, which was to move west and northwest from Kidney Hill. Not completely trusting Lumsden, Montgomery stayed in close touch with the operation and found that his corps commander was not keeping his artillery commander informed of plans and operations. Not wishing to risk his armor by leaving it unsupported, Montgomery again changed plans.

His new approach was to create an armored reserve to use for a decisive thrust, although the infantry would have to do the initial fighting with even less shield available than previously. At least Montgomery knew from ULTRA intercepts that, even though Rommel was thinking about breaking off, fuel shortages would not allow the Axis side to seek a battle of movement. Meanwhile, Churchill was more worried about winning a victory over the Afrika Korps before the Allied landings in western North Africa (Operation TORCH). The Vichy French were more likely to stand aside or even cooperate in these attacks if Axis forces in eastern North Africa were on the run. Churchill was thus not pleased to learn that armored units were being withdrawn from the Battle of Alamein.

As the fighting evolved, the target shifted from the northern coast road, where German troops were being brought in,

to the Miteiriya Ridge area, where the attack would hit mostly Italian units. Again, the start was delayed when the armor commanders failed to coordinate plans. The basic idea now called for two regiments of armored cars to drive behind the Axis defenders and envelop them. Early on 2 November, the attack began. And again, the infantry did well, quickly gaining 4,000 yards, but the armor failed to advance. Although slow to react because he was convinced the main attack would come farther north, Rommel organized a full-scale counterattack. This move played into the hands of the British, for their armor and antitank weapons could now take defensive positions and destroy the panzers. By the evening of 2 November, Rommel had only 35 German and 20 Italian tanks capable of combat.

Montgomery, however, had two armored divisions in reserve and spent 2 November gathering infantry reserves. He used this reserve force to break out to the southwest. By the evening of 2 November, Rommel was planning to fall back—news made available to Montgomery via ULTRA intercepts. When Adolf Hitler learned of Rommel's plan, however, he ordered the Afrika Korps to fight to the death. Rommel later claimed that this order resulted in the destruction of his army, but since it reached him more than half a day after his withdrawal started, it had little effect on the outcome. In any case, British attacks continued, and Allied air bombardment added a new destructive element. By the afternoon of 4 November, the victory was clearly won. The Italian XX Corps had been destroyed, and the Afrika Korps on its left had been shattered. On the afternoon of 4 November, Rommel ordered a retreat. Several days later, the Allies landed in western North Africa.

Casualty figures for the Battle of El Alamein vary widely. The British claimed to have inflicted 50,000 casualties, but the actual number is probably closer to 2,300 killed, 5,500 wounded, and 27,900 captured. Rommel had also lost almost all his tanks and artillery. Eighth Army casualties amounted to 4,600 killed and 9,300 wounded. The British also lost 432 tanks destroyed or disabled.

Despite the battle's outcome, historians have been critical of Montgomery for attacking the strength of the Axis line, and his subsequent claim that everything had gone according to plan is simply not true. Nonetheless, although Africa was not cleared of Axis forces for another six months, the end was plainly in sight.

Electronic Intelligence

The collection and analysis of electromagnetic emissions that provide insight into an enemy's technological capabilities. The broader category of signals intelligence (SIGINT) includes both communications intelligence (COMINT) and electronic intelligence (ELINT). COMINT encompasses the monitoring of radio and telephone traffic, the decryption of coded messages, and the analysis of the contents of those messages. ELINT is the collection and analysis of electromagnetic emissions, such as telemetry and radar signals, with the expectation that the successful analysis of ELINT will provide information about enemy technology and lead to the development of effective countermeasures.

During World War II, signals intelligence played an important role in strategic decision making. Its best-known successes were in COMINT and included breaking the Japanese and German codes in MAGIC and ULTRA. The Axis powers also had some success in breaking Allied codes, most especially those regarding the Atlantic convoys. Signals intelligence activities during World War II were not limited to intercepting and reading communications, however. ELINT activities during the war included monitoring radar signals to determine the transmitting power, range, and accuracy of the air defense systems built by both the Allies and the Axis powers. In the Atlantic and Pacific Oceans, Great Britain and the United States used sophisticated radio receivers to approximate the positions of submarines, merchantmen, and surface warships by means of triangulation (interpreting the strength and point of origin of radio transmissions). As the war progressed, ELINT techniques became more sophisticated. Because of the role played by both COMINT and ELINT in the conflict, World War II has sometimes been referred to as the SIGINT war.

Emilia Plater Independent Women's Battalion (1943–1945)

First Polish cohesive, all-female combat unit, consisting of volunteers forcibly resettled in the Soviet Union and ironically named after a leader of an insurrection in 1830 directed against Russia.

Initially attached to the 1st Tadeusz Kościuszko Division, the battalion swore the oath of allegiance on 15 July 1943. It became directly subordinated to the I Polish Corps in August 1943 and to the First Polish Army in July 1944. Unlike women's auxiliary units in the West, the battalion lacked special military regulations. Its command personnel were men, and its political officers were women.

In August 1943, the battalion included five companies (two infantry and one each of fusiliers, machine guns, and handheld antitank grenade launchers) and six platoons (mortar, reconnaissance, signals, medical, engineer, and logistics). In late 1943, one transport platoon was added. Because the battalion also provided basic training to women subsequently assigned elsewhere, its strength fluctuated.

Women subsequently trained at the Infantry Officers' School in Ryzań, and they commanded companies and platoons of the new Polish army because of the drastic shortage of male Polish officers (of whom about 15,000 had been killed at Soviet prisoner-of-war camps in 1940). Among these women was Second Lieutenant Emilia Gierczak, platoon commander of the 10th Infantry Regiment. She distinguished herself in the fighting on the Pomeranian Rampart, while leading an assault group in Kołobrzeg (Kolberg).

About 70 women in the battalion died in the war. In May 1945, its strength of roughly 500 women was only a small percentage of the total of women serving in two Polish armies formed in the Soviet Union, with estimates ranging from 8,500 to 14,000.

Empress Augusta Bay, Battle of (2 November 1943)

Naval battle between U.S. and Japanese naval forces during the Bougainville Campaign. On 1 November 1943, Major General A. H. Turnage's 3rd Marine Division, which had been reinforced, landed at Empress Augusta Bay, about halfway up the west coast of Bougainville Island in the northern Solomon Islands. The landing was part of Operation CARTWHEEL, which was designed to neutralize the major Japanese air and naval base at Rabaul on New Britain Island to the north.

In addition to air attacks from Rabaul, which were thwarted by Allied fighter aircraft, the Japanese dispatched a scratch naval task force to attack the Torokina beachhead on Bougainville. Commanded by Rear Admiral Omori Sentaro, the force consisted of the heavy cruisers *Myoko* and *Haguro*,

Wounded in the initial invasion at Empress Augusta Bay, Bougainville, this American is hoisted aboard a Coast Guard–manned transport off shore, November 1943. (Still Picture Records LICON, Special Media Archives Services Division (NWCS-S), National Archives at College Park)

two light cruisers, six destroyers, and five destroyer transports carrying 1,000 troops who were to be landed on Bougainville. Rear Admiral Ijuin Matsuji commanded the left flank screen with the light cruiser *Sendai* and three destroyers, and Rear Admiral Osugi Morikazu had the right with the light cruiser *Agano* and three destroyers.

The transports turned back late in the evening of 1 November after Omori concluded that the task force had been sighted by American planes. Omori, however, continued to Bougainville with his other ships in the expectation that he could destroy the Allied transports and cargo vessels in a night battle. Unknown to him, the transports had been quickly unloaded and had left Empress Augusta Bay earlier that day.

Learning of Omori's task force from U.S. Army reconnaissance aircraft, Rear Admiral A. Stanton Merrill, whose Task Force 39 had been providing bombardment support for the Bougainville landing force, moved to intercept the Japanese about 20 miles north of Empress Augusta Bay. Task Force 39 was centered on Merrill's Cruiser Division 12, consisting of the light cruisers *Montpelier* (the flag), *Cleveland*, *Columbia*, and *Denver*. Captain Arleigh Burke's Destroyer Division 45 made up the van, and Commander B. L. Austin's Destroyer Division 46 comprised the rear. Merrill hoped to engage the Japanese ships at long range to avoid a torpedo attack while making use of his radar-controlled, 6-inch guns.

The two task forces encountered each other at 2:27 A.M. on 2 November and fought a complicated battle that was really three engagements in one: Merrill's cruisers against Omori's cruisers and individual battles waged respectively by the two destroyer divisions. Although the Japanese were superior in gunfire and torpedoes and although Omori thought he had inflicted serious losses on the Americans, he broke off the battle after an hour, at 3:27.

Merrill's cruisers sank the Japanese light cruiser *Sendai*, and Destroyer Division 46 sank the Japanese destroyer *Hatsukaze*, which already had been badly damaged in a collision with the cruiser *Myoko*, Omori's flagship. Task Force 39's losses were limited to damage to two ships; the destroyer *Foote* had her stern blown off by a torpedo. Merrill abandoned pursuit of the Japanese ships at dawn to await the inevitable Japanese air response from Rabaul. It came at about 8:00 A.M. in the form of 100 Japanese aircraft, which were met by a smaller number of Allied fighters. The Japanese inflicted only minor damage, with the cruiser *Montpelier* taking two bomb hits on her starboard catapult. Omori was subsequently relieved of command for failing to carry out his orders.

The Battle of Empress Augusta Bay did not end the Japanese naval threat to the Allied lodgment on Bougainville. However, the prompt U.S. Navy reaction prevented Japanese disruption of the landing, and along with massive air raids

against Rabaul over the next days and the naval battle of Cape St. George on 25 November, it helped ensure the success of the Bougainville Campaign.

Enigma Machine

At the 1923 International Postal Congress, Arthur Scherbius, a German, demonstrated his invention of a commercial encoding machine, known as the Enigma device. Enigma resembled a typewriter in appearance with a series of rotors or wheels, the settings of which could be changed. Early versions of the device enabled the operator to encode a plaintext in any of 150 million possible ways.

As with all major military powers, the Germans sought to develop a secure means of military communications and assumed that messages encoded by Enigma were unbreakable. By 1928, the German military was using the Enigma, and Japan and Italy also bought the machine and used it. Other countries, such as the United States, purchased the Enigma machine but did not attempt to unlock its secrets.

The Poles, concerned about a resurgent Germany as a threat to their own security, formed a special cryptography group at the University of Poznan in 1928. They also purchased the commercial model of Enigma, and by 1935, they had broken into the German radio codes, information they largely shared with the British and French in 1938. Late that year, however, the Germans added a sixth rotor, which helped to convince the Poles that the Germans were about to make an aggressive military move. The Poles modified their own machines to keep up with the German advances, and they continued to break into the German codes, but the defeat of their country came too quickly for Enigma to be of use to them.

An Enigma cipher machine, used by the German military in World War II. (Hulton Archive)

After Poland's defeat, the Polish code-breakers and their machines were spirited away to France and England. At Bletchley Park outside of Buckingham, the British assembled a mixed group of experts to continue the work begun by the Poles. Over time, Bletchley Park developed additional devices that could sort through the possible variations of an encoded text, although the Enigma's changeable settings meant that most messages could not be read in "real time." Nonetheless, Enigma proved invaluable in the Allied military effort and undoubtedly shortened the war. Information on ULTRA intercepts was not made public until 1974, when Group Captain F. W. Winterbotham published *The Ultra Secret*. Its revelations forced the rewriting of most earlier histories of the war.

Eniwetok, Capture of (17–22 February 1944)

Eniwetok Atoll lies on the northwestern edge of the Rilik Chain in the Marshall Islands, some 2,000 miles west of Pearl Harbor. Thirty small islands comprise this coral atoll, mostly on the western edge of a circular lagoon. The three major islands are Eniwetok in the south, Parry in the southeast, and Engebi in the north. Following the capture of islands in the Gilbert chain in November 1943, Vice Admiral Raymond A. Spruance took command of operations against the Marshalls.

Because of the rapid success in securing Kwajalein Atoll in the Marshalls, American planners decided to proceed with Operation CATCHPOLE to take Eniwetok. The assault force of just under 8,000 men centered on the 22nd Marine Regiment and soldiers of the army's 27th Division and attached troops. Brigadier General T. E. Watson had overall command, with Rear Admiral Harry W. Hill commanding the landing group. Unlike assaults in the Gilberts, adequate numbers of LVTs (landing vehicles, tracked) were available, and this operation saw the first extensive use of the DUKW amphibious trucks. Initially, fewer than 60 naval personnel defended Eniwetok Atoll, but on 4 January, Major General Bishida Yoshimi's 1st Amphibious Brigade, a veteran fighting unit, arrived, bringing total Japanese strength on the atoll to nearly 3,500 men.

The Eniwetok Expeditionary Group sortied from Kwajalein Lagoon on 15 February, covering the 326 miles to Eniwetok by two different routes. Engebi was the main U.S. objective because it had the atoll's only airfield. Including soldiers of the 27th Division and attached units, there were just under 8,000 men in the assault force. The invasion began at 8:44 A.M. on 17 February 1944, with the 1st and 2nd Battalions of the 22nd Marine Regiment landing on the southeastern beach. The attackers were supported by medium tanks of the 2nd Separate Tank Company. Initial Japanese resistance was light, and the only organized resistance occurred near Skunk Point. By 2:50 P.M., the island was declared secured, although mopping up continued into 18 February.

Operations against Parry and Eniwetok Islands would be more difficult. At 7:19 A.M. on 19 February, U.S. naval gunfire pounded Eniwetok Island, which was defended by 808 Japanese troops. The fire expended was minimal compared with that on the other islands, and few Japanese positions were damaged. At 9:17 A.M., the 1st and 3rd Battalions of the army's 106th Infantry Regiment landed. Things went badly from the start. The terrain prevented many of the LVTs from moving inland, and the Japanese covered the beach with automatic weapon and mortar fire.

These Marines, dirty and weary from two days and two nights of fighting, were typical of the victors of Eniwetok Atoll. (Still Picture Records LICON, Special Media Archives Services Division (NWCS-S), National Archives at College Park)

At midday on 19 February, the Japanese launched a spirited counterattack with 300 to 400 men. The 106th was able to defeat the counterattack but at heavy cost. Shortly after 12:00 P.M., the 3rd Battalion, 106th Infantry was committed, but it failed to influence the course of the battle. An hour later, the 3rd Battalion, 22nd Marines was ordered ashore and directed to support the army's left flank. That night, the American units completed the capture of the western edge of the island and consolidated a defensive line near the beach.

The battle to secure the eastern side of Eniwetok was similar to the western battles. The 3rd Battalion, 106th Infantry landed on Yellow Beach 1 beginning at 9:17 A.M. on 19 February. Many of the Japanese beach defenses had been destroyed by naval gunfire, but once they were inland, the attackers discovered and were delayed by bunkers, pillboxes, and spider holes. Supported by carrier aircraft, the attacking troops secured the island on 21 February.

Parry Island was defended by 1,347 Japanese. Fortunately for the attackers, prisoner interviews and intelligence material captured on Engebi and Eniwetok revealed the Japanese defensive positions and provided U.S. planners a framework for a detailed preinvasion bombardment. Beginning at 10:00

P.M. on 20 February and continuing until the landing two days later, the battleships *Tennessee*, *Pennsylvania*, and *Colorado*, assisted by two heavy cruisers, pounded the island. Aircraft from three escort carriers also joined the assault.

Beginning at 9:08 A.M. on 22 February, the 1st and 2nd Battalions of the 22nd Marines landed abreast and were met by Japanese machine-gun and mortar fire at the water's edge. At 10:00 A.M., the Japanese opened up with 77 mm field guns, which were quickly silenced by naval gunfire. Meanwhile, the 3rd Battalion, 22nd Marines went ashore. The Marines fought to the ocean side of the island and then formed two lines. Each line battled to the opposite end of the island. By 7:30 P.M. that day, Parry was declared secure.

The battles to capture Eniwetok Atoll were the last major battles of the Eastern Mandates Campaign. Although planners expected this effort to be easy, stiff Japanese resistance from well-prepared positions slowed the progress of the U.S. forces. American casualties were 195 killed and missing and 521 wounded. Of the total Japanese force of some 3,431 men, only 64 prisoners were taken. No American ships were lost during the operation, although there was some damage from friendly fire. No Japanese surface ships contested the land-

ing, but four submarines were sunk, along with a number of small supply ships and patrol craft.

Estonia

The Baltic state of Estonia received its independence as a consequence of World War I. The smallest and most northerly of the three Baltic states, Estonia feared both Germany, because of dispossessed German landowners, and Russia. On 2 February 1920, however, the Russian Soviet Federated Socialist Republic recognized Estonia as an independent country. The Estonian government in Tallinn subsequently negotiated nonaggression pacts with the Soviet Union in June 1932 and Germany in June 1939. In 1939, the country was ruled by the nationalist Peasant Party, headed by K. Päts. Estonia was a member of the League of Nations.

Another nonaggression pact, this one between Germany and the Soviet Union in August 1939, proved to be Estonia's downfall. Arrangements under this pact consigned the country to Soviet influence. After the German invasion of Poland in September, the Soviet Union increasingly encroached on Estonian sovereignty. On 28 September, Estonian officials reluctantly signed a mutual assistance pact with the Soviet Union, which allowed the Soviets to station troops and to establish naval and air bases on Estonian soil. By 17 June 1940, Estonia was occupied by Soviet troops, and the process of Sovietization began.

Soviet officials then managed, through coercion and violence, to secure the election of favorable candidates to the legislature, which then voted to make Estonia a Soviet republic.

On 6 August 1940, the Estonian Soviet Socialist Republic was formally admitted to the Soviet Union. The Estonian government also nationalized industry and large banks and collectivized land. It also imposed censorship and restructured the schools. The Soviet regime dealt brutally with any opposition, executing more than 2,000 Estonians and deporting 19,000 others to isolated areas of the Soviet Union.

Adolf Hitler's decision to invade the Soviet Union brought the German occupation of Estonia. German troops were on Estonian soil by 5 July 1941, and they controlled the majority of the country by August. Stiff resistance by Soviet troops in northern Estonia devastated the region.

German efforts to recruit an Estonian Schutzstaffel (SS) division had only limited success, as did attempts to convince Estonians to volunteer for labor in Germany. German racial policies also impacted Estonia: the vast majority of the country's small Jewish population was murdered. Estonians suffered as the Germans requisitioned much of their food and livestock. In addition, the German occupation forces maintained the strict government control over industry and land that had originally been imposed by the Soviets.

The westward advances of the Soviet army in February 1944 again turned Estonia into a battleground, and tens of thousands of Estonians fled to western Europe. During the war, the country lost approximately 20 percent of its prewar population of some 1,136,000 people. After the war, Soviet officials deported around 31,000 others, suspected of opposition to Communist rule. This loss of population was made up by an influx of more than 500,000 Soviet citizens. Estonia did not regain its independence until August 1991.

F

Falaise-Argentan Pocket (August 1944)

Military opportunity in France in which Allied forces failed to trap a significant portion of retreating German forces. In July 1944, U.S. Operation *COBRA* broke the monthlong stalemate in Normandy and shattered the German defensive lines, creating a war of movement. Third Army commander Lieutenant General George S. Patton Jr. envisaged a drive on the Seine River and the liberation of Paris, but a politically less dramatic and strategically more important opportunity soon developed: trapping German forces west of the Seine. If this could be accomplished, the Allied advance east to Germany would be greatly eased and the war shortened.

On 7 August, German forces counterattacked with elements of four panzer divisions at the express order of Adolf Hitler and over the opposition of Field Marshal Günther Hans von Kluge, commander of Army Group B and commander in chief west. Kluge was convinced the attack was doomed from the start. It would drive German forces into the heart of the planned Allied envelopment. Unfortunately for the Allies, it did slow the Canadian push to Falaise.

At this point, however, Allied planning began to break down. Patton suggested a deeper envelopment that would net all the Germans west of the Seine. However, his superior, Lieutenant General Omar N. Bradley, commander of 12th Army Group, rejected this and insisted on a shorter hook. On 10 August, Patton then turned units north from Le Mans, and by 12 August he had taken Alençon. The speed of Patton's movements surprised all concerned. The opportunity to close the Falaise pocket seemed in the offing.

Excluding forces in the Brittany peninsula, there were then some 350,000 German troops west of the Seine. About half were caught in the Falaise pocket, their only route of escape the 15-mile-wide Falaise gap. If American forces could close this, the envelopment would be complete.

At this point, with success apparently in hand, the cautious Bradley ordered Patton to hold at Argentan. Officially, this was to avoid a chance head-on meeting between the two converging Allied armies, but Bradley was clearly concerned about Patton's willingness to leave his flanks open. Patton regarded the risk as both limited and worth taking. Continued slow movement by British and Canadian forces from the north left the pocket open. Allied ineptness, more than German courage and skill, was the primary reason the trap was not closed in time.

Primary responsibility for this failure rests with Bradley, 21st Army Group commander General Bernard L. Montgomery, and Supreme Commander, Allied Expeditionary Forces General Dwight D. Eisenhower. Bradley wanted to take no chances, and Eisenhower preferred to let his subordinates work out strategic and tactical decisions on their own. Eisenhower failed to step in and bring the three competing generals—Montgomery, Bradley, and Patton—to consensus or to order a common plan. Montgomery failed to push his subordinate commanders hard enough, but there were also logistical problems. Other Allied military leaders, including commander of the British Second Army Lieutenant General Sir Miles Dempsey, Canadian First Army commander Lieutenant General Henry Crerar, and Free French 2nd Armored Division commander Major General Jacques Leclerc con-

tributed to the disjointed nature of the Allied operation. A subsequent proposal by Patton to turn from his drive to the east and make a deeper envelopment was slow to reach Bradley, who ultimately rejected it.

In the Falaise pocket, the Germans lost approximately 200 tanks, 300 heavy guns, 700 artillery pieces, 5,000 vehicles, and a great many carts and horses. But the personnel losses were considerably less than hoped for—no more than 10,000 Germans killed and 50,000 captured. Some 115,000 well-trained German troops escaped the pocket. In all, 240,000 German soldiers crossed the Seine in the last week of August and established a solid defensive line protecting the western approaches to Germany. In September, the Allied Operation MARKET-GARDEN, a combined-arms assault to cross the lower Rhine River into Germany, was stymied by German units that had escaped from Normandy.

Fermi, Enrico (1901–1954)

Italian physicist considered by many to be the “father of the atomic bomb.” Born in Rome on 29 September 1901, Enrico Fermi entered the University of Pisa in 1918 and earned his doctorate there in 1922. He developed mathematical models

that led to significant advances in understanding the potential for the atom, and he published papers that placed Italy in the center of theoretical and experimental physics. Fermi held professorships at the University of Florence and the University of Rome. One of the first physicists to expound the importance of nuclear physics and quantum theory, Fermi was awarded the Nobel Prize in physics in 1938 for his

Enrico Fermi seated at control panel of a particle accelerator, the “world’s most powerful atom smasher.” (Library of Congress)

groundbreaking work on neutrons and for identifying a new radioactive element.

After being awarded the Nobel Prize, Fermi left Italy because of his growing concern over the relationship between Fascist Italy and Nazi Germany and to ensure that his wife Laura, a Jew, would not be affected by growing anti-Semitism in Europe. Fermi accepted a professorship at Columbia University in New York City, where he continued to make significant scientific contributions.

In 1942, Fermi moved to the University of Chicago. Here he worked with a group of physicists in the Metallurgical Laboratory and was one of the main architects of the MANHATTAN Project to develop an atomic bomb. Fluent in German, Fermi was aware of the advances made by German physicists in the area of nuclear physics. On 2 December 1942, Fermi’s group at the University of Chicago carried out the world’s first controlled nuclear chain reaction, providing the experimental groundwork for developing a nuclear weapon. In 1944, Fermi and his team moved to New Mexico, where on 16 July 1945

the first atomic device was detonated at Alamogordo. Fermi is considered by many to be the “father of the atomic bomb.” Fermi died in Chicago on 28 November 1954.

Festung Europa

“Fortress Europe,” the generic term for the fortifications ring-ing German-occupied Europe, especially the massive defenses erected on the Atlantic coast from Norway to Spain, the so-called Atlantic Wall. Designed to guard against the possibil-

ity of an Allied amphibious invasion, these static defenses stretched from Norwegian outposts on the Arctic Ocean all the way to the more integrated beach and harbor defenses along the Bay of Biscay. In modern military terms, this series of engineering works was an exercise in “force multiplication” in that, by constructing strong defensive works, the Germans expected to be able to use inferior military units to man them, freeing up more capable troops for open warfare elsewhere.

The Germans built the defenses largely by forced and conscripted labor. Under the control and direction of Fritz Todt, German minister of armaments and munitions (and Albert Speer, Todt’s successor after February 1942), hundreds of thousands of workers labored to build the fortified positions. The work began slowly, however, only gaining momentum after the tides of war had definitively shifted against the Germans. The plans originated at the direction of Adolf Hitler himself, who ordered the construction of some 15,000 defensive positions to be defended by 300,000 men.

Although Hitler’s construction objective was never reached, the numbers were nonetheless impressive. By the time of the Allied invasion of Normandy in June 1944, the Germans had placed 6.5 million mines, erected 500,000 beach obstacles, and expended 1.2 million tons of steel to reinforce 13.3 million tons of concrete in the thousands of positions that were completed.

When Field Marshal Erwin Rommel was appointed to command the likely invasion area, he decried the state of the defenses as he found them. Doubling and tripling the workload, Rommel greatly strengthened the defenses. Nevertheless, his professional opinion was that these works would never be sufficient to keep the Allies off the beaches. He believed that if the Allies came ashore and could establish a lodgment, there would be no way to defeat them. Recognizing the threat not only of amphibious assault but also of parachute and gliderborne attacks, Rommel seeded the open fields and meadows behind the beaches that the Allies might use as landing zones with stout iron bars linked with barbed wire. These obstacles became known as “Rommel’s asparagus.” In the end, the static defenses erected by the Germans proved no more effective than the French Maginot Line had been four years earlier.

Fighter Tactics

Methods and procedures for employing fighter aircraft against enemy aircraft. The sky offers extremes of visibility and no natural cover save clouds. The victor in any fight is usually the one who sees his opponent first. Seeing enemy aircraft is generally difficult; visibility from the cockpit of a typical World War II fighter varied from very bad to good, and there was always a blind area to the rear and below. Early war aircraft such as the Messerschmitt Bf-109E had particularly poor cockpit visibility; later aircraft, such as the Typhoon and P-51D, had bubble canopies that afforded better visibility, but their pilots could still be surprised from behind and below.

Assuming that the cockpit framing and bulletproof windscreen didn’t get in the way, individual fighter-sized aircraft could usually be seen perhaps two miles away, four-engine bombers from three or four. A formation or group of aircraft could sometimes be seen six or seven miles away. Visual detection range could be doubled if enemy aircraft were maneuvering. However, aircraft could not be seen by anyone looking directly at or close to the sun, and clouds could provide concealment.

To mount a coordinated attack on a target, it was necessary for a group of fighters to fly in formation. The number of aircraft in the formation and their positions had a relatively large influence on the aircrafts’ effectiveness and survivability.

Before World War II, the basic formation used by many air forces (including the British Royal Air Force [RAF]) was a V or “vic” of three aircraft flying very close together, about a wingspan apart. A squadron was typically composed of four vics. This was fine for air displays and flying in cloud, but its severe disadvantage was that every pilot except the formation leader was concentrating on maintaining formation, leaving little time to look for enemy aircraft. Considering that about 80 percent of all pilots who were shot down never saw their attackers, the folly of using this type of formation can be readily understood. Several instances are recorded of a single enemy plane shooting down two or three aircraft without the rest of the formation noticing anything amiss.

The Luftwaffe had learned from combat experience in the Spanish Civil War, and at the urging of Werner Mölders, a leading German fighter pilot in Spain, it adopted a widely spaced *Rotte* (pair) as the basic tactical unit, the two aircraft flying a few hundred yards apart. Each pilot was then free to search for enemy aircraft without worrying about avoiding collision and could easily check the other’s blind area, making a surprise attack less likely. When the formation leader attacked a target, the wingman’s duty was to guard his leader’s tail. The basic unit of maneuver was two pairs arranged side by side like the four fingers of a hand, with the leaders of the

pairs at positions two and three. When the RAF and most other air forces eventually adopted this formation during 1941 and 1942, it was usually known as the Finger Four.

The U.S. Navy adopted a variation of this in which the pairs flew farther apart (about one turn radius). When either of the pairs was attacked, the two pairs turned toward each other, providing one pair with a head-on shot at the other pair's attacker. This tactic was known as the Thach Weave after its originator, Lieutenant Commander John S. "Jimmy" Thach. A variant was used by the Soviet air force later in the war. The Soviet air force also learned lessons from the Spanish Civil War, but many of the officers who might have been able to make a systematic change were removed in Josef Stalin's purges.

The nature of fighter-versus-fighter combat is such that the greatest chance of success is to be obtained by gaining a position advantage on an opponent, making a single unobserved attack, and then breaking off. This is essentially the technique used by German ace Erich Hartmann on the Soviet Front. There are numerous recorded instances of this technique working for a single attacker against a large formation of aircraft. The fact is that a single aircraft is much more difficult to spot than a formation, and a formation is more difficult to control than a single aircraft.

A position advantage is really any position that allows an aircraft to launch an attack, the precise nature of which will vary depending on the characteristics of the fighter and target aircraft. When attacking single-seaters, this was somewhere in the rear hemisphere of the target, preferably positioned so that the target would have to look into the sun to see the attacker and usually positioned higher so that the fighter could dive on the target with a speed advantage. The fighter would then open fire in the dive or would dive below the target and shoot in a shallow climb. This variation was favored by German ace Adolf Galland. Many aces were good shots; some went very close to their targets—a few yards, in some cases—to be sure of a kill.

The art of air-to-air gunnery is to ensure that the projectiles and target arrive at the same point in space simultaneously. To accomplish this, the pilot must aim some distance in front of the target; this is called the *deflection angle*. This applies only unless the shooter is immediately behind the target or attacking head-on. Some pilots were able to instinctively apply the correct amount of deflection, but most could not. The British introduced the Gyro Gun Sight in 1944, which dramatically increased the number of hits scored by the average squadron pilot.

Having delivered the attack, the pilot could then either break off combat or convert his speed advantage into an altitude advantage and reattack if necessary. This tactic could be particularly effective if the fighter had good dive acceleration and zoom-climb capabilities (e.g., Messerschmitt Bf-109, P-51 Mustang).

The usual counter to a fighter attack was a very hard ("break") turn toward the attacking aircraft to present a difficult firing solution. After the attacker had fired, several possible courses of action were open to the defender—assuming, of course, that the attacker had failed to do significant damage on his first pass. If the attacker was forced to overshoot, a roll reversal back toward the attacker could yield a firing solution for the defender, but this would probably be fatal if the attacker had a wingman. This maneuver could degenerate into what in current terminology is called a "scissors"; in it, each aircraft repeatedly turns hard toward the other to try to force an overshoot. The advantage in this case would usually be with the aircraft that had the lower wing loading, although pilot skill played a part.

Alternatively, if the attacker continued turning in an effort to get a firing solution and was flying a significantly more maneuverable aircraft (e.g., Spitfire IX versus Messerschmitt Bf-109G or Mitsubishi Zero versus Curtiss P-40), the defender's best option was to break off the engagement. The preferred method of doing this varied with the aircraft's relative capabilities. If the attacker did not have a significant top speed or dive advantage, a favored technique was to half-roll and enter a full-throttle vertical dive (the "split-s" or *Abshwung*). This could lose as much as 10,000 ft of altitude, and if the attacker did not also immediately dive, the defender would usually be able to get sufficient separation and speed to break off the engagement. Finally, if the defender had a maneuverability or performance advantage, he could elect to stay and fight it out by turning hard to get onto his opponent's tail. If his aircraft had a significantly lighter wing loading, three or four circles were usually enough to gain a firing position.

If a formation of disadvantaged aircraft were attacked by enemy aircraft, a viable tactic was to form a defensive circle or "Lufbery," named for a famous American World War I fighter pilot. In this tactic, the defenders flew in a circle so that each aircraft covered the one in front. An attacker would then have to fly through the field of fire of the following aircraft to attack any aircraft in the formation. The defensive circle could be a double-edged sword; during the Battle of Britain, Spitfires were able to get inside defensive circles of Messerschmitt Bf-110s flying in the opposite direction and were able to engage each aircraft in turn without exposure to significant enemy fire. In June 1942, German ace Hans Joachim Marseille managed to shoot down six South African P-40 Tomahawks over Libya by making repeated diving and zoom-climb passes inside a defensive circle and shooting at very high deflection angles.

If the target aircraft had a second crew member, the priority was to approach in such a way that the target was not aware of the presence of the fighter. In the case of a two-seater, this usually meant attacking from below and behind out of the field of fire of defensive weapons. If an unobserved approach was

impossible (e.g., for a well-armed four-engine bomber), the choices came down to either approaching from a direction that had poor defensive coverage (e.g., from the beam if the target only had nose and tail weapons) or approaching in such a way as to present a difficult target for defensive weapons (e.g., with a large speed advantage from the rear quarter). If the attacking pilots could shoot accurately, however, the frontal attack was a better and possibly safer option. Bombers usually had fewer and less-effective weapons firing forward, the attackers were exposed to defensive fire for a much shorter period of time, and the bomber's defensive armor was designed to protect from attacks originating from below and behind the bomber rather than from the front.

If the target had defensive armament and was flying in formation, the other aircraft in the formation would be able to contribute defensive fire, and attacking became significantly more hazardous. The effect of defensive fire could be reduced by making multiple simultaneous attacks or by selecting a target on the edge of the formation. Some antibomber weapons (e.g., the German Wgr-21 rocket) were designed to break up formations and allow individual targets to be picked off.

Late in the war, German jet fighters were used against bombers, and the amount of excess speed generated in a dive made sighting extremely difficult. To cope with this, a roller-coaster-type attack was developed whereby the attacking jets approached from the rear of the formation, dived through the fighter screen at speed to a position 1,500 ft below and behind the bombers, and then pulled up into a steep climb to bleed off most of the excess speed before selecting a target and opening fire.

The tactics employed by radar-guided night fighters were concerned more with accurate interception techniques and visual acquisition before firing than with violent maneuvering, although there were exceptions. The tactics were dominated by the target-acquisition performance of onboard radar; the British AIMk IV had an effective range of 3–4 miles at 15,000 ft, degrading to half a mile at 3,000 ft. The minimum usable radar range was usually about 1,000 yards and the maximum visual acquisition range was usually about 1,400 yards, although this varied depending on moon and cloud conditions.

Most home-defense night fighters relied heavily on ground controllers, although both sides had electronic devices that allowed a fighter to home onto a target from many miles away. The Germans had a Flensburg receiver that homed onto the Monica tail-warning radar and Naxos that detected H2S bombing radar; the British had Serrate, which homed onto German airborne radar transmissions and Perfectos that triggered German aircraft IFF (Identification Friend or Foe) equipment.

Ground control and radar operators usually aimed to approach the target from astern and from slightly below so

that the target was silhouetted against the night sky, maximizing the chance of visual acquisition. Very low targets were, however, usually approached from above to maximize radar detection range. German night fighters fitted with *Schräge Musik* (upward-firing cannon) could attack from almost directly below the target and were very effective against RAF bombers until the tactic became known.

Film and the War

By the beginning of World War II, the governments of the nations involved certainly had grasped the proven persuasive power of film as well as its potential for motivating or manipulating their populations. Whether employed in narrow focus for military training and indoctrination or more widely as documentaries, newsreels, spectacles, dramas, and comedies produced for mass consumption, the medium played a journeyman role during the war years in promoting and sustaining sentiments of national unity and patriotism.

Men and women in military service on all sides of the conflict received intensive practical training, and as a matter of course they also participated in activities designed to increase morale, unit cohesion, and unity of purpose. For many, this preparation included viewing hours of films both instructional and inspirational. In the United States, for example, training films ran the gamut from featurettes or “shorts” on personal hygiene, literacy promotion, and knowing the enemy to detailed elucidations of artillery, aircraft, or naval component operation and maintenance—even a 1942 U.S. Army series on horsemanship for cavalry recruits. The Disney Studios weighed in between 1942 and 1945 with dozens of animated and live-action educational shorts remembered with varying degrees of fondness by many World War II veterans.

In the years leading to war, film studios in the United States (which led world production) began addressing the larger political environment beyond its borders. Although most of the nation tended toward isolationism, Hollywood, with its influential Jewish contingent, reflected a concern with the growing

Nazi and Fascist threat in Europe. Charles Chaplin portrayed a buffoonish Adolf Hitler-like character in his *The Great Dictator* (1940), and the horrors of life in Nazi Germany were revealed in Sherman Scott's *Beasts of Berlin* (1939), which harked back to a sensationalist World War I-era film, *The Kaiser, Beast of Berlin*. Hollywood also produced heroic nationalist films, such as *Sergeant York* (1941), a movie by Howard Hawks about Alvin York, a U.S. Army icon of World War I. Hollywood's anti-Germany/pro-Britain stance is most clearly seen in Henry King's *A Yank in the RAF* (1941), starring Tyrone Power as an American who joins the Royal Air Force. After the United States entered the war, the administration of President Franklin D. Roosevelt mobilized Hollywood with creation of the Office of War Information (OWI) in 1942. Directors and movie stars alike assisted the war effort in a wide variety of ways, from production of training films to starring roles in an increasing number of war epics. Director Frank Capra, famous for his screwball comedies, created an important seven-part documentary series intended for both military and civilian audiences, *Why We Fight* (1942–1944). Hollywood stars were also prominently active in bond rallies, United Service Organizations (USO) tours, and Red Cross events. Actress Carole Lombard, returning from a bond-promoting tour, died in an airplane crash near Las Vegas in 1942.

The studios steadily turned out films that portrayed the heroic efforts of the American armed services, including John Farrow's *Wake Island* (1942), Ray Enright's *Gung Ho!* (1943), Lloyd Bacon's *Action in the North Atlantic* (1943), Tay Garnett's *Bataan* (1943), Lewis Seiler's *Guadalcanal Diary* (1943), Delmar Daves' *Destination Tokyo* (1943), Zoltan Korda's *Sahara* (1943), John Stahl's *Immortal Sergeant* (1943), and Mervyn Le Roy's *Thirty Seconds over Tokyo* (1944). The studios also raised American audiences' spirits with patriotic comedies and musicals including Michael Curtiz's *Yankee Doodle Dandy* (1942), Charles Vidor's *Cover Girl* (1944), Bruce Humberstone's *Pin Up Girl* (1944), and George Sidney's *Anchors Aweigh* (1945).

While Disney labored to produce training films, it also released a popular cartoon in 1943 called *Der Fuehrer's Face* or *Donald Duck in Nutzi Land*. Warner Brothers, on the other hand, routinely spiced theater fare from 1939 through 1945 with a cavalcade of propaganda cartoons featuring Bugs Bunny and Daffy Duck. More complex, studied treatment of the war's personal impact was offered in American films such as Curtiz's *Casablanca* (1943) and Alfred Hitchcock's *Lifeboat* (1944). As the war ground on toward its end, grimmer depictions of real combat emerged from Hollywood, among them John Ford's *They Were Expendable* (1945), William A. Wellman's *The Story of GI Joe* (1945), Edward Dmytryk's *Back to Bataan* (1945), and Lewis Milestone's *A Walk in the Sun* (1946).

In Great Britain, the film industry responded to the war in a fashion mirroring its influential American counterpart.

Before 1937, mainstream British cinema addressed little in the way of international politics or foreign policy, but with the onset of war in 1939—and under heavy government censorship via the Ministry of Information—Britain began one of the most aggressive propaganda film efforts of any warring power. Newsreels abounded, and dramatized documentaries such as *Target for Tonight* (1941), *Coastal Command* (1942), *Fires Were Started* (1943), and *Western Approaches* (1944) had widespread and enthusiastic audiences. Feature films such as Penrose Tennyson's *Convoy* (1941), Anthony Asquith's *Freedom Radio* (1941) and *The Demi-Paradise* (1943), Bernard Miles' *Tawny Pipit* (1944), David Lean's *This Happy Breed* (1944), Michael Powell and Emeric Pressburger's controversial *The Life and Death of Colonel Blimp* (1943) and the morality tale *A Canterbury Tale* (1944), and Asquith's RAF tribute *The Way to the Stars* (1945) personified the resolute British determination to see the war through to victory. Heroic acts of British warriors—not always in World War II—were portrayed in numerous movies, including Powell's *The Lion Has Wings* (1939), Harold French's *The Day Will Dawn* (1942), Charles Friend's *The Foreman Went to France* (1942), Powell's *One of Our Aircraft Is Missing* (1942), Noel Coward's *In Which We Serve* (1942), Frank Launder and Sidney Gilliat's *Millions Like Us* (1943), Sergei Nolbandov's *Undercover* (1943), Carol Reed's *The Way Ahead* (1944), and Sir Laurence Olivier's *Henry V* (1944), famously scored by composer Sir William Walton.

The Soviet film industry, in the firm grip of Stalinist censors by the mid-1930s, produced a string of propaganda works preceding the war that glorified traditional Russian and Soviet heroes such as Peter the Great, the young Civil War commander Vasilii Chapaev, and socialist-realist author Maxim Gorky, balanced evenly by a stream of purely escapist fare. Director Sergei Eisenstein anticipated the coming war with Germany in his epic *Alexander Nevsky* (1938) and obliquely depicted Josef Stalin's dictatorship in his sprawling, two-part *Ivan the Terrible* (1944–1946); both films were brilliantly scored by composer Sergei Prokofiev. Fridrikh Ermler directed perhaps the most emblematic Soviet narrative of the Great Patriotic War, *She Defends the Motherland* (1943), which, along with Mark Donskoi's *The Rainbow* (1944), celebrated Soviet women partisans. Ukrainian Mark Dovzhenko confined his output to *Battle for Our Soviet Ukraine* (1943) and *Victory in Right-Bank Ukraine* (1945). Eminent director Vsevolod Pudovkin portrayed Catherine the Great's military champion in *Suvorov* (1940), addressed the war with *In the Name of the Motherland* (1943), and labored on the eponymous film biography of the tragic nineteenth-century Russian hero of Sevastopol, *Admiral Nakhimov*, which was released in 1946. Unlike in other major Allied and Axis film industries, wartime Soviet production focused primarily on the war at hand, departing from that

James Cagney (front) performing in *Yankee Doodle Dandy*. (Undated movie still, Bettmann/Corbis)

agenda only to present historical dramas or filmed versions of opera.

French cinema, the most cosmopolitan in Europe just before the war, divided its art between lighthearted fare like Sacha Guitry's *The Story of a Cheat* (1936) and Marcel Pagnol's *The Baker's Wife* (1938) and a darker stratum of melodramas typified by Anatole Litvak's *Mayerling* (1936) and Abel Gance's *Paradise Lost* (1939) and poetic realist films such as Jean Renoir's *The Human Beast* (1938) and Marcel Carne's *Daybreak* (1939). With the German occupation of France in 1940, directors and actors who did not emigrate (many went to the United States) were able to find work in the Vichy-governed free zone or with the German-controlled industry in Paris. Production by the latter rapidly outstripped that of the cash-strapped south. During this period, Pagnol and Gance filmed the trenchant *Well-Digger's Daughter* and *The Blind Venus* (both 1940). Filmmakers were safest, however, producing escapist comedies, musicals, and period dramas such as Carne's *Children of Paradise* (1943–1945), which nonetheless managed to boost the

independent-French spirit. Postliberation film production at first concentrated on documentaries and features detailing the heroic French Resistance. Within several years, however, the war theme became submerged for a time as postwar French film reestablished its place in world cinema.

Italy, like France, endured wartime division, but one of both territory *and* time, marked by the September 1943 armistice and the subsequent military occupation by Germany of its former Axis ally. Since 1926, the Fascist Party had enjoyed a monopoly on the production of documentaries and newsreels, but it displayed ambivalence in using feature films as convenient propaganda vehicles. Only about 5 percent of the more than 700 films produced in Italy between 1930 and 1943 overtly championed Italian accomplishments or adventures in World War I (Goffredo Alessandrini's *Lucio Serra, Pilot* in 1938); in the naval dominion of the Mediterranean Theater (Roberto Rossellini's *The White Ship* of 1941); in the Spanish Civil War (Augusto Genina's 1939 epic *The Siege of Alcazar*); and in the conquest of Africa, glorified in Carmine

Gallone's Roman costume epic *Scipio the African* (1937). The huge body of film not directly concerned with nationalist jingoism was characterized in 1943 by director Luchino Visconti as "a cinema of corpses." Visconti's own *Obsession* (1943) pointed the way out of the Italian morass of Hollywood-inspired "white telephone" features (which, set in opulent surroundings where elegant characters often conversed vacuously on such appliances, obliquely satirized the privileged classes in 1930s Italy) and empty costume dramas toward the postwar achievement of Visconti and his fellow neorealists, whose films offered simple depictions of lower-class life.

As the Nazis consolidated their power during the 1930s, film became the medium of choice for promoting their government's point of view to the German people. By 1937, the National Socialist Party exercised total control over the German film industry, and five years later no private film production companies remained in Germany. Joseph Goebbels took charge of monitoring the film industry, advising executives as to what constituted a "good" film and banning outright several dozen films he believed ran counter to Third Reich values. Of the more than 1,000 films made in Germany under the aegis of the Nazi regime, however, fewer than 15 percent constituted pure propaganda. These were powerfully conceived, such as Leni Riefenstahl's masterful prewar *Triumph of the Will* (1935) and *Olympia* (1938). The ubiquitous newsreels, depicted as Goebbels saw fit, were designed to promote the Nazi Party as Germany headed toward war. Fritz Hippler's overtly anti-Semitic pseudodocumentary *The Wandering Jew* (1940) trumpeted the party's persistent shibboleths; Veit Harlan's *Jew Suss* (1940) couched its message in a costume drama. The numerous dramas and comedies produced for wartime entertainment were not without their political or ideological content: the Prussian spirit was lionized in Wolfgang Liebeneier's *Bismarck* (1940) and Harlan's *The Great King* (1942), the plight of Mary Queen of Scots at the hands of the English was set to music in Carl Froelich's *The Heart of a Queen* (1940), and the nobility of the Afrikaner resisting British dominion in South Africa was celebrated in Hans Steinhoff's *Uncle Kruger* (1941). Eduard von Borsody's *Request Concert* (1940) presented a cavalcade of German musical figures in support of the war effort. As the tide of war turned against the Third Reich, audiences were entertained by outrageous fantasy in Josef von Baky's *Munchausen* (1943). Harlan struggled to film his apocalyptic *Kolberg* during late 1943 and 1944; by the time of its premiere in January 1945, many German theaters had fallen to Allied bombs.

Japan's conquest of China spawned scores of films in the 1930s that lionized the military. As the army grew in power, it acted to control the medium through official means: by 1936 the film industry operated under the Media Section of the Japanese Imperial Army. Strict laws enacted in 1939 governed the production of national policy films designed to portray the

dedication and bravery of Japanese warriors and their supporters on the home front, among them Tomotaka Tasaka's *Mud and Soldiers* (1939), Naruse Mikio's *The Whole Family Works* (1939), Ozu Yasujiro's *Brothers and Sisters of the Toda Family* (1941), Tetsu Taguchi's *Generals, Staff, and Soldiers* (1942), and Yamamoto Kajiro's *The War at Sea from Hawaii to Malaya* (1942). Kurosawa Akira's debut *Sanshiro Sugata* (1943) was followed by his industrial paean *The Most Beautiful* in 1944. Period epics such as Uchida Tomu's *History* (1940) and Kinugasa Teinosuke's *The Battle of Kawanakajima* (1941) bolstered reverence for Japanese tradition, and Uchida's *Earth* (1939) portrayed simple farmers. Kurosawa's *They Who Tread on the Tiger's Tail* (1945) endured criticism from both Japanese and U.S.-occupation censors and was not officially released until 1954. The ravages of sustaining the war had taken a grievous toll: from its pinnacle in the 1930s, Japanese film production had dropped from a yearly output of about 500 releases to a mere 26 by the end of 1945.

Since the war's end in 1945, filmmakers in countries touched directly or indirectly by World War II have examined and reexamined its details and have tried to express its lasting political or personal effects throughout the world. Immediately after the war, films such as William Wyler's *The Best Years of Our Lives* (1946) and Fred Zinnemann's *The Men* (1950) depicted the trauma of servicemen returning to civilian life in the United States. Heroism and bravery characterized William Wellman's *Battleground* (1949), Allan Dwan's *Sands of Iwo Jima* (1949), and Henry King's *Twelve o'Clock High* (1949). More complex in tone were Zinnemann's *From Here to Eternity* (1953) and David Lean's *Bridge on the River Kwai* (1957). The 1960s and 1970s brought several epic historical dramas to the screen, including *The Longest Day* (Andrew Marton, Ken Annakin, and Bernhard Wicki, 1962), Otto Preminger's *In Harm's Way* (1965), Annakin's *The Battle of the Bulge* (1965), Franklin Schaffner's *Patton* (1970), and the Japanese-American collaboration *Tora! Tora! Tora!* (Masuda Toshio, Fukasaku Kinji, Ray Kellogg, and Richard Fleischer, 1970). American and British audiences also responded favorably to cinematic war stories such as J. Lee-Thompson's *The Guns of Navarone* (1961), John Sturges' *The Great Escape* (1963), Robert Aldrich's *The Dirty Dozen* (1967), Guy Hamilton's *Battle of Britain* (1969), Brian G. Hutton's *Where Eagles Dare* (1969), Mike Nichols' irreverent *Catch-22* (1970), and Richard Attenborough's *A Bridge Too Far* (1977). As the twenty-first century approached, the horrors of combat in World War II, which has been called "the good war," were startlingly revisited to great realistic effect, notably in Terrence Malick's *The Thin Red Line* (1998) and Steven Spielberg's *Saving Private Ryan* (1999). Overblown and historically inaccurate blockbusters such as Michael Bay's *Pearl Harbor* (2001) have contributed little to the cinematic record of the war.

The Soviet Union's nearly Pyrrhic victory in World War II left an indelible mark on the USSR. Such was the collective trauma of coping with more than 20 million deaths in battle and in the ravaged cities that memorializing the Great Patriotic war soon displaced the great October Revolution as the national touchstone—becoming, in effect, the secular state religion. Film would become indispensable in the solemnization of the immense national loss, but in the immediate postwar period Soviet studios were hamstrung by a general ideological retrenchment that oppressively slowed film production. Emerging from this situation was a film expressing the apotheosis of the Stalinist cult of personality blended with the glory of the recent victory over Germany, Mikhail Chiaureli's two-part *The Fall of Berlin* (1949–1950). In the years after Josef Stalin's death in 1953, a cultural thaw gradually yielded more expressive and complex war films such as Mikhail Kalatozov's *The Cranes Are Flying* (1957), Grigorii Chukhrai's *Ballad of a Soldier* (1959), Andrei Tarkovsky's *Ivan's Childhood* (1962), and Alexander Askoldov's allegory of the October Revolution, *The Commissar* (1967). The stagnant Leonid Brezhnev years of the late 1960s to the early 1980s produced a string of mostly forgettable rote panegyrics to the war's memory, but standing out due to its massive scale, length (five parts), and sheer volume was Iurii Ozerov's epic *Liberation* (1972). This was balanced soberly in 1985 by Elem Klimov's tragic and unrelenting *Come and See*. With the artistic freedom afforded them beginning in the late 1980s by Mikhail Gorbachev's perestroika and glasnost, Soviet directors indulged in social and cultural criticism as never before. Yet the war still loomed in Ozerov's *Stalingrad* (1989) and Mikhail Ptashuk's *August 1944* (2000).

France and Italy evinced complex and ambivalent political and artistic landscapes as a result of their war experiences. The war's compromised memory was expressed in haunting films from French director Alain Resnais such as *Hiroshima Mon Amour* (1959) and *Muriel* (1963) and by Italian directors Roberto Rossellini's *Open City* (1945), Carlo Borghesio's satirical *How I Lost the War* (1947), and Rossellini's grim *Paisa* (1946) and nihilistic *Germany, Year Zero* (1948). The urban and economic ruins of postwar Italy informed classics like Vittorio de Sica's *Shoeshine* (1946), *The Bicycle Thief* (1947), and *Umberto D.* (1952). The Fascists and the war receded from mainstream cinematic view until renewed interest was revealed in such varied films as Bernardo Bertolucci's *The Conformist* and *The Spider's Stratagem* of 1970, de Sica's *Garden of the Finzi-Continis* (1971), Federico Fellini's nostalgic *Amarcord* (1973), Ettore Scola's *A Special Day* (1977), Paolo and Vittorio Taviani's *The Night of the Shooting Stars* (1982), and Gabriele Salvatores' *Mediterraneo* (1991). Acknowledgment of the German occupation and the Vichy era emerged in the work of French directors, including Claude Chabrol's *Line of Demarcation* (1966), Marcel Ophuls' *The Sorrow and the Pity* (1969), Louis Malle's *Lacombe Lucien*

(1974), François Truffaut's *The Last Metro* (1980), Malle's *Au Revoir les Enfants* (1987), Ophuls' *Hotel Terminus* (1987), and Chabrol's *The Story of Women* (1988) and *Eye of Vichy* (1993).

Germany and Japan shared in their utter defeat and subsequent occupation by the Allies, and their film industries came under strict censorship. In Japan, copies of more than 200 films on topics forbidden by the Americans were rounded up and burned in 1946; similar German films not already expropriated by the Soviets were likewise confiscated. In East Germany, the base of the film industry, Wolfgang Staudte depicted the postwar situation in *The Murderers Are Among Us* (1946), while Slatan Dudow offered tribute to the new socialist order in *Our Daily Bread* (1949) and Gerhard Klein offered a study of love divided by politics in *Berlin Romance* (1956). West Germans were held to a strict regimen of Allied reeducation, under which depressing melodramas like Josef von Baky's *The Sky Above Us* (1947) found approval, but U.S. imports like *Gone with the Wind* were banned. In West Germany in 1951, Peter Lorre directed *The Lost Man*, Robert Siodmak exposed the Gestapo in *The Devil Strikes at Midnight* (1957), and Bernhard Wicki questioned the war in *The Bridge* (1959). Ichikawa Kon directed moving Japanese war stories in *The Burmese Harp* (1956) and *Fires on the Plains* (1959), Kumai Kei explored Japanese treatment of American prisoners of war in *The Sea and Poison* (1986), and Japan's nuclear trauma was expressed in Imamura Shohei's *Black Rain* (1989). Perhaps the most outstanding film ever produced about submarine warfare was the German film *Das Boot* (1982), directed by Wolfgang Petersen.

Andrzej Wajda of Poland directed significant films about the war: *Generation* (1955), *Kanal* (1957), and *Ashes and Diamonds* (1958). Polish film also addressed the aftermath of Auschwitz in Andrzej Munk's *The Passenger* (1963), and Janusz Zaorski's *Mother of Kings* (1976) examined Poland's history from the period of World War II to Stalinist times. The effects of the war on India were explored in Satyajit Ray's *Distant Thunder* (1973). In presenting the theme of a controversial romance between a Thai woman and a Japanese officer in wartime Thailand, director Euthana Mukdasanit's *Sunset at Chaopraya* (1996) moved almost full circle in echoing the similar tension of Japanese director Fushimizu Osamu's notorious propaganda film of 1940, *China Nights*.

Whether triumphant, tragic, sentimental, dispassionate, or cynical in tone, these postwar films bear witness to the persistence of World War II in collective human memory and the questions the war continues to provoke.

Finland, Air Force

In the 1930s, two controversies hindered Finnish aircraft acquisition. The first was the issue of whether fighters or bombers should have priority (the need for fighters seeming paramount). The second was the country from which to purchase aircraft. The head of the Defense Council, Carl Mannerheim, favored Germany, and the air force commander, Colonel Jarl Lundquist (later a lieutenant general), favored Britain. Mannerheim stressed the danger of air attacks on Finnish cities when arguing for more funds for the air force, but he gave priority to air support for ground forces when war came.

In September 1939, the Finnish Air Force (FAF) had only 36 modern interceptors (Dutch Fokker D-XXIs) and 21 bombers (14 Bristol Blenheims and 7 Junkers K430s). Lundquist deployed his limited fighter assets forward to protect the army and defend as much Finnish air space as possible. Following the Soviet invasion of Finland in November 1939, Finnish bombers attacked airfields and supported ground forces. In late December 1939, the FAF was able to purchase additional Fokker fighters, but its best aircraft came in the form of Morane-Saulnier MS-406s purchased from France. The Finns purchased additional Blenheims, U.S. Brewster F2A Buffalos (the Finns enjoyed considerable success with this much-maligned aircraft), Italian Fiat G-50s, and additional MS 406s. Most arrived too late for the war.

During this Finnish-Soviet War of 1939–1940, also called the Winter War, the FAF supposedly accounted for approximately 200 Soviet aircraft, and more than 300 others were destroyed by antiaircraft fire or on the ground. Finnish losses during the war amounted to 62 aircraft.

In 1941, when Finland again went to war with the Soviet Union (the Finnish-Soviet War of 1941–1944, also called the Continuation War), Finland's air force had increased substantially. It possessed 144 modern fighters (a mixture of

U.S., British, French, Dutch, and Italian planes); 44 British and ex-Soviet bombers; and 63 mostly British and German reconnaissance planes. Once the Continuation War began, Finnish access to aircraft from other nations except Germany was cut off. The Finns did have their own aircraft industry, which produced limited numbers of aircraft including the VL Myrsky II fighter.

Finnish Air Force strategy stressed aggressiveness; isolated fighters usually attacked no matter the number of Soviet aircraft. The FAF employed a blue swastika marking (no relation to the Nazi version) for national identification. The Luftwaffe and FAF cooperated in this conflict, although neither could prevent Soviet air raids into Finnish territory nor completely screen the Finnish army from air attacks.

Finland, Army and Navy

In September 1939, Finland had a small military establishment. Finland's war mobilization plan dated from May 1934 and divided the country into nine military regions. Depending on its size and population density, each region had two or three districts. Each district furnished one infantry regiment of three battalions and a field artillery battalion of 12 guns. The more populous districts provided additional support troops or regiments. On full mobilization, Finland could call up some 337,000 men. Carl Gustav Mannerheim, commander of the Finnish armed forces, designed the plan. Despite his best efforts, the military services were constantly underfunded, underequipped, and plagued by a government that insisted on relying on domestic sources that often did not exist.

When the first Finnish-Soviet War (the Winter War) began in 1939, the Finns concentrated their forces in key areas along the Soviet border, much of it impassable wilderness. The army fought hard and well, uninhibited by any rigid military doctrine or tactical theory. It used initiative and guile in exploiting terrain to its advantage—making fierce, sudden attacks according to *motti* tactics (*motti* is the Finnish word for a pile of logs held together by stakes ready to be chopped into firewood) to ambush and destroy road-bound Soviet

Finnish infantry troops in action in World War II. (Hulton-Deutsch Collection/CORBIS)

columns. Finnish military thought had stressed encirclement tactics since the 1930s. The Motti tactics were highly successful, involving mobile Finnish ski troops trained to fight in winter conditions who took advantage of their familiarity with the terrain. By February 1940, however, in consequence of Soviet air supremacy, the Finns could hold their lines only by withdrawing during the day and counterattacking at night. Finally, the Finnish army was ground down by vastly superior Soviet numbers and firepower. During the Winter War, the Finnish military sustained 22,425 killed, 1,424 missing, and 43,557 wounded.

On the conclusion of peace, Mannerheim immediately began making plans to rebuild the military. His new mobilization plan provided for 16 divisions with a total strength of 475,000 troops, or 13 percent of the entire population. Because of the limited Finnish economic base, any future war would have to be concluded speedily. Mannerheim also increased the amount of artillery in the army, forming a tank battalion equipped with tanks captured from the Soviets and acquired from Britain plus a heavy-tank platoon and seven independent-tank platoons.

The second Finnish-Soviet War (1941–1944), known as the Continuation War, began in late June 1941. In this war, the

Finns took back their 1939 borders and a slight amount of additional territory. The Soviets fought stubbornly, and the Finns suffered unexpectedly high casualties. After reaching those borders in late September, the Finns advanced into Soviet territory to shorten their three front lines on the Karelian isthmus, but they refused to take part in operations against Leningrad as the Germans wished. A lull in the fighting allowed 20 percent of the troops to be demobilized and returned to industry and agricultural pursuits in the early months of 1942. When the tide of war on the Eastern Front turned decisively against Germany, the Soviets renewed their attacks against the Finns in June 1944, and with vastly superior resources they soon overwhelmed the Finnish positions. Fighting was concluded by a cease-fire in September 1944. During the Continuation War, the Finns suffered approximately 65,000 dead against the Soviets and a further 2,000 against the German forces following the end of fighting with the Soviets.

The Finnish navy was quite small, and its activities were largely limited to minelaying. At the start of the Winter War, Finland had 5 submarines, 2 armored coastal vessels, 4 gunboats, and 10 motor torpedo boats. Operations in the Gulf of Finland halted in the winter when it froze. The Finnish navy cooperated with German naval units during the Continuation

War to confine the Soviet Baltic Fleet to the eastern end of the Gulf, and it mined the Soviet coast. Throughout the Continuation War, Finnish naval strategy was defensive, designed to prevent the Soviets from interfering with trans-Baltic shipping or intervening in the land battles.

Finland, Role in War

Finland numbered some 3.6 million people in September 1939. The country had secured its independence from Russia in 1917, but the Finns had to fight to maintain it. Concerned about the growth of German military power, in the late 1930s Soviet dictator Josef Stalin applied pressure on Finland for territory in the Karelian Isthmus and for the naval base of Hango on the Gulf of Finland to provide protection for Leningrad, the Soviet Union's second-largest city. In return, Stalin was prepared to yield more territory than he sought, but it was far to the north. The Finnish leadership, believing the Soviets were bluffing, rejected the demands. The Soviet Union invaded Finland in November 1939, and the first Soviet-Finnish War (known as the Winter War) lasted until March 1940. The governments of both Great Britain and France discussed the possibility of military intervention, in large part to cut Germany off from Swedish iron ore, but both Norway and Sweden denied transit rights to the Allies. Commander of Finnish armed forces Marshal Carl Mannerheim led a spirited Finnish defense. However, the Finns were overwhelmed by sheer weight of Russian numbers and military hardware. On 12 March 1940, the Finns signed the Treaty of Moscow. By the terms of the treaty, which went into effect at noon the next day, Finland lost one-tenth of its territory, including the entire Karelian Isthmus. The country then had to absorb 400,000 refugees, as virtually all the Finns moved out of the surrendered territory rather than live under Soviet rule.

New Soviet pressure angered the Finns, who signed a secret transit agreement with Germany in August 1940 allow-

ing German troops to pass through Finland to northern Norway. Discussions began between the German and Finnish staffs regarding Operation BARBAROSSA, the German invasion of the Soviet Union, but the Germans never told the Finns details of the plan until the invasion was about to commence. The Germans began arms shipments to Finland in 1941, particularly artillery and antitank weapons. By June 1941, the Finnish government of President Risto Ryti committed to the plan but resisted a formal alliance with Germany, maintaining that the Finns were merely fighting a defensive war against Soviet aggression and were a *cobelligerent*. Indeed, the Finns managed to evade every request for such an alliance throughout the war.

Finland never defined war aims for this second Soviet-Finnish War, the Continuation War. Halting offensive military operations 50 to 90 miles beyond the 1939 borders (the additional territory taken for defensive reasons) was the clearest statement of its aims. Carl Mannerheim, commander of Finnish armed forces, hoped that by limiting its advance into Soviet territory, Finland might retain its friendship with the United States and Great Britain. The Finnish government endeavored to convey the impression that Finland had been drawn into the conflict, although this was hard to accomplish with German troops in Finland before the commencement of BARBAROSSA, with naval cooperation between Finland and Germany, and with the German air force flying in Finnish air space and refueling at Finnish airfields. Britain warned Finland at the end of September to advance only to the 1939 frontiers and declared war on Finland on 6 December 1941, the same day Finland halted its advance into Soviet territory.

The front with the Soviet Union was stable from May 1942 until June 1944, when the Soviets launched a powerful offensive with vastly superior manpower and firepower. The Ribbentrop-Ryti agreement between the German foreign minister, Joachim von Ribbentrop, and Ryti was signed in late June 1944, promising that Finland would not seek a separate peace in exchange for weapons. Finland had earlier in the year rejected peace terms from the Soviet Union because of their harshness and because Finland hoped that an Allied invasion of Germany would cause the Red Army to race to Berlin. By July, the Red Army was doing exactly that; President Ryti resigned, and Mannerheim assumed office. Mannerheim repudiated Ryti's agreement and negotiated a cease-fire with the Soviet Union. As part of the cease-fire, concluded on 19 September 1944, Finland had to expel or intern all German troops on its soil. This went peacefully until the Germans tried to seize Suursaari Island, which led to bitter fighting there and in Lapland in northern Finland. Although the campaign was virtually over at the end of November 1944 (the date established by the cease-fire agreement for Finnish demobilization), the last German troops did not depart Finland until April 1945.

A Finnish ski patrol looking for Russian troops on the Petsamo front, in northern Finland during the Finnish-Soviet War (Winter War) of 1939–1940. (Library of Congress)

The cease-fire and later armistice with the Soviet Union reaffirmed the 1940 borders, accepted Soviet reparations demands for raw materials and machinery, and limited the Finnish military in numbers and types of weapons. Finland lost in the nearly 92,000 dead (including 2,700 civilians) during World War II. The Soviet Union did not occupy Finland, and Finland's political institutions were left intact—the only eastern enemy of the Soviet Union so treated.

Finnish-Soviet War (30 November 1939–12 March 1940) (Winter War)

Regional conflict between Finland and the Soviet Union. In late 1939, Soviet leader Josef Stalin was concerned with the sharp increase in German power following the conquest of Poland, and he sought to acquire additional territory to protect portions of the Soviet Union from possible German attack through Finland. He was especially anxious to protect approaches to Leningrad, which was only 20 miles from the Finnish border on the Karelian Isthmus. These security concerns prompted Stalin to demand that Finland cede much of the isthmus, destroy all fortifications there, and cede certain islands in the gulf, as well as to grant the Soviet Union land for a naval base to the west on the Hango Peninsula. Stalin was prepared to grant more territory than he demanded—

Troops Involved in Finnish-Soviet War, 1939–1940

2,134 square miles in return for 1,066—although the Soviet territory Stalin offered was in the less desirable north in East Karelia above Lake Ladoga.

With a population of only 3.6 million people (the Soviet population was 193 million in 1941), Finland hardly seemed in position to reject Stalin's demands. Although the Finns were open to some compromise regarding territory above Leningrad, they were upset about demands for the destruction of their fortifications and a for naval base on the Hango Peninsula. Tough negotiations continued for two months without result. Finnish leaders believed that Stalin was bluffing, but after a contrived border incident on 26 November, Stalin ordered the invasion, which began on 30 November 1939. It was not one of Stalin's finer military exploits. Despite overwhelming superiority in manpower, resources, and equipment, it took the Red Army nearly four months to crush its tiny opponent.

About the only advantages for Finland were the harsh climate, soldiers' familiarity with the area, superior leadership and training, and high morale (the Finns were fighting for their homeland). The abundant forests provided good cover and concealment amid sparse settlements and poor trails. Only the Karelian Isthmus had developed towns and farming areas with roads. This environment worked against mechanized operations and gave the advantage to mobile forces equipped with skis. Marshal Carl Gustav Mannerheim, commander of the Finnish forces, possessed keen insight regarding the strengths and weaknesses of the Red Army, and Finnish commissioned and noncommissioned officers were well trained and exhibited considerable initiative.

In all, the Finns fielded about 300,000 men. They had only 422 artillery pieces, 32 tanks, and a few aircraft. Many independent battalions and separate companies were dispersed throughout the country. The Finns lacked equipment of all

sorts, and what they had was a mixed variety provided from different countries. The soldiers were well acclimated and wore white camouflage uniforms to facilitate swift movement. The Finns also did what they could to strengthen their natural defensive line on the Karelian Isthmus by constructing obstacles, trenches, and bunkers.

For the initial invasion, Stalin employed only 20 Soviet divisions against 16 Finnish divisions, and he must bear responsibility for the initial Soviet military failure in Finland. Fresh from the Red Army's relatively bloodless triumph in Poland, Stalin personally intervened to reject the plan advanced by his chief of staff, Marshal Boris M. Shaposhnikov, which entailed a careful buildup and use of the best Soviet troops, even those from the Far East. Many of the Soviet units were poorly trained and improvised formations. Worse, the Soviet troops were unprepared for winter fighting. Stalin rebuked Shaposhnikov for overestimating the Finns and underestimating the Red Army. The new plan, worked out on Stalin's orders and confirmed by him, led to the fiasco of the early Soviet defeats, leaving Shaposhnikov to remedy the situation.

The Soviet military was in wretched shape; recent purges had decimated the officer corps and left in command unqualified men who were reluctant to take the initiative. The soldiers were poorly trained in winter fighting and breaching fortified lines. The standard Soviet rifle division was well manned and equipped, but the heavy material was not suited to such a primitive operational environment. The Soviets did have an advantage in heavy artillery, but very little coordination had been developed between the arms, so attacks were not synchronized for effectiveness. A severe lack of communications equipment added to the problems of coordination and tactical flexibility. Among the rank and file, morale was poor. These factors mitigated overwhelming Soviet advantages in manpower and quantities of equipment.

In December 1939, the Finns halted the main Russian thrust across the Karelian Isthmus at the so-called Mannerheim Line. The Finns gained an early advantage when they obtained the Soviet tactical codes through the corps level. Thus they could monitor Soviet radio communications and decrypt Soviet units' locations. This intelligence became a force multiplier and helped the Finns to detect, outmaneuver, and defeat far larger Soviet formations. The Finns would cut off the enemy line of communications, separate the road-bound columns into pockets called *mottis* (*motti* is the Finnish word for a pile of logs held together by stakes ready to be chopped into firewood), and then destroy them piecemeal. By moving quickly, firing from concealed positions, and rapidly eliminating Soviet patrols, the Finns produced fear that reduced the ability of Soviet forces to react. The Finns also showed great ability in improvisation (as with the gasoline bomb in a bottle hurled at Russian tanks and dubbed "Molotov cocktail"), by their effec-

tive use of ski troops, and by fitting largely antiquated biplane aircraft with skis so that they could operate in snow.

After decisive tactical defeats destroyed several of their divisions at Tolvajärvi and Suomussalmi, the Soviets brought in new divisions and spent almost a month training intensively in tactics to develop better coordination among infantry, tanks, and artillery. In addition, they focused on better close-air support and the development of mobile reserves to exploit breakthroughs. At the small-unit level, special assault groups were organized to destroy Finnish bunkers efficiently.

Not until February 1940 did Soviet forces mount an effective assault on the Mannerheim Line. They doubled their strength against the Mannerheim Line with the Northwest Front, commanded by Marshal Semyon K. Timoshenko, and concentrated more than 35 divisions, which included heavy artillery and new-model tanks, against the weakened Finns. Sheer weight of numbers enabled the Soviets to break through the Finnish line at Summa on 11 February, and by 8 March they captured part of the key Finnish defensive anchor at Viipuri (Vyborg).

Stalin then dictated a peace settlement. Stalin did not annex Finland, or even Helsinki, but he exacted territorial

concessions well in excess of those sought before the war. The Finns were forced to yield some 25,000 square miles of territory, including the Karelian Isthmus. The war also displaced some 400,000 Finns, for virtually all left the territory ceded to the Soviet Union.

Although Soviet terms were regarded as harsh by the Finns and by Finland's many international supporters, they were mild compared with those the Soviet Union imposed on the other three Baltic countries. In the case of Finland, Stalin may have been deterred by strong anti-Soviet sentiment that the invasion had aroused throughout the world. Indeed, 11,500 volunteers went to Finland to fight against the Soviets. Britain and France actually considered military intervention against the Soviet Union, including bombing strikes against the Caucasian oil fields and an "uninvited landing" in Norway as a preliminary step to sending troops to Finland. Seen in retrospect, such a step would have been disastrous to the Allied war effort. Stalin may also have been restrained by his desire to keep open the option of a possible alliance with the west against Hitler and to minimize the many disadvantages resulting from the Soviet aggression. One consequence for the Soviet Union of its invasion, expulsion from the League of Nations, was not a major blow.

Ultimately, the Soviets threw 1.5 million men (almost half their army in Europe), 3,000 aircraft, and nearly as many tanks against Finland. The Soviets suffered 230,000 to 270,000 dead—many the result of the cold and because of poor Soviet medical services—and a comparable number of wounded. They also lost 1,800 tanks and 634 aircraft. The Finns sustained far fewer casualties (22,425 killed and 43,557 wounded), and 62 of the 162 planes of their largely antiquated air force were lost.

One of the war's most important effects was the damage to Soviet military prestige. Many observers believed that the Soviet Union was incapable of waging a large-scale war. This was a conclusion Hitler was too quick to draw. Another consequence was the Soviet decision to adopt the Finnish automatic sidearm. After the German invasion of the Soviet Union in June 1941, Finland waged war against the Soviet Union as a cobelligerent of Germany, a decision that led to it unfairly being branded as an Axis power and to its second defeat in 1944.

Finnish-Soviet War (25 June 1941–4 September 1944) (Continuation War)

Renewal of warfare between Finland and the Soviet Union, also called the Continuation War. The fighting occurred mainly northwest and northeast of the Soviet city of Leningrad.

Finland's rejection of Soviet demands for territory and bases to protect access to Leningrad—including the cession of Viipuri (Vyborg), Finland's second-largest city, and the surrounding Karelian Isthmus—led to the first Finnish-Soviet War, known as the Winter War. The war began in November 1939, and although the Finns fought well, the odds against them were hopeless. In March 1940, Finland was obliged to sue for peace, in which it had to cede even more territory than the Soviets had originally demanded.

Fearing additional Soviet demands and resenting Soviet interference in its policies, Finland aligned itself with Germany. In fall 1940, chief of the Finnish General Staff Lieutenant General Erik Heinrichs held talks in Berlin with German leaders, who requested Finnish assistance during Operation BARBAROSSA, the planned German invasion of the Soviet Union (chiefly of Leningrad and Murmansk). The Finnish government welcomed this as an opportunity to recover territory lost to the Soviet Union in the Winter War. As planning progressed, the Germans and Finns agreed that German forces would secure the nickel-rich Petsamo region and attack Murmansk in the far north, while the Finns would be responsible for operations in the southeast toward Leningrad and Soviet Karelia, centered around Petrozavodsk. General Carl Mannerheim (he was raised to field marshal in 1942) commanded the Finnish forces, as he had in the Winter War of 1939–1940. Mannerheim had 16 divisions: 11 along the frontiers, 1 opposite the Russian base at Hanko, and 4 in reserve.

On 22 June 1941, the Germans launched their massive invasion of the Soviet Union. Finland had already secretly mobilized its forces and declared war on 25 June, but as a cobelligerent of Germany rather than as an ally. The German drive in the far north from Petsamo eastward fell short of both Murmansk and the large Soviet naval base at Polyarny. German forces also had little luck driving east from the northern

city of Rovaniemi, failing to cut the Soviet rail line running from Murmansk south along the White Sea coast. In the south, however, the Finns made much better progress. Preoccupied with the massive German onslaught, Red Army forces north of Leningrad were outnumbered.

General Mannerheim divided his forces into two armies: one drove down the Karelian Isthmus between the Gulf of Finland and Lake Ladoga, and the other marched southeast between Lake Ladoga and Lake Onega toward the Svir River to take Petrozavodsk, capital of Karelia. On 29 June, the Finnish Karelian Army (II, IV, VI, and VII Corps) attacked to the west and east of Lake Ladoga, crossing the Russo-Finnish border of 1940, recapturing Finnish Karelia, and driving on toward Leningrad. Aided by German contingents, Army Group Mannerheim attacked Soviet Karelia. Farther north, combined Finnish and German forces recaptured lost Finnish territory around Salla while the German mountain troops, coming from Norway, reached as far as the Litsa River on their drive toward Murmansk.

The Finns had originally planned to unite their troops with German Army Group North around Leningrad. On 1 September, the Finns reached the old Russo-Finnish border. Despite heavy fighting, the Soviets were able to withdraw, but by late August the Finns had recovered all territory lost to the Soviet Union in the Winter War. The Finnish attacks stalled north of Lake Ladoga in September.

Although the Finns were not eager to take non-Finnish land, they did advance somewhat beyond the pre-November 1939 borders for defensive purposes. Much to Germany's displeasure, however, they refused to cooperate with German troops against the city of Leningrad. Finnish and German commanders disliked each other, and the German air force failed to provide as much air cover as had been promised. German troops did not perform well in the northern part of the front. In the dense forests and swamps that marked the terrain in the north, tanks, heavy artillery, and aircraft were often ineffective. Finnish casualties were not light, and Finland had a small population and insufficient resources for a long war. Given these points, the Finns only undertook those operations that suited them, and that did not include Leningrad. The Finns were nonetheless disappointed that the German army was unable to secure a rapid defeat of the Soviet Union.

After capturing Petrozavodsk and Medveshjegorsk on the western and northern shore of Lake Onega, in December the Finns established a defensive position somewhat inside Soviet territory and about 20 miles from Leningrad. Had the Finns advanced farther, Leningrad would probably have fallen to the Germans, with uncertain consequences for the fighting on the Eastern Front. The Finnish Front remained largely static from early 1942. Despite some Soviet counterattacks toward Petsamo, the battle lines changed very little in the months to follow.

At this point, in August 1942, Moscow offered the Finns extensive territorial concessions in return for a separate peace, but the Finns, confident of an ultimate German victory, refused. In September 1941, London and Washington made it clear to Helsinki that any Finnish effort to advance beyond its prewar frontiers would mean war. Indeed, Britain declared war on Finland in December 1941.

As the war continued into 1942 and then 1943, the Finns lost enthusiasm for the struggle, especially when German military fortunes changed. In January 1944, a Soviet offensive south of Leningrad broke the blockade of that city. With the tide fast turning against Germany, the Finns asked the Soviets for peace terms, but the response was so harsh that Finland rejected it. Not only would Finland have to surrender all its territorial gains, but it would have to pay a large indemnity.

Soviet leader Josef Stalin then decided to drive Finland from the war. The Soviets assembled some 45 divisions with about half a million men, more than 800 tanks, and some 2,000 aircraft. Using these assets, in June 1944 the Soviets began an advance into Finland on both flanks of Lake Ladoga on the relatively narrow Karelian and Leningrad Fronts. While the Finns were well entrenched along three defensive lines, they could not withstand the Soviet onslaught. Viipuri fell on 20 June after less stubborn resistance than during the Winter War. Heavy fighting also occurred in eastern Karelia. Although they failed to achieve a breakthrough, Soviet forces caused the Finns to retreat and took the Murmansk Railway.

After the fall of Viipuri, the Finnish government requested German assistance. The Germans furnished dive-bombers, artillery, and then some troops, but it demanded in return that Finland ally itself firmly with Germany and promise not to conclude a separate peace. President Risto Ryti, who had been forced to provide a letter to that effect to German Foreign Minister Joachim von Ribbentrop (which bound him, but not his country, to such a policy), resigned on 1 August in favor of Marshal Mannerheim.

On 25 August, Helsinki asked for terms. Moscow agreed to a cease-fire to take effect on 4 September, but Soviet forces actually fought on for another day after that. One of the cease-fire terms was that the Finns should break diplomatic relations with Berlin and order all German troops from Finnish soil by 15 September. German leader Adolf Hitler refused the Finnish request for an orderly departure of his forces and ordered German troops in northern Finland to resist expulsion and, if forced to retreat, to lay waste to the countryside. The German troops followed this order to the letter. Because there were 200,000 Germans in Finland, the damage to Lapland, where they were located, was considerable. During October, the Russian Fourteenth Army threw back German forces at Liza, supported by a large amphibious landing near Petsamo, and by the end of the month the Germans had withdrawn completely into Norway.

The war ended for Finland on 15 October 1944. The Continuation War cost Finland some 200,000 casualties (55,000 dead)—a catastrophic figure for a nation of fewer than 4 million people. Finland also had to absorb 200,000 refugees. Finland agreed to withdraw its forces back to the 1940 frontiers, placed its military on a peacetime footing within two and one-half months, granted a 50-year lease of the Porkkala District, allowed the Soviets access to ports and airfields in southern Finland, and provided the Soviet Union use of the Finnish merchant navy while the war continued in Europe. Finland also paid reparations of US\$300 million in gold over a six-year period. Stalin did refrain from absorbing the entire country, but in the coming decades Western-oriented democratic Finland was obliged to follow policies that would not alienate the Soviet Union.

Flamethrowers

Modern flamethrowers were first used by the German army in World War I. A flamethrower is a pressure-operated device that shoots a stream of inflammable liquid. The liquid is ignited as it leaves a nozzle, which can be placed at the end of a hand-held tube or mounted on a tube projecting from an armored fighting vehicle. A flamethrower consists of four elements: the fuel container, a mechanism to force the fuel from the container, a projecting tube and nozzle, and an igniting system that will set the stream of fuel on fire. Ignition systems are based on powder cartridge, electric coil, and electric spark designs.

Flamethrowers can be used in both antimatériel and antipersonnel roles. Typically, they are used in complex terrain with short standoff distances, such as in trench, city, and jungle fighting. They are used against hard targets such as bunkers, pillboxes, and mobile and dug-in tanks. German forces also used flamethrowers as defensive mines. Although these weapons possess combat advantages, the advantages are balanced by disadvantages including short burn times, the fact that the user immediately becomes a priority target, and the vulnerability of their fuel cylinders, which can explode if struck by a bullet or shrapnel.

Men of the 7th Division using flamethrowers to drive Japanese from a block house during fighting on Kwajalein Island, 4 February 1944. (National Archives)

U.S. military forces used the 70 lb M-1 model fielded in 1942 and also used the M1-A1 model. The M-1 could generate a 10 sec stream of fire, carried 4 gal of fuel, and was man-portable. It had a range of 82 ft. The improved M1-A1 model had a range of 131 ft.

The U.S. M1-A1 flamethrower was man-portable and had a range of 131 feet.

In addition to using flamethrowers in infantry assault forces and ad hoc mechanized forces, the U.S. Army created the 713th Flame Throwing Tank Battalion in November 1944. It consisted of 54 M-4 Sherman tanks. Each Sherman was retrofitted with a Ronson flamethrower gun and had a 300 gal fuel capacity and a flamethrowing range of 75–100 yards. The unit saw action during the invasion of Okinawa and was used to kill more than 4,500 Japanese soldiers.

British man-portable flamethrowers were based on the 1940 No. 1 Mk-II “Marsden” and 1942 No. 2. Mk-II “Lifebuoy” models. The Marsden was an 85 lb unit with a 98 ft range. The Lifebuoy (also called the “ack-pak” unit) was a 64 lb doughnut-shaped device with a 131 ft range. The British also fielded a flamethrower tank built on the tank chassis of a Churchill tank. Known as the Crocodile, it carried 10 minutes’ worth of fuel and could tow a trailer holding fuel for an additional 30 minutes. The tactical disadvantage of the trailer was that, if hit by enemy fire, it could explode like a massive bomb, killing the tank crew. Crocodile tanks were organized in three battalions of the 79th Armored Division and operated in platoons attached to other military units.

French flamethrowers were incidental to the war, given France’s early defeat. They were based on the World War I man-portable Schilt model. Early Soviet models were variants of German designs, but the Soviets introduced improved flamethrowers in 1943 with the 50 lb ROKS-2 and 75 lb ROKS-3 man-portable models. They had effective ranges of 115 ft

and 230 ft, respectively. A triple-tank man-portable model known as the LPO-50 also existed. The Russians used numerous armored fighting vehicle-mounted flamethrowers during the war. Typically, they were retrofitted to the turrets and chassis of older tanks.

German forces used a wide variety of flamethrowers. Man-portable systems were the Model 35, Model 40, Model 41, and Model 42. They ranged in weight from 35 to 79 lb and projected a stream of fire about 25–35 yards. A lighter and highly accurate para-flamethrower used by Schutzstaffel (SS, body-guard) troops and a “field gun” trailer flamethrower with a weight of 900 lb also emerged.

The Germans placed flamethrowers on the Sd Kfz 251 3 ton half-track, the Panzerjäger 38 chassis, and the Pz. Kpfw. II and III tank series. Typical fuel capacity was 150 to 200 gal with flame-throwing ranges out to 65 yards. The static flamethrower (Abwehrflammenwerfer 42) was used as a defensive mine and was fired by electrical squibs. It shot a flame 5 yards wide by 3 yards high out to 30 yards.

Italian flamethrowers were the Lanciaflamme models 35 and 40, introduced in 1935 and 1940, respectively. *Guastori* (Italian combat engineers) employed them in fighting in Ethiopia, North Africa, and the Soviet Union. The Italian flamethrowers lacked the range of German flamethrowers, but these manpacks were simple in design and effective. A larger version built for the small Italian L3 tank pulled a fuel wagon.

Japanese flamethrowers were based on the Type 93 and Type 100 man-portable models. The Type 93 had a weight of 55 lb and a range of 25–30 yards. It could shoot a stream of fire lasting 10–12 sec and relied on a revolving 10-cylinder blank cartridge ignition system. The Type 100 was a shorter and lighter variant of the Type 93, with a removable, rather than a fixed, nozzle outlet tip. Flamethrowers were not normally mounted in Japanese armored fighting vehicles.

Fletcher graduated from the U.S. Naval Academy in 1906. Commissioned an ensign in 1908, Fletcher commanded the destroyer *Dale* in the Asiatic Torpedo Flotilla in 1910. Fletcher saw action in the 1914 U.S. intervention at Veracruz, Mexico. For his bravery in moving more than 350 refugees to safety, he earned the Medal of Honor. Lieutenant Fletcher then served in the Atlantic Fleet. Following U.S. entry into World War I in 1917, he won promotion to lieutenant commander and commanded the destroyer *Benham* on convoy escort and patrol operations. Fletcher’s postwar commands included submarine tenders, destroyers, and a submarine base in the Philippines, where he helped suppress an insurrection in 1924.

Fletcher attended both the U.S. Naval War College (1929–1930) and U.S. Army War College (1930–1931). From 1933 to 1936, he served as aide to the secretary of the navy. From 1936 to 1938, Fletcher commanded the battleship *New Mexico* and then served in the navy’s Bureau of Personnel. Following his promotion to rear admiral, Fletcher commanded Cruiser Division 3 in the Atlantic Fleet.

On 15 December 1941, Fletcher took command of the Wake Island relief force centered on the carrier *Saratoga*, but he moved cautiously, and the island fell on 23 December before he could arrive. In January 1942, Fletcher received command of Task Force 17, which was centered on the carrier *Yorktown*. He participated in carrier raids on the Marshall and Gilbert Islands and joined Task Force 11 in attacks on Japanese shipping in the Solomon Islands. Fletcher commanded U.S. forces in the May 1942 Battle of the Coral Sea. Following his return to Pearl Harbor for hasty repairs to the *Yorktown*, Fletcher raced back with her to join the U.S. force near Midway, where he helped orchestrate the dramatic U.S. victory on 3–6 June 1942, in which four Japanese carriers were lost in exchange for the *Yorktown*.

Fletcher then commanded the three-carrier task force supporting 1st Marine Division assaults on Tulagi and Guadalcanal (Operation WATCHTOWER). Unwilling to risk his carriers, Fletcher took the controversial decision to withdraw them before the transports had completed unloading supplies to the Marines, forcing the transports to depart as well. He then committed his forces against the Japanese counter-attack toward Guadalcanal, resulting in the Battle of the Eastern Solomons. Fletcher was wounded when his flagship, the carrier *Saratoga*, was torpedoed, and he returned to the United States.

After his recovery, Fletcher commanded the 13th Naval District and the Northwestern Sea Frontier. Fletcher’s reputation for caution led Chief of Naval Operations Admiral Ernest J. King in 1943 to assign him to command the North Pacific area. Following Japan’s surrender in August 1945, Fletcher oversaw the occupation of northern Honshu and Hokkaido.

Fletcher, Frank Jack (1885–1973)

U.S. Navy admiral. Born in Marshalltown, Iowa, on 29 April 1885, the son of Rear Admiral Thomas Jack Fletcher, Frank

U.S. Navy Vice Admiral Frank Jack Fletcher. (Corbis)

In 1945, Fletcher joined the navy's General Board, which advised the secretary of the navy; he served as its chairman from May 1946 until May 1947, when he was promoted to full admiral and retired. Fletcher died at Bethesda, Maryland, on 25 April 1973.

Flying Tigers (American Volunteer Group, AVG)

Group of American volunteer pilots officially named the American Volunteer Group (AVG) who flew for China in the early months of 1942. The Flying Tigers were commanded by Claire Lee Chennault, who, after retiring from the U.S. Army Air Corps as a captain in 1937, went to China as an aviation adviser to Nationalist leader Jiang Jieshi (Chiang Kai-shek). Chennault also served as a colonel in the Chinese Air Force. Following several frustrating years of trying to build up a Chinese air force while China was fighting one war against Japan

A Chinese soldier guards a line of American P-40 fighter planes, painted with the shark-face emblem of the Flying Tigers, at a flying field in China, circa 1942. (National Archives)

and a civil war against the Communist forces of Mao Zedong (Mao Tse-tung), Chennault finally developed a plan to form a volunteer group of American pilots and ground crews to be recruited directly from the U.S. Army and U.S. Navy.

Chennault overcame great hurdles to implement his plan, but China had powerful friends within the U.S. government, including Secretary of the Navy Frank Knox. On 15 April 1941, President Franklin D. Roosevelt issued an unpublished executive order authorizing reserve officers and enlisted men to resign from the U.S. military for the purpose of joining the AVG. In another deal, the British government agreed to waive its rights to a production run of 100 almost obsolete P-40B fighters in exchange for guaranteed priority on another order of a later model. The tiger-shark jaws that AVG pilots painted on the noses of their P-40s contributed to their nickname, which was bestowed on them by *Time* magazine in its 27 December 1941 issue.

Members of the AVG signed a one-year contract with the Central Aircraft Manufacturing Company, a U.S. firm that had the contract with the Chinese government to provide

pilots, planes, and crews. Pilots' salaries ranged from \$250 to \$750 per month. Not part of the written contract was an agreement that pilots were also to receive \$500 for each Japanese plane shot down.

The first contingent of AVG pilots departed for China by ship in July 1941. The next month, they commenced training at the British air base in Toungoo, Burma. Training focused on air-combat theories, then somewhat unconventional, that Chennault had developed during his years in the U.S. Army Air Corps and tested in China after 1937. Chennault's tactics were built on the two-plane element and a careful analysis of the relative strengths and weaknesses of the opposing aircraft. Chennault stressed, for example, that his pilots should never try to turn with the more maneuverable Japanese aircraft. Instead, they should take advantage of the P-40's heavier weight to attack from above and then dive to break contact with the enemy. Chennault insisted that his pilots learn their enemy's fighter tactics better than the Japanese pilots knew the tactics themselves.

When the entire contingent arrived in Asia, the AVG was organized into three squadrons: the 1st ("Adam and Eves"),

the 2nd (“Panda Bears”), and the 3rd (“Hell’s Angels”). The AVG first went into combat over Yunnan Province in China on 20 December 1941, almost two weeks after the Japanese attacked Pearl Harbor. The AVG then had 82 pilots and 79 operational P-40s.

As soon as the United States entered World War II, plans were immediately developed to bring the AVG personnel back into the U.S. military. Chennault himself returned to active duty in the U.S. Army Air Forces (USAAF) on 7 April 1942 as a colonel. The AVG was to be reintegrated by 4 July 1942 to become the 23rd Fighter Group, which would be commanded by Colonel Robert L. Scott, who was newly arrived from India. The 23rd would be part of the larger China Air Task Force (CATF), which would be commanded by Chennault as a brigadier general and subordinate to the U.S. Tenth Air Force in India. The CATF later grew to become the Fourteenth Air Force, commanded by Chennault as a major general.

The pilots and ground crew of the AVG were offered assignments in the USAAF and were strongly encouraged to accept them or face the draft board back home. Many, however, objected to the strong-arm tactics. In the end, only 5 AVG pilots agreed to rejoin the U.S. military and fly for the CATF. Another 19 stayed in China and continued to fly for China National Airways. To help Chennault with the transition, however, 20 pilots and 24 ground crew agreed to serve two weeks beyond 4 July. Two of those volunteer pilots were killed during that period. Other AVG pilots who did not stay in China later made significant contributions in other theaters of war. They included James Howard, who flew with the 354th Fighter Group in Europe, and Gregory Boyington, who flew with the Marines in the Pacific. Both subsequently earned the Medal of Honor.

Although some military experts predicted at the time that the AVG would not last three weeks, it achieved one of the more impressive records in air warfare. In less than seven months in combat, the unit destroyed 299 Japanese aircraft and probably destroyed another 153. The AVG lost only 12 P-40s and 4 pilots killed in air-to-air combat. It lost another 6 pilots to ground fire: 3 were captured and 3 were killed on the ground by enemy bombs. Another 10 pilots died in flying accidents.

Despite the fact that most members of the AVG came from the U.S. military (and many returned to the military to serve in World War II), they were branded as mercenaries for many years following the war. In 1991, a U.S. Air Force panel concluded that all members of the AVG had been fighting for the United States at the time and were eligible for veterans’ benefits on the basis of that service. On 8 December 1996, the air force further recognized the AVG by awarding the Distinguished Flying Cross to the pilots and the Bronze Star Medal to the ground crews.

Forrester, James Vincent (1892–1949)

U.S. secretary of the navy and later secretary of defense. Born in Beacon, New York, on 15 February 1892, James Forrester entered Dartmouth College in 1911. The next year he transferred to Princeton, but he left school without graduating in 1914. Two years later, Forrester secured a position with the investment-banking corporation of William A. Read and Company (later known as Dillon Read Company). When the United States entered World War I in April 1917, Forrester enlisted in the navy. Soon afterward, he transferred to the aviation branch; he trained in Canada with the Royal Flying Corps but never saw combat. At the end of the war, he left the navy as a lieutenant and returned to Dillon Read Company, becoming its vice president in 1926 and its president in 1938.

In 1940, Forrester resigned his position to join the Franklin D. Roosevelt administration as undersecretary of the navy. His primary role was in procurement, which was vital in preparing the U.S. Navy for World War II. He worked closely with his army counterpart, Undersecretary of War Robert P. Patterson, to streamline contracting and purchasing policies. Forrester oversaw the rapid expansion of the navy in the early years of the war, including not only number of ships but also facilities and training. On the sudden death of Secretary of the Navy William F. Knox, Forrester succeeded to the post in May 1944 and continued in the position until 1947.

In September 1947, Forrester became the first secretary of defense. In this capacity he is sometimes referred to as the “godfather of the national-security state.” Forrester was a staunch proponent of efforts to halt what he saw as Soviet

James V. Forrestal, ca. 1942. (Library of Congress)

expansionist policies, and he lobbied hard for George Kennan's Containment Doctrine and the North Atlantic Treaty Organization (NATO). He also supported the concept of a balanced military establishment.

The immense strain of his position weighed on Forrestal and led to irrational behavior. In January 1949, President Harry S Truman informed Forrestal that he was replacing him as defense secretary with Louis Johnson. On 1 March 1949, Forrestal resigned his post. Admitted to Bethesda Naval Hospital, Maryland, for psychiatric care, on 22 May 1949 Forrestal leaped to his death from the sixteenth floor of that facility.

FORTITUDE, North and South, Operations (1944)

Deception operations in support of Operation OVERLORD, the Allied invasion of Normandy in June 1944. Operation OVERLORD was a vast operation, impossible to conceal, that involved more than 150,000 troops and 5,000 ships. Operation FORTITUDE was the elaborate deception plan designed to mislead the German defenders as to the timing and location of the Allied invasion.

Operation FORTITUDE had two components: FORTITUDE NORTH and FORTITUDE SOUTH. Operation FORTITUDE NORTH was designed to convince the Germans that the Allies planned to invade Norway in cooperation with a Soviet offensive designed to drive Finland from the war. Operation FORTITUDE NORTH was an attempt to deceive the Germans into thinking the Norwegian invasion would take place prior to an invasion in France. The intent was to cause the Germans to shift divisions from France to Norway or to have these forces in transit so they could not take part in the battle. To achieve this, the British in Scotland employed dummy vehicles, inflatable tanks and aircraft, fake radio transmissions, and dummy subordinate headquarters simulating the Fourth Army Group in "preparations" for an invasion of Norway. German reconnaissance aircraft were allowed to fly over the "assembly points" and report this information to Berlin. Operation FORTITUDE NORTH worked, as the Germans actually reinforced Norway.

As the time for OVERLORD approached, the second component of the deception plan, FORTITUDE SOUTH, became critical. Knowing that the Allied buildup in southern England could not be kept hidden, the British and Americans planned to persuade the Germans that the chief Allied assault would fall in the Pas de Calais (across the English Channel from Dover) rather than in Normandy (the actual landing area). The Pas de Calais was the most obvious choice for a major amphibious operation. It was the closest point on the French coast to England and would minimize the length of Allied supply lines as well as offer an extensive road network that could be exploited in follow-on attacks through the Low Countries toward Germany once the beaches were taken.

The first step was to leak plans of the sham invasion of Calais. This was done, as during FORTITUDE NORTH, through the British secret services, which planted stories and documents with double agents. Incredibly, the British seem to have identified or turned (recruited as a double agent) every German agent in Britain during the war. Double agents were particularly useful for providing small bits of information, which the

Germans could then piece together. The British also arranged to leak sham information through neutral diplomats with Axis sympathies.

To build the desired perception on the part of German intelligence, a fictitious First U.S. Army Group (FUSAG) was portrayed directly across from Calais in Kent and Sussex. Lieutenant General George S. Patton, whose reputation as a hard-driving army leader was very well known by the Germans, was repeatedly identified as FUSAG's commander. This fictitious force was composed of the U.S. Fourteenth Army and Fourth British Army. With the exception of three real British divisions included in the fictitious British army, all of these formations were bogus. The ghost divisions had elaborate stories woven around them to make their existence more believable. The Allies even created shoulder patches for the nonexistent FUSAG and its subordinate divisions. The Allies also had real soldiers wear the ghost division patches in case enemy agents were in a position to report their existence.

Special Allied signal units were used to transmit false radio transmissions from FUSAG and to simulate division, corps, and other army-level communications; these were transmitted in easily breakable ciphers so the Germans could decode the messages. In addition, false references to the fake headquarters were mentioned in bona fide messages.

As in *FORTITUDE NORTH*, dummy tanks and airplanes built of inflatable rubber were placed in realistic looking "camps" where German aerial reconnaissance was bound to see them. The deception was made even more believable by FUSAG troop movements in southeast England. Some were elaborate hoaxes, but in most cases they corresponded to actual preinvasion movements by real British and Canadian divisions. Even though the "real" movements were being made to support the Normandy invasion, they were close enough to the FUSAG area to convince German aerial photo interpreters that they were seeing the imminent invasion of Calais.

A fleet of landing craft deemed unseaworthy but still useable bobbed in British ports across from Calais. Instructions for acts of sabotage were radioed to the French Resistance in the Calais area. In addition, to reinforce the notion that FUSAG would debark on the short route to Calais, the Allied air forces in their program of bombardment prior to *OVERLORD* dropped three times the tonnage east of the Seine as they did to the west.

In all these activities, Allied intelligence, knowing what picture it wanted the Germans to see, had carefully taken apart FUSAG and sent bits and pieces about it where they knew the German intelligence services would pick them up. The Allies relied on the Germans to put the pieces of the puzzle together for themselves.

Soon it became apparent that the deception was bearing fruit. *ULTRA* signals intercepts of German classified message traffic made reference to FUSAG. This was the proof the *FOR-*

TITUDE operators needed. They could not expect to fool the Germans forever, but they hoped to minimize German anticipation of a Normandy landing until it was actually under way—and thereafter to keep alive anxiety that the "real" invasion would follow in the Pas de Calais at a later stage.

German intelligence arrived at the desired conclusion. German army maps captured following the Normandy Invasion indicated the presence of FUSAG in southeast England. Division areas and corps headquarters corresponded almost exactly with the areas indicated by the Allied deception plan. However, Adolf Hitler was only partly deluded. On 4 and 20 March and 6 April, he alluded to the likelihood of a Normandy landing in messages to his senior commanders. Still, apart from allocating Panzer Lehr and 116th Panzer Divisions to Normandy in the early spring, he made no decisive alteration of German defensive dispositions. Indeed, until he allowed divisions to cross the Seine into Normandy from the Pas de Calais at the very end of July, he himself remained prisoner to the delusion of a second "main" invasion in the Calais area throughout the critical weeks following the initial landings at Normandy.

Fourcade, Marie-Madeleine Bridou (1909–1989)

French Resistance leader. Born in Marseille on 8 November 1909, Marie-Madeleine Bridou married in 1929, had two children, and was divorced by the time World War II began. She sent her children to safety in Switzerland shortly after she became involved in the Resistance movement in June 1940.

Marie-Madeleine Fourcade, who was the head of the French resistance unit Alliance called Noah's Ark during World War II, shown here in 1979. (AFP/Getty Images)

Fourcade was recruited for the French Resistance by Georges Loustau-Lacau, the leader of the Navarre network, which was primarily involved in gathering information for the British. When he was arrested in May 1941, she assumed command under the code name POZ 55. Fourcade was the only woman to run a major resistance network in France during the war. The Navarre network became known as the Alliance. The Germans knew it as Noah's Ark, for its members were assigned animal names. Fourcade's code name was Hedgehog. The Alliance reported German troop movements and monitored submarine activities and German military operations within France. It also published propaganda tracts and journals. Members of the network also helped identify launch facilities for V-1 buzz bombs and V-2 rockets. Under Fourcade's guidance and supported by British money and equipment, the network grew to more than 3,000 members. Arrested by the Gestapo twice, Fourcade escaped each time. The first time she was caught because a wireless operator sent by the British turned out to be a double agent working for the Germans.

In 1941 and 1942, Fourcade's network helped to conceal British airmen who had been shot down and then to smuggle them out to Spain and safety. In July 1943 after 30 months of leading the Navarre network, Fourcade was evacuated by the British along with some of the downed airmen. She continued to run the network from a house in Chelsea until July

1944, when she returned to France. Of more than 3,000 members in her network, 438 were caught and executed.

After the war, Fourcade was active in organizing the Union for the New Republic, the political party of Charles de Gaulle. She also championed recognition for former Resistance members. Fourcade died at Paris on 20 July 1989.

France, Air Force

Recriminations over the poor performance of the French air force (*Armée de l'Air*) in 1940 began even before the armistice with the Germans, and they were a key element in the notorious Riom Trial held by the Vichy authorities in 1942 to prosecute the alleged saboteurs of France's war effort. Postwar historiography was scarcely less politically charged, and it is only with the passage of more than half a century that the history of France's wartime air force may be examined with some necessary detachment. Whatever the cause, the air service's accomplishments in the 1940 Battle for France were extremely disappointing, and its contribution to the national catastrophe was significant. Why this should have been so, when France in 1940 boasted an experienced cadre of fighter and bomber pilots and many aircraft comparable in quality to the best fielded by the German *Luftwaffe* and British Royal Air Force, will probably always remain something of a mystery. It can be better understood, however, by looking at the air service's convoluted and often tempestuous development between World War I and World War II.

In many respects, France led the world in aviation technology in the 1920s and 1930s. Its aircraft manufacturers produced many combat machines, and half of the world's airspeed records were set in French-built planes. But the country did not create an independent air service until 1928, and the motivation for its creation was more political than strategic. From its inception, the *Armée de l'Air* was a pawn in the long-standing intrigue between the Third Republic's political class and its generals, many of whom had never reconciled themselves to civilian authority. The air force was intended as a counterweight to the war ministry, and this atmosphere of interservice rivalry was exacerbated by the country's most influential pre-war air minister, Popular Front appointee Pierre Cot, who

served from 1933 to 1940. For all his undoubted administrative skill, Cot's overbearing style only deepened military suspicions that the Armée de l'Air was "the armed service of the Left," with all the ideological contamination that implied.

As with many of their contemporaries, the French air chiefs between the wars were intrigued by the strategic bombing theories of Giulio Douhet and other air-power advocates. Not only was an independent strategic role a fashionable concept in aviation circles, but it also entrenched the Armée de l'Air's autonomy from the war ministry. Cot was an enthusiast, but in trying to simultaneously placate both the strategic bombing advocates and army commanders who urged him to create a tactical support arm for the ground forces, he proposed the ill-fated BCR solution: a multi-role fighter-bomber aircraft that was necessarily mediocre in all its capacities and a waste of much time and money. After Cot's replacement by Guy La Chambre in 1938, the strategic bombing plan was theoretically sidelined, but its influential proponents within the air service felt betrayed by the government and began a policy of tacit noncooperation with both state and army. Despite official doctrine, little or no progress was made on genuine collaboration between the ground and air forces prior to the outbreak of World War II.

In principle, neither supply nor quality of aircraft was a key problem. By May 1940, the Armée de l'Air possessed no fewer than 4,360 machines, of which approximately 2,900 were modern combat aircraft, with 67 fully equipped fighter squadrons, 66 bomber squadrons, and 30 observation squadrons (*escadrilles*). Some 619 new aircraft were arriving from French factories each month, as well as regular shipments of Curtiss 75A (export version of the Curtiss P-36 Hawk) fighters from the United States. The chief problem lay in lack of pilots, technical support, and trained ground crews, rather than lack of aircraft.

The best of France's own fighters, in particular the brand-new Dewoitine 520 (which went into service a few days after the German assault in the west), were on a par with their chief adversary, the Messerschmitt BF-109E. But scarcely one-quarter of this force was deployed on the crucial northeastern front. Explanations for this critical waste of resources have frequently focused on accusations of personal incompetence or even treachery, but the real culprit appears to have been France's inadequate supply of pilots. The aviation training program had not kept pace with the expansion in combat machines, so that even by calling up middle-aged reservists, the service's wartime commander General Joseph Vuillemin was unable to crew nearly the number of planes that were available. Far too many excellent aircraft remained uselessly crated up in storage while the air battle over France intensified.

Nor were the aircraft committed to France's defense well used. In February 1940, Vuillemin had relented to a demand that his frontline units be subordinated in command to Gen-

eral Alphonse Georges' individual army groups, maintaining for Vuillemin's personal direction only the strategic bomber reserve. Neither the airmen nor their peers in the land forces were properly trained in close-support techniques, and the resulting air/ground "cooperation" proved tragically inept: aircraft and pilots were wasted in piecemeal assaults on the German spearheads that lacked any coherent choreography with the army's counterattacks. Individual skill and bravery could not overcome such clumsy organization, and the withdrawal of the best squadrons to North Africa, which started five days before the armistice, indicates how profoundly the air force had lost confidence in its own ability to resist.

In the Vichy settlement, the army took its revenge on the Armée de l'Air, stripping it of its ministerial independence and reducing it once more to being a branch of the regular ground forces. The surviving 19 metropolitan squadrons were equipped with obsolescent machines; the superior *escadrilles* were posted mostly to Algeria and Morocco, where in time they would be absorbed into de Gaulle's forces after the 1942 Operation TORCH Allied landings in North Africa.

Despite its undoubted weaknesses, the air force's contribution to the Allied war effort should not go unrecognized. The 600–1,000 German aircraft it destroyed in May and June 1940 were sorely missed by the Luftwaffe during the ensuing Battle of Britain. But perhaps Cot's postwar eulogy concludes the story best: "The French did not lose the air battle; bad organization did not even let them fight it."

France, Army

The "strange defeat" of the French army in the May–June 1940 Battle for France invites some of the most intriguing counterfactual assumptions of World War II. Was France's enervated and demoralized military fated to suffer catastrophe against the German Ardennes offensive—or could sounder deployment, more energetic leadership, and a little more luck in the field have forestalled the sudden German victory? When did the slow decay within the antebellum army become truly crit-

ical? To address such questions, one must acknowledge the dual importance of contingency and determinism in matters of war. Certainly, the success of German leader Adolf Hitler's May 1940 PLAN YELLOW (FALL GELB), the assault on France and the Low Countries, relied to some extent on specific errors of judgment by the French and British political-military leadership that greater forethought might well have prevented. However, the collapse of the Third Republic was symptomatic of deep and profound flaws within its army's prewar preparations, flaws that would have inevitably compromised France's defense no matter how spirited or ingenious its commanders had proved to be in 1940.

The dilemma for France's military planners in the 20 years after the 1918 armistice was how to provide effective national security from a resurgent Germany when France faced a now permanently weakened manpower base and diminishing prospects of allied support. The horrific casualties of World War I began their demographic payoff in the mid-1930s as the "hollow classes" of conscripts fell 140,000 people short of target each year. At the same time, political considerations demanded the reduction of the traditional three-year draft into the army regiments to a single year, and although the draft was increased to two years in 1935, the new law was not uniformly enforced. One option was to consider a smaller but better-equipped and better-trained army of career professional soldiers. Such was the case sketched by young Major Charles de Gaulle in his provocative 1934 work *Vers l'armée du métier* (*The Army of the Future*), in which he proposed the creation of six heavily armored divisions that would form an elite cadre for future offensive operations. Quite apart from cost, the civilian ministers recoiled at the thought of this potential Praetorian guard; relations between the army and the Republican political class were still bad enough in the 1930s for the possibility of a military coup to be taken seriously.

The army, then, would remain a mass conscripted force. France's deficiency in manpower would be made up instead by defensive works, applying the lessons of Verdun—however incompletely understood—to the Maginot Line, a series of sophisticated frontier fortifications along the Franco-German border named for Minister of War André Maginot. The line was designed to canalize any German attack to the north, and it accomplished this in 1940. Comfortably ensconced behind this apparently impregnable fortress wall, the field army's task would be to stand in reserve and repel intrusions between the main Maginot forts while thrusting into Belgium to engage any German assault north of the Ardennes. With a heavy concentration on defense and a battlefield this time mercifully removed from France's industrial heartland, the hope was to oppose and halt a westward attack despite the significant numerical advantage the Germans would enjoy.

At the outbreak of war, the Armée Métropolitaine mobilized 94 frontline and reserve divisions for the defense of

France, with 215 infantry regiments all told—less than two-thirds the number mustered in August 1914. These divisions were organized into nine field armies and four army groups, with supreme command vested in General Maurice Gamelin, chief of staff of national defense. Gamelin's authority was, however, compromised by the unclear chain of responsibility between him and General Alphonse Georges, his commander on the crucial northeast front. Personal antagonism between the two men did nothing to dispel this ambiguity. Georges' 1st and 2nd Army Groups of three armies apiece were disposed along the Franco-Belgian border along with the newly arrived British Expeditionary Force (BEF), while the 3rd Army Group under General Antoine Besson kept watch in Alsace-Lorraine. General René Henri Olry's Army of the Alps commanded the mountainous frontier against Italy. As it turned out, it accomplished this task magnificently after Italy's clumsy offensive in June 1940, the only redeeming chapter in France's agony that year. Scattered units of General Henri Honoré Giraud's Seventh Army guarded the French coasts.

A quartet of bureaus administered this great force: 1st (personnel and organization), 2nd (intelligence), 3rd (operations), and 4th (transport and services). Their staffs were located with neither Gamelin nor Georges, a characteristic multiplicity of headquarters that abetted the natural confusion caused by the commander in chief's refusal to take wireless communications seriously. The delays in transmitting and receiving messages to and from the respective commands—messages usually dispatched by motorcycle courier—would have been tardy by World War I standards; they were inexcusable in a war of portable radios and high-speed maneuver.

A typical *division d'infanterie* (infantry division) out of the 63 at Gamelin's disposal would consist of 17,500 men: 9 battalions of infantry (870 men each), 2 regiments of artillery—many of them equipped with the famous but now obsolete 75 mm World War I field gun—and individual companies of antitank, reconnaissance, pioneer, engineer, signals, transport, medical, and supply troops. *Divisions légères mécaniques* (DLMs, light mechanized divisions), created in the scramble after the BEF evacuation at Dunkerque, had only 6 battalions and a single artillery regiment each. About half of this total force were reserve divisions, divided into type A and type B according to age. There were also several miscellaneous reserve units judged unfit for combat duty that performed light communications and security duties behind the line.

As part of war minister (from 1936 to 1938) Édouard Daladier's massive rearmament program from 1936 onward, a small number of modern armored divisions (*divisions cuirassées de réserve* [DCRs]) were planned, which would each boast 4 battalions of more than 150 heavy and light tanks. The most powerful of France's armored vehicles, such

General Lattre de Tassigny, commander in chief of the French armies in France, inspecting the Allied Sherman tanks that liberated the French city of Colmar, 11 February 1945. (Hulton Archive)

as the 30-ton Char B1 bis with 75 mm and 47 mm armament, could comfortably outgun any German tanks of the period and were generally better armored, although they tended to lack speed, range, and radio equipment. Supply shortages and ministerial penny-pinching meant that the first two DCRs were not, however, created until January 1940, and only then at half strength. A third division appeared in March, while the fourth, commanded by Colonel Charles de Gaulle, did not make its entrance until the battle for France was well under way.

Partly compensating for this shortfall were the three DLMs, former cavalry divisions that had been totally upgraded with Somua and Hotchkiss medium tanks as well as motorized dragoon and reconnaissance elements. Three *divisions légères de cavalerie* were a less successful variant on this. They were hybrid formations consisting of 1 mounted brigade and 2 battalions of motorized dragoons each. Those vehicles operated by the *chars de combat*, the army's tank arm, that were not delegated to one of the armored or mechanized divisions—more than half of France's tanks—were

instead scattered across the various army groups in small packets for infantry support, sometimes at battalion level but more often to companies or platoons.

As well as its metropolitan army, France could also call on its two imperial forces: the Armée d'Afrique, raised in Algeria, Tunisia and Morocco; and the Troupes Coloniales, who guarded France's sub-Saharan territories, Madagascar, and Indochina. Each force was a combination of European French-only *Zouave* and African *tirailleur* infantry regiments. The Tirailleurs Sénégalais of the Troupes Coloniales were especially prized for their fearsome reputation. The Armée d'Afrique also included *spahis*—irregular mounted troops and the 12-regiment-strong French Foreign Legion. Many colonial units were shipped to France at mobilization, so that by May 1940 there were 21 regiments of Algerian and Tunisian Tirailleurs at the front line and several brigades of African cavalry.

Following the armistice with Germany, the rump Vichy regime was allowed only 100,000 men for metropolitan defense (presumably in conscious mimicry of the allowance

given the Reichswehr in the Treaty of Versailles following World War I). This Armée de l'Armistice was organized into 8 divisions, which because of the army's modest size were quite well provided with personal infantry weapons but which lacked all motorized transportation and heavy equipment. By contrast, the Germans were sufficiently impressed by the vigorous defense of Dakar by Free French Forces in late 1940 that they allowed the two imperial armies to expand. The Armée d'Afrique grew first to 127,000 and later to 225,000 men strong and was allowed the use of tanks, heavy guns, and other modern weaponry. Unfortunately for their German sponsors, however, neither of Vichy's colonial armies was willing to use its windfall of hardware when it encountered more substantial opposition, such as the Anglo-American TORCH landings in November 1942. It was these landings that precipitated the winding up of the Vichy independent government and the final dissolution of the vestiges of the Third Republic's army. France's military future then lay elsewhere.

France, Battle for (10 May–11 July 1940)

Germany's sudden strike west in May 1940 through neutral Holland and Belgium caught the Allies by surprise, leading to military defeat and the collapse of the French government. Despite Germany's successful April 1940 invasions of Norway and Denmark, France remained committed to the defensive posture it had assumed on mobilization. The French and the British Expeditionary Force (BEF), grown to nearly 400,000 men, could not occupy their intended defensive positions in neutral Belgium until events forced that nation into the war. When the blow came, the Allied failure to prepare a realistic defense strategy, France's weak government, Germany's blitzkrieg tactics, and

the lingering influence of the Phony War ("Sitzkrieg") period combined to produce a rapid German victory.

The Germans did not have numerical or technological superiority over their opponents. Against Adolf Hitler's 136 divisions (2.5 million men), the French, British, Belgians, and Dutch could field 135 divisions (more than 2 million men). The Allies and neutral powers also had more tanks (perhaps 3,600, compared with 2,500 for the Germans). The Allies were sadly deficient, however, in numbers of anti-aircraft guns and aircraft. Against 1,444 German bombers, the Allies could send up only 830 fighters. These would have to cope with 1,264 German fighter aircraft, more than 1,000 of which were Bf-109s. Overall, the German air fleets deployed in the west numbered 3,226 combat aircraft, whereas the British and French had half that number.

Well aware of this parity, the German General Staff were reluctant to undertake any assault in the late fall of 1939, instead producing the Phony War, when both sides were largely idle. Hitler's insistence on striking into France forced the issue, producing a series of changing operational plans that eventually invalidated the assumptions underlying the French defensive strategy. That strategy, and France's ability to execute it, suffered substantial defects by May 1940. The prolonged period of inactivity along the front since the fall of Poland had seriously eroded both Allied military morale and confidence in France's military and civilian leadership. Defeatism and internal political struggles divided Premier Paul Reynaud's government. The French High Command deliberately overestimated German strength in its pronouncements to provide an excuse in the event of disaster, and bureaucratic inertia and stubbornness hampered efforts by Colonel Charles de Gaulle and others to concentrate France's greater number of tanks into armored units capable of opposing Germany's panzer divisions. The first three French tank divisions did not assemble until January 1940, and they lacked radios. Most of France's tanks were parceled out in small packets along the front to act in support of infantry.

Allied strategy predicted that any German assault would bypass the fortified Maginot Line by moving through the neutral Low Countries and then pivoting north of Liège to fall upon the Channel ports and move against France from the north. But following the January 1940 compromise of the original German plan, which would have met Allied strength, Generals Fritz Erich von Manstein and Heinz Guderian convinced Hitler to abandon this approach in favor of concentrating the bulk of the resources on a more southern axis. Under the new plan, while other units extended the line to the sea, the main German force would drive through the Ardennes forest south of Liège to strike the French army as it moved to defend Belgium.

General Feodor von Bock's Army Group B, charged with invading Belgium and Holland, was downgraded from 37

Soldiers of the British Expeditionary Force on the beach at Dunkerque fire at German aircraft, which are bombing the ships sent to evacuate them, June 1940. (Fox Photos/Getty Images)

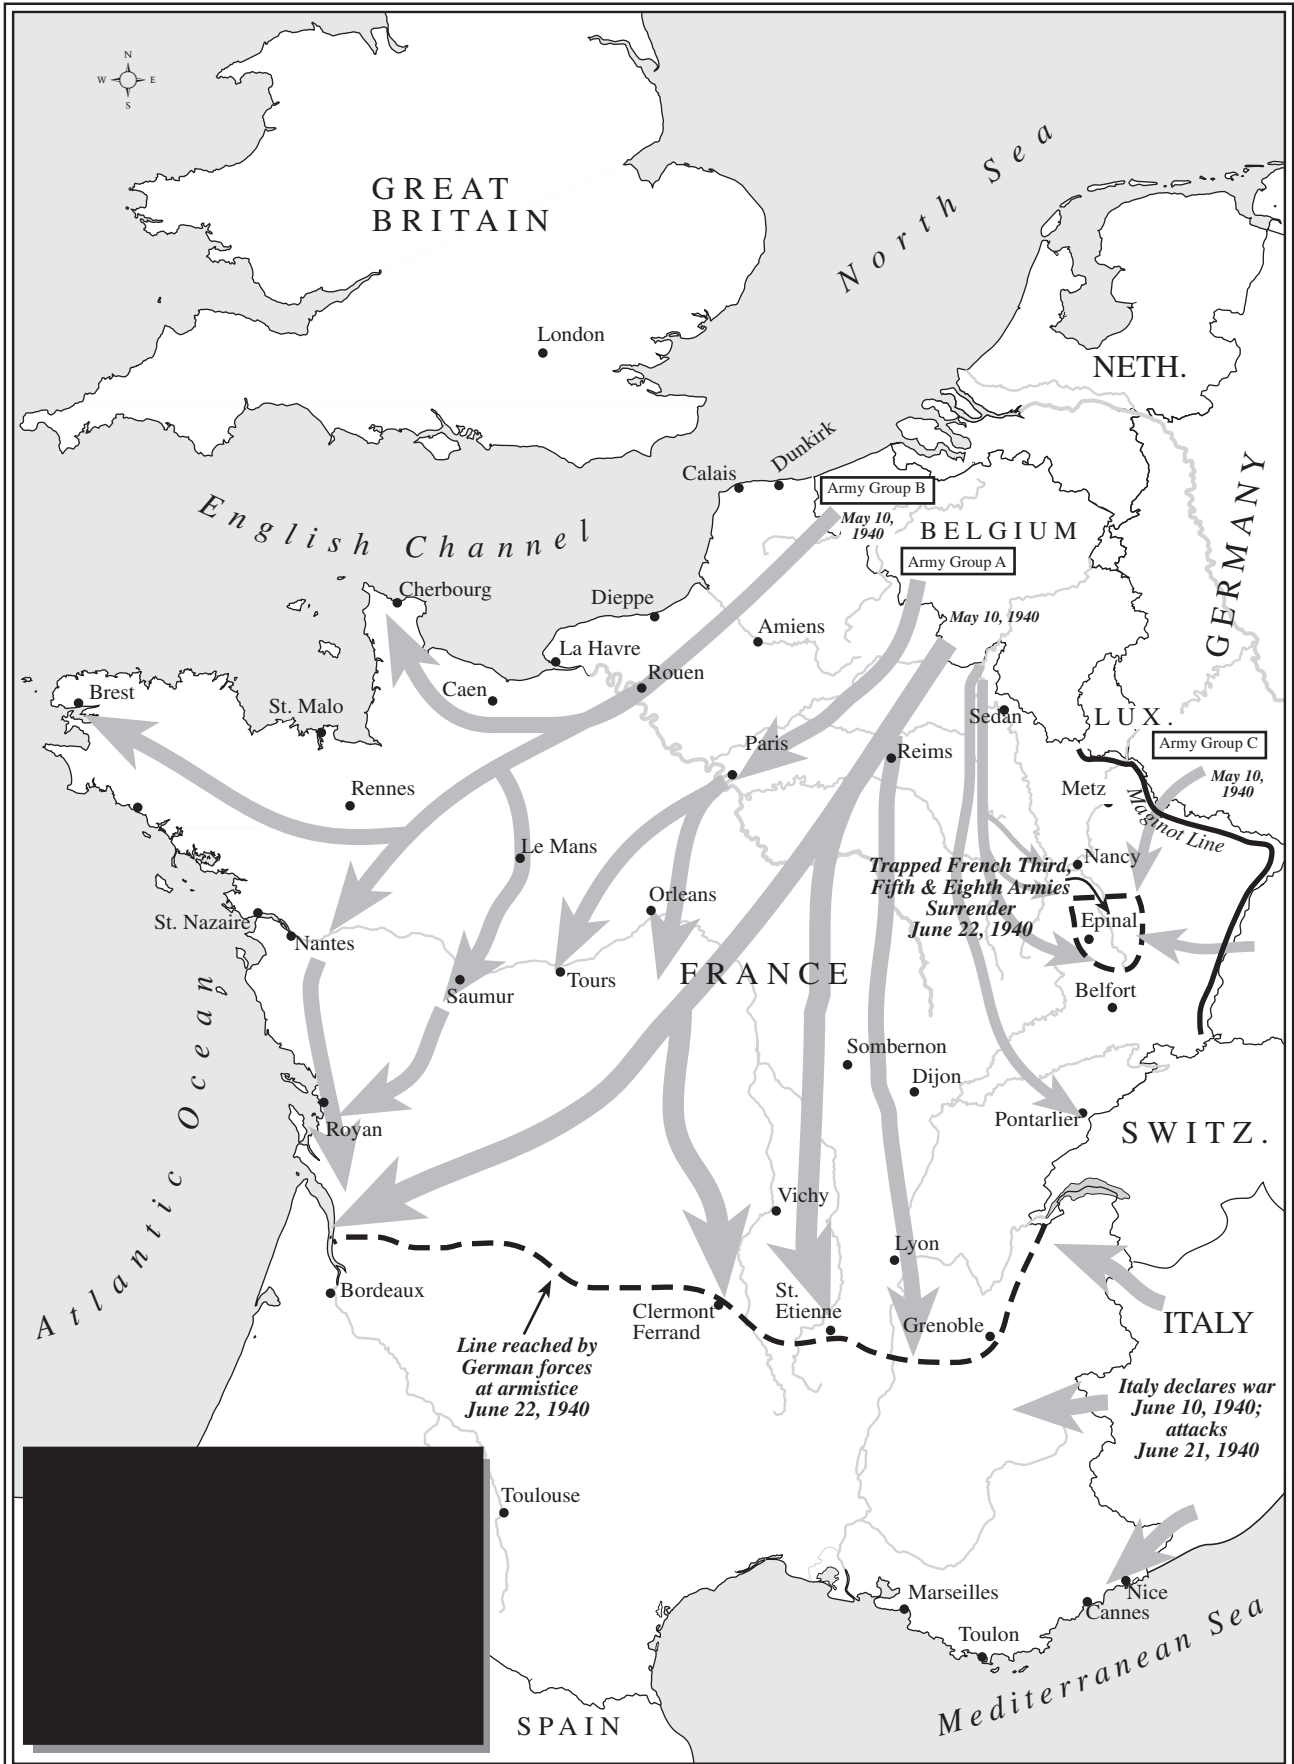

divisions in the original plan to only 28 in the Manstein plan, and 3 rather than 8 armor divisions. General Gerd von Rundstedt's Army Group A, which was to move through the Ardennes, was upgraded from 17 to 44 divisions, including 7 rather than a single armor division. Thus, at the point of the breakthrough, the Germans would outnumber the French 44 divisions to 9.

By early May, the signs of an impending attack were obvious to those who wished to see, but its direction, speed, and success caught the Allies by surprise. French intelligence services, usually among the world's best, completely misread German intentions and strengths. Manstein's plan capitalized on the French tendency to anticipate a repetition of the World War I offensive inspired by the Schlieffen Plan. Therefore, the operation began on 10 May with an attack into Holland by von Bock's Army Group B. Although some positions held for two or three days, German blitzkrieg tactics drove the bulk of the Dutch army back in short order. The French Seventh Army raced across Belgium to the rescue, arriving on 12 May only to join the retreat.

The great fortress of Eben Emael anchored Belgium's defenses on the south. A German glider assault took the allegedly impregnable position in just 28 hours, opening the

path for German tanks. Similar airborne assaults carried bridgeheads and lesser defensive positions, overwhelming Belgian defenses. There, too, help arrived on 12 May. British and French forces executing the planned strategy managed to slow the German advance through Belgium by 14 May, but the concurrent German strike through the Ardennes obliterated that planned strategy. Quickly overrunning Luxembourg, von Rundstedt's Army Group A advanced through the Ardennes to reach the main French line along the Meuse River on 12 May. French army commander General Maurice Gamelin's belated efforts to stem the tide with reinforcements came too late to prevent German forces from crossing the Meuse. The Germans took Sedan and punched a 50-mile-wide gap in France's defenses. By 16 May, they were on the Aisne River in open country.

The BEF and many French armor forces were already committed to battle in the north. Gamelin now ordered up reserves and formed a new army under General Robert Auguste Touchon, the Sixth, to try to seal the gap. General Henri Giraud took over command of the Ninth Army, but his forces were badly mauled by the Germans on 17 May, and Giraud himself was captured. From 17 to 19 May, Colonel Charles de Gaulle scored the only French successes of the bat-

HISTORIOGRAPHICAL CONTROVERSY

Hitler's Stop Order (24 May 1940)

German leader Adolf Hitler's *Haltebefehl* (halt or stop order) of 24 May 1940 was one of the most controversial decisions in connection with the fighting in Europe and Hitler's first major military mistake. This decision allowed the British Expeditionary Force (BEF) to carry out its epic evacuation from the French port of Dunkerque and continue the war.

The German plan for the French Campaign, *SICHELSCHNITT* (CUT OF THE SICKLE), designed to cut off the best British and French armies after they advanced into Belgium, worked to perfection, and the BEF withdrew to the French Channel port of Dunkerque. Reichsmarschall (Reich Marshal) Hermann Göring, commander of the German air force, was worried that the Luftwaffe, which had performed brilliantly in the campaign, would nonetheless not receive the credit it deserved. On the afternoon of 23 May, Göring telephoned Hitler and declared that, if Hitler would order the army to stand back and provide room, credit for the destruction of the BEF would go to the German air arm (the creation of National Socialism) rather than the army of the Prussian aristocrats.

Göring's arguments fell on fertile ground. Hitler was worried about his armor, convinced that Flanders was not suitable tank country. Also, he had to preserve his tanks to take Paris and was reluc-

tant to see his armor formations shattered in an effort to defeat nine desperate British divisions with their backs to the sea. Göring's arguments seemed to make good sense. In any case, a pause in the panzer operations would allow infantry to close on the evacuation beaches in support.

On 24 May 1940, Hitler flew to Charleville to consult with General Gerd von Rundstedt, commander of Army Group A. There Rundstedt explained that he had stopped the panzers on 23 May to allow the remainder to catch up. He favored having the infantry continue on east of Arras while the tanks held fast on the Aa Canal Line, where they could simply defeat the BEF as it was driven back by German Army Group B from the other side of the pocket.

Hitler immediately approved Rundstedt's decision, emphasizing the importance of maintaining the panzers for the coming offensive against French forces regrouping to the south. Any further advance by the tanks would make it more difficult for the Luftwaffe's Ju-87 Stuka dive-bombers. That afternoon, a new order went out—more explicit than that issued by Rundstedt the day before—ordering the tanks to go no farther than the Lens-Béthune-Aire-Saint Omer-Gravelines line.

German panzer commanders at the front could not believe the order, which

Hitler issued in ignorance of the actual situation. Several generals, including commander in chief of the army General Walther von Braunschweig, tried without success to persuade Hitler to change his mind. By 26 May, even Rundstedt had doubts about the order, which was finally lifted that afternoon. Necessary preparations for the panzers and their crews to recommence the offensive, however, meant that the advance was not resumed until the predawn hours of 27 May, when the Dunkerque evacuation was already under way.

tle when he flung his 4th Armored Division in three successive thrusts against the southern flank of the German advance from Laon. Aided by air power, the Germans blunted the Allied attacks and swept on.

The speed of the German advance caught even von Rundstedt by surprise, as his armor commanders subverted instructions to slow down, slipped around areas of heavy resistance, and reached the English Channel by 21 May. Germany's spectacular success broke General Gamelin's ability to respond. French communications were abysmal, and there was no strategic reserve. Convinced of France's inevitable defeat, Gamelin ceased to exercise effective command. Premier Reynaud dismissed him on 19 May and replaced him

with General Maxime Weygand, but the situation was already too far gone for Weygand to stave off disaster. The BEF was trapped in the north, and cooperation between it and the French First Army broke down. Forced to choose between supporting an increasingly unlikely French breakout (which both Weygand and British Prime Minister Winston L. S. Churchill ordered) or maintaining his line of retreat to the sea, on 24 May BEF commander General Sir John Gort ordered the BEF to withdraw to the north and the port of Dunkerque.

This proved to be one of the important decisions of the war, for it saved the BEF to fight another day. Hitler now committed his first major military mistake of the war, which allowed the BEF to escape. On 26 May, Rundstedt, worried about the

speed of the advance, halted the panzer divisions when they were within striking range of the last Channel ports open to the British. Hitler then converted this temporary halt into a firm order. He wanted to allow time for the infantry to come up and was convinced by Luftwaffe commander General Hermann Göring that the Luftwaffe could destroy the British on the beaches, preventing their escape. Not until 29 May did Hitler release the tanks again, and by that time the BEF was in place, protected in large part by the French First Army. In the week-long Operation DYNAMO, the British evacuated some 365,000 men from France, of whom nearly 225,000 were British.

Reynaud's new cabinet proved to be unable to deal with the deteriorating situation. The French government increasingly disintegrated into rival factions and descended into defeatism. Although much of the army was still intact, it was bereft of leadership or sound strategy and psychologically defeated. Although Churchill proposed a union of Britain and France to keep the latter in the war, he refused, under pressure from the RAF, to commit the remainder of his fighter aircraft to the battle for France. It appeared to Paris that Britain was withdrawing from the war, leaving France to fight alone.

By 5 June, the Germans had repositioned the bulk of their forces in preparation for the final conquest of France. France opposed the onslaught with a greatly weakened military and an already defeated government. On 8 June, von Bock's Army Group B reached the Seine. One of his generals, Erwin Rommel, pushed on to Rouen before turning back up the coast, encircling the remaining British and French units along the seashore. East of Paris, French forces held out, perhaps in response to Weygand's futile and foolish 8 June order to hold without thought of retreat. But on 12 June, Rundstedt's forces broke through the French line at Châlons. Before his tanks stretched open ground and the retreating French army. That same day, the French government abandoned Paris for Bordeaux in the southwest. On 13 June, the government declared Paris an open city to spare it the fate of Warsaw and Rotterdam, and the next day German troops took peaceful possession of the capital.

For a full week, the French government struggled to find a solution while its demoralized forces fought an unorganized withdrawal without any clear strategy. The cabinet rejected alternatives ranging from a retreat to North Africa and the still-secure resources of the colonies to the outright union of France and Britain. The premier summoned Marshal Henri Philippe Pétain, hoping he could restore morale and reinvigorate resistance. Unfortunately, the aged hero believed the war was lost and added his voice to the defeatists opposing Reynaud. On 10 June, Italy entered the war on Germany's side, although Italian forces did not attack France in the southeast until 20 June.

Late on the evening of 16 June, with the Germans having taken Verdun and beginning to cut off the Maginot Line from the rear, Reynaud resigned. With his departure, any hope of

France remaining in the war disappeared. Pétain succeeded him as premier, proclaiming in a radio address to the French people the next day that the country had lost the war and "the fighting must stop." Many army commanders interpreted this as an order, and the German advance continued largely without resistance. Brigadier General de Gaulle and a few other Frenchmen escaped to Britain.

France and Germany signed a cease-fire on 22 June 1940, but operations continued at Hitler's insistence until the Italians agreed to the armistice on 25 June. Signed at Compiègne—at the same site and in the same railway carriage that had witnessed the signing of the armistice with Germany in 1918—the 1940 armistice allowed Germany to occupy northern France and the Atlantic coastal regions to the Spanish border, with France to pay for the German costs of administration. French prisoners of war remained under German control. The French fleet, much of which had escaped to North Africa, would remain under French control but was to be demobilized. The French government, having fled Paris, continued to rule the unoccupied zone from Vichy under the leadership of Pétain.

France, Free French

On 18 June 1940, French army Brigadier General Charles de Gaulle—until the previous day undersecretary of war in the Paul Reynaud government—appeared before the microphones of the British Broadcasting Corporation in London and broadcast an appeal for Frenchmen to rally to him and continue the fight, saying that "France has lost a battle, but France has not lost the war."

General Charles de Gaulle inspecting members of the newly formed Free French command unit at Wellington Barracks, ca 1942. (Hulton Archive)

Of nearly 100,000 French troops in England at that time—most of whom had been evacuated from the area around Dunkerque—only 1,300 volunteered to stay in England and join de Gaulle; the remainder returned to France. Of the volunteers, 900 were Foreign Legionnaires of the 13th Demi-Brigade who had recently been evacuated from Norway. Undeterred by the limited response, de Gaulle recruited forces and established the “Fighting French” (Free French Forces). On 2 August, a court-martial initiated by Marshal Henri Philippe Pétain’s Vichy French government sentenced de Gaulle to death in absentia for treason. On 7 August, de Gaulle signed an agreement with the British government regulating the French forces and placing them under the “general directives of the British High Command.”

Over the next year, de Gaulle’s small force steadily increased in number. In August 1940, sufficient troops to form four battalions joined from Equatorial Africa (Chad, Cameroon, Middle Congo, and Gabon). Hoping to enlist units in West Africa, de Gaulle mounted a 1,445-man expedition with British naval support against Dakar in West Africa, but the city remained loyal to Vichy France and the operation failed.

Other Free French Forces served abroad. Volunteers from Syria were formed into the 1st Marine (Naval) Infantry, which was attached to the British 7th Armoured Division. These troops assisted in the capture of Tobruk, Libya, in January 1941. In December 1940, Colonel Raoul-Charles Magrin-Vernerey (a.k.a. Monclar) formed the Brigade d’Orient of 1,200 men from several units of infantry (including the 13th Demi-Brigade) and a horse cavalry squadron. The brigade fought in Eritrea from January to May 1941, the cavalry unit making the last French cavalry charge in history (against Italian cavalry).

On 25 May 1941, Major General Paul Louis Legentilhomme formed the 5,400-man 1st Free French Light Division from several units of French Legionnaires, Africans, and Arabs. On 8 June, operating with British Commonwealth forces, the division invaded Syria, meeting bitter resistance from Vichy forces there. The campaign ended on 11 July. Of the 38,000 Vichy troops in Syria, 5,331 (including 1,000 Legionnaires) joined the Free French; the remainder were allowed to return to France. On 20 August 1941, the Light Division was disbanded; with additional reinforcements, it became several independent brigade groups, some of which remained in Syria for garrison duties.

The 1st French Brigade, commanded by Brigadier General Marie Pierre Koenig, was formed in December 1941. It consisted of the 13th Demi-Brigade and several naval infantry battalions. These *Fusiliers-Marins* provided a bit of color, as the sailors retained their red pom-pom naval caps and the chief petty officers wore their peaked caps. Assigned to the British XIII Corps, the 1st Brigade was posted to the “box” at Bir Hacheim at the left end of the Gazala Line in Libya.

Attacked by the Italian Ariete Division and elements of the German 90th Light Division on 27 May 1941, the 1st Brigade held, despite continuous combat and constant Luftwaffe attack. On 11 June it was ordered to withdraw, breaking through to British lines. Bir Hacheim was the defining battle for the Free French. Prior to it, British support had been lukewarm. However, after the brigade withstood German Afrika Korps assaults longer than any of the Commonwealth “boxes” on the Gazala Line, there were no longer any doubts that the Free French would fight and fight well.

By the time of the Battle of El Alamein in October 1942, Free French units were fighting with the British 7th Armoured Division, 50th Infantry Division, and the Long-Range Desert Group. The 1st Free French Division was formed 1 February 1943 for the campaign in Tunisia under Koenig, who was now a major general. After a brief resistance to the Allied landings on 8 November 1942, eight divisions of the French North and West African Armies went over to the Allied side. The XIX Algerian Corps under Major General Alphonse Pierre Juin fought alongside the British First Army in Tunisia, although Juin refused to take orders from the British commander. Additional political problems arose when some elements of the Free French forces refused to associate with the North African ex-Vichy troops.

On 4 August 1943, a new French army came into being, consisting of eight infantry divisions, four armored divisions, four regiment-sized groups of French North African troops, six commando battalions, and one parachute regiment. Under the terms of an inter-Allied agreement, the United States assumed responsibility for rearming, reequipping, training, and supplying the French forces. Language problems and the emphasis on fielding the greatest number of combat units possible at the expense of support units were the most prominent obstacles encountered. Other problems arose over weapons (the French never received the excellent U.S. M1 Garand rifle) and supplies (the French never received tanker jackets and, more seriously, initially received a smaller ration scale than American troops). Eventually most problems were resolved.

A French Expeditionary Corps of five divisions was formed on 18 May 1943. Commanded by Major General Juin and sent to Italy in late 1943 and early 1944, it was instrumental in winning the Fourth Battle of Cassino, outflanking the German position by moving through the mountains as Juin suggested. A reinforced Free French division liberated

the Mediterranean islands of Corsica and Elba in September 1943 and June 1944, respectively.

On 15 August 1944, what became the French First Army under Major General Jean Marie Gabriel de Lattre de Tassigny landed in southern France as part of the U.S. Sixth Army in Operation DRAGOON. Its eight divisions and 200,000 men fought their way up the Rhône Valley, arriving on the right flank of U.S. Lieutenant General George S. Patton’s Third Army. The French First Army advanced into southwest Germany, and by the end of the war it had reached the Tyrol in western Austria. In addition, Major General Philippe Leclerc’s Free French 2nd Armored Division served with the U.S. First Army, liberated Paris, and joined the French First Army in February 1945. By the end of the war, the rebuilt French air force consisted of 25 fighter, bomber, and reconnaissance squadrons equipped with American and British aircraft. The Free French navy, which initially consisted of only three ships, had grown by war’s end to a total of 240 warships.

At a cost of 23,500 killed and 95,500 wounded, the Free French Forces demonstrated a will to fight that impressed their Allied counterparts. Although it was significant, the Free French contribution to the Allied victory in Europe is not generally recognized.

France, Navy

In 1939 France possessed a powerful battle fleet. The navy had been largely rebuilt beginning in the 1920s and was generally regarded as the world’s fourth most powerful maritime force. Georges Leygues, a National Assembly French deputy who had served as minister of marine, was a chief architect. Admiral Jean Darlan, the personification of a political admiral,

Part of the French navy's fleet at sea, the cruisers *Diadem*, *Cleopatra*, and *Dido*, 1941. (Hulton Archive)

commanded it. The navy was undoubtedly the most pro-American and anti-British of the three French services during World War II.

In the pre-World War II era, French naval planning was guided by the formula that the navy should be equal in strength to the combined German and Italian navies. In addition, while the bulk of the French fleet was stationed in the Mediterranean, the navy was to be capable of operating elsewhere in the world, primarily in the Atlantic. Between 1925 and 1937, the French laid down new warships at the rate of 32,426 tons a year. With the approach of war, this increased to 41,000 tons annually, severely straining France's shipyard capacity.

The French fleet was centered on the battleship. France's two oldest battleships were seized by the British in July 1940 during Operation CATAPULT, but they were of so little worth that they would not see further naval action. Its next three older—but slow—battleships of the Bretagne-class had been reconstructed in the interwar period. The *Bretagne* was sunk at Mers-el-Kébir during CATAPULT, and the *Provence* was damaged there and later scuttled at Toulon. The *Lorraine* joined the Free French fleet in 1943.

In the 1930s, the French built two fast battleships, the *Dunkerque* and the *Strasbourg*. Displacing 35,500 tons fully loaded, they were rated at 29 knots and were armed with 8 × 13-inch guns in the distinctive French quadruple turrets. Under construction the French had two of the best battleships in Europe in armor design, the *Jean Bart* and the *Richelieu*. Both were armed with 8 × 15-inch guns in two quadruple turrets. Both would see action as Vichy and Free French warships and would survive the war. France also had one elderly aircraft carrier, the *Bearn*, that would remain idle in the West Indies most of the war. Two aircraft carriers were under construction but were never completed.

France maintained a cruiser force centered on 7 heavy ships. With the exception of the *Algérie*, they were probably the worst armored heavy cruisers of any major navy. It also possessed 12 modern light cruisers, of which 6 were Gloire-class ships: fast, well armed, and well armored. France also developed a unique destroyer force. It had built 32 large destroyers of a type designated as *contre-torpilleurs*. Fast, long-ranged, and almost light cruisers in concept, the best known were the 6 ships of the Le Fantasque-class. Capable of

maintaining 37 knots at full load, they were for the whole of their careers the fastest flotilla craft afloat (*Le Terrible* made 45 knots in her trials). Displacing 2,800 tons (3,400 tons fully loaded), they were armed with 5 × 5.5-inch guns. These “superdestroyers” were designed to operate in squadrons of 3 each. France also had 26 destroyers designed for fleet operations (*torpilleurs d'escadre*) and 12 light destroyers, the latter being 610-ton torpedo-boats similar to the Italian Spica-class vessels. A total of 23 destroyers of all types were under construction in 1940, but none would be completed.

With the exception of the legendary monster submarine *Surcouf*, France's submarines consisted of three types. France had 38 first-class submarines of 900 to 1,800 tons displacement, 32 second-class submarines of approximately 600 tons displacement each, and 6 minelaying submarines. Rounding out the fleet were numerous sloops, patrol boats, and other small craft; many trawlers and similar small vessels were requisitioned during the war for coastal work.

France did not have sonar until after the outbreak of the war, and during the Vichy era there was only very limited introduction of radar. Free French naval units were dependent for advanced equipment on the British and the United States, chiefly the latter. Meanwhile, the greatest gift by Vichy France to the Axis war effort may have been Darlan's presentation to the German navy of the “Metox” device for detection of radar.

During the war, the French Navy had no role during the Polish Campaign, but it did participate in the Norwegian Campaign. The latter included a destroyer raid into the Skagerrak, an arm of the North Sea between Norway and Denmark. The navy also conducted convoy and antisubmarine operations as well as operations in the Atlantic against German raiders. French naval units also participated in the Dunkerque evacuation, losing several destroyers to German aircraft. With the fall of France, the majority of the ships passed to Vichy government control. After the British attack at Mers-el-Kébir, most of the now-truncated fleet was relocated at Toulon, where virtually all were lost in a mass scuttling on 27 November 1942. Seventy-seven ships went down: 3 battleships (the *Strasbourg*, the *Dunkerque*, and the old *Provence*), 7 cruisers, 32 destroyers, 16 submarines, and 19 other craft. A few destroyers and smaller ships were raised and towed to Italy, but the Axis powers gained little from them. Five submarines escaped; 1 was badly damaged by bombing and had to be scuttled, another was interned in Spain, and 3 arrived in Algeria.

Some Vichy warships participated in actions against the Allies, primarily off Syria, Madagascar, and Dakar and during Operation TORCH. The French warships also conducted convoy operations to France. The successful Vichy defense of Dakar on 23–24 September 1940 was an important factor in Adolf Hitler's decision to continue backing the Vichy regime in 1940–1941.

Charles de Gaulle placed the few mostly smaller warships of the Free French under Vice Admiral Émile Muselier. As late as January 1943, this modest force had only 5,314 men, but it would expand as the war progressed to include several small British- and U.S.-built warships. They would operate in all oceans, participate in operations against the Vichy territories, and later take part in Operation OVERLORD and in Pacific Ocean battles with Japan.

Major wartime losses for French ships were 4 battleships, 4 heavy cruisers, 6 light cruisers, and 58 destroyers and large torpedo boats. Unfortunately for France, its navy was little able to influence events at the beginning of the war, and the defeat of France in June 1940 came too soon for the navy to contribute in a meaningful way.

France, Role in War

On 3 September 1939, for the second time in a generation, France found itself at war with Germany. In sharp contrast to August 1914, this time the mood in the Third Republic was one of somber resignation. Although France was among the victors in World War I, it had been devastated by the war, with 1,385,300 dead and 4,329,200 wounded (690,000 permanently disabled). One-quarter of all French males of military age lay dead. Much of the fighting had been on French soil, and large stretches of northeastern France had been scarred by the fighting. Buildings and railroads would have to be rebuilt and farms put back in cultivation. The costs were staggering, and finances remained a major problem for French governments of the 1920s. Political instability caused by fre-

quent changes of cabinet and the lack of a strong executive were other major problems.

Denied the genuine national security in terms of protection from Germany that it had sought in the Paris Peace Conference following World War I, France played a Cassandra role in the 1920s and 1930s, warning of the German threat and finding little support in this from Great Britain and the United States, its World War I allies. When the German government defaulted on reparations, in 1923 French troops occupied the Ruhr. Although this action forced the German government to live up its treaty obligations and French troops then departed, the financial cost of the operation was high, and it brought condemnation of France from Britain and the United States. It also brought the Left to power in France in 1924.

The Ruhr occupation was the last such independent French action before World War II. Thereafter, France followed Britain's lead regarding Germany in return for a guarantee of Britain's support in the event of a German invasion. Successive British governments, however, refused to commit themselves to collective security arrangements regarding eastern Europe that might have prevented war. Meanwhile, German leader Adolf Hitler tore up the Treaty of Versailles and the Locarno Pacts, the latter of which Germany had voluntarily signed. In 1936, Hitler sent German troops into the Rhineland. The French army was then regarded as the world's most powerful military force, and France might have acted unilaterally and halted this step, which could have meant the end of Hitler. When the British refused to support military intervention, though, French leaders took this as an excuse to do nothing.

In September 1938, France and Britain permitted Hitler to seize the Sudetenland from Czechoslovakia, a French military ally. In March 1939, Hitler secured the whole of Czechoslovakia, prompting Britain, in the worst possible circumstances, to extend a guarantee to Poland—Germany's next target and already a French ally—that Britain would defend it against attack. Following the German invasion of Poland on 1 September 1939, the French government joined Great Britain in declaring war two days later.

The Popular Front that had come to power in France in 1936 had launched a major disarmament program, but on the eve of war France had begun to rearm. It made substantial outlays in arms expenditures and sharp increases in weapons, especially tanks, of which the French army had more than the German army. Time was vital if France (and Britain) were to catch up with German rearmament. The most glaring French military weaknesses, even by May 1940, were in modern aircraft and in antiaircraft guns.

Both London and Paris were confident of military victory, but both governments and their military establishments embarked on the war in leisurely fashion. While the French called up reservists and retrieved artillery from storage, the

German army rolled over Poland. The French army carried out only a halfhearted offensive in the Rhineland. Had the offensive been on a larger scale and more forcefully prosecuted, it would have carried to the Rhine. Britain was even slower to mobilize and dispatch the British Expeditionary Force (BEF) to the Continent. France and Britain expected to blockade Germany and use their control of the seas to secure the means to match the Germans in terms of their military establishment, especially in numbers and quality of aircraft. The seven months of inactivity after the German conquest of Poland—known as the *Sitzkrieg* or Phony War—seemed to suggest that time was on the side of the Allies.

Meanwhile, there was sharp dissension on the French home front. From 1935 to 1939, the French Communist Party had been in the forefront of the antifascist crusade and urged rearmament. The German-Soviet Non-aggression Pact of August 1939, however, converted the French Communists overnight into advocates of neutrality. The government of Premier Édouard Daladier then unwisely moved against the French Communist Party, outlawing it and interning many of its leaders, including those in the National Assembly. Communist agitation against the war continued, however, helping to produce doubt and defeatism, particularly among industrial workers conscripted into the army. This led to the myth that a fifth column had been responsible for the French military defeat in 1940. Dissatisfaction over the lack of aggressive military activity also led to a cabinet crisis and change of premier in March 1940; Paul Reynaud replaced Daladier. The new premier projected energy and optimism, but politics forced Reynaud to keep Daladier as minister of war, and the continuing rivalry between the two men handicapped the war effort.

The Phony War ended on 9 April 1940 when German forces invaded Denmark and Norway. The French joined the British in sending troops to Norway, but these troops could not halt the German conquest and were withdrawn on the opening of the Battle for France. Then, on 10 May 1940, German forces invaded the Low Countries and France. The French Maginot Line, built at great cost beginning in 1929, served its intended purpose of channeling the German invasion to the north through Belgium. However, several elements led to disaster: the failure of France and Britain to work out detailed plans with Belgium (which had declared its neutrality and was fearful that cooperation with the Allies would be the excuse for a German invasion), serious flaws in the Allied command structure, inept French senior military leadership, the inability of the Allies to understand the changed tempo of battlefield conditions that represented the German blitzkrieg, and the misuse of superior armor assets.

British and French military deficiencies, especially in the air, were soon all too evident. Too late, the French attempted major command changes. Only a month after the start of the

campaign, on 10 June 1940, the French government abandoned Paris for Bordeaux. To spare the city destruction by the German Luftwaffe, the government declared Paris an open city; four days later German troops moved in. On 16 June at Bordeaux, Reynaud suggested that the government and its armed forces move to French territory in North Africa and continue the fight from there. His vice premier, 84-year-old Marshal Henri Phillipe Pétain, opposed this step, as did the new commander of the French army, 73-year-old General Maxime Weygand. Both men considered the war lost and sought to end fighting that they believed could only lead to additional lives lost for no gain. When a majority of the cabinet voted to ask the Germans for terms, Reynaud resigned on 16 June.

Ironically, Reynaud had brought Pétain, hero of the World War I Battle of Verdun, into the government on 18 May to stiffen French resolve following initial Allied setbacks in the campaign for France. On 16 June, Pétain became premier and immediately opened negotiations with Germany to end the fighting. The Germans delayed to improve conditions, but the French government signed an armistice with Germany on 22 June and with Italy on 24 June. Fighting ceased on the battlefields of France on 25 June. The campaign had lasted but six weeks. Never before in its military history had France been as broken militarily and psychologically.

The armistice of 25 June 1940 divided France into occupied and unoccupied zones. A pass was necessary for French citizens who desired to move between the two. German forces occupied three-fifths of the country, including northern and western France and the entire Atlantic coast. France had to pay “administrative costs” to the Germans at the absurdly high sum of 20 million reichsmarks a day, calculated at a greatly inflated rate of exchange of 20 francs per reichsmark. This amounted to some 60 percent of French national income. Save for a few units to maintain order, all French military formations were disarmed and demobilized. Ships of the French navy were to assemble in designated ports and be demobilized. The armistice also called for all German prisoners of war to be immediately released, whereas Germany would retain until the end of the war the 1.5 million French prisoners it had captured. France was also forced to surrender German refugees on French territory.

A new French government was then established at Vichy in central France under Pétain to administer the remaining two-fifths of metropolitan France, which included the Mediterranean coast. Vichy France was left with control of its colonies, although Japan sent in troops and established de facto authority over French Indochina during 1940 and 1941. France then played a schizophrenic role until the end of the war. Most French, convinced that for the indefinite future Germany would rule Europe and disgusted with the infighting and weak leadership that had characterized the Third

Republic, rallied to the Vichy regime and its calls for a conservative revolution. Meanwhile, young Brigadier General Charles de Gaulle, the only figure of some consequence to escape abroad following the defeat, sought to rally the French to the then-dim hope of eventual victory. He called on French people in Britain or those who could reach there, as well as the French Empire, to join him in continuing the fight. De Gaulle’s Free French, soon recognized by the British government, slowly grew in numbers and support as the war wore on and as Germany failed to defeat Britain and suffered rebuff in its invasion of the Soviet Union. The Resistance was an amalgamation of several diverse groups that finally coalesced in May 1943 as the Conseil National de la Résistance (CNR, National Resistance Council), headed by Jean Moulin. Its military arm was the Forces Françaises de l’Interieur (FFI, French Forces of the Interior).

Although some French men and women were active in the Resistance, most of the population simply tried to endure the German occupation. Many actively collaborated with the German occupiers for financial gain, and a few fervently supported the Nazi policies opposing Communism and persecuting the Jews. The Vichy government organized a force known as the Milice to combat growing numbers of FFI.

British Prime Minister Winston L. S. Churchill’s government recognized de Gaulle’s government as the legitimate representative of France, but Churchill also created strong Anglophobia in France by his decision to move to secure the French fleet, most notably at Mers-el-Kébir, where fighting occurred with considerable loss of French life. This affair still rankles the French today, as the French government had promised that it would not let the Germans seize the fleet and ultimately scuttled its main fleet to honor that pledge, even after the events of Mers-el-Kébir.

U.S. President Franklin D. Roosevelt strongly distrusted de Gaulle, and the United States maintained diplomatic relations with Vichy until the Allied invasion of North Africa—Operation TORCH—in November 1942. French resistance to the Allied landings and devious dealings by Vichy representatives ended Allied attempts to negotiate with Pétain’s government.

De Gaulle’s Free French Forces greatly expanded after the Allied invasion of North Africa. Rearmed and reequipped by the United States, a French Expeditionary Corps of five divisions was sent to Italy in late 1943, and it made a major con-

France had to pay 20 million reichsmarks a day to Germany during the occupation, about 60% of the French national income.

tribution to the Allied military efforts there. What became the French First Army landed in southern France in August 1944 as part of Operation DRAGOON. Its 10 divisions fought through France into Germany and Austria. Meanwhile, Allied forces had come ashore in Normandy, and the French Resistance played a key role in isolating the beachheads and preventing German resupply. Everywhere, French men and women assisted the Allied armies. Paris was liberated on 25 August, the 2nd French Armored Division leading the Allied units into the city to join with those fighting the Germans and saving the city's honor.

De Gaulle soon established his government in Paris, and French troops continued with the liberation of French territory. Following the war, nearly 40,000 French citizens were imprisoned for collaboration, including Marshal Pétain and his vice premier, Pierre Laval. Both men were sentenced to death, although de Gaulle commuted Pétain's sentence to life imprisonment in recognition of his World War I service. At least 10,000 people were executed for collaborating with the Nazis. Collaboration was and still is a highly sensitive topic in postwar France.

The high hopes and idealism of the Resistance were soon dashed. Although an overwhelming 96 percent of Frenchmen voting in an October 1945 referendum rejected the constitutional structure of the Third Republic, sharp political divisions ensured that the Fourth Republic that followed it was virtually a carbon copy of the Third. Not until 1958, when the Fourth Republic was overthrown and de Gaulle returned to power, would France have a constitution that ensured a strong executive. Despite de Gaulle's wartime promises of a new relationship with the colonies, the government in Paris pursued a short-sighted policy of trying to hold on to its major colonies, believing that only with its empire could France still be counted as a great power. Such grandiose and outdated notions led to disastrous wars in Indochina and later in Algeria, ultimately toppling the Fourth Republic.

France, Vichy

The government organized in the area of France not occupied by the Germans. The armistice of 25 June 1940 divided France into occupied and unoccupied zones. Germany occupied three-fifths of the country, including northern and western France and the entire Atlantic coast. A new government under 84-year-old Marshal Henri Phillippe Pétain, the last premier of the Third Republic, administered the remaining two-fifths of metropolitan France, including most of the Mediterranean coastline. French citizens needed a pass to cross from one zone to the other. The French government was left with its colonies (although Japan established de facto control over French Indochina during 1940–1941).

Beginning on 9 July, the French National Assembly convened in the resort town of Vichy about 250 miles south of Paris to consider Pétain's plans for the future of France. Meanwhile, several dozen politicians who had left metropolitan France to try to set up a new government in North Africa and continue the fight were arrested and returned to France, where they were charged with plotting against the security of the state.

In July 1940, Pétain enjoyed overwhelming popular support. The vast majority of the French assumed the war was lost and that Britain would soon also be defeated. They were disillusioned with the leaders of the Third Republic, and the defeat produced strong support for new leadership and authoritarian government. Vice Premier Pierre Laval assumed the key role in the cabinet to draft and carry through Pétain's program. In a completely legal procedure, on 10 July 1940 the French National Assembly in a vote of 567 to 80 (most of the latter were Socialists) terminated the Third Republic and handed over full authority to Marshal Pétain to recast the state and promulgate a new constitution to be ratified by the nation.

The task of creating a new constitution was never completed, but a series of decrees issued by Pétain dissolved the parliament and eliminated the office of president. Pétain assumed the functions of "chief of the French State." Further decrees set up a court at Riom to try those "responsible for the war" and prescribed loyalty oaths for government officials and the military. The National Revolution, as Pétain

described his regime to the French people in a broadcast on 8 July, never in fact established its political institutions, although in 1941 the government convened a National Council of nominated notables to serve as an advisory body only.

The conservative Vichy regime claimed to be sweeping away the old corruption and factionalism that had marked its predecessor Third Republic, to replace it with a new morality under the slogan “Work, Family, and Fatherland,” which now replaced the “Liberty, Equality, Fraternity” of the old republic. Vichy was, in fact, marked by factions, cliques, and considerable infighting and was notable for its constantly changing parade of officeholders.

Vice Premier Pierre Laval, the marshal’s designated successor, favored active collaboration with the Germans. The key figure in the government in the early months of the new regime, Laval arranged a meeting between Pétain and Adolf Hitler on 24 October 1940 at Montoire, France. Hitler sought

French participation in the war against Britain; Pétain wanted a final peace treaty and an end to the German occupation. Neither side made the necessary concessions, and the meeting ended unsatisfactorily, but many French were appalled by the marshal’s meeting with Hitler and his announcement that he accepted, in principle, collaboration with Germany.

In December 1940 Pétain abruptly dismissed Laval, who had for some time been the object of intrigues by the advisers around the marshal. Following the brief tenure of Pierre Flandin, in February 1941 Pétain appointed as his chief minister Admiral Jean Louis Xavier François Darlan, commander of the French navy but a man with a passion for politics and intrigue. Darlan lasted 14 months but was unsuccessful in his effort to turn France into Germany’s favorite ally. Summing up the difference between Laval and Darlan, one German officer later said, “When we asked Laval for a chicken, he gave us

an egg; and when we asked Darlan for an egg, he gave us a chicken.” Darlan, who hated the British—especially following the Royal Navy’s attack on the French fleet at Mers-el-Kébir—followed a policy of everything short of war against Britain. He even sought to negotiate an arrangement with the Germans that would have given them a base at Dakar and French-convoyed supplies to assist the Axis effort in North Africa. He accorded the Germans and Italians basing rights in Syria that brought British military intervention and fighting by Frenchmen against Frenchmen.

In April 1942, Darlan departed and Laval returned to power. This time the situation was different. The outcome of the war was now in doubt, and Laval pursued a double game in which he tried to dissemble and delay on German demands and to preserve some French autonomy. Initially, the majority of the French population passively accommodated the German occupation. However, as the war wore on, Britain survived, and Germany suffered reversals in the Soviet Union, support for Vichy began to ebb away. This was abetted by the system of forced labor in Germany (the *service du travail obligatoire*), in which some 700,000 Frenchmen and women were relocated to work in the Reich. Laval also cooperated with the Germans to a degree in rounding up Jews, who were then transported to the death camps. Of some 76,000 French Jews deported, only about 2,500 survived the war.

A small but vicious war developed within France pitting growing numbers of members of the French Resistance against the Germans and their Vichy allies. Laval established a special police force, the Milice, to arrest and punish “terrorists,” thus freeing up the Gestapo for work elsewhere. About 8,000 Frenchmen also joined the German armed forces—most notably a legion of anti-Bolshevik volunteers that fought on the Eastern Front and became the 33rd Waffen-SS (Schutzstaffel, bodyguard unit) Charlemagne Grenadier Division.

The British government had no formal diplomatic relations with Vichy, as it officially supported the Free French movement headed by General Charles de Gaulle. However, it kept contact with Vichy through the Canadian embassy. The U.S. government maintained diplomatic ties with Vichy and entertained the vain hope that France could be persuaded to reenter the war against Germany.

Vichy’s weak resistance to Operation TORCH, the Allied landings in North Africa beginning on 8 November 1942, resulted in the German occupation of the unoccupied zone and the disbanding of the French army and air force. On 27 November 1942, the French navy scuttled its ships in Toulon harbor to prevent the Germans from capturing them, rebuffing an order by Darlan (then in Algiers) on 11 November that the ships should sail to North Africa if they were in danger of capture by the Germans. Admiral Jean Abrail, who had command at Toulon, decided that the fleet’s loyalty was to the

Pétain government, and 77 ships—roughly half the tonnage of the French navy—went to the bottom.

Pétain remained in office after the Germans occupied the rest of France following TORCH, but any pretense of independence was gone. The marshal failed to place himself at the head of the remaining armistice French forces or to attempt to escape to Algiers. Removed to Sigmaringen, Germany, in the summer of 1944, the Vichy government no longer had any relevance. Postwar, some 10,000 French were executed for collaboration with the Germans, including Laval. Pétain, stripped of his rank, was condemned to death, but de Gaulle commuted the sentence to life in prison. Despite de Gaulle’s efforts to cast France during the war as a nation of resisters, the four-year-long Vichy regime left a legacy of shame and controversy that still haunts France today.

France Campaign (1944)

Allied campaign to liberate France. The campaign to drive the Germans out of western Europe began with the 6 June 1944 Allied landing in Normandy, the largest amphibious operation in history. U.S. General Dwight D. Eisenhower had overall command; General Bernard L. Montgomery commanded the landing force of 21st Army Group, which consisted of Lieutenant General Miles Dempsey’s British Second Army and Lieutenant General Omar N. Bradley’s American First Army.

Even with stiff resistance by German defenders, especially the 352nd Division at Omaha Beach, Allied forces expanded the beachhead from 5 to 20 miles inland and joined all five beaches into a single continuous front by 12 June. French Resistance forces supported the Allied effort by providing

Men of the U.S. Army 28th Infantry Division march down the Champs Élysées, Paris, in the “Victory” Parade of 29 August 1944. (National Archives)

intelligence, sabotaging bridges and railways, and conducting harassment operations. Dempsey’s Second Army began the drive toward Caen but met heavy resistance from German forces, including two panzer divisions. Meanwhile, Bradley’s First Army moved up the Cotentin peninsula toward the important port city of Cherbourg. Units of the U.S. VII Corps assaulted Fort du Roule and, guided by the French Resistance, scaled the cliffs. By 27 June Cherbourg was secure, but the Germans had heavily damaged the port facilities, which were unusable for more than a month.

By the beginning of July, Allied progress in Normandy had been slowed by the hedgerows of the *bocage* country, strong German positions at Caen, and the logistical challenges of supplying the Allied forces over the beaches. Enjoying the advantage of overwhelming air superiority, the eight corps of 21st Army Group pushed south, seizing Caen on 10 July and Saint-Lô on 18 July. The capture of these two important cities

set the stage for the Allied breakout west into the Brittany peninsula and east toward Paris.

The slow pace of their advance in France concerned Allied commanders who feared that fighting would bog down, resulting in trench warfare resembling that of World War I. Bradley believed the weak link in the German army defenses was General Paul Hausser’s Seventh Army south of Saint-Lô. Bradley’s breakout plan, code-named Operation *COBRA*, was temporarily put on hold so vital supplies could be sent to support the British Second Army’s Operation *GOODWOOD*, an attempt to penetrate German lines outside of Caen. Although *GOODWOOD* did not achieve a breakout, it assisted *COBRA* by holding two German panzer divisions in place and preventing their redeployment to the Saint-Lô area.

Heavy saturation bombing along a four-mile-wide corridor preceded *COBRA*, as elements of Major General J. Lawton Collins’s VII Corps attacked west of Saint-Lô on 25 July.

Concurrently, Major General Troy H. Middleton's VIII Corps, located west of VII Corps, struck toward Countances. Within two days, VII Corps had pushed the German defenders back 10 miles, and on 28 July elements of the 4th Armored Division secured Countances. Sensing that the breakthrough was decisive, Bradley ordered Collins to continue the drive south toward the strategic city of Avranches. By the end of July, it too was in Allied hands, and the German Seventh Army was in a precarious position with its left flank exposed.

The capture of Avranches opened the Brittany peninsula to the Allies. Meanwhile, Lieutenant General George S. Patton's U.S. Third Army became operational on 1 August as part of an overall restructuring of the Allied command. Montgomery's 21st Army Group was now composed of the British Second Army and Lieutenant General Henry D. G. Crerar's Canadian First Army. Bradley assumed command of the new 12th Army Group composed of the American First and Third Armies. Patton's Third Army gained the greatest success, and Patton was certainly the outstanding general of the campaign for France. The Third Army displayed instant efficiency and turned Operation COBRA, a local breakthrough, into a theater-wide breakout. The Third Army immediately exploited the opening at Avranches: Patton sent his VIII Corps to clear the Brittany peninsula, the XX and XII Corps south to the Loire River, and the XV Corps east toward Le Mans. These objectives were secured by 13 August.

While the Third Army moved against limited opposition, the German Seventh Army hastily reorganized to launch a counterattack toward Avranches, hoping to cut off the Third Army. Not only did this spoiling attack fail, but also it put the Seventh Army in a position in which it might be surrounded by the Allies. To accomplish this, Montgomery, who was still overall ground commander, ordered the Canadian II Corps to attack south as Patton's XV Corps drove north. The objective for both corps was the town of Argentan. Major General Wade Haislip's XV Corps reached Argentan on 13 August, but the Canadian II Corps progressed slowly and was more than 20 miles from the objective. Patton pleaded with Bradley to allow XV Corps to press northward, but the 12th Army Group commander refused, fearing that XV Corps might itself be cut off or that excessive casualties from friendly fire might result from XV Corps moving into a zone reserved for the Canadian II Corps.

Even though the gap between the towns of Falaise and Argentan was not closed until 19 August, the area was turned into a killing ground by constant Allied air attack, artillery bombardment, and direct ground fire from armored and infantry units. Although the German Seventh Army was savaged in these attacks, a great many German soldiers escaped. Failure to close the gap was one of the major mistakes of the war. Had the gap been sealed and the Seventh Army annihilated, the western Allies would have faced far less resistance as they pushed east toward Germany, and the war might have

ended in 1944. Operations following COBRA were so successful that most German forces in northwest France had to retreat to the Seine River. Paris was liberated on 25 August.

German garrisons doggedly held out in the northern port cities of Saint-Malo, Brest, Lorient, and Saint-Nazaire. Combat commands from the 4th and 6th Armored Divisions were insufficient to secure these heavily fortified ports quickly. Repeated assaults supported by air attacks and naval bombardments failed to dislodge the defenders. Saint-Malo was not taken until 2 September, and Brest fell on 19 September. In both cases, the Germans had demolished their port facilities. On the basis of these experiences, Supreme Headquarters, Allied Expeditionary Forces (SHAEF) canceled planned assaults on Lorient and Saint-Nazaire, and German garrisons there held out until the end of the war.

The western Allies addressed concern about the exposed southern flank of their armies, the need to secure a large functioning port, and interest in cutting off what German forces remained in southern France in Operation DRAGOON, the invasion of southern France. British Prime Minister Winston L. S. Churchill strongly opposed the plan because the COBRA operation had proven to be such a huge success, but Eisenhower prevailed, and DRAGOON commenced on 15 August. Lieutenant General Alexander Patch's American Seventh Army landed in southern France just east of Toulon. Major General Lucian Truscott's VI Corps spearheaded the landing, and by 17 August had established a 20-mile-deep beachhead. The French II Corps followed with the task of driving west to secure Toulon and Marseille, which it accomplished by 28 August. VI Corps moved rapidly west and then north up the east side of the Rhône River—except for an armored group, Task Force Butler, that moved east of the Rhône River valley in an effort to envelop German forces gathering at Montelimar. By this time the German Nineteenth Army, led by general of infantry Friedrich Wiese, was pulling out of southern France. However, Truscott's corps inflicted severe material damage on retreating Germans, capturing 57,000 of them and liberating Montelimar by 28 August.

By 3 September, the Seventh Army had driven north almost 250 miles up the Rhône River. The 1st Airborne Task Force was used to seal the Swiss border; the French I Corps took up a position to the right of Truscott's VI Corps, and the French II Corps flanked the left. On 14 September, Patch's Seventh Army linked up with Patton's Third Army, sealing the open southern flank. On 15 September, the 6th Army Group was formed, with Lieutenant General Jacob Devers commanding. It was composed of the American Seventh Army and General Jean de Lattre de Tassigny's French First Army. Besides securing the Allied southern flank, DRAGOON greatly aided the logistical situation by making available the large port at Marseille. Finally, southern France was cleared of German forces.

By the middle of September 1944, France had been liberated and German forces had withdrawn into the Netherlands and to the West Wall along the western German border. Although it had been severely bloodied, the German army in the west was not annihilated but was reorganizing and entrenching itself for a long fight. Unfortunately, the Allied drive east was so fast that lines of communication and supply could not keep up with the tactical advance. With insufficient supplies to advance all his army groups at once, Eisenhower now decided to support Montgomery's plan to cross the lower Rhine into Germany, Operation MARKET-GARDEN.

Franco, Francisco (1892–1975)

Spanish army general and dictator of Spain. Born into a middle-class family in El Ferrol in Galicia on 4 December 1892, Francisco Paulino Hermenegildo Teódulo Franco-Bahamonde did not enter the navy, as was family tradition, because budget cuts had led to the closing of the Naval Academy following the 1898 Spanish-American War. Franco entered the Infantry Academy at Toledo in 1907 and graduated in 1910. Commissioned a second lieutenant, he refused a comfortable posting in El Ferrol for one in Spanish Morocco.

Franco's leadership, courage, and ruthlessness, demonstrated during the Riff Rebellion in Morocco, brought rapid promotion, and in 1920 he became deputy commander of the Spanish Foreign Legion in Morocco. In June 1923, King

Spanish dictator Francisco Franco. (Library of Congress)

Alfonso XIII personally promoted him to lieutenant colonel and gave him command of the Spanish foreign legion. That same year, the young colonel married María del Carmen de Polo, a member of one of Spain's most influential families; the king served as best man by proxy. In 1926, Franco was promoted to brigadier general, the youngest soldier to hold that rank in any European army.

An archconservative, Franco was closely identified with General Miguel Primo de Rivera, who governed Spain in the name of Alfonso XIII from 1923 to 1930 and who appointed Franco commander of the General Military Academy of Zaragoza (Saragossa). In 1931, on the proclamation of a republic, the Left came to power and transferred Franco to the Balearic Islands, where he served from 1931 to 1934. He returned to Spain to play a role in crushing a revolt by miners in Asturias in 1935. Later that year, he accepted the post of chief of staff of the army offered him by the conservative government.

The leftist Popular Front won the hotly contested national elections of February 1936, and the new government sent Franco to command the Canary Islands garrison. As expected, the conservative Nationalists defied the mandate, and Franco was in the forefront of the revolt that began in July 1936. The untimely deaths of Generals José y Sacanell Sanjurjo and Emilio Mola Vidal left Franco as the military leader.

Thanks to German assistance, Franco was able to airlift units of the Foreign Legion from Morocco to Spain, and he launched a drive on Madrid. In September 1936, Franco became chief of the Nationalist government, and in April 1937 he assumed leadership of the Falange Party. Franco was de facto head of Spain on the fall of Madrid in March 1939, marking the end of the Civil War. Franco then carried out a ruthless purge of the opposition. Throughout his long years in power, he remained undeviatingly true to his mission of preserving traditional Spain.

When World War II erupted, Franco openly sided with Adolf Hitler and Benito Mussolini. The Caudillo (leader), as he became known, met with Hitler at Hendaye, France, on 23 October 1940. He pledged his loyalty to Hitler but then refused to bring Spain into the war because he believed his cause was better served in “nonbelligerency” (not neutrality), a stance that infuriated Hitler. Franco did send troops—the 18,000-man well-equipped Blue Division—to fight in the Soviet Union. Throughout the war, Franco provided the Germans with observation posts in Spanish Morocco for use in monitoring Allied ship movements, and he allowed German submarines to be serviced in Spanish ports. After the Allied landings in North Africa, Franco shifted to a strictly neutral stance. But when the war was over, Spain became a primary refuge for leading Nazis and quislings (Nazi collaborators).

After the war, the Allies punished Franco’s wartime conduct with quarantine treatment. Spain was kept out of the United Nations and condemned for its nature and for its close association with the Axis states. However, with the coming of the Cold War, the United States came to regard Franco’s Spain as a bulwark against communism. In the revisionist version, Franco became the shining knight who had saved Europe from atheist communism. The United States established air and naval bases in Spain, and U.S. aid propped up the Franco regime, a position remembered with bitterness by many Spanish democrats.

Franco declared Spain a monarchy in 1947 but remained Caudillo until his death in 1975. Franco relaxed his authoritarian regime somewhat in the 1950s, but unrest in the 1960s led to renewed repression. Having selected Prince Juan Carlos de Bourbon, grandson of Alfonso XIII, as his heir, Franco died in Madrid on 20 November 1975. The new king presided over the transition to democracy in Spain.

Fraser, Bruce Austin (First Baron Fraser of North Cape) (1888–1981)

British navy admiral. Born into a military family (his father was an army general) on 5 February 1888, Bruce Fraser was educated at Bradfield College and the fleet training school of HMS *Excellent*. His early service was in battleships and destroyers, and he became known as a gunnery officer, holding that post on cruiser *Minerva* in the Mediterranean during World War I.
