In the following years, Fraser served as gunnery officer for the Mediterranean Fleet. From 1929 to 1932, he commanded the cruiser *Effingham* and then served as director of naval ordnance, playing an important role in helping to design the King George V–class battleships. Following command of aircraft carrier *Glorious* in 1936 and 1937, Fraser was promoted to rear admiral in 1938 and became chief of staff of the Mediterranean Fleet. In March 1939, Fraser was appointed controller of the navy and made third sea lord. Early in World War II, Fraser was responsible for the development of a new class of corvettes. In May 1940, Fraser was promoted to vice admiral, and a year later he was knighted. Fraser was appointed second in command of the Home Fleet in June 1942, and in May 1943 he assumed its overall command.

In that capacity, Fraser oversaw the adoption of new anti-submarine tactics against German U-boats and increased cooperation with U.S. naval forces during the height of the Battle of the Atlantic. In December 1943, Fraser personally commanded British Task Force 2, which engaged and sank the German battleship *Scharnhorst* during her sortie against an Allied Arctic convoy.

The Allied successes in the Atlantic and the resultant reduction of the German U-boat and surface raider threat led British Prime Minister Winston L. S. Churchill to assign Fraser to command the Pacific Fleet in late 1944. Fraser led the return of British naval units to the Pacific with a force built around aircraft carriers. For the remainder of the war, Fraser maintained excellent relations with American commanders and led British forces in support of U.S. amphibious and naval operations. Fraser was the British representative at the formal Japanese surrender aboard the battleship *Missouri* in Tokyo Bay on 2 September 1945.

Rewarded with the title of First Baron Fraser of North Cape, in 1948 Fraser was promoted to admiral of the fleet and appointed first sea lord and chief of naval staff. He held this post until his retirement in 1951. Fraser died in London on 12 February 1981.

Fredendall, Lloyd Ralston (1883–1963)

U.S. Army general. Born in Wyoming on 15 January 1883, Lloyd Fredendall attended West Point in 1902 and 1903, but he dropped out because of poor grades. He next attended the Massachusetts Institute of Technology. In 1907, he obtained a direct commission as a lieutenant of infantry, and he served in the Philippines and Hawaii. Following U.S. entry into World War I, Fredendall commanded a training center in France.

Fredendall was an instructor at the Infantry School from 1920 to 1922. He graduated from the Command and General Staff School in 1923 and the Army War College in 1925. Following a tour as professor of military science and tactics at the University of Minnesota, Fredendall commanded the 57th Infantry Regiment in the Philippines from 1936 to 1938. From August 1938 to December 1939, he served in the office of the chief of infantry.

Promoted to brigadier general in December 1939, Fredendall served with the 5th Infantry Division. In October 1940, Fredendall won promotion to major general. He then commanded the 4th Division from October 1940 to July 1941. Known as an effective troop trainer, he took charge of II Corps in August 1941 and XI Corps on its activation in June 1942. Again heading II Corps that October, Fredendall commanded the U.S. landing at Oran, Algeria, on 8 November 1942. Reportedly, he did not leave his command ship until the fighting was over. By early 1943, elements of his corps held the exposed right flank of a combined British, French, and U.S. force facing eastward into Tunisia. Short of troops, Fredendall foolishly ignored the advice of Major General Orlando Ward, commander of his 1st Armored Division, with whom he was barely on speaking terms; Fredendall scattered widely the combat elements of Ward's division. Fredendall himself remained some 70 miles behind the front at his fortresslike command post. On 19 February, German columns under Major General Hans von Arnim and Field Marshal Erwin Rommel initiated an offensive against Fredendall's forces

Major General Lloyd R. Fredendall. (Library of Congress)

that resulted in the Battle of Kasserine Pass. This first major clash for the Americans with German troops resulted in a major U.S. defeat. Fredendall apparently suffered a temporary breakdown during the battle. The Allied forces rallied, however; the Germans were unable to exploit their victory and soon withdrew.

This defeat, combined with Fredendall's abrasive manner and his habitual absence from the front, cost him the confidence of subordinates and superiors alike. On 6 March, General Dwight D. Eisenhower replaced Fredendall with Major General George S. Patton Jr. Sensitive to public opinion, the War Department decided not to disgrace Fredendall. Instead, he was recalled to the United States, promoted to temporary lieutenant general in June 1943, and assigned first as deputy commanding general and then commanding general of the Second Army from March 1943 until his retirement in March 1946. Fredendall died in La Jolla, California, on 4 October 1963.

Frenay, Henri (1905–1988)

French army officer and Resistance leader. Born in Lyons on 19 November 1905, Henry Frenay graduated from the French Military Academy of Saint Cyr. A captain in 1940, he fought and was captured by the Germans in the Battle of the Vosges. He escaped on 27 June 1940 and made his way to Marseilles, where he became a Vichy garrison officer. Regarded as an expert on the Third Reich because of his studies at the Centre d' Études Germaniques at Strasbourg, Frenay was attached to the military intelligence division. He soon came to realize that the Vichy regime, headed by Marshal Henri Philippe Pétain, was intent on collaboration with the Germans. By early 1941, Frenay had become involved in the Resistance, creating the Mouvement de Libération Nationale, which produced three clandestine newspapers.

In November 1941, Frenay's publications merged with another, published by François de Menthon, to become Combat, the largest Resistance group in France. Frenay, code-named "Charvet," also pioneered most of the techniques used within the French Resistance. Frenay, a staunch anti-communist who had little time for any prewar French political grouping, was initially suspicious of the directing role which London-based Free French leader Charles de Gaulle claimed within the Resistance. Although Frenay eventually accepted de Gaulle's authority, his relationship with Jean Moulin, de Gaulle's representative in France, was strained. He distrusted Moulin's achievement in creating a fusion of the French Resistance groups, the National Council of the Resistance, although he eventually joined it.

In June 1943, the German military arrested most of the top French political and military Resistance leadership, including Moulin. Frenay fled to Algiers on 19 June to request additional support from the newly created French National Liberation Council. Concerned for his safety, Free French representatives persuaded him to remain, and in November 1943 Frenay became Free French minister of prisoners, deportees, and refugees, a position he retained for a further year after returning to Paris with de Gaulle in 1944.

In 1945 he went into business, representing the French film industry until 1958 and holding various directorships. Frenay was a legendary figure in France, and his memoir, *The Night Will End*, not published until 30 years after the war, was a best-seller in France. Frenay died at Porto Vecchio, Corsica, on 6 August 1988.

French Indochina

On the outbreak of World War II in Europe in September 1939, France ruled Indochina. Strictly speaking, only Cochinchina (southern Vietnam) was an outright colony; Annam (central Vietnam), Tonkin (northern Vietnam), Laos, and Cambodia were officially protectorates. For all practical purposes, however, France completely controlled all five entities that constituted French Indochina. In 1939, Indochina was France's richest overseas possession, producing rice, rubber, and other important raw materials.

When war broke out in Europe, Governor General Georges Catroux, who came to favor a more liberal policy toward nationalism in the French colonies, ordered a general mobilization throughout Indochina and outlawed the Indochinese Communist Party (ICP), arresting several thousand suspected communists. The Sixth Plenum of the Party Central Committee, secretly meeting outside Saigon, proclaimed a new anti-imperialist National United Front to struggle for independence.

Following the defeat of France in Europe in June 1940, French Indochina came under pressure from Japan and Thailand. Although France had 50,000 troops in Indochina, 38,000 of these were poorly trained indigenous troops of questionable loyalty. Japan had been at war with China since 1937 and was anxious to secure bases from which to strike the Burma Road and cut off assistance to China's Nationalist government. Tokyo now brought heavy pressure on Catroux to close the Sino-Vietnam border and halt shipment of supplies to

Japanese troops advancing through the port of Haiphong in Indochina, 24 November 1940. (Bettman/Corbis)

China. Catroux tried to stall for time, but he had no bargaining strength and was forced to accede to Japanese demands.

Catroux's protest of Vichy France's armistice with Germany and his independence in dealing with the Japanese led the Vichy government to replace him with Vice Admiral Jean Decoux, French commander of naval forces in the Far East. On 24 September 1940, Decoux was forced to grant Japan three air bases in Tonkin and the right to station 6,000 troops there. Then, in July 1941, similarly pressed by the Japanese, France yielded bases and concessions in southern Indochina. This placed Japanese long-range bombers within striking range of Malaya, the Netherlands East Indies, and the Philippines. These brought economic pressure on Japan by Britain, the Netherlands, and the United States that resulted in the Japanese decision to attack Pearl Harbor. Soon the Japanese had 35,000 men in Indochina, and although Japan left the French administration intact, it was clear to the Vietnamese that Japan was calling the shots. The Japanese occupation dealt an irreparable blow to the French position in Indochina.

Bangkok also sought to take advantage of French weakness to secure several provinces it claimed in Laos and Cambodia. From November 1940 to January 1941, Thailand and France fought a war on land and sea that France largely won. Tokyo, then influential in Bangkok, interceded to impose a settlement. In May 1941, France agreed to turn over to Thailand three Cambodian and two Laotian provinces on the right bank of the Mekong River—some 42,000 square miles of territory. This settlement did not last, however. In September 1945, when the French returned in force to Indochina, they demanded and secured from Thailand the seized provinces, forcing Thailand to recognize the Mekong River as the boundary separating Thailand from Laos and Cambodia.

The French had to address Vietnamese nationalism. In 1940, French authorities crushed abortive rebellions led by local communists in the area bordering China and in Cochin China. Then, in February 1941, Ho Chi Minh, a member of the executive committee of the Communist International (Com-

intern), returned to northern Vietnam after 13 months' imprisonment in south China, bearing with him financial support from Chinese authorities in return for his pledge to cooperate against the Japanese. Ho now presided over the Eighth Plenum of the ICP at Pac Bo. Here on 19 May, the Communists established another front organization—Viet Nam Doc Lap Dong Minh Hoi (League for Independence of Vietnam, or Viet Minh)—to fight both the Japanese and French. Although their tactics led Viet Minh leaders to conceal their communist goals and focus on national liberation to secure the widest possible support, the organization was in fact led and dominated by the ICP. Former schoolteacher Vo Nguyen Giap became the Viet Minh's military leader.

The Chinese Nationalist government grudgingly provided limited support for the Viet Minh, as did the United States through the Office of Strategic Services (OSS, the forerunner of the Central Intelligence Agency). The OSS gave the Viet Minh some light weapons, medical supplies, communications equipment, and training in return for Viet Minh aid in saving downed U.S. pilots and cooperation against the Japanese. By 1945, the Viet Minh had secured control over northern Tonkin.

Until nearly the end of World War II, the French authorities and army still were in place in Indochina; the Japanese were exercising indirect control. That changed in March 1945. The French authorities, anxious to liberate themselves, began active plotting to that end. The Japanese learned of the French plans, and on 9 March 1945, they arrested all the French officials and military personnel they could find. By announcing on 11 March the independence of Vietnam under previously French-controlled Emperor Bao Dai of Annam, Tokyo also exacerbated the postwar situation. This was the situation when Japan surrendered.

Ho Chi Minh then stepped into the vacuum. At the end of the war, starvation gripped much of Vietnam, and as many as 2 million Vietnamese died, chiefly in the north. The Viet Minh made great strides with the people by seizing rice stocks held by the Japanese and distributing them to the people. Then, on 16 August, Ho proclaimed the independence of Vietnam, and three days later the Viet Minh took power in Hanoi, capital of Tonkin. On 2 September, Ho announced establishment of the Democratic Republic of Vietnam.

Decisions taken during the Potsdam Conference in July 1945 had the Nationalist Chinese receiving the Japanese surrender in northern Vietnam and the British doing the same in the south. Ho appealed to the United States and the Soviet Union for assistance, but he received no response and was forced to negotiate first with the Chinese to secure their withdrawal and then with the French. Meanwhile, the British in the south let the French out of prison. A Viet Minh uprising there was soon crushed, and French control was reestablished in the south and then in Laos and Cambodia. The north

was another matter, however. On 6 March 1946, French representative Jean Sainteny negotiated the Ho-Sainteny Agreement, in which France recognized Ho's Democratic Republic of Vietnam within the French Union and promise a plebiscite in the south to see whether the south also wanted to join. The agreement also allowed the return of some French troops to the north. The failure of the French to implement the provisions of this agreement led directly to the First Indochina War, which began in November 1946.

Freyberg, Bernard Cyril (1889–1963)

New Zealand army general. Born in Surrey, England, on 21 March 1889, Bernard Freyberg moved with his family in 1891 to New Zealand. In 1911, Freyberg qualified as a dentist, a profession he rarely practiced. A few years later, he served as a volunteer on Pancho Villa's side in the revolutionary upheaval in Mexico. By August 1914, Freyberg was in London, where he met Winston L. S. Churchill, then first lord of the Admiralty. Through Churchill, Freyberg obtained a commission as a temporary lieutenant in the Royal Navy Volunteer Reserve. In World War I, Freyberg commanded a company in the Hood Battalion of the Royal Naval Division during the disastrous Gallipoli Campaign. In November 1916, Freyberg led the battalion in the last major attack of the Somme Campaign. Although wounded four separate times, Freyberg refused to relinquish command. For his actions, he was awarded the Victoria Cross. Wounded at least six times in World War I, Freyberg also received the Distinguished Service Order (DSO) with two bars.

Following World War I, Freyberg remained in the British military, transferring to the army. In 1937, a heart condition resulted in his medical discharge as a major general. When World War II began in September 1939, Freyberg was recalled and given a training command. But that position was too tame a job for Freyberg, who offered his services to New Zealand. With Churchill's support, Freyberg was appointed commander of the New Zealand Expeditionary Force.

Freyberg commanded Commonwealth forces on Crete in 1941, conducting the fighting withdrawal from the north to the south coast and then the evacuation. Freyberg then commanded the New Zealand Division in North Africa, where he often clashed with General Sir Claude Auchinleck, commander in chief of British Commonwealth forces in the Middle East. After a short mission to Syria, Freyberg and his New Zealanders returned to face German General Erwin Rommel at Minqar Qaim, Alam Halfa, and El Alamein. During the pursuit across Africa following Alamein, Freyberg's New Zealanders—reinforced with armor to corps size—swung wide to the left of the Mareth Line to hit the Germans at the Tebaga gap. Throughout most of these actions, Freyberg was up front in his mobile tactical headquarters, a Stuart tank with a dummy wooden gun.

In 1942, Freyberg was promoted to lieutenant general, which was almost unprecedented for an Allied divisional commander. Freyberg continued to lead the New Zealand Division through Sicily and the landings on the Italian mainland. In January 1944, the New Zealand Division came under the U.S. Fifth Army. Freyberg received control of two additional British divisions and a U.S. armored regiment to become the commander of the New Zealand Corps—while simultaneously retaining command of his own division. His mission was to break through at Cassino, which led to one of the most controversial Allied actions of the war, the bombing of the medieval monastery. Cassino and Crete were regarded as Freyberg's two major "failures" in World War II, but it is doubtful that any other general could have done better in either case. Freyberg probably saw more direct combat than any other Allied senior commander. Churchill once called him "the salamander of the British Empire." During the war, Freyberg won almost unprecedented third and fourth DSOs.

During and after the war, Freyberg received his share of honors. He was knighted in 1942 and raised to the peerage in 1951 as 1st Baron Freyberg. His identification with his New Zealanders was so strong that he was appointed governor general of New Zealand in 1945. In 1950, his term in office was extended another two years at the request of the government in Wellington. In 1952, Freyberg became the lieutenant governor of Windsor Castle. He died at Windsor on 4 July 1963.

Frick, Wilhelm (1877–1946)

German minister of the interior. Born on 12 March 1877 in Alsenz, Wilhelm Frick studied law from 1896 to 1901 at Göttingen, Munich, Beylin, and Heidelberg (where he received his doctorate). From 1904 to 1924, Frick worked in the Munich police department, heading the political police section after 1919. An early adherent of Adolf Hitler, Frick participated in the 1923 Munich Beer Hall Putsch, Hitler's abortive effort to seize power in Munich, and was arrested, tried, and sentenced to 15 months' imprisonment. He was able to avoid a prison term when the newly renamed National Socialist Freedom Party picked him as one of its representatives to the Reichstag in 1924. He served in the Reichstag from that point forward.

On 23 January 1930, Frick became the first National Socialist minister in a provincial government, responsible for education and the Ministry of the Interior in Thuringia. Under his administration, the Thuringian police force was purged of officers who supported the Weimar Republic; Nazi candidates for office were illegally favored; the antiwar film *All Quiet on the Western Front* was banned, as was jazz music; and rabidly militaristic, anti-Semitic propaganda was allowed to flourish unchecked. On Frick's instruction, special German freedom prayers were instituted in Thuringian schools, glorifying the German *Volk* and German national honor and military power while denouncing "traitors." Frick used his influence as interior minister to grant Hitler German citizenship by implementing a provision of the law that extended citizenship to anyone named to an official post in Germany. Frick managed to have Hitler named a councilor for the state of Braunschweig.

When the Nazis came to power in Germany in January 1933, Frick was appointed minister of the interior, a key position that he held until August 1943. In this post, he was directly responsible for many measures taken against Jews, Communists, Social Democrats, dissident churchmen, and other opponents of the regime. Frick also had charge of drafting and then administering the laws that gradually eliminated the Jews from the German economy and public life, culminating in the Nuremberg race laws that reduced Jews to second-class status in the Reich. It was Frick who framed the extraordinary law that declared all Hitler's actions during the Blood Purge of the Sturmabteilung (SA, storm troops) in June 1934 to be legal and statesmanlike. Although nominally Hein-

Wilhelm Frick, German politician and participant in Hitler's Munich putsch. (Hulton Archive)

rich Himmler's superior, Frick singularly failed to impose any legal limitations on the power of the Gestapo and the Schutzstaffel (SS, bodyguard units) nor seriously interfered with their encroachment on his area of jurisdiction.

On 24 August 1943, Frick was appointed Reichsprotektor (administrative head) of Bohemia and Moravia, a position he held until the end of the war, although real authority was concentrated in the hands of his subordinate Karl-Hermann Frank. At the Nuremberg trial, Frick was charged with and found guilty of crimes against peace, war crimes, and crimes against humanity committed in concentration camps in the Protectorate (Bohemia and Moravia). The dedicated Nazi bureaucrat and loyal implementer of Hitler's ruthless aims was hanged at Nuremberg on 16 October 1946.

Frogmen

Popular term for members of underwater demolition teams (UDTs), which played an important role in World War II. Italy was at the forefront in training combat swimmers; the Italian 10th Light Flotilla was composed mostly of sailors who manned small surface and underwater craft with explosive warheads. Their mission was to sink Allied warships and merchant shipping, a role in which they enjoyed some success.

The United States also devoted attention to such activity, training and deploying frogmen in demolition and commando tactics. The first unofficial U.S. frogmen were organized in September 1942 as a detachment of sailors who received a week of training in underwater demolition tactics before being sent to North Africa as part of Operation TORCH. They destroyed nets blocking the entrance to the Sebou River in Morocco, allowing U.S. assault ships to enter the river and offload rangers to assault Vichy-held Port Lyautey Field.

This success led Chief of Naval Operations Admiral Ernest J. King to issue orders on 6 May 1943 for the formation of UDTs. The first Naval Combat Demolition Unit consisted of 13 volunteers who trained at the Naval Amphibious Unit at Solomon Island, Maryland. They were instructed in the destruction of underwater obstacles and use of explosive charges to make channels through sandbars.

These newly designated frogmen took part in the invasion of Sicily in July 1943. They destroyed roadblocks near the coast, used bangalore torpedoes to remove barbed wire along the beach, salvaged stranded boats, and cleared channels through sandbars. On completion of their mission, most of the frogmen were sent back to the United States to work as instructors following further training at the Naval Amphibious Training Base at Fort Pierce, Florida. In the European Theater, frogmen also participated in the invasion of Normandy, where they were tasked with the destruction of steel girders and heavy timbers on Omaha and Utah Beaches, clearing the way for the landing craft. Frogmen also played a key role in the Pacific Theater, participating in the many amphibious operations. The British also used frogmen in the war. In the United States, frogmen were the forerunners of the U.S. Navy SEAL (*sea, air, land*) elite special-operations commando teams.

Fuchida Mitsuo (1902–1976)

Japanese navy officer and aviator. Born at Nagao in Nara Prefecture on 3 December 1902, Fuchida Mitsuo graduated from the Naval Academy in 1924 and completed flight training in 1927. While he was posted to the Yokosuka Kokutai (Air Corps), he developed the coordinated dive-bombing techniques intended to saturate target defenses that subsequently became standard Japanese tactics.

In 1939, Fuchida became the bomber group leader of 1st Carrier Division aboard the aircraft carrier *Akagi*. He was a major participant in planning for the Pearl Harbor attack and was selected as overall strike commander for the 330-plane force from Vice Admiral Nagumo Chūichi's First Air Fleet that surprised the U.S. Pacific Fleet on 7 December 1941. Fuchida actively participated in the attacks on Rabaul and Port Darwin and the devastating raid by the First Air Fleet into the eastern Indian Ocean during the spring of 1942. Fuchida was incapacitated by appendicitis during the Midway operation. When the *Akagi* was attacked and sunk by U.S. Navy dive-bombers he was severely wounded, barely managing to survive.

Following his recovery, Fuchida was posted to the staff of Yokosuka Kokutai and undertook a series of planning assignments before transferring to operational posts in the Mariana Islands and the Philippines. He returned to Japan with the rank of captain to participate in planning for the final defense of the home islands. Fuchida narrowly escaped death at Hiroshima; he left the city the day before the atom bomb was

Mitsuo Fuchida as he was when he led the Japanese air strike on Pearl Harbor (right) and in 1973 (left). (Photo by Keystone/Getty Images)

dropped. He attended the surrender ceremony aboard the U.S. battleship *Missouri* on 2 September 1945.

After the war, Fuchida took up farming and converted to Christianity with such fervor that he became a globe-circling evangelist. He emigrated to the United States in 1966 and became a citizen. Fuchida died while visiting Osaka on 30 May 1976.

G

Gamelin, Maurice Gustave (1872–1958)

French army general. Born in Paris on 20 September 1872, Maurice Gamelin was commissioned in the army in 1893 on graduation from the French military academy of Saint Cyr. His rise in the army was closely linked to French commanding general Joseph Joffre. Gamelin was serving as Joffre's operations officer at the beginning of the war and remained with him until the latter's dismissal in 1916. During the rest of the war, Gamelin served with distinction as a brigade commander (1916) and then a division commander (1918). After the war, Gamelin commanded French forces in the Middle East, where he helped pacify the Druze in Lebanon. He became chief of the General Staff in 1931 and commander in chief designate in 1935, replacing Maxime Weygand.

Gamelin benefited from the patronage of Radical Party politician Édouard Daladier, who was three times premier in the 1930s. The two men, both veterans of the Battle of Verdun, agreed on the need to modernize French forces. As chief of staff, Gamelin supported mechanization and investments in air power. Against his wishes, the French government proceeded with the construction of the Maginot Line, leaving little money for the reforms he championed. As with his mentor Joffre, Gamelin isolated himself and had little contact with his men, refusing even to have a telephone installed at his headquarters at Vincennes.

Gamelin urged France to fund emergency modernization measures in 1938, but French politicians, including Daladier, disagreed. In the first months of World War II, Gamelin advocated waiting for the British to rearm fully before assuming the offensive. He assumed (correctly) that Germany would not attack the Maginot Line. He also assumed (incorrectly)

that the Germans would not attempt to cross the Ardennes Forest, believing they would attack through Belgium as they had done in 1914.

Gamelin bears primary responsibility for the disastrous Dyle plan, which called for Allied forces to move into Belgium to meet an anticipated German invasion. The plan underestimated the strength of the Maginot Line, devoting half of French effectives there. It also left 100 miles of the Ardennes virtually unguarded. Gamelin learned nothing from the September 1939 Polish campaign and thus failed fully to appreciate the speed and strength of the German army. The Dyle plan placed French troops in an untenable position in Belgium and northeastern France. Worse, the Germans anticipated its broad outlines and planned to defeat it by moving through the Ardennes and then north and west toward the Channel ports.

On 21 March 1940, Paul Reynaud replaced Daladier as premier. Daladier remained in the government, first as defense minister and then as foreign minister, but his patronage could not save Gamelin. On 10 May, the day of the German invasion, Reynaud was involved in discussions designed to remove Gamelin, in whom he had little confidence. Reynaud finally replaced him on 19 May with General Maxime Weygand, the man Gamelin had succeeded in 1935. Following the defeat of France, the Vichy government arrested Gamelin and brought him to trial at Riom, where he refused to defend himself. Deported to Germany in 1943, Gamelin was released by the Allies at the end of the war.

After the war, Gamelin wrote his three-volume memoir, *Servir*. He died at Paris on 18 April 1958.

Gandhi, Mohandas Karamchand (1869–1948)

Indian nationalist and spiritual leader, known as Mahatma or “great soul.” Gandhi, a spare, short man with bowed shoulders and thick spectacles, was more than any other single individual responsible for bringing an end to the British Empire. Born

2 October 1869 in Porbandar, Kathiawar, India, Mohandas Gandhi went to England at age 19 to study law at University College, London. On being admitted to the bar, he returned to practice in India, where he had only modest professional success.

In 1893, Gandhi left India to practice law in South Africa. Here he encountered strong racial prejudice against the Indian population that had settled in Natal. The mild-mannered, passive Gandhi became an activist, protesting unjust laws through a nonviolent campaign of civil disobedience and noncooperation with the authorities. Gandhi eschewed his social position and lived a life of poverty and self-denial. During both the Boer War (1899–1902) and the Natal revolt of 1908, Gandhi organized and served with Red Cross units.

Gandhi returned to India in July 1914. He supported the British recruitment of Indian soldiers for World War I, but in 1919, with the passage of antiseditious laws (the Rowlatt Acts), he began a protest against British rule. He called off the campaign, however, when violence flared. By 1921, Gandhi was the acknowledged leader of the Indian National Congress, which he transformed from a party of the upper class into a mass movement. Meanwhile, Gandhi was jailed numerous times. In 1930, he launched a campaign against the hated salt tax, and he also campaigned against prejudices toward the lowest social caste, the “untouchables.” His program of passive resistance was a brilliant move because although the British had ample power to crush any armed rebellion, they were never able to devise an answer to nonviolent resistance. British rule in India and elsewhere rested primarily on the consent of the governed.

Gandhi dressed in a simple loincloth (dhoti) and worked at his spinning wheel daily, stressing his devotion to a life of simplicity. Although Gandhi condemned Hitler and fascism as well as the persecution of the Jews, he hated war more, and he naively advised nonviolent protest as the best course of action even in the event of a Japanese invasion of India. He broke with more pragmatic National Congress leaders over the degree to which India should support the Allied effort in World War II. But after a March 1942 British mission headed by Stafford Cripps failed to agree on a program that would secure Indian independence in return for support against the Japanese, most congress leaders supported Gandhi.

On 8 August 1942, the Indian National Congress passed a resolution calling on Britain to “quit India,” which prompted British authorities to arrest Gandhi and other National Congress party leaders. Following considerable violence in which some 2,500 people were killed and wounded and considerable property was damaged, the British managed to restore order. Gandhi, in poor health, was held under house arrest near Poona for two years, but, with doctors reporting him to be near death, the authorities released him on 6 May 1944. He had spent a total of 2,089 days in Indian prisons and another 249 in prisons in South Africa.

Indian nationalist leader Mohandas Karamchand Gandhi, popularly known as Mahatma Gandhi, whose policy of peaceful demonstration led India from British rule to independence after World War II. (Hulton Archive)

Gandhi recovered and took a leading role in negotiations with Clement Attlee's Labour Party in Britain at the end of World War II. Attlee appointed Lord Louis Mountbatten to carry out the unwelcome task of ending British rule. The intransigence of Moslem leader Mohammad Ali Jinnah over the creation of a Moslem state led to the partition of India, despite Gandhi's great opposition. India and Pakistan were proclaimed independent states on 14 August 1947.

Independence brought near anarchy in both India and Pakistan. The problems of partition were staggering, and millions of people were uprooted and forced to move from one state to another. Religious hatred mingled with sheer greed, and perhaps a quarter of a million people died in the violence. In volatile Calcutta, Gandhi kept the peace, but only by offering his own person as a hostage and by beginning a fast unto death. Gandhi's reward for telling Hindus and Moslems that they had to learn to live together as brothers was his assassination by a young Hindu fanatic in Calcutta on 30 January 1948. Fortunately, Gandhi's death marked the end of the insensate communal killings.

A prolific writer, Gandhi influenced many others through his teachings of nonviolence. He inspired many activists, including Martin Luther King Jr., leader of the civil rights movement in the United States.

Garand, John Cantius (1883–1967)

Inventor of the U.S. Garand rifle. John Garand was born on 1 January 1883 on the family farm near Saint Remi, Quebec, Canada. His mother died in 1891, and he moved with his father to Connecticut in 1894. Garand dropped out of school to work in a steel mill. By 1897 he had filed for his first patent for a new type of jack screw. Garand became a machinist at the mill in 1901. Helping his father at a shooting gallery in Norwich, Connecticut, led to his interest in firearms. A few years later, Garand moved to Providence, Rhode Island, where he worked for the Federal Screw Corporation. He took up motorcycling and designed his own engine. Firearms, however, became his passion.

Garand then moved to New York City, where he worked in a micrometer plant and continued his education via correspondence courses. He also kept up his interest in rifles and marksmanship. In 1917, Garand learned that the U.S. Army was searching for a reliable machine gun, and he designed such a weapon and sent the plans for it to the U.S. Bureau of Standards. By 1919, Garand was the consulting engineer for the army's arsenal in Springfield, Massachusetts. He became a U.S. citizen in 1920.

In the 1920s, the Ordnance Department wanted to develop a semiautomatic rifle to replace the superb but difficult-to-master 1903 Springfield bolt-action rifle used by the U.S. Army in World War I. In 1923, Garand submitted his design for Bureau of Standards testing, and over the next 11 years he

M.K. Gandhi spent more than 2,300 days of his life in prison to protest British policies.

John C. Garand, inventor of the Garand rifle, pointing out some of the features of the rifle to Major General Charles M. Wesson during his visit to the Springfield Arsenal. At right is Brigadier General Gilbert H. Stewart, commanding officer of the arsenal. (Library of Congress)

refined and improved the design until it met army standards for field testing. In 1936, the U.S. Army adopted Garand's weapon, describing it as "Rifle, Semi-Automatic, M1." The United States became the only country in World War II to have a semiautomatic rifle as a standard infantry weapon. The Garand, 43.6 inches long and weighing 9 lb 8 oz (unloaded), was a gas-operated, clip-fed, air-cooled, semiautomatic shoulder weapon that fired .30 ammunition from an 8-round clip. It had an effective range of 440 yards and a maximum range of 3,200 yards. A total of 4,040,000 M1s were produced, and it was the standard U.S. infantry firearm from 1936 to 1957.

The M1 had many advantages, including its accuracy, superior rate of firepower, and user-friendly sights. The Garand fired 40 rounds a minute in the hands of the average rifleman. It had 40 percent less recoil than the Springfield it replaced and only 72 parts. The Garand could be entirely broken down using only one tool, a .30-caliber round.

Although Garand never received what many believe to be his financial due for the development of the M1, he was

awarded the Government Medal of Merit in 1944. He retired as chief ordnance engineer in 1953 and died in Springfield, Massachusetts on 16 February 1967.

Gaulle, Charles de

See de Gaulle, Charles.

Gavin, James Maurice (1907–1990)

U.S. Army general, airborne pioneer, author, and statesman. Born on 22 March 1907 at Brooklyn, New York, James Gavin was abandoned by his biological mother and subsequently adopted. At age 16, he enlisted in the army and eventually earned an appointment to the U.S. Military Academy. Graduating in 1929, he was commissioned in the infantry.

Gavin attended the Infantry School at Fort Benning, Georgia, served in the Philippines, and then was an instructor at West Point. He transferred to duty with parachute troops and, promoted to colonel in July 1942, rose to command the 505th Parachute Infantry Regiment, which eventually became part of the 82nd Airborne Division. In 1943, Gavin's 505th jumped into Sicily, where Gavin personally led a portion of his regiment during a fight on Biazza Ridge and stopped elements of the Hermann Göring Panzer Division from breaking through to the invasion beaches. After Sicily, Gavin led the 505th in another combat jump into Salerno on 14 September 1943. Promoted to brigadier general in October, he was appointed assistant division commander.

Gavin left Italy for Britain in November 1943. There he headed the airborne planning effort for Operation OVERLORD,

U.S. Army Major General James Gavin, February 1945. (Photo by MPI/Getty Images)

the invasion of France. He then rejoined the 82nd Airborne Division and made his third combat jump—into Normandy on 6 June 1944 as commander of Task Force A.

In August 1944, Gavin assumed command of the 82nd and led it on its fourth combat jump in September into Nijmegen, Holland, during Operation MARKET-GARDEN. He continued in command of the division for the remainder of the war, fighting through the Battle of the Bulge (Ardennes) and the subsequent drive into Germany. Gavin was only an observer in Operation VARSITY, the March 1945 airborne assault by the British 6th Airborne Division and U.S. 17th Airborne Division to secure British Field Marshal Sir Bernard Montgomery's bridgehead across the Rhine. However, by the end of the war, Gavin had made more combat jumps than any other general in history. At the end of the war, Gavin accepted the surrender of an entire German army.

Gavin continued to command the 82nd Airborne Division until March 1948. He was then, in succession, chief of staff of Fifth Army; chief of staff, Allied Forces South; commander of VII Corps; and deputy chief of staff of the U.S. Army. Promoted to lieutenant general in March 1955, Gavin was in line for promotion to general when he retired in 1958 because of differences with the defense policies of the Dwight D. Eisenhower administration—specifically what he regarded as its overreliance on nuclear forces. Gavin returned to public life during the John F. Kennedy administration, serving as ambassador to France in 1960 and 1961. He died at Baltimore, Maryland, on 23 February 1990.

Gazala, Battle of (26 May–13 June 1942)

Key North African battle between Axis and Allied forces. The Battle of Gazala of 26 May–13 June 1942 sprang from Operation VENEZIA. In the operation, Adolf Hitler sought to tie down as many Allied troops as possible in North Africa while German forces fought the decisive battle in the Soviet Union. Hitler also wanted to capture Allied forward airfields so that Axis forces might render Malta harmless. Axis forces

for VENEZIA, formed into Panzerarmee Afrika or Armata Corazzata Africa, consisted of two Italian infantry corps, one Italian armor corps, and the German Afrika Korps. The Afrika Korps had recently received reinforcements and new equipment.

Italy had sent some of its best units and equipment to North Africa. It had retrained its units and altered some of their structures to replicate German tactics. An Italian infantry division now numbered only 7,000 men, but it had a heavier artillery component. Although its tanks were still of limited value, Italy sent some self-propelled artillery armed with 75 mm guns, and some Italian divisions boasted both 90 mm and German 88 mm antitank guns.

German Afrika Korps commander General Erwin Rommel, nominally under General Ettore Bastico, head of Comando Superiore Forze Armate Africa Settentrionale (high command armed forces in North Africa), planned to attack the Allied forces entrenched with the protection of heavy minefields along the Gazala Line. He hoped to outflank the line from the south and then drive on and capture Tobruk, all within 10 days. Rommel could call on 332 German and 228 Italian tanks. Rommel also had the advantage in the air.

Lieutenant General Neil Ritchie commanded the British Eighth Army. Ritchie had an armored corps of two divisions and an infantry corps built around three divisions. Another division was in reserve, attached to army headquarters. All were numerically larger than the Axis divisions. The Eighth Army had recently received 242 U.S.-built Grant tanks as well as improved 6-pounder antitank guns. Ritchie could call on 839 Allied tanks, with a further 145 moving up. Both sides added tanks during the battle. Each side also had a small amphibious element, but neither was deployed in that capacity during the battle.

Ritchie had hoped to mount an attack to relieve Axis pressure on Malta, but Rommel struck first. On 26 May, while Axis infantry held the line, Axis motorized units poured around the southern Allied flank. Achieving some small successes, they stalled at the Free French fort of Bir Hacheim. Positioning themselves in the Allied rear, the Axis motorized units then took up defensive positions while also operating against Bir Hacheim, which fell on 11 June after a heroic French defense. Meanwhile, Eighth Army tanks mounted a series of assaults against Axis armor in the so-called Cauldron, but the British were repulsed with heavy losses from Axis antitank artillery guns.

The Axis forces having opened a supply line and the Eighth Army reeling from heavy tank losses, Rommel resumed the offensive on 12 June. At Knightsbridge, he ambushed British armor, destroying 120 tanks and forcing a general Allied retreat. In less than three weeks, the Axis offensive had forced the Allies to withdraw into Egypt. This paved the way for a third assault on the port of Tobruk. Ritchie was relieved of

command, and General Claude Auchinleck took command of the withdrawal.

Geiger, Roy Stanley (1885–1947)

U.S. Marine Corps general, the first Marine ever to command an army in combat. Born on 25 January 1885 in Middleburg, Florida, Roy Geiger earned a law degree from Stetson University in DeLand, Florida, but he only briefly practiced law. He enlisted in the Marine Corps in November 1907 and received a commission in 1909. He first served with Marine detachments aboard battleships and then saw constabulary duty ashore in Panama, Nicaragua, the Philippines, and China. In Nicaragua, Geiger helped capture the fortified hills of Coyotepe and Barranca.

In 1916, as a captain, Geiger became the fifth Marine Corps aviator. Following U.S. entry in World War I, as a major he commanded Bomber Squadron A of the 1st Marine Aviation Force in France. After the war, Geiger's career centered on Marine aviation and advanced schooling. He served with Marine air units, and from 1931 to 1935 he headed Marine Corps aviation, playing a major role in its development. Geiger won promotion to colonel in 1935. He graduated from the U.S. Army Command and General Staff School (1925), the Army War College (1929), and the Naval War College (1941). Promoted to brigadier general in 1941, Geiger took command of the 1st Marine Aircraft Wing, Fleet Marine Force that September.

From September 1942, Geiger led the 1st Marine Aircraft Wing at Henderson Field on Guadalcanal. He returned to the United States in May 1943 to direct Marine Corps aviation. Promoted to major general, in November 1943 he assumed command of the I Marine Amphibious Corps on Bougainville in the Solomon Islands, which he led—following its redesignation as III Amphibious Corps—in fighting on Guam, Peleliu, and Okinawa. Following the death of Lieutenant General Simon Bolivar Buckner in the struggle for Okinawa, Geiger briefly (18–23 June) commanded the Tenth Army on Okinawa, the first Marine officer to command a numbered

field army. Promoted to lieutenant general in June 1945, the next month Geiger became commanding general of the Fleet Marine Force in the Pacific. He returned to Headquarters Marine Corps in November 1946 and died on 23 January 1947 at Bethesda, Maryland. By act of Congress in July 1947, Geiger received posthumous promotion to full general.

Genda Minoru (1904–1989)

Japanese navy officer and aviator. Born in Hiroshima on 16 August 1904, Genda Minoru graduated from the Japanese Naval Academy in 1924. Following sea service, he took flight training at Kasumigaura in 1928 and 1929, graduating at the head of his class. He served with the Yokosuka Kokutai (air corps) and aboard the carriers *Akagi* and *Ryujo* before becoming a fighter flight instructor at Yokosuka in 1934, where he gained national fame as leader of the Genda Circus, an aerobatics team. While at Yokosuka and subsequently at the Naval Staff College in 1937, Genda developed and expounded his concepts of massed air attacks under fighter umbrellas and the central role of naval aviation in future warfare. Following combat service in China and command of the Yokosuka Kokutai, he became assistant naval attaché in London from 1938 to 1940.

When Genda returned to Japan in 1940, he joined the staff of the 1st Carrier Division. On its formation in April 1941, he became chief air officer of First Air Fleet, which concentrated all of Japan's carriers into a single force to maximize their combat effectiveness, much as he had advocated since the mid-1930s. In February 1941, Genda drafted a very aggressive plan for an air assault on Hawaii, expanding on Admiral Yamamoto Isoroku's initial tentative suggestion for a preemptive strike to neutralize the U.S. Pacific Fleet. Genda played a leading role in designing the tactical plan for the Pearl Harbor attack. Although Genda's demands for concentration of force and surprise were heeded, his emphasis on destroying the U.S. carriers and following up with an inva-

sion to eliminate Hawaii as an American forward base formed no part of Yamamoto's eventual plan.

During the Pacific war, Genda served in carriers in the Pearl Harbor attack, in the Indian Ocean, in the Battle of Midway, and in the Solomon Islands. He was on the staff of the Eleventh Air Fleet at Rabaul until his promotion to captain in late 1944, when he became senior aviation officer in the Naval General Staff. In 1945, Genda was charged with the air defense of the Japanese home islands as commander of Kokutai 343, a large formation equipped with the best navy interceptor aircraft flown by the most experienced available crews. He served in this capacity until Japan's surrender.

Following World War II, Genda was first in private business; he then headed the Japanese Air Self-Defense Forces from 1955 to 1962, retiring as a full general. He was elected to the upper house of the Japanese Diet in 1962, serving there until 1982. Genda died in Tokyo on 15 August 1989.

George VI, King of England (1895–1952)

King of Great Britain and Northern Ireland and constitutional head of the British Empire. Born on 14 December 1895 at Sandringham, England, the second son of King George V and Queen Mary, George was by nature unpretentious and modest. He also suffered from a severe stammer. No intellectual, he was educated by private tutors. Following family tradition, he entered the navy at age 13 and attended the Royal Navy College of Dartmouth. George saw action in the 1916 Battle of Jutland, and in 1918 he joined the Royal Flying Corps and became a wing commander.

George married Lady Elizabeth Angela Marguerite Bowes-Lyon in 1923. They had two daughters, the future Queen Elizabeth II and Princess Margaret. As Duke of York, George

His Majesty King George VI of Great Britain. (Library of Congress)

helped set up summer camps to get young men out of industrial slums in the cities and into the countryside. George succeeded to the throne on 12 December 1936 following the abdication of his brother, King Edward VIII. He made numerous state visits in 1938 and 1939, including to the United States, which cemented valuable friendships. He was the first British monarch to visit the United States.

Despite the fact that military personnel swore allegiance to him and that military orders were issued in his name, George VI had no real powers as king. His role in World War II was to provide an example to the nation. In frequent radio broadcasts, George VI encouraged his people to remain calm, firm in resolve, and united behind the war effort. His popularity soared because he refused to leave London, despite the fact that Buckingham Palace was hit by German bombs. He also toured the bombed areas. George VI had an excellent relationship with Prime Minister Winston L. S. Churchill.

George VI established medals for citizens who exhibited wartime bravery, and his frequent wartime visits to factories and hospitals and to the troops boosted morale. He also strongly supported monarchs in exile in Britain. At the end of the war, the popular bond with the monarchy had never

been as strong in modern times. George VI lived to see dramatic changes in Britain's world position at the end of the war and the breakup of the British Empire, especially the independence of India in 1947. He died at Sandringham, England, on 6 February 1952 and was succeeded by his daughter, Queen Elizabeth II.

Georges, Alphonse Joseph (1875–1951)

French army general. Born on 19 August 1875 at Montluçon, Alphonse Georges graduated third in his class in 1897 from the French military academy of Saint Cyr and was posted to Algeria. During World War I, he was seriously wounded in 1914 while commanding a battalion. Following his recovery, he was posted to the army General Staff. He ended the war as chief of operations for Marshal Ferdinand Foch. After the war, he served as chief of staff to Marshal Henri Philippe Pétain during the Riffian Wars in Morocco. He was a division commander in Algeria from 1928 to 1932 and was then assigned to the Supreme War Council in Paris. Georges was wounded during the assassinations of King Alexander of Yugoslavia and French foreign minister Louis Barthou at Marseille in 1934. This aggravated the wound he had received in 1914.

Georges's physical condition may have played a critical role in his deteriorating abilities during the late 1930s. He expected to be named chief of staff of the French Army in 1935, but the French premier, Édouard Daladier, suspected him of right-wing tendencies. Georges was also closely linked to Paul Reynaud, Daladier's political rival. Daladier thus named General Maurice Gamelin to the position instead and named Georges as Gamelin's assistant.

The troubled professional and personal relations between Gamelin and Georges severely weakened French preparations for war during the last half of the 1930s. Georges assumed responsibility for northeast France, placing him in direct command of the units most likely to meet a German invasion. In 1940, these units included two French army groups and the British Expeditionary Force (BEF). Fully confident of the abilities of his force, Georges was stunned by its subsequent poor performance.

French General Alphonse Georges. (Photo by March of Time/Time Life Pictures/Getty Images)

Georges also bears partial responsibility for the decision to implement the Dyle plan, which placed substantial Allied units on the road to Belgium rather than in the Ardennes, the main axis of German attack. As the military situation collapsed, so did any semblance of professionalism between Georges and Gamelin. On 17 May 1940, both men were relieved of command in favor of General Maxime Weygand. Georges refused to play any role in the subsequent Vichy government, but he also had no real role in the French Resistance because he did not enjoy the confidence of Charles de Gaulle. He briefly served as minister without portfolio in the French Committee of National Liberation in 1943. Georges died in Paris on 24 April 1951.

German-Soviet Non-aggression Pact (23 August 1939)

Treaty between Germany and the Soviet Union (often called the Nazi-Soviet Non-aggression Pact) that facilitated Germany's 1 September 1939 invasion of Poland and its war effort before 1941. German Chancellor Adolf Hitler, having maintained that the Sudetenland of Czechoslovakia was his last territorial demand and having been granted that area in the 1938 Munich Agreement, absorbed the remainder of the country in March 1939. On 31 March, in an effort to prevent further German territorial expansion aimed at Poland, Great Britain and France jointly issued a guarantee to declare war on Germany should it invade Poland. In effect, this pledge placed Britain and France in Poland, securing for Soviet dictator Josef Stalin about as much as he could have gotten in negotiations with the two western powers.

The British and French governments now attempted to negotiate with the Soviet Union to bring it into the alliance against German expansion. Although France could attack western Germany in the event of an invasion of Poland, the British and French would be hard-pressed to get forces to Poland in time to help that nation stave off a German invasion. Negotiations of the British and French with the Soviet Union for an alliance that would preserve Poland proceeded at a leisurely pace throughout the spring and summer of 1939.

These talks yielded little, as Stalin did not trust the western powers. He also insisted on the right of Soviet forces to move into Poland and the Baltic states in the event of a German thrust east, something refused by these countries, which feared the Soviets more than the Germans. The Soviets assumed that the western powers wanted them to bear the brunt of the attack. The western powers, for their part, were unwilling to yield territory to the Soviet Union the way they had to Hitler.

Stalin was also concerned about the possibility of having to fight a two-front war against both Germany and Japan. There had already been serious fighting between Soviet and Japanese forces in the Far East in 1938 and 1939. Concern over the Japanese threat may have been a major factor in Stalin's thinking regarding an alliance with Germany. An agreement with Germany, Stalin believed, would not only gain space in the form of territorial concessions but also win the time necessary to rebuild the Soviet armed forces after the costly purges of their senior leadership.

While they were negotiating more or less openly with the British and French, the Soviets were also secretly negotiating with Germany. The western powers discounted this possibil-

ity, believing that the Soviet and German political systems were diametrically opposed and that the two powers were permanent enemies.

Although Berlin rejected Stalin's initial efforts, Hitler became convinced that Stalin was serious when in May 1939 the Soviet dictator dismissed Foreign Minister Maxim Litvinov, a champion of collective security and a Jew. The pragmatist and nationalist Vyacheslav Molotov replaced Litvinov. At the end of May, the German government indicated its willingness for a "certain degree of contact" with Moscow, beginning the process that would culminate in the German-Soviet pact.

On 21 August 1939, after a series of German communications, Stalin telegraphed Berlin and asked that Foreign Minister Joachim von Ribbentrop come to Moscow. Ribbentrop arrived on 23 August and met personally with Stalin. The pact was signed that same night, stunning the world. The pact had three major provisions, two of them secret and not revealed until the Nuremberg Tribunal after World War II had ended. The open provision consisted of a 10-year nonaggression pact between the Soviet Union and Germany.

The first of the two secret sections divided the Baltic states and Poland between the Soviet Union and Germany. The Soviet sphere of influence was to include eastern Poland, Bessarabia (a province of Romania), Estonia, Latvia, and Finland. The Germans secured western Poland and Lithuania. A month after the pact was signed, Hitler traded Lithuania to the Soviet Union in exchange for further German concessions in Poland. The second secret clause stipulated that the Soviet Union would provide Germany with massive amounts of raw materials and act as its purchasing agent abroad for items it could not itself furnish. In return, Germany agreed to provide finished goods and weapons technology from Germany. This was particularly helpful to Germany, nullifying the effects of the British naval blockade of Germany.

After signing the pact, Stalin drew Ribbentrop aside and told him that the Soviet Union would live up to its provisions and never betray Germany. Stalin understood the danger of the alliance, yet he continued to trust his ally until the German invasion of the Soviet Union, Operation BARBAROSSA, in June 1941. With the signing of the pact, Hitler freed himself of the threat of Soviet military intervention and a two-front war. He was now free to launch his invasion of Poland. On 1 September 1939, German forces crossed the border. Two days later, Great Britain and France honored their pledge to Poland and declared war on Germany. The Soviet Union denied the secret provisions of the pact until 1990.

Germany, Air Force

The German air force, the Luftwaffe, existed officially for barely a decade, but during that time it was the pride of Nazi Germany. Before the war, the Luftwaffe was useful in coercing concessions from other countries. It was the world's most powerful air force in 1939, and once World War II began, it became an essential element of the blitzkrieg—the "lightning war." The Luftwaffe was, however, basically a tactical force, and it came apart under the strain of the German invasion of the Soviet Union.

The Versailles Treaty after World War I denied Germany an air force. Nonetheless, the Germans continued experimenting with aviation, and the military developed air doctrine and training programs, monitored technological developments, and built an industrial infrastructure for civilian aviation. At the same time, the German military established clandestine air facilities in the Soviet Union to build and test aircraft and train personnel. When Adolf Hitler came to power in January 1933, he pushed development of aviation and in 1935 openly began building an air force. The western Allies were reluctant to use force to halt this development, which was a direct violation of German treaty obligations.

Unlike the army and navy, the Luftwaffe was purely a Nazi creation and became the primary focus of Hitler's rearmament program. Hitler selected Hermann Göring, a World War I ace pilot, as minister of aviation and commander in chief of the Luftwaffe. Hitler was also much impressed with theories, notably those of Italian Giulio Douhet, that future wars could be won by air forces alone.

In 1936, Hitler sent the Kondor Legion, essentially a Luftwaffe outfit, to fight in the Spanish Civil War. Here the Germans gained invaluable experience in testing aircraft, tactical concepts, and experimenting with strategic bombing (as at Guernica). Hitler's boasts about German air power, although many of them were empty, helped face down the French and British in his March 1936 remilitarization of the Rhineland and in the 1938 crisis over Czechoslovakia.

As with so many other agencies in the Reich, the Luftwaffe suffered from organizational weaknesses and overlap at the

A formation of Luftwaffe Junkers Ju-87D Stuka dive-bombers in the air. (Hulton Archive)

top. Göring, one of Hitler's inner circle from the early days, was Hitler's designated successor, and Hitler allowed him to run the Luftwaffe without any real interference. The Reich Air Ministry consisted of the office of state secretary for air Erhard Milch; it supervised aviation matters apart from operations. Milch was also inspector general of the Luftwaffe. In addition there was Luftwaffe chief of staff Hans Jeschonnek. Until his suicide in 1943, Jeschonnek headed the air force's organization, operations, intelligence, training, quartermaster, and signal branches. Milch and Jeschonnek did not get along. Jeschonnek only had access to Göring on operational matters and had no control over personnel, which Göring made his own province. Ernst Udet, chief of the Technical Office and World War I ace, proved an incompetent administrator. Udet reported to Milch, who took over Udet's office after Udet's 1941 suicide. Too late, in May 1944, the administrative structure was streamlined with the creation of the Oberkommando der Luftwaffe (Air Force high command, OKL). Also in 1944, Albert Speer's Armaments Ministry gained control of all German aircraft production, and Milch's ministry was abolished.

The Luftwaffe, the newest of the military services, was the least professional and suffered the most from promotions not based on merit. Göring surrounded himself with advisers whose principal qualifications were that they were Nazis, as opposed to experienced aviation military officers. Many times they either offered poor advice or, not wishing to anger him, agreed with whatever ideas he developed. Increasingly, Göring, who held numerous offices in the Reich, largely abandoned his command of the Luftwaffe, intervening only in fits and starts and often with disastrous results, as during the 1940 Battle of Britain. During the war, the Luftwaffe was also the agency least conscious of communications security.

The Luftwaffe controlled all air services but had little interest in naval aviation. Airborne troops were Luftwaffe personnel, and the air force also had charge of anti-aircraft artillery. Eventually the Luftwaffe even fielded 22 ground divisions, including the Hermann Göring Armored Division. The Luftwaffe itself was organized into Luftflotten (air fleets), constituted so as to perform a variety of roles and consisting of a wide variety of aircraft types. At the beginning of the war,

Germany had four Luftflotten, and during the course of the conflict three more were added. The next operational division was the Fleiegerkorps (flier corps), and below that was the Fleigerdivision (flier division). These last two each contained several Geschwader (squadrons) that were designated as to types (including fighters, bombers, night fighters, training, and so on). Each division controlled three to four Gruppen (groups) comprising three or four Staffein (squadrons). In September 1939, the Luftwaffe had 302 Staffein.

At that point, Germany's chief advantage was in the air, for at the start of hostilities the Luftwaffe was certainly the world's most powerful air force. In September 1939, Göring commanded more than 3,600 frontline aircraft. The death in 1936 of strategic bomber proponent General Walther Wever, however, had brought a shift in emphasis to tactical air

power. This remained the case throughout the war. Although Germany developed four-engine bomber prototypes, these were never placed in production. It could be argued, however, that a tactical air force was the best use of Germany's limited resources.

The German air force was essentially built to support ground operations. It suited ideally the new blitzkrieg tactics, and the

Junkers Ju-87 Stuka dive-bomber was a highly accurate form of "flying artillery." Impressed by U.S. Marine Corps experiments with precision dive-bombing, the Germans embraced this technique; indeed, all German bombers had to be capable of dive-bombing. This entailed considerable aircraft structural change with attendant production delays and a decrease in bomb-carrying capacity. The flying weight of the Junkers Ju-88 twin-engine bomber went from 6 to 12 tons, sharply reducing both its speed and its bomb-carrying capacity. Nonetheless, the Germans developed some exceptional aircraft. In addition to the Stuka, they had a superb air-superiority fighter in the Messerschmitt Bf-109, certainly one of the best all-around aircraft of the war. And before the end of the war, the Germans had introduced the Messerschmitt Me-262, the world's first operational jet aircraft. But Hitler also wasted considerable resources on the development of terror or "vengeance" weaponry, the V-1 and V-2.

The Luftwaffe played key roles in the German victories over Poland in 1939 and over France and the Low Countries in 1940. Its limitations first became evident during the Battle of Britain, when Göring attempted to wage a strategic bombing campaign with a tactical air force. Germany's defeat in this battle was its

first setback of the war. The Luftwaffe was also impressive in the fighting against the Soviet Union, at least until the Battle of Stalingrad. But in the fighting on the Eastern Front, the superb combined-arms instrument that had been the German military to that point began to come unhinged. By the fall of 1941, Germany was overextended, and the Luftwaffe's small airlift capacity of Junkers Ju-52 trimotor transports was unable to fulfill all the missions required of it. Although Germany increased its aircraft production during the war, as the conflict continued, and under relentless Allied bombing, it suffered from lack of aviation fuel. This was the key factor in the defeat of the Luftwaffe, rather than inferior or too few aircraft.

By 1944, the Luftwaffe was feeling the effects of the Allied bomber offensive. In the first half of the year, pilot losses were averaging 20 percent a month, and the scarcity of fuel forced the routine grounding of aircraft not only for operations but also for training. In a period when replacement aircrews were desperately needed, flight time for trainees had been reduced to less than half that for their Allied counterparts. This in turn led to increasing numbers of accidents. By the time of the June 1944 Normandy invasion, the much-vaunted Luftwaffe had been largely silenced.

Germany, Army

At the tactical level of warfare, the German army—the Reichsheer—of World War II may well have been the best

Before the end of the war, the Germans introduced the Messerschmitt Me-262, the world's first operational jet aircraft.

ground force in the history of warfare to that time. On the strategic level, the Germans had major blind spots that go a long way toward explaining why they lost two world wars despite having the best army in the field. At the middle level of warfare—that of operations—historians continue to argue about the German army. One school holds that the German doctrine of blitzkrieg was the most sophisticated example of the operational art to that time. The other school argues that what passed for operational art in the German army was little more than tactics on a grand scale.

The Reichsheer of World War II (the Wehrmacht was the entire German military, not just the army) grew out of the 100,000-man Reichswehr that was allowed to Germany following World War I under the terms of the Treaty of Versailles. On 1 October 1934, Adolf Hitler ordered the threefold secret expansion of the Reichswehr. Conscription was reintroduced in March 1935, establishing a further increased objective base strength of 38 divisions and approximately 600,000 troops. By 1939, the two main components of the German army were the field army (Feldheer) and the replacement army (Ersatzheer). The field army had more than 2 million soldiers and was organized into 120 divisions—99 infantry, 9 panzer, 6 motorized, 1 cavalry, 3 mountain, and 2 parachute. The replacement army consisted of a force of approximately 100,000 men in training or transit. From 1942 on, the numbers of replacements became progressively insufficient to keep frontline units up to authorized strength levels.

The infantry division was the primary tactical element of the German army. In 1940, the standard German infantry division had 17,200 troops, 942 motor vehicles, and 5,375 horses. By 1944, there were 226 infantry divisions, but their size had shrunk to 12,352 troops, 615 motor vehicles, and 4,656 horses. Despite its reputation as the master of mechanized and mobile warfare, the German army relied heavily on horses right up until the end of the war. Almost all field artillery in the infantry divisions was horse-drawn. The German divisions were organized according to a triangular structure, with (1) three infantry regiments of three battalions of three companies each; (2) a divisional artillery command with a field artillery regiment of three battalions of three batteries each, a heavy artillery battalion, and an observation battalion; (3) reconnaissance, engineer, signals, and antitank battalions; and (4) the divisional (supply) trains. Each division also generally had an antiaircraft battalion attached to it from the Luftwaffe.

The Germans did, however, field various forms of motorized or mechanized units. By 1941, they had a total of 10 motorized infantry divisions and light infantry divisions. Later in the war, these units were redesignated as panzergrenadier divisions. Germany ultimately fielded 22 of these units. They were organized along the general lines of the infantry divisions, but they had more motor vehicles and an

organic tank regiment. In 1940, the standard motorized/light division had 14,000 troops, 3,370 motor vehicles, 158 tanks, and more than 1,500 horses. The 1944 panzergrenadier division had 13,833 soldiers, 2,637 motor vehicles, 48 tanks, and more than 1,400 horses.

The Germans had several specialized divisions. Mountain divisions were essentially smaller and lighter versions of the infantry division. Germany had 3 mountain divisions in 1940 and 13 in 1944. Fortress divisions and security divisions were divisions in name only; they could not be seriously equated with other divisions in the army's order of battle. The fortress divisions were little more than stationary garrisons, seldom larger than a regiment in strength. The security divisions were used to secure rear-area lines of communication and to conduct antipartisan operations on the Eastern Front. In a last act of desperation late in the war, Germany created Volksgrenadier (people's grenadier divisions) for defense of the Reich itself. Heavily manned by old men and young boys with almost no military training, these units were armed with a high proportion of automatic and antitank weapons. Because of the weapons' high firepower and the fact that the units were defending their home ground, these units sometimes gave a surprisingly good account of themselves.

The Germans began the war with one (horse) cavalry division, which fought in the Poland Campaign in 1939. By 1944, Germany actually had four such divisions, all operating on the Eastern Front. Late in the war, Germany fielded its single artillery division, which was based on the Soviet model. The Red Army, which had hundreds of thousands of artillery pieces, fielded almost 100 artillery divisions. But for the Germans, who were chronically short on artillery throughout the war, fielding an artillery division was an almost pointless exercise. The Germans did not have sufficient artillery to equip their infantry and panzer divisions, let alone form more artillery divisions.

Organizationally, all German parachute divisions were part of the Luftwaffe, but operationally they fought under army command. The Germans had 2 parachute divisions in 1940 and 11 in 1944. After the near-disaster on Crete, German parachute divisions never again jumped in combat. They spent the remainder of the war fighting as light infantry, but their traditional paratrooper élan remained, and they were fierce opponents, especially in Italy. The German air force also fielded land divisions that operated under army command. The formation of these air force field units was another desperate measure. As attrition ground down the Luftwaffe's aircraft, especially on the Eastern Front, excess personnel were hastily grouped into these field divisions. Often, the new ground soldiers had little or no infantry training. Germany had 19 such divisions in 1944.

The panzer division was the mailed striking fist of the German army. The first three panzer divisions were raised as

German soldiers in Russia, 1941. (National Archives)

completely new units in the fall of 1935, but they were not fully operational until September 1937. Thereafter, new panzer divisions were created by converting infantry or other divisions. There were 9 panzer divisions by 1939 and 26 by 1944. From 1941, the panzer divisions were in action almost constantly and continually subject to being ground down by attrition. A panzer division in 1940 had some 14,000 troops, 1,800 motor vehicles, and 337 horses. The standard panzer division had 324 tanks, and a variation known as a light panzer division had 219 tanks. By 1944, the typical panzer division had 13,700 troops, but the number of motor vehicles had decreased to 48, whereas the number of horses had increased to almost 1,700. On paper, at least, a 1944 panzer division had 150 tanks; in the last year of the war, however, many panzer divisions could only field a handful of tanks.

The *Waffen-Schutzstaffel* (*Waffen-SS*) was separate from the army and even from the *Wehrmacht*. However, it was essentially the Nazi Party's army, and it fielded combat divisions that fought under army command and control, much like the *Luftwaffe's* field and parachute divisions. By 1944, there were 7 *SS* panzer divisions and 11 panzergrenadier divisions. The organization of the *Waffen-SS* divisions was similar to the organization of their *Wehrmacht* counterparts, but because of their unquestioning loyalty to Hitler they were often better equipped.

The echelon of command above the division was the corps, which consisted of two or more divisions and additional corps support troops and artillery. The two basic types of corps were the army corps, consisting primarily of infantry divisions, and the panzer corps, consisting primarily of panzer divisions. The *XCI Armeekorps* was the highest-numbered corps. The next-higher echelon of command was the field army, comprising two or more corps. Field armies normally were designated by numbers, but in a few instances they were designated by a name. Field armies also had their own pools of combat assets such as artillery and separate heavy tank battalions. The German army's largest operational unit was the army group (*Heeresgruppe*), which controlled several field armies or corps directly. The army group also was responsible for providing support to all units in its area, as well as for the rear-area lines of communication and logistical services. Army groups were designated by their locations, by their commander's name, or by a letter.

The Germans had several elite units designated only by their name. *Grossdeutschland* (greater Germany)—also called “the bodyguard of the German people”—was first formed in 1938 as a ceremonial battalion. By 1939, it had expanded to the size of a regiment, and by 1942 it was an oversized division. At the end of the war, *Panzerarmee Grossdeutschland* commanded five divisions under two corps. The *Panzer Lehr* Division, which was

the most powerful German armored division in Western Europe at the time of the Allied landings in Normandy, was formed in the winter of 1943–1944 with instructors and troops from the German armored school. The Infanterie-Lehr Regiment was an elite unit formed from instructors and infantry-school troops. In 1944, Hitler personally ordered the Infanterie-Lehr to Anzio to block the Allied landings there.

Command and control in the German army suffered from a confused structure at the very top, which only compounded the German weaknesses at the strategic and operational levels. Three different high-command headquarters were seldom in agreement and often in competition. The Oberkommando des Heeres (army high command, OKH), the Oberkommando der Wehrmacht (armed forces high command, OKW), and the supreme commander (Hitler) and his staff often issued conflicting orders to the same units. In theory, OKH ran the war in the Soviet Union, and the OKW ran the war everywhere else. Hitler's Führerhauptquartier (Führer headquarters) issued all the key strategic orders.

Despite the popular stereotypes, reinforced by countless Hollywood movies and television programs, the common German soldier of World War II was anything but stupid and unimaginative, and his officers and noncommissioned officers (NCOs) were neither machinelike nor inflexible autocrats. Rather, the German army encouraged initiative among its subordinate leaders and stressed flexibility and creativity to a degree far greater than any other army prior to 1945. This was the key to its tactical excellence. German combat orders, rather than dictating detailed and rigid timelines and specific instructions on how to accomplish missions, tended to be short and as broad as possible. The principle under which the German command system operated was called *Auftragstaktik*, which can only very loosely be translated into English as “mission orders.” For *Auftragstaktik* to work, a subordinate leader had to understand the intent of his higher commander at least two echelons up. That meant that the subordinate had the right to ask his superior why something was being done, and the superior was obligated to explain. Such a practice was virtually unheard of in almost all the other armies of World War II.

Despite superb organization and tactical tools at the lower levels, the confused high-command structure and Germany's incoherent strategy doomed the German army over the long run. Hitler did a great deal personally to subvert solid military command and control. He distrusted his generals, and for the most part they distrusted him. During the early years of the war, 1939 and 1940, Hitler was the beneficiary of outrageously good luck and inept opponents. This only served to reinforce his belief in what he thought was his divinely inspired military genius. When the commander in chief of the German army, General Walther von Brauchitsch, retired for medical reasons in late 1941, Hitler—the former World War I lance corporal—assumed direct command of the army. By

that time, however, Hitler had led Germany once again into its worst strategic nightmare, a two-front war.

The German army also suffered from several internal and external handicaps that were beyond its ability to control. Germany was chronically short of virtually every vital resource necessary for modern warfare. A panzer division in 1940 still had more than 300 horses, and four years later that number had risen to 1,700. Roughly only 10 percent of the army was ever motorized. In 1940, OKH planners estimated that it would require at least 210 divisions to execute the invasions of France and the Low Countries while simultaneously garrisoning Poland and Norway. At the time, they were 20 divisions short. The chronic shortages of manpower and motorized transport only worsened as the war progressed. The situation did not improve even after German industry was mobilized in 1944. By then, of course, it was far too late.

Germany, Collapse of (March–May 1945)

Adolf Hitler's failed Ardennes Offensive (Battle of the Bulge) during December 1944–January 1945, far from stalling the western Allies as Hitler had hoped, actually hastened the German military collapse. By 1 March 1945, Allied Supreme Commander in the west General Dwight D. Eisenhower had assembled sufficient forces for a full frontal assault. By April,

it would be the largest coalition army ever assembled in war. Several hundred miles to the east, Soviet leader Josef Stalin massed three fronts (army groups) for the final drive on Berlin. The Soviets were consolidating their positions for a final assault and ensuring that their Baltic flank was not exposed. Supporting these huge Allied armies were their air forces, which now had complete control of the skies. Large numbers of British and U.S. aircraft continued the strategic bombing campaign against the German heartland. During the period 1–21 March, more than 10,000 American and British bombers dropped in excess of 31,000 tons of bombs on the Ruhr area alone.

Undaunted by the overwhelming odds against him, German leader Adolf Hitler clung to the hope of victory. Conducting operations from the troglodyte atmosphere of his Berlin bunker and surrounded primarily by sycophants, the Führer relied on his so-called V (for “vengeance”) weapons—the V-1 buzz bomb and V-2 rocket—as well as new jet aircraft. He also hoped for some miracle, such as Allied dissension, to turn the tide. The only military realist in headquarters was army chief of staff General Heinz Guderian. His clashes with Hitler, however, led to his departure at the end of March.

The onslaught from the west began with a drive to the Rhine River. From north to south, Field Marshal Bernard Montgomery commanded the 21st Army Group. It consisted of General Henry Crerar’s Canadian First Army, Lieutenant General Miles Dempsey’s British Second Army, and Lieutenant General William H. Simpson’s U.S. Ninth Army, temporarily assigned to Montgomery’s command from that of Lieutenant General Omar N. Bradley’s 12th Army Group. In the center was Bradley’s 12th Army Group, the largest American field force ever commanded by a U.S. general. Bradley’s army group comprised the U.S. First Army under Lieutenant General Courtney Hodges; Lieutenant General George S. Patton’s U.S. Third Army; and Major General Leonard Gerow’s U.S. Fifteenth Army, whose forces were engaged in occupation duty and the elimination of bypassed pockets of German resistance. In the south was the 6th Army Group of Lieutenant General Jacob Devers, which consisted of Lieutenant General Alexander Patch’s U.S. Seventh Army and General Jean de Lattre de Tassigny’s French First Army. The 6th Army Group eliminated the Colmar pocket and advanced toward the Rhine between the Belgian and Swiss borders.

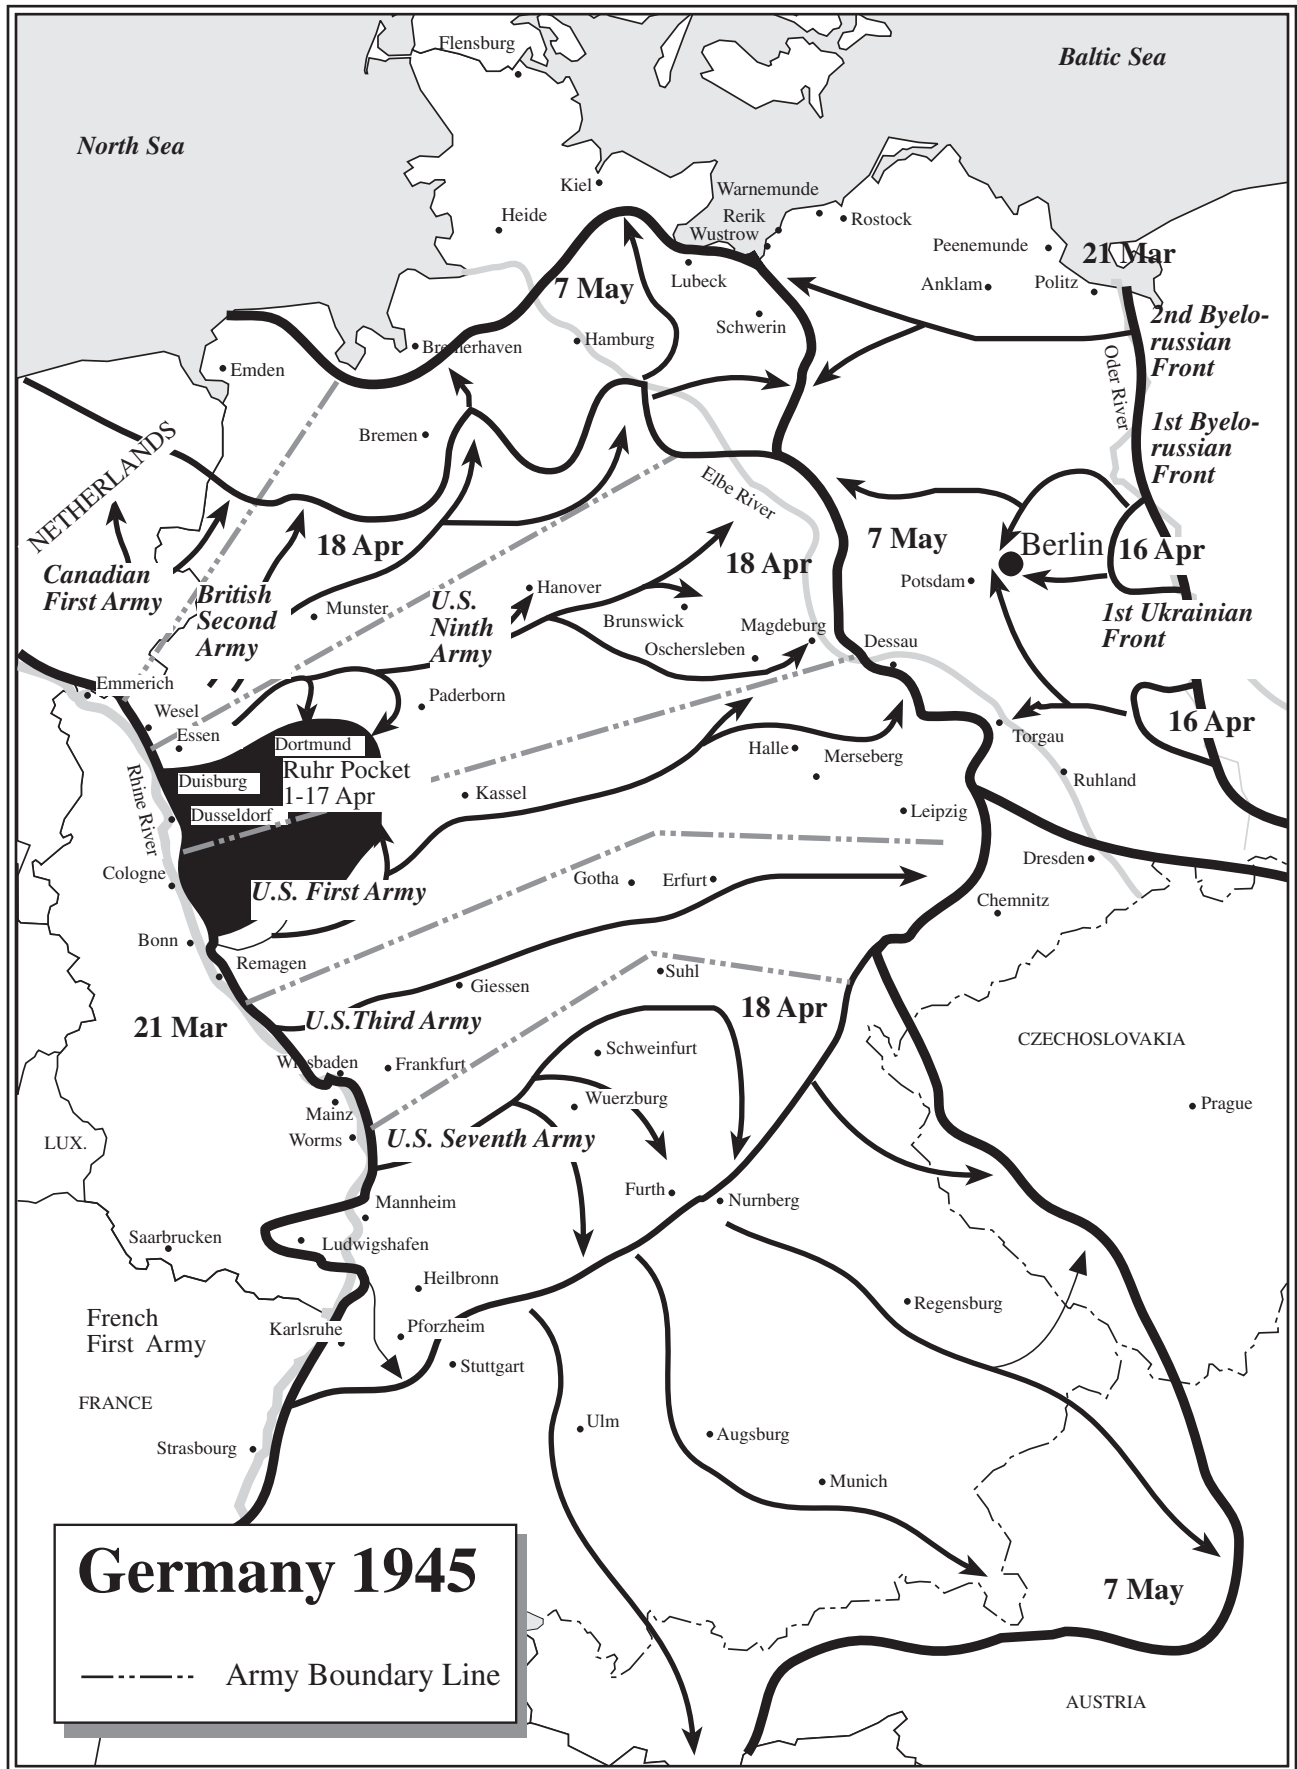

Elements of Hodges’s First Army discovered the railroad bridge at Remagen intact, and they pushed forces across it to establish a bridgehead on the eastern side of the Rhine. German troops were everywhere withdrawing toward the Rhine. In typical fashion, Hitler replaced his commander in the west, Field Marshal Gerd von Rundstedt, with Field Marshal Albert Kesselring. The western Allies then launched Operation *UNDERTONE*, an assault on the Saar-Palatinate region, wherein

the U.S. Third and Seventh Armies broke through the German Siegfried Line and destroyed Schutzstaffel Oberstgruppenführer Paul Hausser’s German First Army. On 22–23 March, Montgomery launched Operation *PLUNDER*, a large-scale attack on the lower Rhine. Meanwhile, Patton’s troops crossed the Rhine at Oppenheim on 22 March. All along the front, Allied forces moved relentlessly eastward. In April, the XVIII Airborne Corps encircled Field Marshal Walther Model’s Army Group B, resulting in the surrender of 300,000 German troops. German cities capitulated rapidly; many streets were lined with white flags. On 20 April, Nuremberg fell to Patch’s U.S. Third Army.

On 31 March on the Eastern Front, three Soviet fronts (army groups) opened the Berlin Campaign to take the German capital. They were Marshal Ivan Konev’s 2nd Ukrainian Front, Marshal Georgii Zhukov’s 1st Belorussian Front, and Marshal Konstantin Rokossovski’s 2nd Belorussian Front. Konev’s troops, supported by massive artillery barrages, cut across the Neisse River, destroying the German Fourth Panzer Army. Zhukov faced stiff German resistance and sustained heavy casualties, although his forces wore down the defenders. By this time, the German armies were only shadows of their former selves and included many young untrained levies. Steadily the Soviets drove Army Group *Vistula* back near Berlin. Hitler, meanwhile, insisted on a scorched-earth policy; he also called on German citizens to act as “werewolves,” and he dared to hope that the miracle of the House of Brandenburg of the Seven Years’ War—in which the coalition against Prussian King Frederick II came undone on the death of Russian Tsarina Elizabeth—might be repeated. He even seized on the death of U.S. President Franklin D. Roosevelt on 12 April 1945 as an omen that Germany would yet survive. As propaganda minister Josef Goebbels exhorted the people of Berlin to defend their city, Hitler called up Volkstrum troops (the largely untrained older civilian militia) and the Hitler Youth to defend his dying Third Reich.

At the same time, millions of German refugees were fleeing west to avoid falling into the hands of the Soviets. The German navy evacuated hundreds of thousands of Germans from the Baltics. Many others made their way west on foot. Ultimately, perhaps 16 million Germans were displaced from their homelands in Poland, Czechoslovakia, and elsewhere. More than 2 million may have been killed in the exodus that followed. Those who escaped or were forced to leave added yet another burden on already strained German social services.

On Hitler’s birthday, 20 April 1945, Zhukov’s troops pierced through three German defensive lines defending Berlin. On 22 April, Soviet troops were fighting in the city itself, and three days later they had surrounded Berlin. That same day, 25 April, elements of Bradley’s 12th Army Group

linked up with Soviet troops of Konev's 1st Ukrainian Front at Torgau on the Elbe River.

The last significant German counterattack of the war occurred on 25–26 April when General der Waffen-SS Felix Steiner's Eleventh Army struck at Soviet forces driving on Berlin near Oranienburg, to no avail. Almost 500,000 Soviet troops were now battling for Berlin. Hitler, defiant to the last, refused to leave his capital and committed suicide on 30 April. To the end, he refused to accept responsibility and blamed others for Germany's defeat. Hitler's designated successor as chief of state, Grossadmiral Karl Dönitz, then took over what remained of German forces. Meanwhile, the Allies had overrun northern Italy. Remaining German forces there surrendered on 2 May.

In the west, Lieutenant General Walton Walker's XX Corps of Patton's Third Army reached the Austrian border opposite Braunau. Then, on 2 May, Lieutenant General Helmuth Weidling, commander of Berlin, surrendered the German capital to Soviet Colonel General Vassili Chuikov. On 3 May, elements of Montgomery's 21st Army Group linked up with Rokossovsky's 2nd Byelorussian Front at Wismar. Marshal Rodion Malinovsky's 2nd Ukrainian Front moved from Hungary into Austria and Czechoslovakia and prepared to link up with Patton's Third Army, which was advancing down the Danube near Linz.

Remaining German forces under Dönitz still controlled Norway, Denmark, western Holland, and portions of Germany, Yugoslavia, Austria, and Czechoslovakia. Although Dönitz realized defeat was certain, he briefly stalled for time to rescue additional German refugees fleeing westward. On 7 May, Dönitz surrendered all German forces unconditionally to the victorious Allies; a formal ceremony was held the next day. The guns fell silent. Germany lay prostrate and in ruins, its social services a shambles and its cities great wastelands of twisted girders and rubble.

Germany, Home Front

The popular assumption that Nazi Germany was a well-organized war machine is patently false. It is true, however, that no time was likely to be as favorable as September 1939 for German leader Adolf Hitler to join in war with the western powers. Britain and France were only then rearming, and Germany had a population of 80 million people, a strong industrial base, and the world's most powerful army and air force. The economy was unbalanced, with imports running well in excess of exports, but Hitler planned to redress this imbalance by seizing in war all that the Reich required.

The National Socialist state controlled the media, with propaganda minister Joseph Goebbels adroitly manipulating the press, radio, film, and party rallies. Informers on every block and the Gestapo (secret state police) kept a close watch on activities, but most Germans accepted the Führer's policies. Sullen resignation over the start of the war in September 1939 turned to euphoria after Germany's victories over France and the Low Countries. In the winter of 1941, when the military situation began to deteriorate on the Russian plains, Germans settled into a sort of stoic determination that lasted until near the end. Most Germans were aware of the price their nation was exacting from the rest of Europe, and they could thus believe the Allies would repay them in kind. However, to ensure the loyalty of the Reich's citizens, Hitler ordered that judges ignore established law and procedure and dispense only "National Socialist justice." Hitler expressly approved the Gestapo's use of torture. The complete subversion of the German legal system to Nazi rule came with the appointment in August 1942 of Roland Freisler as president of the Volksgerichtshof (people's court).

Once he had secured power in 1933, Hitler sought to harness the German economy for war preparation. He well understood that his desire for new lands in the east (lebensraum) had to be realized through a series of swift and decisive military victories. The German economy could not sustain a long drawn-out war. Thus the blitzkrieg (lightning war) was born of economic necessity.

In 1936, Hitler instituted a Four-Year Plan for the economy under Reichsmarschall (Reich Marshal) Herman Göring. The idea was designed to centralize the economy. However, as with everything else in the Third Reich, the rivalry of higher-ranking officials, encouraged by Hitler, meant that the economy remained a battlefield for various competing interests, even within the armed forces themselves. Despite these inefficiencies, Germany rebuilt its mili-

General view of the German city of Nuremberg, following the cessation of organized resistance. In the distance, the twin-spired Lorenz Church; on the right and surrounded with rubble is a statue of Kaiser Wilhelm I, 1945. (Roberts Commission, National Archives)

tary. Spending on the armed forces, however, was consuming 50 percent of the budget, or approximately 60 billion reichsmarks, per year. Hjalmar Schacht, head of the Reichsbank, pointed out that this level of expenditure could not be sustained.

Besides military growth, another goal of the Four-Year Plan was German economic autarky in such key areas as the petrochemical industry and reduction of imports of other raw materials necessary for war production, including rubber and minerals. From 1936 to 1938, the Four-Year Plan concentrated on production of raw materials; after 1938, attention was focused on production of finished goods such as tanks, aircraft, and artillery pieces for immediate war use. Between 1936 and 1942, the Four-Year Plan represented 50 percent (13.25 billion reichsmarks) of total German industrial investment.

Memories of World War I, when the British naval blockade starved Germany of raw materials and foodstuffs, underpinned German planning. The August 1939 German-Soviet Non-aggression Pact, however, removed much of the impact of the blockade during World War II, as did the addition of

Romania—with its important oil fields of Ploesti—to the Axis alliance after the war began.

Despite emphasis on military production, the Nazi hierarchy feared the impact on home-front morale of shortages of consumer goods. Production of consumer goods from 1936 to 1939, when Germany was straining to increase its armaments, actually went up by 25 percent. This continued during the war; Germans enjoyed both “guns and butter” and a relatively high standard of living until 1944. After the successful military campaigns of 1939 and 1940, Hitler recommended a reduction in arms production in order not to affect civilian morale. The government pacified the population with incentives such as bonuses for night shifts and overtime pay on holidays. Despite an official decree to freeze salaries, average wages from September 1939 to March 1941 rose by 10.4 percent.

Even in 1942, consumer expenditures were maintained at about the 1937 level, and few new economic restrictions were imposed. Raw materials were in short supply, but these were deliberately depleted in the expectation of a quick victory over the Soviet Union. This optimistic outlook changed with

the German reverses in the winter of 1941–1942. In February 1942, when Fritz Todt, minister of armaments and production, died in a plane crash, Hitler named Albert Speer as Todt's replacement.

An organizing genius with a keen interest in efficiency rather than ideology, Speer created a centralized machinery of control in the Central Planning Board. By 1943, Speer had nearly complete control of the national economy and was able substantially to boost production. He also enacted industrial policies to standardize production by limiting the number of different types of armaments produced and promoting factory assembly-line methods. In fact, German war production was at its height in 1944, despite Allied bombing, and production of consumer goods dropped only slightly. In March 1944, German aircraft plants went on double shifts and a seven-day workweek. Thus Germany attained its highest levels of aircraft, tanks, and munitions production in late 1944 while bearing the full brunt of Allied bombing. But by then it was too late. When the Allies shifted their bombing emphasis to lines of communication and petroleum production, the transportation system collapsed and there was no fuel to operate the tanks and new jet aircraft.

Speer might have accomplished more had he not been handicapped by jealous rivals, such as the multi-hatted Hermann Göring and Reichsführer-Schutzstaffel (leader for the Reich, RFSS) Heinrich Himmler. Himmler was a major hindrance. Constantly scheming to enhance the power of the SS within the Reich, he actually undermined the economy. The SS grew to be a state within a state, and Hitler even approved Himmler's proposal to build an SS-owned industrial concern to make it independent of the state budget.

Major factors in Speer's success, of course, were the substantial territory and resources Germany had acquired by 1942. Germany could exploit the resources of this new empire—skilled labor, industry, and metallurgical resources from France and Belgium; foodstuffs and other resources from Denmark, Norway, and the Balkans. There were also substantial resources in the vast stretches of the Soviet Union occupied by the German army from June 1941 onward, although many of these resources were simply those Germany had depended on in the past.

Spain was a friendly neutral country, and Sweden, Portugal, and Switzerland continued to trade with the Reich and conduct its business. In addition, ruthless German economic exactions helped finance the war. German-occupied Western Europe provided substantial raw materials and money to fuel the German war machine. Of the total German war expenditure of 657 billion reichsmarks, the German people paid only 184.7 billion. France alone paid “administrative costs” to Germany at the absurdly high sum of 20 million reichsmarks a day, calculated at the greatly inflated rate of exchange of 20 francs per reichsmark and amounting to some 60 percent of French national income.

The National Socialist regime failed to use two readily available sources of labor, however. The Nazis had done all in their power to reverse the emancipation of women during the Weimar Republic. Restricting women to the “three Ks” of *Kinder*, *Kirche*, and *Küche* (children, church, and kitchen) meant that during the Great Depression jobs were secured only for men. This system carried forward into the war with serious implications for the war economy. Speer claimed that mobilizing the 5 million women capable of war service would have released 3 million German males for military service. Such a step might have altered the results of battles and campaigns, although it probably would not have affected the overall outcome of the war.

As early as 1942, Speer recommended that women be recruited for industry, but Hitler rejected this advice. Not until 1943 were women between 17 and 45 years of age required to register for compulsory work. Later, the upper age limit for women was raised to 50, and the age span for men was set at 16 to 65. By 1944, German women actually outnumbered men in the civilian labor force at 51.6 percent.

Another available source of skilled labor that had served the Fatherland well during World War I was the Jews. Numbering about 600,000 when Hitler came to power, many German Jews soon escaped abroad. Virtually all who remained and were identified perished in the “final solution.” The systematic extermination of European Jewry also took its toll on the war effort, as considerable manpower was absorbed simply in rounding up and transporting European Jews to the death camps.

The Third Reich sought to compensate for labor shortages by using foreign workers. In March 1942, Fritz Sauckel became general Reich director for labor, or minister of labor. In 1942, there were 3.8 million fewer people employed in the German economy than in 1939. The Germans tried to attract foreign skilled workers with financial incentives. When this approach failed, the occupiers simply rounded up those they thought necessary and shipped them to Germany to work in appalling conditions. By the end of 1942, the total number of people working in the German arms industry had risen by 1.3 million. By September 1944, there were 7.5 million foreign and 28.4 million German workers, and at the end of the war there were upward of 10 million foreign workers in the Reich. Such labor was hardly efficient. Speer noted that in October 1943, some 30,000 prisoners working in armaments production produced over a seven-month period only 40,000 carbines, whereas 14,000 U.S. workers turned out 1,050,000 carbines in the same amount of time. Until 1944, most German factories only ran a single shift per day, and only 10 percent of employees were working a second or third shift.

Only at the very end of the war, when it was clear even to the German leadership that the war was lost, did the regime risk disrupting the German home front. By then, of course, German cities were being devastated by Allied strategic

bombing. The suffering of his people did not seem to disturb Hitler. He held that Germans had proven “unworthy” of him and thus deserved to perish with him.

Germany, Navy

Under Adolf Hitler, Germany embarked on a program to rebuild its navy on a global scale. The German navy (Kriegsmarine) began this major effort after the signing of the Anglo-German Naval Treaty in June 1935. The goal was creation of a balanced fleet that would serve as the core of a future blue-water navy dominated by battleships. This Z Plan envisioned a powerful fleet that would one day challenge Britain and the United States for world naval mastery.

In 1938, Hitler's aggressive foreign policy forced the navy to consider the possibility of a future naval war against Great Britain. The navy's commander, Grand Admiral Erich Raeder, designed a strategy to attack the British sea-lanes. His proposal to build ships more suited to a commerce war, including additional U-boats, was rejected by Hitler, who was intent on building a battleship-dominated navy that would serve as an instrument of political and military force commensurate with a world power. Shortages of resources contributed to delays in naval construction, and Raeder's blind confidence in the Führer's diplomatic successes and promises that war would not come before 1942 or 1943 found the navy unprepared for war in September 1939.

At the beginning of the war, the German navy consisted of 79,000 men, 2 battleships, 3 pocket battleships (small, fast, strongly constructed battleships), 1 heavy cruiser, 6 light cruisers, and 33 destroyers and torpedo boats. Fewer than half of the 57 U-boats available were suitable for Atlantic

operations. In spite of Raeder's initial pessimism that the navy could only “die gallantly,” thereby creating the foundations for a future fleet, he intended to carry out an aggressive naval strategy that would attack British sea communications on a global basis using his concept of diversion and concentration in operational areas of his own choosing and timing. Raeder persistently argued with Hitler that only total economic warfare against England could have a decisive impact.

Hitler's restrictions on naval operations, particularly on the U-boats, frustrated Raeder's attempts to seize the initiative and achieve early successes. In late 1939, concerned that the British were planning to invade Norway, Raeder instigated planning for the successful German occupation of Norway and Denmark (Operation WESERÜBUNG). This April 1940 operation was for the navy its “feat of arms”—justifying its contribution to the war effort and future existence. Although the navy did secure important port facilities for surface raiders and U-boats in Norway as well as the shipping route for iron ore from Sweden, it also suffered substantial losses in the operation in the form of 3 cruisers and 10 destroyers. In June, with the defeat of France, the navy acquired additional ports on the Atlantic and Bay of Biscay for surface ships and submarines. But the navy also now had to protect an extended coastline from occupied France to Scandinavia. From 1940 to 1943, Germany also sent to sea 9 armed auxiliary cruisers.

Raeder's intent to prove the worth of the surface fleet, in particular the battleships, led him to demand of his commanders that they take risks yet avoid unnecessary combat that could lead to losses. Two fleet commanders lost their jobs when they failed to exhibit the necessary aggressiveness. The scuttling of the pocket battleship *Graf Spee* in December 1939 and Hitler's displeasure over this loss further reinforced the inherent contradictions in Raeder's orders to strike boldly but avoid damage to the navy's own ships. With new battleships *Bismarck* and *Tirpitz* joining the fleet, Raeder envisioned a new phase of the Atlantic surface battle, with task forces that would engage Allied convoys protected by capital ships. In an effort to prove the value of the battleships, Raeder pressed the *Bismarck* into service before the other battleships were available for action. Her loss in May 1941 represented the end of the surface war in the Atlantic and Hitler's increasing interference in the use of Germany's remaining capital ships.

Unable to achieve the conditions for a cross-Channel invasion (Operation SEA LION) in September 1940, Raeder tried to divert Hitler from his plans to attack the Soviet Union. Raeder advocated an alternative strategy in the Mediterranean to defeat Britain first, especially given the growing cooperation between that nation and the United States. After the Japanese attack on Pearl Harbor, Raeder saw an opportunity to link up with the Japanese in the Indian Ocean and use the French African colonies and the Atlantic islands of Portugal and Spain to expand the bases for a long-term war against the

Anglo-American naval forces in the Atlantic. These plans never materialized, as the war against the Soviet Union faltered and Germany was forced to come to the aid of Italy and secure its southern flank in the Balkans.

Nervous about British threats to Norway and Allied support to the Soviets in the north, Hitler ordered that the two battleships in Brest—the *Gneisenau* and *Scharnhorst*—and the heavy cruiser *Prinz Eugen* be either moved to Norway or scrapped. The “Channel dash” in February 1942 was a tactical success but a strategic defeat for the navy. With the fleet relegated to Norway as a “fleet-in-being,” the U-boat arm, under the command of Admiral Karl Dönitz, continued its role as the navy’s primary weapon. The lack of Luftwaffe support, though, continued to seriously hamper all operations. The navy never resolved the issue of whether the U-boat war was a “tonnage” war or a commerce war in which U-boats attacked targets that had the greatest potential for a decisive impact. Dönitz continued to argue that all resources should go to the U-boat war and disagreed with the diversion of U-boats to other theaters such as the Mediterranean or to the defense of Norway.

In late December 1942, the failure of the *Hipper* and *Lützow* to close with a weakly defended convoy in the Barents Sea (Operation RAINBOW) led an angry Hitler to attack Raeder and the surface fleet. Raeder resigned, and Dönitz succeeded him. Although Dönitz was determined to prosecute the submarine war ruthlessly, as with the surface fleet, the defeat of the U-boats in May 1943 resulted from Allied technology and successes in code-breaking that reflected the shortcomings in the naval leadership and military structure of the Third Reich. As the military situation of Germany deteriorated, the navy provided support to the army, particularly in the Baltic, where it conducted a massive and highly successful evacuation effort of troops and civilians.

In sharp contrast to the navy’s collapse after World War I, the German navy during World War II enforced strict discipline until the end. In April 1945, Hitler named a loyal Dönitz as his heir and successor.

Germany, Surrender of (8 May 1945)

German leader Adolf Hitler resolutely refused appeals from his subordinates for an end to the war. Claiming that the German people were unworthy of him, Hitler asserted that they must suffer the consequences. On 30 April 1945, with much of Germany in ruins and with Berlin under siege, Hitler committed suicide. His handpicked successor, Admiral Karl Dönitz, assumed the office of president of the Reich. Dönitz established a new government at Flensburg in the German province of Schleswig-Holstein.

This administration, dedicated to preserving the Third Reich, was compelled by the sharply deteriorating military situation to surrender German forces to the Allied powers. Dönitz’s chief consideration at the beginning of May was to negotiate an armistice with only the western Allied powers in order for German forces in the east to conduct a fighting withdrawal that would save them from Soviet captivity. This goal, however, was frustrated by the insistence of the western Allies that Germany surrender unconditionally to all of the Allied powers.

Dönitz tried to stave off absolute capitulation through the piecemeal surrender of portions of the Third Reich and occupied Europe. On 3 May, Admiral Hans-Georg von Friedeberg surrendered German forces in Denmark, Holland, and northern Germany to British Field Marshal Sir Bernard Montgomery. Dönitz was able to avoid complete surrender for several additional days after Friedeberg’s action, which allowed 3 million German troops to escape the Soviets. Unable to postpone action any longer, however, on 7 May 1945 Colonel General Alfred Jodl signed a surrender document at Supreme Commander, Allied Expeditionary Forces General Dwight D. Eisenhower’s headquarters in Rheims, France. Lieutenant General Walter Bedell Smith and Major General Ivan Sousloparov represented the western Allies and the Soviet Union, respectively. Also in attendance was Major General François Sevez of the French army. The agreement specified the unconditional surrender of all German land, sea, and air forces to the Supreme Commander, Allied Expeditionary Forces and also to the Soviet High Command.

The terms of the German surrender stipulated that all German military forces would cease fighting at 11:01 P.M. central European time on 8 May 1945. The final terms of the agreement stated that the surrender could be superseded by any similar

German officers sign unconditional surrender in Rheims, France. (National Archives)

legislation passed by the United Nations, and it promised swift retaliation were any German forces to resume combat operations. This document signaled the end of fighting, but the actual surrender of German troops in German-occupied regions stretched until a capitulation on 11 May at Helgoland, an island located in the North Sea off the coast of Germany.

At the insistence of Soviet Premier Josef Stalin, a second, formal surrender instrument containing largely the same stipulations was signed in Berlin just after midnight on 9 May, despite the fact that the cease-fire had already gone into effect. Acting on behalf of the German High Command were Admiral Hans-Georg von Friedeburg, Field Marshal Wilhelm Keitel, and Colonel General Hans Jürgen Stumpff. Marshal Georgii Zhukov and Air Marshal Sir Arthur W. Tedder represented the Soviet Union and the western Allies, respectively. Also in attendance were French General Jean de Lattre de Tassigny and U.S. Army Air Forces General Carl Spaatz.

Although the agreement signed at Rheims signaled the end of Germany's participation in World War II, it did not terminate the Third Reich. The Allies retained Dönitz's government initially to deal with the immediate postwar problems of food distribution to German citizens and refugees. On 23 May 1945, however, Dönitz and his cabinet were removed and arrested

by the Allies. The new rulers of Germany, as of 5 June, were the Allied powers. They soon implemented plans for postwar Germany determined during wartime diplomatic conferences.

Gerow, Leonard Townsend (1888–1972)

U.S. Army general. Born in Petersburg, Virginia, on 13 July 1888, Leonard Gerow graduated from the Virginia Military Institute in 1911 and was commissioned a second lieutenant of infantry. Gerow took part in the 1914 occupation of Veracruz,

Lieutenant General Leonard T. Gerow. (Library of Congress)

Mexico. Following U.S. entry into World War I, Gerow served in France from April 1918 with the Signal Corps, fighting in the Second Battle of the Marne and the St. Mihiel and Meuse-Argonne Offensives.

Following the war, Gerow won promotion to permanent major in June 1920. Between the wars he commanded the Signal Corps (1919–1921) and alternated staff assignments in Washington; tours in Shanghai and the Philippines; and training courses at Fort Benning, Georgia; and Fort Leavenworth, Kansas, where he excelled. From 1935 onward, Gerow served in the War Department's War Plans Division. Promoted to brigadier general in October 1940, he became chief of the War Plans Division in December 1940. From December 1941, he served simultaneously as assistant chief of staff.

In February 1942, Gerow was promoted to major general and took command of the 29th Infantry Division, which began advanced training in Britain the following October. Gerow was a leading member of the talented group of top American officers that General Dwight D. Eisenhower gathered around himself when he was supreme commander in Europe. In July 1943, Gerow took command of V Corps of what became Lieutenant General Omar N. Bradley's First Army, which experienced heavy fighting in the Normandy Invasion of June and July 1944. On 25 August 1944, Gerow was the first Allied general to enter Paris. He then led V Corps

in campaigns through northern France and the Rhineland. In January 1945, Gerow was promoted to lieutenant general and took command of the new Fifteenth Army, which secured the western French coast, taking the ports of Saint-Nazaire and Lorient. The area was also a staging ground for training and equipping units to join the 12th Army Group, which carried the battle into Germany itself.

From October 1945 to January 1948, Gerow was commandant of the Command and General Staff College. He then commanded the Second Army at Fort Meade, Maryland, retiring in July 1950. He died at Petersburg, Virginia, on 12 October 1972.

Ghormley, Robert Lee (1883–1958)

U.S. Navy admiral. Born in Portland, Oregon, on 15 October 1883, Robert Lee Ghormley graduated from the University of Idaho in 1902 and from the U.S. Naval Academy in 1906. Ghormley's first assignments were in cruisers. During World War I, he served as aide to the commander of the Battleship Force, Atlantic Fleet. He was then assistant director of the Overseas Division, Naval Overseas Transportation Service.

Between the wars, Ghormley held a variety of staff positions. In 1935 and 1936, Captain Ghormley commanded the battleship *Nevada*. He then directed the War Plans Office and, in 1939, became assistant to the chief of naval operations. In August 1940, now a rear admiral, Ghormley was sent to London as a naval observer and to recommend possible U.S. naval aid to Britain.

In June 1942, newly promoted to vice admiral, Ghormley was named commander to the South Pacific Area and Force. He assumed his new command as plans for the invasion of the U.S. Guadalcanal were in progress. Believing his forces to be unready, he requested a postponement in the operation, which was denied. He then seems to have distanced himself from the operation, while tensions between his subordinate commanders were left unresolved. After the Allied defeat in the Battle of Savo Island, Ghormley feared that the entire Guadalcanal operation would fail. As a result, he continued to maintain strong garrisons on other islands in the event of future Japanese

U.S. Vice Admiral Robert L. Ghormley. (Photo by Keystone/Getty Images)

advances, rather than using those forces to assist in winning the protracted struggle on Guadalcanal. Ghormley suffered from a severely abscessed tooth at the time, which may have interfered with his decision making. In October 1942, following the Battle of Cape Esperance, Admiral Chester W. Nimitz, commander of the Pacific Fleet, replaced Ghormley with Vice Admiral William F. Halsey Jr., who infused an offensive spirit into the campaign that Ghormley seemed incapable of maintaining.

In 1943, Ghormley commanded the Hawaiian Sea Frontier, and in 1944 he took charge of the 14th Naval District, Hawaii. At the end of the war, Ghormley assumed command of U.S. Naval Forces in Germany (Task Force 124), which was charged among other things with demobilizing the German navy. Ghormley retired from the navy as a vice admiral in August 1946, and he died at Bethesda, Maryland, on 21 June 1958.

GI Bill (22 June 1944)

U.S. social welfare program for those serving in World War II. Officially known as the Serviceman's Readjustment Act of 1944, the GI Bill remains one of the most popular and effective government programs in American history. Although federal law protected the right of veterans to return to their prewar jobs, many wanted and expected more than a return to their 1941 positions. The GI Bill was born partly out of a desire to reward the men of America's military for their service. President Franklin D. Roosevelt had originally envisioned a much larger program that included job retraining, but he agreed to a slightly less ambitious plan advanced by an alliance of Democrats and progressive Republicans.

Signed on 22 June 1944, the GI Bill paid for college tuition and vocational training and provided students with housing and medical benefits. Other aspects of the bill made available low-interest loans guaranteed by the federal government for mortgages and starting businesses. Unemployed veterans received cash payments. Supporters sought to use the program to empower veterans through education and training, thus making them less dependent on corporations, unions, or—in the long run—the federal government. The bill had the support of veterans' groups such as the American Legion, which helped to draft the legislation, and the Veterans of Foreign Wars. The Hearst newspapers also lent their support.

The GI Bill had motives beyond showing the nation's gratitude to returning veterans. Remembering the plight of World War I veterans and the ignoble episode of the 1932 Bonus Army—when some 20,000 World War I veterans, impoverished by the Great Depression, converged on Washington in 1932 in the hope of collecting their adjusted compensation bonuses immediately rather than in 1945 as legislated—the bill aimed to ease veterans into the workplace slowly. Many economists and politicians feared that if 12 million veterans descended on the job market at the same time, the United States might return to economic depression. By placing some veterans in schools and supporting the desires of others to start small businesses, the GI Bill sought to lessen these pressures.

The GI Bill had a long and lasting influence on American society. More than 1 million veterans attended colleges and universities using the bill's benefits, and more than 8 million veterans used one or more of its programs. The bill

Books and supplies, as well as tuition and other fees, up to a total of \$500 per year, were furnished to each veteran under the GI Bill. (UPI/Bettman/Corbis)

underwrote more than 3.5 million mortgages, and in 1947 it funded almost 40 percent of all housing starts in the United States. The GI Bill thus helped to fuel the postwar economic boom by stimulating the construction industry and all of its subsidiary industries. It also provided enormous cash infusions into American colleges and universities. Since World War II, the U.S. government has enacted various legislation offering GI Bill–type benefits to veterans of the Korean and Vietnam Wars, as well as to some members of the peacetime military.

Gilbert Islands Campaign (November 1943)

U.S. amphibious campaign in the Central Pacific and an important advance toward the Japanese home islands. The 16 atolls that constitute the Gilbert Islands lie astride the equator. The Americans invaded the Gilbert Islands in late November 1943; approximately 200 ships and more than 30,000 troops seized the atolls of Makin, Tarawa, and Abemama in Operation GALVANIC. Fifth Fleet commander Vice Admiral Raymond A. Spruance had overall command of the operation, and Rear Admiral Charles A. Pownall commanded Task Force 50.

Following preparatory air strikes against Rabaul, the 11 fleet carriers in Task Force 50, which were divided into 4 different carrier groups, neutralized Japanese bases in the Marshall Islands and pounded Makin and Tarawa in preparation for landings there. At the latter two atolls, 7 battleships and

accompanying cruisers bombarded the shore for more than an hour the morning of the invasion. On 20 November, Rear Admiral Richmond K. Turner's Task Force 54 landed elements of the army's 27th Division on Butaritari Island; 2nd Marine Division troops landed on on Betio Island.

At Butaritari, 4 battalions from the 27th Division assaulted Beach Yellow in the lagoon and Beach Red on the western face of the island. Although the reef line forced the men in the lagoon to wade the last 300 yards to shore, initial resistance was light since only 300 Japanese combat troops defended the island. The attack became bogged down by enemy snipers and small counterattacks, however, and it took three days to secure the island. The army suffered 64 killed and 150 wounded.

Resistance was heavier on Betio, a small but well-fortified island defended by 4,000 Japanese troops. Initially, three Marine battalions landed on Beach Red along the wide lagoon side of the island. These troops ran into heavy fire, and, as low tide prevented heavy equipment from crossing the reef line, the attack stalled in the face of determined Japanese resistance. Two additional battalions landed as reinforcements

later that day, and a sixth battalion landed the following morning. All suffered heavy casualties in the process. The situation improved late on the second day when destroyers and aircraft supported the landing of a seventh battalion at the narrow western end of Betio. Using tanks, grenades, TNT blocks, and flamethrowers, the Marines secured most of the island by 22 November. Two Japanese counterattacks were repulsed that evening, and the entire atoll was cleared six days later. The United States lost 980 Marines and 29 sailors killed; 2,106 troops were wounded. Only 17 Japanese survived the battle; they were taken prisoner along with 129 Korean laborers.

Although the Japanese surface navy did not intervene, Japan's air and submarine units did strike the American invasion force. At dusk on 20 November, 16 twin-engine "Betty" bombers attacked a carrier group off Tarawa and torpedoed the light carrier *Independence*. The explosion killed 17 sailors and wounded 43, and it forced the carrier to retire for repairs. At least three similar raids followed over the next week, although none scored hits because American air cover—including the first use of night-combat air patrols—broke up

the attacks. More deadly were Japanese submarines, one of which torpedoed and sank the escort carrier *Liscombe Bay* on

The Gilbert landings cost the lives of roughly 1,800 Americans and 5,000 Japanese.

24 November, killing 642 sailors. Overall, the Gilbert landings cost the lives of roughly 1,800 Americans and 5,000 Japanese, including the crews of 4 lost Japanese navy submarines. The Gilbert Islands

Campaign provided important lessons in amphibious operations, and it paved the way for the next U.S. amphibious operation, which was conducted against the Marshall Islands in January and February 1944.

Giraud, Henri Honoré (1879–1949)

French army general. Born in Paris on 18 January 1879, Henri Giraud graduated from the French Military Academy of Saint-Cyr in 1900. During World War I, he fought on the Western Front. As a captain he was taken prisoner by the Germans near Guise in late August 1914, but he escaped that October and returned to France in February 1915. Giraud distinguished himself in later fighting, rising at the end of the war to command a battalion.

165th Infantry assault wave attacking Butaritari, Yellow Beach Two, find it slow going in the coral bottom waters. Japanese machine gun fire from the right flank makes it more difficult for them, Makin Atoll, Gilbert Islands, 20 November 1943. (National Archives)

Giraud was in Turkey from 1918 to 1922 and in Morocco from 1922 to 1934. He played an important role in the Riffian Wars in Morocco, and his forces captured Moroccan nationalist leader Abd-el-Krim in 1926. Giraud was promoted to colonel in 1927, to brigadier general in 1930, to major general in 1934, and to lieutenant general in 1936. He commanded the Sixth Military Region at Metz, France, from 1936 to 1939. On the French military mobilization for World War II on 2 September 1939, he took command of Seventh Army as a full general. Giraud had little comprehension of the new theories of high-speed warfare with tanks operating en masse.

When the Germans invaded France and the Low Countries in May 1940, Giraud led the Seventh Army into Belgium in accordance with the Allied plan. On 15 May, he assumed command of the collapsing Ninth Army. The Germans captured Giraud on 18 May at Wassigny and imprisoned him at Königstein in Saxony. Giraud escaped on 17 April 1942 and crossed Germany to Switzerland and then to Vichy France—embarrassing Vichy officials, who had been attempting to improve relations with the German occupiers. At a meeting on 2 May 1942 attended by Admiral Jean François Darlan and Pierre Laval, Giraud refused to accept German Ambassador Otto Abetz's invitation to return to prison.

In November 1942, Giraud was spirited out of France and transported by the British submarine *Seraph* to North Africa. (The Anglophobic Giraud had insisted on an American boat, but none was available, and so he was tricked into believing the *Seraph* was a U.S. submarine). U.S. and British officials, hoping that Giraud might replace Charles de Gaulle as leader of Free French Forces, made him commander of French forces in North Africa in December 1942. On 30 May 1943, de Gaulle arrived in Algiers, and on 3 June agreement was reached whereby Giraud became co-president with de Gaulle of the French Committee of National Liberation. De Gaulle was easily able to elbow the politically inept Giraud aside, and the arrangement only lasted until 9 November 1943, when Giraud resigned.

As commander in chief of French armed forces until 4 April 1944, Giraud continued to play an important role in rebuilding the French military forces before being forced to retire. In June 1946, Giraud won election to the French National Assembly from Moselle, and he continued to serve as vice president of the Supreme War Council until 1948. Giraud died at Dijon on 11 March 1949.

Glide Bombs

Precursor to today's cruise missiles developed by the Germans. The Germans developed two types of weapons systems, the first of which was the free-fall FX-1200 bomb. Designed by Max Kramer of the Ruhrstahl AG, it weighed 3,460 lb with a warhead of 771 lb. The FX-1200 had small 5 ft 3-inch wings to enable it to glide, and it was radio-controlled by means of an electrical tail unit. Glide bombs were carried by such German aircraft as the Dornier Do-217, Heinkel He-117, and Junkers Ju-88 and Ju-290.

On 9 September 1943, after Italy had announced an armistice with the Allies, the Germans used FX-1200 glide bombs to sink the Italian battleship *Roma*; half of her crew was lost. The Germans also severely damaged the battleship *Italia*. The FX-1200 could be dropped from an altitude of 18,500–22,700 ft and a distance of up to 3 mi from the target.

The second glide bomb was the Hs-293, designed by Herbert Wagner of the Henschel Company. The Hs-293 was a rocket-assisted, guided, winged bomb, initially designed for use against ships. It was fitted with a Walter 109–507B rocket motor of 1,323 lb thrust, giving it a speed of about 360 mph. The Hs-293 was 13 ft 4 inches long with a wingspan of 10 ft 7 inches. It weighed about 2,140 lb, of which about 165 lb was in the rocket and 1,124 lb was in the warhead—a substantial ratio of warhead to delivery system. The Hs-293 employed a Dortmund/Duisburg wire-guided system for control, and it had a useful range of almost 10 nautical miles.

Modifications to the Hs-293 included the Hs-294 (16 ft 5 inches long with a wingspan of 14 ft 2 inches), Hs-295, Hs-296, Hs-297, Hs-298, and Hs-344. The Hs-298, a smaller version of the Hs-293, was designed to be launched from night fighters against Allied bombers. It had a two-stage rocket motor and could operate at heights up to 20,000 ft. Its warhead weighed about 150 lb. The Hs-344 was another lightweight version designed for use by fighters against other aircraft. These versions were largely just tested.

The Germans first used the Hs-293 on 24 August 1943 in the Bay of Biscay. During Allied Operation PERCUSSION, an antisubmarine air and surface attack on German U-boats, the Canadian 5th Support Group came under air attack from 14 Dornier Do-217 bombers of the 2nd Squadron of Kampfgeschwader 100 and 7 Junkers Ju-88Cs of another unit. The attackers employed Hs-293s to damage the sloop *Landguard* in 4 near hits and the sloop *Bideford* in 1 near hit. On 28 August, 18

Do-217s attacked the relieving 1st Support Group and sank the British sloop *Egret* and heavily damaged the Canadian destroyer *Athabaskan*.

Kapfgeschwader 100 mounted further attacks with the Hs-293 in the Mediterranean in September 1943. During the U.S. landing at Salerno on 11 September, Kapfgeschwader 100's Do-17s attacked and heavily damaged the cruiser *Savannah* and narrowly missed the cruiser *Philadelphia*. On 13 September, the British cruiser *Uganda* was hit and heavily damaged. The *Philadelphia* and British destroyers *Loyal* and *Nubian* were both damaged. The hospital ship *Newfoundland* was sunk, probably by an Hs-293. On 16 September, the British battleship *Warspite* sustained heavy damage from 2 Hs-293 hits. Among other Allied warships that were struck and sunk were the British destroyer *Intrepid* and the Greek destroyer *Vasillissa Olga* on 26 September, the Italian destroyer *Euro* on 1 October, and the British destroyer escort *Dulverton* on 13 November 1943.

During the landing at Anzio, Do-217s and Ju-88s again attacked Allied ships with Hs-293 glide bombs. On 23 January 1944, these glide bombs sank the British destroyer *Janus* and damaged the destroyer *Jervis*. On 29 January, Hs-293s sank the British cruiser *Spartan*, and on 25 February they sent to the bottom the British destroyer *Inglefield*.

The glide bomb was well conceived and well tested. Some 2,300 were used in combat, but production was limited by the many other demands on the German armaments industry at the time. The Germans claimed that the glide bombs sank or damaged 400,000 tons of Allied shipping, but this was an exaggeration. The Germans also sent plans for their rocket motors by submarine to the Japanese, who used them to develop their Oka manned rocket bomb.

Late in the war, the United States tested several types of air-to-surface missiles, including the Fletcher XBG-1, Fletcher XBG-2, Cornelius XBG-3, Pratt-Reed LBE, Piper LBP, and Taylorcraft LBT. The term "glomb" was used as shorthand for "glide bomb." The Eighth Air Force used the GB-1 series of glide bombs beginning on 28 March 1944. Some 1,000 were launched, but they lacked accuracy. Later versions incorporated television guidance, but only one version (Project Batty, a GB-4) was used in combat. Instead, bombs without wings but with a guidance system were used. One was the Azon (for "azimuth only"); another was the Razon (azimuth and range guidance). Azons were used successfully in combat. A later version, the Tarzon, was used effectively during the Korean War.

The most advanced winged missile of World War II was the Bat, a glide bomb with a 1,000 lb bomb and semiactive radar homing. Employing PBV-42s Privateer aircraft, the U.S. Navy used the Bat with great success against Japanese shipping. The Bat had a 10 ft wingspan, was a little longer than 11 ft, weighed 1,880 lb, and achieved 300 mph in the glide.

Range depended on the release height; a Bat sank a Japanese destroyer at 20 mi distance from the drop aircraft.

Goebbels, Paul Joseph (1897–1945)

Key German official and minister of propaganda. Born on 29 October 1897 at Rheydt in the Rhineland, Joseph Goebbels was physically small with a clubfoot. He grew up in a deeply religious Catholic setting, but on graduation from the University of Heidelberg with a doctorate in literature in 1921, he renounced his faith.

Unsuccessful in his desired literary career, Goebbels temporarily worked in a bank. In 1924, he formed a close association with Adolf Hitler. After spreading Nazi propaganda as the editor of the *Voelkische Freiheit* (people's freedom) at Elberfeld, "the Little Doctor," as he came to be called, moved up in the Nazi Party hierarchy. Hitler recognized his abilities and appointed him Gauleiter (leader) of Berlin in November 1926, charging him with rebuilding the party organization there. From 1927 to 1935, Goebbels edited the weekly newspaper *Der Angriff* (*The Attack*), which eventually became a daily and a financial success. Goebbels displayed considerable organizational skill and ability as a motivational speaker. He also ordered the Sturmabteilungen (Storm Troops, SA) to use physical force in the streets against the leftist opposition. In 1928, Goebbels won election to the Reichstag, and in 1929 he took charge of Nazi Party propaganda, playing an important role in building Nazi political strength throughout Germany.

Goebbels successfully used American advertising tools, psychology, and modern propaganda techniques to spread the message of Nazism. He made Horst Wessel, a thug who was killed in a barroom brawl, into a Nazi martyr, and he pushed the use of the Nazi salute and of "Heil Hitler"

German Nazi propagandist and politician Paul Joseph Goebbels. (Hulton Archive)

as a mandatory greeting. He also advanced new slogans and myths, including the *Führermythos*, that Hitler was the one savior of the German nation. He engaged in gross anti-Semitism.

Hitler rewarded Goebbels in March 1933 by appointing him to the cabinet as minister of propaganda. Goebbels exercised complete control over mass communication—the press, films, theater, radio, and sports—organizing all of it to work for the Nazi cause and later the war effort. He lived up to his own slogan, “Propaganda has nothing to do with truth.” Throughout the war, Goebbels worked to buoy the confidence of the German people. He trumpeted the claim of a “final victory” and in a speech in February 1943 invoked “total war.” Appointed plenipotentiary for total war in July 1944, Goebbels called on the German people for more and more sacrifices, imposing longer working hours and reducing benefits. He also proclaimed the advent of German “miracle weapons” that would win the war.

At war’s end, Goebbels and his family joined Hitler in the *Führerbunker* in Berlin. On 1 May 1945, a day after Hitler’s suicide, Goebbels and his wife Magda also committed suicide after first having poisoned their six small children.

Goebbels’s diaries are an important source of information about the National Socialist regime.

Goerdeler, Carl Friedrich (1884–1945)

German political figure and Nazi opposition leader. Born in Schneidemuhl, Pomerania, on 31 July 1884, Carl Goerdeler studied law and entered the civil service. An officer in World War I, he became deputy mayor of Königsberg in 1922 and lord mayor of Leipzig in 1930. In 1932, German Chancellor Heinrich Brüning appointed Goerdeler as commissioner of prices, a post he held until July 1935.

Adolf Hitler came to power in Germany in January 1933. At first, the traditionalist Goerdeler supported the new government, especially its centralization of authority. Goerdeler also believed that Hitler might solve Germany’s pressing economic problems. However, it soon became apparent that the new government insisted on total submission. In protest, Goerdeler resigned as mayor of Leipzig in 1937. Goerdeler was troubled not only by the regime’s domestic policies but also by its aggressive foreign policy, which he feared would lead to a general European war. He became one of the first to publicly speak out against the Nazi government and soon emerged as one of the leaders of the German Resistance movement against Hitler.

Once war began in September 1939, Goerdeler became a leading member of a conspiracy to overthrow Hitler. He wrote documents spelling out the goals of the Resistance and what should take place politically following Hitler’s removal from office. Throughout, Goerdeler maintained a close relationship with General Ludwig Beck, leader of the army officers who opposed Hitler. Although Goerdeler vigorously urged Hitler’s removal from office, he initially opposed an assassination that might make Hitler a martyr. Goerdeler argued that the Führer should be arrested and his guilt

exposed in a public trial. Others in the Resistance, however, believed assassinating Hitler was the certain course of action. By early July 1944, Goerdeler reluctantly agreed. According to plans developed by the Resistance groups, Goerdeler was to become the chancellor in a post-Hitler Germany.

On the failure of the 20 July 1944 bomb plot against Hitler, Goerdeler went into hiding. Arrested on 12 August, Goerdeler endured interrogation and was then sentenced to death. He wrote several essays and letters while in prison, and he was executed at Plötzensee Prison, Berlin, on 2 February 1945.

GOODWOOD, Operation (18–20 July 1944)

British Second Army attack in an attempt to break out of the Normandy beachhead near Caen, France. Operation GOODWOOD was originally suggested as an operation supporting Lieutenant General Omar Bradley's Operation COBRA, the breakout of his American 12th Army Group from Saint-Lô. British General Bernard Montgomery later saw GOODWOOD as an opportunity for his 21st Army Group to achieve a breakthrough or even perhaps a double breakout by both U.S. and British forces. Operation GOODWOOD involved three corps: three armored divisions of the British VIII Corps in the east provided the main effort to gain the rolling plain southeast of Caen rising toward Falaise, the Canadian II Corps was to secure the southern half of Caen, and the British XII Corps would conduct diversionary attacks on the right several days before the 18 July 1944 kickoff.

The concept for GOODWOOD, developed by commander of the British Second Army Lieutenant General Miles Dempsey, was to use massed airpower and artillery followed by an armor breakthrough of the German defensive crust. Prior to the ground attack, 1,700 heavy bombers from the Royal Air Force (RAF) Bomber Command and the U.S. Eighth Air Force, plus nearly 400 medium bombers and fighter-bombers of the U.S. Ninth Air Force, dropped 7,700 tons of bombs on the German defenses. Only fighter-bombers attacked in the zone of the main effort to prevent the massive cratering that had slowed British armor in its earlier attacks to seize Caen.

The air and ground bombardment began at 5:30 A.M. on 18 July, and the ground attack by the three armored divisions of VIII Corps occurred on schedule at 7:30 A.M. The effects of the bombardment and tactical surprise allowed the ground elements to advance more than 3 miles in slightly over an hour. In only about 3 hours, VIII Corps was nearing a clean breakthrough when it encountered the final German defensive line of antitank and flak guns. In an oversight, this defensive line had not been targeted for air bombardment and it, combined with dogged German defense, ground the advance to a halt. Limited local attacks continued on 19 and 20 July, but a heavy thunderstorm on 20 July turned the landscape into a quagmire, and GOODWOOD came to an end.

During the four-day operation, the Canadian II Corps captured the rest of Caen and part of the plain to the southeast, and the British VIII Corps secured nearly 35 square miles of terrain. However, the operation cost VIII Corps more than 4,000 casualties and the loss of 500 tanks—36 percent of all British armor on the Continent at that time. Although General Montgomery declared that the purposes of GOODWOOD had been achieved, the results were more disappointing. Some in the higher levels of Allied command, even on the British side, hinted that it might be time for Montgomery's removal. The failures of GOODWOOD focused Allied hopes for a breakout in Normandy on Operation COBRA.

Göring, Hermann Wilhelm (1893–1946)

German air force marshal and head of the Luftwaffe. Born on 12 January 1893 in Rosenheim, Bavaria, Hermann Göring was educated in military school in Karlsruhe. He then entered officers' training school at Gross Lichterfelde, and on graduation in 1912 he was commissioned in the infantry. He served in the German army and fought in World War I with the infantry until 1915, when he joined the air service. Göring succeeded Baron Manfred von Richthofen on the latter's death as commander of the Richthofen Squadron in July

German Reichsmarschall Hermann Göring. (Library of Congress)

1918. Credited with 22 aerial victories in World War I, Göring was awarded the coveted *Pour le Mérite*.

After the war, Göring moved to Scandinavia, where he took up show flying and married a Swedish baroness. He returned to Germany in 1921 and became a close associate of Adolf Hitler. In 1922, Hitler gave Göring charge of the *Sturmabteilungen* (SA, Storm Troopers), which grew dramatically in strength. Seriously wounded in the 1923 Beer Hall Putsch, Göring fled Germany but returned in 1927. In 1928, Göring was elected to the Reichstag, and in 1932 he was its president. Göring had easy access to influential individuals in industry, banking, and the military, and he acted as liaison between them and Hitler, playing a key role in the Nazi accession to power.

After Hitler became German chancellor in January 1933, Göring secured even more power and influence. Among his many offices were minister without portfolio, minister of the interior for the state of Prussia, and minister of the air force (Luftwaffe). Göring soon began rebuilding the Luftwaffe, and he was instrumental in all major policy decisions affecting its composition and training. In April 1933 out of the Prussian political police Göring established the *Geheime Staatspolizei* (Gestapo, political police), a force designed to crush all resistance to Nazism. In 1936, he was appointed to oversee the Four-

Year Plan, which gave him virtual control over the economy. As far as the Luftwaffe was concerned, Göring supported the notion of a tactical air force at the expense of strategic bombing, arguably the correct decision given the heavy military demands on Germany's industrial base. In 1939, Hitler appointed Göring Reichsmarschall (Reich Marshal) and designated him as his heir. Göring was also instrumental in the development of concentration camps, and he worked with Reinhard Heydrich, chief of Reich security, in formulating an *Endlösung* or "final solution" to the "Jewish question." Göring also amassed a large fortune and, especially during World War II, indulged his passion for collecting fine art.

Göring's Luftwaffe was influential in the early Nazi victories in Poland in 1939 and France in 1940. His interventions in the Battle of Britain in 1940, however, negatively affected the German effort and led to a loss of his influence with Hitler. Göring opposed Operation BARBAROSSA, Hitler's invasion of the Soviet Union, favoring a Mediterranean strategy instead. He was blamed, probably falsely, for having suggested that the Luftwaffe, with only a limited transport capacity, could supply the Sixth Army at Stalingrad. Popular opinion also turned against him as Allied air raids on the Reich became increasingly effective. Increasingly marginalized, Göring spent more time at his estate of Karinhall, where he indulged his interests in hunting and art collecting. Although Hitler had designated Göring as his successor, the latter's impatience at the end of the war—painted by Martin Bormann, head of the Party Chancery, and others as an attempt by Göring to wrest power from Hitler—led the Führer to order that Göring be stripped of his posts and arrested. Göring surrendered to elements of the U.S. 9th Infantry Division on 9 May 1945 and was tried at the International Military Tribunal at Nuremberg. Unrepentant, he was found guilty and sentenced to death. Göring committed suicide by swallowing poison on 15 October 1946 only hours before his planned execution.

Gott, Lord John

See Vereker, John Standish Surtees Pendergast (Sixth Viscount Gott).

Gott, William Henry Ewart “Strafer” (1897–1942)

British army general. Born on 13 August 1897 in Leeds, England, William Gott was educated at Harrow and Sandhurst. Commissioned into the King’s Royal Rifle Corps (KRRC) in February 1915, Gott fought in France during World War I, where he was wounded, awarded the Military Cross (MC), and taken prisoner. Gott continued in the army after the war, serving in the 13th London Regiment. He was promoted to major in January 1934 and saw service in India. Advanced to lieutenant colonel in 1938, Gott commanded a battalion of the KRRC.

In 1940, Gott was promoted to brigadier general and appointed as a staff officer to Major General Percy Hobart’s Mobile Force in Egypt, which he was rapidly developing into an armored division. As commander of the Support Group of the 7th Armoured Division, Gott took part in Operation COMPASS in December 1940, and in May 1941 he led the composite armored strike force for Operation BREVITY, the first Allied attempt to relieve Tobruk. Gott was then promoted to major general and given command of the 7th Armoured Division, which he led with great daring during Operation CRUSADER.

As with most other British officers, Gott—himself an infantry officer—initially failed to comprehend the concept of mobile mechanized warfare. However, on the basis of his experience fighting the Germans, who coordinated antitank guns, artillery, and infantry with their tanks, Gott suggested using 25-pounder field artillery to support British tanks. He was primarily responsible for the belated British policy of breaking down the traditional and rigid divisional organization into combined all-arms brigade groups, which became standard throughout the British army.

Gott built a reputation as a brilliant and energetic armored commander, and he was widely recognized as knowing more about the desert than any other senior British officer. Standing 6 feet 2 inches and built like a heavyweight boxer, Gott had an imposing presence and was one of the most inspiring commanders in the Middle East. Gott had an unrivaled knowledge of the exigencies and possibilities of desert warfare and a reputation for a lightning-quick grasp of a situation and a faculty for making rapid decisions. A legend in the desert fighting,

Gott was known as a “British Rommel,” tirelessly roaming the battlefield to rally and drive on the shaken troops.

Promoted to lieutenant general in 1942—one of the youngest officers of that rank in the British army—Gott took command of XIII Corps and led it through the defeats at Gazala and Mersa Matrûh. Nevertheless, his reputation was not tarnished during the British withdrawal to El Alamein. In August 1942, British Prime Minister Winston L. S. Churchill selected Gott to replace Auchinleck as commander of the Eighth Army. Although Gott protested that he was tired out and depressed by fatigue and defeat and would like nothing more than three months’ leave in England to recuperate, he agreed to take on the new post. On 7 August 1942, he flew to Cairo to take up his appointment. His aircraft was intercepted by a lone German fighter and shot down. Although his plane managed to land safely, Gott had been shot and killed. Following his death, Churchill immediately appointed his second choice, Lieutenant General Bernard Montgomery, as commander of the Eighth Army. Gott’s death, therefore, had a great impact on succeeding events in the desert and subsequently in Europe.

Graziani, Rodolfo (Marchese di Neghelli) (1882–1955)

Italian army marshal. Born at Filettino near Rome on 11 August 1882, Rodolfo Graziani joined the Italian Army and served in Libya in 1914 before being posted to the Italian Front during World War I. There he commanded a brigade, was wounded twice, and won promotion to major. A colonel at the end of World War I, Graziani earned a reputation as Italy’s most successful colonial general. Distinguishing himself in Tripolitania in the 1920s, for which he was promoted to brigadier general in 1923, he was dispatched to Cyrenaica, where he conducted a brutal but effective pacification campaign against the Senussi in 1930–1932. Promoted to major

Italian army Marshal Rodolfo Graziani. (Library of Congress)

general in 1930 and to lieutenant general in 1932, Graziani commanded a corps and then was appointed governor of Somalia in 1935. Graziani participated in the attack on Ethiopia in 1936 and destroyed the remnants of the Ethiopian army in February 1937. His successes earned him promotion to marshal and viceroy of Ethiopia on the departure of Marshal Pietro Badoglio. However, Graziani's savage rule provoked a widespread insurgency. He was severely wounded in an assassination attempt on 29 February 1937, and the Italian army crushed the uprising only with great difficulty. The Italians employed poison gas and were guilty of other atrocities.

Graziani left Ethiopia in January 1938 and was made honorary governor of Italian East Africa. In October 1939, Italian dictator Benito Mussolini appointed Graziani army chief of staff. Mussolini sent Graziani to Libya to replace Italo Balbo, who was killed in an airplane crash on 28 June 1940.

Although the 250,000 Italian forces in North Africa vastly outnumbered the scanty British troops there, Graziani refused to launch an offensive into Egypt, citing serious deficiencies in supplies and equipment. Infuriated by Graziani's timidity, Mussolini ordered him to attack. The subsequent tentative Italian offensive sparked a devastating British counteroffensive that drove the Italians from Cyrenaica in Febru-

ary 1941, and Graziani returned to Italy in semidisgrace and resigned from the army.

Because Graziani was the only general of note to remain loyal to the fascist regime after its collapse in 1943, that September Mussolini appointed him defense minister and chief of staff of the rump Italian Social Republic. Graziani spent the remainder of the war attempting unsuccessfully to rebuild the army in an atmosphere of intensifying civil warfare and German domination. In 1950, Graziani was sentenced to 19 years in prison for war crimes, but he was released after only a few months. He then headed the neofascist Italian Socialist Movement. Graziani died in Rome on 11 January 1955.

Great Britain, Air Force

The future of the Royal Air Force (RAF) appeared bleak at the end of World War I. With extensive personnel and aircraft drawdowns, the RAF's existence as an independent service remained in doubt until the appointment of General Sir Hugh Trenchard as chief of the Air Staff in January 1919. As dogged as he was visionary, Trenchard proved the viability of the third service, and by the mid-1920s he secured the RAF's future. In search of a mission, the RAF turned to imperial policing, especially in Somaliland, Aden, Palestine, India, and Iraq, where it proved highly successful.

Still, growth in force size was slow due to economic difficulties and an ever-shrinking defense budget. Of the 52 squadrons approved in 1923, only 42 had been established by 1934. In 1935, the transition to monoplane designs began, a process resulting in the most successful British fighter aircraft of the early war years—the Hawker Hurricane designed by Sydney Camm, which entered service in 1937; and the Supermarine Spitfire, designed by R. J. Mitchell, which appeared in 1938. In 1936, future manpower needs were addressed with the establishment of an RAF Volunteer Reserve. By January 1939, the total RAF establishment consisted of 135 squadrons.

Despite advancements in fighter types as defense against strategic bombers, the prevailing attitude throughout European air services reflected the airpower theories of such

visionaries as Brigadier General Billy Mitchell in the United States and Giulio Douhet in Italy, both of whom argued the primacy of the bomber. To overcome the loss of strategic mobility, a difficulty that was suffered by the armies of the Western Front in World War I, Britain embraced the concept of strategic bombing. This concept was based on the theory that long-range bombing would inevitably undercut an opponent's will and civilian morale, as well as cripple his economic ability to wage war.

The beginning of World War II in September 1939 found the RAF considerably better prepared than it had been only four years earlier. The Bomber Command order of battle included 54 squadrons equipped with Bristol Blenheims, Vickers Wellingtons, Armstrong Whitneys, and Handley Page Hampdens. The critical weakness lay in the match between air strategy and the instruments of war available in 1939. The RAF had no heavy bomber capable of delivering the crippling physical and economic blows necessary for strategic bombing success. Not until the Handley Page Halifax heavy bomber entered service in late 1940 did Bomber Command possess a heavy bomber that could carry the air war deep into enemy territory.

Fighter Command entered the war considerably better prepared in terms of equipment capability. The 35 home-based fighter squadrons with first-line Hurricanes and Spitfires were enhanced by a series of coastal radar stations known as Chain Home. Though relatively primitive, the radar network soon proved robust and difficult for the German Luftwaffe to destroy. Thus with a total of 1,466 aircraft, of which roughly 1,000 were first-line, the RAF faced Reichsmarshal Hermann Göring's Luftwaffe.

The first months of the war can best be characterized as a sparring match characterized by mainly frustrated attempts by the RAF to attack German navy warships. In France, Air Chief Marshal Sir Hugh Dowding, commander in chief of Fighter Command, insisted on sending only squadrons for the Advanced Air Striking Force (AASF) that were equipped with older, less robust aircraft such as the Gloster Gladiator. He feared losing first-rate aircraft and stripping home defense of fighting capability. Despite Dowding's conservatism, the RAF lost nearly 1,000 aircraft in the Battle of France, half of them fighters.

The Luftwaffe had high hopes of quickly dispatching the undermanned and outgunned RAF when as a precursor to invasion it launched Operation SEA LION, Germany's main air offensive against Britain, on 8 August 1940. However, Dowding's prewar innovations soon showed their worth. Fighter Command employed the group/area command-and-control system, in which each group was subdivided into sectors encompassing forward and primary airfields. Initially, groups 11 and 12 covered the country; they were later further divided into four groups. Within each sector and group, an operations room controlled activities; the whole enterprise was coordi-

nated at Fighter Command Headquarters. Connected by telephone to the Chain Home system and the Observer Corps, the command-and-control system allowed for a reaction to a raid in a matter of minutes with an appropriate number of aircraft being vectored to target. The system allowed Fighter Command to husband resources, identify incoming raids, scramble appropriate units, vector aircraft to target, and essentially ambush incoming German raids. This combination of the Chain Home system, coordinated sector control, and superior air frames—all due in large measure to the prewar efforts of Dowding—proved to be the decisive factors that led the United Kingdom to win the Battle of Britain.

In the first phase of the Battle of Britain, the Germans sought to draw the RAF into the air and destroy its fighting strength by attrition. By late August, that strategy had failed, and the Germans turned to destroying British airfields south of the Thames. This far more dangerous threat to RAF viability took a great toll of RAF men and machines by early September. Dowding estimated that three more weeks of such assaults would destroy Fighter Command's ability to mount any viable defense. Then, on the night of 24 August, German bombers were dispatched to strike an oil storage depot near London. Their navigation was faulty, and they dropped their bombs on London. Churchill immediately ordered the bombing of Berlin on the night of 25 August. One hundred and three British aircraft took off that night for Germany, 89 of them for Berlin. Only 29 bombers actually reached Berlin because of clouds and poor navigation equipment. The raid was certainly not a success, but it led Adolf Hitler to order a concentration on London. The Luftwaffe's primary target became the destruction of London rather than the vastly more important RAF airfields and production facilities. The shift to bombing London on 7 September allowed Fighter Command to repair airfields and facilities. For the next several months, British cities suffered through an almost nightly bombing campaign dubbed the Blitz, a failed strategy to attack civilian morale. Although the Chain Home radar network did not operate especially well at night, improved radar and night fighters, including the Beaufighter, proved capable of challenging German night bombing, and German losses mounted. In early autumn 1940, Hitler canceled SEA LION, and by May 1941 the air assault abated. Of the more than 3,000 pilots who flew in the RAF in the Battle of Britain as Winston Churchill's "few," some 500 died in combat.

In the initial stages of the war, the RAF had been loath to attack German industrial targets, despite the doctrine of strategic bombing. During the battles for France and Britain, Bomber Command had been reduced to attacking German shipping and invasion force transport. Some successful raids against Luftwaffe airfields occurred with good results. The turning point for the strategic air campaign occurred on the night of 23 September 1940, when 84 bombers attacked

Firebombs being loaded into a Royal Air Force Short Stirling bomber before an attack on industrial Germany. (Library of Congress)

Berlin. Although bomb damage and RAF losses were minimal, the RAF had commenced the practice of night bombing first industrial (especially oil) and infrastructure and later civilian targets. In 1942 the Avro Lancaster heavy bomber arrived in numbers. Having a range of more than 1,600 miles and capable of carrying 22,000 lb of bombs, the Lancaster was Britain's mainstay heavy bomber of World War II, and it enabled Bomber Command to carry the air war deep into Germany. The Lancaster Mark II, which appeared in 1943, had a range of 2,250 miles and could carry 14,000 lb of bombs. However, night navigation and target identification proved highly problematic. With no visual reference aids at night, bomber crews relied on Pathfinders. First fielded in August 1942, Pathfinder aircraft flew ahead of the formations, identified targets, and dropped color-coded marker flares. As the war progressed, electronic navigation improved, including the relatively primitive radio set known as "Gee," followed by the more-sophisticated blind-bombing device called "Trinity." The latter was a precursor of the advanced "Oboe" system, which employed a ground-distance-measuring station. The H2S system provided a radar display indicating prominent geographic features such as rivers, coastline, and urban structures, thus providing the hitherto missing navigational landmarks.

Night-bombing accuracy always suffered compared with the daylight assaults carried out by the B-17s and B-24s of the U.S. Army Air Forces (USAAF) Eighth Air Force beginning in 1943. To counter the night bombing, the Luftwaffe developed efficient night fighters and relied on massed anti-aircraft artillery. When the Blitz ended, Bomber Command increased the intensity of night strategic bombing. In a night raid on Hamburg on 8 May 1941, 300 bombers dropped several new 4,000 lb bombs.

On 22 February 1942, Air Chief Marshal Sir Arthur Harris took charge of Bomber Command. An energetic and enthusiastic advocate of terror bombing, Harris resolved to bludgeon Germany into submission. Night bombing of industrial targets increased immediately. To underscore the new attitude (and the advantage of the Lancasters with improved electronic navigation and targeting gear), Harris ordered the first thousand-bomber raid, which struck the German city of Köln (Cologne) on 30 May 1942. Simultaneously, the newly fielded and capable De Havilland Mosquito quickly established itself as an extraordinary melding of mission capabilities, including reconnaissance, bomber, fighter-bomber, and night fighter. Under Harris, British strategic night bombing increased in intensity, capability, and destructive force for the next three years.

Italy's entry into the war on 10 June 1940 found the RAF in the Middle East and Mediterranean dispersed over 4 million square miles of mainly desolate and hostile terrain. Its 300 first-line aircraft were organized into 29 operational squadrons. Most of the aircraft represented previous generations of fighters. Whereas this was suitable for imperial policing against tribesmen and ill-organized rebels, the Italian and later German air forces presented a difficult problem. The Italians could send up to 1,200 additional aircraft from Sicily and Italy to augment the 500 already in Africa. With imperial strategic interests threatened, notably the tenuous India/Far East supply line through the Suez Canal, Britain embarked on rapid air and troop reinforcement. Because few aircraft could make the journey completely by air, a scheme developed for shipping aircraft by sea to the Gold Coast; the planes then made a difficult flight across Africa to Egypt. Gradually, the Desert Air Force established air superiority in North Africa and aided Field Marshal Archibald Wavell's advance through Libya. Additionally, Malta, a linchpin of British Mediterranean power, was heavily reinforced; the island and its RAF garrison withstood furious, concerted Axis air assaults.

With the injection into North Africa in February 1941 of German ground forces supported by the Luftwaffe, the air advantage temporarily swung back to the Axis. As more Hurricanes, Spitfires, and American-made Curtiss Kittyhawks arrived, the Desert Air Force slowly overwhelmed the Axis air forces. By the time of the Battle of El Alamein at the end of October 1942, RAF aircraft outnumbered Axis aircraft by 1,200 to 690. Because it had more aircraft and was reinforced by top-of-the-line fighters and because many of its pilots were veterans of the Battle of Britain, the RAF gained air superiority and contributed heavily to the eventual Allied North African victory.

The war effort of the RAF Coastal Command is often overlooked, yet it played a tremendous part in subduing the submarine threat and keeping the sea lifeline open. In the early months, before Germany could mount a credible U-boat threat, the RAF concentrated maritime defense efforts against enemy commerce raiders. With only 19 home-based squadrons operating outdated aircraft, Coastal Command could do little more than close-in coastal patrol. As equipment and numbers improved, particularly with the arrival of the Short Sunderland and the American B-24 Liberator, Coastal Command's reach extended to practically the entire world. By late 1940, Coastal Command aircraft had begun minelaying operations and raids on the coast of France and in the North Sea.

By 1941, the German submarine threat intensified, and Coastal Command took up the challenges of shipping protection in the approaches and submarine hunting. The most dangerous area lay in a reconnaissance gap halfway across the Atlantic that land-based aircraft could not reach. In this area,

U-boats inflicted great casualties until the wide-scale employment of the Liberator, which operated from bases in Scotland, Iceland, and Canada and closed the gap in aerial coverage. Additionally, a new airborne radar, the ASV, improved air-dropped depth charges, and the organization of antisubmarine warfare (ASW) forces into hunter-killer groups of combined air and ship units all contributed to the growing effectiveness of ASW air operations. By late 1943, the Battle of the Atlantic had been won, and Coastal Command had played a major role in that victory. Of German U-boat losses in the Atlantic, 55 percent are believed to have been the result of air attack (although many of these losses were to aircraft flown from escort carriers). A further 19 percent of U-boat losses were the result of combined aircraft-warship actions.

In short, the RAF grew from a relatively small force wedded to strategic bombing and imperial policing in the early 1930s to a highly capable multimission force by the end of the war. Aircraft design advanced measurably with attendant gains in effectiveness and lethality. By 1943, the RAF deployed thousands of aircraft to every theater of operations and simply wore down the enemy through superior technology and weight of numbers. Advances in technology—particularly bomber navigation, targeting, and ASW radar—far outstripped Axis technological development, giving Britain's RAF not only a decisive quantitative advantage, but also a qualitative advantage by 1943.

In many respects, the RAF had established itself by 1945 as a coequal partner with the Royal Navy in defense of the British Empire and home islands. Certainly, the RAF consumed a huge portion of Britain's war economy, and its role and sacrifice in the war cannot be discounted. Fighter Command saved the nation in 1940, and Coastal Command challenged and eventually helped nullify the U-boat maritime trade threat. Although the effectiveness and morality of the strategic bombing offensive may be debated, its destruction of key German industrial targets, notably those of oil production and transportation, contributed significantly to the eventual Allied victory.

From an initial manning of 175,692 personnel (RAF and Women's Auxiliary Air Force [WAAF]) on 1 September 1939, the RAF reached a peak of 1,079,835 personnel of all ranks, branches, and nationalities (including Allied personnel serving in the RAF and Imperial/Dominion forces) by 1 May 1945. Of that number, 193,313 served as aircrew. The RAF had 9,200 aircraft of all types in all theaters in an operational status as of 1 May 1945. The cost was high. Relative to all other British services and branches, the RAF suffered the greatest personnel losses. From 1939 to 1945, the RAF lost 70,253 personnel killed or missing. Bomber Command flew 372,650 sorties, losing 8,617 aircraft and 47,268 men killed in combat or taken prisoner and a further 8,305 killed in training accidents. Deaths from other causes cost Bomber Command

ground crews and WAAFs a further 1,570 deaths. Fighter Command lost 3,690 aircrew killed in action and 1,215 seriously wounded.

Stanley D. M. Carpenter

Great Britain, Army

For many of the British army's commanding officers who had served as infantry subalterns during World War I 20 years earlier, the events of September and October 1939 must have conjured up a powerful sense of déjà vu. Then, as in 1914, a small expeditionary force of two corps assembled to take up position on the left of the French line in Flanders, awaiting the inevitable German advance across the Belgian plain. Decades-old plans for entrenchment and the tactics of a static war of attrition were dusted off and reissued. However familiar the first months of World War II may have been to these veterans of Arras and Ypres, however, their army's war was to take a dramatically unexpected turn less than a year later when the British Expeditionary Force (BEF) was ignominiously ejected from the European mainland after just a few weeks of sharp, mobile combat. They were not to return for another four years. Of the seven army-strength formations raised by Britain during the period 1939–1945, only one, the 2nd, was to fight in northwest Europe again. The bulk of Britain's land operations were conducted far from its old

World War I trench lines—in the Western Desert of North Africa, Sicily and Italy, the Balkan peninsula, Norway, Malaysia, Burma, and the northeast frontier of India. Such a fast-paced global struggle required a very different kind of army from that of World War I, with much greater technical specialization and more attention paid to the thorny problems of supply, communications, and control.

Although many key aspects of army life, such as the centuries-old regimental system, were carried forward mostly unaltered into World War II, the British army of 1939–1945 was to a large degree hurriedly reinvented institution. This ad hoc metamorphosis was a necessary reaction to the new conditions of warfare, for which the interwar years had inadequately prepared the army's leaders and structures. After the demobilization that followed the 1918 armistice, the British army had quickly returned to its traditional role as a small imperial security force made up of long-service regulars, the part-time home reserve of the Territorial Army (TA), and a variegated auxiliary of colonial troops overseas. The problems of policing such trouble spots of the Empire as Palestine and India were far removed from the new theories of mechanized breakthrough warfare being discussed by forward-thinking military strategists in Europe, and the army languished in its attachment to the bayonet and the quick-firing rifleman—important for crowd control in overseas colonies, but less useful on the modern battlefield.

There were, in spite of this, significant attempts to bring the army up to date. Captain B. H. Liddell Hart's revised infantry manual stressed the "expanding torrent" tactics of mobility and exploitation, and Colonel J. F. C. Fuller called for fresh thinking on tank warfare. The Experimental Mechanized Force established briefly in the late 1920s was the world's first prototype for the armored division. But a combination of Treasury parsimony and knee-jerk opposition from the "Colonel Blimps" who dominated the army's upper echelons prevented any profound reform until the eve of war, when—prompted by the dynamic but ill-fated Minister of War Leslie Hore-Belisha—the government finally accepted the need for rearmament funding and a peacetime conscription bill. The doubling in size of the Territorial Army in March 1939 and passage of the National Service Act a month later provided for hundreds of thousands of new recruits, but in the short term these developments only added to the administrative confusion of a force hurriedly trying to reequip for a new continental commitment in alliance with France.

At the outbreak of war, the army's manpower stood at 897,000, the regulars and TAs having merged by government decree. Five regular infantry divisions were available in the United Kingdom for transportation to France. Two infantry divisions were deployed in Palestine suppressing the Arab revolt; the Western Desert Force (WDF) in Egypt had a fledgling armored division (another was forming in the UK, and

would eventually join the BEF); and the remainder of the Empire was garrisoned either by individual battalions of regulars, units from the 300,000-strong Indian army, or indigenous militia like the King's African Rifles (KAR) in Kenya and Uganda. From these modest beginnings, the government of Prime Minister Neville Chamberlain proposed to recruit an army of 55 divisions (32 British, the remainder Indian and Dominion) for what it suggested would be at least a three-year war. There was as yet little clear plan as to where these divisions would be employed, or when.

Political control of the armed forces was exercised during hostilities through the War Cabinet, a subset of the full cabinet that liaised with the Chiefs of Staff Committee (COS) representing the uniformed heads of the army, Royal Navy, and Royal Air Force (RAF). The chief of the Imperial General Staff (CIGS) was the army's representative on the COS and, after the appointment of General Sir Alan Brooke in 1941, its permanent chairman. The CIGS had a vice-chief responsible for operations, plans, intelligence, and training and a deputy chief in charge of general organization. With the adjutant general (personnel), quartermaster general (logistics), and master general of ordnance, these men collectively made up the Army Council, which was chaired by the secretary of state for war. The War Office retained nominal ministerial responsibility for the army. However, Winston L. S. Churchill, appointed Prime Minister and Minister of Defence in May 1940, preferred to deal with the uniformed chiefs directly, and so Whitehall was relegated to a purely administrative function.

Operational control in the United Kingdom was vested in General Headquarters (GHQ) Home Forces, and the country was divided into a series of command districts: South Eastern, Southern, Western, Northern, Scottish, Eastern, London, and Northern Ireland. Various overseas GHQs were established in the Middle East, East Africa, Persia, and Iraq and in other theaters according to the vagaries of war; the commander in chief of the Indian army held sway across the Indian subcontinent. In 1939 and 1940, there was an unsuccessful attempt to create a viable Anglo-French Supreme War Council, but as the multinational character of the war developed with the entry of the United States in December 1941, command of British forces was increasingly delegated to pan-Allied authorities such as the Combined Chiefs of Staff at the strategic level and Supreme Headquarters, Allied Expeditionary Forces (SHAEF) and South-East Asia Command (SEAC) at the operational level.

The spiritual core of the army remained the 5 guard and 64 line infantry regiments that performed a unique administrative, but nontactical, function. Following the pattern established in World War I, the army expanded not by creating new regiments but by adding battalions to existing regiments, some of which traced their origins to the seventeenth century. The heart of the regiment was an organizational depot located

at the home barracks, while its component field battalions served scattered across the world in various brigade formations. It was uncommon for two or more of the same regiment's battalions to serve closely together at the front.

Regimental tradition was a powerful reinforcement of esprit de corps, particularly as most regiments had a regional recruitment base. But as the war progressed and manpower became scarcer, the territorial associations of each regiment were weakened, with a corresponding loss of group identity. The remainder of the army was similarly divided into administrative units with regimental or corps-level designations but no tactical roles. The Royal Armoured Corps was a composite of the old cavalry regiments, now mechanized, and the Royal Tank Regiment. The Royal Corps of Signals handled communications for the entire army down to individual battalion levels, where company signalers took over. Some of the services, such as the Royal Artillery and the Royal Engineers, had traditions and battle honors every bit as distinguished as those of the infantry; others, such as the Reconnaissance Corps, were newly created and short-lived. The most important noncombat services were the Royal Army Service Corps, which carried supplies to troops in the field; the Royal Army Ordnance Corps (RAOC), responsible for the procurement and maintenance of equipment; and the Royal Army Medical Corps, which handled the sick and wounded.

The greater emphasis in World War II on technical and logistical matters caused a much larger proportion of manpower to be allocated to the "tail" (as opposed to the "teeth") of the army than was the case during World War I. Some support formations became so unwieldy that they gave birth to spin-off services of their own, such as the Royal Electrical and Mechanical Engineers, which was formed from the RAOC in 1942. Other notable services handled pay, military policing, spiritual affairs (the Royal Army Chaplains), intelligence, catering, physical training, and education—the last being accused by many conservative officers of foisting socialist ideology onto the rankers, precipitating the Labour Party's 1945 election victory! Eventually a General Service Corps was created to process incoming recruits and provide basic training and ultimate service allocation. The all-women's Auxiliary Territorial Service played an increasingly critical role in support of the regulars, as did the Queen Alexandra's Imperial Military Nursing Service and the First Aid Nursing Yeomanry on the medical front.

Tactically, each late-war British army was divided into four corps, each with two infantry divisions and one armored division. An infantry division of 18,000 men consisted of three brigades of three battalions apiece, an independent machine-gun battalion, three Royal Artillery (RA) field regiments, and an antitank and antiaircraft regiment, plus the usual supporting attachments of signalers, engineers, and so on. Tank brigades were often temporarily attached to infantry divisions on an as-needed basis. The full-strength infantry battalion had four rifle companies of three platoons apiece, a headquarters

company, and a support company. The structure of armored divisions changed markedly throughout the war as experiments to find the best mixture of tanks to other services evolved. In 1939, there were two armored brigades per division, each of three regiments, with a motorized infantry battalion, field artillery regiment, and accompanying support units. By D day, this had changed to a single armored brigade of three tank regiments (78 tanks per regiment) plus a fully mechanized infantry battalion in armored personnel carriers, a motorized infantry brigade in trucks, an armored reconnaissance regiment, one or two RA field regiments, and a plethora of antitank, antiaircraft, and other support formations, for a total of 343 armored vehicles at full strength.

Two forces existing out of the standard army structure, special services and the Home Guard, deserve mention. The special services or "Commando" brigades were created after the Battle of France as Britain's only way of directly striking back at the Germans on the European continent. Although their hit-and-run tactics were of limited utility in the absence of an Allied second front, they played an important propaganda role in the testing years before Operation OVERLORD and later became a useful auxiliary to the conventional armies fighting in France and the Low Countries. Certain theaters of war spawned their own commando-like units, such as the Special Air Service (SAS) in the Western Desert and Orde Wingate's Chindits in Burma. The Parachute Regiment, which by the end of the war was two divisions strong, was originally a part of special services. The Home Guard, formed by a call for underage and over-age volunteers after Dunkerque, was originally intended as a last-ditch militia in the event of a German invasion of the British Isles. As the threat of attack receded, the Home Guard's function adapted to take over security and antiaircraft duties in the home islands from the regular army and to act as a training service for those about to be conscripted. At its peak in 1943, there were 1.7 million Home Guardsmen in 1,100 battalions.

By the end of the war, more than 3.5 million men and women had served in the regular forces, with the peak of 2.9 million reached in 1945. Eleven armored, 34 infantry, and 2 airborne divisions had been created. Other Imperial forces had expanded at an even greater rate: the Indian army was over 2.5 million men strong by V-J Day. Despite its early muds and campaign disasters, the army had matured to become one of the world's preeminent fighting forces and a signal contributor to the ultimate Allied victory. It had accomplished this with casualties of 264,443 killed, 41,327 missing, and 277,077 wounded.

Great Britain, Auxiliary Territorial Service (ATS)

Women's unit of the British army that provided ancillary and support services. The ancestry of the Auxiliary Territorial Service (ATS) can be traced to the World War I Women's Army Auxiliary Corps (WAAC), a quasi-military female support unit created in January 1917 with the aim of freeing more men for fighting. Its 57,000 members served in clerical positions and as telephone operators, cooks, and waitresses, but its women "officers" were not granted military commissions or titles. It disbanded in 1921.

In September 1938, as European war seemed ever more likely, the British government decided to establish a women's auxiliary army to be attached to the existing territorial army. The new ATS incorporated the venerable First Aid Nursing Yeomanry (FANY), formed by Lord Horatio Herbert Kitchener in 1907, whose members constituted most of the ATS Transport Section. ATS recruits received two-thirds of the pay of men. Initially, numbers were small, and most new enlistees served as cooks or storekeepers or in clerical positions. In spring 1940, 300 volunteered to accompany the British Expeditionary Force (BEF) to France, and ATS telephonists were among the last British service personnel evacuated from Dunkerque, France.

With the April 1941 introduction of national civilian or military service for all childless and single British women aged between 18 and 30, ATS numbers rose dramatically, reaching 65,000 within six months. Only women between the ages of 17 and 43 were eligible to enlist, a provision waived for female WAAC veterans of the previous war. In July 1941, ATS enlistees were granted full military status, although no woman

could be compelled to serve in situations where she might be subject to physical attack nor to operate a weapon without her prior consent. The range of ATS duties also expanded enormously. Among other duties, women functioned as mechanics, drivers, stevedores, orderlies, dental clerks, masseuses, photographers, munitions inspectors, and military police. They administered postal services and operated anti-aircraft batteries, guns, and radar installations. Women were banned from active combat duty, but their ancillary functions were often physically hazardous, especially when they took part in overseas campaigns in Egypt, North Africa, Italy, France, and Asia. A total of 198,000 women joined the ATS, of whom 335 were killed on duty. Another 302 were wounded, 94 went missing in action, and 22 became prisoners of war, a rate proportionately higher than that in either the women's naval or aviation auxiliary services. In part, these figures reflected the fact that appreciable numbers of ATS women were recruited as agents for the dangerous Special Operations Executive (SOE), which mounted covert operations in occupied Europe and elsewhere.

Although the ATS continued in existence after 1945, its numbers fell precipitously as all British armed forces experienced substantial postwar demobilization. In 1949, the ATS was disbanded and its remaining members were absorbed in the new Women's Royal Army Corps, which in 1992 finally amalgamated completely with the British army.

Great Britain, Home Front

Prime Minister Neville Chamberlain headed a coalition government on the outbreak of war. When Britain declared war on Germany on 3 September 1939, the public mood was one of resignation rather than the enthusiasm that had greeted entry into World War I. Indeed, during the period September 1939–May 1940, the so-called Phony War, there was a rather nonchalant attitude toward the war.

The United Kingdom of England, Wales, Scotland, and Northern Ireland numbered nearly 48 million people. The

nation had been battling the worldwide economic depression and, although the government had belatedly begun rearmament, much of the economy remained stagnant, and unemployment was high. Britain sustained few casualties in the early fighting, although the war was brought home by the mass evacuation of children from the cities, especially London, and imposition of a blackout at night. On the whole, however, domestic life was not much disturbed.

Although Parliament passed an Emergency Powers Act in September 1939 granting the government control of the economy, Chamberlain sought a more limited effort than was essential to bring victory. Aerial attack was a great concern, and the government endeavored to relocate families, especially those in London, to rural areas of the country. But Britain was slow to mobilize its assets for the war, especially its land forces. In the spring of 1940, Britain was still producing civilian automobiles, and unemployment was at 1 million people. Not until the German invasion of France and the Low Countries in May 1940 did the government and the people discover the true seriousness of the situation.

The Allied debacle in Norway precipitated a political crisis. Despite the fact that the Conservatives held a large majority in Parliament, Prime Minister Chamberlain was forced from office on 10 May 1940, the same day the German Army invaded France and the Low Countries. Former First Lord of the Admiralty Winston L. S. Churchill became prime minister. Completely committed to total victory, Churchill was one of history's great war leaders. Perhaps more at home in the nineteenth century, as far as spheres of influence and his attitude toward colonialism were concerned, Churchill was both eloquent and effective in rallying the British people behind the war effort. Flashing his famous "V for victory" sign, he later took it on himself to visit the bombed-out areas of London (unlike German leader Adolf Hitler, who never mingled with the German people). To the rest of the world, Churchill was the embodiment of British pluck and resolve.

Despite the efforts of his service chiefs to keep him at arm's length, Churchill insisted on a hands-on approach to the war, often intervening in military matters. The one sin for Churchill was inaction, but his decisions often had deleterious effects. Churchill also took a lively interest in scientific developments, in code-breaking, and in a wide range of schemes and gadgets that might be employed against the Axis powers.

Early on, Churchill developed a close relationship with President Franklin D. Roosevelt of the United States, but the British leader's vision of the world, in which Britain was a major imperial power, was fading. Churchill's influence over strategy also waned in the course of the war as the military strength of the United States grew dramatically vis-à-vis that of Great Britain.

With the German invasion of the west in May 1940, all the "phoniness" of the war disappeared. The government rapidly

Firemen at work in bomb-damaged street in London, after a German air attack in 1941. (New Times Paris Bureau Collection, National Archives)

expanded the Emergency War Powers Act of the year before, giving it “complete control over persons and property.” The nation survived the debacle of the German conquest of Western Europe and the subsequent Battle of Britain, thanks to the English Channel, the Royal Navy, and the Royal Air Force (RAF). Citizens were proud of their defiant stand against Germany—what Churchill referred to as the nation’s “finest hour.” Despite depredations by Axis submarines, Britain continued to access world resources, and the next year both the Soviet Union and United States entered the war on its side, ensuring an eventual Allied victory.

With the nation at last committed to total war, economist John Maynard Keynes supervised a survey of British resources. Completed in 1941, it greatly aided the government in assuming the direction of the entire economy. The government introduced strict price controls and rationing and mobilized its civilian population fully for the war effort. The National Service (Armed Forces) Act of 2 December 1941 authorized conscription of all males ages 18 to 50 for the mil-

itary, industry, or other national service. In June 1944, some 22 percent of adults were in the military and another 33 percent were in civilian war work. Women played a key role; by 1944 they comprised 37.9 percent of the civilian labor force.

The British government enjoyed great success increasing its production of armaments. In 1940, for example, Britain produced more aircraft than Germany (15,049 to 10,249). Labour Party member Ernest Bevin was a highly effective minister of labor. There was little unrest among British workers, especially as burdens were seen to be shared, and the standard of living was not seriously depressed.

About half of national resources went into the war effort, as exports dropped off and imports, especially of food, rose. The government sharply raised taxes to avoid as much borrowing as possible. The basic tax rate was 50 percent, whereas excess business profits were taxed at 100 percent. Some called this tax policy “war socialism.” Without Lend-Lease from the United States and assistance from Commonwealth nations, however, it would have been very difficult for Britain to survive.

Britain suffered far less material damage than most other warring states. It sustained in the war 244,723 military and 60,595 civilian deaths. But Britain's massive wartime effort, the expenditure of capital at home, the recall of overseas investment, the disruption of trade, and deficit spending all hastened a national economic decline already in progress. The hardships of war that imparted a sense of a shared national effort also heightened interest in reform at the end of the war. As early as 1942, the Beveridge Report called for establishment after the war of a minimum income level, medical insurance, and cradle-to-grave security for all citizens. Even during the war, Parliament extended to the entire population the right to a secondary school education. Popular interest in wide-ranging reform was not understood by Churchill, who focused almost exclusively on the war, but this mood led the Labour Party leadership to demand elections after the defeat of Germany. Held in July 1945 while the war against Japan was still in progress, the elections produced a surprising Labour upset; the party won 393 of the 640 seats in the House of Commons. In a nearly seamless transition, Labour leader and Deputy Prime Minister Clement Attlee replaced Churchill in the midst of the Potsdam Conference.

Although the United Kingdom experienced the exhilaration of victory, the country was hard hit economically and socially. Indeed, to finance long overdue social legislation, the Labour government was forced to cut in many other areas. The government also began a program of retrenchment abroad, and this meant giving full independence to much of the British Empire—India being the most dramatic example. The Labour government also soon determined that Britain could no longer continue as the world's policeman, and by 1947 it had largely passed that burden to the United States.

Great Britain, Navy

The somewhat disappointing performance of the Royal Navy during World War I led to considerable improvements in many tactical and operational areas by 1939. Despite the treaty limitations of the interwar years, the Royal Navy had reemerged as the world's dominant naval force by 1939. (The U.S. Navy did not embark on a massive rebuilding program until the Two Ocean Navy Act of 1940, and it became the larger naval and maritime force only by 1944.) Significant improvements in tactical and operational doctrine occurred in the 1920s and 1930s, especially in surface action and night-fighting techniques. In contrast to the lack of offensive-mindedness with concomitant reluctance to risk assets that characterized the Royal Navy in World War I, the Royal Navy of 1939 was imbued with a reinvigorated offensive spirit.

Weaknesses did hamper operations, notably the poor state of naval aviation, particularly when compared with naval aviation in the United States and Japan. Of the seven aircraft carriers in service at the start of 1939, only the *Ark Royal* (laid down in 1935) could be considered a modern carrier. Four of the other six had been modified earlier from battleship or battle cruiser hulls. The five new fleet carriers under construction would not begin operational service until well into 1940.

Despite the lessons of antisubmarine warfare (ASW) learned by 1918 and the need to protect merchant shipping and convoys, the Royal Navy had relatively poor commerce protection capabilities in 1939. Warship design had primarily emphasized coastal protection and submarine hunting, resulting in the short-range corvette ship type, which first came into service in 1939, and small escort destroyers. Although these ships had long-endurance capabilities, they proved unsuitable for open-ocean convoy escort primarily because of their size. Open-ocean convoy protection had been neglected, especially in training programs, and larger destroyers capable of trans-Atlantic convoy protection were in short supply. Despite the drawbacks, Britain managed to improve ASW capability and assets fairly quickly in response to the German U-boat threat. Although the smaller corvettes proved minimally effective for long-range mid-ocean operations, their successor—the larger, more seaworthy frigate, particularly the *River*-class dating from the 1940 building program—proved especially effective for convoy escort after 1942.

The initial German threat came from a three-part German offensive against commerce (*Handelskreig*) based on submarines, mines, and surface raiders. The Royal Navy quickly and effectively addressed each threat, although significant casualties did occur. Germany began the war with not many

more submarines than it had at the start of World War I—just 51 operational U-boats, about half of them coastal vessels. The organization of British convoys in the Western Approaches, combined with the Straits of Dover mine barrage, resulted in nine U-boats sunk by the end of 1939.

Although some vessels were lost to German mines, the navy reduced this menace with new technology, including degaussing against magnetic mines. Surface raiders threatened British commerce, particularly in the remote waters of the Indian Ocean and South Atlantic. Although German raiders such as the *Atlantis* and pocket battleship *Graf Spee* provided some tense moments early in the war, by late 1941 most surface raiders had been hunted down and sunk.

In April 1940, Germany attacked Norway, primarily to secure its northern flank and the vital iron ore trade with Sweden. The British navy opposed the German landings, but a daring run of 10 German destroyers into Narvik subdued the Norwegian defenses. The combination of the entire German surface fleet with German land-based air power quickly resulted in the occupation of Norway. Reacting to the German moves, a Royal Navy force of destroyers attacked the Germans at Narvik, but it suffered heavy losses. A follow-on attack three days later by a large force based around the battleship *Warspite* devastated the Germans, which severely hampered future enemy surface operations. Ultimately, though, the Royal Navy could not prevent German victory, especially in the face of effective enemy airpower. Additionally, the German fast battleships *Scharnhorst* and *Gneisenau* sank the fleet carrier *Glorious*.

The fall of France and loss of French ports heralded a realignment of Royal Navy forces, because prior to World War I, Britain had relied on France for the bulk of Mediterranean sea power. With the appearance of a hostile Vichy government, though, the navy established Force H based at Gibraltar under Vice Admiral Sir James Somerville and charged with controlling the western Mediterranean. Force H carried out a distasteful duty in the bombardment of the French Fleet at Mers-el-Kébir in July 1940. Force H also played a central role in the destruction of the German battleship *Bismarck* in May 1941, as well as in hunting down and destroying the Atlantic commerce raiders. But the loss of France allowed Germany to base long-range U-boats in Bay of Biscay ports such as Brest and Lorient. The toll on British and Imperial shipping dramatically increased by autumn 1940 as Adolf Hitler declared (on 17 August 1940) a total blockade of the British Isles.

By autumn 1941, the tide in the commerce war had turned in favor of Britain. Escort ships provided by the United States (50 World War I-era destroyers) and the increasing number of Royal Canadian Navy destroyers, improved detection equipment including radar; high-frequency direction-finding sets and Antisubmarine Detection Investigation Committee

(ASDIC or sonar), implementation of a cohesive and effective enemy submarine tracking system based on radio intercepts and code-breaking, and better cooperation with RAF Coastal Command all contributed to the reduction of the German submarine threat and effectiveness. Additionally, Germany's loss of the *Bismarck* and the relatively ineffective German effort to use heavy surface units to interdict the convoys to the northern Soviet Union across the Arctic above Norway all helped to lessen the threat to British maritime commerce by the middle of 1943. The Soviet convoys began receiving more robust escort following the destruction of the ill-fated PQ17 convoy in summer 1942. This enhanced escort included greater destroyer strength and escort carriers. The destruction of the battleship *Scharnhorst* off the Norwegian North Cape in December 1943 by a British battleship and cruiser force essentially ended the German surface threat to British and Allied maritime shipping.

Finally, despite a high number of U-boats operating in the Atlantic by March 1943 (up to 70 at any given time), the increasing skill of Allied submarine hunters and the closing of the "Black Hole" area south of Greenland, where air cover had not been previously available, meant a diminishing submarine threat and higher losses in U-boats. Escort carriers provided air cover while long-range maritime patrol aircraft (primarily modified B-24 Liberator bombers) made U-boat operations less effective. Additionally, hunter-killer escort groups attached to vulnerable convoys mauled the Germans.

In the Mediterranean, Italy's entry into the war in May 1940 required reinforcement of the theater naval forces under Admiral Sir Andrew Cunningham. With some modernized older battleships and the new carrier *Illustrious*, Cunningham defeated the Italians in fleet engagements at Calabria in July 1940 and Cape Matapan in March 1941 and raided the Italian anchorage at Taranto in November 1941 with naval aircraft. Cunningham stressed the improvement of anti-aircraft protection, which paid off as the naval war in the Mediterranean increasingly devolved into attacks on shipping and naval vessels by Axis aircraft.

Faced with substantial damage to their supply convoys by British destroyers and submarines, the Germans dispatched U-boats to the Mediterranean in October 1941, resulting in the sinking of the battleship *Barham* and the carrier *Ark Royal*. At the fleet anchorage in Alexandria, the battleships *Queen Elizabeth* and *Valiant* were sunk at their moorings by Italian *Maiale* human torpedoes.

Faced with the loss of capital ships and the threat of enemy aircraft and submarine attack, British resources in the Mediterranean were stretched dangerously thin. Malta, the linchpin of Britain's efforts to hold the Mediterranean, came under horrendous air attack. Convoys to resupply and reinforce the island suffered substantial casualties, among them the aircraft carrier *Eagle*.

The British aircraft carrier Ark Royal, seen from an accompanying destroyer, ca. 1940. (Hulton Archive)

The entry of the United States into the war in December 1941 had a profound impact on the Mediterranean Theater. Operation TORCH, the Allied landings in North Africa in November 1942, resulted in the eventual destruction of Axis forces in North Africa. Reinforced and reconstituted, the Mediterranean Fleet conducted an ambitious and destructive assault on Italian shipping throughout 1942 and 1943 that crippled enemy resupply efforts. Cunningham admonished his sailors and airmen to “sink, burn and destroy: let nothing pass.” By the end of 1942, Britain had again established maritime supremacy in the Mediterranean, despite substantial losses.

In the Pacific Theater, Japan entered the war against Britain concurrent with the assault on the United States. Quickly overrunning Hong Kong, the Japanese army forced the capitulation of Singapore, Britain’s “Gibraltar of the Pacific.” Faced with the loss of basing facilities, the Royal Navy withdrew from Southeast Asian waters, particularly after the loss of the battleship *Prince of Wales* and battle cruiser *Repulse* to air attack in December 1941 (Force Z under Admiral Sir Tom Phillips). The admiral’s disregard of the air threat coupled with woefully inadequate antiaircraft protection (the navy had only two modern destroyers) greatly aided the land-based Japanese aviators, who easily sank both capital ships.

Following the crippling of the U.S. Pacific Fleet at Pearl Harbor, Japan’s main striking force—Vice Admiral Nagumo Chūichi’s First Air Fleet—wreaked havoc on the remnants of British sea power in the Indian Ocean in spring 1942. In carrier-based air attacks against British surface units, the veteran Japanese naval aviators sank detached portions of Admiral Sir James Somerville’s forces based in Ceylon, including two cruisers and the carrier *Hermes*. However, Somerville avoided a general action and preserved his force as the Japanese withdrew to support their thrust into New Guinea and the Solomon Islands. Naval action in the Pacific Theater after May 1942 involved mainly U.S. and Australian naval units, but, with the defeat of Germany in May 1945, the Royal Navy again engaged Japan with substantial forces.

Under Admiral Sir Bruce Fraser, the Pacific Fleet of four carriers (later joined by two additional decks) and two battleships with substantial escort destroyers and cruisers arrived in the Pacific in March 1945, where they joined the Americans in the assault on the Japanese home islands and Okinawa. Equipped with the U.S. Hellcat and Corsair fighters, Royal Naval aviators did great destruction to the Japanese. American aircraft proved greatly superior to earlier British Seafire (modified from the Spitfire), Martlet, Fulmar,

and Sea Hurricane models. The heavily armored British carrier decks proved worthwhile as a defense against Japanese suicide kamikaze aircraft (the lightly armored American carriers suffered more extensive damage).

From strategic and operational viewpoints, the Royal Navy performed exceptionally well in the war. Although losses were heavy (1,525 warships of all types, including 224 major surface units of which 5 were battleships or battle cruisers and 5 were fleet carriers; and 50,000 personnel dead), the aggressiveness and risk-taking nature of senior and individual ship commanding officers overcame the tenacious and highly competent Axis opponents. In the Atlantic, the Axis commerce warfare offensive failed to starve the country into submission or impede the arrival of overwhelming U.S. forces and personnel. In the Mediterranean, the Royal Navy kept British and Imperial ground and air forces supplied and reinforced while simultaneously strangling the Axis supply lines to North Africa. In the Pacific, despite initial defeats by the Japanese, British sea power returned late in the conflict and helped the U.S. Navy carry the fight to the Japanese home islands. As it had not done in the previous war, the navy at all levels showed exceptional ability to adapt rapidly to technological and methodical innovations and advances in doctrine, organization, and training. To man the new ships of more than 900 major combatants and the supporting shore establishment (training, research, logistics, support, and administration), by war's end Royal Naval personnel had increased from the pre-war 129,000 to 863,500, which included 72,000 women in the Women's Royal Naval Service (WRNS). In short, the navy vindicated itself following the disappointments of World War I. British sea power both kept Britain in the fight until the United States arrived in force and subsequently provided the domination needed to attack the Axis powers at all vulnerable points with little interference.

Great Britain, Women's Auxiliary Air Force (WAAF)

Women's arm of the Royal Air Force that provided support services. In September 1939, the Women's Auxiliary Air Force (WAAF), an auxiliary branch of the Royal Air Force (RAF) with a mission to provide support services tailored to RAF needs, was established. Its precedent was the Women's Royal Air Force (WRAF), which came into existence on 1 April 1918 during World War I and was disbanded exactly two years later.

On 10 April 1941, the WAAF was formally incorporated as an official part of the armed services of the British crown. Theoretically, only women aged between 18 and 43 could serve in the WAAF, but some members, especially those with World War I service credentials, were older, and one young woman who managed to join at the age of 14 was allowed to remain. A total of 171,200 women served in the WAAF, 187 of whom were killed in service. Another 420 were wounded, and 4 went missing while on duty.

Although British women aged between 18 and 30 were subject to conscription for war work from 1941 onward, they were permitted to choose agriculture, industrial work, or the armed services. Even in the women's auxiliary units of the armed forces, moreover, no woman could be compelled to serve in a situation in which she might have to wield a weapon. As with their female naval counterparts, members of the WAAF had a particularly glamorous reputation, which their relatively smart uniforms and association with the much-admired pilots enhanced.

Although supposedly restricted to noncombat roles, WAAFs often had important responsibilities, especially when functioning either as radar plotters to track incoming hostile airplanes and warn of forthcoming air raids or as radar controllers directing formations of British fighters and bombers. Many young women relished the independence and freedom such employment conferred on them. WAAFs also served in a wide variety of clerical and other support roles—as drivers and mechanics, for example—freeing up

WAAF personnel work on the advanced rigging maintenance of a Lysander aircraft. (Hulton Archive)

men for active duty. A small minority of women became pilots, although to do so they had to join the Air Transport Auxiliary (ATA) and become civilians. They were restricted to ferrying and delivering airplanes and could not undertake combat duties. Thousands of WAAFs served overseas in the Egyptian and North African Campaigns and in Europe, controlling air operations as Allied forces advanced. Some WAAFs were also recruited for dangerous clandestine work in the Special Operations Executive, which mounted covert operations in countries occupied by Axis powers. Others took part in ULTRA code-breaking operations at Bletchley Park. The British Dominions, Canada, New Zealand, and Australia all established similar women's auxiliary air forces.

In recognition of WAAF wartime contributions, the service remained in existence after World War II, although by 1950 only 517 of the wartime recruits remained in the service. In 1948, however, 14 WAAFs who were ex-ATA members became flying officers. In February 1949, the WAAF reverted to its old name and once again became the WRAF, and in 1994 it finally merged completely with the RAF.

Great Britain, Women's Land Army (WLA)

The Women's Land Army (WLA) was a British wartime program to provide female laborers to help overcome labor

shortages in agriculture. As war clouds began to gather in the 1930s, British government officials realized that if war should break out, the country would require numerous additional workers. For agricultural work, officials made plans to find more laborers from a variety of sources including older and younger workers, seasonal labor from nearby towns, and, as the war progressed, prisoners of war. The most widely publicized effort was the Women's Land Army.

In April 1938, the government asked Lady Gertrude Denman, the dynamic head of the Women's Institutes, to lead the new organization. Using a Women's Land Army formed in World War I as a guide, Lady Denman, her coworkers, and local authorities were able to launch a national recruiting campaign in the spring and summer of 1939. By the time the call came in September, more than 1,000 volunteers had signed up, and soon afterward WLA recruits began arriving at British farmsteads.

The "land girls," as they were called, had to be at least age 17 to join. They were primarily from cities, where they had been employed as barmaids, hairdressers, store clerks, and in other similar positions. They underwent four weeks of training and then were sent to individual farms or lived under supervision in hostels. They were given uniforms consisting of a green sweater; brown, knee-length trousers; high black boots; a light brown overcoat; and a brown felt hat. They usually worked 11-hour days and were to have half a day per week and Sundays off, but often that was impossible because of the nature of their jobs. They did all kinds of work, from weeding and threshing to cleaning ditches and milking cows. Some eventually became tractor drivers. They were paid the equivalent of about \$3.50 per week, half of it for room and board.

Farmers at first were reluctant to hire WLA workers. By the spring of 1940, however, the labor market had become tighter, and farmers became more receptive to the idea. By the end of the year, 6,000 women were working in rural areas. The number reached a peak of 87,000 in July 1943, and total of 250,000 had enrolled by war's end.

Shirley Joseph has written movingly about her life as a land girl. She recalled being interviewed and asked, among other things, whether she realized that cows had to be milked every day. She was then trained and sent out to work. Her first job was at Warborough farm in Oxfordshire, where she worked from 6:15 A.M. to 5:00 P.M., and her most important task was to assist with morning and late-afternoon milking. On Wednesdays, she received a half day off and often used the time to hitchhike to her home nearby. She lived part of the time in a cottage with no electricity and no running water. Later she worked out of three different hostels, and although she was allowed to do some milking, her main jobs were threshing and hoeing crops, which she described as dirty, hard work. She remembered hard bunks, queuing for meals,

the total lack of privacy, boyfriends (some of them American GIs), and long hours of work. Her experiences were probably typical of those who served.

The Women's Land Army gained increasing acceptance from the public, partly because it was well organized. Lady Denman and other WLA leaders gave talks over the radio about the Land Army's service, kept local supervisors informed, and even published a magazine, *The Land Girl*, that was distributed to the workers. Denman was also able to enlist influential patrons. Queen Mary, for example, was a major supporter, and she employed land girls at one of the royal family's country estates. Although the Women's Land Army may not have played as large a role in solving the agricultural labor problem as its backers have claimed, it did help, and it was a worthwhile experiment.

Great Britain, Women's Royal Naval Service (WRNS)

Women's arm of the British Royal Navy, reconstituted in 1939. The Women's Royal Naval Service was first created in 1917, during World War I. Before the organization was disbanded on 1 October 1919, 6,000 British women had undertaken naval support duties, during the course of which 23 died.

In 1938, on the approach of another war, planning began to reestablish the WRNS. The organization was reconstituted in April 1939 under the direction of Vera Laughton Mathews. Enlistment was initially voluntary, but under the April 1941 Registration of Employment Order, all single and childless British women aged between 19 and 30 and not yet engaged in work "essential to the war effort" became subject to conscription and were offered the choice of factory work, service in one of the auxiliary service units, or enrollment in the Women's Land Army.

As with the other female auxiliary services, especially the Women's Auxiliary Air Force, the WRNS (its members were called Wrens) constituted something of a prestigious and elite service. In the course of the war, 74,620 women enlisted in the WRNS, of whom 102 were killed and 22 wounded. Government regulations prevented female civilian volunteers and military personnel to serve without their consent in hazardous circumstances in which they were liable to come under physical attack—manning antiaircraft guns, for example—nor could they be compelled to operate weapons. Even in the auxiliary armed forces, women were restricted to noncombat roles, and the primary function of WRNS members was perceived as releasing male naval personnel from shore jobs. As the war progressed, however, the WRNS and other female auxiliary military units undertook an increasingly wide range of duties—more than 200 jobs by 1944. Many served in clerical positions or as wireless telegraphists, electricians, fitters, radio mechanics, photographers, technicians, cooks, stewards, gardeners, dispatch riders, or stokers; others helped to plan and organize naval operations. Thousands served overseas, often in hazardous conditions. A small minority qualified as naval pilots, although, as with those in the quasi-civilian Air Transport Service, they were normally barred from combat duties and restricted to ferrying planes.

Thousands of women also enlisted in associated naval units including the Fleet Air Arm, Coastal Forces, Combined Operations, and the Royal Marines. In all, 303 British women died during World War II while on active duty in the various naval services. Canada, Australia, and New Zealand established similar women's naval auxiliary services. British women's naval contributions were highly respected, and the

WRNS became a permanent service arm in February 1949. In 1993, the WRNS disappeared as a separate unit when it became fully integrated into the British navy.

Greece, Air Force

In 1940, Greece's Air Ministry administered the Royal Greek Air Force (*Vassiliki Aeroporia*). The navy controlled the naval cooperation squadrons, and the army controlled fighters, bombers, and ground-support squadrons. The Greek air force's modern aircraft were grouped into four fighter squadrons and three bomber squadrons. At the start of the war with Italy in October 1940, Greece deployed 216 first- and second-line aircraft of all types, including liaison. Greece also had about 60 obsolete aircraft dating back to World War I. At the beginning of its invasion of Greece, Italy operated 187 modern aircraft from Albania, and it could also draw on hundreds of aircraft operating from Italy. The Greek air force was composed of a mélange of Czech, Polish, German, French, and later British machines. Greece had no reserves and was totally dependent on the British for resupply. Securing replacement parts was a nightmare, and the lack of parts meant that many aircraft became inoperable.

During 1940 and 1941, the Greek air force aggressively operated with some success in support of army operations on the Albanian Front. However, as the army advanced into mountainous Albania, flying distances became longer and more problematic, whereas Italian aircraft were able to operate closer to their own bases. By the time Germany invaded Greece in April 1941, the Greek air force was down to 41 operational aircraft. Following the Axis victory at the end of April, the Greek government in exile maintained an air force of two fighter squadrons and one bomber squadron in the Mediterranean under British control.

Greece, Army

In October 1940, at the time of the Italian invasion, the Greek army, commanded by General Alexandros Papagos, numbered some 430,000 men in 18 divisions. By April 1941, when the Germans invaded Greece, army strength was some 540,000 men. Each division numbered at full strength approximately 18,500 men, formed in three regiments of three battalions each. Most of these were of World War I type and were lightly armed mountain divisions. The army had almost no tanks, although in the course of the fighting the

Greeks captured some Italian L3 “tankettes” and formed a weak motorized division. The Greeks also had little in the way of anti-aircraft artillery, and much of the army’s equipment was also antiquated. Although the Greeks had few mortars, they possessed more machine guns and more effective heavy artillery than did the Italians. Greek supply services were poor, leading to much hardship among the troops in the mountains and during the winter.

In October 1940, when the Italian army invaded from Albania, the Greek army had four first-line divisions on the Albanian frontier. The Greek army fought well against the Italians; in its counterattack, it expelled the Italian army from Greece and penetrated into Albania. The Greeks were overwhelmed when the German army entered the fighting in April 1941, however. During the 1940–1941 campaign, the Greek army sustained 13,408 killed and 42,485 wounded. Some 9,000 soldiers were evacuated to Crete, and others escaped through Turkey to Egypt. Ultimately, the Greeks formed the 18,500-man Royal Hellenic Army, which fought under British command in the Middle East. It consisted of three infantry brigades, an armored-car regiment, an artillery regiment, and the Greek Sacred Regiment composed entirely of officers.

Greek gun crew at work during the campaign in Albania in 1940. (Library of Congress)

One brigade of the Royal Hellenic Army fought in the Battle of El Alamein, but most of the force saw little action, the consequence of political infighting. A mutiny in 1944 led to the internment of much of the army, although part of it was used in nonoperational duties. A newly formed unit, the 2,500-man Third Mountain Brigade, did fight with distinction in the Italian Campaign, where it was known as the Rimini Brigade.

Greece, Navy

In late 1939 the Royal Hellenic Navy (RHN) was a relatively small force of obsolescent warships, some of which dated to before World War I. The navy consisted of the armored cruiser *Giorgios Averoff* (built in Italy in 1910), six destroyers, six submarines, one minelayer, several torpedo boats, and an assortment of auxiliary vessels. No warships were under construction, although the RHN planned to take delivery of two additional (British-built) destroyers. In addition to generally obsolete equipment, the RHN suffered from the national political schism of the 1930s that brought purges of the officer corps.

In mid-1940, Italy began a period of harassment that included air attacks on Greek ships at sea and the sinking on 15 August 1940 of the anchored minelayer *Helle* by the Italian submarine *Delfino*. Once Italy declared war on Greece on 28 October 1940, the RHN was active in supporting the army and in conducting destroyer sweeps in the Ionian Sea. The RHN experienced severe losses from air attacks following the April 1941 German invasion of Greece. The surviving Greek ships, their bases seized by German troops, withdrew first to Crete and then to Egypt, where they were integrated into the British Royal Navy.

The Royal Navy had operational control of the Greek ships, and the RHN was responsible for their administration. The Greek ships were in need of refit and modernization, and they received from the British Navy modern fire-control systems

and antiaircraft and antisubmarine armaments. The British also transferred to the RHN a variety of destroyers, corvettes, submarines, and smaller craft, including minesweepers.

RHN ships then served throughout the eastern Mediterranean. Beginning in 1942, the RHN experienced nearly continual political unrest concerning the composition of the Greek government in exile. This culminated in the April 1944 mutiny of virtually the entire RHN at Alexandria and Port Said. Although the mutiny was crushed, the Greek ships were out of action for about four months while units were purged of mutineers.

After the German retreat from the Balkans, in October 1944 the RHN returned to Greek waters. It spent the remainder of the war reestablishing itself in its home territory, opening ports, engaging communist groups that resisted the return of the government from Egypt, and containing German garrisons on the larger islands of the Aegean Sea.

Greece, Role in War

The nation of Greece, with a population of some 7.3 million people in 1940, was drawn into World War II by Italy's invasion from Albania. Greek dictator General Ioannis Metaxas had sought to maintain his nation's neutrality, but that policy ended when an Italian invasion began a Balkan campaign that drew in Britain as well as Germany and other Axis powers. The result of these developments was Axis control of the Balkans until the last months of the war. Greece suffered horribly in the war and continued to suffer in the years immediately afterward in a costly civil war from 1946 to 1949.

In October 1940, without informing his ally Adolf Hitler in advance, Italian dictator Benito Mussolini launched an invasion from Albania. Having both superior numbers and greater military hardware, Mussolini confidently expected to complete the conquest before winter set in. The Greeks, however, resisted valiantly. They not only held the Italians but went on the offensive and drove them back, while the British bombed Albania and neutralized the Italian navy. Mussolini's invasion

of Greece turned into a disaster from which neither he nor his regime recovered. Determined to shore up his southern flank before he began an invasion of the Soviet Union, Hitler stepped in. Metaxas died at the end of January 1941, and in April the Führer sent the German army against both Greece and Yugoslavia, quickly overwhelming both. Neither the courage and will of the Greeks nor British army reinforcements sufficed to withstand the Luftwaffe and the panzers.

The Axis occupation of Greece involved German, Italian, and Bulgarian troops and lasted three years. It was a dark period in the history of a nation that had undergone much suffering since Roman times. The Germans set up a puppet government and insisted that the Greeks pay the full cost of the occupation, which resulted in catastrophic inflation. The Germans also requisitioned resources and supplies, with no concern for the fate of a population that, even in the best of times, was obliged to import most of its food. Famine and disease decimated Greece and killed perhaps 100,000 people in the winter of 1941–1942 alone. The suffering was such that British Prime Minister Winston L. S. Churchill agreed—under pressure from the Greek government in exile and the United States—to partially lift the blockade so the International Red Cross might bring in food supplies. Greeks living in Western Thrace and Eastern Macedonia also had to undergo forced Bulgarianization. The flourishing Jewish community in Salonika was devastated in the Holocaust; fewer than 10,000 of an estimated 70,000 Greek Jews survived the war. The Greek underground fought back with sabotage and ambush and tied down 120,000 Axis troops. In reprisal, the Germans and Italians burned whole villages and executed large numbers of Greek hostages for every Axis soldier slain.

Greek King George II and his ministers went into exile in Egypt with the retreating British forces in 1941. Almost immediately, Greek resistance groups formed. Of the various resistance movements that had appeared during the German occupation, the largest was the National Liberation Front (EAM), with the National People's Liberation Army as its military wing. Relations were poor between it and the National Republican Greek League. Indeed, actual fighting broke out between the two groups in the winter of 1943–1944, although a truce was arranged in February 1944. As in Yugoslavia, the communist-dominated EAM apparently enjoyed wider support than the nationalist underground. When the Germans pulled out of Greece, EAM held the vast majority of the country. Greek society was fractured into three factions: the monarchists, republicans, and communists.

At approximately the same time, in October 1944 Churchill journeyed to Moscow to meet with Soviet leader Josef Stalin. Churchill struck a bargain with Stalin concerning predominance in various Balkan states, under the terms of which Britain was to have 90 percent predominance in Greece. The Greek communists, who had carried the brunt of resistance

against the Axis and now controlled the majority of territory, understandably resented this imperial arrangement struck in Moscow and were unwilling to submit to it.

When the Nazis withdrew, George Papandreou, a left-of-center statesman, headed a government of national unity. Fearing the communist underground, however, he requested British troops, who began arriving early in October 1944. When the British called on the guerrilla forces to disarm and disband, EAM quit the cabinet, called a general strike, and held protest demonstrations. In this serious situation, Churchill took the impetuous decision to fly with foreign secretary Anthony Eden to Athens on Christmas Day 1944. Though the government and EAM reached accord early in 1945, it quickly broke down. EAM members took to the hills with their weapons.

In the first Greek elections, held in 1946, the Royalist People's Party was victorious, and a royalist ministry took office. A September 1946 plebiscite resulted in a majority vote for the king's return. King George II, who was unpopular in Greece, died the following April and was succeeded by his son Paul, who reigned until 1964.

By the end of 1946, communist rebels were ready to attempt a comeback, assisted by the communist governments of Yugoslavia, Bulgaria, and Albania. (Ironically, Tito's support for the civil war in defiance of Stalin was one reason Yugoslavia was subsequently expelled from the international communist movement). The communists came close to winning in Greece, but Greece was saved as a Western bastion because the British were determined that the nation—with its strategic control of the eastern Mediterranean—not become communist. But in February 1947, deep in its own economic problems, Britain informed a shocked Washington that it could no longer bear the burden of supporting Greece. U.S. President Harry S. Truman agreed to take over the responsibility, and in March 1947, he announced the Truman Doctrine of aid to free nations threatened by internal or external aggression. This policy received the enthusiastic support of the U.S. Congress and an appropriation of \$400 million for both Greece and Turkey. Ultimately, the United States contributed about \$750 million for the final three years of guerrilla warfare.

Gradually, General Alexander Papagos, Greek commander in chief, dismissed incompetent officers and created a military force sufficient to turn the military tide. Another important factor was that Marshal Tito (Josip Broz) needed to concentrate on resisting Soviet pressures, cutting off many of the supplies for the rebel cause. By the end of 1949, the communists had been defeated and Greece saved for the West. The cost of the civil war to Greece was as great as the cost from the tormented years of World War II and the Nazi occupation. As with so many civil wars, the struggle had been waged without quarter on either side. Thousands of hostages

had been taken and simply disappeared. A million Greeks had been uprooted and displaced by the fighting. Casualties may have been as high as half a million people—all of them Greeks killed by Greeks. After the war, the purges and reprisals continued for some time. Unfortunately for Greece, further upheaval fanned by other nations and dictatorship lay ahead before true democracy could be achieved.

Greece Campaign (28 October 1940–March 1941)

In April 1939, Italian dictator Benito Mussolini ordered the Italian army to invade Albania to secure control of the Adriatic Sea. On taking over Albania, Italy began a major engineering project there to improve roads to the Greek border. This was accompanied by assurances from Rome to Athens that Italy would not attack Greece. Simultaneously, on 13 April, Britain and France extended guarantees to both Greece and Romania to preserve their integrity.

In spite of assurances to the Greek government, Italy was indeed planning an invasion. Code-named CASE G, the plan for an attack on Greece received major impetus from foreign minister (and Mussolini's son-in-law) Galeazzo Ciano, who was much involved in Albanian affairs and sponsored this operation to expand his influence over Greece as well. Mussolini also resented Adolf Hitler's decision to send German troops to Romania to protect the Ploesti oil fields, a move destroying Italian influence in Romania. Mussolini was determined to redress the Balkan balance.

On 15 October 1940, Mussolini met in Rome with his military leaders, including chief of General Staff Marshal Pietro Badoglio and deputy chief of the army staff General Mario Roatta, to discuss the attack on Greece. Also present was General Sebastiano Visconti-Prasca, commander of the Eleventh Army in Albania and author of the invasion plan, a much

shrunk CASE G. Although questions were raised during the meeting, none of those present seriously opposed the decision to begin the invasion in a few days. At this time, Mussolini wrote to Hitler seeking advice and informing him of his intentions; but by delaying sending this letter, Mussolini hoped to surprise his ally, just as Hitler had surprised him with his timing of the invasion of France. Hitler, who had accurate information about Italian intentions, made no effort to restrain his ally.

Before dawn on 28 October 1940, the Italian ambassador in Athens presented an ultimatum to Greek prime minister and dictator General Ioannis Metaxas, accusing Greece of allowing British ships to use Italy's territorial waters and demanding free passage of Italian troops on Greek soil. Athens rejected the ultimatum, and at 5:30 A.M. that same day, Italy began its invasion.

For the invasion, the Italians had deployed in Albania six infantry divisions (two regiments each, reinforced with a lightly armed Blackshirt Legion, with a total of 12,500 to 14,500 men in each division). These were the Siena, Ferrara, Piemonte, Parma, Venezia, and Arezzo Divisions. In addition, the Italians had the Centauro Armored Division and the Julia Alpine Division. In all, the army deployed some 150,000 men—giving them only a slight numerical superiority over the Greek army before mobilization, instead of the 2:1 advantage that Visconti-Prasca claimed.

The weather was poor, with torrential fall rains. The main body of the Italian troops, consisting of the Ferrara, Centauro, and Siena Divisions, advanced near the Adriatic coast where the terrain was more favorable, trying to push across the Kalamas River and reach Janina. The Julia Division attacked toward Metsovon Pass to penetrate between Epirus and Macedonia. To the extreme Italian left, the Parma and Piemonte Divisions were on the defensive at Korçë.

In defense along the Albanian border, the Greeks had deployed four infantry divisions of three regiments each. These resisted the invaders while King George II of Greece appealed to Britain for assistance. His request won friendly reception from British Prime Minister Winston L. S. Churchill. Although Metaxas, not wanting to offend Hitler, requested only weapons and equipment, Churchill favored sending an expeditionary force. In any case, London immediately dispatched five Royal Air Force (RAF) squadrons and an inter-service mission.

On 31 October, British forces arrived on the islands of Crete and Lemnos, placing British bombers within range of the Romanian Ploesti oil fields. In response, on 4 November, Hitler ordered his Army High Command to begin preparations for a German attack on Greece.

The same day that the Italian invasion began, on 28 October, Mussolini met with Hitler in Florence and proudly informed him of the event. Mussolini's triumph was short-lived, however, as the Greek army, commanded by General

Alexandros Papagos, offered stiff resistance. Indeed, by the end of the month, the Italian offensive had ground to a halt. The Greeks mobilized reserves for a total force of 18 divisions, with French-supplied artillery superior to that of the Italians. They were, however, inferior in air assets. By 1 November, the Greeks had launched a series of counterattacks that stopped the Italians on the Kalamas River. The Italians made no progress on the Epirus Front, whereas the Julia Division arrived at the Metsovon Pass only to be counterattacked and cut off as the Greeks advanced toward to the Korçë basin, there overrunning the Parma and Piemonte Divisions. The Italian High Command ordered the Venezia and Arezzo Infantry Divisions, deployed on the Yugoslavian border, to reinforce the front. On their arrival, though, they were obliged to retreat in chaos before a spirited Greek advance that aimed to cut the road from Korçë to Perati and envelop the invaders turned defenders. The only possible option for the Italians was to withdraw their entire line into Albania. This took place on 8 November, a bleak time for the Italian army in the campaign. The following day, Italian commander General Visconti-Prasca was replaced by deputy chief of the Italian High Command General Ubaldo Soddu, who then formed the Italian forces into the Albanian Army Group.

Although Mussolini boasted on 19 November that he would “break Greece’s back,” a day later he received a sharply critical letter from Hitler. It criticized Mussolini’s move, which had opened a new front that allowed the British to operate in the Balkans. The Germans were already preparing Operation BARBAROSSA, an invasion of the Soviet Union, and for security reasons did not wish to disclose their plans to the Italians.

As a consequence of the Italian failure, Marshal Badoglio came under fire, and on 26 November he and other military leaders were forced to resign. On 4 December, general of the army Ugo Cavallero replaced him. Cavallero demanded more power for the chief of General Staff and directly helped to facilitate the crisis on the Albanian Front. Cavallero would shortly take over command of the Albanian Army Group from Soddu, who retired in disgrace.

In early December, the Italian retreat from Greece back into Albania continued, forcing Mussolini to seek assistance from Hitler. The Italian “parallel war” now came to an end, along with the illusion that Italy was a great power. With the help of German transport aircraft, the Italians flew in reinforcements and shipped equipment to Valona, but this caused great confusion; units that had hurried to the front quickly disintegrated under Greek pressure and the effects of the winter weather. Moreover, it was difficult for the Italians to transport supplies to the front lines, as all had to be shipped from Italy, and there were not enough pack mules. To make things worse, on 9 December British Commonwealth units under Lieutenant General Archibald Wavell launched a successful offensive in North Africa that overran the more

numerous Italian troops. By 6 January 1941, the British had seized the Libyan border town of Bardia.

The British now faced the strategic problem of having to choose between exploitation of their North African successes and stiffening Greek resistance. On 6 January 1941, Churchill told the chiefs of staff that it would be better to delay exploiting the situation in North Africa in order help Greece seize the port of Valona and avoid military defeat. Churchill therefore informed Wavell that Tobruk would be taken, but follow-up operations would depend on the situation in Greece, which would be the priority. This was also partly because intelligence revealed that German forces were concentrating for a possible offensive in the Balkans. Apparently, the Greeks did not need much outside assistance, as they attacked Klisura and forced the Italians to abandon it. At that point, the Greek drive died, meeting stiffening Italian resistance, which successfully defended Berat and therefore Valona, but at a high price.

On 19 January 1941, Mussolini met Hitler and asked him for assistance to check the British Commonwealth advance in North Africa. Mussolini did not, however, request any help in the Greek theater of operations. Meanwhile, for propaganda purposes, Mussolini demanded that senior Fascist Party leaders join Italian troops at the front. Thus Foreign Minister Ciano took command of a bomber group, and ideologue Bruno Bottai joined an Alpini battalion.

A British military mission arrived in Athens on 22 February to study the situation and propose shipment by sea of an expeditionary corps to Greece. The following day, the Greeks accepted the offer, whereon Britain dispatched some of its best North African forces to Greece: 60,000 men with 240 field artillery pieces, 32 medium artillery guns, 192 anti-aircraft guns, and 142 tanks under Lieutenant General Henry Maitland Wilson. In addition, under German pressure, Bulgaria signed the Tripartite Pact on 1 March, and German army units began to flow in force into Bulgaria to deploy for the future campaign. A few days later, the first British convoy to Greece sailed from Alexandria, and by 7 March, British troops began to disembark at Piraeus.

The Italians tried to force the situation in order to avoid the impression that they had been “saved” by the Germans. In March, General Cavallero launched 27 divisions in an offensive to reach Klisura. It failed and cost 12,000 Italian casualties. On 28 March, in an effort to check the British convoys bringing military aid to Greece, the Italian navy suffered an important naval defeat at the Battle of Matapan.

Meanwhile, on 25 March under heavy pressure, Yugoslavia adhered to the Tripartite Pact. But on the night of 26–27 March, a military coup d’état forced Prince Regent Paul into exile and General Dušan Simović formed a new government. This event prompted German military intervention. On 6 April, with Italian and Hungarian assistance, German forces invaded both Yugoslavia and Greece.

During the Italo-Greek War of October 1940–April 1941, the Greek army suffered 13,408 killed and 42,485 wounded. The Italians lost 13,775 dead, 50,874 wounded, and 25,067 missing. In addition, the campaign cost Italy reinforcements to North Africa, especially in equipment, which went instead to Albania. Thus, the British successes in North Africa in large part resulted from the Italian invasion of Greece.

Greece Campaign (April 1941)

Important Balkan Theater campaign pitting Greek and British Empire forces against German and Italian forces. In the spring of 1941, German leader Adolf Hitler sent forces into Greece. His decision was prompted by his desire to eject the British from the Aegean and eastern Mediterranean; to protect his southern flank—especially the Romanian oil fields at Ploesti—before launching Operation BARBAROSSA, the invasion of the Soviet Union; and to assist Italy, his faltering ally. During the winter of 1940–1941 and into March 1941, German troops were stationed first in Romania and then in Bulgaria, threatening the Greek Second Army. Greece was led by General M. Alexander Koryzsis, who succeeded general and dictator Ioannis Metaxas on the latter's death in late January 1941. General Alexander Papagos commanded the Greek army.

Greece was already at war, having been invaded by Italy in October 1940. The Greeks had not only repelled that invasion, but they had launched a counterinvasion of Albania. Papagos had committed the majority of the Greek army on that front in the northwest, where Lieutenant General Georgios Tsolakoglou's First Greek Army of 16 divisions faced 28 Italian divisions of the Eleventh and Ninth Armies in Albania and had repulsed a large Italian offensive in March.

Lieutenant General K. Bacopoulus's weaker Second Greek Army held the Greek frontier with Yugoslavia and Bulgaria to the northeast. However, the army was dangerously split.

Three divisions were strung out along the Metaxas Line of defensive works east of the Struma River in Macedonia facing Bulgaria. Three other Greek divisions were with the British contingent, including the weak 19th Division, the Greek army's only motorized division. The 19th Division was equipped with a few captured Italian L3 "tankettes," some worn-out British Bren carriers, and trucks.

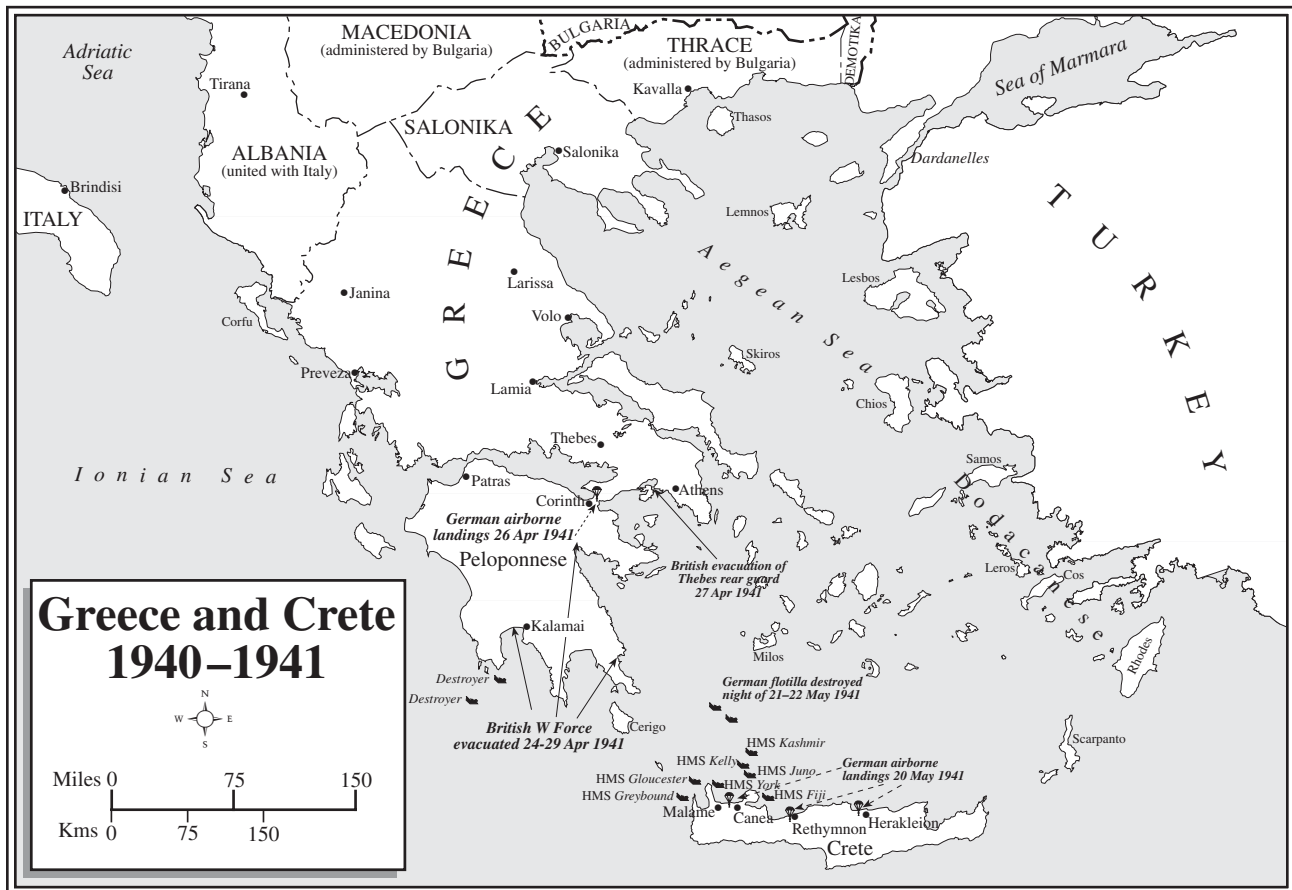

British Prime Minister Winston L. S. Churchill had ordered to Greece from North Africa some of the best British Empire troops there, commanded by Lieutenant General Henry Maitland Wilson. Known as Force W, they were taking up position along the Aliakmon Line, named for the Greek river just southwest of Salonika. Force W consisted of a New Zealand division, an arriving Australian division, and a British armor brigade. Royal Air Force (RAF) units had been fighting in Greece from early November 1940. Altogether, slightly more than 60,000 British Empire forces were in Greece in April 1941.

Because the Italian army was tying down the bulk of the Greek army on the Albanian front, the highly trained, much stronger, and more technologically advanced German army was able without much difficulty to slice through Greek forces to the east. In their attack, the Axis powers enjoyed overwhelming air superiority. Italian air force units operating from Albania alone were equal to the total Allied air strength in Greece, and the German air force had as many Stuka dive-bombers in the theater as the total number of Allied first-line aircraft.

The German invasion of Greece from Bulgaria began on 6 April 1941. Field Marshal Wilhelm List had command. His Twelfth Army was made up of the equivalent of six corps (a seventh was transferred to the Second Army, which invaded Yugoslavia on 12 April) and included three panzer divisions. Leading the assault were the 2nd Panzer Division (known as the "Vienna Division" for the number of Austrians in it), the 9th Panzer Division, and the 5th and 6th Mountain Divisions. List's aim was to smash through the Metaxas Line and drive on Athens.

One of the most dramatic attacks of the campaign occurred on the morning of 7 April, when German aircraft bombed the Greek port of Piraeus and hit two freighters loaded with ammunition. The resulting blasts, heard 150 miles away, destroyed 41,942 tons of shipping and demolished docks. Overwhelming Axis air superiority confined most Allied movements to nighttime and was perhaps the key factor in the Axis victory.

Within three days of the start of their offensive, German forces had seized the port city of Salonika and breached the Metaxas Line. They also had taken 60,000 Greeks prisoner. On 12 April, the Greek High Command ordered General Tsolakoglou to withdraw his First Army from Albania. Lacking mobility and with much of its equipment worn out, the First

Army fell back slowly, only to surrender on 23 April to a joint German-Italian military commission.

The 2nd Panzer Division, meanwhile, was advancing along the Greek eastern coast toward the British forces, which were only just arriving and taking up defensive positions. The 2nd Panzer Division engaged the 2nd New Zealand Division and forced it to retreat. Additional German forces advanced through Yugoslavia and into central Greece from Bitolj, isolating eastern Greece. The Greeks fought hard with what resources they had, but they were simply overwhelmed. With defeat looming, General Papagos promised Wilson that the Greeks would do their best to protect the British forces while they evacuated.

With the defeat of his country imminent, Greek Prime Minister Alexandros Koryzis committed suicide on 18 April. His successor, Emanuel Tsouderos, pledged to assist British Empire troops in evacuating Greece. On 23 April, the same day that the Greek army was forced to surrender, Greek King George II fled his nation to Egypt and there set up a government in exile.

On 24 April, the British abandoned Thermopylae and began withdrawing into the Peloponnese. Royal Navy ships, meanwhile, braved Luftwaffe attacks to carry out night evacuations of British forces from ports in eastern Greece. On 26 April, the

Germans carried out a daring paratroop operation in an effort to cut off the British withdrawal. Using gliders, they successfully seized the only bridge over the Corinth Canal. Although the British managed to destroy part of the bridge with artillery fire, the Germans quickly rebuilt it and used the bridge to press into the Peloponnese. Wilson managed to fight his way through, evacuating most of his troops. More than 50,000 British Empire forces were evacuated in Operation DEMON, although most of their equipment had to be abandoned. The last formal evacuation took place on 30 April; many of the troops were then sent to Crete. Some resistance continued in the Greek islands until 4 May. British naval losses were 2 destroyers and 4 merchant ships; the Greeks lost in the campaign 3 destroyers and a torpedo boat as well as 43 merchant ships of 63,975 tons.

In the entirety of the Greek Campaign, the Germans lost 2,559 killed (including 200 aircrew) and 5,820 wounded. The Greek army sustained 13,408 killed, 42,485 wounded, and 270,000 prisoners. Italian losses during April were 13,775 dead, 54,874 wounded, and 25,067 missing. The British suffered 5,100 dead, wounded, and missing and some 7,000 taken prisoner.

General Tsolakoglou then headed a collaborationist Greek government in Athens; Greece was divided into German, Italian, and Bulgarian occupation zones. In May, the Germans

took Crete by airborne assault. German troops then controlled that island as well as Lemnos, Lesbos, and Chios; some smaller islands in the Aegean; the Turkish border region; Salonika; and the port of Athens and its surrounding area. Bulgarian forces occupied much of Macedonia, and Italy controlled the remainder of the Greek mainland as well as most of the Greek Mediterranean islands.

Some historians have suggested that Germany's invasion of Greece and Yugoslavia delayed Operation BARBAROSSA. However, other factors, especially the need to wait for dry weather for the panzers, were more important. Nonetheless, the panzer divisions that had seen service in Greece had to undergo refit and were thus not immediately available for BARBAROSSA. The campaign also exacted a toll in equipment and in precious stocks of fuel.

Grew, Joseph Clark (1880–1965)

U.S. diplomat and undersecretary of state. Born on 27 May 1880 in Boston, Massachusetts, into a prominent family, Joseph Grew attended Groton School and Harvard University. He then joined the United States diplomatic service, transferring from the consular to the foreign service in 1904. Throughout his life, Grew's influential contacts, including Presidents Theodore Roosevelt and Franklin D. Roosevelt, facilitated his career.

Grew initially enjoyed postings to Cairo, Mexico City, Russia, Berlin, Vienna, and Denmark. He attended the 1919 Paris Peace Conference and the 1922–1923 Lausanne Conference on Near Eastern affairs. After serving as undersecretary of state from 1923 to 1927, in which capacity he helped to implement the 1924 Rogers Act's reorganization of the Foreign Service, Grew became ambassador to Turkey. In 1932, he was appointed the first career U.S. ambassador to Japan, remain-

ing in Tokyo until Japan declared war on the United States in December 1941.

Grew's wife, Alice Vermandois Perry, was descended from Commodore Matthew Perry, who opened Japan to western influence in 1853. She had spent her youth in that country and knew many of its leading figures. Grew firmly hoped that Japan's growing antagonism toward the United States might be reversed. He urged greater American sympathy for Japan's economic problems and sought more latitude as ambassador in handling Japanese-American relations. Grew's regular swings from optimism to pessimism over each successive new Japanese government and his eagerness to conciliate successive new governments brought clashes with Stanley K. Hornbeck, head of the State Department's Division of Far Eastern Affairs.

Seeking to avoid what increasingly seemed to be an inevitable conflict, in October 1939 Grew publicly warned that, if Japan wished to avoid severe American retribution, it must alter its increasingly bellicose international stance. This precipitated harsh Japanese press attacks on him. Subsequently, he unsuccessfully urged a personal meeting between President Franklin D. Roosevelt and Japanese Premier Prince Konoe Fumimaro, which he later unconvincingly claimed might have averted war.

Interned after the Japanese attack on Pearl Harbor and repatriated to the United States in spring 1942, Grew returned to

Washington as a special assistant to Secretary of State Cordell Hull, becoming director of the Division of Far Eastern Affairs in 1944. As undersecretary of state from December 1944 to August 1945, Grew opposed further collaboration with Soviet Russia, unsuccessfully sought to prevent the use of nuclear weapons against Japan by urging American acceptance of a negotiated peace settlement rather than unconditional surrender, and helped to preserve the Japanese emperor's status as nominal head of state. Grew retired in August 1945. He died at Manchester-by-the-Sea, Massachusetts, on 25 May 1965.

Grizodubova, Valentina Stepanovna (1910–1993)

Russian air force colonel and sole woman commanding officer of a men's wing during World War II. Born in Kharkiv on 31 January 1910, the daughter of an aircraft designer, Valentina Grizodubova graduated from Penza Flying Club in 1929, Kharkiv Flying School, and Advanced Flying School in Tula in 1933. She mastered many types of aircraft, setting seven world records in the process. On 24–25 September 1938, Grizodubova flew nonstop from Moscow to the Pacific in an ANT-37. For this pioneer flight she, her copilot Polina Osipenko, and her navigator Marina Raskova received the award of Hero of the Soviet Union, the highest Soviet military decoration. They were the first Soviet women to be thus honored.

In May 1942, Grizodubova was appointed commanding officer of the 101st Long-Range Air Regiment (renamed 31st Krasnosel'sky Guards Bomber Regiment in 1944). She successfully demonstrated the suitability of the Li-2 (modified DC-3) for use as a night bomber. In June 1942, Grizodubova led her unit in delivering supplies to the besieged city of Leningrad. She was noted for flying more than her male col-

leagues and sometimes flew as copilot to monitor her pilots' performance.

In September 1942, Grizodubova's unit was placed at the disposal of Central Partisan Headquarters. Overcoming dense enemy flak and engaging enemy fighters, her aircrews flew more than 1,850 supply missions, and on their return they evacuated wounded partisans and children. In 1943, Grizodubova prevailed on her superiors not to decrease these flights.

Grizodubova flew about 200 wartime missions and was awarded many prestigious military decorations. A senior official of civil aviation after the war, Grizodubova also served on the executive board of several veterans' organizations, assisting numerous former prisoner-of-war camp inmates who were persecuted by Soviet authorities. As a member of the Soviet parliament, she courageously criticized Soviet dictator Josef Stalin's reign of terror. Grizodubova died in Moscow on 1 May 1993.

Groves, Leslie Richard (1896–1970)

U.S. Army general who oversaw the MANHATTAN Project. Born in Albany, New York, on 17 August 1896, Leslie "Dick" Groves attended the University of Washington and the Massachusetts Institute of Technology. He secured an appointment to the U.S. Military Academy, from which he graduated in 1918. He then entered the Army Corps of Engineers.

After initial training at the Engineer School at Fort Humphreys (later Fort Belvoir), Virginia, Groves served in Hawaii, Texas, Nicaragua (where he was awarded the Nicaraguan Medal of Merit for restoring water to Managua following an earthquake), Washington, D.C., and Missouri. Assigned to the War Department in 1939, Groves became chief of the Operations Branch and in 1941 deputy head of the Construction Division. In these capacities, Groves oversaw the vast expansion of military camps and training facilities across the United States. He then supervised construction of the Pentagon, the world's largest office building.

Major General Leslie Groves, who was in charge of the MANHATTAN Engineer District and oversaw the building of facilities for testing of the first atomic weapons. (Hulton Archive)

His success in a variety of engineering projects led to Groves's promotion to brigadier general and assignment in September 1942 to head the MANHATTAN Project, charged with construction of an atomic bomb. In this capacity, Groves controlled 129,000 personnel and \$2 billion in spending. He won promotion to major general in March 1944. This vast effort resulted in the explosion of the first atomic device at Alamogordo, New Mexico, on 16 July 1945. Groves advised President Harry S Truman to use the bomb and helped select Japanese target cities.

After the war, Groves sought international control over atomic energy. When this did not occur, Groves organized the Army Forces Special Weapons Project to study military uses of atomic energy. Promoted to lieutenant general in January 1948, Groves retired from the army that same month and became vice president for research of the Rand Corporation. He retired altogether in 1961. Groves died in Washington, D.C., on 13 July 1970.

Gruenther, Alfred Maximilian (1899–1983)

Born at Platte Center, Nebraska, on 3 March 1899, Alfred Gruenther graduated fourth in his class in 1919 from the U.S. Military Academy. Commissioned in the field artillery, he completed the Field Artillery School in 1920 and served there as an instructor until 1922. He then served with the 9th Field Artillery in 1922 and 1923. Gruenther served in the Philippines with the 24th Field Artillery from 1924 to 1926. He returned to the 9th Field Artillery until August 1927, when he began the first of eight years at West Point as instructor and assistant professor of chemistry and electricity.

Promoted to captain in 1935, Gruenther graduated from the Command and General Staff School in 1937 and the Army War College in 1939. From October 1941 to October 1942, Gruenther was deputy to the army chief of staff and then chief of staff of the Third Army. He was promoted to colonel in December 1940 and to brigadier general in March 1941. In August 1942, Gruenther was appointed deputy chief of staff of Lieutenant General Dwight D. Eisenhower's Allied Force Headquarters and Headquarters Command, Allied Force in London, where he helped plan the invasion of North Africa (Operation TORCH). Promoted to temporary major general in February 1943, Gruenther became chief of staff of Lieutenant General Mark W. Clark's Fifth Army and was a principal planner for the Allied invasion of Sicily and Salerno, Italy. In November 1944, when Clark took command of the 15th Army Group in Italy, Gruenther continued as his chief of staff. Following the war, Gruenther was deputy commander of U.S. occupation forces in Austria in 1945 and 1946. He next became deputy director of the new National War College and then the first director of the U.S. Joint Staff on its establishment in 1947. Promoted to lieutenant general, during 1949 and 1950 Gruenther was deputy chief of staff for plans and then chief of staff for Supreme Headquarters, Allied Powers in Europe (SHAPE) from 1950 to 1953. Promoted to general in 1951, he was Supreme Allied Commander, Europe from 1953 to 1956. He retired in July 1956 because of physical disability. Although Gruenther never commanded troops in combat, he was a superb staff officer.

Following his retirement, Gruenther was president of the American Red Cross from 1957 to 1965 and director of several corporations. He died in Washington, D.C., on 30 May 1983.

Guadalcanal, Land Battle for (August 1942–February 1943)

Bitter contest between the Japanese and the Americans that marked a turning point in the Pacific war. The struggle on Guadalcanal was protracted, and the period from August 1942 to February 1943 saw some of the most bitter fighting of the war. In all, there were some 50 actions involving warships or aircraft, 7 major naval battles, and 10 land engagements.

Guadalcanal is an island in the Solomon chain northeast of Australia. It lies on a northwest-southeast axis and is 90 miles long and averages 25 miles wide. Guadalcanal's southern shore is protected by coral reefs, and the only suitable landing beaches are on the north-central shore. Once inland, invading troops faced dense jungle and mountainous terrain, crisscrossed by numerous streams. The Guadalcanal Campaign encompassed not only Guadalcanal, but Savo and

Florida Islands as well as the small islands between Florida and Guadalcanal: Tulagi, Tanambogo, and Gavutu.

In January 1942, Japanese amphibious forces had landed in the Bismarck Archipelago between New Guinea and the Solomon Islands. They quickly wrested Kavieng on New Ireland Island and Rabaul on New Britain from the Australians. The Japanese consolidated their hold and turned Rabaul into their principal southwest Pacific base. By early March, the Japanese landed at Salamaua and Lae in Papua and on Bougainville. Their advance having gone so well, the Japanese decided to expand their defensive ring to the southeast to cut off the supply route from the United States to New Zealand and Australia. On 3 May, the Japanese landed on Tulagi and began building a seaplane base there. Between May and July, the Japanese expanded their ring farther in the central and lower Solomons. These operations were carried out by Lieutenant General Imamura Hitoshi's Eighth Army from Rabaul. The first Japanese landed on Guadalcanal on 8 June. On 6 July, their engineers began construction of an airfield near the mouth of the Lunga River.

The discovery of the Japanese effort on Guadalcanal led to the implementation of Operation WATCHTOWER. Conceived and pushed by U.S. Chief of Naval Operations Admiral Ernest J. King, it called for securing Tulagi as an additional base to protect the United States–Australia lifeline and as a starting point for a drive up the Solomons to Rabaul. On 1 April 1942, the Pacific was divided into two commands: U.S. Vice Admiral Robert L. Ghormley, commanding in the South Pacific, was to take the southern Solomons including Guadalcanal, and General Douglas MacArthur's forces were to secure the remainder of the Solomons and the northwest coast of New Guinea, the final objective being Rabaul.

If the Japanese were allowed to complete their airfield on Guadalcanal, they would be able to bomb the advanced Allied base at Espiritu Santo. U.S. plans to take the offensive were now stepped up, and a task force was hurriedly assembled. From Nouméa, Ghormley dispatched an amphibious force under Rear Admiral Richmond K. Turner, lifting Major General Alexander A. Vandegrift's 19,000-man reinforced 1st Marine Division. A three-carrier task force under Vice Admiral Frank J. Fletcher provided air support. This operation involved some 70 ships.

On 7 August 1942, the Marines went ashore at Tulagi, Florida, Tanambogo, Gavutu, and Guadalcanal, surprising the small Japanese garrisons (2,200 on Guadalcanal and 1,500 on Tulagi). On the same day, the Marines seized the harbor at Tulagi, and by the next afternoon they had also secured the airfield under construction on Guadalcanal, along with stocks of Japanese weapons, food, and equipment. Supplies for the Marines were soon coming ashore from transports in the sound between Guadalcanal and Florida Islands, but this activity came under attack by Japanese aircraft based at

A casualty from the front-line fighting at Guadalcanal being transferred from the makeshift stretcher before being taken through jungle and down river to a nearby hospital. (National Archives)

Rabaul. Vandegrift told Fletcher he would need four days to unload the transports, but Fletcher replied that he was short on fuel and in any case could not risk keeping his carriers in position off Guadalcanal for more than 48 hours.

Stakes were high for both sides. The fiercest fighting occurred for the airfield, renamed Henderson Field for a Marine aviator killed in the Battle of Midway. Vandegrift recognized its importance and immediately established a perimeter defense around it. Eating captured rations and using Japanese heavy-construction equipment, the U.S. 1st Engineer Battalion completed the airfield on 17 August. As early as 21 August, the day the Japanese mounted a major attack on the field, the first U.S. aircraft landed there. The Japanese now found it impossible to keep their ships in waters covered by the land-based American aircraft during the day, and they found it difficult to conduct an air campaign over the lower Solomons from as far away as Rabaul.

The lack of a harbor compounded U.S. supply problems, as did Japanese aircraft attacks. Allied “coast watchers” on islands provided early warning to U.S. forces of Japanese air and water movements down the so-called Slot of the Solomons. The battle on Guadalcanal became a complex campaign of attrition. The Japanese did not send their main fleet but rather vessels in dribbles. American land-based air power controlled the Slot during the day, but the Japanese initially controlled it at night, as was evidenced in the 8 August Battle of Savo Island. Concern over the vulnerability of the U.S. transports led to their early removal on the afternoon of 9 August along with most of the heavy guns, vehicles, construction equipment, and food intended for the Marines ashore. The Japanese sent aircraft from Rabaul, while initially U.S. land-based aircraft flying at long range from the New Hebrides provided air cover for the Marines as fast destroyer transports finally brought in some supplies. American pos-

session of Henderson Field tipped the balance. U.S. air strength there gradually increased to about 100 planes.

At night the so-called Tokyo Express—Japanese destroyers and light cruisers—steamed down the Slot and into the sound to shell Marine positions and to deliver supplies. The latter effort was haphazard and never sufficient; often, drums filled with supplies were pushed off the ships to drift to shore. One of the great what-ifs of the Pacific War was the failure of the Japanese to exploit the temporary departure of the U.S. carrier task force on 8 August by rushing in substantial reinforcements.

Actions ashore were marked by clashes between patrols of both sides. Colonel Ichiki Kiyonao, who had arrived with his battalion on Guadalcanal in early August, planned a large-scale attack that took little account of U.S. Marine dispositions. His unit was effectively wiped out in the 21 August 1942 Battle of the Tenaru River. Ichiki's men refused to surrender, and they and their commander were killed in the fighting. Marine losses were 44 dead and 71 wounded; the Japanese lost at least 777 killed. From 12 to 14 September, strong Japanese forces attempted to seize U.S. Marine positions on Lunga Ridge overlooking Henderson Field from the south. The Japanese left 600 dead; American casualties were 143 dead and wounded. Both sides continued building up their strength ashore as naval and air battles raged over and off Guadalcanal.

From 23 to 25 October, the Japanese launched strong land attacks against Henderson Field. Fortunately for the Marine defenders, the attacks were widely dispersed and uncoordinated. In these engagements, the Japanese suffered 2,000 dead, while U.S. casualties were fewer than 300. Immediately after halting this Japanese offensive, Vandegrift began a six-week effort to expand the defensive perimeter beyond which the Japanese could not subject Henderson to artillery fire. Meanwhile, Admiral Kondō Nobutake's repositioning of vessels and Vice Admiral William F. Halsey's instructions to Rear Admiral Thomas Kinkaid to seek out the Japanese fleet resulted in the 26 October Battle of the Santa Cruz Islands.

Fighting on land continued on Guadalcanal. On 8 December, Vandegrift turned command of the island over to U.S. Army Major General Alexander M. Patch, who organized his forces into the XIV Corps, including the 2nd Marine Division, replacing the veteran 1st Marine Division, which was withdrawn, and the 25th Infantry Division. At the beginning of January 1943, Patch commanded 58,000 men, whereas Japanese strength was then less than 20,000.

Ultimately, the Americans won the land struggle for Guadalcanal thanks to superior supply capabilities and the failure of the Japanese to throw sufficient resources into the battle. The Americans were now well fed and well supplied, but the Japanese were desperate, losing many men to sickness and simple starvation. At the end of December, Tokyo decided to abandon Guadalcanal.

Meanwhile, on 10 January, Patch began an offensive to clear the island of Japanese forces, mixing Army and Marine units as the situation dictated. In a two-week battle, the Americans drove the Japanese from a heavily fortified line west of Henderson Field. At the end of January, the Japanese were forced from Tassafaronga toward Cape Esperance, where a small American force landed to prevent them from escaping by sea. Dogged Japanese perseverance and naval support, however, enabled some defenders to escape. The Japanese invested in the struggle 24,600 men (20,800 troops and 3,800 naval personnel). In daring night operations during 1–7 February 1943, Japanese destroyers evacuated 10,630 troops (9,800 army and 830 navy).

The United States committed 60,000 men to the fight for the island; of these, the Marines lost 1,207 dead and the army 562. U.S. casualties were far greater in the naval contests for Guadalcanal; the U.S. Navy and Marines lost 4,911 and the Japanese at least 3,200. Counting land, sea, and air casualties, the struggle for Guadalcanal had claimed 7,100 U.S. dead and permanently missing. The Japanese advance had now been halted, and MacArthur could begin the long and bloody return to the Philippine Islands.

Guadalcanal Naval Campaign (August 1942–February 1943)

Significant and prolonged South Pacific sea-land-air campaign. The campaign for Guadalcanal comprised several naval engagements and several vicious land battles fought

from August 1942 to February 1943. On Guadalcanal (90 by 25 miles in size) in the Solomon Islands, U.S. Marines and army troops attacked Japanese land forces, while the U.S. Navy battled the Japanese navy offshore.

Before the battle, U.S. planners were able to build up Pacific Theater resources more quickly than anticipated and take the offensive against the Japanese. This campaign, Operation WATCHTOWER, was the brainchild of U.S. Chief of Naval Operations Admiral Ernest J. King. It had as its objective the seizure of the islands of Tulagi and Gavatu as a preliminary step in securing the Solomons and then the recapture of the Philippines and the eventual defeat of Japan. These plans soon changed when intelligence revealed that the Japanese were building an airstrip on the nearby island of Guadalcanal. Once operational, such a base would pose a serious threat to Allied operations in the South Pacific. Therefore, its seizure became the primary objective of the campaign.

Although hamstrung by a lack of adequate resources because of sealift required for Operation TORCH, the British and American invasion of North Africa, Vice Admiral Robert Ghormley pieced together forces from the United States, Australia, and New Zealand for the invasion. Resources were so meager that some of his officers nicknamed the plan Operation Shoestring. Major General Alexander A. Vandegrift commanded the 1st Marine Division landing force, and Vice Admiral Frank Jack Fletcher had charge of the naval support element.

The U.S. Navy's tasks were to sustain forces ashore and provide naval and air protection for the Marines defending the airfield, which was captured shortly after the landing and renamed Henderson Field. The lack of a harbor compounded supply problems. The Japanese operated aircraft from Rabaul and later from other closer island airfields, but Allied "coast watchers" on islands provided early warning of many Japanese naval movements.

The Marines went ashore beginning on 7 August, but the sealift was so limited that they were without much of their heavier equipment and heavy artillery. The first naval engagement with the Japanese occurred on the night of 8–9 August 1942 in the Battle of Savo Island. A Japanese cruiser squadron overwhelmed an Allied force of equal size, sinking one Australian and three U.S. cruisers and damaging several destroyers, losing none of its own ships. The battle clearly showed the superiority of Japanese night-fighting techniques. The battle was the worst defeat ever suffered by the U.S. Navy in a fair fight, but it was only a tactical success, because the Japanese failed to go after the vulnerable American troop transports off Guadalcanal and Tulagi.

Nonetheless, the Battle of Savo Island and Japanese air attacks led Fletcher and Rear Admiral Richmond K. Turner to withdraw supporting naval forces from Guadalcanal, leaving the Marines ashore isolated, bereft of naval support, and

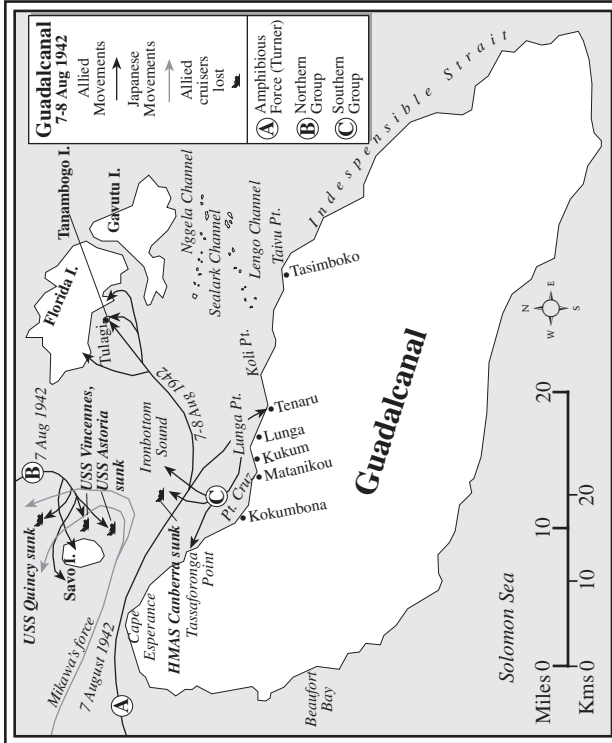

short of critical supplies. Long-range aircraft and destroyers did bring in some resources. The Japanese made a critical mistake in not capitalizing on the U.S. vulnerability to commit their main fleet assets. For the most part, they sent only smaller units in dribbles, chiefly in the form of fast destroyers. The so-called Slot was controlled by the United States during the day but the Japanese owned it at night.

The next major confrontation at sea off Guadalcanal came on the night of 24–25 August in the Battle of the Eastern Solomons. Fletcher's carrier-based aircraft intercepted and attacked the covering group for a Japanese convoy of destroyers and transports carrying 1,500 troops to Guadalcanal. The Americans sank the Japanese light carrier *Ryujo* and damaged another ship, but the U.S. fleet carrier *Enterprise* was located and attacked by Japanese aircraft and badly damaged. The Japanese destroyers and transports delivered the reinforcements and the destroyers and then shelled Henderson Field, although a U.S. Army B-17 sank one of the Japanese ships.

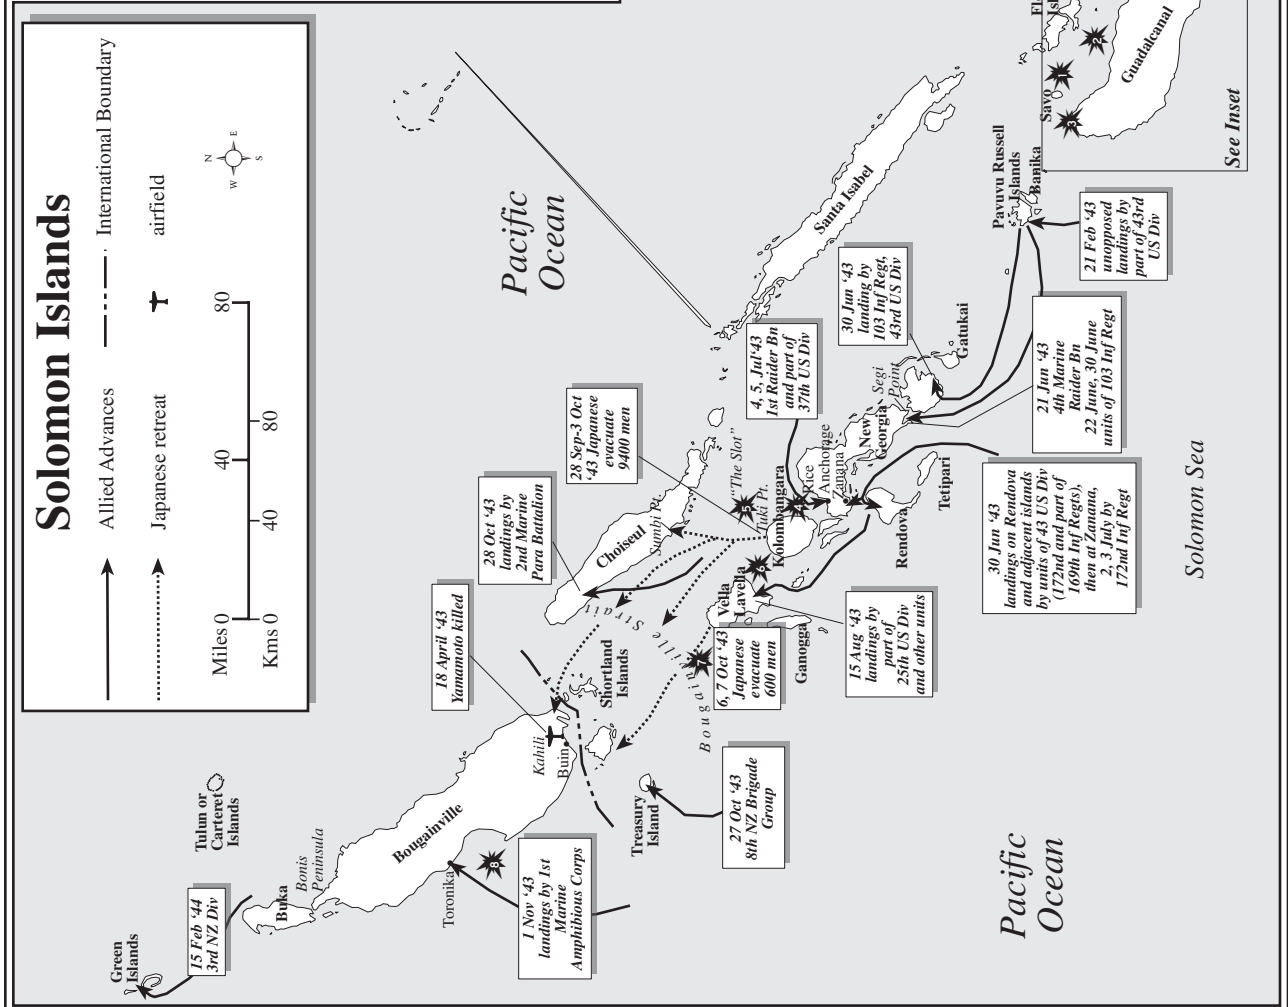

On 31 August, the U.S. carrier *Saratoga* was torpedoed by a Japanese submarine and put out of action for three months. That left only the carrier *Wasp* available for operations in the South Pacific. On 15 September, the *Wasp* was in turn torpedoed and sunk while it was accompanying transports lifting the 7th Marine Regiment to Guadalcanal from Espiritu Santo. A Japanese torpedo also damaged the battleship *North Carolina*, which, however, held her place in the formation. Admiral Turner continued to Guadalcanal, delivering the 7th Marine Regiment safely three days later.

Heavy fighting, meanwhile, was occurring on Guadalcanal; the Japanese were mounting unsuccessful attacks to recapture Henderson Field. The next big naval encounter off Guadalcanal was the Battle of Cape Esperance during the night of 11–12 October. The Japanese sent in their supply ships at night (the so-called Tokyo Express). U.S. ships equipped with radar detected a Japanese convoy off the northwest coast of Guadalcanal. In the ensuing fight, the Japanese lost a cruiser and a destroyer, and another cruiser was heavily damaged. The Americans lost only a destroyer and had two cruisers damaged. The first Allied success against the Japanese in a night engagement, the Battle of Cape Esperance, was a great boost to U.S. morale. A few days later, Admiral Chester W. Nimitz replaced the methodical Ghormley with the offensive-minded Vice Admiral William "Bull" Halsey.

A major engagement occurred on 26–27 October in the Battle of the Santa Cruz Islands. Rear Admiral Thomas Kinkaid and his Task Force 16 centered on the carrier *Enterprise* followed Admiral Halsey's instructions to engage Japanese forces under Admiral Kondō Nobutake. Each side conducted carrier strikes against the other. U.S. aircraft inflicted severe damage on the heavy carrier *Shokaku*, putting her out of action for nine months, and damaged the light carrier *Zuiho*. On the U.S. side, the heavy carrier *Hornet* was

badly damaged and had to be abandoned while under tow; she was soon sunk by Japanese destroyers. Kondō then withdrew. He had won a major victory over the Americans, but he had also lost 100 aircraft and experienced pilots, half again as many as the Americans. Had he continued to pursue the withdrawing U.S. ships, he might have destroyed the *Enterprise*.

During 12–15 November, a series of intense sea fights occurred in what became known as the Naval Battle of Guadalcanal. It took place near the entrance to Ironbottom Sound (so named for being the resting place of many Allied and Japanese ships) off Savo Island between Guadalcanal and Tulagi. In the first, U.S. ships and aircraft fought to block reinforcement of the island by 13,000 Japanese troops in 11 transports, escorted by destroyers, all commanded by Admiral Tanaka Raizo. At the same time, a powerful squadron under Abe Hiroaki arrived to shell Henderson Field. In a confused engagement, both sides suffered heavily. The Japanese lost the battleship *Hiei* and two cruisers sunk; all other Japanese vessels were damaged. The Americans lost two cruisers and four destroyers. A cruiser and a destroyer were close to sinking, and all other ships, save one, were damaged. Among those killed were Rear Admirals Daniel Callaghan and Norman Scott. Tanaka was obliged to retire, and the planned Japanese bombardment of Henderson Field did not occur.

On 13–14 November the Japanese returned, and their heavy cruisers shelled Henderson Field. But the Americans sank seven Japanese transports and two cruisers. During the third phase on 14–15 November, U.S. warships under Rear Admiral Willis A. Lee met and defeated yet another Japanese force under Kondō when the two sides met near Savo Island. The Americans lost two destroyers, but Kondō lost the battleship *Kirishima* and a destroyer. The net effect of the three-day battle was that Tanaka landed only some 4,000 troops (he rescued another 5,000 on his return to Rabaul), whereas the Americans regained control of the waters around the island.

The last major naval battle for Guadalcanal occurred on 30 November at Tassafaronga Point. The Japanese again attempted to land reinforcements on Guadalcanal and were surprised by a larger U.S. Navy task force. However, the Japanese once more demonstrated their superior night-fighting ability. In the exchange, the Japanese lost a destroyer, and the Americans lost a cruiser.

Japanese leaders now came to the conclusion that they could no longer absorb such losses in trying to hold on in Guadalcanal. The final battle of the campaign was a skirmish off Rennell's Island on 30 January 1943. In early February 1943, the Japanese evacuated their remaining ground forces from Guadalcanal.

The Americans won the campaign thanks largely to their superior supply capability and the failure of the Japanese to throw enough resources into the battle. The Tokyo Express down the Slot was haphazard and inadequate; often drums

full of supplies were simply pushed off ships to drift to shore. The campaign for Guadalcanal proved to be as much a turning point for the United States as Midway. The Japanese advance had been halted, opening the way for the long island-hopping advance toward Japan. In combatants the Japanese lost 1 light carrier, 2 battleships, 3 heavy cruisers, 1 light cruiser, 14 destroyers, and 8 submarines. Particularly serious from the Japanese point of view was the loss of 2,076 aircraft (1,094 to combat) and many trained pilots. U.S. Navy losses were 2 heavy carriers, 6 heavy cruisers (including the Royal Australian Navy *Canberra*), 2 light cruisers, and 15 destroyers, but new U.S. naval construction more than offset the U.S. losses. The campaign also destroyed the myth of Japanese naval superiority.

U.S. control of the air had rendered the Japanese ships vulnerable to attack. It also allowed Allied forces to determine the timing and location of offensive operations without Japanese foreknowledge.

Guam, Battle for (21 July–10 August 1944)

U.S. invasion and recapture of the largest of the Mariana Islands. Some 100 miles south of Saipan, Guam is at its greatest extremity some 34 miles long and 7 miles wide. The only one of the Marianas group controlled by the United States before the war, it had been acquired in 1898 as a consequence of the Spanish-American War. Little had been done to pre-

The U.S. Marines salute the U.S. Coast Guard after the fury of battle had subsided and the Japanese on Guam had been defeated, ca. August 1944. (National Archives)

pare the island against attack, and its 200-man Marine garrison, supported by Guamanian police and volunteers, was overwhelmed on 10 December 1941, following three days of fighting, by a 5,500-man Japanese brigade.

U.S. Admiral Ernest King, chief of naval operations, argued as early as January 1943 for an invasion of the Mariana Islands. Although originally planned for 18 June 1944, the invasion of Guam was delayed by more than a month because operations against Saipan took longer than anticipated and the task force reserve of the 27th Division had to be ordered there. Consequently, commander of Fifth Fleet Vice Admiral Raymond A. Spruance rescheduled the operation for 21 July. Marine Corps Lieutenant General Roy S. Geiger commanded the landing force of the 3rd Marine Division, 1st Provisional Marine Brigade, and the army's 77th Infantry Division.

Its limestone terrain veiled in labyrinthine vegetation, Guam was well suited for defense. The island's numerous ridges, hills, valleys, and caves allowed Lieutenant General Takashina Takeshi's 18,500 defenders to magnify their limited artillery resources. In close proximity to one another on the western shore were the two most important military installations: the fortified air base on Chote Peninsula and the navy yard at Apra Harbor.

The invasion was preceded for two days by the longest sustained naval bombardment of the Pacific islands campaigns to that point. The invasion force came ashore on the morning of 21 July in a two-pronged assault five miles apart. The 3rd Marine Division landed on the beach north of Apra Harbor to capture the nearby navy yard; the 1st Provisional Marine Brigade joined with the foremost elements of the 77th Infantry Division below the harbor to take the large airfield on the Orote Peninsula. Poor maps and stiff Japanese resistance prevented an advance of more than a few miles beyond the two designated American beachheads for four days. Enough Japanese guns survived the preliminary naval bombardment to inflict numerous casualties on the exposed American troops.

Late in the afternoon of 25 July, the 1st Provisional Marine Brigade finally seized the road bisecting the neck of the Orote Peninsula, severing Japanese access to the island's interior. That night, the trapped Japanese troops attempted to escape in General Takashina's ill-conceived banzai attack, only to be shattered by concentrated Marine artillery fire. Surviving Japanese were gradually eliminated over the next few days.

In an attempt to splinter the American beachhead north of Apra Harbor, at about 3:00 A.M. on 26 July Takashina mounted a well planned 3,900-man counterstrike against the unsuspecting 3rd Marine Division. Exploiting an unintended gap between two Marine regiments, the attackers swiftly penetrated the American position. Wild fighting ensued, involving support personnel as well as frontline defenders.

Despite initial gains and having inflicted 800 Marine casualties, after three hours the Japanese attack ground to a complete halt. It had cost an astounding 3,500 (95 percent) of the

attacking force dead. Takashina's expensive counterattack proved catastrophic to his already inadequate force. Intermittent fighting continued for several weeks across much of the island's thickly forested interior as organized Japanese resistance slowly dissolved in the face of the Americans' steady northward advance. With the bulk of the island under American control, on 10 August Geiger pronounced active combat operations on Guam at an end.

The loss of Guam and the remainder of the Marianas deprived the Japanese navy of airfields and anchorages and cut Japan's major supply artery with the South Pacific and its large air and naval base at Truk in the Caroline Islands. The United States launched devastating B-29 bombing raids against Japan itself after it gained control of Guam, Saipan, and Tinian.

Guandong (Kwantung) Army

Elite Japanese military force in Manchuria comprising Heilongjiang (Heilungkiang), Jilin (Kirin), and Liaoning Provinces. The Guandong Army (identified at the time as the Kwantung Army) was formed in April 1919 to protect Japanese interests in the part of southern Manchuria that Japan leased from China after the 1904–1905 Russo-Japanese War. Japan stationed one division there to defend the so-called Guandong Leased Territory and the South Manchurian Railway zone. For several years, the territory had been administered by the Guandong governor general, who also commanded Japan's expeditionary forces. In April 1919, a new joint civil/military administration was instituted, and the Guandong Army was charged with maintaining security. The Guandong Army consisted of an independent garrison of six battalions along with a division rotated every two years.

Facing a rising tide of Chinese nationalism and anti-Japanese sentiment in Manchuria, a handful of activist Guan-

dong Army staff officers undertook unauthorized initiatives, such as the assassination in June 1928 of Manchurian warlord Zhang Zuolin (Chang Tso-lin). On 18 September 1931, Lieutenant Colonel Ishihara Kanji and Colonel Itagaki Seishiro arranged to blow up a section of Japanese railway track outside Mukden (now Shenyang), Liaoning Province, which they then falsely blamed on the Chinese. The Mukden Incident was the excuse for the Guandong Army to initiate fighting with local Chinese forces. In this, the so-called Manchurian Incident, the Guandong Army (without the approval of the Tokyo government) embarked on the conquest of most of the rest of Manchuria, leading to the establishment on 1 March 1932 of Manzhouguo (Manchukuo). In 1934, the Japanese installed as ruler Aixinjueluo Puyi (Aisin-gioro P'u-i, known to Westerners as Henry Puyi), the last emperor of China's Qing (Ch'ing) dynasty. The new state was then known as Manzhouguo (Manchoutikuo, the Manchu [Manchu] Empire). It was in fact a puppet Japanese state.

The leaders of the Guandong Army regarded the Soviet Union as Japan's chief enemy. Throughout the 1930s, the two sides increased their forces in the border area of Korea, Manchuria, and the Soviet Far East, and border clashes between Japanese and Soviet troops increased. These confrontations included some heavy fighting in the Chagkufeng Incident (July-August 1938) and the Nomonhan Incident (May-September 1939).

Following the German invasion of the Soviet Union in June 1941, the Guandong Army expected a German victory. It conducted a mobilization exercise to prepare for an attack on the Soviet Union between August and October as soon as the Soviets had transferred forces from Manchuria to the European Front. Twelve Japanese divisions in Manchuria, two in Korea, and two from Japan participated in this exercise. Much to the disappointment of Guandong Army leaders, Tokyo decided instead to move into resource-rich south Asia. Supreme Headquarters in Tokyo enjoined Guandong Army leaders to avoid all border conflicts. Following Japan's string of early victories in Southeast Asia and the Pacific, and again anticipating a German victory, Japan withdrew forces from the Pacific Theater to reinforce the Guandong Army for war against the Soviet Union.

However, in conjunction with U.S. advances in the Pacific from February to July 1944, Supreme Headquarters withdrew 10 army divisions and 2 air divisions from Manchuria to the Pacific. The Guandong Army became a hollow force and easily fell prey to Soviet forces, which invaded Manchuria at the end of the war. Within two weeks of the Soviet strike into Manchuria, commander of the Guandong Army General Yamada Otozō surrendered, and the Guandong Army was disarmed. Some 60,000 men of the Guandong Army were killed in the fighting. After the cease-fire, another 185,000 died in Manchuria. About 600,000—including Japanese troops from North Korea, Sakhalin, and the Kuril Islands—were detained in prisoner-of-war camps, where they were

forced to work through 1950. The last group of prisoners was not released until 1956. In those labor camps, more than 55,000 died of illness or malnutrition.

Guderian, Heinz (1888–1953)

German army general. Born to a Prussian family in Kulm, Germany, on 17 January 1888, Heinz Guderian attended cadet schools and was commissioned a lieutenant in the 10th Hannoverian Jäger Battalion in January 1908. During World War I, he became a communications specialist, serving as assistant signals officer in Fourth Army headquarters until 1918, when he was appointed to the General Staff.

Guderian was active in the Freikorps during 1919, in which he served as chief of staff of the "Iron Division." He was later selected to be retained as one of 4,000 officers in the 100,000-man Reichswehr. Guderian was assigned to the transport troops in 1922. Returning to the General Staff in 1927, he became an advocate of mechanization based on British and French theorists. He was given command of an experimental motorized battalion in 1931 with which he demonstrated armored reconnaissance techniques. He was promoted to colonel in 1933, and in October 1935 he took command of the 2nd Panzer Division, one of only three being formed. He was promoted to General-major (U.S. equiv. brigadier general) in August 1936.

In 1937, Guderian published his treatise on armored warfare (*Achtung-Panzer!*), which espoused the combination of tanks, dive-bombers, and motorized infantry that is characterized as blitzkrieg (lightning war). Rapid promotion followed as Guderian helped expand Germany's armored forces. He became Generalleutnant (U.S. equiv. major general) and participated with his division in the occupation of Austria. In October, Guderian was promoted to general of panzer troops and appointed chief of mobile troops with direct access to Adolf Hitler.

During the invasion of Poland, Guderian commanded the XIX Panzer Corps, demonstrating through aggressive operations the soundness of blitzkrieg. He reached the pinnacle of operational command during the invasion of France in May 1940 when he led his panzer corps across the Meuse River at Sedan and raced to the English Channel to cut Allied forces off in Belgium.

During Operation BARBAROSSA, the June 1941 invasion of the Soviet Union, Guderian, now a full general, commanded

the 2nd Panzer Group in Army Group Center, where he cooperated with General Hermann Hoth's 3rd Panzer Group to encircle large Soviet forces at Minsk on 10 July. Guderian then was ordered south to assist General Paul L. E. von Kleist's 4th Panzer Group encircle more than 600,000 Russians in the Kiev pocket in September. Guderian's short temper and mercurial disposition toward superiors eventually led him to be relieved of command in December over tactical disputes.

Following a year of inactivity, Guderian was recalled to duty by Hitler as inspector general of armored troops in March 1943. Guderian made great efforts to rebuild the worn panzer forces. After the assassination attempt against Hitler in July 1944, Guderian was appointed chief of the General Staff. He stood up to Hitler on numerous occasions, leading to his dismissal on 28 March 1945. Taken prisoner by U.S. forces at the end of the war, Guderian was not prosecuted for war crimes, although he remained a prisoner until June 1948. Guderian died at Schwengen, Bavaria, on 14 May 1953. A headstrong and aggressive battlefield commander, Guderian turned mechanized theory into practice and established a legacy as the father of blitzkrieg warfare.

Guernica, Kondor Legion Attack on (26 April 1937)

The Spanish town of Guernica was bombed by German and Italian aircraft during the Spanish Civil War. When the Nationalists revolted against the Republican government of Spain in July 1936, Germany and Italy sent aid to the Nationalist side. Chancellor Adolf Hitler provided aircraft collectively known as the Kondor Legion commanded by Generalmajor (U.S. equiv. brigadier general) Hugo Sperrle.

By early 1937, the Nationalists' failure to capture Madrid shifted attention to the Basque provinces in the north. Spanish General Emilio Mola commanded the assault on the ground, promising to raze the region if it did not surrender. The air component was largely independent under German control. By late April 1937, Sperrle's chief of staff, Colonel Wolfram von Richthofen, discerned an opportunity to cut off the Republican retreat by bombing the Renteria bridge near the Basque town of Guernica. The Basques were a distinct ethnic group with their own language, customs, and tradition of representative government. Guernica was the spiritual center of the Basque people, the home of their parliament and of El Arbol, a sacred oak under which Spanish kings had traditionally promised to respect Basque rights.

On 26 April 1937, Richthofen ordered air assaults on the Renteria bridge as well as the surrounding suburbs to block the retreat of Basque troops. At approximately 4:40 P.M., the first German bomber appeared over Guernica and dropped its payload on a plaza near the bridge. Some 25 minutes later three more bombers arrived, followed by fighters that strafed the panicked population. Shortly after 6:00 P.M., waves of German and Italian bombers reached the town. Because smoke and dust blanketed the target, coupled with primitive bombsights, crews simply dropped their bombs into the city. More than 100,000 pounds of high explosives and incendiaries rained down on Guernica.

Normally Guernica numbered 5,000 inhabitants, but uncounted refugees and soldiers had swollen the population. As a result, exact casualty figures remain elusive, but the dead

certainly numbered in the hundreds. Although the raid razed more than half of the town's structures, the Renteria bridge survived, as did the Basque parliament and El Arbol. Even so, Richthofen expressed pleasure with the results.

That evening press reports reached the major European capitals concerning the bombing, many depicting it as a premeditated terror attack. The Nationalist press claimed that the city was burned by the Republicans to discredit the Nationalist cause. Not until the 1970s did the Spanish government admit Nationalist involvement in Guernica's destruction.

Learning of the tragedy in Paris, Spanish artist Pablo Picasso began work on a mural depicting the anguish and devastation. Scholars often credit this work, *Guernica*, for connecting the Basque town with the indiscriminate destruction of modern war.

Gustav Gun

The Krupp 80 cm K(E), known as the *schwere Gustav* (heavy Gustav), was the largest artillery piece ever built. A railway gun that had to move over a specially laid double track, it was supported by two bogies, each with 20 axles. The gun weighed 1,344 tons and had a bore diameter of 31.5 inches. Using a 3,000-lb propellant charge, it fired two different types of projectiles. The 10,560-lb high-explosive round had a maximum range of nearly 30 mi. The 15,600-lb concrete-piercing shell had a maximum range of 23 mi.

The German army ordered three 80 cm K(E) guns in 1937 for the specific mission of demolishing the French forts on the

Maginot Line. However, by the time the first gun was delivered in late 1941, France had long since fallen. In January 1942, Heavy (Railway) Artillery Unit 672 was formed to man the gun; the unit moved to the Crimea in April. The gun, nicknamed "Dora" by the crew, was not ready to fire its first round in the siege of Sevastopol until 5 June. Between then and 17 June, it fired a total of 48 rounds in combat. The rounds all landed anywhere from 197 ft to 2,400 ft from their targets. Nonetheless, the shells were large enough that their destructive power contributed to the fall of Forts Stalin, Lenin, Siberia, and Maxim Gorki.

After the fall of Sevastopol, the Gustav gun returned to Germany to receive a new barrel. Plans to send the gun to Leningrad were preempted by the Soviets having raised the siege. Some sources report that the gun fired against the Poles during the Warsaw Rising in August 1944, but that has never been confirmed.

The second 80 cm K(E) was completed and delivered, but the crew was never raised. The third gun was still incomplete when the war ended. In April 1945, the German army destroyed both completed weapons.

The Gustav gun was a technical masterpiece, but it was a tactical white elephant. Under the best of conditions, it never fired more than seven or eight rounds per day. Once the gun reached its designated firing position, it required three to six weeks to assemble and place into battery. Its entire detachment numbered 1,420 men, commanded by a colonel with his own headquarters and planning staff. The main gun crew numbered 500, most of whom moved, prepared, and serviced the ammunition. The remainder of the unit consisted of an intelligence section, two antiaircraft artillery battalions, and two guard companies.

H

Haakon VII, King of Norway (1872–1957)

Born on 3 August 1872 at Charlottenlund Castle near Copenhagen, Denmark, Prince Charles was the second son of the future King Frederik VIII of Denmark. Charles was educated by private tutors and entered the Danish navy at age 14. In 1893, he became an officer, and in 1896 he married Princess Maud of Great Britain, daughter of King Edward VII. They had one son, Alexander, later renamed Olaf. Norway declared independence from Sweden in 1905 and Charles was elected its constitutional monarch, choosing the Norwegian title of Haakon VII.

Haakon worked to establish a modern monarchy. His motto was “All for Norway.” He hoped Norway could remain neutral during World War II, but when the Germans invaded his country in April 1940, Haakon rejected demands that he appoint pro-Nazi Vidkun Quisling as premier and urged his people to resist. Haakon reluctantly left Norway aboard a British warship on 7 June 1940 with his son Olaf and members of the Storting (parliament) for exile in Britain. As head of the Norwegian government in exile, Haakon spoke to his people via radio, explaining that the Norwegian constitution allowed him to wage war against the Germans from abroad and refusing to abdicate. During the rest of the war, Haakon was heavily involved in the resistance movement; he became both Norway’s symbol of resistance and its rallying point.

Haakon was warmly welcomed on his return to Oslo on 7 June 1945, exactly five years from his departure and the fortieth anniversary of Norway’s independence. His spirited wartime activities had created a strong bond between him and his people. Haakon spent the immediate postwar years helping with reconstruction. He also dispensed with the formali-

King Haakon VII of Norway. (Library of Congress)

ties of court life, endearing himself further to the Norwegians. This well-loved “people’s king” died at Oslo on 21 September 1957. He was succeeded by his son, who reigned as Olaf V.

Haile Selassie, Emperor of Ethiopia (1892–1975)

Haile Selassie was emperor of Ethiopia (also known as Abyssinia). He was born at Ejersagoro on 23 July 1892 as Tafari Makonnen. His father was Ras Makonnen, a Coptic Christian and leading general and political figure. Tafari was a grandnephew of Emperor Menelik II (reigned 1889–1913).

An excellent student, Tafari attended both the Capucin school and the palace school. From age 13, he governed Harer, Selale, and Darass. On Menilek’s death, his grandson Lij Iyasu succeeded to the throne, but he Islamized the government. The Christians denounced this policy, and Iyasu was deposed. Menilek’s daughter, Empress Sawditu I (reigned 1916–1930) made the progressive-minded Tafari the regent and heir. From 1917 to 1928 he traveled in the west expressly to absorb the culture and ideas.

Tafari was proclaimed emperor on Sawditu’s death in 1930. Declaring himself a direct descendant of King Solomon and the Queen of Sheba, Tafari adopted the name Haile Selassie, meaning “might of the trinity.” His suppression of slavery was a matter of personal pride. He established the Bank of Ethiopia and promulgated a new criminal code. Selassie soon earned a worldwide reputation as a humanitarian, although he centralized power in his own person and was in fact a royal dictator.

Selassie took his country’s disputes with Italy to the League of Nations. Italy’s invasion in 1935 found the Ethiopians no match for the invaders, who had complete air supremacy and employed poison gas. Selassie fled to Britain in 1936, appealing for support in a masterful but unsuccessful address to the League of Nations. Following Italy’s entry into World War II in June 1940 and the extension of the fighting to Africa, British forces liberated Ethiopia, and Selassie returned to his capital in triumph in 1941.

Selassie’s progressive policies after the war included political reform, social reform, and a national assembly in 1955.

Haile Selassie, Emperor of Ethiopia (1930–1936 and 1941–1974). (Photo by Hulton Archive/Getty Images)

His focus in the 1960s and 1970s was pan-African. In 1960, he crushed a revolt of army officers and intellectuals who advocated further reforms. He was successfully overthrown on 12 September 1974 and placed under palace arrest. Selassie died mysteriously on 17 August 1975.

Halder, Franz (1884–1972)

German army general. Born on 30 August 1884 in Würzburg, Germany, Franz Halder joined a Bavarian field artillery regi-

ment in 1902 and attended the Bavarian Staff College in Munich before the outbreak of World War I. As a result of his training, Halder served throughout the war as a staff officer at the division through army-group levels on both the Western and Eastern Fronts. His performance during World War I secured him a position in the postwar Reichswehr (state armed forces). Serving in both command and staff positions during the interwar years, he was promoted to colonel in December 1931, to Generalmajor (U.S. equiv. brigadier general) in October 1934, to Generalleutnant (U.S. equiv. major general) in August 1936, and to General der Artillerie (U.S. equiv. lieutenant general) in February 1938. In October 1938, Halder was appointed chief of the army General Staff.

Halder played a crucial role in the planning and execution of Germany's campaigns before World War II and during its first years. By the end of the Polish Campaign in 1939, he had convinced the German army commander in chief, Generaloberst (U.S. equiv. full general) Walther von Brauchitsch, to place overall responsibility for operations in his hands. His claims to sole authorship of the 1940 campaign in France were unjustified, although Halder was at the center of the campaign's successful execution. Halder was promoted to Generaloberst in July 1940.

Anticipating future operations in the east, Halder established a planning group in the summer of 1940 to develop a campaign plan against the Soviet Union. His lack of vision and unwillingness to encourage innovation among his subordinates, however, resulted in a plan that did not fully address the Red Army's capabilities or clearly identify the campaign's objectives. Failing to defeat the Red Army in the summer of 1941, Halder maintained his belief that the German army would decide the campaign at the gates of Moscow.

Through the spring of 1942, Halder became increasingly disillusioned with Adolf Hitler's conduct of operations, particularly the 1942 offensive on the Eastern Front. By September, the Führer had had enough of the army chief of staff's intransigence and summarily relieved him on 24 September. Halder remained on the inactive list, keeping in contact with Colonel General Ludwig Beck, former chief of the General Staff and a leader of the resistance against Hitler. As a result of these exchanges, Halder was imprisoned in the Flossenbürg concentration camp in the aftermath of the 20 July 1944 attempt on Hitler's life. Halder's association with Beck was sufficient to prevent his conviction at the International Military Tribunal at Nuremberg. Halder then spent 14 years with the U.S. Army Historical Division and received the Meritorious Civilian Service Award in 1961. Halder died on 2 April 1972 in Aschau, West Germany.

Halifax, Edward Frederick Lindley Wood, Earl of

See Wood, Edward Frederick Lindley (Earl of Halifax).

Halsey, William Frederick, Jr. (1882–1959)

U.S. Navy admiral. Born in Elizabeth, New Jersey, on 30 October 1882, William Halsey Jr. was a naval officer's son. He

graduated from the U.S. Naval Academy in 1904 and was commissioned an ensign in 1906. Halsey served in the Great White Fleet that circumnavigated the globe from 1907 to 1909 and was then in torpedo boats. When the United States entered World War I in April 1917, Halsey was a lieutenant commander and captain of a destroyer. He then commanded destroyers operating from Queenstown, Ireland.

Following World War I, Halsey's service was mostly in destroyers, although he also held an assignment in naval intelligence and was a naval attaché in Berlin. Promoted to captain in 1927, he commanded the *Reina Mercedes*, the Naval Academy training ship, and became fascinated by naval aviation. Halsey attended both the Naval War College and Army War College, and in 1935, despite his age, he completed naval flight training and took command of the aircraft carrier *Saratoga*. Promoted to rear admiral in 1937, Halsey assumed command of Carrier Division 2 of the *Enterprise* and *Yorktown*. He was promoted to vice admiral in 1940.

Halsey was at sea on 7 December 1941 when Japanese aircraft attacked Pearl Harbor. In early 1942, Halsey's carriers raided Japanese central Pacific installations and launched Colonel James Doolittle's raid on Tokyo in April. Acute skin disorders requiring hospitalization removed him from the Battle of Midway in June 1942. In October 1942, Halsey replaced Admiral Robert Ghormley as commander of the South Pacific and began the most successful phase of his career. He was promoted to admiral in November. Despite severe tactical losses, Halsey retained strategic control of the waters around Guadalcanal in late 1942, and during 1943 he supported operations in the Solomon Islands and into the Bismarck Archipelago. Halsey came to be known as "Bull" for his pugnacious nature.

In March 1943, Halsey took administrative command of the Third Fleet, although he continued his command in the South Pacific until June 1944. In the Battle of Leyte Gulf, the Japanese battle plan and the flawed American command system combined with Halsey's aggressiveness to shape one of the more controversial episodes of the war. On 24–25 October, a Japanese force centered on four fleet aircraft carriers that were largely bereft of aircraft under Admiral Ozawa Jisaburo decoyed Halsey and his entire Task Force 38 away from the U.S. landing sites, leaving the sites vulnerable to a powerful Japanese surface force under Kurita Takeo. Although Halsey destroyed most of Ozawa's force in the Battle of Cape Engaño, disaster for the support ships off Leyte was only narrowly averted when Kurita lost his nerve. Widely criticized for not coordinating his movements with Vice Admiral Thomas Kinkaid, who had charge of the invasion force of Seventh Fleet, Halsey never admitted responsibility. He instead blamed the system of divided command.

Halsey endured further condemnation when he took the Third Fleet into damaging typhoons in December 1944 and

U.S. Navy Admiral William Frederick Halsey, Jr. (Library of Congress)

June 1945. Still, his flagship, the *Missouri*, hosted the formal Japanese surrender on 2 September 1945. Promoted to admiral of the fleet in December 1945, Halsey retired in April 1947. He then served on the boards of several large corporations. Halsey died at Fisher's Island, New York, on 16 August 1959.

Hamburg, Raids on (24 July–3 August 1943)

The air battle of Hamburg, Operation GOMORRAH, consisted of a series of six raids in July and August 1943 that destroyed a large portion of the city and killed more than 45,000 people. Most of them died in the horrendous firestorm of the night of 27 July, the first such conflagration induced by bombing. More than half of the residential units in the city were destroyed, and 900,000 people lost their homes. The Americans and British bombed the city many times later in the war, but none of those raids approached the results or notoriety of the July attack.

Four of the attacks were mounted at night by the Royal Air Force (RAF), and two in daylight by the U.S. Army Air Forces (USAAF) Eighth Air Force. The initial British operation,

which began the night of 24 July, featured the first use of chaff, code-named WINDOW, in combat. The cloud of metallic strips blotted out large segments of enemy radar screens and provided cover for aircraft that stayed within the pattern, cloaking the bomber stream. This helped keep losses relatively low during RAF operations; only 87 British bombers were lost out of more than 3,000 sorties.

The USAAF sent 252 B-17 Flying Fortresses over Hamburg on 25 and 26 July but lost 17 aircraft. In addition, the American bombing accuracy was poor, since primary targets were often obscured by smoke from the earlier RAF raid. The Americans dropped only about 300 tons of bombs on the city, whereas RAF bombers delivered more than 8,000 tons.

The second British attack combined concentrated bombing with ideal weather conditions of high temperature and low humidity to produce an unexpected firestorm, which was further helped along because most of Hamburg's firefighters were in distant sectors of the city dealing with the results of the earlier attacks. Most of the dead had heeded the advice of local authorities to stay in basement shelters, where they were

Bombed buildings, Hamburg, Germany, July 1943. (Library of Congress)

asphyxiated by carbon monoxide or crushed by collapsing buildings. However, taking to the streets was no guarantee of safety. Those who fled the shelters sometimes met even more horrible deaths, sucked into fires by high winds or caught in molten asphalt.

German armaments minister Albert Speer feared that if the Allies could quickly follow up with six similar devastating firestorms, the German economy might collapse. However, although RAF Bomber Command tried, it could not achieve the same result until its February 1945 assault on Dresden.

The air battle of Hamburg killed more than 45,000 people and 900,000 people lost their homes.

Hamburg itself recovered surprisingly quickly, and the Luftwaffe changed its defensive tactics to counter the RAF night-bombing campaign. Scholarship conducted 50 years after the bombing of Dresden has considerably lowered the casualty figures from that bombing; it appears that the 27 July attack on Hamburg,

not the Dresden bombing, was the deadliest air raid in the European Theater. The raids on Hamburg set a standard that RAF Bomber Command found difficult to duplicate and still provide a vivid symbol of the horrors of the bombing of cities and of total war.

Hand Grenades

Numerous types of hand grenades were used by the military forces during World War II. The U.S. military used offensive, defensive, and special-use grenades. The MkIII A1, a can-shaped grenade filled with 8 oz of flaked TNT, was used for offensive purposes because no fragmentation took place after the initial explosion. The MkII "pineapple" grenade was for defensive use and was based on the old British "Mills Bomb" design. Troops could not assault forward because of the fragmentation of its serrated shell, which created a 10-yard killing

radius. The M15 WP "Willie Pete" or white-phosphorous grenade, used for smoke generation and the assaulting of caves and pillboxes, saw limited use. In tight quarters, the almost 2 lb M15 WP created severe eye, respiratory, and skin injuries.

The standard hand grenade for British forces was the revised M36 Mills Bomb. It had a serrated cast-iron body filled with TNT and was used defensively. Of note was the screw-in fuse, which was put in place prior to combat. To use the grenade, the user pulled the pin and then threw the grenade. When the grenade left the user's hand, the spring-loaded lever was released, activating the fusing sequence. A more specialized grenade was the "Gammon Bomb" (No. 82), a 20 oz cloth bag filled with plastic explosive. It had an attached screw-off metal cap that was removed to arm the device. The Gammon Bomb was effective against pillboxes and bunkers.

The French military drew on the venerable F1 defensive grenade. This grenade had a serrated body and used a 5 sec delay fuse activated by a pin-and-lever system similar to that found in the British M36.

The standard German hand grenades were the high-explosive stick grenade (*Stielhandgranate* 24) and the high-explosive hand grenade (*Eihandgranate* 39). The offensive *Stiel*. 24, universally known as the "potato masher" grenade, contained a bursting TNT charge and could be fitted with a fragmentation sleeve for defensive use. The igniter was activated by pulling the porcelain bead found in the handle behind the metal cap. A heavier *Stiel*. 43 variant existed; it contained almost twice the TNT charge and could also be fitted with a fragmentation sleeve. The offensive *Ei*. 39 is egg-shaped, and its older and newer designs differed slightly. The TNT filler was initiated by a detonator and friction igniter. More specialized German grenades were the offensive wooden and concrete improvised hand grenades (*Behelfshandgranate-Holz* and *Beton*) and numerous forms of smoke grenades (*Nebelhandgranate*) based on stick, conventional, egg, and glass body designs.

The Italian army used three main types of grenades, known as "Red Devil Grenades" from their color. All used a pull firing pin. The Breda Model 35 (introduced in 1935) weighed 7 oz and had only 2 oz of TNT; the SRCM Model 35 also weighed 7 oz but had only 1.5 oz of TNT. The OTO Model 35 weighed 7.4 oz and had 2.5 oz of TNT. Italian grenades tended to have too little explosive filler and broke into large fragments, so that often they did little damage to their targets. The Breda Model 42 with a handle (potato-masher style) was developed to attack enemy tanks and contained 1.5 lb of TNT.

Hand grenades in use by Japanese forces were the Model 91 (1931), Model 97 (1937), Model 99 (1939), and Model 23. The Model 91 had a serrated body and was for defensive use. Its fuse had to be struck against a hard object, such as a helmet, to ignite it. The Model 97 was a newer variation of the

A Marine (second from right) throws a hand grenade against a Japanese position, Saipan 1944. (Library of Congress)

Model 91. It had a shorter fuse delay time of 4–5 sec rather than 7–8 sec, could not be fired from a discharger, and was carried by all frontline troops. The lighter Model 99 Kiska had a smooth, cylindrical body and a flange at either end. It also used an impact fuse, and because it was smaller, it could be used for offensive purposes. The Model 23 looked like the Model 91 but had two lugs and rings on the side for mooring so it could also be used in booby traps. It had a pull-type friction igniter fuse and was filled with granular TNT. Other more specialized grenades included the 18 oz incendiary grenade, the incendiary stick grenade, and the high-explosive stick hand grenade.

Soviet hand grenades were based on the Type-1933, Type-1942, and F-1 models. The Type-1933 (RGD-33) was composed of a grenade head and a throwing handle. It could be used in either a defensive or an offensive mode, depending on whether the fragmentation jacket (normal and lightened types) was used over the grenade head. Detonation time was

3.2 to 3.8 sec after fuse ignition. The can-shaped Type-1942 (RG-42) was for offensive and defensive use. Although it created a lethal bursting radius, it was somewhat smaller than average because of the lighter scored squares found in its internal metallic belt. The F-1 was for defensive use. Externally, it resembled the U.S. MkII pineapple grenade, but it was based on either the standardized (UZRG) or Koveshnikov fuse. Because it expelled heavy fragments out to 656 ft, the F-1 was only thrown from trenches or other covered positions.

Harbor, Artificial

See Mulberries.

Harriman, William Averell (1891–1986)

Key U.S. diplomat posted to Great Britain and the Soviet Union during World War II. Born on 15 November 1891 in New York City—the son of Edward Henry Harriman, owner of the Union Pacific Railroad and one of the wealthiest U.S. businessmen—W. Averell Harriman initially pursued a career as a venture capitalist and with Union Pacific. In 1920, he invested in German shipping, Soviet manganese mine concessions, and aviation. In 1931, he merged his investment firm with an established merchant bank to form Brown Brothers Harriman. From the late 1920s onward, a burgeoning interest in politics caused Harriman to support the Democrats and back President Franklin D. Roosevelt's reformist New Deal policies. Harriman held several posts in the National Recovery Administration and sought a World War II government job.

In March 1941, Roosevelt sent Harriman to London as “defense expediter” to coordinate and facilitate the anticipated flood of American wartime supplies to Britain under the newly established Lend-Lease program. Harriman quickly established a warm and confidential relationship with Britain's wartime prime minister, Winston L. S. Churchill. He often bypassed the U.S. ambassador, John G. Winant, to report directly to White House aide Harry Hopkins and serve as an unofficial liaison between Churchill and Roosevelt. In London, Harriman, although married, began a clandestine love affair with Churchill's daughter-in-law, Pamela Digby Churchill, who eventually (in 1971) became his third wife.

When Germany invaded Russia in June 1941, the United States extended Lend-Lease aid to the Soviet Union, and dealings with Moscow likewise fell within Harriman's remit. In 1943, Harriman replaced Admiral William H. Standley as U.S. ambassador to the Soviet Union, where he remained until 1946, attending the major wartime Allied conferences at Tehran, Yalta, and Potsdam. In late 1944, when Soviet troops allowed occupying German forces to suppress Polish rebels in Warsaw before themselves mopping up the remaining

Germans (a policy deliberately designed to eliminate future opponents of a Soviet-backed Polish regime), Harriman sent diplomatic dispatches to Washington sounding one of the earliest official warnings against future Soviet designs for the nations of eastern Europe.

Harriman subsequently held numerous other government positions under Democratic presidents, gaining the reputation of advocating a firm but flexible and nonalarmist stance toward the Soviets. Harriman died in Yorktown Heights, New York, on 26 July 1986.

Harris, Sir Arthur Travers (1892–1984)

Royal Air Force air chief marshal and commander of Bomber Command. Born on 13 April 1892 in Cheltenham, England, Arthur Harris joined a Rhodesian regiment at the beginning of World War I. In 1915, he transferred to the Royal Flying Corps and became a pilot, and by the end of the war he commanded the 44th Squadron. After the war, he served in India and Iraq and commanded a training school. He completed the Army Staff College (1927), again served in the Middle East, and then held posts at the Air Ministry (1933–1937).

On the outbreak of World War II, Harris commanded Number 5 Bomber Group. He then was deputy chief of the Air Staff and headed a mission to Washington. Dissatisfaction with the course of British strategic bombing led to his appointment in February 1942 as head of Bomber Command and his promotion to air chief marshal.

Harris committed himself to maintaining Bomber Command as an independent strategic arm. In May 1942, he launched the first of the 1,000-plane raids against Köln (Cologne), which did much to raise morale at home. Harris, who was nicknamed “Bomber,” maintained that massive bombing would break German civilian morale and bring about an end to the war. Harris ordered Bomber Command to conduct massive night raids against German cities. Among

Royal Air Force Air Chief Marshall Sir Arthur Harris/Commander.
(Library of Congress)

other missions, Harris directed the May 1943 raid on the Ruhr dams by 617th Squadron, the July 1943 raid against Hamburg, attacks against German rocket factories at Peenemünde in August 1943, the November 1943 attacks against Berlin, and the destruction of Dresden in February 1945.

Harris remains controversial, especially because of his seeming lack of concern over collateral bomb damage. He was at odds with his superior, chief of the Air Staff Air Marshal Charles Portal, and others who sought to target specific industries considered essential to the Nazi war effort. What appeared to be indiscriminate bombing of cities also brought harsh criticism on Harris at the end of the war. His aircrews, however, remained fiercely loyal to him.

Harris retired from the RAF in September 1945 and headed a South African shipping company. His memoir, *Bomber Offensive*, was published in 1947. Made a baronet in 1953, Harris died on 5 April 1984 at Goring-on-Thames, England.

Hart, Thomas Charles (1877–1971)

U.S. Navy admiral. Born in Davison, Michigan, on 12 June 1877, Thomas Hart graduated from the U.S. Naval Academy in 1897 and was commissioned an ensign in 1899. He served in Cuban waters on the battleship *Massachusetts* during the Spanish-American War and commanded a submarine force of seven boats based in Ireland during World War I.

Between the world wars, Hart commanded submarine and cruiser forces and the battleship *Mississippi*. He graduated from the Naval War College in 1923 and the Army War College in 1924. In 1929, Hart was promoted to rear admiral and took command of submarines in the Atlantic and Pacific Fleets from 1929 to 1931. He was superintendent of the Naval Academy from 1931 to 1934. He commanded a cruiser division of the Scouting Force from 1934 to 1936 and served as a member of the navy's General Board from 1936 to 1939.

In June 1939, Hart was promoted to full admiral and given command of the small U.S. Asiatic Fleet. During the next years, he accelerated fleet training and drills and made plans to defend the Philippine Islands and to cooperate with the British and Dutch if war broke out with Japan. Lacking the resources to counter the Japanese invasion of the Philippines in December 1941 and denied air support from the U.S. Army's Far East Air Force, Hart sent his surface units to the Netherlands East Indies (NEI) at the end of the month and moved his headquarters to Java.

In January 1942, Hart was appointed commander of the naval forces of the American-British-Dutch-Australian Command (ABDACOM), which was charged with defending the NEI. Hart had no chance of success, for his resources were limited and he had no prospect of reinforcements. Moreover, the British and Dutch disagreed with his plans for using his ships. At the end of January, Hart sent his cruisers and destroyers against Japanese forces in the Battle of Makassar Strait, but the Dutch wished to concentrate ABDACOM's ships for the defense of Java. As a result, in February 1942, Hart relinquished his command to Vice Admiral C. E. L. Helfrich of the Netherlands navy and returned to the United States. Later that month, most of ABDACOM's ships were lost in the Battle of the Java Sea.

Hart served with the General Board until his retirement in February 1945, when he was appointed a U.S. senator from

U.S. Admiral Thomas C. Hart. (Photo by Bernard Hoffman/Time Life Pictures/Getty Images)

Connecticut, a post he held until 1947. Hart died in Sharon, Connecticut, on 4 July 1971.

the Luftwaffe was not desperate for pilots, and Hartmann was the beneficiary of nearly 19 months' training before his first posting. In October 1942, he reported to Staffel (squadron) 7, III Gruppe (group), Jagdgeschwader (fighter wing) 52 (7.III/JG52) on the Eastern Front. The veterans nicknamed the youthful Hartmann "Bubi" (lad). Hartmann would spend the next two and one-half years in various units in JG52.

On his nineteenth sortie, Hartmann scored his first victory. He continued to score steadily, although his career nearly came to a sudden end when he was shot down and captured after his ninetieth victory. He managed to escape and eventually return to German lines. Hartmann continued to run up his score, and he was awarded the Knight's Cross in October 1943 after 150 victories. By August 1944, he had doubled his total. He was awarded every order of the Knight's Cross—Oak Leaves, Swords, and eventually Diamonds, Germany's highest military award.

Known as the "Black Devil of the Ukraine" by his Soviet opponents in recognition of his skill and the paint scheme of his aircraft, Hartmann scored his 352nd and last victory on 8 May 1945. He surrendered his fighter group to a U.S. Army unit but was handed over to the Soviets. Tried and convicted as a war criminal, Hartmann was imprisoned until his repatriation in late 1955.

Hartmann joined the new Federal Republic of Germany air force in 1956 and was appointed commander of the newly formed JG71 Richthofen. He retired in 1970 as a colonel. In retirement, Hartmann remained active in German civilian aviation, operating flight schools and participating in fly-ins, sometimes with other World War II aces. Erich Hartmann died on 19 September 1993 at Weil im Schönbuch.

Hartmann, Erich Alfred (1922–1993)

Luftwaffe fighter pilot and highest-scoring ace of all time. Born in Weissach, Germany, on 19 April 1922, Erich Hartmann grew up in an aviation-minded family. His mother learned to fly in 1929, and Hartmann was an avid glider pilot as a young man. Hartmann joined the Luftwaffe in October 1940 and began his flight training in March 1941. At the time,

Hausser, Paul "Papa" (1880–1972)

German Schutzstaffel (SS) general. Born on 7 October 1880 at Brandenburg, Paul Hausser joined the army and was commissioned a lieutenant in 1899. He served during World War I as a staff officer on both the Western and Eastern Fronts and rose to the rank of major in 1918. Hausser joined the Reichswehr of the Weimar Republic but retired in 1932 as lieutenant

general. Hausser joined the Nazi SS in 1934, and as an inspector for its academies he helped train the armed SS units, the nucleus of the Waffen-SS.

In October 1939, Hausser commanded one of the two new SS combat divisions (Waffen-SS) and led this division, known as *Das Reich*, in campaigns in France (1940) and Yugoslavia (1941) and on the Eastern Front in the invasion of the Soviet Union, where he was wounded and lost an eye. He returned to active duty, and from June 1942 to June 1944, he commanded the first SS army corps formation, I SS Panzer Corps (later II Panzer Corps). During the Battle of Kharkov in early 1943, Hausser ignored Adolf Hitler's directives and ordered a retreat. He was criticized for this decision, but he was able to save his troops from annihilation and then retake Kharkov, which contributed significantly to the stabilization of the German Front. He also participated in the Battle of Kursk.

Transferred to France in June 1944, Hausser took command of the Seventh Army, which resisted the Allied invasion of Normandy. Hausser was seriously wounded in August during the desperate escape of his army at Falaise. He was promoted to *Oberstgruppenführer* and full general of the Waffen-SS in January 1945, and his last command, dating from 28 January, was of Army Group G in the southern part of the German Western Front. Hausser tried to organize an effective resistance against the advancing Allies, but it was impossible to meet Hitler's expectations, and the Führer removed him from command on 4 April 1945. He spent the remainder of the war on the staff of Field Marshal Albert Kesselring, commander in chief, west. Hausser is generally regarded as the most militarily accomplished of the Waffen-SS generals.

Hausser was imprisoned in May 1945 and not released until 1948. In the postwar Federal Republic of Germany, Hausser became the leader of Waffen-SS veterans. An author, Hausser insisted in his books that his men had been "soldiers as any others." Hausser died at Ludwigsburg, Germany, on 21 December 1972.

He Yingqin (Ho Ying-ch'in) (1890–1987)

Nationalist Chinese Army general. Born into a landowning family in Xinyi (Hsing-i), Guizhou (Kweichow) Province on 2 April 1890, He Yingqin (Ho Ying-ch'in) received a thorough military education in both Chinese and Japanese military schools. After the outbreak of the Chinese Revolution in 1911, he returned to China and joined the revolutionary forces in Shanghai, Jiangsu (Kiangsu). Following the ill-fated "Second Revolution" in 1913, he returned to his studies in Japan, which he completed in 1916. In 1924, he was appointed chief instructor at the newly founded Huangpu (Whampoa) Military Academy, and he participated in the Northern Expedition. He became a close associate of Jiang Jieshi (Chiang Kai-shek) and directed military operations against dissident Guomindang (GMD [Kuomintang, KMT], Nationalist) forces as well as the Red Army in the "Extermination Campaigns" of the 1930s.

He was ordered to appease the Japanese in the humiliating Tanggu (Tangku) Truce of 1933 and the He-Umezu

Chinese Nationalist General He Yingqin (Ho Ying-Ch'in). (Photo by Leonard Mccombe/Time Life Pictures/Getty Images)

Agreement of 1935, resulting in widespread student demonstrations against GMD policy. After the Lugoujiao (Lukou-ch'iao) Marco Polo Bridge Incident and the onset of a full Sino-Japanese War in 1937, He was appointed chief of staff of the Chinese army. Between 1942 and 1944, he developed a prickly rivalry with U.S. Lieutenant General Joseph W. Stilwell, commander of forces in the China-Burma-India Theater and Allied chief of staff to Jiang. He also clashed with General Chen Cheng (Ch'en Ch'eng), Stilwell's choice for Chinese commander. When Stilwell was relieved of command in 1944, He was relieved of his war portfolio but not his military position.

On 9 September 1945, He formally received the Japanese surrender in Nanjing (Nanking) in Jiangsu from General Okamura Yasuji, commander of Japanese forces in China. During the Chinese Civil War period, He's political fortunes waned. In 1949, he joined the Nationalists on Taiwan. He served as chief Chinese delegate to the United Nations' Military Advisory Committee (1946–1948) and then as chairman of the Strategy Advisory Committee in Taiwan (1950–1958). He died in Taipei on 21 October 1987.

Heisenberg, Werner (1901–1976)

German nuclear physicist. Born in Würzburg, Germany, on 5 December 1901, Werner Heisenberg graduated in 1923 from the University of Munich with a doctorate in physics. Heisenberg subsequently established a reputation as a talented scientist. One of his greatest accomplishments was his theory of quantum mechanics, for which he won the Nobel Prize in physics in 1932. By the late 1930s, despite being an opponent of the Nazi regime, Heisenberg was the leader of the German project to manufacture an atomic weapon.

This endeavor, known as the *Uranverein*, occupied Heisenberg throughout the war. The project was not successful, but the cause of its failure is still a matter of debate. Heisenberg claimed after the war that he had tried to impede the project

German physicist Werner Heisenberg. (Library of Congress)

as best he could to deny the Nazis an atomic bomb, a claim that some scholars contest. A principal cause of the project's failure was a lack of resources. The dearth of material and the resulting slow progress in research led to a mid-1942 report to Adolf Hitler that projected the development of a German atomic bomb as being several years in the future. Hitler, convinced that Germany would not be able to deploy such a weapon during World War II, consequently took little interest in the project.

Following the defeat of Germany, Heisenberg was among those German physicists briefly imprisoned in Britain by the Allies. In 1946 he was allowed to return to Germany and reorganized at Göttingen the Institute for Physics, later known as the Max Planck Institute for Physics. Heisenberg remained active in the field of physics in subsequent years. He died in Munich on 1 February 1976.

Helicopters

Helicopters are a type of aircraft supported through the air by the aerodynamic lift created by one or more rotors, essentially rotating wings or blades, turning about a substantially vertical axis. The interest in helicopters came about because of its highly valued ability to ascend and descend almost vertically and to land in relatively small areas without benefit of lengthy landing strips.

Probably the first helicopterlike design was by artist and inventor Leonardo da Vinci in the fifteenth century. Three hundred years later in 1783, inspired by a “flying top” toy brought from China, two Frenchmen named Launoy and Bienvenu built a working model of a vertical-flight machine. In the mid-nineteenth century, British nobleman Sir George Cayley built a full-size, unpowered heloglider that flew a few feet with his coachman aboard.

These early designs had two problems: their flight was uncontrolled, and they lacked a source of power for sustained flight. With the advent of gasoline engines and shortly after the first heavier-than-air flight of Orville and Wilbur Wright, French inventor Charles Renard built a small helicopter that flew pilotless. He was followed in 1907 by Louis Breguet and Paul Cornu, who each built a manned machine that lifted off the ground, but both suffered from control problems. In 1909, before turning his inventive powers to producing large fixed-wing aircraft for the Russian tsar, Igor Sikorsky experimented with rudimentary helicopters, but he was unable to solve control and stability problems.

Between 1916 and 1918, Austrian Lieutenant Stefan Petroczy and Theodore von Karman designed and built two prototype vertical-lift machines for the Central Powers during World War I. The second made more than 30 successful flights before it crashed. The war ended before a third could be built. The designers of these machines handled problems of control and stability by tethering the machines to cables anchored to the ground.

During the 1920s, a Frenchman named Dourheret, the American father-and-son team of Emile and Henry Berliner, and George de Bothezat, a Russian under American contract, all produced vertical-lift machines. All efforts were disappointing because of stability and control problems. But in 1923, Spanish engineer Juan de la Cierva solved one instability problem—caused because the retreating blade produced less lift than the advancing blade—by hinging the blades for more flexibility. Although Cierva’s invention was a rotary-wing aircraft, it was not a true helicopter. It was an autogiro or gyroplane that depended on a propeller to provide horizontal movement while the unpowered rotating wings provided the

A canteen worker handing a cup of tea to the pilot of a Sikorsky R-4 helicopter hovering overhead at the RAF Helicopter School in Andover in January 1945. (Photo by Fox Photos/Getty Images)

lift. As working rotary-wing aircraft, autogiros held the field through the late 1920s and early 1930s.

The first true helicopters appeared in the 1930s in the United States, France, and Germany. In France, Louis Breguet and René Dorand built a twin-rotor helicopter that set the speed record in 1935 and the endurance and distance records in 1936. In 1937, Heinrich Focke’s helicopter set new records for time aloft, speed, distance, and altitude. Igor Sikorsky, who had emigrated to the U.S. in 1919, made his maiden helicopter flight in a craft of his own design in 1939.

Despite these successes, more autogiros than helicopters were used during World War II. Only Japan and the Soviet Union used autogiros in a very limited role in support of their ground forces, and the Japanese used some in service with their navy for antisubmarine warfare and liaison. Britain deployed a few to France for observation and communications duties in 1939, but the defeat of France ended those activities.

The U.S. military program to develop helicopters began in the late 1930s and fell under the direction of the U.S. Army

Air Corps. While other services—primarily the navy—looked into the possibility of helicopter use, in May 1942 the Army Air Forces took delivery of the first practical helicopter put into military service, a Sikorsky R-4.

Helicopters had no real impact in World War II. The German army used a small number of them for reconnaissance, supply, transport, and casualty evacuations, and the navy used them for shipboard reconnaissance and antisubmarine patrol. By the end of the war, more than 100 Sikorsky R-4 helicopters had been delivered to the U.S. Army Air Forces, Navy, and Coast Guard and to Britain's Royal Air Force and its Fleet Air Arm. These helicopters were used in experiments, primarily antisubmarine warfare, and for search-and-rescue operations. In April 1944, one of the four U.S. Army Air Forces R-4s sent to India for experimentation was used to rescue four men from an airplane crash site in Burma behind Japanese lines.

By the end of the war, helicopters had entered limited military service, and some had seen combat. Many commanders believed the helicopter was too fragile and vulnerable for the battlefield and too difficult to maintain. Despite its tentative beginnings, in later wars the helicopter would come to revolutionize military operations by providing entrance to and exit from the battlefield by means of the air while being nearly uninhibited by terrain.

Hershey, Lewis Blaine (1893–1977)

U.S. Army general and director of the Selective Service System. Born in Angola, Indiana, on 12 September 1893, Lewis Hershey graduated from Tri-State College in Angola in 1914. He was then principal of Flint High School in Indiana. Hershey had joined the National Guard in 1911, and he was promoted to first lieutenant in 1916. After the United States entered World War I, Hershey was activated for military service. He served on the Mexican border and then in France, but too late to see combat. Promoted to captain, he returned to the United States in September 1919 and received a regular army commission in July 1920.

Over the next decade Hershey held a variety of routine assignments. He was left permanently blind in his left eye

from a polo accident in 1927. He graduated from the Command and General Staff School in 1931 and the Army War College in 1933. Promoted to major in 1935, Hershey was assigned to Washington that September as secretary of the Joint Army and Navy Selective Service Committee of the War Department General Staff, tasked with developing a system for raising military manpower in the event of need. This undertaking led to the Selective Service Act.

Hershey became deputy director of Selective Service in 1940. In July 1941, President Franklin D. Roosevelt appointed him the director. During World War II, Hershey oversaw the mobilization of more than 10 million men for the U.S. armed forces gathered from a network of 6,400 local draft boards. He was promoted to major general in April 1942.

The original Selective Service Act expired in 1947, but with the coming of the Cold War, Congress reinstated it the next year, and President Harry S Truman reappointed Hershey the director of Selective Service. The system worked efficiently during the Korean War and again during the Vietnam War. President Richard Nixon pledged to dismiss Hershey; he favored centralized and nationalized draft classifications, which ran counter to Hershey's locally run system. Nixon relieved Hershey in 1970, promoting him to full general in compensation and reassigning him as presidential adviser on manpower. Hershey retired from the army in April 1973. He died in Angola, Indiana, on 20 May 1977.

Hess, Walter Richard Rudolf (1894–1987)

German deputy Führer. Born on 26 April 1894 in Alexandria, Egypt, to a German merchant family, Rudolf Hess volunteered for the 1st Bavarian Infantry Regiment in August 1914 during World War I, but in the last weeks of the war he became an officer pilot. Following the war, Hess settled in Munich and began university studies in history, economics, and geopolitics. An early member of the National Socialist Party, he became a close associate of Adolf Hitler and participated in the Beer Hall Putsch of November 1923. Hess was sentenced to prison for 18 months, during which time he

Deputy Führer of the German Reich Rudolf Hess, 1940. (Hulton Archive)

acted as private secretary to Hitler, working with Hitler on *Mein Kampf*. On his release, Hess secured a position with the geopolitician Karl Haushofer.

In December 1932, Hess became head of the Central Political Committee of the National Socialist Party. He had the reputation of being a slavish follower of Hitler. Power mattered little to him; Hitler's approval was all. In April 1933, three months after becoming German chancellor, Hitler named Hess deputy Führer. A member of the Nazi inner circle, Hess was nonetheless not up to the tasks demanded of him. Traces of madness surfaced, and he was not well physically.

On 10 May 1941, six weeks before the German invasion of the Soviet Union (Operation BARBAROSSA), Hess, having learned to pilot the Me-110 long-range German fighter, flew solo from Germany to Scotland. In a rather extraordinary feat of navigation, he piloted the aircraft to within 10 miles of his goal, the estate of the Duke of Hamilton, where he bailed out and was taken prisoner. Much speculation remains as to the reason for Hess's flight. Most likely, Hess hoped to broker a peace agreement between Britain and Germany, but this had no authority from Hitler. The German government admitted the event but denied any official backing. In any case, Hess was immediately taken prisoner by British authorities.

Hess remained in prison in Britain for the remainder of the war. One of the major defendants before the International War Crimes Tribunal at Nuremberg, Hess was found guilty of conspiracy to wage aggressive war and crimes against peace. He was sentenced to life in prison. During his trial, Hess revealed to the world the secret agreements of the Soviet-German Non-aggression Pact of 23 August 1939 that had provided for a partition of the Baltic states and Poland between Germany and the Soviet Union. The Soviets never forgave Hess and refused repeated British requests that he be released on medical grounds, especially when he was the only inmate of Spandau Prison in Berlin. Hess served the longest time of any of the Nuremberg defendants sentenced to prison. He died at Spandau on 17 August 1987.

Hewitt, Henry Kent (1887–1972)

U.S. Navy admiral. Born in Hackensack, New Jersey, on 11 February 1887, H. Kent Hewitt graduated from the U.S. Naval Academy in 1906. He then joined the global cruise of President Theodore Roosevelt's Great White Fleet. During World War I, Hewitt commanded destroyers in European waters. Between the wars, he alternated shore duty as an instructor at the Naval Academy, battleship tours, staff assignments, and study at the Naval War College (1929).

In 1933, Hewitt took command of Destroyer Division 12. He was promoted to captain the next year. Hewitt then commanded the cruiser *Indianapolis*. In December 1939, he took over Cruiser Division 8. He was promoted to rear admiral in December 1940 and commanded task groups on neutrality patrols in the Atlantic. Following U.S. entry into the war in December 1941, in April 1942 Hewitt assumed command of the Amphibious Force, Atlantic Fleet. As such, he was responsible for U.S. amphibious forces in the Atlantic and Europe. Hewitt was the U.S. naval officer most involved in the development of amphibious doctrine in the Mediterranean and European Theaters during the war. He had charge of every major Allied amphibious operation in the Mediterranean Theater during the war.

Hewitt was promoted to vice admiral in November 1942, and in March 1943 he assumed command of the U.S. Navy Eighth Fleet. Working within an Allied command structure in which he was subordinate to the British Admiral Sir Andrew Browne Cunningham, and forced to coordinate military and naval operations and deal with such forceful characters as Major General George S. Patton, Hewitt demonstrated considerable diplomatic ability. Hewitt's mathematical and logistical skills were equally fully exercised in planning and directing complicated large-scale landing operations, reinforced by naval gunfire support, in North Africa (November 1942), Sicily (July 1943), Salerno (September 1943), and southern France (1944). His most difficult decision was whether to proceed with Operation TORCH, the North African landings, despite adverse weather conditions. He elected to proceed, a difficult choice that led to military success.

Promoted to full admiral in April 1945, shortly afterward Hewitt assumed command of the Twelfth Fleet, U.S. naval forces in European waters. He returned to the United States in October 1946 and took a special assignment at the Naval War College in Rhode Island before becoming naval representative to the United Nations Military Staff Committee. Hewitt retired in March 1949 and died at Middlebury, Vermont, on 15 September 1972.

Heydrich, Reinhard Tristan Eugen (1904–1942)

Chief of the German security police and Sicherheitsdienst (SD, Security Service). Born in Halle, Germany, on 7 March 1904, Reinhard Heydrich believed in the stab-in-the-back legend

(that the German army had not been defeated militarily in World War I, but had been undone by the collapse of the German home front) and in the myth of Aryan supremacy. He joined the Freikorps at age 16 and the German navy in 1922. Planning to make the navy his career, Heydrich was forced to resign in 1931 following an indiscretion with another officer's daughter. That same year, Heydrich joined the National Socialist Party and became active in the Sturmabteilung (SA, Storm Troops) in Hamburg. Heydrich's managerial abilities and Germanic appearance led Schutzstaffel (SS, bodyguard troops) chief Heinrich Himmler to appoint him as head of the SD. Heydrich soon built the SD into a powerful organization, and by 1933 he was an SS-Brigadeführer.

After directing the opening of Dachau, the first of many Nazi concentration camps, Heydrich helped to organize the 1934 purge of the SA (the "Night of the Long Knives"), in which the SA leadership was liquidated. Feared even within party ranks for his ruthlessness and known as the "Blond Beast," Heydrich helped create the Nazi police state. He also played a leading role in the 9 November 1938 Kristallnacht (Night of Glass), an orgy of SA violence against the German Jewish community.

Following the invasion of Poland, Heydrich assumed command of the Reichssicherheitshauptamt (RSHA, Reich Main Security Office), which was responsible for carrying out Hitler's extermination of the Jews. He established the Einsatzgruppen killing squads charged with executing Jews and members of opposition groups in German-controlled Poland and later in the Soviet Union. Heydrich was also a leading participant at the Wannsee Conference on 20 January 1942, when top Nazis planned the extermination of European Jewry.

Although he still retained his other duties, Heydrich in late 1941 became the Reich protector of Bohemia and Moravia. On 27 May 1942, British-trained Czech commandos ambushed Heydrich's car, seriously wounding him. Heydrich died on 4 June 1942. In retaliation for his death, the Germans destroyed the village of Lidice and murdered many of its inhabitants.

Himmler, Heinrich (1900–1945)

German political figure and leader of the Schutzstaffel (SS, bodyguard units). Born on 7 October 1900 in Munich, Hein-

Heinrich Himmler (wearing glasses) inspects a prisoner of war camp in Russia, circa 1940–1941. (Heinrich Hoffman Collection, ca. 1946, National Archives)

rich Himmler attended secondary school in Landshut. During World War I, he progressed from clerk to officer cadet in the 11th Bavarian Regiment. He then studied agriculture at the Munich Technical High School from 1918 to 1922. Himmler joined the National Socialist Party and played a small role in the November 1923 Munich Beer Hall Putsch. Although he remained politically active, he also married, bought a farm, and raised poultry.

In January 1929, Adolf Hitler appointed Himmler as head of the SS. Within a few years, Himmler built the SS from a force of 200 men into an organization 50,000 men strong with its own distinctive black uniform, personal devotion to Hitler, and ethos. In 1934, Reichsführer (leader) of the SS Himmler gained control of the Gestapo. Hitler rewarded him for his active role in the 1934 Blood Purge by making the SS

an independent organization second only to his own immediate authority. In June 1936, Himmler also gained control of all the police forces of Germany.

Although he was physically far removed from the ideal Aryan type, Himmler was a fanatical adherent of Nazi racial theories. He busied himself with fantastic schemes to breed a new race of “pure Aryans”—an SS version of the medieval knights—who would rule Europe from the Atlantic to the Urals. He set up special Lebensborn homes for unmarried mothers with impeccable racial antecedents, and special schools (the SS Junkerschulen) for training the SS future elite. Hitler, despite his promise to the German army, allowed Himmler to establish armed SS formations, known as the SS Verfügungstruppen (emergency troops), from which came the divisions of the Waffen-SS during World War II. The SS

also came to have considerable economic interests, including armaments factories. By 1939, Himmler's influence overshadowed the Nazi Party; many high-ranking officials, even in the military, found it prudent to hold SS ranks. Himmler was one of the most important figures in Germany, and perhaps the most dreaded.

Controlling Germany's racial policies, Himmler directed the "final solution"—the extermination of the Jews as well as the incurably ill, the disabled, gypsies, and homosexuals. The

SS already ran the concentration camps. It now established and ran the death camps as well.

After the July 1944 bomb plot against Hitler, Himmler took command of the Reserve Army. In November 1944, Hitler gave Himmler command of Army Group Rhine, and during January–April 1945, he had charge of

Army Group Vistula—two positions for which he was utterly unqualified. In April 1945, Himmler attempted to negotiate a surrender to the Western Allies. A furious Hitler stripped him of his posts. Himmler attempted to flee but was captured by British troops. Identified on 23 May 1945, Himmler committed suicide by means of a hidden cyanide capsule.

Annette Richardson

Heinrich Himmler was one of the most important figures in Germany, and perhaps the most dreaded.

On 25 December 1926, Hirohito acceded to the throne on the death of his father, ushering in the Shōwa period in Japanese history. His reign spanned more than six decades. The new emperor's close advisers included political moderates who desired close relations with Britain and the United States. They also hoped that Hirohito might reverse the decline in popular reverence for the Imperial throne that had occurred in the Taisho period.

In his early years as emperor, Hirohito and his imperial entourage found Prime Minister Tanaka Giichi's hard-line China policy at best problematic. This was one reason why Hirohito harshly reprimanded the military officer turned politician over his response to the June 1928 assassination of Zhang Zuolin (Chang Tso-lin) in Manchuria. When Tanaka's successor Hamaguchi Osachi was placed in a politically untenable position over the 1930 London Naval Disarmament Treaty, Hirohito did voice unequivocal support for cooperation with Britain and the United States and threw the weight of his support behind the beleaguered civilian prime minister. Although these actions no doubt illustrated Hirohito's desire for peace, they inexorably enmeshed him in the rough-and-tumble political process and made his entourage vulnerable to attack by hard-liners.

These experiences in the early years of his reign and his observations of European governments led Hirohito to conclude that he must defer to cabinet decisions. On the basis of this particular understanding of his constitutional function, Hirohito chose, despite personal reservations, to accept policies presented to him by the cabinet at key historical junctures, such as the outbreak of the military conflict with China in 1937 and the Japanese attack on Pearl Harbor.

Hirohito rendered an independent political judgment only twice: when the cabinet was unable to act effectively on the attempted coup by army junior officers on 26 February 1936 and when Japan accepted the Potsdam Declaration and Hirohito called on the Japanese people to surrender at the end of World War II. Such studied self-restraint did not make him a hapless stooge. As head of state under the Meiji constitutional system, Hirohito often expressed his concerns and opinions to those who made policy recommendations to him, but he usually upheld the cabinet's decision. After the war, some Western historians, notably David Bergamini, alleged that Hirohito had been deeply in sympathy with Japanese expansionist policies, but the available documentation largely contradicts this. During the war, Hirohito's role as commander in chief became more pronounced, but his reprimands and exhortations to the military during the conflict should be understood in their proper historical context. As a wartime head of state, he acted to try to win the war. Although threatened with military revolt, Hirohito decided to accept the Potsdam Declaration, risking a possible coup d'état when he made the decision to surrender.

In the new postwar Japanese constitution, the emperor became the symbol of the nation. In keeping with the new

Hirohito, Emperor of Japan (1901–1989)

Japanese emperor. Born at the Aoyama Palace in Tokyo on 29 April 1901, the oldest son of Emperor Taisho, Japan's future emperor was named Hirohito by his grandfather the Emperor Meiji. His imperial title was Michinomiya. Hirohito was heir to the chronically ill and frail Emperor Taisho. During a six-month period in 1921, Hirohito traveled in Europe, and his visit to Britain and his meeting with King George V profoundly shaped his view of constitutional monarchy.

Hirohito, Emperor of Japan, wearing imperial regalia and Shinto priest headdress. (Library of Congress)

constitutional principle of popular sovereignty, the emperor carried out certain ceremonial duties with the advice and approval of the cabinet. In 1971, Hirohito traveled to Europe, and in 1975 he went to the United States. Hirohito died in Tokyo on 7 January 1989. In Japan he is commonly referred to as Emperor Shōwa.

Hiroshima, Bombing of (6 August 1945)

The U.S. bombing of the Japanese city of Hiroshima was the first use of the atomic bomb. On 25 July 1945, commander of United States Strategic Air Forces General Carl Spaatz received orders to use the 509th Composite Group, Twenti-

eth Air Force, to deliver a “special bomb” attack on selected target cities in Japan, specifically Hiroshima, Kokura, Niigata, or Nagasaki. Following rejection of conditions promulgated by the Potsdam Proclamation on 26 July, a declaration threatening Japan with total destruction if unconditional surrender was not accepted, President Harry S Truman authorized use of the special bomb.

Assembled in secrecy and loaded on the Boeing B-29 Superfortress *Enola Gay*, the bomb consisted of a core of uranium isotope 235 shielded by several hundred pounds of lead, encased in explosives designed to condense the uranium and initiate a fission reaction. Nicknamed “Little Boy,” the bomb possessed a force equivalent to 12,500 tons of TNT (12.5 kilotons).

The *Enola Gay*, commanded by Colonel Paul Tibbets, departed Tinian at 2:45 A.M. on 6 August. Two B-29s assigned as scientific and photographic observers followed, and the three aircraft rendezvoused over Iwo Jima for the run over Japan. Captain William Parsons of the U.S. Navy completed the bomb’s arming in the air shortly after 6:30 A.M. The flight to Japan was uneventful, and Tibbets was informed at 7:47 A.M. by weather planes over the targets that Hiroshima was clear for bombing. Japan’s eighth largest city (it had about 245,000 residents in August 1945), Hiroshima was an important port on southern Honshu and headquarters of the Japanese Second Army.

The *Enola Gay* arrived over the city at an altitude of 31,600 feet and dropped the bomb at 8:15:17 A.M. local time. After a descent of some nearly 6 miles, the bomb detonated 43 seconds later some 1,890 feet over a clinic and about 800 feet from the aiming point, Aioi Bridge. The initial fireball expanded to 110 yards in diameter, generating heat in excess of 300,000 degrees Centigrade, with core temperatures over 50 million degrees Centigrade. At the clinic directly beneath the explosion, the temperature was several thousand degrees. The immediate concussion destroyed almost everything within 2 miles of ground zero. The resultant mushroom cloud rose to 50,000 feet and was observed by B-29s more than 360 miles away. After 15 minutes, the atmosphere dropped radioactive “black rain,” adding to the death and destruction.

Four square miles of Hiroshima’s heart disappeared in seconds, including 62,000 buildings. More than 71,000 Japanese died, another 20,000 were wounded, and 171,000 were left homeless. Some estimates place the number of killed at more than 200,000. About one-third of those killed instantly were soldiers. Most elements of the Japanese Second General Army were at physical training on the grounds of Hiroshima Castle when the bomb exploded. Barely 900 yards from the explosion’s epicenter, the castle and its residents were vaporized. Also killed was one American prisoner of war in the exercise area. All died in less than a second. Radiation sickness began the next day and added to the death toll over several years.

HISTORIOGRAPHICAL CONTROVERSY

The Decision to Employ the Atomic Bomb

Of historiographical controversies associated with World War II, few, if any, have produced as much venom as that surrounding the American use of atomic bombs against the Japanese cities of Hiroshima and Nagasaki in August 1945. Although the morality of using atomic weapons against what were arguably civilian targets has been an issue of debate, the controversy has really revolved around the two major questions: what motivated the Harry S Truman administration to use the bombs in combat, and was dropping the bombs necessary to secure a Japanese surrender without an invasion of the home islands?

There was little controversy in the United States at the time the bombs were dropped, and Truman said he never lost any sleep over the decision.

Debate on the U.S. use of atomic bombs began in earnest in the spring of 1965 with the publication of Gar Alperovitz's *Atomic Diplomacy: Hiroshima and Potsdam*. Drawing evidence from previously unexploited documents, Alperovitz argued that the primary motivation for the Truman administration's decision to use the bombs was to intimidate the Soviet Union. Alperovitz asserted that the bombs were not needed to end the war in the Pacific or to obviate a U.S. invasion of Japan and that President Truman and Secretary of State James Byrnes ignored viable alternatives to the bombs because they wanted Moscow to see the new terrible weapon in U.S. possession.

In making his claims, Alperovitz offered a revision to the official explanation for the decision to use the bombs. This had been put forth most cogently by Henry L. Stimson, U.S. secretary of war from 1940 to 1945, in "The Decision to Use the Atomic Bomb" (*Harper's Magazine*, February 1947). Stimson held that the bombs had been dropped to shorten the Pacific war, to eliminate the need for an invasion of the Japanese home islands

(scheduled for 1 November 1945), and to save American lives (perhaps 1 million had the invasion taken place). Although Alperovitz was not the first to challenge the official explanation, his conclusions, unlike those found in earlier revisionist works by William Appleman Williams, D. F. Fleming, and Herbert Feis, engendered heated responses from several scholars and established the parameters for ongoing debate about the development, use, and legacy of the atomic bombs.

During the ensuing decades, new scholarship on the atomic bomb question, much of it based on new primary source material, produced a revision of Alperovitz's revisionism. The resulting synthesis combined elements of both the official and revisionist positions, while adding fresh perspectives. Fashioned by the research efforts of Barton J. Bernstein, Martin J. Sherwin, J. Samuel Walker, and others, this synthesis held that diplomatic considerations played a secondary role and that the Truman administration's primary objective in using the bombs was to shorten the Pacific war and save American lives—although not the 500,000 to 1 million commonly quoted by adherents to the official explanation. Additionally, the new scholarship emphasizes that the bomb had been developed with the assumption that, once completed, it would be used in combat, and that this contributed to its employment; that domestic political considerations influenced American policymakers; that viable alternatives to both invasion and atomic bombs existed; and that in all probability, the Pacific war would have ended before the 1 November 1945 scheduled invasion of Kyushu, even without the bombs.

Although many scholars have come to accept the synthesis interpretation in whole or in part, debate about use of the atomic bombs has not ceased. Adherents to both the official and revisionist positions continue to argue their cases while

refusing to accept any significant modifications of their interpretations. The question concerning use of the atomic bomb retains the power to inflame public passions, a fact perhaps best exemplified by the furor over the Smithsonian Institution's proposed 1995 exhibit of the *Enola Gay*, the Boeing B-29 bomber that dropped the first bomb at Hiroshima.

The ruins of Hiroshima after the dropping of the atomic bomb. (Hulton Archive)

Following three observation circuits over Hiroshima, the *Enola Gay* and its escorts turned for Tinian, touching down at 2:58 P.M. The bombing mission, 12 hours and 13 minutes long covering 2,960 miles, changed the nature of warfare but did not end the war. Truman released a statement on 7 August describing the weapon and calling on Japan to surrender, but his message was ignored by most Japanese leaders as propaganda. The United States dropped another atomic bomb on 9 August, this time on Nagasaki.

Hitler, Adolf (1889–1945)

Leader (Führer) of Germany. Born on 20 April 1889 in Braunau am Inn, Austria, Adolf Hitler had a troubled childhood. He was educated at primary school and Realschule in Linz, but he dropped out at age 16. Hitler aspired to become an artist, and on the death of his mother Klara in 1907 (his father Alois had died in 1903), he moved to Vienna. He attempted

to enroll at the Viennese Academy of Fine Arts but was unsuccessful. Hitler lived in flophouses and made some money selling small paintings of Vienna scenes to frame shops. It was in Vienna that Hitler developed his hatred of Jews, who had assimilated into Vienna society. But he also developed an aversion to internationalism, capitalism, and socialism. He developed an intense sense of nationalism and expressed pride in being of German descent.

Probably to avoid compulsory military service, Hitler left Austria in May 1913 and settled in the south German state of Bavaria. On the outbreak of World War I, he enlisted in the Bavarian army and served in it with distinction. Here he found the sense of purpose he had always previously lacked. He saw extensive military action, was wounded, and served in the dangerous position of *Meldegänger*

While in power, sales of his book *Mein Kampf* and his images made Hitler immensely wealthy.

(runner). Temporarily blinded in a British gas attack, Hitler ended the war in a military hospital. He had risen to the rank of lance corporal and won the Iron Cross First Class, an unusual distinction for someone of his rank.

After the war, Hitler returned to Munich and worked for the military, reporting to it on political groups, and he then became involved in politics full time. In the summer of 1919, Hitler joined the *Deutsche Arbeiterpartei* (German Worker's Party), later known as the *Nationalsozialistische Deutsche Arbeiterpartei* (NSDAP, National Socialist Party or Nazi party). His oratorical skills soon made him one of its leaders. Disgruntled by Germany's loss in the war, Hitler became the voice of the dispossessed and angry. He blamed Germany's defeat on the "November criminals"—the communists, the Jews, and the Weimar Republic.

Taking a cue from Benito Mussolini's march on Rome the previous year, on 8 November 1923 Hitler and his followers attempted to seize power in Bavaria as a step toward controlling all of Germany. This Beer Hall Putsch was put down by the authorities with some bloodshed. Hitler was then arrested and brought to trial for attempting to overthrow the state. He used his trial to become a national political figure in Germany. Sentenced to prison, he served only nine months (1923–1924). While at the Landsberg Fortress, he dictated his stream-of-consciousness memoir, *Mein Kampf* (*My Struggle*). Later, when he was in power, royalties on sales of the book and his images made him immensely wealthy, a fact he deliberately concealed from the German people.

Hitler formed few female attachments during his life. He was involved with his niece, Geli Raubal, who committed sui-

Adolf Hitler at Nazi party rally, Nuremberg, Germany, circa 1928. (National Archives)

cide in 1931, and later with Eva Braun, his mistress whom he hid from the public. Deeply distrustful of people, Hitler was a vegetarian who loved animals and especially doted on his dogs. He was also a severe hypochondriac, suffering from myriad real and imagined illnesses.

Hitler restructured the NSDAP, and by 1928 the party had emerged as a political force in Germany, winning representation in the Reichstag. In April 1932, Hitler ran against Field Marshal Paul von Hindenburg for the presidency of Germany. Hitler railed against the Weimar Republic for the Versailles Treaty at the end of World War I, the catastrophic inflation of 1923, the threat posed by the communists, and the effects of the Great Depression. Hindenburg won, but Hitler received 13 million votes in a completely free election, and by June 1932 the Nazis were the largest political party in the Reichstag.

On 30 January 1933, Hindenburg appointed Hitler chancellor. Hitler quickly acted against any political adversaries. Fresh elections under Nazi auspices gave the Nazis in coalition with the Nationalists a majority in the Reichstag. An Enabling Act of March 1933 gave Hitler dictatorial powers. On the death

of Hindenburg in August 1934, Hitler amalgamated the office of president and took control of the armed forces. In the “Night of the Long Knives” of July 1934, Hitler purged the party and also removed several political opponents. Hitler also reorganized Germany administratively, dissolving political parties and labor unions and making Germany a one-party state. Nazi Germany became a totalitarian state that Hitler, now known as the Führer (leader), ruled alone.

Resistance to the Nazis was crushed, and many dissidents were sent to concentration camps. The ubiquitous Gestapo kept tabs on the population, but the state was not characterized solely by repression by any means. In the first several years, Hitler was carried forward on a wave of disillusionment with the Weimar Republic, and a plebiscite showed that a solid majority of Germans approved of his actions.

Almost on assuming political power, Hitler initiated actions against the Jews. They were turned into a race of “untouchables” within their own state, unable to pursue certain careers and a public life. The Nuremberg Laws of 1935 defined as Jewish anyone with one Jewish grandparent. That a terrible fate would be their lot was clear in Hitler’s remarks that war in Europe would lead to the “extinction of the Jewish race in Europe.”

In 1934, Hitler took Germany out of the League of Nations and the Geneva disarmament conference. Germans were put back to work; and rearmament, albeit at first secret (it was announced openly in 1935), was begun. Hitler’s most daring gamble was in March 1936, when he marched German troops into the Rhineland and remilitarized it. In November 1937, he announced plans to his top advisers and generals for an aggressive foreign policy and war, and in March 1938 he began his march of conquest with the *Anschluss* (annexation) of Austria. That fall, he secured the Sudetenland of Czechoslovakia, and in March 1939, he took over the remainder of Czechoslovakia. Poland was the next pressure point. To secure his eastern flank, in August 1939 Hitler concluded a nonaggression pact with the Soviet Union. On 1 September 1939, German forces invaded Poland, touching off World War II.

Applying new tactics of close cooperation between air and ground elements centered in a war of movement that came to be known as the blitzkrieg (lightning war), the German military enjoyed early success on the battlefield. Poland was taken within one month. When Britain and France, which had gone to war with Germany on the invasion of Poland, rejected peace on a forgive-and-forget basis, Hitler invaded the west. Norway and Denmark were taken beginning in April 1940. France and Benelux fell in May and June. Hitler’s first rebuff came in the July–October 1940 Battle of Britain, when the Luftwaffe failed to drive the Royal Air Force from the skies, a necessary precursor to a sea invasion. After next securing his southern flank in the Balkans by invading and conquering Greece and Yugoslavia in April 1941, Hitler

invaded the Soviet Union that June. When the United States entered the war against Japan in December 1941, Hitler declared war on the United States.

Increasingly, Germany suffered the consequences of strategic overreach: German troops not only had to garrison much of Europe, but they also were sent to North Africa. Hitler’s constant meddling in military matters, his changes of plans, and his divide-and-rule concept of administration all worked to the detriment of Germany’s cause. On Hitler’s express orders, millions of people, mainly Jews, were rounded up and systematically slaughtered.

From mid-January 1945, Hitler took up residence in Berlin. He refused negotiation to the end, preferring to see Germany destroyed. Hitler married Eva Braun on 29 April 1945, and—rather than be taken by the Russians, who were then closing in on Berlin—he committed suicide in the bunker of the Chancellery on 30 April 1945.

Ho Chi Minh (1890–1969)

Revolutionary Vietnamese leader who aided the Allies against the Japanese in World War II. Born Nguyen Sinh Cung on 19 May 1890 in the Annam region of French Indochina, Ho Chi Minh was the son of a scholar and government official. Later he would use some 100 different aliases. After graduation from high school, Nguyen became a teacher. In 1911 he hired on as cook’s assistant on a French merchant ship. He then held a variety of jobs, including gardener, waiter, photographer’s assistant, and assistant pastry chef, finally settling in London.

Vietnamese nationalist leader Ho Chi Minh. (Hulton Archive/Getty Images)

When World War I began, Nguyen moved to Paris. There he changed his name to Nguyen Ai Quoc (“Nguyen the patriot”) and busied himself organizing the Vietnamese community in France, which had swollen in numbers during the war. Nguyen joined the French Socialist Party and became its spokesman in colonial matters. Ignored in his efforts to secure a hearing for Vietnamese independence at the Paris Peace Conference (1919), Nguyen was one of the founders of the French Communist Party in 1920. He then participated in the Vietnamese underground independence movement and in activities of the Communist International (Comintern) in the Soviet Union and China. In 1930, he helped to fuse various Vietnamese communist groups into the Indochinese Communist Party.

In the 1940s, Nguyen took the name Ho Chi Minh (“he who enlightens”). During World War II, Ho fought against both the French and the Japanese (who had arrived in Indochina in 1940). In 1941, Ho founded the Vietminh (League for the Independence of Vietnam), a nationalist front organization

to end foreign control of Vietnam. In 1942, he was arrested in China by the Nationalist government but was released in 1943 in order to organize anti-Japanese intelligence activities throughout Indochina.

Ho’s Vietminh worked with the U.S. Office of Strategic Services (OSS) to supply intelligence on Japanese activities, provide tactical support to Allied operations, and rescue downed American pilots. By war’s end, Ho and the Vietminh had succeeded in liberating much of northern Vietnam from Japanese control. The Japanese had arrested the French officials and military in March 1945, so when Japan surrendered in August, the Vietminh was the only effective organized force in the northern party of Vietnam. The Vietminh then seized control of Hanoi, and Ho was declared president of Vietnam on 20 September 1945.

Despite an arrangement worked out with Ho by a representative of the French government, Paris persisted in attempting to reestablish French control over all of Vietnam, and fighting broke out in November 1946. In 1954, following its military defeat in the Battle of Dien Bien Phu, the French government agreed at the Geneva Conference to recognize the independence of the Democratic Republic of Vietnam in northern Vietnam. It also agreed to a plebiscite in the southern part of the country on the issue of independence. With the failure to hold that plebiscite, fighting resumed, this time involving the United States, which supported the southern Republic of Vietnam government. Ho died in Hanoi on 3 September 1969, not living to see Vietnam reunited in 1975.

Hobby, Oveta Culp (1905–1995)

U.S. officer and Women’s Army Corps commanding officer. Born on 19 January 1905 at Killeen, Texas, Oveta Culp attended Mary Hardin Baylor College in Killeen, Texas, and then stud-

Colonel Oveta Culp Hobby talks with Auxiliary Margaret Peterson and Captain Elizabeth Gilbert at Mitchell Field, New York. (*World Telegram and Sun* photo by Al Aumuller, Library of Congress)

ied law at the University of Texas at Austin. From 1925 to 1931 and from 1939 to 1941, she was parliamentarian of the Texas House of Representatives. In 1931, Culp married *Houston Post* publisher and former Texas governor William P. Hobby.

During the 1930s, Oveta Hobby was an editor for the *Houston Post*. In June 1941, she was appointed head of the Women's Activities Section of the U.S. Army to coordinate matters concerning the wives and dependents of army personnel. She then became director of the subsequent Women's Interest Section, War Department Bureau of Public Relations.

Following the Japanese attack on Pearl Harbor, Hobby was asked to head a task force to determine how a possible volunteer women's corps could assist the army. Chief of staff General George C. Marshall and Secretary of War Henry Stimson supported her work, and after Hobby recommended establishment of the Women's Auxiliary Army Corps (WAAC), Marshall asked her to command it.

Hobby had to overcome numerous problems, such as lack of funds and supplies and lack of cooperation from other army organizations, such as the engineers. Hobby and staff members drew barracks plans and attempted to redesign the standard-issue WAAC uniform to be more appealing to women, but the Quartermaster Corps rejected the design as too wasteful of cloth. Hobby was successful, however, in securing equal pay for women. In July 1943, the WAAC received full army status, and "Auxiliary" was dropped from the name, making it the Women's Army Corps (WAC). Hobby also oversaw the integration of female African American officers. Hobby was the first woman colonel in the U.S. Army.

During Hobby's tenure, the number of jobs approved for WACs expanded from 54 to 239. Hobby traveled to Europe and Africa to inspect WAC units, and she traveled with Eleanor Roosevelt to England to review Great Britain's women's aux-

iliary forces. Hobby's WACs proved their competence doing military work that freed men for frontline service.

Hobby resigned her post in the summer of 1945 and was hospitalized for exhaustion. Among her many honors, she was presented the Distinguished Service Medal, the first woman to receive this highest noncombat award.

Hobby continued to support civil rights and humanitarian issues. A lifelong Democrat, Hobby nonetheless backed Dwight D. Eisenhower for president, and in 1953 he named her the first secretary of the Department of Health, Education and Welfare. She resigned the position in 1955 and returned to help her husband with the *Houston Post*. Hobby died in Houston, Texas, on 16 August 1995.

Hodges, Courtney Hicks (1887–1966)

U.S. Army general and commander of the First Army. Born in Perry, Georgia, on 5 January 1887, Hodges attended the U.S. Military Academy for one year, but he dropped out for academic reasons and enlisted in the army. In 1909, Hodges earned a commission. He then served in the Philippines and in the 1916 Punitive Expedition into Mexico. During World War I, he fought in France in the Saint Mihiel and Meuse-Argonne Offensives, ending the war as a temporary lieutenant colonel.

Hodges attended the Field Artillery School in 1920 and then served as an instructor at West Point. He graduated from the Command and General Staff School in 1925, taught at the Infantry School, and then graduated from the Army War College. In 1938, he was appointed assistant commandant of the Infantry School at Fort Benning, Georgia. Promoted to major general in May 1941, Hodges was assigned as chief of infantry. He assumed command of X Corps in May 1942. In February 1943, he was promoted to lieutenant general and took over the Southern Defense Command and Third Army. In January 1944, Hodges joined the First Army in Britain,

U.S. General Courtney Hodges. (Photo by Gabriel Benzur/Time Life Pictures/Getty Images)

which was then preparing for the Normandy Invasion, as deputy commander under Lieutenant General Omar Bradley.

In August 1944, Hodges succeeded to command of the First Army when Bradley moved up to head the Twelfth Army Group. First Army then defended Mortain, reduced the Falaise-Argentan pocket, helped in the liberation of Paris, penetrated the Siegfried Line, captured Aachen, and suffered heavy casualties in the Hürtgen Forest. In December 1944, the First Army bore the brunt of the German Ardennes counteroffensive. To deal with the crisis, General Dwight D. Eisenhower temporarily reorganized his command structure and placed a portion of First Army—and Hodges—under British Field Marshal Bernard Montgomery, who thought Hodges was at his breaking point. Eisenhower refused any suggestion that Hodges be relieved, and Hodges' performance in the Battle of the Bulge vindicated Eisenhower's view. The First Army rallied to hold the northern shoulder of the Bulge and then played an important role in the successful counterattack. First Army soldiers crossed the Rhine at Remagen, joined in the closing of the Ruhr pocket, and, at the end of the war, linked up with Soviet forces on the Elbe River.

In April 1945, Hodges was promoted to general. Following V-E Day, he and the First Army were under orders for the Pacific Theater to lead the invasion of Honshu when the Japanese surrendered. After the war, Hodges remained in

command of the First Army until his retirement in 1949. He died in San Antonio, Texas, on 16 January 1966.

Hoepner, Erich (1886–1944)

German army general. Born in Frankfurt an der Oder on 14 September 1886, Erich Hoepner was commissioned in the army in 1906. He fought in World War I as a company commander and General Staff officer. After the war, Hoepner participated in the 1920 Kapp Putsch. He remained in the German army after the war in different troop and staff commands. In 1933, Hoepner became chief of staff in the 1st Military District, continuing in the military despite his opposition to Adolf Hitler and National Socialism. Promoted to Generalmajor (U.S. equiv. brigadier general) in 1936, Hoepner was part of a plot by the German Resistance during the 1938 Czechoslovakian crisis to remove Hitler from power. His orders were to lead his 1st Light Division to prevent Schutzstaffel (SS) troops from reaching Berlin, but the plot collapsed with the Munich Agreement.

Taking command of XVI Army Corps, General Hoepner led his men in the occupation of Bohemia and Moravia in March 1939. Promoted in April to General der Kavalerie (U.S. equiv. lieutenant general), he led XVI Corps in the invasion of Poland as part of the Tenth Army, advancing 140 miles to Warsaw in only a week. In the invasion of France and Low Countries in May 1940, his corps spearheaded the advance of the Sixth Army to Liège and then on to Dunkerque, later taking Dijon. Hoepner was promoted to Generaloberst (U.S. equiv. full general) in July 1940.

Hoepner commanded 4th Panzer Group in Operation BARBAROSSA, the invasion of the Soviet Union. A leading exponent of armored warfare, Hoepner favored a bold thrust to seize Leningrad during the 1941 advance, but Hitler ordered his forces to join Army Group Center under Field Marshal Fedor von Bock with the mission of taking Moscow from the north. His panzers got to within 20 miles of the city when they were stalled by Soviet resistance and the onset of winter.

Following the Soviet counterattack in December 1941, Hoepner put his career in jeopardy when in early January he

began withdrawing some of his units to save them from certain annihilation by Soviet forces. Hitler removed several of his generals on the Eastern Front, but he made a special example of Hoepner, who was court-martialed and cashiered. Publicly humiliated, Hoepner was denied the right to wear a uniform or his decorations. This treatment turned him into an active conspirator against the Nazi regime.

Hoepner was deeply involved in the 20 July 1944 plot against Hitler, and he was designated to take command of the Home Forces should General Friedrich Fromm prove unreliable. He was also considered as a possible minister of war. With the failure of the plot, Hoepner rejected an opportunity to commit suicide, preferring to go on trial. Arrested and tried by the People's Court, Hoepner, having been tortured by Gestapo interrogators, appeared uncertain during the trial before Judge Roland Freisler. He was found guilty and executed by being hanged by wire suspended from meat hooks at Plotzensee Prison in Berlin on 8 August 1944.

Holcomb, Thomas (1879–1965)

U.S. Marine Corps general and commandant. Born on 5 August 1879 in New Castle, Delaware, Thomas Holcomb joined the U.S. Marine Corps in 1900, serving with the North Atlantic Fleet, Beijing, and the Philippines in the early twentieth century. An excellent instructor, he always emphasized marksmanship training, reflecting his own skills as a world champion in long-range shooting and a member of the Marine Corps Rifle Team and contributing to his unit's success in World War I. From November 1917 to August 1918, Holcomb commanded the 2nd Battalion, 6th Regiment in France, fighting tenaciously during the spring 1918 German offensive and at Belleau Wood. As executive officer of the 6th Marine Regiment, he took part in other combat actions.

Between the wars, Holcomb spent further tours in Germany, Cuba, and Beijing. He graduated from the Fort Leavenworth Army Staff College, the Naval War College, and the Army War College and served in the Office of Naval Operations, winning promotion to brigadier general in 1935. The following year, President Franklin D. Roosevelt appointed him major general and commandant of the Marine Corps, advancing him above more senior officers.

As commandant, Holcomb undertook initiatives that would bear fruit during the Pacific war. He greatly enhanced the Marines' growing capacity for amphibious warfare, developing several new types of landing craft. He supervised the expansion of the Marine Corps from 16,000 officers and men in 1936 to 50,000 in mid-1941, 143,000 six months later, and more than 300,000 by 1945, comprising six combat divisions and four air wings. In December 1940, Roosevelt appointed Holcomb to a second term as commandant, and in February 1942, Holcomb was promoted to lieutenant general. Holcomb trained and equipped the Marines but had no operational control over their activities in the field. After disputes in 1942 at Guadalcanal between Rear Admiral Richmond Kelly Turner and Marine commander Major General Alexander Vandegrift, Holcomb insisted on the definition of clear lines of authority in joint amphibious operations. He won the decision that navy and Marine Corps commanders would enjoy equal authority and that superior officers would resolve any disputes. As commandant, he also resisted racial integration of the Marines on the grounds that it would detract from combat efficiency.

Holcomb reached mandatory retirement age in August 1943, but Roosevelt retained him in post and made him the first Marine officer ever to become full general. At the end of 1943, Holcomb insisted on making way for a younger successor and retired. He then spent four years as ambassador to South Africa, seeking modest mitigation of that nation's racial policies. Holcomb returned to the United States in 1948. He died in New Castle, Delaware, on 24 May 1965.

Hollandia, Battle of (22–26 April 1944)

Important battle in New Guinea. In early 1944, General Douglas MacArthur's Allied forces in the Southwest Pacific Area (SWPA) were advancing along the northeastern coast of New

U.S. Army Fifth Air Force planes bomb the Japanese-held base of Hollandia in New Guinea, 1944. (Hulton-Deutsch Collection/Corbis)

Guinea. Following the capture of Saidor, MacArthur planned to seize Hansa Bay about 120 miles to the northwest. But after the seizure of the Admiralty Islands in early March, he decided to bypass Hansa Bay and leap nearly 600 miles northwest to Hollandia in New Guinea.

Hollandia (now Sukarnapura), a major Japanese air and supply base, held two crucial advantages for the Allies. The port of Hollandia in Humboldt Bay was the best-sheltered anchorage along a lengthy stretch of the New Guinea coast, and the surrounding area had four airstrips. Together these assets could provide a major staging base for future operations in western New Guinea and the Philippine Islands. In addition, SWPA's intelligence determined that Hollandia was garrisoned only by a small force of 11,000 Japanese troops from the 6th Air Division, most of them service personnel. By attacking Hollandia, MacArthur could avoid potentially bloody battles to the east at Hansa Bay and Wewak, both of which were more strongly defended.

MacArthur and his staff were compelled to include a simultaneous attack at Aitape, 140 miles east of Hollandia. Airstrips there would provide a permanent staging area within range of Hollandia, enabling the Allies to seize command of the air. The Hollandia and Aitape invasions together required a flotilla of more than 200 ships and 80,000 personnel.

During late March and early April 1944, Allied pilots destroyed most of the 6th Air Division's aircraft, paving the way for the landing of ground troops on 22 April. At the same time, General Adachi Hatazō, commander of the Eighteenth Army headquartered on Rabaul, regrouped his battered forces near Hollandia. U.S. forces, meanwhile, carried out a remarkable counterintelligence scheme to divert Adachi. False radio transmissions, decoy raids, patrols, and bombing convinced the Japanese that an Allied assault at Hansa Bay was imminent.

The landing, dubbed Operation RECKLESS, was entrusted to Lieutenant General Robert L. Eichelberger's I Corps. One regiment from the 24th Infantry Division went ashore at Tanahmerah Bay, and another regiment from the 24th Division and two regiments from the 41st Infantry Division landed at Hollandia about 25 miles to the east. Simultaneously, a regiment from the 41st Division and a regiment from the 32nd Infantry Division landed at Aitape, 125 miles to the southeast to secure a fighter strip. Their chief opposition came in the form of the marshy beaches themselves. Later that day, the 163rd Regimental Combat Team took Aitape against only limited resistance, demonstrating the effectiveness of the Hansa Bay ruse. With Aitape in hand, the ground forces at Hollandia trudged through trackless marsh and bog to encircle the three main Japanese airfields. Confusion, fear, and lack of weaponry prompted a large-scale Japanese retreat west.

Suppressing remaining resistance, U.S. forces secured Hollandia on 26 April 1944 only four days after the initial landings, although mop-up operations continued for several weeks. The most telling evidence of the Allied air attacks before the landings was the wreckage of more than 340 Japanese aircraft on Hollandia's runways. Allied casualties were 159 killed and 1,100 wounded. The Japanese lost 3,300 dead and 600 prisoners. At Aitape, all objectives were secured by 25 April at a cost of 3 American dead. About 600 Japanese were killed, and 27 were taken prisoner. Another 6,000 Japanese were either killed by units from the 24th Division or died from starvation and disease as they retreated from Hollandia to Wadke-Sarmi 140 miles to the west.

Operation RECKLESS was a major triumph for MacArthur. It split the Japanese forces defending New Guinea in half, leaving the Eighteenth Army isolated in eastern New Guinea. It also gave MacArthur a superb base from which to increase the tempo of operations in the SWPA, and before long U.S. engineers had turned Hollandia into a vast complex of military, naval, and air facilities occupied by 140,000 men.

Holocaust, The

Nazi effort to exterminate the Jews of Europe during World War II. Historians have developed several interpretations of the Holocaust. While some see it as the last, most horrible manifestation of historical anti-Semitism, others view it as the outcome of factors inherent in Western civilization, such as economic rationalization, technocracy, and the eugenics movement. The “intentionalists” see Adolf Hitler as the crucial factor in the Holocaust, determined on the destruction of the Jews from the beginning. A straight line supposedly runs from his earliest anti-Semitic comments through World War II and his final testament of April 1945. On the other hand, the “functionalists” see the persecution of the Jews as a slowly developing process, exhibiting no overall plan. Not until after the beginning of World War II, when the Nazis found themselves in control of well over 3,000,000 Jews, did the full implementation of the Holocaust occur. Attempts have been made to reconcile these positions, for example, emphasizing the fusion of anti-Semitism with bureaucratic techniques of extermination.

The French Revolution of 1789 saw the beginning of the process of emancipation of the European Jews and their increasing assimilation into European society. At the same time, traditional Christian anti-Judaism gave way to modern racial anti-Semitism, fostered by hyper-nationalism, Social Darwinism, and pseudo-racial “science.” Anti-Semites made the Jews the scapegoat for all the supposed ills of the modern world, including capitalism, socialism, and the press.

Anti-Semitism was a pan-European movement, as is exemplified by the Dreyfus Affair in France. Indeed, eastern Europe (especially Russia) was the scene of violent pogroms and ritual murder trials into the twentieth century. In about 1900, agents of the tsarist secret police, the Okrana, wrote the *Protocols of the Elders of Zion*, a forgery proclaiming a Jewish conspiracy to dominate the world.

Jewish Population, Europe, before and after World War II (with inset of Jewish Population in Poland)

By 1900, Jews in Germany numbered about 600,000 of a population of 60 million. Jews were prominent in such areas as banking, journalism, and medicine. Some 85 percent were assimilationists and enthusiastically supported Germany during World War I. Nonetheless, Germany's defeat in World War I and the accompanying economic turmoil of the early 1920s allowed extremist right-wing groups such as the National Socialist German Workers Party, led by Adolf Hitler, to spread. These groups held Jews responsible for everything from betraying Germany on the home front during World War I to causing the evils of urban life. Whether it stemmed from his Vienna years, as portrayed in *Mein Kampf*, or developed essentially after his entry into politics at the end of World War I, Hitler's obsessive, pathological anti-Semitism, its identification with Bolshevism, and a crude social Darwinism became the core of his and Nazism's ideology.

Hitler's overall role and guilt in fostering the persecution of the Jews is clear. After 1934, however, he gradually withdrew from domestic politics, fostering power struggles among various party agencies. In this atmosphere, his lieutenants attempted to anticipate his wishes—a process that led to increasingly radical anti-Jewish measures.

The Nazis' assumption of power in 1933 led to increased random attacks on Jews. The Nazis did not appear to have a coordinated plan to deal with the "Jewish question." Indeed, the years 1933 to 1938 saw a tension between party radicals such as Joseph Goebbels and Julius Streicher and moderates such as foreign minister Konstantin von Neurath and economics minister Hjalmar Schacht, who feared that anti-Semitic actions would damage Germany's international position and economic recovery. Some level of anti-Semitism was common among many Germans, but there is little evidence that most Germans were imbued with an elimination-

ist anti-Semitism, ready to murder Jews once they were given the opportunity.

The opening of the Nazi attack included a one-day unsuccessful boycott of Jewish stores on 1 April 1933 and the 7 April Law for the Restoration of the Professional Civil Service, which dismissed non-Aryans from government service. Although the boycott was unpopular with large sections of the public and the civil service law included exemptions such as World War I veterans, these actions began a gradual process that by 1939 would lead to the exclusion of Jews from German life.

On 14 July 1933, the Law for the Prevention of Genetically Diseased Offspring was promulgated, which by 1937 led to the sterilization of some 200,000 people. Although the Nazi eugenics program was not aimed specifically at Jews, and indeed was influenced by the general European and American eugenics movement, it ran on a parallel track with the anti-Jewish legislation. By World War II, the two tracks would merge in a program of euthanasia and mass murder.

In September 1935, the so-called Nuremberg Laws were passed by a special session of the Reichstag convened during the Nazi Party rally of that month. The laws were drawn up in great haste during the rally itself, indicative of the unsystematic nature of Nazi policy concerning the Jews during the 1930s. Jews became subjects, not citizens; it became illegal for Jews to marry or have extramarital relations with non-Jews. On 14 November, a supplementary law was enacted, defining a "full Jew" (having three or four Jewish grandparents) and the categories of first-degree and second-degree *Mischling* (mixed race).

In 1938 there was another major escalation of anti-Jewish persecution. In Austria after the *Anschluss* in March, a wave of humiliations, beatings, and murders occurred that were worse than anything else seen so far in Germany. The Nazis quickly set up agencies to forcibly expropriate Jewish businesses and expedite emigration, the latter effort led by Adolf Eichmann, Zionist expert of the Sicherheitsdienst (SD, Security Service). Some scholars see this sequence of violence, expropriation, and emigration as a model for how the Nazis would later attempt to handle the "Jewish question," with emigration replaced by something far worse.

During the spring and summer of 1938, violent attacks on Jews in Germany increased, culminating in the pogrom of 9–10 November. In retaliation for the murder of the third secretary of the German Embassy in Paris, Ernst von Rath, by Jewish youth Herschel Grynszpan, Jews were attacked all over Germany, businesses were vandalized, and synagogues were burned. The streets were so covered with glass they appeared to be made of crystal, hence the term "crystal night" to describe the event. Party, police, and governmental offices all were complicit in the pogrom. Estimates hold that some 91 Jews died, 30,000 were arrested, and a like number were sent to concentration camps. A total of 267 synagogues were burned, and 7,500 businesses were vandalized. The Jews

received no insurance payments and in fact were fined more than a billion Reichsmarks.

The period from November 1938 to the outbreak of World War II saw the removal of Jews from virtually all aspects of German society. During a Reichstag speech in January 1939, Hitler made his infamous threat that if international Jewry succeeded in starting another world war, the result would not be its victory but “the annihilation of the Jewish race in Europe.”

By the time the war broke out, more than half of German and Austrian Jews had departed Germany, the official policy of which still promoted emigration. Emigrants were subject to expropriation and payment of flight taxes. Few countries were willing to increase their quota of Jewish immigrants, however. International conferences such as that held in Évian, France, in July 1938 proved fruitless.

After their conquest of Poland in the fall of 1939, the Nazis found themselves in control of some 2 million Jews. Another million were in the Soviet sphere of occupation. Nazi treatment of Poles and Jews, considered inferior races, was brutal. Western Poland was annexed to Germany, and the eastern part was turned into the General Government under Nazi lawyer Hans Frank. To facilitate the implementation of Nazi policies, head of the Schutzstaffel (SS) Heinrich Himmler on 27 September amalgamated all police and security services in the Reichssicherheitshauptamt (RSHA, Reich Security Main Office) under Reinhard Heydrich.

On 21 September, Heydrich issued instructions to Einsatzgruppen (mobile strike forces) leaders in which he distinguished between the “final aim” of Jewish policy and the steps leading to it. Jews were to be moved from the countryside and concentrated in cities near rail lines, implying the ghettoization of Polish Jews. Each ghetto was to elect a Jewish Council (Judenrat) that would be responsible for carrying out Nazi orders. In October, Jews were expelled from the annexed area of Poland, called the Warthegau, into the General Government. In addition, Frank ordered that all Jews must perform compulsory labor and wear a Star of David on the right sleeve of their clothing.

Despite the mention of the “final aim” and the brutality of these measures, most scholars do not believe the Nazis had yet adopted the idea of mass extermination. Their main goals during 1940 were either fostering emigration by Jews or deporting them to a colony in Africa or the Near East.

The first major ghetto was established in Lodz in February 1940. The Warsaw ghetto, the largest, was established in October 1940. Ghettos were in older sections of cities, with inadequate living space, housing, and food. They were surrounded by walls and barbed wire, and attempts to leave were punished by death. Disease and starvation were common. Jewish Councils had their own police forces, which were themselves brutal in enforcing Nazi orders. The Nazi film *The Eternal Jew* (1940) cynically portrayed these conditions as normal Jewish living habits.

Despite the terrible conditions, Jews secretly practiced their religion, educated their children, and maintained cultural activities. In Warsaw, the historian Emmanuel Ringelblum started the Oneg Shabbat (“in celebration of the Sabbath”), a secret organization that chronicled life in the ghetto. Its records, partly recovered after the war, are an invaluable picture of ghetto life.

In a speech to senior army officers on 30 March 1941 preceding the invasion of the Soviet Union (Operation BARBAROSSA), Hitler maintained that, in contrast to war in the west, the war against the Soviet Union would be a war of annihilation, a brutal campaign to subjugate inferior Slavs and to exterminate Jewish-Bolshevism. Hitler’s BARBAROSSA Decree of 13 May 1941 and the Commissar Order of 6 June 1941, as well as orders issued by various generals, called for liquidation of the Bolshevik leadership without trial, reprisals against whole villages for partisan actions, and the freeing of military personnel from prosecution for crimes against civilians. These orders would pave the way for military complicity in war crimes against Russian soldiers and civilians and against the Jews.

After the German invasion of the Soviet Union on 22 June 1941, four Einsatzgruppen, each numbering 600–1,000 men, swept through the conquered territories in the wakes of the invading armies, shooting Communist Party functionaries and especially male Jews. The Einsatzgruppen were drawn primarily from various security and SS units. The German army provided no obstacles to their actions and in some cases actively cooperated with them. After their numbers were augmented in August, the Einsatzgruppen rapidly expanded their killing of Jews, including women and children. Between June and August the Einsatzgruppen killed approximately 50,000 Jews; in the next four months some 500,000 would perish. On 29 and 30 October at Babi Yar near Kiev, some 33,000 Jews were shot, and their bodies were dumped in a ravine. Hitler had undoubtedly given the overall approval to widen the killing in August, and he regularly received reports of Einsatzgruppen activities.

Collaborators throughout eastern Europe actively aided—and in some cases, outdid—the Nazis. For example, the German invasion of Lithuania was accompanied by horrendous butchery of Lithuanians against Lithuanians. Germany’s Romanian allies actively murdered Jews. On 22 October, the Romanian military headquarters in Odessa was blown up and 60 lives were lost. In reprisal, Romanian army units massacred 19,000 Jews and locked another 20,000 in warehouses in a nearby village, which were then set on fire and machine-gunned. Babi-Yar and Odessa were perhaps the two worst massacres of the war.

Although no written order has come to light and although Hitler confined himself to murderous ranting about the Jews, there can be no doubt that the Holocaust proceeded with Hitler’s express knowledge and desire. Scholars are divided,

Slave laborers in the Buchenwald concentration camp near Jena; many had died from malnutrition when U.S. troops of the 80th Division entered the camp, 16 April 1945. (National Archives)

however, about when exactly the “final solution” was put into effect. Some authorities place the decision as early as the spring of 1941 during the planning for Operation BARBAROSSA, and others argue that there was a gradual escalation of measures throughout the summer and fall of 1941. Hitler’s final decision may have come on 12 December 1941, in a talk to party leaders at the Reich Chancellery, one day after his declaration of war on the United States. Hitler now saw the events he had described in his speech of 30 January 1939 as coming to pass: the Jews had started a world war, and now they would perish.

On 20 January 1942, the much-postponed Wannsee Conference held for the purpose of coordinating activities by various agencies with regard to the “final solution” took place. Chaired by Reinhard Heydrich, it included major SS and government agency representatives. Europe’s Jewish population was set at an exaggerated figure of 11 million. The Jews—even those not under Nazi control—were to be “evac-

uated” to the east. This “final solution to the Jewish question” would be implemented first in the General Government. Hitler’s hatred of the Jews, the realization that the war against the Soviet Union would not be over quickly, the huge number of Jews in eastern Europe augmented by deportations from the west, and killing actions initiated by local commanders all combined to replace deportation with systematic mass murder.

Since execution by shooting was too inefficient and was stressful for the shooters, the Nazis began gassing victims. The model for mass murder came from the euthanasia program, which had been ordered by Hitler on 1 September 1939 and which officially ended in August 1941 after strong protests from German churches. Known as the T-4 program (named after its headquarters at Tiergartenstrasse 4 in Berlin), it had been responsible for killing some 5,000 children and 70,000 to 80,000 adults, at first by injection and then

by carbon monoxide. Several T-4 staff members were transferred to the extermination program of eastern Europe.

In December 1941, Chelmno, near Lodz in the Warthegau, was the first extermination center to begin operation. Between March and July 1942, in connection with Operation REINHARD (the plan to kill the Jews of the General Government), three more death camps were set up: Belzec, Sobibor, and Treblinka. Deportations to these camps from Polish ghettos took place throughout 1942 and into the fall of 1943.

As Jews were rounded up, they were told they were being resettled to labor camps in the east. When the Jews arrived in the camps, their belongings were confiscated and they were then forced to undress and to move down a ramp (“the tube”) into gas chambers falsely labeled as showers. The Jews were then killed with gas fed into the chamber. Special units of Jewish prisoners called Sonderkommandos removed the dead from the gas chambers, collected their possessions, and then buried the corpses in mass graves. Eventually, the Sonderkommandos too were killed. Jews from all over occupied Europe, as well as Roma (gypsies), were killed in these camps. Authorities estimate the approximate death toll at 1.9 million.

Majdanek (near Lublin in the General Government) and Auschwitz (in a section of southern Poland annexed to Germany) operated as concentration, extermination, and forced-labor camps. Exterminations in gas chambers began in Majdanek in the fall of 1942 and greatly increased in November 1943, when the Nazis launched Operation HARVEST FESTIVAL to kill off the remaining Jews in the General Government. By the time Soviet forces overran Majdanek in July 1944, some 360,000 people had died.

Auschwitz I was set up as a concentration camp in May 1940. Here the Nazis brutally murdered thousands at the “Black Wall” and carried on gruesome pseudoscientific medical experiments, including sterilization, castration, and hypothermia. Auschwitz II or Auschwitz-Birkenau was essentially an extermination camp. It began operations on 3 September 1941 when 900 Soviet prisoners of war died after being gassed with Zyklon B, crystallized hydrogen cyanide. By 1943, four large gas chamber/crematoria were at work as Jews from all over Europe were brought to Auschwitz. Work to expand the facility continued essentially until the summer of 1944. During the spring and summer of 1944, more than 400,000 Hungarian Jews were deported to Auschwitz and gassed. A conservative estimate puts the overall death toll here at 1.1 million Jews, 75,000 Poles, 21,000 Roma, and 15,000 Soviet prisoners of war.

Prisoners destined for the camps were packed into unheated and unventilated cattle cars with no food and perhaps one bucket for a toilet. Many died before reaching the camp. Upon arrival, prisoners underwent “selection”: those unfit for work were immediately sent to the gas chambers,

which were disguised as showers. Sonderkommandos cleaned the gas chambers, cremated the corpses, and collected valuables.

In the fall of 1941, I. G. Farben decided to build a Buna (synthetic rubber) plant at Auschwitz to exploit cheap slave labor. The so-called Auschwitz III expanded into a 40-square-mile area with numerous subcamps. Periodic selections singled out weak and sick workers for extermination.

Numerous survivors, including Elie Wiesel and Primo Levi, have described the brutal Auschwitz camp regime, which was intended to dehumanize its victims. “Kapos”—usually incarcerated criminals—enforced order. Hunger was all-pervasive. Finally, on 27 January 1945, Soviet forces liberated the few remaining prisoners in Auschwitz. Some 60,000 had been forced on death marches to camps in Germany. Many died on the marches or before the German camps were liberated.

Between 1942 and early 1945, the Nazis extended the Holocaust to occupied western, central, and southern Europe. Numerous government agencies including the RSHA, the Transport Ministry, and the Foreign Office lent their assistance. Adolf Eichmann, head of RSHA Jewish Affairs and Evacuation Affairs (coded IV-B-4), coordinated the deportations. The European rail system was taken over and used to move Jews east to the killing sites.

In many places, the Nazis were assisted by collaborationist authorities, but elsewhere, such as in Denmark and in Italian-held areas, they were actively resisted by local officials. The result was that thousands of Jews went into hiding or were assisted in escaping the Nazi dragnet. Although exact numbers will never be known, it is estimated that 3.5 million to 4 million people died in the six death camps. When victims of pogroms, the Einsatzgruppen, and those who died of overwork, starvation, and disease are added, the Holocaust claimed some 6 million lives.

Resistance was made difficult by numerous factors—the impossibility of believing the reality of what was happening, the hostility of local populations, the difficulty of obtaining weapons, the deception of the Nazis, and the decision of Jewish councils to obey Nazi demands in hopes of saving the lives of the remnant Jewish population that worked in defense industries.

Most Jews who were rounded up for execution or transport to a camp went without resistance. In some cases, however, open rebellion broke out. The most famous example is

Although the exact numbers will never be known, it is believed that between 3.5 and 6 million people died in the Holocaust.

the Warsaw Rising, beginning on 19 April 1943, in which 700 to 1,000 resistance fighters in the Warsaw ghetto held off several thousand heavily armed German and Baltic auxiliaries under SS-Brigadeführer Joseph (Jürgen) Stroop for almost four weeks. Revolts in Treblinka in August 1943 and in Sobibor in October 1943 led to the closing of these camps. On 7 October 1944, the Sonderkommando at Auschwitz revolted, killing several SS men and blowing up one of the crematoria. All were killed in the ensuing escape attempt. In several cases, Jews were able to escape the ghettos and either join or form their own partisan groups that fought against the Nazis.

Allied officials were clearly aware of the Holocaust by late 1942, but like the Jews themselves, they had difficulty believing what they were hearing. In addition, anti-Semitism was still strong in many countries. American State Department official Breckinridge Long worked actively to keep Jewish refugees out of the United States. In the Allied countries, winning the war was the first priority. American Jewish organizations were hesitant to make waves or press President Franklin D. Roosevelt for fear of stirring up even more anti-Semitism. In a still-controversial decision, the Allies refused to bomb the Auschwitz camp or the rail lines leading to it. Not until early 1944 did Roosevelt create the War Refugee Board, after the Treasury Department had exposed the State Department's duplicity.

Some governments or individual diplomats resisted the Nazis. The Danish people ensured the rescue of more than 95 percent of Danish Jews. The Bulgarian government refused to give over its native Jews, although it handed over Jews in occupied territories. The Italian fascist government refused cooperation with the Nazis, and Franco's government allowed Jewish refugees to travel through Spain. Diplomats defied their orders by issuing visas to Jews. The Swede Raoul Wallenberg and other diplomats in Budapest rescued thousands of Jews in the summer and fall of 1944 by issuing false papers and setting up safe havens. Citizens from France to Poland sheltered Jews, in some cases for years, at tremendous risk to themselves. In 1940, Chiune Sugihara, a minor diplomat in the Japanese consulate in Kaunas, Lithuania, quietly defied his government's orders and issued illegal visas to more than 2,000 Jewish families.

In the case of the churches, it was more often individuals than institutions that did rescue work. Numerous Protestant, Eastern Orthodox, and Catholic clergy and laymen intervened to help Jews, whereas others remained silent or backed Nazi actions. Controversy still surrounds the role of Pope Pius XII, who never publicly condemned the Holocaust, even when the Jews of Rome were being rounded up in October 1943.

As the Nazi empire crumbled in late 1944 and early 1945, Himmler and others carried out increasingly desperate negotiations, attempting to trade Jewish lives for ransom. As the Soviet army moved westward, hasty attempts were made to

dismantle camps and burn victims' bodies. Prisoners were forced on death marches back to camps within Germany. By May 1945, the last of the camps had been overrun. Some 50,000 prisoners were liberated, but many were so sick and emaciated they died soon after. In his political testament of 29 April 1945, Hitler blamed the war on the Jews and called on Germans to continue the struggle against international Jewry.

The pre-World War II Jewish population of Europe had been approximately 9 million. At the end of the war, 3 million remained. In Poland, some 45,000 survived out of a prewar population of 3 million, many of whom were Hasidic Jews. In the words of the sect's founder, Israel Ba'al Shem Tov: "In forgetfulness is the root of exile. In remembrance the seed of redemption."

Hong Kong, Battle of (8–25 December 1941)

Battle for British Asian colony, the capture of which by Japan symbolized the defeat of western imperialism in Asia. The colony of Hong Kong, 400 square miles of islands and an adjacent peninsula on the coast of Guangdong, South China, was both the headquarters of the Royal Navy's China Squadron and a significant entrepôt and commercial center. From the mid-1930s onward, the British Joint Chiefs of Staff believed that, in the event of attack by Japanese forces, Hong Kong would be indefensible.

In 1935, Major General Sir John Dill, director of military operations, ranked Hong Kong's strategic significance far

below that of Singapore, Britain's other naval base. A 1939 strategic review also assigned Britain's interests in Europe much greater importance than those of Hong Kong. British leaders nonetheless feared that a failure to defend Hong Kong or even the evacuation of civilians would signal their country's intention of abandoning its Asian position and damage the morale of the embattled Chinese Guomindang (GMD [Kuomintang, KMT], Nationalist) government in its struggle to resist Japanese invasion.

By June 1940, sizable Japanese forces blocked Hong Kong's access to the Chinese mainland. That August, Dill—now chief of the Imperial General Staff—recommended the withdrawal of the British garrison. Although Prime Minister Winston L. S. Churchill accepted this recommendation, it was not implemented. Some women and children were evacuated to Manila in the Philippines, and in October 1941, Britain accepted the Canadian government's ill-considered offer to send 2 Cana-

dian battalions to reinforce the 2 Scottish and 2 Indian battalions already manning Hong Kong's defenses.

Even with this assistance, Hong Kong's defenses remained decidedly inadequate: 12,000 troops, augmented by the Hong Kong and Singapore Royal Artillery and the civilian Hong Kong Volunteer Defense Force, were too few to man the colony's main lengthy defense line (Gindringer's Line), which ran 3 miles north of Kowloon in the New Territories. Air and naval forces comprised a pitiable 7 airplanes, 8 motor torpedo boats, and 4 small gunboats. It was generally known that many Japanese civilians in the colony were fifth columnists, agents only awaiting the opportunity to facilitate a Japanese assault. The British government had no intention of sending any further assistance but merely expected its defenders to stave off inevitable defeat as long as possible.

On 8 December 1941, as Japanese forces simultaneously attacked Pearl Harbor, a surprise raid on Kai Tak airfield by

Taiwan-based Japanese bombers destroyed all 7 British airplanes. Twelve battalions of the 38th Division of the Japanese Twenty-Third Army, commanded by Lieutenant General Sano Tadayoshi, crossed the Shenzhen River separating the New Territories and mainland China. Churchill urged Hong Kong's defenders to resist to the end, but within 24 hours Japanese forces had breached Gindrinker's Line. British commander Major General Christopher M. Maltby ordered a retreat to Hong Kong island, and by 12 December, Japanese troops held Kowloon.

Sano's artillery began heavy bombardments of British positions on Victoria, the central district, but Maltby refused a 14 December ultimatum to surrender and the following day repulsed a Japanese attempt to land troops on the island. A second attempt three nights later succeeded, and Japanese forces swiftly advanced across the island to its southern coast, splitting British forces. Despite heavy losses, British troops fought fiercely, on 20 December compelling Sano to halt temporarily to regroup his forces. The advance soon resumed, however, and by 24 December Japanese units had destroyed the water mains, leaving their opponents as short of water as they were of ammunition. On 25 December 1941, the British governor negotiated an unconditional surrender.

Immediately afterward, the Japanese victors treated their defeated foes with great brutality, massacring many of the defending forces, Chinese and western, including hospitalized wounded men. They raped and sometimes killed hospital nurses and other captured women. Surviving prisoners of war and Allied civilians were interned for the duration of the war, often in severe conditions, while the supposedly liberated Chinese population likewise experienced harsh and arbitrary rule and numerous atrocities.

Hong Kong remained under Japanese occupation until August 1945 when, despite the hopes of Chinese Nationalist leader Jiang Jieshi (Chiang Kai-shek) that it would revert to China, British forces reestablished control. Hong Kong subsequently remained a British colony until its 1997 reversion to China.

Hopkins, Harry Lloyd (1890–1946)

U.S. diplomat and presidential adviser to Franklin D. Roosevelt. Born on 17 August 1890 in Sioux City, Iowa, Harry Hopkins graduated from Grinnell College in 1912. He became a social worker in New York City and then joined President Roosevelt's New Deal administration first as head of the Federal Emergency Relief Administration (1933–1935) and then, from 1935 to 1938, as head of the Works Progress Administration (WPA). Roosevelt named him secretary of commerce in 1938.

Stomach cancer and ill health caused Hopkins to step down in 1940 to become an adviser to Roosevelt. In this position, he had great influence with Roosevelt, and he also served as an intermediary between Roosevelt and other Allied leaders. In January 1941, Hopkins flew to Britain as a personal envoy of Roosevelt to coordinate the Lend-Lease Act. He convinced Roosevelt to ignore U.S. Ambassador Joseph Kennedy's pessimistic reports regarding Britain's ability to remain in the war. To secure an agreement in discussions about the Atlantic Charter on 14 August 1941, Hopkins helped smooth over differences between Roosevelt and British Prime Minister Winston L. S. Churchill on the issue of colonialism. Another example of Hopkins's influence was his ability in 1944 to convince chairman of the Joint Chiefs of Staff Admiral William Leahy to continue supplying British forces in Greece, even though the United States disagreed with London's policy toward communist rebels there. Hopkins was not always successful, as in Moscow in June 1945, when he failed to secure Russian leader Josef Stalin's support for democratic reforms in Poland that had been agreed to at the Yalta Conference the previous February.

After Roosevelt's death, Hopkins assisted the new president, Harry S. Truman, in arrangements for the Potsdam Conference. Hopkins also played a leading role in the formation of the United Nations. Forced by ill health to retire from public life in fall 1945, Hopkins died in New York City on 29 January 1946.

Horii Tomitaro (1890–1942)

Japanese army general. Born in Hyogo Prefecture on 7 November 1890, Horii Tomitaro was commissioned as a second lieutenant in the Imperial Japanese Army in December 1911. Following several staff and line postings, Horii commanded a battalion beginning in August 1932. He was promoted to colonel in August 1937, and in July 1938 he was attached to headquarters of the 8th Depot Division. Horii then took command of the 82nd Infantry Regiment. By August 1940, he was a major general commanding the 55th Regimental Group. This formation consisted mostly of the reinforced 144th Infantry Regiment and was better known as the South Seas Detachment.

At the start of World War II, Horii's force quickly captured Guam. On 4 January 1942, Imperial General Headquarters ordered Horii to prepare to take Rabaul. Escorted by the aircraft carriers *Kaga* and *Akagi*, the invasion force landed in the predawn darkness of 23 January. The Australian garrison there was quickly overwhelmed, and Horii's soldiers proceeded to torture and execute many of the prisoners.

The South Seas Detachment formed most of the Japanese invasion force intended to capture Port Moresby in May 1942. This operation triggered the Battle of the Coral Sea, the first naval battle fought only with carrier aircraft. To Horii's disappointment, the transports carrying his soldiers turned back to Rabaul on 9 May.

Horii's South Seas Detachment was then ordered to advance by land south over the Owen Stanley Mountains to Port Moresby. Japanese forces went ashore at Buna beginning on 20 July. The Japanese drove off the few defenders and soon reached Kokoda. Horii himself reached Buna by mid-August. By 21 August, he had more than 8,000 combat troops and 3,000 construction workers under his command. Soon Horii, riding his white horse, was at the head of the Japanese advance. By mid-September, the Japanese had pushed to within 30 miles of Port Moresby.

The American landing on Guadalcanal in August 1942 drew away Japanese reinforcements intended for New Guinea. Disease, malnutrition, and combat severely reduced Horii's command. The terrain also proved to be a formidable obstacle. In addition, a Japanese supporting attack on Milne Bay was defeated, allowing the Allies to pour reinforcements into Port Moresby. On 24 September 1942, Horii was ordered to withdraw toward Buna. An Allied counterattack soon turned the retreat into a rout. Horii was inspecting rear-guard positions on 12 November when his party was cut off by an Australian attack near Wairopi. That night, Horii and his aides tried to cross the Kumusi River on a raft of logs. The raft came apart in the turbulent water, and Horii, his chief of staff,

and two others were drowned. His death was confirmed 10 days later.

Horrocks, Sir Brian Gwynne (1895–1985)

British army general. Brian Horrocks was born on 7 September 1895 in Ranikhet, India, and educated at the Royal Military Academy, Sandhurst. He was commissioned in 1914. Wounded at Ypres in October 1914, Horrocks was captured and spent the next four years as a prisoner of the Germans. He then volunteered to go to Russia on a mission to assist White forces in Siberia, and he was a prisoner of the Red forces from January to October 1920. An outstanding athlete, Horrocks competed in the 1924 Olympic Games in the pentathlon.

In the 1930s, Horrocks attended the Staff College of Camberley, and he was subsequently an instructor there. In 1939, Horrocks commanded a battalion in the 3rd Division in France, where he made an excellent impression on his commander, Bernard Montgomery. Promoted to brigadier general in June 1940 during the Dunkerque evacuation, Horrocks then commanded the 9th Armored Division. In August 1942, when Montgomery took over the Eighth Army, he named Horrocks, now a lieutenant general, to head XIII Corps. XII Corps played a key role in repelling the Afrika Korps attack at the crucial Battle of Alma Halfa, and it fought against the 21st Panzer Division at El Alamein. Horrocks then took command of X Corps and led it during the successful flanking maneuver at Mareth in March 1943. During April and May 1943, Horrocks commanded IX Corps during the final drive against Tunis.

In June 1943, while preparing for the invasion of Italy, Horrocks was badly wounded during an air raid on Bizerte. This kept him out of action for a year. In August 1944, Horrocks took command of XXX Corps, which he led until the end of the war in General Miles Dempsey's Second British Army. Accomplishments of XXX Corps included the capture of Amiens, Brussels, Antwerp, and Bremen and helping to reduce the Ardennes salient. Horrocks is best remembered

for his role during Operation MARKET-GARDEN, when XXX Corps failed to relieve the British 1st Airborne Division at Arnhem. Horrocks called the failure “the blackest moment of my life.”

After the war, Horrocks commanded the British Army of the Rhine before his war wounds forced his retirement in 1949. Horrocks later wrote his autobiography, *A Full Life* (1960), and became a television commentator. Horrocks died in Fishbourne, England, on 4 January 1985.

Horthy de Nagybánya, Miklós (1868–1957)

Hungarian navy admiral in World War I, politician, and regent of Hungary. Born in Kenderes, Hungary, to landed gentry on 18 June 1868, Miklós Horthy de Nagybánya graduated from the Naval Academy in 1886 and entered the Austro-Hungarian navy, where he served for 32 years. As a captain, Horthy commanded the successful May 1917 attack on the Otranto Barrage, during which he was wounded in both legs. Horthy became a hero in Hungary for his role in the battle, which led to his promotion to rear admiral in March 1918. That same month, following mutinies in the fleet, Emperor Karl promoted Horthy to vice admiral and named him commander of the Austro-Hungarian battle fleet.

Following the war, Horthy retired. He soon entered politics as the leader of the conservative White forces against the communist government of Béla Kun. On 1 March 1920, Horthy became regent of Hungary and head of the executive authority. At first Horthy had little power, but his power

Hermann Göring (right, hat with feather) with Admiral Horthy (center, facing Göring), regent of Hungary, at Carinhall, Göring's country estate. (Library of Congress)

increased sharply after 1937 when he refused to be bound by decisions of the Hungarian Parliament.

In domestic policy, Horthy rejected universal and secret suffrage and land reform. In foreign policy, his chief aim was revision of the Treaty of Trianon of 1920, by which Hungary had lost two-thirds of its territory and population. For this reason, although he was strongly anti-Fascist, Horthy sought the support of, and an alliance with, Germany and Italy. His diplomatic efforts were successful in that between 1938 and 1940, Hungary recovered some of the territory it had lost after World War I to Czechoslovakia, Romania, and Yugoslavia.

Horthy successfully managed to afford involvement in the war in September 1939. By April 1941, however, pressure from Adolf Hitler, coupled with promises of additional territory and access to the Adriatic, led to Hungarian military operations against Yugoslavia on the Axis side. Horthy was also forced to send troops to fight on the Eastern Front against the Soviet Union, but he resisted German efforts to have him deport Hungarian Jews.

In 1943, Horthy was already considering escaping from Hitler's grasp and negotiating with the Allied powers. Aware of this activity and determined to keep Hungary in the war on his side, Hitler sent German troops to occupy the country on 19 March 1944. Horthy remained in his post. In September, Soviet troops invaded Hungary from Romania, and on 28 September Horthy dispatched representatives to Moscow. There they signed a preliminary armistice agreement on 11 October, which Horthy announced publicly four days later. A lack of coordination with army chief of staff General János Vörös led to a continuation of the fighting. The German army then occupied Budapest and took Horthy's son hostage, forcing Horthy to appoint Ferenc Szálasi, head of the German Arrow Cross (Fascist) Party, as "Leader of the Nation."

The Germans then removed Horthy to Bavaria, where he was captured by the Americans. In 1946, Horthy appeared as a witness at the postwar International Military Tribunal at Nuremberg. The Yugoslav government requested his extradition so that he might be tried there for war crimes, but the U.S. authorities refused the request. Horthy then moved to Portugal, where he remained. The Soviet occupation and subsequent communist government of Hungary made it impossible for him to return there. Horthy wrote his memoirs in 1953, but they were not published in Hungary until 1990. He died in Estoril, Portugal, on 9 February 1957. In 1993, following the departure of the last Soviet soldiers from Hungary, Horthy's remains were reburied in Kenderes, Hungary.

Hoth, Hermann (1885–1971)

German army general. Born in Neuruppin near Berlin on 12 April 1885, Hermann Hoth joined the army in 1904. He graduated from the Prussian War Academy in 1913 and became an intelligence officer. A staff officer during and after World War I, he became a specialist in armored warfare.

In 1935, Hoth took command of the 18th Division and was promoted to major general. Promoted to lieutenant general, in November 1938 he commanded the XV Motorized Corps and distinguished himself in the invasion of Poland in September 1939. With his panzer group, Hoth also distinguished himself in the invasion of France and Benelux in May 1940. In this campaign, he pushed through the Ardennes Forest to the English Channel and then into Normandy and Brittany. Hoth won promotion to full general in July. His formation was redesignated 3rd Panzer Group in November. He led it in the invasion of the Soviet Union in June 1941. Hoth commanded the Seventeenth Army in Ukraine from October 1941 to June 1942, when he took command of Fourth Panzer Army. Hoth's task was to encircle Voronezh and then drive south to the lower Don River. He led this army across the Don and toward the Caucasus and lower Volga.

Although Hoth subsequently failed to break through Soviet defenses to Stalingrad, he subsequently carried out a successful counteroffensive that helped open an escape route around Rostov for Army Group A. The Fourth Army helped restore the German lines and participated in the Battle of Kursk in July 1943. That November, Adolf Hitler dismissed the capable and well-liked Hoth for his "defeatist attitude."

Tried by a U.S. military court after the war for "crimes against humanity" committed by subordinates, Hoth was found guilty and sentenced at Nuremberg in October 1948 to 15 years in prison. He was released in 1954 and then wrote on armored warfare. His memoir, *Panzer-Operationen*, was published in 1956. Hoth died at Goslar/Harz on 25 January 1971.

Hu Tsung-nan

See Hu Zongnan.

Hu Zongnan (Hu Tsung-nan) (1896–1962)

Chinese Nationalist general, known as the “King of the Northwest.” Born in Zhenhai (Chenhain), Zhejiang (Chekiang), on 16 May 1896, Hu Zongnan (Hu Tsung-nan) received a primary education in the Confucian classics and became a teacher. In 1924, he studied at the newly founded Huangpu (Whampoa) Military Academy. As a Jiang Jieshi (Chiang Kai-shek) loyalist, Hu participated in the 1926–1928 Northern Expedition and continued to fight warlords, the Kuomintang (KMT [Guomindang, GMD], Nationalist), and Communist forces through the 1930s.

On the outbreak of the Sino-Japanese War in 1937, Hu participated in the defense of Shanghai in Jiangsu (Kiangsu) Province as commander of the First Army. In 1938, he received command of the Seventeenth Army Group and was responsible for military training in northwest China, with headquarters at Xian (Sian), Shaanxi (Shensi). He was assigned the dual task of resisting the Japanese in north China and containing the Communists in northern Shaanxi, where he became the center of the powerful “Huangpu clique” in Chinese military politics. In 1939, he commanded the Thirty-Fourth Group Army. In 1943 he received command of the First War Area comprising Hebei (Hopei), Northern Shandong (Shantung), Henan (Honan), Anhui (Anhui), and Shaanxi.

In the spring of 1944, the Japanese began their ICHI-GŌ Campaign, which was aimed at removing China from the war. Hu’s forces were hit hard but were able to prevent the Japanese from entering Shaanxi Province. In 1945, at war’s end, Hu traveled to Zhengzhou (Chengchow) in Henan Province to accept the surrender of the Japanese forces.

After the war and Jiang’s order to go on the offensive against the Communists, Hu marched into northern Shaanxi and captured Yan’an (Yenan) in March 1947. This victory marked the high-water mark of Nationalist achievement in the Chinese Civil War. As his forces became isolated from other GMD troops and supplies, they were eventually routed and then wiped out during 1949 by the Communists. Hu and

a small group of advisers escaped to Hainan Island and eventually made their way to Taiwan. He served the Nationalist government in Taiwan as commander of the guerrilla forces on Dachen (Tach’en) Island and ended his career in command of Nationalist forces in the Penghus (Pescadores). He retired in late 1959 and died in Taipei on 14 February 1962.

Hull, Cordell (1871–1955)

U.S. secretary of state from 1933 to 1944. Born in the community of Star Point in Pickett County, Tennessee, on 2 October 1871, Cordell Hull studied law at National Normal University in Lebanon, Ohio, and the Cumberland Law School in Lebanon, Tennessee. In 1892, he entered Tennessee state politics as a Democrat. During the 1898 Spanish-American War, Hull volunteered and spent several months in the army. He was elected to Congress in 1903, and in 1930 he became senator for Tennessee. He resigned that position in 1933 when President Franklin D. Roosevelt appointed him secretary of state.

An old-fashioned Jeffersonian Democrat and progressive, Hull admired President Woodrow Wilson; Hull had supported U.S. membership in the League of Nations following World War I. As secretary of state, he favored free trade, peace agreements, international conferences, and reliance on legal principles and institutions. During the 1930s, Hull negotiated numerous reciprocal trade agreements with other nations. He also devoted particular attention to revitalizing U.S. relations with Latin America through the “Good Neighbor” policy, whereby his country renounced the right to intervene in Latin America, and through the conclusion of related hemispheric security agreements.

President Roosevelt, who preferred to retain personal control of American foreign policy, frequently bypassed Hull. This tendency became more pronounced as World War II approached, and Hull found it both irritating and frustrating. Even so, since the two men fundamentally shared the same perspective on international affairs, Hull chose not to resign. Hull believed the European dictators posed a dangerous threat to all free nations and, believing that arms embargoes were ineffective and generally favored aggressors, he

opposed the various neutrality acts passed by Congress between 1935 and 1939. He was inclined to be slightly less conciliatory than Roosevelt and was unenthusiastic toward Roosevelt's 1938–1939 peace messages to European powers.

Once war began in Europe, Hull staunchly supported Great Britain and France against Germany and Italy. However, he was virtually excluded from the Anglo-American Destroyers-Bases Deal of summer 1940 and the drafting of Lend-Lease legislation some months later. Nor did he attend the Anglo-American military staff conversations held in Washington early in 1941 or the mid-August 1941 Argentinia Conference that drafted the Atlantic Charter. Roosevelt, preoccupied with European affairs from April to December 1941, delegated to Hull responsibility for protracted American negotiations with Japan. The objective of the negotiations was to reach a temporary agreement in Asia, where Japan had been at war with China since 1937. In the negotiations, Japan also sought further territorial gains from British, French, and Dutch territorial possessions. Despite the expressed concern of American military leaders that the United States was unprepared for a Pacific war, by late November 1941 Hull—who was privy to intercepted Japanese cable traffic—believed that war was

inevitable, and he refused to contemplate further American concessions to Japanese demands.

After the Japanese attack on Pearl Harbor, Hull was often excluded from major meetings, including the 1942 Casablanca Conference, the 1943 Cairo and Tehran Conferences, and the 1944 Quebec Conference, a summit meeting of Allied leaders. Hull opposed Roosevelt's decision, announced at Casablanca, to demand the unconditional surrender of the Axis nations, believing this would encourage them to continue the war. Hull also opposed the 1944 Morgenthau Plan to partition a defeated Germany and eradicate its industrial capacity, and with the assistance of Secretary of War Henry L. Stimson, he succeeded in obtaining the scheme's ultimate rejection.

Hull put great effort into establishing the 1942 United Nations alliance of anti-Axis nations. Following his Wilsonian instincts, he then concentrated on planning for the postwar United Nations, an international security organization that would replace the defunct League of Nations. Under Hull's guidance, the State Department drafted the proposals for the United Nations Charter accepted at the 1944 Dumbarton Oaks Conference and adroitly won bipartisan congressional support for these. Addressing Congress in late 1943, Hull overoptimistically stated that the projected new organization would eliminate spheres of influence, the balance of power, and international alliances and rivalries. He shared Roosevelt's anticolonial outlook and his belief that the United States should treat China as a great power and thereby encourage it to become one.

Increasingly poor health led Hull to resign after the November 1944 presidential election. Consulted on the terms of the July 1945 Potsdam Declaration urging Japan to surrender, Hull insisted that it include no promise to retain the emperor. Hull was awarded the Nobel Peace Prize in 1945 and lived quietly in retirement, producing lengthy memoirs. Suffering from strokes and heart problems, he died in Bethesda, Maryland, on 23 July 1955.

Hump, The

Allied air transport route supplying China from India. With Japanese forces controlling all of coastal China even before the U.S. entry into World War II, supplies to the Nationalist Chinese trickled along the Burma Road into western China. Recognizing the inadequate rate of supply, in November 1941 the Chinese National Aviation Corporation (CNAC) successfully devised a route through the Himalaya Mountains between Kunming, China, and Assam in upper India.

In 1942, the Japanese captured Burma, thereby cutting off all overland access to the Nationalist government headed by Jiang Jieshi (Chiang Kai-shek). U.S. President Franklin D. Roosevelt believed it vital to support Jiang, and military planners wanted to use China as the jumping-off point for the eventual invasion of the Japanese home islands as well as a base for strategic bombing. The U.S. Army Air Forces (USAAF) used the route pioneered by the CNAC to accomplish these tasks, although it was not ideal. A single narrow-gauge railroad connected Assam to the Indian coast.

The air route itself was more than 500 miles and very dangerous. Japanese air activity, unpredictable weather, the lack of navigational aids, unmapped territory, and peaks rising above 20,000 feet all made flying especially treacherous. Conflicting demands by Generals Claire Chennault and Joseph Stillwell—and also from Jiang—confused the supply situation. The deployment of B-29s to China in 1944 further strained the logistical chain.

The aircraft available were also inadequate. Initially, the twin-engine Douglas C-47 Skytrain was the main aircraft used, but it could only carry 2.5 tons of supplies. The twin-engine Curtiss C-46 Commando entered service before it had been fully tested. It could carry 5 tons of supplies, but early mechanical problems led to numerous accidents. Finally, late in the war the Douglas C-54 Skymaster, a four-engine transport capable of carrying 10 tons of cargo, became available.

Infrastructure also had to be created from scratch. Thousands of laborers built runways in China of crushed rock by hand. Trucks were scarce, so fuel was often transported in cans and aircraft fueled by lines of people passing these containers.

Supplies over the Hump began slowly. In July 1942 only 85 tons of supplies were delivered. Not until 1944 did transport over the Hump become rationalized. First, Major General William Tunner assumed command of the China-India Air Transport Command directly answerable to USAAF commanding general General Henry H. Arnold in Washington. The Hump operation marked the first time air transport was autonomous from the local or theater commander. Tunner regularized crew rotation, aircraft maintenance, and loading

and unloading procedures. Largely through his work, during July 1945 Allied aircraft flew more than 70,000 tons of cargo over the Himalayas. The Hump route was very costly. Over 500 aircraft were lost and more than 1,300 pilots and crewmen were killed or missing in action in the course of the Allied operation, which ended in September 1945.

Hungary, Air Force

Under the terms of the Treaty of Trianon following World War I, Hungary was forbidden a military air service. Between the two world wars, however, the Hungarian government secretly worked to establish, develop, and modernize an air force. The Hungarian air force came into being as an independent arm on 1 January 1939. For financial reasons but also because it lacked the industrial infrastructure (especially machine tools) and raw materials required, Hungary did not attempt to produce its own combat aircraft but purchased them from abroad, chiefly from Italy. In the late 1930s, however, it did begin production of an excellent short-range biplane reconnaissance aircraft, the Weiss Manfred 32 Solyom (Hawk).

The Hungarian air force was first deployed in April 1941 during the invasion of Yugoslavia. At the time, it had on paper 302 aircraft, but only 189 of them were operational and most were obsolete. After Hungary declared war on the Soviet Union in late June 1941, the air force was deployed to the Eastern Front. In 1942, the 2nd Air Force Brigade was established with 76 aircraft to support operations of the Second Hungarian Army in the Soviet Union. Almost half of its aircraft were gone by early 1943, and those that remained were merged into German squadrons.

In 1943, under terms of an agreement with the German government, Hungary began production of the Messerschmitt Bf-109 fighter to offset production from German factories destroyed by Allied bombing. Hungary also produced the Me-210. The terms of the agreement provided that 40 percent of aircraft production was to remain in Hungary, but this

pledge was not kept. Nonetheless, Hungary was able to add some 170 modern aircraft to its inventory by 1944.

The revitalized Hungarian air force suffered devastating air raids by the Allied powers beginning in 1944. Remaining aircraft were then removed to Austria. Ammunition and fuel shortages meant that no Hungarian aircraft participated in the last weeks of the war. Those that remained were either destroyed by their crews or handed over to Allied forces. During the war, Hungary produced 1,182 aircraft and 1,482 aircraft engines. Among the aircraft were 488 Bf-109s and 279 Me-210s. Of these, Hungary received only 158.

Hungary, Army

The Treaty of Trianon between the Allied powers and Hungary following World War I limited both the quantity and quality of Hungary's armed forces. The army was restricted to a maximum of 35,000 officers and men, and it was not allowed any heavy artillery, tanks, or military aircraft. Hungary was also forbidden to organize and train reservists. The armed forces, consisting of seven mixed brigades and a river flotilla, could take up arms only for the maintenance of internal order or to oppose a foreign invasion of Hungary. Having been stripped of two-thirds of its territory and population following World War I, Hungary was also deficient in war-related industry and resources.

In 1938, an agreement between Hungary and the neighboring Little Entente states of Czechoslovakia, Romania, and Yugoslavia recognized Hungary's right to rearm. The Hungarian government increased the military budget, but in September 1939 the army numbered only 9 light divisions or brigades. In 1941, it had 27 light divisions or brigades of 2 regiments each. Each regiment numbered about 4,000 men, so the effective size of the infantry force was only 216,000 men. There were also 2 cavalry brigades and 2 motorized brigades. Most of the equipment was obsolete; its rifles were old and they frequently jammed, and the army had no antitank guns. Although Hungary produced its own tanks, it had only 190 of

these, and they were too light for combat operations on the Eastern Front, where the army would do most of its fighting. Even by 1943, the army had only one-third of the motor transport required and had to use civilian vehicles.

In the spring of 1941, Hungary conducted its first military operation since World War I when it sent a mechanized army corps to support the German invasion of Yugoslavia. The army was still under-equipped when Hungary officially entered the war on 26 June 1941 with a declaration of war on the Soviet Union. For operations in the Soviet Union, the army assembled an expeditionary force designated the Mobile Corps and commanded by General Ferenc Szombathelyi. Numbering some 44,000 men, it consisted of 2 infantry brigades (a mountain brigade and a border guard brigade), a cavalry brigade, and 10 Alpine battalions, 6 of which used bicycles. Nonetheless, it contained the army's best-trained and best-equipped troops. It was assigned to the German Seventeenth Army, and partly because Soviet forces were then retreating, the Mobile Corps reached the Donets River. In the autumn of 1941, some Hungarian army light infantry divisions were assigned the task of guarding German rear areas in the central part of the front. Although poorly armed and equipped, these divisions effectively carried out their assignment and were not withdrawn until the autumn of 1944.

Under heavy German pressure, Hungary made a major military effort in 1942, deploying Gusztáv Jány's Second Hungarian Army to the Eastern Front. Consisting of three army corps, an armored division, and a mixed Air Force regiment and numbering about 200,000 men, the Second Army fought with General Maximilian von Weich's Army Group B in the Ukraine. Between June and September 1942, it helped drive back Soviet forces behind the Don River, suffering losses of nearly 22,000 men in the process.

Although the Germans provided the Second Army with some equipment, including tanks, much of this was obsolete and, in any case, inadequate in quantity. The Germans supplied only a few antitank guns, and the Hungarians did not have the heavy-caliber guns necessary to stop Soviet tanks. Opposing Soviet forces enjoyed a vast superiority in manpower, guns, tanks, artillery, and stocks of ammunition. Moreover, there had been no effective resupply since the summer campaign of 1942. Weapons and equipment would not work in the bitter cold of winter, there was no winter clothing, and even food was in short supply.

On 12 January 1943, Soviet forces—which outnumbered Hungarian forces by three to one in manpower and had a decided edge in military equipment including tanks, aircraft, and artillery—launched a massive offensive across the Don River and pushed the Hungarians back, causing heavy casualties and material losses. Perhaps 160,000 men in the Second Army died in the battle or subsequent retreat. The Don catastrophe confirmed the Hungarian government's worst

Over 50 Hungarian soldiers are shown in an effort to recover this disabled Soviet tank. It was captured by Hungarian forces who had been fighting on the Eastern Front alongside the German troops. (© Bettmann/Corbis)

fears, and the government used the excuse that its war industries were unable to manufacture new equipment and arms fast enough to equip additional troops in order to avoid dispatching the men to the Eastern Front. The light divisions in occupation duties remained, however.

In March 1944, German forces occupied Hungary and put additional pressure on Hungary to assist with the war. As Soviet forces advanced west, the government deployed the First Hungarian Army to the Ukraine. Part of the German Army Group South, it consisted of 4 infantry divisions, 1 light division, 1 armored division, and 2 mountain brigades. The First Army held its positions until the end of July 1944, when it was forced to withdraw to the Carpathian Mountains. By early autumn, it became obvious that the weak Hungarian forces would be unable to stop Soviet and Romanian troops from invading the country. Army morale plummeted, especially when the Germans took control in Budapest and the fascist Arrow Cross seized control of the government. Whole Hungarian units melted away. Planned new fascist military

units were not organized in time to see action. The leaders of the army hoped to be able to hold out until they could surrender to U.S. and British forces, but this proved impossible. For most of the Hungarian military, the war ended in February 1945, although some Hungarian formations withdrew with German units into Austria and Germany.

Hungary, Role in War

In 1939, Hungary was a nation of some 10 million people. At least half of the population still made its living from agriculture. The government—headed by Regent Miklós Horthy de Nagybánya, who had wide powers—steadfastly rejected calls for land reform, and more than half the arable land of Hungary was owned by only some 10,000 landowners. Horthy, who remained head of the government from 1920 to 1944, also beat back proposals for universal suffrage.

The chief Hungarian foreign policy objective between the two world wars was revision of the 1920 Treaty of Trianon. Virtually all Hungarians saw the treaty as a national humiliation. It had destroyed the economy and national territorial integrity of Hungary by stripping away some two-thirds of the territory and population. It also consigned 3 million Hungarians to foreign rule. Revisionist sentiment meant the Horthy government fell easy prey to German promises of territorial aggrandizement if Hungary joined the Axis. As a result of the Munich Conference and First Vienna Decision in the autumn of 1938, the German occupation of Czechoslovakia on 15 March 1939, and the Second Vienna Decision in August 1940, Hungary received some of the territories lost after World War I without having to take part in any military operations. Hungary's new alliance with Italy and especially with Germany seemed to be working to the nation's advantage. In return, Hungary provided Germany with increasing amounts of raw materials and food. During the war, Hungary also emerged as a major source of oil for the Reich, ultimately surpassed only by Romania.

In December 1940, the Hungarian government concluded a friendship agreement with Yugoslavia. A few months later, however, Adolf Hitler decided to attack Yugoslavia, and he insisted that Hungary participate in the military operations. Rather than dishonor himself with such an act, Hungarian Prime Minister Pál Teleki committed suicide. Regent Horthy, new Prime Minister László Bárdossy, and chief of staff of the army General Henrik Werth were all committed to Hungarian participation in the invasion of Yugoslavia. They hoped in the process to gain additional territory and cement the alliance with Germany. Hungary entered the war on 11 April 1941.

When Germany invaded the Soviet Union in June 1941, it called on Hungary to participate fully in the war effort. Hun-

gary suspended diplomatic relations with the Soviet Union, and on 27 June, after a northern Hungarian city was bombed by aircraft identified as Soviet (but which were in fact of unknown origin), Hungary declared war on the Soviet Union. Hungarian army leaders expected a rapid German victory over the USSR.

By the end of June, Hungarian troops were deployed on the Eastern Front. Hungarian forces were split: offensive units advanced with German forces into Soviet territory, and an occupying force provided security for the German rear areas. Much to its chagrin, Hungary ultimately found itself at war with Britain and the United States. The United States declared war on Hungary on 5 June 1942.

In January 1942, under heavy German pressure, Bárdossy promised to send additional troops to the Eastern Front. On 9 March 1942, largely because the Germans had failed to secure a quick victory over the Soviets, Horthy replaced Bárdossy as prime minister with Miklós Kállay. The new prime minister sought to continue his predecessor's policy of open cooperation with Germany while also conducting secret negotiations with the Anglo-Saxon powers in the hope of extricating Hungary from the war.

Meanwhile, between April and June 1942, the Second Hungarian Army of 200,000 men was sent to the Eastern Front to bolster German forces there. Hungarian forces in the Soviet Union suffered from obsolete and insufficient equipment, poor logistics, and insufficient ammunition. The tragic defeat of the Second Hungarian Army near Voronezh in the Battle of the Don River during the winter of 1943 was a catastrophe for Hungary that resulted in the deaths of some 120,000 troops.

Following this loss, Kállay was more determined than ever to extricate Hungary from the war. His secret diplomacy intensified even as Hungarian participation in military operations was being curtailed. This angered Hitler, who demanded nothing less than full Hungarian participation in the war. Hitler was also upset by secret Hungarian negotiations with the western Allies to withdraw from the war, an activity about which pro-German individuals within the Budapest government kept him well-informed.

Alarmed by the Hungarian government's attempts to leave the war, on 19 March 1944 Hitler sent in German troops to occupy the country and force its continued participation on the German side. Under German pressure, Horthy also appointed Döme Sztójay, a pro-German former Hungarian ambassador to Berlin, as the new prime minister. Anti-Nazi parties were banned, and politicians opposed to German policy were arrested. The Hungarian government was also forced to deploy additional soldiers to the Eastern Front to fight against the Soviets. One irony of the German occupation was the reduced economic value of Hungary to the Reich, thanks to the occupation costs, the mass arrest and deportation of Jews, and increased Allied bombing.

In an attempt to decrease German influence, on 29 August 1944 Horthy appointed a new prime minister, Géza Lakatos, who ordered Hungarian army units to attack southern Transylvania to halt a Soviet-Romanian invasion. Understanding that the war was lost, Horthy dispatched a delegation to Moscow to negotiate an armistice with the Soviet Union, the terms of which were agreed to on 11 October 1944.

On 15 October 1944, Horthy announced over the radio Hungary's unconditional surrender. Because of a lack of coordination with army chief of staff János Vörös, the Hungarian army continued to fight, and Horthy's attempt at surrender failed. The Germans then took over Budapest and forced Horthy to step aside in favor of Ferenc Szálasi, leader of the Arrow Cross (the Hungarian fascist party) as prime minister and head of state. Horthy was then arrested by the Gestapo and removed to Germany with his family. During Szálasi's brief tenure, a reign of terror swept Hungary. Thousands of people, including many Jews who had sought refuge in Budapest, were arrested and executed or sent to concentration camps.

Meanwhile, the Soviet army continued to advance, and by December 1944 it laid siege to Budapest. Two and a half months later, the remaining German forces in Buda surrendered. Meanwhile, Hungarian representatives signed an armistice in Moscow on 20 January 1945. Most fighting in the country ended in February 1945, and the last German troops were forced from Hungarian soil on 13 April 1945. The country then passed from German to Soviet army control.

Hunter-Killer Groups

Specialized antisubmarine units formed to hunt and destroy submarines before they could attack and to provide roving support for convoy escort groups. In late 1942, as production and delivery of antisubmarine vessels increased, the British began forming support groups—permanently established

formations charged with reinforcing hard-pressed convoy escorts. Unlike escort groups, these units trained and exercised intensively to develop and master techniques for hunting and destroying enemy submarines. Their existence and the imminent arrival of large numbers of escort carriers from U.S. shipyards spurred the deployment of specialized hunter-killer units in the navies of the British Commonwealth and the United States.

The Atlantic Convoy Conference of 1–12 March 1943 mandated the formation that year of 10 hunter-killer groups, each centered on an escort carrier. Five British and Canadian groups would support operations in the North Atlantic, and five American groups were to attend to the needs of the Middle Atlantic.

Although convoy support was a significant role, the most important mission of these groups was to locate, intercept, and destroy U-boats before they could attack the slow merchantmen. Central to implementation of this mission were significant advances in three areas: code-breaking, high-frequency direction finding (HF/DF, or "huff-duff"), and radar. By mid-1943, even though significant changes had occurred in the German naval cipher, Allied decoders were able to read 80 percent or more of the U-boat arm's traffic. Furthermore, the British and American submarine tracking rooms were able to predict submarine movements with a fair degree of accuracy on the basis of types of traffic, even if the message itself was unreadable.

High-frequency direction finding also was important in tracking and locating submarines. Shore-based installations became sufficiently sophisticated to give close "fixes," whereas advances in miniaturization produced sets suitable for installation aboard ships. From late 1942, half of all U.S. destroyer and escort production was fitted with HF/DF. The British followed suit in the spring of 1943.

Code-breaking, direction finding, and tracking ashore provided the hunter-killer groups with close approximations of the positions of U-boats at sea. Shipborne huff-duff, the new centimetric radar sets, and improved sonar equipment and procedures, together with the groups' organic aircraft, substantially enhanced their location rates. Better depth charges, ahead-throwing weapons, and aircraft-launched rockets or homing torpedoes eased the task of sinking the target. Hunter-killer groups trained together thoroughly, developed new coordinated tactics, and, above all, focused on locating and destroying U-boats rather than protecting convoys.

From the moment of their deployment, Allied hunter-killer groups played a major role in the destruction of Germany's U-boats. For example, between May and December 1943, the group formed around the American escort carrier *Bogue* sank 10 U-boats in the Atlantic; between June 1943 and January 1944, the Royal Navy's 2nd Support Group destroyed

14 submarines. The attack on *U-358* illustrates the significance of persistent attack made possible by adherence to a single mission: the British 1st Support Group maintained continuous contact for 38 hours and expended 530 depth charges before forcing the submarine to the surface and carrying out its destruction.

Hürtgen Forest Campaign (12 September–16 December 1944)

Although it is little remembered today, the battle for the Hürtgen Forest was one of the worst defeats ever suffered by the U.S. Army. In three months of combat operations, the Americans sustained almost 33,000 casualties but accomplished almost nothing tactically or operationally in the process.

By late August 1944, the apparently defeated German army had been pushed out of France and back to the borders of the Reich. Many GIs began to believe that the war would be over by Christmas. But the situation changed as the Allies reached German territory and the defenses of the German West Wall (called the Siegfried Line by the Americans but never by the Germans). In the central sector of the West Wall defensive line lay the dark and almost impenetrable Hürtgen Forest.

At that point in the war, the Allied logistics system was stretched to the breaking point, and the advancing armies were on the verge of running out of ammunition and fuel. Allied military planners were faced with the two strategic options of attacking Germany—on a broad front or on a narrow front. Lieutenant General George S. Patton Jr. and Field Marshal Sir Bernard Montgomery were the two leading advocates of the narrow-front approach, but each general thought his forces should execute the “dagger thrust” into the heart of the Reich.

Pressed hard by Montgomery, Supreme Commander, Allied Expeditionary Forces General Dwight D. Eisenhower

agreed in September 1944 to support the British plan for a combined ground and airborne thrust into Holland and then across the Rhine River at Arnhem. Launched on 17 September, Operation MARKET-GARDEN soon failed. With supplies starting to dwindle to a trickle, the western Allies had no real choice other than to revert to the broad-front strategy of applying even pressure against the Germans all along the line.

Just prior to the start of MARKET-GARDEN, the U.S. First Army, commanded by Lieutenant General Courtney H. Hodges, breached the West Wall in two places and attacked the city of Aachen immediately north of the Hürtgen Forest. Hodges's 250,000-man force consisted of eight veteran divisions in the U.S. VII, V, and VIII Corps. After taking Aachen, Hodges planned to attack around the north end of the Hürtgen Forest across the flat open Rhine plain toward the city of Köln (Cologne). But Hodges also believed that he had to first secure the Hürtgen Forest to avoid dangerously exposing his southern flank.

The Hürtgen Forest is a classic piece of defender's terrain. It is an interlaced network of bald, exposed ridgelines and deeply wooded ravines, and the Roer River runs through the middle of the forest and then out across the Rhine plain. The small river itself was not a significant military obstacle, but a series of dams high in the forest had created a huge artificial lake holding millions of gallons of water. By releasing that water at the right moment, the Germans could flood the Rhine plain, which would slow, disrupt, and channelize Allied military movement for weeks. Those dams, in the vicinity of the town of Schmidt, were the one significant military operational objective in the Hürtgen Forest; but ironically, neither side appeared to recognize that significance until the battle was almost over.

Although the German army had a reputation as the master of mobile, offensive warfare, it also was tenacious and resourceful in the defense. The German army group commander in that sector, Field Marshal Walter Model, was a master defensive tactician.

The Hürtgen Forest campaign started on 12 September when the veteran 9th Infantry Division attacked the southern end of the forest in an attempt to move through a passage known as the Monschau Corridor. The 9th Infantry Division took the town of Lammersdorf in the south, but it was stopped just short of Germeter in the center of the forest. In late October, the 9th Infantry Division was withdrawn from the line after suffering 4,500 casualties. The 28th Infantry Division replaced it.

The U.S. First Army planned another attack, this time with VII Corps, commanded by Major General J. Lawton Collins. It was to move through the northern passage called the Stolberg Corridor. As a diversionary effort to draw off German forces, Major Leonard Gerow's V Corps to the south would attack with one division against Schmidt on the far side of the

U.S. tanks advance to the battle front in the Hürtgen Forest, November 1944. (Photo by U.S. Signal Corps/Time Life Pictures/Getty Images)

Kall River gorge. The supporting attack was scheduled for 2 November, and the main attack was to follow on 5 November. However, VII Corps could not get ready in time, and the main attack was postponed—first until 10 November and then until 16 November. For some reason, the timing for the supporting attack never changed.

The 28th Infantry Division launched the attack toward Schmidt with all three of its infantry regiments attacking in diverging directions, which dissipated rather than concentrated its combat power. The most notable feature of that battle was the near-epic struggle to get a handful of M-4 tanks and M-10 tank destroyers down the steep and narrow forest trail into the Kall River gorge and back up the other side to the open ground near the towns of Kommerscheidt and Schmidt. The 112th Infantry Regiment took Schmidt on 3 November. The Germans counterattacked immediately, supported by PzKpfw-V Panther tanks.

Despite the gallant fight against superior odds, in which antitank platoon leader Lieutenant Turney Leonard earned a posthumous Medal of Honor, all American armor east of the Kall River was destroyed. By 8 November, the 28th Infantry Division was pushed back almost to its starting positions, having sustained 6,184 casualties in only 7 days of fighting. Major General Norman Cota, the 28th Infantry Division commander, was widely criticized for the tactically stupid offensive scheme, a plan that actually had been imposed on him by V Corps. Cota had tried to protest it.

The 28th Infantry Division was relieved in the line by the 8th Infantry Division on 13 November. Three days later, the Americans launched the postponed main assault, with VII Corps' 104th, 1st, and 4th Infantry Divisions attacking through the north of the forest. South of VII Corps and just to the north of where the 28th Infantry Division had been mauled, V Corps' 8th Infantry Division launched a support-

ing attack. Once again, the Americans ran into a determined and skillful German defense. The attackers suffered heavy casualties in exchange for mere yards of ground. The GIs fought under terrible conditions of snow, rain, mud, cold, and almost impenetrable woods in fierce infantry combat reminiscent of World War I.

The Americans were still trying to punch their way through the Hürtgen Forest and making almost no progress when, on 16 December, the Germans launched their Ardennes Offensive to the south. The almost complete tactical and operational surprise the Germans achieved brought the Hürtgen Forest campaign to a halt, as all Allied forces focused on containing the Germans in the Battle of the Bulge. Even after the major German offensive was turned back, the Americans did not take Schmidt and the Roer River dams until early February 1945. Just before the Germans withdrew, they managed to blow up the valves controlling the spillway of the Schwammenauel Dam, the major dam in the system.

The Hürtgen Forest campaign was a brilliantly executed economy-of-force operation by the Germans. Most of the German records from that period did not survive, but Germany probably suffered more casualties than did the United States. Nonetheless, the Germans held the vastly better supplied and better equipped attackers to a dead standstill for three months, while just a few miles to the south, three German field armies assembled in almost complete secrecy for the Ardennes Offensive.

The Hürtgen Forest area today is little different than it was in late 1944 before the battle started. The forest has returned,

and the tree lines are much as they were. The towns and villages have been reestablished and are today only slightly more built up than they were at the time of the battle. Very few markers or memorials exist to indicate the prolonged and savage fighting. Yet, almost 60 years after the battle hardly a year goes by without another discovery of human remains in the forest known as the “dark and bloody ground.”

Iba Field, Attack on (8 December 1941)

Japanese air attack in the Philippines Islands, simultaneous with the raid on Clark Field. The Japanese planned to fly at night from Formosa (Taiwan) to avoid interception, arriving at first light to strike Nichols and Clark Fields, the main U.S. fighter and bomber bases in the Philippines. However, early-morning fog on Formosa grounded the aircraft of the Japanese navy's Eleventh Air Fleet. With no prospect of surprise, planners decided to ignore Nichols Field in favor of Iba, a pursuit-aircraft base northwest of Manila on Luzon's west coast. An attack on Iba would cover the flank of the Japanese force attacking Clark. When the fog lifted on the morning of 8 December, 54 twin-engine navy Mitsubishi G4M1 Type medium bombers (known to the Allied side by the code name BETTY) of the Takao and Kanoya Air Groups and 50 Mitsubishi A6M Reisen (Zero) fighters of the 3rd Air Group took off from Formosa and flew toward the Philippines.

At Iba, the U.S. 3rd Pursuit Squadron flew 16 P-40Es off the grass strip about 11:45 A.M. to intercept the Japanese planes, reportedly heading for Manila. This action was the Americans' second scramble of the morning. They failed to detect any Japanese, and the planes raced back when they heard Iba Field's radio warn of a hostile force approaching from the sea. The 3rd Pursuit Squadron reached Iba low on fuel and, in any case, failed to locate the Japanese aircraft. The squadron entered the landing pattern at 12:45 P.M. Six aircraft landed just as the Japanese bombers and fighters struck. Japanese bombs tore into barracks, service buildings, and maintenance equipment. A bomb also destroyed Iba's radar, a fatal blow to subsequent U.S. air-defense efforts.

A few American pilots turned their aircraft against the Zeros, despite near empty fuel tanks. The nimble Japanese shot down five P-40s, and swirling dogfights ran three more Americans out of gas. These desperate American attacks prevented the Zeros from strafing Iba. Ultimately, however, the 3rd Pursuit lost 16 P-40s in the air and on the ground—nearly the entire squadron—as well as 45 trained pilots and mechanics. Damage to the field and equipment was significant.

The unexpected success of the Japanese raids on Clark and Iba stunned both the Japanese and the Americans. The attacks crippled General Douglas MacArthur's air force and made possible the safe approach of the Japanese invasion convoys.

ICHI-GŌ Campaign (April–December 1944)

Last major Japanese offensive in China during the war. In spring 1944, the war was going badly for the Japanese. With Lieutenant General Joseph W. Stilwell's forces progressing in northern Burma, the Japanese launched their last offensive in China. Known as the ICHI-GŌ Campaign (Operation NUMBER ONE), it was aimed primarily at the Nationalist forces; the Japanese strategic objectives were to destroy these forces, capture air bases in southeast China, consolidate control over eastern China, and secure control of the Beijing (Beiping)-Hankow-Canton railroad line. The Japanese also hoped to relieve some of the pressure on their forces in Burma and establish a stronger base in China from which to resist any potential Allied invasion of the Japanese home islands.

The first phase began in March and lasted until July 1944, with the offensive being mounted on a broad front across central and south China. Japanese aims were to press toward the Nationalist capital of Chongqing (Chungking), open up direct communications with French Indochina, and capture airfields in southeast China being used by U.S. aircraft to attack Japanese ground forces and shipping. The early phase of the operation went well for the Japanese, with Nationalist forces quickly collapsing. This situation ended whatever hope remained among Western leaders that China might play a major role in the defeat of Japan.

In northern China during April and May, the Japanese cleared the Beijing-Hankow railway and took Henan Province, even though they had to move at night to avoid constant attacks from Major General Claire Chennault's Fourteenth Air Force. Despite their air superiority, the Chinese Nationalist forces lost almost every time they met the Japanese. Some Chinese soldiers were even attacked by their own people, enraged by earlier mistreatment, and on occasion, starving peasants actually killed retreating Chinese troops and welcomed the Japanese.

Nationalist military failures exacerbated the already rocky relationship between Nationalist Chinese leader Jiang Jieshi (Chiang Kai-shek) and Stilwell, as well as that between Chennault and Stilwell. Stilwell was convinced that the key to restoring China lay in reopening a land supply to Chongqing through Burma, whereas Chennault feared for the preservation of his airfields in eastern China. Jiang, realizing that the Americans were going to defeat the Japanese in due course, seemed more concerned with the threat posed to his regime

by the Chinese Communists. In fall 1944, the rift led to Stilwell's dismissal.

Phase two of the ICHI-GŌ Campaign began in July with a pincer movement by two Japanese armies, one from Wuhan and one from Canton, attempting to take Guilin and open a land route between central China and Southeast Asia. By November, all of Guangxi and eastern Hunan had been overrun, and the Japanese were threatening Guiyang, capital of Guizhou Province. In the process, the Japanese captured all but three of the U.S. airfields in south China. The Allies feared that if Guiyang fell, the Japanese might capture Kunming and Chongqing. But the Japanese were not able to advance farther, and in December, they attacked Guiyang but were repulsed. ICHI-GŌ was over.

In early 1945, the Japanese began limited offensives to consolidate the gains of 1944, but these failed to accomplish much, since the threat of war with the Soviet Union forced them to transfer several divisions to defend Manchuria and the Japanese mainland. Between May and July, the Nationalist Chinese used this situation to recover Guangxi and western Guangdong, but most Chinese lands captured by the Japanese during the ICHI-GŌ Campaign remained in their hands until the end of the war. The ICHI-GŌ offensive also greatly benefited Communist forces in China, who took advantage of the Nationalist defeats to occupy more territory and greatly expand their army.

Iida Shōjirō (1888–1975)

Japanese army general and conqueror of Burma in 1942. Born in Yamaguchi Prefecture, Japan, in 1888, Iida Shōjirō joined the army in 1908. He graduated from the War College in

December 1915 and was promoted to captain in December 1918. Iida participated in Japan's Siberian Intervention and served two terms as an instructor at the Infantry School between postings to infantry regiments. By August 1934, he commanded 4th Infantry Regiment, Guards Division. Promoted to lieutenant general in August 1939, he then commanded the Guards Division. In July 1941, Iida's Twenty-Fifth Army occupied French Indochina. He established his headquarters in Saigon and prepared for an invasion of Thailand.

In December 1941, Iida took command of the newly formed Fifteenth Army, consisting of the 33rd and 55th Infantry Divisions, charged with occupying Thailand. Beginning on 8 December, his superior forces easily overcame light Thai resistance. The Thai government then accepted occupation and signed a mutual defense pact with Japan.

On 20 January 1942, Iida's divisions crossed into Burma. Iida had only 35,000 men and limited supplies. The terrain sharply circumscribed Japanese operations, forcing the troops to abandon most of their heavy weapons and vehicles and utilize animals to carry their provisions. Although Japanese air attacks on Rangoon failed to close that port, Iida quickly outmaneuvered British forces. The Japanese force-marched along jungle trails, often outdistancing the motorized British. On 8 March, his men took Rangoon, and Iida immediately used that port to receive reinforcements and supplies. The fall of Rangoon also cut the Burma Road and isolated China from Western aid. By May, British and Chinese forces in Burma had been driven back to India and China, respectively. The Japanese had inflicted some 30,000 casualties, with their own ground force losses numbering only 7,000.

In April 1943, Iida was assigned to the General Defense Command. He retired in December 1944 but was recalled to command the Thirtieth Army in Manchuria in July 1945. He had barely taken up his post before it was overrun by the Red Army in August. Iida was taken prisoner and only released in 1950. He died in Tokyo on 23 January 1975.

Imamura Hitoshi (1886–1968)

Japanese army general and commander of the Eighth Area Army at Rabaul. Born in Miyagi Prefecture, Japan, on 4 Octo-

ber 1886, Imamura Hitoshi was commissioned into the Imperial Japanese Army in December 1907. He graduated from the War College in 1915 and then was an observer in Britain and India. In April 1932, Imamura took command of the 57th Infantry Regiment, followed in March 1935 by command of the 40th Infantry Regiment. He then served as deputy chief of staff of the Guandong (Kwantung) Army in Manchuria and then assumed the post of commandant of the Army Infantry School. Imamura commanded the 5th Infantry Division in China from November 1938 to March 1940. He returned to China as commander of the Twenty-Third Army in June 1941.

In December 1941, Imamura took command of the Sixteenth Army, which was intended to conquer the Netherlands East Indies. During the invasion of Java on 1 March 1942, the transport that was carrying him, the *Rujo Maru*, was sunk in the Battle of Sunda Strait. Clinging to a piece of wood, Imamura managed to reach shore. His force soon after overran the Dutch defenders on Java, and on 9 March, Imamura accepted the surrender of all remaining Allied forces in the Netherlands East Indies. As military governor of the former Dutch colony, he established a liberal occupation policy and freed Indonesian dissidents from prison.

In November 1942, Imamura took command of the new Eighth Area Army at Rabaul. Imperial General Headquarters had realized that General Hyakutake Haruyashi could not adequately direct operations on both Guadalcanal and New Guinea. Hyakutake took direct control of the Seventeenth Army on Guadalcanal, and General Adachi Hatazo took over the units on New Guinea, now designated the Eighteenth Army. Imamura was unable to deliver two new divisions to Hyakutake when the Japanese navy failed to control the sea around Guadalcanal. Instead, he had to order Hyakutake to evacuate Guadalcanal.

Imamura's efforts to reinforce New Guinea were also hampered by growing Allied airpower. The complete destruction of a convoy in the Battle of the Bismarck Sea in March 1943 convinced Imamura that New Guinea would also be lost. Within weeks, operations on New Guinea were transferred to the Second Area Army, and Imamura was left with only the Seventeenth Army.

Hyakutake and his Seventeenth Army were cut off on Bougainville by an American invasion in November 1943. On 25 March 1944, Imamura ordered the aggressive Hyakutake to cease offensive operations and adopt a purely defensive stance. Imamura himself was isolated at Rabaul with 70,000 troops when Australian forces captured the rest of New Britain. He hoped his presence would provide a strategic benefit to Japan, and he surrendered in 1945 only after Emperor Hirohito ordered him to do so. Tried and convicted of war crimes after the war, Imamura was imprisoned until 1954. He died in Tokyo on 4 October 1968.

Imphal and Kohima, Sieges of (March–July 1944)

Crucial battles that marked the turning point in the defense of India. In February 1944, Lieutenant General Mutaguchi Renya, commander of the Japanese Fifteenth Army in Burma, undertook an invasion of eastern India, partly in response to raids by the British. Mutaguchi hoped to forestall a British offensive and perhaps spark a revolt against British rule in India. He mustered about 220,000 men for his campaign, but his effort was hampered by a lack of heavy artillery and a ten-

uous supply line. The campaign was made more difficult by the mountainous terrain of eastern India, where the towns and villages were usually situated on saddles connecting high, rugged ridges. Mutaguchi's plan was to cut the road running south to Imphal from the supply depot at Dimapur. Then, after his troops had infiltrated the British-Indian positions, he planned to seize the high ground, force his opponents to retreat, and utilize captured supplies to march farther west.

The Japanese offensive opened in earnest on 11–12 March 1944, after Mutaguchi feinted south of Imphal and then surrounded it with his 33rd and 15th Divisions, cutting off supplies and laying siege to 150,000 British-Indian defenders. British Lieutenant General William Slim, commander of the defending Fourteenth Army, had expected an attack but was surprised by the speed of the Japanese advance. He countered by flying ammunition, provisions, fuel, and the 5th Indian Division into Imphal to reinforce the defenders. The British also benefited from having the 254th Tank Brigade at Imphal, the only armor in the battle. The British tanks played a decisive part in reopening the road and placing the Japanese infantry around Imphal on the defensive by the beginning of the monsoon season in May.

Meanwhile, Japanese Lieutenant General Satō Kōtoku's 31st Division had surrounded the key village of Kohima,

On Imphal front, Sikh signaler (left) operates walkie-talkie for British officers, listening to patrols reporting Japanese positions. (Library of Congress)

north of Imphal. If Kohima fell, all British units to the south would have been forced to retreat. But the 161st Indian Brigade at Kohima held, and once again, Slim turned to his air transports, flying the 2nd Infantry Division into Dimapur; that unit then pushed down the road to relieve Kohima. When the troops broke the circle about the village on 18 April, Slim went over to the attack.

General Satō held his ground, forcing the British-Indian troops to evict the Japanese from their positions yard by yard. Finally, on 2 June, ignoring orders from Mutaguchi to stand to the last man, Satō withdrew his battered division. Mutaguchi ordered the remainder of his army to retreat a month later.

British-Indian casualties in the campaign were about 15,000 men, but Japanese losses exceeded 90,000. The latter included several thousand troops of Subhas Chandra Bose's Indian National Army. The Japanese defeat at Imphal and Kohima paved the way for the British and Chinese offensives into Burma the next year.

Incendiary Bombs and Bombing

Air-delivered ordnance used to damage or destroy physical structures by means of fire; a form of strategic bombing intended to cause widespread damage to industrial and population centers, that is, firebombing.

During the early days of World War II, proponents of strategic bombing advocated large-scale air attacks against vital enemy military and industrial targets. These air raids were to be carried out during the day to facilitate precision bombing and maximize damage. However, both the German Luftwaffe during the Battle of Britain and the Royal Air Force (RAF) Bomber Command during raids over Germany suffered such great losses of men and material that both turned to nighttime area attacks. To compensate for the inherent loss of accuracy, they also turned to the use of incendiary bombs (IBs). In addition to the physical destruction these bombs caused, the use of incendiaries was calculated to have a devastating effect on the morale of the civilian populations in enemy cities.

The Luftwaffe employed chiefly the 2.2 lb B1 El, containing a mixture of magnesium and thermite, in raids against

Great Britain. One of the most infamous Luftwaffe firebombing raids was conducted against the city of Coventry on 14–15 November 1941. In that one raid, the Germans dropped more than 56 tons of incendiaries, causing extensive damage and casualties.

The RAF's Bomber Command began experimenting with incendiary bombing in the early months of 1942, and on 2 May 1942, the head of Bomber Command, Air Chief Marshal Sir Arthur Harris, ordered the first thousand-plane raid against the German city of Köln (Cologne). Using a mixture of high-explosive and incendiary bombs, the attack on 30–31 May destroyed over 8 square miles of the city. Assessment of these early attacks convinced Harris that widespread devastation could be achieved with the right combination of ordnance in strikes conducted over several successive days and nights. The RAF would launch the night attacks with high explosives creating the fuel for the incendiaries that followed. The British 4 lb magnesium IB and the 30 lb phosphorous IB would then begin the fires. More high explosives would follow to disrupt fire-fighting and rescue units, concluding with another round of incendiaries. The U.S. Army Air Forces (USAAF) Eighth Air Force would also participate with "precision" (actually, area) daylight bombing on areas missed by the previous night's raid. The most famous of these perfected raids were against the cities of Hamburg and Dresden.

Beginning on the night of 24 July 1943 and lasting until 2 August, the attack on Hamburg, code-named Operation GOMORRAH, created a firestorm that destroyed over 6,000 acres of the city and killed at least 40,000 Germans. Then, on 13–14 February 1945, 1,400 RAF bombers attacked the city of Dresden at night, with 1,350 U.S. bombers following the next day. The resulting firestorm destroyed much of the city and killed tens of thousands of people. Following the Dresden raid, firebombing came under close scrutiny by the British and American governments and was suspended for the remainder of the European conflict.

In the Pacific Theater, the USAAF began experimenting with incendiary bombing in early 1945. Major General Curtis LeMay, who took over command of the Marianas-based bombing campaign against the Japanese home islands in January 1945, was under pressure from Washington to reduce the loss rates for the B-29 bombers in missions over Japan and increase the effectiveness of the high-altitude, daylight, precision-bombing attacks against major Japanese cities.

On the night of 9–10 March 1945, 334 B-9 bombers dropped more than 2,000 tons of incendiaries on central Tokyo.

LeMay decided on low-level nighttime bombing runs with aircraft stripped of much of their protective armament in order to maximize bomb loads.

On the night of 9–10 March 1945, 334 B-29 bombers dropped more than 2,000 tons of incendiaries on central Tokyo. Unlike the magnesium-thermite and phosphorous bombs commonly used in Europe, the B-29s carried 100 lb, oil-gel M47 bombs and 6 lb, gelled-gasoline M69 bombs, calculated to be most effective against the wood and paper building materials so common in Japanese cities. The resulting firestorm destroyed 16 square miles of the city and killed an estimated 100,000 Japanese. Over the next weeks, B-29s fire-bombed the major Japanese cities, save the shrine city of Kyoto. The damage to Japan's major industrial cities was so extensive that LeMay was convinced he had found the means to end the war in the Pacific without an invasion of Japan itself.

The tactical potential of incendiary bombing was only beginning to be realized. Allied aircraft employed napalm—jellied gasoline ignited by thermite—against Japanese positions throughout the island-hopping campaigns. Incendiary bombing continued to be used on a wide scale in the Korean and Vietnam conflicts.

India

India, with a population of 319 million in 1941, played an important role in World War II. Its location, population, vast extent, and resources all made it vital to the Allied war effort. India became the base for British operations against Burma and for resupply efforts to China. It was also a key source of manpower, important raw materials, and finished goods.

In September 1939, Lord Linlithgow (Victor Alexander John Hope, 2nd Marquess of Linlithgow), the viceroy of India from 1936 to 1943, declared war on Germany and Italy on behalf of India and suspended the Government of India Act of 1935. Although this move was constitutionally correct, Linlithgow's failure to consult with the Indian legislature

proved politically disastrous, as the British government had been endeavoring to encourage representative government by Indian elites. In response to Linlithgow's action, a large number of Congress Party members resigned their government posts. This outcome was ironic, as most Indians, including many princes and Congress Party leader Jawaharlal Nehru, opposed the Axis. A small number of Indian politicians, most notably Mohandas K. Gandhi, opposed all wars as a matter of principle.

In March 1942, Sir Richard Stafford Cripps arrived in India with a proposal for granting immediate self-rule after the war ended. The Congress Party rejected this offer and answered with the Quit India movement, announced on 8 August 1942. The movement called for an immediate end to British rule in India and involved mass struggle by nonviolent means. The British responded by arresting 60,000 leaders of the Congress Party, including both Nehru and Gandhi. Although the Muslim League also rejected the Cripps Plan, it benefited from its more moderate stance, and the influence of its leader, Mohammed Ali Jinnah, grew.

As noted, India was an important source of manpower for the Allied war effort. In 1938, British War Secretary Leslie Hore-Belisha recommended that the Indian army be reorganized, since too many British soldiers were deployed in India. But in June 1939, the Chatfield Commission held that a wholly Indian military was not feasible. The commission members believed British troops were necessary to keep peace between Muslims and Hindus—and, not incidentally, to maintain British control. In consequence, no major reorganization or modernization of the Indian army occurred. In 1939, the army numbered 189,000 men, of whom 65,000 were in administrative or communication positions. Much of the army's equipment was obsolete. Moreover, the army had no antitank units and only eight anti-aircraft guns; there was also a serious shortage of artillery, let alone modern types.

The British government in India believed that the country would not be heavily involved with the war, particularly not overseas. Consequently, in the first eight months of the conflict, the government accepted only 53,000 volunteers to supplement existing forces. Even so, two brigades of the Indian army were deployed to Egypt in October 1939. And in 1940, Indian troops were dispatched to the Afghan border, Iraq, Malaya, Burma, and East Africa.

The Indian military grew considerably during the war. Defense spending increased from 49.5 million rupees in 1939–1940 to 395.3 million in 1945–1946. The army also expanded apace. A total of 2,644,323 men served in the Indian army during the war, of whom approximately 2 million were combatants. Indian forces fought in Syria, North Africa, East Africa, the Middle East, Malaya, Greece, Sicily, and Italy. A total of 179,935 became casualties, including prisoners of war (POWs). Indians formed the bulk of Allied fighting troops in

A worker in one of India's fast-expanding munitions plants in the early 1940s. During the war, India produced more than 50 different kinds of arms and ammunition. (Library of Congress)

Southeast Asia; of 1 million British troops in the region, more than 700,000 were Indian. Although Muslims were only 27 percent of the total Indian population, they formed two-thirds of the Indian troops in North Africa, Italy, Malaya, and Burma.

In April 1942, in order to counter a possible Japanese invasion of India from Burma, the British commander in chief, General Archibald P. Wavell, reorganized the Indian army structure of independent commands and formed it into Central Command and three armies: Northwestern, Central, and Eastern. In December 1942, the Eastern Army attacked into the Arakan, and the next year, it became General Sir William J. Slim's Fourteenth Army. In 1943, the British command placed more emphasis on jungle training, which stood Indian forces in good stead when they engaged the Japanese.

In the Japanese capture of Singapore in February 1942, 60,000 Indian troops became POWs. Radical Indian nationalist politician Subhas Chandra Bose and the Japanese convinced some 25,000 of them to join the Indian National Army (INA, also known as the Azad Hind Faj) and fight to end

British rule in India. The Japanese viewed this force as an effective tool against British power, whereas its members saw themselves as an army of national liberation. Ultimately, some 7,000 INA troops were attached to Japanese units and fought in the Imphal Offensive into India. The remainder were used as auxiliaries. Most of the poorly trained and poorly equipped INA forces were either taken prisoner or deserted.

The rapid acceleration of the Indian war effort, especially following the Japanese attack on Pearl Harbor, spurred tremendous economic growth and led to a major expansion of India's industrial base. India contributed vast amounts of material to the British Empire's war effort, including raw materials, steel, locomotives and rolling stock, assault craft, and electrical components. Batteries produced in India were a vital component of air-to-ground communications, and India took the lead in manufacturing parachutes and uniforms and in assembling tens of thousands of armored vehicles from Canadian and U.S. components. India also supplied more than 50,000 stretchers, in excess of 1 million blankets,

250,000 mosquito nets, 1.5 million water-testing tablets, and 160 tons of mosquito-repellent cream. Further, to cope with the Allied rubber shortage, India established rubber plantations, experimented with reclaimed rubber, and produced considerable quantities of tires and hoses. It also produced alloy steels for guns and small arms, bayonets, shells, primers, and explosives, as well as steel for the manufacture of anti-aircraft guns, anti-tank shells, and light machine guns.

In addition, Indian princes contributed on an individual basis to the war effort, donating material goods such as blankets, woolen cloth, silk for parachutes, and rubber products. The nawab of Bhopal liquidated his investments in the United States and used the money to purchase a squadron of Spitfire aircraft.

The war brought restrictions on movement, civil rights, and food supplies. As the threat of a Japanese attack

India supplied more than 50,000 stretchers, 1 million blankets, 250,000 mosquito nets, and 160 tons of mosquito-repellent cream.

increased, the viceroy ordered a “scorched-earth” policy that mandated the confiscation of all bicycles and boats in major coastal cities such as Calcutta. These seizures threatened the livelihood of many Indians and made food distribution more difficult. Between 1940 and 1942, prices of basic consumer goods increased an average of 250 percent, and the government began rationing grain,

sugar, and cloth. Bengal was especially hard hit, for a famine there in 1943 claimed between 700,000 and 1.5 million lives; it was brought on, in part, by Japanese attacks against shipping along India’s east coast. In addition to the high prices for food, India was unable to secure food imports from Burma after it was controlled by the Japanese.

Once the war had ended, it was apparent that the British could not long retain their control of India: the war had strengthened indigenous nationalist movements. Consequently, on 20 February 1947, the Labour government in London announced that it would transfer power to India no later than June 1948. However, despite Gandhi’s pleas, religious animosity led to the partition of India. The Muslim eastern and western portions became Pakistan on 14 August 1947; a day later, the remainder of India became independent.

Indian Ocean, Japanese Naval Operations in (March–May 1942)

By late March 1942, the Japanese placed primary importance on the elimination of British naval forces in the Indian Ocean that might threaten the oil-rich East Indies. Imperial Headquarters therefore decided to attack Colombo and Trincomalee on Ceylon (Sri Lanka), off India. The Japanese hoped this move would force the British westward; spread panic in India and cause the British to divert resources there from Burma; and open the way to the conquest of Madagascar, which would enable them to cut Allied supply lines to the Pacific, Egypt, and the Soviet Union.

British Vice Admiral James Somerville commanded the Eastern Fleet, with 29 ships. He split his ships into Force A and Force B. The main body, Force A, consisted of his fastest ships: 2 fleet aircraft carriers, 1 battleship, 2 heavy cruisers, 2 light cruisers, and 6 destroyers. Force B consisted of 1 light carrier, 4 old R-class battleships, and a hodgepodge of 11 old cruisers and destroyers. Somerville faced a superior Japanese force under Vice Admiral Nagumo Chūichi. His First Air Fleet consisted of 5 large aircraft carriers (the *Kaga* remained in Japan), 4 battleships, 2 heavy cruisers, 1 light cruiser, and 11 destroyers.

En route to Ceylon, the Japanese attacked Port Darwin in Australia and, on 27 February, sank the U.S. seaplane tender *Langley*, bound for Java with aircraft. On 23 March, the Japanese took the Andaman Islands, securing the sea route to Rangoon from Singapore. Two days later, Nagumo’s ships entered the Indian Ocean.

Earlier, on 7 March, the battleships *Haruna* and *Kongo* had shelled Christmas Island, located 190 miles southwest of Java and considered important for its phosphate resources. A Japanese task force, commanded by Rear Admiral Kyuji Kubo and consisting of 3 cruisers, 2 destroyers, and transports, then arrived. Japanese troops forced the island’s surrender on 31 March. The U.S. submarine *Seawolf* scored a hit on Kubo’s flagship, the light cruiser *Naka*, which had to be towed to Singapore for repairs. Several months later, the

Japanese withdrew from Christmas Island because it was unsuitable for any military facilities.

The attack on Ceylon, code-named Operation C, consisted of a strike against Colombo on 5 April and another on Trincomalee on 9 April. The British believed the Japanese planned to attack Ceylon beginning on 1 April, and Somerville stationed his ships south of Ceylon on 31 March.

Late on 2 April, however, Somerville, who feared a Japanese submarine attack and a daylight air attack on his ships, split his fleet. He sent the majority to Addu Atoll, a small refueling base in the Maldives some 600 miles southwest of Ceylon. He also dispatched the cruisers *Dorsetshire* and *Cornwall* to Colombo and the light carrier *Hermes* and the destroyer *Vampire* to Trincomalee. Immediately after the British ships reached Addu Atoll on 4 April, the Japanese were sighted 360 miles south of Ceylon. The main British force was now too far away to attack the Japanese, but bases on Ceylon were put on high alert. Somerville realized that he had blundered and recalled the two cruisers to Addu Atoll. The *Hermes* and *Vampire* were to rendezvous once they were finished fueling.

At 8:00 A.M. on Easter, 5 April, Japanese aircraft struck Colombo. Forty-two British fighters met the attackers, which were protected by escorting fighters. The Japanese planes destroyed shipping and paid particular attention to shore installations: railroad yards, repair shops, and the airfield. High-altitude Japanese bombers sank an immobilized armed merchant cruiser and a destroyer, and they severely damaged a submarine tender. The raid, completed by 8:35, cost the Japanese only 7 aircraft, whereas the British lost 25. Once the Japanese had recovered their planes, a floatplane spotted the *Dorsetshire* and *Cornwall* at sea, and Nagumo launched 88 aircraft against them. The Japanese sank both British heavy cruisers in short order. Somerville had set out from Addu Atoll to engage the Japanese but failed to locate them. When Force B joined him the next day, he regarded it as a liability and promptly dispatched it to Kenya.

Nagumo, meanwhile, moved his ships toward Trincomalee. Believing the Japanese were next going to attack Addu Atoll, Somerville positioned his ships off the atoll, 1,000 miles from the Japanese fleet. With the threat to India's coast and the sinking of merchant ships, the British decided to cede the eastern Indian Ocean to the Japanese and sent Force A to the western coast of India. The *Hermes* and *Vampire* were ordered to hug the coast and join Force A.

The Japanese raid on Trincomalee, beginning at 7:25 A.M. on 9 April and conducted by 91 bombers and 38 fighters, was met by 23 British aircraft. The Japanese planes found no warships in the harbor, but they did sink a merchant ship there. They concentrated on the shore installations and airfield and shot down 9 British Hurricane fighters, as well as 5 Blenheim bombers sent against the Japanese carrier *Akagi* as she retired (the British bombers scored no hits). That afternoon,

Japanese aircraft spotted the *Hermes* and *Vampire* at sea. Nagumo sent 90 aircraft against them, and the *Hermes*, with no planes aboard, and her escorting destroyer were promptly sent to the bottom.

As part of this same operation, the Japanese convoyed their 18th Infantry Division to Rangoon without incident. It arrived there on 7 April. Also, a Japanese raiding force attacked the sea-lanes off India's east coast. This Malaya Force, commanded by Vice Admiral Ozawa Jisaburo, consisted of the light carrier *Ryujo*, 5 heavy cruisers, 1 light cruiser, and 4 destroyers. Between 5 and 6 April, it sank 19 merchant ships (92,000 tons) and damaged 3 others. Air strikes by Japanese aircraft flying from Burma brought this total up to some 185,000 tons of shipping sunk, and Japanese submarines operating off India's west coast sank an additional 32,000 tons.

By 10 April, the Japanese had pushed the British navy out of most of the Indian Ocean, created a buffer against British naval raids on the East Indies and other Japanese possessions, and destroyed significant British military assets. Nagumo concluded that he had achieved his objectives and ordered the First Air Fleet to return to Japan. His fleet had been at sea for many months, and its ships badly needed refitting.

Ultimately, their Indian Ocean victory fueled a belief in their own invincibility among the Japanese and led to the overexpansion of their empire. The extended Japanese Indian Ocean operation also meant that many of the ships were unavailable for the next big sea fight, the Battle of the Coral Sea in May.

Indianapolis, Sinking of (July–August 1945)

The sinking of the U.S. heavy cruiser *Indianapolis* by a Japanese submarine in the Philippine Sea two weeks before the end of the war remains controversial to this day. Built in Camden, New Jersey, and commissioned in 1932 at the Philadelphia Navy Yard, the *Indianapolis* (CA-35) displaced 9,800 tons and was 610' in length. The engines drove her at a maximum

speed of 32.5 knots, and she mounted 9 × 8-inch and 8 × 5-inch guns. She had carried President Franklin D. Roosevelt as a passenger during three cruises in the 1930s, and she served with distinction in the Pacific Theater throughout the war.

While shelling Okinawa prior to the invasion of the island, the *Indianapolis* was severely damaged by a Japanese bomber in late March 1945, necessitating a voyage to Mare Island, California, for repairs. After the work was completed, the ship, under the command of Captain Charles B. McVay III, was ordered to carry to the island of Tinian the internal components of the two atomic bombs to be dropped on Hiroshima and Nagasaki. The *Indianapolis* subsequently departed on a high-speed voyage from San Francisco, arriving at Tinian 10 days later, on 26 July. She next stopped at the island of Guam and departed on 28 July with orders to proceed to Leyte. While traveling without escort—under radio silence at 17 knots in moderate seas with good visibility—she was torpedoed twice by the Japanese submarine *I-58* in the early morning hours of 30 July; she sank in only 12 minutes. Survivors were spotted by a U.S. Navy aircraft on 2 August. Of some 800 members of her 1,199-man crew who initially survived the sinking, only 316 were eventually rescued. The vast majority of those who died fell victim to sharks and exposure. The incident remains the worst case of shark attacks in history.

Following a court of inquiry into the loss of the *Indianapolis*, Admiral Chester Nimitz proposed reprimanding McVay. Instead, however, Secretary of the Navy James Forrestal followed the advice of the chief of naval operations, Fleet Admiral Ernest King, and ordered McVay to stand trial by court-martial. McVay was subsequently found guilty of an error of professional judgment in unreasonably placing the *Indianapolis* at risk by failing to steer a zigzag course; he was acquitted of inefficiency in ordering his crew to abandon ship. The court unanimously recommended clemency, and Forrestal remitted the sentence of the court-martial. McVay retired as a rear admiral in 1949; he committed suicide in 1968.

In recent years, crew members of the *Indianapolis* have endeavored to clear McVay's name. They have pointed out the poor visibility at the time the ship was sunk, the ship's engine problems, and the fact that McVay had not been informed of Japanese submarine activity. Also, McVay's request for escorts had been refused, even though the *Indianapolis* lacked antisubmarine detection devices. In 2001, the U.S. Congress passed a resolution exonerating McVay of any wrongdoing.

Infantry Tactics

Firepower and maneuver are the two primary elements of applied combat power. Firepower delivers the destructive force necessary to defeat an enemy's ability and will to fight. Maneuver is the movement of combat forces to gain positional advantage, usually in order to deliver or to threaten to deliver fire by direct or indirect means. Artillery and aircraft deliver fire on the modern battlefield. The tank, though considered a maneuver weapon, really combines both elements, firepower and maneuver. The infantry is primarily a maneuver force.

Infantry is defined traditionally as the branch of an army made up of units trained to fight on foot. Despite the appearance of large-scale mechanization in World War II, infantry dominated the battlefield in that war as it has since the dawn of human history—and as it is likely to do so well into the high-tech future. Early in the nineteenth century, the Prussian military theorist Carl von Clausewitz wrote, "The end for which a soldier is recruited, clothed, armed, and trained, the whole object of his sleeping, eating, drinking, and marching is simply that he should fight at the right place and the right time." Clausewitz was talking primarily about the infantryman.

The World War II infantryman had much in common with his counterpart in the Roman legions 2,000 years earlier. In both eras, the individual infantryman lived and fought on the ground, day or night, in all weather, on all types of terrain. In both eras, he carried almost everything he needed on his back, he fought with handheld weapons, and his primary mission was to close with and destroy an enemy. The World War II infantryman, however, had far greater destructive power, reach, and staying power than his ancient counterpart. A World War II infantry company was more lethal than an entire infantry regiment of Napoleon's era. This advance resulted not only from the reach and rate of fire of modern weapons but also from communications technology that allowed an infantry company commander or even a platoon leader to call in the fire of an entire divisional artillery or air force fighter-bombers.

American infantrymen were the best equipped of World War II. The German infantrymen arguably were the best trained and best led. Soviet infantrymen were probably the toughest and most inured to physical hardship. The question of which army fielded the best infantrymen overall is open to debate, but the

U.S. infantrymen charge a German position during the Normandy campaign. Prone soldier in foreground is preparing to fire a rifle grenade. (Hulton Archive)

battlefield performance of the Australians, the New Zealanders, and the Gurkhas was consistently outstanding.

As with the tactics of the other arms, infantry tactics have always been a function of the technology and culture of the times. Most armies entered World War I with tactical doctrines that assumed mobile operations would be the norm. But infantrymen on both sides of the front lines in 1914 encountered previously unimaginable levels of firepower delivered by the new technologies of quick-firing artillery, the magazine-fed rifle, and especially the machine gun. Unable to survive the withering fire on the surface of the earth, the troops dug in. With the onset of trench warfare, the military planners on all sides spent the rest of the war searching for the tactical methods that would break the deadlock and restore mobility to the battlefield. They were close to achieving the solution by the time the war ended in 1918.

Contrary to popular belief, most armies did not spend the period between the two world wars training and organizing for a repetition of trench warfare. The majority of profes-

sional soldiers concluded soon after World War I that positional warfare had been an anomaly. But during the 1920s and the early part of the 1930s, an almost universal revulsion to all things military combined with the social, political, and economic factors of the era to retard advancements in military technology and doctrine. France, which had suffered more than any other of the Western Allies, especially adopted a defensive attitude to warfare and entrenched itself behind the Maginot Line.

The Allied armies ended World War I with massive stockpiles of weapons and equipment, which also tended to retard advancements in military technology. For economic reasons, political leaders insisted that the existing stocks be consumed before new weapons were developed and fielded. Germany, however, was in a different situation. The draconian provisions of the Versailles Treaty ironically worked to Germany's longer-term military advantage. Deprived of virtually all its armaments in 1919, the German military was forced to make a fresh start, both technologically and doctrinally.

Many of the technologies that had their primitive origins in World War I matured in the interwar years and radically altered the face of ground combat in World War II. Doctrinally, the modern concept of combined-arms operations also emerged in World War I. Combined-arms operations are those in which the effects of infantry, artillery, armor, air support, engineers, communications, and the like are all brought to bear on an objective in a coordinated and synchronized manner that produces a multiplier effect greater than the sum of its parts. Each of the combat arms has particular strengths and weaknesses. In a combined-arms effort, the strength of one arm compensates for the weakness of another. Tanks, for example, are vulnerable to light infantry armed with antitank weapons such as the bazooka or the Panzerfaust. By combining infantry with tanks, the infantry protects the tanks from enemy infantry while the tanks provide their own infantry with increased firepower and mobility.

Motorization was one of the major technological differences between World War I and World War II. During the earlier conflict, the primary source of battlefield motive power was human and horse muscle, as it had been for thousands of years. By the start of World War II, however, the American and British armies were completely motorized. The Soviet and German armies were partially motorized, but they and the Japanese and Italian forces continued to use horses and mules on a large scale. Despite the popular image of Germany's fast-moving mechanized armies, the Germans' field artillery and much of their infantry supply trains were horse-drawn right up to the end of the war.

The requirement for infantry to keep up with armored vehicles in fast-paced combat led to the development of motorized infantry and then mechanized infantry, also called armored infantry. Motorized infantry units, which first appeared near the end of World War I, were transported in trucks to assembly areas, where they dismounted and then deployed for combat. Mechanized infantry troops moved in various types of armored personnel carriers that usually were tracked or half-tracked. The armored personnel carriers mounted machine guns and heavier weapons that provided additional firepower. Mechanized infantry units usually dismounted from their vehicles to fight but sometimes fought from them. German mechanized infantry troops, known as panzergrenadiers, were an integral element of their panzer divisions.

German commanders always tried to avoid launching set-piece frontal attacks, the most costly form of combat. They preferred, wherever possible, to attack around an enemy's flanks, using the operational principles articulated by Count Helmut von Moltke in the late nineteenth century: *Umfassen, Einschliessen, Vernichten*—fix, encircle, destroy. When a deliberate attack was unavoidable, the Germans usually opted for a penetration with conventional infantry, supported closely by engineers, artillery, and tactical air support.

Once a penetration or flanking movement succeeded, the German panzers exploited by encircling the enemy, from two directions in a pincer if possible. After the jaws of the pincer closed, the attacking force formed two concentric rings, one facing inward to hold and destroy the trapped enemy force and the other facing outward to prevent any relief efforts. The Germans called this tactic a *Kesselschlacht*—a cauldron battle—and used it very successfully and on a large scale in many of the early battles in the Soviet Union in the summer of 1941. Later on the Western Front, the Germans themselves fell victim to the *Kesselschlacht* at Falaise and the Ruhr pocket.

A key element of German tactics was the concept of *Auftragstaktik*, which loosely translates into English as “mission tactics.” Despite the popular stereotypes, reinforced by countless Hollywood movies and television programs, the common German soldier of World War II was anything but stupid and unimaginative, and his officers and noncommissioned officers (NCOs) were neither machinelike nor inflexible autocrats. German leaders, down to the most junior officers and NCOs, were encouraged to be flexible and innovative in their approach to accomplishing their assigned missions. German operations orders generally described what subordinate units had to accomplish and the time in which it needed to be done. The question of how to carry out the task was left to the subordinate leaders, who were supposed to understand the overall intentions of their commanders at least two levels up. The result was that German units, even large units such as divisions, could react quickly to changes in the tactical situation, often acting on only verbal, fragmentary orders.

The primary document for German operations and tactics was a manual called *Truppenführung* (Unit Command), which was issued in 1934 and remained in force until the end of the war. It remains, to this day one, of history's most influential milestones in the development of tactical doctrine. Yet for all its tactical sophistication, the German army became overextended and ground down by the demands of waging a two-front war. To maintain their massive armies in the field, the Germans were forced to decrease training times progressively and even to commit training units to combat during emergencies. The decline in infantry quality meant that infantry units survived for shorter periods in combat and thus had to be replaced at a faster rate. It was a vicious cycle. In response, German commanders tried to rely more heavily on firepower as the conflict wore on, but the German army was chronically short of artillery throughout the war.

The fighting in the Soviet Union was more infantry-intensive than that in North Africa or in western Europe. After the initial successes of 1941, the Germans' so-called blitzkrieg began to fail because the panzer forces and even more so the Luftwaffe became more and more thinly spread over the vast spaces in the east. As that happened, the advantage slowly shifted to the Soviets, with their vast numbers of infantry divisions and their over-

whelming superiority in artillery tubes. Although some battles, such as Kursk, were classic clashes of armor, the foot soldier dominated the set-piece urban fight for Stalingrad.

Early in the war, Soviet attacks had great difficulty breaking through German defenses. The Soviet solution was to put the bulk of a unit's combat power as far forward as possible, with as many as 19 of a division's 27 infantry companies in the front line for a typical divisional deliberate attack. Later in the war, the German defenses developed much greater depth as they were being pushed back from Soviet territory. In response, the Soviets developed echeloned attack tactics.

Infantrymen do not fight as individuals. They fight as part of a carefully synchronized team, and each member of that team performs a specialized function. The basic infantry tactical unit is a squad—or section—of 8 to 15 soldiers commanded by a junior-ranking NCO. The squad is the largest unit that a leader can command by direct personal influence on the individual soldier. As the building blocks of larger combat units, the squads' organization and structure were a direct reflection of the tactical doctrine of the larger army.

At the start of World War II, the German infantry squad consisted of 10 men organized into two groups. The 4-man machine-gun group (gunner, assistant gunner, and 2 ammunition bearers) was armed with the excellent MG-34 light machine gun. The 5-man rifle group supported the machine-gun group. The two groups advanced by mutually supporting fire and movement, coordinated and synchronized by the squad leader. The Germans placed particular emphasis on selecting and training squad leaders. But by 1943, manpower shortages forced the Germans to reduce the infantry section to 9 men.

The organization of the French infantry squad was superficially similar to that of the Germans, but its method of maneuvering reflected the overwhelming defensive mentality of the French army. The Germans believed that fire and movement complemented each other, but the French believed that movement was only possible once fire superiority was established. The French squad had 12 men, organized into a 6-man light-machine-gun or automatic-rifle team, and a 5-man rifle team. Rather than maneuvering individually and providing mutual support to each other, the two teams were linked rigidly to the machine gun. The function of each member of the squad was defined in terms of the gun—fire it, move it, feed it, and protect it.

The Soviets and the British had the smallest infantry squads. The Soviet squad had 9 men and a light machine gun. The British infantry squad consisted of a corporal, 7 men, and the Czech-designed Bren gun as the automatic weapon. The Bren, which was much lighter than the Lewis gun it replaced, facilitated an increased emphasis on fire and movement within the British infantry.

The U.S. Army did not become involved in ground combat operations until late 1942. The American infantryman, armed

with the outstanding semiautomatic M1 rifle, could produce a far greater rate of fire than either his Axis enemies or his Canadian and British allies, all of whom generally were armed with bolt-action rifles. The 12-man American infantry squad was organized into three teams. The squad leader (a sergeant) usually moved with the 2-man scout (Able) team. Once an enemy objective was located, the squad leader ordered the 4-man fire (Baker) team, which was based on a Browning automatic rifle (BAR), to lay down a base of fire. The 5-man maneuver (Charlie) team then attacked the objective in short rushes. In practice, the unbalanced teams and especially the low rate of fire of the BAR made the American infantry squad particularly vulnerable to casualties. After World War II, American infantry squads were reconfigured into two evenly balanced teams.

Many popular beliefs about the infantry and infantrymen are false. Infantrymen, for example, are not the intellectual underclass of an army. Modern infantry combat has become so technical, so fast-paced, and so lethal that only the quick-witted, physically fit, and highly trained can survive it. Nor did the infantry suffer the highest casualty rates in World War II. Combat aircrews and, above all, submarine crews had higher rates. Few would argue, however, that the "poor bloody infantry"—as the British called them—led the hardest lives in the war. Regardless of the overall scheme of maneuver of the larger unit, every attack is a frontal attack at the level of the individual infantry soldier.

Ingersoll, Royal Eason (1883–1976)

U.S. Navy admiral whose logistical skills contributed to the success of the Normandy Invasion. Born in Washington, D.C., on 20 June 1883, Royal Ingersoll was the son of a

U.S. Navy Admiral Royal E. Ingersoll. (Bettmann/Corbis)

distinguished admiral. Graduating from the U.S. Naval Academy in 1905, he participated in the final portion of the Great White Fleet's voyage around the world. Quietly intellectual, unobtrusive, a superb administrator and skilled seaman, Ingersoll filled assorted staff, teaching, and sea-going assignments. Heading the Navy Department Communications Office during World War I, he ably directed its enormous wartime expansion and subsequently directed U.S. communications at the Paris Peace Conference in 1919.

Following tours as the executive officer of two battleships, Ingersoll headed the branch of naval intelligence responsible for code-breaking efforts against the Japanese. In 1927, he graduated from the Naval War College and was promoted to captain. He then held staff assignments and commanded cruisers. For three years, from 1935 to 1938, Ingersoll headed

the War Plans Division, where he helped revise Plan Orange against Japan. In 1937, he launched informal discussions with Great Britain on potential Anglo-American cooperation in any future conflict with Japan.

Promoted to rear admiral in 1938, Ingersoll commanded Cruiser Division 76. He was recalled from sea duty in 1940 and became assistant to Chief of Naval Operations Admiral Harold R. Stark. Ingersoll played a crucial role in helping prepare the U.S. Navy for war. In January 1942, as a vice admiral, he took command of the Atlantic Fleet, based at Norfolk, Virginia; his mission was to counter the German U-boat campaign, thereby safeguarding Atlantic lines of communication and protecting convoys bound for Europe, and to secure the Western Hemisphere. In June 1942, his only son and namesake, a naval lieutenant, died in action at the Battle of Midway. Ingersoll was promoted to full admiral

the following month. That November, his vessels transported the U.S. Western Task Force to Morocco in Operation TORCH, thenceforth supporting Allied operations in the Mediterranean.

From May 1943, Ingersoll worked closely with the new Tenth Fleet, established under the direct command of Chief of Naval Operations Admiral Ernest J. King. Ingersoll's logistical and managerial skills proved particularly valuable in deploying American forces to maximum effect, and, by substantially neutralizing German submarine forces, greatly facilitated the June 1944 Normandy landings.

In November 1944, Ingersoll became commander, Western Sea Frontier, to implement the complex transfer of American naval forces from the Atlantic to the Pacific for the projected invasion of Japan, a task effectively obviated by the sudden end of the war in August 1945. He retired one year later. Ingersoll died in Washington, D.C., on 20 May 1976.

Ingram, Jonas Howard (1886–1952)

U.S. Navy admiral who was given command of the Atlantic Fleet in 1944. Born in Jeffersonville, Indiana, on 15 October 1886, Jonas Ingram graduated from the U.S. Naval Academy. A gunnery specialist, he served at sea in the Atlantic during World War I on Admiral Hugh Rodman's staff. Between the wars, Ingram held seagoing commands, taught football and athletics at the Naval Academy, directed naval public relations in Washington, learned to fly as a naval aviator, and took staff courses.

In 1940, Rear Admiral Ingram assumed command of Cruiser Division 2, subsequently rechristened Task Force 23 and then the Fourth Fleet, stationed in Brazilian waters to secure the South Atlantic against Nazi ships and submarines. Promoted to vice admiral in 1942, he worked closely with Brazilian officials, winning their consent to the construction of American air, naval, and military facilities on Brazilian territory, while helping to upgrade Brazilian naval and air capabilities. Under Ingram's supervision, Ascension Island, 1,000 miles from Brazil's coast, became one of the largest existing air bases, enabling him to launch both aerial and naval attacks

on German U-boats. In late 1943, Ingram declared the Atlantic secure from Brazil to West Africa. In November 1944, he was promoted to full admiral and took command of the Atlantic Fleet, protecting shipping routes between North America and the European Theater—and especially troop convoys—against the final German submarine sorties.

Ingram retired from the navy in 1947 to become commissioner of the All-American Football Conference and a vice president of Reynolds Metal Company. He died in San Diego, California, on 10 September 1952.

Inoue Shigeyoshi

See Inouye Shigeyoshi.

Inouye (Inoue) Shigeyoshi (1889–1975)

Japanese navy admiral who advocated a negotiated end to the war. Born in Miyagi Prefecture, Japan, on 9 December 1889, Inouye (Inoue) Shigeyoshi graduated from the Naval Academy in 1909. His early career included both sea duty and staff assignments. Inouye attained flag rank in 1935. Two years later, he was appointed chief of the Naval Affairs Bureau. He shared Navy Minister Admiral Yonai Mitsumasa's belief that radical elements in the officer corps posed a threat to Japan's future. In 1939, Inouye was promoted to vice admiral and appointed chief of staff of the China Area Fleet.

Convinced that naval aviation would play a vital role in any future conflict, he successfully lobbied for appointment as chief of the Naval Aeronautics Bureau in 1940 in order to gain practical experience. In that position, he drafted a memorandum entitled "Modern Weapons Procurement Planning," in which he attacked the construction of battleships and called for greater emphasis on aircraft carriers and naval aircraft.

Inouye's views caused him to fall from favor. In August 1941, he was transferred to command the Fourth Fleet on

Truk, a backwater assignment. When World War II began, he led the forces that captured Guam and Wake Islands from the Americans. As other islands fell to the advancing Japanese, Inouye's area of responsibility expanded to include Rabaul and the Gilbert Islands.

In April 1942, Inouye was charged with planning and executing the invasion of Port Moresby. He remained in Rabaul while seven naval task forces, as well as land-based naval aircraft, moved against Tulagi, Guadalcanal, and Port Moresby in early May. The resulting Battle of the Coral Sea was a Japanese tactical victory, but the unavailability of close-air support due to the loss of an aircraft carrier in the battle led Inouye, on 8 May, to postpone the landing at Port Moresby. The commander of the Combined Fleet, Admiral Yamamoto Isoroku, was furious at this decision but unable to reverse Inouye's orders.

Inouye's Fourth Fleet was then largely relegated to logistical duties, and operations in the South Pacific were turned over to the Eighth Fleet. Inouye was relieved in October 1942 and took command of the Japanese Naval Academy. He was recognized as an advocate of peace, and when Admiral Yonai was recalled as navy minister after Tōjō Hideki's fall in August 1944, Inouye became vice minister. In May 1945, he was promoted to full admiral and became a member of the Supreme War Council. He spent the next months working for an end to the war. Inouye died in Miyagi on 15 December 1975.

International Military Tribunal: Far East (Tokyo War Crimes Trials) (1946–1948)

Trials of senior Japanese leaders after World War II. General of the Army Douglas MacArthur, heading the military occupation of Japan, established the International Military Tribunal for the Far East, popularly known as the Tokyo War Crimes Trials. The body held sessions in Tokyo from 3 May 1946 to 12 November 1948. Trials conducted by the tribunal were similar to those held at Nuremberg, Germany. The defendants were 28 senior Japanese military and civilian leaders, chosen from among 250 Japanese officials originally accused

Sentences imposed by Far East Military Tribunal

of war crimes. General Tōjō Hideki, who held various posts including prime minister and chief of the General Staff, was the best-known defendant among the 18 military officers and 10 civilians charged. General MacArthur, with President Harry S Truman's support, exempted Emperor Hirohito from trial because of concerns over potential Japanese resistance to military occupation. More than 2,200 similar trials, including some held in Tokyo that preceded the tribunal, were conducted in areas formerly occupied by Japan, ranging from China to Pacific islands including Guam. The trials generated strong emotions, and they remain controversial to this day.

The Tokyo tribunal consisted of 11 judges, 1 each from Australia, Canada, China, Great Britain, the Netherlands, New Zealand, the Soviet Union, the United States, France, India, and the Philippines. The Philippine justice was a survivor of the Bataan Death March. The tribunal's chief prosecutor, Joseph B. Keenan, was appointed by President Truman. Keenan's credentials included service as a former director of the U.S. Justice Department's Criminal Division as well as assistant to the U.S. attorney general. His staff included 25 lawyers. The tribunal was not bound by technical rules of evidence normally observed in a democracy and could admit any evidence that it chose, including purported admissions or statements of the accused.

The tribunal sought to establish clearly the principle that aggressive war was a crime and to prevent or deter future crimes against peace. Those who planned and initiated aggressive war in contravention of treaties, assurances, and international agreements were to be considered common felons. The tribunal also claimed jurisdiction over conventional war crimes and crimes against humanity, such as murder, mass murder, enslavement, deportation of civilian populations, and persecutions based on political or racial grounds in connection with other crimes under tribunal jurisdiction.

Some defendants were accused of being responsible for the actions of personnel under their command who had committed crimes against prisoners of war and civilian internees.

These offenses included murder; beatings; torture; ill-treatment, including inadequate provision of food and clothing and poor sanitation; rape of female nurses and other women; and the imposition of excessive and dangerous labor. Charges of murder were also leveled in cases involving the killing of military personnel who had surrendered, laid down arms, or no longer had means of defense, including survivors of ships sunk by naval action and crews of captured ships.

Seeking to conduct a fair trial, the tribunal gave each of those accused a copy of his or her indictment in Japanese, and trial proceedings were conducted in both English and Japanese. Defendants had a right to counsel, and the defense could question witnesses. Subject to court approval, the defense could also request the appearance of witnesses and the provision of documents. The mental and physical capacity of the accused to stand trial was also considered. After a conviction, the tribunal had the power to impose a death sentence or other punishment on a defendant. Of the 28 original defendants, 25 were convicted. Seven (including Tōjō) were sentenced to death by hanging, 16 to life imprisonment, 1 to 20 years of incarceration, and another to 7 years in prison. The remaining 3 were not convicted, 1 being declared mentally unstable and 2 dying before their trials ended.

As with the Nuremberg trials, the tribunal has been accused of promulgating “victors’ justice,” and some have called the proceedings racist. But fueled by horror at continuing military atrocities in places such as Bosnia and Cambodia, a legacy of the Tokyo and Nuremberg trials has been the widespread international support for a permanent war crimes tribunal. The U.S. government, however, has resisted the formation of such a body, fearing that it could be politically influenced to harass American military forces operating overseas.

International Military Tribunal: The Nuremberg Trials (16 October 1945–20 November 1946)

The Allies were determined to hold German leaders, both civilian and military, accountable for the war and the mass killings that had taken place in German-occupied Europe. British Prime Minister Winston L. S. Churchill and Soviet leader Josef Stalin agreed in 1941 to try those guilty of war crimes. The logistics and framework needed to carry out this policy were discussed throughout the war. At Moscow in October 1943, a declaration signed by British, Soviet, and U.S. representatives stated that war criminals would be brought to trial. Such a procedure was further discussed at important meetings at Tehran (November–December 1943), Yalta (February 1945), and Potsdam (July 1945). Finally, the London Agreement of 8 August 1945 set forth the method—a court trial—and identified jurisdiction. Although the Soviets proposed that the trials be held within their zone of occupation, in Berlin, the Western Allies insisted on Nuremberg.

The city of Nuremberg was selected because the palace of justice there had received only minimal damage during the war. The large stone structure had 80 courtrooms and over 500 offices and thus offered sufficient space for a major international legal proceeding. Furthermore, an undestroyed prison was part of the justice building complex, so all prospective defendants could be housed on site. Moreover, the proclamation of the Third Reich’s racial laws against the Jews had been made at Nuremberg. U.S. Army personnel prepared the palace of justice for the trial, repairing damage and laying thousands of feet of electrical wire.

Broadly speaking, the Nuremberg proceedings fell into two categories. The first set—and the subject of this essay—took place between November 1945 and October 1946 and involved the trial of 22 defendants before an international military tribunal (IMT) established by Britain, France, the Soviet Union, and the United States. Subsequently, a series of

Sentences imposed by Nuremberg Military Tribunal

The 21 defendants at the Nuremberg War Crimes Trial sitting in the dock awaiting sentencing, Nuremberg, Germany. Among the defendants are (front row; left to right): Hermann Göring, who received the death penalty; Rudolf Hess, life imprisonment; and Joachim von Ribbentrop, who also received the death penalty. (Hulton Archive)

other trials were held at Nuremberg until the spring of 1949 before U.S. tribunals in the American zone of occupation, involving nearly 200 other defendants.

The Nuremberg IMT opened on 8 October 1945. Judges from France, Great Britain, the Soviet Union, and the United States presided. The Western judges dressed in traditional robes, whereas the Soviet judge wore a military uniform. Judge Iola T. Nikitschenko, a Soviet, presided during the first session.

The prosecution presented indictments against 24 major criminals and 6 organizations. The individuals were Martin Bormann, deputy Führer after 1941 (tried in absentia); Karl Dönitz, admiral and commander of the navy from 1943 to 1945; Hans Frank, governor-general of Poland; Wilhelm Frick, minister for internal affairs; Hans Fritzsche, head of the Radio Division of the Ministry of Propaganda; Walther Funk, minister of Economic Affairs; Hermann Göring, Reichsmarschall (Reich Marshal) and commander of the Luftwaffe; Rudolf Hess, deputy Führer until May 1941; Alfred Jodl, army general and head of Operations, Oberkommando der Wehrmacht (OKW); Ernst Kaltenbrunner, head of the Sicher-

heitsdienst (SD, Security Service); Wilhelm Keitel, army field marshal and chief of OKW; Gustav Krupp von Bohlen und Halbach, industrialist and head of Krupp armaments; Robert Ley, head of the Labor Front (he committed suicide on 26 October 1945); Konstantin Neurath, protector of Bohemia and Moravia from 1939 to 1943; Franz von Papen, former vice chancellor and ambassador to Turkey; Erich Raeder, grand admiral and commander of the navy until 1943; Joachim von Ribbentrop, foreign minister; Alfred Rosenberg, minister for the Occupied Territories in the East until 1941; Fritz Saukel, plenipotentiary for the mobilization of labor; Hjalmar Schacht, president of the Reichsbank, from 1933 to 1939 and minister of economics from 1934 to 1937; Baldur von Shirach, leader of the Hitler Youth and Gauleiter (area commander) of Vienna; Arthur Seyss-Inquart, commissioner for the Netherlands from 1940 to 1945; Albert Speer, minister of armaments from 1942 to 1945; and Julius Streicher, publisher of the newspaper *Der Stürmer*. The indicted organizations were the Nazi Party (NSDAP), the Schutzstaffel (SS), the SD, the Gestapo, the General Staff, and Hitler's cabinet.

The charter governing the proceedings declared that the IMT's decisions would be made by majority vote. British Lord Justice Geoffrey Lawrence, president of the court, would cast the deciding vote in the event of a tie among the four sitting judges. The charter identified four categories of crimes: (1) crimes against peace: planning and/or preparing a war of aggression and violating international agreements; (2) crimes against peace: participating in a conspiracy to plan a war of aggression; (3) war crimes: a violation of custom and laws of war, use of slave labor, killing of hostages; and (4) crimes against humanity.

The trial itself lasted 218 days, and some 360 witnesses gave either written or verbal testimony. A new simultaneous translation system allowed the trial to proceed efficiently and swiftly in four languages. Although the defense was given the right to call its own witnesses, it was not allowed to bring forth any evidence against the Allies.

The proceedings at Nuremberg laid bare before the world the horrific crimes committed by the Third Reich. Most revealing were testimonies regarding the brutalities of the death camps. When shown German films of concentration camps, some of the defendants wept or became noticeably upset.

One aspect of the trial that caused debate at the time was the legality of trying military officers. Some suggested it was the role of military officers to carry out orders, but this defense was disallowed at Nuremberg. The prevailing view held that German military leaders had knowingly approved and planned aggressive war and had sanctioned war crimes.

On 1 October 1946, U.S. Army Colonel Burton Andrus led 21 defendants into the somber courtroom. (Martin Bormann was tried in absentia, Robert Ley had committed suicide, and Gustav Krupp von Bohlen und Halbach was too weak to be present.) Sir Geoffrey Lawrence announced that the verdicts would be delivered first, followed by the sentencing. Twelve defendants were sentenced to death by hanging (the counts on which they were found guilty are in parentheses): Hans Frank (3 and 4), Wilhelm Frick (2, 3, and 4), Hermann Göring (all four), Alfred Jodl (all four), Ernst Kaltenbrunner (3 and 4), Wilhelm Keitel (all four), Robert Ley (all four), Joachim von Ribbentrop (all four), Alfred Rosenberg (all four), Fritz Saukel (3 and 4), Arthur Seyss-Inquart (2, 3, and 4), and Julius Streicher (1 and 4).

Göring escaped the hangman's noose by committing suicide with poison smuggled into the prison. Franz von Papen, Hans Fritzsche, and Hjalmar Schacht were the only defendants to be acquitted. Charges against Gustav Krupp von Bohlen und Halbach were dropped on the grounds that he was physically unable to stand trial. The remaining defendants received various terms, ranging up to life in prison: Karl Dönitz, 10 years (2 and 3); Walter Funk, life imprisonment (2, 3, and 4); Rudolf Hess, life imprisonment (1 and 2); Konstantin Neurath, 15 years (all 4); Erich Raeder, life imprison-

ment (1, 2 and 3); Baldur von Schirach, 4 to 20 years (1 and 4); and Albert Speer, 4 to 20 years (3 and 4). Of those imprisoned, Rudolf Hess lived the longest. He died in Spandau Prison in 1987 at age 93.

Even before the trial ended in 1946, debate began on the validity of the tribunal. Although some have argued that the IMT was merely a case of the victor trying the vanquished, it nonetheless exposed the horrors of the Third Reich, most especially the Holocaust, the use of slave labor, and the heinous war crimes.

Iran

During World War II, Iran was occupied by British and Soviet troops, with the United States becoming an important new factor in Iranian politics. Germany had a significant economic influence and presence in Iran prior to the outbreak of the war, for in the 1930s, Reza Shah Pahlavi (r. 1925–1941), founder of the new dynasty, had turned to Germany for economic assistance. The shah's sympathy toward Germany, which had no tradition of imperial intervention in Iran or the Middle East, was well known, along with his distrust of Britain and the Soviet Union, both of which had dominated Iran in the nineteenth and early twentieth centuries.

U.S. Lend-Lease fighters and bombers intended for the Soviet Union at a delivery depot in Iran. (Hulton-Deutsch Collection/Corbis)

When the war began in Europe in September 1939, Reza Shah declared Iran's neutrality. However, after the Germans attacked the Soviet Union in June 1941, Iranian involvement in the war became inevitable. The USSR and Great Britain, Iran's perennial enemies, once again formed an alliance. As German troops pushed eastward and threatened the Caucasus, the strategic significance of Iran for the Allies grew. The Allied objectives in Iran were to protect the British-controlled oil fields in Khuzistan; to employ Iran and, in particular, its newly built Trans-Iranian Railroad to channel military supplies to the Soviet Union; and to curb the activities of German agents in Iran.

The British and Soviet representatives in Iran demanded that the government expel German nationals and let the Allies use the railroad to transport war materials. When Reza Shah refused to comply on the grounds of Iran's neutrality, the Allies invaded and occupied the country. On 25 August 1941, Soviet forces entered Iran from the northwest and the British entered from Iraq. The Allied forces suppressed Iranian military and naval resistance in just three days. Left with no choice, Reza Shah abdicated on September 1941, and his 22-

year-old son, Muhammad Reza, succeeded him. Reza Shah was sent into exile and died in 1944 in South Africa.

The fate of Iran in World War II resembled that which had prevailed in World War I: once more, Iran was occupied and dominated by foreign powers. The Soviet and British zones of occupation were consistent with the spheres of influence into which Iran had been divided by the humiliating Anglo-Russian Convention of 1907. The Soviets occupied the north, the British took control in the south, and Tehran and other central areas were put under joint Anglo-Soviet protection. In January 1942, Iran, the Soviet Union, and Great Britain signed the Tripartite Treaty of Alliance, whereby the great powers promised to respect the territorial integrity, sovereignty, and political independence of Iran; to safeguard the Iranian economy from the effects of the war; and to withdraw from Iranian territory within six months of the cessation of hostilities.

By the spring of 1942, Iran had severed diplomatic relations with Germany, Italy, and Japan and expelled their nationals. On 9 September 1943, Iran declared war on Germany. Two months later, one of the most important Allied meetings of the war, the Tehran Conference, was held, with the partici-

pation of U.S. President Franklin D. Roosevelt, British Prime Minister Winston L. S. Churchill, and Soviet leader Josef Stalin. Recognizing the help provided by Iran to their war effort, the three Allied leaders promised during the meeting to provide economic assistance to Iran and address its problems after the war.

The war had a devastating impact on Iran. It lost effective sovereignty to the domination of the occupying powers, and the central government that had been strengthened by Reza Shah became ineffective. Political instability and social disintegration grew, and economic hardship developed. Further, the use of major roads and the Trans-Iranian Railroad for the transportation of supplies to the Soviet Union disrupted Iranian trade; the demands of Allied troops aggravated inflation; and a poor harvest in 1942 led to widespread famine. Short-lived cabinets were unable to deal with the emergency situation, resulting in social unrest and the rise of separatist movements. All of these factors and the new political freedom resulting from the paralysis of a dysfunctional government led to a surge in political activity by various groups and parties. Political conflict among them was encouraged by the occupying powers.

During the course of their involvement, the Soviet Union and Britain revived and intensified their rivalry in Iran, a contest that was an integral part of what had been known as the "Great Game" in the late nineteenth and early twentieth centuries. Each side tried to expand its own influence and to limit the other's influence. The Soviets closed their zone of occupation to free entry. They supported left-wing trade unions in the north and the Communist Party, which had been banned in 1937 but was revived in 1941 under the new name of Tudeh (Masses). The Soviets also patronized the separatist leftist movements in Iranian Kurdistan and Azerbaijan. One result of these Soviet activities was the establishment of an autonomous state of Azerbaijan in December 1945. Meanwhile, the British in the south supported conservative elements, including the tribes, Muslim clerics, and the proponents of monarchy. They also sponsored the right-wing, pro-Western, and anticommunist National Will Party.

During the war, Washington became aware of the economic importance of Iran, stemming from its oil and its strategic location. After the United States entered the war, American troops arrived in Iran. The Persian Gulf Command, which eventually numbered 30,000 men, helped orchestrate the movement of supplies from the gulf to northern Iran, where they were handed over to the Soviets. American financial and military advisers were also sent to Iran at the request of the Iranian government. Between 1942 and 1943, a financial mission headed by Arthur Millspaugh worked on reorganizing Iran's finances. A mission headed by Colonel H. Norman Schwarzkopf took charge of the reorganization of the Gendarmerie (rural police).

In the first half of 1944, two American oil companies and then the Soviet government attempted to receive oil concessions from the Iranian government in order to undermine the monopoly of the Anglo-Iranian Oil Company. The Majles (Parliament), however, passed a bill, authored mainly by Mohammad Mossadeq, that prohibited oil-concession agreements with any foreign company until after the end of the war.

British and American troops withdrew from Iran in January 1946, whereas the Soviet occupation of the northern provinces of Azerbaijan and Kurdistan lasted until May 1946 when, under pressure from the United Nations, the Soviets withdrew.

Iraq

The Middle Eastern nation of Iraq was the object of a peripheral but critical struggle between Great Britain and the Axis powers in 1941. Iraq was a major oil producer (2.5 million tons in 1940), and were that nation to side with Hitler, its location on the Persian Gulf would have enabled Germany to threaten British trade, supplies, and troop movements to and from India. Granted nominal independence by Britain in 1930, Iraq was a Hashemite monarchy. The 1930 treaty that established Iraq's *de jure* independence also protected British oil interests there and granted Britain military bases at Habbaniya, about 25 miles west of Baghdad, and near Basra.

Iraq was unstable, and there were numerous coups and coup attempts. In December 1938, pro-British General Nuri al-Said came to power. Instability in Iraq increased, however, when King Ghazi I died in an automobile accident in April 1939. As the new king, Faisal II, was only four, his uncle Abdul Illah acted as regent. Meanwhile, Nuri put down an attempted coup by a group of army officers in March 1939 and another in February 1940. Nuri wanted to declare war on Germany but encountered opposition from Iraqi nationalists who sought concessions from Britain first. In consequence, Nuri followed Egypt's lead and declared Iraq's neutrality. Relations with Germany were severed, although those with Italy were not.

Axis successes in the Mediterranean beginning in the fall of 1940 encouraged Iraqi nationalists, who believed that the circumstances were right for Iraq to end remaining British control. Another issue involved the long-standing Iraqi opposition to British policies in Palestine.

In March 1940, Rashid Ali replaced Nuri as prime minister, although Nuri remained in the government as foreign minister. Rashid Ali now came under the influence of four nationalist, pro-Axis Iraqi army generals who called themselves the “Golden Square.” In March 1941, however, the regent secured Rashid Ali’s resignation because of the latter’s pro-Axis connections and reluctance to break relations with Italy. Taha al-Hashimi became prime minister. Axis military successes and hints of Axis aid emboldened the Golden Square, which staged a coup on 2 April that reinstated Rashid Ali in power. He immediately formed a cabinet that contained a number of individuals known to have Axis connections. The regent and Nuri fled.

Encouraged by hints of Axis aid, Rashid Ali refused to honor British demands to enforce provisions of the 1930 treaty

that allowed the transportation of British troops from Basra across Iraq. The Iraqi government also positioned troops and artillery around the British bases in Iraq. Fighting broke out at the British air base at Habbaniya on 2 May when Iraqi troops opened fire. The British air force immediately went into action, and Britain also dispatched some 5,800 troops, including the 1,500-man Arab Legion from Transjordan under the command of Major John B. Glubb. It was soon obvious that the British would triumph over the five poorly trained and inadequately equipped divisions of the Iraqi army unless the Axis powers immediately dispatched assistance.

The German government now brought pressure to bear on the Vichy government of France, which then ordered French High Commissioner of the Levant General Henri Dentz to allow the transit of Axis aid to Iraq through Syria. Axis arms and equipment then began to be transported via Aleppo to Mosul to assist Rashid Ali, albeit it in insufficient quantities to affect the outcome of the fighting. Meanwhile, British forces broke the siege at Habbaniya. The British occupied Fal-luja on 20 May and surrounded Baghdad by the end of the

month. Rashid Ali, some supporters, and the German and Italian ministers fled to Iran. In deference to Nuri and Regent Abdul Illah, the British did not enter Baghdad. This decision allowed the remnants of the Golden Square to attack Baghdad's Jewish community and kill some 150 Jews there.

Nuri again became prime minister, with a pro-British administration. Following its return to the British side, Iraq became an important supply center for Allied assistance to the Soviet Union until the end of the war. The government broke diplomatic relations with Vichy France on 18 November 1941, and it declared war on Germany, Italy, and Japan on 16 January 1943, the same day on which it announced its adherence to the UN Declaration.

Ireland

Irish nationalists had long demanded independence from Great Britain. Following bloodshed and the passage of home rule legislation in Britain, the Irish Free State came into being in December 1921. In 1937, with the promulgation of a new constitution, the new state became known as Eire (Ireland in Gaelic). Not included in this sovereign nation were the six largely Protestant counties in the north; these were known as Northern Ireland or Ulster and remained part of the United Kingdom.

Parliamentary elections in 1932 had brought the Fianna Fail Party to power, and Eamon de Valera became president of the executive council. In April 1938, de Valera negotiated agreements with London that removed British naval installations and troops from the republic, making Eire responsible for its own defense. Other agreements provided for Ireland to pay a final settlement of the land annuities, as well

as annual payments to compensate Britain for losses sustained in the violence of the 1920s. Each nation was also accorded favored-nation status in trade with the other. All causes of difference between Great Britain and Eire were thus removed, except for the vexing question of partition. Benefiting from popular support for the diplomatic agreements, de Valera won the elections of June 1938, giving the Fianna Fail a decisive majority.

The outbreak of World War II provided de Valera another opportunity to show that Eire was independent of Great Britain. In contrast to other members of the British Commonwealth, Eire at once declared its neutrality, a stance supported by the majority of its 2.9 million people. In any case, the country was in no position to make a major military contribution in troops. In September 1939, its army numbered about 7,500 men, its navy consisted of two patrol boats, and its air service had only four effective fighter aircraft. However, the inability of the Royal Navy to use the ports returned to the Irish in 1938 was a serious handicap for the Allies in the Battle of the Atlantic. During the war, de Valera steadfastly rejected British government offers, tendered even by Prime Minister Winston L. S. Churchill, to resolve partition in return for an end to Irish neutrality.

There was also some pro-German sentiment among the Irish. Anti-Semitic bills were brought before the Dail (the Irish Parliament), and de Valera refused to expel Axis diplomats; further, on Adolf Hitler's death, he went in person to the German Embassy to express his condolences. However, Eire did allow British overflights of its territory, and it returned downed Allied pilots to Northern Ireland instead of interning them; it also allowed British patrol craft in its waters. Thousands of Irish also volunteered for service in the Allied armies. During the war, more than 180,000 people left Eire for Northern Ireland or the United Kingdom, 38,544 of whom volunteered for service with the British armed forces, including some 7,000 deserters from the Irish army and several thousand Irish citizens living in the United Kingdom.

Acts of violence by the illegal Irish Republican Army (IRA) were a problem for the Eire government, which feared the British might use these incidents as an excuse to intervene. During the war, de Valera sharply increased the size of the Irish army and auxiliary forces to some 250,000 men (albeit poorly armed and trained) in order to forestall this possibility. Ireland suffered economically during the war, but de Valera doggedly pursued his policies. In 1948, Eire became the Republic of Ireland.

Northern Ireland was an important base for Allied operations during the war. Soon after the Japanese attack on Pearl Harbor, U.S. President Franklin D. Roosevelt and Churchill agreed that Northern Ireland and Scotland would provide bases for the Allied troop buildup for the invasion of France. The Americans agreed to take over the defense of Northern

The arrival of U.S. troops in Northern Ireland, 24 January 1942. (Photo by PNA Roto/Getty Images)

Ireland, thus allowing British soldiers to be deployed elsewhere. Ireland officially protested this agreement.

The first of hundreds of thousands of American soldiers arrived in Northern Ireland in late January 1942. During the course of the war, the United States constructed new bases and airfields and improved the naval facilities at Derry. Early troop deployments to Northern Ireland trained and took part in Operation TORCH and the North Africa Campaigns. Northern Ireland also played a major role in the massive buildup for the Normandy Campaign. U.S. troops at bases in Armagh, Cookstown, Lurgan, Newcastle, Newry, and Omagh trained for the D day landings, and units of the Eighth Air Force of the U.S. Army Air Forces operated out of the air base at Greencastle. Aircraft assembly, testing, service, and repair stations were built in Langford and Lodge. Airfields and ports were also used to protect the convoys ferrying troops and materials across the Atlantic Ocean.

Recognizing the importance of Northern Ireland to Allied plans, the German Luftwaffe bombed targets in Belfast as well

as the Greencastle airfield. Throughout the war, however, the people of Northern Ireland accommodated American soldiers by building cinemas and clubs. As in Britain, local groups arranged entertainment and hospitality events. Unfortunately for the people of Ireland, sectarian violence continued on the island after the war, as the IRA sought to bring about the union of Northern Ireland with the Republic of Ireland.

Ironside, Sir William Edmund (First Baron Ironside) (1880–1959)

British army general and chief of the Imperial General Staff from 1939 to 1940. Born 6 May 1880 in Edinburgh, William Ironside graduated from the Royal Military Academy, Woolwich and was commissioned into the Royal Artillery in 1899. He served in the Boer War and on the Western Front in World War I, rising to command a brigade by 1918. Ironside commanded British forces in Archangel, Russia, during the 1918–1919 expedition that attempted to overturn the Bolshevik regime and was knighted. A large man, he was (naturally) widely known as “Tiny.”

Ironside’s service between the wars was, like that of many officers in those thin years for the British military, a difficult period of marking time while awaiting the retirement or death of those senior to him. He served in India and was named to command the Eastern District of Britain in 1936. But as he noted in a diary that was later published, there were few men and even less equipment in the British military at the time. Early in 1938, Ironside became governor of Gibraltar, but he was called home as inspector general of Overseas Forces in May 1939.

On 3 September 1939, Ironside was named chief of the Imperial General Staff (IGS) by Leslie Hore-Belisha, Prime Minister Neville Chamberlain’s war secretary, despite the fact that he had never held any staff position in the War Office. Although convinced the Middle East would be the critical theater of war, Ironside understood the need to bolster French defenses. However, his impatient and brusque manner limited his effectiveness during the trying period of the “Phony War.” In early 1940, he worked closely with First Lord of the Admiralty Winston L. S. Churchill to promote a Scandinavian strategy to outflank the Germans. The relationship between the two men cooled when the Norwegian Campaign descended into disaster in April.

On 27 May 1940, as the Germans swept through northern France, Ironside was replaced as CIGS and shifted to command the Home Forces. He readily admitted he had been ill suited for the CIGS post and welcomed a return to a real command. Less than two months later, however, Alan Brooke replaced him, and Ironside retired. He was promoted to field marshal and created Baron (Lord) Ironside of Archangel in 1941. He died on 22 September 1959 in London.

Ishiwara Kanji (1889–1949)

Japanese army general and head of the East Asian League. Born in Akita Prefecture, Japan, on 18 January 1889, Ishiwara Kanji graduated from the Military Academy in 1909. Following routine service in Korea, he entered the Army Staff College and graduated second in his class in November 1918. He spent the years from 1922 to 1924 in independent study in Germany, which exposed him to European military thought and gave him an opportunity to observe the results of World War I.

Ishiwara’s experience in Europe, as well as his adherence to the Nichiren sect of Buddhism, led him to theorize that in the future, Japan would engage in an apocalyptic war with the United States. This struggle, which he dubbed “the Final War,” would be a protracted total war in which airpower

would play a decisive role. Ishiwara believed, however, that Japan could overcome its material inferiority by harnessing the economic resources of the Asian mainland, especially Manchuria and Mongolia. He published his theories in a book entitled *Thoughts on the Final Global War*.

In 1928, Ishiwara was posted to Manchuria, where he served as chief of operations for the Japanese Guandong (Kwantung) Army. Impelled by his sense of the urgency of preparing for the Final War, Ishiwara played a major role in planning and carrying out the Japanese army's seizure of Manchuria beginning in 1931. Shortly before the establishment of the puppet state of Manzhouguo (Manchukuo) in 1932, he returned to Japan. Promoted to colonel, he headed the Operations Section of the army General Staff. After becoming a major general, he was in charge of General Staff's Operations Division. Nonetheless, Ishiwara's considerable earlier influence as a military theorist waned during the 1930s. Marginalized for his tacit support of a failed officers' rebellion in February 1936, as well as for his increasingly outspoken criticism of Japan's war with China (he was chief of staff of the Guandong Army in 1937 and 1938), he was promoted to lieutenant general but was forced into retirement in 1941.

Ishiwara headed the Toa Remmei (East Asian League), which opposed Premier Tōjō Hideki's policies during the war. He briefly returned as an adviser to the "Surrender Cabinet" and urged that Japan conclude a peace.

Following the war, Ishiwara was investigated by the Allied occupation authorities, who briefly considered trying him as a war criminal. Instead, he testified as a prosecution witness at the Tokyo War Crimes Trials in 1947. Ishiwara died in Akita Prefecture on 15 August 1949.

Ismay, Hastings Lionel (First Baron Ismay of Wormington) (1887–1965)

British army general and chief of staff to the British War Cabinet. Born 21 June 1887 in Naini Tal, India, Hastings Ismay graduated from Sandhurst and was commissioned in the Royal Army in 1905, posted to the cavalry in India. During World War I, he served in British Somaliland. He returned to India between 1922 and 1925 and again as military secretary

Lord Hastings Lionel Ismay, secretary-general of NATO (1952–1957), with the newly adopted NATO emblem behind him. (Photo by Keystone/Getty Images)

to the viceroy, from 1931 to 1933. Early in his life, he was affectionately dubbed "Pug" for his amiable expression.

Ismay served in the War Office in Britain as assistant secretary (1925–1930), deputy secretary (1936–1938), and secretary (1938–1939) of the Committee of Imperial Defense. He was then named deputy military secretary to the War Cabinet (1939–1940) under Neville Chamberlain. When Winston L. S. Churchill became prime minister on 10 May 1940, Ismay served as his military chief of staff. He was promoted to lieutenant general in 1942 and general in 1944. All with whom he worked during the war, from Churchill down, attested to his invaluable and essential efforts, keeping paper moving and all channels of communication open. Ismay attended virtually all the summit conferences and acted as the primary channel between the service chiefs of staff and the cabinet. Both patient and informed, he was also not afraid to express the truth and could be critical when necessary and supportive at other times. Ismay admired Churchill greatly, but he could disagree with him; similarly, he was evenhanded with the chiefs of staff, sometimes adopting their viewpoints and at other times disagreeing or suggesting alternatives. With his two assistants, Ian Jacob and Leslie Hollis (both of whom became generals and were knighted), Ismay was the essential oil in the British High Command.

After retiring from the army in 1946, Ismay served as chief of staff to the viceroy of India, Lord Louis Mountbatten, from March to November 1947 and was then made a peer (becoming First Baron Ismay of Wormington). In Churchill's second government, he served as secretary of state for Commonwealth relations (1951–1952). He became the first secretary-general of the North Atlantic Treaty Organization (NATO) in 1952, retiring five years later. Ismay died in Broadway, England, on 17 December 1965.

Italy, Air Force

In the period between World Wars I and II, the Royal Italian Air Force (Regia Aeronautica) was regarded as one of the most advanced in the world, winning 96 international aviation awards. In 1939, Italy also had the third-largest European commercial air fleet, behind only Germany and the United Kingdom. Moreover, with the possible exception of Japan, Italy had more interwar combat experience than any other nation, from the suppression of the Senussi in Libya to the Italo-Ethiopian War and culminating in the Spanish Civil War, where the Italians contributed more aircraft than did Germany. Between 1935 and 1939, Italy expended 1,500 aircraft in combat, and an additional 925 planes were exported. The Royal Italian Air Force was also the most Fascist of the three services and the favorite of Italian dictator Benito Mussolini and the Fascist Party.

Yet in World War II, the Italian air force was found wanting. When Italy entered the war in June 1940, its air force had almost 1,000 front-line aircraft, backed by about 2,000 second- and third-line aircraft. But these figures were deceptive. Italy had a few high-performance planes—those that had set a number of aviation records—but most of the aircraft were, in fact, obsolete.

The chief of staff and undersecretary of the Regia Aeronautica, General Giuseppe Valle, commanded the air force. Italy was organized into three air zones, with several regional commands and army-air cooperation units and land- and sea-based naval reconnaissance units. The air force retained control of all pilots, and coordination between the three military branches was poor at best. The lack of a coherent air philosophy and an effective building program compounded the problem.

General Valle was relieved of his command on 31 October 1939, charged with responsibility for the poor state of the air force when it was mobilized at the beginning of the war. He was placed on trial, and although he was later freed, the public mistakenly held him responsible for the state of unpreparedness. General Francesco Pricolo commanded the air force from 31 October 1939 to 14 November 1941, when he was, in turn, replaced by General Rino Corso Fougier until 26 July 1943.

Italy joined the war in June 1940 and only fought in the Battle for France for several weeks, after which it received some French aircraft. Later, Mussolini insisted on sending aircraft to Belgium to assist in the Battle of Britain. The Germans thought the planes would be far more useful in North Africa. They proved hopelessly inadequate in the skies over Britain and had to be withdrawn. In 1941, Italy sent a more effective air contingent to fight in the Soviet Union.

In the Mediterranean Theater, the Italian air force was invoked in air strikes against Malta, targeted on British merchant ships and naval units operating near Italy. It also conducted raids against Gibraltar and Palestine and even as far afield as the Persian Gulf. However, the Italians soon learned that aircraft that had been successful against stationary merchant ships docked in harbors during the Spanish Civil War were ineffective in high-altitude bombing attacks against warships. Indeed, early in the war, the aircraft occasionally attacked Italian warships by mistake, although recognition improved as the war unfolded. But not until March 1941 did the air force place liaison officers on board warships at sea.

The Italian air force was more successful in fighting in the Balkans, against Greece and Yugoslavia. It also fought in the Western Desert from 1940 to 1943, as well as in Ethiopia. When fielding modern machines—the later models with German engines—the air force was effective. But despite the fact that the Italian air force had operated in Libya since 1911, its aircraft still lacked dust filters on the eve of war, and its tactics were reminiscent of World War I acrobatics.

With the exception of three fighters embarked on two battleships late in the war, the only sea-based air effort (apart from ship-launched reconnaissance aircraft) involved the crash conversion of two passenger ships into aircraft carriers. Neither was completed by the armistice. The failure to develop aircraft carriers seriously affected Italian naval operations in the war, largely because of the short range of Italy's land-based fighters.

On the whole, Italy's aviation industry was badly organized and inefficient, producing a wide variety of aircraft types in small numbers. The various companies involved resisted manufacturing each other's more successful designs, and the almost artisan production methods resulted in production times that were more than 50 percent longer than for comparable German aircraft. The Italian air force largely depended on radial engines, but these low-powered machines seldom exceeded 1,000 hp. Adoption of the bulkier but much more

On any given day, operational efficiency in the Italian Air Force was rarely higher than 70%.

powerful German-designed Daimler-Benz in-line engine helped solve that problem.

The fact that the CR-42, a wood-and-canvas biplane fighter with nonretractable landing gear, was still in production in 1944 (and a serious candidate for the Daimler-Benz engine) reveals the sad state of Italian aircraft production. Italian fighters were almost all underarmed, due to financial considerations and poorly designed, weak wings. Radios were not installed in all aircraft until 1942; fuel was stored in thinly lined, leaking tanks; most airfields were dirt runways; and pilots were slow to adapt to closed canopies. On any given day, operational efficiency was rarely higher than 70 percent. Ground-support aircraft, based on precepts developed by General Amadeo Mecozzi, were so poorly designed that early in the war, Italy simply retired its ground-attack planes and purchased 159 Ju-87 Stuka dive-bombers from Germany.

One area in which the Italian air force excelled was the torpedo-bomber. Although use of this plane was hindered by interservice rivalry before the war, the torpedo-bomber was deployed to units by late 1940. German air units later successfully emulated Italian torpedo-bombing tactics and purchased torpedoes from Italy. Yet the Italians chose simply to adapt a three-engine SM-79 level bomber for torpedo bombing rather than design a true torpedo-bomber.

Although Italy formally embraced the concept of strategic bombing developed by General Giulio Douhet, it did not practice it. Ironically, Douhet had more influence on British and U.S. air policies then at home. Italy did produce a partially successful four-engine bomber, the P-108, but only in small numbers. With the armistice in September 1943, there were two Italian air forces: one for the Fascist state in the north and another, utilizing many different Allied aircraft, that fought for the Allied government in the south.

figure would rise during the war to 2,563,000. King Victor Emmanuel III was nominal commander in chief, with the title of *comandante supremo delle Forze Armate dello Stato* (supreme commander of the Royal Army of the Kingdom of Italy), but Italian dictator Benito Mussolini exercised actual command.

Contrary to popular misconceptions, some units of the army fought well in World War II, but the army itself was basically a light infantry force lacking in equipment and poorly prepared for a modern European war. In 1940, it numbered 73 divisions—43 infantry; 5 Alpine; 3 light; 2 motorized; 3 armored; 12 “self-transportable,” with a regiment of truck-drawn artillery; 3 militia, and 2 Libyan. Many military formations were understrength, and much of the army’s equipment was obsolete at best. Morale was not always optimal, for many Italians thought their nation was on the wrong side in the war. The men were often indifferently led, as many officer appointments were made on the basis of party loyalty rather than ability.

An Italian infantry division was composed of two infantry regiments, an artillery regiment, an engineer company, and occasionally an attached Blackshirt (Voluntary Militia for National Security, or MVSN) legion. The “binary” division had only about 10,000 men at full strength. The royal infantry regiments pledged allegiance to the king, but the highly motivated Blackshirt legions, which numbered about 1,300 men each, swore loyalty to Mussolini. Many regular army officers deeply resented the inclusion of Blackshirt regiments in the army. In 1940, the equivalent of four MSVN divisions were destroyed in fighting in North Africa. Eventually, “M battalions” made of Blackshirts fought in the Soviet Union and in Yugoslavia. They also manned anti-aircraft artillery batteries throughout the Italian Empire.

In 1940, the Italian army had more than 8,000 artillery pieces, which were classified as divisional (field), corps (medium), and army (heavy). Much of the artillery was left over from World War I, and some guns were modernized World War I prizes, such as pieces manufactured at Skoda. In 1940, Italy had more than 1,200 tanks, but most were only two-man light “tankettes.” Many of the larger models were too thinly armored to stop armor-piercing bullets, let alone stand up to northern European armor.

On 20 June 1940, Mussolini entered the war by attacking France in the western Alps with 32 divisions. The Italians did poorly, being largely held at bay by 5 French divisions. When the leaders in Paris surrendered on 24 June, the Italians took a small portion of southeastern France. The French admitted to having 37 soldiers killed in the campaign; Italian losses were 631.

On 28 October 1940, on short notice, Mussolini sent Italian troops into Greece from Albania. The invasion involved fewer than 100,000 Italian troops, and by late November, the

Greek army had driven the Italian army back into Albania, where both forces suffered heavily in a bloody stalemate during the winter. Hitler came to the rescue of his ally on 6 April 1941, when German forces invaded Greece and conquered it in a few short weeks. Italian forces, chiefly the Second Army, also participated in the invasion and conquest of Yugoslavia that same month.

Italy's subsequent occupation of portions of Yugoslavia, France, Corsica, and Greece tied down numerous divisions. Resistance efforts created an ever growing list of casualties. During their occupation of Yugoslavia, the Italians raised a number of units usually organized on religious lines—Catholic, Orthodox Christian, and Muslim—from men seeking to fight the Partisans.

After Hitler invaded the Soviet Union in June 1941, Mussolini eagerly offered Italian forces. Eventually, Italy sent more than 250,000 men to the Soviet Front. Most of the Italian Eighth Army was lost in the Battle of Stalingrad. Included in Italian forces operating mainly in the Ukraine was a Croatian legion raised in Croatia. The Italians also helped organize a small Cossack anticommunist volunteer group. If the units sent to the Soviet Union had been added to forces in North Africa, they might well have affected the outcome of the struggle there.

Italy made a major military effort in North Africa in order to fulfill Mussolini's dream of establishing a great Italian empire. Before the war, Italy had colonized Libya, Eritrea,

Somalia, and Ethiopia (Abyssinia). Italian forces there were, however, underequipped and undergunned compared with the British forces they had to fight.

Amedeo Umberto di Savoia, the duke of Aosta, commanded forces in Italian East Africa (Somalia, Ethiopia, and Eritrea). Of his 256,000 men, 182,000 were "indigenous" levies. European colonists, including some Blackshirt troops, formed part of the units under the duke's command. Fighting there began in early July 1940 when the Italians captured a number of small British posts, but they halted their offensive in the Sudan when intelligence estimates magnified the actual British forces arrayed against them.

On 4 August, the Italians invaded British Somaliland from Ethiopia. They were able to overwhelm the small British forces defending that colony. The British withdrew to Aden, and their losses were only one-tenth those of the Italians. During the 1940–1941 winter, the British built up their resources, and beginning on 19 January 1941, they went on the offensive. By the end of 1941, the British had secured control of Italian East Africa.

In North Africa, Field Marshal Rodolfo Graziani commanded some 236,000 Italian troops. After the defeat of France, Italian forces were shifted to eastern Libya to face the British in Egypt. Major General Richard O'Connor, the British commander in Egypt, had only 31,000 men—largely from the 4th Indian Division and the 7th Armoured Division, later reinforced by the 6th Australian Division. Graziani appeared

to be in position to overwhelm the outnumbered British; however, his troops were short of heavy artillery, tanks, and antitank and anti-aircraft weapons, as well as transport and logistical support. A shortage of radios often reduced communications to relaying information by messenger.

On 13 September 1940, Graziani, pressed to act prematurely by Mussolini, launched an offensive against the British. The Italians fared badly, and by December, the British had penetrated the Italian chain of forts that were protecting the Libyan border but set too far apart to be mutually supporting. Many Italian units fought effectively but to no avail. By January 1941, the British had taken some 100,000 Italian prisoners.

In February 1941, General Erwin Rommel arrived in Libya with his Afrika Korps (Africa Corps). Although smaller in number than the Italian force and officially under Italian control, the Afrika Korps quickly became the dominant partner. The Germans were far better equipped and more effectively organized and led. By contrast, the Italians lacked mobility, adequate staffing, and an effective system of command and control.

The Italians fought back and forth across northern Africa until they were finally defeated at Tunis in May 1943. A major factor in the Axis defeat was Britain's control of Malta, which enhanced the British ability to intercept by sea and air supplies destined for Axis troops in North Africa. British communications intelligence, notably *ULTRA* intercepts, also played a role in the Allied victory.

In July 1943, the British and Americans invaded Sicily, held by 190,000 Italians and 40,000 Germans. The performance of Italian units varied widely. The newly formed and indifferently equipped coastal divisions, composed of middle-aged home guards, often surrendered without a fight. Certain defeat in Sicily led the Fascist Grand Council to strip Mussolini of power in July. Marshal Pietro Badoglio then formed a new government, and on 3 September, he signed a secret armistice with the Allies, to go into effect five days later. The Germans, well aware of Italian efforts to switch sides, immediately implemented plans to take control of Italy. When the Germans occupied Rome on 10 September, King Victor Emmanuel III and Badoglio fled south and made Brindisi the new seat of government. Meanwhile, German troops arrested and disarmed Italian army units. More than 600,000 Italians were deported to labor camps in Germany.

German commando units rescued Mussolini on 12 September 1943 and set up the Italian Social Republic (RSI), with its capital at Salò in the north. Many Fascists joined the new RSI army. New units and those from the former Italian army that remained loyal to fascism were formed into various bodies. The first of these was the *Esercito Nazionale Repubblicano* (ENR, National Republican Army), arranged into four divisions composed of formations newly raised by officers still

loyal to Mussolini and mixed with some autonomous older units. Many thousands were recruited into the ENR divisions from among Italian soldiers interned by the Germans. These formations were usually trained in Germany and then deployed to Italy. Most of their fighting was against partisans.

The *Guardia Nazionale Repubblicana* (GNR, National Republican Guard) replaced the old Blackshirts. Basically a policing unit, it ultimately numbered 80,000 men. It was assigned to local security duties and fighting the partisans. Some GNR units in occupied France and Yugoslavia continued occupation duties in cooperation with the Germans.

As the struggle with the partisans intensified, all able-bodied Fascists were organized into a new militia, the *Brigate Nere* (Black Brigades). Formed in June 1944 as an armed branch of the RSI's new Fascist Party, this militia eventually numbered some 30,000 men. Composed of fanatical Fascists, it engaged in a no-holds-barred struggle with the partisans. The members of the Black Brigades were motivated by the belief that they would be killed in the event of a Fascist defeat.

The "X" *MAS* (Decima Mas) unit was an autonomous force organized by Prince Julio Valerio Borghese. Composed of 25,000 volunteers, it gained a reputation for effective and hard fighting against the partisans, primarily Tito's Yugoslav Partisans in Istria. It also included a women's unit. In addition, the Germans recruited Italian volunteers into the *Waffen-SS*. These units had both Italian and German names and usually were commanded by German officers. They performed well on the Anzio Front and against partisans.

In the south of Italy, the newly reorganized government led by King Emmanuel and Badoglio established an "army of the south," with the status of a cobelligerent force. It was organized as the *Corpo Italiano di Liberazione* (CIL, Italian Liberation Corps). Composed of old Italian Royal Army men and units, to which new recruits were added, the CIL was formed into six weak divisions, known as "combat groups." With the transfer of some Allied units to participate in the Riviera landings in France, four of these divisions were brought into the line and saw combat. They fought well and sustained casualties of 1,868 dead and 5,187 wounded. Many Italians also served with the Allied forces in support units, handling transportation and ammunition and other supplies. Some of these units were muleteers working in the rugged mountain tracks. Partisan forces also fought in the north, behind German lines. As the war drew to a close, thousands joined partisan groups in order to sanitize their pasts or ensure their futures.

The Italian army suffered substantial casualties in the war. The total of those in the army who died fighting the Allies, in German reprisals following the armistice with the Allies, and in fighting the Germans probably exceeded 300,000 men. In addition, an unknown but large number were wounded, and some 600,000 were taken as prisoners.

Italy, Home Front (1940–1945)

There was little enthusiasm among Italy's 42 million people when Italian dictator Benito Mussolini took his nation into World War II in June 1940. The timing was conditioned by Mussolini's desire to profit from German military successes and also by the illusion that Italy might compete with its ally for the spoils. During the nearly two decades that Mussolini had held power, his Fascist secret police and judicial system of special courts had silenced the internal opposition. The minority of Italians who totally opposed the war were mostly abroad.

Initial Italian military failures in 1940 were offset in the public eye by the overall Axis successes that extended into the fall of 1941. Weekly propaganda newsreels trumpeted Axis battlefield victories. Such claims were tempered in October 1942, however, when the Western Allies began bombing northern Italian cities. At the same time, the tide clearly was turning against the Axis powers in North Africa. The war at last became a grim reality in urban Italy, with many people forced to abandon the cities. The destruction of the Italian Eighth Army in the Soviet offensives in the Stalingrad area during the 1942–1943 winter only strengthened the public mood. Despite

the Fascist regime's eavesdropping and censorship, opposition to Mussolini's policies grew. Strikes in the northern industrial cities in March 1943 surprised the authorities.

For political reasons, Mussolini sought to maintain, insofar as possible, the appearance of normalcy on the domestic front. Morale plummeted, however, with the introduction of rationing in 1941. Coffee, sugar, and soap had already been rationed since 1939. But with the war, the Italian average daily caloric intake progressively declined because Italy was not self-sufficient in food, especially wheat. Per capita daily calorie intake went from 2,100 in 1943 to 1,800 in 1944–1945, although some Italians were able to supplement this with black-market purchases. Only those who worked in heavy labor might have more. This further depressed morale, especially because rations for nonworking Italians, primarily the elderly or disabled, were well below the national average and totally inadequate. The overall situation deteriorated thanks to an inefficient distribution system and increased Allied bombing of railroad lines.

Times were hard for most Italians. By 1942, newspapers were reduced to four pages (and later, to two). Essentials were in short supply. Rationing meant that one might purchase one pair of new shoes or a few articles of clothing per year. Repeated increases in wages were more than offset by inflation, which, although rampant, was not so severe as to wreck the economy. Government deficits ballooned, and the government printed more paper money; circulation of paper money quadrupled between 1940 and 1943, and a lively black market flourished, thanks to the fact that farmers refused to bring their food products to the government collection points. Following the Allied invasion and German occupation, the food situation worsened for most Italians, especially in the more populous, urbanized northern part of the country, where the standard of living fell back to the levels of 1861.

Labor was in short supply, given the country's needs for military manpower. Agricultural requirements compelled Mussolini to recall 600,000 soldiers from the front on the eve of the Greek Campaign to assist with the harvest, with obvious military consequences. In three years of war, Italy mobilized some 5 million men for military service, and an additional 3,850,000 workers of military age were employed in war production at the end of 1941. In 1943, this figure was reduced to 3,638,000, but it was still high.

Italy was handicapped by having few natural resources; its industry lacked even the most basic raw materials. The nation consumed 12 million tons of coal per year, but only 1 million tons came from domestic production. Iron ore was scarce, and Italy had no oil of its own, being forced to rely on Germany, where supplies were also short. Civilian automobile travel was almost completely forbidden, and Italy had to make do with a limited quantity of natural gas from the Po River valley.

U.S. soldier shares his food rations with hungry villagers in the Cassino area in Italy, 1944. (Hulton-Deutsch Collection/Corbis)

Despite problems, Italian industry managed to produce 7,000 artillery pieces, although half these were of 47 mm or smaller caliber; 10,545 aircraft; and some 60,000 trucks of rather high quality. This last figure may be compared with a total of 71,000 private and commercial vehicles produced in 1939. Much of this military equipment, however, was obsolescent. Industry emphasized quantity and older designs rather than switching to newer designs with potential dips in production. Thus, in 1943, Italy continued to produce biplanes at the expense of modern aircraft designs. The same approach was followed in Italy's rather small production run of some 2,500 tanks. The country never attempted to produce under license the far better German models. In sum, Italy's war industry was less effective than it had been in World War I.

Homeland defense was organized in fifteen corps areas and was centered on coastal batteries manned by the *Milizia Artiglieria Maritima* (MILMART, naval artillery militia) and

Guardia alla Frontiera (GAF, border guards). Along its Alpine border, Italy already maintained an old fortified line. Between 1938 and 1943, it added a new one, which could only have been directed against its German ally. Protection against amphibious assault was difficult, given the country's long coastline. When Italy entered the war, it had only 200 modern antiaircraft batteries (all lacking fire-direction systems) with which to defend the cities and industrial areas, as well as strategic targets such as bridges, rail lines, and the like.

For defense against invasion, Italy also fielded some 400 battalions of territorial units of various types, but they were poorly armed; some were equipped with nineteenth-century *Wetterli* rifles. During the war, a few mobile units were added. Regular army units resting or training in Italy were also available. The government sought to counter the threat of paratroopers and saboteurs by the formation of some 350 platoon-level army units, often motorized or equipped with

bicycles. These were, for instance, reasonably successful in tracking down British paratroops dropped in Calabria on 10 February 1941. To these forces should be added the three main police corps—the police, the military police (the Carabinieri) and the Financial Guard.

Mussolini's disastrous policies and the Allied invasion of Sicily brought about the dictator's fall, engineered not by outside pressures but within his own party from the Fascist Grand Council, which deposed him on 25 July 1943. The new government, headed by Marshal Pietro Badoglio, signed an armistice with the Allies, which was announced on 8 September, after Allied forces invaded Italy itself. The Germans then occupied much of the country and disarmed many Italian military units that were left without orders. Italy became the battleground for outside powers, with bitter fighting persisting until 2 May 1945.

After the armistice, there were several different administrations: the Allied military government in the south (which printed its own occupation money); the Italian government under King Victor Emanuel III, which became a cobelligerent from October 1943 on and took over many liberated areas from the military; and German-occupied Italy to the north. The Germans rescued Mussolini from imprisonment and installed him in the north as head of the puppet Italian Social Republic (RSI). Some provinces of northern Italy, however, were directly controlled by the Third Reich. The German Armaments Ministry took control of northern industries, which produced surprisingly well, given the difficult conditions.

As the Allies struggled with the Germans in Italy, Italian Resistance fighters also fought the Germans and other Italians. The Resistance in the north liberated some mountainous territories and proclaimed them to be independent. The north suffered from the civil war, hunger, and Allied bombing. The south was far better off. Although it had little in the way of industry, it could at least rely on Allied help in the form of food and goods.

Italy entered the war hoping to expand its overseas empire and win military glory. Instead, the nation lost its existing empire, was invaded, and became a battlefield and the scene of a civil war. The prolonged fighting and slow Allied advance up the length of the Italian peninsula severely damaged Italy. The war destroyed some 8 percent of the nation's industrial plant, demolished a considerable amount of housing (mostly in the cities), and severely dislocated the railroads (60 percent of the locomotives were lost, along with half of the rolling stock). Some 5,000 bridges were destroyed, and agricultural production fell by 60 percent. Nonetheless, by 1948, the nation was able to regain the economic levels of 1938, and it experienced considerable growth in the 1950s and 1960s.

Italy, Navy

In the interwar period, the Royal Italian Navy (Regia Marina) had been designed to fight the French navy in surface naval battles reminiscent of the 1916 Battle of Jutland. On the eve of World War II, the navy began transforming itself, albeit unsuccessfully, into an “oceanic” navy that would not be confined by the British-controlled Mediterranean choke points of Gibraltar and the Suez. In the unlikely event that funding and resources were made available, the Italian navy by 1942 would include 9 battleships, 3 aircraft carriers, 36 cruisers (including 12 small Capitani Romani-class, of which 3 were completed before the armistice), and 84 oceangoing submarines. The navy had 5.4 officers for every 100 sailors (France had 7.5 and Britain 9.2 officers per 100 sailors), and many of the sailors were volunteers.

On the eve of Italy's 10 June 1940 entry into the war, the navy was consuming about 33 percent of the annual military budget, placing it well behind the army but ahead of the air force. The core of the navy was built around the new 30-knot, massive, Littorio-class battleships armed with 9×15 -inch guns. Two were being completed when war was declared, and a third was added during the war. Italy also had two small, older, and completely rebuilt and speedy World War I-era battleships ready for sea and two others that were almost ready. Although they were the weakest Axis battleships of the war, they were more powerful than any cruiser.

Italy also had 7 heavy cruisers, 12 light cruisers (adding 3 during the war), 59 destroyers (adding 10), 62 large torpedo boats (adding 17), and 113 submarines (adding 32). Various escorts, raiders, MAS-style patrol torpedo (PT) boats, and successful war-built corvettes—the 700 ton Gabbiano-class, of which 28 were completed before the armistice—rounded out the major fleet units.

Although it was a substantial force on paper, the Italian navy suffered from fundamental problems. Italy lagged in several key areas of naval technology. One area was sonar, which was just beginning to be introduced at the start of the war. Also, in the disastrous March 1941 Battle of Matapan, the Italians discovered to their dismay that the Allies had deployed radar on their warships. The Italians did not deploy their first warship radar until a year later, in March 1942. Ironically, Italy's scientific community had been working on radar in the mid-1930s, but the Italian government did not fully support its efforts. Of ULTRA intercepts, the Italians knew nothing, although they assumed the Germans were letting the Allies know about Italian operations, and the Germans assumed the Italians were doing the same.

Italian ship armor plate was inferior as judged by Allied standards. Italian heavy ships relied on long-range gunnery, but guns in cruiser and destroyer turrets were mounted too close to each other, thus interfering in the flight of shells, a problem compounded by an immoderate 1 percent weight tolerance for shells. This resulted in excessive salvo spreads, as opposed to the much tighter British salvos.

The Italians sought to avoid night fighting by their heavy ships, and the navy lacked flashless night charges for ships with 8-inch or larger guns, an error not rectified until 1942. The navy dropped night-fighting training for large ships in the 1930s, precisely when the British navy was adopting such tactics for its heavy ships, including battleships. Italian losses in night surface actions during the war would be heavy and almost completely one-sided.

Italy also experienced problems with its submarines. There were three classes of subs. The large oceangoing submarines were part of the new oceanic navy. Many were based out of Bordeaux, France. In 189 patrols, they sank over 500,000 tons of Allied ships, with another 200,000 tons damaged. They also conducted mostly ineffective runs to Japan for key war supplies, and they operated in the Indian Ocean and Red Sea. Medium and small submarines hunted closer to home. In the Mediterranean Sea, these classes conducted 1,553 patrols with dismal results when contrasted to the successes tallied by far fewer German submarines dispatched to that theater. This outcome was, in part, due to the Italian doctrine that called for submarines to submerge during daytime and wait for a target to come within range. The Italians eschewed attacks on the surface in wolf packs at night. Their torpedoes were reliable but had smaller warheads than those of most other nations,

thus causing less damage. Despite its long coastline and its colonies, Italy had only 25,000 mines in 1939, and most dated of these from World War I.

In the 1920s, the Italians experimented with the snorkel, a tube to the surface that allowed submarines to secure air while submerged, but they ultimately dropped its development as a dead end. Their submarines also suffered from slow submerging speeds—they were two or three times slower than German boats. Italy also had to rebuild many of its submarines during the war because their large sails (the superstructure where the surface bridge and periscope were located) were easily picked up by radar. Italian periscopes were too short, and the Mediterranean itself was a much clearer sea than the Atlantic, which made it easier for Allied pilots to locate submerged submarines.

Italy also failed to develop the aircraft carrier. Italian dictator Benito Mussolini and the navy High Command believed that the country's long coastline and the many Italian islands and bases in the central Mediterranean rendered aircraft carriers unnecessary. But the slow communication and response between the Italian navy and air force, fueled by interservice rivalries, meant that too few planes arrived too late too often: early in the war, Italian planes actually attacked Italian ships several times. High-level bombing of warships under way also proved to be ineffective. Mussolini changed his mind about the aircraft carrier, and during the war, he twice intervened personally to secure the conversion of two passenger ships to carriers, although neither was completed before the end of the war.

Italy also failed to develop torpedo-bombers before the war, in large part because of interservice jealousy. The air force, with only limited funds, opposed development of torpedo-bombers, preferring to use the money for high-altitude bombers. So although the Italian navy developed a torpedo for air launch, it was not until the war was several months old that the air force carried out its first torpedo attack. In the course of the war, the Italians achieved several successes with these airplanes.

The most innovative naval arm was the "X" MAS (Decima Mas). This unit was made up of (1) midget submarines; (2) underwater swimmers trained in sabotage; (3) surface speedboats filled with explosives and piloted by crewmen who jumped off shortly before the vessels hit their targets; and (4) the slow-moving torpedo, or SLC, which was ridden by two men under water into enemy harbors. The most successful of these weapons was the SLC, directly developed from a World War I weapon that was employed against Austria-Hungary with good results; it was usually launched from a submarine. The most spectacular success for the SLCs occurred on 18 December 1941, when three of them entered Alexandria harbor and crippled the British battleships *Queen Elizabeth* and *Valiant*. With the exception of the midget submarines, the

naval High Command ignored these weapons until 1935 and then only grudgingly supported junior officers involved in innovative development. A more forceful development program begun after World War I might well have made an important difference in World War II.

In spite of these limitations, the fuel-strapped Italian navy fought bravely during the war and transported to Africa 85 percent of the supplies and 92 percent of the troops that left port. In numerous battles above, on, and below the seas, the navy sank many Allied warships and forced the British to maintain a powerful naval force at both ends of the Mediterranean. In September 1943 when Italy switched sides in the war, the bulk of the Italian fleet joined the Allies.

Italian naval losses before the armistice consisted of 1 battleship, 11 cruisers, 44 destroyers, 41 large torpedo boats, 33 MAS-style PT boats, 86 submarines, and 178 other vessels. After the armistice, Italy lost 1 battleship, 4 destroyers, 5 large torpedo boats, 25 MAS boats, 3 submarines, and 23 other vessels. Mussolini's Italian Social Republic, organized in north Italy, seized some Italian warships, and most of these were subsequently sunk; the most important was the heavy cruiser *Bolzano*. Total wartime personnel losses for the Italian navy came to 28,837, with 4,177 of this number occurring after the armistice. Up to the armistice, Italy also lost 2,018,616 tons of merchant shipping.

military staffs agreed to follow the Axis defeat in North Africa with an invasion of Sicily. Several weeks later, the Americans also agreed to a subsequent invasion of the Italian Peninsula. This campaign would allow the Allies to retain the strategic initiative, expand their control in the Mediterranean, open a second front on the mainland of Europe to relieve pressure on the Soviets, and provide air bases closer to strategic bombing targets in Austria, Romania, and parts of Germany.

In a month-long campaign commencing on 10 July 1943, in their largest amphibious assault in the war to date, Allied troops defeated Axis forces in Sicily. The Allied conquest of Sicily had a profound effect in Italy, where, faced with growing unrest and the reluctance of Italian forces to oppose the Allies, the Fascist Grand Council launched a coup d'état that overthrew Italian dictator Benito Mussolini and installed a new government led by Marshal Pietro Badoglio. Secret negotiations between the Allies and the new Italian government for an armistice began immediately but soon became bogged down by the Allied insistence on unconditional surrender. A "short military armistice" was eventually signed, on 3 September. Meanwhile, however, Adolf Hitler used the interlude to move another 16 German divisions to Italy, including the crack 1st SS Panzer Division from the Soviet Union.

The Germans then occupied the entire country and took control of most of the Italian army. Much of the Italian fleet escaped to Malta. On 12 September 1943, German commandos led by Schutzstaffel (SS) Standartenführer Otto Skorzeny rescued Mussolini from captivity in the mountains at Grand Sasso in a daring airborne raid. Hitler then installed Mussolini as head of the Italian Social Republic (RSI) in northern Italy.

The strategic logic for continuing the Allied campaign in the Mediterranean appeared obvious to the British Chiefs of Staff, who saw an invasion of Italy as an opportunity to accomplish several goals: to continue the ground war against Germany utilizing experienced troops who would otherwise remain idle for a year; to draw Axis troops away from France and the Soviet Union; and possibly to create opportunities elsewhere in the eastern Mediterranean. The U.S. Joint Chiefs of Staff, however, were far less convinced and believed that Allied efforts should be directed to the cross-Channel invasion of France, now sanctioned for the spring of 1944. They were also skeptical of British motives, fearing that the post-war preservation of colonial interests was a high priority for Britain—a goal they vehemently opposed. A final decision to invade the Italian mainland was not made until the Trident Conference in Washington in May 1943, but there was no strategic plan other than to continue the existing operations. The Americans were reluctant to commit to a new Italian campaign, and there was no new, large-scale amphibious landing in northern Italy. Any such operation would have been beyond the range of Allied fighter aircraft, and it is an open question whether that type of operation and an airborne

Italy Campaign (1943–1945)

At the American-British Casablanca Conference in January 1943, with a cross-Channel invasion of France no longer an option for that year, British Prime Minister Winston L. S. Churchill and U.S. President Franklin D. Roosevelt and their

raid to capture Rome would have brought the campaign to a rapid conclusion.

The Allied invasion plan envisaged a pincer movement across the Straits of Messina by General Sir Harold Alexander's 15th Army Group, with the first objective being the vital southern Italian port of Naples. In Operation *BAYTOWN*, Lieutenant General Bernard Montgomery's Eighth Army crossed from Sicily to Reggio di Calabria on 3 September, followed by the British 1st Airborne Division, which landed by sea at Taranto six days later. The main assault, by 165,000 troops of the Anglo-U.S. Fifth Army under Lieutenant General Mark W. Clark, went ashore at Salerno in Operation *AVALANCHE*, 35 miles south of Naples, on 9 September. Salerno was chosen chiefly because it was the farthest point in the north for which air support could be provided from Sicily. The Allies hoped that, once ashore, their invading forces would somehow find a way to open the road to Rome before the end of the year.

German Field Marshal Albert Kesselring had convinced Hitler that Italy could be easily defended because of its ideal terrain. The central mountainous spine of the Apennines rises above 10,000 feet and has lateral spurs that run east and west toward the coast, between which are deep valleys containing wide rivers flowing rapidly to the sea. The north-south roads were confined to 20-mile-wide strips adjacent to the Adriatic and Tyrrhenian coasts, where the bridges that carried them were dominated by natural strong points.

Kesselring formed the six divisions in the south of Italy into the Tenth Army under General Heinrich von Vietinghoff, but he had anticipated a landing at Salerno and stationed the 16th Panzer Division in the area. At Salerno, Fifth Army attacked with two corps abreast: the U.S. VI Corps and the British X Corps. Initial resistance was light, but the Germans reinforced by 11 September and, despite their weakness, launched a counteroffensive that almost split Fifth Army between the two invading corps. By 15 September, the beachhead was secure, in large part because of an overwhelming weight of firepower in the form of accurate naval gunfire and massive air support and because more reserves were landed. Fifth Army then began an advance on Naples, 30 miles away. Montgomery, disappointed that he had only been assigned a secondary role, was needlessly cautious in his advance—so much so that a group of dismayed war correspondents drove themselves through German-occupied territory to contact Fifth Army more than a day before Montgomery's advanced units managed to do so on 16 September.

Two days later, Kesselring ordered a fighting withdrawal to the first of the series of mountainous, fortified defensive lines, from which the Germans planned to defend the approaches to Rome. On 1 October, Fifth Army captured Naples while Eighth Army advanced up the Adriatic coast and captured the airfields at Foggia; there, the Allies installed the U.S. Fifteenth Air Force to launch strategic bombing raids against the Reich. By

early October, the two Allied armies had formed a continuous, 120-mile line across the peninsula running along the Volturno and Biferno Rivers. But in the previous three weeks, Fifth Army alone had taken 12,000 casualties.

Henceforth, the campaign in Italy became a slow, remorseless, and grinding battle of attrition, and as the rain and snow turned the battlefield into a muddy quagmire, the appalling struggles resembled World War I battles. Kesselring had fortified a series of defensive lines, known collectively as the Winter Line, between Gaeta and Pescara. The western end based on the Garigliano and Rapido Rivers, known as the Gustav Line, was particularly strong and hinged on the great fortress of the Benedictine abbey at Monte Cassino.

On 12 October, the Allies began the Volturno River Campaign, with the objective of seizing the approaches to Rome. Their plan was too ambitious, given the Germans' skill at defending the mountainous terrain. Between the Volturno and Rome lay 120 miles of rugged country. Fifth Army's VI Corps successfully attacked across the line of the Volturno River, and X Corps seized two crossings. To exploit the success, General Clark ordered an advance across the entire Fifth Army front. Particularly in the VI Corps area, poor roads, demolished bridges, and the difficulties of bringing supplies forward combined with German resistance to slow the advance. Meanwhile, in a series of bitterly contested actions, Eighth Army crossed the Trigno River and advanced to the Sangro River. By 15 November, however, the Germans had stopped the advance along the Winter Line, a position that extended along the Garigliano River to Mount Camino, the Mignano gap, the mountains to the northeast, and the Sangro River to the Adriatic Sea.

The Winter Line Campaign, lasting from 15 November 1943 to 15 January 1944, marked the failure of the Allied plan for a major winter offensive. Eighth Army was to break through on the Adriatic coast and then swing left behind the Germans, at which time Fifth Army would advance. When the two came within supporting distance, Fifth Army would launch an amphibious operation south of Rome. Although its efforts to break into the German position were initially successful, Eighth Army fell victim as much to weather as to the German defense. In early December, the Sangro River, vital to Eighth Army communications, rose 8 feet, and bridges were under water or washed away.

By mid-December, it was clear that the efforts to break through the German defenses were futile. Meanwhile, Fifth Army successfully cleared the heights dominating the Mignano gap after much hard fighting, but it was stopped at the Rapido River. Allied forces had reached the defensive position of the Gustav Line, which generally ran along the Garigliano, Rapido, and Sangro Rivers. One of the key points was the town of Cassino on the Rapido. However, four successive attacks by Fifth Army failed to make any significant

headway. The winter campaign had degenerated into a situation in which two separate armies were attempting to penetrate the Gustav Line.

In four months, the Allies had slogged just 70 miles from Salerno and were still 80 miles from Rome. Fifth Army alone had incurred 40,000 casualties, far exceeding German losses, and a further 50,000 men were sick; meanwhile, six experienced divisions were withdrawn for the cross-Channel invasion of France, Operation *OVERLORD*. The supreme Allied commander of the European Theater of Operations and U.S. forces in Europe, General Dwight D. Eisenhower, and Montgomery also departed to lead the cross-Channel invasion. In recognition of British predominance in Italy, General Maitland "Jumbo" Wilson was appointed to head the Mediterranean Command, and Lieutenant General Oliver Leese became commander of Eighth Army.

Kesselring, who was appointed commander of Army Group C on 21 November, now had 15 (albeit weakened) divisions in Tenth Army vigorously holding the Gustav Line. On 22 January 1944, in an attempt to unhinge this force, the Allies launched another amphibious landing, Operation *SHINGLE*, at Anzio, 30 miles south of Rome. The U.S. VI Corps, under Major General John Lucas, achieved complete surprise and safely landed 70,000 troops within a week, but it failed to exploit the advantage. Churchill later wrote, "I had hoped that we were hurling a wild cat on to the shore, but all we got was a stranded whale."

Kesselring hastily improvised eight divisions into Fourteenth Army, commanded by General Eberhard von Mackensen. This force resolutely counterattacked at Anzio, employing "Goliath" remote-controlled, explosive-filled miniature tanks for the first time in the war. The beachhead was saved only by the excellent tactical use of intelligence in one of *ULTRA*'s most important triumphs. Major General Lucian K. Truscott replaced Lucas, but for three months, he could do no more than hold the defensive ring. Meanwhile, Allied forces to the south were unable to break through the Gustav Line. Losses were heavy on both sides as the Allies battered against the line. VI Corps held on at Anzio but was unable to break out of the beachhead. A stalemate persisted until spring.

On 17 January, V Corps launched an attack on the Gustav Line but was forced to call it off within a month, after the badly exhausted troops had advanced just 7 miles, at a cost of 17,000 casualties. The New Zealand Corps then attempted a direct assault on Monte Cassino, preceded by the questionable bombing by 145 B-17 Flying Fortresses that destroyed the famous monastery. The 1st Parachute Division troops defending the heights were some of the German army's finest, and they did not flinch. They now took up positions in the ruined monastery. A third attack by New Zealand and Indian infantry, using even heavier air and artillery bombardments,

also failed to break through, not least because the rubble created an impregnable defensive position.

On 11 May, the Allies launched a fourth attack, Operation *DIADEM*, in which General Alexander coordinated Fifth and Eighth Armies as an army group for the first time. The aim was to destroy the German armies. In an astonishing feat of arms, Polish and Free French troops seized Monte Cassino, and XIII Corps broke the Gustav Line in a set-piece battle. Moreover, Kesselring, who had been duped into expecting another amphibious landing farther north, was slow to send reinforcements southward.

Alexander was alerted to the German movements through *ULTRA* intelligence, and when victory seemed complete, he ordered the Anzio breakout on 23 May. He planned for the U.S. VI Corps to strike directly inland to encircle the German Tenth Army. Rome would thus be ripe for the taking, but more important, the Germans would be unable to form any organized defenses in the rest of Italy, enabling the rapid occupation of the country right up to the Alps. However, Clark, perhaps the most egocentric Allied commander in the war, was enticed by the glory of capturing Rome and altered the direction of his thrust toward the city. Fifth Army linked up with VI Corps on 25 May and made the triumphant march into Rome on 4 June, but the spectacle of the first capture of an Axis capital was eclipsed by the Allied invasion of France two days later.

Clark's change of objective from Alexander's intent enabled Kesselring to withdraw to the Pisa-Rimini Line, 150 miles north of Rome. This line was the first of the next series of defense lines across the peninsula that were known collectively as the Gothic Line, which he reached in August. Alexander still hoped to make for Vienna, but the Italian Campaign had assumed a definite secondary status to the invasion of France. Six divisions were withdrawn in the summer, and when the autumn rains and mud forced operations to be suspended at the end of the year, another seven divisions were withdrawn.

A prolonged Allied tactical air-interdiction program during the autumn and winter of 1944 effectively closed the Brenner Pass and created an acute German fuel shortage that drastically reduced the mobility of Army Group C in northern Italy (commanded by Vietinghoff after Kesselring was severely injured in a road accident in October). Although the Germans still had over half a million men in the field, the Allies had been invigorated in both spirit and outlook by substantial reinforcements, including the Brazilian Expedition Force, and an abundant array of new weapons.

On 9 April, after the ground had dried, Alexander launched his spring offensive, with Eighth Army attacking through the Argenta gap. Fifth Army struck on 15 April, and just 10 days later, both Allied armies met at Finale nell'Emilia, after having surrounded and eliminated the last German forces. The

Allies then advanced rapidly northward, the Americans entering Milan on 29 April and the British reaching Trieste on 2 May. Fifth Army continued to advance into Austria, linking with the U.S. Seventh Army in the Brenner Pass on 6 May.

The isolated and hopeless position of German and RSI forces led Schutzstaffel (SS) General Karl Wolff, military governor and head of the SS in northern Italy, to initiate background negotiations for a separate surrender as early as February 1945. The talks, facilitated by Allen Dulles, head of the U.S. Office of Strategic Services in Switzerland, held much promise, although they were complicated and took place in an atmosphere of mutual suspicion and mistrust. Wolff wished to avoid senseless destruction and loss of life and to repel the spread of communism; he also hoped to ingratiate himself with the West in case war crimes trials were held in the future. From the Allied perspective, Wolff offered the prospect of preventing the creation of a Nazi redoubt in the Alps. The head of the SS, Heinrich Himmler, halted the talks in April, forestalling their conclusion before the Allied spring offensive, but by 23 April, Wolff and Vietinghoff decided to disregard orders from Berlin. Wolff ordered the SS not to resist the Italian partisans on 25 April, and an unconditional surrender was signed four days later, to be effective on 2 May, six days before the German surrender in the West.

The Italian Campaign gave the Allies useful victories in the interval between the reconquest of the Mediterranean and the reconquest of northwest Europe. In a theater of increasingly secondary importance, Kesselring's position was merely a defensive one, and the best the Allies could claim was that they kept 22 enemy divisions from fighting in another theater. Allied casualties came to 188,746 for Fifth Army and 123,254 for Eighth Army, whereas German casualties were about 434,646 men. The Italian Campaign did, however, afford the Allies experience in amphibious operations and the stresses of coalition warfare, all of which proved invaluable during the invasion of France.

Itō Seiichi (1890–1945)

Japanese navy admiral who ordered the attack on Pearl Harbor and later commanded Japan's Second Fleet. Born in Fukuoka, Japan, on 26 July 1890, Itō Seiichi graduated from the Naval Academy in 1911 and the Naval War College in 1923. He studied at Yale University in the United States in 1928 and was promoted to captain in 1930. He held cruiser commands before assuming command of the battleship *Haruna* in 1936. Promoted to rear admiral in 1937, he became chief of staff of Second Fleet. Itō then served in the Navy Ministry between 1938 and 1940. In November 1940, he took command of Cruiser Division 8.

In April 1941, Itō became chief of staff of the Combined Fleet, and in September, he was appointed vice chief of the navy General Staff under Admiral Nagano Osami. He was promoted to vice admiral that October and played a key role in the development of Japanese naval strategy in the Pacific war. Reluctant to see Japan go to war against the United States, he opposed the Pearl Harbor attack, but Admiral Yamamoto Isoroku, commander of the Combined Fleet, urged Nagano to authorize the plan. On 1 December 1941, with the fleet already at sea, Itō ordered the attack on Pearl Harbor. He held his staff post for more than three years, but he desired a naval command.

In December 1944, he was appointed to command the Second Fleet. The Japanese navy had already been crushed in the Battle of Leyte Gulf the previous October, and Itō's fleet was the only operative Japanese navy force. On 5 April 1945, Admiral Toyoda Soemu ordered Operation TEN-GO, whereby Second Fleet would join the battle for Okinawa, which had recently been invaded by U.S. forces. This operation was so reckless that Itō refused the order. His fleet lacked both aircraft carriers and aircraft, which were essential to protect its ships from air attack. Moreover, the fleet would be provided only enough fuel for a one-way trip from Kyushu to Okinawa.

It was obvious to Itō and others that Toyoda intended to send the 7,000 men of the fleet on a suicide mission.

Ultimately, Vice Admiral Kusaka Ryunōsuke prevailed on him to obey the order, and on 6 April, Itō set out with the battleship *Yamato* and eight destroyers. The plan called for the *Yamato* to fight its way to the U.S. invasion site, destroy as many American ships as possible, and then beach itself to act as a stationary battery. On 7 April 1945, the Second Fleet ships were attacked by U.S. Vice Admiral Marc A. Mitscher's Fast Carrier Task Force 58 in the East China Sea, and the *Yamato* was sunk, along with Itō and 3,700 of her crew.

Iwabuchi Sanji (1893–1945)

Japanese navy admiral who vigorously defended Manila in the waning months of the war. Born in Niigata Prefecture, Japan, on 2 March 1893, Iwabuchi Sanji graduated from the Naval Academy in 1915. Trained as a pilot, he then became a gunnery specialist and entered the Gunnery School in 1923. Between 1930 and 1933, he served as a gunnery officer on cruisers and battleships. Promoted to captain in 1937, Iwabuchi was assigned to command the training cruiser *Kashii* in 1941, then the battleship *Kirishima* in April 1942. His battleship took part in the Battle of Midway and the campaign for the Solomon Islands during 1942. On 15 November 1942, in the naval Battle of Guadalcanal, the *Kirishima* was fatally damaged by gunfire from the U.S. battleship *Washington* and had to be scuttled.

Promoted to rear admiral in May 1943, Iwabuchi was appointed commander of the 31st Naval Special Base Force in Manila. In November 1944, he was also assigned 4,000 army personnel and named commander of the Manila Naval Defense Force. General Yamashita Tomoyuki, commander of Japanese forces in the Philippines, ordered Iwabuchi's forces to evacuate Manila and conduct a protracted struggle in the mountainous regions of northern and central Luzon as well as east of Manila, but Iwabuchi refused to carry out the order. Commanding 15,000 navy and 4,000 army personnel, he was determined to defend Manila to the last. During three weeks

in February 1945, there was fierce house-to-house fighting in Manila, and most Japanese forces chose to fight to the death rather than surrender. Iwabuchi died near the end of the battle on 26 February at Intramuros; he received a brevet promotion to vice admiral after his death.

Iwabuchi's decision to defend Manila to the last resulted in the deaths of some 16,000 Japanese troops, 1,000 American forces, and perhaps 100,000 civilians. Some of the latter were deliberately massacred by Japanese troops, but most were killed by U.S. artillery fire. Iwabuchi's actions also resulted in the trial and execution of General Yamashita as a war criminal.

Iwo Jima, Battle for (19 February–26 March 1945)

The penultimate test of U.S. Marine Corps amphibious doctrine and practice. By the end of 1944, American forces had secured from Japan control of the Mariana Islands to provide air bases for B-29 strategic bombers that could strike Japan. En route to Japan, these bombers flew over Iwo Jima (Sulphur Island). Located in the Japanese Bonin Islands, halfway between the Marianas and Japan, the pork-chop-shaped volcanic island of Iwo Jima is from 800 yards to 2.5 miles wide and 5 miles long, with a total area of some 8 square miles.

Iwo Jima housed a large radar facility that gave Tokyo advance notice of impending air attacks, as well as three airstrips for fighter aircraft used to harass the U.S. bombers. As a consequence, U.S. commanders formulated Operation DETACHMENT to seize Iwo Jima. In American hands, the island's airstrips would provide emergency landing facilities for bombers returning from Japan and also allow U.S. fighters stationed there to escort bombers the entire length of their missions.

Japanese leaders realized the strategic importance of Iwo Jima and began reinforcing it a year prior to the American invasion. Lieutenant General Kuribayashi Tadamichi, the island's commander, disregarded the traditional Japanese defensive doctrine of meeting the enemy at the shoreline and implemented a new strategy that relied on 1,500 interlocking strong points inland, designed for a battle of attrition. His

Flag raising on Iwo Jima, 23 February 1945. (National Archives)

force of 21,000 men dug out thousands of yards of tunnels in the soft volcanic rock to connect natural caves, underground bunkers, and man-made “spider-traps” from which concealed defenders could infiltrate and attack any enemy positions. These extensive subterranean complexes would also shield the defenders from extensive preliminary air and naval bombardment by U.S. forces. Japanese artillerymen also pre-registered the beachheads to maximize the effectiveness of their own shelling. Kuribayashi ordered the defenders to die in place and to kill at least 10 Americans before dying themselves. He was, however, handicapped by a lack of fresh water. The absence of a natural harbor limited Japanese reinforcement of the island, and U.S. submarines also sank a number of Japanese supply ships, including one transport with a regiment of Japanese tanks.

Beginning in August 1944, U.S. Army aircraft in the Marianas subjected Iwo Jima to air strikes, and from 8 December, the island came under daily attack. Three heavy cruisers

bombarded Iwo Jima three times in December and twice in January. Then, for two weeks beginning in late January, Seventh Air Force bombed Iwo Jima day and night, and B-29s struck it twice. In all, U.S. forces dropped 6,800 tons of bombs and fired 22,000 rounds of 5-inch to 16-inch shells prior to the invasion, the heaviest bombardment of the Pacific war. Still, the naval bombardment of the island, begun on 16 February 1945, lasted only three days, a far shorter period than V Marine Amphibious Corps commander Lieutenant General Holland M. “Howlin’ Mad” Smith had requested. Smith led a force of 80,000 men, supported by Admiral Raymond A. Spruance’s Fifth Fleet. Vice Admiral Richmond Kelly Turner had overall charge of the invasion.

On 19 February 1945, 30,000 U.S. Marines from the 3rd, 4th, and 5th Marine Divisions stormed ashore, only to encounter Iwo Jima’s coarse, black volcanic sand. Heavy surf smashed the landing craft against the island’s shelf, and the deep sand immobilized many vehicles on the beach. The

resulting logjam of men and equipment on the beachhead provided prime targets for highly accurate Japanese artillery fire. With little or no cover, the Marines had no choice but to fight their way inland. One group wheeled south, toward the island's most prominent terrain feature, the 556-foot Mount Suribachi, while the majority of the Marines attacked northward toward the first airfield. On D+4 (the fourth day after the initial landing), Marines reached the crest of Mount Suribachi, and although still under fire, they raised a small American flag. A few hours later, another group raised a second, larger flag as Associated Press reporter Joe Rosenthal impulsively snapped a photo. Rosenthal's picture of these five Marines and one navy corpsman planting the second flag became a Marine Corps icon and the symbol for American victory in the Pacific. The photograph remains one of the most widely reproduced images of all time.

Marines assaulting the main line of resistance to the north waded through rain-soaked sand into a maze of Japanese pillboxes, bunkers, and caves. Assisted by flamethrowers, demolition charges, bazookas, tanks, and air support, they pushed their way through Kuribayashi's defenses for 36 days, sometimes advancing only a few feet per day. By 26 March

1945, nearly 70,000 Marines had conquered most of the island, at a cost of approximately 6,500 dead and 20,000 wounded. More than 95 percent of the Japanese defenders died during the same period, and pockets of Japanese resistance continued to emerge from concealed cave complexes throughout April and May, resulting in 1,600 additional Japanese deaths. Fewer than 300 Japanese were taken prisoner.

Was the capture of Iwo Jima worth the high cost? With the island firmly in U.S. possession, U.S. bombers pounded the Japanese homeland unabated. In the midst of the heaviest fighting on 4 March, the first of 2,500 U.S. bombers made emergency landings on the island, and some 2,000 B-29s force-landed there from March to August. Given that these planes carried 10-man crews, this represented up to 20,000 airmen. The U.S. Army Air Forces (USAAF) VII Fighter Command moved to Iwo Jima and began to send its long-range P-47 Thunderbolts and P-51 Mustangs as escorts with the B-29s to Japan. The bombers now mixed medium-level daytime raids with the low-level night attacks. With the USAAF fighters along, losses of Japanese planes mounted rapidly, while those of the B-29s continued to decline.

The struggle for Iwo Jima epitomized the courage and esprit of the Marine Corps during the war. Twenty-two Marines, four navy corpsmen, and one navy officer on Iwo Jima earned the Medal of Honor (almost half of them posthumously), accounting for one-third of all such medals won by Marines during the entire war. Fleet Admiral Chester Nimitz testified to the level of courage and bravery among the Americans fighting on Iwo Jima in stating, "Among the Americans who served on Iwo Jima, uncommon valor was a common virtue."

J

Japan, Air Forces

Japan did not possess an independent air force during World War II. Instead, the army and navy each had their own air service. Each had different hypothetical enemies in the interwar period: the army planned to fight against the Soviet Union, and the navy expected to fight the United States and Britain in the western Pacific Ocean. As a consequence, each service developed its own air arm tailored to meet its particular needs.

Unfortunately for the Japanese war effort, neither service cooperated with the other. Army and navy aircraft employed different electrical systems; when the Japanese developed an Identification, Friend or Foe (IFF) capability, army operators on Iwo Jima in 1944 could not identify Japanese navy aircraft as friendly. Further, aircraft factories were divided between those areas that made army planes and those producing naval aircraft, and each kept design developments secret from the other. There was no exchange of data. The navy's Zero fighter was superior to the army's Hayabusa, but the navy did not want to share the Zero with the army. If the army had adopted the Zero, the number of Japanese fighter aircraft produced during the war would have been greatly increased. There was little standardization between the Zero and Hayabusa, even in small screw parts.

Japan also failed to develop heavy bombers comparable to those of Britain and the United States. Not until January 1944 did the army and navy agree to develop a joint, 6-engine heavy bomber, dubbed the "Fugaku," but this project came too late and had to be abandoned. Finally, each service also concealed its weaknesses from the other; thus, it was 1945 before army leaders discovered how catastrophic the 1942 Battle of Midway had been for the Japanese naval air arm.

At the beginning of the Pacific war in December 1941, the Japanese army possessed 4,800 aircraft. Most army fighters were of the obsolescent Nakajima Ki-27 Type 97 ("Abdul" in the Allied recognition system). The army had only 50 first-class fighters—the Nakajima Ki-43 Hayabusa ("Oscar"), which made its debut over Malaya in December 1941. The Ki-43 gradually became the army's most numerous fighter; 5,751 were built during the war. Later, the army introduced new fighters: the Nakajima Ki-44 Shoki ("Tojo"), with initial deliveries in September 1942; the Kawasaki Ki-61 Hien ("Tony"), in August 1942; and the Nakajima Ki-84 Hayate ("Frank"), in April 1944. The best of Japan's wartime army fighters to reach mass production, the Ki-84 was superior to the North American P-51 Mustang and Republic P-47 Thunderbolt in certain respects. The Japanese army had no heavy bombers or dive-bombers and only three medium types: the Mitsubishi Ki-21 Type 97 ("Gwen"), the Nakajima Ki-49 Donryu ("Helen"), and the Mitsubishi Ki-67 Hiryu ("Peggy").

As of December 1941, the Imperial Japanese Navy air arm, which played a major role in the early battles in the Pacific, possessed 3,000 airplanes, 1,300 of which were with the fleet in 1941. Most numerous of its aircraft was the excellent, highly maneuverable Mitsubishi A6M Zero fighter ("Zeke"). Others included the Nakajima B5N Type 97 torpedo-bomber and light bomber ("Kate"); the Aichi D3A Type 99 carrier dive-bomber ("Val"); and two twin-engine, land-based medium bombers, the Mitsubishi G3M ("Nell") and the G4M Type 1 ("Betty"). Zero fighters took part in every major Japanese operation of the war. In the first six months of the war, the Zero was superior to any Allied fighter aircraft. Japan produced a total of 10,370 Zeros during World War II. As new

Allied aircraft were introduced, the Japanese navy developed new aircraft, such as the Kawanishi NIK2-J Shiden (“George”) and the Nakajima B6N Tenzan (“Jill”).

In the Sino-Japanese War and the first stage of the Pacific war, the Japanese air forces met with considerable success. They dominated the skies over China and instituted strategic bombing of Chinese cities in 1938. The Japanese naval air arm was undoubtedly the best in the world, and Japanese pilots were among the best trained. In 1941, first-line Japanese pilots had 500 to 800 flying hours, and 50 percent of army pilots and 10 percent of navy pilots had combat experience against China and/or the Soviet Union.

On 7 December 1941, the naval air arm executed the attack on Pearl Harbor, conclusively demonstrating the supremacy

In the period between 1940 and 1945, the U.S. built 297,199 aircraft; during the same period, the Japanese built 74,656.

of airpower in modern naval warfare and establishing the effective combination of carriers and aircraft. A few days later, navy land-based aircraft sank the British battleship *Prince of Wales* and the battle cruiser *Repulse* off Malaya. For the first time, a self-defending battleship under way had been sunk by aircraft, which showed that in the future, ships would require air protection. However, in 1942,

Japanese air forces suffered heavy losses in the Battles of Midway and Guadalcanal. These battles spelled the ruin of the fine Japanese naval air arm and revealed the serious flaw of an inadequate pilot-replacement system; much of the trained naval air arm was lost in the battle and could not be replaced. The army also sustained heavy aircraft and pilot losses over New Guinea in 1943, and navy air squadrons were badly hurt at Truk and the Caroline Islands from February to April 1944.

The Battle of the Philippine Sea (“the great Marianas turkey shoot”) in June 1944 and the Battle of Leyte Gulf in October 1944 finished off the Japanese naval air arm as an effective fighting force. The army and navy delivered new planes, such as the Hayate and Tenzan, but shortages of adequately trained pilots and fuel negated any advantage. By 1944, Japan was so short of aviation fuel that it could scarcely train its pilots; Japanese aviators had only about 120 hours of flying time before combat.

Japan produced some excellent, highly maneuverable aircraft during the war, but they tended to be lightly armored and caught fire easily. The Zero fighter was essentially unarmored, and Allied pilots dubbed the G4M Type 1 (“Betty”) bomber “the flying cigarette lighter” because it so readily caught fire. Japanese aircraft simply could not sustain heavy damage. The

planes also tended to be more lightly armed than their U.S. counterparts. When the Boeing B-29s began the strategic bombing of Japan, Japanese fighters had difficulty shooting them down. The Japanese planes also lacked airborne radar.

As Japan faced overwhelming Allied forces by late 1944, the military instituted kamikaze suicide attacks. Such strikes were ordered by Vice Admiral Ōnishi Takijirō during the Battle of Leyte Gulf, and they reached culmination in the Battle of Okinawa between April and June 1945. The kamikaze strike proved highly effective: the U.S. Navy sustained greater personnel losses from these attacks during the Battle of Okinawa than in all its previous wars combined. Yet even this new tactic could not turn the tide for Japan.

In the period between 1940 and 1945, the United States produced 297,199 aircraft; during the same period, Japan produced 74,656. In the Pacific war, the Japanese army lost 15,920 planes and the Japanese navy 27,190.

Japan, Army

The Imperial Japanese Army (Dai Nippon Teikoku Rikugun) defies easy or simple recounting, in no small measure because Japanese official histories of World War II begin in September 1931 with the start of the Manchurian Campaign. Thus, any account of the Japanese army and the war really has to cover a 14-year period and to be divided into two very separate parts. One of these parts concerns its campaigns both on the ground and in the air because the Rikugun, as with the navy, had its own air force. Also, the Rikugun was involved in two wars, one in East Asia and the other in the Pacific and Southeast Asia, that were largely separate from one another, and both contained a number of campaigns that again were very largely separate from one another. Thus, the war in East Asia divides into the campaign in Manchuria, 1931–1932; the Sino-Japanese War, 1937–1944; and the final phase of the war, after December 1944, which saw major Japanese withdrawals throughout southern China and then defeat at Soviet hands in August 1945 in northern China and Manchuria. This

accounting leaves unlisted the period of Japanese encroachment in northern China and Inner Mongolia between 1932 and 1936, in which time the power of the Chinese Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT)—was neutralized in these areas, as well as the four-phase China war of 1927 to 1945.

The other part concerns the process by which the Rikugun came to dominate the political process in Japan and, in effect, to control the Japanese state. This was the most important single dimension of Rikugun activity because of its results and implications, but the process by which the army came to dominate the Japanese state was, in turn, the product of developments that reached back into the 1920s and beyond, at least to the Russian and Chinese Civil Wars. In the course of these two conflicts, Japanese military formations found themselves undertaking operations without direct control and guidance from superior authority in Tokyo. This situation bred a habit of independent action, which over time came to be identified with the belief that action could and would not be repudiated by Tokyo. The first real example of this came in 1928, when Japanese military personnel from the Guandong (Kwantung) Army, the garrison force in Manchuria, murdered the local warlord, but the Army Ministry blocked all moves to have those responsible tried by courts-martial, on the grounds that such proceedings would be damaging to the army's prestige. The cabinet gave way, and having surrendered on such a crucial matter, it had no real basis on which to oppose deliberate insubordination when events revealed powerful support within Japan for the Guandong Army's action in 1931 and 1932 in overrunning Manchuria.

The Manchurian episode was crucial to the process whereby the Imperial Army in effect came to control the state. Officers of the Guandong Army staged the Mukden (Shenyang) Incident in Liaoning on 18 September 1931, and what followed amounted to a coup inside Mukden by the Guandong Army. After an emergency cabinet meeting in Tokyo, the Japanese government announced that it was committed to a policy of nonaggression within Manchuria, but the Army Ministry declared that it would not consult the cabinet about future policy but would be bound by the Guandong Army's decisions. The cabinet immediately denied the Guandong Army's request for three divisions and ordered the Korean command not to provide reinforcements for that army, whereon the Korean command did just that on 21 September. The government found itself confronted by a *fait accompli* and outmaneuvered at every turn by a military that played the card of public opinion against any attempt to halt proceedings inside Manchuria. The government fell in December; then, on 15 May 1932, the new premier, Inukai Tsuyoshi, was assassinated by a group of naval officers and army cadets.

This event marked the beginning of the military's domination of the political process within Japan because in its

aftermath, the Rikugun would only nominate an army minister if a party leader did not head the government. After the 15 May incident, governments could only be formed with the assent of the military and only if they were prepared to accede to the military's demands. When Hirota Kōki became prime minister in July 1936 in the wake of the army mutiny on 26 February 1936, he found that the army minister had effective veto power over all appointments. In practice, the army could refuse to appoint an army minister or use the threat of resignation in order to ensure compliance with its will. There was to be no basic change in such arrangements until Japan was overwhelmed by national defeat.

In terms of the major military commitments in this 14-year period, the Manchurian Campaign was of minor importance. There was no serious, sustained, or coherent resistance within Manchuria, set up by the Japanese as a puppet state known as *Manzhouguo* (Manchukuo, and after 1934 *Manzhoudiguo* [*Manchoutikuo*], the *Manzhou* [Manchu] Empire). The Sino-Japanese War, which began in 1937, was another matter. The ease with which Japanese forces overran northern China after July 1937 was testimony to the extent of Japanese success over the previous five years, but the real point was that the Rikugun found itself involved in a protracted war it had not sought and that tied down its resources. As in 1932, the Japanese navy instigated fighting in Shanghai in Jiangsu (Kiangsu) Province, and again, the army had to be deployed there to rescue its sister service: it could only do so by extensive mobilization and escalation of a crisis it would have preferred to have resolved through threat, intimidation, and a series of piecemeal Chinese surrenders, rather than war. The war and the Japanese military effort quickly widened.

There were some defeats along the way, the most notable being in front of *Tai'erzhuang* (*Tai' erh-Chuang*) on 6–7 April 1938. The next day, Imperial General Headquarters formally sanctioned an escalation of the war by ordering the capture of *Xuzhou* (*Hsuchow*), Jiangsu Province. This move enabled the Japanese military to link what had been two very separate efforts, in northern and central China, and then to develop the offensive that would result in the capture of the Wuhan cities of Hubei (*Hupei*) Province in October.

The period after 1938 was notable for two developments, namely, the rice raids that began in Hubei Province in late 1940 and then the opening of the "Three All"—"Kill All, Burn All, Destroy All"—campaigns in Communist-held/infected areas in northern China. In the course of this and subsequent Japanese operations, the population of Communist base areas was reduced from an estimated 44 million to 25 million by a policy of mass deportations, murder, and deliberate starvation. The Communists were neutralized as a threat, with no major guerrilla activity in northern China for the remainder of the war, but as in all matters Japanese in this war, success was an illusion. By 1938, if not before, the Japanese army, with

Japanese army tanks approaching the Singapore Causeway, February 1942. (Hulton Archive)

a million troops in China, found itself learning again the truth of the Clausewitzian dictum that it is easy to conquer but hard to occupy. The reason for this was the adoption by the GMD regime in China of a policy of protracted resistance that precluded negotiations. The Japanese countered with a strategic bombing offensive, but this did not bring the GMD leadership to surrender. Perhaps the only point of real interest in these campaigns was the first attempt by any armed force to use airpower to kill a head of state. On 30 August 1941, army bombers attacked a villa in Chongqing (Chungking) in Sichuan (Szechwan), where Jiang Jieshi (Chiang Kai-shek) was known to be taking part in staff talks.

These efforts ran concurrently with defeats at Soviet hands. Japanese commitments in China dictated a cautious policy in Manchuria and Inner Mongolia, but in 1938 and 1939, several small and two major clashes occurred between Japanese and Soviet forces. The first major clash took place between 11 July and 10 August 1938 in the area around Zhanggufeng (Chang-ku-feng) where Manchuria, Korea, and the Maritime Provinces met; the second occurred between May and September 1939 in the area between the River Halha and Nomonhan. In both cases, single Japanese divisions attempted to clear Soviet forces from their territorial holdings, but in the first action, the Japanese were checked, and in the second, they were subjected to attack by an enemy possessing overwhelming numerical superiority in aircraft, tanks, and artillery. Beginning on 20 August, the Soviets undertook an offensive that literally shredded the Komatsubara Force and then totally destroyed one infantry regiment on the banks of the Halha. By mid-September, the Japanese had brought three fresh divisions to Nomonhan, but by this stage, both sides had very little interest in continuing the battle, and a local truce was arranged: the Zhanggufeng and Nomonhan disputes were resolved in June 1940.

The defeat at Nomonhan coincided with the 1939 German-Soviet Non-aggression Pact, and Germany's act, together with the Anglo-French declaration of war on Germany, caused Japan to adopt a cautious policy and wait on events. The German victory in northwest Europe in spring 1940 was immediately followed by a change of government. On 21 July, Prince Konoe Fumimaro replaced the more circumspect Yonai Mitsumasa as prime minister. The two services' precondition for allowing Konoe to form a government was his prior acceptance of their demands for a treaty with Germany and Italy, additional credits for the army, a nonaggression treaty with the Soviet Union, and the adoption of a forward strategy in southeast Asia.

In the China theater, however, the international situation offered the army the means to isolate the Chinese Nationalist regime by intimidating the British and French colonial authorities in Southeast Asia. The German attack on the Soviet Union in June 1941 and the U.S. embargo of various goods,

which was drastically extended that July, placed Japan in a situation in which a choice had to be made. At the navy's insistence, Japan's leaders decided to move into Southeast Asia to ensure access to raw materials. Without these assets, Japanese leaders believed their nation could not survive as a great power, even if this move meant war with the United States.

The army's role in such a war would be to provide garrisons in the islands that were to mark the defensive perimeter on which the Americans would be fought to a standstill. The navy's belief was that the fleet and land-based aircraft would be able to meet the Americans more or less on the basis of equality and thereafter fight them to exhaustion. A stalemate would then force the United States to reach some kind of negotiated settlement. Although this has been overlooked, the role of the army in the Pacific war was therefore very limited in one sense, and even in the initial phase, during which Southeast Asia was overrun, the commitment of the Imperial Army remained modest. The campaigns in Burma, Malaya, the Netherlands East Indies, and the Philippines involved only 11 Japanese divisions, the equivalent of a single army, and after these conquests were completed, no single campaign, whether in the southwest, central or north Pacific, involved a corps equivalent or more in the field until that in the Philippines in 1944 and 1945. Admittedly, the defeats Japan incurred in eastern New Guinea (March 1942 to December 1943) and thereafter along the northern coast of the island (December 1943 to May 1944) and in the central and upper Solomons (February to November 1943) did involve more than a corps equivalent, but these were a series of local defeats largely separated from one another. Probably no single reverse, even that on Guadalcanal (August 1942 to February 1943) at the very beginning of second-phase operations, involved more than two divisions.

The only defeat of corps-sized proportions incurred by the Rikugun prior to the Philippines Campaign was in Burma at Imphal and Kohima in the 1943–1944 campaigning season, the so-called March on Delhi that went disastrously wrong. The origins of this defeat lay in the ease with which the Japanese, with just one division, had frustrated a corps-sized British offensive in the Arakan in 1943, a campaign in which the Japanese outthought and outfought British forces with ease and one that bears comparison with the original campaigns of Japanese conquest in Southeast Asia.

In these 1941–1942 campaigns, the Japanese had no military margin of superiority, but they outfought individual enemies that were defensively dispersed and subjected to successive amphibious assaults by Japanese forces enjoying local air and naval superiority. The campaigns, conducted across a frontage of more than 3,000 miles, were characterized by economy of effort and even an almost aesthetic quality, as successive landings penetrated to the depth of Allied defenses.

Thereafter, the problem for Japan and the Rikugun was threefold. First, once they were no longer taking the initiative in the Pacific, Japanese garrisons were subjected to an overwhelming attack by massively superior Allied assets. No force could sustain itself against such an attack, and no resistance, however protracted and effective in terms of tying down U.S. military assets, could alter a pattern of defeat that brought American forces astride Japanese lines of communication to the south and took the war to the home islands. Second, the Rikugun deployed formations to the Pacific primarily at the expense of garrison forces in Manchuria and China, where these formations were not easily replaced. By 1944, ammunition shortages precluded Rikugun live-fire training. By August 1945, the class of 1945 was basically untrained, and the 1944 class was little better. The army, which had numbered some 24 divisions in the mid-1920s and 51 divisions in December 1941, raised 3 armored and 107 infantry divisions for service overseas: 1 tank and 55 infantry divisions remained in the home islands.

Despite these numbers, the quality of the army was declining because Japan quite simply lacked adequate industrial capacity to meet the requirements of total war. Japanese output in 1944 was equivalent to 4 percent of the American production of mortars, 4.7 percent of tanks, 8 percent of anti-aircraft ammunition, perhaps 10 percent of all ordnance, and 6.5 percent of small-arms ammunition. With minimum capability, the divisions in the home islands in 1945 were singularly ill prepared to resist assault landings.

The Japanese army never, as it happened, experienced defeat in the home islands, but it faced defeat repeatedly on the continental mainland. The year 1945 saw Japanese forces defeated throughout Burma (with the exception of Tenasserim) and, in August, also throughout Manchuria, northern China, and Korea, as well as on Sakhalin and in the Kuriles, when Soviet forces put together a masterly short campaign. The Japanese forces numbered some 750,000 troops, but of these, some 300,000 were Manchurians suited only to garrison duties. The Japanese troops were mustered in 17 infantry divisions, equipped with 1,155 tanks, 5,360 artillery pieces, and 1,800 aircraft, but these were utterly routed by an enemy force consisting of 1 tank and 11 infantry armies. Seeking to consolidate what they held and to allow removal of formations to more important theaters, the Japanese had already begun major withdrawals within China, ending the period of Japanese successes that had begun in spring 1944 when Japan undertook a series of offensives throughout southern China. The Japanese conduct of these operations resembled their previous efforts in terms of brutality.

In July 1945, the Japanese army had 26 infantry divisions in China and another 7 in Korea, but even so, its position was hopeless. The extent of failure can be gauged by the fact that

Japan managed to conjure into existence an alliance that included the world's most populous country; the greatest empire; the greatest industrial, naval, and air power; and the greatest military power. However unintentional, this was a formidable achievement, but it went in tandem with fundamental failure by the army leadership to comprehend the nature of the war in which it was involved. Drawing on its own highly selective interpretation of Japanese history and hobbled by the fact that, never having been defeated, it could not understand defeat, the army was dominated by an ethos that stressed a castelike reverence for rank and was strictly hierarchical. A very formal organization, it had no real capacity for flexibility and initiative at the lower levels. Its broad distaste for political and economic liberalism coexisted with its belief in what it deemed traditional Japanese martial values—specifically, its willingness to die in order to fight. The war was to prove, however, that sacrifice could not confound superior enemy matériel.

Japan, Home Front during the War

Japan experienced the demands of total war as intensely as any other principal combatant in World War II. In 1931, the Japanese Guandong (Kwantung) Army had conquered all Manchuria, and in 1937, the Sino-Japanese War began. It has indeed become customary among Japanese to associate the era of total war for their country with the decade preceding World War II.

Young school girls pressed into service in factories to help with the Japanese war effort, 1945. (Photo by Keystone/Getty Images)

Although Japan was a major industrial power with a population of 73 million people in 1939, it was decidedly deficient in natural resources and not even self-sufficient in food. Virtually everything Japan needed had to come by sea, a vulnerability the United States was quick to exploit. Japan's leaders discounted these economic difficulties and believed that the territories conquered in war, especially the Dutch East Indies, would bring them the resources they required.

Japan lacked the industrial base of its Western enemies. In 1941, for example, it produced 6.7 million tons of steel, whereas the United States produced 73.9 million tons. To some extent, too, Japan was already exhausted by years of fighting in China when its government undertook yet another war with an even more formidable opponent in the United States.

The period of warfare from at least 1937 to 1945 is customarily referred to by the Japanese as a "dark valley" of unrelieved misery and pain. The Great Depression brought

widespread hardship to Japan, which was exacerbated by sharp increases in military expenditures prior to 1937 that created a serious balance-of-payments problem and an inflationary crisis. Between 1937 and 1940, real wages fell by 17 percent. By 1939, Japan was spending about 36 percent of its gross national product (GNP) on the military, as opposed to only 23 percent in Germany and 8 percent in Britain.

The Japanese government took early action to control and allocate its dwindling resources effectively. In preparation for total war, it instituted full-scale mobilization measures, whereby it directed systematic programs to put more people to work in agriculture and in ammunition plants. One way to facilitate this was by using women in these sectors. Initially, the government rejected this move as a sign of national weakness, but essentially, it had no other choice. By 1945, women constituted nearly 42 percent of the labor force, a figure higher than that in the United States. By the 1940s, girls as young as 12 were deemed eligible for the workforce.

Japan did have some success in its efforts to increase industrial production. During the period from 1940 to 1944, production increased 25 percent, although much of this rise occurred because the government consolidated production in larger firms. Even so, Japanese efforts in this regard paled beside the achievements of the United States.

The demands of total war went beyond economics to include a variety of efforts designed to strengthen the national will. The nation underwent political restructuring that brought both the dissolution of political parties and the establishment of the Imperial Rule Assistance Association (IRAA) in October 1940. Although the IRAA failed to achieve its goal of restructuring Japanese society along the lines of the Fascist states in Europe, its establishment symbolized increasing domestic repression. Simultaneously, governmental monitoring of dissidents increased. The Special Higher Police and the Military Police carefully monitored religious sects, Koreans, and suspected leftists and pacifists.

The Japanese people fully supported war with the United States, which they believed had been forced on their nation by American economic policies designed to cripple Japan. Nonetheless, the government instituted rigid censorship and used propaganda and the state-controlled education system to strengthen national spiritual mobilization. As the diarist Kiyoshi Kiyosawa noted, the Japanese were bombarded with appeals to remember their “spiritual” superiority over their enemies. Ultrnationalist societies, all to some extent proclaiming Japan’s destiny to expand its territory on the Asian continent, also proliferated. In addition, the government established several women’s patriotic societies designed to improve civil defense, welcome soldiers home from the battlefield, visit hospitals to comfort the sick and wounded, and raise money for the relief of bereaved families. Small communities were also organized, so that everyday life was systematized to impose a shared social unity in which people might monitor their neighbors, and privacy became a thing of the past. Perhaps the saddest manifestation of Japan’s response to total war was the decision late in the war to utilize suicide missions. The so-called kamikaze played on the courage and fatalism of young men who believed their country faced destruction and hoped their deaths would serve family and country.

Early in the Pacific war, food shortages became apparent. In December 1940, the government began food rationing on a ticket system. Often, basic necessities, such as cotton and soy sauce, were also strictly rationed. The scarcity of food caused black markets and serious malnutrition.

Even while Japanese society was reorganizing in response to the demands of total war, actions by Japan’s military enemies forced increasing disruptions of the emerging total war system. One particular concern was the vulnerability of Japan’s major cities to aerial attack, as the strategic bombing of civilian centers became part of the new era of total war. The

April 1942 Doolittle raid first demonstrated this vulnerability to the Japanese people. Although the raid inflicted little physical damage, it had a pronounced psychological effect.

From June 1944, the United States began a strategic bombing campaign directed against Japanese industry, the bulk of which was located in the cities. Constructed largely of wooden buildings, the cities were appallingly vulnerable to firebomb attack, as shown in the great 9–10 March 1945 raid on Tokyo, probably the most destructive in the history of air warfare; it claimed some 120,000 lives and was followed by other attacks. One by one, the Japanese cities became burned-out shells. Americans justified these attacks as essential to reach and destroy the largely dispersed Japanese industrial base, but civilians paid a horrific price. By the time Japan surrendered in August 1945, every major city except the shrine city of Kyoto had been torched, and some 10 million Japanese had fled the cities to escape the raids.

The government began this resettlement in August 1944 by moving 350,000 urban schoolchildren between the ages of 8 and 12 into village temples, shrines, and inns. In 1945, a further 450,000 elementary school students were evacuated. Although Germany’s surrender in May 1945 seemingly offered Japan a chance to extricate itself from a clearly worsening situation, the government refused to take the initiative, and U.S. forces stepped up their firebombing of what was left of Japan’s major cities. In some cases, this bombing merely rearranged the rubble. Meanwhile, submarine attacks on Japanese shipping and aerial mining of Japanese harbors and coastline destroyed the already marginal Japanese shipping capacity, cutting off the flow of vital imports of food and oil and further damaging the economy.

Finally, in August 1945, the United States dropped atomic bombs on Hiroshima and Nagasaki. At the same time, the Soviet Union honored its pledge at Potsdam and declared war on Japan. Hundreds of thousands of lives were lost as a result of this “twin shock,” and Japan finally surrendered. The nation was devastated both physically and psychologically.

Japan, Navy

By the 1920s, the Nippon Teikoku Kaigun (Imperial Japanese Navy, or IJN), which dated only from the late 1860s, ranked as the third-largest navy in the world. By then, it had fought three wars, and at the Battle of Tsushima in May 1905, it won one of the most comprehensive and annihilating victories ever recorded in naval warfare. The IJN was to fight two more wars, one in the western Pacific, directed against China, and the other throughout the Pacific, eastern and southeast Asia, and the Indian Ocean. The latter resulted in utter and total national defeat and the destruction of the Kaigun as a service.

From 1907 onward, IJN leaders identified the United States as the enemy against which preparations had to be made. Yet the Kaigun faced a basic and insoluble problem, namely, Japan's acceptance of the limitation of its navy to three-fifths those of the United States and Great Britain, as agreed at the 1921–1922 Washington Naval Conference. This stance resulted from the conviction of Minister of the Navy Admiral Kato Tomosaburo that the only thing worse for Japan than an unrestricted naval construction race with the United States would be war against that country. Kato believed an unrestricted naval race could only bring the remorseless and irreversible erosion of Japan's position relative to the United States, and Japan therefore had to seek security through peaceful cooperation and diplomatic arrangements rather than through international rivalry and conquest. Kato and others viewed the navy as a deterrent and, in the event of war, a defense; however, they also believed Japan's best interests would be served not by confrontation and conflict with the United States but by arrangements that limited American naval construction relative to Japan and so provided the basis of future American recognition and acceptance of Japan's regional position. The problem was that events unfolded in a manner that forced the IJN into planning for a war that, by its own calculations, it was certain to lose.

The basis of this position was twofold. First, the Kaigun found itself obliged to fight not one but two wars. It would have to confront an American enemy that would seek battle and undertake major amphibious undertakings across the western Pacific to bring the war to Japanese home waters. It would also be obliged to fight a maritime war to defend Japanese shipping and seaborne trade. Losing either would result in Japan's full-scale defeat, no matter whether its navy lost a naval war that left the merchant fleet intact and undiminished or whether Japan was defeated in a maritime war that left its fleet's naval forces unreduced. In the event, Japan and the Kaigun suffered a double defeat, both naval and mercantile.

In a very obvious sense, the maritime defeat was one that could have been predicted. Four Shimushu- or Type A-class escort warships were ordered under the 1937 naval estimates,

but none was begun before November 1938, to be completed between June 1940 and March 1941. In December 1941, these four ships were the only purpose-built escorts in service with the IJN, and they all lacked underwater detection gear (sonar).

Quite simply, Japanese industry did not have the capacity to build and service both warships and merchantmen, nor to build both fleet units and escorts (see Table 1). Japan's limited industrial capacity forced it to choose between warships and merchantmen, between building and refitting. Moreover, the Kaigun had no real understanding of trade defense and the principles of convoy. Not until November 1943 did the navy institute general convoy, and lacking sufficient escorts and integrated air defense, this practice merely concentrated targets rather than protecting shipping.

Herein, too, lay the basis of Japan's naval defeat in the Pacific. In order to fight and defeat the American attempt to carry the war across the Pacific, the Kaigun developed the *zen-gen sakusen* (all-out battle strategy), a concept that envisaged the conduct of the decisive battle in five phases. Submarines gathered off the Hawaiian Islands would provide timely reports of U.S. fleet movements, and with top surface speeds of 24 knots, they were to inflict a series of nighttime attacks on U.S. formations. It was anticipated they would suffer accumulated losses of one-tenth of strength in this phase and the same in the next, when Japanese shore-based aircraft, especially built for superior range and strike capability, would engage American formations. The enemy would then be subjected to night attack by massed destroyer formations, Japanese battle cruisers and cruisers being used to blast aside escorts: the Japanese anticipated massed scissors attacks using as many as 120 Long Lance torpedoes in a single effort. Thereafter, with U.S. formations losing their cohesion and organization, Japanese carriers would join the battle, employed in separate divisions rather than concentrated, in order to neutralize their opposite numbers. Finally, Japanese battleships would engage the American battle line, in what Japanese planners expected to be the decisive battle. In the 1930s, when these ideas were formulated, the Japanese expected the main battle would take place around the Marianas.

The Kaigun organized its formations and building and refitting programs accordingly. Destroyers featured torpedo armaments, and battleships and cruisers emphasized armament, speed, and armor rather than range. The Yamato-class battleships, at their full displacement of 71,659 tons, carried a main armament of 9×18.1 -inch guns, an armored belt of 16 inches, and turrets with a maximum of 25.6 inches of armor; they had a top speed of 27.7 knots and a range of 8,600 nautical miles at 19 knots or 4,100 nautical miles at 27 knots. These ships were deliberately conceived as bigger and more formidably armed and protected than any American battleship able to use the Panama Canal. The Japanese quest for qualitative superiority extended through the other classes of

Note: The drawing of direct comparisons between different types of warships, specifically escorts, is somewhat difficult. Counted under the heading “Esc” in the Japanese listings are named escorts and patrol boats; under the heading “CD” are the *kaiboken*, or coastal defense ships. These types were not the direct equivalents of U.S. destroyer escorts and frigates, respectively, but diversity precludes these types of American and Japanese ships being compared with anything but one another. U.S. figures exclude Lend-Lease vessels.

warships. As part of this process, the Kaigun developed the famous Long Lance torpedo; land-based and carrier-based aircraft such as the A6M Zero-sen and long-range Betty bomber; and long-range submarines, one type equipped with seaplanes in order to extend scouting range: individually and collectively, these were qualitatively unequalled in 1941 and 1942, and in terms of night-fighting capability in 1941, the Kaigun undoubtedly had no peer.

Despite these apparent advantages, the Japanese naval battle plan represented an inversion of the reality of what was required. By December 1941, the Kaigun had basically secured parity in the Pacific with the United States, with warships, carrier air groups and aircraft, and a pool of trained manpower that were qualitatively probably the best in the world. The problem, however, was that Japan and its armed services lacked the means to fortify the islands of the central and western Pacific. The perimeter along which the Japanese planned to fight the Americans to a standstill largely consisted of gaps. Japan had neither the shipping nor the base organizations needed to transform the island groups into the air bases that were essential to the fleet. The latter, moreover, could not be guaranteed to be permanently ready to meet any American move, which would, by definition, be made in a

strength and at a time that all but ensured American victory. Individual Japanese bases or even several bases within a group or neighboring groups could be overwhelmed by an enemy free to take the initiative and choose when to mount offensive operations, a second flaw within the zengen sakusen concept. By 1942, the Kaigun was only prepared to fight the battle it intended to win, and it could only win the battle it intended to fight. Instead, of course, the battle it was called on to fight was not the one for which it had prepared.

The IJN, moreover, faced not one enemy but two. It opened hostilities with a total strength of 10 battleships; 6 fleet and 3 light fleet carriers and 1 escort carrier; 18 heavy and 20 light cruisers; 111 destroyers; and 71 submarines. A token of its future problems lay in the fact that only 1 fleet unit, a destroyer, was not in service on 6 December 1941. But even when it went to war, the Kaigun faced a prewar U.S. Navy that, between May 1942 and November 1943, fought it to a standstill. After that date, the Kaigun faced a wartime U.S. Navy, virtually every ship of which had entered service after Pearl Harbor. The Japanese shipbuilding effort from 1942 to 1944, though substantial, was simply overwhelmed by a truly remarkable American industrial achievement: 18 U.S. fleet carriers to 7 for Japan, 9 light fleet carriers to 4, 77 escort car-

riers to 4, 8 battleships to 2, 13 heavy and 33 light cruisers to 4 light cruisers, 349 destroyers and 420 destroyer escorts to 90, and 203 submarines to 116. U.S. superiority was not simply numerical: radio, radar, and diversity of weaponry were all areas in which the Kaigun could not match its U.S. enemy but was systematically outclassed as the war entered its second and third years.

During 1943 and 1944, the Americans acquired such overwhelming numerical superiority that the Kaigun was denied not merely any chance of victory but even any means of effective response. Between 26 December 1943 and 24 October 1944, Japanese warships and aircraft destroyed no American fleet units, if U.S. submarines are excluded. The simple truth was not just that the Japanese were prepared to die in order to fight but also that the only way the Japanese could fight was to die.

Events in 1945 conspired to demonstrate the singular ineffectiveness of such a course of action, as Japanese losses between July 1944 and August 1945 reflected both this dilemma and the wider national defeat. In the war overall, the Kaigun lost 1,028 warships of 2,310,704 tons, of which 631 warships of 1,348,492 tons were destroyed in the last 13 months of the war (see Table 2). The wartime losses incurred by the merchant fleet—not the service auxiliaries—told the same story, totaling 1,181.5 merchantmen (there were navy, army, and civilian ships and, occasionally, shared ships, which are here calculated as one half a ship) of 3,389,202 tons, of which 811 vessels of 2,077,249 tons were lost in this same final period, after the Battle of the Philippine Sea. Losses of this order were both the cause and the result of defeat, in practice reducing the Kaigun to no more than an ever less effective coastal defense force.

By August 1945, Japan had been pushed to the edge of final, total, and comprehensive defeat, losing all semblance

of strategic mobility. Its industry was in end-run production; its people would have died by the millions from disease and starvation had the war lasted into spring 1946. To all intents and purposes, the Kaigun had by then ceased to exist, as American carrier air groups flew combat air patrol over Japanese airfields. A remarkable American achievement, unparalleled in 400 years, had reduced the Kaigun to impotent irrelevance. States, especially great powers, are rarely defeated by naval power, but in this case, the Kaigun had been entirely powerless to prevent such an outcome.

Japan, Official Surrender (2 September 1945)

On 10 August 1945, the Japanese government issued a statement accepting the terms of the Potsdam Declaration of July that had outlined “unconditional surrender.” The following day, U.S. Secretary of State James Byrnes accepted Japan’s offer to end hostilities. Emperor Hirohito announced Japan’s surrender to the Japanese people on 15 August.

The official Japanese surrender ceremony took place at 9:00 A.M. on 2 September aboard the U.S. battleship *Missouri* in Tokyo Bay. The supreme commander for the Allied powers, General Douglas MacArthur, formally accepted the Japanese capitulation by signing the instrument of surrender. Foreign Minister Shigemitsu Mamoru and General Umezu Yoshijiro signed for Japan. Admiral Chester W. Nimitz represented the United States, followed by General Hsu Yung-ch’ang for China, Admiral Sir Bruce Fraser for the United Kingdom, Lieutenant General Kuzma Derevyanko for the Soviet Union, General Sir Thomas Blamey for Australia, Colonel L. Moore Cosgrave for Canada, General Jacques Le Clerc for France, Admiral C. E. L. Helfrich for the Netherlands, and Air Vice Marshal Leonard Isitt for New Zealand.

Japan, Role in the War

The efforts of Japan, one of the three major Axis powers of World War II, to enhance its own position in East and Southeast Asia were responsible for making the conflict a truly global one and the Pacific region one of the two major fulcrums of a worldwide war. From the late nineteenth century onward, a modernizing Japan sought to become the dominant power in Asia, replacing the European empires and subjecting China and Southeast Asia to its own effective hegemony. In 1895, Japan annexed the Chinese island of Taiwan (Formosa), which it retained until 1945. After its victory in the 1904–1905 Russo-Japanese War, Japan sought to replace Japanese influence in the northeastern Chinese provinces

of Manchuria. In 1910, it annexed the neighboring state of Korea.

Japanese leaders, who quickly joined World War I in 1914 on the side of the Allied powers of Great Britain and France, saw that conflict primarily as an opportunity to secure further gains in Asia. By the end of 1914, they had taken over the German concession in Shandong (Shantung) Province, China, and driven Germany from various Pacific possessions—the Marshall, Caroline, and Marianas Islands—that Japan annexed. In early 1915, Japan also demanded substantial political, economic, and territorial concessions from China, which would have given it a special status in that country. Under pressure, the Chinese government initially accepted most of the Twenty-One Demands, but it later repudiated them. From 1918 to 1920, Japanese troops also intervened in northeast Russia in the Vladivostok area, as did British and American forces. Their mission was supposedly to protect rail communications links and safeguard Allied supplies in the region after the Bolshevik government that took power in November 1917 negotiated the peace of Brest-Litovsk with Germany and abandoned the war. Japan’s allies, however, feared that Japan sought permanent territorial gains at Russian expense, something they hoped their own forces might manage to prevent.

At the 1919 Paris Peace Conference, Japan sought to replace Germany in the Shandong concession. Student protests in China, which began on 4 May 1919 in Beijing, forced Japan to renounce its privileges formally, but in practice, the area remained under effective Japanese control. Under the 1921–1922 Washington conference treaties, Japan agreed to accept a fleet only three-fifths the size of those of Great Britain and the United States and to respect both the territorial integrity of China and the interests of other nations, including the Western colonial powers, in the Pacific region. Throughout the 1920s, Japanese troops from the Guandong (Kwantung) Army remained stationed in north China, supposedly to safeguard Japan’s special economic interests in China. The chaotic state of much of China, divided between rival warlord armies and the Republican governments of the Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT)—of Sun Yixian (Sun Yat-sen) and his successor, the military leader Jiang Jieshi (Chiang Kai-shek), was an additional pretext for the Japanese military presence.

In 1931, units from the Guandong Army deliberately staged the Mukden Incident, an episode in which Japanese officials alleged Chinese troops had sabotaged Japanese-controlled railway lines near Mukden (Shenyang) in Manchuria. This event became the pretext for Japanese forces, without authorization from the civilian government in Tokyo, to take over all of northeast China; there, in March 1932, they established the puppet state of Manzhouguo

(Manchukuo, later Manzhouguo [Manchoutikuo]), a nominally independent nation under the rule of the last emperor of China, Aixinjueluo Puyi (Aisingioro P'u-i, known to Westerners as Henry Puyi). In response to protests from the League of Nations—most of whose member nations, together with the United States and the Soviet Union, refused to recognize the new state and imposed rather weak economic sanctions on both Japan and Manzhouguo—Japan withdrew from the league in 1933.

Japanese forces were also based throughout much of north China, their presence a perennial irritant to the Chinese government, with the potential to provoke military clashes. For much of the 1930s, the Chinese Nationalist government, now firmly under the control of President Jiang Jieshi (who had consolidated his military position in the late 1920s), effectively acquiesced in Japanese demands. Although Jiang believed that war with Japan was probably inevitable in time, he sought to defer this until, with the benefit of German military advisers, he had successfully modernized China's armed forces. In the early 1930s, his first priority was to eliminate the GMD's major political rival, the Chinese Communist Party (CCP). The CCP was led by the charismatic and innovative Mao Zedong (Mao Tse-tung), against whose forces Jiang mounted annual campaigns every year from 1930 to 1935. Only after December 1936, when another leading Chinese politician, the Manchurian warlord Zhang Xueliang (Chang Hsüen-liang) captured him and made his release conditional on joining with the Communists to form a united Chinese front against the Japanese, did Jiang reluctantly and temporarily renounce his deeply rooted anti-Communist hostility. The two camps never trusted each other, and political factionalism within the GMD also persisted throughout the war, hampering Jiang's freedom of action and his ability to wage effective warfare against Japanese forces.

Full-scale war between Japan and China began in July 1937, when long-standing tensions with Japan—provoked by Japan's effective annexation of Manchuria in 1931 and a continuing series of territorial, economic, and political incursions in other areas—caused the escalation of a small skirmish near the Lugouqiao (Lukouchao) Marco Polo Bridge, close to Beijing (Peking) in Hebei (Hopeh). The Chinese invariably referred to the conflict as the "War of Resistance against Japanese Aggression." Until December 1941, when China formally declared war on Japan and thus aligned itself with the Western Allies after the Japanese attack on Pearl Harbor, Japan dismissively referred to the conflict as the "China Incident"; after that date, it became part of the "Greater East Asia War."

In its early stages, the war was one of rapid movement and military victory for Japan. In late July 1937, Japanese troops took over the entire Beijing-Tianjin (Tientsin) area of north China. They inflicted a series of major defeats upon Jiang's

military, wiping out most of his modernized units and, over the following 18 months, successively taking Shanghai and Nanjing (Nanking), Guangzhou (Canton), and Wuhan, China's provisional capital after Nanjing fell. Although Chinese troops had occasional triumphs, notably the April 1938 Battle of Taierzhuang (Hsieh Chan T'ai-Erh-Chuang), these were rarely followed up. Japanese leaders assumed Jiang would sue for peace before the end of 1938, but to their frustration, he refused to do so. Instead, he adopted a strategy of trading space for time, based on the assumption that by retreating, the Chinese could force the Japanese to overextend themselves, making them vulnerable to a lengthy war of attrition. This prediction proved substantially correct, as by 1940, Japanese forces were bogged down in an inconclusive war in mainland China, occupying vast tracts of territory without fully controlling them. Even so, despite the scorched-earth policy Jiang followed, the regions he ceded to Japanese rule from March 1940, exercised through the puppet regime of renegade Chinese politician Wang Jingwei (Wang Chingwei), included most of China's leading cities, its major industrial areas, and most of the fertile and densely populated agricultural regions.

Much as they did between 1914 and 1918, Japanese leaders in the 1930s believed the deteriorating European situation offered them further opportunities to enhance their influence in Asia. From May 1932, when military cadets assassinated Japanese premier Inukai Tsuyoshi, Japan's military largely dominated the government. In November 1936, Japan and Nazi Germany, whose National Socialist dictator Adolf Hitler had pursued increasingly aggressive policies in Europe since 1933, signed the Anti-Comintern Pact, an agreement directed at all Communist states and individuals, whom both these authoritarian and Fascist regimes perceived as their chief ideological opponents. The prime target was the Soviet Union, whose territory both Germany and Japan ultimately coveted. In 1937, Fascist Italy also joined the pact, effectively aligning all the dissatisfied have-not states of the post-World War I era together. In 1938 and 1939, Japanese forces in Manchuria and Mongolia clashed repeatedly with Soviet units, encounters that culminated in August 1939 in a major Soviet victory at the Battle of Nomonhan on the Manchurian border, the world's largest tank battle to that date.

In October 1938, the Japanese government announced its intention of creating a New East Asian Order, which would end western colonialism in the region and replace it with Japanese leadership and dominance. One year later, in September 1939, Germany invaded Poland, whereon Britain and France declared war on Germany. The spring 1940 German blitzkrieg quickly brought the defeat of Belgium and the Netherlands as well as French and German domination of virtually all of western Europe, leaving Britain embattled against Hitler and British, Dutch, and French colonial possessions vulnerable to

Japan. In September 1940, Japan, Germany, and Italy signed the Tripartite Pact, obliging each nation to assist the others should another country attack them, though not to assist in a war in which one of three was itself the aggressive party. Japanese officials hoped this agreement would persuade Great Britain and the United States to make concessions to Japanese interests in East Asia, including pressuring the recalcitrant Chinese government into a peace settlement that would end the war in China and grant Japan easy control of much of that country. They also sought Western acquiescence in the establishment of Japanese bases in French Indochina, which would be particularly useful in interdicting the flow of military and other supplies to southwest China.

For some months, Japanese military and political leaders debated whether they should follow a northern strategy and attack the Soviet Union or a southern strategy designed to enhance their position in Southeast Asia at the expense of Britain, France, the Netherlands, and the United States. After bitter debate, Japan picked the second option in April 1941 and signed a neutrality pact with the Soviet Union, while opening protracted negotiations with the United States in

Over 1.5 million Japanese soldiers and civilians died in World War II, and ten times that many were displaced.

the hope of persuading the American government to accept Japanese dominance in both China and French Indochina. In late July 1941, Japanese troops moved into French Indochina, allowing the Vichy-affiliated colonial authorities to continue as the nominal government but establishing bases and effectively controlling the

colony. The American government responded by freezing Japanese assets in the United States and imposing a complete embargo on trade with Japan. Japan purchased virtually all its oil from the United States and only had sufficient stockpiles to supply its military for two years. The two countries continued intensive diplomatic negotiations for several more months, but until early December 1941, most Japanese leaders, unwilling to relinquish, moderate, or compromise their ambitions in China and Southeast Asia, believed war with the United States and other Western states was inevitable. Japan was under some pressure from Germany to take military action against its enemies; Hitler would have preferred that Japan move against the Soviet Union, which his forces had invaded in June 1941, but he settled for Japanese action against Britain and the United States, even though he was not yet formally at war with the latter.

Negotiations between Japan and the United States finally broke down at the end of November. On 7 December 1941, carrier-based Japanese warplanes attacked the U.S. Pacific

Fleet at its base at Pearl Harbor, Hawaii, only declaring war after this assault had taken place. Japanese forces quickly swept through and conquered much of Southeast Asia, and by mid-1942, they controlled the former American colony of the Philippines; Dutch Indochina (Indonesia); and the British colonies of Malaya, Singapore, Burma, and Hong Kong. They also threatened Australia and India. Japan now controlled most of the valuable economic resources it had coveted, including the oil wells of Dutch Indochina, Malaya's tin and rubber, and Southeast Asia's rice fields. Defeating Japan took second place in Allied strategy to victory over Germany and Italy, which both declared war on the United States immediately after Pearl Harbor. Even so, in the long run, Japan could not match the United States in industrial capacity or population, and it found itself unable to continue the war indefinitely. Although Japan proclaimed the establishment of the Greater East Asia Co-prosperity Sphere, to which all those areas under its hegemony could belong, and although it established quasi-independent collaborationist governments in China, the Philippines, and Burma, Japanese rule was far from popular with its new subjects. Japanese military successes undoubtedly played a crucial role in the dissolution of Western imperialism in Asia once World War II was over, but brutal atrocities committed against the local populations and the blatant exploitation of all available resources for the Japanese war effort undercut Japan's claims to gratitude as the power that had liberated most of Asia from Western colonial dominance.

Japan's strategy rested on the hope of a quick victory in Asia, after which its leaders trusted they would be able to persuade the Western allies, especially the United States, to accept a negotiated peace. In June 1942, the U.S. victory in the Battle of Midway, in which the American fleet destroyed three of Japan's four fleet carriers, effectively restricted the Japanese navy to defensive operations in the future. The rapid drives by Japanese troops through much of Southeast Asia ended about the same time, and Japanese military power reached its furthest extent in summer 1942. Throughout the war, the China theater continued to tie down over a million Japanese troops. In late 1942, Allied forces under the command of General Douglas MacArthur began the selective island-hopping campaigns in the Pacific that would gradually isolate Japan, interdicting the shipment of vital supplies and slowly threatening the Japanese homeland. Although Japanese forces often fought bitterly, exhibiting the bravery of desperation, they found themselves increasingly outnumbered and outequipped, with little hope of reinforcements. On the home front, the Japanese civilian population—like those of the areas occupied by Japan and, indeed, Japanese soldiers as well—experienced increasing privations from 1943 on, with food and other staples rationed and in ever shorter supply. From summer 1944, American airplanes sub-

jected all major Japanese cities except the shrine city of Kyoto to ferocious bombing raids, and after three months of heavy fighting, U.S. troops took the island of Okinawa in late June 1945, opening the route for the invasion of Japan itself.

By the summer of 1945, facing what seemed inevitable defeat, some Japanese politicians sought to explore the possibility of a negotiated peace, using the still officially neutral Soviet Union as an intermediary, but these talks proved inconclusive. Military leaders in Japan were still determined to fight on and defend the homeland islands to the last. At the July 1945 Potsdam Conference of Allied leaders, Soviet president Josef Stalin agreed to enter the war against Japan. Receiving word that the first atomic bomb test had been successful, U.S. President Harry S Truman called on Japan to surrender forthwith or face horrific attacks from new weapons of unparalleled destructiveness. The Potsdam Declaration proved unavailing, and on 6 August 1945, an American B-2 bomber exploded a nuclear device over the Japanese city of Hiroshima. Two days later, the Soviet Union declared war on Japan, and on 9 August, a second bomb was dropped on the city of Nagasaki. By this time, Soviet troops had already begun a highly effective campaign in Manchuria. Faced with the prospect of additional casualties in a homeland invasion and uncertain whether Japan might have to endure yet further nuclear attacks, the Emperor Hirohito exerted his authority over the still recalcitrant Japanese military on 14 August and made a radio broadcast accepting the terms of the Potsdam Declaration. Three days later, he instructed Japanese forces to lay down their arms.

Japan ended the war devastated—its cities in ruins, its population starving, its shipping and trade largely destroyed, and its colonial empire gone. Over 1.5 million Japanese soldiers and civilians died during the war, and until 1952, the country was under American occupation. Ironically, Cold War pressures soon meant that Japan became a crucial ally of its former enemies, especially of the United States, and the linchpin of American strategy in Asia. China, by contrast, where the Sino-Japanese War helped to weaken the Nationalist government and enhance the position of the Chinese Communist Party (which took power in October 1949), was for several decades after that event a sworn enemy of its former ally, the United States. Other Asian powers undoubtedly had long memories of Japanese wartime atrocities against their countries, and they particularly resented efforts by the Japanese government and nationalist organizations to minimize these or even deny that they ever occurred. Yet by encouraging the Japanese economic recovery, the United States helped to make Japan Asia's strongest economic power, thereby enabling it to achieve the dominant position in the Asia-Pacific region for which Japanese leaders had strived since the late nineteenth century.

Japan, Surrender of (15 August 1945)

By early 1945, it was clear to most observers that Japan could not hope to win the war. The U.S. captured Iwo Jima in February. Okinawa, secured in June, could be used as a staging area for a U.S. invasion of the Japanese home islands. Germany, Japan's only remaining ally, had been defeated in May. Meanwhile, B-29 Superfortresses flying from the Marianas were destroying Japan's cities, while submarines cut off Japanese seaborne trade and B-29 aerial mining eliminated much of the important coastal trade, raising the specter of starvation for the Japanese people. Still, Japan fought on.

Revisionist historians have held that since the Japanese government was, by this time, seeking desperately to leave the war, employing the atomic bomb against Japan was unnecessary. Intercepts of diplomatic messages, however, indicate that Japan had still not reached the decision to surrender when the first bomb was dropped. Although Emperor Hirohito and his principal advisers had concluded that Japan could not win the

war, they hoped for a negotiated settlement after a last “decisive battle” that would force the Allies to grant more favorable peace terms. On 28 July, the Japanese government formally rejected acceptance of the Potsdam Declaration, as demanded by U.S. President Harry S Truman two days before—a refusal that led Truman to decide to employ the atomic bomb.

On 6 August 1945, the United States dropped an atomic bomb on the Japanese city of Hiroshima. About 100,000 people perished outright or died later from radiation effects; another 40,000 were injured, and most of the remaining population suffered some long-term radiation damage. Even so, this carnage was less than that inflicted in the firebombing of Tokyo in March 1945. Meeting with the emperor, the army leadership still strongly opposed accepting the Potsdam Declaration.

On 8 August, the Soviet Union declared war on Japan, with Josef Stalin honoring his pledge at Yalta to enter the war

against Japan “two or three months after the defeat of Germany.” One day later, Soviet troops invaded Manchuria in force. That same day, a B-19 bomber dropped a second atomic bomb, on Nagasaki. The blast there claimed about 70,000 dead, either killed outright or dying later from radiation, and it injured as many more.

After prolonged meetings with his top advisers, Emperor Hirohito made the decision for peace on 14 August. He stated that as onerous as it would be to order the surrender, have the Japanese homeland occupied, and see loyal servants face possible trial as war criminals, these considerations had to be weighed against the devastation facing the Japanese people in a continuation of the war.

Braving possible assassination by high-level fanatics determined to stage a coup d’état and fight to the end, Hirohito communicated this decision over the radio on 15 August at noon

Tokyo time, the first occasion on which the Japanese people had heard his voice. In the course of his remarks, Hirohito said, "We have resolved to pave the way for a general peace for all generations to come by enduring the unendurable and suffering what is unsufferable." He referred specifically to the atomic bombs when he said, "Moreover, the enemy has begun to employ a new and more cruel bomb, the power of which to do damage is indeed incalculable, taking the toll of many innocent lives." On 2 September, the final terms of surrender were signed aboard the battleship *Missouri* in Tokyo Bay, and the Japanese islands came under the rule of a U.S. army of occupation.

Japanese Americans

After the Japanese attack on Pearl Harbor, there was tremendous paranoia in the United States regarding Japanese Americans and a general belief among the U.S. counterintelligence community, including the Federal Bureau of Investigation (FBI), that Japanese Americans were engaged in widespread spying for Japan. Certainly, racism, especially on the West Coast of the United States, played a role. During the conflict, the U.S. government treated Japanese Americans very differently from German Americans and Italian Americans.

On 11 December 1941, the FBI ordered the detention of 1,370 Japanese classified as "dangerous enemy aliens." By early January 1942, many notable American politicians were calling for the complete removal of Japanese immigrants and many Japanese American citizens from the entire West Coast. Later that year, the California State Personnel Board voted to remove all "descendants of natives with whom the United States is at war" from civil service positions. Although this act clearly included German and Italian Americans, it was only enforced on Japanese. Almost simultaneously, the U.S. Army created 12 West Coast "restricted zones," in which enemy aliens were confined to a 5-mile radius around their homes and subjected to a curfew; again, this measure pertained almost exclusively to the Japanese.

Then, on 19 February 1942, President Franklin D. Roosevelt signed Executive Order (EO) 9066, authorizing the secretary of war to define military areas "from which any or all persons may be excluded as deemed necessary or desirable." Secretary of War Henry Stimson ordered Lieutenant General John DeWitt, commander of Fourth Army and the Western Defense Command, to enforce EO 9066. On 2 March, DeWitt issued Public Proclamation No. 1, creating military areas in Washington, Oregon, California, and parts of Arizona and declaring the right to remove German, Italian, and Japanese aliens and anyone of "Japanese ancestry" living in specified military areas should the need arise. In March, the government opened its first concentration camp, Manzanar, in Owens Valley, California. That same month, the government began the forced removal of Japanese Americans from the military zones. By 7 August, eight months after Pearl Harbor, General DeWitt announced the complete evacuation of 111,000 Japanese (64 percent of whom were U.S. citizens)

from two of the major military zones to army concentration camps. Included in the removal were West Coast Japanese and those having at least one grandparent who had emigrated from Japan. Forced to settle their personal affairs immediately, the Japanese were removed to 10 camps located in California, Arizona, Colorado, Idaho, and Utah.

Ultimately, the government did allow 35,000 Japanese to leave the camps in return for loyalty oaths and pledges not to settle on the West Coast. Japanese living in the Hawaiian Islands were untouched. That U.S. territory contained the nation's largest concentration of Japanese Americans: 150,000 people, representing 37 percent of the islands' population. Deporting them would have destroyed the islands' economy.

Despite its actions in forcibly relocating Japanese Americans, the U.S. government began recruiting American-born Nisei (second-generation) Japanese for the armed forces in 1943. The Nisei 442nd Regimental Combat Team, recruited from Japanese American volunteers from the mainland concentration camps and from Hawaii, fought with distinction in the European Theater of Operations and became one of the most highly decorated units in U.S. military history. The 442nd also proved to be an invaluable asset in the Pacific Theater, decoding communications, interrogating prisoners, and broadcasting propaganda. In June 1943, while the Nisei were fighting and dying in the Pacific and European Theaters, California Governor Earl Warren signed a proclamation forbidding Japanese Americans from filing for fishing licenses.

By 1945, the U.S. government began authorizing the return of Japanese Americans to their homes. Racism continued, however, for in that same year, Hood River, Oregon, removed the names of 17 Nisei soldiers from its community roll of honor because they were Japanese. During the four years the United States was at war, even as thousands of Japanese were detained in military camps, only 10 people were convicted of spying for Japan; all were Caucasian. Not until a half century later did the U.S. government admit its mistake regarding the Japanese Americans and make partial restitution.

Japanese-Soviet Neutrality Pact (13 April 1941)

Important diplomatic treaty between the Soviet Union and Japan. The failure to coordinate policy and exchange information was typical of the Axis powers in World War II. When the Soviet Union and Germany concluded their nonaggression pact on 23 August 1939, the Japanese were caught by surprise, and when Japanese Foreign Minister Matsuoka Yōsuke visited Berlin in March 1941, Adolf Hitler ordered that he not be informed about Operation BARBAROSSA, Germany's plan to invade the Soviet Union.

On the way back to Tokyo, Matsuoka stopped in Moscow, where he concluded the Japanese-Soviet Neutrality Pact on 13 April 1941. This agreement guaranteed territorial inviolability as well as neutrality in case either power became involved in hostilities with a third nation. The agreement had far-reaching consequences, as it provided for Japanese neutrality when Germany invaded the Soviet Union in June 1941. The treaty was to be valid for five years, with an automatic extension for an additional five years unless one side declared otherwise.

Since 1939, Tokyo had sought an agreement with the Soviet Union to remove a threat from that direction as it attempted to conquer China. The Japanese side first raised the idea of a nonaggression pact in May and June 1940 when the fall of France allowed Tokyo to contemplate a move against the European colonies in Southeast Asia, in which Soviet neutrality would be essential.

Negotiations between Japan and the USSR began in August 1940. During the ensuing negotiations, the Soviets pursued a cautious approach, suggesting a neutrality agreement instead of a nonaggression pact in order not to strain its relationship with the Western powers, whereas the Japanese urged a more binding treaty modeled after the German-Soviet pact of 1939, with the undisguised goal of Japanese expansion southward. The Japanese memorandum resembled the content of the secret protocol of the German-Soviet pact, calling on the Soviet Union to recognize the traditional interests of Japan in Outer Mongolia and the three provinces of northern China (i.e., Manchuria) and to agree that French Indochina and the Netherlands East Indies lay within the Japanese sphere of influence. In return, Japan agreed to look favorably on a Soviet advance into Afghanistan and Persia (Iran).

The Japanese-Soviet Neutrality Pact of April 1941 greatly facilitated Japanese expansion in the southeastern Pacific and its attack on the United States. Josef Stalin's policy toward Japan in the summer and fall of 1941 resembled his attitude toward Germany before June 1941. He ordered his

generals in the Soviet Far East to avoid any hostilities with Japan along their common border in Manchuria and Mongolia. Even if Japanese forces should attack, the Soviet Pacific Fleet was to withdraw northward.

Despite this treaty, Japan contemplated attacking the Soviet Union in the fall of 1941. Leaders of the Guandong (Kwantung) Army in Manchuria especially supported such a move, but Tokyo decided in favor of a move south into the vacuum created by the temporary weakness of the European powers in Southeast Asia. Tokyo reached its decision on the basis of the outcome of earlier fighting with the Soviets, the difficult weather in Siberia, and the absence from that region of oil and rubber, the two natural resources Japan needed most critically at that time.

The Soviet-Japanese Neutrality Pact of 1941 was of immense assistance to the Soviet Union in its war with Germany. Had Germany and Japan cooperated militarily against the Soviet Union, that country would probably have been defeated, and the Axis powers might have won World War II. Thanks to Japan's neutrality, the Soviet Far East provided the Soviet Western Front with 250,000 men between 1941 and 1944. The pact also allowed the Soviet Union to benefit from substantial and vital U.S. Lend-Lease aid. Simultaneously, Japan gained immensely from the pact. During its war with the United States, it received from the Soviet Union 40 million tons of coal, 140 million tons of wood, 50 million tons of iron, 10 million tons of fish, and substantial quantities of gold from Siberia and the Soviet Far East. Soviet trade helped make possible Japan's war with the United States.

The Soviet Union ultimately broke the nonaggression pact with Japan in 1945. At the February 1945 Yalta Conference, Stalin promised his Western allies that his country would enter the war against Japan "two or three months" after the end of the war in Europe, in return for territorial concessions in the Far East. Three months to the day, on 8 August 1945, the Soviet Union declared war on Japan.

Java Sea, Battle of the (27 February 1942)

Naval battle marking the end of organized Allied resistance at sea in the Netherlands East Indies. By January 1942, the Allied defense of the southwest Pacific was collectively organized in the American-British-Dutch-Australian (ABDA) Command.

On 24 February, two Japanese invasion forces set sail for Java. A Dutch patrol plane discovered the eastern force some 50 miles north of Surabaya on 27 February. Rear Admiral Takagi Takeo commanded a force of 2 heavy cruisers, 2 light cruisers, and 14 destroyers covering 41 transports. Dutch Admiral Karel Doorman commanded the ABDA striking force of 2 heavy cruisers, 3 light cruisers, and 9 destroyers, representing all four ABDA nations. In the ensuing engagement, the lack of coordination was a major factor limiting Allied effectiveness. There was no plan of attack, and each nationality used different radio frequencies, signals, and tactics. Furthermore, the Allied crews were exhausted, and many ships were in need of either maintenance or repair. At 4:16 P.M., the Japanese opened the battle. Soon thereafter, the heavy cruisers USS *Houston*—her aft turret inoperable from earlier battle damage—and HMS *Exeter* returned fire. The Japanese scored the first hit when a dud shell struck Doorman's flagship, the Dutch cruiser *De Ruyter*. At 4:35 P.M., the Japanese launched a mass torpedo attack, without success. Shortly after 5:00 P.M., Japanese ships made another torpedo attack, this time sinking the Netherlands destroyer *Kortenaer*. Concurrently, a Japanese shell knocked out most of *Exeter*'s boilers, which disrupted Doorman's formation. Further adding to the disarray, HMAS *Perth* made smoke to protect the disabled British cruiser. The Allies were now in confusion. Two British destroyers covering *Exeter*'s withdrawal engaged the Japanese ships, and during this engagement, shells from HMS *Electra* hit the Japanese light cruiser *Jintsu*, flagship of Rear Admiral Tanaka Raizo's destroyer squadron. Several Japanese destroyers pounded *Electra* in return until she sank at 6:00 P.M. American destroyers made a torpedo and gun attack shortly thereafter, holing but not sinking the Japanese destroyer *Asagumo*.

Under cover of darkness, Doorman futilely attempted to reach the Japanese transports. He tried a run along the Java coast, during which HMS *Jupiter* struck a Dutch mine and eventually sank. HMS *Encounter* lingered to pick up survivors. Being low on fuel and having no remaining torpedoes, the American destroyers also withdrew. That left Doorman with only four cruisers, which the Japanese detected just after 11:00 P.M. A Japanese torpedo struck *De Ruyter* aft, and the

British heavy cruiser HMS *Exeter* sinking during the Battle of the Java Sea. (Corbis)

ship sank. Doorman perished with his flagship. A torpedo hit also doomed *Java*. Before losing contact, Doorman had ordered *Houston* and *Perth* to withdraw to Batavia. In the Battle of the Java Sea, the Allies lost two light cruisers and three destroyers. Three cruisers and six destroyers (four American) survived. The Japanese lost no ships, although one destroyer suffered moderate damage and other units light damage. The battle was the last major naval engagement preceding the Japanese conquest of the Netherlands East Indies.

Jeep

U.S. World War II military vehicle. The jeep was developed in answer to the army's need for a rugged, fast, small motor vehicle designed for reconnaissance and utility uses and capable of operating cross-country.

At Fort Benning, Georgia, in the late 1930s, Captain Robert G. Howie and Master Sergeant Melvin C. Wiley built a machine-gun carrier made of parts from junked automobiles, but it was not sufficiently rugged. In 1940, Howie was detailed to the American Bantam Car Company in Baltimore to help produce a more robust design. The president of Bantam, Harry Payne, had previously developed a small truck for logging camps and construction sites, and he set about, with Howie's assistance, to modify this vehicle for sale to the army.

Shortly thereafter, the U.S. Army Ordnance Department sent invitations to 135 companies to bid on a quarter-ton 4-by-4 truck. Only Bantam and Willys Overland submitted bids. In short order, Bantam produced 70 small trucks. Although enthusiastically received, these vehicles suffered from numerous mechanical problems. Willys, meanwhile, developed two prototype test vehicles at its own expense and independent of the contract. The company ignored some of the army specifications, which had stressed lightness, and concentrated instead on performance and ruggedness.

Meanwhile, the secretary of the General Staff, Major General Walter Bedell Smith, interceded, touting the Bantam version to the army chief of staff, General George C. Marshall. In November 1940, Bantam received a contract for 1,500 trucks. Doubts persisted that the company could fulfill its contract, so the government also ordered 1,500 of the Willys version, and the Ford Motor Company was talked into building 1,500 of its own design. In addition, the vehicle weight was increased to 2,160 lb. Tests of the three vehicles were conducted. Both the Ford and Bantam versions contained smaller engines, and the Bantam proved unreliable mechanically. The Willys was over the weight limit, but engineers managed to pare it down to meet the 2,160 lb limit—but only if the vehicle was clean.

The new vehicle had a 60 hp engine and was capable of a speed of 55 mph. It could climb steep grades and ford streams up to 18 inches deep. Willys engineers called it the "jeep" after a popular cartoon character, although almost until the end of the war, soldiers generally referred to it as a "peep." "Jeep" was the term used by Willys, civilians, and the newspapers, and it stuck.

The jeep was remarkably successful. It could easily transport four men and 800 lb of equipment and even trail a 37 mm antitank gun. Wartime production amounted to some 650,000

Four Japanese-American U.S. Army servicemen ride in a jeep, towing a supply trailer on a rural road in France. (Hulton Archive)

units. The jeep, with some modifications, remained in the army inventory until the mid-1980s.

Jeschonnek, Hans (1899–1943)

German air force general and early architect of the Luftwaffe. Born in Hohensala, Prussia, on 9 April 1899, Hans Jeschonnek volunteered for military service at age 15 during World

War I. Accepted as a cadet to the Military School at Berlin-Lichterfeld, he was commissioned a second lieutenant in 1915. Two years later, he completed flight training and was posted to the Western Front. By the end of the war, he had two victories, or kills, to his credit.

After the war, Jeschonnek continued in the Reichswehr, serving in the Ordnance Department from 1923 to 1928. He graduated at the top of his class from the General Staff College in 1928. In September 1933, he became adjunct to Aviation Minister Erhard Milch and played an important role in the secret building of the Luftwaffe. He was next assigned as Luftwaffe chief of operations in 1937, and a year later, he was promoted to colonel. Appointed chief of staff of the Luftwaffe in February 1939, he was made a brigadier general that August and a full general in 1942.

An ambitious and hard-working officer, Jeschonnek was totally dedicated to Adolf Hitler and National Socialism. He never questioned policies and took Hitler at his word. Informed

by the Führer that he intended to wage a short war, Jeschonnek never prepared the Luftwaffe for a protracted campaign, nor did he mobilize the production assets to ensure an adequate number of replacement aircraft. Devoted to tactical aviation, he insisted that all bombers be able to dive-bomb, which increased the weight of aircraft and reduced bomb loads.

As the war progressed and Germany's fortunes turned, the head of the Luftwaffe, Hermann Göring, shifted more and more blame on his young chief of staff. Eventually, the burdens of the war and the bickering and backstabbing at the higher levels of command overcame Jeschonnek. Made a scapegoat by Göring for the Luftwaffe's failure to stop the Allied bombing of Germany and to supply Sixth Army at Stalingrad, Jeschonnek committed suicide on 18 August 1943 at Hitler's headquarters at Rastenburg, Germany.

Jet and Rocket Aircraft

Aircraft propelled by gas turbines or rocket engines. Compared to the piston engine, the gas turbine (or jet engine) (see Table 1) promised to offer unrivaled power-to-weight ratios, provided that the metallurgical, mechanical, and aerodynamic design problems could be solved. While still a Royal Air Force (RAF) cadet in 1928, Frank Whittle argued that the gas turbine was a practical power unit. He continued to work

on the idea and formed his own company, Power Jets, in 1935. In Germany, Hans-Joachim Pabst von Ohain developed a jet engine that first ran in 1937, flying it in a Heinkel 178 test aircraft in August 1939. Whittle's prototype engine flew in the Gloster E28/39 in May 1941.

The Germans also experimented with rocket fighters, with the Messerschmitt

Me-163 entering service in June 1944 against U.S. bombers. The Me-163 had an incredible climb but used a highly corrosive fuel that was inclined toward instability, and many pilots

were lost in landing accidents. Less than 50 Me-163s were operational at any one time; they had limited success, but their effect was mainly psychological.

The first operational jet fighter was the British Gloster Meteor, which entered service in July 1944. The Meteor I was distinctly underpowered and had serious limitations as a fighter, being difficult to control at speeds over Mach 0.67. It was armed with four 20 mm cannons. All World War II jet and rocket aircraft had compressibility problems at high speeds and were generally slow to accelerate at low speeds, but they were much better than propeller-driven rivals at high speed, easily outclassing them in acceleration and zoom climb.

The German Messerschmitt Me-262 first flew on jet power in July 1942 and also entered operational service in July 1944, but it was a much better fighter than the Meteor. In common with most jets, it was vulnerable during the landing and take-off phases. It was armed with four 30 mm cannons. A total of 1,200 were built, but only about 200 entered squadron service. The Heinkel He-162 jet fighter utilized nonstrategic materials and required an experienced pilot during the takeoff and landing phases. Armed with two 20 mm cannons, the He-162 was prone to catastrophic structural failure if carelessly handled. A handful of He-162s became operational in April 1945.

The German Arado 234 "Blitz" was the world's first jet bomber. A prototype flew for the first time in June 1943, but delays in securing its engines meant that it did not enter service—and then, in only very limited numbers as a reconnaissance variant—until August 1944. The first bomber version was operational in December 1944. A total of 210 were built.

The Japanese also built such aircraft. Their Yokosuka Ohka MXY 7 Oka ("Cherry Blossom"), built at the Yokosuka Naval Arsenal, was essentially a rocket-propelled, man-guided missile, carried to the target area under a specially converted Mitsubishi G4M Betty bomber. Once the pilot was in position, the canopy was sealed shut. Employed in combat from March 1945, most of these planes were shot down by Allied navy fighters, although one did sink the U.S. destroyer *Monmert L. Abele* in April.

The Bell P-59 Airacomet was the only jet aircraft of the U.S. Army Air Forces (USAAF) to see combat in the war. The twin-engine, straight-wing P-59 flew for the first time in October 1942. It had a top speed of only 400 mph and offered few advantages over the piston-powered U.S. aircraft then in service. Fifty production models were initially deployed with the 412th Fighter Group in 1945. Although the P-59 proved a valuable testing platform, the first mass-produced U.S. jet fighter was the Lockheed P-80 Shooting Star. Utilizing the British H-1 turbojet engine, it first flew in January 1944 and exceeded 500 mph on its first flight. The U.S. Army ordered 5,000 P-80s, but with the end of the war, production was scaled back to 917 aircraft. Ultimately, 1,714 were built.

Andy Blackburn

The first mass-produced U.S. jet fighter was the P-80 Shooting Star, with a top speed of over 500 mph.

*Range is maximum flyable distance on internal fuel, including reserves. Combat radius for jet aircraft would typically be 30 to 35 percent of this value at high altitude, 15 to 18 percent if at sea level.

Jewish Resistance

The Nazis exterminated 6 million Jews during World War II. Those who claim that Jews went as meekly as sheep to the slaughter ignore the many instances of remarkable courage in the face of this staggering crime against humanity. In reality, Jewish resistance took many forms. That it often proved futile reflects the poignant vulnerability of Jews rather than any lack of bravery or courage.

Resistance may be divided into the two general categories of passive and active. Passive resistance took the form of cultural and spiritual endurance and assertiveness. Jews confined to ghettos such as Warsaw continued to practice their culture and religion despite prohibitions. They organized symphonies, drama clubs, schools, and other voluntary and educational associations. They also risked their lives by trading across ghetto walls, despite threats of torture and execution.

Passive resistance drew on a long and esteemed Jewish tradition of outlasting the persecutor. Initially believing that the Nazis and their various European sympathizers wanted to put Jews in their place, not in their graves, Jewish leaders sought to endure discriminatory laws, pogroms, and deportations, hoping for an eventual relaxation of anti-Semitic policies or perhaps even a defeat on the battlefield.

Thus, Jewish resistance remained largely nonviolent until 1943, in part because the Germans succeeded in deceiving the Jews. They were helped in this by the fact that the German soldiers of World War I had generally behaved decently, treating Jewish noncombatants humanely. Jews in Poland and the east initially expected similar behavior from the Nazi invaders. Even after it became apparent that Nazi soldiers and especially police were intent on human butchery on a scale previously unimaginable, Jewish cultures that embraced the sanctity and sheer joy of life found it difficult to comprehend a culture built on hate and murderous brutality, especially one that continued to worship civilized icons such as Goethe and Beethoven. Many Jews put their faith in God—hoping for the best, preparing for the worst, yet not daring at first to think the unthinkable.

When Jewish communities and individuals recognized the unthinkable—that the Nazis and their various European allies wanted to exterminate systematically all Jews in Europe—

active and armed resistance increased. Active resistance included acts of industrial sabotage in munitions factories or isolated bombings of known Nazi gathering spots. One must recognize, however, the near utter futility of such efforts, given the impossibility of Jews “winning” pitched battles against their killers. The Nazis had machine guns, dogs, and usually superior numbers, and they could call on tanks, artillery, and similar weapons of industrialized modern warfare. The Jewish resisters were often unarmed; at best, some might have pistols or rifles with limited ammunition, perhaps supplemented by a few hand grenades. Such unequal odds often made the final result tragically predictable, yet many Jews decided it was better to die fighting than to face extermination in a death camp.

When it became apparent that they were being deported to Treblinka to be gassed, the Jews of Warsaw at first refused to assemble and then led a ghetto uprising in April 1943, the ferocity of which surprised the Germans. More than 2,000 German soldiers, supported by armored cars, machine guns, flamethrowers, and unlimited ammunition, faced approximately 750 Jews with little or no military training. The Schutzstaffel (SS) general in command, Jürgen Stroop, estimated he would need two days to suppress the uprising. In fact, he needed a full month, as Jews, armed mainly with pistols, homemade grenades, and Molotov cocktails, fought frantically and ferociously from street to street and bunker to bunker. The Warsaw uprising was only the most famous example of nearly 60 other armed uprisings in Jewish ghettos.

Resistance was less common in death camps such as Chelmno, Sobibor, and Treblinka, mainly because there was not sufficient time for resistance networks to form. Resistance requires leaders, organization, and weapons. These elements cannot be improvised and employed in a few hours or even days: months of planning and training are required. Despite nearly insurmountable difficulties, however, Jews did revolt at all three of these death camps, as well as at Auschwitz-Birkenau and 18 forced-labor camps.

One of the most extraordinary acts of Jewish resistance took place at Treblinka. On 2 August 1943, one year after the inauguration of the camp, a group of Jewish prisoners rose up, killed their guards, burned the camp, and escaped. Of 600 prisoners who got away, only about 40 survived the war.

Jews also participated actively in resistance networks in Poland, the Soviet Union, France, and other countries. Their plight was difficult in the extreme, since anti-Semitism within these networks often required Jews to hide their ethnicity. In some cells of the Polish Resistance, Jews were killed outright. Many Soviet partisans distrusted and exploited Jews; nevertheless, between 20,000 and 30,000 Jews fought as partisans in the USSR against Nazi invaders. In France, Jews made up less than 1 percent of the population yet 15 to 20 percent of the French underground. In 1944, nearly 2,000 Jewish resisters in France united to form the Organisation Juive de

Combat (Jewish Fighting Organization), which supported Allied military operations by attacking railway lines and German military installations and factories.

Impressive as it was, Jewish resistance was always hamstrung for several reasons. In general, Jews lacked combat experience, since many countries forbade Jewish citizens from serving in the military. As with Soviet prisoners-of-war (POWs) taken by the Germans, many Jews, especially those confined in ghettos, were weakened by disease and deliberate starvation. Under these conditions, trained Soviet soldiers died with hardly a murmur of protest, so it is not surprising that Jewish families who had never been exposed to the hardships of war would likewise succumb.

The Nazis succeeded in creating a Hobbesian state of nature in which people were so focused on surviving from hour to hour that their struggles consumed virtually all their energy and attention. Dissension within Jewish communities also inhibited resistance, with older Jews and members of the *Judenräte* (Jewish councils) tending to support a policy of limited cooperation with the Nazis, hoping that by contributing to the German war effort, they might thereby preserve the so-called productive elements of Jewish communities.

More controversially, Jewish resistance was hampered by weak and irresolute international support. Although Western leaders often condemned Nazi actions, they took little action. Official Catholic and Protestant statements were equally tentative. Irresolute and sporadic support unintentionally played into the hands of the Nazis as they planned for Jewish extermination.

Observant Jews were people of God's law, the Torah, who put their faith in God, with Jewish culture in general tending to disavow militant actions. Confronted by murderous killing squads possessing all the tools of industrialized mass warfare, some Jews nevertheless resisted courageously, both passively and actively. That their resistance often ended tragically does not mean that it failed. Indeed, Jewish resistance was the acorn from which the modern oak of the Israeli Defense Forces sprang.

Jiang Jieshi (Chiang Kai-shek) (1887–1975)

Chinese general and Guomindang (Nationalist) politician, president of China from 1928 to 1949 and of the Republic of China on Taiwan from 1949 to 1975. Born on 30 October 1887 in Zhejiang Province, China, Jiang Jieshi entered the Chinese military as a career officer in 1908. After joining a revolutionary organization that sought to overthrow the Qing government, Jiang welcomed the successful 1911–1912 Chinese Revolution. In 1920, he allied himself with Sun Yixian (Sun Yat-sen), the head of the Guomindang, or Nationalist, Party and president of China from 1920 until his death in 1925. In Guangzhou (Canton), where he became commandant of the Guomindang Huangpu (Whampoa) Military Academy in 1924, Jiang rapidly developed his own power base. After Sun's death, Jiang undertook the 1926–1927 Northern Expedition, suppressing the Communist movement and subjugating warlords to Nationalist rule. In December 1927, he consolidated his power by marrying Song Meiling (Soong May-ling), daughter of a politically and financially influential Shanghai Christian family.

In 1928, Jiang became head of the Nanjing-based Guomindang government, continuing his ferocious anti-Communist campaigns. Antiforeign and authoritarian in outlook, he promoted a revival of Confucian social and political values. When Japanese forces seized China's northeastern province of Manchuria in 1931 and established the puppet state of Manzhouguo (Manchukuo), he protested to the League of Nations but received little concrete assistance from that organization, and in 1933 and 1935, Jiang signed agreements with Japan whereby he acquiesced, at least temporarily, to Japan's domination of northern China. Although he began building up and modernizing Chinese military forces, his continuing drive to eliminate the Chinese Communist Party aroused serious discontent. In 1935, his northern warlord ally Zhang Xueliang and his troops broke off an anti-Communist military campaign. In the subsequent December 1936 Xi'an Incident, Zhang kidnapped Jiang and forced him to agree to join an anti-Japanese united front with the Communists.

In July 1937, Japanese and Chinese forces clashed at the Marco Polo railway bridge near Beijing, an incident that quickly—probably against the original intentions of both sides—escalated into full-scale war between Japan and

Generalissimo Jiang Jieshi (Chiang Kai-shek) inspecting high-ranking officers of Officers Training Corps at Lushan, Kinkiang, Jiangxi Sheng. (Library of Congress)

China. From August to November, Jiang staunchly resisted Japanese assaults on Shanghai, but he eventually abandoned that city and in quick succession also lost Nanjing (Nanking), his capital, and Wuhan (Hangzhou or Hankow). Fighting steadily at Changsha and other cities, Jiang nonetheless gradually fell back westward. In late 1938, he established his capital in Chongqing (Chungking) in the southwestern Province of Sichuan. Jiang's overall strategy was to wage a protracted war of attrition, forcing Japanese troops to overextend their lines and occupy territory they could never fully control.

Jiang repeatedly sought assistance from Western powers (especially the United States and Britain), but until 1940, he only received modest American financial and military aid and the imposition of limited economic sanctions on Japan. Japan's formal September 1940 alignment with Germany and Italy in the Axis Tripartite Alliance brought increased aid from the United States, including some airplanes. In response to Japanese demands on the Vichy government for air bases in Indochina and other concessions, American policy toward

Japan hardened, and sanctions were tightened beginning in the summer of 1940. In autumn 1941, President Franklin D. Roosevelt repeatedly demanded that Japanese forces withdraw from Chinese territory. He also permitted volunteer American aviators to fight under Colonel Claire Lee Chennault, Jiang's American air adviser.

After the sudden Japanese attack on the United States at Pearl Harbor, China formally declared war on Japan, and the Allies appointed Jiang supreme commander in the China theater. When dealing with his Allied partners, he uncompromisingly defended China's interests, demanding, for instance, the end of Western colonialism and special privileges in China, together with additional wartime assistance to China. At the 1943 Cairo Conference, the Allies also accepted Jiang's demand that China regain all territories ceded to Japan since the 1890s.

Chennault and Jiang enjoyed good relations, sharing the ill-founded faith that airpower alone could win the war against Japan. Jiang sought to conserve his best forces for the postwar struggle he anticipated with the Communists, who

consolidated their own power around their wartime base at Yan'an (Yenan) in Shaanxi (Shensi) Province. His attitude provoked acerbic disputes with General Joseph W. Stilwell, the American commander of the China-Burma-India Theater, who sought to build up a strong Chinese army, preferably under his own command, to mount a large anti-Japanese ground campaign. Stilwell's plans implied major reforms to upgrade the Chinese army. Although Jiang was not personally corrupt, many of his military and civilian associates were. As a consequence, such measures would have jeopardized his tenuous hold on the loyalties of a large number of his semi-independent military field commanders, at least some of whom deliberately embezzled part of the funding intended to support their troops and thereby fielded poorly equipped and understrength units. In 1944, Roosevelt withdrew Stilwell from China. Jiang enjoyed better relations with his successor, General Albert Wedemeyer. The China theater stalemated, and neither Jiang nor the Japanese ever won a decisive victory over the other, though Chinese opposition tied down more than a million Japanese troops.

As the war ended, Jiang faced renewed threats from his Communist opponents, who, with Soviet assistance, quickly took control of much of northern China. In late 1945 and 1946, lengthy American mediation efforts headed by the wartime chief of staff, General George C. Marshall, failed to avert civil war between Guomindang and Communist forces. In 1949, Jiang fled to the island of Taiwan; he served as president of the Republic of China until his death in Taipei (Taipei) on 5 April 1975. On numerous occasions, he fruitlessly attempted to persuade the United States to restore his rule over the Chinese mainland, whose legitimate government he still claimed to head. Tough and authoritarian but limited in vision, Jiang skillfully and shrewdly balanced and maneuvered among the various Chinese factions, but he lacked the broader ability to unify his countrymen around the Guomindang.

Jodl, Alfred (1890–1946)

German army general who was chief of operations for Adolf Hitler's regime. Born on 10 May 1890 in Würzburg, Germany, Alfred Jodl joined a Bavarian field artillery regiment in 1910 and served on the Western Front for the first two years of World War I. After recuperating from wounds he received there, he was transferred to the Eastern Front and served with a Hungarian artillery regiment before moving back to the west and finishing the war as a general staff officer. His superior performance secured him a position in the postwar Reichswehr (State Armed Forces). Serving primarily in staff positions during the interwar years, Jodl was assigned in 1939 as a Generalmajor (U.S. equiv. brigadier general) to the Oberkommando der Wehrmacht (OKW, or Armed Forces High Command) as chief of the Wehrmachtführungsamt (Armed Forces Operations Office, renamed in 1940 to Wehrmachtführungsstab, or Armed Forces Operations Staff). Promoted to General der Artillerie (U.S. equiv. lieutenant general) in 1940, he held this position until the German surrender in May 1945.

Despite his position as Adolf Hitler's chief of operations, Jodl had little direct influence on the planning and execution of Germany's military campaigns, a result of Hitler's unwillingness to delegate authority to OKW. He was an admirer of the Führer's successes in 1939 and 1940, but Jodl was not slavish in his devotion to Hitler. After investigating Army Group A's lack of progress during the Caucasus Campaign of 1942, he returned to endorse the commander's actions, thus contradicting Hitler. In the inevitable tirade that followed, he stood his ground against Hitler, reportedly giving as good as he got. Yet, even though he was disillusioned with his commander in chief and with the conduct of the war, Jodl held true to his belief in obedience and duty and remained at his post for the remainder of the war. He was promoted to Generaloberst (U.S. equiv. full general) in January 1944.

Brought before the International Military Tribunal at Nuremberg after the war, Jodl was tried as a war criminal for crimes against peace, war crimes, and crimes against humanity. Found guilty on all counts, he was condemned to death and hanged on 16 October 1946.

Joint Chiefs of Staff

Ad hoc organization composed of the chiefs of the U.S. military services, formed to coordinate strategic planning with the British Chiefs of Staff during World War II. The Joint Chiefs of Staff was originally formed in January 1942, soon after the United States entered World War II, when the British chiefs went to Washington to reaffirm earlier informal agreements. One proposal that the Anglo-American chiefs agreed on was the establishment of a permanent organization for collaboration—the Combined Chiefs of Staff, defined as the British Chiefs of Staff and their opposite numbers from the United States. It was primarily to provide these opposite numbers to the British membership in the Combined Chiefs that the U.S. Joint Chiefs of Staff was created.

Initially, the Joint Chiefs of Staff consisted of the army chief of staff, General George C. Marshall; the commanding general of the army air forces and deputy chief of staff for air, Lieutenant General Henry H. Arnold; the chief of naval operations, Admiral Harold R. Stark; and the commander in chief of the U.S. Fleet, Admiral Ernest J. King. In March 1942, the positions held by Stark and King were combined under King, and Stark was sent to London to command U.S. Naval Forces in Europe. In July, President Franklin D. Roosevelt brought the former chief of naval operations, Admiral William D. Leahy, out of retirement and appointed him chief of staff to the president. This position was the forerunner of today's chairman of the Joint Chiefs of Staff.

Throughout the war, the U.S. Joint Chiefs followed the British lead and established their primary subordinate organization, the Joint Planning Staff, along the British pattern. In early 1942, most U.S. planning was done by the War and Navy Departments, which focused primarily on Europe and the Pacific, respectively. By 1943, however, the practice of joint and combined planning was carried out by joint committees and coordinated by the Joint Planning Staff and then submitted to the Joint Chiefs for approval. The National Security Act of 1947 finally codified the establishment of the Joint Chiefs of Staff.

Journalism and the War

Recognizing that mass popular support was fundamental to the prosecution of a total war by their entire societies, both the Western democracies and the totalitarian regimes involved in the war co-opted their various media resources to support their war efforts. Manipulation of the press as an organ for wartime state propaganda first became prevalent during World War I, when the governments of the United Kingdom, Germany, tsarist Russia, and France, followed by that of the United States, employed a combination of comprehensive censorship, coercion, and legislation to ensure that the mass media printed only officially sanctioned versions of events relating to the war. During the interwar period, however, these tactics produced a severe backlash, which was particularly pronounced in the United States.

In the totalitarian states, including all three Axis nations and also the Soviet Union and China, state control of the media was already well established when the war began. These countries had no long-standing tradition of a free press as a voice against government encroachments on the rights of the people, and throughout the war, their mass media functioned primarily as outlets through which governments could present their preferred version of reality. Until August 1945, for example, press and radio told the Japanese people that their armies were still winning glorious victories overseas. In those territories occupied by Axis armies, the press was quickly reduced to a similar condition. In both Axis and occupied states, however, some clandestine publications circulated—at great danger to their authors and distributors, who ran the risk of arrest and imprisonment or execution, fates that frequently befell them.

The United Kingdom and the United States each had a strong free press tradition, and in these states, the government control over the press in wartime was more restrained. With the onset of World War II, Great Britain and France again placed restrictions on their media, which applied to both radio and print journalism. Some of these constraints affected not only their own citizens but also foreign journalists reporting from Allied countries, who could be denied access to sensitive areas and also to the facilities they needed to transmit their stories. In practice, many leading American correspondents were staunchly pro-Allies in sympathy, and the Allied censors therefore granted them considerable latitude. Edward R. Mur-

Press censors at work in the British Ministry of Information, 1940. (Hulton-Deutsch Collection/Corbis)

row of Columbia Broadcasting Service, for example, transmitted radio broadcasts from the London Blitz that gave the American people a sense of the war's immediacy and helped to generate popular support for Britain's battle against Adolf Hitler's forces. The United States, a neutral during the first two years of the war, retained its tradition of independent journalism based on the foundation of the First Amendment to the U.S. Constitution. This ended when that country entered the war after Japan's surprise attack on Pearl Harbor on 7 December 1941.

In part because the very nature of the Japanese attack struck almost all Americans as the epitome of duplicitous and dishonorable behavior, U.S. media representatives immediately acceded to their government's requests that they submit to censorship, engage in self-censorship, and submit any questionable materials to the government and the military for vetting prior to their release. Even movies were expected to showcase the official view of the war—that all American soldiers were patriotic and honorable and their enemies evil,

untrustworthy, and despicable. The media also presented a sanitized, even glamorized view of war, playing down its horrific aspects and ensuring that only enemy soldiers, not the home team, were seen to encounter gruesome deaths. Before the advent of television, straight battlefield reporting was highly restrained, emphasizing the heroism of commanders and troops on one's own side and omitting the filth, foul language, and other unsavory aspects that also formed part of the combat experience. As in other nations at war, such censorship in the United States created a public perception that all its fighting men and women were brave and patriotic, that the home front was united behind the war effort, and that government decisions were wise and just. If reported at all, military disasters were presented as merely minor reverses. One exception was that the press was encouraged to pillory fraudulent activities or overly opportunistic "war profiteering." Even so, in both Britain and the United States, newspaper criticism of governmental incompetence, especially instances in which officials had allegedly been inefficient in

prosecuting the war effort, continued to appear, often as part of the normal political process, which was by no means suspended during the war.

Military commanders expected war correspondents accredited to their forces to function primarily as adjuncts to their own efforts, disseminating only those messages and images acceptable to the government. Only occasionally, as when Lieutenant General George S. Patton Jr. slapped a hospitalized soldier who had suffered a nervous breakdown, did correspondents report news that was unflattering or discreditable to the military. These policies brought a near total suspension of in-depth investigative journalism over a wide range of topics. The complete censorship of communications coming from military units (extending even to the personal correspondence of soldiers) made reporters doubly dependent on the goodwill of the armed forces. One by-product of this was to preclude the publication of critiques of military operations or strategy in the open forum of the press.

As a result, in almost all combatant nations, the bulk of World War II military journalism consisted of variations on the “personal interest” or “feature” story. Generally, these stories eschewed hard facts (who, what, when, where) for profiles emphasizing human interest stories. In the United States, the recognized master of this format was the military journalist Ernie Pyle, whose affinity for the common infantryman won him the label “friend of the dogface.” Pyle produced classic pieces that became more realistic over time and, as he moved to the Pacific Theater, grew increasingly honest and made less effort to minimize the misery and deprivation the fighting troops experienced. Even today, his famed dispatch entitled “The Death of Captain Wasko” remains a staple for American soldiers. Like a number of other war correspondents, Pyle paid the ultimate price for his efforts to accompany soldiers to the front when a Japanese sniper killed him on the island of Ie Shima off Okinawa in the closing days of the war.

Together with many other well-known American journalists, among them the young Walter Cronkite, Pyle often wrote for the *Stars and Stripes*, a four-page (later, eight-page) daily newspaper produced by the armed forces and widely circulated among the troops. This journal first appeared during the American Civil War and reappeared in World War I; in 1942, the U.S. military resumed its publication in London, with the first issue carrying an article by Army Chief of Staff General George C. Marshall lauding its contributions to morale in World War I. The paper’s editors and correspondents accompanied the U.S. forces through their various campaigns and had to locate suitable publication facilities as they moved through the different theaters of war. In 1945, the *Stars and Stripes* also began to issue a Pacific edition, and from World War II onward, it continued to appear without a break. Unlike publications designed for a civilian audience,

the *Stars and Stripes* could afford to be somewhat more frank about the rigors and dangers of combat. Both Marshall and General Dwight D. Eisenhower, supreme commander of the Allied Expeditionary Forces, took pride in the fact that this newspaper belonged to the “free press” and instituted a hands-off policy forbidding military censorship of its contents. Although its articles were far more honest than those in similar Axis publications designed for the troops, contributors to the *Stars and Stripes* were usually, in practice, military employees who firmly supported the overriding wartime objective of victory. On those occasions the newspaper criticized military practices it considered unfair or inefficient, it did so from the perspective of the insider who sought to improve an institution he fundamentally supported and on which, indeed, he depended.

Throughout World War II, the media in all belligerent countries were expected to support their own nation’s war effort. Although press controls were far more stringent in totalitarian countries, even democracies with a traditionally strong free press exercised a substantial degree of censorship over the media and demanded that print and broadcast outlets alike publish nothing potentially detrimental to the war effort. Bulky equipment often made live newsreel coverage from the front impracticable, and except when the intention was to stir up popular feeling against the enemy, newspapers were forbidden to disturb the public by featuring overly graphic photographs of bodies of soldiers or civilians who had suffered particularly horrific deaths. In practice, even where censorship was relatively restrained, the home front media usually presented a simplistic and sanitized view of the experience of combat troops in fighting that deliberately minimized brutality, dirt, and bodily discomforts; omitted the mention of savage fighting tactics or atrocities unless these were committed by the enemy; and tended to present all soldiers from their own country as invariably brave, heroic, steadfast, and patriotic. Although there were other reasons for such sentiments, practices of this type undoubtedly contributed to the continuing popular view of World War II as a “good war.” In the 1960s, when war reporting became far more graphic and immediate, with vivid images of actual combat and civilian deaths in Vietnam televised within hours throughout the United States and the rest of the world, public attitudes toward the Vietnam conflict quickly became far more ambivalent than they had been toward World War II.

Juin, Alphonse Pierre (1888–1967)

French army marshal who participated in the Italian Campaign later in the war. Born at Cape Rosa near Bône, Algeria, on 16 December 1888, Alphonse Juin joined the French army and completed two years of obligatory enlisted service. He then entered the French Military Academy of St. Cyr in 1910 and was commissioned two years later, graduating first in his class. His classmate Charles de Gaulle became a close friend. Juin immediately served in Morocco with the 1st Regiment of Algerian Tirailleurs, undertaking large-scale pacification operations under General Louis Hubert Lyautey, who would become his long-term patron. During World War I and in North Africa, where he served both before and after the war, the highly decorated Juin demonstrated almost foolhardy courage, together with unconventional tactical military brilliance.

Juin studied and taught at the *École Supérieure de la Guerre* (1919–1921, 1933–1935). He also attended the Higher Command Course in Paris (1938–1939), but he spent most of the interwar period with the French North African Army in staff assignments, participating in pacification campaigns. By 1935, he had risen to colonel and commanded a regiment in Algeria.

In December 1939, Juin took command of the 15th Motorized Infantry Division in France. From 10 to 29 May 1940, in the Battle for France, he and his troops performed well in Belgium and northern France, covering the Allied retreat to Dunkerque and helping to make possible the evacuation there. On 30 May, German troops captured Juin; at the insistence of General Maxime Weygand, he was repatriated in June 1941. Sent by the Vichy government as a major general to North Africa, he commanded French troops in Morocco and, from November as lieutenant general and then general, French troops in Algeria and Tunisia as well. Juin worked to build up his forces so that they could defend North Africa

General Alphonse Juin, chief of staff of the French Committee of National Defense, in England to meet the chiefs of staff of the three British services. (Hulton Archive)

against any invader. He had no advance knowledge of the Anglo-American North African landings (Operation TORCH) in November 1942, but later that month, he was instrumental in persuading Admiral Jean Darlan to order a cease-fire.

Briefly heading the French army detachment on the Tunisia Front (1942–1943), Juin was soon occupied with the preparation of the French Expeditionary Corps (CEF), which deployed to Italy in November 1943. To command this corps, he accepted a voluntary reduction in rank to lieutenant general. In Italy, he established a good working relationship with the U.S. Fifth Army's temperamentally difficult commander, Lieutenant General Mark W. Clark. Juin convinced Clark and his superior, British General Sir Harold Alexander, to take advantage of his colonial North African troops' expertise in mountain warfare. The CEF displayed its mettle from January 1944 and played a decisive role in the Allied breakthrough of the German Gustav Line to Rome in May. Outflanking the

Germans in the Apennines, the CEF enabled the Allied capture of Monte Cassino in May 1944 and Siena and Florence that July. Juin was arguably the ablest Allied commander in the 1943–1945 Italian Campaign.

In 1944, Juin favored reinforcing Allied troops in Italy, but General Charles de Gaulle, head of the Fighting French government-in-exile, insisted on French participation in the scheduled Allied landings in southern France and ordered Juin to relinquish his troops to General Jean de Lattre de Tassigny for that purpose. De Gaulle later wrote that de Lattre was better suited than the colonial Juin to lead soldiers in metropolitan France, but there has been speculation that he preferred that no single general except himself emerge from the war as France's principal military hero.

Juin served as chief of the French defense staff (1944–1947), resident general in Morocco (1947–1951), inspector general of the armed forces (1951), and commander of the North Atlantic Treaty Organization (NATO) land forces in Central Europe (1951–1956). Made a marshal of France in 1952, Juin outspokenly opposed Algerian nationalism and was embittered by de Gaulle's decision to grant Algerian independence in 1962. He died in Paris on 27 January 1967.

July Bomb Plot (20 July 1944)

Assassination attempt on Adolf Hitler's life. The effort to kill Hitler on 20 July 1944 was, however, only the most visible sign of resistance to the Führer and the last in a string of assassination plots. Many prominent Germans were involved in this activity. The plot included Foreign Ministry officials Adam von Trott zu Solt, Ulrich von Hassell, and Count Friedrich von

Schulenberg. Carl Goerdeler, the former mayor of Leipzig, was perhaps the most prominent civilian involved. Military leaders included Field Marshal Erwin von Witzleben, Generals Ludwig Beck and Friedrich Olbricht, and Admiral Wilhelm Canaris, head of the Abwehr. Opposition to Hitler within the military crystallized after Operation BARBAROSSA, the German invasion of the Soviet Union in June 1941. Disillusioned by the brutal actions carried out by Germany in the USSR, a group of young officers made several attempts to kill Hitler. They planted bombs on his airplane and in the pockets of his overcoat and carried them into meetings with the Führer. Incredibly, fate always intervened to foil each attempt.

Killing Hitler would exempt members of the Wehrmacht from their oath of allegiance and make a coup d'état possible. And even if this move would not secure better terms from the Allies, at least there would be a moral victory. In early 1944, a new leader instilled the movement with renewed hope. Count Claus Schenk von Stauffenberg became disillusioned with Nazi occupation policies on the Eastern Front. He had been badly wounded in Tunisia that year, losing his left eye, right hand, and two fingers on his left hand. While recovering in Germany, he dedicated himself to the task of killing Hitler. Appointed chief of staff of the Reserve Army in July, Stauffenberg developed a daring scheme to assassinate the Führer.

Stauffenberg openly developed a plan, under the code name VALKYRIE, for the Berlin garrison to impose military control on the city in case of a rebellion by the millions of foreign workers employed there. This plan provided cover for the plot to suppress the Schutzstaffel (SS) after Hitler had been removed. The police chief and commandant of Berlin supported the plan, and Stauffenberg carefully coordinated with sympathetic military officials in Paris and Vienna. He hoped to carry off the coup before any Allied invasion could occur and then negotiate an end to the war.

D day occurred before an attempt could be made, however, and many conspirators argued that the invasion rendered the question of assassination moot. Stauffenberg remained determined. Twice he carried explosives to meetings where Hitler was to appear; twice circumstances stayed the event. Then, on 20 July 1944 at a meeting of Hitler and the General Staff near Rastenburg, East Prussia (Ketrzyn, Poland), Stauffenberg armed the bomb concealed in his briefcase and set it down 6 feet from the Führer, and slipped from the meeting to signal the start of the coup d'état.

Through an accident, the bomb was moved, and it only wounded Hitler. Meanwhile, while waiting for confirmation that the Führer was dead, Stauffenberg's coconspirators hesitated and then divided. When news came that Hitler was still alive, the plot collapsed as SS leader Heinrich Himmler and the head of the Armed Forces High Command (OKW), Field Marshal Wilhelm Keitel, moved quickly to crush it. Troops

loyal to Hitler arrested the leading conspirators. Beck was permitted to commit suicide, whereas Stauffenberg and Olbricht were shot out of hand. Further investigation by the Gestapo revealed the breadth of the activity, which came as a surprise to the regime. Ultimately, some 7,000 people were arrested. The leaders were tortured and subjected to farcical “trials” before the People’s Court and then executed in the most hideous fashion, with the event filmed for the amusement of Hitler and other Nazi leaders. In all, perhaps 5,000 opponents of the regime, no matter what the level of their involvement in the plot, were executed.

As the best-known act of resistance in Nazi Germany, the unsuccessful attempt of military leaders to kill Hitler remains controversial. Some scholars hail it as an act of conscience that laid the foundations for a new Germany, but others note that the attempt did not come until Germany was on the brink of defeat. They interpret it, moreover, simply as a repudia-

tion of Hitler himself and not of Nazi principles in general. Whether an act of conscience or a simple coup attempt, the only serious, internal attempt to end Nazi power in Germany resulted in failure.

K

Kaiten

Japanese suicide submarines. By late 1944, the situation for Japan in the Pacific had deteriorated to the point that its leaders turned to extraordinary measures in an attempt to stem the tide of Allied victories. Already employing kamikaze suicide pilots, the Japanese also focused on developing and building the *kaiten* (“turning the heavens”) suicide submarine, which was really nothing more than a Type 93 Japanese torpedo with a small compartment for a pilot.

The individual kaiten torpedo was to be lashed to the deck of a submarine and transported under water to the approximate location of a U.S. ship or naval anchorage. Following the appropriate ceremony, the pilot would leave the submarine and enter the kaiten while it was submerged. The kaiten would then be released and propelled at high speed by its oxygen-fueled engine to smash into the enemy ship. Capable of sustaining a speed of 40 knots for one hour, the kaiten could outrun any American warship. There was no provision for the kaiten to be recovered by the launching submarine. Although the Japanese Naval General Staff had insisted that a means be provided for the pilot to be ejected from the kaiten about 150 feet from impact, no pilot is known to have attempted to escape from his speeding torpedo as it approached the target. The first group of kaiten pilots began training in August 1944, and several submarines were modified to carry the submersibles. All kaiten pilots were volunteers.

The first kaiten mission occurred in November 1944 when three submarines, each carrying four kaiten, departed Japan to attack U.S. fleet anchorages in the Caroline Islands. The

kaiten were launched on the morning of 20 November. Although three could not get under way because of mechanical difficulties, five others set off for anchored U.S. warships in Ulithi Lagoon. Explosions followed, with the Japanese later claiming three aircraft carriers and two battleships were sunk. In reality, one U.S. tanker, the *Mississinewa*, was sunk. One submarine, still carrying her four kaiten, was detected by U.S. warships and sunk.

More kaiten missions followed. A kaiten unit composed of three submarines sailed for Iwo Jima on 22 February 1945. One was sunk by the U.S. destroyer escort *Finnegan*, which was escorting a convoy from Iwo Jima to Saipan when it happened on the Japanese submarine. The surviving submarines inflicted no damage on the U.S. anchorage at Iwo Jima.

The last kaiten operation saw six submarines sortie between 14 July and 8 August 1945, each carrying five or six kaiten. Again, mechanical problems plagued the operation, and three submarines had to turn back to Japan. The kaiten from the others attacked U.S. ships off Okinawa in the most successful of the suicide missions. On 24 July, a kaiten from *I-53* sank the destroyer escort *Underhill*, with a loss of 114 officers and men.

The kaiten effort had failed. Only two U.S. ships had been sunk, one each on the first and the last kaiten missions, but eight of the carrying submarines were sunk, with almost 900 crewmen lost. The kaiten, as with the kamikaze pilots, were an indication that the Japanese had run out of alternatives to counter the rapidly advancing Allied forces on their march toward Japan.

Kalinin, Recapture of (15 December 1941)

Major battle during the Soviet counteroffensive to throw back the German army in its drive to Moscow. Kalinin (now Tver), situated some 100 miles northwest of Moscow, served as the northern linchpin in the defense of the Soviet capital. Retreating to within 40 miles of Moscow, the Soviets brought up 100 fresh divisions, including 34 from Siberia that were specially trained for winter warfare. From mid-November to 4 December, German casualties had reached some 85,000 in the Moscow area alone. The unusually early and harsh winter, with temperatures as low as -31°F (-37°C), had brought most motorized transport to a halt. The German army, unlike its Soviet counterpart, was ill prepared to fight in such conditions.

To complicate the situation further, German leader Adolf Hitler had issued orders on 1 December that threw the German High Command into disarray. On that date, Hitler relieved Field Marshal Karl Gerd von Rundstedt as commander of Fifth Panzer Army and personally took command of this crucial sector of the front before Moscow. That same day, Field Marshal Fedor von Bock, commanding Army Group Center (Heeresgruppe Mitte), relayed the message that German troops were completely exhausted. The German drive against Moscow had ground to a halt.

On 30 November, Soviet leader Josef Stalin had agreed to plans drawn up by the chief of the Soviet General Staff, Marshal Boris M. Shaposhnikov, and the next day, the General Staff made final preparations for the offensive. On 5 December, the Soviet commander on the Moscow front, General Georgii K. Zhukov, started the first great Soviet counteroffensive in the Kalinin sector. Siberian troops, who were extremely effective in cold-weather operations, were used for these actions. The next day, Zhukov ordered a general offensive against German forces west of Moscow—Army Group Center. Some 88 Soviet divisions with 1,700 tanks and 1,500 aircraft attacked 67 German divisions (many of them understrength) on a 500-mile-long front between Kalinin and Jelez.

They pushed back the completely exhausted Germans, encircling them where possible and forcing a general retreat.

Hitler, however, forbade anything but the shortest withdrawals. On 8 December, with the Red Army achieving many breakthroughs, he ordered his troops to go over to purely defensive operations and hold their positions at all costs. This decision, though helping to ensure that the retreat did not turn into a general rout, condemned thousands of Germans to death. On 13 December, Soviet forces moved to relieve Leningrad, extending the counteroffensive to the northwest. On 14 December, German troops departed Kalinin, which the Soviets entered the next day. Hitler assumed command of the German army on 19 December, and German forces managed to establish a stable front line some 55 miles west of Moscow one day later. The Red Army's winter counteroffensive continued into February 1942, although its greatest gains were registered at its beginning.

Kaluga, Battle of (26–30 December 1941)

The culmination of the Soviet winter offensive in December 1941 that threw back advancing German forces and halted their drive on Moscow. Kaluga is situated some 90 miles southwest of Moscow; the Germans had taken it on 12 October 1941.

Reinforced by 100 fresh divisions, the Soviets launched a massive counteroffensive to save Moscow on 5–6 December 1941. The action took place in subzero temperatures and with German forces completely spent and strung out along a front of 560 miles, from Kalinin in the north to Yelets in the south. During the first days of their offensive, the Soviets registered significant progress. Where possible, they avoided frontal assaults, endeavoring to flank and get behind the German positions and cut them off, creating maximum confusion and panic. Partisans also struck the overextended German communication and supply lines.

Fearful of encirclement, German troops destroyed what they could and then withdrew. On 13 December, the Soviet

government issued a communiqué announcing that the German effort to take Moscow had failed. On 14 December, Soviet General Ivan Zakharin's Forty-Ninth Army went on the offensive north of Tula against Army Group Center (Heeresgruppe Mitte). Despite German leader Adolf Hitler's order of 16 December calling for "fanatical resistance," the right wing of the German Fourth Army on the east bank of the Oka collapsed, and on 17 December, Aleksin fell. The offensive continued in the direction of Tarusa, which was taken the next day.

A special mobile group under Lieutenant General V. S. Popov, including cavalry, infantry, and tank units, then moved in deep snow through the woodlands on the southern bank of the Oka. The offensive to recapture Kaluga began on 17 December. In three days, Popov's troops covered nearly 60 miles, and by the evening of 20 December, they had Kaluga in sight. The Germans there were taken completely by surprise. During the morning of the next day, the 154th Rifle Division, supported by the 31st Cavalry Division and tanks, attacked the railway station.

On 26 December, German resistance in the Nara-Fominsk area broke and the city was retaken. Borovsk and Maloyaroslavets soon fell. On 28 December, Hitler issued a new order calling for every hamlet and farm to be turned into defensive positions and held at all costs. Counterattacks ordered could not be realized, however. German tanks were no longer capable of offensive operations but could only cover retreating infantry units.

Much more adept at fighting in winter conditions, the Soviets threw back every German attempt to stop their advance. Unable to cover and plug the ever increasing number of holes appearing in their front line, the Germans had to withdraw even farther west. On 30 December, Soviet forces completely secured Kaluga. The Soviet offensive ended on 5 January 1942. The Soviet army had established a line between Uhnov, Kirov, and Ludinovo and completed the encirclement of Army Group Center. The German army had lost 25 percent of its original strength in the east and been handed its first strategic defeat.

Kamikaze

Japanese suicide pilot. The special corps of suicide aviators was organized by Rear Admiral Arima Masafumi in 1944 to compensate for the critical shortage of skilled Japanese pilots and the increasingly desperate situation of the Japanese forces after the Battle of the Philippine Sea. The term *kamikaze* means "divine wind" and derives from two legendary Japanese victories over invading Mongol forces in the thirteenth century. At that time, a typhoon or kamikaze wind destroyed the Mongol fleet as it lay off Japan in preparation for an invasion. The Japanese had long believed that this kamikaze wind was a divine intervention, and over many centuries, they had come to accept the proposition that Japan was shielded from calamity by a supernatural force much greater than any man might assemble. Japanese leaders hoped that the kamikaze pilots, like the wind that had saved their land from Mongol conquest seven centuries earlier, would spare Japan an Allied victory and occupation in the twentieth century.

Admiral Arima had little trouble in recruiting pilots for his suicide missions. Thousands of young Japanese volunteered. A last-ditch defensive measure, the kamikaze missions succeeded in wreaking havoc on Allied warships without sapping Japan's other resources. The first kamikaze missions were flown during the Battle of Leyte Gulf in October 1944 when 24 volunteer pilots of the Japanese navy's 201st Air Group on Leyte attacked a force of U.S. escort carriers. During this action, one carrier, the *St. Lô*, was sunk, and two others were heavily damaged.

The kamikaze plane operated as a kind of guided missile with human control. Kamikaze pilots tried to crash their planes into enemy ships. Most kamikaze aircraft were ordinary fighters or light bombers, often loaded with bombs and extra gasoline tanks. Many of the aircraft were old (some were biplanes with nonretractable gear), but later, the Japanese also used a new aircraft, which was a piloted rocket. Specifically developed for suicide missions, this aircraft, called "Baka" by the Allies for the Japanese word for fool, was carried to the target area by a medium bomber. Dropped from an altitude of over 25,000 feet, the rocket would glide to about 3 miles from its target before the

At least 1,450 kamikaze pilots gave their lives at Okinawa, sinking or damaging 263 Allied ships, resulting in the deaths of 5,000 men.

A Japanese kamikaze pilot tries to crash his plane onto the deck of a U.S. Pacific Fleet warship, 1 January 1945. (Hulton Archive)

pilot turned on the three rocket engines, accelerating the craft to more than 600 miles per hour in its final dive.

After Leyte was nearly secured, the Allies prepared to land on Luzon. With the loss of Leyte, there was little the Japanese could do to stop the American advance, but they decided to make the Luzon Campaign a costly one for their adversaries. Having lost the bulk of their fleet in the various encounters with Allied forces in the Battle of Leyte Gulf, the Japanese had to turn in force to kamikazes to combat the Allied fleet. During the landing of American forces on Luzon, kamikaze pilots constantly harassed the U.S. ships. One estimate holds that 1 out of every 4 kamikazes hit its target and that 1 out of every 33 sank a ship.

During the Battle for Iwo Jima, the kamikaze threat was lessened because of the distance between the island and the nearest Japanese air bases. However, there were still kamikaze attacks. On 21 February 1945, kamikazes sank the escort carrier *Bismarck Sea* and damaged the fleet carrier *Saratoga* (with the loss of some four dozen of her aircraft), as well as the escort carrier *Lunga Point*, a cargo ship, and two LSTs (landing ships, tank).

The kamikaze effort reached its zenith during the Battle of Okinawa, when the Allied task force was repeatedly attacked by waves of suicide planes. This tactic was new. Previously, kamikazes had operated in separate and individual attacks. During this battle, however, the fleet was subjected to massed kamikaze raids. These *kikusui* (floating chrysanthemum) raids, as the Japanese called them, were far more devastating than single kamikaze attacks and took a heavy toll of Allied ships. In several of the raids, more than 350 planes were sent against the fleet. Often, these suicide missions were supported by conventional air attacks conducted simultaneously. By the end of the campaign for Okinawa, at least 1,450 kamikaze pilots had given their lives for their emperor; in the process, they sank or damaged 263 Allied ships, resulting in the deaths of 5,000 men—the greatest losses ever suffered by the U.S. Navy in a single battle and more than it had lost in all the wars of U.S. history to that point.

The effect of the kamikaze attacks, particularly during the Battle of Okinawa, had a major impact on Allied strategic planners as they contemplated an invasion of the Japanese home islands. If several thousand of these suicide pilots could

wreak havoc on Allied forces in Leyte, Iwo Jima, and Okinawa, what might one expect when Japan was invaded? No doubt, this consideration played a role in the decision to employ the atomic bomb.

Kan'in Kotohito, Imperial Prince of Japan (1864–1945)

Japanese general and member of the Imperial family. Born on 22 September 1864 in Kyoto, Japan, Prince Kan'in Kotohito received the title of Imperial Prince Kan'in in 1872. Educated at the Army Cadet School, he studied in the French Army Cadet School and the Cavalry School from 1878 to 1882. Following his return to Japan, he served in almost all major cavalry posts in the army. During the 1904–1905 Russo-Japanese War, Major General Prince Kan'in served in the headquarters of Manchuria Expeditionary Army. Promoted to lieutenant general, he commanded both the 1st Division and the Imperial Guards Division. Kan'in was promoted to field marshal in 1919.

As a “grand old man” of the Imperial Army, Kan'in occupied the post of chief of staff of the army between December 1931 and October 1940. His age made him a mere figurehead, providing the opportunity for radical midrank officers to increase their influence in army decision making. Prince Kan'in died in Tokyo on 20 May 1945.

Kasserine Pass, Battle of (14–22 February 1943)

Axis counteroffensive in Tunisia and a tactical defeat for the Allies. By late 1942, U.S. and British forces invaded Vichy-held French North Africa (Operation TORCH) while the British Eighth Army pushed Italian and German forces from Egypt into Libya. Italy and Germany then rushed reinforcements to Tunisia, but Axis forces there soon found themselves sandwiched between two Allied armies. Victory for the Allies seemed only a matter of weeks away, until the friction of logistics, poor weather, and overconfidence provided the Axis an opportunity to seize the initiative and launch a counterstroke.

Hindering any Axis operation was the issue of who controlled the two armies in Tunisia. German Field Marshal Albert Kesselring in Italy had overall tactical command of Axis forces in the Mediterranean. Under him, Field Marshal Erwin Rommel commanded Panzerarmee Afrika (Panzer [or Tank] Army Africa) in southern Tunisia, and Colonel General Hans Dieter Jürgen von Arnim commanded the Fifth Panzerarmee in the north. The Axis plan called for von Arnim's 10th and 21st Panzer Divisions to move through Faid Pass and destroy American forces at Sidi bou Zid. Rommel was to seize Gafsa on the Allied right flank and then move north to link up with von Arnim. Although the Axis forces enjoyed combat experience, effective air support, and better equipment, the murky command arrangement mitigated against decisive success on the battlefield.

For the Allies in Tunisia, the embryonic nature of coalition operations began to manifest itself at all levels, to include integrating the French into the operational structure. The major U.S. element was Lieutenant General Lloyd Fredendall's II Corps, which held the southern flank between Faid and Maknassy Passes. Fredendall, both overconfident and overly cautious, deployed his inexperienced troops in unsupportable positions and unnecessarily complicated the command-and-control structure. His main battle element, the 1st Armored Division, was scattered into small detachments and could not fight as a complete unit. Fredendall directed operations from an elaborate underground command post some 70 miles from the front in Tebessa, which caused both superiors and subordinates to question his competence.

During a raging sandstorm on 14 February 1943, over 200 of von Arnim's tanks, supported by aircraft, began an attack reminiscent of the early blitzkriegs. The Americans' inexperience and poor leadership proved no match for the veteran panzer divisions, which quickly bypassed and isolated over 2,500 Americans near Sidi bou Zid. In two days, the Allies lost six battalions of infantry, armor, and artillery, leaving the 1st Armored Division in shambles. As Axis forces attacked

American soldiers examine a captured Italian Carro Armato M15/42 medium tank taken during a successful Allied counterattack at Kasserine Pass in southeastern Tunisia, February 1943. (Hulton-Deutsch Collection/Corbis)

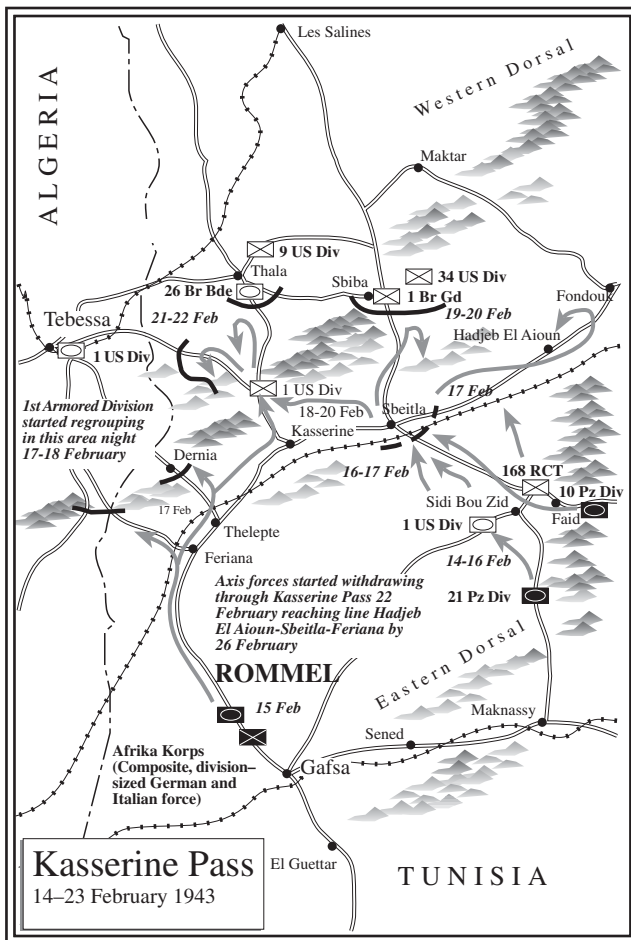

toward Sbeitla, the demoralized Americans began a general retreat, during which they destroyed supplies to prevent their capture by the Axis forces.

As the Allies rushed reinforcements forward to stabilize their defense, the German command debated the objective. Rommel wanted complete operational control in order to cut Allied lines of communications and capture the logistics base at Tebessa. But Kesselring refused to grant Rommel's request and subsequently ordered the attack toward Le Kef and Allied reserves. This disagreement diluted the Axis attack and provided the Allies valuable time to recover and rest their disorganized forces.

On 19 February, Rommel struck at Kasserine Pass, a constricted defile 800 yards wide between 4,000-foot hill masses. The pass was guarded by a mixed force of more than 2,000 U.S. infantrymen and engineers, as well as French artillery, including a battalion of tank destroyers, all commanded by Colonel Robert Stark. Fredendall ordered Stark to "pull a

Stonewall Jackson." Stark's command held until the next day, when an Axis attack supported by Nebelwerfer rockets broke through his defense. Deterred from gaining Tebessa by a strong Allied defense, Rommel ordered his forces toward Thala, where they swept through a British armor rear guard. An apparent Axis victory was blunted by a dramatic reinforcement of U.S. artillery on 21 February. Frustrated by stiffening Allied resistance and an inability to gain firm control of all the Axis forces, Rommel withdrew on 22 February to face General Bernard Montgomery's Eighth Army along the Mareth Line to the east.

Aided by Axis indecision, the Allies had held just long enough, but the cost was high. Records on both sides are fragmentary, but the Allies sustained nearly 4,000 casualties, with 60 artillery pieces and 64 armored vehicles captured. II Corps probably lost 20 percent of its engaged forces, as well as up to 400 armored vehicles and more than 200 artillery pieces. Kasserine Pass was a serious defeat for the inexperienced

Americans. The U.S. commander in North Africa, General Dwight D. Eisenhower, quickly took steps to reshuffle his command including the replacement of Fredendall as commander of II Corps by Major General George S. Patton Jr.

Katyń Forest Massacre (1940)

World War II Soviet atrocity in Poland. On 13 April 1990, the Soviet news agency Tass announced that a joint commission of Polish and Soviet historians had found documents

proving the involvement of personnel from the Narodnyy Kommissariat Vnutrenniakh Del (NKVD, or People's Commissariat for Internal Affairs) in the deaths of some 15,000 Polish officers in the Katyń Forest of eastern Poland in 1940. The general secretary of the Communist Party of the Soviet Union and president of the USSR, Mikhail Gorbachev, handed over a list of the victims to Polish President Wojciech Jaruzelski. In October 1992, Russian President Boris Yeltsin produced more archival documents, helping to determine the burial sites of missing officers not found near Katyń. Even in the light of Gorbachev's glasnost and perestroika policies, this admission of Soviet responsibility for the massacre was still a bombshell.

The USSR had consistently denied murdering captured Polish army officers after its occupation of eastern Poland ever since Radio Berlin announced, on 13 April 1943, that German troops, tipped off by local inhabitants, had discovered mass graves near Smolensk. That June, the German Field Police reported that 4,143 bodies had been found in the Katyń Forest, all fully dressed in Polish army uniforms. Some 2,815 corpses were later identified by personal documents in their pockets. Without exception, all the officers, ranking from general to noncommissioned officer, had been killed by shots in the back of the head. Medical examination later showed that a few bodies had jaws smashed by blows or bayonet wounds in their backs or stomachs, probably sustained when the individuals tried to resist execution.

The Germans predictably tried to exploit the Katyń murders for propaganda purposes, pointing out to their wartime enemies that any alliance with the "Bolshevik" perpetrators of this atrocity was too dangerous to continue. By then, General Władysław Sikorski's London-based Polish government-in-exile and General Władysław Anders, then commander of the Polish forces in the USSR and the Middle East, had been worrying for a considerable time over the fate of the missing Polish officers. Following the Soviet-Polish agreement in the summer of 1941, a small but steady trickle of Poles arrived at the reopened Polish Embassy in Kuibyshev. These individuals, from prison camps scattered over the western parts of the USSR, agreed that their fellow servicemen had been transferred to unknown destinations when the NKVD liquidated these camps in April 1940. The arrivals at Kuibyshev turned out to be the few survivors of the Katyń Forest Massacre. The massacre was apparently a Soviet effort to deprive the Poles of their natural leaders, who would undoubtedly protest a Soviet takeover.

After numerous fruitless discussions on the subject with Soviet authorities, including dictator Josef Stalin himself, the Polish government-in-exile came to believe the German announcement of April 1943 and demanded an independent investigation by the International Committee of the Red Cross (ICRC). This move caused the Kremlin to accuse the Polish

A German doctor performing an autopsy on a dead Polish soldier selected at random from a mass grave at Katyń Forest. This photo, which was used at the congressional hearings probing the Russian massacre of Polish officers believed to have taken place in 1940, was taken in 1943 when American and British soldiers held prisoner by the Germans were taken to view the massacre site. (Bettmann/Corbis)

government-in-exile of siding with the “fascist aggressors” and to break off diplomatic relations. The ICRC, pursuing its policy of neutrality, could take no action without Soviet consent. London, although embarrassed by this development, made it plain that it was unwilling to risk the breakup of the alliance with the Soviet Union against Nazi Germany over such an investigation. The United States took a similar stance.

When the Red Army finally drove the German armies westward, Moscow determined it needed to present its own investigation results in 1944. A Soviet “special commission,” pointing out that the bullets found on the crime scene were manufactured in Germany, concluded that the Germans had killed the Polish officers in 1941. British and American protests notwithstanding, the Soviet prosecution raised the Katyń affair at the International Military Tribunal in Nuremberg, but since the Soviets were unable to prove the Germans guilty, the tribunal simply dropped the case. Throughout the Cold War, the issue of the Katyń Forest Massacre resurfaced time and again, partly due to the efforts of the Polish émigré community. However, it remained unresolved until the demise of the USSR.

Keitel, Wilhelm (1882–1946)

German army field marshal and chief of the Oberkommando der Wehrmacht (OKW) throughout the war. Born on 22 Sep-

tember 1882 in Helmscherode, Germany, Wilhelm Keitel joined a Prussian field artillery regiment in 1901 and served as the regiment's staff captain during the early months of World War I. Seen to have potential, he was posted to the German General Staff, an unusual appointment for a non-Prussian and field artillery officer. His demonstrated abilities while serving during the latter part of the war secured him a position in the postwar Reichswehr. Chosen to head the Wehrmachtamt (Armed Forces Office) in 1935, Keitel became chief of staff to the commander in chief of the Wehrmacht. When Adolf Hitler assumed command of the Wehrmacht in 1938, Keitel remained as chief of staff, although with the new title of OKW chief, and he maintained that position until Germany's surrender in 1945. He was promoted to Generalmajor (U.S. equiv. brigadier general) in April 1934, Generalleutnant (U.S. equiv. major general) in January 1936, and Generaloberst (U.S. equiv. full general) in November 1938. He became a field marshal in 1940.

Although competent as a staff officer, Keitel maintained his position as a direct result of his personal loyalty to Hitler

and not because of his abilities. With his headquarters responsible for only one operation during World War II, the 1940 Denmark-Norway Campaign, German commanders and staffs consistently bypassed him and OKW and went directly to Hitler. Privately, they referred to Keitel as *Lakeitel* (lackey), a reference to his relationship to Hitler and his limited influence on Germany's military operations. More than any other act, his work in the promulgation of the Commissar Order of 1941, a decree that mandated the immediate execution of all captured political officers on the Eastern Front, led to his classification as a war criminal. Brought before the International Military Tribunal at Nuremberg after the war, he pleaded not guilty to all charges, citing his responsibility to carry out superiors' orders as his defense. Convicted and condemned to death, Keitel was hanged on 16 October 1946.

Kesselring, Albert (1885–1960)

German air force field marshal whose air fleets participated in many of the key engagements of the war, including the invasions of Poland, France, the Low Countries, and the Soviet Union. Born in Marksheft, Bavaria, Germany, on 20 November 1885, Albert Kesselring joined the Bavarian army as an officer candidate in the 2nd Regiment of Foot Artillery in 1904 and was commissioned in 1906. A trained balloon observer, he served with his battery on the Western Front during World War I. Soon, he was on the staff of a regiment and then a division and finally with the 2nd Bavarian Army Corps until the armistice.

He continued in the postwar Reichswehr and secured his reputation as a superb administrator. Colonel Kesselring transferred to the still-secret air force in 1933 as chief of administration and military assistant to Luftwaffe State Secretary Erhard Milch; there, he helped direct the secret expansion of the air force, for which he deserves considerable credit. In June 1936, he became the Luftwaffe chief of staff as a Generalleutnant (U.S. equiv. major general).

Unable to work with Milch, Kesselring applied for retirement. Instead, the Luftwaffe chief, Reichsmarschall (Reich Marshal) Hermann Göring, gave him command of the Third Air Region and a promotion to General der Flieger (U.S. equiv. lieutenant general). Later, he commanded 1st Air Group, which was upgraded to Luftflotte 2 (Second Air Fleet), composed of 20 bomber and fighter groups; he led this fleet in the invasion of Poland in September 1939. He commanded Luftflotte 2 in the invasion of France and the Low Countries in May 1940, his aircraft striking both Rotterdam and Dunkerque. Raised to field marshal in July 1940, Kesselring continued to command Luftflotte 2 in the Battle of Britain in 1940, when he advised Adolf Hitler to concentrate on London in order to bring up the Royal Air Force (RAF) so that it might be destroyed. He also commanded Luftflotte 2 in the invasion of the Soviet Union in June 1941. With some 1,000 aircraft, this force was the largest German air fleet in the invasion.

In December 1941, Kesselring went to Italy as commander in chief, South, a post he held until March 1945. His command encompassed the Mediterranean Basin, and there, he won the nickname "Smiling Albert" for his ability to get along with Ital-

Field Marshal Albert Kesselring. (Library of Congress)

ian leaders. Kesselring believed that the key to the supply situation in North Africa was control of Malta, and he ardently urged Hitler to take the island by airborne assault. Hitler promised to do so but never acted. Kesselring won admiration for the skillful Axis evacuations of Tunis in May 1943 and Sicily in August 1943, as well as the defense of Italy. Badly injured in a car accident in October 1944, he underwent successful brain surgery and returned to his command the following January. On 8 March 1945, he succeeded Field Marshal Karl R. Gerd von Rundstedt as commander in chief, West. On 15 April, Hitler divided the remaining Reich into two defensive zones. Admiral Karl Dönitz took command of the north, and Kesselring received command of the south. Kesselring surrendered his forces to the Western Allies on 7 May 1945.

Tried after the war for his role in the Ardeatine Caves Massacre, Kesselring was sentenced to death in 1947, but his sentence was remitted to life in prison. He was released in October 1952 as "an act of clemency" when he developed cancer of the throat. Kesselring then wrote his memoirs (published in English as *A Soldier's Record*), which criticized Hitler only for some military decisions. Kesselring also headed the

Stahlhelm, a right-wing German veterans' organization. He died in Bad Nauheim on 20 July 1960.

Kharkov, Battle for (1–14 March 1943)

Important Eastern Front battle. The Soviets claimed to have inflicted 1 million German casualties in the period between November 1942 and March 1943, and despite some replacements, the Germans estimated a shortfall of 470,000 men on the Eastern Front. Following their victory at Stalingrad, the Soviets drove to the Donets River in February 1943 and recaptured Kursk, Rostov, and Kharkov, leading Adolf Hitler to order a counterattack during his visit to the front between 17 and 19 February 1943. In the resulting offensive action on 20 February, Field Marshal Fritz Eric von Manstein's Southern Army Command struck the Soviet flank with a panzer attack from the south in a running battle from Krasnoarmeiskaia to the northern Donets River; Fourth Panzer Army's XL Corps encircled and destroyed what was left of Group Popov, consisting of four understrength Soviet tank corps.

The German thrust, assisted by First Panzer Army after 23 February, continued to the northeast. On 22 February, SS Panzer Corps and LVIII Panzer Corps attacked the flank of Colonel General Nikolai Vatutin's Southwest Front, the lead elements of which (XXV Tank Corps) were within 12 miles of Zaporozhye. Having run out of fuel, the latter units abandoned their equipment and made desperate efforts to escape to the north; for the most part, these attempts were successful, as the Germans took only 9,000 prisoners of war. But Manstein claimed to have killed 23,000 Soviet soldiers and destroyed or captured 615 tanks, 354 artillery pieces, and 69 anti-aircraft guns.

On 1 March, Manstein began an advance on Kharkov, attempting to get behind the Soviets west of that city who were

German soldiers dislodged from a house on the outskirts of Kharkov taking cover outside a building that has been set on fire, 23 February 1943. (Photo by Keystone/Getty Images)

pushing against Army Detachment Kempf, commanded by General der Panzertruppen (U.S. equiv. lieutenant general) Werner Kempf. A five-day battle for the city raged with Fourth Panzer Army getting the better of Lieutenant General Pavel S. Rybalko's Third Tank Army, which had been sent to aid the hard-pressed Southwestern Front but had gone on to Kharkov only to be cut off with the advent of the rainy season. By 5 March, the Germans had mauled units of Third Tank Army on the Berestovaya River southwest of the city, capturing 61 tanks, 225 guns, and 600 motor vehicles in a small pocket at Krasnograd.

Manstein wanted to proceed west to attack the rear of the Soviet Voronezh Front, forcing it to fight simultaneously in two directions near Poltava, but because of the rain and mud, the Germans tried to strike the Soviet flank. They attacked north on 7 March and made steady progress, driving a wedge between the Third Tank and Sixty-Ninth Soviet Armies, with pressure eventually coming from the west as Army Detachment Kempf was freed for action. The Soviets brought up II Guards Tank Corps from the east. The SS Panzer Corps, apparently desiring to present the trophy city of Kharkov to Hitler, had to be restrained to ensure that it did not launch a frontal assault on the city, which Manstein feared could produce another Stalingrad.

Hitler's visit to Manstein's headquarters on 10 March probably inspired the SS Panzer Corps commander, Lieutenant General Paul Hauser, to disobey orders and involve the Das Reich and Leibstandarte Divisions in three days of house-to-house battles. Thus, the Germans recovered Kharkov on 14 March 1943. At the same time, to the north of Army Detachment Kempf, the Gross Deutschland Division moved rapidly on Belgorod. At Gaivoron, the Germans wiped out Soviet armored forces that sought to defend Belgorod. The capture of Kharkov and Belgorod marked the end of the German counterblow, which had reestablished the Donets-Mius Line.

Kiev Pocket, Battle of the (21 August–26 September 1941)

Significant German encirclement of Soviet forces on the Eastern Front in 1941. A month into Operation BARBAROSSA, the German invasion of the Soviet Union, sharp disagreements developed between Adolf Hitler and his senior generals as to strategy. The generals—led by the army chief of staff, Colonel General Franz Halder, and the army commander, Colonel General Walther von Brauchitsch—pointed out that not all German army groups would be able to accomplish their assigned tasks. Field Marshal Fedor von Bock's Army Group Center was advancing faster than the weaker Army Groups North and South. At the same time, Hitler was preoccupied with securing the industrial and agricultural heartland of Ukraine and the Crimea and linking up with the Finns at Leningrad.

In consequence, Hitler decided on 19 July, in Führer Directive 33, to divert substantial panzer units from Army Group Center, thereby postponing the drive on Moscow. He sent Colonel General Hermann Hoth's 3rd Panzer Group north to assist in the drive to Leningrad and Colonel General Heinz Guderian's 2nd Panzer Group south to deal with the bulge created by Soviet Colonel General M. P. Kirponis's Southwestern Front with its mechanized corps. The German generals argued against this decision, pointing out that Moscow was the more important objective. Not only the political capital of the Soviet Union, it was also a major industrial area and transportation nexus. Attempts to convince

Hitler that the advance on Moscow was more important failed, and he issued a final directive on 21 August that ordered a major encirclement operation, with the goal of destroying Soviet forces in northern Ukraine.

On July 10, Soviet leader Josef Stalin had appointed the barely competent Marshal S. M. Budenny to command the Southern and Southwestern Groups. German forces advanced under the capable leadership of Field Marshal Karl Gerd von Rundstedt, commander of Army Group South. Stalin poured troops into the new command, amounting ultimately to almost 1 million men, insisting that the Dnieper River Line be held at all costs.

Budenny's forces in Uman—the Sixth, Twelfth, and Eighteenth Armies—were encircled, and he remained stationary as Colonel General Ewald von Kleist's 1st Panzer Group drove around his flank to the southeast. Kleist's panzers advanced north even as Guderian's 2nd Panzer Group attacked south through the weakly held northern flank of the Southwestern Front, aiming for a linkup east of Kiev. When the Soviet army chief of staff, General Georgii Zhukov, tried to point out the dangers of encirclement to Stalin on 5 August, the latter sent him to Leningrad's defense and appointed Marshal B. M. Shaposhnikov in his stead.

By early September, Kiev was a salient endangered by advancing German troops to the north and the south. An attempt by Lieutenant General A. I. Yeremenko's newly formed Bryansk Front to halt Guderian's push south failed on 2 September, and by 11 September, the German pincers were closing on Kiev. Budenny requested authority to retreat, but Stalin preferred to replace him with Marshal S. K. Timoshenko. On 12 September, Kleist's panzers broke through the Soviet Thirty-Eighth Army, attacking north from bridgeheads at Cherkassy and Kremenchug.

Despite the onset of the rainy season, the 1st and 2nd Panzer Groups linked up at Lokhvitsa, 125 miles east of Kiev, on 16 September. Timoshenko and Nikita Khrushchev, representing the War Council of the Southwestern Direction, authorized a Soviet withdrawal, but General Kirponis feared Stalin's reaction and refused to move until Moscow confirmed the orders near midnight the next day.

The encirclement was still sufficiently porous to allow some Soviet forces to escape, including Timoshenko, Khrushchev, and Thirty-Seventh Army commander Andrei Vlasov (whose forces had defended Kiev skillfully), but Kirponis was among the dead. The Soviet Fifth and Twenty-First Armies were destroyed, along with major portions of the Thirty-Seventh and Fortieth Armies. Army Group South also claimed 665,000 Soviet prisoners taken, along with 3,500 guns and 900 tanks. For all practical purposes, the Soviet Southwestern Front ceased to exist. It had to be entirely reconstructed from the nucleus of the 15,000 men who escaped the disaster.

Ironically, this major German success, one of the greatest tactical victories of the war—despite opening a 200-mile gap in Soviet defenses and permitting the investment of the eastern Ukraine—had long-range strategic consequences. Senior German commanders, including Halder and Guderian, concluded that this diversion from the drive on Moscow had been a major blunder, ultimately dooming the German attempt to take the Soviet capital in 1941.

Kimmel, Husband Edward (1882–1968)

U.S. Navy admiral and commander of the Pacific Fleet at the time of the Japanese attack against Pearl Harbor, Hawaii. Born in Henderson, Kentucky, on 26 February 1882, Husband Kimmel graduated from the U.S. Naval Academy in 1904 and was commissioned an ensign in 1906. Over the next years, Kimmel served on battleships; participated in the 1914 intervention at Veracruz, Mexico; served as a naval aide to Assistant Secretary of the Navy Franklin D. Roosevelt; and was staff gunnery officer for the American battleship squadron attached to the Royal Navy's Grand Fleet during World War I.

Kimmel, a highly regarded gunnery expert, rose to the rank of rear admiral in 1937 and served at the Naval Gun Factory; he also commanded a destroyer squadron, attended the Naval War College, commanded the battleship *New York*, and served as chief of staff of the battleships in the Battle Force. From 1937 to 1939, he was budget officer of the navy, and following command of a cruiser division and of cruisers in the Battle Force, Pacific Fleet, he was named commander of the U.S. Pacific Fleet in February 1941 as a full admiral. During the next months, Kimmel put the Pacific Fleet through a vigorous training program in preparation for a possible war with Japan and refined plans for offensive operations in the western Pacific if

U.S. Navy Admiral Husband E. Kimmel. (Bettmann/Corbis)

war came. Following the Japanese attack against Pearl Harbor on 7 December 1941, which put all of the Pacific Fleet's battleships out of commission, he was relieved of his command.

Kimmel has been the subject of considerable controversy for his actions preceding the Japanese attack. Several investigations and historians determined that he was too lax in his command and not sufficiently prepared for the possibility of war. Defenders—and Kimmel himself—believed he was made a scapegoat for the failures of Washington authorities, arguing that he was denied both crucial intelligence about deteriorating Japanese-American relations and adequate numbers of long-range reconnaissance aircraft.

On 1 March 1942, Kimmel retired in disgrace from the navy. Thereafter, he was employed by an engineering consulting firm until 1947. He died in Groton, Connecticut, on 14 May 1968.

Kimura Heitaro (1888–1948)

Japanese army general who assumed command of the Burma Area Army in 1944. Born in Tokyo on 28 September 1888, Kimura Heitaro joined the army in December 1908. Although trained in the artillery, he held a number of unusual positions, including that of resident officer in Germany from 1922 to 1925. In 1930, he was a member of the Japanese delegation to the London Disarmament Conference, where his naval counterpart was Captain Yamamoto Isokoru. By 1938, Kimura had advanced to the rank of lieutenant general. After commanding the 32nd Division, he served as chief of staff of the Guandong (Kwantung) Army in Manchuria.

Kimura sided with those who favored Japanese expansion, and from April 1941, he was vice minister of war and a close adviser to General Tōjō Hideki, helping to develop the Japanese military strategy for war with the United States. When Japanese efforts to secure Guadalcanal failed, he became the scapegoat, and he was removed from his post in March 1943.

Kimura returned to active military duty in August 1944, succeeding Kawabe Masakazu as commanding general of the Burma Area Army; Kawabe had been sacked as a result of the disastrous Imphal Campaign. Kimura commanded three armies of 250,000 men in 10 divisions. Expecting an attack by the British Fourteenth Army during the dry season, along the lines of earlier attacks, he planned to withdraw behind the Irrawaddy River and counterattack when British supply lines were overextended. But British commander Lieutenant General William Slim learned of Kimura's intention and revised his own plan. Employing aerial resupply, Slim was able to move forces through difficult terrain to Meiktila and Mandalay. Kimura was surprised and outmaneuvered. In fighting between 21 February and 31 March 1945, the British effectively destroyed the Fifteenth Army. Kimura then precipitously abandoned Rangoon, leaving behind much equipment and many troops. Occupying the city on 2 May, the British improved their supply lines and were in a position to continue their advance when weather permitted.

Kimura was promoted to full general in May 1945. Following the war, he was arrested and tried for war crimes. Convicted of mistreating prisoners of war during the construction of the Burma-Thailand railroad, he was executed in Tokyo on 23 December 1948.

King, Edward Postell, Jr. (1884–1958)

U.S. Army general and commander of the Luzon Force on the Bataan Peninsula. Born in Atlanta, Georgia, on 4 July 1884, Edward King received a law degree from the University of Georgia in 1903. He began his military career with the Georgia National Guard. In 1908, he was commissioned a second lieutenant in the U.S. Army and assigned to the 6th Field Artillery Regiment. In the following years, King served in the

Philippines, did three tours in the Office of the Chief of Field Artillery, and was both a student and an instructor at the Command and General Staff School and the Army War College. He also graduated from the Naval War College.

In September 1940, Brigadier General King returned to the Philippines to command Fort Stotsenberg. Later, he supervised artillery training for the Philippine army. During the first months of World War II, King, now a major general, was artillery officer for General Douglas MacArthur, commander of U.S. forces in the Far East. On 21 March 1942, Lieutenant General Jonathan Wainwright, commander of all U.S. forces in the Philippines, appointed King to head the Luzon Force, which was responsible for defending the Bataan Peninsula, the last major piece of territory on Luzon still in American hands. King had more than 80,000 men under his command, but their situation was hopeless. Short of food, racked by disease, exhausted from months of fighting, and cut off from any reinforcement, they were unable to stop an offensive the Japanese launched on 5 April to complete the conquest of the peninsula. King had orders from Wainwright and MacArthur to counterattack the Japanese; however, he was fearful his men would be massacred by the advancing Japanese and on his own initiative surrendered his force on 9 April, the greatest capitulation in U.S. military history. King spent the remainder of the war in Japanese prison camps in the Philippines, Formosa, and Manchuria. After the war, King served with the secretary of war's Personnel Board until his retirement in November 1946. He died in Brunswick, Georgia, on 31 August 1958.

King, Ernest Joseph (1878–1956)

U.S. Navy Fleet Admiral and chief of Naval Operations. Born in Lorain, Ohio, on 23 November 1878, Ernest King graduated from the U.S. Naval Academy in 1901. He subsequently held a variety of appointments on cruisers, battleships, and

U.S. Admiral of the Fleet and Chief of Naval Operations Ernest Joseph King. (Library of Congress)

at the Naval Academy, where he was an instructor of ordnance and gunnery from 1906 to 1908. King commanded a destroyer in 1914. Between 1916 and 1919, he served on the staff of the commander of the Atlantic Fleet.

In 1919, Captain King headed the Naval Academy's post-graduate school. During the next seven years, the ambitious, hard-driving, and forceful King specialized in submarines. In 1926, he took command of an aircraft tender and was senior aide to the commander of Air Squadrons, Atlantic Fleet. In 1927, King underwent flight training, and the next year, he became assistant chief of the Bureau of Aeronautics. In 1929, he commanded the Norfolk Naval Air Station, and from 1930 to 1932, he commanded the aircraft carrier *Lexington*.

King then graduated from the Naval War College and, promoted to rear admiral, served as chief of the Bureau of Aeronautics from 1933 to 1936. He spent the next five years in senior naval aviation assignments, including a tour as commander of the Aircraft Base Force. In 1938, he was promoted to vice admiral. Appointed to the Navy General Board in 1939, King criticized the lack of war preparations, recommending that should the United States go to war with Japan,

it had to follow an offensive Pacific naval strategy. He also proposed measures for the better integration of aircraft, submarines, and small fast ships with battleships and aircraft carriers.

In February 1941, King won promotion to admiral and was appointed commander of the Atlantic Fleet. On 30 December 1941, following the Japanese attack on Pearl Harbor, he became commander in chief of the U.S. Fleet. The following March, President Franklin D. Roosevelt appointed King as chief of naval operations, making him the only U.S. Navy officer ever to hold both positions concurrently.

As a member of the Joint Chiefs of Staff, King was a major architect of wartime strategy. He vigorously prosecuted a two-front war in both the Atlantic and the Pacific but consistently gave higher priority to operations utilizing naval forces. He was therefore more committed to extensive Pacific operations, which relied heavily on naval power, than was his colleague General George C. Marshall, the army chief of staff, who generally followed a Europe-first strategy. King forcefully implemented a strategy of aggressive advance against Japan through the Central Pacific, later modified to include a second, southwestern offensive by way of the Philippines and Taiwan. Despite feuds over authority with Secretary of the Navy Frank Knox and his successor, James Vincent Forrestal, King successfully built up American naval forces, introduced tactical and technological innovations, and contributed heavily to the Allied victory in the Pacific.

In October 1945, King abolished the position of commander in chief of naval forces, and in December, he retired, succeeded as chief of naval operations by Admiral Chester W. Nimitz. Over the next decade, he served as a special adviser to the secretary of the navy and also headed the Naval Historical Foundation. King died in Portsmouth, New Hampshire, on 25 June 1956.

King, William Lyon Mackenzie (1874–1950)

Wartime prime minister of Canada. Born on 17 December 1874, at Berlin (now Kitchener), Ontario, Canada, Mackenzie King graduated from the University of Toronto and did graduate work at the University of Chicago. He was appointed Canada's first deputy minister of labor and then briefly served as minister of labor (1908–1911). He spent the war years in the United States as the chief labor mediator for the Rockefellers, but in 1919, he returned to Canada to seek the leadership of the Liberal Party, which had been shattered by the 1917 conscription crisis. King revived the Liberals, becoming the Canadian prime minister in 1921 and winning subsequent elections in 1925, 1926, and 1935. During the 1920s, he played the central role in Canada's transition to an autonomous dominion.

A skillful administrator and consensus builder and an astute politician, King deserves much of the credit for Canada's remarkable economic and military mobilization during World War II. In September 1939, French Canadian support for the war was lukewarm at best, and a great many among the English Canadian majority questioned their fellow citizens' loyalty. King forged a precarious unity by promising his Liberal government would emphasize war production rather than expeditionary forces. This policy of "limited liabilities" did not, however, survive the defeat of France in June 1940. King also promised not to impose conscription for overseas service. Luck—the Canadian army saw little combat until mid-1943—combined with a sincere political effort not to isolate the people of Quebec and simultaneously to reach out to "moderate" English Canadians almost got the country through unscathed. With the Allies facing a desperate shortage of infantry reinforcements in the autumn of 1944 and with his own leadership at stake, King reluctantly implemented limited overseas conscription that November. In retrospect, his handling of the explosive conscription issue was a singular political achievement.

Although Canada's international stature and national pride grew dramatically during the war years, the ever cautious King was content for the country to continue playing the role of a loyal subordinate. His relationship with British Prime Minister Winston L. S. Churchill was often strained, but his government still provided enormous military, economic, and financial assistance to the "mother country," most of it ultimately at no cost. In contrast, his relationship with U.S. President Franklin D. Roosevelt was warm. Common sense, of course, dictated that King encourage closer ties with the United States. The wartime advantages of this policy were immeasurable for Canada. Few Canadians warmed to King, but in the June 1945 election, running on a platform of

Canadian Prime Minister Mackenzie King (left) and U.S. President Franklin D. Roosevelt (right) in Quebec, 19 August 1943. (Franklin D. Roosevelt Library (NLFDR)/National Archives)

progressive social and economic measures for the postwar era, his government won a majority (albeit a slender one). Worn out by his wartime exertions, King retired in October 1948. He died in Ottawa on 22 July 1950.

Kinkaid, Thomas Cassin (1888–1972)

U.S. Navy admiral whose forces were involved in many of the key engagements in the Pacific Theater. Born in Hanover, New Hampshire, on 3 April 1888, the son of Rear Admiral Thomas W. Kinkaid, he graduated from the U.S. Naval Academy in 1908, then served in the Great White Fleet in its circumnavigation of the globe. Kinkaid began his naval career in ordnance and aboard battleships. During World War I, he was assigned as a naval envoy at the British Admiralty. From 1929 to 1930, he attended the Naval War College. Promoted to captain in 1937, he commanded a cruiser, and two years later, he was assigned as naval attaché to Italy and Yugoslavia.

In late 1941, Kinkaid was promoted to rear admiral and took command of Cruiser Division 6. In March 1942, he led his ships in raids on Rabaul and New Guinea, then participated in the May Battle of the Coral Sea and the June Battle of

Midway. In August 1942, Kinkaid assumed command of Task Force 16, centered on the carrier *Enterprise*, and took part in the invasion of Guadalcanal and the Battles of the Eastern Solomons and the Santa Cruz Islands. In January 1943, Kinkaid took command of the North Pacific Force in Alaskan waters, his ships participating in the recapture from the Japanese of the Aleutian islands of Attu and Kiska.

Promoted to vice admiral, Kinkaid was put in charge of the Seventh Fleet, “MacArthur’s Navy,” in November 1943, with the mission of providing amphibious lift and protection to General Douglas MacArthur’s Southwest Pacific Area forces on their approach to the Philippines. Seventh Fleet then participated in the defense of landings at Leyte by destroying attacking Japanese forces in Surigao Strait. In January 1945, Kinkaid led Seventh Fleet in the invasion of Luzon at Lingayen Gulf. Promoted to admiral in April, he took the surrender of Japanese forces in Korea in September.

Following World War II, Kinkaid briefly commanded the Eastern Sea Frontier and then the Sixteenth (Reserve) Fleet. He retired in May 1950 and died in Bethesda, Maryland, on 17 November 1972.

Kirk, Alan Goodrich (1888–1963)

U.S. Navy admiral in charge of the American naval forces involved in the Normandy Invasion. Born in Philadelphia, Pennsylvania, on 30 October 1888, Alan Kirk graduated from the U.S. Naval Academy in 1909. He specialized in gunnery and served in the Asiatic Fleet. During the period of U.S. involvement in World War I, Kirk was stationed at the Naval Proving Ground, Dahlgren, Virginia.

In the 1920s, Kirk was executive officer of the presidential yacht and served as presidential naval aide. He next served as the gunnery officer on the battleship *Maryland*. Kirk gradu-

ated from the Naval War College in 1929 and then was an instructor there for two years. In 1931, he received his first command, a destroyer, and from 1933 to 1936, he was in the Office of the Chief of Naval Operations. He was the executive officer of the battleship *West Virginia* before taking command of the light cruiser *Milwaukee* and serving as operations officer to the commander of the U.S. Fleet. In 1939, Kirk became the American naval attaché in London, where he familiarized himself thoroughly with Royal Navy practices—practices he strongly admired, even though British condescension occasionally irked him. His forceful advocacy of greater Anglo-American cooperation and his urgent warnings in 1940 of the extreme danger Britain faced helped persuade President Franklin D. Roosevelt and his administration to assist Britain with measures potentially liable to precipitate conflict with Germany.

In March 1941, Kirk became director of Naval Intelligence, but partially because of fierce bureaucratic infighting with the War Plans Division, his office failed to produce any specific warnings of Japan’s intentions vis-à-vis the United States, despite clues that an attack on American forces was being planned. In October 1941, he returned to sea duty as commander of a division of destroyer escorts in the Atlantic Fleet, fortuitously escaping responsibility for the failure to predict the Pearl Harbor raid.

Promoted to rear admiral in November 1941, Kirk became chief of staff to Admiral Harold Stark, commander of American naval forces in Europe, in March 1942. In London, he contributed substantially to Allied strategic planning. In February 1943, Kirk took command of Amphibious Force, Atlantic Fleet, and that July, he led an amphibious naval task force in the Sicily landings. His outstanding success in the face of unexpectedly difficult conditions brought him command of all U.S. naval forces for the June 1944 Normandy landings. Later that year, he commanded all U.S. naval forces in France. He was promoted to vice admiral in May 1945.

Kirk retired with the rank of admiral in March 1946. He then served as ambassador to Belgium and minister to Luxembourg until 1949 and spent a further two years as ambassador to the Soviet Union (April 1949 to October 1951) and the Republic of China (May 1962 to April 1963). Kirk died in New York City on 15 October 1963.

Kleist, Paul Ludwig Ewald von (1881–1954)

German field marshal and commander of Army Group A. Born at Braunfels an der Lahn, Germany, on 8 August 1881, Paul von Kleist entered the army in 1900 and rose to the rank of captain by 1914. During World War I, he fought on both the Eastern and Western Fronts. Following the war, he served in artillery and cavalry posts. Though he was promoted to lieutenant general in August 1936, he retired in February 1938 during Adolf Hitler's purge of the army.

Recalled to active service in August 1939, Kleist commanded XXII Panzer Corps in Fourteenth Army during the invasion of Poland. He then assumed command of the army-sized Panzer Group Kleist in the May 1940 invasion of France and the Low Countries, spearheading Army Group A's advance. Promoted to full general in July 1940, Kleist commanded 1st Panzer Group in the April 1941 invasion of Yugoslavia, then First Panzer Army in Army Group South in Operation BARBAROSSA, the invasion of the Soviet Union. His forces pushed into Ukraine and devastated nearly 20 Soviet divisions, assisting in the encirclement of Kiev and establishing a bridgehead west of Rostov before being forced to retreat that winter.

Kleist's 1st Panzer Group carried out a decisive counterstroke in the First Battle of Kharkov (May 1942). Ordered to take the Caucasus oil fields, Kleist saw his forces drained away for the cauldron of Stalingrad. He commanded Army Group A in November 1942 and proved adept at defensive operations. Promoted to field marshal in February 1943, he carried out an orderly withdrawal of German forces from the Crimea that October. He then withdrew his force, redesignated Army Group South Ukraine, into Romania. Hitler lost confidence in Kleist and relieved him of command in March 1944, whereon Kleist retired.

Kleist was taken prisoner by the U.S. 26th Infantry Division on 25 April 1945. He was then turned over to Yugoslavia, where he was tried for war crimes, found guilty, and sentenced in 1948 to 15 years in prison. Extradited to the Soviet Union, he was sentenced there to an additional term of imprisonment. He died at Vladimir Prison Camp in the Soviet Union on 15 October 1954.

Kluge, Günther Adolf Ferdinand von (1882–1944)

German army field marshal and one of Adolf Hitler's most able commanders. Born at Posen, Prussia (now Poznan, Poland), into an old, aristocratic family on 30 October 1882, Günther Adolf Ferdinand von Kluge joined the army as an artillery officer in 1901. He served on the General Staff in

World War I between 1916 and 1918 and was wounded in fighting at Verdun in 1918. Kluge was selected to continue in the Reichswehr after the war. Promoted to brigadier general in February 1933, he was named inspector of Signal Troops. He became a major general in April 1934 and commanded the 6th Division in Münster. After Hitler began to expand the German army, Kluge commanded VI Corps in 1936. In 1938, Hitler purged Kluge, along with other German generals, for supporting General Werner von Fritsch, who was retired on trumped-up charges of homosexuality for his opposition to Hitler in February 1938.

With war looming, Hitler needed experienced commanders, and he recalled Kluge from retirement in October 1938 and gave him command of the newly created 6th Army Group, headquartered at Hanover. Later, the unit was redesignated as the Fourth Army. Kluge led Fourth Army during the invasion of Poland in September 1939. Proving himself an innovative commander in that campaign, he won Hitler's admiration and promotion to colonel general. Kluge led Fourth Army against France and the Low Countries in May 1940. Raised to field marshal in July, he went on to command Fourth Army in the invasion of the Soviet Union in June 1941 and Army Group Center from December 1941 to October 1943, again proving himself an effective commander.

Injured in a car accident in October 1943, Kluge went on prolonged leave during his recuperation. In July 1944, he replaced Field Marshal Karl Gerd von Rundstedt as commander in chief, West, and commander of Army Group B in Normandy. Kluge disliked the Nazis but was pleased with the territorial acquisitions made under Hitler. He was aware of the plot to assassinate the Führer, but he wavered in his support and finally declined to participate. He also failed to report it. Following the bomb attempt on Hitler's life on 20 July 1944, he came under increased Gestapo suspicion.

Kluge led the German counterattack at Avranches in August, but on its failure, he was relieved of command, on 17 August 1944, by Field Marshal Walther Model. He wrote to Hitler, urging him to make peace and end the suffering for the German people. Aware that he would be implicated in the conspiracy against Hitler and depressed by the military situation, Kluge committed suicide at Valmy, France, on 19 August 1944.

**Knox, William Franklin "Frank"
(1874–1944)**

U.S. secretary of the navy during the war years. Born on 1 January 1874 in Boston, Massachusetts, Frank Knox followed his political idol and role model, Theodore Roosevelt, and joined the 1st Volunteer U.S. Cavalry (the Rough Riders) in 1898 to fight in Cuba during the Spanish-American War. After mustering out, he became a highly successful newspaper editor and publisher, acquiring papers in Michigan and New Hampshire. A strong supporter of U.S. intervention in World War I, Knox served in the artillery in France in 1917 and 1918, rising from private to major. Between the wars, he returned to the newspaper business and was active in Republican politics, running unsuccessfully as the Republican vice presidential candidate in 1936.

In the late 1930s, Knox firmly believed that the United States could not remain aloof from the increasingly critical situation in Europe. Consequently, though he was unsympathetic toward President Franklin D. Roosevelt's domestic policies, he strongly endorsed the president's interventionist and pro-Allied international outlook. In 1940, Roosevelt persuaded Knox, together with former Republican Secretary of State Henry L. Stimson, to join his cabinet, with Knox serving as secretary of the navy—a step designed to win support from nonisolationist Republicans. Knox quickly recruited as assistants various able young businessmen and lawyers, such as James V. Forrestal (whom he appointed undersecretary), Ferdinand Eberstadt, and Adlai E. Stevenson. Knox utilized their industrial and organizational skills to implement expeditiously a massive naval expansion, as the U.S. Navy prepared for war in both the Atlantic and the Pacific. He also introduced modern business and management methods to the Navy Department's administration.

Knox helped to devise and lobby for the Destroyers-for-Bases deal of 1940, whereby Britain acquired American warships in exchange for leases to Caribbean naval bases, and the 1941 Lend-Lease program to aid the Allies. Like other Roosevelt administration officials, he did not predict the surprise Japanese attack on Pearl Harbor of 7 December 1941, and he rather ascribed responsibility for this U.S. defeat almost solely to the unpreparedness of the base's naval and military commanders.

Knox, who had previously found Roosevelt's pro-Allied policies insufficiently bold, welcomed American intervention in World War II. During its course, he traveled extensively to the various theaters of war. As a former newspaperman, he strongly emphasized the importance of good public relations, holding frequent press conferences. He stalwartly supported the abortive National Service Act of 1944, which would have

Secretary of the Navy W. Franklin Knox. (UPI-Bettmann/Corbis)

imposed the obligation of national service on all Americans, military and civilian alike. He died suddenly of heart failure in Washington, D.C., on 28 April 1944.

Koenig, Marie Pierre Joseph François (1898–1970)

French army general who commanded the Free French Forces of the Interior (FFI). Born in Caen, Normandy, France, on 10 October 1898, Pierre Koenig volunteered for service in the army during World War I after obtaining his baccalaureate in 1917. He ended the war as a temporary second lieutenant with the Médaille Militaire.

After World War I, Koenig served with the French army of occupation in Germany. Promoted to lieutenant in 1920, he

participated in the French occupation of the Ruhr in 1923 and then served with occupation forces in the Rhineland between 1923 and 1929. From 1931, Koenig served with the French Foreign Legion in Morocco. Promoted to captain in 1932, he participated in pacification campaigns.

With the start of World War II, Koenig departed Morocco in February 1940 and, as a major in the legion's demibrigade, fought in the Norway Campaign at Narvik. In June 1940, Koenig joined the Free French Forces of General Charles de Gaulle and commanded a battalion, fighting Vichy French forces in Africa and the Middle East in 1940 and 1941. Koenig's advance was rapid. He made colonel in June 1941 and became chief of staff of the 1st Free French Division in the Sudan, taking part in the Syria and Lebanon Campaign. Promoted to temporary major general that August, he commanded the 1st Free French Brigade in Egypt.

Koenig won renown for leading this unit in the Battle of Bir Hacheim, a critical point in the British Eighth Army's defensive line against the Afrika Korps (Africa Corps). Koenig's men held Bir Hacheim from 27 May 1942, refusing to withdraw until ordered to do so on the night of 10–11 June. Their epic stand restored French military honor following the

French General Marie Pierre Koenig, commander in chief of French forces of the interior and governor of Paris, after placing a wreath at the cenotaph in London. (Photo by Hulton Archive/Getty Images)

debacle of May–June 1940 and established the Free French as an effective fighting force.

Koenig then went to Algiers, where he was promoted to lieutenant general in May 1943. That July, he became deputy chief of staff of the French army. In April 1944, he was named commander of Free French Forces in Britain. On 25 June, he was promoted to full general, and as a member of General Dwight D. Eisenhower's staff, he took command of Free French Forces of the Interior following the Normandy Invasion. The FFI made a substantial contribution to Allied success by disrupting German lines of communication and tying down German military assets in Brittany and elsewhere.

In August 1944, Koenig became military governor of Paris. Between 1945 and 1949, he commanded the French zone of occupation in Germany, and he was promoted to General of the Army in 1946. He retired from the army in 1951 and was elected as a Gaullist deputy to the National Assembly. He served as minister of defense in 1954 and 1955 but resigned in opposition to the government's policy toward Morocco. Retiring from politics in 1958, Koenig died in Neuilly, a suburb of Paris, on 2 September 1970. He was posthumously promoted to marshal in 1984.

Koga Mineichi (1885–1944)

Japanese navy admiral and commander of the Combined Fleet. Born in Saga Prefecture, Kyushu, Japan, on 25 April 1885, Koga Mineichi graduated from the Naval Academy in 1906. A specialist in naval gunnery, he also graduated from the Naval War College four years later. He served on the staff of the Second Fleet and took part in the Japanese capture of Qingdao (Tsingtao) at the beginning of World War I.

From 1916 to 1922, Koga held a number of administrative assignments ashore, including that of resident officer in France. Promoted to commander in 1922 and to captain in 1926, he was naval attaché to France between 1926 and 1928 and attended the 1927 Geneva Arms Limitation Conference. Returning to Japan in 1928, he was then secretary to the minister of the navy and a member of the Japanese delegation to the London Naval Conference of 1930. From 1930 to 1932, he commanded first the heavy cruiser *Aoba* and then the battle-

Japanese Navy Admiral Koga Mineichi. (Corbis)

ship *Ise*. Promoted to rear admiral in 1932, Koga next held a number of staff positions, including head of the Intelligence Division (1933) and vice chief of the Naval General Staff (1937). He was promoted to vice admiral in 1936.

Koga commanded Second Fleet from 1939 to 1941. He strongly opposed the conclusion of the Tripartite Pact with Germany and Italy in September 1940. In 1941, he assumed command of the China Area Fleet, supporting naval operations against Hong Kong at the beginning of the Pacific war. Promoted to full admiral in May 1942, Koga then commanded the Yokosuka Naval Station (1942–1943).

In May 1943, Koga succeeded Yamamoto Isoroku as commander in chief of the Combined Fleet following the latter's death in the Solomon Islands on 18 April 1943. By mid-1943, Japan had lost Guadalcanal as well as Attu and Kiska in the Aleutians to Allied counteroffensives. Koga worked to rebuild Japanese naval air strength and at the same time sought to retrieve the situation before it became irreversible by a decisive naval action employing the Combined Fleet. In October 1943, Koga ordered Vice Admiral Ozawa Jisaburo to launch the *RO-gō* Operation to attack U.S. naval forces in the Solomons, but Ozawa suffered a major reversal in the operation, losing 120 of 170 aircraft in November.

Koga then planned the *o-gō* Operation to smash U.S. naval forces in the Marshall Islands in February 1944. In the process

of relocating his headquarters from Palau to Davao in the southern Philippines for this operation, Koga's plane was lost in a heavy storm on 31 March 1944. He was posthumously promoted to Admiral of the Fleet. Admiral Toyoda Soemu succeeded Koga as commander of the Combined Fleet.

Kohima

See Imphal and Kohima, Sieges of.

Koiso Kuniaki (1880–1950)

Japanese army general who became prime minister in 1944. Born in Yamagata Prefecture, Japan, on 22 March 1880, Koiso Kuniaki graduated from the Military Academy in 1900 and saw combat during the 1904–1905 Russo-Japanese War. Graduating from the General Staff College in 1910, he was posted to the General Staff in 1913. While still a junior officer, Koiso associated himself with elements in the Japanese military seeking to pursue expansion on the Asian continent. In 1916, he played a role in the Japanese army's unsuccessful attempt to foster an independence movement in Manchuria and Mongolia in order to detach those areas from China.

As he advanced in rank, Koiso continued to support not only the expansionistic aims of the Japanese military but also its attempts to dominate the government. He joined the *Kokuhonsha*, a right-wing political organization formed in 1924, and in March 1931, he lent his support to a military coup attempt staged by a group of junior officers. Despite his involvement in the affair, Koiso's career continued to advance. In 1937, he was appointed governor-general of Korea and promoted to full general. Koiso returned to Japan in 1939 to serve as minister of colonies.

From 1942 to 1944, Koiso again served as governor-general of Korea, where his second term was characterized by a brutal attempt to eradicate the cultural identity of the Korean people. He was recalled to Japan in July 1944 to succeed prime minister Tōjō Hideki, who had been forced to

Japanese Army General Kuniaki Koiso. (Photo by Keystone/Getty Images)

resign. Although Koiso believed that the war was lost, he attempted to bolster Japan's deteriorating war effort. He lowered the draft age, established the Supreme War Leadership Council as a liaison between the military and the cabinet, and attempted to coordinate munitions production. He could not, however, supply victories, and he was forced to resign in April 1945.

Following the war, Koiso was tried and convicted of war crimes by the International Military Tribunal for the Far East. Sentenced to life imprisonment, he died in the Sugamo Prison in Tokyo on 3 November 1950.

Kokoda Trail Campaign (July 1942–January 1943)

Important land battle fought on New Guinea. The Battles of the Coral Sea in May 1942 and Midway in June placed the Japanese navy on the defensive in the Central and South Pacific and altered Japanese plans to take the key Allied base at Port Moresby, from which they could strike Queensland, Australia, by air. The upcoming battles for Guadalcanal in the Solomon Islands and Port Moresby in New Guinea were critical to the Allies in gaining and maintaining the offensive in the Pacific Theater. The Americans struck first in the Solomons, but the Japanese took the initiative in New Guinea. While U.S. Navy and Marine elements prepared for operations in the Solomons, the supreme Allied commander in the South Pacific, General Douglas MacArthur, and his Allied Land Force commander, Australian General Sir Thomas Blamey, began a series of actions to strengthen Allied defensive positions in New Guinea, including the August 1942 deployment of two brigades of the Australian 7th Division to Port Moresby and one to Milne Bay. These moves were the prelude for a bloody, six-month-long campaign in some of the world's most difficult terrain, with far-reaching strategic consequences.

In early July 1942, the 39th Infantry Battalion of the Australian militia was sent to reinforce local Papuan infantry at Kokoda Pass in the Owen Stanley Mountains. The area was a critical terrain feature the Japanese would have to secure in order to assault Port Moresby from the north. Denied an invasion of Port Moresby by sea as a consequence of the Battle of the Coral Sea, the Japanese now endeavored to take it by land, working southwest along the treacherous Kokoda Trail that crossed the east-west Owen Stanley Mountains. The trail was as high as 8,000 feet in places and as low as 1,000 feet, with valleys that sloped 60 degrees. On 21 July, the Japanese Yokohama Force of engineer, infantry, and marine units landed at Buna on the north side of New Guinea to prepare the way for the follow-on South Sea Detachment commanded by Major General Horii Tomitaro, who arrived himself in mid-August. Horii now pushed a force inland from Gona, drove back local Allied troops, and moved up the rugged and treacherous track of the Kokoda Trail that ran south to Port Moresby. By mid-August, the Japanese had seized the passes over the Owen Stanley Mountains that ran across the island.

During the march, Japanese forces quickly fixed and bypassed the detachments of Australian and Papuan forces guarding several key areas, including Kokoda. The 21st Brigade of the Australian 7th Division was then sent to relieve the elements that had borne the brunt of the fighting. The Japanese, however, outflanked the 21st Brigade and forced it to withdraw, a maneuver repeated several times over the next few weeks. In

early September, the 25th Brigade arrived to reinforce the 21st, and in mid-September, it joined in the unsuccessful defense at Ioribaiwa, some 30 miles from Port Moresby. The Japanese entered that village on 16 September in what was their last land victory of the Pacific war. There, Australian and U.S. forces under Major General Edmond F. Hering, benefiting from Allied air superiority, helped contain the Japanese advance.

On 25 August, the Japanese landed 1,900 men at Milne Bay at the eastern tip of Papua. This force planned to make its way west and support Horii's drive on Port Moresby. Australian forces, not greatly superior to the Japanese in size but with the advantage of air support, contained the landing and then mounted a counterattack. On the nights of 5 and 6 September, the Japanese evacuated 1,300 survivors, half of them wounded. The Australian victory in the Battle of Milne Bay was extremely important: both a humiliation for the Japanese and a lift for the Allies, it proved the Allies could defeat the Japanese in jungle warfare. And its outcome isolated the Japanese coming off the Kokoda Trail.

The Japanese engineers at Buna had hoped to construct a small road along the Kokoda Trail. When this proved impossible, the engineers fortified an area about 10 miles long and several miles deep between Gona and Buna on the Solomon Sea. There, 7,000 Japanese, half of them survivors of the Kokoda Trail march, awaited an Allied attack.

Fighting on Guadalcanal deprived the Japanese of resources for Papua, and during October, Allied pressure and orders from General Imamura Hitoshi on Rabaul to withdraw caused Horii to fall back over the Owen Stanley Mountains. The Australian 7th Division followed. But instead of withdrawing to the coast at Buna, Horii decided to make a stand near the Kokoda Trail between the settlements of Oivi and Gorari, a few miles east of Kokoda. He was confident of victory, but by early November, the Allies had learned much about jungle warfare, and in the Battle of Oivi-Gorari, the Australians flanked the Japanese position, driving Horii's men off the trail and into a river. Taking advantage of the dense jungle, many Japanese managed to reach the coast. Horii was not among them; he drowned a week later while crossing the Kumusi River.

In late November 1942, the Australians approached Buna from the Kokoda Trail. Meanwhile, the U.S. 32nd Division advanced up the Papuan coast in a strange collection of fishing boats and coastal vessels. Because the coast was poorly charted and also because there were numerous reefs as well as concerns over Japanese aircraft, the U.S. Navy did not support the operation with transports or warships, which adversely affected its progress. The Kokoda Trail was far too rugged to move artillery and significant quantities of supplies by that route; nor could artillery be brought in on the small U.S. Army vessels. Thus, the 32nd Division, unprepared for the jungle conditions in any case, had to go into battle with-

out artillery support against Japanese machine-gun nests that were well dug in and concealed in the dense jungle.

The Australian-U.S. advance against the Buna-Gona fortified zone began on 18 November. Progress in the jungle and swamps was slow, and many of the troops were incapacitated by disease. Fortunately for the Allies, fighting on Guadalcanal meant that the Japanese on Papua received few supplies. The Japanese had to deal not only with disease but also with malnutrition.

Displeased with the situation, MacArthur brought in U.S. Army Lieutenant General Robert L. Eichelberger to command I Corps, ordering him to take Buna or not come back alive. Eichelberger flew to Dobodura on 1 December 1942 to take command of the American sector. An effective commander, he soon restored Allied morale. In early December, U.S. engineers were able to open an airfield near Buna, significantly improving the Allied supply situation. On 9 December, the Australians took Gona. The more heavily fortified Buna resisted U.S. pressure, but on 23 January 1943, a concerted attack by Australian and U.S. forces secured it as well.

Köln (Cologne), Raid on (30–31 May 1942)

City targeted for the first thousand-plane air raid in World War II. Although the British had first bombed German industry in 1940, their successes until 1942 had been minimal. The British strategic bombing campaign suffered from a lack of bombers (prior to 1942, the Royal Air Force [RAF] Bomber Command never possessed more than 400 bombers) and an inability to hit targets with any accuracy at night. In the spring of 1942, the war was going badly for the Allies, and the Soviet Union was pressing for a second front. As the only alternative for direct offensive action against Germany, the British changed their policies on strategic bombing.

With the accession of Air Chief Marshal Sir Arthur Harris as commander of Bomber Command in February 1942, the British began a deliberate program of targeting built-up areas instead

of industries. In a desperate need to boost morale at home and to demonstrate the increasing capabilities of Bomber Command, Harris proposed to Prime Minister Winston L. S. Churchill the idea of a thousand-plane raid. The plan immediately received Churchill's approval. By temporarily stripping Training Command of aircraft and securing other planes from Coastal Command, Harris assembled 1,086 aircraft, more than enough planes to cover any aborted takeoffs. The Admiralty then withdrew the 250 Coastal Command aircraft, but Harris was determined to reach the thousand-plane figure, even though it meant sending some crews who were not yet fully trained.

Köln (Cologne) and Hamburg were the two possible targets. They were selected over the more valuable Essen because each was located on a large body of water and could be readily identified by *Gee* (for G or grid), a new navigational aid. On the day of the raid, bad weather ruled out Hamburg, but Köln was clear. Known as Operation MILLENNIUM, the raid occurred on the night of 30–31 May 1942. As it worked out, Harris got 1,046 bombers aloft, 600 of them Wellingtons. His goal was to pass all aircraft over Köln in only 90 minutes.

The air raid on Köln, Germany's fifth-largest city, lasted approximately 100 minutes, with the British bombers passing over the city at an average of 11 per minute. A total of 890 bombers reached Köln and dropped more than 1,455 tons of bombs on the city, two-thirds of them incendiaries. The bombing resulted in the destruction of an estimated 13,000 homes and the razing of almost 600 acres of the city. Casualties amounted to 469 dead and over 5,000 wounded on the German side, with another 45,000 left homeless. The British lost over 300 crewmen in the 41 bombers that failed to return, a loss of just 3.8 percent. The large number of bombers overwhelmed the German fighter defenses. The considerable destruction of this raid captured the imagination of the British public amid a series of Allied defeats in North Africa and East Asia.

Following the Köln raid, the British also launched thousand-plane raids against Essen and Bremen in June 1942. The Köln raid confirmed to Harris and Bomber Command the viability and effectiveness of night area bombing. The raid also shattered German illusions about who was winning the war and caused Adolf Hitler to lose confidence in the Luftwaffe. But instead of accepting the need to strengthen Germany's air defenses, Hitler ordered retaliatory German air attacks.

Kolombangara, Battle of (13 July 1943)

Naval engagement between Allied and Japanese forces off the coast of Kolombangara, a small island north of New Georgia in the Solomon Islands. Rear Admiral Walden Ainsworth commanded an Allied force of three cruisers, reinforced by five destroyers under Captain Francis McInerney and another five under Captain Thomas Ryan. Rear Admiral Izaki Shunji led the Japanese squadron of one cruiser and five destroyers. Izaki's squadron was protecting transports carrying 1,200 soldiers to Vila.

At about 12:36 A.M. on 13 July, a "Black Cat" PBY reconnaissance aircraft spotted Izaki's ships heading southeast toward Kolombangara. At 1:00 A.M., the U.S. destroyer *Nicholas* made radar contact, followed by visual contact 3 minutes later. Ainsworth ordered his squadron into a single column and headed west on a closing course. He assumed he would achieve complete surprise, since the Japanese ships lacked radar. However, the Japanese were using a new device that sensed radar impulses. In the first operational test of the device, Izaki had learned of Ainsworth's presence 2 hours earlier.

At 1:08, Izaki's squadron came within 10,000 yards of Ainsworth's forces and launched torpedoes. The American destroyer vans launched their own torpedoes 2 minutes later. Izaki then turned his column directly north, and the Japanese cruiser *Jintsu* turned her searchlights on the destroyer *Nicholas*. While the *Jintsu* fired both guns and torpedoes, Ainsworth waited until all three of his cruisers had closed the range before opening up fire. By 1:17, the *Jintsu* was dead in the water. Ainsworth then ordered his whole squadron to turn away, but the New Zealand cruiser *Leander* caught a torpedo. Severely damaged, she was nonetheless able to retire.

Black Cat aircraft then reported that two Japanese ships were escaping to the north, leaving the impression that four ships had been crippled. In reality, only the *Jintsu* had been damaged; the rest of Izaki's squadron had retired north in order to reload their torpedo tubes. In just 18 minutes, they reversed course again to reengage.

Meanwhile, Ainsworth decided to head northeast to chase what he thought were the fleeing Japanese ships. As he pursued, he was unable to locate his destroyers by radio and ordered his two cruisers to illuminate unidentified targets on radar with star shells to see if they were McInerney's destroyers. Rather than U.S. destroyers, the unidentified vessels turned out to be Japanese warships that had just fired 31 reloaded torpedoes. Their radar detectors had alerted the Japanese by 1:57 A.M. of the presence of the U.S. ships. At 2:08 Ainsworth ordered fire opened, but before this order could be followed, the cruisers *St. Louis* and *Honolulu* took torpedoes in their bows and the destroyer *Gwin* was hit amidships.

The *Gwin* was scuttled the next morning. The Allies thus had three cruisers badly damaged in exchange for the *Jintsu*, which went down with her entire crew. Personnel losses numbered 482 Japanese, 61 Americans, and 28 New Zealanders. The Japanese were able to land all 1,200 reinforcements at Vila. The Battle of Kolombangara was thus a clear Japanese victory.

Komandorski Islands, Battle of the (26 March 1943)

Concluding naval battle of the Aleutian Campaign in the northern Pacific and the last major daylight naval action in which aircraft played no role. The Aleutian Campaign began in June 1942 with the Japanese occupation of the islands of Attu and Kiska. To protect their northern flank, the Japanese held these islands into 1943, while U.S. bombers and submarines from Dutch Harbor, enduring terrible weather conditions, slowly cut off Japanese supplies.

To break this tightening noose and reinforce Attu, Japanese Vice Admiral Hosogaya Boshiro led a task force of the heavy cruisers *Nachi* and *Maya*, the light cruisers *Tama* and *Abukuma*, and four destroyers escorting the heavily armed, 7,000-ton converted merchant cruisers *Asaka Maru* and *Sakito Maru*, which were acting as transports. Informed that the Japanese were en route, Rear Admiral Charles McMorris set out to intercept them with a much smaller force of the heavy cruiser *Salt Lake City*, the light cruiser *Richmond* (flagship), and four destroyers. The Americans encountered the Japanese force near the Komandorski Islands.

Before dawn on 26 March 1943, U.S. radar picked up the approaching Japanese ships. McMorris, expecting only lightly escorted supply ships, made for the Japanese and closed to gun range, only to discover that he was both outnumbered and outgunned. He then attempted to maneuver, hoping to draw the Japanese eastward toward American air support and perhaps slip past their warships to attack the supply vessels.

The two task forces engaged in a running duel for four hours. With more ships, more guns, and superior torpedoes, Hosogaya could have closed on the Americans and won a decisive victory. But his ships lacked effective radar, and he hesitated to press his advantage. Late in the battle, the *Salt*

U.S. Navy anti-aircraft gun on station near Attu in the Aleutian Islands. (Horace Bristol/Corbis)

Lake City was struck by shells fired by either the *Maya* or *Nachi* and lost steam. McMorris then ordered his destroyers to carry out a torpedo attack while he moved the *Richmond* in to cover the stricken *Salt Lake City*. Although the U.S. destroyers scored no hits and the destroyer *Bailey* was damaged by return fire, the attack gave the *Salt Lake City* time to again get under way. At that point, Hosogaya broke off the action and withdrew, without delivering the vital supplies to Attu. He later explained his decision on the grounds that he was low on ammunition and fuel and worried about U.S. air attacks. His superiors were not impressed by this explanation, however, and Hosogaya was relieved of his command.

Although his ships had sustained damage, McMorris had lost none of them, and he had won a strategic victory. The American 7th Infantry Division landed on Attu in May, securing that island after a hard fight against the isolated Japanese defenders. The Japanese evacuated Kiska a month later, ending the Aleutian Campaign.

Kondō Nobutake (1886–1953)

Japanese navy admiral who commanded the China Sea Fleet. Born in Osaka Prefecture, Japan, on 25 September 1886, Kondō Nobutake graduated from the Naval Academy in 1907 and became a gunnery officer. He graduated from the Naval War College in 1919 and was promoted to lieutenant commander. A resident officer in Russia in 1919 and 1920 and in Germany from 1921 to 1923, he was appointed aide to the Imperial prince in 1924. He was then assigned as a staff officer in the Grand Fleet. Promoted to captain in 1927, he was an instructor at the Naval War College. He next commanded the cruiser *Kako* and then the battle cruiser *Kongo*.

Made a rear admiral in 1933, Kondō became vice president of the Naval War College, and in 1935, he was chief of staff of the Grand Fleet. One year after being promoted to vice admiral in 1937, he took command of the Fifth Fleet. In 1939, he became vice chief of the Naval General Staff.

In September 1941, Kondō took command of the Second Fleet, and at the outbreak of the Pacific war, he provided support for the Japanese force invading Malaya. On 10 December 1941, Kondō's aircraft sank the British battleship *Prince of Wales* and the battle cruiser *Repulse*. His fleet then provided cover for Japanese forces occupying the Philippines and Java in the Netherlands East Indies.

At the Battle of Midway, Kondō commanded the Main Support Force, which did not see action. He then took a leading role in the long-running naval struggle for control of the island of Guadalcanal. He was unsuccessful in luring the U.S. naval forces into a trap in the Eastern Solomons in late August 1942, and in the Battle of the Santa Cruz Islands on 16 to 27 October, his units provided gunfire support for the Japanese land effort to retake Henderson Field. This action also led to the crippling of the U.S. carrier *Hornet* and her eventual loss. In naval actions off Guadalcanal from 12 to 15 November, his forces were defeated, losing the battleship *Kirishima*. Their withdrawal sealed the fate of Guadalcanal. Kondō then supervised the successful evacuation from the island of Japanese ground-force survivors.

In April 1943, Kondō was promoted to admiral, and he was appointed commander in chief of the China Sea Fleet the following December. In May 1945, he became military adviser to Emperor Hirohito. Kondō died in Tokyo on 19 February 1953.

Kondor Legion

German Luftwaffe unit that served on the Nationalist side in the Spanish Civil War of 1936 to 1939. The Kondor (Condor) Legion was instrumental in the eventual Nationalist victory over the Republicans. At the same time, it provided a laboratory for the tactics, technology, and organization that the Luftwaffe would employ in World War II.

The beginning of the Spanish Civil War in July 1936 caught the Nationalist side unprepared, with many of its troops stationed in Spanish Morocco and the Republican side controlling the sea through the Spanish navy. The Nationalists sought Adolf Hitler's support, and on 26 July 1936, Hitler began to provide clandestine military aid to them by airlifting troops to Spain from North Africa. Initial support included 10 Ju-52 transports, a handful of obsolete biplane fighter aircraft, some 88 mm antiaircraft artillery, and crews.

The Ju-52s soon began the first major military airlift in history, and together with Italian aircraft, they transported more than 13,000 troops of General Francisco Franco's Army of Africa from Spanish Morocco to Spain between July and October 1936. The German biplane fighters, however, proved no match for the Republican side's Soviet fighter aircraft. In October, Hitler decided to increase the Luftwaffe presence in Spain, resulting in the official formation of the Kondor Legion in October 1936. Eventually, the legion numbered more than 5,000 "volunteers" and fielded more than 100 aircraft of various types. But a total of 19,000 men and 300 to 400 planes served in the legion over the course of the war, and the Kondor Legion was made up of regular German military units, not volunteers.

The relatively poor performance of the legion's biplanes against the Republican fighters led the Germans to employ them in a ground-support role, essentially as flying artillery. This move was instrumental in the development of Luftwaffe doctrines of close-air support for ground operations. Kondor Legion aircraft hammered Republican troop lines just before Nationalist troops assaulted, while the Germans simultaneously struck enemy rear areas to prevent reinforcement.

Members of the German Kondor Legion arriving in Gijón Harbor, Spain, 1939. (Bettman/Corbis)

These tactics proved key in a number of Nationalist ground victories.

The legion employed the most advanced German aircraft as they became available, including the Heinkel He-111 bomber and the Messerschmitt Bf-109 fighter. The legion also field-tested new aircraft, such as the first Junkers Ju-87 Stuka dive-bomber, and it experimented with new combat techniques. The legion became notorious in 1937 for its “carpet bombing” of the Basque city of Guernica.

By 1938, the Nationalists secured air superiority. The Legion quickly appeared on any front required, with its support relocated via train and air transport. Its 88 mm flak guns, originally sent to provide air defense, eventually became the backbone of Nationalist artillery batteries, serving as highly mobile field artillery. Certainly, the Kondor Legion was an important factor in the Nationalist victory. Success, however, did not come without cost: some 330 members of the Kondor Legion died in Spain, and approximately 1,000 were wounded.

Some of the Luftwaffe’s leading fighter aces, such as Adolf Galland, received their baptism of fire with the legion. The

Luftwaffe adopted much of the legion’s organization and tactics for World War II, particularly in ground-support and psychological operations.

Konev, Ivan Stepanovich (1897–1973)

Marshal of the Soviet Union who would command Soviet occupation forces in Germany at war’s end. Born in the vil-

Marshal of the Soviet Union Ivan Konev. (Hulton Archive/Getty Images)

lage of Lladeino, near Kirov, Russia, on 28 December 1897 and schooled to age 12, Ivan Konev initially became a lumberjack. After being conscripted into the Russian army in 1916, he served in the artillery on the Galician Front, achieved officer rank, and was demobilized in November 1917. Konev joined the Red Army and the Communist Party in 1918, serving as military commissar on an armored train on the Eastern Front. He rose to divisional commissar by 1920.

Konev played a notable role in crushing the Kronstadt Rebellion of March 1921. He graduated from the Frunze Military Academy six years later and then switched to the command side. He was given divisional command and attended special courses at the Frunze in 1934 and 1935. He went on to serve as commander of the Special Red Banner Army in the Far East and then as head of the Transbaikalian Military District (1938–1941). His presence in the Far East and his political acumen helped him survive the late 1930s' great purge of the Soviet army officer corps. In the course of fighting against the Japanese in 1939, he developed a bitter rivalry with Georgii Zhukov.

Promoted to lieutenant general, Konev assumed command of the North Caucasus Military District in January 1941. In June, when the Germans invaded the Soviet Union, he received command of the Nineteenth Army. That September, he was promoted to colonel general and succeeded

Semen Timoshenko as commander of the Western Front. Terrible Soviet defeats followed, with five Soviet armies encircled and a half million men taken prisoner. Responsibility for the defeat lay with Konev and Josef Stalin, as the large encirclement could have been prevented. Zhukov then replaced Konev. However, in an appeal to Stalin, Zhukov saved Konev and made him his deputy—a favor that Konev would not repay.

When the Kalinin Front was formed in October, it was commanded by Konev as colonel general. In that post, he successfully defended the northern approaches to Moscow, and in mid-December, he drove the German army from Kalinin.

In August 1942, Konev again secured command of the Western Front when Zhukov returned to duty with the Stavka. He halted the last German drive toward Moscow and was shifted to command the Northwestern Front (February to June 1943). During the critical July 1943 Battle of Kursk, Konev commanded the strategic reserve Steppe Front, the powerful armor forces of which blunted the German panzers at Prokhorovka.

Konev secured promotion to General of the Army in August 1943. In October, his front, now known as the 2nd Ukrainian Front, played a key role in the encirclement of German forces at Korsun-Shevchenko, earning him promotion to marshal of the Soviet Union in February 1944. Taking command of the 1st Ukrainian Front that May, Konev swept through southern Poland and captured the Silesian industrial region. Zhukov was initially assigned the honor of taking Berlin, while Konev moved south of the German capital to the Elbe. But heavy German resistance allowed Konev to propose that his armor be diverted north to the city, and Stalin agreed. Thus, on 25 April 1945, Konev's tanks linked up with those of Zhukov, isolating Berlin. That same day, Konev's patrols made contact with the U.S. First Army on the Elbe at Torgau, in effect splitting Germany. Konev then commanded Soviet occupation forces in Austria.

By July 1946, Konev had succeeded Zhukov as commander of occupation and ground forces in Germany, having provided "evidence" against Zhukov during Stalin's inquiry of the latter's "improper behavior." He would go on to serve as chief inspector of Soviet Forces (1950–1952), commander of the Transcarpathian Military District (1952–1955), and commander in chief of Soviet Ground Forces (1955–1956).

On the formation of the Warsaw Pact, Soviet leader Nikita Khrushchev named Konev commander of its forces (1956–1960) in time to crush the Hungarian uprising of 1956. Konev again turned on Zhukov when Khrushchev removed him in 1957. Ironically, Konev's Zhukov-like objections to the move from conventional forces to missiles resulted in his "voluntary" retirement to the Inspectorate. During the Berlin crisis of 1961, he was called on to head Soviet Forces in Ger-

many again, through April 1962. Konev went into “active retirement” in 1963 as a Ministry of Defense inspector. He died in Moscow ten years later, on 21 May 1973.

Konoe Fumimaro, Prince of Japan (1891–1946)

Japanese politician during the war years. Born in Tokyo on 12 October 1891, Konoe Fumimaro was a member of one of the five highest-ranked aristocratic families in Imperial Japan. His father, Prince Atsumaro, was a renowned pan-Asiatic movement leader who founded Tōadōbun-shoin University in Shanghai.

A graduate of the Department of Law of Kyoto Imperial University, the young Konoe pursued a career in diplomacy and attended the Paris Peace Conference in 1919 as a junior member of the Japanese delegation. There, he observed the reality of international power politics, in which the defeated became prey to victors. Japan’s failure to secure a statement on racial equality in the League of Nations Covenant disillusioned the young diplomat. Highly critical of the Anglo-American domination of the peace conference, Konoe published an article in 1920 attacking the hypocrisy of the postwar settlement.

Having served some years as a member of the House of Peers in the Japanese government, Konoe was appointed prime minister in 1937. His popularity was immense, and he enjoyed widespread support from both the military and the general public. Following the Marco Polo Bridge Incident of 7 July 1937, Konoe permitted the hard-liners in his cabinet to pursue an all-out war against China, thus making a fateful choice for Japan. In January 1938, he made the statement “*Shōkaiseki wo aiteni sezu*” (We do not negotiate with Jiang Jieshi [Ching kai-shek]), which severely hampered peace negotiations with China. With the military stalemate in China, Konoe resigned in January 1939.

Konoe was once again called to the premiership in July 1940. In his second cabinet, a drastic political restructuring was carried out in the dissolution of existing political parties and establishing the Taisei Yokusankai (Imperial Rule Assistance Association). Konoe became the first president of this organization, which was modeled on the one-party systems of Nazi Germany and the Soviet Union. While preparing for a total war at home, he agreed to the army’s strategy of sending troops into northern French Indochina in September 1940. That same month, under the initiative of Foreign Minister Matsuoka Yōsuke, Japan concluded the Tripartite Pact with Germany and Italy. These actions further worsened already declining U.S.-Japanese relations. Faced with a diplomatic stalemate with the United States, Konoe resigned in July 1941 and was succeeded by General Tōjō Hideki.

After the tides of war turned, Konoe maneuvered carefully to rally anti-Tōjō elements in Japan in order to secure a negotiated peace with the Allies. In early 1945, he was designated as a special envoy to the Soviet Union to seek peace through a Soviet intermediary, which did not materialize. These actions did not, however, save Konoe from prosecution by the International War Crimes Tribunal in Tokyo after the war. Rather than face trial, he committed suicide before his arrest, on 16 December 1946 in Tokyo. His only son, Fumitaka, a junior army officer, was interned in Siberia and allegedly killed there by the Soviets.

Korea

Caught between three powerful neighbors—China, Russia, and Japan—Korea experienced a stormy history. The nation was long dominated or controlled by China, but Japanese

leaders saw Korea as a “dagger” pointed at their country and believed that control of the peninsula was a necessary step to dominating Manchuria and China. After defeating China between 1894 and 1895, Japan went to war against Russia in 1904 and 1905. In the resulting Treaty of Portsmouth of 1905, Japan gained control of Korea. Five years later, Japan forced the Korean king to abdicate, and it formally annexed Korea.

Korean nationalists were buoyed by U.S. President Woodrow Wilson’s World War I call for the “self-determination of peoples,” but demonstrations in March 1919 were met with severe Japanese repression. Some Korean nationalist leaders fled abroad and established a Korean provisional government at Shanghai. In 1925, a Communist movement was formally organized within Korea. It had ties to the Communist International (Comintern).

Japanese rule in Korea was both oppressive and exploitive, a poor advertisement for the Greater East Asia Co-prosperity Sphere the Japanese government proclaimed in the late 1930s in the hope of winning support from Asian nationalist movements. Japan built highways and railroads, but they were designed for military use and to consolidate the Japanese position. It also industrialized Korea, but the economy was completely integrated with that of Japan. In 1937, the Japanese in Korea under Governor-General Koiso Kuniaki, an army general, began a process of cultural assimilation for the 24 million Koreans, banning the Korean language and literature and insisting that all education (fewer than 20 percent of Koreans were literate) be conducted in Japanese. In 1939, the Japanese began employing Korean labor in other parts of their empire, and in 1942, they introduced conscription in Korea for the Japanese army. Meanwhile, Korean nationalists and communists organized military formations in China to fight the Japanese. In 1941, these were integrated into a single military force under Yi Pon-sok, and troops of this force fought the Japanese in Burma. Communist units also formed in Siberia under the young communist leader Kim Il-sung.

During World War II, the Koreans suffered extensively. Japan ruined many of the country’s industrial plants by overworking the machinery without providing adequate maintenance. It also expropriated most chemical products, especially nitrogen, causing near total soil depletion in Korea. Japan also stripped the country of much of its rice production and cattle. Unrest in Korea increased, forcing Japan to increase its military presence; by 1945, 300,000 Japanese troops were in Korea. By the end of the war, Japan had also sent 723,000 Koreans as laborers to other parts of its empire, including Japan itself. Tens of thousands of Korean women were also forced into prostitution as “comfort women” for Japanese troops.

Korea became a focus of Allied attention only as World War II was ending in Europe. The December 1943 Cairo Conference resulted in a joint statement, involving leaders of the

United States, Great Britain, and China, that called for a “free and independent” Korea in “due course.” But as one of many countries being freed from German or Japanese control, Korea became a focal point for clashing U.S.-Soviet interests. At the February 1945 Yalta Conference, President Franklin D. Roosevelt and Premier Josef Stalin touched on the postwar status of Korea. Roosevelt advocated a 20- to 30-year trusteeship to be administered by the United States, the Soviet Union, and China. Stalin suggested that Great Britain should also be a trustee. Following Roosevelt’s death in April 1945, Stalin informed President Harry S. Truman’s special envoy, Harry Hopkins, that the Soviet Union was committed to a four-power trusteeship for Korea.

Agreement regarding the extent of advancement into Korea of Soviet and American military forces was not reached until the July 1945 Potsdam Conference of the great powers, following the end of fighting in Europe and before the August declaration of war against Japan by the Soviets. There, the United States proposed—and the Soviets accepted—a demarcation line along the thirty-eighth parallel to separate the different Allied forces. Soviet troops were to occupy the northern part of the country and U.S. forces the southern part. The Soviet Twenty-First Army invaded Korea at the end of the war, and U.S. Lieutenant General John Hodge’s XXIV Corps occupied southern Korea beginning in early September 1945.

This occupation was supposed to be temporary, but as in the case of Germany, efforts to create a unified country foundered on the rock of the Cold War. Occupation lines became permanent, and two states appeared, the northern one under Communist control and bound to the Soviet Union and the southern state supported by the United States. In 1950, North Korean leader Kim Il-sung, with the support of the Soviet Union and China, invaded the South in an effort to unify all Korea under Communist rule. The 1950–1953 Korean War prevented him from realizing this goal, but unlike Germany, which did reunify at the end of the Cold War, Korea remains divided and is a world flash point today.

Korsun Pocket, Battle of the (25 January–17 February 1944)

Important Eastern Front battle. The Battle of the Korsun Pocket, known to the Soviets as the Korsun Shevchenkovsky Operation and to the Germans as the Cherkassy pocket engagement, pitted Marshal Georgii K. Zhukov against Field Marshal Fritz Eric von Manstein. Zhukov was supervising elements of General of the Army Nikolai F. Vatutin's 1st Ukrainian Front and General of the Army Ivan S. Konev's 2nd Ukrainian Front; Manstein was leading Army Group South. The Battle of the Korsun Pocket was the first successful large-scale Soviet encirclement combat since Operation URANUS in the Battle of Stalingrad 14 months before. The battle became known as "little Stalingrad on the Dnieper."

Unlike previous major Soviet offensives, Korsun Shevchenkovsky did not result from weeks or months of careful planning and force buildup. Rather, the Soviet Stavka and the two Ukrainian fronts organized it opportunistically. The battle demonstrated a Soviet operational adaptability comparable to that shown by the Germans between 1941 and 1943.

On 28 January 1944, converging attacks by the Fifth Guards Tank Army and Sixth Tank Army cut off and isolated the bulge in the Germans' lines that was their last toehold on the Dnieper River. The Soviets trapped at least 60,000 German soldiers, including the 5th SS (Viking) Division. In response, employing the Eighth Army's XLVII Panzer Corps and the III Panzer Corps of First Panzer Army, Manstein sought to punch through the Soviet siege ring, relieve the trapped German troops, and in turn encircle the surrounding Soviet armies.

On the Soviet side, the Battle of the Korsun Pocket included six tank corps, a mechanized corps equipped with Sherman tanks, and a cavalry corps. They opposed eight German panzer divisions, a heavy tank regiment equipped with Tiger and Panther tanks, and a reinforced Schutzstaffel (SS) motorized division. Substantial amounts of infantry, artillery, and air units on both sides were also involved. The Soviets halted two German armored relief attempts and simultaneously endeavored to crush the German pocket.

When it became obvious that the German counterattacks had failed, troops in the pocket were told that they would have to save themselves. An initially successful breakout on the night of 16–17 February, obscured by a blizzard, turned into

a massacre as day broke. The desperate German columns were beset by everything from air attacks to saber-swinging Soviet cavalymen. The battle ended on 17 February.

Soviet and German claims about the numbers of troops lost in the pocket are contradictory, but at least half of the German forces trapped there were killed, wounded, or captured, and even the survivors were in no shape to fight again for weeks or months. Six German divisions were destroyed. When the battle ended, Soviet forces were poised to complete the liberation of the western Ukraine.

Kretschmer, Otto August Wilhelm (1912–1998)

German submarine commander, the most successful of World War II. Born at Heidau, Liegnitz, Germany, on 1 May 1912, Otto Kretschmer joined the German navy in April 1930 and entered the officer training program. He subsequently served on the light cruisers *Emden* and *Köln*. In January 1936, he volunteered for submarine service and took up his first command, the *U-35*, in July 1937, in which he conducted a patrol in Spanish waters during the Spanish Civil War. In September 1937, Kretschmer assumed command of the *U-23*, a Type II coastal U-boat.

During the first eight months of World War II, Kretschmer conducted eight patrols in *U-23* in the North Sea near the coast of Great Britain but achieved little success due to the limited capabilities of his submarine. His most notable achievements were sinking a tanker in January 1940 and the destroyer HMS *Daring* in February 1940. In April 1940, Kretschmer took command of *U-99*, a much larger and more capable Type VII submarine. After two months of intensive training with his crew, he began the first of eight patrols into the Atlantic in June 1940.

During these patrols, Kretschmer refined his tactics of slipping into the middle of convoys at night and torpedoing ships from the surface, often at very close range. The success of these attacks spawned his motto "One torpedo, one ship." He also earned recognition for sinking three British armed merchant cruisers in November 1940, including two on the

night of 3–4 November in a running surface engagement in which he utilized his 88 mm deck gun. This action helped to convince the British Admiralty to discontinue the use of such ships. Kretschmer was the first German submarine commander to sink 250,000 tons of Allied shipping.

The most successful U-boat commander of the war, Kretschmer was known as “the tonnage king” because of his exploits. From September 1939 to March 1941, he sank 47 merchant ships totaling 273,503 tons and earned Germany’s highest award for bravery, the Knight’s Cross with Oak Leaves and Swords to the Iron Cross. Kretschmer, however, eschewed efforts to propagandize his accomplishments, earning another nickname, “Silent Otto.” On 17 March 1941, he successfully attacked the 10-ship HX.112 convoy south of Iceland. After expending his torpedoes, he was returning to base in France when two British destroyers attacked and sank his boat. He and 40 of his 43-man crew were rescued.

Kretschmer spent the remainder of the war as a prisoner of war in Canada, returning to Germany in December 1947. In 1955, he joined the postwar navy of the Federal Republic of Germany, the Bundesmarine, and in 1965, he became chief of staff of the North Atlantic Treaty Organization (NATO) Baltic Command, a position he held for four years. He retired in 1970 with the rank of Flotillenadmiral (U.S. equiv. rear admiral). Kretschmer died at Straubing, Germany, on 5 August 1998.

Krueger, Walter (1881–1967)

U.S. Army general who commanded Sixth Army in the Pacific Theater. Born in Flatow, West Prussia, on 26 January 1881, Walter Krueger emigrated to the United States in 1889. He enlisted in the army during the 1898 Spanish-American War and saw action in Cuba and in the Philippine Insurrection, earning a commission in 1901. He graduated from the Infantry and Cavalry School in 1906 and the Command and General Staff School in 1907. He was a faculty member at the army’s School of the Line and Staff College between 1909 and 1912. Captain Krueger participated in the 1916–1917 Punitive Expedition into Mexico. Sent to France during World War I, he rose to be chief of staff of the Tank Corps of the American Expeditionary Forces as a temporary colonel. He was then chief of staff for VI Corps in France and IV Corps in Germany.

Krueger graduated from the Army War College in 1921 and the Naval War College in 1926 and later taught at both schools before serving with the War Plans Division for three years. He was promoted to colonel in 1932 and brigadier general in 1936 and then headed the War Plans Division from 1936 to 1938. He next commanded a brigade and was promoted to major general in February 1939, thereafter taking command of the 2nd Division at Fort Sam Houston, Texas. He went on to command VIII Corps, and in May 1941, he took command of Third Army as a temporary lieutenant general. Krueger’s Third Army “won” the 1941 Louisiana training maneuvers.

When the United States entered World War II, there seemed little chance that Krueger would receive a battlefield command because of his advanced age and his skill as a trainer of soldiers. In January 1943, however, General Douglas MacArthur personally requested Krueger and Third

U.S. Army Lieutenant General Walter Krueger (left) and Navy Vice Admiral Thomas Kinkaid peer at the shores of Leyte in the Philippines during the opening stages of the landings in October, 1944. (Corbis)

Army for deployment to the southwest Pacific. Instead, the War Department transferred Krueger and some of his staff to Australia to activate Sixth Army. Krueger commanded Sixth Army in a series of widespread combat operations across the southwest Pacific until the end of the Pacific war, beginning with the occupation of Kiriwina and Woodlark Islands in June 1943. He headed operations against New Britain, the Admiralty Islands, New Guinea, Biak, and Morotai. By midsummer 1944, New Guinea was in Allied hands, and MacArthur was ready to return to the Philippines. Krueger led the landings at Leyte and the Lingayen Gulf. In the ensuing campaign, Sixth Army captured Manila and cleared most of Luzon Island. Promoted to general in March 1945, Krueger was scheduled to lead the invasion of Kyushu Island when Japan surrendered.

Critics thought Krueger too slow and methodical, but very few have complained about his low casualty rates relative to his successes. Although MacArthur may have been displeased at Krueger's slowness on Luzon, he still selected him to lead the planned invasion of Japan. Rarely seeking the limelight, Krueger enjoyed MacArthur's full confidence.

After the war, Krueger remained with Sixth Army during the occupation of Japan. He retired in July 1946 and died on 20 August 1967 at Valley Forge, Pennsylvania.

Küchler, Georg von (1881–1968)

Germany army field marshal who took command of Army Group North in 1942. Born near Hanau, Germany, on 30 May 1881, Georg von Küchler entered the German army in 1900 and was commissioned a lieutenant the next year. Promoted to captain, he took command of an artillery battery on the outbreak of World War I, distinguishing himself in combat on the Western Front and in General Staff service.

Küchler continued in the German army after the war, and his service was marked by steady advancement. He was promoted to major in 1924, to lieutenant colonel in 1929, and to full colonel in 1932. By 1934, he was a Generalmajor (U.S. equiv. brigadier general), commanding the 1st Infantry Division in East Prussia. Promoted in 1935 to Generalleutnant (U.S. equiv. major general), Küchler was appointed to the post of inspector general of the service academies.

In April 1937, Küchler was made General der Artillerie (U.S. equiv. lieutenant general), commanding I Army Corps at Königsberg. In March 1939, his forces participated in the incorporation of Memel into the Reich. In the German invasion of Poland, Küchler commanded Third Army, which struck south from East Prussia as part of Colonel General Fedor von Bock's Army Group North. During the Polish Campaign, Küchler directed the northern portion of the envelopment of Warsaw. Although seen as a favorite of Adolf Hitler, Küchler defied Schutzstaffel (SS) leader Heinrich Himmler and ordered the courts-martial of German soldiers guilty of committing atrocities against Poles.

During the invasion of France and the Low Countries in May 1940, Küchler commanded Eighteenth Army, consisting of 11 divisions in Bock's Army Group B. He had responsibil-

ity for the invasion of the Netherlands and the linkup with highly vulnerable German airborne forces holding key bridges, cities, and installations. Following the surrender of the Netherlands on 15 May, Kuchler's forces occupied Antwerp, then forced the Scheldt and drove on Ghent in Belgium. His forces then mopped up the remaining resistance following the British evacuation at Dunkerque before driving south toward Amiens and taking Paris on 14 June.

Promoted to full general in July 1940, Kuchler then led his Eighteenth Army as part of Field Marshal Wilhelm von Leeb's Army Group North in Operation BARBAROSSA, the invasion of the Soviet Union. Eighteenth Army held the north flank in the advance toward Leningrad. In addition to forcing prisoners of war to clear mines, Kuchler also enforced Hitler's Commissar Order, and he ordered the execution of both partisans and Gypsies.

In January 1942, Kuchler took over command of Army Group North from Leeb. He was promoted to field marshal in June 1942. When the Soviets launched their great counteroffensive at Leningrad on 28 January 1944, Kuchler was forced to withdraw to the Luga River. Hitler made him the scapegoat for the reverse, and on 29 January, he temporarily replaced him with Field Marshal Walther Model. On 31 January, Hitler retired him altogether.

Arrested after the war, Kuchler was tried and convicted of war crimes at Nuremberg in October 1948 and sentenced to 20 years of imprisonment. Freed in February 1955, he died in Garmisch-Partenkirchen, Germany, on 25 May 1968.

Kula Gulf, Battle of (6 July 1943)

Pacific Theater naval battle, the first of two night surface actions fought for control of the major deepwater entrance to New Georgia Island. Rear Admiral Walden L. Ainsworth, with a light cruiser task group, had been in the gulf on the night of 5 July 1943 on a bombardment mission and was southeast of Guadalcanal when he received orders to return and intercept a Japanese transport group believed to be making for Vila.

Joined by two destroyers from Tulagi, Ainsworth headed back, arriving off the entrance an hour after midnight. The

sky was overcast, there were passing showers, and visibility was 2,000 yards or less. Radar contact was made at 1:36 A.M. on 6 July with three warships some 22,000 yards distant, standing out of the gulf 5,000 yards off the Kolombangara shore. Ainsworth immediately assumed battle formation: two destroyers in column ahead; the light cruisers *Honolulu*, *Helena*, and *St. Louis* behind them; and two destroyers astern. At the same time, Ainsworth turned left to close with the Japanese, and then, at 1:49, he came back right to unmask all guns. Radar then picked up a second Japanese group astern the first, and Ainsworth delayed opening fire as he pondered this new situation.

The Japanese were, in fact, in three groups. The first, with which Ainsworth had made contact, was Rear Admiral Akiyama Teruo's covering force of the destroyers *Niizuki* (flag), *Suzukaze*, and *Tanikaze*. The second group was made up of four destroyer-transport that Akiyama had first ordered to make for Vila; when contact was made with Ainsworth, he directed them to reverse course and join in the battle. The third group of three destroyer-transport was already unloading at Vila.

Ainsworth opened fire on the Akiyama's group at 1:57 A.M., and the rapid-firing, radar-directed 6-inch guns in which the Americans put their faith quickly hammered the *Niizuki* into a wreck. But the gunfire lit up the American battle line, and almost immediately, the *Suzukaze* and *Tanikaze* launched 16 torpedoes and escaped to the northwest. Believing that he had accounted for all three ships of Akiyama's group, Ainsworth countermarched at 2:03 A.M. to deal with the transport group. Seconds later, three Japanese Long Lance torpedoes struck the *Helena*. She sank about 2:25. At 2:18 A.M., Ainsworth took the transport group under fire, scoring some hits, but the four destroyers scattered and headed for Vila, the only casualty resulting when the *Nagatsuki* ran hard aground on Kolombangara.

Finding no targets to the west and convinced that he had accounted for many more Japanese ships than the *Niizuki*, Ainsworth, whose own ships were low on both fuel and ammunition, ordered his force to head for Tulagi, leaving the *Nicholas* and *Radford* to pick up the *Helena*'s survivors. Three times during the early morning hours, the two destroyers interrupted their work to engage Japanese ships. Although gunfire and torpedoes were exchanged, there was no major damage to either side, and by daylight, Kula Gulf was clear of the Japanese vessels.

Kuribayashi Tadamichi (1891–1945)

Japanese army general charged with defending Iwo Jima. Born in Nagasaki Prefecture, Japan, on 7 July 1891 to a family of samurai descent, Kuribayashi Tadamichi graduated from the Military Academy in 1914. After serving in the cavalry, he was admitted to the General Staff Academy, from which he graduated in 1923, second in his class. In 1928, he was posted to the United States as a deputy military attaché, and between 1931 and 1933, he served as military attaché to Canada. Promoted to lieutenant colonel in 1933, Kuribayashi commanded a cavalry regiment in 1936 and 1937, followed by promotion to major general in 1940 and a series of brigade commands and promotion to chief of staff of the Twenty-First Army in China in 1941. In 1943, he returned to Japan, where he commanded the 1st Imperial Guards Division until 1944.

In May 1944, Kuribayashi took command of the 109th Infantry Division and was assigned the defense of Iwo Jima, part of the Volcano Island chain located approximately 700 miles from Tokyo. Kuribayashi arrived on Iwo Jima in June and began preparing the island to meet an anticipated U.S. amphibious assault. Disregarding the advice of his subordinates and ignoring the protests of the commander of Iwo Jima's contingent of naval troops, he decided not to attempt to hold the island's beaches. Instead, he ordered his troops to construct deep and heavily fortified positions inland, centered on the 556-foot-high Mount Suribachi. Kuribayashi's aim was to exact as heavy a toll as possible on the invaders after they landed.

Iwo Jima's defenders dug in accordingly, which allowed them to withstand over two months of U.S. air strikes and naval bombardment before the American landing on 19 February 1945. Although Kuribayashi's plan succeeded in inflicting heavy casualties on the attacking Americans, he and his men were inexorably ground down. On 17 March, Kuribayashi, who had been promoted to full general, made a farewell radio broadcast to Japan. He died in action during the last few days of organized resistance, sometime in the period between 21 and 24 March, but his body was never recovered.

Kurita Takeo (1889–1977)

Japanese navy admiral involved in the 1944 Battle of Leyte Gulf. Born in Ibaragi, Japan, on 28 April 1889, Kurita Takeo graduated from the Naval Academy in 1910. In the 1920s, he held a number of destroyer commands. Promoted to commander, Kurita was an instructor at the Torpedo School between 1928 and 1934 and again between 1935 and 1937. He was promoted to captain in 1932. He commanded the cruiser *Abukuma* in 1934 and 1935 and then the battleship *Kongo* in 1937 and 1938. Promoted to rear admiral in 1938, he commanded destroyer squadrons over the next two years.

Made a vice admiral in May 1942, Kurita commanded the Close Support Group in the Battle of Midway. Then, in August 1943, he took command of Second Fleet. In the October 1944 Battle of Leyte Gulf, Kurita commanded the 1st Strike Force (the central force) in executing Operation SHŌ-GŌ (VICTORY ONE). Kurita's force was the most powerful of those that were to converge on the U.S. landing site on Leyte Gulf; it was to proceed through San Bernardino Strait and then join up with the 3rd Force under Vice Admiral Nishimura Shoji, which would pass through Surigao Strait to the south. Kurita's force had five battleships, including the *Yamato* and *Musashi*. The two forces were to come together at the U.S. landing site and destroy the support ships there, while the U.S. covering force was drawn off by a decoy Japanese carrier force under Vice Admiral Ozawa Jisaburo.

As it worked out, Nishimura's force was destroyed, and Kurita's force was discovered by U.S. aircraft; the *Musashi* was sunk. Kurita then reversed course, but unknown to the Americans, he turned around again. Meanwhile, Admiral William F. Halsey took his entire covering Third Fleet to engage Ozawa's decoy force, as Kurita's force issued from San Bernardino Strait to engage Vice Admiral Thomas C. Kinkaid's Seventh Fleet in Leyte Gulf.

In the early morning of 25 October, Kurita's ships approached the unprotected U.S. transports and their weak support force off Leyte, and they were on the verge of being able to annihilate them when Kurita decided to withdraw. He never explained his decision publicly, but apparently, he mistakenly believed that the aircraft attacking his ships were from Halsey's force. Several days of near incessant air attacks on his ships may also have impacted the exhausted Kurita,

but the reasons for his decision are still debated. Not censured for the “mysterious u-turn,” as his action is known in Japan, Kurita subsequently returned to Japan. He commanded the Naval Academy from January 1945 until the end of the war. He died in Hyogo, Japan, on 19 December 1977.

Kursk, Battle of (5–13 July 1943)

Major Eastern Front battle and the largest tank engagement in history. The Battle of Kursk demonstrated the end of German dominance on the Eastern Front. The 1942–1943 win-

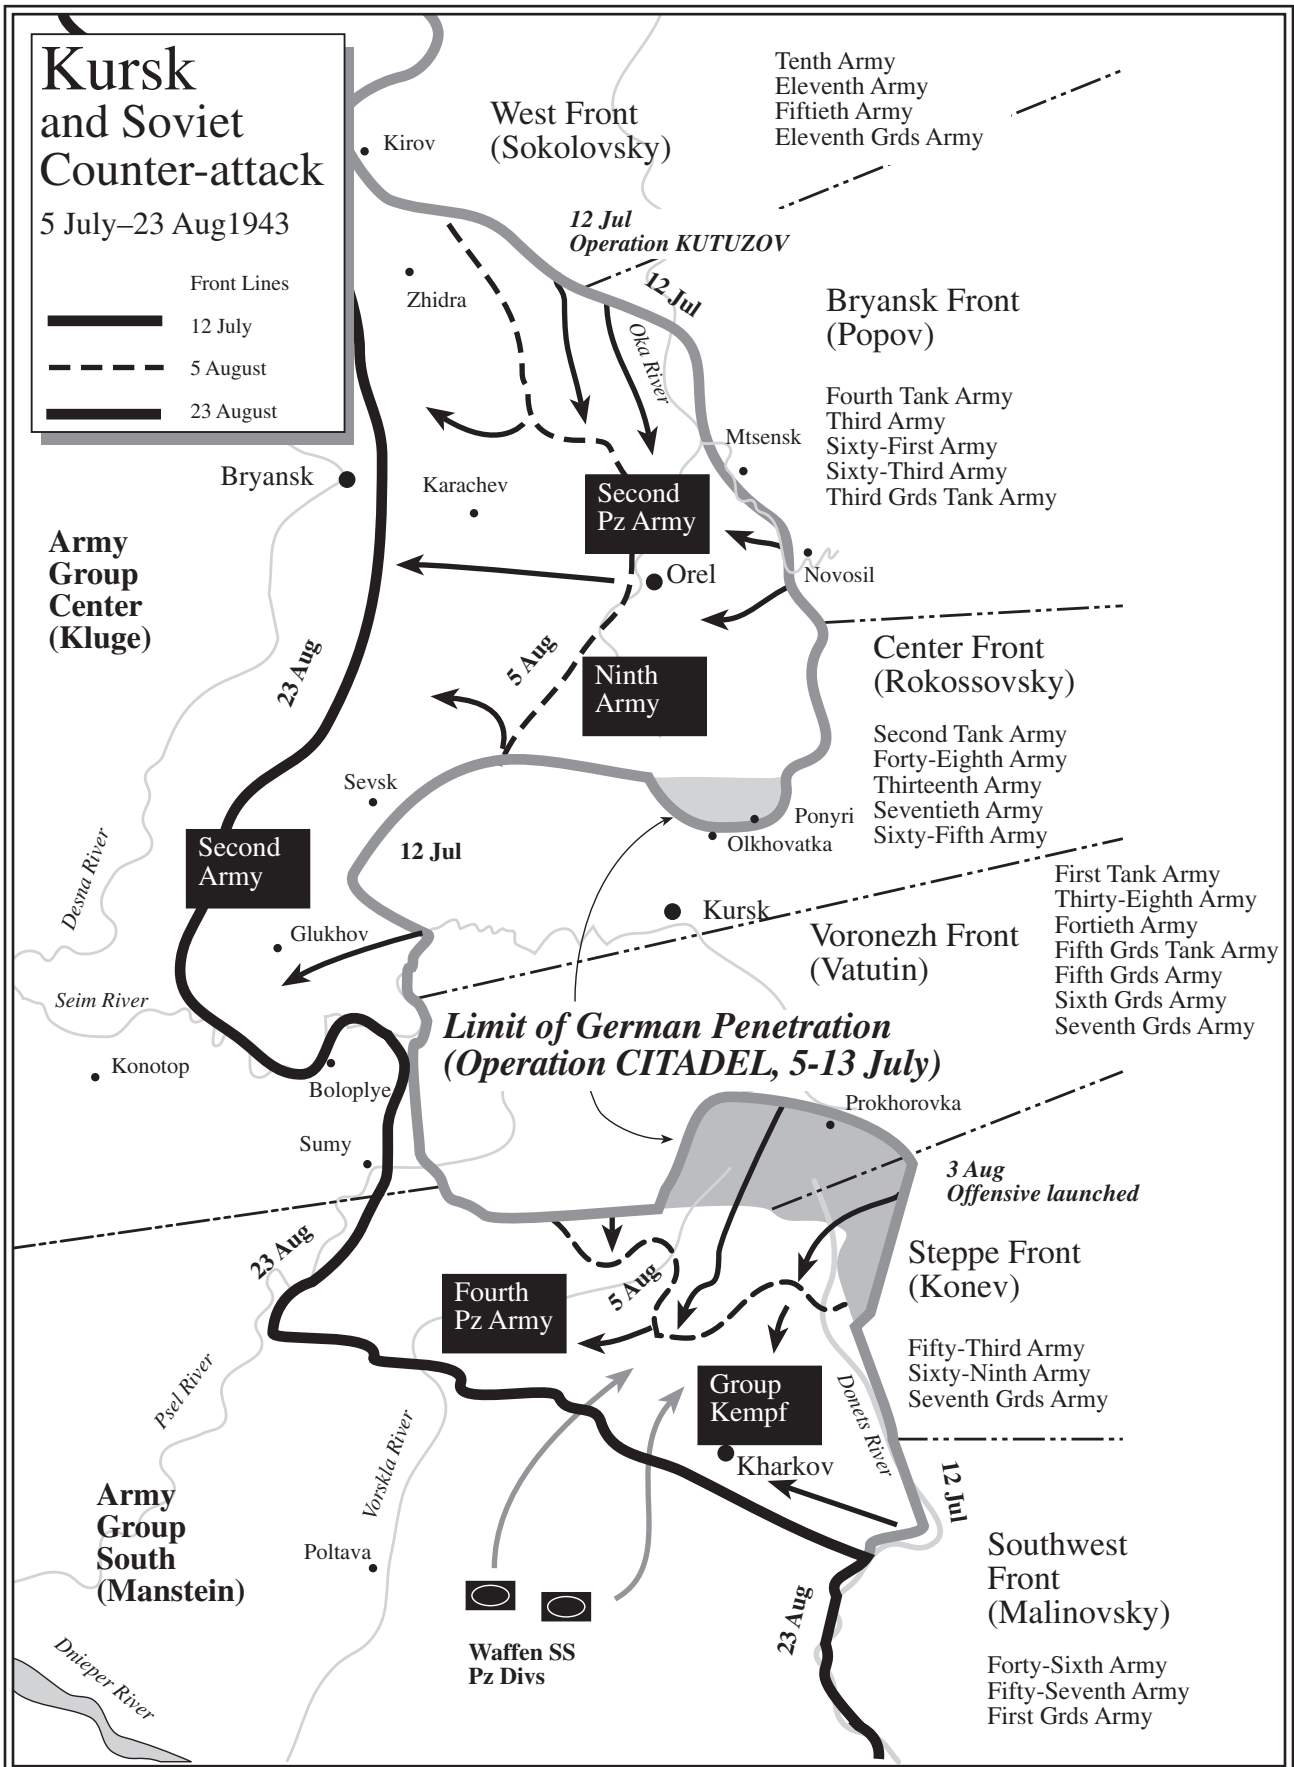

ter campaign had left a 120-mile-wide bulge around Kursk, an important rail junction north of Belgorod and Kharkov, protruding 75 miles deep into German-held territory.

Adolf Hitler saw the salient as an opportunity. By reducing it, his army could regain prestige lost by previous setbacks. By April, plans to blast the Soviets from Kursk were under discussion, and they were solidified into Operation ZITADELLE (CITADEL) by early May. The plan was to reduce the salient with two armor-led pincer attacks at the northern and southern shoulders that would meet in the middle, surrounding all of the forces in the pocket. From the north near Orel, Field Marshal Günther von Kluge’s Army Group Center would launch General Walther Model’s Ninth Army, led by two panzer corps. The main thrust, however, would come in the south from Field Marshal Fritz Eric von Manstein’s Army Group South, with Colonel General Hermann Hoth’s Fourth Panzer Army moving north from near Belgorod.

Hitler left the start date for the operation open to sometime after 1 May. He then delayed it to June and again to July in order to build up the panzer forces with newly developed heavy Tiger and Panther tanks and Ferdinand 88 mm self-propelled assault guns, although they had been rushed into production and suffered from design flaws.

The Soviets knew of the plans for the impending German offensive through reconnaissance and intelligence agents. Soviet leader Josef Stalin wanted a preemptive spoiling attack, but Stavka representative Marshal Georgii Zhukov convinced him that within the Kursk salient, the Central Front, under General Konstantin Rokossovsky, and General Nikolai Vatutin's Voronezh Front would be able to absorb the initial German blows with the defenses they had established, and to the rear, General I. S. Konev's Steppe Front could then counterattack.

Both sides built up armor and troop concentrations for the coming battle. The Germans amassed 900,000 men in 50 divisions, of which 19 were panzer and motorized, with 2,700 tanks and assault guns, 10,000 artillery pieces, and 2,000 aircraft. The delay, however, allowed the Soviets to assemble 1.3 million men, 3,600 tanks, 20,000 artillery pieces, and 2,400 aircraft. Some 300,000 local civilians joined the Red Army in laying a massive array of tank traps, minefields, and dug-in antitank guns designed to channel the German armor into kill zones for Soviet artillery.

The German attack commenced on 5 July. In the north, the Ninth Army assaulted on a narrow, 30-mile front but managed to penetrate only 6 or 7 miles in seven days of fierce fighting. The fighting resembled some of the fierce attrition battles of World War I. Fourth Panzer Army in the south did slightly better, pushing to the third Soviet defensive belt about 20 miles deep. The critical stage of the battle came between 11 and 12 July when General Hoth turned his panzer spearhead northwest to envelope the Soviet 1st Tank Army, and with about 400 tanks, his forces reached Prokhorovka Station. Zhukov responded with a counterattack of five tank armies, two coming from the Steppe Front. This engagement was a cauldron embroiling more than 1,200 tanks from both sides (three-quarters of them Soviet) in the largest tank battle of the war. By the end of 12 July, Prokhorovka lay littered with the burned-out hulks of German and Soviet tanks.

At that point, on 13 July, Hitler called off the offensive in order to withdraw panzer forces to reinforce units in Sicily, where the Allies had landed three days earlier. The German commanders had no choice but to conduct a fighting retreat in the face of a Soviet counteroffensive that began on 12 July. By 5 August, the Soviets had retaken Orel and Belgorod, and they retook Kharkov by 23 August, an action that the Soviets consider to be part of the Battle of Kursk. By that reckoning, Kursk involved 4 million men, 13,000 armored vehicles, and 12,000 aircraft, making it one of the largest battles of the war.

In the Battle of Kursk, the Germans lost an estimated 70,000 men killed, 2,900 tanks, 195 self-propelled guns, 844 artillery pieces, and 1,392 planes. More important, the battle cost the German army the strategic initiative. The Germans now began an almost continuous retreat that would end in Berlin.

Kuznetsov, Nikolai Gerasimovich (1904–1974)

Soviet navy admiral, minister of the navy, deputy minister of Soviet armed forces, and commander of Soviet naval forces. Born in the Arkhangelsk Oblast of northern Russia on 24 July 1904, Nikolai Kuznetsov joined the Red Navy in 1919. After service in the Russian Civil War, he graduated from Leningrad Naval College in 1926 and from the Voroshilov Naval Academy in 1932. In 1936 and 1937, he served as the Soviet adviser to the Republican navy during the Spanish Civil War. The Great Purges exacted a frightful toll on the Soviet navy leadership, and as a consequence, Kuznetsov was named people's commissar of the navy (minister of the navy) in 1939 at just 37 years of age.

In August 1939, Kuznetsov submitted an ambitious naval construction plan designed to produce 2 aircraft carriers, 18 battleships, 48 cruisers, 198 flotilla leaders and destroyers, and 433 submarines. However, the demands and costs of overseeing widely dispersed Soviet naval actions during World War II prevented any meaningful result from this initiative. Promoted to admiral in 1940 and Admiral of the Fleet in May 1944, Kuznetsov commanded the Soviet Pacific Fleet that supported the Red Army's operations against the Japanese at the end of the war. Kuznetsov's postwar shipbuilding plan was far beyond the means of the Soviet Union's war-ravaged industries and did not reflect Soviet dictator Josef Stalin's expectations. Kuznetsov was named deputy minister of the USSR's armed forces and commander in chief of naval forces in 1946, minister of the navy in 1951, and first deputy minister of defense of the USSR and commander in chief of naval forces in 1953. Stripped of these titles in December 1955, Kuznetsov was demoted to vice admiral in February

1956 and forcibly retired, apparently because of the October 1955 explosion and sinking of the battleship *Novorossiisk* (formerly the Italian *Giulio Cesare*) while it was moored at Sevastopol. His immediate subordinate, the more progressive Admiral Sergei Georgievich Gorshkov, assumed his post and led the Soviet navy to unprecedented prominence over the next three decades. Kuznetsov was posthumously restored to his rank of Admiral of the Fleet by the Supreme Soviet in 1988, nearly 14 years after his death in Moscow on 6 December 1974.

Kwajalein, Battle for (19 January–6 February 1944)

Battle for a strategic Japanese logistics base in the Marshall Islands. Kwajalein, the world's largest atoll and one of 32 separate atolls that comprise the Marshall Islands, was a primary target of the U.S. Navy's Central Pacific Campaign. As a consequence of its participation in World War I, Japan had secured the Marshalls, located approximately halfway between Pearl Harbor and the Mariana Islands. Control of the Marshalls allowed the Japanese to extend their power south-east to the Gilbert Islands. These island bases also protected their fleet anchorage to the west at Truk and the airfields to the northwest on the Marianas, which lay close enough to Japan to be within the range of U.S. strategic bombers.

Following their bloody initiation in the opposed amphibious landing on Tarawa, American military planners devised Operation **FLINTLOCK** to bypass the heavily defended eastern

“Paradise Lost” by the Japanese at Kwajalein. American troops arrive in a Coast Guard–manned landing craft at palm-studded Carlos Island, in the Marshall Islands, February 1944. (National Archives)

atolls and strike directly at the administrative and communication complexes centrally located on Kwajalein. A secondary assault on Eniwetok (Operation CATCHPOLE) to the west would follow. FLINTLOCK incorporated lessons learned from the Tarawa experience. The Marshalls landings benefited from a sharp increase in the quality and quantity of naval gunfire support, large-scale air bombardments of the target prior to D day, and land-based artillery prepositioned on adjacent atolls to provide additional fire support. “Frogmen” of the newly created navy underwater demolition teams scouted the beaches for potential obstacles and marked the lanes for the landing craft. Requirements and procedures for landing assault troops were revamped to increase speed and efficiency in getting ashore, and the assaulting troops would have greatly increased firepower, including more automatic weapons, flamethrowers, and demolition charges.

An unprecedented two-day aerial and naval barrage preceded troop landings by the 4th Marine Division and the army’s 7th Infantry Division on 1 February 1944. The Marines stormed Roi-Namur, two islands linked by a causeway on the atoll’s northern tip, while the army took responsibility for seizing the main island of Kwajalein at the southern end. Although confusion plagued the Marines’ initial ship-to-shore movement, the assault on Roi met with light resistance and secured the island’s airfield in a single day.

The attack on Namur’s supply facilities encountered heavier opposition, and only a portion of the island had been taken by nightfall. At least 120 American casualties occurred on Namur when engineers unknowingly detonated a bunker containing torpedo warheads. Just before daybreak on 2 February, the Marines repelled a counterattack by the remaining Japanese defenders and secured the island. The more orderly landings on Kwajalein met with substantial opposition, and it required four days of intense fighting to clear the island. Nearly the entire garrison of 8,675 Japanese soldiers on Roi-Namur

and Kwajalein perished in these battles, with half of these casualties resulting from the preliminary bombardment. U.S. forces took only 265 prisoners, including 165 Korean laborers. U.S. losses were 372 dead and 1,582 wounded.

Operations FLINTLOCK and CATCHPOLE validated the American revised doctrine of amphibious warfare employing massive fire support and speed to achieve victory with minimum casualties. The success in the Marshall Islands actions also confirmed the wisdom of the Central Pacific “island-hopping” campaign, which called for bypassing and isolating Japanese strong points to move within striking distance of the Japanese home islands.

Landing Craft

Both the Axis and Allied powers utilized amphibious warfare during World War II, most especially the Allies (see Table 1). Landing craft were widely employed in the Mediterranean, European, and Pacific Theaters. The Italians used amphibious warfare in Albania and in Africa, and the Germans used it in Norway and Denmark and in the Greek islands. Early landing craft were usually improvised from conventional vessels, but World War II saw the development of craft purpose-built to land troops and equipment on a hostile shore. Such specialized craft allowed an attacker to land a larger number of men and their equipment and to do so faster and in a smaller area than would otherwise be possible. Modified craft continued to be used during the war, however; for example, in 1940, the Germans assembled vessels for Operation SEA LION, their planned cross-Channel invasion of Britain, and between 1942 and 1944, General Douglas MacArthur's forces used modified craft in the southwestern Pacific.

During the years before the war, the U.S. Marine Corps embraced amphibious warfare as its *raison d'être*. This doctrine was spelled out in its *Tentative Landing Operation Manual* (1935). The Marines also developed a prototype for the landing vehicle, tracked (LVT). However, it took the practical demands of World War II to force mass production of landing craft and amphibious tractors. Only the United States built large numbers of amphibious wheeled and tracked vehicles that allowed the transport of men and equipment from ship to shore and then inland.

Landing craft came in a wide variety of forms. They were armored and unarmored and designed to transport both personnel and vehicles. Some had bow ramps, and others had a

fixed-bow configuration. Most landing craft, however, had a blunt bow; were powered by diesel engines acting on twin screws; were anchored at the stern; and had a shallow draft forward, a flat bottom, and a bow ramp. This ramp allowed the rapid unloading of men or cargo.

German *Wasser-Pionieren* (water engineers) developed small landing craft before the war, but the senior German leadership had little interest in these. Landing craft only became a priority in 1940, with the planning for Operation SEA LION. During the war, the Germans built slightly more than 1,000 landing craft of all types; the largest of these had a displacement of 280 tons. The Germans utilized their landing craft chiefly to resupply their Mediterranean island garrisons and for operations in the Aegean, Adriatic, Black, and Baltic Seas. At the end of the war, these vessels were utilized to evacuate forces pressed by the Soviet advance.

Italy built approximately 100 landing craft based on German models. The first 65 of these were roughly 154' long and could carry up to 65 tons of cargo at a speed of 11 knots for some 800 miles. Known as the *mule de mare* (mule of the sea), this landing craft was armed with a 76 mm antiaircraft gun and two machine guns and had a crew of 13.

The standard Japanese landing craft was known to the navy as the *Daihatsu* (the army designation was LB-D). It had a length of 47'11", a beam of 11", and a draft of 2'6". Displacing in excess of 20 tons and capable of carrying 10 tons of cargo, it had a crew of 12 men and was armed with 2 × 7.7-mm machine guns (2 or 3 × 25-mm antiaircraft guns in later versions). It had a speed of 7.5 to 8.5 knots. The Japanese built 3,229 of them between 1935 and 1945. In addition, they built small numbers of landing craft that were roughly 33', 43', and

56' long. Beginning in 1944, they also built 1,140 49' Moku Dai-hatsu landing craft of wood. Japanese amphibious doctrine developed during the war with China that started in 1937.

The Western Allies and especially the United States built by far the largest number of landing craft during the war to meet needs in both the European and Pacific Theaters. Allied troops had to invade and secure areas in the Mediterranean and then invade northwest Europe, and in the Pacific, they had to recapture the various islands held by the Japanese. Many Allied landing craft were quite large and carried smaller landing craft on their decks. The craft were identified not by name but by numbers appended to the general designation. The most common designators, from largest to smallest vessels, were:

LSV	Landing Ship, Vehicle
LSD	Landing Ship, Dock
LST	Landing Ship, Tank
LSM	Landing Ship, Medium
LCI(L)	Landing Craft, Infantry (Large)
LCS(L)	Landing Craft, Support (Large)
LCT	Landing Craft, Tank
LCM	Landing Craft, Mechanized
LCVP	Landing Craft, Vehicle or Personnel

In 1941, the British pioneered development of the LST and the LCT. Both were intended to be seagoing craft to deliver vehicles and bulk supplies directly to the shore. The United States altered the original British design and produced them for both nations. The British later modified some of the designs for their own use.

The LST was undoubtedly the most widely known larger landing vessel of the war, a staple of later landings in the Pacific Theater. The most common version of the LST was 328' in overall length, with a beam of 50' and a displacement of 4,080 tons, fully loaded. LSTs were unarmored or only lightly armed (with 8 × 40-mm and 12 × 20-mm antiaircraft guns). The bow of the ship opened, allowing the front ramp to drop and the crew to land cargo directly on a shore. The LST could carry smaller LCTs and was configured with davits to lower personnel landing craft (LCVPs) over the sides. Some LSTs carried only two LCVPs in this fashion; others carried six. The LST crew complement was 111 officers and men.

The LCS(L) was developed to provide support to amphibious landings. With a crew of 71, it was armed with one 3-inch/50 caliber gun, 4 × 40-mm guns (2 × 2), 4 × 20-mm guns, and 10 rocket launchers.

The smaller LCT carried trucks, tanks, or cargo directly to an invasion beach. The LCVP, developed by New Orleans entrepreneur Andrew J. Higgins and popularly known as the

LSTs pouring army equipment ashore on Leyte Island in the Philippines, 1944. (National Archives)

“Higgins boat,” was made of wood. With a crew of 3 men, it was designed to land 36 troops (or one 6,000-pound vehicle or 8,100 pounds of cargo) directly on the beach. The vessel was developed for ease of mass production, and more than 23,000 had been manufactured by the end of the war.

The Allies also developed true amphibians capable of transporting men and equipment from ship to shore and then inland. Of these, the best known is undoubtedly the DUKW (an administrative code for a 1942 model amphibious four-wheel-drive truck). The DUKW had both a propeller and wheels that moved it at 5.5 knots in the water and up to 50 miles per hour on land. It carried 25 troops or 5,000 pounds of cargo and was particularly useful for transporting litters of wounded. A number of the popular DUKWs remain in service today as tourist attractions.

Landing craft were immensely important to the Allies in the war, so much so that U.S. Army Chief of Staff George C.

Marshall stated in 1943, “Prior to the present war I never heard of landing craft except as a rubber boat. Now I think of nothing else.” The availability of landing craft dictated timetables for Allied amphibious actions, and the shortage of them precluded simultaneous landings in northern France (in Operation OVERLORD) and south France (in Operation ANVIL-DRAGOON). Some historians have argued that the U.S. chief of naval operations, Admiral Ernest J. King, placed too many landing craft in the Pacific, thus hindering Allied efforts in Europe. Current scholarship has concluded that the major problem was overcommitment within the European Theater itself. Far less glamorous than combatant vessels, landing craft were nonetheless an essential element in the Allied victory in World War II, just as they continue to be an integral part of naval operations today.

Laon, Battle of (17–19 May 1940)

Battle during the 1940 campaign for France. On 15 May, the French commander in chief on the Northeast Front, General Alphonse Georges, ordered Colonel Charles de Gaulle to buy time while Sixth Army built a defensive line on the Aisne and Ailette Rivers. In this effort, de Gaulle was to employ the 4th Armored Division, a newly created force gathering some 120 miles northeast of Paris at Laon on the southern flank of the invading German armies.

Since 1933, de Gaulle had argued that France needed a modern, mechanized force, but this would be his initial experience commanding tanks in battle. He met most of his troops for the first time on the day of the battle. After reconnoiter-

ing, de Gaulle chose as his objective the crossroads at Montcornet on the River Serre, 20 miles northeast of Laon. Units dribbled in on 17 May. The tank crews had fired guns of the most modern tanks only once, if at all. The drivers were equally inexperienced.

Almost immediately, de Gaulle dispatched 46th Battalion to Montcornet. The battalion operated Char Bs, France's most modern heavy tank. The 46th was joined by a company of SOMUA D-2 tanks from the 6th Demibrigade. Both tank models had firepower and frontal armor superior to that of the German tanks. The 2nd and 24th Battalions operated R-35s, obsolete tanks but comparable to Germany's older models. However, the Germans had the advantage in training, experience, communications ability (by radio), tactical doctrine, and integration of combined arms.

The French force shot up two columns of soft-skinned vehicles from General der Panzertruppen (U.S. equiv. lieutenant general) Heinz Guderian's XIX Panzer Corps and knocked out a few light panzers before fighting its way into Montcornet around 3:00 P.M. Meanwhile, the French 4th Battalion of Chasseurs eliminated a threat to the French rear from German infantry concealed near Chivres. For three hours, the 4th Armored Division endured German artillery and air strikes with no means of responding. Finally, it fell back to Laon, harassed by Ju-87 Stuka dive-bombers. At least two Char Bs and about 200 infantrymen were lost in combat.

On 19 May, de Gaulle attacked again, this time northwest of Laon toward bridges at Crécy, Mortiers, and Pouilly. Although his troops were reinforced to about 30 Char Bs, 40 SOMUAs, and 80 R-35s, plus 75 mm guns from the 332nd Artillery Regiment and additional infantry, de Gaulle still lacked adequate artillery and air support. His troops could not fight their way across the Serre. Sixth Army had completed its defensive deployment on the Aisne by this time. Ordered to add his tanks to those defenses, de Gaulle lingered another day and then withdrew his troops in good order, fending off attacks by German armored cars along the way.

Although ballyhooed at the time, de Gaulle's counterstrikes had no effect. Guderian had been ordered to halt before de Gaulle attacked, a pause that lasted only 24 hours, and he did not even report the impotent French counterattacks to army headquarters until the following day. Regardless, the actions around Laon became one of four pillars of the de Gaulle pantheon. The others were his prewar advocacy of a mechanized army, his leadership of the Free French during the war, and his postwar political role.

Latin America and the War

After World War II began in Europe, representatives of the United States and Latin American nations convened in Panama in September 1939 and issued a "general declaration of neutrality," indicating that it was the intention of all the American republics to remain neutral in the European conflict. In the event that the United States and Latin America were drawn into the war, U.S. strategic planners did not envision an important military role for the armed forces of Latin America, beyond defense of their own countries. However, the United States did want the Latin American nations to furnish bases for U.S. operations, to increase the flow of strategic materials, and to take action to curb Axis subversive and intelligence activities.

The United States engaged in negotiations with the Latin American nations concerning closer military cooperation and the acquisition of bases. Washington signed a series of bilateral "staff agreements" promising military aid in return for the Latin American nations' promise to call for assistance if attacked, to combat subversive activities, to exchange intelligence, and to permit the transit of U.S. forces going to the aid of another Latin American country. In response to the request for bases, Latin American leaders expressed concerns about jurisdiction and access. The United States responded by offering to provide financing and technical assistance for bases, with the host country retaining jurisdiction and administration. Moreover, the bases would be open not only to the United States but also to all other Latin American nations. The United States signed staff agreements with every Latin American nation except Argentina and base agreements with 16 countries.

The U.S. Lend-Lease Act, which went into effect in March 1941, authorized the president to lend, lease, or sell military items to any country whose defense was deemed vital to the defense of the United States. In April, Roosevelt certified that Latin America came under the provisions of the act, and in October 1941, the U.S. Congress approved funding for Latin America. Washington eventually provided \$475 million in Lend-Lease aid to Latin America, with some \$348 million of that amount going to Brazil.

In the meeting room of historic Tiradentes Palace, President of Brazil Getulio Vargas addresses delegates to the Conference of American Foreign Ministers, 20 January 1942. (Bettmann/Corbis)

When the United States officially entered the war in December 1941, all of the Latin American nations made some positive response. Nine countries declared war on the Axis powers in December 1941: Costa Rica, Cuba, the Dominican Republic, El Salvador, Guatemala, Haiti, Honduras, Nicaragua, and Panama. Colombia and Mexico broke diplomatic relations with the Axis powers. Brazil, Ecuador, Paraguay, and Peru declared their solidarity with the United States, and the remaining countries granted the United States nonbelligerent status, giving it greater freedom of action within their national territories.

A meeting of the American republics called by the United States and Chile convened in Rio de Janeiro on 15 January 1942. Washington was not seeking a joint declaration of war because of the military demands that would result. Instead, it supported a joint declaration calling for a break in relations with the Axis powers. The conference approved a resolution

that “recommended” a break in diplomatic relations as well as in commercial and financial connections. Those countries that had not already broken diplomatic relations quickly did so, except for Argentina and Chile. The conference also established the Inter-American Defense Board, made up of military and naval representatives from each country to coordinate hemispheric defense.

The fact that the consultative conference was held in Rio de Janeiro indicated the special role that the United States assigned to Brazil. U.S. planners believed that the most likely scenario for an Axis attack on the Western Hemisphere was a German assault launched from Africa against Brazil’s northeastern “bulge.” The United States wanted to send U.S. troops to defend the bulge, but the Brazilians were unwilling to accept U.S. ground forces and wanted U.S. arms instead. Both sides eventually accepted a trade-off between U.S.

troops and arms for the Brazilians. Brazil received a large increase in military aid in return for permitting unrestricted U.S. air operations in the Brazilian northeast and even the stationing of U.S. troops. In August 1942, Brazil declared war on the Axis after German submarines attacked Brazilian shipping. Brazil also became the only Latin American country to provide a major military force for combat. (Mexico provided one fighter squadron.) With the United States furnishing training, supplies, and transport, the Brazilian Expeditionary Corps of approximately 25,000 men participated in the 1944–1945 Italian Campaign.

The United States recognized early on that it had to address the economic as well as the military consequences of war. Even in the summer of 1940, Washington planners were already thinking in terms of a “hemispheric economic policy” that called for much closer economic relations with Latin America. Strategic metals were of particular interest to the United States; in November 1940, the U.S. government contracted to purchase virtually the entire Latin American production of copper and tin. The United States also developed a blacklist of firms and individuals operating in Latin America who were considered pro-Axis or anti-United States. U.S. firms were prohibited from dealing with anyone or any firm on this “Proclaimed List of Certain Blocked Nationals,” and Franklin D. Roosevelt’s administration attempted, with considerable success, to get Latin American governments to enforce this blacklist. The United States also dramatically increased its lending to Latin America, mainly to finance the purchase of U.S. products.

The U.S. entry into the war led to even greater efforts at economic cooperation between the United States and Latin America. As mentioned, the Rio Conference in January 1942 approved a resolution recommending a break in commercial and financial relations with the Axis powers. The conference also called for a complete economic mobilization of the American republics to provide an adequate supply of both military and civilian goods. U.S. purchases of Latin American commodities continued to be at the center of U.S.–Latin American economic relations. Washington stepped up its purchases of strategic metals, reaching agreements with 12 Latin American nations to buy metals. Cut off from its principal source of natural rubber in Asia, the United States also entered into contracts with 16 Latin American nations to promote the production of rubber. In addition, actions were taken to improve transportation within the hemisphere. An inter-American technical commission was established to improve maritime transportation, and the United States tried to improve land transportation by reviving construction on the Inter-American Highway, concentrating on the Central American section of the road. Axis-connected firms operating airlines in Bolivia, Brazil, Colombia, Ecuador, and Peru were forced out of business and were replaced by U.S. firms

or locally controlled operations. The United States even provided aircraft for local airlines in Brazil and Chile. The net effect of all of these actions was to create an even greater economic interdependence between the United States and Latin America. From 1941 to 1945, the United States purchased more than 50 percent of Latin America’s exports and provided more than 60 percent of its imports.

Wartime themes and postwar plans came together at the Chapultepec Conference in Mexico City in February and March 1945. The Latin American nations were concerned that the United States might relegate the inter-American system to a lesser role once it had served its wartime purposes. They also hoped that the United States would facilitate the transition to a peacetime economy and would aid in Latin America’s postwar development. When the United States finally agreed to the Chapultepec Conference, it sent an impressive delegation, including the new secretary of state, Edward Stettinius, who was returning from the Yalta Conference. The Latin American nations wanted to put the inter-American system on a more formal basis, but the United States delayed action until the next regular inter-American conference. Latin American demands for a strengthening of the inter-American security system led to the Act of Chapultepec, which classified an attack against any American state as an attack against all American states and required consultation on the measures to be taken in response, including the use of force. Although the act applied only for the duration of the war, it was to be incorporated in a permanent treaty once the war concluded. On the question of economic relations, the United States agreed to aid in the transition to a peacetime economy by gradually reducing its purchases of strategic raw materials; it also indicated, in general terms, its support for economic development in Latin America but did not commit itself to any specific programs of assistance.

The warm glow of the Chapultepec Conference soon faded. The meeting scheduled for Rio in October 1945 to place the Act of Chapultepec into treaty form was postponed, and there were repeated delays in holding the technical conference to deal with inter-American economic problems. The war had put the Latin American nations in the role of principal supporters of the inter-American system at the very time that the United States was shifting its emphasis to global organization. Latin America wanted to enlist U.S. support in dealing with its growing social and economic problems; the United States, however, was preparing for another struggle: the Cold War with the Soviet Union.

Lattre de Tassigny, Jean Joseph Marie Gabriel de (1889–1952)

Marshal of France, a commander of Free French forces in World War II, and one of France’s greatest soldiers. Born in Mouilleron-en-Pareds in the Vendée, France, on 2 February 1889, Jean de Lattre de Tassigny graduated from the French Military Academy of St. Cyr in 1911 and was commissioned in the cavalry. In September 1914, he received the first of six wounds he suffered during World War I. He fought the remainder of the war in the infantry, ending up in command of a battalion. He was cited eight times for bravery. He subsequently served four years in Morocco in pacification campaigns and was again wounded. In 1932, de Lattre was selected to join the staff of the Supreme War Council. Promoted to lieutenant colonel, he held the post until 1935, when he was advanced to full colonel and took command of a regiment at Metz.

In March 1939, de Lattre commanded the 14th Infantry Division, which acquitted itself well during the Battle for France, at Sedan, at Rethel, on the Marne, and on the Loire, ending the campaign near Clermont-Ferrand.

De Lattre continued in command of the 14th Division in the Armistice Army, before becoming commandant at Puy-de-Dôme Depot. He then commanded the 13th Military Region and worked to retrain what was left of the French army. In September 1941, de Lattre was posted to command French forces in Tunisia. In fighting between British/Free French forces and the Germans in Libya, de Lattre maneuvered his own troops so as to cut off the German retreat. Alarmed, the Vichy government ordered his return to France, where he took command of the 16th Military District at Montpellier in January 1942.

When the Germans entered unoccupied France in November 1942, de Lattre contravened Vichy orders and began defensive operations, allowing many anti-German French to escape to the Mediterranean coast. Subsequently arrested, he was sentenced to 10 years of imprisonment. In September 1943, de Lattre escaped from Riom Prison, evading capture with the help of the *maquis* (guerrillas), until he was evacuated to England on 17 October.

On reporting to the head of the Free French government in Algiers, General Charles de Gaulle, de Lattre took charge of training French forces in North Africa. He then commanded

French troops in the June 1944 invasion of Elba. He led the Free French First Army into southern France in Operation DRAGOON, and his subsequent capture of the fortified ports of Toulon and Marseille proved a brilliant feat of arms. The First Army fought on the Allied right flank through Alsace. By occupying territory technically within the Allied boundaries, de Lattre reached the Franco-German border abreast of the Americans, rather than behind them as he had been ordered. Among his successes was the capture of the fortress of Belfort at a cost of only 1,000 French casualties. He then pushed nine divisions into Germany by the armistice, helping to secure for France a substantial role in the postwar occupation of Germany.

Following the armistice, de Lattre served on the Allied Control Council for Germany. He then served as inspector general of the French army, overseeing its modernization and retraining. From 1948 to 1950, he was commander of land forces of the Western European Union.

In December 1950, as a gesture of its determination, the French government sent de Lattre, its greatest living soldier, to Indochina as high commissioner as well as commander of French military forces. De Lattre infused new vigor in the French military effort and won a series of pitched battles against the Vietminh. Consumed by cancer, de Lattre returned to Paris in December 1951 and died there on 11 January 1952.

Latvia

Along with the other Baltic states of Estonia and Lithuania, Latvia had the unfortunate fate to be occupied by both the Soviet Union and Germany during World War II. The initial Soviet occupation was presaged by the German-Soviet Non-aggression Pact of 23 August 1939, which had a secret “additional protocol” stipulating that Latvia and Estonia would be under Soviet control and Lithuania under German control. In October 1939, Latvia was forced to agree to the Treaty of Friendship and Cooperation with Moscow, which permitted the stationing of Soviet troops.

The Latvian representative in Great Britain, Karlis Zarins, was given authority to handle national affairs overseas should contact with the home country be broken. In June 1940, following the German invasion of France, the Soviet

Union activated the pact and its troops invaded Latvia. Threats by Moscow to bomb Latvian cities ended preparations for armed resistance, and Moscow established a puppet “people’s government” in the country. On 5 August 1940, the Latvian Soviet Socialist Republic (SSR) was formally admitted into the Soviet Union.

In June 1941, Germany invaded the Soviet Union and the German army occupied the Baltics. The German blitzkrieg moved with great speed, and some 15,000 men in Latvia defense battalions surrendered to German forces. Certainly, an element of the population strongly favored the Nazi cause.

German plans called for annexing the Baltic states, expelling approximately two-thirds of their populations, and integrating the remainder with German immigrants. Nazi leader Alfred Rosenberg, a Baltic German, proposed a substantial expansion of Latvia and the other republics with land from Belorussia and the USSR. The harshness of the occupation was reflected in the confiscatory devaluation of the Latvian currency, the seizure of private property, and the forced conscription of citizens into labor and military units, including deportations. Property that had been expropriated by the Soviets was not returned but rather was turned over to specially created German companies.

Censorship and a strict regulation of formal education were also features of the occupation. Riga and Tartu Universities were closed, then reluctantly reopened in early 1942. Kaunas and Vilnius Universities were opened in the fall of 1941 following Soviet closure, then closed again early in 1943. Nazi principles were integrated into school textbooks on biology and history. The burden of censorship, combined with paper shortages, forced newspapers out of print. Certain books were also banned.

Administrative directorates implemented German instructions but provided for some informal independence and resistance to the occupation as well. The directorate of Latvia successfully opposed a conscription of 13,000 women from Estonia and Latvia that was announced in the spring of 1943. Bribery and promises of a smooth administration of the economy were useful tools in persuading the occupiers to be more flexible in their policies. Nonetheless, the German occupation steadily grew more harsh, with the directorates bypassed in the drive for laborers and other assets. The total number of Latvian people killed or deported by the Nazis has been estimated at 120,000, approximately half of them Jews. At the end of the war, the Soviet Union reestablished its control and replenished the loss with Soviet immigrants, who soon threatened to become an absolute majority.

Laval, Pierre (1883–1945)

French politician and Vichy official. Born in Châteldon, Puy-de-Dôme, France, on 28 June 1883, Pierre Laval was trained as a lawyer, specializing in the defense of labor unions. In 1914, he won election to the Chamber of Deputies of the French National Assembly as a socialist and pacifist. Despite frequent policy shifts in other matters, he consistently promoted his policy of peace at any price—a policy that led directly to his collaborationist platform during World War II.

Laval served in the National Assembly from 1914 to 1919 and again from 1924 to 1927. Following the split in the Socialist Party at Tours in 1920, he became a political moderate, eschewing party affiliation. He gradually moved to the right politically, in the process acquiring a reputation as an unprincipled political manipulator. Laval held important positions from 1925 to 1936, including that of premier in three successive governments between January 1931 and February 1932 and then again from November 1934 to January 1936 (when he was also minister of foreign affairs). As foreign minister, he played an important part in developing the Rome Accords of January 1935 with Benito Mussolini’s Italy. Evidence suggests that Laval offered Italy a free hand in Ethiopia. Certainly, he and British Foreign Minister Sir Samuel Hoare sought to arrange an economic protectorate for Italy in Ethiopia, even after the Italian invasion of that country. Public outcry over this situation led to the resignation of both men. Laval then remained something of a political outcast until World War II.

His strong opposition to the war in September 1939 helped his political career the following June when he actively supported an armistice with Germany, along with Marshal Henri Philippe Pétain and General Maxime Weygand. On 21 June, he helped lead the opposition to removing the government to North Africa, and two days later, Laval joined the Vichy government as minister of state. On 1 July, he played the key role in removing the government to the resort town of Vichy in central France.

Laval’s intervention helped convince leaders in the National Assembly to accept constitutional changes on 10 July 1940 that gave Pétain sweeping powers as the head of state. As vice president of the Council of State and Pétain’s designated successor, Laval encouraged active collaboration with the Germans. After meeting with the German ambassador, Otto

Vichy France political leader Pierre Laval in 1943. (Hulton-Deutsch Collection/Corbis)

Abetz, in July, he visited with Adolf Hitler at Montoire on 22 October to prepare an encounter between Pétain and the German leader two days later. His role of matchmaker was, however, less appreciated by Pétain and the Vichy ministers. Following considerable intrigues by the latter, Pétain dismissed Laval from his posts and had him arrested on 13 December 1940 on suspicion of planning a coup d'état. The Germans secured his release.

During the next year and a half, Laval remained near German-occupied Paris, barely surviving an assassination attempt on 27 August 1941 at Versailles. He continued criticizing Pétain for not collaborating sufficiently with the Germans before he returned on 18 April 1942 to play the leading role in the Vichy government as minister of foreign affairs, information, and the interior, largely on German insistence. He purged the government of his enemies and continued collaborating with the Germans, as evidenced in his declaration of 22 June 1942 expressing hopes for a German victory to prevent the spread of communism. Laval sought to win concessions from the Germans in return for supplying them with

French workers; his *La Relève* (Relief) system involved the exchange of French workers for prisoners of war. This system was soon replaced by *Le Service de Travail Obligatoire* (Obligatory Labor Service). Laval agreed to having French Jews in both zones of France rounded up and shipped to Germany, and he created the French Milice (Militia) to secure internal order and repress the French Resistance.

As the tide of war turned, however, he sought to play a double game, trying to hold off on some of Hitler's demands for increased French assistance. In the fall of 1943, Germany again intervened to prevent the firing of Laval, who had been joined by even more extreme collaborators in the government. In August 1944, following the Allied landing in Normandy in June, Laval moved the government to Belfort; one month later, he moved with Pétain and the Vichy government to Sigmaringen in Germany. At the end of the war, Laval sought asylum in Spain, which refused to accept him. He was returned to France for a controversial and particularly rapid trial before the High Court of Justice in Paris. He was found guilty of collaboration on 9 October and sentenced to death. After a failed attempt to kill himself with poison, Laval was shot by a firing squad at the prison of Fresnes on 15 October 1945.

Leahy, William Daniel (1875–1959)

U.S. Navy Admiral of the Fleet who was an adviser to Presidents Franklin D. Roosevelt and Harry S Truman. Born in Hampton, Iowa, on 6 May 1875, William Leahy graduated from the U.S. Naval Academy in 1897. He first served aboard the battleship *Oregon*, taking part in the Spanish-American War and the Boxer Rebellion. From 1899 to 1907, Ensign Leahy served in the Pacific, including the Philippines, and in Panama. During World War I, he formed a friendship with Roosevelt, who was assistant secretary of the navy at the time. In 1918, Leahy won promotion to captain.

He served at sea and also held important posts ashore. Promoted to rear admiral in 1927, he headed the Bureau of Ordnance (1927–1931) and then the Bureau of Navigation (1933–1935). He was made a vice admiral in 1935. In Janu-

U.S. Navy Admiral of the Fleet and Chairman of the Joint Chiefs of Staff William D. Leahy. (Library of Congress)

ary 1937, Leahy was promoted to admiral and appointed by President Roosevelt as chief of naval operations (CNO). As CNO, he argued for naval expansion. After retiring from the navy in August 1939, he served as governor of Puerto Rico (September 1939–November 1940). Roosevelt next named him U.S. ambassador to Vichy France.

In May 1942, Roosevelt recalled Leahy to active duty and made him his chief of staff and unofficial chairman of the Joint Chiefs of Staff (JCS). Leahy also presided over the Combined Chiefs of Staff meetings when the United States was the host. Throughout the war years, he was an adviser and confidant to Roosevelt, especially during meetings with Allied heads of state at places such as Casablanca, Cairo, Tehran, and Yalta. A strong nationalist, Leahy did not put much credence in Roosevelt's cherished United Nations. In December 1944, he won promotion to Fleet Admiral, becoming the first naval officer to be so promoted.

When Roosevelt died on 12 April 1945, Leahy became one of President Truman's closest advisers, playing an important role at the Potsdam Conference of July and August 1945. He

opposed dropping the atomic bomb on Japan, urging Truman to continue conventional bombing and to tighten the naval blockade in the belief that Japan was ready to sue for peace. He also feared that the atomic bomb might not work.

After the war, Leahy played a major part in the formation of the National Security Act of 1947. His advice helped lead to the subsequent establishment of the National Military Establishment (NME), later known as the Department of Defense, and the Central Intelligence Group, later known as the Central Intelligence Agency. He continued to play vital roles in the formation and expansion of the National Security Council (NSC), the JCS, and the North Atlantic Treaty Organization (NATO).

Leahy was an ardent anticommunist who shared Truman's abiding distrust of the Soviet Union. He retired from government service in March 1949 but continued to act as a key adviser to the secretary of the navy. He also helped establish the Naval Historical Foundation and served as its first president. In 1950, Leahy published his autobiography, *I Was There*. He died on 20 July 1959, in Bethesda, Maryland.

Leclerc, Jacques Philippe (Count Philippe de Hauteclocque) (1902–1947)

French army general who commanded Free French forces in Africa and Europe. Born on 28 November 1902 into a distinguished and ennobled military family near Amiens, France, Count Philippe de Hauteclocque would take the nom de guerre of Leclerc during World War II to avoid reprisals against his family in France.

Too young to have fought in World War I, he graduated from the French Military Academy of St. Cyr in 1924 and distinguished himself in combat against rebels in Morocco. He then taught at St. Cyr.

While fighting as a captain during the campaign for France in 1940, Leclerc was wounded and captured by the Germans. They thought he was too weak to move and placed him at a

French General Jacques Philippe Leclerc. (Hulton Archive)

chateau belonging to some of his friends, from which he managed to escape. After a perilous journey through Fascist-controlled Spain and Portugal, he arrived in London in July to join General Charles de Gaulle's Free French forces. Following Leclerc's recuperation and promotion to major, de Gaulle sent him to French Equatorial Africa, where he organized Free French forces.

Starting with only about 20 men, Leclerc defeated Vichy French forces and won control of Gabon and the Cameroons during October and November 1940. By 1942, Free French forces controlled all of French Equatorial Africa. Leclerc, now a colonel, commanded the Desert Army and conducted raids against Italian outposts in the Sahara. In December 1942, he led a march from Lake Chad to Tripoli, covering 2,000 miles in 39 days. Leclerc's actions guaranteed the safety of the Takoradi air route used to ferry supplies from the United States to the Soviet Union. In January 1943, his forces linked up with the British Eighth Army outside Tripoli.

In June 1944, Leclerc assumed command of the 2nd French Armored Division as a major general. He and his unit fought in the Normandy Campaign and in the drive across France. On 23 August, on General Dwight D. Eisenhower's approval, his unit was the first Allied formation to enter Paris.

Promoted to lieutenant general, he then helped liberate both Strasbourg and Bordeaux.

After the Allied victory in Europe, de Gaulle appointed Leclerc to command the French Expeditionary Force sent to restore French control over Indochina; on the way there, he represented France in the formal Japanese surrender. Despite having only 40,000 men, Leclerc speedily restored French authority in Vietnam and Cambodia. Aware of the great difficulties of engaging in jungle warfare against nationalist guerrillas, he was not optimistic about his country's long-term prospects in the area, and he informed the government in a secret report that there would be no victory through force in Indochina. Undercut by French nationalists, Leclerc asked for and received a transfer. In July 1946, he was promoted to full general and appointed to command French forces in North Africa. He died in a plane crash in Algeria on 28 November 1947. France posthumously awarded him the rank of marshal.

Lee, John Clifford Hodges (1887–1958)

U.S. Army general who was responsible for assembling the troops and supplies needed for the Allied invasion of occupied Europe. Born in Junction City, Kansas, on 1 August 1887, John Lee graduated from the U.S. Military Academy in 1909 and was commissioned in the Corps of Engineers. During World War I, he served as aide to Major General Leonard Wood, commanding general of the 89th Division, and then as chief of staff of the 89th Division. Lee graduated from the Army General Staff College at Langres in 1918 and was actively involved with the planning of the Saint-Mihiel and Meuse-Argonne Offensives. He ended the war as a temporary colonel.

During the interwar years, Lee graduated from the Army War College (1932) and the Army Industrial College (1933). He oversaw numerous harbor and river projects and commanded the San Francisco Port of Embarkation (1940). Promoted to brigadier general in October 1940, the arrogant Lee, whose initials were J. C. H., came to be known as "Jesus Christ Himself." In November 1941, he received command of the 2nd Infantry Division, and in February 1942, he was promoted to major general.

That May, Lee took command of the Services of Supply (SOS) in the United Kingdom to oversee the greatest engi-

neering project of the war: the massive buildup of men and supplies for the invasion of occupied Europe, code-named BOLERO. In addition to commanding the SOS (designated the Communications Zone [COMMZ] on 7 June 1944) and acting as the G-4 (Supply) officer for the European Theater of Operations, U.S. Army Headquarters, Lee served as deputy theater commander, with special responsibility for administration and supply, from January to July 1944. He was promoted to lieutenant general in February 1944.

With the dissolution of the COMMZ at the end of the war, Lee took charge of the successor command—Theater Service Forces, European Theater. In January 1946, he became the commanding general of the Mediterranean Theater and deputy supreme commander of Allied Forces, Mediterranean. Lee retired from the army in December 1947 and died in York, Pennsylvania, on 30 August 1958.

Lee, promoted to lieutenant colonel in February 1941 and colonel that December, had a major role in that effort.

In March 1942, the army established the Airborne Command, and it was headed by Lee, who was made a brigadier general that April. The Airborne Command consisted of two airborne divisions: the 82nd and 101st. Lee was promoted to major general in August 1942, and he took command of the “Screaming Eagles,” the 101st Airborne Division, and accompanied it to Britain for the June 1944 Normandy Invasion. Lee—the oldest parachute-qualified officer among U.S. forces—did not accompany the 101st into battle. He suffered heart attacks in February and March 1944. Medically retired in December 1944, he died in Dunn, North Carolina, on 25 June 1948. His home there has been transformed into an airborne museum.

Lee, William Carey (1895–1948)

U.S. Army general, considered the father of U.S. airborne forces. Born in Dunn, North Carolina, on 12 March 1895, William Lee graduated from North Carolina State University and was commissioned through the Reserve Officers' Training Corps (ROTC) as a second lieutenant in August 1917. He served with the American Expeditionary Forces (AEF) in France during World War I, where he commanded an infantry platoon. He then served on occupation duty in Germany through most of 1919. Lee taught military science with the ROTC program at North Carolina State University from 1922 to 1925. Between 1926 and 1929, he served in Panama. He then attended the Tank School at Fort Meade, Maryland, and later became an instructor. Major Lee graduated from the Command and General Staff School in 1938. Assigned to the army's Airborne Project in June 1940, he became the foremost proponent of U.S. parachute and gliderborne infantry formations.

In July 1940, Lee formed the Parachute Test Platoon, and within three months, this organization had grown into a parachute infantry battalion. Following Germany's successful seizure of Crete with airborne forces in May 1941, the British and Americans developed large airborne formations.

Lee, Willis Augustus “Ching” (1888–1945)

U.S. Navy admiral who played a pivotal role in readying American forces to fight a war spanning two oceans. Born on 11 May 1888 in Natlee, Kentucky, Willis Lee graduated from the Naval Academy in 1908. An early gunboat billet with the Asiatic Fleet and a fondness for China earned him the sobriquet “Ching.” An expert marksman, he won five Olympic Gold Medals in 1920 as a member of the U.S. rifle team. Lee advanced steadily through the various grades before World War II and served in numerous capacities, both at sea and ashore, including four tours with the Division of Fleet Training. He returned to that organization as its director in 1941 and 1942.

Promoted to rear admiral in January 1942, Lee subsequently took command of the Pacific Fleet's Battleship Division 6, composed of the recently commissioned fast battleships *Washington* and *South Dakota*. At Guadalcanal, he repulsed a superior Japanese force on the night of 14–15 November 1942. Despite losing his destroyer screen, Lee engaged the Japanese. Through the judicious use of radar, he identified and targeted the battleship *Kirishima*, which fell victim to devastatingly accurate gunfire from the *Washington's* 16-inch batteries. With *Kirishima* mortally damaged, the

Japanese ships withdrew. Lee's victory, in essence, effectively ended Japan's efforts to dislodge U.S. forces from Guadalcanal and was thus a turning point in the Pacific Theater.

Although promoted to commander of the Pacific Fleet's battleships in 1943, Lee never again engaged the Japanese in a decisive surface battle. Eclipsed by naval airpower, his battlewagons were reduced to providing antiaircraft screens for the fast carrier task forces, for which he nevertheless earned recognition. Selected to develop kamikaze countermeasures in July 1945, Lee, who had been made a vice admiral in March, had just formed his task group when the war ended. He died shortly thereafter, on 25 August 1945.

Although Lee was hero of the fighting at sea, his efforts at the Division of Fleet Training remain his greatest contribution to victory. Improving the equipment of combat ships and spearheading the drive to outfit vessels with radar, "Ching" Lee prepared the U.S. Navy for a two-ocean war.

Leeb, Wilhelm Franz Josef Ritter von (1876–1956)

German army field marshal who led Army Group North in the invasion of the Soviet Union. Born on the family estate in Landsberg-am-Lech, Bavaria, Germany, on 5 September 1876, Wilhelm von Leeb began his military career as an officer cadet in the Bavarian army's 4th Artillery Regiment in 1895. Commissioned as a lieutenant in 1897, he saw action in the 1900 multinational expedition to rescue the foreign legations in Beijing during the Boxer Uprising. He attended the Bavarian War Academy in Munich and then served on the Bavarian General Staff (1907–1909) and on the Greater General Staff in Berlin (1909–1911).

Promoted to captain in 1911, Leeb was serving on the General Staff of the I Bavarian Army Corps in Munich when World War I began. During the war, he was a staff officer with the Bavarian 11th Infantry Division on the Western, Galician, and Serbian Fronts. He was awarded the Bavarian Military Order of Max Joseph for exceptional bravery, and as a member of the knighthood, he could add the title "Ritter" to his

name. Promoted to major, he participated in the Battle of Kovel against the Russians.

Selected for retention in the postwar German army, Leeb won promotion to lieutenant colonel in 1920. Six years later, he took command of the 7th Artillery Regiment, and in 1928, he was one of two deputy commanders of the 5th Infantry Division at Stuttgart. In 1929, he was deputy commander of the 7th Infantry Division in Munich, and in December of that year, only five years after being promoted to lieutenant colonel, he was advanced to Generalleutnant (U.S. equiv. major general). In 1930, he commanded VII Military District in south Germany. Considered an expert on defensive warfare, Leeb wrote extensively on that subject, including the book *Die Abwehr* (On Defense, published in 1938), and was well known internationally. Indeed, the Soviets incorporated many of the principles he espoused in his prewar publications into their 1936 field regulations. In that regard, Leeb helped shape the Soviet army tactics and operational art that cost the Germans so heavily in World War II. He stressed that in a new war, Germany should initially maintain a strategic defense, force the numerically superior enemy to attack, and reduce its forces through attrition warfare, only then going over to offensive warfare centered on armor. Leeb also wrote a history of his family, earning him the nickname "the Family-Tree General."

Leeb was not fooled by Adolf Hitler, who branded him an "incorrigible anti-Nazi." A thinker rather than a man of action, however, Leeb was never active in the anti-Hitler resistance. Promoted to General der Artillerie (U.S. equiv. lieutenant general) in 1934, he then took command of 2nd Army Group at Kessel. Leeb headed the list of senior officers retired on Hitler's insistence after the 1938 Fritsch-Blomberg Affair, being advanced to colonel general.

Recalled to active duty in August 1938 during the crisis over Czechoslovakia, Leeb received command of the newly created Twelfth Army. When Germany secured the Sudetenland without war, Leeb's forces occupied it peacefully, and he then returned to Bavaria and retirement. But in Hitler's preparations for an invasion of Poland, Leeb was again called to active duty in 1939, taking command of Army Group C to defend against a possible Allied attack in the west while the German army invaded and absorbed Poland. Leeb contained the weak French advance into the Saar region and launched a counteroffensive there in mid-October.

Leeb opposed Hitler's plans to invade western Europe and especially neutral Belgium, which he objected to on moral grounds. He circulated a memorandum among other generals, but many of them, intoxicated by the success of the invasion of Poland, regarded him as too cautious and behind the times. Army Group C played only a minor role in the 1940 campaign for France, but Leeb's feints against the French Maginot Line were so successful that the French held many

units there until it was too late to commit them to meet the main German thrust to the north. In the subsequent fighting during the British evacuation at Dunkerque, his forces took 250,000 French prisoners. In July 1940, Leeb was among the generals rewarded by Hitler with promotion to field marshal.

Leeb commanded Army Group North in the invasion of the Soviet Union, for the first time directing a large number of panzer formations, with which he had no experience. Nonetheless, in less than 90 days, his force drove to within 20 miles of Leningrad. However, the Soviets successfully rallied and held the city, resulting in a siege that would last for three years. Leeb was one of the senior German officers who recommended withdrawing to more defensible positions and resuming the offensive later, and his comments about whether Hitler was actually allied with Soviet leader Josef Stalin against the German army were known to the Führer. Frustrated with Hitler's micromanagement of his forces, Leeb asked to be relieved of his command on 16 January 1942. He retired to Bavaria for a third and final time, never again serving in an active capacity. Arrested by the Allies at the end of the war, he was tried and sentenced to three years of imprisonment as a minor war criminal, a severe sentence given his military record. On his release, he lived quietly in retirement. Ritter von Leeb died in Hohenschwangau in Bavaria on 29 April 1956.

Leese, Sir Oliver William Hargreaves (1894–1978)

British army general who became commander of the Eighth Army at the end of 1943. Born in London on 27 October 1894, Oliver Leese was educated at Eton. In 1914, after the start of World War I, he joined the Coldstream Guards and served with the regiment in France. Wounded three times during the war, he won the Distinguished Service Order (DSO) as a platoon commander in the 1916 Battle of the Somme.

In 1940, Leese was appointed deputy chief of the General Staff of the British Expeditionary Force (BEF) in France. Fol-

lowing the evacuation from Dunkerque, he took command of an infantry brigade in England. He was promoted to major general in 1941 and was later appointed to form and train the Guards Armoured Division. In September 1942, Leese was sent to Egypt to command XXX Corps in Bernard Montgomery's Eighth Army. Montgomery held a high opinion of Leese and declared to the chief of the Imperial General Staff, General Sir Alan Brooke, that "the best soldier out here is Oliver Leese." Leese was assigned to achieve the breakthrough in the Battle of El Alamein, and he subsequently served in the advance across Libya to Tripoli, the Tunisia Campaign, and the amphibious invasion of Sicily.

In December 1943, Leese succeeded Montgomery as commander of the Eighth Army. In that post, he participated in two major offensives: the Fourth Battle of Cassino in May 1944 and Operation OLIVE in August 1944. OLIVE, planned and developed by Leese, achieved considerable success, as it forced the Gothic Line and brought an Allied breakout into the Po Valley. He was promoted to lieutenant general in 1944.

In November 1944, Leese was appointed army group commander in Southeast Asia under Lord Louis Mountbatten. In this position, he provided direction to Lieutenant General William Slim's Fourteenth Army in Burma. Following the fall of Rangoon in May 1945, Leese's career met with disaster when he attempted to dismiss Slim. He believed Slim was both worn out after several years of service in Burma and inexperienced in the amphibious warfare required in the proposed campaign in Malaya. Leese attempted to assign Slim to a less important command but did not have the authority to do so. As a result of this blunder, Leese was himself dismissed in July 1945. He took the sacking with his usual aplomb and returned to England to briefly lead Eastern Command before retiring in 1946. He died in Cefn Coch, Wales, on 22 January 1978.

Legacy of the War

See page 21.

Leigh-Mallory, Sir Trafford L. (1892–1944)

British air marshal famous for promoting the Big Wing concept in World War II. Born in Mobberley, Cheshire, England, on 11 July 1892, Trafford L. Leigh-Mallory graduated with honors from Cambridge University. He served in the British army in the infantry during World War I but transferred to the Royal Flying Corps in 1916. By war's end, he commanded a fighter squadron.

After the war, Leigh-Mallory remained with the Royal Air Force (RAF) and graduated from both the RAF Staff College and the Imperial Defence College. He also taught at the Army War College. He was promoted to air commodore in 1936 and to air vice marshal in 1938.

In 1937, Leigh-Mallory assumed command of Number 12 Fighter Group, a post he held when the war started. During the Battle of Britain, his primary responsibility was the defense of the Midlands industrial area and reinforcing Num-

British Air Chief Marshal Sir Trafford Leigh-Mallory, August 1941. (Hulton Archive/Getty Images)

On D-day, Leigh-Mallory commanded 9,000 aircraft over the beaches of Normandy.

ber 11 Fighter Group over southeastern England. He disagreed with his counterpart at Number 11, Air Vice Marshal Keith Park, and the head of Fighter Command, Air Chief Marshal Hugh Dowding, over which fighter tactics best opposed the Luftwaffe.

Leigh-Mallory favored the so-called Big Wing tactic involving multiple squadrons striking the attacking Luftwaffe with all available air assets at once, which, because of the assembly required, meant the defenders were sometimes slow to respond. Park and Dowding supported repeated single-squadron attacks with quicker response times. In actions that bordered on insubordination, Leigh-Mallory boasted he would secure Dowding's removal. That prediction became reality when Air Marshal Sir Charles Portal backed Leigh-Mallory, which led to Dowding's dismissal in November 1940 and Park's transfer the next month. Air Marshal William Sholto Douglas, the new Fighter Command chief, named Leigh-Mallory to command Number 11 Fighter Group.

Under his command, Number 11 Group instituted his Big Wing tactics but with only marginally greater success than previously experienced. Leigh-Mallory began offensive air operations against Luftwaffe airfields in France, and he commanded the air support for the ill-fated August 1942 Dieppe raid. In November 1942, he assumed leadership of RAF Fighter Command. He emphasized operations known

as “rhubarbs,” “circuses,” and “beehives”—hunter-killer flights of hundreds of fighter aircraft, often combined with bombers, that flew at low level over France in search of Luftwaffe targets of opportunity. Such operations were considered ineffective by many, and they incurred grievous losses.

In November 1943, the Combined Chiefs of Staff named Leigh-Mallory commander of the Allied Expeditionary Air Forces for Operation OVERLORD. Promoted to air chief marshal in December 1943, Leigh-Mallory directed Allied fighter attacks in his “Transportation Plan” against railroad marshaling yards in an effort to disrupt German reinforcement efforts against the Normandy beachhead. On D day, he commanded 9,000 aircraft, and his pilots swept the skies over the beaches to clear them of German fighters.

Leigh-Mallory's job of coordinating Allied tactical air forces was largely completed by October 1944, when he was named to head all Allied air forces in the Far East. En route to his new post, he and his wife were both killed when the airplane in which they were passengers crashed near Grenoble, France, on 14 November 1944.

LeMay, Curtis Emerson (1906–1990)

U.S. Army Air Forces (later, U.S. Air Force) general who commanded the Twentieth Air Force by the close of the war. Born on 15 November 1906 in Columbus, Ohio, Curtis LeMay graduated from Ohio State University in 1928 with an engineering degree. Completing pilot training at Kelly Field, Texas, he secured a commission in October 1929 as a second lieutenant in the U.S. Army Air Corps Reserve and a regular commission in January 1930.

LeMay spent four years with the 27th Pursuit Squadron and then served with other fighter squadrons before being assigned to the 49th Bomb Squadron in 1937. In June 1942, he assumed command of the 305th Bomb Group, flying the B-17 Flying Fortress. That unit's fourth commanding officer within four months, LeMay became known as "Iron Ass" for the relentless pressure he placed on his men. In May 1943, he took command of the 3rd Bombardment Division, and he was promoted to temporary brigadier general that September. On 17 August 1943, LeMay piloted the lead bomber in the 3rd Air Division's bombing raid on Regensburg, Germany. That day, the 3rd lost 24 of 127 planes, but the raid inflicted heavy damage on the aircraft factory that produced nearly 30 percent of Germany's Me-109 fighter aircraft.

Promoted to temporary major general in March 1944, LeMay became the head of the 20th Bomber Command in China. In January 1945, he took over the 21st Bomber Group in Guam in the Mariana Islands. LeMay stressed extensive training and instituted new tactics that included low-level night attacks in the firebombing of Japanese cities. On the night of 9–10 March, his B-29s struck Tokyo in what was the single most destructive bombing raid in history. That July, LeMay assumed command of the Twentieth Air Force, composed of 20th and 21st Bomber Groups.

From 1945 to 1947, LeMay was deputy chief of the Air Force Staff for Research and Development. In September 1947, when the air force became a separate military branch, LeMay, a temporary lieutenant general, took command of

U.S. Army Air Force Major General Curtis Emerson LeMay. (Library of Congress)

U.S. Air Forces in Europe (USAFE) and helped organize the 1948–1949 Berlin Airlift.

In October 1948, LeMay became head of the Strategic Air Command (SAC). He was promoted to general in October 1951. He commanded SAC until July 1957, when he was appointed air force vice chief of staff. In May 1961, LeMay became chief of staff of the air force, remaining in that post until his retirement in February 1965. He had served as a general officer for 22 years.

LeMay published his autobiography in 1965 and was chairman of the board of Network Electronics from 1965 to 1968. In October 1968, he entered politics as George Wallace's vice presidential running mate on the American Independent Party ticket. LeMay was an outspoken proponent of the bombing of North Vietnam, and his campaign generated a firestorm of controversy. He died on 1 October 1990 at March Air Force Base, California.

Lend-Lease

U.S. military aid program begun during World War II. Designed originally as a means for the United States to assist Great Britain without becoming a belligerent itself, the Lend-Lease program provided more than \$50 billion in aid to 38 nations between March 1941 and June 1947. The British Empire received the most aid under the program (\$31.4 billion), followed by the Soviet Union (\$11 billion).

The immediate impetus for Lend-Lease was the fall of France in 1940, which left Great Britain fighting Adolf Hitler alone. Strapped for cash, Britain could no longer afford to purchase supplies from the United States. Britain's economic crisis notwithstanding, President Franklin D. Roosevelt believed that the United States had to find ways to maintain the resolve of the British, thereby allowing them to continue in the war.

British problems were not the only barrier to be overcome. U.S. firms were hampered from trading with Britain because of restrictions included in the Neutrality Acts that were passed in

the late 1930s. These measures required that trade be conducted on a "cash-and-carry" basis, meaning that American firms could neither extend credit nor transport materials across the U-boat-infested Atlantic Ocean. With Britain nearly out of hard currency, trade

under the cash-and-carry provisions became virtually impossible. The original Lend-Lease authorizations specified that the funds were to be given only to democracies that agreed to pay the loans back in full at the earliest possible opportunity.

From the start, however, Roosevelt envisioned that Lend-Lease would operate much like his domestic New Deal did. It would be a practical and flexible program that was able to meet changing demands. It would also be centrally controlled from the executive branch, leaving Roosevelt the options of deciding which nations would receive aid and what forms that aid would take. Rhetoric notwithstanding, the program was more realistic than ideological.

Yet Lend-Lease was not an entirely idealistic endeavor. Roosevelt also promoted it as being in the direct strategic interests not only of Great Britain but also of the United States. He compared Lend-Lease to lending a neighbor a fire hose when his house was in flames. This act would help save the lender's house from destruction as well, and once the fire was out, the hose would be returned.

To answer the charge of critics who believed that the impoverished British government would never repay Lend-Lease obligations, Roosevelt said that he expected Britain to honor a gentleman's agreement to eventually repay the United States in kind. He linked Great Britain's war to the United States in compelling rhetoric that helped to overcome abiding strains of American isolationism. Roosevelt reinforced these points in a series of "fireside chats" that led to widespread public acceptance of the program.

On 6 January 1941, supporters introduced the Lend-Lease bill, which they patriotically numbered H.R. 1776, in Congress. In a speech delivered soon afterward, Roosevelt connected Lend-Lease to the famous Four Freedoms that defined America's global goals: freedom of speech, freedom of religion, freedom from want, and freedom from fear. Lend-Lease, Roosevelt argued, promised to further those aims without putting American lives at risk. After adding an amendment stipulating that the U.S. Navy would not convoy supplies to Britain directly, the bill passed both houses of Congress by large majorities on 8 March 1941. It authorized the president to "sell, transfer to, exchange, lease, lend, or otherwise dispose of" property to any nation whose defense the president deemed "vital to the defense of the United States." As the program's success became more manifest, public opposition to Lend-Lease, always in the minority, became even less vocal.

The emergency faced by the Soviet Union after the German invasion of June 1941 required a reconsideration of the specific provision that Lend-Lease applied only to democracies. In August, Roosevelt had declared that Lend-Lease did not apply to the Soviets, but he was even then accepting a 29-page list of Soviet requests. Despite serious misgivings from anti-Communist members of Congress, where the extension was debated over a four-month span, the United States finally added the Soviet Union to the program in November 1941. Roosevelt agreed with British Prime Minister Winston L. S. Churchill that, whatever the ideological conflict, the Soviets had to be supplied if they were to remain in the war against Germany. Sensitive to the tensions involved in extending Lend-Lease aid to a Communist nation, Roosevelt sent Harry Hopkins, his most trusted adviser, to Moscow to coordinate Lend-Lease assistance there.

The U.S. Office of Lend-Lease Administration worked to overcome myriad complex problems of logistics. Until the

The British Empire received the most aid under the Lend-Lease program at \$31.4 billion.

American-made .38 caliber revolvers shipped to England from the United States under Lend-Lease are unpacked at an English ordnance depot. (Library of Congress)

Allies gained the upper hand in the Battle of the Atlantic, supplying Britain proved difficult, and supplying the Soviet Union necessitated air routes over Africa, sea routes along the Arctic Ocean, and land routes across Persia. Complications with flying supplies over “the Hump”—as the Himalaya Mountains were known—limited U.S. aid to China, though that country still received almost \$2 billion in assistance. Because of the immense logistical difficulties, the vast majority of Lend-Lease aid to China comprised light weapons systems that could be flown in.

Lend-Lease worked in reverse, as well. Thus, Britain shared with the United States radar technology, in which it then led the world. The British also provided technology on jet engines and rocketry. Reverse Lend-Lease of all types amounted to some \$7.8 billion during the war.

Lend-Lease provided a wide range of arms, equipment, food, and raw materials to nations fighting the Axis powers. In the end, munitions formed almost half of the total aid package. Although the British Empire received more than 60 percent of the aid distributed under the program, Lend-Lease assistance proved to be critical to the Soviet Union. The Americans provided the USSR with 34 million sets of

uniforms, 15 million pairs of boots, 350,000 tons of explosives, 3 million tons of gasoline, sufficient food to provide a half pound of food per Soviet soldier a day, 12,000 railroad cars, 375,000 trucks, and 50,000 jeeps. American vehicles and petroleum supplies allowed the Red Army to develop a “deep-offensive” doctrine in 1943 that enabled Soviet units to go greater distances. The Soviet Union could also concentrate on the production of tanks and artillery because of the steady supply of trucks and jeeps arriving from the United States.

Roosevelt and his closest advisers sought to employ Lend-Lease to open the Soviet system to American ideas. In a similar vein, they insisted that any nation receiving Lend-Lease assistance had to agree to open its markets to U.S. products. Thus, Washington finally forced Great Britain to abandon the Imperial Preference System that had provided more favorable trade terms to members of the British Empire.

Lend-Lease paid important dividends on the strategic level, as well. U.S. aid helped to fend off Soviet demands for a second front in western Europe. It also helped the Americans to convince Chinese Generalissimo Jiang Jieshi (Chiang Kai-shek) that he must at least appear to accept the counsel of his American advisers—most notably, the reform-minded Lieutenant General Joseph W. Stilwell. The United States later extended Lend-Lease aid to many Latin American nations, prominently Mexico and Brazil. The program brought these nations closer to the Allies and ensured that the Axis powers would not be able to establish important connections there.

Lend-Lease thus served many key roles during the war. Most critically, it unquestionably shortened the conflict and relieved the suffering of millions. As Allied armies advanced across western Europe, Lend-Lease funds paid for food and livestock shipments to France, the Netherlands, and Belgium. America’s allies certainly appreciated its value. Churchill called Lend-Lease the most unsordid act in history. Although Soviet historians later discounted its value, Joseph Stalin himself said that the Soviet Union could not have won the war without Lend-Lease.

Leningrad, Siege of (10 July 1941–27 January 1944)

The longest and most devastating siege of a major urban center in the history of modern warfare. The nightmare that engulfed the population of the Soviet Union's second-largest city lasted from 10 July 1941 to 27 January 1944. The once vibrant city had been built by Peter the Great and was considered Russia's window to the West. But by March 1943, Leningrad and its 3.2 million people had been reduced to a militarized fortress of some 700,000 inhabitants.

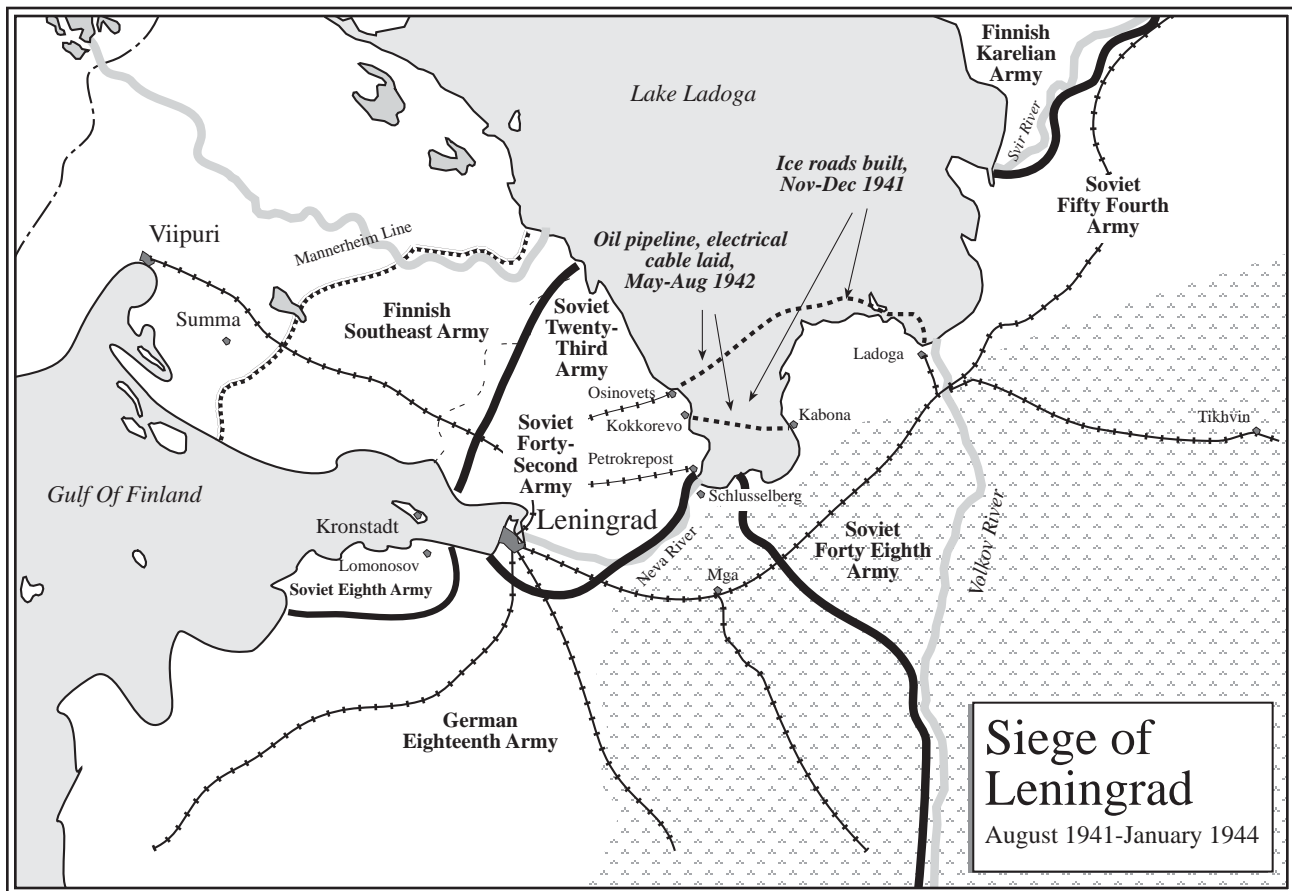

The Germans invaded the Soviet Union on 22 June 1941. The capture of Leningrad—a city described by Adolf Hitler as the “hotbed of Communism”—was one of the major strategic goals of Operation BARBAROSSA. Field Marshal Wilhelm von Leeb commanded Army Group North, advancing northeast toward the city. He believed that his troops would soon take the city in cooperation with the Finns, who had reentered the war. Finnish forces, meanwhile, drove south, both to the east and the west of Lake Ladoga, toward the Svir River and Leningrad.

On 8 July, the German Fourth Panzer Army reached the old fortress of Shlisselburg east of Leningrad, guarding the point at which the Neva River flows out of nearby Lake Ladoga. Taking it cut off Leningrad from the Soviet interior. The siege, which was actually a blockade, officially began on 10 July. Leeb's hopes for a quick victory were dashed, however, when the Finns merely reoccupied the territory taken by the Soviets in consequence of the 1939–1940 Finnish-Soviet War (also known as the Winter War), thus halting some 26 miles north of Leningrad. The refusal of the Finns to push beyond the Svir or their pre-1940 borders was a major factor in the city's survival. Leeb also lost much of his Fourth Panzer Army, which Hitler diverted to the drive on Moscow.

Hitler ordered Leningrad obliterated through artillery fire, air attack, and blockade; moreover, he prohibited any acceptance of a surrender, were one to be offered. In mid-October, he ordered Leeb to make a wide sweep of some 150 miles around Lake Ladoga to link up with the Finns on the Svir River. On 8 November, the Germans took the vital rail center of Tikhvin, about halfway to the Svir. Josef Stalin then shifted major reinforcements north, and in mid-December,

Leningrad inhabitants, including women of all ages, using shovels and picks to help construct antitank ditches during the siege of that city. (Library of Congress)

Hitler authorized Leeb to withdraw. Soviet troops reoccupied Tikhvin on 18 December.

Authorities in Leningrad had done little to prepare the city for a possible blockade. Although the city was believed to be a major German military objective, efforts to evacuate part of the population suffered from bureaucratic delays. The party boss in Leningrad, Andrei Zhdanov, second only to Stalin in the party hierarchy, and Marshal Kliment E. Voroshilov, appointed by Stalin to defend the city, were reluctant to order any measures that might be branded defeatist.

On 11 July, the Leningrad Party Committee ordered the civilian population to take part in the construction of tank traps and other defensive positions in front of the city. Between July and August, nearly half of the population between the ages of 16 and 55 engaged in this effort, which proceeded under constant German artillery and air attacks. The city government also ordered the establishment of some civilian combat units made up of workers, men and women alike, but they were poorly trained and had virtually no weapons.

In normal circumstances, Leningrad was entirely dependent on outside sources for its food and fuel and for the raw materials used in its factories. Now it had to find food for some 2.5 million civilians as well as the forces of the Leningrad Front

and the Red Banner Fleet in the Baltic. By November, rations had been cut to the starvation level. The soldiers and sailors received priority in the allocation of food, and rationing authorities literally held the power of life and death. Rations were cut again and again, beyond the starvation level. People tried to survive any way they could, whether on stray animals and on the glue from wallpaper. Hunger even led to instances of cannibalism. The hardships were not, however, evenly shared, for Communist officials ate well throughout the siege.

Lake Ladoga was the only means of accessing the rest of the Soviet Union. In winter, trucks were able to travel on a "road" across the ice, and in summer, some boats got through. But this route was insufficient to overcome the fuel shortage. The Soviets rebuilt the rail line from Tikhvin, but the Germans bombed and shelled it, as well as the Lake Ladoga route.

In January 1942, Stalin ordered General Kirill A. Meretskov's Volkhov Front to strike the German lines from Lake Ladoga to Lake Ilmen, but after punching a narrow gap in them, the Soviet offensive faltered. When Stalin refused to allow a withdrawal, the Germans cut off the Soviet forces in June and restored their own lines. Soviet authorities, meanwhile, managed to evacuate 850,000 people from Leningrad,

including a large number of children, between January and July 1942.

Hitler's plans for the summer 1942 campaign called for the destruction of Leningrad and the occupation of the area between Lake Ladoga and the Baltic in order to free up the Finns for operations against Murmansk. In August, Meretskov carried out another attack against the eastern part of the German lines. Field Marshal Fritz Eric von Manstein, sent to Leningrad by Hitler, replied with a counterattack in September.

That summer, the Soviets managed to lay both pipelines and electric cables under Lake Ladoga. The Germans brought in E-boats, and the Italians also operated some midget submarines in the lake. In January 1943, in Operation SPARK, Red Army troops in Leningrad (which the Soviets had managed to reinforce and which were now commanded by General Leonid A. Govorov) and Meretskov's forces to the east struck the Germans from the north and east. The offensive was successful, with the two Soviet armies meeting at Shlisselburg on 19 January, thus breaking the siege and opening a 10-mile-wide corridor. On 7 February, a Soviet train reached Leningrad through the corridor and across the Neva on tracks over the ice. Although this line came under constant German attack and had to be repaired daily, it operated continuously thereafter.

On 14 January 1944, Govorov and Meretskov struck German positions, with their forces outnumbering the Germans by a ratio of 2 to 1 in men and 4 to 1 in tanks and aircraft. Yet Hitler refused to authorize a withdrawal, and bitter fighting ensued. Ultimately, the Soviets were successful, driving the Germans back. On 27 January 1944, with the Leningrad-to-Moscow railroad line reopened, Stalin declared the "900-day" blockade at an end.

During the blockade, perhaps 1 million people in Leningrad—40 percent of the prewar population—died of hunger, the majority of them in the 1941–1942 winter. The entire city was within range of German artillery fire, and the bombing and shelling claimed many of the city's buildings and architectural and art treasures, including works from the Hermitage Museum. The travail of Leningrad became the chief subject of Soviet war literature. Similar to the bombings of Dresden and Hiroshima, the siege of Leningrad became a national and even a worldwide symbol of the horror of war.

Léopold III, King of Belgium (1901–1983)

Belgian king who assumed before the outbreak of war. Born on 3 November 1901 in Brussels, the son of King Albert and Queen Elisabeth of Belgium, Léopold was educated at Eton and served in the army while on school leave. He succeeded his father to the throne in 1934. He had married Princess Astrid of Sweden in 1926. They had three children, but a car accident, with Léopold driving, claimed Astrid's life in 1935. Many Belgians never forgave him.

Léopold was heavily influenced by the German invasion of his country in 1914 and sought to avoid its repetition by taking refuge in neutrality. After the German remilitarization of the Rhineland in March 1936, he withdrew Belgium from its military alliance with France and followed a neutral stance. When war began in September 1939, Léopold rejected appeals from Britain and France for discussions of war plans, for fear of giving Adolf Hitler a pretext to invade his country.

In the end, Léopold's policy did not spare Belgium from German invasion, which occurred in May 1940. British and French forces then moved into Belgium to support that country. However justified in terminating hopeless resistance, Léopold's surrender of the Belgian army on 28 May 1940 after only a brief stand was a violation of pledges given to Britain and France, and it made inevitable the Dunkerque evacuation. Even more dubious was the king's failure to go abroad with his ministers to support a government-in-exile in London. Many Belgians suspected him of both German sympathies and authoritarian preferences. Then, he compounded his unpopularity by marrying a commoner—his children's governess, Liliane Baels—in 1941.

Removed from Belgium by the Germans in 1944, Léopold was freed by U.S. troops in Austria at the end of the war. Since he was being held in Germany when Belgium was liberated in the fall of 1944, his brother, Prince Charles, the count of Flanders, assumed the title of regent. Léopold, meanwhile, resided in Switzerland.

After the war, the question of the future of the monarchy remained in abeyance for several years. There was strong socialist opposition in Belgium to the monarchy, and so, it was not until a referendum in March 1950 gave him a 58 percent favorable vote that Léopold attempted to regain his throne. His return precipitated such a major crisis that he then relinquished control of affairs to his son Baudouin.

When Baudouin reached majority age, Léopold abdicated in his favor, in 1951. Léopold died in Brussels on 25 September 1983.

Leyte, Landings on and Capture of (20 October–25 December 1944)

U.S. amphibious operations on Leyte Island in the Philippines. In July 1944, U.S. President Franklin D. Roosevelt met with his Pacific Theater commanders, General Douglas MacArthur and Admiral Chester Nimitz, to determine the next U.S. military objective. MacArthur argued for a return to the Philippines, whereas Nimitz and the navy wanted to bypass these islands entirely in favor of securing Formosa. Ultimately, because sufficient resources were available, Roosevelt decided to focus on the Philippines and a landing at Okinawa in the Ryukyus.

The U.S. Philippine invasion had three main phases: first, the capture of Leyte Island, between the big island of Luzon to the north and Mindanao to the south; then, the capture of Luzon; and finally, the clearing of other Japanese-held islands to the south. A precondition to such an undertaking was the neutralization of Japanese airpower. In wide-ranging pre-invasion operations between 7 and 16 October, Admiral William Halsey's Third Fleet and Lieutenant General George C. Kenney's Far East Air Force struck all Japanese bases within range, while XX Bomber Command B-29 Superfortress bombers attacked Formosa from bases in China, decimating the rebuilt Japanese naval air arm and destroying some 700 Japanese planes and 40 ships.

Japanese leaders knew that they would have to hold the Philippines to prevent the severing of the supply route between Japan and the vital oil and other resources of the Netherlands East Indies. Tokyo was thus prepared, once U.S. forces committed themselves, to gamble what remained of the Japanese fleet on a vast and complex naval operation. This action would culminate in the great Battle of Leyte Gulf.

The Japanese commander in the Philippines, General Yamashita Tomoyuki, had some 350,000 troops to defend the islands. The Japanese miscalculated American intentions, believing that the U.S. effort would be against the big island of Luzon, where Yamashita had placed his Fourteenth Area Army and prepared defensive positions. Meanwhile, U.S. invasion forces headed for Leyte. U.S. planners assembled a vast amphibious force. The 700 vessels of Vice Admiral Thomas Kinkaid's Seventh Fleet transported Lieutenant General Walter Krueger's 194,000-man U.S. Sixth Army, consisting of Major General Franklin C. Sibert's X Corps and Major General John Hodge's XXIV Corps. Rear Admiral Thomas L. Sprague's air-support escort carrier group consisted of 16 escort carriers, 9 destroyers, and 11 destroyer escorts. Rear Admiral R. S. Berkey commanded a close covering group of 4 cruisers (2 of them Australian) and 7 destroyers (2 Australian). Admiral William Halsey's Third Fleet was to provide covering protection and engage the Japanese fleet should it decide to do battle.

On 20 October, following a heavy naval bombardment, four divisions went ashore on Leyte's east coast on a 10-mile-wide front. The landing forces achieved surprise, and Major General Tomochika Yoshiharu's 16,000-man 16th Division offered scant resistance. By nightfall, some 132,400 men were ashore, along with 200,000 tons of supply and equipment. U.S. forces soon seized port and coastal air facilities. An important element in the initial American successes was intelligence provided by Philippine guerrillas who were in continuous communication with the invasion forces. They cooperated closely with the U.S. forces throughout the campaign and also assisted in the rescue of thousands of American civilians and prisoners of war.

MacArthur, complete with corncob pipe and aviator glasses, and Philippine President Sergio Osmeña went ashore on Red Beach with the third wave at 1:00 P.M. on 20 October, and within an hour, MacArthur had announced, "People of the Philippines I have returned." On 23 October, despite the fighting only 2 miles away, MacArthur installed the Philippine government in a formal ceremony in the damaged Tacloban Municipal Building. Meanwhile, Krueger's troops drove inland. By 24 October, they had captured airfields and Tacloban, Dulag, and the provincial capital of Leyte.

Immediately on learning of the landings, the Japanese navy initiated the *shō-gō* plan, and between 23 and 26 October, the U.S. Navy won a decisive victory, defeating the Japanese effort to attack the landing site from the sea. The naval Battle of Leyte Gulf smashed the Japanese navy, ending its days as a major fighting force.

Meanwhile, Yamashita was reinforcing Leyte. Between 23 October and 11 November, he managed to send Leyte some 45,000 reinforcements and 10,000 tons of supplies from Luzon and the Visayas, using destroyers and transports that chiefly entered through the western port of Ormoc. By 25

Landing craft loaded with troops sweep toward the Leyte invasion beaches as American and Japanese planes duel overhead. Troops watch the battle above as they approach the shore, 1 October 1944. (National Archives)

October, the Japanese had concentrated their defensive efforts in the northern part of the island, digging in on “Breakneck Ridge” near the port of Carigara and engaging the 24th Division of X Corps in a month-long battle there.

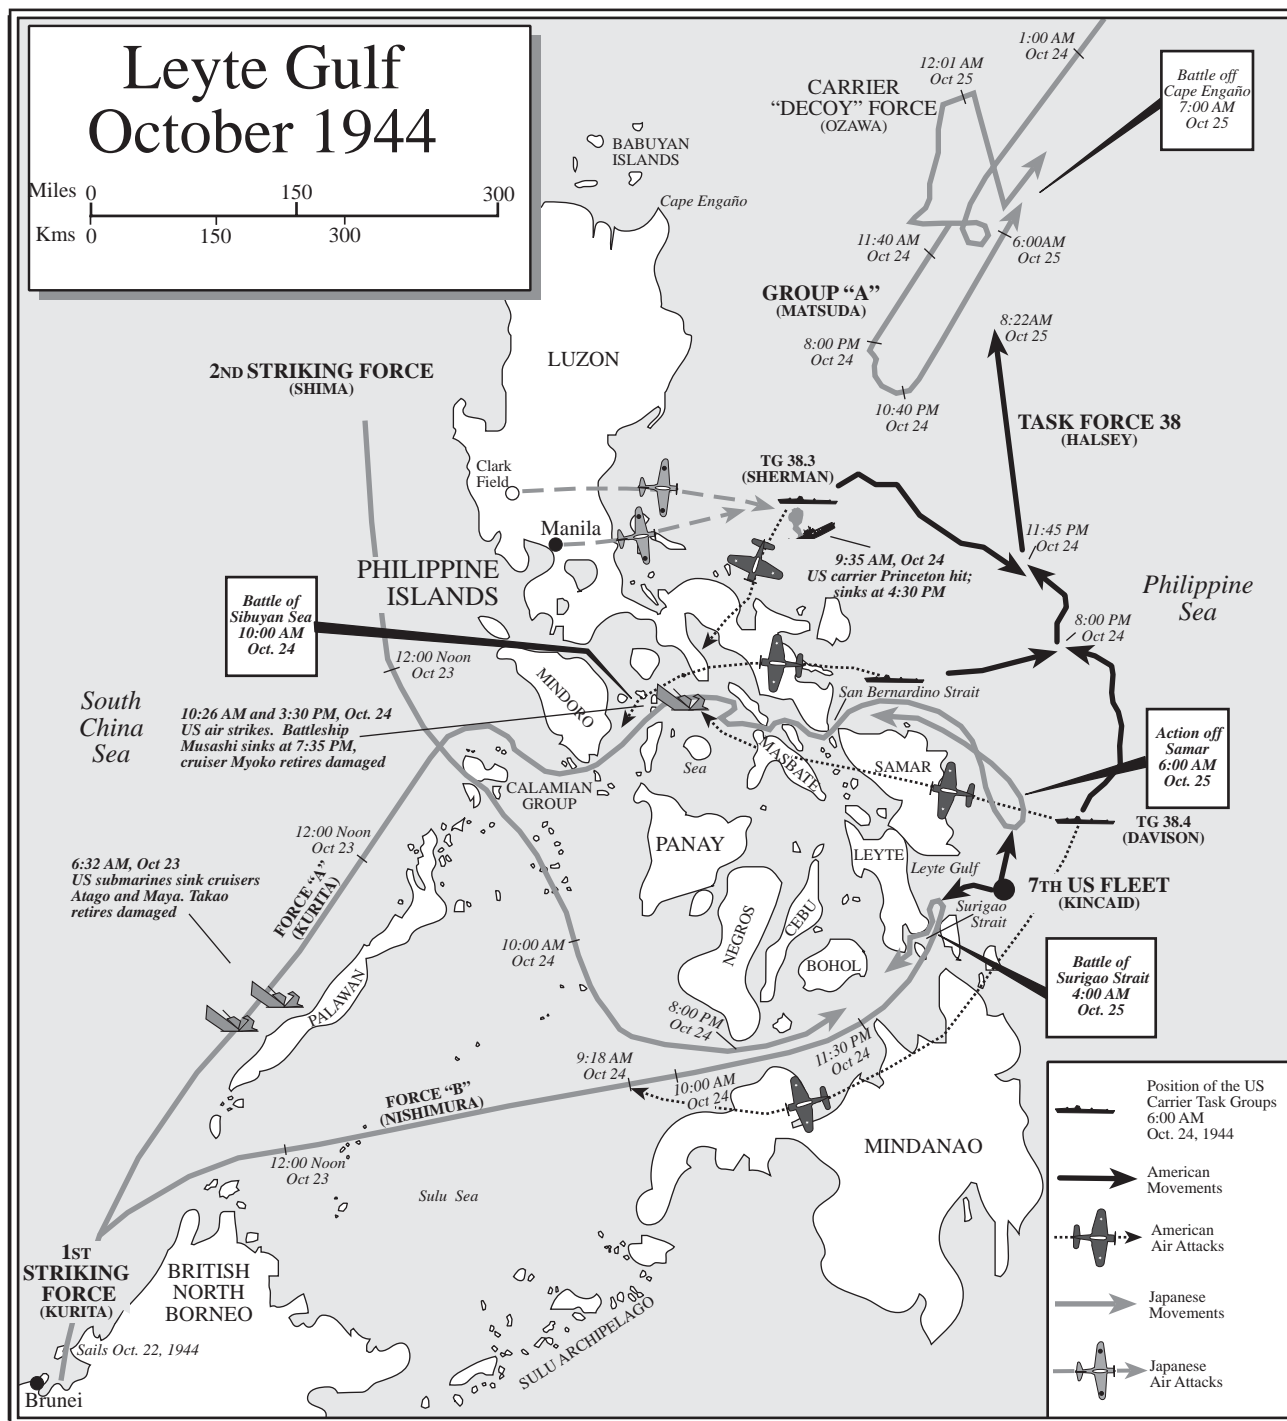

By 2 November, however, U.S. forces had taken Carigara Bay and Abuyog and all of Leyte’s airfields. Gradually, Kenney’s Far East Air Force and Halsey’s Third Fleet aircraft also choked off the stream of Japanese reinforcements. Then, on 11 November, attacks by Third Fleet aircraft decimated a Japanese convoy with 10,000 troop reinforcements.

After the U.S. 7th Infantry Division crossed the center of the island, General Kreuger split Japanese defenses by landing the 77th Infantry Division 3 miles south of Ormoc on 7 December. This assault came only hours before Japanese Field Marshal Terauchi Hisaichi’s convoy of reinforcements attempted a landing and was driven back. Ormoc fell on 10 December when American tanks broke through Japanese

defenses there. The 7th Division linked up with the 77th Division the next day. Japanese forces in the north were now cut off. Organized resistance on Leyte ended on Christmas Day 1944. Sporadic fighting continued into the next spring, but there were no survivors from the Japanese 16th Division, responsible for the infamous Bataan Death March.

Although the unexpected Japanese reinforcements and heavy rains had delayed the conquest of Leyte, the outcome was never in doubt. The Japanese lost some 70,000 men on the island, most of them dead. In addition, another 135,000 Japanese soldiers were cut off, caught behind the American advance. U.S. losses were about 3,500 killed and 12,000 wounded. Meanwhile, in late October, U.S. forces had landed on the adjoining Samar Island, and in mid-December, U.S. forces seized Mindoro in the northern Visayas, just south of Luzon, as an air base for the coming assault on Luzon.

Leyte Gulf, Battle of (23–26 October 1944)

Pacific war naval battle and history's largest naval engagement in terms of the amount of ships, personnel, and area involved. The battle engaged 282 vessels (216 American, 2 Australian, and 64 Japanese) and nearly 200,000 men, and it took place over an area of more than 100,000 square miles. It saw all aspects of naval warfare—air, surface, submarine, and amphibious—as well as the employment of the largest guns ever at sea, the last clash of battleships, and the introduction by the Japanese of kamikaze aircraft. The engagement also involved excellent planning and leadership, deception, failed intelligence, and great controversies.

The battle resulted from U.S. President Franklin D. Roosevelt's decision to follow the conquest of the Mariana Islands with the recapture of the Philippines. This idea was proposed by the commander of Southwest Pacific Forces, General Douglas MacArthur; the chief of naval operations, Ernest J. King, wanted to land on Formosa instead. The latter move made sound military sense, the former political sense.

On 20 October, the U.S. Sixth Army began an invasion of Leyte, with more than 132,000 men going ashore the first day. Warned by the preliminary bombardment, the Japanese put into effect their overly complicated contingency plan. As early as 21 July 1944, the Naval General Staff in Tokyo had issued a directive for an operation in which the Combined Fleet would seize the initiative “to crush the enemy fleet and attacking forces.” On 26 July, the General Staff informed the Combined Fleet commander, Admiral Toyoda Soemu, that the “urgent operations” would be known by the code name SHŌ (VICTORY). The Japanese had four of these operations to combat the next U.S. offensive; SHŌ ICHI-GŌ (Operation VICTORY ONE) covered defense of the Philippine Archipelago, to which the Japanese decided to commit the entire Combined Fleet. Toyoda knew it was a gamble but believed the chance had to be taken. Should the Americans retake the Philippines, they would be in a position to cut Japanese access to oil from the Netherlands East Indies.

Prior to the battle, Japanese naval air strength had been severely reduced in the June 1944 Battle of the Philippine Sea (“the great Marianas turkey shoot”), and between 12 and 14 October, U.S. carrier planes and army B-29 bombers struck Japanese airfields on Formosa, Okinawa, and the Philippines. These strikes denied the Japanese navy badly needed land-based air support and alone doomed the Japanese plan. The Japanese did add extra antiaircraft guns to their ships in an attempt to offset the lack of aircraft, but offensively, they had to rely on naval gunnery and some 335 land-based planes in the Luzon area.

The Japanese plan was to destroy sufficient U.S. shipping to break up the Leyte amphibious landing. There were four prongs in the Japanese attack. A decoy force would draw U.S. naval covering forces north while two elements struck from the west on either side of Leyte, to converge simultaneously on the landing area in Leyte Gulf and destroy Allied shipping there. At the same time, shore-based aircraft were to attack U.S. naval forces offshore.

On 17 October, on receiving information that U.S. warships were off Suhuan Island, Admiral Toyoda alerted his forces. The next day, he initiated SHŌ ICHI-GŌ. The original target date for the fleet engagement was 22 October, but logistical difficulties delayed it to 25 October. Vice Admiral Ozawa Jisaburo's decoy Northern Force (Third Fleet) consisted of the heavy carrier *Zuikaku*, 3 light carriers, 2 hybrid battleship-carriers, 3 cruisers, and 8 destroyers. Ozawa had only 116 aircraft, flown by poorly trained pilots. His force sortied from Japan on 20 October, and on the evening of 22 October, it turned south toward Luzon. At the same time, Japanese submarines off Formosa were ordered south toward the eastern approaches to the Philippine Archipelago, and shortly before 23 October, what remained of the Japanese Second Air Fleet began to arrive on the island of Luzon.

The strongest element of the Japanese attack was the 1st Diversion Attack Force, which reached Brunei Bay in northwest Borneo on 20 October, refueled, split into two parts, and resumed its movement two days later. The Center Force under Admiral Kurita Takeo had the bulk of the Japanese attack strength, including the giant battleships *Musashi* and *Yamato* with their 18.1-inch guns; Kurita also had 3 older battleships, 12 cruisers, and 15 destroyers. Center Force sailed northeastward, up the west coast of Palawan Island, and then turned eastward through the waters of the central Philippines to San Bernardino Strait. Meanwhile, the Southern Force (C Force) of 2 battleships, 1 heavy cruiser, and 4 destroyers, commanded by Vice Admiral Nishimura Shoji, struck eastward through the Sulu Sea in an effort to force its way through Surigao Strait between the islands of Mindanao and Leyte. The Southern Force was trailed by Vice Admiral Shima Kiyohide's 2nd Diversion Attack Force. Shima had 2 heavy cruisers, 1 light cruiser, and 4 destroyers. Shima's warships left the Pescadores on 21 October, steamed south past western Luzon, and refueled in the Calamian Islands. Late in joining Nishimura's ships, Shima's force followed them into Surigao Strait.

Opposing the Japanese were two U.S. Navy fleets: Vice Admiral Thomas C. Kinkaid's Seventh Fleet, operating under General MacArthur's Southwest Pacific Command, and Admiral William F. Halsey's Third Fleet, under the Pacific Fleet commander, Admiral Chester W. Nimitz, at Pearl Harbor. Leyte was the first landing to involve two entire U.S. fleets and also the first without a unified command, which would have unfortunate consequences.

Two Coast Guard-manned LSTs open their bows in the surf that washes on Leyte Island beach, as soldiers strip down and build sandbag piers out to their ramps to speed up unloading operations. 1944. (National Archives)

Seventh Fleet was divided into three task groups. The first consisted of Rear Admiral Jesse B. Oldendorf's 6 old battleships, 16 escort carriers, 4 heavy cruisers, 4 light cruisers, 30 destroyers, and 10 destroyer escorts. The other two elements were amphibious task groups carrying out the actual invasion. Seventh Fleet had escorted the invasion force to Leyte and now provided broad protection for the entire landing area. As most of Halsey's amphibious assets had been loaned to Kinkaid, Third Fleet consisted almost entirely of Vice Admiral Marc Mitscher's Task Force (TF) 38 of 14 fast carriers, with more than 1,000 aircraft, organized into four task groups containing 6 battleships, 8 heavy cruisers, 13 light cruisers, and 57 destroyers. Third Fleet had the job of securing air superiority over the Philippines and protecting the landings. If the opportunity to destroy a major part of the Japanese fleet presented itself or could be created, that was to be Third Fleet's primary task.

The Battle of Leyte Gulf was actually a series of battles, the first of which was the 23–24 October Battle of the Sibuyan Sea. Early on 23 October, the U.S. submarines *Darter* and *Dace* discovered Kurita's Center Force entering Palawan Passage from the South China Sea, and they alerted Admiral Halsey, whose Third Fleet guarded San Bernardino Strait. The submarines sank two Japanese heavy cruisers, the *Atago* (Kurita's flagship) and the *Maya*, and damaged a third. Kurita transferred his flag to the *Yamato*, and his force continued east into the Sibuyan Sea where, beginning in the morning of 24 October, TF 38 launched five air strikes against it. The first wave of carrier planes concentrated on the *Musashi*, which absorbed 19 torpedoes and nearly as many bombs before sinking, taking down half of her 2,200-man crew. Several other Japanese ships were also damaged. In midafternoon on 25 October, American pilots reported that

Kurita had reversed course and was heading west; Halsey incorrectly assumed that this part of the battle was over. He did issue a preliminary order detailing a battle line of battleships known as TF 34, to be commanded by Vice Admiral Willis A. Lee. Admiral Kinkaid was aware of that signal and assumed TF 34 had been established.

Meanwhile, Japanese land-based planes from the Second Air Fleet attacked a portion of TF 38. Most were shot down, but they did sink the light carrier *Princeton* and badly damaged the cruiser *Birmingham*. Also, unknown to Halsey, Kurita's force changed course after nightfall and resumed heading for San Bernardino Strait.

Warned of the approach of the Japanese Combined Fleet, Admiral Kinkaid placed Oldendorf's 6 old Seventh Fleet fire-support battleships (all but 1 a veteran of Pearl Harbor),

flanked by 8 cruisers, across the mouth of Surigao Strait to intercept it. He also lined the strait with 39 patrol torpedo (PT) boats and 28 destroyers. In terms of naval warfare, the 24–25 October Battle of Surigao Strait was a classic case of crossing the T. The PT boats discovered the Japanese moving in line-ahead formation, but Nishimura's force easily beat them back.

The Japanese lost more than 500 aircraft, 29 sea vessels, and more than 10,500 men during the Battle of Leyte Gulf.

Although the battleships often get the credit for the Surigao Strait victory, it was U.S. destroyers that inflicted most of the damage. Their converging torpedo attacks sank the battleship *Fuso* and 3 destroyers. The Japanese then ran into the line of Oldendorf's battleships, which sank all the Japanese warships save the destroyer *Shigure*. Nishimura went down with his flagship, the battleship *Yamashiro*.

Shima's force, bringing up the rear, then came under attack by the PT boats, which crippled a light cruiser. Shima's flagship collided with one of Nishimura's sinking vessels. Oldendorf's ships pursued the retreating Japanese. Another Japanese cruiser succumbed to attacks by land-based planes and those of Admiral Thomas L. Sprague's escort carriers. The rest of Shima's force escaped when Oldendorf, knowing his ships might be needed later, turned back. The battle was over by 4:30 A.M. on 25 October.

Meanwhile, during the night of 24–25 October, Kurita's force moved through San Bernardino Strait, issued from it unopposed, and turned south. In the most controversial aspect of the battle, Halsey left San Bernardino Strait unprotected near midnight to rush with all available units of Third Fleet after Ozawa's decoy fleet, which had been sighted far to the north. Several of Halsey's subordinates registered reser-

vations about his decision, but he would not be deterred. Compounding the error, Halsey failed to inform Admiral Kinkaid, who, in any case, assumed TF 34 was protecting the strait. Halsey's decision left the landing beaches guarded only by Seventh Fleet's Taffy 3 escort carrier group, commanded by Rear Admiral Clifton A. F. Sprague. It was one of three such support groups operating off Samar. Sprague had 6 small escort carriers, 3 destroyers, and 4 destroyer escorts.

Fighting off Samar erupted about 6:30 A.M. on 24 October, as Taffy 3 found itself opposing Kurita's 4 battleships (including the *Yamato*), 6 heavy cruisers, and 10 destroyers. The aircraft from all three of the Taffy groups now attacked the Japanese. Unfortunately, the planes carried fragmentation bombs for use against land targets, but they put up a strong fight, harassing the powerful Japanese warships. Sprague's destroyers and destroyer escorts also joined the fight. Their crews courageously attacked the much more powerful Japanese warships, launching torpedoes and laying smoke to try to obscure the escort carriers. These combined attacks forced several Japanese cruisers to drop out of the battle.

Kurita now lost his nerve. By 9:10 A.M., his warships sank the *Gambier Bay*, the only U.S. carrier ever lost to gunfire, as well as the destroyers *Hoel* and *Johnston* and the destroyer escort *Samuel B. Roberts*. But Kurita believed he was under attack by aircraft from TF 38, and at 9:11 A.M., just at the point when he might have had a crushing victory, he ordered his forces to break off the attack, his decision strengthened by news that the southern attacking force had been destroyed. Kurita then exited through San Bernardino Strait. The four ships lost by Taffy 3 were the only U.S. warships sunk by Japanese surface ships in the entire battle.

At 9:40 P.M., Kurita's ships reentered San Bernardino Strait. As the Japanese withdrew, they came under attack by aircraft from Vice Admiral John S. McCain's task force from Halsey's fleet, losing a destroyer. Meanwhile, Sprague's escort carriers and Oldendorf's force returning from the Battle of Surigao Strait came under attack from land-based kamikaze aircraft, the first such attacks of the war. These attacks sank the escort carrier *St. Lô* and damaged several other ships.

At about 2:20 A.M. on 25 October, Mitscher's search planes, from Halsey's force, located Ozawa's northern decoy force. At dawn, the first of three strikes was launched, in what became known as the Battle of Cape Engaño. Ozawa had sent most of his planes ashore to operate from bases there and thus had only anti-aircraft fire with which to oppose the attack. While engaged against Ozawa, Halsey learned of the action off Samar when a signal came in from Kinkaid at 8:22, followed by an urgent request eight minutes later for fast battleships. Finally, at 8:48, Halsey ordered McCain's TG 38.1 to make "best possible speed" to engage Kurita's Center Force. The task group was en route from the Ulithi to rejoin the other elements of TF 38. Since it had more carriers and planes than any of the three other task

groups in Halsey's force, it made good sense to detach this unit. Several minutes later, Halsey was infuriated by a query from Nimitz at Pearl Harbor: "WHERE IS RPT WHERE IS TASK FORCE THIRTY-FOUR RR THE WORLD WONDERS." (The last three words were simply what was known as "padding," drawn from the poet Alfred Lord Tennyson's "Charge of the Light Brigade," but Halsey took them to be an integral part of the message and felt they were a reproach delivered in an insulting manner.)

At 10:55 A.M., Halsey ordered all 6 fast battleships and TG 38.2 to turn south and steam at flank speed, but they missed the battle. After the war, Kurita admitted his error in judgment; Halsey never did. In fact, Halsey said his decision to send the battleships south to Samar was "the greatest error I committed during the Battle of Leyte Gulf."

By nightfall, U.S. aircraft, a submarine, and surface ships had sunk all 4 Japanese carriers of Ozawa's force, as well as 5 other ships. In effect, this blow ended Japanese carrier aviation. But the battle of annihilation that would have been possible with the fast battleships had eluded Halsey. Still, of Ozawa's force, only 2 battleships, 2 light cruisers, and a destroyer escaped.

Including retiring vessels sunk on 26 and 27 October, Japanese losses in the Battle of Leyte Gulf came to 29 warships (4 carriers, 3 battleships, 6 heavy and 4 light cruisers, 11 destroyers, and 1 submarine) and more than 500 aircraft; in addition, some 10,500 seamen and aviators were killed. The U.S. Navy lost only 6 ships (1 light carrier, 2 escort carriers, 2 destroyers, and 1 destroyer escort) and more than 200 aircraft. About 2,800 Americans were killed, and another 1,000 were wounded. The Battle of Leyte Gulf ended the Japanese fleet as an organized fighting force.

largest single shipbuilding program of World War II. Eighteen shipyards, using assembly-line methods, completed 2,710 Liberty ships, beginning with the *Patrick Henry*, launched on 27 September 1941 (only eight months after the groundbreaking at the new Bethlehem-Fairfield yard), and ending with the *Albert M. Boe*, which was launched in October 1945 by New England Shipbuilding.

The British *Dorington Court* of 1939 was the basis for the Liberty ship design, adapted for welded construction and with improved crew accommodation. Liberties were 441'6" in overall length and 57' in beam, and they registered 7,176 tons gross and 10,865 tons deadweight. Two oil-fired boilers provided steam for a three-cylinder, triple-expansion engine of 2,500 indicated hp that drove the vessel at 11 knots. The commission was criticized for specifying such old-fashioned machinery. However, as it worked out, there was a critical shortage of more modern turbine machinery because of the demands of other wartime expansion programs; moreover, the engines themselves were thoroughly reliable, and there was a substantial force of engine room crewmen who were very familiar with this type of plant.

Speedy construction and delivery was central to the Liberties' contribution to the war effort. An overwhelming majority of the yards in which they were constructed were newly created facilities purpose-built either by the Maritime Commission or by the contractors. Initially, the vessels required around 250 days for completion, but within a year, this was reduced to less than 50 days. The Richmond Shipbuilding Corporation, a subsidiary of Henry J. Kaiser's Permanente Metals Corporation, broke all records by assembling the *Robert E. Peary* in just over four days between 8 and 12 November 1942 and delivering the ship three days later. More important, American shipyards delivered 93 new ships in September 1942, totaling more than 1 million deadweight tons, of which 67 were Liberties.

Liberty ships proved to be very adaptable. Although intended to operate as freighters, they were modified for service as troop transports, tankers, aircraft transports, depot ships, and an array of naval auxiliaries.

Liberty ships were tough, even though they were classified as expendable war materials. Some problems were encountered with unexpected stress fatigue, but the ships often survived considerable combat damage and served successfully throughout the world in all types of weather. Many continued in postwar commercial service for 25 years or more. Two are preserved as tributes to the type's crucial contribution to the Allied victory: the *John W. Brown* at Baltimore, Maryland, and the *Jeremiah O'Brien* at San Francisco.

Lidice Massacre (9–10 June 1942)

German wartime atrocity in Czechoslovakia. On 4 June 1942, SS-Obergruppenführer Reinhard Heydrich, chief of the German Sicherheitsdienst (SD, or Security Service) and Acting Reichsprotektor (administrator) of Bohemia and Moravia,

died of wounds suffered when his car was attacked with grenades in Prague on 27 May 1942. The attack was carried out by two agents of the London-based Czech government-in-exile, Jan Kubis and Jozef Gabčík. German reprisals for the attack on Heydrich were swift and deadly. Ultimately, the Germans raided 5,000 towns and villages; in the process, some 3,180 persons were arrested, and 1,344 were sentenced to death. Adolf Hitler ordered additional severe reprisals against the Czechs, threatening to kill 30,000 of them. This threat was not carried out, but the mining village of Lidice near Kladno, 11 miles northwest of Prague, was chosen for a conspicuous reprisal, presumably because some villagers there had sheltered Heydrich's assassins and had been otherwise identified with the Czech Resistance.

The German operation against Lidice was carried out on 9–10 June by German police and SD personnel led by SS-Hauptsturmführer Max Rostock. German police and SD troops surrounded the village on the evening of 9 June, and the action began the following morning. First, the police and

SD men rounded up and took away the children and most of the women. Then, an execution squad of 3 officers and 20 men methodically killed 172 males over the age of 16. Later that day, another 11 workers from the late shift at the Lidice mine were also executed, as were 15 relatives of Czech soldiers serving in Britain who were already in custody, bringing the total number of men murdered to 198. The Germans also executed 71 women in Lidice, and another 7 were taken to Prague, where they, too, were shot. Of the 184 Lidice women transported to Ravensbrück concentration camp and the 11 already in prison, 143 eventually survived. The 98 children in the village were transported to a camp at Gneisenau. Eighty-two of the children were gassed at Chelmno, and 8 are known to have been given to Schutzstaffel (SS) families to raise. In any event, only 16 surviving Lidice children could be identified in 1945. The village of Lidice itself was burned to the ground. The site was then dynamited and bulldozed, and the ground was sowed with grain.

A similar reprisal was carried out on the village of Lezaky, east of Prague, where the radio transmitter used by the Czech

agents was discovered. All of the village's adult inhabitants were killed, and only 2 Lezaky children survived the war. On the orders of SS-Reichsführer Heinrich Himmler, 252 friends and relatives of the Lidice inhabitants were gassed at the Mauthausen concentration camp on 24 October 1942.

No link between Lidice and the Heydrich assassination was ever proven. The village was rebuilt nearby after the war and renamed Nove Lidice. SS-Hauptsturmführer Rostock was executed in 1951 for his part in the Lidice Massacre, which came to symbolize the Nazi oppression of Czechoslovakia.

Lighter-than-Air Craft

Barrage balloons, blimps, dirigibles, and zeppelins. A number of disasters during the interwar period, combined with ever advancing airplane technology, caused most nations to move away from using lighter-than-air (LTA) craft for military purposes by World War II. The U.S. Navy lost three dirigibles between the wars: the *Shenandoah* (1923) and *Akron* (1933), both due to adverse weather, and the *Macon* (1935), due to structural failure.

Many countries employed barrage balloons in defending cities or military installations against low-level air attacks. The British staged some 450 large kite balloons around London, which would be sent aloft while trailing large, steel cables that had to be avoided by incoming aircraft. British sources claimed 200-plus “kills” of German V-1 buzz bombs from these barrage balloons. The Soviet Union employed similar technology against German air attacks.

During World War I and in the interwar period, the United States tried several types of LTA technology, with varying

degrees of success. By 1939, the U.S. Navy had determined that rigid airships were not effective in military applications. Nonrigid airships, or blimps, saw the most extensive wartime use. The navy registered 167 blimps, most of which were used to patrol the North American coastline or as long-range air support for convoys in the Atlantic and Mediterranean. Of more than 89,000 total ships escorted by blimps in convoy, only one, the tanker *Persephone*, was lost (25 May 1942) while under airship protection in two world wars. LTA craft could patrol in more varieties of weather than airplanes could, and they were capable of remaining aloft far longer; however, they had extremely limited offensive uses. No submarine kills by blimps have been confirmed, but the blimps were an effective deterrent, forcing the submarines to stay submerged and inactive.

Three different types of blimps were employed during World War II by the U.S. Navy. The G-series came from the navy’s 1935 purchase of the Goodyear *Defender*. The next seven G-series airships held 6 crewmen, measured 192’ in length and 45’ in diameter, and had a volume of 196,000 cu ft and a speed of 60 mph. The K-series comprised the majority of the Navy’s LTA fleet. These blimps housed a 12-man crew,

Dirigible escort above U.S. Navy escort carrier *Casablanca*, 8 August 1943. (National Archives)

measured 251.7' in length and 62.5' in diameter, and had a volume of 425,000 cu ft; they had a top speed of 75 mph and a range of 2,000 mi. Only a few M-Series craft were built. They had distinctive, 117-ft-long cars. These held 10-plus crewmen, had a volume of 647,000 cu ft (refurbished to 725,000 cu ft), and a top speed of 75 mph. These craft were posted along both U.S. coasts, in the South Atlantic, in the Caribbean, and in the Mediterranean.

In the postwar years, LTA technology was never again so widely employed in military use. By the 1960s, nearly all LTA craft were retired from military service.

Lin Biao (Lin Piao) (1907–1971)

Chinese Communist marshal and commander of the Chinese Communist Fourth Field Army from 1937 to 1951. Born in Huanggang (Huang-kang) County, Hubei (Hupeh) Province, China, on 5 December 1907, Lin Biao (Lin Piao) was the son of a factory owner. In 1925, he moved to Shanghai in Jiangsu (Kiangsu) Province, where he joined the Socialist Youth League and the Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT). At the Huangpu (Whampoa) Military Academy in Guangzhou (Canton), Kwangdong (Kwangtung) Province, where he graduated in 1926, Lin met Communist leader Zhou Enlai (Chou En-lai), deputy director of the school's Political Department. Lin served with GMD forces in the 1926–1927 Northern Expedition, rising to the rank of major, but in the summer of 1927, he defected with his troops to assist the unsuccessful Jiangxi (Kwangsi) Communist rising.

Lin then joined Communist leaders Zhu De (Chu Teh) and Mao Zedong (Mao Tse-tung) in the 1927–1928 Jiangxi Soviet, commanding Communist troops who resisted the GMD's protracted 1930–1936 “bandit (Communist) suppression campaigns.” In 1934 and 1935, Lin led Communist I Corps in its breakout from GMD encirclement in Jiangxi on the Long March to Yan'an (Yenan), in Shaanxi (Shensi) Province.

Appointed commander of the Eighth Route Army's 115th Division in 1937, Lin gradually expanded his forces into what became the Fourth Field Army after the Communist-

Nationalist anti-Japanese rapprochement. In September 1937, his troops ambushed a Japanese regiment, and Lin featured prominently in the unsuccessful autumn 1940 “Hundred Regiments” Offensive. From then until Japan surrendered in August 1945, Lin concentrated on building up Communist bases and forces behind Japanese lines in northern China, facilitating the Communist position in that region during the postwar conflict between GMD and Communist forces.

Immediately after the war ended, Lin entered Manchuria with 100,000 men. Although GMD troops forced him to retreat northward between April and June 1946, he regrouped; when he resumed the attack in May 1947, he had expanded his army to 500,000 men. Sweeping south throughout China, Lin's army captured several major cities: Shenyang (Mukden) in Liaoning in November 1948, Beijing (Peking) in Hebei in January 1949, and Guangzhou in October 1949.

From November 1950 to April 1951, Lin's Fourth Army spearheaded the Chinese forces that entered the Korean War. In 1955, he became 1 of the 10 marshals of the Chinese People's Liberation Army and in 1959 minister of defense. In 1969, Communist Party Chairman Mao named Lin—his supporter from 1966 to 1969 during the Cultural Revolution—as his heir. But for reasons that remain decidedly obscure, Mao apparently broke with him in 1971. Subsequently, Lin was alleged to have mounted an unsuccessful coup or assassination attempt against Mao, and on 13 September 1971, he died with his family in an airplane crash near the Mongolian frontier while fleeing for asylum to the Soviet Union.

Lindbergh, Charles Augustus (1902–1974)

U.S. aviation pioneer and isolationist leader. Born 4 February 1902 in Detroit, Michigan, Charles Lindbergh attended the University of Wisconsin but left school to study flying in Minnesota in 1922. He then joined a flying circus. He was commissioned in the Army Air Service in 1924, and two years later, he became an airmail pilot. On 20 May 1927, Lindbergh took off in *The Spirit of St. Louis* from Roosevelt Field, Long Island, New York, on the first solo transatlantic flight, and 33.5 hours later, he landed at Le Bourget Field in Paris. Lindbergh returned to the United States a national hero. Awarded the Medal of Honor, he carried out a goodwill tour of North and South America. He and his wife, Anne Morrow Lindbergh, then pioneered air routes that would later be used by commercial airliners.

In 1936, after the kidnapping and death of his infant son in 1932, Lindbergh moved his family to Europe to escape the press. The “Lone Eagle,” as he was known, was invited to inspect the German Luftwaffe and came away convinced of the Germans’ air superiority. He also accepted a decoration from Nazi Germany for his 1927 flight.

Returning to the United States in 1939, Lindbergh became one of the chief advocates of U.S. neutrality after Germany invaded Poland, and he was openly critical of President Franklin D. Roosevelt’s efforts to support the Allies. In a series of speeches across the country, he became the leading spokesperson for the Committee to Defend America First. The animosity between Roosevelt and Lindbergh was acute, and Lindbergh resigned his Air Corps reserve commission. A Madison Square Garden speech he gave on 23 May 1941 produced a popular backlash; threats were made against his life, his books were removed from library shelves, and his hometown even painted over his likeness on the city water tower. In a speech in Des Moines, Iowa, Lindbergh claimed the Roosevelt administration, the British, and the Jews were pulling the United States into the war.

After the Japanese attack on Pearl Harbor, Lindbergh urged support for the war effort, and in late December 1941, he offered his services to the military but was rejected because of his prewar position. Seeking to become part of the war effort, he joined the Ford Company to assist in production of the B-24 bomber at its Willow Run plant. Lindbergh then joined United Aircraft, and in 1944, he helped to test fighter aircraft in the Pacific and teach fuel economy techniques. He also flew combat missions and shot down at least one Japanese plane. Returning to the United States, he spent the remaining years of his life championing conservationist causes. He won the 1953 Pulitzer Prize for his autobiography,

Charles A. Lindbergh beside his plane, *The Spirit of St. Louis*. (Library of Congress)

The Spirit of St. Louis. Lindbergh died of cancer on 26 August 1974, in Hana, Maui, Hawaii.

Literature of World War II

The devastation wrought by World War II was immense. This second world conflagration of the century was experienced on all continents and by almost every human being; age-old distinctions between military and civilian populations were gradually obliterated. Decades after hostilities ended, psychological damage lingered, and the financial burden would fall on generations unborn when the war itself was waged. Well into the twenty-first century, books of fact and fiction would endeavor to explain how enlightened peoples could have drifted into such horror. For the writers, there would be no armistice.

This grim drama unfolded in an age when communication was becoming immediate and global and when reading materials of all types and qualities were at last available to almost everyone. The letters, notebooks, diaries, journalism, and official documents generated by the war provided historians an incomparable record, and thousands of poems, short stories, plays, and novels in the major languages provided corroborative testimony that spoke more directly to the masses of people. One of the chief results of this deluge of highly personal writing was the blurring of the distinction between reportage and fiction, along with the refinement of what has been called “documentary fiction.”

The novel and poetry at their best, through the selection of strategic detail and the exploitation of the connotative power of words and images, create empathy and provide that expansion of experience rarely achieved by merely factual documents. Poets do not lie; rather, they probe for a higher truth. Yet Plato, who himself possessed the artistic imagination, warned against the poets. Their characteristic subject was “arms and the man,” and their harrowing descriptions of combat, he feared, would make young men afraid to defend their lands. Since antiquity, major literary talents have taken war as their subject. Yet it seems strange at first that the most total war of all history, World War II, produced no *War and Peace* or even a *Gone with the Wind* to capture the public fancy as a defining epic. Although acclaimed poets expressed wartime sentiments and poetic controversies arose over the clash of ideologies, no single poem moved the masses the way the verses of Siegfried Sassoon and Wilfred Owen had done in World War I. The frustrations of the common soldier entangled in bureaucracy continued to provide black humor, yet no picaresque novel achieved the renown of Jaroslav Hasek’s World War I classic, *The Good Soldier Svejk*.

No overriding myth stirred the literary artists in their struggles against fascism, nazism, and Japanese racism. This war was not fought to make the world safe for democracy. Neither was it believed to be a war to end all wars. After the surrenders, however, almost everyone agreed that the right side had prevailed. Nazi thugs and Japanese bullies had been defeated. British novelist Anthony Burgess pronounced the war a grim but necessary chore.

Even while books proliferated, another medium had captivated the masses with its portrayals of wartime courage and its later postwar celebration. The Hollywood films and, with more self-conscious seriousness, the French “New Wave Cinema” would effectively tell the story. Decades later, television’s History Channel in the United States would take World War II as its special province.

U.S. Literature from World War II

The United States may have been the major winner, economically and culturally, of the war. The nation shed the cultural

inferiority complex that had so long plagued it, as it became evident that it possessed not only an intact publishing industry but some of the most talented writers in the world. Almost alone among warring nations, the United States had been able to maintain the distinction between civilian and armed populations. In Europe, the strong emotions generated by ruined cities and ruined lives could not yet be contemplated in tranquility, but Americans could still experience emotions at some distance from the carnage. Even for U.S. servicemen, the war, despite its horrors, had remained a foreign adventure. The American postwar mood, unlike the existentialist malaise that spread through Europe, was optimistic. Soldiers returned home to resume their lives, start their families, and revitalize society.

The vitality of American fiction writers and their wartime inspiration were soon evident in Norman Mailer’s *The Naked and the Dead* (1948), Irwin Shaw’s *The Young Lions* (1948), and James Jones’s *From Here to Eternity* (1951). These were bulky novels, with more attention to plot and theme than to stylistic finesse. Their milieu, described with as much gritty detail as the sensibilities of the period permitted, was intensely masculine. Female presence seemed unessential in the serious male business of warfare. The novels of Herman Wouk—conservative, old-fashioned books—were also widely read: *The Caine Mutiny* (1951), *The Winds of War* (1971), and *War and Remembrance* (1978) were later successfully filmed.

These books have frequently explored the ethnic intricacies of U.S. society under battle conditions. Thomas Heggen’s *Mister Roberts* (1946) combined satire, humor, and serious themes in its study of the boredom of an assorted crew on a navy cargo ship. As late as 1986, Richard Wiley’s novel *Soldiers in Hiding* placed Japanese American jazz musicians on tour in their ancestral land during the attack on Pearl Harbor. Stranded, they are forced to contend with conflicting loyalties while saving their lives.

In a gentler vein was James Michener’s 1948 *Tales of the South Pacific*, more famous in the Rogers and Hammerstein musical adaptation, *South Pacific*. Against the backdrop of war in the Pacific, a U.S. Army nurse finds love with a courtly European gentleman. Readers also welcomed John Hersey’s reassuring 1944 Pulitzer Prize winner, *A Bell for Adano*, about an American military governor’s efforts to provide justice for a defeated people during the occupation of Sicily.

Several novels used the techniques of satire, fantasy, and surrealism to express their themes. Joseph Heller’s *Catch 22* (1961) was a cynical study of military bureaucracy. *Gravity’s Rainbow* (1973) by Thomas Pynchon was a complicated compendium of wartime allusions, skillfully written but so obscure that it is frequently read with a commentary in hand. One of the most eccentric yet appealing books inspired by personal wartime experience was Kurt Vonnegut’s 1969 novel, *Slaughterhouse Five*. Vonnegut had been a prisoner of

war in a German slaughterhouse during the firebombing of Dresden, and the destruction of that stately city and its people continued to haunt him long after he returned home. His hero, the aptly named Billy Pilgrim, reacts to Dresden's destruction by becoming unhinged in time. Past, present, and future merge for him in a narrative that humorously and poignantly combines surrealism with images and clichés from science fiction.

American poets earnestly surveyed the war-torn world; to many of them, it was further proof of the wasteland modern life inhabited. T. S. Eliot, an American-born British citizen, recorded his reflections on the crisis in *Four Quartets* (1935–1942), the major work of his later years. His younger contemporary, W. H. Auden, an Englishman transplanted in the United States, embraced Christianity as the consolation and sole resolution of the disruptions of the war, rejecting his earlier reliance on Marx and Freud. Auden's collaboration with Christopher Isherwood in the early 1930s had already resulted in several provocative publications; *Journey to a War* had scrutinized Japan's invasion of China. Auden's later poetry was conditioned by his friendship with refugees from Nazi tyranny, and he even provided asylum for the daughter of writer Thomas Mann by marrying her. Two other major poets moved by the war were Randall Jarrell and Archibald MacLeish. Jarrell's experiences in the U.S. Army Air Forces led to a series of embittered poems entitled *Little Friend, Little Friend*, in 1945. MacLeish, who became librarian of Congress during the war years, composed a poetic drama, *The Fall of the City* (1937), as a parable of Adolf Hitler's rise to power.

The American literary establishment experienced a major embarrassment in the highly publicized case of Ezra Pound. From distinguished American lineage, Pound had earlier established himself as poet and mentor to a generation of serious American and British poets. In 1925, he had settled in Italy; by 1941, he was on Italian radio, broadcasting propaganda for his hero, Benito Mussolini. These public rants, increasingly anti-Semitic, continued after the Japanese attack on Pearl Harbor. Not surprisingly, on the liberation of Italy, Pound was taken into U.S. custody. In accusing him of treason, the government faced a dilemma. Does one pardon a notorious traitor whose crimes are public, or does one execute a man many believe to be the most important poet of his generation? The problem was evaded when Pound was declared insane and committed to a comfortable incarceration in St. Elizabeth's Hospital near Washington, D.C. There, he held court to his admirers and accepted awards. He was finally allowed to return to Italy, where he died in 1973.

British Literature from World War II

Unlike the United States, Britain endured the war at home as well as on the battlefield. Despite severe paper shortages and the disruptions of civilian life, quality writings appeared

there throughout the period. Elizabeth Bowen and William Sanson wrote of hardships on the home front. A much loved novel of early wartime sacrifice was Jan Struther's *Mrs. Miniver* (1939), filmed by Hollywood in 1942 with an all-star cast headed by the elegant British actress Greer Garson, who projected a reassuring image of courageous domesticity. Vera Brittain, whose writing during World War I had been so moving, attempted unsuccessfully to repeat her earlier success with a melodramatic tale of shell shock and battle fatigue in *Account Rendered* (1944).

British novels after the war made vivid the range of situations the British people, often directly in the line of fire, had endured. Muriel Spark's *The Prime of Miss Jean Brody* (1961) was a story of Edinburgh school girls precariously mentored by their charismatic and misguided teacher. It explored the romantic fascination Mussolini exerted on the imaginations of repressed individuals of romantic temperament. Graham Greene, one of the eminent twentieth-century writers, told of an adulterous love conducted in the ruins of the Blitz in *The End of the Affair* (1951). Greene's descriptions of war-ravished Vienna in *The Third Man* (1950) had presented an ultimate picture of a great city in defeat, though the book was sometimes dismissed as a mere "entertainment." Evelyn Waugh's *Men at Arms* (1952) was the first part of a trilogy about an old British Catholic family swept up in military commitments. Mary Renault's *The Charioteer* (1953) introduced a topic daring for its decade, homosexuality among servicemen in a military hospital.

Two novels are sometimes identified as the outstanding British contributions to the literature of the war. Peter Towry's *Trial by Battle* (1959) described the experiences of a young British officer in Malaya during the Japanese advance. The distinguished critic Frank Kermode said it was "probably the best English novel to come out of the Second World War." Equally admired was J. G. Ballard's *Empire of the Sun* (1984), the fictionalized account of the author's own childhood experiences in occupied China.

Poems occasioned by the war were penned by major British poets. Those with the strongest international reputations were Stephen Spender and Dylan Thomas. A lesser-known collection of "soldier-poets" who were lost in battle or deeply scarred by their combat experiences were honored by the British. They included Alan Lewis, killed in Burma; Keith Douglas, who fell in Normandy; and Roy Fuller and Henry Reed, who survived but with bitter memories.

Soviet Literature from World War II

The Soviets were also victors in the war. Their incomparable reputation as writers of fiction had been well established by the end of the nineteenth century, and Count Leo Tolstoy's *War and Peace* ranks beside Homer's *Iliad* as an epical account of warfare. But during World War II, the Soviet

Union's talented men and women of letters had been demoralized by German invaders and inhibited by the harsh regime of Josef Stalin. Whatever censorship they might face, a number of Soviet citizens were still committed to serving with their pens "the holy cause" of the homeland. Ilia Ehrenburg's *The Fall of Paris* (1942) was written to inspire Soviets to avoid the fate of the French, whereas Mikhail Sholokhov's *The Science of Hatred* (1942) protested German brutality toward Soviet children, women, and common soldiers. Konstantin Simonov's *Days and Nights* (1945) praised the heroic Soviet defense of Stalingrad, as would Vasily Grossman's later novel, *Life and Fate* (1980). Vera Panova's *The Train* (1946) vividly detailed the treatment of the wounded and dying on a Soviet hospital train, related with a warmth and compassion that echoes nineteenth-century Russian fiction. Unforgettable was Anatoli Kuznetsov's *Babi Yar* (1967), a "documentary novel" about the murder of 200,000 Soviet Jews outside Kiev in 1941. This episode had also inspired a poem by Yevgeny Yevtushenko in 1962.

German Literature from World War II

It has been said that military histories are written by the victorious. In World War II, however, the losers were often as eloquent as the victors. German writers, at home and in exile, recorded their experiences in journals and novels, with a soul-searching that only intensified with the end of hostilities. Within Germany and Austria, the Nazis had sought to control all artists, and many established German-language writers—such as Thomas Mann, Anna Seghers, Franz Werfel, Robert Musil, and Hermann Broch—had sought early exile from the regime. After the war, other voices could also be more freely raised. Stefan Heym, author of *The Crusaders* (1948), may have been the youngest of the literary dissidents; later, he became a mentor to other middle and east European writers. Bruno Erich Werner's 1949 novel, *The Slave Ship*, was one of the most powerful statements from any party to the war. It identified Nazi-controlled Germany as the "slave ship" of its title. Erich Maria Remarque, who had made his reputation writing about World War I, did not achieve the same success with *Spark of Life* (1952), about starving victims of Nazi concentration camps. By this time, Remarque was well settled in Hollywood and married to a movie star, and he seemed to possess less credibility. Henrich Boll's *Adam, Where Art Thou?* (1955) dealt with the disintegration of Germany and an army demoralized in defeat. In *Dog Days* (1963), Günter Grass handed readers another scathing if surrealistic vision of the Hitler years.

Although German atrocities were freely acknowledged in these books, the courage and skill of the German fighting man was not slighted. Theodor Plievier, as early as 1948, had presented the siege of Stalingrad from the viewpoint of German soldiers. In *Stalingrad: The Death of an Army*, young Germans endure freezing cold, lack of adequate food, and the onset of

disease, eventually perishing alone and far from home. In *Arrow to the Heart* (1950), Albrecht Goes told the story of a German army chaplain sent to attend the execution of a compatriot in the Ukraine in the early years of the Soviet Campaign. Willi Heinrich's *The Cross of Iron* (1956) provided another classic portrayal of endurance; a German platoon on the Eastern Front stoically accepts hardship and prepares for death.

Italian Literature from World War II

It is widely believed, in Italy as elsewhere, that the Italians were halfhearted in their pursuit of the war. Many Italian intellectuals had refused to serve the Fascist cause. Luigi Pirandello, the most famous writer in Italy, had attempted to avoid political entanglements and write his plays and stories in peace, even while accepting Mussolini's patronage. He died in 1936 and was thus spared the bitter decisions other writers had to make, and his reputation accordingly survived intact. Giuseppe Ungaretti and Salvatore Quasimodo continued writing their poetry, trying to serve a higher calling than that of Mussolini, whereas Cesare Pavese and Umberto Saba were keenly anti-Fascist. Ignazio Silone's *Bread and Wine*, written from Swiss exile and first published in 1937, was a powerful indictment of the Fascist regime and its destructive influence on the Italian character.

Whatever their politics, Italian writers were always best at showing the war's effects on the poor and oppressed; they had less interest in writing about military successes or defeats. Possibly the most widely translated Italian novelist of wartime reflection was Alberto Moravia. His 1958 novel, *Two Women*, followed the struggles of a mother and daughter in Rome during the final year of the war. The women suffer at the hands of their Italian compatriots, are further oppressed by the occupying Germans, and finally are ill treated by Allied liberators. Elsa Morante's *History: A Novel* (1974) described life in the Roman slums during the German occupation and the plight of a half-Jewish widow seeking to survive and protect her family. A number of other women writers came to prominence in Italy during this period. Natalia Ginsburg, who was Jewish Italian, was one of the most talented.

Japanese Literature from World War II

World War II was, of course, fought on two major fronts. It is possible that the people who suffered most among all the contending parties were the Japanese. Although the novel, as it is known in the West, was an import to their islands, Japanese writers quickly demonstrated their genius of adaptation. Their fiction is fast finding a broader audience. The best-known World War II novel from the Japanese point of view remains Sholei Ooka's *Fires on the Plain* (1957). It described the emotional collapse of a brave warrior who first witnesses his country's disintegration and realizes that he is no longer sustained by national myth. After he becomes a prisoner of the Americans, he acknowledges the futility of all sacrifices in war.

Foreign editions of *The Diary of Anne Frank*. (Todd A. Gipstein/Corbis)

Akira Yoshimjara's powerful novel *One Man's Justice*, though originally published in 1978, did not become available in English translation until early in the twenty-first century. Though it contained no mention of Pearl Harbor or the atrocities committed by the Japanese against the Chinese and other peoples who fell under their control, it movingly captured the thoughts and emotions of its hero, a Japanese soldier. On the run from a U.S. military tribunal, the soldier feels no guilt for having beheaded an American prisoner of war after the end of hostilities. He has witnessed the sufferings of Hiroshima and does not believe Americans have the moral authority to judge him. They have exterminated his countrymen "as if they were vermin" and, he learns, listened to jazz while returning from their murderous bombing raids.

Considering the magnitude of the event, there are relatively few fictional treatments of the beginning of the atomic age and the destruction of Hiroshima and Nagasaki. Perhaps more time must pass before these events can be confronted. One well-known novel is, however, based on diaries and interviews with survivors of Hiroshima. This is Masuji Ibuse's *Black Rain* (1985). Although individual sections are powerful, the book—in its piling up of horrors—illustrates

the aesthetic problems of journalism too immediately and directly transmuted into fiction.

The implications of the bomb have been left largely to the futuristic fiction writers. The most provocative books have been Neville Shute's *On the Beach* (1957) and Walter M. Miller's *A Canticle for Leibowitz* (1960). In Shute's novel, the Australian nation awaits, in a matter of days or weeks, the coming of the radiation that has already destroyed the rest of humanity. Miller describes a monastic society of the future that retains a faint memory of the civilization that has been destroyed, as it starts laboriously to rebuild.

Occupation Literature

Occupation literature, with its profound sense of violation, comprises another major category of World War II fiction. During the German occupation of France, film, theater, and literature flourished, sometimes in open collaboration with the oppressor and at other times with cryptic anti-Nazi messages. As a result of the German curfew, the urban French became avid readers, and copies of Paul Eluard's resistance poem "Liberté" were dropped by the thousands into occupied France by the Royal Air Force. *Wartime Pilot* (1942), by

Antoine de Saint-Exupéry, was a poetic narrative of wartime missions, based on the author's adventures as a pioneer aviator. The book, which found special favor with the subjugated French, has been called "the odyssey of the skies."

After the liberation of France, there was freedom to reflect on the national humiliation. Simone de Beauvoir's *The Blood of Others* (1948) placed ill-fated lovers adrift in wartime France. Henri Troyat's 1958 novel, *The Encounter*, examined the German occupation through the eyes of a woman who kept a music shop and loved American jazz. Jean Paul Sartre's *Troubled Sleep* (1959) tried to suggest reasons for the ignoble capitulation of France. The short stories, novels, and plays of both Sartre and Albert Camus—and the existentialist philosophy they expressed—were likewise products of occupation and experiences of the Resistance. But perhaps the most curiously disturbing French writer during the period was Louis-Ferdinand Céline, who vacillated between admiration for and abhorrence of Hitler, between French patriotism and denunciation of his countrymen. Céline first made his reputation with his descriptions of the London underworld during World War I, and his last important works, *Castle to Castle* (1957) and *North* (1960), described the Nazi nightmare world that France became in the war.

The best-loved World War II novel from a French writer was Pierre Boulle's *The Bridge on the River Kwai* (1954), with its generally admiring view of the professionalism of British servicemen, its exploration of the moral ambiguities of wartime, and the humor and irony with which it examined relationships between Japanese officers and British prisoners of war.

World War II Literature of Other Countries

Of the many war novels written in the less widely known languages of participants, several have been translated and merit mention. Tage Skou-Hansen's *The Naked Trees*, translated from Danish and first published in 1959, was a love story from occupied Denmark. The best-known Finnish novel from the war was Paavo Rintala's *The Long Distance Patrol* (1967), detailing the experiences of Finnish soldiers caught between two oppressors, the Soviets and the Germans. A powerful Dutch novel was Hugo Claus's *The Sorrows of Belgium* (1990), which viewed the trauma of a complex society in wartime and the collaboration of certain Flemish nationalists with invading Nazis.

Two Czech novels that have received international acclaim are Josef Bor's *The Theresien Requiem* (1963) and Bohumil Hrabal's *Closely Watched Trains* (1968). Bor fictionalized an actual event, performances of Verdi's *Requiem* for an audience of Nazi officials, including the notorious Adolf Eichmann. The musicians, all prisoners of the Theresienstadt camp, were exterminated after their last concert. Hrabal's novel pictured life in a small, depleted Czech village in the last days of the occupation.

Other East European writers have left unique records. Constantin V. Gheorghiu's *Twenty-Fifth Hour* (1950) was a

grimly picaresque tale of the misadventures of a Romanian peasant held for 13 years in different work camps, caught up in the various bureaucracies, and perplexed in turn by fascists, communists, and democratic governments. Another Romanian novel of note was Zaharia Stancu's *The Gypsy Tribe* (1971), which took as its grim subject the Nazi persecution of Romany peoples.

The Polish writer Monika Kotowska, in *The Bridge to the Other Side* (1963), provided a sensitive rendering of the sufferings of children during the war and its aftermath. The better-known Polish novelist Stanislaw Lem employed the image of a mental hospital to convey the insanity of the Nazi subjugation of Poland in *Hospital of the Transfiguration* (1975).

Istvan Orkeng, a Hungarian, wrote *The Toth Family* (1966), a black comedy indicting the general compliance of his countrymen with nazism. Danilo Kis's *Hourglass* (1984) displayed a Kafkaesque world on the multiethnic borders of Hungary and Yugoslavia, where suicide, murder, and instant disappearance became mundane events.

The most acclaimed Serbo-Croatian novel was Miodrag Bulatovic's *A Hero on a Donkey* (1965), set in Montenegro under the Italian Fascist military presence. With a lighter touch, Bulatovic reinforced the common perception that an Italian occupation was the least of many possible misfortunes. Stasis Tsirkas's *Drifting Cities* (1974) was the most notable Greek novel of the war, with its mysterious locales of Cairo, Jerusalem, and Alexandria and its celebration of the Greek struggle against both fascism and communism.

Two books with special exotic appeal came from Indonesia and Iran, respectively. Ismail Marahimin's *And the War Is Over* (1977) was set in fabled Sumatra, among Dutch prisoners of the Japanese. The book won the highest literary prize offered by Indonesia. *Savushun: A Novel of Modern Iran* (1969) by Simin Daneshvar described Iran during English and Soviet occupations. Although protection of the oil fields is the official concern, one simple family struggles to maintain honor and dignity, despite disease, famine, and the assassination of their patriarch. The book was also notable for its feminine point of view; it was the work of an accomplished Iranian woman novelist.

Holocaust Literature

One subgenre of World War II literature that has grown to immense proportions and is still expanding is Holocaust

The Diary of Anne Frank so captured public imagination that its author is one of the most famous women of all time.

Author Elie Weisel. (Mitchell Gerber/Corbis)

writing. Most of this literature is thinly fictionalized memoir; its motive is “lest we forget” and its message “I alone survive as witness.” Of all the atrocities of the bloody twentieth century, the one that stands out most vividly in the Western collective memory, thanks to the creative writers as much as to the historians, is the extinction by the Nazis of two-thirds of the Jewish population of Europe. *The Diary of Anne Frank* has so captured public attention that its author is now one of the four or five most famous women of all time. Though the diary was a factual report, a coming-of-age memoir of years in hiding from the Nazis, it was artistically formed and bore the marks of an emerging literary talent. Elie Weisel’s *Night* (1960) and Tadeusz Borowski’s “This Way for the Gas, Ladies and Gentlemen” and other stories (1948) were further examples of strong personal narrative formed by the techniques of fiction. Weisel, winner of the Nobel Peace Prize, may be the most famous Holocaust survivor. Though Borowski was not Jewish, he was a prisoner at Auschwitz, and until his untimely death by his own hand after the war, he was a rising star of Polish letters.

Other notable Holocaust writings were not by survivors but by talented novelists who had lived among survivors. *The Shawl* and *Rosa* (1989) were admirably crafted novelettes by Cynthia Ozick, who wrote almost exclusively of Jewish subjects and themes. William Styron’s *Sophie’s Choice* (1979) was another much discussed and debated novel about survival from Auschwitz, though neither Styron nor his heroine was Jewish.

Juvenile Literature from World War II

Juvenile literature, too, has felt the impact of World War II. No feature of the conflict has been ignored in the hundreds of fictional books now available for youth. Combat, ghettos, concentration camps, home front concerns, and the war’s aftermath have all been examined. With a vision more complex and cosmopolitan than could be found in earlier juvenile fiction, the postwar books tried to teach tolerance for all people, the necessity of compassion, and the lesson that war is tragedy rather than adventure. The books, despite their new realism, retained the moralistic messages children’s literature has long conveyed.

Juvenile series books, usually churned out by a writing syndicate under a host of pen names, have for decades engaged children with vicarious adventures, even while they dismayed teachers and librarians. During World War II, Helen Wells took Cherry Ames, her nurse heroine, into jungle tents and military barracks of the South Pacific, as well as conventional military hospitals, in *Cherry Ames, Army Nurse*, *Cherry Ames, Chief Nurse*, and *Cherry Ames, Senior Nurse*, all published in 1944.

Juvenile books have always attempted to help children understand people in foreign lands. V. F. H. Visser’s *Gypsy Courier* (1964), translated from the Dutch, was the story of a 15-year-old Romany boy who delivers messages for the Polish underground and becomes a skilled saboteur of German records. *Petros’ War* (1971), translated from the Greek of Alki Zei, showed the plight of a 10-year-old Greek child confronting both Italian and German enemies. An especially reassuring tale was Betty Green’s *The Summer of My German Soldier* (1973), in which a Jewish girl living in the American South befriends a young German prisoner of war, bringing down the wrath of both her family and community.

The animal story is a staple of juvenile books, and both the heroism and suffering of animals in wartime provide gripping reading. *Poor Elephants: A Sad Story of Animals and People and War* (1979), by Yukio Tasuchiya, was an account of starving elephants in the Tokyo Zoo, when there was no longer food for them or even the means to euthanize them. *Renni the Rescuer* (1940) related the adventures of a dog who rescued the wounded on the battlefield. It was written by Felix Salten, the beloved creator of *Bambi*.

Popular Fiction, Science Fiction, and Fantasy

Popular fiction, which strives primarily to entertain and sometimes to propagandize, also went to war. Frank G. Slaughter, who had given up medical practice to write medical thrillers that entertained people all over the world, moved into the war zone with *Air Surgeon* (1943) and *Battle Surgeon* (1944). In Britain and the United States, Barbara Cartland, Eric Ambler, Agatha Christie, Leslie Charteris, and Mignon Eberhart were among popular writers who found an ultimate background to adventure in the war. As late as the 1980s, Elliot Roosevelt, the son of President Franklin D. Roosevelt, published *A Family Matter*, in collaboration with Sam Toperoff. Although it had no apparent basis in fact, the book postulated a scheme by which Roosevelt would share MANHATTAN Project secrets with the Soviets in exchange for their help in defeating Japan. Not to be outdone by his brother, James Roosevelt, who fancied himself a writer of detective fiction, initiated the Eleanor Roosevelt mystery series, which transformed his mother into a Miss Marple-style detective. In *The White House Pantry Murder*, published in 1987 but set in the 1940s, Eleanor uncovers a Nazi assassination plot in the White House itself.

The genre of science fiction and fantasy, which was the best-selling category in paperback fiction by the 1980s, has also mirrored the themes and concerns of the war. Alternate history or “what-if?” books have been especially provocative. What if the Allies had been unsuccessful and the world had been left to the devices of the Germans and the Japanese? Three notable books outlined a future in which Hitler did win the war: Philip K. Dick’s *The Man in the High Castle* (1962), Robert Harris’s *Fatherland* (1992), and John Barnes’s *Finity* (2000). Henry Turtledove went a step further into the stratosphere, injecting an alien invasion from outer space into the European war in his curious *Worldwar: Striking the Balance* (1997). Perhaps the scariest work of the science fiction genre, which does not seem so far-fetched at the beginning of the twenty-first century, was Ira Levin’s *The Boys from Brazil* (1976), in which the notorious Nazi medical researcher Josef Mengele survives in a South American jungle laboratory and produces multiple clones of Hitler to send forth to adoptive parents throughout the world as little boys. Even more bizarre was Roland Puccetti’s 1972 nightmare fantasy, *The Death of the Führer*. Hitler’s brain is extracted by a Nazi scientist and placed in the body of an unidentified person who is pledged to resurrect the collapsing Reich. Nazi hunters, learning of the feat, begin a search-and-destroy mission. The Brain turns out to be housed in the body of a voluptuous woman, who reveals her secret to a Jewish Nazi hunter she has bedded in the moment of erotic climax.

Hitler’s place as supervillain of a villainous century seems secure in the popular imagination. Fictionalized biographies, works of acknowledged fiction, and unauthenticated tabloid

exposés have assured him this status. Bogus Hitler diaries have appeared, and so great is the thirst for Hitler information that reputable historians and major news magazines have been fooled. Books purporting to be by or about an alleged wife or daughter have attracted the curious. The Führer’s suicide in his Berlin bunker was barely reported before a barrage of quasi-pornographic writings started appearing, detailing the secrets of his love chambers or reporting sightings of him throughout the world.

The vast literature—whether good, mediocre, or downright silly—that has already been spawned by World War II could not be digested in a single lifetime. And a stream of it continues. Although the many journalistic documents of war on two major fronts leave priceless resources for historians, the creative writers have left posterity equally valuable records of the thoughts and feelings of lives forever changed by this global calamity.

Lithuania

Largest and most southerly of the Baltic states, occupied by both the Germans and the Soviets during World War II. Lithuania achieved its independence from Russia on 16 February 1918 as a consequence of World War I. The Russian Soviet Federated Socialist Republic recognized this independence in a bilateral treaty in July 1920, and this was confirmed in a nonaggression pact between Lithuania and the

German forces landing with their equipment at Memel in Lithuania, May 1939. (Hulton-Deutsch Collection/Corbis)

Soviet Union on 18 September 1926, extended to a 10-year period in 1934. In 1939, Antanas Smetona ruled Lithuania as dictator from the capital of Kaunas. Unlike the other Baltic states, Lithuania enjoyed satisfactory relations with the Soviet Union. The nation's vulnerability to its more powerful neighbors was shown in the 1920 Polish seizure of Wilno (Vilna), the old medieval capital of Lithuania. Then, in March 1939, Germany seized Memel.

Lithuania remained independent until implementation of the terms of the nonaggression pact between Germany and the Soviet Union of 23 August 1939. Under the terms of this agreement, Lithuania was originally assigned to Germany, but in return for additional territory in Poland, Germany ceded Lithuania to the Soviet Union's sphere of influence on 28 September.

After the German invasion of Poland in September 1939, Lithuania declared its neutrality. On 10 October, its leaders signed a mutual assistance treaty with the Soviet Union. The Soviets then returned Wilno to Lithuania from Poland in exchange for permission to station Soviet troops on Lithuanian

soil. The Soviet Union also promised not to interfere in Lithuanian internal affairs. On activation of this treaty in June 1940, Soviet troops entered Lithuania, and, pledges to the contrary notwithstanding, the Soviet government carried out subversive activities, arrested several thousand Lithuanians, and subverted the election process, which brought the Communists to power and resulted in the proclamation of the Lithuanian Soviet Socialist Republic. The new government then voted to join the Soviet Union, as announced by Moscow on 5 August 1940.

The process of the Sovietization of Lithuania then commenced. Lithuanian institutions were done away with, and Soviet laws replaced Lithuanian ones. Soviet authorities abolished religious teaching in the schools, seized private lands, and nationalized industries. At least 40,000 Lithuanians believed to be in opposition to these policies were deported to remote portions of the Soviet Union in early June 1941, just before the German invasion of the USSR in Operation BARBAROSSA.

The German army soon occupied Lithuania and subjected the country to its own control. Industries nationalized by the Soviets now came under Third Reich control. Food and

basic goods were rationed. The Germans also attempted to recruit a Lithuanian Schutzstaffel (SS) division, but so few responded that the effort failed. Tens of thousands of Lithuanians were deported to Germany to serve there as slave laborers. The Germans also encouraged the settlement of native Germans in Lithuania, and efforts to secure “racial purity” led to the killing of some 170,000 Lithuanian Jews, chiefly from the ghettos of Wilno and Kaunas.

The reoccupation of Lithuania by the Soviets, beginning in April 1944, brought the flight of tens of thousands of Germans and Lithuanians westward and a new wave of terror. Once the Soviets had control, they reintroduced the Communist leaders from 1940 and Sovietization, including collectivization in land, deportation of remaining Poles, and persecution of the Catholic Church.

The war claimed at least 25 percent of the population of the country through the deportations and loss of virtually all its minorities, including at least 135,000 Jews, as well as the Germans and Poles. Between 1947 and 1950, Soviet authorities ordered the deportation of some 350,000 additional Lithuanians. The country did not regain its independence until 1991.

Litviak, Lidiia (Lilia or Liliia) Vladimirovna (1921–1943)

Soviet air force officer and first woman fighter pilot to shoot down an enemy aircraft in daytime. Born in Moscow on 18 August 1921, Lidiia Litviak became a flying instructor after graduating from the Kherson Flying School. By mid-1941, she had trained 45 pilots. That fall, she joined Major Marina Raskova's 122th Group. Litviak's 586th Fighter Regiment, which flew Yak-1 fighters, became operational in April 1942 and was assigned the defense of military and civilian installations in Saratov.

In September 1942, Litviak was sent with her squadron to Stalingrad. With fighter pilots Raisa Beliaeva, Ekaterina Budanova, and Mariia Kuznetsova, she joined the 437th Fighter Regiment, scoring her first two victories, or “kills,” on 13 September 1942. As her new wing did not fly Yaks, she soon

transferred with Budanova to the 9th Guards Fighter Regiment, commanded by Lieutenant Colonel Lev Shestakov.

In January 1943, when this wing began acquiring American Bell P-39 Cobras, Litviak and Budanova transferred to the 296th Fighter Regiment (renamed the 73rd Stalingrad-Vienna Guards Fighter Regiment) of 6th Fighter Division, Eighth Air Army, to continue flying Yaks. They were both commissioned as junior lieutenants on 23 February 1943, the twenty-fifth anniversary of the founding of the Red Army. (Budanova was posthumously proclaimed a Hero of the Russian Federation, the highest Russian military decoration, in January 1995.) Litviak and Budanova both became “free hunters,” searching for targets of opportunity. Litviak's final score stood at 12 autonomous and 3 group victories.

Outnumbered in a dogfight, Guards Senior Lieutenant Litviak was killed on 1 August 1943. Because her Yak was missing, rumors persisted that she had gone over to the Germans. Her loyalty to the Soviet regime was suspect, as her father, the former deputy minister of transportation, had been executed in 1937 in the Great Purges. After her remains, which had been found in 1979, were identified, Litviak was rehabilitated in March 1986. She was posthumously given the Hero of the Soviet Union award by Mikhail Gorbachev on 5 May 1990.

Lockwood, Charles Andrew, Jr. (1890–1967)

U.S. Navy admiral who served as commander of the Pacific Fleet's submarines from 1943. Born on 6 May 1890 in Midland, Virginia, Charles Lockwood graduated from the U.S. Naval Academy in 1912. He commanded submarines during World War I and then evaluated captured German U-boats after the war. He spent most of the interwar years in the submarine service. He taught at the Naval Academy from 1933 to 1935, before becoming chief of staff to the U.S. Fleet submarine commander between 1939 and 1941.

When the United States entered World War II, Lockwood was serving as U.S. naval attaché to Great Britain, a post he retained until March 1942, when he was promoted to rear admiral and became commander of U.S. submarines in the southwest Pacific. Lockwood assumed command during a difficult time. The navy had recently reorganized his command and relocated it to Australia. In addition, U.S. submarine commanders were experiencing serious problems with unreliable torpedoes. Lockwood led the way in ordering tests to determine the cause of torpedo failure. These experiments eventually resulted in securing properly functioning weaponry for the submarines.

In February 1943, Lockwood became commander of submarines in the Pacific Fleet, and that October, he was promoted to vice admiral. Under his direction, the U.S. Pacific submarines became the most effective submarine force in history, utilizing radar, signals intelligence, improved torpedoes, and more aggressive tactics to sink two-thirds (5.3 million tons) of Japanese merchant ships and a third of Japanese warships, at a cost of 52 U.S. submarines sunk.

Lockwood also played an important role in developing procedures to rescue aircraft personnel. In 1943, he adopted a plan that posted submarines in various locations to retrieve downed pilots. This program, dubbed the “Lifeguard League,” led to the safe return of more than 500 Americans shot down over the Pacific.

After the war, Lockwood went on to serve as navy inspector general, Office of the Chief of Naval Operations. He stayed in this capacity until his retirement in September 1947. Over the next two decades, he wrote several books about his experiences. Charles Lockwood died in Monte Serena, California, on 6 June 1967.

to locations thousands of miles distant, with climates as varied as the frozen Aleutian Islands, the tropical jungles of New Guinea and Burma, and the deserts of North Africa. The service troops not only had to deliver the goods but also usually had to develop the transportation infrastructure before large quantities of materials could flow efficiently. The Allied powers of Great Britain, the Soviet Union, and the United States proved adept at solving most logistical challenges and getting the required materials to the locations where they were most needed.

The production of war materials was and still is ultimately dependent on resources. Although the Axis powers were short of many strategic materials from the very beginning of the war, the Allies were fortunate to have adequate supplies of the most vital war resources. The United States and the Soviet Union were especially well placed as far as natural resources were concerned, with sufficient supplies of such resources as coal, oil, iron, copper, lead, and zinc. Shortages of tin, nickel, manganese, tungsten, and magnesite were made up from other Allied powers or neutral states. These resources were available as long as the Allies controlled the seas and had sufficient merchant shipping to move them where needed. Latin America produced tin; Canada supplied nickel; and India, South Africa, and Latin America had supplies of manganese. Latin America had tungsten, and the Soviet Union and Australia had magnesite. What one country lacked, another often had in surplus.

No single resource proved more important than oil, and the Allies had adequate supplies of that vital commodity. The United States produced 60 percent of the world's oil in 1937, and Latin America produced 15 percent. Germany, by contrast, produced just .2 percent and depended on Romanian oil, which accounted for 2.4 percent of the world's production in 1937. The Allies drew on American domestic production along with oil from Latin America, the Caribbean, and the Middle East.

The only petroleum problems experienced by the Allies involved the production of sufficient high-octane aviation fuel and the general distribution of petroleum products. The United States eliminated the shortage of high-octane fuel by implementing a major construction program to build additional refineries. The construction of oil tankers, the defeat of the U-boat menace, and the development of pipelines to move fuel—such as the “Pipeline under the Ocean” (PLUTO) for the Normandy Invasion and the petroleum, oil, lubricants (POL) pipeline system across France—all were key to solving the transportation problems. Some campaigns were affected by fuel shortages, such as Lieutenant General George Patton's drive across France in the summer of 1944, but the Allies usually had ample supplies of fuel with only occasional spot shortages, whereas major fuel shortages hindered the Axis powers throughout most of the war.

Logistics, Allied

Logistics—the ability to procure, maintain, and transport military material, facilities, and personnel—was one key to the Allied victory in World War II. The war required the procurement and transportation of vast quantities of materials

Coast artillerymen wait to board the transport USS *Thurston* (AP-77). Their commanders, Major Gordon Dixon (*center*) and Lt. Col. Ronald N. Schartle (*right*) accompany the men, 9 May 1943. (The Mariners' Museum/Corbis)

The four major Allied powers each had special logistical requirements and problems during the war, which they confronted with varying degrees of success. In the end, the combined logistical effort enabled the Allies to defeat the Axis powers.

In the Far East, the Chinese—both the Nationalist Chinese led by Jiang Jieshi (Chiang Kai-shek) and the Communist Chinese led by Mao Zedong (Mao Tse-tung)—had large numbers of ground forces in the field and millions of troops during the war but limited industrial capability to support them. By 1941, most of China's industrial areas had been overrun by the Japanese, following their invasion of Manchuria in 1931 and China proper in 1937. The Chinese needed whatever aid the other Allies could spare, but geography imposed serious limitations on transporting that aid into the country. Prior to December 1941 and the U.S. entry into the war, Western aid to China was limited to a trickle of supplies arriving through

Burma or was primarily symbolic, such as that provided by the famed Flying Tigers (the American Volunteer Group) commanded by Claire Chennault.

Construction of the Burma Road and later the Ledo Road and the establishment of an air bridge over the Himalaya Mountains enabled greater quantities of aid to reach China, but these provisions were limited in comparison to materials going to Great Britain and the Soviet Union. Japan's invasion of Burma and its subsequent drive toward India imposed further difficulties on providing aid to China. Indeed, getting military assistance there remained a daunting task throughout the war. The success of the air bridge and the Burma and Ledo Roads helped keep the Chinese in the war, thereby tying down the majority of the Japanese army.

The British mobilized when war broke out in 1939, but they were dependent on their overseas empire and trade for foodstuffs and war materials. The timely arrival of merchant ships

loaded with fuel and raw materials was crucial to the long-term survival of the British Isles in the war. If resources could not reach the homeland and British troops overseas expeditiously, then the war would be lost. Thus, the Battle of the Atlantic proved to be the most important campaign of the war for Britain. Maintaining the sea-lanes to its overseas empire, along with securing massive amounts of aid from the United States in the form of Lend-Lease assistance, enabled Britain to remain in the war.

The Soviet Union, which joined the Allied camp in June 1941 after it was invaded by Germany, faced some of the most difficult logistical challenges. With millions of military and civilian casualties and much of its European territory occupied by the German army, the Soviet Union had to mobilize fully its remaining population and endure sacrifices at levels not known in the West. The Soviet logistical effort relied on the complete mobilization of the Soviet citizenry and the use of Siberian resources, supplemented by Lend-Lease materials from the Western Allies.

During the initial campaign of the summer of 1941, the Soviet Union evacuated entire industries, moving factory machinery from the path of the advancing Germans to safety behind the Urals. Workers were also relocated in large numbers so they could put the machinery back into production, often in the dead of winter. The sacrifices of the Soviet people were extraordinary, but by the end of 1942, the Soviet economy was outproducing

To ensure rapid delivery of gasoline, the Allies laid a pipeline under the English Channel to Normandy.

that of Germany in nearly all key areas of armaments production, such as tanks, aircraft, and artillery.

Recognizing that it was vital to keep the Soviet Union in the war, the United States extended Lend-Lease to that country in November 1941, sending large quantities of weapons, trucks, and equipment to the Red Army and also food. Aid to the Soviet Union was sent by one of three routes: by ship to Murmansk, by ship to the Persian Gulf and then by rail to the Soviet Union, or by ship across the Pacific to Vladivostok in Soviet hulls. U.S. shipments of tanks and aircraft equaled less than 10 percent of the total produced by the Soviets, but additional items such as trucks (over 400,000), boots, sugar, foodstuffs, and communications equipment played important roles in helping Soviet forces survive and then take the offensive against the Germans.

In the United States, the Two-Ocean Navy Act of 1940, the expansion of the army and its burgeoning need for weapons, and armaments orders from France and Great Britain all promoted the growth of military industries. The Lend-Lease Act, passed by Congress in March 1941, provided for the shipment

of goods and war materials to nations fighting the Axis powers and helped make the United States the “arsenal of democracy.”

During the war, the United States produced vast quantities of goods for the war effort, including aircraft, tanks, trucks, warships, merchant ships, oil, and agricultural products. Henry J. Kaiser mastered the art of mass-producing merchant ships, and in 43 months of operation, Henry Ford’s Willow Run, Michigan, factory turned out 8,685 B-24 bombers, one every 102 minutes. Its industrial might enabled the United States not only to arm its allies but also to field the best-supplied, most mobile force to that point in military history.

In March 1942, President Franklin D. Roosevelt approved Army Chief of Staff General George C. Marshall’s reorganization of the army into the Army Ground Forces, the Army Air Forces, and the Army Service Forces (ASF). Headed by General Brehon Somervell, the ASF was responsible for supplying, quartering, and transporting the ground and air forces. It provided the myriad services required by an army in the field. Meeting the logistical requirements for an expanding military within the continental United States was, in itself, a daunting task, not to mention the job of supporting forces in the European and Pacific Theaters.

Although the Allied invasion of France did not take place until 1944, the buildup for the invasion began in May 1942. Then, in November 1942, Allied forces invaded North Africa in Operation TORCH. The Mediterranean Theater of Operations, Services of Supply command oversaw the American logistical effort in the Mediterranean.

To ensure the safe buildup of supplies in Britain and the continued support of Allied forces in the Mediterranean, winning the Battle of the Atlantic was critical. British Prime Minister Winston L. S. Churchill and Roosevelt met at Casablanca in January 1943 and decided that battle and the bombing of Germany would have the highest priority. The accomplishment of both goals reflected the importance of logistics: the first ensured the safe and timely arrival of war materials from North America, and the second hindered the German and Italian logistical efforts by around-the-clock bombing of Axis industry.

The Normandy Invasion required an immense logistical effort, ultimately involving the transportation of hundred of thousands of troops and millions of tons of cargo. Allied planners knew that they could not count on using French ports, so to ensure that materials could be gotten ashore, the Allies constructed two artificial harbors known as Mulberries and then moved them to the invasion area. The Mulberries were truly an engineering marvel, but they failed to meet expectations because one was destroyed and the other was severely damaged by a Channel storm in late June 1944. To ensure the rapid delivery of gasoline, the Allies laid a pipeline under the English Channel that allowed fuel to be pumped from England to Normandy, where it was decanted into 5-gallon cans

or pumped into large storage tanks until the pipeline could be extended across France.

Once Allied forces were ashore in France, the European Theater, Services of Supply command—known after June 1944 as the Communications Zone (COMMZ)—oversaw the supply and administration needs of the U.S. Army in France. Commanded by Lieutenant General John C. H. Lee, COMMZ played a vital role in keeping the army moving forward. When the Allies broke out of Normandy in Operation COBRA in late July 1944, the First and Third U.S. Armies moved so quickly across northern France that they outran their supply lines. As an emergency measure, the Red Ball Express was activated—a circular truck route on which vehicles moved around the clock to transport fuel, ammunition, and food to the forward units. The route helped fill the gap until French rail lines could be restored. Toward that end, the Allies transported locomotives and rolling stock to France aboard ships. In sum, the Allied logistical effort in the Mediterranean and in western Europe made the defeat of Germany in May 1945 possible. Without adequate logistics support, Allied forces would have been unable to pressure the Germans on multiple fronts and destroy the ability of the Axis states to wage war.

A key to victory in the Pacific Theater was the transportation of men and material across the ocean to newly created bases. Units such as the Seabees carved air and naval bases out of tropical islands in record time. Marines and army units secured suitable islands, and fleet anchorages and depots ashore were established. Before the war, naval leaders assumed that the U.S. Navy would have to fight at vast distances in the Pacific, and they developed the “fleet train” concept, one of the most important factors in the Allied victory in the Pacific. A great fleet of merchant ships, fleet oilers, tenders, and support vessels of all kinds kept the supply lines open and the fleet functioning for long periods at considerable distances from the nearest bases. The U.S. Navy mastered the art of midocean refueling and reprovisioning. U.S. ships were thus able to remain at sea for extended periods, only calling at a fleet anchorage for major repairs or crew rest and relaxation. The ability of the navy to bring everything it needed to establish a fleet anchorage turned peaceful lagoons such as Ulithi into bustling, major port facilities. Logistics proved essential in the China-Burma-India Theater as well. Although low on the overall priority list, the movement of supplies over the Burma Road and the aerial resupply of China over the Himalaya Mountains from bases in northern India helped keep China in the war and tie down the bulk of the Japanese army.

Throughout the war, the use of aircraft to haul supplies to advancing armies or forces cut off from the more conventional forms of resupply became increasingly important. Whether bearing supplies or paratroopers, the cargo planes—the C-46 and C-47—were vital additions to the overall

logistical effort. During the war, both sides learned the limitations in the use of aircraft for resupply, but the Allies had far more transport aircraft than the Axis powers and were able to use them more effectively. Allied aircraft supported airborne operations, supplied troops and evacuated the wounded, and transported high-priority supplies to advancing units of Patton’s Third Army during its drive across France. Transport aircraft were very valuable assets, provided their limitations were understood.

In all theaters of the conflict, logistics proved critical to Allied successes in World War II. When the Axis powers failed to achieve a quick victory in the war, the initiative passed to the Allies, with their far greater collective economic strength. This factor, together with their ability to get these resources to the fighting fronts, helped ensure the Allies’ victory.

Logistics, Axis

The war required the procurement and transportation of vast quantities of materials over considerable distances and in climates as diverse as the Arctic, jungles, and deserts. The inability

ity of the Axis powers of Germany, Italy, and Japan to procure, maintain, and transport military material, facilities, and personnel in sufficient quantities played a key role in their eventual defeat in World War II. The Axis logistical effort was handicapped from the very beginning of the war by a combination of factors, including limited resources and production capacity, mismanagement, and transportation difficulties.

As long as they could successfully conduct short and decisive campaigns and avoid protracted conflicts, the Axis powers could compensate for most logistical shortfalls they encountered. But when forced to conduct a lengthy war of attrition against the economic giants—the United States and the Soviet Union—the Axis powers discovered that their logistical shortcomings continually limited their military options, which led directly to their eventual defeat.

Germany began the war with an economy mobilized unlike any other in Europe. Fortunately for the Allies, however, Germany had neither the centrally planned and centrally commanded economy of the Soviet Union or the free enterprise, capitalist-driven economy of the Western Allies. In the end, the German economy, along with those of Italy and Japan, suffered from poor management, which resulted in inefficient production and the misuse of valuable resources. For example, whereas the Allies standardized weapons in order to speed up mass production, the German Luftwaffe at one point was producing 425 different aircraft models and variants. Such diversity made it difficult to mass-produce war materials.

Germany began the war with serious shortages of strategic resources. It imported oil, iron ore, copper, tin, nickel, bauxite, manganese, tungsten, chromium, molybdenum, sulphur and pyrites, phosphates, rubber, rice, maize, wheat, and meat. Some of the shortages could be made up by prioritizing the use of resources and by acquiring new supplies through conquest. The vital resource most in short supply in Europe was oil. Germany produced only .2 percent of the world's oil in 1937. Romania, its chief supplier of oil, produced just 2.4 percent. The Allies, by contrast, had access to nearly all the world's oil production; the Soviet Union had 10.6 percent, the United States 60.4 percent, and Latin America 15.3 percent. Germany had experimented with synthetic fuel production in the interwar years and had had some success, but without imports of oil from Romania throughout the war and from the Soviet Union prior to the German invasion of that country in 1941, the German war machine would have ground to a halt. Germany's Axis allies were in even worse shape with regard to oil. The Axis powers were desperately short of oil throughout the war, which severely limited their mobility, the training of their armed forces, and the overall production of war materials.

Logistical support for the German military improved greatly with the appointment of Albert Speer as the minister of armaments in 1942. He led an effort to centralize the Ger-

man economy, reduce the number of weapon types, and maximize production. Weapons production trebled in three years. However, just when the efforts to centralize production in large assembly plants began to result in increased output, the Allied bombing campaign began in earnest, and the large production facilities were bombed repeatedly by Allied aircraft.

Speer's efforts to boost production could have been even more successful had Adolf Hitler approved the large-scale use of German women in the war economy. Unlike the situation in the United States, Great Britain, and the Soviet Union, only a small percentage of German women were engaged in manufacturing work at the beginning of the war. And instead of mobilizing women for the factories, Germany relied on the use of millions of slave laborers to meet the ever increasing demand for workers. Speer's efforts most certainly prolonged the war, but they came too late to bring Germany victory.

The lack of resources affected German strategy during the war. Supplies of iron ore from Sweden were secure when the Baltic Sea was open, but during the winter, the ore had to be shipped through Narvik in Norway. Keeping the supply route through Narvik open was a prominent factor in the German decision to invade Norway in April 1940. Similarly, the invasion of the Soviet Union, which ultimately proved to be a logistical disaster, was partially prompted by logistical reasons. The wealth of resources there, both agricultural and mineral, would have gone a long way toward making Germany self-reliant in most areas. Hitler's decision to turn the armored forces south to envelop Kiev in August 1941 not only resulted in the surrender of a large Soviet force but also secured the Ukraine, the breadbasket of the Soviet Union. The German 1942 campaign that culminated at Stalingrad was the result of Hitler's attempt to capture the Caucasus oil fields. In 1944, the German army used all available resources in its attempt to keep the Red Army from seizing the Ploesti oil fields in Romania. The loss of Romanian oil, along with the Allied bombing of the German synthetic fuel plants, helped bring about the ultimate defeat of Germany in many ways; for example, it sharply reduced training time for pilots.

Once materials were produced, the sinews of war had to reach the armed forces at the front. Despite the popular image of panzer divisions slicing their way across Europe, the German army was basically a force of foot soldiers supported by horses, wagons, and railroads. Throughout the war, 80 to 85 percent of the army moved on foot and received supplies by wagon from the nearest railhead, and Germany actually used more horses in World War II than it did in World War I. Indeed, the German logistical system for supplying the armed forces had advanced little since World War I, save for the use of trucks by some units. To motorize only 15 percent of its forces, Germany confiscated trucks from the occupied countries whenever possible. As a result, the German military eventually had 151 different types of trucks in service, and it

proved virtually impossible to get the right spare parts to the right trucks expeditiously. The Americans, by contrast, had one primary truck—the rugged 2.5-ton “deuce-and-a-half,” of which over 2 million were produced.

The most important element of the German supply system was the railroad. When the Luftwaffe had air superiority early in the war, the railroads were secure. But by 1943, the Allies were gaining control of the air, and the resulting fighter-bomber and bomber strikes on the German transportation system began crippling the German logistical effort. By the end of the war, German production, even though maximized by Speer’s reforms, was rendered nearly useless when the materials that were produced could not be transported to the front for use by the troops.

The Italian logistical situation was even worse. Italy entered the war unable to support its armed forces in a long conflict. In fact, the nation lacked all the vital resources necessary to fight a major war, regardless of duration. Oil was in short supply, as were most strategic metals. Benito Mussolini’s drive for empire—the invasion of Ethiopia in 1935, as well as the invasions of France, Greece, and Egypt in 1940—failed to improve Italy’s logistical situation. These campaigns actually did more harm than good because they taxed Italy’s limited resources, and the resulting supply lines to its far-flung empire were virtually insupportable. Long and tenuous supply lines to Italian forces in Ethiopia, for example, could not be sustained, and the Italians there fell victim to a British offensive in 1941. Support of Italian forces in Libya required control of the central Mediterranean Sea. Yet by late 1942, the Allies, operating from Malta and bases at Gibraltar and Alexandria, had gained effective control of the Mediterranean Sea.

Italy had too little fuel to produce additional war materials or even to support the tanks and aircraft that it already possessed. The navy lacked the fuel to sortie, so it remained largely in port. The army, as with the German military, was dependent on horses, mules, and wagons, as well as the railroads and a few trucks.

Japan, an island nation, suffered from the same logistical problems. It lacked resources and had to import nearly all its strategic materials in merchant ships. The quest for resources was an important factor in the Japanese moves into Korea in 1904, into Manchuria in 1931, and into China in 1937. The main goal of the Greater East Asia Co-prosperity Sphere was the economic independence of Japan. When the United States embargoed scrap metal and then oil following Japan’s move into French Indochina between 1940 and 1941, Japan found itself in the awkward situation of having to back down and withdraw from the occupied territory or go to war to solidify its hold on the needed resources. The attack on Pearl Harbor covered the Japanese drive to seize Southeast Asia in order to acquire the oil fields of the Netherlands East Indies and the rubber and tin of Malaya, as well as other strategic resources.

Unfortunately for Japan, the country did not have enough time to develop its newly acquired resources, nor did it have the sealift capacity to transport the materials that were produced. In December 1941, Japan had only 49 tankers totaling 587,000 tons. By contrast, Britain, which was also dependent on foreign oil, had 425 tankers of 2,997,000 tons in 1939, and the United States had 389 tankers of 2,836,000 tons.

The marginal Japanese sealift was steadily reduced during the course of the war by U.S. submarines and airpower. By late 1944 and into 1945, Japan was almost completely cut off from imports, and the overall lack of petroleum products crippled the Japanese war effort even more severely than was the case for Germany. Aerial mining by B-29s also disrupted or destroyed much of the Japanese coastal trade.

Growing Allied air superiority, increasing shortages of merchant ships, the failure to convoy (there were scarcely any escorts available) or implement an effective antisubmarine effort until late in the war, limited resources within Japan itself, and the U.S. strategic-bombing campaign against Japan all but doomed the Japanese supply system to failure. By the last years of the war, bypassed Japanese forces in the Pacific were starving for lack of logistical support. All that the Japanese could do was convert some of their submarines to transports and deliver small quantities of supplies to isolated garrisons. Such stopgap measures did little but briefly prolong the war.

For the Axis powers, logistical factors were always a major concern. German mechanized warfare was ultimately limited by the lack of motor transport available to the German military. But even if Germany had been able to produce more vehicles, the limited availability of fuel would have sharply restricted their use. By 1944, when German single-engine fighter production peaked, the lack of high-octane aviation fuel so limited training that the pilots quickly fell victim to the better-trained and more experienced Allied pilots. The Italians also suffered from a lack of oil from the beginning of the war, and their inability to transport gasoline and replacement weapons and personnel across the Mediterranean in sufficient numbers proved a major factor in the Axis defeat in North Africa. Japan’s inability to protect its merchant fleet and ensure delivery of fuel and other resources from Southeast Asia ultimately destroyed the Japanese economy in 1945 and left the nation on a starvation diet. Axis victories on the battlefield became fewer and farther between as the logistical situation of the Axis powers deteriorated during the course of the war.

Löhr, Alexander (1885–1947)

German air force general and commander of the Twelfth Army in the Balkans. Born at Turnu-Severin (in today's Romania) on 20 May 1885, Alexander Löhr joined the Austro-Hungarian army and became a lieutenant in 1906. He contributed greatly to the buildup of the Dual Monarchy's air service during World War I. In the interwar period, he saw service in the Austrian War Ministry and commanded the aviation branch as a Generalmajor (U.S. equiv. brigadier general) in 1934.

After Germany's annexation of Austria in March 1938, Löhr joined the German Luftwaffe, and in 1939, he commanded its Fourth Luftflotte. During the invasion of Poland in September 1939, his aircraft destroyed Polish communications and traffic lines. In early April 1941, Löhr was assigned a similar task against Yugoslavia, with the additional charge of paving the way for advancing army units. On the morning of 6 April 1941, without a declaration of war, Löhr's bombers attacked Belgrade. They destroyed the Yugoslav command structure but also killed 1,500 civilians.

Promoted to colonel general on 9 May 1941, Löhr was supreme commander of the bloody German airborne assault of Crete, beginning on 20 May 1941. After the invasion of the Soviet Union on 22 June 1941, he commanded 4th Air Force Group in the southern part of the front. In July 1942, Adolf Hitler appointed him to command Twelfth Army in the Balkans (renamed Army Group E in January 1943). From 1943, Löhr additionally acted, with several interruptions, as supreme commander, Southeast. His task was to suppress the resistance movements and defend Greece against Allied landings.

In the summer of 1944, Soviet forces advanced toward Bulgaria and Hungary and threatened to cut off German units in the Balkans. Therefore, Hitler authorized a withdrawal through Yugoslavia to Hungary. Under constant partisan attacks, Löhr's army nonetheless slowed the Soviet advance until the end of the war. A prisoner of war of the Yugoslavian government from 11 May 1945, Löhr was tried for war crimes by a Yugoslav military court, sentenced to death, and executed in Belgrade on 26 February 1947.

Lombok, Battle of (19–20 February 1942)

Pacific naval battle, also known as the Battle of Badeong Strait, fought between Japanese and Allied forces on the night of 19–20 February 1942. The encounter followed the Japanese effort to isolate the important Netherlands East Indies island of Java by an amphibious assault on Bali on the morning of 19 February.

As soon as he received word of the Japanese landing on Bali, Dutch Rear Admiral Karel Doorman, commander of the American-British-Dutch-Australia (ABDA) surface force, ordered a naval attack into Lombok Strait in hopes of destroying the Japanese invasion force. U.S. submarine attacks had earlier failed, largely because of faulty torpedoes, although Allied air strikes had damaged one Japanese transport that was escorted by two Japanese destroyers of Captain Abe Toshio's Destroyer Division 8.

Three waves of Allied warships attacked the two Japanese destroyers. Doorman led the first wave, consisting of the Dutch light cruisers *De Ruyter* and *Java* and three destroyers (one Dutch and two American) in a lengthy line-ahead formation at approximately 11:00 P.M. on 19 February. The two Japanese destroyers returned fire, disabling by gunfire the Dutch destroyer *Piet Hein* and then sinking her with torpedoes. After the first Allied attack had passed through the strait, the Japanese destroyers exchanged fire with one another, although without damage.

The second Allied attack wave arrived at about 1:30 A.M. on 20 February. It consisted of four American destroyers, followed by the small Dutch light cruiser *Tromp*. An exchange of gunfire and torpedoes at ranges as close as 2,000 yards resulted in damage to several Allied ships, including the *Tromp*, and both Japanese destroyers. The remaining two destroyers of Abe's Division 8 now arrived in Lombok Strait to reinforce.

Abe steamed in the opposite direction among three of the Allied destroyers and the *Tromp*. The Japanese destroyer *Michishio* was heavily damaged in the exchange of fire, with

96 killed and wounded. Both sides then disengaged. The third attacking Allied wave arrived in the strait about 5:30 A.M. It consisted of seven Dutch motor-torpedo boats, but these failed to locate the Japanese.

The Battle of Lombok forced the *Tromp* to steam for Australia and repairs, and the two Japanese destroyers returned to Japan for the same purpose. The damaged U.S. destroyer *Stewart* would enter dry dock at Surabaya in the Netherlands East Indies, where she was captured by the Japanese and recommissioned in their navy as a patrol ship. The mix of Allied ships manned by exhausted crews was insufficient to deter the Japanese from their advance on Java. A lack of Allied training, faulty tactics that did not allow for a coordinated attack, and poor luck accounted for this Allied defeat.

Lorraine Campaign (1 September–18 December 1944)

Fall 1944 offensive by the Third U.S. Army in the European Theater. The Lorraine Campaign of 1 September to 18 December 1944 followed the successful Allied breakout from the Normandy beachhead and the rapid pursuit of the retreating German forces across France to the Meuse River between July and September 1944.

After a brief pause at the Meuse to allow their supply lines to catch up, the Allies resumed their advance to the Rhine River in early September. The main effort was an attack through Belgium and Holland toward the Rhine and the Ruhr industrial area by Field Marshal Sir Bernard Law Montgomery's British-Canadian 21st Army Group, assisted by the First U. S. Army of Lieutenant General Omar Bradley's 12th U.S. Army Group. Lieutenant General George S. Patton Jr.'s Third U. S. Army, also a part of 12th Army Group, was assigned the mission of conducting a secondary offensive through Lorraine and across the Moselle River to occupy the Siegfried Line sector covering the Saar and then to seize Frankfurt.

The initial plans for Third Army's operations envisioned a rapid, continuous action spearheaded by armored units to

occupy Lorraine, penetrate the West Wall, and cross the Rhine. However, difficult terrain, bad weather, logistical shortages, and a tenacious German defense delayed the Third Army's arrival at the West Wall until mid-December 1944, at which time several of its key units had to be diverted to block an unexpected German counteroffensive in the Ardennes.

The Province of Lorraine sits astride the traditional invasion route between France and Germany. A plateau ranging from 600 to 1,300 feet in elevation, it has many rivers and ridges that provide natural lines of defense. Its rolling farmlands are frequently broken by dense woods or towns that limit observation and fields of fire in combat situations. Moreover, Lorraine was heavily fortified. The French Maginot Line ran through Lorraine, and the city of Metz had been strongly fortified since Roman times. In 1944, two high-speed highways led from Lorraine into Germany: the first from Metz via Saarbrücken to Mannheim and the second from Nancy through the Vosges Mountains to Strasbourg.

The fall climate of Lorraine is foggy and rainy. The rainfall in autumn 1944 was two to three times above average, with 7 inches of rain falling in November alone. Flooded streams and oceans of mud hampered the mobility of the heavily mechanized American forces, and poor flying weather limited Allied air support. At the start of the campaign, Patton's Third Army had only two available corps: the XII under Major General Manton S. Eddy and the XX under Major General Walton H. Walker. VIII Corps, under Major General Troy H. Middleton, remained tied down clearing German units from the Brittany ports. However, for the first phase of the campaign, Major General Wade Haislip's XV Corps was available, thus giving Third Army a force of three armored and six infantry divisions, supported by the usual array of nondivisional combat and logistical units.

Patton's combat power was limited by the fact that his forces were at the far end of a fragile logistical line. Priority for logistical support had been assigned to Montgomery's 21st Army Group, and the French ports had not yet been fully cleared. Moreover, the U.S. Army was already beginning to run short of infantry replacements.

German forces were in even worse shape, having been badly battered on the Eastern Front and in Normandy. The principal German units facing Third Army were the LXXXII Corps and XLVII Panzer Corps of the German First Army under General der Infanterie (U.S. equiv. lieutenant general) Kurt von der Chavallerie, which, on 8 September, was joined with the German Nineteenth Army in Army Group G, commanded by Generaloberst (U.S. equiv. full general) Johannes von Blaskowitz. Many of the German combat units were seriously understrength in both men and horses, their primary means of mobility. Elite units, such as the Waffen-SS and Luftwaffe parachute divisions, were in better shape, but many of the German defenders were in newly formed Volksgrenadier

divisions manned by poorly equipped troops of low quality. Although German lines of communications were shorter, Allied air interdiction made it difficult to move men and supplies to the front.

The campaign opened in early September with only limited success. In the north, the 90th Infantry Division of XX Corps suffered heavy casualties in unsuccessful efforts to cross the Moselle near Metz, but south of Metz, the 5th Infantry Division gained a limited bridgehead over the river. Farther south, XII Corps had better luck after a few setbacks. On 13 September, the 4th Armored Division conducted a double envelopment around Arracourt, 20 miles beyond the Moselle, and forced the German First Army to evacuate the city of Nancy on 14 September.

A German counterattack from the south designed to destroy Third Army before it could link up with the 6th U.S. Army Group advancing from southern France failed when Haislip's newly assigned XV Corps hit and shattered the German left flank. In the center, a German attempt between 19 and 29 September to squeeze out the 4th Armored's Arracourt salient also failed. As a result, General Blaskowitz was relieved as commander of Army Group G by General der Panzertruppen (U.S. equiv. lieutenant general) Hermann Balck. On the northern side of the XII Corps salient, in the forest east of Nancy, a weak German force almost broke through the 35th Infantry Division in confused forest fighting between 27 September and 1 October, but the front was restored when Patton committed his army-level reserve, the 6th Armored Division.

On 22 September, Supreme Allied Commander General Dwight D. Eisenhower reaffirmed the logistical priority of Montgomery's 21st Army Group and ordered Patton to restrict his offensive operations. In addition, Patton had to relinquish the 7th Armored Division and eventually the entire XV Corps. Despite serious shortages of gasoline and other supplies, the always aggressive Patton continued local attacks during October, the most important of which was a vain effort to capture Fort Driant on the west bank of the Moselle facing Metz, an attempt that cost the 5th Infantry Division some 500 casualties.

The October pause was also costly for the Germans. General Balck had to transfer two divisions, and several of his higher headquarters, including that of the Fifth Panzer Army, were moved north for the planned Ardennes Offensive. This situation left the German First Army with approximately 87,000 men and 130 tanks to oppose the 250,000 men and 700 tanks of Third Army.

The Allied logistical situation improved at the end of October as the port of Antwerp was restored to use. The commander of 12th Army Group, General Bradley, planned a new offensive, but the First Army on Patton's left was unable to meet the schedule, and Third Army attacked alone on 8 November. Using skillful deception techniques, XX Corps on the left took Metz in a double envelopment between 8 and 19

November. Some of the Metz forts were captured by surprise; others were neutralized and bypassed. North of Metz, in only five days, the Americans constructed the longest Bailey bridge in Europe, allowing the commitment of the new 10th Armored Division to pursue the Germans back to the Saar River.

The XII Corps attacks east of Nancy did not go as smoothly. The 26th Infantry Division suffered over 6,000 casualties in heavy fighting between 18 and 28 November. The 4th Armored Division passed through the 26th Division on 22 November and seized a crossing over the Saar the next day. By accident, the 4th Armored ran into and halted the German Panzer Lehr Division, which was moving to attack the XV Corps, then part of Seventh Army to the south. On the left of XII Corps, both the 35th and 80th Infantry Divisions used artillery and close-air support to reduce German outposts in the old Maginot Line. The 6th Armored Division passed through the 35th Infantry Division on 25 November, but its advance was limited by mud and German fortifications.

The slow advance of Third Army in November was mainly the result of poor weather and a lack of mass, for its nine understrength divisions were spread along a 62-mile front. Nevertheless, by 2 December, the Third Army had reached the West Wall along the Upper Saar. Under cover of fog, a battalion of the 95th Infantry Division crossed the river on the morning of 3 December and seized the bridge at Saarlautern intact. Intense fighting followed as the American troops inched their way through a maze of houses and pillboxes. Heavy battle and nonbattle casualties, plus the declining availability of infantry replacements, limited the American advance. Just as Patton's infantry began to make progress, the Germans launched their Ardennes counteroffensive.

Between 16 and 18 December, Patton halted his advance, spread his divisions to cover wider frontages, and turned the 4th Armored and 80th Infantry Divisions 90 degrees to the left and rushed to attack the left flank of the German advance in the Ardennes, thereby ending the Lorraine Campaign after three and a half months of heavy fighting under trying logistical and climatic conditions.

Love, Nancy Harkness (1914–1976)

Squadron commander of the U.S. Women's Auxiliary Ferrying Squadron (WAFS). Born on 14 February 1914 in Houghton, Michigan, Nancy Harkness developed an interest in aviation early in life. At the age of 16, she earned her pilot's license, and while a student at Vassar College, she began a flying school. Harkness earned an air transport rating in 1933. In 1936, she married Robert Maclure Love, who owned Inter-City Aviation, an aircraft sales and service company in Boston.

On 10 September 1942, Love, with the support of Colonel William H. Tunner, head of the Ferrying Division's Domestic Wing of the U.S. Air Transport Command (ATC), orga-

nized 25 women pilots into the WAFS. Headquartered at New Castle Army Air Base in Delaware, the WAFS was formed to deliver planes from factories to military bases.

On 5 August 1943, the WAFS and the Women's Flying Training Detachment (WFTD) merged to form the Women Airforce Service Pilots (WASP), with Jacqueline Cochran as director of the WASP and its Training Division and Love as director of the Ferrying Division. Love's duties included the administration of six WASP ferrying squadrons and the planning of operational and training procedures.

Love was the first woman to be qualified to fly the North American P-51 Mustang fighter, and by March 1943, she was also proficient in the North American A-36 Apache dive-bomber and 14 other types of military aircraft. She was also the first woman to fly the North American B-25 Mitchell bomber, piloting it coast to coast in record time. Accompanied by Betty Gillies, Love was one of the first two women qualified to fly the Boeing B-17 Flying Fortress bomber. She was also the first woman to deliver a Douglas C-47 Skytrain and to qualify in the Douglas C-54 Skymaster transport.

Nancy Harkness Love, director of the U.S. Women's Auxiliary Ferry Squadron, adjusts her helmet in the cockpit of an Army plane before taking off from an eastern U.S. base. The women under her command ferried aircraft from factories to coastal airports, from which they were flown to overseas battle fronts during 1942 to 1945. (National Archives)

At the end of the war, Love and her husband, a major in the Army Air Forces, were each awarded the Air Medal for their leadership and service in World War II. After the war, Love continued as an aviation industry luminary and became a champion in the fight to have the women who served in WASP recognized as military veterans, a status they received in 1977 shortly after Love's death in Sarasota, Florida, on 22 October 1976.

Lucas, John Porter (1890–1949)

U.S. Army general and commander of Fifth Army's VI Corps. Born in Kearneysville, West Virginia, on 14 January 1890, John Lucas graduated from the U.S. Military Academy and was commissioned a second lieutenant of cavalry. He served in the Philippines and in the Punitive Expedition into Mexico in 1916. Promoted to temporary lieutenant colonel, he served in France during World War I with the 33rd Infantry Division and was wounded.

Reverting to his permanent rank of captain after the war, he taught military science at the University of Michigan. He transferred to the field artillery and was promoted to major on graduation from the Field Artillery School (1921), where he taught for two years. He graduated from the Command and General Staff School and then taught military science at Colorado Agricultural College (1924–1929). Following a command slot at Fort Bliss, he graduated from the Army War College (1932). He then served on the War Department General Staff. Promoted to lieutenant colonel (1935), he commanded the 1st Field Artillery Regiment at Fort Bragg, North Carolina (1936–1937). He next served on the Field Artillery Board (1937–1940) and was promoted to brigadier general (1940).

After briefly leading the 2nd Infantry Division, Lucas assumed command of the 3rd Infantry Division (July 1941) and was advanced to major general (August 1941). He then commanded III Corps in Georgia (1942–1943). Sent to the

Mediterranean in mid-1943, he served as observer and deputy for Lieutenant General Dwight D. Eisenhower. Following the Allied conquest of Sicily, Eisenhower selected Lucas to command VI Corps in Lieutenant General Mark Clark's Fifth Army, although Lucas was not Clark's choice. Lucas's corps was Fifth Army's principal U.S. Army formation during its slow northward advance from Naples to the German Gustav Line at Cassino.

On 22 January 1944, Lucas commanded an uncontested amphibious landing at Anzio behind the German lines. Mounted with insufficient manpower and logistical support, the effort was undertaken in response to insistent pressure from Prime Minister Winston L. S. Churchill and the theater land forces commander, General Sir Harold Alexander, who anticipated that it would compel a precipitous German retreat from the formidable Gustav Line and open the way to Rome. Instead of striking immediately to the interior and securing the Alban Hills, Lucas consolidated the beachhead. Field Marshal Albert Kesselring rushed reserves there, and the Germans staged a powerful counterattack. Alexander blamed Lucas for the resultant stalemate, describing the cautious, pessimistic American general as "an old woman." Lucas was relieved on 22 February 1944, replaced by Major General Lucian K. Truscott.

Lucas headed the Fourth Army in Texas (1944–1946) and the Army Advisory Group in China (June 1946–January 1948) and was then deputy commander of Fifth Army in Chicago, where he died on 24 December 1949.

Houses in Mondorf, Luxembourg, destroyed during the first day of the German invasion, 10 May 1940. (Library of Congress)

Luxembourg

This small country (with only 293,000 people in 1939) was strategically located between Belgium, France, and Germany. It enjoyed a high standard of living, the consequence of its rich deposits of iron ore. Although Luxembourg declared its neutrality, the German army invaded the country on 10 May 1940 in its campaign against the Low Countries and France. Grand Duchess Charlotte and her government escaped to London, where they established a government-in-exile.

On 29 July 1940, the Germans replaced the military occupation with a civil administration, and on 14 August, Berlin decreed an end to Luxembourg's independence, abolishing its constitution, laws, and governmental institutions. Although the vast majority of Luxembourgers were hostile to the German occupation, some chose to join the German People's Movement for a variety of reasons.

Beginning in April 1941, the Germans deported some 12 percent of Luxembourg's population to Germany. A number of citizens joined one of the five separate resistance movements that sprang up in response to the German occupation.

The Belgian Resistance played an important role in rescuing downed Allied airmen. The Germans executed those who offered direct resistance, and they also suppressed a general strike in 1942 protesting conscription into the German military. More than 25 percent of Luxembourg men who were drafted refused to report for duty, but a total of 2,848 Luxembourgers died in German uniform, including some who were shot for desertion. A number also served on the Allied side, both in the Belgian Brigade and with British military formations. In an effort to "Germanize" the country, the authorities forbade Luxembourgers from speaking French, using French names, and even wearing berets.

Allied troops entered Luxembourg on 10 September 1944, driving the Germans eastward. Extremely heavy fighting took place in Luxembourg during the German Ardennes Offensive (Battle of the Bulge) of December 1944 to January 1945, and Luxembourg was not finally liberated until February 1945. It then became an important Allied staging and supply area until the end of the war.

Luxembourg was hard hit by the war. The country had been stripped of important resources of food, raw materials, and finished goods, and the fighting destroyed or seriously

damaged a third of the country's dwellings. During the war, 5,159 civilian Luxembourgers were killed. After the war, the government punished some 10,000 people for collaboration with the Germans.

M

MacArthur, Douglas (1880–1964)

U.S. Army general and, during World War II, supreme commander of Allied forces in the southwest Pacific. Born on 26 January 1880 in Little Rock, Arkansas, the son of General Arthur MacArthur, Douglas MacArthur graduated from the U.S. Military Academy in 1903 with highest honors and as first captain. Following service in the Philippines and Japan, he became an aide to President Theodore Roosevelt (1906–1907). He took part in the 1914 occupation of Veracruz, Mexico, where he was nominated for the Medal of Honor, and served on the General Staff (1913–1917).

After the United States entered World War I in April 1917, MacArthur went to France as chief of staff of the 42nd Infantry Division. Promoted to temporary brigadier general, he fought with the division in the Second Battle of the Marne. MacArthur then led the 8th Infantry Brigade in the Saint-Mihiel and Meuse-Argonne Offensives. He commanded the 42nd Division at the end of the war.

Following occupation duty in Germany, MacArthur returned to the United States as superintendent of West Point (1919–1922), where he carried out much-needed reforms. He again served in the Philippines and claimed that his extensive service there gave him special insight into the “Oriental mind.” MacArthur was then chief of staff of the army (1930–1935), his reputation suffering in the 1932 Bonus Army Incident when he employed force to oust a protest by World War I veterans in Washington, D.C. In 1935, MacArthur returned to the Philippines as adviser to the Philippine government in establishing an army capable of resisting a Japanese invasion. He retired from the U.S. Army in 1937 and became field marshal of Philippine forces.

Recalled to active service with the U.S. Army in July 1941, MacArthur received command of all U.S. forces in the Far East. Believing his forces could defend the islands, he scrapped the original, sound plan to withdraw into the Bataan Peninsula. His refusal to allow Major General Lewis Brereton to launch an immediate retaliatory strike against the Japanese on Formosa following the attack on Pearl Harbor meant that most of his air force was caught and destroyed on the ground.

Although the Japanese force invading the Philippines was composed of only 57,000 men, half that of MacArthur’s own numbers, many of the general’s men were poorly trained (some were recent inductees), and they were thinly spread. The Japanese had little difficulty taking Manila and much of the island of Luzon. MacArthur then ordered his forces to follow the original plan for withdrawing into the Bataan Peninsula. Unfortunately, the bases there were not ready, and the retreating troops had to abandon precious stocks of supplies and ammunition in the process. Over the next months, MacArthur spent most of his time on Corregidor. Rather than see him become a prisoner of the Japanese, President Franklin D. Roosevelt ordered MacArthur to Australia on 22 February 1942, where he became supreme commander of Allied forces in the southwest Pacific. MacArthur also was awarded the Medal of Honor, an honor that many defenders of Bataan and Corregidor believed was undeserved. Officials in Washington were also miffed by MacArthur’s acceptance of a \$500,000 payment from his friend Manuel Quezon, the Philippine president.

From Australia, MacArthur initially developed a deliberate strategy to return to the Philippines. The slow pace of the Allied advance led Washington to insist on a leap-frogging approach that would bypass strongly held Japanese islands

U.S. Army General Douglas MacArthur. (National Archives)

and positions, such as Rabaul on New Britain Island and Truk. In the spring of 1944, MacArthur's troops invaded New Guinea and isolated Rabaul. By September, they had taken Morotai and the rest of New Guinea.

In a meeting with Roosevelt in Hawaii in July 1944, Admiral Chester Nimitz, who commanded forces in the Central Pacific, proposed moving against Formosa, whereas MacArthur sought to retake the Philippines. The goal of both approaches was to deny Japanese forces access to supplies in the south. The upshot was that Roosevelt agreed MacArthur would be allowed to retake the Philippines, and Nimitz shifted his resources against Okinawa.

MacArthur commanded ground forces in the liberation of the Philippines. In October, U.S. troops landed on Leyte. They then secured Luzon between January and March 1945, followed by the southern Philippines. An invasion of Japan proved unnecessary, and MacArthur, one of those promoted to the new rank of General of the Army, presided over the formal Japanese surrender ceremony on the battleship *Missouri* in Tokyo Bay on 2 September in his capacity as supreme commander of the Allied powers.

President Harry S Truman then named MacArthur commander of Allied occupation forces in Japan. In this position, the general in effect governed Japan as a benevolent despot, presiding over the institution of a new democratic constitution

and domestic reforms. On the beginning of the Korean War in June 1950, Truman appointed MacArthur commander of the UN forces sent there to prevent a North Korean victory. During the perilous UN withdrawal into the Pusan Perimeter, MacArthur husbanded his resources, and in September 1950, he launched a brilliant (but also lucky) invasion at Inchon that cut North Korean supply lines to the south. He then oversaw the United Nations Command (UNC) invasion of North Korea, but his faulty troop dispositions and his disdain for possible Chinese intervention nearly led to disaster. His increasingly public disagreement with Truman over the course of the war—which the administration in Washington sought to limit and MacArthur wanted to widen by attacking China proper—led to his removal from command in April 1951.

MacArthur returned to the United States a national hero. He then retired from the military, accepting the position of chairman of the board of Remington Rand Corporation. His attempt to run for the presidency as a Republican in 1952 quickly collapsed, and the nomination and office went to another general, whom MacArthur held in great disdain—Dwight D. Eisenhower. MacArthur died in Washington, D.C., on 5 April 1964.

Machine Guns

Relatively small-caliber, automatic-fire, crew-served weapon. The machine gun of World War II was a weapon class in itself. In World War I, machine guns had been, in the main, heavy, water-cooled, belt-fed weapons mounted on heavy tripods and used for trench defense or for long-range suppressive fire. However, the need for machine guns in aircraft and the invention of the British Lewis gun and the U.S. Browning automatic rifle (BAR) in World War I created a new form of machine gun. Germany and the United States were the first nations to develop the light machine gun (lmg)

for infantry assault use. The Germans stripped down their *Machinengewehr 08* (MG-08), fitted it with a bipod and a rudimentary stock, and reduced the operational weight to 28 lbs. The resulting MG-34 with its 75-round drum magazine could be carried by a man on the battlefield. It was produced in large numbers throughout the war. In 1942, the Germans introduced the MG-42. An even better development was the Browning automatic rifle, which fired the American .30–06 rifle cartridge, weighed 19.4 lbs, and was fed by a 20-round box magazine. The French World War I M-1914 Chauchat machine gun remained in service. It came in 7.65 mm, 7.92 mm, and 8 mm models but was of questionable tactical value.

Machine guns of the period operated either by recoil or by gas. Recoil-operated machine guns, such as the German MG-34 and MG-42, often had high rates of fire. When the cartridge was fired, the recoil was used to eject the spent cartridge by pushing the breechblock rearward against a spring, after a suitable safety delay period. The spring then forced the breechblock forward again and in so doing reloaded the weapon, which fired as soon as the breech was locked. Gas-operated weapons used gas from the cartridge discharge, which was bled off from a gas port in the barrel. This operated a gas piston, which interacted with the breechblock to extract and reload the weapon.

Machine guns were classified in the period after World War I as either heavy or light. The heavy versions were still mounted on tripods, equipped with both direct and indirect sighting methods, and used for direct shooting and long-range interdiction fire. The light machine guns, however, were the weapons used prolifically by the infantry. These weapons were often but not always fed by magazines or cartridge strips. They were fitted with bipod legs and could be carried in battle by one man. Normally, because of the high rate of ammunition expenditure, one or two other men accompanied the light machine gunner, carrying spare ammunition and sometimes spare barrels.

Ammunition was supplied to the machine gun in various ways. One method was the strip, in which a number of rounds were held on a metal base that was fed through the gun and then reloaded when empty. This method was used with the French Hotchkiss, the Italian Breda, and the Japanese heavy machine gun. Another method was the magazine, which was a spring-loaded box or drum fitted to the gun that could be replaced when empty. Magazines held about 30 rounds of ammunition, and weapons so fitted included the British Bren, the French M-1931A, the American BAR, the Soviet DP (Degtyarev Pekhotniya [Obratsa] or Degtyarev Infantry [Pattern]) (as a drum), and the Japanese type-96 and similar weapons.

Belt feeds, which allowed sustained long-range fire, were found, for example, on the Browning M-1917A1 and M-1919A4 .30 caliber machine guns, the German MG-34 and MG-42, the

British Besa 7.92 mm gun (mainly used as coaxial tank armament), and the Italian 8 mm Fiat Model 35 machine gun.

One other method was used—the clip box. This box, which held ammunition in rifle clips that were fed automatically into the gun, was a rarity. It was seen on the Japanese Nambu 6.5 mm and the Italian Revelli 6.5 mm. Feed and supply problems rendered these weapons inefficient, and they were soon phased out.

The light machine gun was issued on the basis of one weapon to every 7 to 10 men, meaning that every infantry platoon had three or four lmg's; infantry could also call on support from the heavy machine guns if needed. World War II infantry tactics were based on fire and movement, with the lmg firing and the riflemen of a section moving or vice versa. In the British army during the war, the lmg was considered a support weapon, allowing the riflemen to close on the enemy and to attack with the bayonet. The Germans also saw the lmg as the weapon with which to win a firefight with the enemy, who was then to be rolled up by the infantrymen in the section.

U.S. Army infantry troops were equipped with the BAR of World War I fame as well as light machine guns. The M-1917 series water-cooled, .30 caliber Browning lmg was used by U.S. units throughout the war. It was belt fed and could be carried in the platoon, as well as fitted to just about every vehicle in or near the front line. It led to the M-1919 series, .30 caliber, air-cooled machine guns that were the principal U.S. machine guns of the war. They were only moderately accurate, as they had no butt stock to allow effective fire control but instead were fired with a pistol grip at the rear of the gun body. Backing up these weapons was the .50 caliber Browning. The M-1921 series was originally a water-cooled weapon developed to attack aircraft and observation balloons. Its air-cooled offspring, the M-2 series “Ma Deuce,” was used by every U.S. branch in every environment and theater of the war. It could be fired from a tripod mount or fixed on vehicles and could be set for single-shot fire, although it was not intended for use against personnel. The M-2 .50 caliber was also fitted in a number of aircraft. It is still issued to many armies today.

British infantry used the Lewis gun initially, but this weapon was rapidly replaced by the Enfield version of an lmg produced on license from the Brno arms firm of Czechoslovakia. Known as the Bren gun, it was regarded by many as the finest lmg ever made. The Bren was a .303 caliber, detachable-

The Bren gun was a .303 caliber, detachable-box, magazine-fed, gas-operated weapon with a fire rate of 450 to 540 rounds per minute.

U.S. Army Air Force gunner Sergeant William Watts firing his machine gun at a German aircraft during a bombing mission in 1942. (Franklin D. Roosevelt Library (NLFDR)/National Archives)

box, magazine-fed, gas-operated weapon with a rate of fire of 450 to 540 rounds per minute. It was accurate and had a very quick barrel-change system that coped with rapid firing. The Bren gun served throughout World War II and was well respected, although its rate of fire and the tactical restrictions placed on it meant that it was no match in a firefight with its German equivalent. The British also used the famous Vickers .303 machine gun in a support role.

The Soviets began the war with heavy, wheel-mounted, and shield-protected Maxim M-1910 machine guns, but experience with the Germans led to the rapid development of the DP, a section automatic weapon, fed with 7.62 mm rounds from a top-mounted round drum with a capacity of 47 rounds. This weapon was increasingly backed up by the sub-machine gun, which meant that the firepower of a Soviet section began to approximate that of a German infantry section, although weight and rate of fire figures were still lower.

Machine guns were not only used by the infantry, however. They were also mounted in tanks for protection against infantry, although the Germans' self-propelled Ferdinand gun was not so fitted; as a consequence, German troops suffered greatly from Soviet infantry attacks during the Battle of Kursk. Most tanks had a coaxial rifle caliber machine gun fitted in the turret and another in the hull, the latter operated by the driver, codriver, or radio operator. These machine guns were of great value in suppressing enemy machine guns and artillery when use of the main armament was ineffective or impossible.

The Americans and Germans also linked two or more machine guns for antiaircraft use. Early in the war, the Germans had a small infantry cart fitted with two MG-34 machine guns and the appropriate sights for antiaircraft defense; it was soon found, however, that the cart was too easy a target for the aircraft themselves, and the idea was discon-

tinued. U.S. tanks were equipped with .50 caliber machine guns for anti-aircraft defense, the gun being fitted above the commander's cupola on the tank and capable of a 360-degree traverse and a 90-degree elevation. Although the .50 caliber machine gun was a formidable weapon, it had few anti-aircraft successes and was often used in the ground role for attacking soft-skinned vehicles and buildings.

Aircraft were also fitted with machine guns. The British Spitfire, for example, carried eight .303 caliber machine guns, but these were short-ranged and relatively ineffective against German aircraft. The British also employed the .303 caliber machine gun for bomber defense. The Americans entered the war with the .50 caliber weapon in their aircraft, which could inflict great damage on German and Japanese fighter aircraft. The Germans, however, were using 20 mm and 30 mm cannon from the start, and they soon learned that one hit from such a weapon was worth more than any number of .303 rounds and even a good burst of .50 caliber ammunition.

The British turned to the 20 mm cannon for later versions of their fighter aircraft, and the weapon proved singularly effective. The smaller caliber also meant that more ammunition could be carried per gun as compared with the German 30 mm cannon, but the Germans turned to another air weapon—the anti-aircraft rocket. American fighter aircraft, however, continued to utilize the .50 caliber gun.

Naval use of machine guns was limited, although early World War II warships carried some machine guns for local protection. It was soon found, however, that much heavier weapons were needed for anti-aircraft protection, and in most cases, the light and heavy machine guns went into lockers. Naval aircraft reflected their ground-based counterparts in terms of the weapons fitted on them.

numbered 4 million, and 34,000 Malagasy troops participated in fighting preceding the defeat of France.

Madagascar was part of a failed scheme in 1940 to create a settlement colony there for European Jews. Actually, plans to resettle Jews there had been advanced in the late 1930s by the Polish and German governments, but only after the defeat of France in June 1940 did the plan gain wider support from Nazi leaders. The so-called Madagascar Plan involved the relocation of 4 million Jews to the island, which France would transfer to German control. However, nothing came of the plan, which other events soon superseded.

Following the British navy's attack on the French fleet at Mers-el-Kébir, Madagascar's administration proclaimed its allegiance to the Vichy government headed by Marshal Henri Philippe Pétain. In March 1942, acting on information that the Germans were pressing the Japanese to seize Madagascar and establish bases there in order to attack shipping around Cape Horn and gain control of the Indian Ocean, London dispatched to the island an expeditionary force of British, British East African, and South African troops under Major General Robert Sturges, supported by naval forces under the command of Rear Admiral Neville Syfret.

The invasion began on 5 May 1942 with a descent on the northern port city and naval base of Diégo-Suarez, the first major British amphibious assault of the war. Although the invasion achieved total surprise, French resistance led to fighting. In September, other landings occurred on the island, and Vichy French authorities surrendered on 5 November. The fighting had claimed some 1,200 casualties, including 600 Malagasy. In January 1943, the British handed over Madagascar to the Free French. Between 1947 and 1948, there was a major uprising on the island against French rule, resulting in the deaths of between 11,000 and 80,000 people. Madagascar became independent in June 1960.

Madoera Strait, Battle of (4 February 1942)

Naval battle in the Netherlands East Indies. On 10 January 1942, responding to the deteriorating situation in the Far East, the Allies established the joint American-British-

Dutch-Australian (ABDA) Command. The next day, the Japanese began their conquest of the Netherlands East Indies by invading Tarakan in Borneo and Menado in the Celebes. This move was followed by their capture of Balikpapan in Borneo and Kendari in the Celebes on 24 January and Ambon in the Moluccas on 27 January. ABDA Command retaliated with its aircraft and an inconclusive naval strike against Balikpapan.

On 2 February, ABDA naval commander U.S. Admiral Thomas Hart formed the Combined Striking Force in order to concentrate his naval resources to meet the next Japanese move. When a Japanese convoy was spotted assembling at Balikpapan, he ordered a sortie. Hart wanted his warships to strike the Japanese as the convoy approached either Makasser in the Celebes or Bandjermasin in Borneo. Already assembled at Madoera Island, near Java's naval base of Soerabaja, were the ABDA cruisers USS *Houston* and *Marblehead* and HMNS *Tromp*, supported by seven destroyers: the USS *Barker*, *Bulmer*, *John D. Edwards*, and *Stewart* and the HMNS *Banckert*, *Piet Hein*, and *Van Ghent*. When their air reconnaissance sighted these vessels on 3 February, the Japanese gathered 36 Mitsubishi G4M (known as "Betty" in the Allied recognition system) and 24 Mitsubishi G3M ("Nell") bombers, along with 7 Mitsubishi CSM2 ("Babs") reconnaissance aircraft to seek out and destroy this threat.

On the morning of 4 February, Dutch Rear Admiral Karel Doorman led the Combined Striking Force north. No ABDA air cover was available except for the *Houston's* three float-planes. Doorman's concern that his force would be spotted by Japanese aircraft was confirmed at 9:49 A.M. when nine Japanese bombers found his ships passing through the Madoera Strait. For the next two hours, the Japanese concentrated their air attacks on the U.S. cruisers.

The Japanese had only one plane shot down and two damaged. Although the Japanese failed to sink any of the ABDA ships, they did inflict serious damage. The *Houston's* after-turret was knocked out, and the *Marblehead* was so badly damaged that she was forced to steam to the United States for repairs. Doorman was obliged to withdraw his force to Tjilatjap on Java's southern coast. U.S. casualties in the battle totaled 63 dead and 84 wounded. Hollywood dealt with the story of the wounded sailors in the 1944 propaganda film *The Story of Dr. Wassell*, starring Gary Cooper.

Maginot Line

Massive French defensive fortifications built between 1929 and 1938 along both the German and Italian frontiers. Bled white by huge losses in World War I's trench warfare, France resolved in the 1920s to defend its borders with an efficient fortified wall to make up for its lack of manpower. The maxim of French defense became "Stingy with manpower; extravagant with steel." In part based on the effective resistance of Verdun's underground forts in 1916, the building of the line became the driving passion of Defense Minister André Maginot.

The Maginot Line was conceived as a self-contained system, eventually consisting of two distinct geographic regions. The main part of the line protected Alsace-Lorraine along the Rhine frontier. The Thionville-Metz region was the most heavily fortified and included the huge Hackenberg fortress, with more than 6 miles of underground galleries separated into sectors by heavy antiblast doors, connecting 17 combat blocks. Less known even today was what some sources call the Little Maginot Line. This line protected the French Alpine provinces facing Italy, including important mountain passes, with about 25 miles of continuing fortification down to the Mediterranean at Menton. One of these forts, Rimplas, was the first of the entire system to be built, beginning in 1928.

In each region, the Maginot Line was made up of advance posts, major forts, support facilities, and lines of communication—all built to a standard plan and widely dispersed to withstand modern artillery attack. Located 3 to 6 miles behind the frontier, major (*gros*) and smaller (*petit*) infantry or artillery forts (*ouvrages*) were built to make effective use of terrain to control transportation routes. Artillery pieces—mortars and howitzers—were especially designed for Maginot Line use and were housed in huge casemates, some with retractable turrets. (The largest howitzers were 134 mm caliber weapons.) Each fort had its own diesel power supply and storage deep underground. The largest forts were served by up to a thousand men able to operate for a month at a time, moved

American soldiers inspect the Maginot Line in 1944. (National Archives)

from one part of a fort to another by underground electric trains (*métro*). Forts were located in positions that gave troops the ability to fire on their neighbors to fend off surface enemy attacks (which did not happen at Eben Emael) without harming the occupants (casemate reinforced concrete was more than 10 feet thick and then further protected with many feet of earth). Command-and-control facilities were often buried 60 or more feet deep, relying on input from fortified observation cupolas, an extensive buried telephone network, and radio links. All entrances (usually one for provisions and another for men) were heavily fortified, featured retractable drawbridges (or lifting bridges), and were made airtight against gas attack. There were also emergency entrances for all forts.

What did the Germans know of the Maginot Line before the war? Actually, they knew quite a bit, much of it learned from the captured Czech border forts that were closely modeled on Maginot examples. Aerial surveys just before the war, spies, and interviews with many who had helped to construct the forts (some of them Germans!) gave the German military a good sense of where the Maginot Line forts were and what they could offer in resistance. The Germans did begin work in 1937 on the Gustav gun, with the intention of using it to crack the Maginot Line.

The Germans were also well aware of the fatal flaw in the Maginot Line's geographic conception. Persuaded that no sizable military force could penetrate the dense Ardennes Forest region of southern Belgium, the line of forts stopped at that point, and only light fortifications (dubbed the Maginot Extension) were built along the Belgian frontier to the English Channel. The French plan was to advance into Belgium and assist their allies at the Belgian border fortresses. The plan depended on having enough time to move the requisite armies.

When the German attack finally came in May 1940, of course, blitzkrieg tactics did not provide that time. Guderian's panzers and infantry broke through the Ardennes and turned the flank of the Maginot Line while other forces drove toward the Channel, cutting off British forces. The French, who could barely advance, were rapidly overwhelmed by the German onslaught.

German attacks never breached the structures of any of the gros ouvrages, though some of the smaller outlying facilities were taken in fierce fighting because the surface forces supporting them had been withdrawn. And despite the German use of huge siege mortars and cannon, no major fort fell. Indeed, the Germans took only a few petit ouvrages on the far western end, even though they expended considerable effort and usually greatly outnumbered the defenders. To the south, the Italians never broke through the Alpine defenses, although they did directly assault the gros ouvrage of Cap Martin overlooking the sea in a failed attempt to gain control of the coast road.

In the end, the Maginot Line accomplished exactly what it was designed to do—protect Alsace-Lorraine and the French

provinces facing Italy. It did not “fail,” despite the fact that some of its forts had not yet been fully armed. The existence of the line, originally designed to give the army time to mobilize and then attack, had clearly lulled France into complacency in the face of a rearming Germany and Italy. The French army fell into a defensive stance and ignored mobile warfare, as the High Command was convinced the line could contain any enemy attack. Only after the Germans occupied two-thirds of the nation did Maginot Line forces surrender with the rest of France.

Forces stationed at many of the forts (e.g., Hackenberg and Simershoff) fought again in 1944 as the Allies neared the German frontier, and some of the fortifications were heavily damaged as they had not been in 1940. After the war, the French reoccupied and partially rearmed the Maginot Line, maintaining some forts into the 1960s; then, they were finally abandoned for good. A few facilities, such as a part of Hochwald, are still used by the French army or air force, generally for storage or communications. A number of ouvrages have been opened as museums; others are used to grow mushrooms or store wine. The rounded cement outlines of Maginot casemates will stand out against the terrain for decades to come.

Makassar Strait, Battle of (4 February 1942)

Air-sea battle between Japanese naval airpower and naval forces of the Allied American-British-Dutch-Australian (ABDA) Command. Located between Borneo and Sulawesi, Makassar Strait connects the Celebes Sea to the Java Sea and was a key sea-lane for the Japanese conquest of the Netherlands East Indies. After capturing Kendari on Sulawesi on 24 January 1942 and establishing an air base there, the Imperial Japanese Navy prepared a convoy of troops to seize the town of Makassar on the southern tip of Sulawesi.

ABDA, the Allied command in the Dutch East Indies, was a polyglot force lacking training, air support, and a common language. In contrast, the Japanese were superbly equipped and trained, and they possessed superior airpower. Admiral Thomas Hart, commander of the U.S. Asiatic Fleet and ABDA, ordered the ABDA's naval Combined Striking Force to interdict the Japanese convoy headed toward Makassar. Led by Dutch Rear Admiral Karel Doorman in the Dutch cruiser *de Ruyter*, the mixed fleet included the U.S. light cruiser *Marblehead* and heavy cruiser *Houston*, the Dutch light cruiser *Tromp*, four American destroyers guarding the flanks, and three Dutch destroyers in the rear. Supported by only four flying boats, the Allied formation lacked any form of air cover.

Departing Bunda Roads at midnight on 3–4 February, the force headed north through Makassar Strait. At 9:54 A.M., 37 Japanese twin-engined "Nell" bombers from the Eleventh Air Fleet stationed at Kendari spotted the ABDA formation and attacked. Within minutes, the *de Ruyter* lost antiaircraft fire control due to a near miss from a bomb. Several bombs also straddled the light cruiser *Marblehead*, and near misses jammed its rudders to port, caused a loss of steering control, and sprung bow hull plates, resulting in flooding and a 10-degree list to starboard. The *Marblehead* could only maneuver using its screws. Two bombs then struck the cruiser, tearing open the rear deck and inflicting over 50 casualties. The *Houston* took a bomb on its 8-inch after-turret, and almost 100 men, including all but 2 of the turret crew, burned to death.

With three cruisers struck or damaged and the *Marblehead* crippled and in danger of sinking, Doorman retired through Bali Strait toward Tjilatjap. On 4 February, a U.S. submarine torpedoed and sank a Japanese destroyer off Kendari. Doorman, however, never sighted the Japanese invasion convoy, which sailed to Makassar, landing and capturing that town on 8 February 1942.

Makin Island, Battle of (20–23 November 1943)

Makin Atoll is part of the Gilbert Island chain in the Central Pacific. It was the site of two World War II battles, both of which occurred on Butaritari, the largest island. Makin is shaped like a long, crooked, handled hammer; the head is 3.5 miles long and the handle about 11 miles long. In the first battle on 17 and 18 August 1942, the 2nd Marine Raider Battalion destroyed the Japanese seaplane base there and decimated the garrison. This outcome had an unfortunate effect for the Americans, for it caused the Japanese to strengthen their defenses in the Gilberts. On Butaritari, they constructed bunkers, trenches, machine-gun nests, gun emplacements, and two deep tank traps; the traps each ran shore to shore across the central part of the handle of the island to defend a 3,000-yard-long area known as the Citadel, where the Americans had landed in 1942. Navy Junior Grade Lieutenant Seizo Ishikawa commanded some 500 Japanese military personnel, and there were 79 Japanese and 200 Korean construction workers.

The invasion of Makin was part of the U.S. campaign against the Gilberts, which included the bloody struggle for Tarawa. The Makin assault force numbered 6,471 men: the 165th Regimental Combat Team and a battalion of the 105th Infantry Regiment of Major General Ralph C. Smith's 27th Infantry Division, originally a National Guard unit. Rear Admiral Richmond Kelly Turner directed operations from the battleship *Pennsylvania*. The navy supported the landing with 3 battleships, 5 cruisers, 13 destroyers, and planes from 5 aircraft carriers.

Beginning at 5:40 A.M. on 19 November 1943, naval gunfire, including 14-inch shells from the battleships *Pennsylvania*, *New Mexico*, and *Mississippi*, pounded Makin. Carrier planes followed a half hour later. The Japanese had no effective means of response.

On 20 November, beginning at 8:30 A.M., the navy's Northern Attack Force put the troops ashore on two beaches on the western part of the island. Later, another force went ashore on the lagoon side. The attackers met little opposition, pushing east toward the Citadel and taking the western Japanese tank barrier by the end of the day.

U.S. soldiers on Makin Atoll in the Gilbert Islands. (Photo by Sergeant John Bushemi/Library of Congress)

Here, the attack bogged down, as the troops allowed themselves to be pinned down by Japanese snipers. On the night of the third day, the Japanese mounted a counterattack, during which they lost more than 50 men. But at 10:30 A.M. on 23 November, the army declared Makin secured. The attackers had suffered 64 men killed in action and another 150 wounded. V Amphibious Corps commander Marine Major General Holland Smith regarded the four days it had taken to secure the island, despite the army's overwhelming superiority in manpower, as "infuriating slow." During the invasion of Saipan the next year, he removed General Ralph Smith from command. Following Makin's capture, army engineers built an airstrip to allow further attacks on nearby Japanese forces.

The capture of the island proved far more costly for the U.S. Navy. During the preliminary bombardment, a turret explosion on the *Mississippi* killed 43 men and wounded 19. Also, the delay in taking Makin caused the supporting warships to remain close by, where they were vulnerable to attack by Japanese sub-

marines sent there from Truk. On 24 November, *I-175* torpedoed the escort carrier *Liscombe Bay*. A terrific explosion tore apart the entire after third of the carrier, and 640 sailors died.

Makin Island Raid (17–18 August 1942)

U.S. Marine assault on Makin Atoll in the Gilbert Islands group in the Central Pacific. This operation by the 2nd Marine

Raiders was designed to divert Japanese attention from the Solomons Campaign and to boost American morale. U.S. Pacific Fleet commander Admiral Chester Nimitz decided to employ Lieutenant Colonel Evans F. Carlson's 2nd Raider Battalion. Specific plans called for the two large, 2,700-ton, minelaying submarines *Nautilus* and *Argonaut* to land two companies of 221 raiders on Butaritari Island of Makin Atoll just before dawn on 17 August in order to wipe out the Japanese garrison there. Withdrawing that evening, they were to land the next day on Little Makin Island and destroy its installations. The stated goals were to gather intelligence and take prisoners, destroy Japanese supplies and installations, and distract Japanese attention from the U.S. reinforcement of Guadalcanal and Tulagi.

The submarines arrived off Makin early on 16 August and put the Raiders ashore early the next morning. Unfortunately for the Americans, the premature discharge of a rifle by one of the Marines destroyed the element of surprise. Carlson's Raiders then moved inland and engaged the Japanese troops on Makin Island, virtually wiping them out. Following Japanese air strikes, Carlson decided to withdraw, but rough seas and the failure of outboard engines capsized a number of the boats and stranded Carlson and some 120 Raiders ashore, most of them without their weapons. Fearing he was surrounded, Carlson considered surrender and even sent out a patrol with a surrender note.

On the morning of 18 August, Carlson led a patrol inland and discovered 83 Japanese bodies. Utilizing rubber boats and dugouts made by local peoples, most of the remaining Raiders had returned to the submarines by 11:00 that night. In the raid, the Japanese lost perhaps 160 dead; the Marines had 19 killed and 9 missing. The 9 Marines evaded capture with help from locals until their food ran out. They surrendered on 30 August. The Japanese then took these men to Kwajalein and beheaded them as war criminals. The Raiders had fought well, and Sergeant Clyde Thomason, who sacrificed his life to save several comrades, became the first enlisted Marine in World War II to win the Medal of Honor.

Although the raid did divert attention from Guadalcanal, it also taught the Japanese that they needed to strengthen their defenses. As a result, they heavily fortified Tarawa, which witnessed one of the bloodiest Marine landings of the Pacific War 16 months later.

In 1943, Hollywood produced a movie about the raid, entitled *Gung Ho!* and starring Randolph Scott. Between 2000 and 2001, the remains of the 19 dead Raiders were returned to the United States. Thirteen were interred at Arlington National Cemetery.

Malaya Campaign (1941–1942)

Malaya comprised the 700-mile-long Malay Peninsula and Singapore. The British took Malaya from the Dutch in 1810 during the Napoleonic Wars and established political and administrative control over four of the sultanates on the peninsula in a contractual protectorate relationship known as the Federated Malay States. Protectorate status was extended to the remaining five sultanates by 1914, but these remained outside the federation.

During the mid-nineteenth century, Malaya's economic value grew following the discovery of significant tin deposits there, and after the turn of the century, the rubber industry underwent considerable development. These two resources became critical to upholding the exchange value of sterling, and the peninsula therefore acquired great strategic importance for Britain.

Following World War I, the British government decided to develop Singapore into a large naval base, intended to defend against Japanese expansionism. Construction was slowed by the exigencies of the worldwide depression and was never completed. During the 1930s, the British built a series of airfields on the peninsula in the belief that Singapore and Malaya could best be defended from the air. Malaya's wartime population was about 5.5 million people, of whom only about 2.3 million were indigenous Malay. The remainder were Chinese (2.4 million), Indians (750,000), and other nationalities including the British (100,000).

In October 1940, Air Chief Marshal Sir Henry Robert Brooke-Popham, who had been called from retirement in 1939, was appointed commander in chief, Far East, with his headquarters in Singapore. Brooke-Popham had never served east of Suez and was unfamiliar with the political and military forces girding for war in Southeast Asia. Below him were Sir Shenton Thomas, governor of the Straits Settlements and high commissioner of the Malay States, and the individual service commanders. The senior of these—the general officer commanding (GOC), Malaya, Lieutenant General Arthur Ernest Percival—arrived in May 1941. London rejected Brooke-Popham's requests for more resources and a preemptive strike in southern Thailand against the mounting Japanese threat.

When the Japanese finally began their invasion of Malaya with landings along the northeastern coast on the night of 7–8 December 1941, the British were caught unprepared. With insufficient ships and aircraft to create a simultaneous presence in all theaters, Britain had been forced to establish priorities, and the theaters receiving most of the naval and air assets were the Atlantic and North Africa. Consequently, the defense of the peninsula was left to the army, which numbered some 88,600 Australian, British, Indian, and Malay troops. The principal ground units were the understrength 9th and 11th Indian Divisions and two brigades of the 8th Australian Division, as well as the 1st and 2nd Malaya Brigades at Singapore. The British had only 158 aircraft, mostly obsolete types, and no tanks. They also suffered a severe blow when Japanese aircraft sank Admiral Sir Tom Phillips's new battleship, the *Prince of Wales*, and battle cruiser, the *Repulse*, on 10 December when they attempted to oppose the Japanese landings.

The Japanese had devoted extensive planning to the Malayan operation, and the occupation of southern Indochina

earlier in 1941 had formed part of their preparation. Malaya would provide them with tin and rubber resources, a strategic naval base at Singapore, and a jumping-off point for further expansion into the oil-rich Netherlands East Indies and the Indian Ocean.

The invading Japanese forces, commanded by General Tomoyuki Yamashita, went ashore beginning on the night of 7–8 December. Some 60,000 men were centered in three divisions, supported by Vice Admiral Ozawa Jisaburo's Malay Force, 158 naval aircraft, and 459 aircraft of the 3rd Air Division, as well as 80 tanks, 40 armored cars, and several artillery regiments. The Japanese quickly gained air superiority and began a rapid move southward. On 15 December, in a desperate move, Governor Thomas accepted an offer of cooperation from the Malayan Communist Party (MCP) and lifted the official proscription on both it and the Nationalist Party—the Guomindang, or GMD (Kuomintang, or KMT). Many members of these two parties would now be trained in guerrilla warfare and sabotage at the 101st Special Training School, which had been hastily created at Singapore.

In late December, Brooke-Popham was recalled and blamed, unjustly, for the Japanese successes. Kuala Lumpur fell on 11 January. British, Australian, and Indian reinforcements, most of them poorly trained, were sent in through Singapore harbor to the retreating front but could do little to stem the Japanese advance. In a series of short battles in mid-January, the remaining British defenses in southern Malaya were broken, and on 31 January, the defenders blew the causeway linking Singapore with the mainland.

Soon after the invasion had begun in December, General Sir Archibald Wavell, commander of Allied forces in the Far East, had visited Singapore and warned that the island's defenses had to be prepared should mainland units eventually be compelled to withdraw to it. Unfortunately, little serious effort was made to comply with this direction. On 9 February, the Japanese landed on the island's northwest coast. Singapore was now crowded with refugees, its inhabitants demoralized and its facilities stressed.

On 15 February, the British commander, Lieutenant General Percival, surrendered his remaining 70,000 troops. Most of the surviving graduates of the 101st Special Training School took to the jungles to carry on the fight, forming the Malayan People's Anti-Japanese Army (MPAJA) in March 1942.

Prime Minister Winston L. S. Churchill described the loss of Malaya as the greatest disaster in British military history. The loss clearly demonstrated that the British had grossly underestimated Japanese capabilities. Furthermore, their commanders had done a poor job in handling the ill-trained and inadequately equipped force they had sent to meet the invasion. The larger lesson of Malaya was that for commitments to be realistic, they had to be supported with sufficient resources.

The long-term repercussions were enormous and irreversible. Even though the British would return to Singapore and the Malay Peninsula at war's end, their stay would be temporary. European prestige and the omnipotent image of the white man in Southeast Asia was forever tarnished, stoking the fires of nationalism and hastening decolonization.

Malinovsky, Rodion Yakovlevich (1898–1967)

Marshal of the Soviet Union who played an important role in both the Battle of Stalingrad and the Battle of Kursk. Born to a peasant family near Odessa, Russia, on 23 November 1898, Rodion Malinovsky enlisted in the Russian army at the outbreak of World War I. Badly wounded in 1915, he spent several months recuperating before being reassigned as a machine gunner with the Russian Expeditionary Corps in France in April 1916. Malinovsky was decorated for bravery and again wounded. His unit mutinied in the spring of 1917, however, and he was transported to North Africa.

Malinovsky returned to Russia via Vladivostok in August 1919. He made his way along the Trans-Siberian Railway to Omsk, where he joined the Red Army and fought against the White forces. He then served as chief of staff of III Cavalry Corps. In 1926, Malinovsky joined the Communist Party, and a year later, he entered the Frunze Military Academy for a three-year officers' training program. He then went to Spain as a military adviser to the Republican forces in the Spanish Civil War between 1937 and 1938. Returning to the Soviet

Marshal of the Soviet Union Rodion Y. Malinovsky, shown here in 1960. (Photo by Carl Mydans/Time Life Pictures/Getty Images)

Union, he served on the faculty of the Frunze Military Academy as a senior instructor.

In March 1941, Major General Malinovsky assumed command of the new XLVIII Rifle Corps on the Romanian border. In August, following the German invasion of the Soviet Union, he had charge of Sixth Army in Ukraine, where he had no choice but to withdraw before the advancing Germans. Promoted to lieutenant general that November, Malinovsky took command of the Southern Front one month later. Following the ill-fated Kharkov Offensive in June 1942, for which he shared blame, he was reassigned to rear-echelon duty.

During July and August 1942, Malinovsky headed the Don Operational Forces Group before being named to command Sixty-Sixth Army in August. He also developed a long association with Nikita Khrushchev, then a political officer reportedly assigned by Josef Stalin to watch him. Malinovsky next commanded the Voronezh Front in October and the Second Guards Army in November. In the latter capacity, he played a key role in the Battle of Stalingrad, defeating Army Group Don, the German relief force under Field Marshal Erich von Manstein, in December.

Malinovsky was promoted to colonel general in February 1943, commanding the Southern Front that month and the Southwest Front in March. In April, he was promoted to General of the Army. He played a major role in the Battle of Kursk in July 1943 and then spearheaded the drive across Ukraine, taking Odessa in April 1944. His command was redesignated the 3rd Ukrainian Front in October 1943 and the 2nd Ukrainian Front in May 1944. From Ukraine, Malinovsky led Soviet forces into Romania, Hungary, Austria, and Czechoslovakia. In September 1944, he was promoted to marshal of the Soviet Union.

When the war in Europe ended, Malinovsky took command of the Transbaikal Front in the Far East, pushing into Japanese-held Manchuria. A prominent member of the Soviet military hierarchy after the war, he headed the Far East Command between 1947 and 1953 and the Far East Military District from 1953 to 1956. He was then deputy minister of defense from 1956 to 1957, when he succeeded Marshal Georgii Zhukov as minister of defense. In this post, he introduced strategic missiles into the Soviet arsenal and oversaw Soviet military modernization. Malinovsky died in office in Moscow on 31 March 1967.

Malmédy Massacre (17 December 1944)

Notorious incident involving the murder of unarmed American soldiers during the German Ardennes Offensive (Battle of the Bulge). In the offensive, I Panzer Korps had the task of breaking through Allied lines in the Monschau-Losheim sector and advancing to the Meuse. The 1st SS Panzer Division was on the left wing of the corps, and SS-Obersturmbannführer Joachim Peiper commanded the division's spearhead, known as Kampfgruppe Peiper.

On 17 December, the second day of the offensive, 1st Panzer Division broke through the Allied lines between the Belgian towns of Malmédy and Saint Vith. At the village of Baugnez, Peiper's unit encountered a small group of trucks and jeeps belonging to Battery B of the U.S. 285th Field Artillery Observation Battalion. In the ensuing fight, some 20 U.S. soldiers were killed and Peiper's force took 125 prisoners. Peiper left behind some men to guard the prisoners before moving on to his next objective. A few hours later, another 1st SS column arrived at Baugnez, adding some additional prisoners.

The Germans herded the Americans into a snowy field, where they were held under guard. Meanwhile, another group of separated Americans who had previously escaped from the Germans moved toward the crossroads, and a fire-fight broke out in which more Americans were killed. This engagement led the guards in the field to fire on their prisoners, perhaps believing they would try to escape. The Germans then moved among the wounded, executing them with bullets to their heads. Most of those shot were unarmed. At least 72 men were killed, although some 30 others feigned death and later escaped to American lines.

The incident was the worst atrocity against Americans in the European Theater during the war. News of the event, which became known as the Malmédy Massacre, quickly circulated among Allied troops, and the U.S. Army made the most of it for propaganda purposes, even including civilians who had died in the fighting in the total of persons killed, although many were actually victims of U.S. bombing.

In May 1946, Peiper and 73 members of the 1st Panzer Division, a number of them selected randomly, were brought to trial by a U.S. military court for the Malmédy killings and the murder of soldiers and civilians elsewhere during the offensive. Army prosecutors presented testimony from massacre survivors and civilian witnesses, captured German documents indicating that German troops had been urged to be "ruthless" with prisoners during the offensive, and confessions from some of the accused. In response, the defense argued that pretrial investigations had not been thorough and that confessions had been extorted by mock trials and threats of summary execution. The court dismissed these

Bodies of U.S. Army personnel slain by the Germans after capture near Malmédy, Belgium, 11 December 1944. (Franklin D. Roosevelt Library (NLFDRL)/National Archives)

complaints and convicted all of the defendants. Peiper and 42 others were sentenced to death, and the rest were given lengthy prison sentences.

Questions about the trial results were raised almost immediately, and review boards cited errors in the court's procedural rulings. Several defendants indeed claimed that their confessions had been extracted by physical force, charges that the original prosecutors angrily denied. The army reduced the death sentences to long prison terms, but ultimately, all the defendants, including Peiper, were released from prison within a few years.

Malta

British-held island in the central Mediterranean, located only some 60 miles from Sicily. This archipelago of 122 square

miles, with a civilian population of 270,000 people, played a crucial role in the struggle to control the Mediterranean. Just as Malta had been a key location for forces traveling to the Near East in support of the Crusades and during the French Revolution and Napoleonic Wars, so it proved a vital link in the defeat of Axis forces in North Africa. Formally a British possession since 1814, Malta had the only British port facilities between Alexandria, Egypt, and Gibraltar, but because it was 1,000 miles from the nearest British base, it was difficult both to defend and to resupply.

The governor of the island—Lieutenant General William Dobbie and then, from May 1942, General Lord John Gort—also acted as its military commander. The British used Malta as an air and naval base to interdict Axis supply lines between Italy and Libya. In October 1941, British ships and planes operating from Malta sank two-thirds of the Axis supplies sent to Libya.

Both sides recognized the importance of Malta to operations in the Mediterranean Theater. When Italy declared war on the Allies in June 1940, it immediately began air attacks on Malta, and initially, the British had only a handful of Sea Gladiator biplanes to meet these attacks. The Germans increased the pressure on the island by sending Fliegerkorps X to Sicily to neutralize Malta so that Axis supplies and men might reach North Africa. Beginning in January 1941, Fliegerkorps X struck both the island and the British supply convoys in what became a furious, two-year aerial campaign.

Sustaining Malta became a top priority for the Allies in the Mediterranean Theater. From August 1940 until January 1943, the British pushed 13 convoys through to Malta, all of which sustained losses to Axis naval and air attacks. Critical to Malta's survival was the resupply of fighter aircraft, sent to the island via aircraft carrier. The situation became so desperate and British naval forces were stretched so thin that the United States employed the fleet carrier *Wasp* to fly in Spitfire aircraft during April and May 1942. This was at a time when the U.S. Pacific Fleet desperately needed every available carrier in the Pacific to stem the Japanese advance there.

Despite Allied efforts, the situation in Malta remained precarious for much of 1942. The largest effort to resupply the island came in Operation PEDESTAL in August 1942, when the British sent 4 aircraft carriers, 2 battleships, 7 cruisers, and 24 destroyers to escort a convoy of 14 merchantmen to the island. After numerous air and U-boat attacks, the convoy limped into Malta's harbor on 12 August with just 5 merchant ships, 3 of them damaged. The Royal Navy lost 1 aircraft carrier, 2 cruisers, and 1 destroyer, with another carrier and 2 cruisers damaged. However, PEDESTAL was sufficient to allow operations from Malta to continue. In the spring of 1942, Axis leaders discussed employing Italian and German paratroopers, supported by a sea invasion, to seize the island, but the

British warships in Valletta harbor, Malta 1944. (Photo by Keystone/Getty Images)

Italians' lack of preparation, the desire to move German air units to the Eastern Front, General Erwin Rommel's recent success in Libya, and the memory of the costly Crete operation all led Adolf Hitler to cancel the operation.

By the time the siege of Malta had been lifted in December 1942, more than 1,500 Maltese had died from Axis air attacks. In recognition of their stoutness and to improve their morale during the bleakest of times, Britain's King George VI bestowed on the entire population of Malta the George Cross for valor.

Malta, Air Battles of (1940–1942)

The island of Malta in the central Mediterranean was ideally placed to interdict Axis lines of communication to Libya and was an important way station for Allied aircraft in transit to North Africa. The air attacks on Malta by the Axis powers were initially intended to reduce the disruption of Axis supplies to North Africa from Malta-based bombers and submarines, but they were also to be the precursor to a planned Axis invasion of the island, Operation HERKULES (the Italian name was C-3).

At the start of World War II, Air Commodore F. H. M. "Sammy" Maynard was the air officer commanding (AOC) Malta. He developed a reputation for hanging on to any useful aircraft that happened to land on the island. Initially, Malta's fighter defense consisted of four antiquated Gloster Sea Gladiator biplanes (three of them popularly known as "Faith," "Hope," and "Charity").

The first Italian bombing attack on Malta was made on 11 June 1940. Bombing continued throughout the summer and autumn, but reinforcements continued to arrive on the island, including a few Hurricane fighters. From mid-

February 1941, the Luftwaffe deployed large numbers of fighters to the battle, and the Royal Air Force (RAF) began to take heavier losses among its Hurricane fighters. Bombing attacks eased off during May 1941 as the Luftwaffe concentrated on Crete. Then, on 22 June 1941, Adolf Hitler invaded the Soviet Union in Operation BARBAROSSA, and many of the Luftwaffe units were diverted to the Soviet front. As a result, defense and interdiction forces on Malta could be strengthened; supply convoys arrived, and attacks on Axis shipping intensified. Also in June, Air Vice Marshal Hugh Lloyd replaced Maynard as AOC Malta.

Malta had become the most important British overseas base in the world, and from the Axis point of view, corrective action was required. In December 1941, Field Marshal Albert Kesselring's Luftflotte 2 of more than 600 aircraft was transferred to Sicily with orders to neutralize Malta. Between December 1941 and April 1942, Kesselring mounted sustained heavy attacks on the island, and the activities of its bomber force were drastically curtailed. In January 1942, no Axis ship supplying North Africa was sunk, and the February Allied supply convoy to Malta was forced to turn back. The total tonnage of bombs dropped on Malta in March and April 1942 was more than the total dropped on London during the whole of 1940.

After February 1942, the British adopted more effective fighter tactics, and 31 Spitfires were delivered from the aircraft carrier HMS *Eagle* during March 1942. Hurricanes were good dogfighters, but given the short distance from Italian airfields (60 miles), they lacked the climb performance to gain an altitude advantage before attacking. With the advent of Spitfires, the defending fighters were able to gain sufficient altitude to attack from above. Malta pilots became adept at high-speed dive and zoom attacks. Many aces were made at Malta, not least of whom was George "Screwball" Beurling (with 31 victories, or kills).

The March 1942 Allied supply convoy to Malta nonetheless suffered very heavy losses, and many ships were sunk; only 5,000 tons of supplies got through. By April, food, fuel, spare parts, and ammunition were all in short supply, and rationing was severe and disease rife; the situation was becoming critical. On 15 April 1942, King George VI took the highly unusual step of awarding the George Cross to the entire island. During April and May 1942, the aircraft carriers USS *Wasp* and HMS *Eagle* delivered a total of 132 Spitfires to Malta. On 10 May, Kesselring, following a particularly poor intelligence assessment, reported to the German High Command that the neutralization of Malta was complete.

Renewed Axis attacks against the island in June were timed to coincide with the advance of the Afrika Korps (Africa Corps) to Egypt. Italian warships forced back an Allied supply convoy from Alexandria, and another convoy from Gibraltar was heavily attacked. But two merchantmen

Inhabitants salvage their belongings from a bombed building in Valetta, Malta. The island of Malta suffered extensive air raids during World War II, with over 2,000 alerts. (Hulton-Deutsch Collection/Corbis)

reached Grand Harbor, preventing starvation on the island for another two or three months.

Air Vice Marshal Keith Park was appointed AOC Malta in July 1942, and he instituted an aggressive forward-interception policy to attack Axis raiders as they were forming up. Within a few weeks, this policy had dramatically reduced the effectiveness of the bombing and inflicted increasingly severe losses on the Luftwaffe. During July and August, bombers from Malta again inflicted heavy damage on Axis convoys, greatly assisting the British Eighth Army during the Battles of Alam Halfa and El Alamein. During August, Operation PEDESTAL delivered 53,000 tons of supplies to Malta.

Axis forces made one last series of heavy attacks between 10 and 20 October and were then mostly transferred to North Africa. Raids on the island were gradually reduced thereafter. The siege was lifted altogether on 20 November when Operation STONEAGE delivered another 35,000 tons of supplies, and a further 55,000 tons were delivered in December. The battle officially ended on 31 December 1942.

Manchuria Campaign (9 August–5 September 1945)

The Soviet conquest of Manchuria. At the Yalta Conference in February 1945, Soviet leader Josef Stalin promised that the Soviet Union would enter the war against Japan “two to three months” after the conclusion of fighting in Europe. The Soviets began serious preparations for this eventuality in April 1945, when they initiated the transfer of the equivalent of 12 army corps and tremendous amounts of supplies from eastern Europe via the Trans-Siberian Railway, headed east to three commands fronting Manchuria: the Transbaikal Front to the northwest, the 2nd Far Eastern Front to the northeast, and the 1st Far Eastern Front on the east. Force tailoring was evident in the selection of these units: for example, the Sixth Guards Tank Army was chosen for the Transbaikal Front because its experience in the Carpathian Mountains would be vital in crossing the Greater Khingan Mountains of western Manchuria.

For this campaign, Stavka (the Soviet High Command) created the first Soviet theater-level command, under Marshal Aleksandr Vasilevsky. Against the Japanese, the Soviets amassed 1.5 million men, 28,000 guns and mortars, 5,500 tanks, and 4,370 aircraft; they faced the defending Japanese Guandong (Kwantung) Army, which (although it contained 1.2 million men, including forces in Korea, southern Sakhalin, and the Kuriles) was a shell of its former self. Many of its units had been transferred to Japan for the defense of the home islands. The Guandong Army commander, General Yamada Otozō, called up 250,000 reservists for new units, pulled back his border forces, and planned a defense of central Manchuria, where the bulk of the population was located.

Japanese military intelligence, however, failed to perceive the extent of the Soviet buildup and believed the terrain in the Transbaikal, where the Soviets planned their main attack, would be impenetrable to armor. Fearing Japan's use of biological agents developed by Unit 731 at Harbin, the Soviets vaccinated their troops against plague and other diseases and issued masks to them. (In 1946, some Japanese involved in biological warfare were, in fact, tried by the Soviets for war crimes at Khabarovsk.)

The Soviets presented their declaration of war to Japanese Ambassador Satō Naotake in Moscow only minutes before they attacked. Soviet plans called for nearly simultaneous night attacks from the three fronts beginning after midnight on 9 August 1945, all to converge on the central plain of Manchuria. Vasilevsky later acknowledged that U.S.-supplied trucks and fuel landed at Vladivostok were vital in the Soviets' ability to launch this campaign as rapidly as they did.

The main attack was delivered by the Transbaikal Front of Marshal Rodion Malinovsky, operating from Mongolia. The Sixth Guards Tank Army, with 1,019 tanks and self-propelled guns, acted, in effect, as a forward detachment. The intent was to bypass Japanese strong points where possible to preempt the defenses of the Japanese Third Area Army. The Soviets raced for the 6,600-foot-high passes of the Greater Khingan Mountains and managed to cover 300 miles in only three days, encountering more problems from the terrain and fuel shortages than from the Japanese. The Japanese forces held on to Haliar until 18 August. Changchun and Mukden (today's Shenyang) fell on 21 August. Meanwhile, air-landed troops entered Darien and Port Arthur on 19 August, followed by forces sent via rail.

Driving from the Soviet Maritime Provinces, Marshal Kirill Meretskov's 1st Far Eastern Front had to overrun or bypass seven fortified districts held by the Japanese First Area Army. Attacking in a torrential thunderstorm, the Soviets skirted around most fortified areas, leaving their reduction to follow-on forces. Mutanchiang was held by Japanese forces until 16 August. Soviet aircraft dominated the skies, with the few Japanese planes seeking refuge in Korea or Japan.

Although considered of secondary importance to the deeper, pincerlike thrusts of the other fronts, the efforts of the 2nd Far Eastern Front in northern Manchuria, supported by the Amur River Flotilla, tied down some of the best-prepared Japanese forces by crossing the Amur and moving up the Sungari River toward Harbin. Although the Japanese emperor had signed the Imperial Rescript of Surrender on 14 August and the Guandong Army's commander, General Yamada, had accepted it on 18 August, the Soviets were determined to regain the territories lost in the 1904–1905 Russo-Japanese War. Thus, Soviet forces continued combat operations in Korea until the armistice on 2 September, by which time they had reached the thirty-eighth parallel, and in the Kuriles until

Soviet troops of the Second Far Eastern Front in Manchuria. (Bettman/Corbis)

5 September. The Soviets subsequently turned over a huge cache of Japanese weapons to the People's Liberation Army of Mao Zedong (Mao Tse-tung), including 3,700 guns, 600 tanks, and 861 aircraft.

During the campaign, the bulk of the Guandong Army was not committed to battle, but the Soviets estimated 83,737 Japanese were killed compared with Soviet casualties of more than 12,000 dead and nearly 25,000 wounded. Over 100,000 Japanese in Manchuria died after the cease-fire, and an estimated 594,000 Japanese prisoners were taken back to forced-labor camps in the Soviet Union. The last were not released until 1956, on the normalization of relations between Japan and the Soviet Union.

MANHATTAN Project

Crash program led by the United States to develop an atomic bomb. The discovery of fission in uranium by Otto Hahn and Fritz Strassman in 1938 led physicists such as Enrico Fermi and Leo Szilard to suggest the feasibility of sustained nuclear chain reactions, promising a quantum leap in destructive

power if harnessed in “atomic” bombs. Szilard approached Albert Einstein in 1939 with the idea of writing a letter to President Franklin D. Roosevelt warning of this possibility and of German research into nuclear fission. Szilard and Einstein’s letter prompted Roosevelt to appoint the Uranium Committee to explore the feasibility of developing an atomic bomb. In the spring of 1940, a British memorandum by Rudolf Peierls and Otto Frisch, entitled “On the Construction of a ‘Super-bomb’; Based on a Nuclear Chain Reaction in Uranium,” concluded that “a moderate amount of Uranium 235 would indeed constitute an extremely efficient explosive.” On the U.S. entry into the war in December 1941, British and American cooperation increased.

Recognizing that a project to build atomic bombs would require immense industrial resources, the Americans took the lead. They organized the MANHATTAN Engineer District of the Army Corps of Engineers in 1942. Vannevar Bush, head of the Office of Scientific Research and Development (OSRD), appointed Brigadier General Leslie Richard Groves, who had

overseen construction of the Pentagon, to direct the MANHATTAN Project.

Sustaining and controlling a nuclear chain reaction was the first crucial technical step. Fermi’s team accomplished this at the Metallurgical Laboratory at the University of Chicago on 2 December 1942 (the actual nuclear pile occupied a squash court at Stagg Field). Fermi thus proved that a larger reactor could produce enough of a highly fissionable isotope of plutonium (239Pu) to make a bomb. Work began on a reactor complex at Hanford, Washington, to produce the required plutonium.

The uranium 235 (235U) isotope mentioned in the Frisch-Peierls memorandum also held considerable promise as bomb material and was pursued simultaneously. Separation of 235U from 238U was accomplished at Oak Ridge, Tennessee, by gaseous diffusion and electromagnetic separation in an immense plant that covered 43 acres and employed 31,000 people. As work progressed on 239Pu and 235U production, Groves recognized that a central laboratory was needed to design, develop, and assemble the bombs. He chose Julius Robert Oppenheimer to direct what became known as Los Alamos Laboratory. Work began there in the spring of 1943.

Intense secrecy and compartmentalization characterized the MANHATTAN Project, but at Los Alamos, Oppenheimer fos-

tered a spirit of collaboration, camaraderie, and open communication. Design and assembly of the 235U bomb was straightforward in that a guntype method could be used to initiate the explosion. The time-consuming process of separating 235U was the chief difficulty, but Oak Ridge eventually succeeded in isolating enough 235U for Oppenheimer’s team to assemble “Little Boy,” the bomb used against Hiroshima on 6 August 1945.

By mid-1945, Hanford had produced enough 239Pu for three bombs, but they required a complex implosion device with multiple detonators firing simultaneously to create compression waves that would initiate a core explosion. In 1944, to tackle the implosion design challenge, Oppenheimer called on George Kistiakowsky to head the effort to produce the necessary shaped charges. His design was successfully tested at Alamogordo, New Mexico, on 16 July 1945 and used in “Fat Man,” the plutonium bomb that devastated Nagasaki on 9 August 1945. At a cost of \$2 billion, MANHATTAN Project scientists and engineers had achieved the seemingly impossible—producing three atomic devices by August 1945 that fundamentally changed the nature of warfare, vastly enlarging humanity’s capacity for destruction.

Debates about whether the atomic bomb attacks were needed to end the war continue to rage. Certainly, even after it became apparent by 1944 that Germany had abandoned its effort to produce atomic bombs, nearly all members of the MANHATTAN Project team continued to press ahead. The ultimate decision to use the bombs rested with President Harry S Truman, who never doubted that they were a major factor in Japan’s decision to surrender, thereby saving tens of thousands of Allied lives.

The project’s technical success strengthened an emerging military-industrial complex in the United States and led to the formation of the Atomic Energy Commission (AEC) in 1946. Further research into nuclear weapons production led to the successful test of a hydrogen bomb in 1952, ushering in a new and frightening thermonuclear age.

Manila, Battle for (3 February–3 March 1945)

Battle for the capital of the Philippines, located on the big island of Luzon. Manila was one of the largest cities of South-east Asia, with a population of more than 800,000 people. The Japanese commander in the Philippines, General Yamashita Tomoyuki, had 250,000 men on Luzon, a figure that had been grossly underestimated by General Douglas MacArthur's intelligence chief, Major General Charles A. Willoughby. Beginning on 9 January 1945, General Walter Krueger's Sixth Army assaulted the western coast in the Lingayen Gulf. The Japanese made no effort to contest the landing, and that first day, 68,000 men went ashore. They then drove southward toward Manila. Major General Oscar W. Griswold's XIV Corps had the right flank, and Major General Innis P. Swift's I Corps was on the left. I Corps had the more difficult going.

Beginning on 30 January, units of Lieutenant General Robert L. Eichelberger's Eighth Army began landing north and south of Manila. Major General Charles P. Hall's XI Corps

landed in the Subic Bay area, helping to seal off the Bataan Peninsula and preventing the Japanese from repeating the American defense of 1942. Meanwhile, on 31 January, two regiments of Major General Joseph M. Swing's 11th Airborne Division went ashore at Nasugbu, about 45 miles southwest of Manila. On 3 February, the division's remaining regiment was air-dropped on Tagaytay Ridge, 30 miles south of the city. The next day, elements of the 11th Airborne Division reached Paranaque, just south of Manila.

MacArthur urged a rapid advance. While the 37th Infantry Division of Griswold's corps pushed toward Manila from the north, the lighter and more mobile 1st Cavalry Division also drove on the city. It had just landed to reinforce Griswold's corps, and MacArthur ordered the cavalry division to advance as fast as possible. Elements of the 1st Cavalry reached the northeastern outskirts of Manila on 3 February, the first U.S. unit to do so. As darkness fell, one of its tanks smashed through the gates of Santo Tomas University, releasing 4,000 American prisoners held there.

Rear Admiral Iwabuchi Sanji now defied Yamashita's orders to withdraw from the city and utilized his 18,000 men, mostly naval personnel, to stage a fanatical, month-long,

Smoke and flames pour from the old walled city section of Manila as American troops bombard the Japanese garrison holding out in that part of the city. (Photo by Keystone/Getty Images)

block-by-block and house-by-house defense of the city. As units of the 1st Cavalry and 37th Divisions closed on Manila, Iwabuchi's forces withdrew across the Pasig River, destroying its bridges and setting fire to the highly flammable residential areas. For the next several days, American forces battled these flames.

General MacArthur had hoped that Manila would fall without significant damage to the city. On 6 February, he announced in a communiqué that the complete destruction of the Japanese in Manila was "imminent." To save civilian lives, he ordered that no air strikes be utilized. This order did not pertain to artillery fire, however, and its heavy use by both sides produced many civilian casualties. The doomed Japanese defenders also went on an orgy of murder and rape, killing thousands of innocent Filipinos.

By 22 February, the 37th Division had driven the Japanese defenders into the old walled portion of the city (Intramuros) and the modern business district. In Intramuros, U.S. troops had to fight the Japanese, who were well dug in, one building at a time. Many buildings were simply turned into rubble by the unrestricted support fire, as breaching the buildings with infantry was virtually impossible.

By 26 February 1945, the remaining Japanese resistance was compressed into the three Philippine Commonwealth government buildings off the southeast corner of the walled city. The last organized Japanese resistance was in the Finance Building. Late on 3 March 1945, General Griswold reported that all organized resistance in the Manila area had ended.

The Battle for Manila cost the Americans 1,010 killed and 5,561 wounded. The Japanese lost perhaps 16,000 men in and around the city. In addition, more than 100,000 Filipino civilians were killed in the battle, and perhaps 70 percent of Manila was destroyed. The governmental center was damaged beyond repair, public transportation and electric power were wrecked, and the water and sewer systems required extensive repair. Thirty-nine bridges, including the six major bridges over the Pasig River, were destroyed. Port facilities were so badly damaged that it was mid-April before any ships could unload at Manila Bay.

Mannerheim, Carl Gustav Emil von (Baron) (1867–1951)

Finnish field marshal and president of Finland from 1944 to 1946. Born at Louhisaari in southwest Finland, then part of the Russian Empire, on 4 June 1867, Carl Mannerheim graduated from the prestigious Nikolaevskoe Cavalry School in Saint Petersburg in 1889. Initially commissioned into a dragoon regiment based in Poland, he transferred to the elite Chevalier Guards Regiment in Saint Petersburg in 1890. Following a posting to the Cavalry School, Lieutenant Colonel Mannerheim saw combat in the 1904–1905 Russo-Japanese War and was promoted to colonel.

Between 1906 and 1908, Mannerheim led a special mission for the Russian government, collecting intelligence along Russia's border areas in the Far East. His excellent reports made a favorable impression on Tsar Nicholas II, whom he met in 1908. Mannerheim then commanded cavalry units in Poland and was promoted to major general. He saw considerable combat during World War I, mostly commanding cavalry divisions under General Aleksei Brusilov. He took command of the 12th Cavalry Division in the 1915 Galician Campaign and participated in the 1916 Brusilov Offensive. After Romania joined the war, Mannerheim transferred to the Transylvanian Alps. Promoted to lieutenant general in June 1917, he headed VI Cavalry Corps.

Mannerheim opposed the March 1917 revolution that deposed the tsar, and following the Bolshevik Revolution of November 1917, he retired from the Russian army and returned to Finland. He then commanded the White Army in Finland, defeating the Communist Red Guards and freeing Finland of Russian troops. Thereafter, he resigned his command and traveled in western Europe. Appointed regent in December, he returned to Finland. After being defeated in the presidential election of July 1919, he retired from public life and traveled widely, including to India.

Mannerheim returned to public service as minister of defense in 1931. As part of a program of bolstering Finland's defenses, he oversaw construction of what became known as the Mannerheim Line, which held invading Soviet troops at the beginning of the 1939–1940 Finnish-Soviet War (the Winter War). He commanded Finnish forces in the Winter War and in the renewal of fighting with the Soviet Union between 1941 and 1944 (the Continuation War). Advanced to field marshal in 1942, Mannerheim became president of Finland in 1944 and negotiated the armistice with the Soviet Union. He retired for reasons of ill health in 1946 and moved to Switzerland to write his memoirs. Mannerheim died in Lausanne, Switzerland, on 28 January 1951.

Manstein, Fritz Erich von (originally von Lewinski) (1887–1973)

German army field marshal and commander of Army Group South. Born in Berlin on 24 November 1887 of military stock,

Erich von Lewinski took the name Manstein from his uncle, who adopted him after his father's death in 1896. Manstein received a commission in 1906, serving in his uncle Paul von Hindenburg's regiment. World War I interrupted his studies at the War Academy. He participated in the capture of Namur in Belgium and then served on the Eastern Front, where he was wounded in November 1914. Thereafter, he held staff assignments.

Manstein continued in the German army after the war, and in 1919, he was chief of staff of the Berlin Military District, helping to draw up plans for the 100,000-man German army. In October 1920, he commanded a company of the 5th Infantry Regiment in Pomerania. Promoted to major in 1927, he held staff positions; in September 1929, he was in the Operations Branch of the Truppenamt (the secret General Staff). Promoted to lieutenant colonel, he commanded a battalion of the 4th Infantry Regiment in October 1932. In December of the next year, he was promoted to colonel. In July 1935, he was made head of the Operations Branch of the General Staff, and in October 1936, he was promoted to Generalmajor (U.S. equiv. brigadier general). In February 1938, Manstein became deputy to the chief of staff of the army, General Ludwig Beck, but his opposition to Adolf Hitler's rearmament program led to his reassignment as commander of the 18th Division in Silesia. That August, he was recalled to serve as chief of staff to General Wilhelm von Leeb's Army Group South. Promoted to Generalleutnant (U.S. equiv. major general) in April 1939, Manstein was named chief of staff of Arbeitsstab Rundstedt (Working Staff Rundstedt) and helped plan the invasion of southern Poland and the capture of Warsaw. In August, he was named chief of staff to General Karl Gerd von Rundstedt's Army Group South, a post he held through the Polish Campaign. In October 1939, Manstein was appointed chief of staff to Army Group A under Rundstedt in the west and helped develop an alternative to the strategy for the invasion of France (the Ardennes approach), which Hitler adopted.

In February 1940, Manstein took command of XXXVIII Corps, which he led in the invasion of France. Promoted to General der Infanterie (U.S. equiv. lieutenant general) in June 1940, he received command of the LVI Panzer Corps in East Prussia assigned to Colonel General (U.S. equiv. full general) Erich Hoepner's Panzer Group, Army Group North in May 1941. Manstein advanced over 100 miles in the first two days of Operation BARBAROSSA, the invasion of the Soviet Union, and seized the key bridges at Dvinsk. When the commander of the Eleventh Army, Colonel General Eugen Ritter von Schobert, was killed, Manstein was transferred to Army Group South in September to take command and began the conquest of the Crimea. After hard fighting, his forces managed to secure the prize of Sevastopol on 2 July 1942, the day after his promotion to field marshal.

In August 1942, Manstein was ordered to take a stripped-down Eleventh Army to rescue Eighteenth Army south of

German Field Marshal Erich von Manstein. (Corbis)

Leningrad. He fought a series of costly battles with some success, suffering 60,000 casualties in the process. He urged Hitler to concentrate in the center part of the Eastern Front, without success. Briefly moved into Central Army Group's sector, Manstein was ordered by Hitler, in November 1942, to assume command of the newly formed Army Group Don on both sides of Stalingrad, between Army Group A in the Caucasus and Army Group B. Assigned the mission of rescuing Sixth Army in Stalingrad and working with only three panzer divisions, Manstein fought his way to within 35 miles of the German perimeter before being halted. He did succeed in preventing the Soviets from taking Rostov and trapping German Army Group A.

In February 1943, the Soviets drove to the Donets River and recaptured Kursk, Rostov, and Kharkov to the west, leading Hitler to approve a counterattack. Manstein exploited Soviet fuel shortages with a panzer attack from the south that resulted in the recapture of Kharkov and Belgorod in March 1943. He sought to entice the Soviet army's South and Southwest Fronts into a similar indiscretion near Odessa, but Hitler insisted instead on Operation CITADEL to reduce the Kursk

Salient. Although the Germans made some headway in the Battle of Kursk that July, their offensive soon ground to a halt in what was the largest tank battle of the war.

Hitler's policy of refusing to allow withdrawals frustrated Manstein's approach based on an elastic defense, and Manstein's frankness did not ingratiate him with the German dictator. Manstein fought to prevent a Soviet encirclement after being forced to cross the Dnieper. The Soviets finally succeeded in encircling Manstein's forces in the Cherkassy pocket, but he managed to extract the bulk of two corps. He never could convince Hitler to allow the appointment of a chief of staff for the Eastern Front. A March 1944 conference with the Führer at Berchtesgaden led to a heated exchange and Manstein's relief as commander of Army Group South in April. British military historian Basil Liddell Hart has called Manstein the ablest German general of the war.

Manstein declined to participate in the July 1944 putsch against Hitler. He was arrested in May 1945 at the end of the war and held in Great Britain. Tried and convicted in 1949, largely on Soviet insistence, for war crimes involving the executions of Jews, Gypsies, and Crimean Tartars in his rear areas, he was sentenced to 18 years of imprisonment in February 1950. He was freed in May 1953 for medical reasons. Between 1955 and 1956, Manstein headed a committee created by the chancellor of the Federal Republic of Germany, Konrad Adenauer, to advise the government on the creation of a new German army. Manstein died at Irschenhausen, Bavaria, on 11 June 1973.

Manzhouguo (Manchukuo or Manchuria)

Name meaning "state of the Manzhus (Manchus)," given by the Japanese to Manchuria after their occupation of that Chinese territory in 1931. The Japanese began establishing a significant military presence on mainland Asia with the Sino-

Japanese troops entering Manchuria in the wake of the so-called Mukden Incident in 1931. (Photo by Keystone//Getty Images)

Japanese War of 1894. In 1900, Japanese forces took part in suppressing the Boxer Uprising and remained in China as one of the occupying powers thereafter. At the end of the 1904–1905 Russo-Japanese War, Japan controlled Korea and had large numbers of troops in Manchurian China. Its Guandong (Kwantung) Army was formed from these occupying forces, with the mission of supporting Japanese interests in China and Manchuria. In 1928, Manchurian warlord Zhang Zuolin (Chang Tso-lin) was assassinated in a Guandong Army plot to gain greater control of the region. Zhang Xueliang (Chang Hsueh-liang) replaced his father and quickly became an ally of the Nationalist government of Jiang Jieshi (Chiang Kai-shek).

Amid tensions between the military and political leadership of Japan, the increasingly independent Guandong Army began a military campaign to regain control of Manchuria.

On 18 September 1931, Japanese staff officers of the Guandong Army in southern Manchuria set off an explosion close to the main line of the South Manchuria Railway near Mukden (Fengtien after 1932 and Shenyang today), blaming the act on nearby Chinese soldiers. Guandong Army leaders used the Mukden Incident (or Manchurian Incident) as the excuse to take control of Mukden and mount a campaign to conquer all Manchuria. Presented with a *fait accompli* by its own military, Tokyo nonetheless supported the action.

By October 1931, Japanese forces controlled all of Manchuria. The Japanese falsely claimed that they had acted only in self-defense and insisted that the crisis be resolved through direct negotiations with China. The Chinese government, however, appealed to the League of Nations; this was the first major test involving aggression for that organization. The

League Council was reluctant to initiate tough action against Japan, without the assurance of support from the United States, which was not forthcoming. The British also opposed strong action.

In February 1933, the League Assembly voted to approve the report of its investigating committee, which blamed Japan. It also approved a resolution that called on league states to adopt a doctrine of nonrecognition of Manchukuo (Manzhouguo). Japan alone among the 42 member states voted no. The Japanese delegation then walked out, and Tokyo gave formal notice of its intention to withdraw from league membership.

In March 1932, meanwhile, the Japanese established Manchukuo. Larger than France and Germany combined, this puppet state of Japan had a population of some 34 million people. In March 1933, Japan added to it the Chinese Province of Jehol, and in 1935, it added eastern Chahar.

The Chinese people deeply felt the loss of their five “eastern provinces,” and this led to strong anti-Japanese nationalism in China, especially among the educated classes and students. In 1936, in the aftermath of the Xi’an (Sian) Incident, a united front of Nationalists under Jiang Jieshi and Communists under Mao Zedong (Mao Tse-tung) was formed to oppose Japanese imperialism in China. Tensions continued to mount, and in July 1937, an incident at the Marco Polo Bridge near Beijing (Peking) between Japanese and Nationalist forces precipitated war between China and Japan, marking the effective beginning of World War II in Asia.

Nominally independent, Manchukuo had a Chinese dynastic figurehead in the last Qing (Ch’ing) emperor, Aixinjueluo Puyi (Aisingioro P’u-i, known to Westerners as Henry Puyi), after which the state became known as Manzhoudiguo (Manchoutukuo), but Japanese officials controlled its affairs and instituted an immigration policy that brought in thousands of Korean and Japanese settlers. Some 240,000 Japanese in Manchuria increased to 837,000 inhabitants by the end of the war. Japan maintained its control of Manchuria until the last weeks of World War II.

On 9 August 1945, the Soviets launched a three-pronged offensive designed to capture Manchuria and destroy the vaunted Guandong Army. The Soviet’s bold operation, conducted in difficult terrain against what were considered some of Japan’s best troops, ended by 16 August. The experienced Soviet commanders and their battle-tested formations quickly defeated the defending Japanese forces and gained control of Manchuria.

Soon after the end of the war, U.S. forces acted to support the large-scale redeployment of Nationalist troops to accept the surrender of Japanese forces and regain control of the lost territory. Jiang utilized some of the surrendered Japanese forces in northeast China to fight the Communists in the opening rounds of the Chinese Civil War.

Mao Tse-tung

See Mao Zedong.

Mao Zedong (Mao Tse-tung) (1893–1976)

Chinese political and military leader and founder of the Chinese Communist Party (CCP) in 1921 and the People’s Republic of China (PRC) in 1949. Born on 26 December 1893 into a prosperous peasant family in Shaoshan (Shao-shan), Hunan Province, in central China, Mao Zedong (Mao Tse-tung) graduated from the Fourth Teacher’s Training School in Changsha, Hunan, and also read extensively in both Chinese and Western literature, philosophy, politics, and economics, including Marxist theory. Like many other young Chinese intellectuals of his time, Mao embraced revolutionary thinking, and in July 1921, he attended a meeting in Shanghai in Jiangsu (Kiangsu) Province, where the CCP was founded.

Mao became a labor organizer. In the mid-1920s, following Soviet instructions, he and other Chinese Communists cooperated with the Nationalist Party—the Guomintang, or GMD (Kuomintang, or KMT)—of President Sun Yixian’s (Sun Yat-sen). Mao held several posts in the Guomintang, and in 1925, he was appointed secretary of its propaganda department. After Sun’s death that year, Jiang Jieshi (Chiang Kai-shek)—head of the Huangpu (Whampoa) Military Academy in Guangzhou (Canton), Guangdong (Kwangtung) Province, which had been cofounded by Communists and Nationalists two years earlier—won control of the GMD.

In 1926, Jiang began to eliminate rival political groupings, purging Communists from GMD positions and launching the 1926–1927 Northern Expedition against assorted warlords. In 1927, he turned against Communists who had escaped his

purge and proceeded to establish a base in Jiangxi (Kiangsi) Province, suppressing several Communist insurrections that year, including the Autumn Harvest Uprising of peasants and guerrillas led by Mao. Joined by renegade GMD army officers Zhu De (Chu Teh) and Lin Biao (Lin Piao), who took their troops to join him, Mao founded the Jiangxi Soviet Republic, a Communist redoubt in the province's southeast area; Mao became chairman of the organization in October 1931. At that time, Mao and Zhu elaborated theories of relying on peasant warfare and guerrilla tactics to win control of China, rejecting orthodox Marxist teachings that the urban proletariat had to be the driving force of revolution. By 1933, their base harbored an army numbering 200,000.

The Communists launched several uprisings in major Chinese cities, posing a threat to the authority of Jiang, who took Beijing (Peking) in Hebei (Hopeh) Province in 1928, unifying all China south of the Great Wall, and headed a new GMD government beginning in October. From 1930 onward, Jiang mounted annual campaigns against the Communist Soviet, and eradicating it apparently ranked higher in his priorities than opposing Japan's 1932 establishment of a puppet government in China's northeastern region of Manchuria.

In 1934, GMD forces encircled the Jiangxi Soviet. Mao and Zhu broke out, leading over 100,000 followers on the epic, 6,000-mile Long March to Yan'an (Yenan) in northern Shaanxi (Shensi); during this march, heavy fighting and harsh conditions reduced their numbers to 7,000, and Mao was forced to abandon two of his own children. In 1935, he was elected CCP chairman. That same year, Jiang ordered troops under Zhang Xueliang (Chang Hsüeh-liang), a prominent northern Manchurian warlord who had pledged allegiance to him, to attack the Communists—orders they rejected, urging all Chinese to join forces against the Japanese. In the December 1936 Xi'an (Sian) Incident in Shaanxi, Zhang kidnapped Jiang and forced him to form a united anti-Japanese front with the Communists.

In July 1937, the Battle of Marco Polo Bridge in Lugouqiao (Lukouch'iao) sparked full-scale war between Chinese and Japanese troops, and in 1938, GMD forces retreated to Chongqing (Chungking) in the southwestern Province of Sichuan (Szechwan). From their Yan'an base, the Communists effectively controlled northwestern China, and the GMD controlled the southwest. Mao's Red Army, rechristened the Eighth Route Army, participated in fighting against Japanese troops, and Communist guerrilla forces operated in Henan (Honan), Zhejiang (Chekiang), and Shandong (Shantung) Provinces. Mao still anticipated that the Communists would eventually gain control of China; meanwhile, he consolidated his authority within his own party, which adopted a constitution accepting his teachings as its official ideology in 1945.

By early 1941, the Communist-Nationalist front had largely broken down after Nationalist units defeated the Communist New Fourth Army near the Changjiang (Yangtze) Valley. From

Mao Zedong, leader of the People's Republic of China (1949–1976). (Photo by Hulton Archive/Getty Images)

then until 1945, Communists concentrated their energies on establishing guerrilla bases and securing peasant support behind Japanese lines, efforts that harassed the enemy and also helped to assure them ultimate postwar control of these areas. When the war ended in August 1945, incoming Soviet troops facilitated Chinese Communist moves to take control of much of Manchuria. In early 1946, GMD and Communist forces resumed fighting each other, and U.S. attempts in late 1945 and all of 1946 to negotiate a truce foundered due to both sides' deeply rooted antagonism. Civil war continued until January 1949, and the following October, Mao proclaimed the new PRC, which the United States only recognized in January 1979.

Until his death, Mao remained China's supreme leader, dominating the country's politics. He was responsible for several controversial policies, including the November 1950 decision to attack U.S. forces during the Korean War; the economically disastrous Great Leap Forward between 1958 and 1962; and the Great Proletarian Cultural Revolution of 1966, a socially divisive campaign designed to induce a state of permanent revolution in China. On 9 September 1976, Mao died in Beijing, an event presaged by a major earthquake the previous July in Tangshan (T'angshan), Hebei Province, which

to many Chinese symbolized the passing of one of the most forceful characters in Chinese history.

Maquis

Term describing French guerrilla units that fought as part of the French Resistance. The word *maquis*, which literally means “scrub” or wild brushy land, originated with eighteenth-century guerrilla fighters on Corsica. In World War II, the term identified French men and women who fled to the brush or hills instead of reaching accommodation with the occupying Germans. These resisters formed armed

camps to fight the Germans. As the maquis grew, arms, food, leadership, and training were required. Ultimately, the maquis became affiliated with the Mouvement Unis de la Résistance, under its military chief, Henri Frenay. Frenay appointed Michel Brault, who is said to have originated the term *maquis*, as head of the Service Maquis. Members of the maquis were diverse. They included those determined to fight the Germans and those escaping the Service de Travail Obligatoire (STO), the German compulsory labor service, and they came from all walks of life; students, workers, and farmers were included. Although these Resistance groups were scattered and disconnected, the Western Allies provided some assistance through the U.S. Office of Strategic Services (OSS) and especially the British Special Operations Executive (SOE). The Allies provided some arms, money, supplies, and training for specialists to the many Resistance groups, including the maquis. Such U.S. and British assistance was limited, however, in part from the fear that the maquis might complicate or even compromise the well-organized invasion plans of the United States and Britain.

Initially, the maquis were based in Vichy France, but after the Germans occupied that area in November 1942, maquis units appeared throughout France. Even some Spanish Republicans formed maquis units. The maquis assisted in

rescuing downed Allied airmen and smuggling them out of France so they might return to Britain. These units also conducted limited sabotage attacks against German forces from 1940 to 1943; they also stockpiled weapons, explosives, and supplies dropped by the Allies in order to play a role in the liberation of France. In 1944, all French Resistance groups, including the maquis, were merged to form the Forces Françaises de l'Intérieur (FFI, French Forces of the Interior).

Prior to the Normandy landings, Resistance units throughout France, including the maquis, gathered intelligence on German dispositions. During Operation OVERLORD, the Allied invasion of Normandy, maquis units in northwestern France conducted sabotage operations and destroyed key bridges, rail lines, and communication centers, to isolate the Allied landing sites from German reinforcement. Supreme Commander of the Allied Expeditionary Force General Dwight D. Eisenhower believed this support was invaluable and worth an estimated 15 extra divisions to the operation. No doubt, this assessment was exaggerated, but the French Resistance contribution was very important.

German reprisals against maquis units were swift and often bloody. Many maquis groups operating far from Normandy were hunted down. Between 18 and 23 July 1944, German forces encircled and wiped out nearly 3,000 maquis on the natural defensive position of the Vercors Plateau in southern France. The Germans also carried out reprisals against French civilians in the area. During the 1944 campaign for France, Germans retreating from the Allied advance or trapped behind enemy lines willingly surrendered to British and American forces to avoid the ferocity of the maquis. Regardless of their exact contribution to the Allied victory, members of the maquis helped to restore French national pride, especially after the debacle of the defeat of the French army in June 1940.

Mareth, Battle of (20–26 March 1943)

North African battle that sealed the fate of Axis forces in Tunisia. Following the Battle of Kasserine Pass, units of General Erwin Rommel's Afrika Korps (Africa Corps) turned to face General Bernard Montgomery's British Eighth Army, then preparing to attack the German Mareth Line. The latter,

built on a French defensive belt that stretched more than 20 miles from the Mediterranean to the Matmata Hills, anchored the Axis defense in southern Tunisia.

Rommel ordered his panzer divisions south to force Eighth Army to retreat. Montgomery, warned of the impending attack by ULTRA intercepts, reinforced around Medenine and defended in depth. On 6 March, Rommel attacked on a wide front, his advance spearheaded by the 10th, 15th, and 21st Panzer Divisions, but Montgomery's defense forced Rommel against the strengthened center of Eighth Army.

His offensive halted by antitank fire, Rommel renewed his attacks, which were repulsed with costly panzer losses. Because of his deteriorating physical and mental condition, Rommel departed for Germany on 9 March, leaving command of Army Group Afrika to Generaloberst (U.S. equiv. full general) Hans Jürgen Dieter von Arnim.

Montgomery now went on the offensive, ordering XXX Corps to advance directly against the Mareth Line. Its task was to create a gap that would allow the armor of X Corps to advance through the Gabes gap along the coast toward Sfax and eventually Tunis. Montgomery also ordered the New Zealand Corps wide around the west flank of the Mareth Line. This column swung west and then north in an attempt to break through at the Tebaga gap and reach the El Hamma Plain and envelop Army Group Afrika.

On the night of 20 March, 50th Division launched the main frontal assault on the Mareth Line. A foothold established on the morning of 21 March was lost the next day to counterattacks by the 15th Panzer Division. Meanwhile, on the evening of 20 March, the New Zealand Corps reached Tebaga gap, which forced von Arnim to shift the 164th Light Division and eventually 21st Panzer to meet this threat to his flank.

Montgomery now improvised his original plan and ordered 1st Armoured Division to follow the path of the New Zealand Corps to the Tebaga gap, while the 4th Indian Division took a shorter swing left around the Mareth Line. On 26 March, Montgomery's forces breached the Tebaga gap and threatened the continuity of the German defenses. Von Arnim temporarily saved his deteriorating situation by creating a defensive line at El Hamma. When the 4th Indian Division turned the Mareth Line, von Arnim disengaged the bulk of his forces on 27 March, escaping the envelopment.

In the battle, Montgomery demonstrated his ability to improvise when his initial plan failed, although Army Group Afrika managed to escape his trap. Combined with the successful Operation TORCH landings, these developments meant the die was now cast for the Axis powers in North Africa. Rommel had predicted that a failure to seize Medenine would be fatal; the collapse of the Mareth Line signaled the beginning of the final chapter in North Africa, which ended with the Allied capture of Tunis on 7 May 1943.

Mariana Islands, Naval Campaign (June–August 1944)

Military campaign in the Central Pacific. After securing the Marshall Islands in early 1944, American military planners

decided that the next step would be to bypass the Japanese-held Caroline Islands (including the stronghold of Truk) in order to seize the Mariana Islands. Located equidistant from the Marshalls and the Japanese home islands, the 15 islands of the Marianas are spread over 400 miles, with the largest, Guam, located at the southern end of the chain. Two other large islands, Tinian and Saipan, are 100 miles north. In U.S. hands, the Marianas would offer a base for a subsequent assault on the Philippine Islands to the west and a strike at the Bonin Islands to the north (only 700 miles from the Japanese home islands), as well as a location for air bases from which B-29 strategic bombers might raid the Japanese home islands.

The Japanese military knew that holding on to these islands was essential to their control of the shipping routes to Southeast Asia, their retention of the Philippines, and the defense of Japan itself. In consequence, the Marshalls would prove much more difficult to seize than were the Gilberts and Marshalls.

For the U.S. commander of Central Pacific forces, Admiral Chester W. Nimitz, the primary objective in Operation FORAGER was to secure Guam, Saipan, and Tinian. Vice Admiral

Japanese aircraft shot down attempting to attack the U.S. Navy escort carrier *Kitkun Bay*, the Mariana Islands, June 1944. (National Archives)

Raymond Spruance's Fifth Fleet would conduct FORAGER. The main naval component was Vice Admiral Marc Mitscher's Task Force 58 of four fast carrier battle groups. Also under Spruance was Vice Admiral Kelly Turner's V Amphibious Force. Its task was to put ashore the ground force of nearly six Marine and army divisions under Lieutenant General Holland Smith. The forces involved in FORAGER deployed from as far away as Hawaii, 5,000 miles from the Marianas.

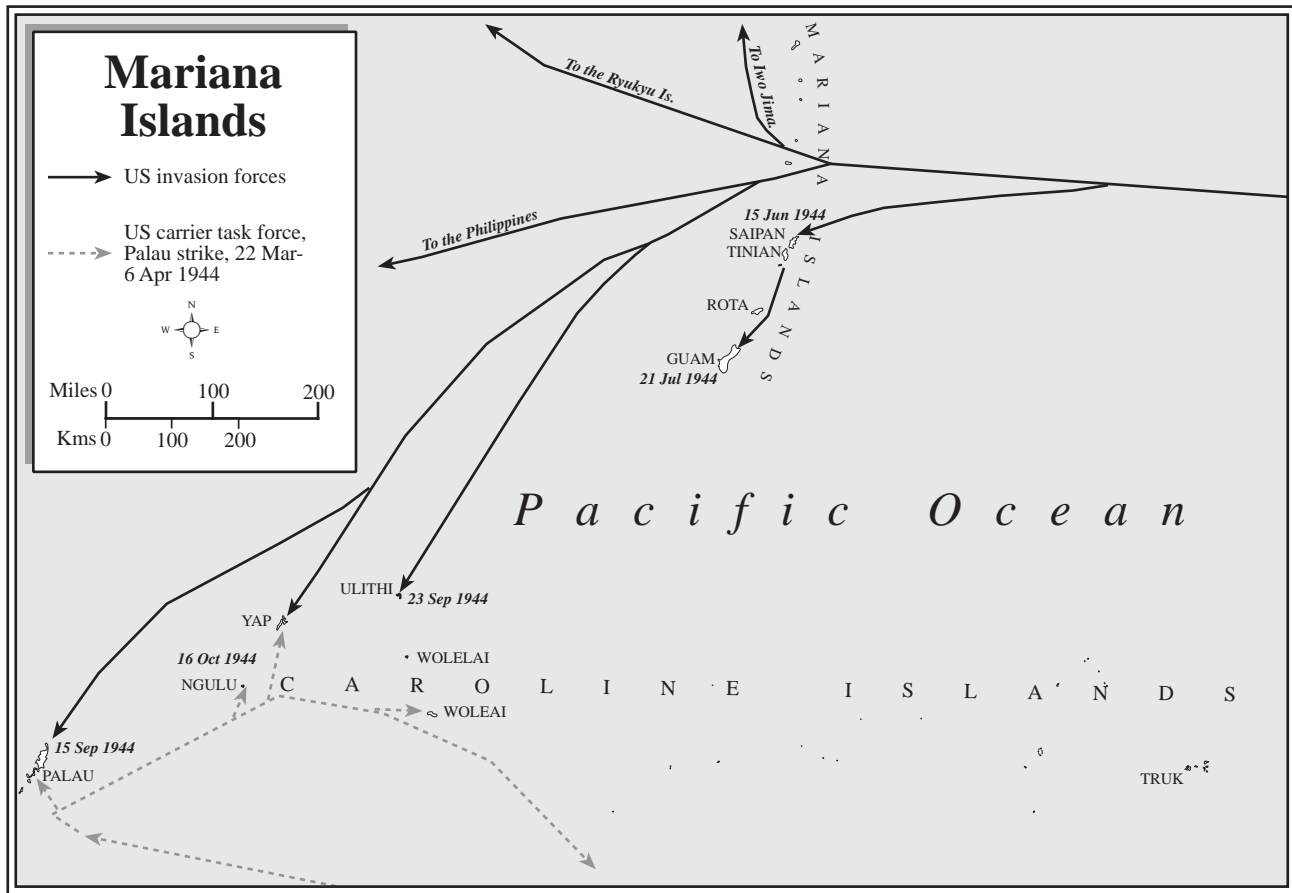

Beginning on 23 February 1944, Mitscher's carrier aircraft repeatedly attacked Japanese air bases in the Marianas, virtually wiping out Japanese airpower. On 15 June, the 2nd and 4th Marine Divisions went ashore on Saipan. Despite intense naval bombardment that pounded the island for two days in advance of the invasion, the Japanese defenders held fast. The Marines did not consolidate their beachhead until late that night, and with army reinforcements, they pushed inland over the next two weeks.

The Japanese had anticipated the U.S. invasion, and on its execution, Admiral Toyoda Soemu, commander of the Japanese Combined Fleet, ordered the 1st Mobile Fleet to

launch Operation A-GŌ, an effort to destroy the Fifth Fleet. The heavily outnumbered Japanese naval forces were supported by land-based aircraft from the Marianas and nearby islands. To meet this Japanese attack, Spruance delayed the amphibious assault on Guam scheduled for 18 June.

From 19 to 21 June, U.S. and Japanese naval forces met in the Battle of the Philippine Sea, essentially a contest of naval airpower and one of the largest and most decisive battles of the war. Superior numbers and pilot proficiency, as well as radar, carried the day for the Americans. The three-day Battle of the Philippine Sea cost the Japanese 3 large carriers and more than 480 aircraft, in what came to be known as the "great Marianas turkey shoot." U.S. losses came to 130 aircraft, with light damage to the battleship *South Dakota*. Spruance then ordered Task Force 58 to fall back on the Marianas, to protect the U.S. shipping there. Spruance was criticized at the time and since for his failure to pursue the Japanese fully, but his primary mission was to cover the assault in the Marianas.

Meanwhile, the struggle for Saipan raged. The Japanese commanders on the island, Lieutenant General Saitō

Yoshitsugu and Vice Admiral Nagumo Chūichi, both committed suicide on 6 July as the remaining Japanese defenders launched wave after wave of suicide charges, the largest of the war; this accelerated the U.S. victory. Thanks to Japan's effective anti-American propaganda, more than 8,000 civilians committed suicide, many by throwing themselves off cliffs on the northernmost end of the island.

Bombardment of Tinian began before Saipan fell on 13 July. The landings on Tinian occurred on 24 July. Marines stormed Tinian's northern coast and encountered little opposition. The situation soon changed, however, when the Japanese defenders regrouped and attacked the Marines in fanatical but futile suicide charges. Tinian was secured by 2 August.

Guam, the most important of the Marianas, had been a U.S. possession for 40 years prior to the war. Actual fighting for Guam began on 21 July, when three American divisions executed near perfect amphibious landings following two weeks of preinvasion bombardment. The ground troops, commanded by Marine Major General Roy Geiger, faced difficult terrain that favored the fanatical Japanese resistance. The

Americans secured Guam by 10 August, although mopping-up operations continued in some areas until the end of the war.

The capture of the Marianas accomplished five key objectives of the Pacific Campaign. The "great Marianas turkey shoot" ended the threat from Japanese carrier-based aviation. Additionally, Guam became one of three major western bases for the Pacific Fleet, and the United States established several air bases on these islands from which to launch massive raids against Japan. U.S. forces were now in position to strike at the Philippines and cut off Japan's oil supply from the East Indies. The U.S. victory in the Marianas also prevented any further Japanese resistance to Allied operations in New Guinea. Finally, the loss of Saipan led to the collapse of Tōjō Hideki's government and his replacement as premier by Koiso Kuniaki.

MARKET-GARDEN, Operation (17–26 September 1944)

Anglo-American offensive that included history's largest airborne operation. The brainchild of British Field Marshal Bernard L. Montgomery, Operation MARKET-GARDEN was designed to catapult the 21st Army Group across the Rhine River into the Ruhr, Germany's industrial heartland, and win the war in 1944. The plan called for three airborne divisions to create a 64-mile-long corridor through which an armored spearhead would pass, ending with Montgomery's forces vaulting the lower Rhine at Arnhem, Holland.

Montgomery conceived this daring plan in the full flush of victory. During the first week of September 1944, Allied intelligence reports painted a picture of a German army in rout that had lost all semblance of cohesion. In light of these reports and having been granted operational control of the newly formed First Allied Airborne Army as well as the U.S. First Army, Montgomery broke with his usual cautious battlefield demeanor and hastily devised MARKET-GARDEN.

The plan called for the establishment of an airborne corridor (MARKET) that would run in a northeasterly direction and comprise, from south to north, Major General Maxwell D. Taylor's U.S. 101st Airborne Division, dropping near Eindhoven, Holland; Brigadier General James Gavin's U.S. 82nd Airborne Division, dropping near Nijmegen, Holland; and Major General Robert "Roy" Urquhart's British 1st Airborne Division, reinforced by Major General Stanisław Sosabowski's Polish 1st Parachute Brigade, dropping outside Arnhem. All airborne forces were to be under the command of British I Airborne Corps commander Lieutenant General Frederick "Boy" Browning.

Lieutenant General Brian G. Horrocks, British XXX Corps commander, led the ground (GARDEN) component and was expected to pass approximately 20,000 vehicles over bridges seized by the 101st and 82nd Divisions and get to Arnhem within 60 hours. Prior to the operation, Montgomery's army group had taken Antwerp but had failed to secure the islands commanding the Scheldt Estuary to the

west. This oversight not only negated use of the port at Antwerp but also allowed the Germans to evacuate elements of nine divisions, totaling over 65,000 men, before they could be cut off and destroyed.

Meanwhile, Hitler had appointed General Kurt Student to form the First Parachute Army from these withdrawing German forces, with the mission of stopping any further Allied advance. Student's force was subordinated to Field Marshal Walther Model's Army Group B. Model, meanwhile, also had at his disposal SS-Gruppenführer Wilhelm Bittrich's II SS Panzer Corps, comprising the 9th SS and 10th SS Panzer Divisions. Unknown to the Allies, these panzer divisions were refitting in the vicinity of Arnhem.

Operation MARKET-GARDEN began with the simultaneous drop of elements of the 101st, 82nd, and British 1st Airborne Divisions in their respective areas during daylight on 17 September. Shortly thereafter, Horrocks's XXX Corps jumped off from its line of departure, the Albert Canal, driving northward toward Arnhem. Although taken by complete surprise, the Germans reacted quickly. They used the restrictive terrain to their advantage, slowing the Allied armor thrust while denying to the airborne elements the swift capture of their

Paratroopers, planes, and gliders fill the skies during Operation MARKET-GARDEN in September 1944. The Allies dropped more than 20,000 paratroopers and landed more than 13,500 glidermen behind German lines in the Netherlands. (Corbis)

respective assault objectives. The Germans were aided by having secured the entire Allied operational plan, carried in defiance of orders by an officer who was killed in the crash of his glider.

Although both the 101st and 82nd Airborne Divisions encountered unexpected resistance, they were able to secure the bridges in their areas by 18 September, with the exception of two: the railroad and highway bridges over the Waal at Nijmegen. Meanwhile, XXX Corps had fought through tough German resistance to link up with the 82nd by the morning of 19 September. On the next day, however, the 3rd Battalion of

the 504th Parachute Infantry Regiment conducted a daylight river crossing and secured the two Waal bridges, opening the way for XXX Corps to continue its advance to Arnhem. Unfortunately for the Allies, elements of Bittrich's II SS Panzer Corps had taken up defensive positions between Nijmegen and Arnhem and blocked any further advance by XXX Corps.

At Arnhem, Urquhart's paratroopers and glidermen landed more than 8 miles from their primary objective, a highway bridge over the lower Rhine in the heart of the city. They succeeded in getting only one battalion, Lieutenant Colonel John D. Frost's 2nd Parachute Battalion, to the northern terminus of

the bridge. The two SS panzer divisions in the city, reinforced by hundreds of German soldiers garrisoned throughout the area, were able to cut off Frost's battalion from the rest of the lightly armed parachute division to the west, as well as from relief from the south. Holding out for three days and four nights, Frost's men were finally overrun as the result of an all-out armor-infantry assault on their positions. The remainder of Urquhart's division, surrounded in the suburb of Oosterbeek to the west, was finally withdrawn to the south of the lower Rhine on 26 September, bringing the operation to a close.

During MARKET-GARDEN, the Allies dropped more than 20,000 paratroopers; landed more than 13,500 glidermen; and air-delivered some 5,200 tons of equipment, 1,900 vehicles, and 560 guns. They were hampered for several days by cloud cover in England, which forced the postponement of follow-on drops, including Sosabowski's Polish paratroopers, leaving the British paratroopers at Arnhem especially short of water, ammunition, and needed reinforcements. British airborne casualties numbered more than 7,200 men, and the 82nd and 101st lost some 1,400 and 2,100, respectively. Horrocks's XXX Corps sustained 1,400 casualties. There is no listing of German casualties throughout the battle area, though they suffered more than 3,000 in Arnhem alone.

Marshall, George Catlett (1880–1959)

U.S. Army general, chief of staff of the army, secretary of state, and secretary of defense. If not America's greatest soldier, General of the Army George Marshall was one of the nation's most capable military leaders and certainly one of the most influential figures of the twentieth century. Born in Uniontown, Pennsylvania, on 31 December 1880, Marshall graduated from the Virginia Military Institute in 1901. Commissioned in the infantry in 1902, he then held a variety of assignments, including in the Philippines. He attended the Infantry and Cavalry School, Fort Leavenworth, in 1907 and was an instructor at the Staff College between 1907 and 1908.

After the United States entered World War I, Marshall went to France with the American Expeditionary Forces as

General George C. Marshall, U.S. Army chief of staff. (Library of Congress)

training officer to the 1st Division in June 1917. Promoted to lieutenant colonel in 1918, he became chief of operations of the U.S. First Army, winning admiration for his logistical skills in directing the repositioning of hundreds of thousands of men quickly across the battlefield for the Meuse-Argonne Offensive. After working on occupation plans for Germany, Marshall became aide to General John J. Pershing, who was named chief of staff of the army in 1921.

Beginning in 1924, Marshall spent three years in Tianjin (Tientsin), China, with the 15th Infantry Regiment, then five years as assistant commandant in charge of instruction at the Infantry School, Fort Benning, Georgia, where he helped to train numerous future U.S. generals. He won promotion to colonel in 1932, holding assorted command posts in the continental United States. He was promoted to brigadier general in 1936.

In 1938, Marshall became head of the War Plans Division in Washington, then deputy chief of staff with promotion to major general that July. President Franklin D. Roosevelt advanced Marshall over many more senior officers to appoint him chief of staff of the army as a temporary general on 1 Sep-

tember 1939, the day that German armies invaded Poland. As war began in Europe, Marshall worked to revitalize the American defense establishment. Assisted by pro-Allied civilians such as Secretary of War Henry L. Stimson, he instituted and lobbied for programs to recruit and train new troops; expedite munitions production; assist Great Britain, China, and the Soviet Union in resisting the Axis powers; and coordinate British and American strategy. After the United States entered the war in December 1941, Marshall presided over an increase in U.S. armed forces from a mere 200,000 to a wartime maximum of 8 million men and women. For this, he became known as the “Organizer of Victory.”

Marshall was a strong supporter of opening a second front in Europe, a campaign ultimately deferred until June 1944. Between 1941 and 1945, he attended all the major wartime strategic conferences, including those at Placentia Bay, Washington, Quebec, Cairo, Tehran, Malta, Yalta, and Potsdam. Marshall was the first to be promoted to the newly authorized five-star rank of General of the Army in December 1944. Perhaps his greatest disappointment was that he did not exercise field command, especially command of the European invasion forces. Roosevelt and the other wartime chiefs wanted him to remain in Washington, and Marshall bowed to their wishes. He was a major supporter of the Army Air Forces, and in 1945, he advocated use of the atomic bomb against Japan.

On the urging of President Harry S Truman, Marshall agreed to serve as special envoy to China (1945–1947). As secretary of state (1947–1949), he advanced the Marshall Plan to rebuild Europe, and he then served as president of the American Red Cross (1949–1950). Truman persuaded him to return to government service as secretary of defense in September 1950. In that capacity, Marshall worked to repair relations with the other agencies of government that had become frayed under his predecessor and to build up the U.S. military to meet the needs of the Korean War and commitments in Europe, while at the same time maintaining an adequate reserve. Marshall opposed General Douglas MacArthur’s efforts for a widened war with China and supported Truman in his decisions to fight a “limited war” and to remove MacArthur as commander of UN forces.

Marshall resigned in September 1951, ending 50 years of dedicated government service. Awarded the Nobel Peace Prize in 1953 for the Marshall Plan, he was the first soldier so honored. He died in Washington, D.C., on 16 October 1959.

Marshall Islands, Naval Campaign (29 January–22 February 1944)

U.S. amphibious assault on Japanese-held territory in the Central Pacific in the drive toward the Japanese home islands. This campaign came after the U.S. seizure of Tarawa and Makin in the Gilberts.

The Marshall Islands are two parallel coral atoll chains, located with a 400,000-square-mile area. They are about 4 degrees above the equator and 2,000 miles southwest of Pearl Harbor. At the beginning of 1944, the Marshall Islands formed the outermost Japanese defensive barrier in the Central Pacific. The Japanese had received the islands from Germany as a consequence of World War I and had had ample opportunity to fortify them.

Initially, U.S. planners intended to capture the Marshalls and bypass the Gilbert Islands immediately to the south, but in mid-1943, the Joint Chiefs of Staff decided to secure the Gilberts first and then use them as a base to attack the Marshalls. In developing the attack plan, which was completed in early December 1943, the Pacific Fleet commander, Admiral Chester W. Nimitz, overrode his own staff by insisting on bypassing the more heavily fortified outer islands of the atoll.

Aerial photography revealed an airstrip under construction on Kwajalein Island, the hub of Japanese operations in the Marshalls; because that airstrip would be capable of handling bombers, it became the priority. The adjacent islands of Roi and Namur were also to be taken. The final objective was Eniwetok Atoll. Kwajalein is in the center of the Marshalls, just south of Roi and Namur, whereas Eniwetok is located at the northern end of the islands and 300 miles closer to Tokyo. The first step, however, would be to secure Majuro, an undefended atoll. Its lagoon would provide anchorage for support vessels.

Vice Admiral Raymond A. Spruance, commander of Fifth Fleet (and Central Pacific Force), had overall charge of the operation. Rear Admiral Richmond Kelly Turner was in charge of

the Joint Expeditionary Force (Task Force 51) of transports and landing craft, and Marine Major General Holland M. Smith would command the assault once troops were ashore. The attacking forces were arranged in three groups: Rear Admiral Richard L. Conolly commanded the Northern Attack Force, charged with taking Roi and Namur in Kwajalein Atoll; Admiral Turner retained command of the Southern Task Force, with the objective of Kwajalein Island; and Captain D. W. Loomis commanded a reserve force that would stand by during the capture of Kwajalein. Later, this force secured Eniwetok. The assault force, not counting the fast carrier task groups of submarines, numbered 197 ships, lifting a total of 54,000 assault troops, double the number in the Gilberts operation; on Kwajalein, there would be 41,000 U.S. troops versus 8,000 Japanese.

Learning from the experience at Tarawa, U.S. planners provided for a much heavier air and naval bombardment. On 29 January, U.S. carrier aircraft began hitting Japanese positions. Roi was the center of Japanese airpower in the Marshalls, with almost 100 aircraft based there. Its aircraft were obliterated in the sky and on the ground, ending any Japanese air threat that same day. U.S. aircraft and ships pounded Mili,

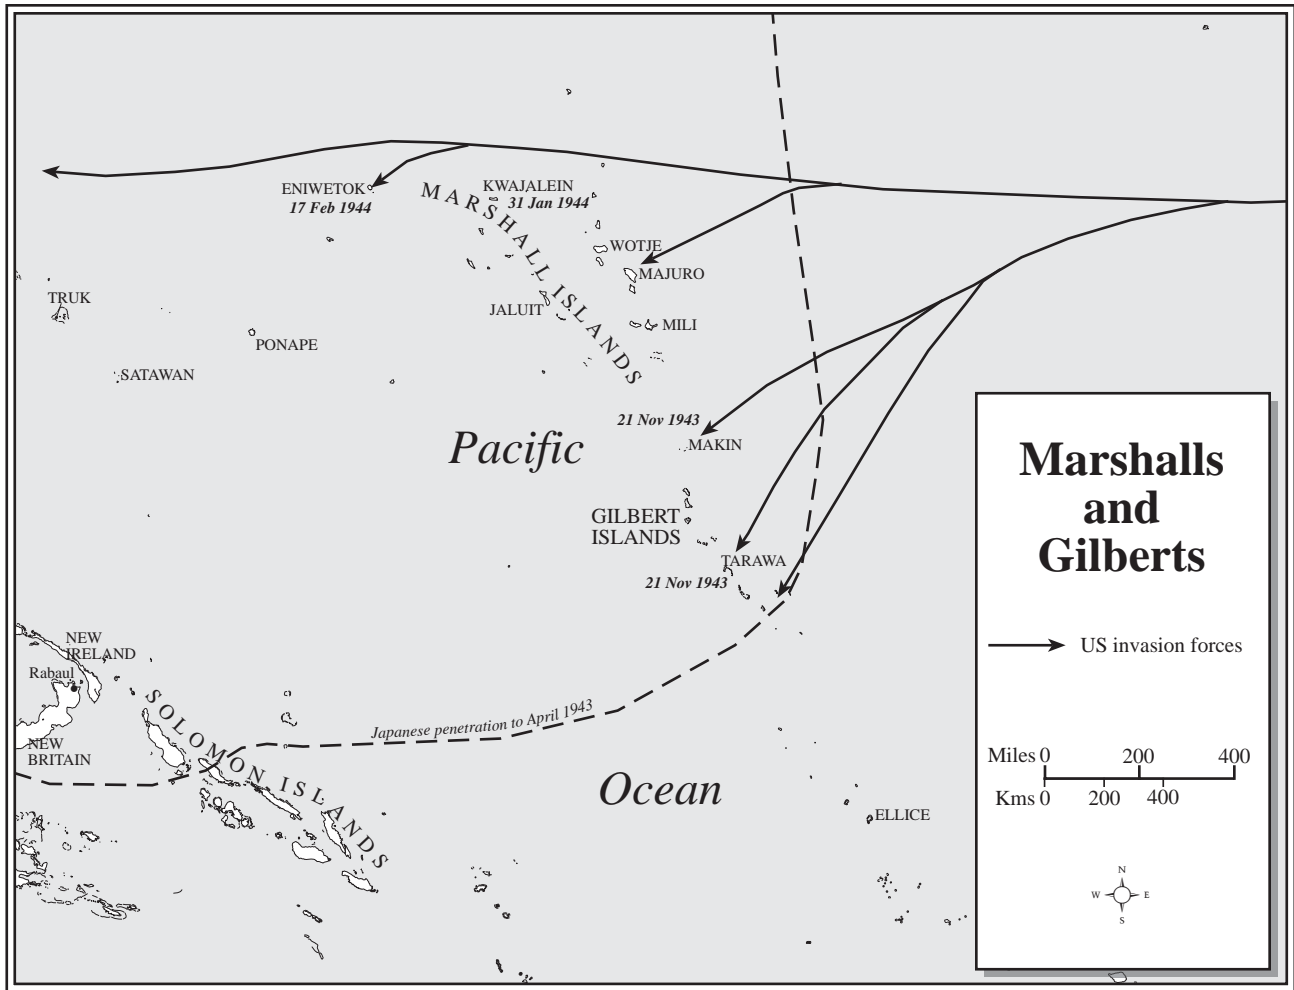

Kwajalein, Roi, Maloelap, Taroa, Jaluit, and Wotje simultaneously with bombs and naval gunfire. Majuro Atoll, composed of 56 islands, was secured between 31 January and 8 February and perfectly served the needs of the mobile supply system.

The primary target was Kwajalein Atoll (Operation FLINTLOCK). On 31 January, troops of the 4th Marine Division landed on Roi and Namur. Unlike operations in the Gilberts, FLINTLOCK had a sufficient number of tracked amphibious landing vehicles (amphtracs, or LVTs) available for the forces, and it also saw the first large-scale use of DUKW amphibian trucks. The prolonged preinvasion bombardment was also effective. Once ashore, the Marines progressed rapidly across the small islands. Japanese resistance ceased by the end of 2 February.

Meanwhile, the U.S. Army's 7th Infantry Division landed on Kwajalein Island. Turner decided first to subject the island to an extensive bombardment from battleships, cruisers, destroyers, and carrier aviation. The preliminary bombardment lasted from 30 January to 1 February. The troops went ashore early on 1 February in near perfect textbook fashion, and Kwajalein was taken on 5 February. After seizing a few

U.S. pilots, pleased over their victory, grin across the tail of an F6F Hellcat on board the USS *Lexington*, after shooting down 17 out of 20 Japanese planes heading for Tarawa, November 1943. (Commander Edward J. Steichen/National Archives)

smaller islands, Kwajalein Atoll was declared secure two days later, at a cost of 372 Americans killed and 1,582 wounded. The Japanese suffered 7,870 killed and only 265 taken prisoner.

At the far western edge of the Marshalls lay Eniwetok Atoll, only 1,000 miles from the Marianas. Eniwetok, whose name translates as “Land between West and East,” came to serve as the staging point for U.S. military operations against the Mariana Islands. Nimitz had not planned to take it until May, but the surprisingly easy victory at Kwajalein emboldened his commanders to move the attack up to February, fearful that a delay would allow the Japanese time to reinforce.

However, Eniwetok lay within striking distance of the massive Japanese base at Truk in the Caroline Islands. This bastion had to be eliminated before operations against Eniwetok could commence. Rear Admiral Marc Mitscher led Task Force 58 to neutralize Truk. His carrier aircraft destroyed more than 200 Japanese aircraft and sank 8 warships and 24 merchant vessels and damaged an aircraft carrier. Mitscher’s raids effectively ended Truk’s value as a major Japanese base.

Code-named *CATCHPOLE*, the operation against Eniwetok was carried out by the 22nd Marine Regimental Combat Team

(RCT) and the 106th Infantry Regiment. The invasion of Eniwetok Atoll began on 17 February with an assault on Engebi Island at the northern end of the atoll. This tiny island was secured by early the next day, but the Japanese defenders who were well dug in on the southern islands of Parry and Eniwetok offered stiffer opposition. Eniwetok Island was secured on 21 February, and Parry Island was declared secure on 22 February. Operations against Eniwetok Atoll claimed 195 American dead and nearly 2,700 Japanese. Only 64 Japanese were taken prisoner.

The fighting ashore had not been easy, but no U.S. ships were sunk and only a few were damaged, although several grounded in the channels between islands. Imperial Japanese Navy (IJN) surface ships did not contest the landings, but submarines were present, four of which were sunk. A number of Japanese supply ships, auxiliaries, and patrol ships were also sunk by U.S. forces during the operation.

U.S. successes neutralized Japanese bases on other islands in the Marshalls group, which remained isolated for the remainder of the war. The Marshalls operation saw the U.S. Navy and Marine Corps perfect their amphibious assault tech-

niques. More important, the operation enabled U.S. forces to bypass Truk and the other Caroline Islands and leap 1,000 miles forward to the Mariana Islands, from which U.S. bombers would be able to strike Japan.

Matapan, Battle of

See Cape Matapan, Battle of.

Matsui Iwane (1878–1948)

Japanese army general and commander of forces involved in the Sino-Japanese War. Born in Aichi Prefecture, Japan, on 27 July 1878, Matsui Iwane graduated from the Military Academy in 1898. He fought in the 1904–1905 Russo-Japanese War as a captain and was awarded the Military Cross. He was a resident officer in China from 1907 to 1912 and from 1915 to 1919 and in France and Indochina between 1914 and 1915. Promoted to colonel in 1918, he commanded the 29th Infantry Regiment in Japan from 1919 to 1921, then served as a staff officer in the Siberian Expeditionary Force at Vladivostok between 1921 and 1922.

Matsui served as a staff officer in the Guandong (Kwantung) Army from 1922 to 1924 and was promoted to major general in 1923. Between 1924 and 1925, he commanded a brigade, and he was then chief of the Intelligence Division of the Army General Staff (1925–1928).

Promoted to lieutenant general in 1927, Matsui commanded the 1st Division (1929–1931) and served as a delegate to the 1931–1933 Geneva Disarmament Conference, after which he was promoted to full general in 1933. In semiretirement, he served on the Supreme War Council between 1934 and 1935. Matsui was shocked at the Aizawa Incident of 12

Japanese General Iwane Matsui salutes his victorious troops as he enters the walled city of Nanjing, 1938. (Bettmann/Corbis)

August 1935, when Army Minister Lieutenant General Nagata Tetsuzan was assassinated in his office by Lieutenant Colonel Aizawa Saburoagata. Matsui then retired from the army.

After he left the army, Matsui traveled widely in China and met with Jiang Jieshi (Chiang Kai-shek), head of the Nationalist Party—the Guomindong, or GMD (Kuomintang, or KMT); he hoped to reconcile Japan and China. Ordered back to duty with the Japanese army in 1937 following the start of the Sino-Japanese War, he commanded the Japanese forces sent to capture Shanghai in Jiangsu (Kiangsu). Following heavy fighting, his forces took the city. In October 1937, Matsui was appointed to command the Central China Area Army.

In November 1937, his forces began their advance on Nanjing (Nanking), in Jiangsu. On 1 December, Matsui demanded that the Chinese commander, General Tang Shengzhi (T'ang Sheng-chih), surrender the city to the Japanese, but Tang refused. On 10 December, Matsui ordered his forces to attack the city, which fell three days later. During this period and afterward, Japanese troops killed thousands of prisoners of war and civilians in what became widely known as the Rape of Nanjing. Estimates of the number of victims vary widely, from

10,000 to 300,000. Although Matsui did not issue an order for his troops to kill civilians, he was held responsible as the overall Japanese commander at Nanjing.

Matsui returned to Japan in 1938 and was a cabinet adviser from 1938 to 1940, when he retired for a second and final time. Following the war, he was brought before the International Military Tribunal for the Far East on war crimes charges stemming from the atrocities at Nanjing. Found guilty, Matsui was sentenced to death and hanged on 23 December 1948.

Matsuoka Yōsuke (1880–1946)

Japanese diplomat and foreign minister from 1940 to 1941. Born in the village of Morozumi in Yamaguchi Prefecture, Japan, on 4 March 1880, Matsuoka Yōsuke went to the United States at age 13, working his way through and graduating from the University of Oregon in 1900. After returning to Japan, he became a diplomat in 1904, and between 1904 and 1921, he developed close ties with the Japanese business community and military.

Matsuoka left the diplomatic service in 1921 to become a director of the South Manchurian Railroad and was its vice president from 1927 to 1929. The following year, he entered the Japanese Diet as a representative of the conservative Seiyūkai Party. In July 1932, he became Japan's representative to the League of Nations in Geneva, where he led the Japanese delegation in walking out following the league's acceptance of the Lytton Commission report on 24 February 1933. A staunch conservative, Matsuoka left the Seiyūkai Party in December 1933, advocating the abolition of political parties. In 1935, he rejoined the South Manchurian Railroad Company, serving as its president until 1939. He was also an adviser to the Japanese cabinet between 1937 and 1940.

From July 1940 to July 1941, Matsuoka was the Japanese foreign minister, taking a strongly pro-Axis position. Outspoken and garrulous, he was known to his friends as "Mr. 50,000 Words." During his time as foreign minister, Japan joined Italy and Germany in the Tripartite Pact of September 1940. In March 1941, Matsuoka traveled to Berlin, where he held talks with Adolf Hitler and German Foreign Minister

Joachim Ribbentrop. Hitler tried to turn the Tripartite Pact into an offensive alliance by convincing Matsuoka that Japan should join Germany in war against Britain, whereas Ribbentrop advocated a Japanese attack on Singapore. Matsuoka was noncommittal.

He then traveled on to Moscow to meet with Soviet leaders. There, on 13 April, he signed a five-year nonaggression pact with the Soviet Union. Following the June 1941 German invasion of the Soviet Union, Matsuoka advocated that Japan join Germany in war against the Soviets, in violation of its neutrality pact with the USSR. He also urged an end to negotiations with the United States. In speeches in Japan, Matsuoka argued for Japanese control of the entire western Pacific.

Matsuoka alienated other members of Japan's cabinet not by his anti-American stance but by his ambition, his obnoxious behavior, and his flouting of the prime minister's position by holding unauthorized talks with the Germans. Indeed, Prime Minister Konoe Fumimaro and the entire cabinet resigned on 16 July 1941 so that the government could be reorganized without Matsuoka. The next day, Konoe again became prime minister—but with Vice Admiral Teijiro Toyoda as foreign minister.

Tuberculosis forced Matsuoka to retire from the political scene. At the end of the war, he flirted with the possibility of heading a military government, installed by a coup d'état and committed to a last-ditch resistance to any Allied invasion. He was arrested after the war and brought to trial before the International Military Tribunal for the Far East at Tokyo as a Class "A" war criminal. Matsuoka died in Tokyo on 27 June 1946, before a verdict could be rendered on his guilt or innocence.

McAuliffe, Anthony Clement (1898–1975)

U.S. Army general who was acting commander of the 101st Airborne Division during the Ardennes Offensive. Born on 2 July 1898 in Washington, D.C., Anthony McAuliffe attended West Virginia University for one year before entering the U.S. Military Academy, where he graduated and was commissioned a second lieutenant of field artillery in 1919. McAuliffe served at Fort Lewis, Washington (1920–1921); at the Presidio in San Francisco (1921–1922); and at the Presidio in Monterey, California (1922–1923). In 1923, he was promoted to first lieutenant and stationed at Schofield Barracks, Hawaii. In 1926, he was assigned to Fort Riley, Kansas, and then was stationed at Fort Heyle, Maryland, the next year.

From 1932 to 1936, he was in Hawaii. Winning promotion to captain in May 1935, McAuliffe graduated from the Command and General Staff School in 1937 and from the Army War College in 1940. He became a major in 1940 and served on the General Staff. He was promoted to lieutenant colonel in 1941 and to colonel the following year.

On 8 August 1942, McAuliffe was advanced to brigadier general and made artillery commander of the 101st Airborne Division. He parachuted into Normandy with the division in June 1944 and took part in Operation MARKET-GARDEN that September. McAuliffe was serving as acting commander of the 101st Division when the German Ardennes Offensive began on 16 December 1944. His division's defense of the strategic town of Bastogne (20–26 December) was important in stopping the German attack. The unit was surrounded by advancing German troops, but McAuliffe replied to the German demand of

General Maxim Weygand (*left*), former commander in chief of the French Army, and U.S. Army Major General Anthony B. McAuliffe (*right*), commander of the 103rd Infantry Division of Seventh Army, at Innsbruck, after McAuliffe's men rescued Weygand and other French generals and statesmen from captivity at Itter Castle in the Tyrolean Alps. (Photo by Horace Abrahams/Keystone/Getty Images)

surrender with the classic curt message “To the German Commander. Nuts! The American Commander.” His men held out until relieved by elements of Third Army. Promoted to major general in March 1945, McAuliffe commanded first the 103rd Infantry Division and then briefly the 79th Infantry Division, which he led into Austria by the end of the war.

Following World War II, McAuliffe commanded the Airborne Center at Fort Bragg, North Carolina (1945–1946). He then held staff positions in Washington; in 1951, he was promoted to lieutenant general. Two years later, McAuliffe took command of Seventh Army in Germany, and between 1955 and 1956, he commanded the U.S. Army in Europe. He retired from the army in 1956 as a full general and became a senior executive at American Cyanamid Company in New York City (1956–1963). McAuliffe died in Washington, D.C., on 11 August 1975.

McCain, John Sidney (1884–1945)

U.S. Navy admiral who commanded a carrier task force in the Pacific. Born in Teoc in Carroll County, Mississippi, on 19 August 1884, John Sidney “Slew” McCain attended the University of Mississippi and the U.S. Naval Academy, where he graduated in 1906. Commissioned as an ensign, he embarked on a successful career as a surface warfare officer, during which he commanded two vessels and rose to the rank of captain. In 1936, he qualified as a naval aviator. His audacious decision to become a pilot led to his command of two naval air stations (Coco Solo and San Diego) and the aircraft carrier *Ranger* (from May 1937 to July 1939).

Promoted to rear admiral in February 1941, McCain received command of the Aircraft Scouting Force, Atlantic. In May 1942, he took command of all land-based naval aircraft in the South Pacific in the Guadalcanal Campaign. That October, he was assigned to Washington as chief of the Bureau of Aeronautics. McCain was promoted to vice admiral and advanced to deputy chief of naval operation for air in August 1943.

In August 1944, McCain returned to the Pacific Theater to command a carrier task group under Vice Admiral Marc Mitscher, and he participated in the Battles of the Philippine

U.S. Rear Admiral John S. McCain, October 1942. (Bettmann/Corbis)

Sea and Leyte Gulf. In October, he took command of Carrier Task Force 38 from Mitscher, who in turn relieved him in January 1945. McCain returned to the same command in May 1945. He coordinated the highly effective air campaigns at Peleliu and Okinawa, and several carrier raids into Japanese home waters, and he also developed tactics to deal with Japanese kamikaze attacks. In only one month, his planes sank 49 Japanese ships and destroyed over 3,000 aircraft on the ground. Although in failing health and hurt by the finding of a court of inquiry into his actions during a typhoon in December 1944, McCain remained aboard the battleship *Missouri* to witness the formal Japanese surrender on 2 September 1945 before returning home to Coronado, California. He died on 6 September 1945 of a heart attack. Congress promoted him to full admiral posthumously.

McMorris, Charles Horatio "Soc" (1890–1954)

U.S. Navy admiral who helped to plan offensives in the Central Pacific. Born on 31 August 1890 in Wetumpka, Alabama, Charles McMorris graduated fifth in his class from the U.S. Naval Academy in 1912. Nicknamed "Soc" or "Socrates" for his intelligence, he took part in the 1914 U.S. Navy landing at Veracruz, Mexico, and served on destroyers in the North Atlantic during World War I.

McMorris then held a variety of assignments, including instructor in seamanship and history at the Naval Academy (1925–1927, 1930–1933). In the interval, he commanded destroyers. From 1933 to 1935, he was a navigator on the battleship *California*. McMorris graduated from the Naval War College in 1938, served as operations officer for the Scouting Force (1938–1939), and then served in the same capacity with the Hawaiian Department (1939–1941).

In January 1941, promoted to captain, McMorris became war plans officer on the staff of Admiral Husband Edward Kimmel, commander in chief of the Pacific Fleet. In April 1942, he took command of the heavy cruiser *San Francisco*. Promoted to rear admiral, he assumed command of Task Force 8 that December and provided gunfire support for the 7th Infantry Division as it retook Attu Island in the Aleutians. On 26 March 1943, some 200 miles west of Attu and without air support, he fought the Battle of the Komandorski Islands, repelling a stronger Japanese naval force under Vice Admiral Hosogaya Boshiro.

In June 1943, McMorris became chief of staff to Admiral Chester W. Nimitz, commander in chief of the Pacific Fleet and Pacific Ocean Area. He helped plan the Central Pacific offensives of the war's final two years and remained in his post until February 1946. Promoted to temporary vice admiral in September 1944, he took command of the Fourth Fleet in 1946. He served on the General Board from 1947 to 1948. In June 1948, he became a permanent vice admiral, commanding the 14th Naval District and Hawaiian Sea Frontier until he retired in September 1952. McMorris died in Honolulu, Hawaii, on 11 February 1954.

McNair, Lesley James (1883–1944)

U.S. Army general responsible for training American ground forces in the war. Born in Verndale, Minnesota, on 25 May 1883, Lesley J. McNair graduated from the U.S. Military Academy in 1904 and was commissioned in the artillery. He was an observer of French artillery in 1913. He served in the Mexican Punitive Expedition in 1916 and then deployed to France with the 1st Infantry Division as a lieutenant colonel in June 1917, where he served with George C. Marshall as an assistant chief of staff. That August, McNair was transferred to the training section of the American Expeditionary Forces (AEF) General Staff at Chaumont, where he was promoted first to colonel in June 1918 and then to brigadier general in October 1918 (the youngest in the U.S. Army).

Reverting to his permanent rank of major after the war, McNair held a succession of routine assignments and graduated from the Army War College in 1929. He was again promoted to colonel in May 1935 and to brigadier general in March 1937, commanding an artillery brigade. McNair had already come to the notice of his friend George Marshall as a talented organizer and trainer of soldiers. In 1939, he became

U.S. Army Lieutenant General Lesley J. McNair, January 1942. (Photo by Thomas D. Mcavoy/Time Life Pictures/Getty Images)

commandant of the Command and General Staff School at Fort Leavenworth, Kansas.

Army Chief of Staff General Marshall then placed him in charge of organizing and training all of the army's ground forces in World War II. McNair was promoted to major general in September 1940 and to lieutenant general in June 1941. He became chief of army ground forces in March 1942.

The training assignment was a task for which McNair was perfectly suited and one that he performed brilliantly. He insisted on rigorous and realistic training, and he set high standards for officers. In this post, he often went into the field to see for himself the results of his training programs. During one inspection trip to see the 1st Infantry Division in Tunisia in the spring of 1943, McNair was wounded. While substituting for General George C. Patton Jr. as commander of the fictitious First U.S. Army Group in the United Kingdom, McNair visited Normandy, France. He was killed there on 25 July 1944 by bombs that fell short near Saint-Lô prior to the U.S. breakout in Operation COBRA. The first U.S. Army lieutenant general to be killed in action, McNair was promoted to full general posthumously in July 1954.

McNaughton, Andrew George Latta (1887–1966)

Canadian army general and commander of the First Canadian Army until his controversial replacement in 1943. Born on 25 February 1887 at Moosomin, North-West Territories (now Saskatchewan), Andrew McNaughton served with distinction in World War I. Appointed counterbattery staff officer at corps headquarters in January 1917, he skillfully applied his scientific training to counterbattery work and played a key role in developing the superb artillery arm that contributed mightily to the Canadian Corps victories in 1917 and 1918. In October 1918, McNaughton was promoted to brigadier general and given command of the Canadian Corps heavy artillery.

After the armistice, McNaughton remained in the Permanent Force (Canadian army). While serving as chief of staff from 1929 through 1935, he pioneered many modernizing innovations, a considerable achievement given the stringent budgets of the depression years. Major General McNaughton was chosen to command the 1st Canadian Division in Sep-

tember 1939. Thereafter, his rise was rapid: Canadian Corps commander and lieutenant general in July 1940 and Canadian First Army commander in April 1942. During the early war years, McNaughton's public reputation was unchallenged; he was a link to the glories of the Canadian Expeditionary Force and embraced as a commander who would forge his army into "a dagger pointed at the heart of Berlin," to use his own phrase.

In reality, McNaughton's prickly temperament, poor judgment in selecting subordinates, administrative deficiencies, and obsession with technological details made it clear to most insiders—British *and* Canadian—that he was unfit to command a large force in the field. A consensus that his performance during Exercise SPARTAN in England in 1943 was a disaster proved the final straw for his many British critics, especially Field Marshal Sir Alan Brooke. The Canadian government agreed, and it fell to Minister of National Defence J. L. Ralston to relieve McNaughton in December 1943 on grounds of "health" and replace him with Henry Crerar.

An embittered McNaughton returned to Canada. When a conscription crisis erupted in the autumn of 1944 and Prime Minister Mackenzie King sacked Ralston, McNaughton—the only senior general still favoring the voluntary enlistment system—entered the cabinet as his old nemesis's replacement. Within a month, however, the government enacted limited overseas conscription, and McNaughton's political career fizzled.

In contrast to the turmoil of his World War II service, McNaughton enjoyed a highly successful postwar career as a diplomat, serving as Canada's representative on the UN Atomic Energy Commission (1946–1948), the International Joint Commission (1950–1962), and the Permanent Joint Board on Defence (1950–1958). McNaughton died in Montebello, Quebec, on 11 July 1966.

Medals and Decorations

Military medals are awards given to soldiers to recognize their service or their participation in a battle or campaign. Decora-

tions are awards given for combat heroism, for outstanding achievement, or for meritorious service for a specific period of time. In most but not all countries that fought in World War II, campaign and service medals had a round shape, whereas decorations tended to take on a variety of shapes, with stars and crosses predominating (see Tables 1 through 4). Although not military medals or decorations in the strictest sense, badges for weapons and equipment qualifications and special skills were also awarded; they comprised a widely developed system in most countries. Some of these badges, such as the U.S. Army's Combat Infantryman Badge, often carried greater prestige than most campaign medals and many decorations.

Some countries, including Great Britain and the United States, had specific decorations that were only awarded for combat valor and others that were only awarded only for service. In Germany and France, by contrast, most decorations could be awarded for either valor or service, and it was impossible to tell the difference once the award was on a soldier's uniform. The Soviet Union, which had the widest array of medals and decorations, had a composite system. Some countries, such as France, Belgium, and the United States, also had a system of awards for entire units, both for valor and service.

In the United States and Germany, all decorations were open to all ranks. In Britain and, to a lesser degree, in France and the Soviet Union, certain decorations were only for offi-

cers, and others were only for enlisted personnel. In most countries with a dual system, the highest combat decoration could be awarded to both officers and enlisted soldiers. Some countries, including France, had a system of decorations that could be awarded to civilians as well as to military personnel. Others, such as Britain, generally had separate awards for civilians. The United States had a mixed system, in which certain military decorations could be awarded to civilians, and some could not. For example, Virginia Hall, an Office of Strategic Services operative (and technically a civilian), became the only woman ever awarded the Distinguished Service Cross, the second-highest combat decoration of the United States.

Medal of Honor and Victoria Cross Recipients in World War II A Representative Sampling of Citations

Private William C. Barrett, U.S. Army

Date of action: 6 June 1944

Place: vicinity of St. Laurent-sur-Mer, France

Citation: For gallantry and intrepidity at the risk of his own life above and beyond the call of duty on 6 June 1944, in the vicinity of St. Laurent-sur-Mer, France. On the morning of D-day, Pvt. Barrett, landing in the face of extremely heavy enemy fire, was forced to wade ashore through neck deep water. Disregarding the personal danger, he returned to the surf again and again to assist his floundering comrades and save them from drowning. Refusing to remain pinned down by the intense barrage of small arms fire and mortar fire poured at the landing points, Pvt. Barrett, working with fierce determination, saved many lives by carrying casualties to an evacuation boat laying off shore. In addition to his assigned mission as guide, he carried dispatches the length of the fire-swept beach; he assisted the wounded; he calmed the shocked; he arose as a leader in the stress of the occasion. His coolness and his dauntless daring courage while constantly risking his life during a period of many hours had a inestimable effect on his comrades and is in keeping with the highest traditions of the U.S. Army.

Private Harold G. Kiner, U.S. Army

Date of action: 2 October 1944

Place: near Palenberg, Germany

Citation: With four other men, he was leading in a frontal assault 2 October 1944, on a Siegfried line pillbox near Palenberg, Germany. Machine-gun fire from the strongly defended enemy position 25 yards away pinned down the attackers. The Germans threw hand grenades, one of which dropped between Pvt. Kiner and two other men. With no hesitation, Pvt. Kiner hurled himself upon the grenade, smothering the explosion. By his gallant action and voluntary sacrifice of his own life, he saved his two comrades from serious injury or death.

***Sergeant Gerry H. Kisters, U.S. Army
(later promoted to first lieutenant)***

Date of action: 31 July 1943

Place: near Gagliano, Sicily

Citation: On 31 July 1943, near Gagliano, Sicily, a detachment of one officer and nine enlisted men, including Sgt. Kisters, advancing ahead of the leading elements of U.S. troops to fill a large crater in the only available vehicle route through Gagliano, was taken under fire by two enemy machine guns. Sgt. Kisters and the officer, unaided and in the face of intense small arms fire, advanced on the nearest machine-gun emplacement and succeeded in capturing the gun and its crew of four. Although the greater part of the remaining small arms fire was now directed on the captured machine-gun position, Sgt. Kisters voluntarily advanced alone toward the second gun emplacement. While creeping forward, he was struck five times by enemy bullets, receiving wounds in both legs and his right arm. Despite the wounds he continued to advance on the enemy, and captured the second machine gun after killing three of its crew and forcing the fourth member to flee. The courage of this soldier and his unhesitating willingness to sacrifice his life, if necessary, served as an inspiration to the command.

***First Lieutenant Jack Lummus, U.S.
Marine Corps***

Date of action: 8 March 1945

Place: Iwo Jima

Citation: For conspicuous gallantry and intrepidity at the risk of his life above and beyond the call of duty as leader of a rifle platoon attached to the 2nd Battalion, 27th Marines, 5th Marine Division, in action against enemy Japanese forces on Iwo Jima in the Volcano Islands, 8 March 1945. Resuming his assault tactics with bold decision after fighting without respite for two days and nights, 1st Lt. Lummus slowly advanced his platoon against an enemy deeply entrenched in a network of mutually supporting positions. Suddenly halted

by a terrific concentration of hostile fire, he unhesitatingly moved forward of his front lines in an effort to neutralize the Japanese position. Although knocked to the ground when an enemy grenade exploded close by, he immediately recovered himself and, again moving forward despite the intensified barrage, quickly located, attacked, and destroyed the occupied emplacement. Instantly taken under fire by the garrison of a supporting pillbox and further assailed by the slashing fury of hostile rifle fire, he fell under the impact to a second enemy grenade but, courageously disregarding painful shoulder wounds, staunchly continued his heroic one-man assault and charged the second pillbox, annihilating all the occupants. Subsequently returning to his platoon position, he fearlessly traversed his lines under fire, encouraging his men to advance and directing the fire of supporting tanks against other stubbornly holding Japanese emplacements. Held up again by a devastating barrage, he again moved into the open, rushed a third heavily fortified installation and killed the defending troops. Determined to crush all resistance, he led his men indomitably, personally attacking foxholes and spider traps with his carbine and systematically reducing the fanatic opposition, until, stepping on a land mine, he sustained fatal wounds. By his outstanding valor, skilled tactics, and tenacious perseverance in the face of overwhelming odds, 1st Lt. Lummus had inspired his stouthearted marines to continue the relentless drive northward, thereby contributing materially to the success of his regimental mission. His dauntless leadership and unwavering devotion to duty throughout sustain and enhance the highest traditions of the U.S. Naval Service. He gallantly gave his life in the service of his country.

***First Lieutenant Jack W. Mathis, U.S.
Army Air Corps***

Date of action: 18 March 1943

Place: over Vegesack, Germany

Citation: For conspicuous gallantry and intrepidity above and beyond the call of duty in action with the enemy over Vegesack, Germany on 18 March 1943. First Lt. Mathis, as leading bombardier of his squadron, flying through intense and accurate antiaircraft fire, was just starting his bomb run, upon which the entire squadron depended for accurate bombing, when he was hit by the enemy antiaircraft fire. His right arm was shattered above the elbow, a large wound was torn in his side and abdomen, and he was knocked from his bombsight to the rear of the bombardier's compartment. Realizing that the success of the mission depended upon him, 1st Lt. Mathis, by sheer determination and willpower, though mortally wounded dragged himself back to his sights, released his bombs, then died at his post of duty. As the result of this action the airplanes of his bombardment squadron placed their perfect attack against the enemy. First Lt. Mathis' undaunted bravery has been a great inspiration to the officers and men of his unit.

Sergeant Ralph G. Neppel, U.S. Army

Date of action: 14 December 1944

Place: Birgel, Germany

Citation: He was leader of a machine gun squad defending an approach to the village of Birgel, Germany, on 14 December 1944, when an enemy tank, supported by 20 infantrymen, counterattacked. He held his fire until the Germans were within 100 yards and then raked the foot soldiers beside the tank killing several of them. The enemy armor continued to press forward and, at the point-blank range of 30 yards, fired a high velocity shell into the American emplacement, wounding the entire squad. Sgt. Neppel, blown 10 yards from his gun, had 1 leg severed below the knee and suffered other wounds. Despite his injuries and the danger from the onrushing tank and infantry, he dragged himself back to his position on his elbows, remounting his gun, and killed the remaining enemy riflemen. Stripped of its infantry protection, the tank was forced to withdraw. By his superb courage and indomitable fighting spirit, Sgt. Neppel inflicted heavy casualties on the enemy and broke a determined counterattack.

Seaman First Class James R. Ward, U.S. Navy

Date of action: 7 December 1941

Place: Pearl Harbor, Hawaii

Citation: For conspicuous devotion to duty, extraordinary courage, and complete disregard of his life, above and beyond the call of duty, during the attack on the Fleet in Pearl Harbor by Japanese forces on 7 December 1941. When it was seen that the U.S.S. Oklahoma was going to capsize and the order was given to abandon ship, Ward remained in a turret holding a flashlight so the remainder of the turret crew could see to escape, thereby sacrificing his own life.

Private Rodger W. Young, U.S. Army

Date of action: 31 July 1943

Place: New Georgia, Solomon Islands

Citation: On 31 July 1943, the infantry company of which Pvt. Young was a member was ordered to make a limited withdrawal from the battle line in order to adjust the battalion's position for the night. At this time, Pvt. Young's platoon was engaged with the enemy in a dense jungle where observation was very limited. The platoon suddenly was pinned down by intense Japanese [fire from a] machine gun concealed on higher ground only 75 yards away. The initial burst wounded Pvt. Young. As the platoon started to obey the order to withdraw, Pvt. Young called out that he could see the enemy emplacement, whereupon he started creeping toward it. Another burst from the machine gun wounded him the second time. Despite the wounds, he continued his heroic advance, attracting enemy fire and answering with rifle fire. When he was close enough to his objective, he began throwing hand grenades, and while doing so was hit again and killed. Pvt. Young's bold action in closing with this Japanese pillbox, and thus diverting its fire, permitted his platoon to disengage itself, without loss, and was responsible for several enemy casualties.

Lance-Sergeant John Baskeyfield, British army

Date of action: 20 September 1944

Place: Arnhem, Holland

Deed: On 20 September 1944 at Arnhem, Holland, Lance-Sergeant Baskeyfield was in charge of a 6-pounder anti-tank gun and in the course of the engagement, when two Tiger tanks and at least one self-propelling gun were destroyed, the lance-sergeant was wounded and all his crew became casualties. Nevertheless he continued to man his gun quite alone, keeping the enemy at bay, until it was put out of action, when he crawled to another 6-pounder and proceeded to man that single handed. He fired two shots at a self-propelling gun, one of which was a direct hit, and was preparing to fire a third when he was killed.

Flight Officer Lieutenant Eric James Brindley Nicolson, Royal Air Force

Date of action: 16 August 1940

Place: near Southampton, England

Deed: On 16 August 1940 near Southampton, England, Flight Lieutenant Nicolson's Hurricane was fired on by a Messerschmitt 110, injuring the pilot in one eye and one foot. His engine was also damaged and the petrol tank set alight. As he struggled to leave the blazing machine he saw another Messerschmitt, and managing to get back into the bucket seat, pressed the firing button and continued firing until the enemy plane dived away to destruction. Not until then did he bail out, and when he landed in a field, he was unable to release his parachute owing to his badly burned hands.

Captain L. E. Queripel, British army

Date of action: 19 September 1944

Place: Arnhem, Holland

Deed: On 19 September 1944 at Arnhem, Holland, Captain Queripel displayed the highest standard of gallantry during the whole of a period of nine hours of bitter and confused fighting. Under heavy fire he carried a wounded sergeant to the regimental aid post and was himself wounded in the face. Later, when it became necessary to withdraw he insisted, despite the protests of his men, in remaining behind to cover their withdrawal, armed only with his pistol and a few hand grenades. This was the last occasion on which he was seen.

Medal of Honor and Victoria Cross Recipients in World War II A Representative Sampling of Citations (cont.)

**Lieutenant Colonel V. B. Turner,
British army**

Date of action: 27 October 1942

Place: El Aqqaqir (Kidney Ridge), Western Desert, Egypt

Deed: On 27 October 1942 at El Aqqaqir (Kidney Ridge), Western Desert, Egypt, Lieutenant Colonel Turner was commanding a battalion of the Rifle Brigade. After overcoming a German position, the battalion fought off desperate counter-attacks by 90 tanks, destroying or immobilising more than 50 of them. During the action, one of

the 6-pounder guns was left with only one officer and a sergeant, so Colonel Turner joined them as loader, and between them they destroyed another five tanks. Not until the last tank had been repulsed did he consent to having a wound in his head attended to.

Charles L. Keese

Prior to the nineteenth century, military awards were few in number and usually reserved for the most senior officers. In the majority of the European monarchies, these tended to be members of military classes of the country's various orders of knighthood. Decorations began to be awarded to the enlisted ranks when Napoleon Bonaparte established the Legion of Honor in 1802 to recognize distinguished military and civilian service. In practice, however, this honor was awarded to privates and noncommissioned officers, which led to the establishment in 1852 of the *Medaille Militaire*. In 1813, Kaiser Friedrich Wilhelm III of Prussia established the Iron Cross, available to all ranks. In 1856, during the last year of the Crimean War, the British established the Victoria Cross (VC) as their highest military decoration. Unlike virtually every other British decoration through the end of World War II, the VC was open to all ranks.

The United States established the Medal of Honor (often erroneously called the Congressional Medal of Honor) at the start of the Civil War. The navy version was authorized on 12 December 1861 and the army version on 12 July 1862. Originally, it was awarded to enlisted men. Officers became eligible for the Army Medal of Honor in 1863 and for the Navy Medal of Honor in 1915. The Army and Navy Medals of Honor also differed in that, from the start, the former could be awarded for acts of combat valor only. The Navy Medal of Honor could be awarded for peacetime acts of heroism until 1942. Between 1917 and 1942, the navy even had two different designs for the medal, one for combat and one for noncombat.

Probably the first campaign medal in the modern sense was the British Military General Service Medal, established in 1847 and awarded to all soldiers who had participated in the Peninsular Campaign against Napoleon more than 30 years

earlier. By the time of World War II, most of the belligerent nations had well-established systems of medals and decorations, with a clearly delineated hierarchy to the decorations. Starting in 1939, all sides established campaign medals to recognize participation in the major campaigns or battles.

American campaign and service medals indicated a soldier's geographic participation. The three primary medals were the European–African–Middle Eastern Campaign Medal, the Asiatic–Pacific Campaign Medal, and the American Campaign Medal. The latter medal was awarded for 30 days of service outside the continental United States but within the theater of operations (such as coastal patrol) or for a total of one year within the continental United States. A small bronze star device affixed to the medal ribbon indicated each individual campaign in which a soldier participated. One silver star device represented five bronze star devices. At the end of the war, all U.S. soldiers also received the World War II Victory Medal.

Great Britain's World War II campaign medals deviated from normal practice in that they were in the shape of a six-pointed star, rather than round. They included the Atlantic Star, Air Crew Europe Star, Africa Star, Pacific Star, Burma Star, Italy Star, France and Germany Star, and 1939–1945 Star for six months of service in an operational area. Soldiers from the Commonwealth nations also received the British campaign stars, but in many cases, those countries also augmented the British awards with their own service medals. Such countries (and, in some cases, provinces) included India, Canada, South Africa, Australia, New Zealand, Southern Rhodesia, and Newfoundland.

The Soviet Union had the widest array of campaign medals, which fell into five broad categories: (1) Defense Medals, awarded to both soldiers and civilians who actively

participated in the defense of certain cities and areas—Leningrad, Moscow, Odessa, Sevastopol, Stalingrad, Kiev, the Caucasus, and the Soviet Arctic; (2) Capture Medals, awarded to soldiers who participated directly in the attacks on certain enemy cities—Budapest, Königsberg, Vienna, and Berlin; (3) Liberation Medals, awarded to soldiers for the capture of east European cities occupied by the Germans—Belgrade, Warsaw, and Prague; (4) Victory Medals, awarded for both Germany and Japan, despite the fact that the Soviet Union was at war with Japan for only 21 days; and (5) Anniversary Medals, awarded starting with the twentieth anniversary in 1965. The Russian Federation continued the practice, issuing a fiftieth Anniversary Medal in 1995.

Although France fell on 17 June 1940, its government-in-exile under General Charles de Gaulle awarded a number of medals, and the newly formed Fourth Republic instituted several others after the war. The limited nature of France's participation in the war also limited the scope of its campaign and service medals, which focused on resistance activities and combat service as part of larger Allied formations. The pri-

mary French decoration of the war was the Croix de Guerre (1939–1945). It was established in September 1939 as a continuation of the Croix de Guerre first established during World War I and was awarded to both individuals and entire units. French campaign medals included the Free French Forces Medal, War Medal (1939–1945), Medal for Those Deported or Interned for Acts of Resistance, Medal for Those Deported or Interned for Political Reasons, Cross for Combat Volunteers, Italian Campaign Medal, Cross for Combatant Volunteers in the Resistance, and Medal for Patriots in Forced Labor.

Germany had an enormous array of awards, decorations, and qualification badges during World War II, although it did not establish a system of campaign medals. The Germans had only one real campaign medal, the Medal for the Winter Campaign in the East (1941–1942), widely known among the soldiers as “the Order of the Frozen Flesh.” Instead of using campaign medals, the Germans recognized participation in

some (but by no means all) battles with either cuff titles or small metal shields that were also worn on the cuff of the uniform. The cuff titles included Spanien (Spain), Kreta (Crete), Afrika, Metz, and Kurland. The cuff shields included Narvik, Cholm, Krim (Crimea), Kuban, and Demjansk.

The premier German decoration of World War II was the Iron Cross, which had been a purely Prussian award before World War I. Under Adolf Hitler, the Iron Cross was reinstated on 1 September 1939. But whereas the Iron Cross prior to World War II came in only two classes plus a Grand Cross, Hitler also initiated a Knight's Cross between the First Class and the Grand Cross. As the war progressed, four more levels of the Knight's Cross were added. Reichsmarschall (Reich Marshal) Hermann Göring was the only recipient of the Grand Cross, and Stuka pilot Hans-Ulrich Rudel was the only recipient of the Knight's Cross with Golden Oak Leaves, Diamonds, and Swords, an award created specifically for him.

Italy's medals and decorations were a complex mixture, reflecting the country's changing status during the war. Italian awards were issued first by the Kingdom of Italy and then by the Republic of Italy and the Social Republic of Italy simultaneously. Instituted in 1833, the Medal for Military Valor was awarded in Gold, Silver, and Bronze Classes. The Medal for Naval Valor was instituted in 1836, and the Medal for Aeronautical Valor was introduced in 1927. Lesser Italian decorations included the War Cross for Military Valor and the War Cross for Military Merit.

Italy awarded campaign medals for the Ethiopian Campaign, the Spanish Campaign, the Spanish Civil War, the French Campaign, the Albanian Campaign, and the African Campaign, as well as the Cross of the Italian Expeditionary Corps in the Soviet Union. Italy also issued a commemorative War Medal for service between 1940 and 1943 and a Liberation Campaign Medal for the 1943–1945 period. After the war,

an unofficial campaign ribbon also appeared to commemorate service in the military forces of the Italian Social Republic.

The Republic of China had a vast and bewildering array of decorations and orders, and it is very difficult to establish their relative order of precedence with any real precision. The most important military decorations included: the Order of the Precious Tripod, the Order of National Glory, the Order of the Blue Sky and White Sun, the Order of Loyalty and Bravery, the Order of the Cloud and Banner, and the Order of Loyalty and Diligence. The Order of the Precious Tripod came in eight classes, the Order of the Cloud and Banner came in nine, and all the rest came in one class. The Order of Loyalty and Bravery was awarded only for acts of great valor while wounded. No other country had such an award.

The fascination of Nationalist leader Jiang Jieshi (Chiang Kai-shek) with his fledgling air force was reflected in the group of Chinese air decorations established in the late 1930s. The premier flying award was the Order of Rejuvenation, which came in three classes. To qualify for the First Class, an airman had to shoot down at least nine enemy aircraft, fly 300 combat missions, and have 900 hours of flight time. The Second Class required six enemy aircraft downed, 250 missions, and 750 hours. The Third Class required three aerial victories, 200 missions, and 600 hours. The requirement for aerial victories effectively meant only fighter pilots could qualify for the order. Thus, the Chinese also had three additional aviation orders, all of a single class, that did not require shooting down enemy aircraft. The Air Force Order of Ho-T'u was awarded for 600 combat missions, the Air Force Order of Ancient Symbols for 500 missions, and the Air Force Order of Ch'ien Yuan for 400 missions. The number of required missions for each order was exactly double the numbers of missions for the three respective classes of the Order of Rejuvenation. Finally, the Chinese also awarded the Air Force Order of Great Unity to distinguished air commanders.

During the war, the Chinese government had offered to present a special campaign medal to American servicemen serving in China. The U.S. government demurred, but the government of Taiwan resurrected the idea in the late 1970s and awarded the medal to all American veterans who could prove they had served in China. Most of those who received the World War II China War Memorial Medal were veterans of the U.S. Fourteenth Air Force and its predecessor organizations, the China Air Task Force and the American Volunteer Group (the Flying Tigers).

Most Japanese decorations and orders were instituted in the late nineteenth century. Japan's premier decoration was the Order of the Chrysanthemum, which was only awarded to members of the royal family and foreign heads of state. The Order of the Rising Sun came in eight classes and was awarded for exceptional civil or military service. The Order of the Sacred Treasure, also in eight classes, was conferred for distinguished civil or military service. The primary Japanese

award for combat heroism was the Order of the Golden Kite, which came in seven classes.

During the war, Japan established several awards for the various occupation and puppet regimes it set up in China. In 1936, Emperor Aixinjueluo Puyi of Manchukuo initiated the Order of the Pillars of State and the Order of the Auspicious Cloud, both for Japanese officers and Chinese officials who cooperated with the Japanese occupation. When the Japanese invaded China proper, they established another puppet regime called the Reorganized National Government of China. In 1943, that government instituted the Order of United Glory, also for Japanese officers and Chinese collaborators.

Meiktila, Battle of (28 February–28 March 1945)

Burma saw some of the more bitter fighting of the Pacific Theater. By mid-1944, however, the tide in Burma had turned, and it was the Japanese who were on defensive. In the first half of that year, Lieutenant General William Slim, commander of Fourteenth Army, blunted Japanese General Mutaguchi Renya's U-gō Offensive before Kohima and Imphal, then liberated northern Burma by the end of the year. Early in 1945, Slim's forces went on the offensive in central Burma. Utilizing new techniques of aerial resupply, Slim directed a drive against the Japanese geographic defense line of the Irrawaddy River.

Meiktila, the center of Japanese logistical infrastructure in the area, was also a gateway to the cities of Rangoon and Mandalay and an equally important center of communication for the entire Burma Theater. Meiktila's airfields were key: capture of these would allow aerial resupply of Allied ground operations throughout the entire theater of operations.

In an effort to trap and destroy Japanese Lieutenant General Katamura Shihachi's Fifteenth Army at Meiktila, Slim resorted to an elaborate deception plan. Code-named CLOAK, it involved sending radio signals from a nonexistent headquarters at Shwebo on his left flank to convince Katamura that Slim's IV Corps was about to drive on Mandalay from that direction. At the same time, Slim secretly moved IV Corps, made up of the 17th Indian Division and 225th Tank Brigade, south down the Mykittha Valley and then across the Irrawaddy River near Pakokku, 100 miles south of Mandalay. On 13 February, IV Corps made a surprisingly easy crossing of the Irrawaddy. The tanks then dashed to cut off Meiktila, easily sweeping aside Japanese-puppet Indian National Army forces.

The Battle of Meiktila opened on 28 February. Major General D. T. Cowan, commander of the 17th Division, had charge of the attack. Meiktila was basically a logistics and medical center, and the Japanese had few fighting units there, other than battalions for airfield defense. In all, there were only 4,000 men. Organized Japanese resistance soon collapsed, but the defenders then broke into small bands, forcing the British to clear the town street by street and house by house. This bloody task was carried out by ruthlessly efficient Gurkha troops.

Meiktila was secured on 3 March, with more than 2,000 Japanese dead and 48 taken prisoner, along with 48 guns. Slim called the capture of Meiktila in only four days "a magnificent feat of arms" and immediately rushed in supplies by air from India in order to prepare for the inevitable Japanese counterattack.

The Japanese response was not long in coming. Burma area commander Lieutenant General Kimura Heitaro had already ordered Lieutenant General Takehara Saburō's 49th Division to Meiktila. Other Japanese units also were committed, including regiments from the 2nd, 18th, and 33rd Divisions. The battle was renewed on 6 March. Although the Japanese managed to cut off the Indian 17th Division at Meiktila and for a time threatened the airfields, Slim was able to bring in a brigade by air. On 16 March, Thirty-Third Army commander Lieutenant General Honda Masaki took command of the 18th and 49th Divisions, with orders to retake Meiktila. But with XXXIII Corps and the remainder of IV Corps coming up, Honda halted the Japanese counterattack, and on 28 March, he ordered Japanese forces to withdraw.

Slim's plan had succeeded brilliantly. The capture of Meiktila opened the way for the British to take Rangoon. Mandalay fell in March and Rangoon in May, but Meiktila was the key to the campaign.

Menado, Battle of (11–12 January 1942)

Initial Japanese attack on the Netherlands East Indies, which featured the first Japanese use of paratroopers. The ultimate prize for the Japanese in the South Pacific was the island of Java. To reach it, the Japanese seized several intermediate locations so that their subsequent advances would be covered by land-based air. Menado, located on the northernmost peninsula of the island of Celebes, met Japanese needs because it had both a good harbor and a nearby airfield.

On 9 January 1942, the First Eastern Invasion Force departed Davao in the southern Philippines for Menado. Ten transports carried 2,500 marines of the 1st Sasebo Special Landing Force. This naval force consisted of two reinforced battalions. Among the supporting units was a tank company equipped with Model 95 light tanks. Five minesweepers and two submarine chasers provided close support. Rear Admiral Tanaka Raizo commanded a covering force of one light cruiser and eight destroyers, and stronger Japanese naval forces provided distant cover.

The Dutch defenders on Celebes were heavily outnumbered. The garrison had 1,500 men, but fewer than 400 were regular soldiers. The remainder were local militia troops and retired soldiers. Heavy weapons were limited, along with communications equipment.

The Dutch were surprised when the Japanese came ashore at Menado beginning at 4:00 A.M. on 11 January. The defenders fell back toward the city itself, but they were hampered by poor communications. The Japanese quickly took the key road centers, and Dutch forces near the beach were overwhelmed, unable to oppose the light Japanese tanks. Soon, the Japanese controlled both the harbor area and the town.

Shortly after 9:00 A.M., the Japanese inserted into the battle the 1st Yokosuka Special Landing Force, a battalion-sized naval parachute unit under Toyoaki Horiuchi, to seize the nearby airfield at Langoan. Twenty-seven G3M1-L transports ("Nell" in the Allied code system) flying from Davao dropped 334 men onto the field. The Japanese made many mistakes in their first combat airdrop. The altitude was too high and the winds too strong, scattering men and equipment over a wide area and allowing the Dutch defenders to inflict heavy casualties. The Japanese commander and 34 of his men were killed, and 90 others were wounded. The paratroopers were largely

ineffectual. On 12 January, an additional 185 paratroopers were dropped at Langoan in reinforcement. The airfield fell the same day, although the Dutch were able to sabotage it somewhat during the fighting. The field was not restored to service until 24 January. Following the surrender, the Japanese executed a number of the surrendered Dutch defenders by beheading or bayoneting. After the war, Captain Toyoaki was tried for this war crime and executed in September 1948.

Many of the Dutch defenders attempted to escape into the jungle to wage guerrilla war against the Japanese invaders, but most were caught and executed. By 12 January, the Japanese had secured both the harbor and airfield, which were then used as staging areas for subsequent Japanese moves farther south.

Menzies, Robert (1894–1978)

Australian politician and prime minister during the war years. Born on 20 December 1894 at Jeparit, Victoria, Australia, Robert Menzies attended Wesley College in Melbourne and the University of Melbourne, where he graduated with honors in 1916. Admitted to the bar two years later, he became a successful lawyer but remained interested in politics. He entered Victoria's state legislature in 1928 and became deputy premier of Victoria in 1932, resigning to enter the Federal Parliament in Canberra in 1934; there, he served as attorney general and became the leader of the United Australia Party (UAP). Because of his activity in battling dockworkers, who refused to load scrap metal for Japan in 1938, he acquired the nickname "Pig-iron Bob." He was also known as "Ming the Merciless."

Following the death of the prime minister, Joseph Lyons, Menzies assumed that office on 26 April 1939, at the head of a minority government. He supported British Prime Minister Neville Chamberlain's policy of appeasing Germany but immediately led Australia into World War II after the British declaration of war. Menzies introduced compulsory military service and then sent three Australian divisions to the Middle East. He barely survived the national election of September 1940.

In early 1941, Menzies went to London to alert the British government to the threat posed by Japan, but his efforts had

no effect. He did, however, develop a close relationship with British Prime Minister Winston L. S. Churchill, and he attended a number of cabinet meetings, including those where it was decided to dispatch troops to Greece—a decision for which he was roundly criticized in Australia. Menzies also toured the war zone of the Middle East before returning to Australia in May 1941. He had sought an imperial war cabinet that would include the Dominion prime ministers, but Churchill strongly opposed this concept.

Australian military defeats under British leadership sharply divided the UAP, and pressure from various quarters forced Menzies to resign in August 1941. He was replaced by his deputy, Arthur Fadden, although he continued as minister of defense. In October 1941, however, the Labour Party, headed by John Curtin, was voted into power. Menzies's wide unpopularity led him to resign the UAP leadership.

Menzies showed a remarkable ability to learn from his mistakes, and from the remnants of the UAP, he put together a new party, the Liberals, which he led to a landslide victory in 1949. He courted the middle class and, under the slogan "Populate or perish," encouraged European emigration to Australia. Knighted in 1963, he was known as the "Queen's man" because of his loyalty to the British royal family. Menzies retired in 1966, having led the Liberals to seven electoral victories. He died on 15 May 1978 in Melbourne.

Meretskov, Kirill Afanasievich (1897–1968)

Marshal of the Soviet Union who commanded the 1st Far Eastern Front in 1944. Born in Nazaryevo, near Moscow, on 7 June 1897, Kirill Meretskov began as a factory worker but joined the Communist Party in 1917, entering the Red Guard. Wounded twice during the Russian Civil War, he decided to make the army a career and was a member of the first class of Red Army officers produced by the newly established General Staff Academy (later the Frunze Military Academy). His

studies were interrupted by fighting during both the Russian Civil War and the Russo-Polish War of 1920.

Meretskov rose rapidly through the ranks thereafter, mostly in staff positions. By 1922, he was a brigadier general and chief of staff of a cavalry corps in the Belorussian Military District. During the next decade, he held a variety of posts in the Chief Personnel Directorate and the North Caucasus and Moscow Military Districts. Meretskov was selected for secret training in Germany in 1931. After a tour in the Special Red Banner Far Eastern Army (1935–1936), he went abroad, first as an observer to Czechoslovakian military maneuvers and then as a military adviser to the Republican side in the Spanish Civil War. He returned to the Soviet Union during Josef Stalin's purges of the army and was assigned as deputy commander of the General Staff.

In 1938, Meretskov headed the Leningrad Military District. When Stalin decided on war with Finland, Meretskov was given only three days to prepare an attack by four armies. The attack was a disaster, and he lost his command. He nonetheless participated in the successful phase of the Finnish war and was promoted to General of the Army in June 1940.

Meretskov took over as chief of the General Staff in August 1940, but his tenure was short-lived after his performance, again with little preparation time, in a briefing of a bilateral strategic war game against the Germans, in which General Georgii Zhukov played the German side. Zhukov succeeded Meretskov as chief of staff in January 1941.

Meretskov was subsequently arrested on false charges but was released in September 1941 and assigned as the Stavka (Soviet High Command) representative in Leningrad. He then commanded the Volkhov Front between the Leningrad and Northwest Fronts until April 1942, when he was transferred to the Western Front as Zhukov's deputy commander. Stalin, recognizing his error in judgment, restored Meretskov to command of the Volkhov Front, which helped break the siege of Leningrad in early 1944.

Meretskov assumed command of the Karelian Front in February 1944 and forced Finland from the war that October. Promoted to marshal of the Soviet Union that same month, he received command of the 1st Far Eastern Front in Manchuria, which carried out a supporting attack in the most heavily fortified Japanese-held area (opposite Soviet Primorye) and helped crush the Japanese Guandong (Kwantung) Army in a nine-day campaign in August.

Meretskov was given assignments to keep him out of the limelight, serving finally as an assistant minister of defense from 1955 until his retirement in 1964. He died in Moscow on 30 December 1968.

Merrill, Frank Dow (1903–1955)

U.S. Army general and leader of the famed Merrill's Marauders. Born in Hopkinton, Massachusetts, on 4 December 1903, Frank Merrill enlisted in the army in 1922. In 1925, he received an appointment to the U.S. Military Academy, where he graduated in 1929. Merrill also earned a B.S. degree in military engineering from the Massachusetts Institute of Technology.

In 1938, Captain Merrill was assigned as assistant military attaché at the U.S. Embassy in Tokyo. Fascinated by East Asian culture, he studied both the history and languages of Japan and China. In early 1941, Major Merrill was transferred to Manila as an intelligence officer on the staff of General Douglas MacArthur. He was in Burma on a mission that December when the Japanese attacked the Philippines. He was then reassigned to the China-Burma-India Theater.

In spring 1942, Merrill was promoted to lieutenant colonel, but he was wounded in action in May when the Japanese pushed Allied forces out of Burma. In October 1943, Merrill became operations chief for Lieutenant General Joseph Stilwell and organized the 5307th Composite Unit (Provisional) in India, modeled after British Brigadier General Orde C. Wingate's Chindits. This regiment-sized infantry formation of nearly 3,000 men was designed for long-range penetration operations and relied entirely on air drops for supplies; it was the first U.S. ground unit to fight on the Asian mainland since the Boxer Uprising of 1900. Merrill assumed command of the 5307th in January 1944 and led Merrill's Marauders, as the outfit became known. Named Galahad, the 5307th took part in operations in north Burma during late February 1944, first in conjunction with two Chinese divisions and later with British Chindits. Over the next four months, the Marauders marched more than 1,000 miles through some of the densest jungles and over some of the highest peaks in Asia. Although consistently outnumbered, they participated in 5 major battles—Walabum, Shaduzup, Inkangahtawug, Nhpum Ga, and Myitkyina Airfield—and 30

U.S. Army Brigadier General Frank D. Merrill, at his headquarters behind Japanese lines in Burma. (Bettman/Corbis)

minor engagements against the veteran Japanese 18th Division. The 5307th sustained significant losses due both to the fighting and to disease. By August, the unit was at one-third strength, and Stilwell decided to disband it.

Merrill suffered a heart attack in the middle of Galahad's actions and was replaced. Promoted to major general in September 1944, he became chief of staff of Tenth Army and fought in the conquest of Okinawa in 1945. In March 1947, Merrill was part of the U.S. military advisory group sent to the Philippines as it gained full independence. He retired from the army in 1948 and then became highway commissioner of the state of New Hampshire. Merrill died on 12 December 1955 at Fernandina Beach, Florida.

Mersa Matrûh, Battle of (28 June 1942)

An engagement in which an Egyptian fortress was seized by Field Marshal Erwin Rommel's Afrika Korps (Africa Corps).

Mersa Matrûh is located approximately 60 miles from Egypt's border with Libya. With Tobruk captured on 21 June 1942, Rommel decided on an immediate advance into Egypt. This approach abandoned the original Axis plan calling for a halt at the border to await the reduction of Malta, which would have ensured Axis supply lines on the drive toward the Suez Canal.

In spite of severe fuel shortages and mechanical breakdowns, Rommel's forces pushed eastward in hopes of enveloping and destroying the British Eighth Army. The Afrika Korps spearhead entered Egypt with fewer than 50 operational tanks, and its speedy advance outstripped fighter coverage, which brought vicious attacks by the Allied Desert Air Force. Nonetheless, on 25 June, advanced elements of the Afrika Korps reached the outskirts of Mersa Matrûh.

The Eighth Army's commander, Lieutenant General Neil N. Ritchie, hoped to make a stand at Mersa Matrûh rather than withdraw to Alamein. On 25 June, General Sir Claude Auchinleck relieved Ritchie and assumed command of Eighth Army himself. He decided to fight using Ritchie's plan, with two strong wing elements of X and XIII Corps and a weakened center. He also instructed his corps commanders to withdraw rather than risk envelopment.

Rommel resumed his advance on 26 June by ordering his Italian infantry to fix X Corps inside Mersa Matrûh's defenses while his armor swung east on the escarpments south of the city, hoping to envelop all British forces to his front. Afrika Korps now found itself heavily engaged with the 2nd New Zealand and 1st Armoured Divisions of XIII Corps and unable to advance. Rommel's 90th Light Division overran Auchinleck's weakened center and, by the afternoon of 27 June, was in striking distance of the coast behind Mersa Matrûh.

Following Auchinleck's orders not to become decisively engaged, the XIII Corps commander, Lieutenant General William H. Gott, broke off the battle and withdrew toward Alamein, not realizing that he had the Afrika Korps in a precarious situation. The withdrawal enabled the 90th Light Division to reach the coast at 7:00 P.M. on 27 June. This move cut off X Corps, which was unaware that XIII Corps had retired.

Rommel besieged Mersa Matrûh on 28 June. The X Corps commander, Lieutenant General William George Holmes, ordered his units to break out of the city that night and escape to Alamein. In spite of bitter fighting, much of the corps reached friendly lines because of the weakened condition of Rommel's forces. Axis troops entered Mersa Matrûh on 29 June, capturing 8,000 British personnel and quantities of weapons and supplies. Afrika Korps then continued its pursuit, reaching Alamein on 30 June.

Mersa Matrûh was Rommel's last victory in the Libyan-Egyptian theater. He had exposed his Afrika Korps to defeat, but Eighth Army had failed to take advantage of the situation.

The battle exhausted much of what little strength was left in Rommel's dash into Egypt after the seizure of Tobruk, however. On the British side, the defeat at Mersa Matrûh sent Eighth Army to its final defensive barrier at Alamein, a mere 60 miles from Alexandria, but Auchinleck had preserved most of his command.

Mersa Matrûh, Battle of (7 November 1942)

Battle in Egypt in which Field Marshal Erwin Rommel's Panzerarmee Afrika (Panzer [or Tank] Army Africa) eluded capture by Lieutenant General Bernard Montgomery's pursuing Eighth Army, following shortly on the Battle of El Alamein. Mersa Matrûh is located about 60 miles from the border with Libya. Montgomery planned to pursue the beaten Rommel and envelop Axis forces before they could escape westward, but he had not allocated any particular forces for this effort prior to the Battle of Alamein. Rommel's temporary halt at Mersa Matrûh offered Eighth Army a chance to surround and destroy Panzerarmee Afrika.

Rommel, who hoped to delay his retreat long enough to allow his infantry an opportunity to avoid capture, ordered his armored troops to fall back to Matrûh on 5 November. Montgomery sent 1st Armoured Division on a wide sweep to the southwest to try to reach Matrûh from the rear. Heavy rains impacted the movement of both armies. Despite poor road conditions and resupply problems, much of Rommel's remaining mechanized forces made it to Matrûh. Both 15th Panzer Division and 90th Light Division reached Matrûh safely, but 21st Panzer Division, short on fuel, was surrounded by 22nd Armoured Brigade. The 21st Panzer Division then took up a "hedgehog" (circular) defense, eventually abandoning most of its remaining tanks.

Heavy rains, minefields, and undelivered fuel supplies prevented Montgomery's armor from advancing farther, saving Panzerarmee Afrika from encirclement. Certainly, the poor weather hampered air strikes by the Desert Air Force, which would have been virtually unchallenged by the Luftwaffe. On 7 November, with three pursuing divisions halted,

1st Armoured Division slowly moved forward along the coast road. But not until the evening of 8 November did the division's patrols enter Matrûh, well after Rommel's departure.

Rommel believed Montgomery's caution allowed his own escape at Mersa Matrûh, whereas Montgomery blamed it on the heavy rains. Since the weather affected both sides equally, it was not the sole determinant. Montgomery had not prepared for a pursuit, and he failed to press his advantage by striking deeper into the desert behind Rommel. Further, the Alamein victory may have so exhausted Eighth Army that an effective pursuit was impossible.

Mers-el-Kébir (3 July 1940)

Naval engagement fought between British and Vichy French ships. This battle, which took place on 3 July 1940 at the naval harbor outside Oran in French Algeria, was the most dramatic part of Operation CATAPULT, the British effort to secure the French navy or at least keep it from falling into German hands. British Prime Minister Winston L. S. Churchill ordered Vice Admiral James Somerville's newly formed Force H to steam to Oran and deliver an ultimatum to Vice Admiral Marcel Bruno Gensoul. The French commander was offered the choice of joining his ships with the British and continuing the fight against the Germans and Italians; sailing them with reduced crews to a British port, with the crews to be promptly repatriated; sailing them with reduced crews to a French port in the West Indies; or scuttling them. If Gensoul refused all these options, Somerville would open fire and sink the French ships.

Somerville had the battle cruiser *Hood*, the battleships *Resolution* and *Valiant* (all 3 with a main armament of eight 15-inch guns each), the aircraft carrier *Ark Royal*, 2 light cruisers, and 11 destroyers. Gensoul commanded the modern fast battle cruisers *Strasbourg* and *Dunkerque*, 2 older modernized battleships, 6 superdestroyers, and a seaplane tender, along with some small craft. At nearby Oran were additional warships.

Somerville arrived at Mers-el-Kébir early on 3 July. Gensoul tried to stall negotiations as he signaled for help from

French battleship *Bretagne* on fire and sinking following British shelling at Mers El Kebir, Algeria, 3 July 1940. (Bettmann/Corbis)

nearby French naval forces, while the *Ark Royal's* aircraft dropped five magnetic mines in the harbor entrance. The mining occurred at about 1:30 A.M. After the French signal was intercepted by the British and decoded, London insisted that Somerville act quickly. At dawn, the *Hood* led the *Resolution* and then the *Valiant* in a battle line and opened fire, utilizing spotting aircraft. The French ships were covered in smoke as they attempted to raise steam and leave the harbor. The range fell to about 15,300 yards.

As both sides had been observing each other for hours and taking the range and with the French ships initially stationary, British fire was quite accurate. The confined waters, the process of getting under way, and the location of the Mers-el-Kébir fort on a ridge overlooking the harbor between the opposing ships all conspired to make it difficult for the French ships to return fire accurately. The French managed to straddle the *Hood* with shells once or twice, and some shell fragments hit her and wounded two men, but no other damage was inflicted on the British ships.

The British fired 36 salvos of 15-inch shells. The *Dunkerque*, hit four times and forced to beach, nonetheless managed to fire 40 13-inch rounds. These rounds and the increasing accuracy of the 9.4-inch and 7.6-inch guns of the French coastal batter-

ies forced the British battle line to the west, away from the harbor entrance. On 6 July, British torpedo planes attacked the *Dunkerque*, further damaging her and taking her out of the war for two years.

The *Bretagne* sustained the worst damage. The second British salvo of several shells hit and penetrated her thin deck armor, causing a massive explosion and capsizing her, resulting in the death of her captain and 976 men out of a crew of 1,012. The battleship *Provence* was hit several times and damaged. She later steamed to Toulon for extensive repairs. The French destroyers, meanwhile, proceeded independently to sea; all escaped save the *Mogador*. She was hit on the stern and disabled. The others joined the *Strasbourg*, which fled the harbor and, although chased by the *Hood*, made it to Toulon.

The *Ark Royal* lost three planes during the battle, and 2 of its men were dead. The French had 1,297 men killed and another 351 wounded. Cheering French sailors met the *Strasbourg* at Toulon, though she had lost 5 men due to an engineering accident during her voyage. Two light destroyers from Oran also steamed to Toulon, and the seaplane tender *Commandant Teste* (undamaged in the action) and six Gloire-class light cruisers from Algiers made Toulon on 5 July. The light destroyers and small craft from Mers-el-Kébir had withdrawn

to Algiers, and one sloop, the *Rigault de Genouilly*, was sunk by a British submarine.

The battle was so one-sided because the French were surprised and their ships were at anchor without having their steam up. The fight at Mers-el-Kébir ruptured Anglo-Vichy France relations and almost brought a Vichy declaration of war against Britain. However, despite this episode, which to this day still rankles the French, the French navy honored its pledge not to surrender its ships to the Germans. In November 1942, it scuttled its ships at Toulon rather than see them fall into German hands.

Messe, Giovanni (1883–1968)

Italian army general who took command of the First Italian Army in 1943. Born at Mesagne (Apulia), Italy, on 10 December 1883, Giovanni Messe volunteered for the Italian army in 1902 as a private. As a noncommissioned officer in 1903, he took part in the international intervention in China following the Boxer Uprising. In 1910, he went to the Modena Military School and was commissioned on graduation, thereafter taking part as a lieutenant in the 1911–1912 Italo-Turkish War. During that conflict, he was promoted to captain.

In World War I, Messe was a battalion and Arditi (shock troops) unit commander, distinguishing himself during a successful counterattack in June 1918 on Mount Grappa. In 1920, he fought in Albania as an assault unit commander. Promoted to colonel, he was assigned to the War Ministry, and from 1935, he commanded the Celere Brigade (a mobile unit). He took part in the 1935–1936 Ethiopian Campaign as a brigadier general and deputy commander of the Cosseria Division, and on his return to Italy, he was named deputy commander of mobile troops. In April 1938, Messe took command of the 3rd Celere Division. He was then sent to Albania as deputy commander of occupation troops. On 21 December 1940, following Italy's invasion of Greece, Messe was assigned command of the Special Army Corps, formed to check the Greek counteroffensive.

In July 1941, Messe was promoted to temporary lieutenant general and assigned to the Soviet Union as commander of the

Corpo di Spedizione in Russia (CSIR, Expeditionary Corps in Russia). In July 1942, Messe's unit was renamed the XXXV Corps, and he continued as its commander. Promoted to full general on 31 January 1943, he was assigned to Tunisia as commander of the First Italian Army, which included the Italian units formerly under Field Marshal Erwin Rommel's command. On 8 May 1943, following a number of defensive battles, First Army surrendered to the Allies. Messe had been promoted to marshal a few days before the surrender. Repatriated on his demand in November 1943, he was appointed chief of staff of the new Italian army on the Allied side. He held this post until 1945. Messe wrote two books of memoirs. Probably the best Italian army senior commander of the war, he was widely respected by his own troops and his German allies.

In 1953, Messe entered the Italian Parliament as a senator in the Christian Democratic Party. Two years later, he founded and became the head of the Unione Combattenti d'Italia (UCI, Italian Veterans Association), which had a strong monarchist bent. In 1957, he was elected to Parliament as a member of the Monarchical Party, and in 1963, he was elected to the same body as a representative of the Liberal Party. Messe died in Rome on 18 December 1968.

Messerschmitt, Wilhelm “Willy” Emil (1898–1978)

German aircraft designer and developer of the most widely produced World War II aircraft. Born in Frankfurt-am-Main, Germany, on 26 June 1898, Willy Messerschmitt developed a relationship with early German glider pioneer Friederich Harth. Together, they designed and built numerous gliders before Harth was mobilized for World War I. In 1916, Messerschmitt was drafted for military service but was discharged for medical reason a year later. Following the war, he continued his engineering studies and graduated from the Technische Hochschule in Munich.

Endeavoring to capitalize on the growing glider craze in Germany, Messerschmitt founded his own company, Flugzeugbau Messerschmitt. After some success with powered designs, he entered into a partnership with Bayerische

German aviation designer and production chief Wilhelm Messerschmitt, ca. 1940. (Photo by Hulton Archives/Getty Images)

Flugzeugwerke (BFW) in 1927. BFW's big opportunity came in 1934 after Adolf Hitler rose to power and began to rearm Germany. Messerschmitt's low-wing monoplane, the Bf-109, won a competition that also involved German aviation giants Heinkel, Arado, and Focke-Wulf. The Bf-109 became the most widely produced fighter of World War II. Between 1939 and 1945, more than 33,000 were built.

Messerschmitt's company also pioneered developments in jet- and rocket-propelled aircraft. The Me-163 Komet rocket-powered fighter was the first of its type in the war. On 28 July 1944, it attacked Boeing B-17s from the U.S. Army Air Forces (USAAF) over Merseburg, beginning a new phase of air warfare. Much more successful was the Me-262. Entering service in the autumn of 1944, it was the world's first operational jet fighter. However, this plane appeared too late in the war and in insufficient quantity to have a major impact.

After the war, Messerschmitt was arrested and imprisoned for employing slave labor. Released after two years in prison, he began to rebuild his business, beginning with sewing machines, housing, and a compact car. In 1958, he resumed work in aviation, combining with two other manu-

facturers to form Messerschmitt-Bolkow-Blohm. Messerschmitt was honorary chairman of this company until his death in Munich, Germany, on 15 September 1978.

Metaxas, Ioannis (1871–1941)

Greek army general and dictator of Greece from 1936. Born on the island of Ithaca on 12 April 1871, Ioannis Metaxas was commissioned in the army on graduation from the Greek Military Academy in 1890. Following service in the 1897 Greco-Turkish War, he studied in Berlin. Metaxas served on the Greek General Staff during the 1912–1913 Balkan Wars. He became army chief of staff in 1913.

Greek dictator Ioannis Metaxas. (Hulton-Deutsch Collection/Corbis)

At the beginning of World War I, Metaxas favored an alliance with the Central Powers. A staunch monarchist, he left Greece following the forced abdication of King Constantine in 1917 and returned with the king three years later. Metaxas entered the Greek Parliament in 1926, and in 1936, he seized power and became dictator, with the justification of preventing a communist takeover. During his rule, the Greeks successfully repelled the Italian invasion that began in October 1940 and indeed went on the offensive the next month, occupying much of Albania. Metaxas died on 29 January 1941, before Germany intervened in Greece.

Metz, Battle of (19 September–22 November 1944)

One of the few siege-warfare battles of the Western Front in Europe during World War II and the most costly single battle of the war for the U.S. Third Army. Lying in the Moselle River valley in Lorraine, Metz was in the path of Lieutenant General George S. Patton’s U.S. Third Army in its quest to reach the Rhine. Bypassing Metz would lengthen the Third Army supply lines by some 100 miles. Furthermore, Metz lay astride one of the principal invasion routes between Germany and France and would be an important staging point for an Allied drive into Germany through Trier, the Kaiserslauten Pass, and the Saverne gap.

Metz had long been a key fortress, and its defenses faced in both directions. The strongest defenses actually faced west. As part of the prewar French Maginot Line fortress system, Metz had an inner circle of 15 forts and a perimeter defense of 28 steel and cement bastions. The Germans had added a number of 210 mm and 105 mm guns in revolving steel turrets, which could withstand direct fire. The defense of Metz was entrusted to Generalleutnant (U.S. equiv. major general) Heinrich Kittel’s 14,000-man 462nd Volksgrenadier Division.

On 10 September, 12th Army Group’s commander, Lieutenant General Omar N. Bradley, ordered Patton’s Third

Army to advance toward Mainz and Mannheim, Germany. With little knowledge of the fortifications in his path, Patton assigned the capture of Metz to Major General Walton Walker’s XX Corps. Walker ordered the 5th and 90th Infantry Divisions, supported by the 81st Chemical Mortar Battalion, to take the fortress. The American attack on the outer ring of the German defenses began on 27 September, with 5th Division carrying the brunt of the attack.

Without major preparations, the Americans mounted a frontal assault into the area of greatest German strength and were repulsed. Even the addition of a combat command of the 7th Armored Division failed to dislodge the Germans. The battle then disintegrated into a protracted siege, similar to the static warfare of World War I. Fall rains worsened conditions, turning the ground to mud. Although air support was called in, 500 lb bombs had little effect on the German fortifications. The Americans utilized smoke screens as they moved to take the villages around the forts, but all attempts in September and early October to take the fortress failed, and the rains continued amid mounting American casualties. Patton’s efforts were also handicapped by the shift in logistics support to the north for Operation MARKET-GARDEN, the failed effort to secure a crossing over the Rhine at Arnhem.

Between 3 and 15 October, the 5th Infantry Division again tried to take the forts through direct assault but failed. The centerpiece of that effort was Fort Driant, the newest and most powerful of the Metz forts. In addition to infantry and tank destroyers, Walker employed 23 battalions of artillery. The assaulting infantry battalion took 50 percent casualties before the attack was canceled.

Third Army was reequipped and resupplied for the November general offensive, and XX Corps was reinforced by the addition of the 95th Infantry and 10th Armored Divisions. The offensive opened on 9 November with a diversionary attack by the 95th Infantry Division on Maizières-les-Metz, distracting the German defenders. Walker then slipped his 90th Infantry and 10th Armored Divisions farther north and crossed the Moselle River, taking Fort Königsmacker. The forces then captured Forts Valstrofe and Distroff. The 90th Infantry Division now closed on Metz from the north, the 95th Infantry from the west and northwest, and the 5th Infantry Division from the south and southwest. This time, the Americans abandoned costly frontal assaults in favor of bypassing strong points and then reducing them with demolition charges.

The first American troops entered Metz on 17 November. The Germans managed to remove some of their defenders from the city, in defiance of Adolf Hitler’s orders that it be held to the last, until the escape hatch was closed by the linkup of the 5th Infantry and 90th Infantry Divisions east of Metz on 19 November. Although Metz surrendered two days later, some Germans chose to obey Hitler and fight on. The last

Metz fort, Jeanne d'Arc, did not surrender until 13 December. Following the fall of Metz, the next U.S. objective was the Siegfried Line.

Mexico

When World War II began in Europe, the controversial administration of Mexican President Lázaro Cárdenas (1934–1940) was coming to an end, and there was considerable uneasiness over the approaching presidential elections in 1940. Mexico's new president following the 1940 elections was the moderate General Manuel Avila Camacho, who had served as Cárdenas's minister of war. Avila Camacho's presidency (1940–1946) encompassed the entire wartime period.

Although the Mexican people were initially divided over which side to support in the conflict, Avila Camacho followed a strongly pro-Allied course from the beginning of his administration. After the U.S. entry into the war in December 1941, Mexico quickly broke diplomatic relations with Germany, Japan, and Italy. The Mexican government also froze Japanese assets and ordered all Axis nationals out of coastal and defense

Bracero program laborers harvesting carrots in 1942. (National Archives/Corbis)

areas. There was, however, little domestic support for a declaration of war. It was not until German submarines sank two Mexican oil tankers that Mexico declared war in May 1942.

Mexico's involvement in the war meant closer relations with the United States. Washington wanted bases for U.S. troops in Mexico, whereas Mexico wanted economic and military aid. The United States never got the type of base agreement it sought, but there was close cooperation between the two countries in military matters. Mexico received military aid under the U.S. Lend-Lease program, and the two nations established a joint defense committee to coordinate military activities. Mexico also established an obligatory military service law, affecting men between the ages of 18 and 45.

Mexico was one of only two Latin American countries (Brazil being the other) to furnish combat troops; Mexico provided the 201st Fighter Squadron, which was equipped with U.S. aircraft and trained in Texas. The 201st served in the Philippines Campaign and had two men killed in training and five in combat. A more important form of military cooperation was the U.S.-Mexico agreement permitting the United States to draft Mexican citizens residing in the United States and even to recruit in Mexico itself. As a result, some 250,000 Mexicans served in the U.S. armed forces during the war, with 14,000 seeing combat. Mexican combat veterans received some 1,000 Purple Hearts and 1 Medal of Honor.

Mexico's wartime response also involved internal security measures. Mexico adopted a program of surveillance, relocation, and deportation aimed at Axis nationals. The Mexican government forcibly relocated Japanese and Japanese Mexicans living in coastal areas and along the U.S. border. Several German agents were detained, and Axis nationals who could not prove Mexican citizenship were deported.

Mexico's greatest contribution to the war was economic. The country provided a variety of strategic materials needed for the war effort: copper, oil, lead, mercury, and zinc. Agricultural products also figured prominently in exports, even though Mexico experienced problems in feeding its own people during the war. Mexico helped to relieve labor shortages in the United States by agreeing to the *bracero* (day laborer) program, a government-regulated system of contract labor under which Mexican workers found employment in the United States. Originally intended to meet the need for agricultural laborers in the U.S. Southwest, the program was expanded in 1943 to include nonagricultural workers as well. Some 300,000 Mexicans worked under the program during the war years. The war had negative economic consequences for Mexico as well; austerity measures, inflation, and rationing affected the daily lives of its citizens. In June 1944, the Avila Camacho administration even suspended the traditional siesta, the afternoon closing of offices and businesses.

World War II had a profound and long-term impact on Mexico's domestic and foreign policies. The war was particu-

larly important in promoting the government's new development approach, with its emphasis on rapid industrialization based on import substitution. The close military ties between Mexico and the United States did not continue after the war, but the already intimate economic connection became even more pronounced. The *bracero* program—conceived to meet a wartime need—continued until 1964. World War II confirmed and increased the dominant role played by the United States in the Mexican economy.

Middleton, Troy Houston (1889–1976)

U.S. Army general and commander of the First Army's VIII Corps at the end of the war. Born near Georgetown, Mississippi, on 12 October 1889, Troy Middleton graduated from Mississippi A&M College in 1909 and enlisted in the U.S. Army the following year. He received a commission in 1912. Middleton served on the Mexican border in 1916, and during World War I, he commanded both the 39th and 47th Infantry Regiments in combat, becoming the youngest colonel in the American Expeditionary Forces (AEF). Future General of the Army George C. Marshall considered Middleton "the outstanding infantry regimental commander on the battlefield in France."

Following the war, Middleton served in the U.S. occupation forces in Germany. Reduced to his permanent rank of captain on his return to the United States, he taught at the Infantry School at Fort Benning. He graduated from the Infantry Advanced Course in 1922, the Command and General Staff School in 1924, and the Army War College in 1929. Forced to resign from the army in 1937 because of an irregular heartbeat, Middleton became the dean of administration at Louisiana State University (LSU). The university president was discovered embezzling funds in June 1939, and Middleton was appointed acting vice president and comptroller, bringing the school out of the crisis.

Because of physical problems, including an arthritic knee, Middleton was not recalled to active duty with the army as a lieutenant colonel until January 1942. In June, he was pro-

moted to brigadier general and became assistant commander of the 45th “Thunderbird” Division. In October 1942, he took command of the division, leading it in the invasions of Sicily and Salerno.

Although hobbled by trouble in his “good” knee, Middleton was appointed to command VIII Corps of General Omar N. Bradley First Army in March 1944, and he led it to the end of the war. His corps played a significant role in the Ardennes Offensive (Battle of the Bulge). Later, suspecting that the Germans had few men in Koblenz, he made a successful surprise attack on the city. His corps crossed the Rhine near the well-known Lorelei—something no other invader had ever attempted because of the unfavorable terrain. Finally, his corps met Soviet forces near the Czech border between Chemnitz and Plauen.

Despite being one of the best U.S. corps commanders in the European Theater, Middleton was not promoted to lieutenant general until June 1945. Retiring from the army that August, he returned to LSU as comptroller, then served as president from 1951 to 1962. Middleton died in Baton Rouge, Louisiana, on 9 October 1976.

Midway, Battle of (3–6 June 1942)

Decisive naval engagement of World War II that turned the tide of the war in the Pacific. Beginning in January 1942, the Japanese attempted to extend their defensive perimeter by seizing bases in Papua and New Guinea and in the Solomon Islands, which would be used to support future operations against New Caledonia, Fiji, and Samoa. By early March, they had taken the entire north coast of Papua and New Guinea and begun preparations for an amphibious invasion of Port

Moresby. On 7–8 May, these events resulted in the Battle of the Coral Sea when the Japanese invasion force encountered an American carrier force. In the first naval battle in which neither fleet sighted the other, the aircraft carrier *Lexington* was sunk and the carrier *Yorktown* was heavily damaged. However, the Japanese had their light carrier *Shoho* sunk, and the loss of its air cover caused the invasion force to turn back. At the same time, the Americans damaged the carrier *Shokaku*. The Americans were able to repair the *Yorktown* in time for the next battle, whereas *Shokaku* could not be readied for that second and decisive fight. The second carrier, *Zuikaku*, also did not participate due to a shortage of aircraft. Thus, on balance, the Battle of the Coral Sea was a strategic U.S. victory.

A second battle soon developed after the Japanese turned their focus on the strategic island of Midway. Despite the setback at Coral Sea, the Japanese continued with their plans to seize Midway Island and bases in the Aleutians. Admiral Yamamoto Isoroku, commander in chief of the Combined Fleet, convinced the Imperial General Staff that the capture of Midway would allow Japan to pursue its Asian policies behind an impregnable eastern shield of defenses in the Central Pacific. The capture of Midway would serve as a dramatic response to the April 1942 U.S. raid on Tokyo. It would also deprive the United States of a forward base for submarines, and it would be a stepping stone for the capture of Hawaii.

A TURNING POINT
Battle of Midway

At the beginning of June 1942, the Imperial Japanese Navy (IJN) held the initiative at sea in the Pacific Theater. For six months after the successful Japanese attack on Hawaii on 7 December 1941, the Japanese enjoyed a string of stunning victories. All this changed with the Battle of Midway between 3 and 6 June.

In the Battle of the Coral Sea in May, the Japanese gained a slight tactical victory but suffered a strategic rebuff in that they called off their invasion of Port Moresby in New Guinea. Moreover, two of their aircraft carriers involved in the battle were unable to participate at Midway. The Coral Sea battle was, however, another inducement for the Japanese to move against Midway.

The commander of the IJN Combined Fleet, Admiral Yamamoto Isoroku, developed the overly complex and polycentric Midway operation. Drawing on Japanese naval successes to that point in the war, he and his advisers were overconfident and tended to denigrate U.S. capabilities, which would prove to be a key factor in their defeat in the approaching battle. According to his plan, Yamamoto expected to capture Midway and several islands in the Aleutian chain to expand the Japanese defense perimeter. The most important part of the plan, however, was to entice the U.S. fleet (especially the carriers) into a major sea engagement in which it would be destroyed. Yamamoto then hoped to use Midway as a base of operations for an invasion of Hawaii. At the least, he expected the island to provide Japan with an important airstrip that could be used for surveillance of the U.S. fleet.

For this operation, Yamamoto assembled the largest task force in the 70-year history of the Japanese navy and the greatest armada to date in the Pacific

Ocean. Although the Americans were greatly disadvantaged in terms of numbers of ships, the Pacific Fleet commander, Admiral Chester W. Nimitz, had a tremendous advantage in that the Americans were able to read IJN radio transmissions and thus gain a good idea of Japanese intentions. Nonetheless, given the sharp difference in military strengths in the battle, there was no guarantee that the engagement would end as it did. Indeed, luck played a pivotal role, for the U.S. dive-bombers caught the Japanese carriers at their most vulnerable time, while their aircraft were on deck being rearmed.

The Battle of Midway, in which the Japanese lost four fleet carriers and the Americans only one, was a major defeat for Japan and one of the few true turning points in the war. In addition to the carriers, the Japanese also lost many of their superbly trained and experienced pilots and aircrew, as well as most of the trained aviation support and maintenance personnel. The IJN fleet's air arm never recovered from these losses, especially since the Japanese did not have an effective pilot-replacement system.

The victory was also a stunning psychological defeat for the Japanese. Overconfidence gave way to something akin to despair. The consequences of the battle were, in fact, considered so devastating to morale that the military and government went to extraordinary lengths to conceal the outcome from the Japanese people.

Midway did not mark the end of the Japanese navy as an effective fighting force, but it did end its absolute dominance at sea. The loss of four fleet carriers and their air complements meant that Japanese ascendancy in battleships and cruisers counted for little because

these surface ships would be forced to rely on Japanese land-based aircraft for protection.

The Battle of Midway gave the Americans an invaluable breathing space until late in 1943 when the new Essex-class fleet carriers became available. Only two months after the battle, U.S. forces launched their counteroffensive with the invasion of Guadalcanal on 7 August 1942. Midway was, as Nimitz himself put it, "the battle that made everything else possible."

A Japanese *Mogami*-class heavy cruiser after having been attacked by U.S. carrier-based naval aircraft during the Battle of Midway. (Library of Congress)

Perhaps most important, it would draw out the U.S. aircraft carriers, giving the Japanese the opportunity to destroy them.

Admiral Yamamoto sent out the bulk of the Japanese fleet. For the operation, he would use some 200 ships—almost the entire Japanese navy—including 8 carriers, 11 battleships, 22 cruisers, 65 destroyers, 21 submarines, and more than 600 aircraft. His plan called for diversionary attacks on the Aleutian Islands both to distract the Americans from Japanese landings on Midway and to allow the Japanese to crush the U.S. reaction force between their forces to the north and at Midway. The Aleutian operation would also secure the islands of Attu and Kiska, placing forces astride a possible U.S. invasion route to Japan.

Yamamoto correctly assumed that the U.S. Pacific Fleet commander, Admiral Chester W. Nimitz, would have to respond to a landing on Midway. When the Pacific Fleet arrived in the area, Japanese carrier and battleship task forces, waiting unseen to the west of the Midway strike force, would fall on and destroy the unsuspecting Americans. Yamamoto believed that the *Yorktown* had been sunk in the

Coral Sea fight and that the *Enterprise* and *Hornet* were not likely to be in the Midway area when the strike force attacked the island. He was not correct. This miscalculation was one of several breakdowns in Japanese intelligence and communication that contributed to the eventual American victory.

For the Aleutians, Yamamoto committed an invasion force of 2,400 men in three escorted transports, a support group of two heavy cruisers and two light carriers, and a covering force of four older battleships. The battle began in the Aleutians with air strikes on 3 June, followed by landings three days later. The Aleutian phase of the operation went well for the Japanese. Carrier aircraft inflicted heavy damage on the U.S. base at Dutch Harbor, and the Japanese then made unopposed landings on Kiska and Attu. They kept this toe-hold on continental U.S. territory until mid-1943.

Despite the Japanese success in the Aleutians, the action there proved to be superfluous to the coming battle at Midway. U.S. intelligence had broken the Japanese naval code, putting the basic outlines of the Midway plan into American hands and thus allowing the Americans to disregard the attacks on the

U.S. Navy Douglas SBD Dauntless dive bombers shown during the attack on the Japanese fleet off Midway, 4–6 June 1942. Visible in the center is a burning Japanese ship. (National Archives)

Aleutians in favor of concentrating on Midway. The Pacific Fleet was ready with three fleet aircraft carriers, including the *Yorktown*. She had been hastily repaired at Pearl Harbor to allow operations in only 2 days instead of an estimated 90 and was sent back to sea with an air group formed of planes from other carriers. She sailed just in advance of a picket line of Japanese submarines that Yamamoto hoped would intercept ships departing Pearl. The U.S. ships were concentrated in an ambush position some 350 miles northeast of Midway, awaiting the westward advance of Yamamoto's armada.

On 3 June, American naval reconnaissance planes sighted, at a distance of 600 miles, the Japanese armada of some 185 ships advancing on Midway. The battle began when Boeing B-17 Flying Fortress bombers from Midway Island struck without effect at the Japanese carrier strike force, about 220 miles southwest of the U.S. fleet. That same night, four Consolidated patrol bombers (PBYS) from Midway staged a torpedo attack and damaged an oiler, although she was able to regain her place in the formation.

Early on 4 June, Nagumo sent 108 Japanese planes from the strike force to attack and bomb Midway, while the Japa-

nese carriers again escaped damage from U.S. land-based planes. However, as the morning progressed, the Japanese carriers were soon overwhelmed by the logistics of almost simultaneously sending a second wave of bombers to finish off the Midway runways, zigzagging to avoid the bombs of attacking aircraft, and rearming to launch planes to sink the now sighted U.S. naval forces. American fighters and bombers, sent from Midway airfields, and aircraft from three U.S. carriers attacked the Japanese fleet. But three successive waves of U.S. torpedo-bombers were virtually wiped out during their attacks on the carriers from 9:30 to 10:24 A.M.: Japanese fighters and antiaircraft guns shot down 47 of 51 planes. The Japanese now believed that they had won the battle.

The Japanese First Air Fleet commander, Nagumo Chūichi, had ordered planes returning from strikes on Midway to rearm with torpedoes to strike the American ships. But as this effort was in progress at about 10:30 A.M., 37 dive-bombers from the carrier *Enterprise* at last located the Japanese carriers in their most vulnerable state, while their decks were cluttered with armed aircraft, ordnance, and fuel. The Japanese fighters in the air were also down low, having dealt with the torpedo-bomber

attacks. Within the span of a few minutes, three of the four Japanese carriers—the *Soryu*, *Kaga*, and *Akagi*—were in flames and sinking. Planes from the only intact Japanese carrier, the *Hiryu*, now struck back, heavily damaging the *Yorktown*. In late afternoon, the *Hiryu* also was hit and badly damaged. The Japanese abandoned her the next day.

During the battle between the U.S. and Japanese naval forces, the two fleets neither saw each other nor exchanged gunfire; all contact was made by Japanese carrier-based planes and American land- and carrier-based aircraft. Yamamoto’s first reaction on learning of the loss of three of his carriers was to bring up his battleships and recall the two light carriers from the Aleutians in hopes of fighting a more conventional sea battle. But the loss of the *Hiryu* and Nagumo’s gloomy reports led him to call off the attack on Midway. Yamamoto still hoped to trap the Americans by drawing them westward into his heavy ships, but the U.S. task force commander, Rear Admiral Raymond Spruance, refused to play his game and reported to Nimitz that he was unwilling to risk a night encounter with superior Japanese forces. By the night of 6 June, the Battle of Midway was over. It had been costly for Japan. In the battle itself, the Japanese had lost 4 fleet aircraft carriers and 332 aircraft, most of which went down with the carriers. The Japanese also had a heavy cruiser sunk and another badly damaged. Three destroyers and a fleet oiler were damaged as well, and a battleship was slightly damaged. The Americans lost the aircraft carrier *Yorktown*, 1 destroyer, and 147 aircraft (38 of these being shore based).

The Japanese navy was still a formidable fighting force, but once it lost the four fleet carriers and their well-trained aircrews and maintenance personnel, the continued Japanese preponderance in battleships and cruisers counted for little. The subsequent Japanese defeat in the protracted fight for Guadalcanal was due principally to a lack of air assets. It can be reasonably stated that the Battle of Midway was indeed the turning point of the long struggle in the Pacific Theater.

Mihajlović, Dragoljub “Draza” (1893–1946)

Yugoslavian army officer and guerrilla leader. Born at Ivanjica, Serbia, in 1893, Dragoljub Mihajlović, nicknamed “Draza,” entered the military academy in Belgrade in 1908 but interrupted his studies to serve with distinction in the 1912–1913 Balkan Wars and World War I. Mihajlović rose to the rank of colonel and was, for a time, inspector general of fortifications. When the Germans invaded Yugoslavia in April 1941, he organized resistance to the Axis occupation forces in the mountains of western Serbia.

Mihajlović’s Četniks (Chetniks, named after the Serbian guerrillas who had fought the Turks) were mostly promonarchist Serbs. Mihajlović was promoted to general in December 1941, and in June 1942, he became minister of war in King Peter II’s Yugoslav government-in-exile.

Already reluctant to pursue a vigorous campaign against the Axis occupation forces lest he provoke reprisals against Yugoslav civilians, Mihajlović correctly understood that a rival resistance group, the procommunist Partisans led by Josip Broz (Tito), posed a greater threat to the restoration of a Serb-dominated monarchy than did the Axis powers, especially as Tito and most of his followers were Croats, the Serbs’ traditional rivals for power. Accordingly, Mihajlović and Tito focused on fighting each other rather than the Germans and Italians, with whom they both also collaborated when it suited their purposes.

At first, the Četniks enjoyed Allied support, but Mihajlović was systematically discredited by communist sympathizers among the British. Pressured by Soviet leader Josef Stalin at Tehran, the Allies agreed to shift their support to Tito. In December 1943, the British halted all aid to the Četniks, and in May 1944, King Peter formed a new government and named Tito as minister of war.

Abandoned by the Allies, the Četniks were soon overpowered, and Mihajlović went into hiding. He was captured by the communists on 13 March 1946, tried for collaboration with the Axis powers, and, despite protests by Western governments, executed in Belgrade on 17 July 1946. In March 1948, U.S. President Harry S Truman secretly awarded Mihajlović the Legion of Merit for rescuing some 500 Allied airmen and for his role in helping to defeat the Axis powers.

Mikołajczyk, Stanislaw (1901–1966)

Polish political leader and premier of the Polish government-in-exile in London. Born on 18 July 1901 at Holsterhausen in Westphalia, Germany, Stanislaw Mikołajczyk was an active member of the insurrectionist Sokoly movement during the 1918–1919 uprising against the Germans in Wielkopolska (Great Poland). In 1920, he graduated from agricultural secondary school and became a private in the Polish army, participating in the Russo-Polish War (1919–1921). In 1922, he joined the large, moderate-rightist Polish Peasants' Party (PSL), and in 1927, he helped found the Wielkopolska Union of Rural Youth in Poznan.

Mikołajczyk emerged as a major figure in Polish politics as he rose through the ranks of the PSL, serving as a Parliament member from 1930 to 1937 and leading peasant strikes in 1937. He fought as a private in the campaign of September 1939, after which he was interned in Hungary before escaping to France on Poland's defeat. From December 1939, he was vice president of the Polish National Council in Paris (the Parliament-in-exile) until his evacuation to London on Germany's occupation of France.

In 1941, Mikołajczyk was appointed deputy premier and minister of the interior in General Władysław Sikorski's Polish government-in-exile in London (the London Poles). One of his principal tasks was to maintain ties with the resistance in Poland. On Sikorski's death in July 1943, Mikołajczyk replaced him as premier. He lacked the national prestige of his predecessor, but he also inherited an impossible political situation, with the Soviet Union demanding that the Curzon Line set by the Allied powers after World War I be made the new eastern border of Poland. The November 1943 Tehran Conference made clear the difficult diplomatic situation in which the London Poles were placed.

In October 1944, British Prime Minister Winston L. S. Churchill traveled to Moscow and met with Soviet leader Josef Stalin. They invited a delegation from the London Poles, including Mikołajczyk, to join them for discussions with Soviet leaders and members of the rival, Soviet-sponsored Lublin Polish Committee (the Lublin Poles), in what was to be a final opportunity for reconciliation. Mikołajczyk was open to some com-

promise, but his colleagues among the London Poles were not. Frustrated by his own increasingly fractious government and the lack of Allied support for the Warsaw Rising, Mikołajczyk resigned on 24 November 1944. Moscow then broke off relations with the London-based government-in-exile.

Probably no genuinely representative Polish government would have been prepared to yield the concessions or exhibit the spirit requisite for Soviet security. Strong British and U.S. pressure, especially at the February 1945 Yalta Conference, induced the communists to admit Mikołajczyk (as deputy premier) and three other representatives to the government, and the West then reluctantly recognized the Lublin Poles as the legal government.

Not until January 1947 did the Polish regime feel confident enough to call elections. The old Polish Peasants' Party had been so completely infiltrated that, on his return to Poland, Mikołajczyk started a new peasant organization, known as the Polish People's Party. The government directed its full attention against it and Mikołajczyk, branding him a British agent or worse. Given the circumstances, no one was surprised when the government bloc, which included the nominal participation of several captive parties, won 394 out of 444 seats in the Parliament.

In October 1947, Mikołajczyk fled Poland, which was completely dominated by the communists by then. Mikołajczyk reached New York in November 1947 and settled in the United States, continuing to champion the Polish cause in exile. He died in Chevy Chase, Maryland, on 13 December 1966.

Milch, Erhard (1892–1972)

German air force general who was instrumental in developing the Luftwaffe. Born on 30 March 1892 in Wilhelmshaven, Germany, Erhard Milch enlisted in the German army in 1910, rising to the rank of lieutenant in the artillery. He became an air observer in 1915, and although not a pilot, he received command of a fighter squadron as a captain in October 1918.

Milch resigned from the army in 1921 to pursue a career in civil aviation and rose to be the chief executive of Lufthansa, the German national airline. He became close friends with Hermann Göring in the process, and when the latter was appointed Reich commissar for air, Milch followed as his secretary of state. Milch is widely credited for laying the organizational groundwork for the Luftwaffe during this period. In many ways, he was the man who built the Luftwaffe into the world's most powerful air force by 1939, but he also shared responsibilities for its shortcomings during the war. Although not technically a member of the armed forces from 1921, Milch was made a Generalmajor (U.S. equiv. brigadier general) in 1934, a Generalleutnant (U.S. equiv. major general) in 1935, and Generaloberst (U.S. equiv. full general) in 1938.

He was named inspector general of the Luftwaffe in 1939, and his lone field command of the war came in 1940 when he directed Fifth Air Force in Norway. For this service, he earned the Knight's Cross and was promoted to field marshal by Adolf Hitler in July 1940. Milch advised an immediate descent on Britain following the evacuation of the British Expedi-

tionary Force (BEF) at Dunkerque, but the idea was rebuffed by Hitler. Milch also expressed grave reservations about attacking the Soviet Union but was again ignored. Following the suicide of Ernst Udet in 1941, he took over his position as director of air armament. He then tripled aircraft production and improved aircraft maintenance procedures. Milch found himself increasingly estranged from both Göring and Hitler, who disliked his realistic assessments. They also rejected his belief that Germany's survival lay in having large numbers of fighters to protect industrial production.

Milch pushed development of new aircraft, but Göring removed him from his posts in July 1944. Taken prisoner by the British in May 1945, he was sentenced to life imprisonment for war crimes, chiefly the use of forced labor in production. He was released from prison in 1954 and died on 25 January 1972 in Wuppertal-Barmen, Germany.

Military Medicine

Military medicine during World War II was marked by advances in triage and transport, management of shock, and treatment of infectious diseases. The war also witnessed the emergence of aviation and submarine medicine and the misuse of human experimentation, resulting in new standards for medical research.

Better transportation and triage were made possible by improved triage systems dating to World War I. By 1939, military surgeons recognized the importance of early management of battlefield trauma. Medics trained and equipped to control blood loss and administer analgesics at the initial site of injury were attached to individual combat units. Injectable morphine dispensed on the battlefield lessened both pain and shock during evacuation. Taking the model developed by the Royal Army Medical Corps, transport from the field was organized in stages, with each step assigned a specific range of duties.

The first stop after field stabilization was the regimental collecting station, where hemostatic bandages and splints could be applied. The collecting stations also had plasma or blood available to manage shock, and staff there could secure adequate ventilation, including tracheostomies if needed. From the collecting station, men could be moved to semimobile field

An American soldier wounded by shrapnel being given a blood plasma transfusion during the campaign of Sicily, July 1943. (Library of Congress)

hospitals equipped to perform emergency surgery. The field hospitals were the first stage fully staffed with physicians. From the field hospital, men could be moved to fixed-station or general hospitals, where more complex procedures (neurosurgery, chest surgery, orthopedic reconstructions, and the like) could be performed and where men expected to return to duty could convalesce. General and rehabilitation hospitals in the zone of the interior could provide major reconstruction (predominantly orthopedic and plastic surgical procedures) and long-term rehabilitation if necessary. Depending on the severity of the injury, a wounded man could exit the system and return to duty at any point in the chain.

Semimobile medical units were linear descendents of the French *auto-chir*, a World War I attempt to create motorized field hospitals. A high level of mobility was less important in that relatively stationary war, and development of the freely movable hospital only blossomed in World War II. These “auxiliary surgical teams” remained somewhat difficult to transport and were limited in the services they could provide,

but they were an important interim step toward the mobile army surgical hospitals (MASH units) of Korea and Vietnam.

Aeromedical evacuation, although tried in a crude way in World War I, came into its own in World War II. The process largely involved the use of fixed-wing aircraft (for U.S. forces, mostly C-47s, C-54s, and C-54As) to move men from field or general hospitals to facilities in the zone of the interior. Medical air transport became especially sophisticated in the long distances of the Pacific war, where the U.S. Army Nurse Corps developed the expertise in managing patients during prolonged transit that engendered current civilian and military flight nurses.

The island war in the Pacific presented unique problems in medical evacuation: the distances were inordinately long, and there was almost never an accessible general hospital to augment basic field hospital care. Although hospital ships had been used since the mid-1800s and had reached a high degree of sophistication under the Japanese in their war with Russia, the U.S. Navy employed them to unprecedented advantage in World War II. At the beginning of the war, the

navy had only two hospital ships (the *Relief* and the *Solace*), and only one of these was in the Pacific. During the war, the United States commissioned an additional eight hospital ships and developed an entire class of troop transports equipped to provide limited hospital services. The navy also deployed a series of adapted landing craft—LST(H)s (landing ships, tank [hospital])—manned with 4 surgeons and 27 corpsmen and capable of serving as a field hospital for up to 350 wounded. Hospital ships, required by the navy to be held well back from areas of direct combat, served essentially the same role as land-based general hospitals.

Although some new surgical techniques, particularly in vascular surgery, were developed during the war, the primary advances were in the early management and treatment of physiologic effects of trauma. As noted, medics made almost immediate hemostasis and pain management a standard. Understanding of the mechanisms and treatment of shock came early in the war. Shock is clinically characterized by a fall in blood pressure, a rise in the pulse, coolness and discoloration of poorly perfused extremities, and mental changes ranging from anxiety through confusion to coma. The syndrome's common denominator is failure of the heart and circulatory system to supply adequate blood to the body's organs. In the early years of the war, clinicians first realized that poor perfusion was the common factor in various types of shock. Blood loss, loss of body fluid such as that caused by weeping burn wounds, sepsis with its toxic bacteriologic by-products, and extreme cold can all cause the circulatory system to fail. The physiologic effects of that failure can (at least temporarily) be ameliorated by increasing the amount of fluid in the system.

Soviet scientists in the 1930s had shown that plasma—blood with the red cells removed—could be effectively used to treat shock. Plasma had two signal advantages: unlike whole blood, it was not type-specific, and it could be readily stored for long periods. Plasma could be started by medics at the front, and it was widely administered from the early days of the war.

Recognizing the need for blood and plasma, the British started a national blood-banking program early in the war, a collection and storage system the Americans later adopted, enlarged, and improved. As the war progressed, plasma's limitations as a replacement for lost blood became evident, and the use of whole blood to treat shock became more prevalent. Although civilian donors played a major role in supplying the blood banks, most donations came from combatants themselves, with medics providing a disproportionate share. In addition to whole blood, military surgeons had cardiac stimulants and vasoconstrictors, such as adrenaline and ephedrine, to augment perfusion.

Military medicine also saw significant advances in the management of infectious diseases during World War II.

These improvements primarily involved the treatment and control of tropical diseases, control of diseases resulting from poor sanitation aggravated by dietary deficiency, and chemical treatment of infections.

The Pacific war forced Japanese and Allied soldiers to fight in areas where tropical infections, especially malaria, were endemic. In the latter part of 1942 and early 1943, American soldiers in the Solomons were hospitalized for malaria at a rate of 970 per 1,000 per year, with 100,000 men ultimately contracting the disease. The unacceptable loss of fighting men led General Douglas MacArthur to form the Combined Advisory Committee on Tropical Medicine, Hygiene, and Sanitation. The committee used preventive measures to bring an 85 percent decrease in the hospitalization rate within six months.

When the war started, quinine was the agent of choice in treating malaria, but the Japanese captured the drug's major sources of supply. The antimalarial Atabrine was developed as a synthetic substitute, and although soldiers had to be forced to take it because of its bitter taste and tendency to turn the skin yellow, 2.5 billion doses had been dispensed by war's end.

Vigorous efforts were used to control the anopheles mosquito that carried the disease, including oil coating of breeding ponds and spraying with the newly developed chemical insecticide DDT. As a result of these preventive measures, less than 1 percent of hospitalized American personnel had malaria by the end of 1943. The Japanese did not do as well. They had access to quinine but were ineffective in distributing it. In addition, their soldiers were often underfed, and their rice-based diet resulted in vitamin deficiencies—particularly B1 deficiency or beriberi—that increased susceptibility to infectious disease.

Besides malaria, soldiers in the Pacific Theater suffered from dengue fever (an untreatable, incapacitating, but usually self-limited viral disease), various forms of infectious diarrhea, and fungal skin diseases (collectively termed “jungle rot”).

Typhus, a louse-borne rickettsial disease, was the most threatening infectious disease in the European Theater. When the Western Allies landed in French North Africa in November 1942, the area was in the midst of a typhus epidemic that ultimately infected over 500,000 civilians. The U.S. Army received a vaccine mass-produced by a process developed in the U.S. Department of Agriculture, and only 11 men from a force of nearly half a million contracted typhus. Allied troops arrived in Europe vaccinated against typhus,

American soldiers in the Solomons were hospitalized for malaria at a rate of 970 per 1,000 per year.

typhoid, paratyphoid, and smallpox, but malaria remained a significant problem, especially in Italy, because Allied soldiers resisted taking Atabrine.

In addition to preventative vaccination, DDT was used to kill body lice that carried the infection. The new chemical agent stayed in clothes, so people could be dusted without removing their garments (an important factor in the North African Muslim culture), and the clothing no longer had to be sterilized or destroyed. Effective delousing was also important in limiting typhus outbreaks in the USSR, eastern Europe, and Germany as the war ended; it was especially useful in controlling epidemics among concentration camp survivors when those facilities were liberated.

One of the most important advances in the treatment of wartime trauma was the use of antibiotics. German scientist Gerhard Domagk, working at I. G. Farbenindustrie, had synthesized Prontosil in 1935, and scientists at the Pasteur Institute in Paris had adapted that chemical to the more effective sulfanilamide, an antimicrobial that could be applied directly to a wound or taken orally. Sulfa drugs were used prophylactically and therapeutically from the first months of the war. Sir Alexander Fleming had accidentally discovered the antibacterial properties of penicillin in 1929, but the drug was difficult and expensive to make and was not widely used until 1940, when scientists at Oxford produced a concentrated form suitable for clinical application. The drug remained so expensive that it was routinely recovered from patients' urine, purified, and reused.

Improvements in aviation and submarine technology outstripped the ability of humans to adapt to newly accessible environments. Frenchman Paul Bert had described the physiologic effects of extreme altitude on balloonists in the previous century, but the extremes of temperature, pressure, and oxygen tension became acute concerns as great depths and nearly stratospheric altitudes were reached. Warplanes had service ceilings well beyond the survival capabilities of humans without artificial pressurization. Supplemental oxygen was required above 10,000 feet, and daytime bombing missions at altitudes in excess of 25,000 feet were often the rule. At these altitudes, temperatures ranged as low as 50 degrees below zero, posing significant risk of frostbite or even hypothermic shock. A dive-bomber could descend at 30,000 feet per minute (compared with a commercial airliner's usual rate of 400 feet per minute), a rate that introduced serious risk of barotrauma to the middle ear, sinuses, or intestines. Pooling of blood in the extremities due to extreme gravitational forces from rapid acceleration caused loss of vision and unconsciousness. Allied pilots taped their legs and abdomens to protect against blackouts, and the Germans manufactured the first pressurized body suit with the same goal. Rapid ascent either from the ocean to the surface or the surface to high altitudes produces intravascular nitrogen bubbles, lead-

ing to the syndrome of joint pain and stroke collectively referred to as the bends.

Human experimentation carried out by the German and Japanese military medical establishments led to permanent changes in standards for scientific research. The Japanese used Soviet and Chinese prisoners of war and civilians in biowarfare experiments in Manchuria and performed anatomy experiments on living American prisoners in Japan. The Germans used concentration camp inmates to perform experiments on pressure and cold tolerance that, although undeniably inhumane, provided information that remains unique. Allied military surgeons were called on to help assess the Axis physicians' behavior after the war, and the resulting Nuremberg Code still sets the standards for ethically appropriate human experimentation.

Military Organization

Militaries are hierarchical organizations. Long ago, army commanders learned through trial and error that a given number of soldiers operating on the battlefield as part of a coordinated and synchronized team functioned far more effectively than an equal or even a larger number of individual combatants. In the classical period, the ancient Greeks developed the phalanx, and the ancient Romans developed the century, the cohort, and the legion. By World War II, there was an amazing similarity in the names and the structures of the various echelons of most of the world's armies. There was somewhat less similarity among the navies and air forces of the various nations.

Armies

The primary unit in almost all armies was the section, or squad (*Gruppe* in German), consisting of 8 to 12 soldiers and led by a junior-ranking noncommissioned officer (NCO), usually a corporal or a sergeant. Most armies further divided

Members of a Royal Air Force Hurricane Squadron, the first to fly over Dieppe, France during the Dieppe raid of August 1942. (Bettmann/Corbis)

the infantry squad into two or three teams, each with a specific function, such as carrying and manning a light machine gun. In artillery units, the section made up the crew of a single gun. In armor units, the crew of a single tank was the primary unit.

The platoon (*Zug* in German) consisted of three or four squads and up to 30 soldiers, commanded by a junior lieutenant and assisted by a midlevel sergeant. In the British army, the lieutenant was called a platoon commander. In the U.S. Army, he was known as a platoon leader. In the U.S. Army, the company was the lowest level at which an officer exercised full command authority. As World War II progressed, attrition of combat units forced many armies to place NCOs in charge of platoons; some NCOs eventually won battlefield commissions in this manner. The term *platoon* derived from the French word *peloton*, which simply means “a group of men,” and was first used to describe any group of soldiers who fired their weapons in unison.

The company (*Companie* in German), consisting of three or four platoons, is one of the oldest of all military organizations. It traces its lineage directly to the Roman century, commanded by a centurion. By World War II, companies in most armies numbered between 100 and 250 soldiers, depending on the type. In artillery units, the company-sized unit was known as a battery (with between two and six gun sections, depending on the size of the gun), and in a cavalry unit, the company-sized unit was called a troop. The company commander was assisted by a senior first lieutenant as the executive officer and a senior NCO as the first sergeant. In almost all armies except those of the British Commonwealth, the company, battery, or troop commander was a captain. The British assigned majors as company commanders and still do so to this day.

In the early seventeenth century, Maurice of Nassau introduced the battalion, patterned on the ancient Roman cohort. Commanded by a lieutenant colonel, the World War II battalion (*Battallion* in German) consisted of three to five

companies, totaling between 400 and 800 soldiers depending on the type of unit. In cavalry organizations, the battalion-sized unit was called a squadron—which was in no way equivalent to a naval squadron or an air force squadron. In most armies, the equivalent artillery unit was also called a battalion, but in the German army it was called an *Abteilung*. The battalion is the lowest echelon at which a commander has a dedicated staff to assist him in planning and conducting operations.

The regiment (*Regiment* in German), commanded by a colonel, is another of the oldest of military formations. Evolving from the ancient Roman legion, the World War II regiment consisted of three or four battalions and had between 1,000 and 3,000 soldiers. Nominally, the next echelon above the regiment was the brigade (*Brigade* in German), but there was a great deal of variation at this particular level from army to army. In the U.S. Army of World War II, a brigade was generally an organization separate from a division, consisting of three or more battalions and commanded by either a colonel or a brigadier general, depending on its size and mission. In the German army, a brigade consisted of two regiments as part of a divisional structure. After World War II, the U.S. Army abandoned the regiment and made the brigade the echelon between the division and the battalion.

The division (*Division* in German) first appeared at the end of the eighteenth century. Composed of two or more brigades or regiments, plus a full range of supporting arms and services, the World War II division was the lowest echelon capable of semi-independent combined-arms operations. Depending on its type (infantry, armored, airborne, cavalry), the division had from 12,000 to 18,000 soldiers. Rather than brigades or regiments, a U.S. armored division of World War II was organized into three combat commands (A, B, and Reserve), which could be task-tailored from the division's battalions from operation to operation. That system was the forerunner of the U.S. Army's modern division-brigade system.

In most armies, the division was commanded by a major general, but in the German and Soviet armies, a lieutenant general led the division. Despite the difference in rank titles, a divisional commander in all cases was the equivalent of a two-star general. Because of high attrition rates among senior officers in the German army, however, it was not uncommon for a German division to be commanded by a colonel.

Two or more divisions composed a World War II corps (*Korps* in German). A product of the mass armies of the French Revolution, a corps of Napoleon's day was commanded by a marshal. During World War II, the standard rank of a corps commander was lieutenant general (or three-star equivalent). In the U.S. Army, however, most of the corps commanders were senior major generals who had successfully commanded at the divisional level. In addition to its subordinate divisions,

a corps also had a number of separate battalions and brigades of supporting arms and services, which it routinely allocated to the divisions to reinforce them for specific operations. Depending on the number of subordinate divisions, a corps could have from 50,000 to 80,000 soldiers. The Japanese equivalent of a corps was called an army, and it directly controlled its subordinate divisions. Corps were always designated in Roman numerals, for example, V Corps. All echelons below that corps were always designated in Arabic numerals, for example, 3rd Infantry Division.

The echelon above the corps was the army (*Armee* in German), sometimes called the field army but also known as the numbered army to distinguish it from the army as a whole (*Heer* in German). In most militaries, the army was commanded by a full general (four-star equivalent), but the majority of U.S. armies in World War II were actually commanded by lieutenant generals. At the end of the war, the most successful of the army commanders, among them George S. Patton, received their fourth star. The Japanese equivalent to a field army was called an area army. Armies are designated by spelling out their numerical designation, for example, Third Army.

The army group (*Heeresgruppe* in German), which first appeared in World War I, is the largest battlefield command in military history. An army group is commanded by either a full general (four-star equivalent) or a field marshal (equivalent to a five-star general). In the Soviet army, the army group was known as a front. Army group designations used Arabic numerals, for example, 12th Army Group.

Above the level of the army group, most World War II militaries had at least one or two additional echelons of command. A theater was responsible for directing all the military activity in a given geographic area of operations. The commander of a theater usually held the title commander in chief (abbreviated as CinC). On the German side, the theater commander held the title of Oberbefehlshaber (OB). The OB only commanded the forces of a single service. In the integrated Anglo-American command structure, a CinC was a joint commander, meaning he had direct command authority over all land, naval, and air forces in his theater. Allied navies and the Royal Air Force (RAF) also use the title CinC for those who commanded both the support units (the shore establishment for navies or the air base and logistics structure for the RAF) and operational units.

At the highest levels of military command in World War II, each nation had a body of military officers that formed the supreme command, presiding over all military activities and reporting directly to the country's political leadership. Britain had the Imperial General Staff, and the United States had the Joint Chiefs of Staff. For the conduct of World War II, however, the two bodies formed a combined committee known as the Combined Chiefs of Staff. The highest Soviet

military body was called the Stavka. The Germans had a supreme command for each of its three services: Oberkommando des Heeres (OKH) for the army, Oberkommando der Kriegsmarine (OKM) for the navy, and Oberkommando der Luftwaffe (OKL) for the air force. Making matters more complicated still, there was a supreme command of the armed forces sitting over them, the Oberkommando der Wehrmacht (OKW). Unfortunately for Germany, the four supreme commands spent almost as much time fighting each other as they did fighting the Allies.

Marines

Almost all marine organizations of World War II were relatively small and specialized. Although they were components of their respective navies, they were all organized along army lines. The U.S. Marine Corps was by far the largest of World War II—larger, in fact, than the entire armies of some nations. The corps was the highest level of command echelon in the U.S. Marine Corps of World War II.

Air Forces

The organization of most air forces was similar to that of armies. The flight was the lowest echelon (composed of four to eight planes in 1939 and four planes by 1940) and was commanded by a lieutenant in the German service, a flight leader in the RAF, and a first or second lieutenant in the U.S. Army Air Forces (USAAF). The equivalent Italian unit was the *sezione* (section), which consisted of three planes until 1941 and two planes after that. Nonflying units had no standard personnel strength, although a flight generally consisted of no more than 20 personnel and a nonflying squadron rarely numbered more than 400. Squadrons (*Staffeln* in the Luftwaffe and *squadriglia* in the Italian air force) consisted of two to four flights and a headquarters flight (which was made up of two planes in a flying unit); they were commanded by captains (in fighter squadrons) or majors (in bomber units) in the U.S. service or the equivalent rank of squadron leader in the RAF. German *Staffeln* and Italian *squadriglia* were usually commanded by captains but might be commanded by majors in some cases.

Above the squadron level, the echelons of command differed among the various air forces. For the RAF, the higher echelons were structured along territorial and aircraft-type lines, and the next level of command was the wing, which consisted of the aircraft assigned to a single airfield (and each airfield might have one to four squadrons). The U.S. Army Air Forces called the next echelon a group, and it was made up of two to four squadrons. The units were commanded by lieutenant colonels in the USAAF or wing commanders in the RAF, although some American bomber groups were commanded by colonels. By 1944, most American bomber groups were commanded by colonels. The Soviet air force grouped

squadrons into 60-plane regiments commanded by majors (for fighters) or lieutenant colonels (for bombers). The equivalent German and Italian formations were the *Gruppe* and the *gruppo*, respectively, and normally were commanded by majors, although some bomber units were commanded by lieutenant colonels.

A U.S. wing consisted of two to four air groups; that echelon was known as a *Geschwader* in the German air force and as a *stormo* in the Italian air force. In all but the Royal Air Force, this was the highest echelon equipped with a single type of aircraft (fighters, bombers, etc.), and it was commanded by a colonel in the U.S. Army Air Forces or the equivalent—an Oberst in the German air force and a colonel in the Italian. In 1944, many American bomber wings were commanded by brigadier generals.

An RAF group captain (equivalent to a colonel) commanded a base, which consisted of two to four airfields located fairly close together. From 1942 on, an air commodore (U.S. equiv. brigadier general) commanded several bases within a designated area. The air commodores reported to the commander in chief of a numbered RAF group, who was normally an air vice marshal (U.S. equiv. major general). The RAF was unique among the air forces of World War II in that its commanders below the theater level commanded only aircraft of a specific type or mission. All but the Soviet air force used this structure primarily for their nonflying air force units. For example, a German *Luftgau* (air district) commanded primarily the nonflying support units within its area of responsibility and was headed by an Oberst (U.S. equiv. colonel), and several districts constituted a *Division* under a Generalmajor (U.S. equiv. brigadier general). The Italian air force utilized a similar command structure for its units above the *stormo* level within Italy, calling them *squadra aeree*, but its *aeree* commands for external regions (such as its African colonies, Sardinia, and the Dodecanese Islands) commanded all air force units within their *aeree*, regardless of type or mission. These *squadra aeree* were commanded by major generals.

For the other air forces, operational commands were based on the number of flying units and the support units assigned them. The German air force organized several *Geschwader* of the same type of aircraft into an air division (*Luftdivision*) under a Generalmajor. A *Luftkorps* (air corps) might be established to support a specific campaign or theater (e.g., *Luftkorps Afrika*), but that was done only three times in the war. The Soviet air force structured its aerial units along the same lines as its army, with air brigades and air divisions built around air regiments of varying aircraft types and missions. An air division or corps might support a Soviet army, whereas a numbered air army of one or more air corps would support a front. For the U.S. Army Air Forces, the command echelon above the wing was the numbered air force,

The U.S. 93rd Infantry Division, reactivated on 15 May 1942, was the first all-African American division to be formed during World War II. Here men of the Division are shown in training at Fort Huachuca, Arizona in 1942. (National Archives)

which was commanded in 1942 and 1943 by a major general whose forces included fighter and bomber groups as well as all support units assigned to them. Initially, a numbered air force was considered the equivalent to a division command, but most were commanded by lieutenant generals in 1944, as the size of some numbered air forces grew. Also, by 1944, the Western Allies had four tactical air commands (TACs)—two-star commands assigned to support the ground campaign. A TAC's various fighter, fighter-bomber, attack, and bomber squadrons were drawn from numbered air forces and assigned to provide close-air support, usually to an army group but on rare occasions to an army. The German equivalent to the numbered air force was the *Lufflotte*, or air fleet, which was commanded by a *Generalleutnant* (U.S. equiv. major general). The Italian air force had *aeree divisioni*, each commanded by a *generale di divisione* (U.S. equiv. major general), but they commanded only aircraft of a single type (bomber, fighter). The next echelon for the U.S. Air Forces

was the theater command, which controlled one or more numbered air forces. In 1944, the U.S. Army Air Forces Mediterranean, for example, was commanded by a lieutenant general, whereas the commander of the U.S. Army Air Forces Europe in 1944 was a full (four-star) general.

Navies

Nations organized their navies along their own unique lines, but in general, seagoing organizations and designations were based on size and ship type, and shore-unit organizations and designations were based on shore-unit size. Destroyers, submarines, and smaller seagoing units were organized in squadrons (in the U.S. and French navies), flotillas (in the British, Italian, and Soviet navies), and *Geschwader* (in the German navy) of 4 to 18 units. Theoretically, 2 to 3 squadrons constituted a flotilla, but that structure was done away with by all but the Italian navy before World War II. Except for the Soviet navy, a destroyer squadron/flotilla consisted of 4 to 6

destroyers of the same class, commanded by a captain (equivalent to an army or air force colonel), with the title of commodore. The Soviet navy assigned 2 or more destroyer squadrons to a flotilla, commanded by a captain first rank (senior to a Royal Navy/U.S. Navy captain but not a flag officer). In European navies, the commodore commanded the flotilla or Geschwader flagship (which was often modified to carry additional communications equipment), as well as the flotilla itself. The U.S. Navy was unique in that it provided its squadron commanders with a small staff.

The fast-attack squadron, flotilla, or Geschwader consisted of 10 to 18 fast-attack boats commanded by a commander (equivalent to a lieutenant colonel). In the British service, the flotilla commander also commanded the tender that provided the boats with their maintenance, logistics, and communications support. Navies sought to have squadrons and flotillas deploy and fight together as teams, but as the war wore on and maintenance requirements increasingly dictated unit availability, squadrons occasionally deployed with units from another squadron or flotilla. Cruisers and larger ships were organized into divisions of two or more units of the same class, commanded by a rear admiral (equivalent to an army major general).

Before 1939, most naval officers expected to fight their warships in divisions and squadrons and trained accordingly. Airpower's proven effectiveness in the 1940 Norwegian and 1941 Pearl Harbor Campaigns changed all that. Fleets deployed and fought in naval formations equivalent to army combined-arms teams. The Royal Navy called those organizations forces and designated them alphabetically (Forces C and D, for example, fought off Crete); the U.S. Navy designated them task groups. A Royal Navy force could consist of as little as a cruiser supported by a pair of destroyers, or it could be centered around a battleship, supported by one to four cruisers of varying types, possibly an aircraft carrier, and one or two destroyer flotillas. Smaller Royal Navy forces were commanded by either a very senior captain or a rear admiral. The largest, normally those established by the Admiralty, were commanded by a vice admiral.

Before December 1941, U.S. Navy task groups were centered around a battleship under the command of a rear admiral, normally the battleship's division commander. After Pearl Harbor, however, they were formed around aircraft carriers. Destroyers, cruisers, and battleships were stationed around the carrier to augment its anti-aircraft firepower and screen it against submarines.

Convoys constituted a special case in the Western navies. They were commanded by one-star "commodores"; the one-star commodore was a wartime rank that was senior to a captain but junior to a rear admiral. Typically a retired navy or merchant ship captain, a convoy commander was in charge of a convoy's merchant ships and, nominally at least, its escorts.

In practice, however, the escort commander deployed his ships as he believed the situation dictated and kept the convoy commander informed, coordinating his actions as required to best protect the convoy. Soviet, German, and Italian navies assigned convoy command to the senior naval officer present; usually but not always, he was the escort force commander.

The U.S. Navy established an echelon above the task group level in 1942, called the task force. Navy task forces consisted of two or more task groups and were commanded by senior rear admirals in 1942. Before late 1943, two or more U.S. Navy task forces constituted a numbered fleet, commanded by a vice admiral. Odd-numbered fleets operated in the Pacific and Indian Oceans, and even-numbered fleets served in the Atlantic and European waters. However, as the navy expanded and numbered fleets came to consist of up to a dozen task forces, some numbered fleets (the Third and the Seventh, whose designations were spelled out just as numbered armies were) came to be commanded by full (four-star) admirals by late 1944. The much smaller Royal and Italian navies placed their largest forces directly under their respective admiralties until they were allocated to a regional or functional commander (e.g., the commander in chief Mediterranean or commander in chief Home Fleet for Britain or, for Italy, a specific mission); these officers were either rear admirals, vice admirals, or admirals, depending on the size and importance of the command. By 1942, the U.S. Navy had two theater-level fleet commanders, called commanders in chief, with the rank of admiral; they were in charge of all shore establishments, numbered fleets, aircraft, ships, submarines, and units within their assigned area of responsibilities. One commanded the Atlantic Fleet and the other the Pacific Fleet (which was also responsible for the Indian Ocean). Admiral Chester Nimitz, commander in chief Pacific, became an Admiral of the Fleet (five-star equivalent) in 1945.

The Kriegsmarine (German navy) organized its smaller combatants into Geschwader, and its cruisers served under the Kreuzer division (the title was changed to Kampfgruppe in 1944). However, only its destroyers, submarines, and smaller units deployed in units. Doctrinally, major German naval units were to deploy in Kampfgruppen. In theory, German naval Kampfgruppen consisted of the units supporting a battleship that deployed under a Konteradmiral (U.S. equiv. rear admiral) or Vizadmiral (U.S. equiv. vice admiral) for a specific mission. Once deployed, the Gruppe operated under one of the navy's three geographic area commanders (Kommando der Marine Oest, Kommando der Marine West, or Kommando der Marine Nord). In practice, however, the Germans never had enough major surface units to implement the system. For example, the *Bismarck* operation was led by the fleet commander himself, Admiral Günther Lütjens. Most German surface units deployed alone and had their operations coordinated either by the Oberkommando der Kriegsmarine (OKM), the Kommando der

Marine West, or the Kommando der Marine Nord, depending on whether they were operating outside the North Atlantic, in the North Atlantic, or in the North and Norwegian Seas, respectively.

The U.S. Navy called its shore-based units either activities, commands, or bases. An activity was a small shore unit with a single mission (maintenance, fuel or ordnance support, ship repairs, etc.), under an officer in charge (ranging from a lieutenant to a lieutenant commander, or the equivalent of an army captain to a major, respectively). The Royal Navy did not refer to activities but designated all its units as commands, with the commander's rank determined by unit size. In the U.S. Navy, a command either consisted of several activities or was a larger unit that conducted a specialized mission but was too large to be treated as an activity. A command could deploy detachments to support a specific mission for short periods of time; an activity rarely had the resources to do so. Lieutenant commanders, commanders, and captains were in charge of commands. A base typically hosted several activities and commands, both shore-based and seagoing. In all navies, captains commanded bases.

Milne Bay, Battle of (25 August–6 September 1942)

Important Pacific Theater battle on New Guinea involving Australian, U.S., and Japanese troops. In late August 1942, the Japanese continued their advance southeastward down

New Guinea's northern coast. Their destination was Port Moresby, initially denied to them by the Battle of the Coral Sea. Milne Bay, on New Guinea's southeast tip, offered a harbor and good sites for airfields. The Australians and Americans had already built one airfield, and two more were under development, all part of the Allied defense of Port Moresby.

On 24 August 1942, Japanese light cruisers *Tenryu* and *Tatsuta*, three destroyers, two submarine chasers, and two transports left Rabaul, transporting 612 naval troops of Kure 5th Special Naval Landing Force and 197 men of Sasebo 5th Special Naval Landing Force. Another 362 navy cadre and civilians of the 16th Naval Construction Unit were also aboard. These troops were to take the Allied airfields.

The Japanese landed at Milne Bay on the night of 25 August and ran into trouble in the form of torrential rains, swamps, mud, and flooded streams. They also encountered many more Allied troops than anticipated. The Japanese navy had estimated Australian forces at Milne Bay at about a battalion, but the Australians had recently reinforced their garrison and had six battalions present from the 7th and 18th Australian Infantry Brigades under Major General Cyril A. Clowes. In and around the airfields were 9,458 Australians and Americans. The Australians also had 34 P-40 fighter aircraft.

The Japanese landed 5 miles from the beaches where they had planned to land and 8 miles from their objective. They had no useful maps, nor did they have mechanized equipment to haul supplies inland. The Australian P-40s bombed and strafed beached supplies, oil drums, and barges and thereby destroyed most of the Japanese food stocks. Bombs from a B-17 bomber also damaged a Japanese transport unloading supplies.

Another Japanese landing unit, actually part of the initial effort, never made it to shore. Some 350 Kure 5th Special Naval Landing Force troops aboard seven powered barges stopped at Goodenough Island for a break. Nine P-40s attacked and sank all seven barges, stranding the men. Japanese reinforcements (568 men of the Kure 3rd and 200 men of the Yokosuka 5th Special Naval Landing Forces) arrived on 29 August aboard three destroyers and three patrol boats.

Despite an early setback, the Australians fought the Japanese to a standstill at the edge of the easternmost airfield. By 30 August, the Japanese at Milne Bay were short of supplies. Rain, mud, malaria, air attacks, and infantry combat wore them down. A final assault on the airfields during the night of 30 August failed. The Australians then counterattacked and drove the Japanese back toward their landing sites.

The Japanese then decided to cut their losses and evacuate the survivors. As a consequence of the Allied air threat and because the Japanese needed only to evacuate men and not equipment or supplies, they employed two light cruisers and destroyers in the evacuation effort. They removed their wounded on the night of 4–5 September; the main body of the

force departed the next night. One Japanese destroyer was lost during the withdrawal, sunk by U.S. aircraft.

The Battle of Milne Bay was a tremendous psychological boost for the Allies. Until then, the Japanese had repeatedly defeated Allied ground forces. Japanese aggressiveness and spirit had previously triumphed over Allied soldiers and matériel—but not at Milne Bay. The Allied repulse administered to crack special naval landing forces helped convinced Allied soldiers that they could defeat the Japanese.

MINCEMEAT, Operation

Major British deception preceding Operation HUSKY, the Allied assault on Sicily. Even as Allied forces cleared Tunisia of Axis troops, their leaders were debating their next target in the Mediterranean. Although British Prime Minister Winston L. S. Churchill wanted a thrust into the Balkans, the Allies settled on Sicily, to be followed by an assault on southern Italy. Operation MINCEMEAT was a British deception to convince the Germans and their Axis partners, the Italians, that the invasion would instead occur in the Greek Isles and Sardinia.

A British intelligence officer, Lieutenant Commander Ewen Montagu of the navy, conceived the idea of using the corpse of a man who had died of pneumonia, a disease that has all the physical characteristics of a drowning. He would be given a false military identity to convey papers that would reach the Germans. On 18 April 1943, at Greenock, Scotland, the British submarine *Seraph* took on board a specially constructed steel container weighing about 400 pounds and marked “Handle with Care—Optical Instruments.”

Eleven days later, early on 30 April, the *Seraph* surfaced off the southern coast of Andalucia, Spain. Officers sworn to secrecy then opened the container and removed a soggy corpse dressed in the uniform of an officer of the Royal

Marines. The body, which had been preserved in ice, had a briefcase affixed with the royal seal chained to one wrist. The officers then inflated the “Mae West” life jacket worn by the corpse, offered a few prayers, and pushed “Major Martin” overboard to drift inland with the tide. Later, a half mile to the south, the same officers turned an inflated rubber life raft upside down and pushed it and a paddle off the submarine.

A Spanish fisherman recovered the body off Huelva and turned it over to the authorities. The British had chosen this location because a German intelligence officer was known to be in the area. The Spanish identified the corpse from its papers as that of Major William Martin of the Royal Marines. It appeared from the condition of the body that it had been in the water for several days, and the Spanish concluded that the death resulted from an airplane crash at sea. They then allowed German intelligence to examine the body and the attaché case. To keep up the ruse, the British demanded that the case be returned without delay. The Spanish finally turned it over on 13 May, and subsequent tests in London revealed that it had indeed been tampered with, its contents in all probability passed on to the Germans.

The briefcase contained presumably sensitive papers and private letters from British leaders in London to theater commanders in North Africa. The Germans could only conclude from the contents that operations against Sicily were only a feint and that the Allies would next invade the Greek islands (Operation BARCLAY) with 11 British divisions. A few days later, a large American force was to invade Sardinia, Corsica, and southern France.

The deception confirmed what the Germans already believed, but there is no evidence that the Italians were deceived. Adolf Hitler, however, sent reinforcements, including the 1st Panzer Division from southern France, to Greece. This unit might have been decisive had it been dispatched to Sicily. Clearly, the invading forces of Operation HUSKY benefited immensely from the MINCEMEAT deception.

Mines, Land

Two basic forms of land mines existed in World War II—antipersonnel and antitank mines. Antipersonnel mines are primarily based on static omnidirectional (360-degree), static directional (180-degree), and bounding omnidirectional (360-degree) models. Often injury rather than death

Members of the British Army Officer Cadet Training Unit observe techniques for the laying of land mines, 1943. (Hulton-Deutsch Collection/Corbis)

was viewed as a more desirable outcome from the use of land mines because of the logistical strain it could create on an opposing force. For this reason, many mines were developed and emplaced to maim rather than kill. Antitank mines were used either in an antimobility or a catastrophic-kill function. Beyond their destructive effects, land mines were also useful to channel enemy forces into kill zones, to create impassable barriers to maneuver, to engage in the area denial of key points, to deny matériel resources via booby-trapping, and to psychologically affect opposing troops.

U.S. land mines were based on both antipersonnel and antitank requirements. The two standard U.S. antipersonnel mines were the M-2 and the M-3. The M-2 was a 6.5 lb bounding mine based on a modified 60 mm mortar shell. This was a mine that would leap into the air and explode, causing far more shrapnel damage to troops than a mine exploding at ground level. It could produce a 30 ft casualty radius. The M-3 was a larger 10 lb mine made out of cast iron and filled with TNT. It could be buried or used in an above-ground, booby-trap mode. It also had a 30 ft casualty radius.

At the start of World War II, the standard U.S. antitank mine was the M-1. This simple mine used a cross-shaped metal pressure detonator, known as a “spider,” that fit over the mine. The M-1 was later replaced by the heavier M-5, which weighed 14.5 lbs. The additional weight allowed for a greater explosive charge to be packed in the mine, which then could better disable a tank tread or destroy a lighter vehicle. The even more effective M-6 was developed next. It weighed 20 lbs. A lighter M-7 weighing 4.5 lbs was also fielded against lighter vehicular threats.

The British forces used both antipersonnel and antitank mines. The British No. 75 “Hawkins,” an antipersonnel mine shaped like a rectangular food tin, was carried by paratroopers and U.S. forces. British forces also utilized U.S. land mines as part of the American aid effort. British minefields were used extensively in North Africa. French mines were based on World War I and interwar designs. One example was the 14.5 lb light antitank mine. This pressure-sensitive mine had a rectangular steel body and was filled with 5.12 lbs of high explosives. It was employed in defensive mine belts to help protect the Maginot Line.

Soviet and German military forces were the principal innovators in land mines during the war. Soviet mine advances were primarily antitank in nature because of the continued operational encirclement threat posed by German panzer divisions. The 1941 AKS was likely the first full-width-attack, tilt-rod-actuated mine. The Red Army employed fusing based on both seismic (VZ-1) and magnetic devices and deployed the first radio-controlled mines in 1942. At Kursk in 1943, the first use of a flame mine took place. Calling on their harsh experiences in the Russo-Finnish War of 1939, Soviet forces also utilized stake mines (based on improvised grenade booby traps), mine daisy chaining, low metal mines, and well-defined countermine assault techniques. The Soviets also employed antitank dog mines during the war. Specially trained dogs carrying explosive mine packs were taught to run under German tanks. The mines were then detonated on the command of the dog handler or set off by a timing mechanism. The technique was not very effective.

German innovations in land mines included the bounding antipersonnel mine of the 1930s. This was known as the “S” mine or the “Bouncing Betty” mine. Scatterable antipersonnel mines, such as the SD-2B Schmetterling, were first used in Poland in 1939 and dropped by fixed-wing aircraft. Side-attack mines based on the Panzerfaust antitank rocket grenade were employed on the Eastern Front in 1943. Booby-trapped antihandling devices, attached to land mines, were also developed by German forces in the war. A chemical mine, known as the “Bounding Gas Mine 37” and based on the mustard gas agent, was developed, but it was never fielded. About 40 types of German antitank mines existed, with the Terrlermine 42, Terrlermine 43, and Terrlermine 35 (two variants) being the most common. The Germans developed numerous types of friction, pull, and pressure igniters for their land mines.

The Japanese were not known as innovators in land mines, but they fielded both land mine types and were adept at booby traps. The Model 93 (1933) “tape-measure mine” was an antipersonnel device that weighed 3 lbs. The mine had four metal rings on the side for carrying it and for emplacement and a brass dome fuze. The Model 99 (1939) armor-piercing mine was developed for use against tanks and the iron doors of pillboxes. This 2.11 lb mine was carried in a stiff canvas pouch and had four permanent magnets attached via khaki webbing to the outer edge of the mine body. It was carried by individual soldiers and was usually coupled with another for greater armor penetration by placing the opposite magnetic poles of the four outer-edge magnets together. The fielding of a Japanese antitank “satchel charge-like” mine, rather than a traditional antitank mine, represents a tactical limitation. This limitation was somewhat made up for by the existence of the Model 96 (1936) dual-use land and water mine and the Bangalore torpedo. The Model 96 carried a 46 lb explosive

charge, and the Bangalore torpedo had sections weighing 10 lbs each (most of that a TNT-cyclonite explosive mixture).

Mines, Sea

As a result of the experiences of World War I, combatants were much better prepared for mine warfare in 1939 than that had been in 1914. All belligerents expected to be committed to a mining campaign. Major advances in mine warfare before and during World War II included the widespread use of influence (i.e., acoustic, magnetic, and pressure-actuated) mines and large-scale aerial mining and the broad application of antisweeping devices. In moored mines, the trend, except in Germany, was to replace the acid-filled Herz horns with electric switch horns.

In spite of prewar financial limitations and errors in judgment, Great Britain entered the war with an adequate stock of mines—both technically and quantitatively. These included some 1917 H.II Herz horn type moored contact mines, but the standard moored contact mine was the switch horn type Mark XVII. It could be configured to take a charge of 320 or 500 lbs and could be laid with a depth setting of up to 303 ft. In 1939, Great Britain had both moored (M Mark I) and air-laid ground magnetic mines (A Mark I) available for deployment. Both were based on the magnetic induction principle (the horizontal magnetic field of a ship induced an electric current in a coiled rod) and proved so satisfactory that they remained in service throughout the war. The airborne ground mine was subsequently modified, in order to conserve scarce materials (A Mark II, III, and IV), to improve compatibility with bomb gears (A Mark V, 1940), and to include acoustic actuation (A Mark VI, 1944).

The majority of the mines laid by Great Britain were dropped by aircraft; hence, the British effort for a ship-laid ground mine was confined to the magnetic M Mark III, a cylindrical device that was introduced in April 1941. The charge weight was increased from 1,500 lbs to 1,600 lbs of amatol (or 1,750 lbs of minol) in 1942, and in 1943, acoustic mechanisms

Arming German UMB-mines. Snaglines with cork floats are attached to the Herz horns (1941). (Photo courtesy of Dirk Steffen)

were added. An upgraded model with improved sensitivity and a pressure firing unit was canceled in 1944. Owing to the wartime shortages of TNT and RD (cyclonite), most British mines had 50/50 ammonium nitrate/TNT (amatol) explosive charges. This low-quality explosive was later improved by the addition of around 20 percent aluminum powder (minol).

Of all belligerents, Germany displayed the greatest creativity and activity in the field of mine technology. It developed a large number of sophisticated mines before and during World War II, with a focus on influence mines. The intense interservice rivalry between the German navy and the air force severely hampered the development of airborne mines, although ultimately, the project was successful. For moored contact mines, the German navy relied on the eminently successful EM designs of World War I, the most common being the EMA (331 lb charge), the EMB (497 lb charge), and the EMC (661 lb charge). The Germans also perfected the art of sweep obstruction. Many of the EM-type mines were fitted with chains (to resist wirecutters) and *Kontaktauslösung* (KA) gear, comprising a 98 ft Tombac tube over the

upper part of the mooring wire, which, when subjected to the upward drag in sweeping, closed a switch and fired the mine.

The best-known German influence mine was probably the LMA airborne parachute magnetic ground mine; when one was retrieved on 22 November 1939, the British were alerted to the fact that the Germans, too, had a capability in noncontact mines. Unlike the British magnetic mines, the German mines were actuated by a change in the vertical component of the magnetic field (the dip needle principle). The LMA had a 661 lb charge and a practical depth limit of 130 ft. It was superseded by the larger (1,554 lb charge) LMB with magnetic (1939), acoustic (1940), combined magnetic/acoustic and magnetic/pressure (1944) firing. The development of the BM 1000 (1,500 lb charge) greatly improved the efficacy of German aerial mining. That mine was dropped without parachute from altitudes of up to 19,700 ft in water depths up to 115 ft, and it was regularly equipped with a variety of antisweeping and antilifting devices. For minelaying from torpedo tubes of submarines and E-boats, the Germans produced the TMA (moored magnetic) and TMB (ground

magnetic and acoustic) mines. Both weapons suffered from serious construction defects that limited their endurance on the seabed to 6 to 12 months.

The construction of the Atlantic Wall, Germany's seaward defense against the Allied invasion, inspired the KMA anti-invasion mine. This was a shallow-water ground mine with a 165 lb charge set in a rectangular concrete block anchor and surmounted by a steel tripod frame with a single Herz horn on top. The total height of the mine was 8 ft, 10 inches, and it could be fitted with a snagline for depths of 16 to 33 ft. German charge weights in general were conspicuously heavy by international standards in order to compensate for the generally poor quality of the explosive fillings, usually made up of a mixture of ammonium nitrate, sodium nitrate, potassium nitrate, cyclonite, ethylene diamine dinitrate, and aluminum—TNT being an exception.

Many of the mines employed by Italy during the war were left over from World War I, some of them from the Austro-Hungarian Empire service. Some Italian mines were specifically built for deployment in warm-water conditions, such as off Libya. The P200 appeared in 1936. It weighed about 2,244 lbs and had an explosive charge of 441 lbs.

The Soviet navy relied mainly on material developed before 1917, such as the M06, M08, and M12. Conditions in the Soviet Union between 1917 and 1941 had stifled mine development, yet the Soviet navy put to use a handful of mines developed in the interwar period.

Notably, Italy and the United States distinguished themselves as substantial mine producers, the latter with an emphasis on submarine and air-laid mines such as the Mk 12/3 and the Mk 12/4 (1,200 lb Torpex charges). Japan, as during World War I, neglected mine development and relied solely on a handful of obsolescent moored contact mines.

quite considerable efforts made in during World War I. The aim of mining was either tactical, by sinking specific enemy ships, or strategic, by assisting in dislocating enemy war efforts in general and contributing to the security of friendly sea lines of communications through the destruction or threat of destruction of enemy forces. The aim of mine countermeasures, in turn, was to permit warships and merchant vessels to use the seas and enter and leave ports as necessary for the furtherance of the war effort and the support of the population, without unacceptable damage or losses from mines.

A grand total of 636,000 mines and sweep obstructors were laid in European waters between 1939 and 1945. Some 95,400 more were laid in the western Pacific between 1941 and 1945. On balance, both sides laid roughly the same number of mines. The Allies lost a total of 1,406,037 tons of merchant shipping to mines—almost exclusively in European waters—representing 6.5 percent of their entire merchant ship losses. The Axis powers lost 660,533 tons of merchant shipping in the European Theater and 397,412 tons in the Pacific. Strategically, the Allies were more effective than the Axis powers in disrupting and obstructing the enemy's seaborne traffic. This was particularly true in the Pacific Theater of Operations, where Japanese minelaying operations had virtually no impact on Allied naval operations. By contrast, a well-conceived American aerial mining operation, in which 15,800 mines were laid in Japanese and Korean waters between December 1944 and July 1945, all but paralyzed Japanese coastal traffic and hastened the collapse of the Japanese Empire's tottering economy.

Several factors impacted minelaying and minesweeping in World War II. First, mines were increasingly of the influence type; second, aircraft emerged as an effective means of delivery; and, third, the use of sweep obstructors and evaders and antilifting devices became commonplace, to the point where mine forces deliberately targeted enemy countermeasure forces and aimed to tie down valuable resources. Again, the Allies had comparatively better success in this respect: throughout the war, the German navy employed about twice as many minesweepers and about one and a half times as many personnel in the war against sea mines in European waters than did its adversaries.

Minelaying distinguished between the two fundamental principles of offensive and defensive mining. Both sides expended a considerable part of their stock for the latter purpose. Great Britain alone laid 185,000 mines in defensive minefields in all theaters of war. Defensive minefields were usually laid by surface craft. Their purpose was to augment coastal defenses by providing operational depth seaward against maritime incursions and invasions. Frequently, a channel between the coast and the minefields was kept open for coastal traffic, thus offering a certain degree of protection to shipping while freeing flotilla craft from tedious coastal escort and patrol duties.

Minesweeping and Minelaying (Sea)

The mine war at sea between 1939 and 1945 was a vast enterprise in terms of men and material that dwarfed the already

Offensive minefields were ideally laid covertly, inviting the use of aircraft and submarines. The former offered an additional advantage because they could penetrate deep into enemy-controlled sea spaces in great numbers and even attack inland waterways. Famous aerial mining operations included those by the Royal Air Force (RAF) against the Kiel Canal on 12–13 May 1944 (11 mines) and against the German oil shipments on the Danube between May and October 1944 (1,200 mines). Both operations caused significant economic disruptions of the German war machine. Of the 76,000 mines laid offensively by Great Britain in European waters, 55,000 were laid by aircraft, mostly by the RAF's Bomber Command.

A variant of both the defensive and the offensive minefield was the tactical minefield. This minefield was usually laid on the basis of tactical intelligence reports or educated guessing in what was assumed would be the probable path of a very specific target. During their advance through the Baltic states in August 1941, for instance, the Germans laid a tactical minefield off Jumida, Estonia, knowing that a heavily escorted Soviet troop convoy from Tallinn had to take that route. On 28 and 29 August, 25 Soviet troop transports out of 29 within the targeted convoy foundered on the minefield. Additionally, because the Germans had deliberately also targeted escorts and minesweepers with shallow-depth mines, the Soviets lost 2 destroyers, 9 minesweepers, and several small patrol craft. This outcome was the largest single tactical success in the history of mine warfare.

The minesweeping effort on all sides necessarily rose to the enormous challenge posed by the extensive minelaying campaigns—both quantitatively and qualitatively. Great Britain had built only 21 fleet minesweepers between 1933 and 1939. During the war years, these were augmented by a further 283 minesweepers. To this substantial minesweeping fleet came hundreds of motor minesweepers and auxiliary minesweepers. By May 1944, the Royal Navy had over 650 trawlers on sweeping duties alone. The Germans entered the war with a number of World War I–vintage sweepers as well as a dozen of very sophisticated, 784 ton M-35–type minesweepers under construction and dozens of cheap but capable *Räumboote* (motor minesweepers), the numbers of which would total 300 at the end of the war. In spite of the eventual mass production of over 400 simplified M-type sweepers, the German navy, too, had to expand its capabilities further, and it requisitioned hundreds of civilian ships for minesweeping duties. As with Great Britain, Germany also built commercial trawlers for minesweeping duties.

In 1939, most minesweeping forces were geared for operations against moored contact mines. To that end, the minesweepers carried an Oropesa gear, or A-sweep, consisting of a steel wire (up to .5 inches in diameter and 1,500 ft long), which was streamed behind the minesweeper. The end of the sweep-wire was fitted with wirecutters and supported by a float known as an Otter. The sweep was held at a prede-

termined depth by a horizontal kite near the stern of the towing vessels, and the angle to the ship's course was maintained by a vertical kite beneath the Otter. The A-sweep could be streamed on one or both sides of the ship. Minesweepers so equipped steamed in a diagonal formation on overlapping tracks. Small A-sweeps streamed from the stem post provided bow protection. Mine cases that rose to the surface after the mooring wires had been cut were usually destroyed by gunfire.

To protect fields of moored mines from sweepers, minefield planners frequently resorted to sweep obstructers such as chains on mooring wires, fuse settings that exploded the mines when swept, and other gear that would destroy or foul the sweeps or endanger the minesweepers. The Germans earned a particular reputation for indulging in this type of warfare, and they deployed minefields that contained up to 30 percent sweep obstructers. Sweep evaders, such as sprocket wheels that would let the sweep-wire pass through the mine's mooring wire, and delayed-rise or multiple-rise mines additionally thwarted sweeping efforts.

The advent of ground-influence mines required different sweeping techniques. For sweeping magnetic mines, navies developed a towed current-bearing cable, called the L-sweep. This equipment consisted of two cables streamed behind the minesweeper that generated a pulsating electric current, which, when passed through the cables and the seawater, produced a magnet tow. In order to overcome dependence on the seawater's conductivity and to improve the individual ship's sweep efficiency, the Royal Navy and later the German navy introduced the closed-loop system. The loop shape of the current-bearing cable was maintained by attaching it to A-sweep wires. Acoustic influence mines required the use of noisemakers. The Allied Pipe Noise Maker ("Foxyer"), originally developed as a decoy for the German T-5 homing torpedo, was eminently well suited to that task. Noisemakers were usually streamed in conjunction with the magnetic sweep.

The improvement in sweeping techniques quite naturally called for responses by minefield planners and mine designers. An easy way to delay any sweeping attempt was to increase the sweep effort necessary to clear a given sea space by laying combined fields of moored contact and ground-influence mines. Ship counters that ignored a certain amount of passes were an even better way to achieve the same effect. This concept was perfected by the British MX organization, which specialized in the modification of standard mines. The MX-modified mine was only actuated when first influenced by a strong magnetic field (i.e., a sweeper) and then by a weaker one within a certain time span. The Germans countered by preceding their U-boats with two minesweepers or *Sperrbrecher*s (literally, barrage breakers), to which the MX organization in turn responded by setting the counters to allow the pass of two strong minefields before it detonated the mine under a third, weaker, magnetic field. The Germans ultimately

adopted the rather wasteful measure of employing three mine-countermeasures vessels.

The ultimate hurdle for mine countermeasures during the war, the pressure mine, was never mastered satisfactorily. For this reason, both sides hesitated to employ it, for fear that it would be captured and used by the enemy. The Germans waited until June 1944 before desperation drove them to lay that type of mine. When the Allies responded with like devices, the Germans used their Sperrbrecher as expendable decoy ships against the pressure mines. Short of crawling through a minefield at speeds of less than 4 knots, this was the only viable method of countering pressure mines.

Minsk, Battle for (27 June–9 July 1941)

Large German encirclement operation on the Eastern Front. Under Adolf Hitler's Führer Directive 21 for the invasion of the Soviet Union, Operation BARBAROSSA, Army Group Center had responsibility for the destruction of Soviet forces in Belorussia. The Germans considered this an essential prerequisite to subsequent drives on Leningrad and Moscow. Toward that end, when the Germans invaded the Soviet Union on 22 June, Field Marshal Fedor von Bock's Army Group Center was the most powerful of the three German army groups. Bock commanded three field armies, along with two of the four available panzer groups. His southern wing, charged with advancing just north of the Pripet Marshes, consisted of Field Marshal Günther von Kluge's Fourth Army of 21 infantry divisions and Colonel General Heinz Guderian's 2nd Panzer Group of one cavalry, five panzer, and three panzergrenadier divisions. In the north, attacking from East Prussia, Colonel General Adolf Strauss's Ninth Army had 12 infantry divisions and Colonel General Hermann Hoth's 3rd Panzer Group had four panzer and four panzergrenadier divisions. In reserve, Bock had Colonel General Maximilian von Weichs's Second Army. To support his ground effort, Bock could rely on the largest German air fleet on the Eastern Front at the time, Field Marshal Albert Kesselring's 1,000-aircraft Second Luftflotte.

Bock's invading German forces were actually matched in terms of numbers and matériel by the Soviet Western Front, consisting of four armies commanded by Colonel General Dimitry G. Pavlov. Unfortunately for the Soviets, three of these armies—the Third, Fourth, and Tenth—were positioned in the westward-protruding Bialystok salient, which turned into a trap for them. The Soviet Thirteenth Army was more to the east, near Minsk.

Pavlov, however, was handicapped not only by manpower dispositions that had been forced on him but by Defense Commissar Marshal Semen Timoshenko's Directive No. 3 that required all fronts, regardless of circumstance, to take the offensive. In the event of a German invasion, the Northwestern and Western Fronts were to launch coordinated attacks from Kaunas and Grodno, respectively. But the front commanders, despite having two mechanized corps each, were unable to mount a coordinated offensive. Still, General Pavlov appointed Lieutenant General Ivan Boldin to form a "shock group" and attack south of Grodno, near Brest. But Boldin soon found promised support unavailable and a German encirclement of his forces a distinct possibility.

Disgusted with Pavlov, Timoshenko replaced him with Lieutenant General Andrei I. Yeremenko. In the meantime, Timoshenko ordered Pavlov to hold Minsk and the Slutsk Fortified District with the Thirteenth Army and his second-echelon mechanized corps.

Pavlov was then ordered to withdraw his armies from the Bialystok salient, where they were now threatened by Hoth's 3rd Panzer Group sweeping around Minsk from the north through Vilno-Molodechno, while Guderian's 2nd Panzer Group drove around the city from the southwest through Baranovichi. On the night of 25–26 June, Pavlov ordered his four armies to withdraw east, but this plan succeeded no better than his earlier offensive. Hoth had torn a 60-mile gap between the retreating Eleventh Army of the Soviet Northwest Front moving to the northeast and the Third Army of the Western Front retreating southeast by attacking along the frontal boundary. Boldin's force, aiding Major General K. D. Golubev's Tenth Army, pleaded for an air drop of fuel and ammunition. By 26 June, it had withdrawn into thick forest south of Minsk. Pavlov had assigned Fourth Army the task of holding Shchara and defending the Slutsk Fortified District in the southwest, only to discover Slutsk had sent all its weapons to Brest.

The Battle for Minsk was joined by 26 June as Pavlov withdrew with his staff to Moghilev, leaving the weak Thirteenth Army to defend Minsk, even as the inner encirclement progressed as part of the "double battle of Bialystok-Minsk." Slutsk fell to the Germans the next day as the German spearheads raced toward the Berezina River. Pavlov's Third and Tenth Armies were withdrawing toward Minsk, hoping to break the inner encirclement despite having little ammunition, but both were cut off by 28 June, along with Thirteenth

Army. Pavlov's pride, the VI Mechanized Corps—a unit that began the campaign with more than 1,000 tanks—was shattered, its commander killed.

On 29 June, Yeremenko took command from Pavlov, who was sent to Moscow. Meanwhile, Yeremenko lost the race to the Berezina to the German panzers. The savaged Soviet Western Front was scattered over a 200-mile area, as Minsk had fallen on 29 June. By 9 July, German mopping-up operations ended. In the operation, the Germans claimed to have destroyed five Soviet armies and taken nearly 324,000 prisoners, 1,809 guns, and 3,332 tanks.

The Soviets, led by surviving commanders such as Boldin, took advantage of the spring rains and managed to break out about 300,000 men. Although Josef Stalin's inept decisions had contributed greatly to the Soviet military failures to that point, Pavlov was made the scapegoat for the Minsk disaster and shot, along with Fourth Army commander General A. A. Korobkov and XLI Rifle Corps commander General I. S. Kosobutsky, both of whom had managed to escape the German trap. Smolensk was the next German objective.

Mitscher, Marc Andrew (1887–1947)

U.S. Navy admiral and commander of a fast carrier task force in the Pacific. Born on 26 January 1887 in Hillsboro, Wisconsin, Marc Mitscher grew up in Washington, D.C., and entered the U.S. Naval Academy in 1906. On his graduation in 1910, he served with the fleet until 1915, when he seized an opportunity to enter naval aviation, becoming naval aviator number 33.

Mitscher spent much of World War I conducting catapult experiments. In 1919, he participated in the U.S. Navy's

U.S. Admiral Marc A. Mitscher, in a boatswain's chair. (Library of Congress)

first attempted transatlantic flight, although his particular aircraft only reached the Azores. Between the wars, Mitscher remained in aviation through a variety of administrative and operational postings, including stints aboard the carriers *Langley* (1929–1930) and *Saratoga* (1934–1935), as well as with the Bureau of Aeronautics (1930–1933 and 1935–1937).

In 1938, Mitscher was promoted to captain. Three years later, he was the first commanding officer of the carrier *Hornet*, and his ship launched Lieutenant Colonel James H. Doolittle's raid on Tokyo in April 1942. Promoted to rear admiral, Mitscher commanded all air operations in the Solomon Islands in 1943. In 1944, he assumed command of Fast Carrier Task Force 58/38 (38 if William Halsey commanded, 58 for Raymond Spruance). In March 1944, Mitscher was promoted to vice admiral. Excluding a brief rest period from October 1944 to January 1945, he remained with Task Force 58/38 for many of the greatest Pacific battles, including the Marshalls, the Marianas, Leyte Gulf, Iwo Jima, Okinawa, and raids on the Japanese home islands.

In July 1945, Mitscher became deputy chief of naval operations for air. In March 1946, he commanded Eighth Fleet,

then assumed the post of commander in chief, Atlantic Fleet in September. Mitscher died of heart failure in Norfolk, Virginia, on 3 February 1947.

Model, Walther (1891–1945)

German field marshal and army group commander involved in many of the major operations in the European Theater. Born in Genthin, Germany, on 24 January 1891, Walther Model joined the army in 1909 and served during World War I, rising to captain. He remained in the Reichswehr after the war, and in 1935, he was appointed head of its Technical Warfare Section.

Promoted to Generalmajor (U.S. equiv. brigadier general) in March 1938, Model served as chief of staff of IV Corps in the September 1939 invasion of Poland. He was made a Generalleutnant (U.S. equiv. major general) in April 1940 and led 3rd Panzer Division in the invasion of France and the Low Countries in May 1940. He next participated in the invasion of the Soviet Union, Operation BARBAROSSA, and was advanced to General der Panzertruppen (U.S. equiv. lieutenant general) in October 1941 and given command of XLI Panzer Corps. In January 1942, Model took over Ninth Army; the next month, he was promoted to Generaloberst (U.S. equiv. full general). An aggressive, capable commander and a supporter of Adolf Hitler, Model nonetheless helped convince Hitler to delay plans for Operation CITADEL, leading to the German defeat in the Battle of Kursk.

Model became commander of Army Group North in January 1944 and was promoted to field marshal that March. The same month, he took over an army group in the southern USSR. Again and again, he proved his astonishing talent in defensive warfare, hampering the Soviet advance. Hitler sent his expert in defensive warfare to various places where an Allied breakthrough was imminent. Model became known as "Hitler's Fireman."

German Field Marshal Walther Model. (Photo by Hulton Archive/Getty Images)

Transferred to the Western Front in August 1944 as supreme commander, West, Model initially believed he could replicate his successful defensive tactics developed in the east. Enormous Allied superiority, especially in airpower, disabused him of this notion. After only 18 days, he reverted to command of Army Group B only, and in September, he blunted the Allied drive to take Arnhem in Operation MARKET-GARDEN. In December 1944, he was increasingly drawn into planning the Ardennes Offensive (the Battle of the Bulge) under Field Marshal Karl Gerd von Rundstedt, who was pessimistic over the outcome.

In 1945, Model was tasked with defending the Ruhr. He clashed with Hitler when the latter refused to allow him to retreat. He committed suicide on 21 April 1945, in Lintorf near Duisburg, Germany, on the destruction of his encircled army group. Model was one of few German generals who did not hesitate to contest Hitler's orders when he believed them wrong. Preoccupied with the immediate military situation, he was not interested in politics or overall military strategy.

Molotov, Vyacheslav Mikhailovich (1890–1986)

Soviet foreign minister from 1939 to 1949. Born Vyacheslav Skriabin in the village of Kukarka, Viatsk Province, Russia, on 9 March 1890, Molotov attended secondary school in Kazan. He became involved in underground revolutionary activities, and in 1906, he joined Vladimir Lenin's Bolshevik faction of the Social Democratic Party. In 1909, he was arrested and exiled. On completion of his sentence in 1911, Molotov moved to Saint Petersburg, where he joined the staff of the Bolshevik journal *Pravda*. While there, he met Josef Stalin, who was one of the editors. By the time of the Bolshevik Revolution in November 1917, Molotov had become one of Stalin's most loyal followers, and as Stalin's star ascended in the 1920s, so did that of Molotov.

In 1926, he became a full member of the Politburo, where he led attacks on Stalin's political adversaries, such as Leon Trotsky. During the 1930s, Molotov faithfully assisted Stalin in carrying out agricultural collectivization and the massive purges of the party and armed forces, for which Stalin rewarded his diligent henchman with a succession of increasingly important positions.

In May 1939, Molotov replaced the internationalist Maksim Litvinov as foreign minister. Although he had no diplomatic experience, his appointment served as a signal that Stalin was seeking to reach accommodation with Nazi Germany. Accordingly, on 23 August 1939, Molotov and German Foreign Minister Joachim von Ribbentrop signed the German-Soviet Non-aggression Pact in Moscow. In November 1940, Molotov went to Berlin to confer with Adolf Hitler about further defining German and Soviet spheres of influence, but the negotiations failed, and Hitler decided to attack the Soviet Union.

When the German invasion commenced on 22 June 1941, it was Molotov, not Stalin, who informed the nation in a radio broadcast; Stalin apparently was incapacitated by shock.

Soviet Foreign Minister Vyacheslav Molotov signs the German-Soviet Non-Aggression Pact in Moscow on 23 August 1939 as German Foreign Minister Joachim von Ribbentrop and Soviet leader Josef Stalin look on. (Corbis)

During the war, Molotov dealt extensively with the Soviets' western allies, but by the end of the war, his stubborn pursuit of Soviet goals and disagreeable demeanor made him one of the symbols of the emerging Cold War.

After World War II, Molotov went into political eclipse. He stepped down as foreign minister in 1949, and he was expelled from the Communist Party in 1962 following a dispute with Nikita Khrushchev. Rehabilitated in 1984 after spending two decades in political obscurity, Molotov died in Moscow on 8 November 1986.

Montélimar, Battle of (21–28 August 1944)

Key battle following the Allied invasion of southern France, Operation DRAGOON. The battle around Montélimar saw the heaviest fighting of the northerly advance. DRAGOON, delayed by a shortage of landing craft, began on 15 August 1944. Lieutenant General Jacob Devers commanded 6th Army Group, composed of U.S., French, Canadian, and British troops. Landing initially at Saint-Tropez, the Allies quickly secured the ports of Marseille and Toulon. Having failed to stop the Allies, the Germans made the logical decision to withdraw. On the night of 17 August, the German Armed Forces High Command ordered Generaloberst (U.S. equiv. full general) Johannes Blaskowitz's Army Group G to evacuate southern France. German forces then began to move to the northeast.

To cut off the Germans and capture as many as possible, VI Corps commander Major General Lucian K. Truscott organized a mobile task force under his chief of staff, Brigadier General Frederick B. Butler, on 17 August. Its job was to drive north, link up with the French Resistance, and try to cut off General Friedrich Paul Wiese's retreating German Nineteenth Army. It set out on 18 August. Task Force Butler advanced north along the Rhône River, and on the night of 20 August, Truscott ordered it to move the next morning to the town of Montélimar east of the Rhône, through which Highway 7 and a railroad line ran north. Its task was to set up blocking positions up the Rhône River valley in that vicinity. Truscott guessed correctly that the Germans intended to use the valley as their major escape route north. Major General John E. Dahlquist's 36th Division would then come up in support. Task Force Butler began arriving in the area on 21 August. As most bridges across the Rhône had been destroyed, the Americans hoped to trap General Wend von Wietersheim's 11th Panzer Division at Montélimar.

The eight-day battle there took place beginning on 21 August in a rough quadrilateral area about 15 miles north and 10 miles east of Montélimar. Despite Truscott's repeated orders to move as quickly as possible, the 36th Division was handicapped by an acute shortage of gasoline. The 141st Regiment of the 36th Division did not begin arriving at Montélimar on 23 August. Repulsed by German artillery, it had to settle for securing positions north of the town and east of Highway 7. Dahlquist, meanwhile, believed his men held the town itself and the highway.

Most German units were still south of Montélimar, and by 24 August, the American units had set up blocking positions. The Germans were now forced to find other escape routes east of Montélimar. Three German divisions, the 198th Infantry, 337th Infantry, and 11th Panzer, were ordered to hold off the

36th Division to the south, while opening escape routes north. The Germans captured an American operations order, and on 25 August, the Germans struck at the hinge between the 141st and 142nd Regiments at Bonlieu. After two assaults, they breached the American line there. A substantial numbers of Germans troops and tanks escaped north through this opening toward the Drôme River before it was closed on 27 August. Other German troops managed to push up Highway 7, although they were subject to heavy artillery fire. Still others made their way west across the Rhône bridges, usually at night to avoid American artillery and aircraft strafing attacks. Not until 28 August did the U.S. 141st Regiment finally gain full control of the heights north of Montélimar, allowing the remainder of the 36th Division to enter the town and conduct mopping-up operations.

Although the Americans failed to entrap the Germans, they did inflict losses of 2,000 motor vehicles, 1,000 horses, 5 railroad guns, and 40 other artillery pieces. They also took more than 3,000 prisoners. Unfortunately for the Allies, most of the Germans had escaped north to continue the fight.

Montgomery, Alfred Eugene (1891–1961)

U.S. Navy admiral who commanded carrier divisions in the Pacific Theater. Born in Omaha, Nebraska, on 12 June 1891, Alfred Montgomery was commissioned as a line officer on graduation from the U.S. Naval Academy in 1912. He briefly served aboard cruisers before transferring to submarines and commanded the *F-1*, which was lost in a collision while on maneuvers in December 1917. As a lieutenant commander, Montgomery commissioned and commanded the *R-20* between 1918 and 1920.

Montgomery earned his pilot's wings at Pensacola, Florida, in 1922 and was closely identified thereafter with naval aviation. In the late 1920s, he was the air officer of the aircraft carrier *Langley*, the U.S. Navy's first carrier. A full commander by 1930, he commanded the Seattle Naval Air

Station until 1932. He was executive officer of the carrier *Ranger* in the Pacific from 1934 to 1936 and her captain in the Atlantic from 1940 to 1941. Montgomery remained on board as chief of staff and aide to the commander, aircraft, Atlantic Fleet in 1941 and 1942. In June 1942, as a rear admiral, he took command of the Naval Air Station, Corpus Christi, Texas.

From August 1943, Montgomery commanded Carrier Division 12, and later Carrier Division 3 in the Pacific Theater. He was almost continually engaged in operations until December 1944, commanding task groups that were usually composed of four fast carriers with escorting vessels. He participated in nearly all of the major Pacific engagements of that period, including the major fleet actions in the Battles of the Philippine Sea (June 1944) and Leyte Gulf (October 1944). He gained a reputation as an aggressive, forceful leader.

Rotated back to the United States, Montgomery commanded the air component of the West Coast Fleet (1945) and, as a vice admiral, the Pacific Fleet Air Forces (1945–1946), rising by 1947 to command of the Fifth Fleet and then the First Task Fleet. Reverting to rear admiral, he held commands in Alaska and Bermuda before retiring in June 1951 in the grade of vice admiral, leaving his final assignment as commander of fleet air at Jacksonville, Florida. Montgomery spent his last years in Seattle, Washington, and died at Bremerton, Washington, on 15 December 1961.

Montgomery, Sir Bernard Law (First Viscount Montgomery of Alamein) (1887–1976)

British army field marshal who was instrumental in the planning and execution of key engagements in North Africa and Europe. Whether considered a latter-day Marlborough or Wellington or “the most overrated general of World War II,” Bernard Law Montgomery remains the most controversial senior Allied commander of World War II. Montgomery was born in Kennington, London, on 17 November 1887. His father became the Anglican bishop of Tasmania, but the family returned to Britain when Montgomery was 13. He attended Saint Paul’s day school, Hammersmith, and entered the Royal Military Academy, Sandhurst, in 1907. The next year, Montgomery was commissioned into the Royal Warwickshire Regiment. Montgomery served in India, and in

World War I, he fought on the Western Front and was wounded in the First Battle of Ypres in 1914. He was then posted to a training assignment in England but returned to the front to fight as a major in the 1916 Battle of the Somme. Montgomery ended the war as a division staff officer. Following occupation duty in Germany after the war, he graduated from the Staff College at Camberley in 1921 and returned there as an instructor five years later. In 1929, Montgomery rewrote the infantry training manual. He then served in the Middle East, commanded a regiment, and was chief instructor at the Quetta Staff College from 1934 to 1937. Between 1937 and 1938, he commanded 1st Brigade. He then took charge of the 3rd Infantry Division, which he led in France as part of the British Expeditionary Force after the start of World War II. He distinguished himself in the British retreat to Dunkerque in May and June 1940, and in July, he took charge of V Corps in Britain, protecting the English south coast.

In April 1941, Montgomery assumed command of XII Corps, which held the crucial Kent area in England. Montgomery established himself as a thorough professional soldier and had no time or patience for the amateur traditions observed by many of his colleagues. Playwright George Bernard Shaw called him “that intensely compacted hank of steel wire.” He was also very much the maverick.

Montgomery helped plan the disastrous Dieppe raid of August 1942 but left to command the First Army in the planned Allied invasion of North Africa. On 13 August, following the death of General W. H. E. Gott, he took command of Eighth Army in Egypt, repulsing Field Marshal Erwin Rommel’s attack at Alam Halfa between August and September 1942.

Montgomery rebuilt Eighth Army’s morale. Known for his concern for his men’s welfare, he was also deliberate as a commander. In the Battle of El Alamein in October and November 1942, his superior forces defeated and drove west German and Italian forces under Rommel. His less-than-rapid advance allowed the bulk of the Axis forces to escape. Montgomery was made a full general that November.

Following the Axis surrender in the Battle of Tunis of May 1943, Montgomery played an active role in planning Operation HUSKY, the invasion of Sicily, and he led Eighth Army in the invasions of both Sicily in July and Italy in September. He returned to Britain to assist in planning Operation OVERLORD, the Allied invasion of Normandy, then temporarily commanded its land forces in the landing until General Dwight Eisenhower moved his headquarters to France in September.

Promoted to field marshal in September 1944, Montgomery commanded the British 21st Army Group. He sought to finish the war by the end of the year with a daring invasion of Germany across the Rhine at Arnhem in Operation MARKET-GARDEN, a surprise from the conservative Montgomery. The plan, however, failed that same month. Montgomery’s forces defended the north shoulder in the Ger-

man Ardennes Offensive (the Battle of the Bulge) in December. At a later press conference, “Monty” gave the impression that he had saved the day for the Americans in the Ardennes, necessitating a statement by British Prime Minister Winston L. S. Churchill that the battle had basically been an American show. Montgomery then directed the drive into northern Germany.

Following the war, Montgomery commanded British occupation troops in Germany between May 1945 and June 1946. From 1946 to 1948, he was chief of the Imperial General Staff. He next served as chairman of the Western European commanders in chief from 1948 to 1951 and commander of North Atlantic Treaty Organization (NATO) forces in Europe and deputy supreme commander between 1951 and 1958. He retired in September 1958. A prolific writer, he personally drafted his memoirs that same year. Montgomery died at Isington Mill, Hampshire, England, on 24 March 1976.

Moreell, Ben (1892–1978)

U.S. Navy admiral who oversaw the construction of military facilities across the globe before and during the war years.

Born on 14 September 1892 in Salt Lake City, Utah, Ben Moreell was raised in St. Louis, Missouri. After graduating from Washington University with a degree in civil engineering and four years with the Engineering Department of the city of St. Louis, Moreell was commissioned a lieutenant (junior grade) in the Civil Engineer Corps (CEC) of the U.S. Navy in 1917. He spent World War I in the Azores.

After the war, Moreell remained with the navy. He then served at bases in the United States and in Haiti. From 1926 to 1930, he was with the Bureau of Yards and Docks. After a period in France studying European engineering techniques at the *École Nationale des Ponts et Chaussées*, Moreell returned to the bureau. In 1937, President Franklin D. Roosevelt appointed him chief of the Bureau of Yards and Docks and chief of the Civil Engineers of the U.S. Navy, as a rear admiral.

In his new position, Moreell oversaw the construction of U.S. bases around the world. To build the infrastructure required by the navy during the war, he spent \$9.25 billion. By the time the United States entered the war, Moreell had 70,000 men engaged in construction projects worldwide. All bases were built by private firms employing civilian laborers, and wherever possible, Moreell worked on a cost-plus-fixed-fee contract basis rather than cost-plus-percentage contract basis. Worried that construction would stop in the event of war because civilians were prohibited by international law from carrying weapons, Moreell recommended the creation of a militarized construction battalion.

Following the U.S. entry into the war and the capture of U.S. construction workers by the Japanese, Moreell received authorization from the Bureau of Navigation on 5 January 1942 to recruit a naval construction regiment, composed of three battalions. Taking their name from the initials for "construction battalions," the Seabees greatly aided the naval war effort by building air bases, docks, roads, bridges, and other facilities around the world. During the war, the Seabees constructed 40 domestic bases and 600 advanced bases in the Pacific and Atlantic. The Seabees' contribution was honored in Moreell's 1945 Distinguished Service Medal citation: "Displaying great originality and exceptional capacity for bold innovation . . . to the end that the Fleet received support in degree and kind unprecedented in the history of naval warfare."

Moreell advanced to the rank of vice admiral in February 1944, the first CEC officer to hold that rank, and was made an admiral in June 1946. He retired from active duty that September and then headed a number of construction and steel businesses. Moreell died in Pittsburgh, Pennsylvania, on 30 July 1978.

Morgenthau, Henry, Jr. (1891–1967)

U.S. secretary of the treasury and friend and adviser to President Franklin D. Roosevelt. Born in New York City on 11 May 1891, the son of a prominent and politically active Jewish real estate speculator whom President Woodrow Wilson appointed as the U.S. ambassador to Turkey, Henry Morgenthau chose to become a gentleman farmer on an estate in Dutchess County, New York. There, a neighbor, the rising young Democratic politician Franklin Roosevelt, soon became his close friend and political adviser. From 1929 to 1932, when Roosevelt was governor of New York State, Morgenthau was his commissioner of conservation.

In 1933, Roosevelt became president of the United States and appointed Morgenthau to head the Farm Credit Association. A year later, Morgenthau became secretary of the treasury, a position he retained until Roosevelt's death in April 1945, serving as one of the president's most trusted advisers on both domestic and international affairs.

An early and tenacious opponent of fascism, Morgenthau argued from the mid-1930s that the United States could not remain aloof from international affairs, and he urged forceful U.S. action in both Europe and Asia. He supported economic sanctions against aggressor nations, and in 1937, he prevailed on Roosevelt to assist China financially against Japan. In 1941, when Japan occupied bases in southern French Indochina, Morgenthau advocated a complete American economic embargo of Japan. He likewise urged the imposition of economic sanctions on Germany, and following the September 1938 Munich crisis, he even suggested that Roosevelt launch an American "defensive war" against Adolf Hitler's Germany. Understandably, Morgenthau was also a leading advocate of massive increases in U.S. defense spending.

Almost a year before Pearl Harbor, the Treasury Department was heavily involved in developing the Lend-Lease program of military assistance to Great Britain and other nations, which had been passed by Congress in spring 1941. Morgenthau successfully financed the extremely costly U.S. war effort while keeping inflation and interest rates low. Under his direction, well-organized campaigns persuaded the American public to purchase over \$12.9 billion in war bonds.

Morgenthau headed the U.S. delegation to the 1944 Bretton Woods Conference, where proposals were drafted for two

financial institutions to fund postwar reconstruction—the International Monetary Fund and the International Bank for Reconstruction and Development. He also strongly supported the creation of the United Nations, an agency he anticipated would enable rich states to facilitate development in poorer nations.

In early 1944, Morgenthau complained to Roosevelt of the State Department's disinterest in assisting Jewish Holocaust survivors in Europe, impelling Roosevelt to create the War Refugee Board. Later that year, hoping to destroy defeated Germany's future war-making potential, Morgenthau drafted a harsh proposal to divide that country into separate states and dismantle its industrial capacity. At the September 1944 Quebec Conference, he initially persuaded Roosevelt and British Prime Minister Winston L. S. Churchill to accept this plan, a decision State and War Department officials subsequently succeeded in reversing.

After Roosevelt's death in April 1945, Morgenthau's influence quickly declined. Three months later, he resigned and returned to his farm. For the next decade, he energetically chaired Jewish philanthropic organizations, raising funds for Israel. Morgenthau died at Poughkeepsie, New York, on 6 February 1967.

Mortars

The mortar began as a short, high-angle-fire weapon used in siege warfare. During World War I, it was well adapted to static trench warfare, and all participants had some version of the weapon. Mortars were the ideal infantry weapon, and their plunging fire rendered them most effective in trench warfare. Proper trench mortars, for which the two chief criteria were ease of use and portability, appeared in 1915. World War I mortars ranged in size from light 7.62 cm trench

U.S. Army private fires a 4.2 inch mortar at Forbach, France during the drive for the Saar. (Bettmann/Corbis)

mortars firing a 9 lb projectile to heavy and difficult to move 340 mm mortars firing a projectile weighing 430 lbs. As infantry artillery, mortars could provide dedicated barrages for companies and battalions without recourse to true artillery units. Most mortar crews were infantrymen who were trained to use the weapon and were part of their unit. This meant that each unit within its parent could call for fire support when it was needed.

The mortar developed from the heavy trench mortar of World War I into the Brandt- and Stokes-type mortars of the 1930s. The latter were battlefield weapons that could be carried by a man and could deliver an effective shell without the time delay of conventional artillery. Set up and firing was a quick process, and in view of the relatively short range of mortars, fire control and correction were easy, even for front-line infantry.

The mortar, in comparison with artillery, has the benefit of simplicity, and it is cheaper to manufacture than a gun or howitzer. As with the howitzer, it has a high angle of fire. Its shell has excellent antipersonnel characteristics. As it descends from the near vertical, the shell, when detonated, produces a 360-degree blast and shrapnel effect, unlike the less effective low-angle gun shell. The mortar also can be used

Table 1
Mortar Statistics

	<i>United Kingdom</i>	<i>Germany</i>	<i>United States</i>	<i>USSR</i>	<i>Japan</i>	<i>Italy</i>
Light mortars						
Caliber	2 inch	5 cm	60 mm	50 mm	50 mm	45 mm
Shell weight (in pounds)	2.25	1.98	3–4	1.9	1.75	1.025
Range, maximum (in yards)	500	550	2,000	800	700	585
Medium mortars						
Caliber	3 inch	8 cm	81 mm	82 mm	80 mm	81 mm
Shell weight (in pounds)	10	7.72	7–15	6.72	7.4	6.9
Range, maximum (in yards)	2,800	2,625	3,290	3,400	3,100	4,430

to overcome obstacles to direct fire, such as buildings, trenches, and hills. Lighter mortars are mobile, especially in terrain into which guns have difficulty penetrating, such as mountainous and wooded ground.

Technically, unlike the gun, the mortar has a low chamber pressure and a smooth barrel, factors that reduce wear on the barrel and thus prolong the effective accuracy and life of the weapon. As a tactical weapon, it is easy to conceal, and it can be fired from a trench, making it possible, although never really desirable, to have mortars in the front line.

In World War II, participants used light and medium mortars at the beginning, with much heavier mortars appearing later, particularly on the Eastern Front in the Soviet Union (see Table 1). Light mortars, of approximately 5 cm or 2-inch caliber, were used by, among others, the Germans, British, Japanese, and Americans. They were issued at the platoon level, the idea being to provide every platoon with a short-range weapon for immediate support. The mortar proved of some value for laying a small smoke screen, but it was soon realized that the high-explosive content of the shell was too small to be effective. The illumination shell, however, proved to be of great value at night, enabling a platoon to light up its front in an instant.

The Germans developed their World War I mortars along the lines of both the Brandt and the Stokes patterns to produce the 8 cm Granatwerfer 34, which was issued to all German army battalions in the support or heavy weapon companies that also controlled the heavy machine guns. The German employment of mortars in World War II was closely linked to their use of machine guns in both attack and defense, and their medium mortar teams gained a solid reputation for their work in supporting their infantry.

The Germans, however, regarded the Soviets as the masters of the mortar. The Soviets issued a series of 5 cm mortars, but these were overshadowed by their larger-caliber weapons. The 82 mm mortar Type M36 (and later, its successors) was the main infantry mortar, and although it fired only a 6.7 lb bomb, the number of mortars available in the Soviet battalion was so high that the effect on the Germans was often catastrophic.

The Soviets had a great liking for the mortar, and they began to bring in heavy mortars, increasing in caliber to 160 mm. These large-caliber weapons did not so much outrange their smaller brethren as outweigh them in the amount of explosive they could drop onto a target. Whereas the 82 mm shell weighed less than 6.71 lbs, the 160 mm shell weighed 89.7 lbs. Explosive fillers were 4.5 and 62 lbs, respectively, which meant that the explosive content of the latter was 14 times that of the former.

The Western Allies generally stuck to the 3-inch or 80 mm mortar during World War II because Allied artillery and air support meant that they did not have to develop new, light-weight methods of delivering shell on the battlefield. For the Germans, however, rocket-propelled shell, such as the 28/320 mm Schweres Wurfgerät 40 and 41 and the 180 mm Raketengranate 4331, meant easier, quicker, and cheaper shell manufacture and the means to deliver high weights of shell at less cost in money and in time on the battlefield.

Although strictly speaking not mortars, the Soviet Katyusha, or “Stalin Organ,” rocket weapons caused the Germans to look carefully at small rocket-propelled shells. They already had the multibarreled Minenwerfer weapons, and soon, they dispensed even with barrels for firing these projectiles. The 28 cm and 32 cm Nebelwerfer 41 shells and many similar projectiles were

fired from their packing cases. The shells' weight was such that they did not need sophisticated sighting systems, just an area to be hit. These latter-day mortars proved effective in battle, and they were the forerunners of today's Multiple Launch Rocket Systems (MLRS).

Development of the mortar in World War II followed two diverse paths. The first was the Allied weapons, where range, bomb, and accuracy improvements were seen as most important. These developments led to rifled-barrel mortars, proximity-fused and rod-detonated shells, and sighting systems nearly as complex as artillery gunsights. The conflict on the Eastern Front, however, led to greatly increased calibers and multibarreled mortars, essential against large masses of attacking infantry.

Moscow, Battle of (30 September 1941-April 1942)

Second major German offensive to seize the Soviet capital following the initial efforts of Operation BARBAROSSA. After phase one successes in Operation BARBAROSSA during June and July 1941, the Wehrmacht appeared to have unimpeded routes to Leningrad, Moscow, and Kiev. However, phase two proved more difficult for several reasons. Soviet defenses were stiffening after the initial shock of the invasion, and an additional 5 million men in the reserve forces were mobilized and thrown into battle. Also, German leader Adolf Hitler and his generals debated what course of action was best for phase two. The generals considered Moscow the main objective because it was a vital communication and industrial center and the Soviet capital and because a battle for it offered the best chance of destroying the Red Army and ending the campaign. Hitler, however, initially thought taking Leningrad and linking up with the Finns should have priority in order to secure the Baltic completely. By mid-August, Hitler changed his mind and focused the main effort on gaining the resources of the Ukraine and Caucasus, relegating both Leningrad and Moscow to secondary status. He even reinforced his Army Group South, stripping panzer forces from the other two army groups.

Phase two finally began with an assault on Kiev, which fell to the Germans on 19 September and netted 650,000 prison-

ers. Then, fall rain and mud slowed the German advance in the south. Progress toward Leningrad also ground to a halt, partly because of increased resistance but also because Hitler conceived a new plan. In that plan, which he directed on 6 September, Leningrad was to be encircled, put under siege, and starved into submission, and the Crimea, the Donets Basin, and the Caucasus were to be taken for the coal and oil resources that would fall to German use. The encirclement and capture of Moscow received highest priority, panzer forces previously transferred to the other army groups were now returned to Army Group Center, and operations began on 30 September. Commencement of the new plan, Operation TAIFUN (TYPHOON) effectively brought to an end Operation BARBAROSSA.

The battle for Moscow breaks generally into three phases: the first German offensive encompassed the period from 30 September to nearly the end of October; the second German offensive took place between 17 November and 5 December; and the Soviet counteroffensive lasted from 6 December to spring 1942. General Heinz Guderian's 2nd Panzer Group of Army Group Center spearheaded the offensive. It took Orel on 3 October and 17 days later captured 665,000 Soviet prisoners around Vyazma and Bryansk. On 6 October, the Germans broke through the Rzhev-Vyazma Line and advanced toward the Mozhaisk Line, an improvised line of fortifications thrown up by the Soviets 50 miles west of Moscow during summer 1941. The Germans bypassed the Mozhaisk Line on the south and captured Kaluga on 12 October and Kalinin two days later. On 18 October, the Soviets abandoned Mozhaisk itself after heavy fighting.

Also on 6 October, the *rasputitsa* (literally, time without roads, caused by the fall and spring rain and mud in the USSR) began with the first wet snow, and alternating rain and snow fell almost continuously. At the same time, reinforcements from the Far East Command were on their way to the Moscow Front. These troops had been freed when the Japan-based Soviet spy Richard Sorge assured Josef Stalin that the Japanese would honor their nonaggression pact. On 10 October, Marshal Georgii Zhukov, pulled from commanding the defense of Leningrad where he had been sent only weeks before, took command of Moscow's defense. With the help of the weather and with the defenders' backs pressed against the capital, Soviet resistance solidified as the Germans advanced. For the first time in the war, the Soviets were able to confront the Germans head on and force them to fight for every mile.

On 15 October, with the Germans driving to within 50 miles of the capital, the Soviet government and diplomatic community were evacuated from Moscow to Kuibyshev on the Volga. This caused a panic among the Muscovites the next day; they believed they had been abandoned. The announcement on 17 October that Stalin was in the Kremlin, where he remained throughout the war, returned the city to relative

calm. On 20 October, the State Defense Council declared the capital under a state of siege in order to deal swiftly with any other acts of civil disorder.

By 18 October, local Soviet counterattacks and the weather slowed the German advance, and between then and the beginning of November, the Germans made very little progress. It was in this context that, on 7 November, ceremonies commemorating the twenty-fourth anniversary of the Bolshevik Revolution were held in Red Square and Stalin made his “Holy Russia” speech, seeking to mobilize resistance to the invaders. The German failure to capture Moscow with the October offensive raised Soviet civilian and military morale and gave the Soviet High Command time to assemble large strategic reserves to the east. However, at the beginning of November, everything pointed to the Germans’ preparation for another all-out attack.

The first major blow fell on 16 November in the Kalinin-Volokolamsk sector, and in two days, the Germans entered Klin, north of Moscow, and Istr, only 15 miles west—the closest the Germans were able to get to Moscow in force. To the south, Tula, which had been connected to Moscow by a narrow bottleneck, was encircled on 3 December for a short time, but the Soviets counterattacked and quickly reopened the Moscow highway. On 4 December, temperatures fell to well below freezing and remained there, stalling the German offensive.

On 6 December, the Soviets launched their winter counteroffensive along the Moscow Front from Kalinin in the north to Yelets in the south. By 1 December, 70 Soviet Far East divisions and another 27 from Central Asia had been transferred to the west. Approximately 20 of these entered the fight around Moscow in December. Although the German offensive, after heavy fighting in December and the first half of January, made fairly good progress in the northern and southern flanks of the front, the advance due west of Moscow was much less successful. The Soviets’ plan had been to encircle the Germans west of the capital, but Hitler had purged some of his generals in Army Group Center and had taken supreme command himself and ordered a stiffening of the defense east of the Rzhev-Vyazma-Gzhatsk-Yukhnovo Line. By the end of January 1942, the Red Army counteroffensive came to a virtual standstill. Fierce combat in the Moscow area continued from January until the end of April 1942, by which point the German army had been driven back up to 160 miles from the Soviet capital.

The German failure to take Moscow within six months of its invasion of the Soviet Union was as important symbolically as militarily. It demonstrated both the Soviet determination and ability to defend the capital city and the inability of Hitler to conquer the Soviet Union as he had western Europe. Apart from being a substantial propaganda blow to

Germany, the Battle of Moscow proved there were definite limits to German military power and marked the end of the German blitzkrieg on the Eastern Front.

Moscow Conference (19–30 October 1943)

First meeting of the “Big Three” Allied foreign ministers, yielding the Four-Power Declaration. U.S. President Franklin D. Roosevelt prodded Soviet leader Josef Stalin in 1943 for a meeting of the Allied heads of state, and the Soviet leader reluctantly agreed but suggested their foreign ministers get together in advance. Hoping to enlist the Soviets in the general American plans for postwar cooperation, 72-year-old U.S. Secretary of State Cordell Hull flew to Moscow, enduring his first airplane trip. Hull understood that Roosevelt intended to resolve the thorniest questions with Stalin at their subsequent meeting. British Foreign Minister Anthony Eden generally favored broad American internationalist ideas but more correctly also hoped to forestall Soviet expansionism and protect the interests of the exiled Polish government in London, recently infuriated by stories of mass Soviet executions of Polish military officers in the Katyń Forest.

Soviet Foreign Minister Vyacheslav Molotov chaired the 12-day meeting in the old Spiridonovka Palace, intent on burnishing the image of Allied cooperation, securing firmer assurances regarding the timing of Operation OVERLORD, and asserting the Soviet Union’s right to play some role in Italy. (Moscow had loudly complained the Anglo Americans had made a separate peace after Benito Mussolini’s collapse.) Hull and Eden affirmed that OVERLORD, the invasion of northern France, would commence in the spring of 1944, though Eden shared British Prime Minister Winston L. S. Churchill’s nagging hints of possible modest delays.

Hull's crowning achievement was the acceptance of the statement of general principles regarding postwar cooperation and creation of the United Nations. For Hull, it was particularly important that the Soviets and British accept the Chinese among the signatories, thereby acknowledging China's status as a major power—one of the “Four Policemen,” in Roosevelt's view. The Soviets agreed to the declaration but only after revising it so as to retain greater freedom in how they might use military or political forces in eastern Europe after the war. Perhaps naively, Hull and Roosevelt thought Moscow's commitment to the general principles of cooperation, embodied in the United Nations, outweighed resolving any specific problems at that stage. Conversely, Eden sought a self-denying pledge from the Soviets regarding future conduct along their western borders, and he suggested a statement affirming nations' rights to self-determination, similar to the Declaration for Liberated Europe that emerged from the Yalta Conference some 15 months later. But, receiving little support from Hull, Eden failed to budge the Soviets, who would go no further than stating their desire to see an independent Poland—but one favorably disposed toward Moscow.

The conferees set up two joint commissions to address postsurrender issues in Italy and the rest of Europe and proclaimed their intent to punish Nazi war criminals. Having agreed on some general principles and set the stage for later, more substantive discussions, the diplomats concluded their work on 30 October. At the closing banquet, Stalin unambiguously volunteered to join the war against Japan after Hitler was defeated. Hull left feeling tremendously pleased by this and by Soviet support for the United Nations. Roosevelt pronounced the spirit of the conference to have been “amazingly good,” but Eden and new U.S. Ambassador to the Soviet Union Averell Harriman, among others, were already worried about Soviet intentions in eastern Europe.

Moulin, Jean (1899–1943)

French Resistance leader. Born in Béziers (Hérault), France, on 20 June 1899, Jean Moulin was educated as a lawyer. A promising young politician, Moulin was France's youngest prefect in 1940, in charge of the Department of Eure-et-Loire, which includes the city of Chartres. After the armistice, he refused a German order to sign a document falsely accusing Senegalese troops of atrocities. Imprisoned and tortured, Moulin tried to commit suicide.

Ordered by the Germans to remove several leftist mayors in his department, Moulin instead fled France and arrived in London in October 1941, where he became connected with several key resistance groups, most notably those with leftist inclinations. The leader of the Free French, General Charles de Gaulle, soon recognized Moulin's value. At de Gaulle's urging, Moulin parachuted with two assistants into southern France in January 1942, with instructions to unite the fractured resistance groups.

French Resistance leader Jean Moulin. (Photo by Hulton Archives/Getty Images)

In early 1943, Moulin established the *Mouvements Unis de la Résistance* (MUR, meaning “wall” in French), an umbrella organization for resistance groups in the south. Moulin returned briefly to Britain to arrange with the Special Operations Executive (SOE) for air drops of arms, radios, and propaganda material. Back in France in May, Moulin presided over the first meeting of the *Conseil National de la Résistance* (CNR) in Paris on 27 May; of the meeting brought together resistance groups from all regions and ideological perspectives, including the anti-Gaullist communists.

Shortly after the founding of the CNR, Moulin was betrayed by an informer and was arrested by the Gestapo in a suburb of Lyon on 21 June. Aware that he had vast knowledge of all resistance cells in France, the Gestapo chief in Lyon, Klaus Barbie, personally oversaw extensive torturing. Moulin refused to talk despite five days of torture. He died on a train on 8 July 1943, probably at Metz, while being transported to Germany. The charismatic Moulin is regarded as the greatest hero and martyr of the French Resistance, who prevented the various groups from engaging in internecine warfare (although after his death, the anti-de Gaulle and pro-de Gaulle factions drifted apart). Today, the Gestapo headquarters in Lyon where he was tortured is a museum of the French Resistance. In 1964, his remains were reinterred in the Pantheon in Paris.

Mountbatten, Louis Francis Albert Victor Nicholas (First Earl Mountbatten of Burma) (1900–1979)

British navy admiral who became supreme commander of the South-East Asia Command (SEAC) in 1943. Born at Frogmore House on the grounds of Windsor Castle on 25 June 1900, “Dicky” Mountbatten was the second son of Admiral of the Fleet Prince Louis of Battenberg (the family adopted the less Germanic name of Mountbatten in 1917). Educated at the Royal Naval College, Dartmouth, and Cambridge University, Mountbatten then accompanied his cousin Edward, the

prince of Wales and future King Edward VIII, on a tour of the Far East.

Mountbatten entered the Royal Navy in 1916 during World War I and served in the Grand Fleet. He rose rapidly in the ranks, gaining expertise in communications. His first command was the destroyer *Daring* in 1934, and he was promoted to captain in 1937. In June 1939, he took command of the destroyer *Kelly*, and in September, he was appointed captain of 5th Destroyer Flotilla. The *Kelly* was mined once, torpedoed twice, and finally sunk off Crete on 23 May 1941. The exploits of the *Kelly* were the subject of Noël Coward's 1942 film *In Which We Serve*, which Mountbatten promoted.

Mountbatten's exploits, dash, and popularity brought him to the attention of Prime Minister Winston L. S. Churchill, who selected him to be director of Combined Operations, with the rank of vice admiral. While he was director, several important raids were conducted, most notably against the French seaport of Dieppe on 19 August 1942. This operation was a costly failure, and Mountbatten bears much responsibility for this. The reverse did not affect his popularity, however, and it did provide lessons for future amphibious operations, particularly the Normandy Invasion of June 1944.

In August 1943, Churchill convinced President Franklin D. Roosevelt to make Mountbatten supreme commander of SEAC. He took up his post in October, first at Delhi in India and later at Kandy in Ceylon. Mountbatten was present at the summit conferences at Cairo in December 1943 and Potsdam in July 1945. As SEAC commander, he made a number of important decisions, including the decision to continue fighting during the monsoon season, which resulted in the defeat of the Japanese Fifteenth Army. He took steps to reduce malaria, and he restored Allied morale. He also played a key role in the defense of Imphal by diverting air assets there. Mountbatten personally took the Japanese surrender at Singapore on 12 September 1945. The British government did not wish to inflame nationalist sentiment in Burma. As the war ended, Mountbatten therefore ordered that Burmese who had at some point collaborated with the Japanese occupation should not suffer reprisals unless they had been personally involved in atrocities. Mountbatten remained at his post until May 1946.

Appointed the last viceroy and first governor-general of India, Mountbatten presided over the independence and division of India into the two states of India and Pakistan. He received an earldom in 1947. Mountbatten was first sea lord between 1955 and 1959, helping to carry out a restructuring of the British armed forces. He then became chief of the Defence Staff in 1960, retiring five years later. On 27 August 1979, Mountbatten was assassinated by the Irish Republican Army while at his vacation home, County Sligo, in the Republic of Ireland.

Mulberries (Artificial Harbors)

Artificial harbors constructed to support the Allied invasion of France in June 1944. Early invasion planning for the Allied assault on occupied Europe quickly revealed the need for securing a major port to support the invasion forces and ensure the operation's success. The Dieppe raid of 19 August 1942 by British and Canadian forces demonstrated to the Allied planners that ports were too difficult to assault directly. It also validated fears that German defenders would be able to destroy vital facilities before a port could be captured.

If the Allies could not capture a major port, they would have to build their own. The British War Office began the planning

Supplies being unloaded at the U.S. Mulberry at Omaha Beach off Celleville, France. (Bettmann/Corbis)

and construction of two artificial anchorages and ports to support the upcoming Allied invasion of France. The Combined Chiefs of Staff officially approved the artificial port concept at Quebec in August 1943. The project was code-named **MULBERRY**. The Allies would fabricate the two artificial ports in England, tow them across the English Channel, and establish them off the French coast. Mulberry A would support the American invasion beaches, and Mulberry B would support the British beaches.

The prefabricated ports incorporated numerous components that had code names of their own. The first step in the process involved the creation of artificial anchorages known as **Gooseberries**. Engineers accomplished this feat by positioning and sinking a number of blockships on D day, 6 June 1944, to create artificial anchorages. Five such anchorages were created, two off Omaha Beach for the Americans and three off the British and Canadian beaches. The ships utilized were obsolete American, British, Dutch, and French warships and merchant vessels.

Two of the anchorages served as the foundation for the two Mulberries. The outermost breakwater consisted of bombardons, large floating constructions that were 200 feet in length, 25 feet across, and weighed 1,500 tons. These were located approximately 5,000 feet out from the high-water line. They enclosed an outer harbor, and 1,000 to 1,500 yards closer to shore, a row of sunken ships known as **Corncocks** and large concrete caissons known as **Phoenixes** created another breakwater to shelter the inner harbor. The floating and sunken breakwaters protected a series of piers, pier heads, and moorings for large vessels, such as Liberty ships, and smaller landing craft.

Plans called for Mulberry A to have three pier heads, two pontoon causeways, and moorings for seven Liberty ships and five large and seven medium coasters. It was to have a capacity of 5,000 tons of cargo and 1,400 vehicles per day. Construction began on 7 June 1944, with a planned completion date of 24 June. Construction proceeded rapidly. On 10 June,

the engineers completed the Omaha Gooseberry, followed on 13 June by the Utah Gooseberry. On 16 June, the first landing ship, tank (LST) pier went into operation at Omaha, with one vehicle landing every 1.6 minutes. By midnight on 17 June, U.S. Navy engineers working on Mulberry A had placed all 24 bombardons and 32 of 52 Phoenixes, along with mooring facilities for two Liberty ships. They also had completed the western LST pier, with work on the eastern pier under way.

As that work progressed, construction on pontoon causeways at both beaches continued. The first and second pontoon causeway at Omaha entered service on 10 and 20 June, respectively. At Utah, the first opened on 13 June and a second on 16 June. The initial concept of the artificial port appeared to be proving its worth. Work on the British Mulberry B proceeded at a similar pace.

Unfortunately for the Allies, the worst Channel storm in a half century hit the Normandy coast on 18 June, halting all landing operations for three days and, more important, destroying Mulberry A and forcing the Americans to abandon the artificial port. The destruction of Mulberry A made the capture of the port of Cherbourg all the more important. Further, as feared, the German defenders put up a stiff resistance, and the port did not fall until 27 June and only after it had been effectively destroyed. The first Allied cargo did not arrive through Cherbourg until 16 July and even then only in small amounts. By the end of July, cargo arriving in Cherbourg constituted only 25 percent of the total arriving over the beaches at Omaha and Utah.

The great storm also seriously damaged Mulberry B off the British beaches, but it could be repaired. General Dwight D. Eisenhower, commander of the Supreme Headquarters Allied Expeditionary Forces (SHAEF), ordered that Mulberry A not be rebuilt and that parts from it be used to complete Mulberry B to the original specifications. When completed, Mulberry B became known as the Harbor at Arromanches. By October, the port enclosed 2 square miles of water and could berth 7 Liberty ships and 23 coasters at the same time. Intended only for use until French ports were repaired and put back into operation, the artificial harbor remained in service until closed on 19 November. By the end of December, disassembly had begun.

While the contribution of the Mulberries did not meet preinvasion expectations due to the destruction by the storm, the artificial harbors proved invaluable in the Allied supply effort. Fortunately for the Allies, DUKW amphibious trucks and LSTs proved more effective in moving supplies over the beaches than expected and were able to compensate for the shortfalls from the Mulberries. The combination of tonnage delivered over the beaches, through the Mulberries and through captured French ports, enabled Operation OVERLORD to succeed, leading to the victory in France. The Mulberries were an engineering marvel that further demonstrated the

Allied technical expertise and ability to turn resources into military power.

Munich Conference and Preliminaries (1938)

International conference at which the major powers agreed to the territorial dismemberment of Czechoslovakia, yielding the Sudetenland to Adolf Hitler. Hitler's expansion of power both domestically and internationally in the late 1930s was predicated on a mixture of belligerence, bluff, bullying, and inspired political insight. His theme of incorporating all Germans into Germany allowed him to move east, where he astutely believed that the Western democracies would not make a stand. In March 1938, he assimilated Austria, but he claimed to have no interest in Czechoslovakia at that time. This situation did not sit well with the largely German population of the Sudetenland, in western Bohemia.

The Czech government in Prague was not particularly concerned. Unlike Austria, the Czechs had strong military and defensive alliances with France and the Soviet Union. The Sudetenland was an industrial area and hurt by the world economic depression, which only worsened discontent created by the sense that the Czech government discriminated against its German citizens. A Nazi movement emerged in the Sudetenland, and its leader, Konrad Henlein, met with Hitler in late March 1938 and called for immediate justice for his people. The Führer, well aware of Czech advantages, preferred what he called a more "evolutionary" arrangement.

Nonetheless, only a month later, Henlein made a speech at Karlsbad demanding autonomy and other concessions for the Sudetenland. Disturbances and clashes between German Czechs and the police followed. The French government openly said that France would fight if Germany intervened. British Prime Minister Neville Chamberlain had previously warned that such a conflict would draw in other nations. Chamberlain did not, however, believe that the Czech situation justified war.

Benito Mussolini (*left*) and Rudolf Hess (*right*) arrive at the Führerhaus for the Munich conference, September 1938. (Library of Congress)

He questioned the viability of an artificial multinational state created only as a consequence of World War I. He convinced French Premier Édouard Daladier to join in pressing Prague to make a deal, while at the same time hinting to Berlin that intervention could lead to war.

Czech President Eduard Beneš offered a conciliatory approach to meeting the Sudeten German demands, and on 18 May, there were talks between representatives of the Sudeten Germans and the Czech government. The next day, however, reports of German troop movements caused widespread confusion. Over the next few days, Prague ordered partial mobilization, Sudeten Germans clashed with police, and France and Britain warned Germany about intervention. Hitler, outraged by press implications that he had been forced to back down, told German military leaders on 28 May that he would finish with the Czechs by 1 October.

With tension growing, French Foreign Minister Georges Bonnet told Chamberlain that he was prepared to force concessions from Prague, although officially, France stood by its commitments to defend Czechoslovakia. For his part, Chamberlain was more than ever determined to avoid war, though he remained committed to supporting France. Chamberlain then received Czech permission to send Lord Runciman as mediator, while continuing to warn Hitler of the threat of war. Runciman had about six weeks until Nazi Party meetings in the second week of September, where Hitler was expected to publicly demand concessions. Bonnet assured Chamberlain that if Runciman's efforts led to a British proposal, Paris would support it, and Prague could go along or stand alone. On 4 September, Runciman informed Beneš that the Czechs would have to accept Henlein's Karlsbad points, and two days later, Beneš yielded. Then talks broke down because of reports that Czech police had abused a Sudeten official.

On 12 September, Hitler spoke in Nuremberg, demanding redress for the Sudetenland but suggesting no specific remedy. Riots followed immediately thereafter in the Sudetenland, raising the specter of insurrection, which the Germans had long said would provoke their intervention.

On 13 September, Chamberlain requested a meeting with Hitler, which took place three days later at Berchtesgaden; Chamberlain made his first flight in an aircraft to attend. Hitler posed as a moderate, calling only for self-determination for the Sudeten Germans. Although he could secure no specifics, Chamberlain decided that annexation of areas with populations that were 50 percent or more German would satisfy the Führer. Hitler then agreed not to act unless there was a major incident, and Chamberlain returned to London to consult colleagues and allies. Once the French agreed to the 50 percent plan, Beneš was told to accept it or face German invasion.

On 22 September, Chamberlain again met Hitler, this time at Godesberg, only to find that the Führer now had upped the ante. He had a map showing areas Germany would occupy by

1 October, and he demanded that all Czech officials be withdrawn from them by that date and that all military, economic, or traffic establishments be removed. The Sudeten Free Corps was already occupying towns. Chamberlain then balked, asserting that this was neither self-determination nor what had been agreed on. London and Paris reluctantly decided to withdraw their advice to Prague not to mobilize, and the Godesberg Conference ended on 24 September. War seemed inevitable.

Over the next few days, the British and French looked for a solution. Although they continued to warn Hitler in rather vague terms, they also made clear to Beneš that the only way to avoid a German attack was to accept the German demands. Hitler continued to insist on concessions. It thus appeared that he might have to carry out his threat to use force and that a general European war might result.

U.S. President Franklin D. Roosevelt then made a direct appeal to Hitler, urging an international conference. On 28 September, Italian dictator Benito Mussolini talked to Hitler and secured his agreement for such a meeting. Perhaps Hitler's acceptance was prompted, in part, by the unenthusiastic reception Berliners accorded to a German motorized division moving through Berlin on 27 September, which left the German leader in a rage.

Chamberlain, Daladier, and Mussolini met with Hitler in Munich on 29 September. The USSR was not invited, and Czechoslovakia itself was not officially represented; this was because the object was to give Hitler the Sudetenland and avoid war. At Munich, Hitler was on his worst behavior, treating Chamberlain in the most brusque and peremptory fashion. After the conference, Hitler vowed to his confidants that he would never again be cheated out of a military victory and that he would attack and destroy the British and the French. This astonishing reaction to his diplomatic triumph showed clearly that Hitler sought war.

The Munich Agreement, dated 30 September but actually signed just after midnight on 1 October, gave Hitler everything he demanded: evacuation would take place between 1 and 10 October under conditions arranged by an international commission, which would also determine plebiscite areas. Early on the morning of 1 October 1938, German troops marched across the frontier, and two days later, Hitler made a triumphal entry into Eger, the unofficial capital of the Sudeten Germans. Other nations of central Europe also joined in the division of Czechoslovakia. Poland demanded and received some 400 square miles around Teschen with roughly 240,000 people, only 100,000 of whom were Poles, and in November, Hungary annexed some 4,800 square miles of Czechoslovakia with a population of about 1 million people.

Seen in retrospect—and psychological and morale factors notwithstanding—the West, unprepared as it was, would have been better off fighting in September 1938 rather than

capitulating at Munich. Britain and France might have secured as allies the Soviet Union and Poland, but even discounting them, the German army would have been forced to fight on two fronts: against both France and Britain and against Czechoslovakia. Despite Hitler's boasts, Germany was unprepared for war in September 1938. The Luftwaffe possessed 1,230 first-line aircraft, including 600 bombers and 400 fighters, but nearly half of them were earmarked for use in the East, leaving the remainder too thinly stretched to counter any serious aerial offensive by the French Air Force and the Royal Air Force (RAF). The Luftwaffe also suffered from deficiencies, including a shortage of bombs. On the ground, Germany had only five fighting divisions and seven reserve divisions available to stand against eight times that number of French divisions.

Of course, the Western democracies were also weak militarily. Britain's rearmament program had begun only in 1937. France had many more artillery pieces than Germany, but it was deficient in aircraft, with only 250 first-quality fighters and 350 bombers of perhaps 1,375 front-line aircraft. If the Allies had fought Germany in 1938, however, they could have counted on 35 well-armed and well-equipped Czech divisions, supported by substantial numbers of artillery pieces and tanks and perhaps 1,600 mixed-vintage aircraft.

Those responsible for the Munich debacle later claimed that it bought time for the Western democracies to rearm. Winston Churchill noted in his memoirs that British fighter squadrons equipped with modern aircraft rose from only 5 in September 1938 to 26 by July 1939 (and 47 by July 1940), but he also observed: "The year's breathing space said to be 'gained' by Munich left Britain and France in a much worse position compared to Hitler's Germany than they had been at the Munich crisis."

The Munich Conference had far-reaching international influence. Chamberlain and Daladier were warmly received by welcoming crowds when they returned home, especially the British prime minister when he reported that he believed he had achieved "peace in our time." The Munich Agreement, however, effectively ended the French security system. Poland, Romania, and Yugoslavia now all doubted French commitments to defend them, and Stalin was further alienated from the West. He told associates that Chamberlain and Daladier had given in to Hitler in order to facilitate Germany's *Drang nach Osten* (drive to the east) and bring about a war between Germany and the Soviet Union. For the German Resistance, Munich was also a disaster. Even the most diehard of plotters realized that the opportunity to eliminate Hitler had vanished.

Despite Hitler's pledges that the Sudetenland was his last territorial demand in Europe, events soon proved the opposite. The very day after Munich, Hitler told his aides that he would annex what remained of Czechoslovakia at the first opportunity. Within a few months, he took advantage of the

internal situation in that country. In March 1939, he supported the leader of the Slovak Popular Party, Jozef Tiso, who sought complete independence for Slovakia. On 14 March, Slovakia and Ruthenia declared their independence from the rest of Czechoslovakia. That very day, Hitler summoned Czech President Emil Hácha to Berlin. One day later, Luftwaffe commander Hermann Göring threatened the immediate destruction of Prague unless Moravia and Bohemia were made Reich protectorates. Hácha fainted. When he was revived, he signed a communiqué placing "the fate of the Czech people and country in the hands of the Führer of the German Reich." On 15 March, Nazi troops occupied what remained of Czechoslovakia. The Czech lands became the Protectorate of Bohemia and Moravia, and Slovakia became a vassal state of the Reich, with little more independence than Bohemia-Moravia.

Murphy, Audie Leon (1924–1971)

U.S. Army soldier and officer who fought across the European Theater and was awarded the Medal of Honor. Born near Kingston, Texas, on 20 June 1924, Audie Murphy was the seventh of 12 children in a sharecropper family. His father abandoned the family when Murphy was 12, and young Murphy helped put food on the table by shooting rabbits. He became a crack shot. When he was 16, his mother died, and he took a job at a store.

Murphy attempted to enlist in the Marines following the Japanese attack on Pearl Harbor, but he was turned down because he was both too small and too young. He enlisted in the army on his eighteenth birthday and was assigned to the 15th Regiment of the 3rd Infantry Division. He first came under enemy fire in Sicily in July 1943. He then fought in Italy, France, and Germany.

Murphy became the most decorated U.S. soldier of the war, earning 33 medals and being wounded three times. Advanc-

U.S. Army Lieutenant Audie Murphy, ca. 1945. (Library of Congress)

ing to sergeant, he received a battlefield commission as a second lieutenant in October 1944. He was awarded the Medal of Honor for his actions at the Colmar pocket on 26 January 1945 during a German attack on his position. He called down artillery fire on his own location and jumped onto a burning tank destroyer and manned its .50 caliber machine gun. Despite being wounded, he then led a counterattack.

Murphy left the service in September 1945 as a first lieutenant. Thereafter, he parlayed his fame and youthful good looks into a movie career. He played himself in the 1955 movie based on his 1949 autobiography, *To Hell and Back*. He also starred in *The Red Badge of Courage* and appeared in some 40 other films. Murphy suffered from personal problems, however, including alcoholism, drug addiction, and gambling. Nearly bankrupt, he died in an airplane crash near Roanoke, Virginia, on 28 May 1971.

Music of World War II

Several musical trends defined themselves in the years between the wars. Some composers placed great emphasis on the sounds of their respective ethnic cultures through the use of folk music and folklore. Others, concerned by the widening rift between composer and audience, created what was called in Germany *Gebrauchsmusik* (utility music), music intended for students and amateurs as opposed to music for its own sake. Neoclassicism remained an influential style (particularly in the United States), the composers of which retained aspects of past musical forms while incorporating new and unfamiliar elements. There were also more and more composers who espoused a radical aesthetic that broke with European tradition. This radicalism led to the evolution of atonality (a free chromaticism that avoided the traditional tonal hierarchy used throughout the eighteenth and nineteenth centuries) and serialism (music written using a systematic ordering of the 12 pitches, also without regard to a tonal center).

In many respects, a great deal of the music that predated the war was written in reaction to World War I, although the responses could be quite subtle (the moving *Cello Concerto* of Sir Edward Elgar [1857–1934] is essentially a war memorial). Nationalism took on a political aspect during the years between the wars and was seen as a means of establishing an ethnic identity in an increasingly intolerant world. Composers such as the Hungarians Béla Bartók (1881–1945) and Zoltán Kodály (1882–1967) used folk songs and folk instruments in their music (Kodály's *Háry János Suite* [1926] and Bartók's *Music for Strings, Percussion and Celesta* [1936] showed the influence of regional musics that they collected in the early years of the century). Nationalism surfaced in the United States as well, perhaps best exemplified by Aaron Copland (1900–1990), whose ballets *Billy the Kid* (1938) and *Appalachian Spring* (1944) drew on uniquely American themes. Two of his works directly connected with the war were the *Fanfare for the Common Man* (1942), the result of a commissioning project in which composers wrote fanfares for brass and percussion on patriotic themes, and *Lincoln Portrait* (1942), for narrator and orchestra. Both received numerous performances during the war years.

Soviet composer Dmitri Shostakovich (1905–1975) composed his *Symphony No. 7* (1941) as a musical response to the heroic defense of Leningrad. Shostakovich had served briefly in the Leningrad Volunteer Home Guard before being evacuated. A photograph of the composer wearing his fireman's helmet appeared on the cover of *Time* magazine in 1942. This work had no fewer than three major conductors (Leopold Stokowski, Artur Rodzinski, and Sergei Koussevitsky) fighting over American premier rights. The numerous performances

Dinah Shore and Bing Crosby entertain at USO show in France, October 1944. (Bettmann/Corbis)

the symphony received were a propaganda boon for both Soviet and American audiences.

Austrian composer Arnold Schoenberg (1874–1951) was forced into exile during the war years. After emigrating to the United States, he took a teaching position at the University of California, Los Angeles. Schoenberg composed two important responses to the war: *Ode to Napoleon Buonaparte* (1942), a setting of the poem by Lord Byron that in Schoenberg's hands became a not-so-veiled reference to Hitler, and the terrifying *Survivor from Warsaw* (1947), ostensibly based on events that took place in the Warsaw ghetto.

There were also composers who responded to the war from the concentration camps: *Quartet for the End of Time* (1941) by Olivier Messiaen was premiered on 15 January 1941 in Stalag VIIIA at Görlitz before an audience of fellow prisoners of war. Composers Pavel Haas (1899–1944), Hans Krása (1899–1944), and Viktor Ullmann (1898–1944) were among many that were incarcerated at Terezín (Theresienstadt) who ultimately would die in the gas chambers. Ullmann's opera *Der Kaiser von Atlantis* (1944) was composed at Terezín and was in rehearsal before the Nazis shut the per-

formance down shortly before deporting the composer to Auschwitz.

The end of the war saw a complete break from nineteenth-century romanticism. Although the newer musical languages were often not conducive to conventional memorials, there were some significant responses. The *War Requiem* by English composer Benjamin Britten (1913–1976), using the text of the requiem mass and the poetry of World War I poet Wilfred Owen, was written for the reconsecration of Coventry Cathedral in 1962 and is one of the most powerful antiwar statements in the history of music. There was also the brilliant *Threnody for the Victims of Hiroshima* (1960) by Polish composer Krzysztof Penderecki (born in 1933). The war marked the end of an era for art music, and the postwar world would ultimately demand a very different kind of music.

The war years were a time when jazz and popular music were essentially identical (compare this with the Vietnam years, when there was a clear distinction between jazz and popular music, that is, rock and roll). Jazz had begun to surface as a major musical force in the United States in the years immediately following World War I, and by the late 1920s, it had reached a point where it could evolve past its Dixieland roots into something new. This new form came in the form of the big bands. Throughout the 1930s, a wide range of these bands worked to solve the problems of getting a large ensemble to “swing,” and by 1938, they were appearing at such august venues as Carnegie Hall. This new swing music was performed by popular bands led by Glenn Miller, Harry James, Count Basie, Duke Ellington, Benny Goodman, and countless others.

The popular songs of the time were closely associated with these bands. Important vocalists, including Bing Crosby, Dinah Shore, Frank Sinatra, Ella Fitzgerald, and the Andrews Sisters, recorded many of these songs. The influence of this music was enormous: in a very real sense, American popular music was *the* popular music of World War II.

The U.S. Army, recognizing the importance of this music, entered the business of providing music for the troops in both European and Pacific Theaters through the Special Services Division of the Army Service Forces. Many of the bands ultimately ended up in uniform, performing overseas, sometimes in circumstances of great danger. Band leader Glenn Miller was killed in 1944 when his plane went down in the English Channel en route to a performance in France.

Jazz, as the official music of World War II, was almost exclusively an American phenomenon; in Adolf Hitler's Germany, jazz was prohibited and actively disparaged. In a now notorious exhibition in 1938, jazz was labeled *Entartete Musik* (degenerate music). Hitler saw the condemnation of American jazz as part of a larger plan to liberate Germany from the “deadly embrace” of “Jewish cultural bolshevism.” As a result, “popular” music in Germany consisted largely of official patriotic songs associated with the Reich, folk songs,

and some sentimental ballads. Strangely enough, one of these sentimental ballads had the unusual distinction of being popular on virtually every front in Europe. “Lili Marlene,” originally written by German soldier Hans Leip in 1915 and set to music by Norbert Schultze in 1938, was as popular with Allied troops as it was with the Germans. An English version was devised shortly after the song became popular in Germany and was made famous by Marlene Dietrich in 1943. There was even a version in French. Since the musical cultures in Europe all stemmed from the same musical roots, this “sharing” of songs is perhaps not surprising. Of course, no such sharing was possible in the Pacific, although Allied troops were kept current with the latest popular songs by broadcasters such as “Tokyo Rose.”

The range of popular songs was enormous. There were patriotic songs, designed to inspire support for the war effort as well as for the realities of day-to-day life during the war (“Cowards over Pearl Harbor,” “America Calling,” “There’ll Always Be an England,” and “Rosie the Riveter”). There were songs directly related to military service, some with specific references to the commanding officers (“Keep Your Powder Dry,” “Nimitz, Halsey and Me,” “Here’s to You, MacArthur”). Sentimental songs of love and separation were particularly popular (“We’ll Meet Again,” “White Cliffs of Dover,” “In the Mood,” made popular by the Glenn Miller Band, “Cleanin’ My Rifle [And Dreamin’ of You]”) as well as novelty songs (“Lalupaluza Lu,” “Little Bo Peep Has Lost Her Jeep,” and “Boogie-Woogie Bugle Boy”). Some songs made unmistakably violent references to the enemy (which read somewhat awkwardly in light of modern sensibilities): “Mow the Japs Down!” “Der Fuehrer’s Face,” popularized by Spike Lee, “Hey, Tojo! Count Yo’ Men!” and “You’re a Sap, Mister Jap.” World War II also witnessed the spread in the United States of country and western music, taking it well beyond its Appalachian and western roots. Young soldiers took this largely rural music into the military camps and urban defense plants, which contributed to its growing popularity not only in the more urban northern United States but ultimately overseas as well.

The end of the war spelled the end of the big band era. Jazz moved on to a grittier style known as bebop, and the popular audience began to turn to another form of music that began to rise from roots in rhythm and blues: rock and roll. This would become the music of another war.

Mussolini, Benito (1883–1945)

Italian dictator from 1922 to 1943. Born in Predappio, near Forlì in Romagna, Italy, on 29 July 1883 to a blacksmith Socialist father and a schoolteacher mother, Benito Amilcare Andrea Mussolini was named after the Mexican revolutionary and president Benito Juárez. He attended local schools and earned a teaching diploma in 1901. His mother wanted him to be a schoolteacher, but Mussolini found the profession too boring.

As an adolescent, Mussolini had joined the revolutionary or syndicalist branch of the Italian Socialist Party. He found that he enjoyed the role of agitator, fomenting strikes and establishing unions. At age 19, he fled to Switzerland to avoid compulsory military service. He stayed there for three years, doing odd jobs and living on money sent by his mother. He intermittently attended some university classes and served time in jail. An amnesty caused Mussolini to return to Italy and perform his military service. He then edited a socialist newspaper, *La Lotta di Classe* (The Class Struggle) at Forlì and was secretary of the local Socialist Party at Forlì. His opposition to war with the Ottoman Empire in 1911 and 1912 earned him national prominence. He was now one of the leaders of the left wing of the Italian Socialist Party. In 1913, he became editor of the Socialist daily *Avanti*, published in Milan.

On the outbreak of World War I, however, Mussolini abruptly modified his socialism by embracing Italian nationalism and urging intervention on the Allied side. This interventionist position caused his expulsion from the Socialist Party. Mussolini then founded a French-financed daily, *Il Popolo d’Italia* (The People of Italy). In October 1914, he also founded the prowar group *Fasci Rivoluzionario d’Azione Internazionalista* (Revolutionary Fasci for International Action) to bring about intervention in the war. In December of that year, the group became the *Fasci di Azione Rivoluzionaria* (Fasci for Revolutionary Action). The word *fascio* recalled the bundle of sticks carried by the lictors of ancient Rome, representing state power; one stick might be broken, but fastened together, the sticks were unbreakable. Mussolini like to call up ancient glories, and this bundle of sticks later became the emblem of Fascist Italy. His belief that the proletariat should unite and create a formidable organization before seizing power was the germ of the Italian Fascist movement. Following Italy’s entry into the war on the Allied side

Benito Mussolini (*left*) and Adolf Hitler (*right*) in Munich, Germany, June 1940. (National Archives)

in May 1915, Mussolini was called up for the army and served until 1917 on the Austrian front, reaching the rank of corporal. He was wounded slightly and discharged.

On the return of peace, the Socialist Party resumed its agitation. Mussolini's reaction to this was to organize ex-soldiers in the *Fascio di Combattimento* (Combat Bands) in March 1919. Mussolini carefully built the Fascist organization, paying special attention to the Blackshirt squads, militia supported with financial contributions (not always voluntary) from businessmen and landlords. Distinguished by their black shirts and Roman salute, the Blackshirts were clashing with Socialists and Communist groups by the summer of 1919. Mussolini's policy was to meet every act of violence with greater violence, and between 1921 and 1922, a veritable civil war with the Socialists raged through the length of Italy.

The Fascist political program was little more than devotion to their leader ("Il Duce"), Italian nationalism, "law and order," and opposition to communism. After they came to

power, the Fascists claimed they had saved Italy from communism. There is, however, little support for that in fact. Certainly, Mussolini did exploit middle- and upper-class fears of socialism and communism.

In the 1921 elections, the Fascists gained less than 10 percent of the vote, but the size of the organization (300,000 members by the end of September 1922) made force—or the threat of it—a possible route to power. By September 1922, Mussolini was openly demanding that he be named premier. In late October, some 10,000 of his followers converged on Rome. During this March on Rome, Mussolini remained safe in Milan until he was informed that it had succeeded, a fact carefully concealed by Fascist historians.

When King Victor Emmanuel III refused to authorize martial law, Premier Luigi Facta resigned, and on 29 October 1922, the king called Mussolini as premier. It was all quite legal—or almost so. On November 25, threatened with new elections held under Fascist supervision, Parliament conceded Mussolini full powers for 1 year; he held them for 20.

A new election law and the trampling of the rights of the opposition in 1924 gave the Fascists 374 of 535 seats. Mussolini then proceeded to disband the opposition parties and secure complete power as *Il Duce*. He alone made the decisions, and he was not only head of state but also foreign minister, chief of the armed service branches, minister of the interior, and minister of the colonies. This concentration of authority produced chaos rather than efficiency. Restoring the economy also proved elusive. The only real domestic achievements of his regime were advances in literacy (Fascist education was more formative than informative) and the 1929 accord with the Vatican (the Lateran Treaty).

Mussolini's dominant motivations were his personal vanity and desire for adulation; not surprisingly, flattery was a key factor in his undoing. He became captivated by his own myth of the invincible leader and came to believe his own propaganda that only he could make the right decisions and that his intuition was always correct. Serious study and discussion were not Mussolini's style. He rushed to rapid decisions, often with unfortunate results. He also changed his mind frequently and precipitously, and he was totally inept as a war leader. He ordered military campaigns begun on short notice, with no thought of the need for detailed planning. The hallmarks of the Italian state and military under Mussolini were administrative confusion and incompetence.

Mussolini pursued an aggressive foreign policy, beginning with the Italian bombardment of the Greek island of Corfu in 1923. Alienation from the West over Italy's 1935 invasion of Abyssinia (Ethiopia) and support of the Fascist side in the 1936–1939 Spanish Civil War led to a rapprochement with Adolf Hitler's Germany.

This Rome-Berlin Axis became a formal alliance in 1939. The year before, Mussolini had allowed Hitler to annex Austria; four years previously, he had helped uphold Austrian independence against an attempted Nazi coup. He also was a prime mover behind the agreement at Munich in September 1938 that led to the dismemberment of Czechoslovakia. In April 1939, Mussolini ordered the invasion of Albania.

When the general European war began in September 1939, Mussolini, fearful that Germany would not win, declared Italy's nonbelligerency. With Germany about to defeat France and being anxious to join in the spoils, he declared war on France on 10 June 1940 and sent Italian divisions into southeastern France and into Egypt from Libya, with little military success. He also insisted on sending obsolete Italian aircraft to participate in the Battle of Britain. In October 1940, without consulting with Hitler, he ordered Italian forces to invade Greece from Albania. The Greeks promptly drove the Italian forces out, leading Hitler to come to the rescue of his hard-pressed ally in the spring of 1941. Mussolini also sent Italian forces to assist the Germans in their invasion of the Soviet Union, a step that was particularly unpopular in Italy.

Following Allied victory in North Africa and the successful Allied invasion of Sicily, the Fascist Grand Council voted to depose Mussolini on 25 July 1943. Hitler ordered him rescued by German commandos, and Mussolini was then installed as nominal leader of a puppet state in northern Italy, under complete German control. In September 1943, Italy switched sides in the war. As the end of the war approached, Mussolini and his mistress, Clara Petacci, attempted to flee northern Italy with a German convoy in April 1945. Partisans captured them on 28 April and shot both that same day. Their bodies and those of other members of Mussolini's government were taken to Milan and strung up there, upside down, in the great square, the Piazzale Loreto. Mussolini's body was later rescued and buried in the family mausoleum.

Mussolini never accepted responsibility for his failures but blamed others, when he alone was responsible. He claimed the Italian people were not worthy of him. He may have been the least brutal of the major dictators of World War II, but he was bad enough. To the end, his chief motivation was personal power rather than the good of the Italian people.

Myitkyina, Siege of (May–August 1944)

The key military objective of the 1944 Allied Northern Burma Campaign in the China-Burma-India (CBI) Theater of Operations. U.S. Lieutenant General Joseph "Vinegar Joe" Stilwell had command of Allied forces in the battle and subsequent "siege." The action began in late April 1944 with attacks in the Mogaung Valley by predominantly Chinese troops, followed by a general Allied effort against the airfield and railroad center of Myitkyina. The aim of the campaign was to reduce Japanese pressure on the air resupply route from India to China over the Himalayas ("the Hump") and to clear a vital road link along the ground line of communications under

U.S. Colonel Charles Hunter (center), commanding Merrill's Marauders at Myitkyina airfield in Burma, pointing out some action to U.S. Lieutenant General Joseph Stilwell (left). (Photo by Time Life Pictures/US Army/Time Life Pictures/Getty Images)

construction from Ledo, India, to Kunming, China (the Ledo Road, later known as the Stilwell Road). British, Chinese, Burmese, and U.S. troops (Merrill's Marauders, the 5307th Composite Unit [Provisional]) captured the airfield on 17 May, but they could not eliminate stubborn resistance by elements of the Japanese 18th and 56th Divisions in the Myitkyina area until 3 August.

The Allied operation, code-named *END-RUN*, was conducted by three separate combat brigade-sized elements organized around the battalions of Merrill's Marauders (code-named *GALAHAD*). H Force, consisting of the 1st Battalion, the 150th Regiment of the 50th Chinese Division, and a battery of the 22nd Chinese Division artillery moved south on 30 April. M Force, the 2nd Battalion with attached Burmese Kachins, began its operations on the southernmost axis on 7 May. K Force consisting of the 3rd Battalion of *GALAHAD* and the 88th Regiment of the 30th Chinese Division began the advance to Myitkyina on 28 April. These three formations were accompanied by U.S. and Chinese support troops, including mobile hospitals, engineers, and animal transport units.

The 17 May attack completely surprised the 700 to 800 Japanese troops defending Myitkyina Airfield. Colonel

Charles Hunter's H Force spearheaded the attack and secured the field and supporting facilities. A U.S. engineer unit, a Chinese infantry battalion, and a British anti-aircraft unit were quickly airlifted into the field. Allied reinforcements also arrived in preparation for the difficult task of taking the town and supporting defensive positions. Initial attempts by Chinese forces to take the town were unsuccessful, and a stalemate ensued. Both sides sent in reinforcements and built strong points that were difficult to overrun.

British forces under General Sir William Slim, fully engaged against the Japanese in the west around the Imphal and Kohima area near the Burma-India border, were unable to provide major combat formations for the Northern Burma Campaign. Major General Orde C. Wingate died in a plane crash on 25 March; his Special Forces, or "Chindits," were placed under the command of Major General W. D. A. Lentaigne. Elements of this force were put under Stilwell's direct command and fought their way north to support the effort around Myitkyina. Unable to quickly consolidate initial gains against stubborn Japanese resistance, Stilwell ordered the exhausted Marauders to continue the fight. He also brought in U.S. combat engineers working on the Ledo Road to serve as infantry, and he called for additional Chinese reinforcements.

Over the next two months, both sides conducted small-scale attacks, with no significant change in the military situation on the ground. By late July, however, continued Allied efforts, supported by increased air sorties and added artillery, began to take their toll on the Japanese defenders. Determined and often bitter small-unit actions wore down the Japanese, and during the last three days of July, Allied forces made significant advances. On 3 August, Myitkyina was declared secure. The key U.S. formation, Merrill's Marauders, fought on doggedly and remained in the field until victory, despite being decimated by combat casualties and losses from sickness and disease. The unit ceased to exist as a viable combat formation and was eventually replaced by the Mars Force under the command of Lieutenant General Daniel Sultan. However, it was the Chinese units, which had shown that they could stand with veteran Japanese formations, that were the key to the eventual Allied victory in northern Burma.

Although delayed by stubborn Japanese resistance, the difficult terrain, and the challenges of coordinating Allied forces, Stilwell's Northern Burma Campaign was a success. With the fall of Myitkyina, the Allies were one step closer to opening a secure ground supply line to China and to setting the stage for a major offensive to drive the Japanese from Burma. General Stilwell, principal architect of the campaign, was relieved of his duties in the CBI in mid-October and replaced as commander of U.S. combat forces in Burma by General Sultan.

N

Nagano Osami (1880–1947)

Japanese navy admiral. Born in Kochi on 15 June 1880, Nagano Osami graduated from the Naval Academy in 1900. Nagano participated in the siege of Port Arthur in a land-based naval artillery unit during the 1904–1905 Russo-Japanese War. He was an instructor at the Naval Academy in 1906 and studied in the United States at Harvard University from 1913 to 1915.

Promoted to captain in 1918, Nagano commanded a cruiser in 1919 and 1920. He was the naval attaché to the United States from 1920 to 1923 and visited the United States again in 1927 and in 1933. Promoted to rear admiral in 1928, Nagano commanded the Naval Academy from 1928 to 1930. He headed the Japanese delegation at the London Naval Conference of 1935–1936, where he proposed equality of total naval tonnage with the British and U.S. navies, a proposal the western powers rejected.

In 1936, Nagano became minister of the navy in the Hirota Kōki cabinet. In 1937, he was appointed commander in chief of the Combined Fleet. From April 1941 to February 1944, Nagano served as chief of the Naval General Staff, in which position he tended to follow recommendations presented by his subordinates. Nagano believed that war with the United States was inevitable and he thus had little interest in U.S.-Japanese negotiations to avoid it. At the same time, although Nagano believed the Japanese navy could not defeat the U.S. Navy in war, he did not oppose the plans of Admiral Yamamoto Isoroku, commander of the Combined Fleet, to attack Pearl Harbor.

In April 1943, Nagano was promoted to admiral of the fleet. After the Japanese surrender, he was arrested and jailed in Sugamo Prison in Tokyo. He was charged as a war criminal

before the International Military Tribunal for the Far East. He died on 5 January 1947 before the end of the trial.

Nagasaki, Bombing of (9 August 1945)

Second U.S. atomic bombing of a Japanese city. Following the Japanese refusal to surrender following the Hiroshima bombing on 6 August 1945, Twentieth Air Force headquarters on Guam issued Field Order 17 on 8 August, directing that, on the following day, the second atomic bomb on Tinian Island be dropped on another Japanese city. Kokura was designated as the primary target, and Nagasaki, a city of some 230,000 persons, was the alternate.

At 3:49 A.M. on 9 August, Boeing B-29 Superfortress bomber *Bockscar* (sometimes written as *Bock's Car*), commanded by Major Charles Sweeney, departed Tinian. It was followed by a second B-29 as scientific observer and a third as photographic observer. The *Bockscar* carried a plutonium nuclear-fission bomb nicknamed “Fat Man” that was 10 ft 8 inches long and

Nagasaki, Japan, showing damage from the atomic bomb, August 1945. (Photo courtesy of Andrew J. Waskey)

5 ft in diameter, with a payload greater than that of the Hiroshima bomb. The plutonium 238 isotope core consisted of two melon-shaped hemispheres surrounded by a ring of explosive charges designed to drive the sections together, achieving “critical mass” and a chain reaction releasing 22 kilotons of energy in one-millionth of a second.

Sweeney flew to Kokura but found it overcast and circled for 10 minutes. Despite the clouds, bombardier Kermit Beahan believed they could bomb visually. Sweeney, concerned about a faulty valve that limited fuel, decided to divert to Nagasaki, which was also partly obscured by clouds. Beahan believed he could bomb by radar, but a break in the clouds allowed him to bomb visually, using the Mitsubishi shipyards as his aiming point.

The *Bockscar* released the bomb from 31,000 ft at 11:02 A.M. local time. The bomb detonated 53 sec later, approximately 1,500 ft over the city, destroying everything within a 1,000 yd radius. An intense blue-white explosion pushed up a pillar of fire 10,000 ft, followed by a mushroom cloud to 60,000 ft.

Although the bomb missed its intended aiming point by 8,500 ft, it leveled one-third of the city. Called the “Red Circle of Death,” the fire and blast area within the Urakami Valley section destroyed more than 18,000 homes and killed 74,000 people. Another 75,000 were injured, and many later died from wounds or complications. Blast forces traveling in excess of 9,000 mph damaged buildings 3 mi away, and the concussion was felt 40 mi from the epicenter. “Ashes of Death” from the mushroom cloud spread radiation poisoning, killing all who were not killed outright within 1,000 yd of the epicenter. The bomb might have killed thousands more, but it detonated away from the city center in a heavy industrial area, vaporizing three of Nagasaki’s largest war factories but “minimizing” deaths.

Sweeney made one complete circle of the city to determine damage and then left after fuel concerns and heavy smoke made other circuits futile. Critically low on fuel, he flew to Okinawa, landing at Yontan Field about 12:30 P.M., his gas tanks virtually empty. After refueling, *Bockscar* flew to Tinian, arriving there at 10:30 P.M. local time after a 20-hour flight.

Included in the instrument bundle dropped from the observation plane was a letter addressed to Japanese physicist Professor F. Sagane that urged immediate surrender and threatened continued atomic destruction of Japanese cities. Written by three American physicists, the letter was a bluff, as no other atomic bombs were then ready. Nonetheless, the second atomic attack, coupled with the 8 August declaration of war by the Soviet Union, provided Japanese Emperor Hirohito with the excuse to end the war.

Nagumo Chūichi (1886–1944)

Japanese navy admiral. Born in Yamagata Prefecture on 25 March 1886, Nagumo Chūichi graduated from the Naval Academy in 1908 and from the Naval Staff College in 1920. Promoted to commander in 1924 and known as a torpedo expert, Nagumo commanded several cruisers before taking command of a destroyer squadron in 1930. He also became a strong advocate of naval air power, even though he was not an aviator and lacked carrier experience.

Advanced to vice admiral in 1939, Nagumo took command in April 1941 of the First Air Fleet, which concentrated Japan's six most powerful aircraft carriers into a single force. He opposed the Pearl Harbor operation advocated by his chief air officer Genda Minoru, the air fleet's air wing commander Fuchida Mitsuo, and commander of the Combined Fleet Admiral Yamamoto Isoroku. Nevertheless, his carriers attacked on 7 December 1941, crippling the U.S. Navy's battle fleet. Nagumo was criticized in some quarters for his caution in refusing to carry out additional air strikes against port facilities or to attempt to locate and destroy U.S. aircraft carriers then at sea.

Nagumo's First Air Fleet next undertook strikes on Rabaul and Port Darwin before beginning operations in the eastern Indian Ocean that devastated Allied naval power in the region. The fleet returned to Japan to refit in the spring of 1942. The carriers *Shokaku* and *Zuikaku* were detached to

Vice Admiral Nagumo Chūichi, Commander of the task force that attacked Pearl Harbor on 7 December 1941, ca. 1940s. (Corbis)

support the Port Moresby operation that ended with withdrawal after the Battle of the Coral Sea. Following their refit, the other four carriers sortied as the principal striking force for the Midway operation, which ended in their loss.

The defeat at Midway ruined Nagumo's reputation. Afterward, he commanded carriers during the Guadalcanal Campaign, and in August and October 1942 he inflicted losses on American forces in the Solomon Islands, but he also sustained heavy damage to his own air groups. Regarded as excessively cautious, Nagumo was relegated to a series of second-line shore commands until recalled to frontline service in late 1943 as commander of the 6,000-member force assigned to defend Saipan against an impending American assault. The invasion began on 13 June 1944 and Nagumo, foreseeing another defeat for which he would be blamed, committed suicide on 6 July 1944.

Nanjing (Nanking) Massacre (13 December 1937–22 January 1938)

Six-week period of atrocities and terrorism after Japanese troops captured the Chinese capital of Nanjing (Nanking) in Jiangsu (Kiangsu) Province. In July 1937, outright war began between Japan and China after the Marco Polo Bridge/Lugouqiao (Lukouch'iao) Incident. Chinese Nationalist

forces under Guomindang (GMD, [Kuomintang, KMT] Nationalist) President Jiang Jieshi (Chiang Kai-shek) initially offered strong resistance to the Japanese invasion, holding out at Shanghai—the country's greatest port city and the site of a major international settlement—from 13 August to 9 November 1937.

The Nationalist troops then fell back, moving inland in a near rout on the Nationalist capital of Nanjing, a symbolic location home to more than 1 million Chinese. Jiang was not prepared to abandon it without a fight, but no defense or evacuation plans had been made. Another of Jiang's objectives in defending both Shanghai and Nanjing, home to numerous foreign embassies, was to attract worldwide attention and win foreign support for China's anti-Japanese war.

In early December, Japanese troops converged on Nanjing. After Chinese troops rejected Japanese demands to surrender, on 9 December the Japanese opened a massive

Chinese prisoners being buried alive by their Japanese captors outside the city of Nanjing, during the infamous rape of Nanjing, 7 November 1938. (Corbis)

assault. Three days later, the Chinese defenders fell back across the Changjiang (Yangtze) River, and the following day the 6th, 9th, and 116th Divisions of the Japanese army entered the city as two Japanese navy flotillas arrived up the Changjiang River. During the ensuing six weeks, the Japanese occupiers deliberately instituted a reign of terror, apparently designed to cow China's population into ready submission to Japanese invasion. Frustration over Jiang's refusal to surrender, which Japanese leaders had expected him to do before the end of 1937, might have been another factor contributing to the reign of terror.

Entering the city on 13 December, Japanese forces fired on streets crowded with refugees, wounded soldiers, and civilians. They also fired on many thousands of refugees who were attempting to escape by swimming the river. The occupying forces used machine guns, swords, bayonets, fire, live burial, and poison gas to massacre captured Chinese soldiers and any young men suspected of being such. Scattered atrocities and murders, often marked by great brutality, continued throughout the city for six weeks, as did heavy looting. Counts of how many soldiers and civilians died in the Nanjing Massacre vary widely, ranging from 42,000 to 300,000. During this period, Japanese soldiers raped an estimated 20,000 women, most of whom were then killed.

The Nanjing Massacre shocked the west and generated extensive international sympathy for China, although this did not necessarily translate into tangible support and assistance. It was an early example of the use of organized brutality to cow and terrorize civilian populations characteristic of many World War II military occupations. As the twenty-first century began, memories of the Nanjing Massacre remained bitter in China; a major museum commemorating the event exists in Nanjing. In contrast, Japanese officials sought for many decades to deny that the episode ever took place, or at least to minimize its scale, and it was omitted from official Japanese accounts of the war. In the late 1990s, however, several Japanese journalists and academics who investigated the subject mounted dedicated efforts to bring the event to the attention of the Japanese people.

Napalm

Incendiary material made from thickened gasoline. Napalm was developed by American scientists at Harvard University early in the war to improve the performance of petroleum-based incendiary weapons. It was available in late 1942. Napalm powder, an aluminum/soap mix, draws its name from the components *naphthene* and *palmitate* combined and mixed with gasoline to create a gel that was then used in bombs or as an improved fuel for flamethrowers. Other nations developed similar materials; the British mix was named *Perspex*. Liquid napalm was a sticky compound with improved burning characteristics and good stability for safe handling.

Napalm was originally delivered in a 100 lb chemical-weapons bomb, the M47. In the strategic bombing campaign against Japan, napalm incendiaries were responsible for the significant destruction of Japanese cities by fire. Boeing B-29 pathfinder aircraft dropped the M47, and the bulk of the following bombers dropped clusters of 6.2 lb M69 bombs. The M69 ignited and ejected the napalm fill from its tail after a delayed fuze allowed the bomb to penetrate the building that it hit. After mid-1944, the U.S. tactical air forces employed a wide variety of sizes of firebombs or napalm bombs against Japanese forces and defensive positions. These bombs were often auxiliary fuel tanks that were simply filled with the napalm mix and equipped with an igniter. Napalm attacks were often cited for their psychological value as well as for their physical destruction. After World War II, *napalm* continued to be used as a generic term for fire-producing weapons, even though the original components that provided the name were no longer used.

Narvik, Naval Battles of (10 and 13 April 1940)

Anglo-German naval battle during the Norwegian Campaign of 1940. The Battle of Narvik comprises two separate engagements near that Norwegian port, the first on 10 April and the other on 13 April.

On 9 April 1940, the Germans landed powerful forces in Norway. To the northern port of Narvik they sent 10 large destroyers, auxiliary vessels, and some 2,000 ground troops. A small Norwegian warship at Ofotjord notified Narvik of the German approach on the night of 8–9 April. Early on 9 April, the Norwegian coastal battleship *Eidsvold* intercepted the German warships and ordered them to turn back. The Germans refused, demanding that the *Eidsvold* surrender to them. When the Norwegian captain refused and prepared to ram the lead German destroyer, the Germans opened fire with torpedoes, sinking the *Eidsvold*, which lost all but 8 of her crew of 193. The Germans then also torpedoed and sank the coastal battleship *Norge*; she went down with 110 of her crew, and another 89 survived. No Germans were casualties in this battle.

That same day, British Captain B. A. W. Warburton-Lee, commanding the 2nd Destroyer Flotilla of five destroyers, was ordered to sink or capture German ships and transport near Narvik and recapture the town at his discretion. His flotilla consisted of the flagship *Hardy*, *Havoc*, *Hotspur*, *Hostile*, and *Hunter*. The British ships arrived undetected off Narvik early on the morning of 10 April, their approach concealed by a snowstorm. Warburton-Lee ordered his flotilla to attack German vessels in the harbor, and the British destroyers sank two German destroyers and several merchant ships and damaged three other destroyers. Five other German destroyers were concealed in fjords, and as the British withdrew they were attacked on the flanks with torpedoes. In the engagement that followed, the *Hardy* was hit several times and beached, the *Hunter* was sunk, and the *Hotspur* was damaged but managed to escape. The Germans then withdrew because of a shortage of fuel. On the way out of the Vestfjord to the sea, the *Havoc* and *Hostile* took under fire a German ammunition ship, which caught fire, exploded, and sank. Warburton-Lee was among the British dead; he was posthumously awarded the Victoria Cross.

The British were determined to sink the remaining German destroyers at Narvik, and on 13 April the Admiralty dispatched Rear Admiral W. J. Whitworth, who was in command of the battleship *Warspite*, and nine destroyers to the site. The battleship's reconnaissance plane engaged and sank the German submarine *U-64* and warned of German destroyers lying in ambush positions in side fjords. A

destroyer action commenced outside Narvik harbor in the early afternoon. Fire from the *Warspite*'s guns caused the German destroyers to retire to the Rombaks and Herjangs fjords, to where they were pursued and where they were destroyed. In the engagement on 13 April, the British ships sank eight German destroyers and only incurred serious damage to two destroyers. Whitworth was also ordered to land forces at the harbor at his discretion. Aircraft from the British carrier *Furious* struck the harbor ahead of the *Warspite*'s arrival. Whitworth declined to send his marines and sailors into action against approximately 2,000 German soldiers there, but he recommended that a military force be dispatched forthwith to exploit the situation because the Germans had limited ammunition reserves and their motor transport had been captured at sea on 11 April. No force was sent until 28 May.

Combined with other losses sustained, the Germans paid a heavy price for their operations in Norway. However, Adolf Hitler considered the loss acceptable because it would protect his northern flank, secure continued access to vital Swedish iron ore, and provide bases for submarines and German surface raiders.

Narvik, Operations in and Evacuation of (24 April–7 June 1940)

The British naval victories of 10 and 13 April 1940 off the northern Norwegian post of Narvik cleared the way for an Allied amphibious assault. Narvik itself was important as the only winter transshipment point for high-grade Swedish iron ore to Germany. In executing such an operation, there was marked disagreement between the Admiralty, which pushed for an immediate landing, and more cautious army leaders, who realized the difficulties of a campaign in the late Norwegian winter. This clash of opposites was reflected in the two men selected to lead the campaign: Admiral William H. Boyle, Lord Cork and Orrery; and Major-General Piers Mackesy. The

two were never briefed together, their instructions were contradictory, and they only met for the first time on 15 April.

On 24 April, in a blinding snowstorm, the Royal Navy bombarded Narvik. Poor visibility prevented observers from determining if German resistance had been broken, and the operation was aborted after three hours. Although the Royal Navy continued to bombard Narvik regularly, Mackesy refused to conduct a direct assault. By 10 May, the Allies had assembled 30,000 Norwegian, British, Polish, and French mountain troops and two battalions of the Foreign Legion. Opposing them was a ragtag German force of paratroopers, Austrian mountain troops, and seamen from the 10 sunken German destroyers of the previous naval battles off the port—in all, some 4,000 men under the command of Generalleutnant (U.S. equiv. major general) Eduard Dietl. However, reinforcements and supplies were already coming in by rail via Sweden, and soon German troops and aircraft would be available from the south.

Commander of the Franco-Polish expeditionary force to Norway Brigadier General Antoine Béthouart was experienced in leading troops in rough terrain. He opposed both Lord Cork's boldness and Mackesy's caution, preferring to work his way up the peninsula in stages until he reached Narvik. The assault

began at Bjervik on the night of 13 May. Darkness minimized Luftwaffe interference in operations while allowing the Allies to make use of naval gunfire support. The success of this first attack led the British to remove the timid Mackesy from his post the next day and replace him with Lieutenant General Claude Auchinleck, which helped improve inter-Allied relations. It did not alleviate other problems faced by the multinational force, including shortages of supplies, winter equipment, and interpreters. Nevertheless, the Allied forces gradually closed on Narvik from its western approaches.

The impending defeat of the Allies in France soon rendered the Allied position in Norway untenable, and on 25 May the British War Cabinet ordered that Narvik be captured and then Norway evacuated. When the order was relayed to Lord Cork, he was not authorized to notify either the Norwegians or the French of the decision. Lord Cork disobeyed and told B  thouart but not the Norwegians.

On the night of 27–28 May, the Allies launched their final assault on Narvik. Heavy resistance by the Germans gained sufficient time for Luftwaffe bombers to attack the naval flotilla and drive it from Narvik, depriving the attackers of heavy artillery support. Fierce German counterattacks nearly drove the invasion force back into the sea, but support from British Hurricane fighters, coupled with desperate assaults by Norwegian troops and French Foreign Legion troops, turned the tide. By the evening of 28 May, Norwegian units entered the town.

Evacuation of the Allied force began almost immediately afterward, on 1 June. Again disobeying orders, Lord Cork prevailed on the British ambassador to inform the Norwegian government of the evacuation. On the evening of 7 June, the last Allied units reboarded their transports for the journey to Britain. Two days later, the Norwegian forces disbanded and an armistice came into effect.

The struggle for Narvik demonstrated conclusively the importance of air supremacy, which was held throughout by the Germans. The Allied defeat there dashed any Allied hopes of maintaining a foothold in Norway.

pean and Pacific Theaters. The traditional adage “a ship’s a fool to fight a fort” had seemed borne out at Gallipoli in World War I. During the interwar years, most navies therefore neglected support of joint operations. For example, the U.S. Navy developed no bombardment ammunition for its battleships until 1940; the Japanese did not do so until 1942. Thus, the amphibious landings of World War II supported by effective naval gunfire present one of the great, if unexpected, success stories of twentieth-century military operations.

During the North African Campaign in 1941 and 1942, the British found most useful two old monitors, the *Erebus* and the *Terror*, which had been originally built to support British troops in Belgium in World War I. With the Allies trying to regain a foothold on the continent in 1943, naval gunnery assets proved one of their trump cards. In the invasions of French North Africa, Sicily, Salerno, and finally Anzio, U.S. and British warships provided great assistance to Allied troops ashore.

Naval gunfire really came into its own in 1944 during the Normandy Invasion, Operation OVERLORD. Promises that heavy bombers would substitute for field artillery, unavailable until at least two days after the initial landings, proved hollow when most bombs fell behind the beaches. Fortunately, the Allies had mustered a strong bombardment force of 137 warships, including 7 battleships, 2 monitors, 23 cruisers, and 105 destroyers. At Omaha Beach, 9 U.S. and 3 British destroyers moved as close as 900 yd to the shore to destroy German guns with counterbattery fire. U.S. Lieutenant General Omar Bradley concluded, “The Navy saved our hides.” He remarked on another occasion, “I would gladly have swapped a dozen B-17s for each 12-inch gun.” At Normandy, Allied warships fired approximately 141,000 rounds of 4-inch. and larger shells, a majority of which were controlled by aerial spotters. In concluding that naval gunfire was approximately 10 times as accurate as bombing, the British also noted that casualties from friendly fire were rare. German Field Marshal Erwin Rommel reported to Adolf Hitler that Allied naval gunfire was so effective “that no operation of any kind by either infantry or tanks is possible in the area commanded by this rapid-fire artillery.” Field Marshal Gerd von Rundstedt counted naval gunfire as one of the three principal factors in the German defeat at Normandy. Following the Saint-L   breakout, British warships continued to assist Allied troops advancing along the coast into November 1944, the veteran battleship *Warspite* shooting until her guns were worn out.

In the Pacific, naval gunfire support proved at least as important as in Europe. In their first test in this role, U.S. warships at Tarawa destroyed nearly all the Japanese artillery positions and wire communications. However, many enemy machine guns remained operational and inflicted heavy casualties on the attacking Marines. In consequence, naval gunfire preparation for the next landing, Kwajalein, was more extensive. The official report concluded, “The entire

Naval Gunfire, Shore Support

Gunfire from ships offshore was one of the great assets making possible Allied amphibious landings in both the Euro-

The 6-inch guns of the U.S. light cruiser *Philadelphia* firing in support of the Allied landing in southern France, August 1944. (Corbis)

island looked as if it had been picked up to 20,000 feet, then dropped. All beach defenses were completely destroyed.”

Thus, the Japanese increasingly sited their defenses specifically to avoid naval gunfire. At Iwo Jima, their deep tunnels enabled many soldiers to escape the extensive three-day bombardment, although the big naval guns, often firing at ranges of less than 2 miles, destroyed over 60 percent of the Japanese coastal artillery in the target area. The defending general, Kuribayashi Tadamichi, reported: “The firepower of the American warships and aircraft makes every landing possible.” In contesting the final Allied invasion of the war at Okinawa, the Japanese command deliberately chose to burrow into the coral ridges in the southern portion of the island to escape the fury of naval gunfire. Still, U.S. warships fired in support of troops 23,210 battleship projectiles and 261,000 5-inch to 8-inch rounds.

During the war, the tonnage of ordnance laid down by Allied warships backing invasions totaled five or six times

that delivered by aviation. The Axis powers gave far less attention to naval gunfire support, although the Italians did build some coastal monitors. In the closing stages of the war, the Germans employed the pocket battleship *Admiral Scheer* in support of retreating German units on the Courland coast.

Only once did Japanese battleships bombard Allied troops. On 14 October 1942, at Guadalcanal, the *Kongo* and *Haruna* fired nearly 900 14-inch projectiles, mostly at Henderson Field. Given the small size of the target area, this proved the most devastating bombardment fired against U.S. troops in any war.

Naval Warfare

Naval operations conducted on a truly global basis were critical in the outcome of World War II. Unlike fighting on land, the struggle at sea proceeded more or less according to expectations. In September 1939, Allied naval superiority was even more marked than in World War I. Britain had one of the world's two largest navies (the other being the United States), and France had the world's fourth largest fleet. Although challenged by German U-boats and later by Japanese surface warships, Allied strength at sea enabled Allied powers to tap the world's resources, transport men and supplies vast distances, and provide naval bombardment and logistics support to amphibious operations, while largely denying these capabilities to the Axis powers. Both sides resorted to convoys as protection against surface raiders and submarines.

Naval technology at the beginning of World War II was little changed from that of World War I. Warships of the 1920s and 1930s were larger and faster than in World War I, and surface ships boasted improved gunnery control. With the exception of radar, however, there had been few technological breakthroughs. The aircraft carrier, which had appeared at the end of World War I, although it was regarded as an important ship type, was not yet seen as the new capital ship.

In 1939, the world's admirals still gave the battleship primary place. The Japanese hoped to secure a decisive edge in the war at sea with the powerful Yamato-class battleships. Their doctrine called for a decisive contest at sea, and the Yamato-class seemed to promise that. Built in great secrecy and displacing nearly 73,000 tons fully loaded and armed with 9 × 18.1-inch guns, the *Yamato* and *Musashi* (2 others were projected, 1 was finished as an aircraft carrier, and the fourth was never completed) were the largest battleships ever built. The United States built 10 modern battleships, more than all three Axis nations combined. The 4 U.S. Navy Iowa-class battleships, although they displaced only 57,500 tons fully loaded and armed with 9 × 16-inch guns, were faster and

not that much off the Yamato-class in capability. The great battleship confrontation at sea—a World War II Battle of Jutland—never occurred.

The primacy of the battleship changed with the Japanese attack on Pearl Harbor, especially when the Japanese sank the British battleship *Prince of Wales* and battle cruiser *Repulse* from the air off Malaya. Unlike the U.S. battleships at Pearl Harbor or the Italian battleships attacked by British aircraft in Taranto harbor in November 1940, the two British capital ships were under way and firing anti-aircraft weapons. From this point on, ships that ventured out without aircraft protection did so at their peril.

The once-mighty battleships never engaged one another in decisive fleet action (apart from the Battle of Surigao Strait during the October 1944 Battle of Leyte Gulf), but the torpedoes fired from U.S. destroyers and torpedo boats probably inflicted the greatest damage. Battleships proved their usefulness in shore bombardment, as anti-aircraft platforms (virtually all warships received increased numbers of anti-aircraft guns), and as “armored oilers” to accompany the aircraft carriers, the new titans of the seas.

Britain's concern over operating its aircraft carriers in narrow seas such as the North Sea or Mediterranean, which would subject them to attack from land-based aircraft, led to the introduction of an armored flight deck. The four-ship *Illustrious*-class, which entered service in 1940 and 1941, carried heavier anti-aircraft protection, an armored flight deck, and an armored “box” protecting the aircraft hangar. These additions provided greater protection but also limited British carriers to fewer aircraft than their U.S. and Japanese counterparts.

British naval resources were stretched thin at the start of hostilities, and although duties and scope of operations roughly corresponded to those of World War I, ships were far fewer. Thus, instead of major surface actions, the majority of the fighting at sea in the European Theater centered on the destruction and protection of seaborne trade, especially in the Atlantic Ocean, which was the critical area of operations. The Royal Navy's chief responsibility was to maintain Britain's seaborne lines of communication, on which the very survival of the nation depended. The Royal Navy transported the British Expeditionary Force (BEF) to France and then to Greece, and it reinforced and supplied garrisons in North Africa, among other places. It also rendered invaluable service by extracting the BEF from France in 1940 and from Greece and Crete in 1941. Had the Royal Navy not been able to execute these operations, Britain could have been forced from the war.

Many of the French ships were modern, the result of a major building program undertaken in the years immediately before the war that had drained sizable resources from the army. French naval strategy at the beginning of the war centered on cooperation with the Royal Navy. The French North Atlantic Fleet had two principal missions: to work with

the British in protecting merchant shipping and escorting convoys and to use its most powerful assets, built around the battle cruisers and organized in the *Force de Raid*, against German surface raiders.

For the German navy, war came a half decade early. When Adolf Hitler took power in 1933, the Kriegsmarine was basically a coastal defense force. Hitler wanted a powerful navy that might one day challenge Britain—or even Britain and the United States—for Atlantic mastery, but he assured German navy chief Grand Admiral Erich Raeder that he had no intention of waging war with Britain. In November 1937, Hitler had stated that war would not occur before 1943 or 1945. Raeder thus set out in the Z Plan of January 1939 to construct a balanced fleet of battleships and battle cruisers, aircraft carriers, cruisers, destroyers, and a force of 249 submarines. He fixed 1948 as the date for its completion, but Hitler gave him a deadline of six years (i.e., 1945). With a lead time on capital ship construction of as much as three or four years, the outbreak of the war thus caught the German navy with the wrong mix of vessels. Germany's sole aircraft carrier, the *Graf Zeppelin*, was never completed. Italy, neutral until 1940, had an impressive medium-sized navy, but its operations, apart from submarines, were largely confined to the Mediterranean.

The Soviet Union projected by 1943 a powerful oceangoing fleet, but by the time of the German invasion in 1941, the largest surface additions were four Kirov-class cruisers. The Soviet naval minister in Moscow was subordinate to the army, and ships were under the control of front commanders; thus the navy played little part in World War II.

When the war began, the overwhelming Allied naval superiority promptly drove German shipping into neutral or home ports. Except in the Baltic, the German flag disappeared from the seas. The British were content, however, to institute a naval blockade of Germany with the aim of denying Germany vital imports but also preventing sorties into the Atlantic of powerful German surface ships. Such a blockade from 1914 to 1918 had been a key factor in the German defeat. However, the blockade of 1939 had little effect on Germany, given its economic arrangements with the Soviet Union and Italy. After Germany's victories of 1940 and 1941 in Denmark, Norway, the Low Countries, France, Yugoslavia, and Greece, moreover, Germany could tap the agricultural and industrial production of most of Europe.

Raeder sought to pursue a commerce-raiding strategy, and he struck back with surface raiders, land-based aviation, mines, and, above all, submarines. His goal was to disrupt Britain's seaborne trade and starve Britain into submission. Germany had a submarine commander of genius in Karl Dönitz, who had assumed control of the U-boat program in 1935, but the paucity of U-boats made it impossible for Dönitz to wage any meaningful campaign against Allied ship-

ping. Dönitz believed that the only way Germany could pressure Britain was through interdicting its Atlantic shipping lanes, and he estimated that 90 submarines on station would ensure success. This meant that a force of some 300 submarines was required. At the start of hostilities, though, Dönitz had only 56 U-boats, of which 46 were ready for action; only 26 were suitable for Atlantic operations. Once the war began, Raeder suspended the Z Plan and gave priority to submarine construction and a commerce-raiding strategy, but much valuable time had been lost.

The April 1940 Norwegian Campaign ended as a brilliant strategic success for Hitler, but it also ruined the German surface navy. The Kriegsmarine lost 3 cruisers and 10 destroyers, half the German total, as well as having several other ships damaged. On the plus side, the many Norwegian fjords provided additional bases for German surface raiders and submarines. The greatest gain for Germany in this regard came in the defeat of France in June 1940. The acquisition of the French Atlantic coastline immensely benefited the U-boat war in the Atlantic, and by early August 1940, German submarines were operating from Lorient on the Bay of Biscay. These bases provided easier access to the Atlantic shipping lanes, and the French repair facilities were superior to the overburdened shipyards in Germany, translating into more U-boats at sea.

After the defeat of France and the loss of its powerful navy, Britain found itself in desperate naval straits. A new naval threat now arose in the form of a belligerent Italy, opening the Mediterranean Sea as a major theater of war. The Italian Fleet posed a severe strategic threat to the key British lines of communication through the Mediterranean. Italy had some excellent ships, and its navy, although far weaker in total strength than that of Britain, was concentrated, giving it what appeared to be local naval superiority. The Italian navy, however, lacked radar until 1942, and it was deficient in night-fighting equipment, antiaircraft protection, and antisubmarine capabilities. The Italians also did not have a naval air arm, which Benito Mussolini and Italian admirals had opposed, claiming that Italy was itself an aircraft carrier. There was no doctrine, however, for employment of land-based aviation in concert with naval units.

Oil from the Persian Gulf and other resources vital to the British war effort passed through the Suez Canal into the Mediterranean, then through the Straits of Gibraltar into the Atlantic and to Britain. Without this route, British shipping would have to go all the way around the Horn of Africa.

In the struggle in the Mediterranean, Allied code-breaking was vital. Intelligence from *ULTRA* provided information to the British about the timing of Axis convoys. Malta also proved critical. The British were able to hold it and use it to harry Axis reinforcement and resupply of North Africa. By the end of 1942, British aircraft were sinking many of the Axis

ships involved in supplying Axis forces in the Mediterranean, with a profound impact on the North African campaign.

Meanwhile, a grim struggle was under way in the Atlantic. The campaign here was certainly one of the key contests of the entire war, for without victory in the Atlantic Theater, Britain would have certainly been forced to sue for peace. On the outbreak of war, the Allies had promptly resorted to convoys. The convoy system was predicated on reducing the number of targets and on the assumption that the more targets there were, the more likely they were to be found. Large numbers of merchant ships would steam together, protected by escort vessels. The U-boats might still sink some vessels, but the percentage of losses would be significantly less. Further, the submarines themselves ran the risk of being sunk by the convoy-escorting destroyers and destroyer escorts.

By May 1943, half of the world's 5,600 merchant ships afloat in 1939 had been sunk by attack.

Meanwhile, it was 1941 before the U-boat building program really emerged. Dönitz asserted that he would have won the Battle of the Atlantic in 1941 or 1942 had he possessed the 300 U-boats he deemed necessary at the beginning of the war. It is probably a false claim, as a higher rate of sinking of merchantmen

would only have forced the Allies to shift assets earlier, including shifting long-range aircraft to Coastal Command. Dönitz's submarines lacked effective radar until near the end of the war, and they struggled—at least in the first year—with defective torpedoes, the same problem that plagued the Americans at the beginning of their submarine campaign against Japan.

To compensate for Allied superiority, Dönitz developed new tactics for his submarines, the most important of which was the Rudeltaktik (pack tactics, which the Allies referred to as the “wolf pack”). Groups of 15 to 20 submarines would spread out along the Atlantic sea-lanes. Merchantmen traveling alone would be immediately attacked, but in the case of a convoy, the submarine would shadow it and radio for reinforcements. The closest U-boats would then converge for a night surface attack, which would maximize confusion for the defenders and minimize the possibility of submarine detection. The submarines would then submerge and reorganize for a second attack.

To enable his submarines to remain on station for longer periods, Dönitz sent out supply submarines. The Germans also had success in code-breaking. The German navy's *B-Dienst* intelligence service listened to Allied radio traffic and broke the British convoy codes, enabling Dönitz to direct his boats to where he believed enemy ships would be. The

Germans also used aircraft, particularly the long-range Focke Wulf Fw-200, with great effectiveness against Allied convoys in the eastern Atlantic when they came within range of German air bases.

British defenses of the vital Atlantic trade routes were strengthened in May 1941 when the U.S. navy began escorting convoys between the United States and Iceland. Then, in June 1941, Canada created the Canadian Escort Force for the same purpose. The Royal Canadian Navy grew dramatically in size during the conflict and played a key role in the Battle of the Atlantic.

By June 1941, however, the Germans had sunk some 5.7 million tons of Allied shipping. British shipyards were able to launch only 800,000 replacement tons. Large Italian submarines, several of them operating from Bordeaux, were also effective. The Germans virtually controlled the Atlantic for more than a year after America's entry into the war. By May 1943, half of the world's 5,600 merchant ships in 1939 had been lost. May was probably the month when the tide of battle turned and the Allies went on the offensive.

A combination of factors brought the Allies victory in the Battle of the Atlantic. The convoy system was important, but so too was technology, primarily 10 cm radar sets that could be carried aloft in long-range aircraft, sonar, improved depth charges, rockets fired from aircraft, and forward-thrown antisubmarine “hedgehogs” or “mousetraps” (small depth charges known to the British as “squids”). The high-intensity Leigh light on aircraft illuminated the sea at night. Radio detection equipment was vital, and long-range aviation helped close the so-called Black Hole in the Middle Atlantic. Intelligence also played a role, chiefly ULTRA intercepts of U-boat communications that guided aircraft to the submarines. The creation of hunter-killer groups of escorts and escort carriers designed for 15 aircraft, each operating independently of the convoys, carried the war to the submarines. It is also true, however, that Allied and interservice cooperation was far too long in coming.

For the Allies, the Battle of the Atlantic was a close-run thing, and it claimed significant resources. German submarines sank 2,452 Allied and neutral ships, totaling 12.8 million gross register tons. During the war, the British merchant marine lost 40,248 men and the Royal Navy another 73,642. The Royal Air Force (RAF) Coastal Command sustained losses of 5,866 men and 1,777 aircraft. The Royal Canadian Navy lost 1,965 men, and U.S. Navy losses in the battle were 2,443 men. The Germans also paid a high price. During the war, Germany built 1,162 submarines. Of 830 operational U-boats, 784 were lost (696 destroyed by enemy action). Of 40,900 Germans who served in submarines, 25,870 perished and more than 5,000 were taken prisoner. U-boat crew fatalities were thus 63 percent, and the overall loss rate was 76 percent, the highest for any service in the war.

In the vast Pacific Theater, sea power was the most important element. The fight here was largely a U.S. Navy enterprise, and it ended in perhaps the most comprehensive victory in naval history. In going to war with the United States, Japanese leaders completely miscalculated in several key areas. They assumed that the Imperial Japanese Navy (IJN) could cripple the U.S. Navy, carry out a series of conquests to secure desired natural resources, and build a defensive ring that would hold the U.S. Navy at bay until it gave up and recognized the inevitability of a new Japanese empire. Yet the defeat of Japan was certain. The key to victory in the Pacific war lay in numbers of ships and planes—and Japan, with a vastly inferior industrial base, was bound to lose that race to the United States. Beginning in 1943, significant numbers of the new Essex-class carriers and accompanying vessels reached the fleet.

Another important factor in the U.S. Navy victory over Japan was the concept of the fleet train, which enabled carrier task forces to operate for extended periods of time and at great

distances from their bases. The fleet train was a vast enterprise that included supply ships, tankers, repair vessels, dry docks, and tenders for seaplanes, destroyers, and submarines. As a result, the U.S. Navy enjoyed unparalleled mobility; its strategic reach in the war was unmatched by any other navy. It was this capability that made possible the recapture of Pacific islands that had been taken by the Japanese, from which long-range land-based strategic bombers could attack the Japanese mainland. It also enabled the navy to establish large fleet anchorages in remote locations such as at Ulithi.

An essentially defensive policy forced the IJN to disperse its assets. In the course of the war, Japan's navy was never able to support individual isolated Japanese strongholds before the Americans overwhelmed them. Japan's leaders also miscalculated their vulnerability in a war against merchant shipping. Obsessed with carrying out fleet actions against the U.S. Navy, the IJN gave scant consideration to the protection of Japan's highly vulnerable merchant trade. Anti-submarine warfare was all but ignored. In December 1941,

the IJN had but four purpose-built escort vessels, and it was not until the autumn of 1942 that any escorts were equipped with sonar. The United States led Japan by a wide margin in antisubmarine technology.

Japan was highly dependent on imports and yet boasted only a marginal shipping capacity. Even with their early successes, the Japanese would not be able to capture, build, or salvage the necessary tonnage to replace even modest losses. As it turned out, U.S. submarines devastated the Japanese merchant marine. The United States outbuilt Japan in submarines by 2:1. The U.S. Navy entered the war with 114 submarines; Japan had 64. During the war, the United States built another 206, and Japan only built 116. In the entire conflict, the United States lost 52 submarines and Japan lost 128. During the Pacific war, the U.S. Navy became the most successful practitioner of the *guerre de course* (war against commerce) in history. One could argue that the submarine was the most important factor in the Allied victory in the Pacific. In effect, the United States succeeded where Germany failed in both world wars.

The United States built long-range submarines of 2,000 tons with 10 torpedo tubes each. Although the Japanese produced some fine boats and actually built the largest submarines of the war (3,500 tons and carrying 3 disassembled planes) with exceedingly long range (in 1942, Japanese submarines shelled the Pacific U.S. coast), their submarine strategy was flawed. They directed their submarines against U.S. warships. Although the Japanese enjoyed some successes, operating against enemy warships took a high toll. Later, the Japanese used their large submarines chiefly to supply isolated garrisons such as the one at Rabaul. The obvious target for their submarines was U.S. cargo vessels, but the Japanese never went after the long and vulnerable U.S. supply lines.

U.S. submarines, moreover, had a deep-dive capability. The standard diving depth for submarines was 300 ft, but U.S. boats could reach 400 ft without stressing the hull and could go deeper if necessary. This was one of the best-kept secrets of the war, and enemy depth charges usually exploded above them. But for the first two years of the war, U.S. submarines suffered because they carried inferior torpedoes. The magnetic pistol to explode the charge under the target ship often did not function correctly. The torpedoes also circled, and at least one U.S. submarine, the *Tang*, was sunk by one of its own "fish." In late 1943, however, new contact pistols were installed, and by 1944 the navy had a new magnetic pistol.

From the beginning of the war against Japan, the United States waged unrestricted submarine warfare. In December 1941, Japan had 5.4 million tons of merchant shipping—only a marginal capacity. The Japanese constructed or acquired another 3.29 million tons during the war, but U.S. submarines sank 6.9 million tons of merchant ships (1,113 vessels). U.S. submarines also extracted a heavy toll of Japanese

warships, sinking 201 totaling 577,000 tons. The Japanese were so short of aviation fuel by 1944 that they could scarcely train pilots. In American submarine successes, code-breaking (*MAGIC*) played a major role.

The June 1942 Battle of Midway marked the turning point of the war in the Pacific, but the October 1944 Battle of Leyte Gulf, the largest naval battle in history, finished off the Japanese Fleet as an organized fighting force. Japanese courage and tenacity were overcome by American determination and numbers. In February 1945, the five carrier task groups operating against the Japanese home islands included 119 warships, yet only 4 of them had been in service before December 7, 1941. By 1945, the U.S. Navy counted 23 battleships, 19 fleet carriers, 1 light carrier, 108 jeep carriers, 351 destroyers, and 255 submarines. The U.S. Navy was, in fact, larger than all the other navies of the world combined.

Netherlands, The

In 1940, the Netherlands numbered about 9 million people. The country was strategically located on the North Sea and had important overseas possessions in the Netherlands West

Indies and Netherlands East Indies. The Netherlands itself had not been at war with another state since 1815, and when World War II began, Queen Wilhelmina declared the nation's neutrality. Adolf Hitler sent the queen his personal assurances that he would respect Dutch neutrality.

The Dutch government made no plans with other nations, not even with neutral Belgium, for a concerted defense. The Dutch defensive strategy, known as Fortress Holland, called for blowing up bridges and dikes in the hope of stopping a German invasion, but it failed to take into account the realities of modern warfare. On paper, the Dutch army appeared impressive. General H. G. Winkelman commanded 400,000 men in 8 divisions and 4 brigades plus several smaller units. The army was, however, poorly armed and trained. It had not a single tank and only 26 armored cars and 656 obsolete artillery pieces. Its Military Aviation Division possessed only 175 aircraft, of which 132 were serviceable and only 72 were modern. The navy was modern but small. It consisted of 4 cruisers (another was almost complete), 8 destroyers, 16 minesweepers, 24 submarines, and several torpedo boats and auxiliary craft. Most of it, however, was in the Pacific to defend the Netherlands East Indies.

Beginning at 3:00 A.M. on 10 May 1940, German forces invaded the Netherlands. Queen Wilhelmina proclaimed the invasion a flagrant violation of international law. The Germans used 1,000 aircraft to attack Dutch airfields and military installations, and most Dutch aircraft were destroyed the first day. The Germans also used parachute and airborne forces effectively, as well the Eighteenth Army. Nonetheless, the Dutch put up stout resistance, especially along major rivers. Hitler ordered the capture of the Dutch Royal Family, but they escaped from the Hague to Britain aboard two British destroyers. With negotiations already in progress, but as an inducement to bring about a speedy Dutch surrender so that their forces could be released for the fighting in France, on 14 May the Germans bombed Rotterdam, destroying much of the city center and causing considerable civilian casualties. Later that same day, Winkelman ordered Dutch forces to lay down their arms.

Also on 14 May, Wilhelmina established a government-in-exile and announced in a radio broadcast to the Dutch people her determination to continue the fight. The government-in-exile secured most of the ships of the important Dutch merchant marine. Its 640 ships, not counting 200 smaller vessels, was of immense help to the Allies. Several participated in the Dunkerque (Dunkirk) evacuation, and the merchant marine played a key role in the Battle of the Atlantic. Ultimately, half of the ships were lost in the war, and some 3,000 Dutch seamen were killed. In early 1942, the Japanese occupied the East Indies, leaving only Suriname in South America and such islands as Aruba, Bonaire, and Curaçao in the Netherlands West Indies under the free Dutch government in London.

A Dutch father, who himself has been severely wounded in his head, hand, and leg, stares in horror at the mutilated corpse of his little girl, Amsterdam, Netherlands, ca. 1940. (Library of Congress)

The Nazis held the Dutch to be fellow Aryans, and Hitler intended to incorporate the Netherlands into a greater Germany. To win the support of the Dutch, Hitler ordered that German occupying forces be on their best behavior. He also released Dutch prisoners of war as a conciliatory gesture. At the same time, the Germans worked to tie the economy of the Netherlands to that of Germany.

On 26 May, Hitler established a government in the Netherlands with Arthur Seyss-Inquart (1892–1946) as Reichskommissar. Hitler deliberately ignored Dutchman Anton Mussert, head of the small National Socialist Movement (Dutch Nazi party) in the Netherlands, although he did grant him the honorific title of De Leider (leader) of Holland. Seyss-Inquart had full administrative authority. In October 1941, Seyss-Inquart abolished the Dutch Parliament and instituted the German judicial system. Labor unions lost their autonomy, and remaining political parties (the Communist and Socialist Parties had been immediately banned) were forced into one political entity, the National Unity Party, although it, too, was disbanded within a year. Censorship was complete; Germany maintained control over the mass media and issued fines for

municipal authorities that violated German rules. Education was reorganized along German lines with the promotion of Nazi racial theories and the rewriting of textbooks.

The British naval blockade during the war cut off traditional markets and access to the Dutch colonies overseas; factories had difficulty securing materials for production; and there was rampant inflation. Rationing was enforced, but food and consumer goods became scarce. The Germans sought to exploit the Netherlands economically, and this agriculturally rich country was forced to deliver most of its produce to Germany. The economic situation worsened after 1943, as the Germans expropriated whatever they deemed useful to their war effort, including personal property. As early as 1941, skilled Dutch workers were transported against their will to the Reich to work in German factories. This practice intensified as the war continued.

Jews were a special target. Legislation deprived 140,000 Dutch Jews from participation in Dutch society and then deprived them of their livelihoods. By 1944, some 110,000 Dutch Jews had been removed from the Netherlands altogether and sent to concentration camps; only 5,000 returned after the war. The other 30,000 survived by going into hiding. Jewish losses in the Netherlands were the highest, in terms of percentage, in western Europe.

Resistance was negligible during the first two years of the German occupation and was mostly passive. But Nazi methods were abhorrent to the Dutch, and by 1943 resistance became active. Resistance groups robbed banks, conducted sabotage, and even assassinated Germans. Not until September 1944, however, were the resistance groups unified.

Some Dutch collaborated with the Nazis, revealing the location of Jewish hiding places, for example. After the war, more than 100,000 people were arrested for collaboration, and approximately half of them were brought to trial.

On 17 September 1944, when the Allies initiated Operation MARKET-GARDEN to secure a crossing over the Rhine River at Arnhem, P. J. Gerbrandy, prime minister of the Dutch government-in-exile, called on Dutch railroad workers to strike, and they heeded the call. In response, Seyss-Inquart shut down shipments of food by rail and canal that were essential to feed much of the population. The winter of 1944–1945 is remembered as the Hunger Winter, and some 20,000 Dutch died of starvation. Misery was compounded by the immense cold. There was no access to coal, electricity, wood, or running water.

During the latter stages of the fighting, defensive flooding inundated large areas, with resultant damage from sea water. Many homes were also destroyed in the fighting. Trade was at a standstill, and the economy was in a shambles. German occupation costs alone had robbed the economy of 8 billion guilders. The Netherlands was by far the worst affected by the war of any western European state.

After the war, the Dutch temporarily brought back the death penalty and executed the most blatant Nazi collaborators. Seyss-Inquart was tried at Nuremberg, found guilty, and executed. The war also caused the Netherlands to abandon its policy of neutrality in favor of a defensive pact with Belgium and Luxembourg and later membership in the North Atlantic Treaty Organization.

Netherlands Campaign (10–15 May 1940)

In May 1940, the Germans launched CASE YELLOW, their attack against France and the neutral Low Countries. In the case of the Netherlands, the country was overrun in five days and suffered heavy losses. The German strategy to invade western Europe called for an attack through neutral Belgium and the Netherlands as well as across the Franco-German border farther south to enable the German forces to carry out a grand sweeping movement. Known as Operation SICHELSCHNITT (THE CUT OF THE SICKLE), it was in effect a reverse of the World War I Schlieffen Plan designed to trap advancing British and French forces in Belgium.

General Henry G. Winkelman's Netherlands army of 8 infantry divisions plus 2 in reserve faced Colonel General Fedor von Bock's Army Group B consisting of General of Artillery (U.S. equiv. lieutenant general) Georg von Kuchler's Eighteenth Army of 11 divisions (9 infantry and 1 each of cavalry and tanks) and Colonel General Walther von Reichenau's Sixth Army with 17 infantry and 2 panzer divisions. The Dutch forces were basically militia with little training and no fighting experience. They also had no tanks and hardly any antitank weapons. Although some Dutch units fought well, the army as a whole broke down rather rapidly.

The attack against Fortress Holland, as the defensive strategy was known, began in the early hours of 10 May 1940. As in the previous month's offensive against Norway, an air assault spearheaded Germany's operation. Most of these air assaults were successful, as with 12 seaplanes landing at Rotterdam and their 120 troops on board securing 3 important bridges. This was at some cost to German air assets. On 10 May alone, the Luftwaffe lost some 170 aircraft and had about the same number damaged. Most key defensive installations were in German hands by the middle of the first day, however. Of the crucial bridges over the Juliana Canal, the Germans captured all but one completely intact. Although by 12 May Allied bombers began to target key bridges in the Netherlands, most bridges had already been secured by the Germans, allowing their forces to advance rapidly.

On 13 May, Generalleutnant (U.S. equiv. major general) Alfred Ritter von Hubicki's 9th Panzer Division managed to achieve a breakthrough toward the bridges at Moordijk 15 miles south of Rotterdam, captured intact by German paratroopers at the start of the operations. Two of these structures were then the longest road and rail bridges in the world. This move enabled the Germans to advance to Rotterdam and split the Netherlands in two. Counterattacks by the French Seventh Army failed to retake

the bridges and establish contact with Dutch forces. The French then were forced to fall back toward Antwerp, making the Dutch position untenable. Recognizing that further resistance would not reverse the situation, the Netherlands government considered capitulation. On 13 May, Queen Wilhelmina, other members of the Dutch Royal Family, and the government fled to Britain, where a government-in-exile was quickly established.

The resistance of Netherlands forces had surprised the Germans, and they wanted to end the campaign quickly to enable forces there to be shifted to France. When on 14 May the Germans demanded the surrender of Rotterdam, the Dutch at first refused. In one of the most controversial decisions of the war, Reichsmarschall and commander of the German air force Hermann Göring then decided to employ Ju-87 Stuka dive-bombers of Fliegerkorps IV against the city to hasten Dutch capitulation. Talks began at noon, but faulty communications meant that the air attack went forward and the city center was virtually destroyed. On 15 May, the Netherlands surrendered. In the five-days campaign, the Netherlands had lost 2,890 dead and 6,900 wounded. There are no separate German casualty figures for the Netherlands fighting. The Netherlands remained under German occupation for the next four years.

Netherlands East Indies

Indonesia was a Dutch possession during World War II and was known as the Netherlands East Indies (NEI). The world's largest archipelago, it is located in southeast Asia straddling the equator and sitting astride major strategic shipping

routes from the Pacific Ocean to the Indian Ocean. The NEI extends over a vast area some 2,275 miles wide by 1,135 miles long and comprises some 17,000 islands, 6,000 of which are inhabited. The largest of these islands were Java, Sumatra, Dutch Borneo, Dutch New Guinea, Celebes, western Timor, and the Moluccas. The 1940 population of the NEI was about 70 million people, of whom 1 million were Chinese and 250,000 were of Dutch extraction. About 70 percent lived on Java. The islands had as many as 300 different ethnic groups speaking 365 languages.

The NEI was immensely rich in natural resources, including oil (more than 59 million barrels produced in 1940), tin, bauxite, and coal. It also produced rubber, copra, nickel, timber, quinine, and important foodstuffs such as rice, sugar, coffee, and tea. The NEI thus represented a major prize for Japan in World War II, especially as Japan had no oil of its own.

Dutch rule in the islands was paternalistic and exploitive; the Indonesians were treated as little more than children. Some 90 percent of the population was illiterate; only a minority attended school in 1940, and few jobs were available for educated Indonesians in a bureaucracy dominated by the Dutch. The authorities ruthlessly crushed any nationalist sentiment, and repressive measures in the 1930s created a wide psychological breach between rulers and ruled.

In May 1940 in Europe, German forces quickly overran the Netherlands, although the Dutch Royal Family and some government officials escaped abroad and established a government-in-exile in London. The advisory Volksraad (People's Council) at Batavia, the NEI legislative body on Java, declared its loyalty to the London government but was soon virtually autonomous. It did refuse Japanese trade demands and obeyed the decision by the Dutch government-in-exile in August 1941 to cut off the export of oil to Japan.

The Netherlands government-in-exile, acting in concert with the British and U.S. governments, declared war on Japan after Japan attacked the United States at Pearl Harbor. Japan desperately needed the resources of the NEI and sought to add the NEI to its Greater East Asia Co-prosperity Sphere. Tokyo quickly dispatched a large number of troops to secure the islands as soon as possible. Beginning on 20 December 1941, units of Lieutenant General Imamura Hitoshi's Sixteenth Army landed on oil-rich Dutch Borneo as well as Celebes and the Moluccas. The poorly equipped Royal Netherlands East Indies Army resisted as best it could, supported by some British, Australian, and U.S. forces. With their few air assets soon destroyed, all the Allies could do was to delay briefly the Japanese advance. The Japanese navy crushed Allied naval forces in the Battle of the Java Sea, and on 8 March the Dutch surrendered on Java. Resistance continued in Dutch Borneo and Celebes until October 1942, and the Japanese never did conquer all the islands.

Antitank gun crew of the Netherlands East Indies Army, 9 December 1941. (Bettmann/Corbis)

Following their victory, the Japanese sent the Indonesian soldiers home and arrested some 170,000 Europeans, including 93,000 Dutch soldiers. All were treated inhumanely on starvation diets, which caused the deaths of 40 percent of the adult males, 13 percent of the women, and 10 percent of the children. Under the Japanese administrative division of the NEI, Java and Madura came under the jurisdiction of the Sixteenth Army. Strategically important Sumatra was controlled by the Twenty-Fifth Army, and the Celebes, the Moluccas, and Dutch New Guinea were under Japanese navy administration. The Japanese army and navy remained at odds, and there was no unified policy for the islands, which in any case differed sharply in size, population, and economy.

Many Indonesians initially welcomed the Japanese as liberators. However, Japanese rule was far more ruthless and exploitive than that of the Dutch. The Japanese took advantage of nationalist sentiment and worked with those leaders whose approach was to seek at least public accommodation with them. The systematic Japanese plunder of resources began immediately after the invasion. Japan also mobilized as many as 2 million unskilled laborers. More than 270,000

of these were sent overseas, but only 50,000 to 70,000 of them returned.

Because of a shortage of labor and the arrest of Dutch administrators, production fell off sharply. By 1943, rubber production was at one-fifth and tea at one-third of pre-1941 levels. Rice output fell 25 percent. The occupation currency issued by the Japanese also rapidly declined in value. By 1945, it was only worth 2.5 percent of face value. Severe shortages and acute economic hardship resulted. The closing of the export market also hurt the economy. In any case, thanks to Allied submarines, shipment of NEI resources to the Japanese home islands, especially desperately needed oil, steadily declined during the course of the war.

Japanese authorities early prohibited all political activities in the islands. They also banned use of Dutch and English and insisted on Japanese language instruction in the schools. Western symbols—statues, for example—were torn down, and streets were renamed. The Japanese ruthlessly crushed all dissent but worked with Indonesian nationalist leaders to help administer the islands under their “guidance.” Clearly, Japanese leaders hoped to annex the islands outright. In Jan-

uary 1943, as a means of securing support for the Japanese war effort, Japanese Prime Minister Tōjō Hideki announced that Burma and the Philippines would be made independent within a year. However, there was no such mention of independence for the NEI until 7 September 1944 (by Prime Minister Koiso Kuniaki), and then only at some unspecified future date.

As the tide of war sharply turned, the Japanese sought to mobilize Indonesians against the Dutch. This included heavy use of propaganda; military training for the young; and creation of a 25,000-man auxiliary military force, the Heiho, which served with the Japanese, and another volunteer force, the 57,000-man Peta, as a guerrilla operation under Indonesian command.

Support among Indonesians for Japan ebbed as the economy declined and as the Japanese seized rice stocks and requisitioned labor. In some cases, also, the Japanese army treated the population brutally. The occupation had the effect of crystallizing Indonesian opposition to foreign rule, and at the end of the war the nationalists moved into the vacuum. On 17 August 1945 at Jakarta, they proclaimed the archipelago independent of the Netherlands and then promulgated a new constitution. The Dutch government in the Netherlands initially refused to accept these actions. Not until 1949 did it bow to the inevitable and agree to an independent Republic of Indonesia.

Netherlands East Indies, Japanese Conquest of (1942)

The desire of Japanese leaders to secure the vast oil and mineral resources of the Netherlands East Indies was one of the principal reasons they took their country to war against the United States. The islands of the Netherlands East Indies (NEI), however, extended over a vast area some 2,275 miles wide by 1,135 miles long.

The Japanese planned a three-pronged semi-simultaneous strategy to secure the archipelago's resources as quickly as possible. In the east, their forces would move from forward bases in the southern Philippines on the islands of Ambon and Timor to sever communications and reinforcements from Australia. In the center, forces from the Philippines would push southward through Borneo and Celebes. In the west, Japan forces would move against Sumatra as soon as Singapore was conquered. Finally, when all initial objectives were secured, the three forces would combine for an assault on Java, the center of Allied naval operations in southeastern Asia and headquarters of the joint Allied military command, ABDA (Australian-British-Dutch-American).

Formed on 15 January 1942, the ABDA was charged with the defense of Malaya, Singapore, the Netherlands East Indies, and the northwestern coast of Australia. British General Sir Archibald Wavell commanded from Lembang, Java. He did what he could to rally his defenders, but Japanese resources were vastly superior. On 20 December, units of Lieutenant General Imamura Hitoshi's Sixteenth Army, having left from Mindanao, the Philippines, landed on Dutch Borneo, Celebes, and the Moluccas. On 11 January, Japanese paratroops saw their first action in the war when about 500 were dropped and secured an airfield on Celebes. Supported by the 21st and 23rd Air Flotillas, the Japanese also captured oilfields in Dutch Borneo and airfields at Kendari in Celebes and Ambon in the Moluccas. On 16 February, 460 Japanese paratroopers assisted other Sixteenth Army forces in taking the major oil refinery at Palembang in southern Sumatra. Japanese paratroopers also took part in the 19 February invasion of East Timor. Australian reinforcements bound for Timor turned back after Japanese bombers from Kendari began attacking the transports. On 19 and 27 February, Japanese raids destroyed much of the defenders' land-based aircraft fleet.

On the seas, the Allies had some success on the night of 23–24 January, when U.S. destroyers sank three Japanese transports off Balikpapan. Wavell hoped to concentrate his isolated assets, but protection of convoys took most of his surface ships, leaving only submarines and a handful of destroyers to defend the whole of the Indies.

For the defense of Java, the last of the Japanese objectives, the Allies had 12 Dutch and 2 Australian infantry battalions,

a U.S. artillery regiment, a home guard of 40,000 inexperienced volunteers, and some 90 aircraft. Land commander Lieutenant General H. ter Poorten placed his best troops at the extremities of the islands, where he expected the Japanese to come ashore. On 25 February, however, the ABDA command was dissolved and the Dutch governor-general on Java assumed command of the remaining forces.

Having secured their other land objectives, the Japanese put to sea two invasion forces for Java under Vice Admiral Ibo Takahashi. On 27 February 1942, the Japanese won a naval victory over Allied warships in the Battle of the Java Sea. Then, on 1 March, the Japanese landed in several locations on Java with the capital of Bandung as their ultimate objective. These assaults met only minimal resistance. The 48th Division reached the capital by 7 March, and the 56th Regiment broke off to assault Tjilatap, the chief port on the southern coast.

On 8 March, General ter Poorten surrendered 93,000 men of the Royal Netherlands East Indies Army. The Japanese also took as prisoners some 5,000 Australian, British, and U.S. military personnel. That same day, Japanese forces landed in northern Sumatra. By the end of the month, they had conquered all of Sumatra and had begun an invasion of Dutch New Guinea. Resistance continued in Dutch Borneo and Celebes until October 1942 and on Timor until December 1942. Part of Dutch New Guinea continued under Dutch control, and the Japanese never did conquer all of the 1,300 islands of the Netherlands East Indies.

NEULAND, Operation (February 1942–September 1943)

German submarine campaign in the Caribbean. In the shadow of Operation PAUKENSCHLAG (DRUMBEAT), the German

U-boat offensive against the American East Coast, the German U-boat command conceived a second offensive against Allied shipping in American waters. This new operation was named NEULAND and was aimed at Allied oil and gasoline shipments in and from the Caribbean Sea. The destruction of large numbers of tankers had a serious impact on both the U.S. and the British economies because, whereas the losses of dry-cargo tonnage were quickly replaced by new construction, tanker losses were not.

Operation NEULAND, as with DRUMBEAT, began like a thunderclap against a poorly prepared enemy, even though Admiral Karl Dönitz had dispatched only five large Type IX U-boats to the Caribbean. On 15 February 1942, two U-boats entered the two most important oil ports of the western hemisphere, Saint Nicholas on Aruba and Willemstad on Curaçao, where they torpedoed several tankers and attempted to shell the refineries. Meanwhile, the other three U-boats created havoc along the crude oil routes from Lake Maracaibo (Venezuela) and in the anchorage of Trinidad, the main Allied base in the region.

Although the Caribbean had been formally integrated into the U.S. seaward defense organization in July 1941, the initial response to the German threat was completely uncoordinated and ineffective. Between 1 February and 1 June 1942, German and Italian submarines encountered only minimal resistance in the Caribbean and sank 52 tankers (out of a total of 114 Allied tankers sunk in that period). The results were devastating: oil imports to Great Britain, which had stood at 1.1 million tons in February 1942, dropped to 623,000 in May. On 2 May, the British government asked the U.S. government for a loan of 700,000 tons of tanker tonnage to avert fuel starvation of the British war effort. The United States complied by transferring a total of 854,000 tons to Great Britain and Canada. The measure incurred a temporary rationing of oil in the northeastern United States until sufficient tank car and pipeline capacity, a more efficient allocation of tanker tonnage, and, ultimately, new tanker construction alleviated the situation during the second half of 1942.

Neither did the introduction of convoys in the Caribbean bring instant relief. The largely American escort forces in the Caribbean were initially inadequately equipped and too inexperienced to take on the battle-hardened U-boat veterans.

Nevertheless, by September 1942, the convoy system had forced the U-boats to concentrate around Trinidad in search of prey. Since February, the antisubmarine forces had accounted for six U-boats and had damaged several more. For the Germans, however, this was still a favorable exchange rate, given the destruction of 187 Allied merchant ships in the Caribbean to that point.

Whereas the offensive against the U.S. East Coast fizzled out in August 1942, the offensive in the Caribbean continued in October when the boats of the first wave returned after the

Tankers from Convoy TM.1 ablaze after a German U-boat attack. (Photo courtesy of Dirk Steffen)

necessary rest and maintenance period. In spite of the stiffened resistance and ceaseless American air patrols, German U-boats sank another 160 Allied merchant ships in the Caribbean Theater until the end of the year. During the 319 days of the offensive, the U-boats had thus sunk a total of nearly 1.9 million tons of Allied shipping in the Caribbean, or 36 percent of all Allied merchant ship losses in 1942 worldwide.

The second part of the offensive came to a climactic end with the destruction of two tanker convoys: TM.1, bound from Trinidad to Gibraltar, and TB.1, bound from Trinidad to Bahia (Brazil). In a spectacular four-day action from 8 to 12 January 1943, five U-boats sank seven of TM.1's nine tankers. The shadow of defeat that hung over the German U-boat campaign in early 1943, however, did not spare the Caribbean Theater. The reassignment of many boats to meet the Allied invasion fleet of North Africa (Operation TORCH) and the Allied air offensive in the Bay of Biscay, which forced many U-boats to abort their missions, resulted in a lull in Caribbean activities. When the German U-boat command attempted to revive the Caribbean Theater following the collapse of the main U-boat campaign in the North Atlantic

in May 1943, the offensive ended in failure before it could begin in earnest. Of 44 U-boats assigned to the renewed operation, 7 were lost in the Caribbean, but, even worse, 22 more—including 11 U-tankers and auxiliary U-tankers vital to the operation—were sunk during transit through the Bay of Biscay and through the Atlantic. The few fuel-starved U-boats that had made it into the Caribbean were hastily recalled after the loss of the U-tankers, and from September 1943 onward U-boats ventured into Caribbean only occasionally to maintain a diversion of Allied antisubmarine assets.

New Britain, Landings (December 1943)

New Britain is an island in the northern Solomon Islands. Rabaul, the major Japanese air and naval base in the South Pacific, was located at the eastern end of the Solomon Islands. In 1942 and 1943, the major Allied effort in the Pacific war was centered on Operation CARTWHEEL, which was designed to neutralize Rabaul. Operation CARTWHEEL began in August 1942 with an Allied landing at Guadalcanal in the southern Solomons.

During the next year, the Allies advanced up the Solomons and along the northern coast of New Guinea so that by the fall of 1943, they were approaching New Britain. At the same time, Allied air raids eliminated Rabaul as a significant threat to future operations. Even though there seemed no reason to capture Rabaul, General Douglas MacArthur, commander of the Southwest Pacific Area, intended to establish

a presence on New Britain. An amphibious assault against the Japanese stronghold, which was defended by nearly 90,000 Japanese troops and naval personnel, was deemed too costly, but the western end of the island was defended by only 7,500 Japanese, who were cut off from reinforcements by a lack of roads, rugged terrain, and Allied air and naval superiority.

MacArthur planned a two-pronged attack. The 112th Cavalry Regiment would land at Arawe on the southwestern coast of New Britain to attract and pin down Japanese reserves, while the 1st Marine Division would land at Cape Gloucester on the northwestern coast, where the Japanese had two airstrips. From these airstrips and a patrol-torpedo (PT) boat base at Arawe, MacArthur would complete the isolation of Rabaul.

The New Britain landings began on 15 December 1943, when the 112th Cavalry Regiment landed at Arawe and established a strong perimeter against little resistance. On 26 December, two Japanese battalions launched a counterattack

United States soldiers landing at Cape Gloucester, New Britain Island, Papua, New Guinea. (Photo by US Navy/Getty Images)

but were beaten back, and in mid-January 1944 the 112th Cavalry eliminated the last pockets of Japanese resistance.

The Cape Gloucester landing began on 26 December. The Marines easily overwhelmed local Japanese resistance, although Japanese bombers sank the U.S. destroyer *Brownson*. By 30 December, the Marines captured Cape Gloucester; however, to secure the lodgment they had to expand their perimeter to two fortified hills on the western side of Borgen Bay. In fierce fighting made more difficult by swamps and heavy rains, they seized Hill 660 on 14 January 1944, ending any Japanese threat to Cape Gloucester.

New Britain now became a backwater as Allied forces moved west along the New Guinea coast. The Americans were content to protect their lodgments rather than mount an advance against Rabaul. But the Australian 5th Division, which replaced the Americans at the end of 1944, launched minor offensives against the Japanese that lasted until the end of the war. Total Allied casualties in the New Britain campaign were more than 2,000 killed and wounded. The Japanese lost more than 20,000 dead. In retrospect, given the air superiority the Allies had acquired over Rabaul by November 1943 and the seizure of the Huon Peninsula on New Guinea in early 1944, the New Britain landings were of little influence in the course of the war.

New Georgia, Battle of (July–October 1943)

The New Georgias are an island group in the central Solomon Islands, which were occupied by Allied forces from the South Pacific Area Command in the summer of 1943. The Battle of New Georgia was part of Operation CARTWHEEL, the Allied campaign to neutralize the Japanese base at Rabaul on New Britain Island at the northern end of the Solomons. At the end of June 1943, Major General John Hester's New Georgia Occupation Force (NGOF), which included Hester's 43rd Infantry Division, landed on islands in the New Georgia group to capture the airfield at Munda Point on the northwest coast of the

main island of New Georgia. Major General Sasaki Noboru commanded 10,500 Japanese troops on the island group.

The main U.S. advance toward Munda, entrusted to the 43rd Division, started on 5 July from Zanana Beach five miles east of the airfield. It immediately stalled in the face of fierce Japanese resistance, a shortage of supplies, poor leadership and inexperience, forbidding terrain, and jungle conditions. As the advance sputtered, the 37th Infantry Division and units from the 25th Infantry Division were committed, and Major General Oscar W. Griswold, commander of the XIV Corps, replaced Hester as commander of the NGOF. Griswold later replaced Hester as commander of the 43rd Division with Major General John Hodge.

Meanwhile, the Allied landings sparked a series of naval battles off New Georgia. On the morning of 6 July in the Battle of Kula Gulf, a U.S. Navy task force intercepted a Japanese squadron bringing reinforcements and supplies to New Georgia Island. The Americans lost a light cruiser while sinking two Japanese destroyers. A week later, in the Battle of Kolombangara, U.S. and Japanese task forces again tangled in an engagement in which the Japanese lost a light cruiser and the Americans a destroyer, and in the Battle of Vella Gulf on 6–7 August, a U.S. Navy task force of six destroyers smashed a Japanese squadron of four destroyers transporting 900 men and supplies to New Georgia. The Americans sank three of the Japanese destroyers, resulting in the deaths of some 1,000 Japanese. Thereafter, the Japanese gave up any hope of expelling the Americans from the island group.

Griswold launched a major offensive against Munda on 25 July supported by massive air, artillery, and naval bombardment. Initially, the Americans gained little ground, but after days of brutal close-in fighting, Griswold's men slowly pushed the outnumbered Japanese from their positions. On 5 August, following Noboru's decision to pull back because of heavy casualties, the 43rd Division captured Munda Airfield. During the next weeks, despite an aggressive pursuit, most of the remaining Japanese defenders escaped to nearby islands. In September, the Americans seized Baanga, Arundel, and Vella Lavella Islands. In early October, the campaign came to an end when the Japanese evacuated 9,000 defenders of Kolombangara Island to Bougainville Island 100 miles to the north.

The New Georgia operation provided the Allies with several good airfields and brought them closer to Rabaul. U.S. losses were 1,094 dead and 3,873 wounded, as well as several thousand casualties from disease and battle fatigue. Japanese losses are not known, although the XIV Corps reported 2,483 Japanese dead exclusive of those on Vella Lavella.

New Guinea Campaign (8 March 1942–13 September 1945)

Important Pacific Theater land campaign that became the focal point for Australia's military efforts. The northeastern corner of the island of New Guinea, along with New Britain

Island, were granted to Australia as a League of Nations mandate after World War I. The southeastern corner of New Guinea contained the Australian colony of Papua.

On 23 January 1942, Japanese forces under Major General Horii Tomitaro invaded New Britain, capturing Rabaul from its Australian garrison, known as Lark Force. Moving into mainland New Guinea on 8 March, Japanese forces then occupied Lae and Salamaua. The Australian defenders (code-named Kanga Force) retreated to the mountain town of Wau while the Japanese moved against the ports of Madang, Finschhafen, and Wewak. For the next 10 months, there was a stalemate as both sides poured resources into the Papuan Campaign.

When the Papuan Campaign ended on 25 January 1943, 1,000 Japanese survivors escaped into New Guinea. That month the Japanese dispatched to New Guinea Lieutenant General Adachi Hatazo's Eighteenth Army. This included the 6th Air Division. The Japanese 41st Division deployed to

Wewak, the 20th Division deployed to Madang, and part of the 51st Division was dispatched to Lae/Salamaua.

To oppose the Japanese, General Douglas MacArthur had the U.S. 32nd and 41st Divisions and the Australian 6th and 7th Divisions and a militia brigade. The 32nd Division was not immediately available as a consequence of battle losses, and two of the brigades of the Australian 7th Division were temporarily deployed to Ceylon. The remaining brigade was sent to New Guinea to reinforce the militia brigade there. Australia was raising more militia, and its veteran 9th Division returned from Egypt in February. MacArthur also had the U.S. Fifth Fleet as well as the Royal Australian Air Force and the small U.S. Seventh Fleet comprising U.S., Australian, and Dutch warships.

To recover the initiative, Adachi ordered his 102nd Regiment to attack Wau on 16 January. By 28 January, the Japanese had driven Kanga Force to the edge of Wau Airfield, but the Australian 17th Brigade then flew in under Japanese fire to reinforce Wau. The fighting lasted until 30 January, when

the Japanese retreated to Salamaua. This defeat depleted the Japanese forces available to defend Lae/Salamaua. Thus on 28 February, the bulk of the Japanese 51st Division boarded 8 merchantmen at Rabaul and, escorted by 8 destroyers, this force sailed for Lae.

On 1 March, Allied aircraft spotted this convoy in the Bismarck Sea. MacArthur's air commander, Lieutenant General George Kenney, attacked with 181 aircraft. Employing skip-bombing techniques, during 2–5 March Kenney's planes destroyed all 8 Japanese transports and 4 destroyers, resulting in the loss of some 3,700 men. Only 850 Japanese soldiers reached Lae. In retaliation, the Japanese launched I Operation to destroy Allied air power in Papua and Guadalcanal. Between 11 and 14 April, Japanese aircraft struck Oro Bay, Milne Bay, and Port Moresby, destroying 2 Dutch merchantmen and 45 Allied planes. But Japanese aircraft losses were higher.

Both sides now slowly built up their forces. The Japanese used barges and submarines to reinforce Lae/Salamaua. MacArthur flew troops into Wau. During April, the Aus-

U.S. infantry advance past the wreckage of a Japanese plane near the Kamiri airstrip in New Guinea. The island of Noamfoor was taken within two days, and the Americans moved on to Saipan to achieve the same result, ca. 1944. (Photo by Keystone/Getty Images)

tralian 3rd Division assembled at Wau and began to push toward Salamaua. MacArthur needed a coastal base for his twin offensives against Lae and Salamaua, and in the Seventh Fleet's first amphibious operation, the U.S. MacKechnie Force (named for Colonel Archibald R. MacKechnie) seized Nassau Bay on 29 June 1943. The Americans then moved up the coast toward Salamaua, linking up with the Australians on 21 July. Distracted by this threat, the Japanese were surprised by a U.S. airborne drop on Nazab in the Markham Valley on 1 September. Allied forces quickly constructed airfields to receive the 7th Division, which began an inland advance on Lae. The 9th Division then landed north of Lae on 4 September. The encircled Japanese abandoned Salamaua on 17 September and Lae the next day and retreated into the interior.

Pursued by the 7th Division, the Japanese conducted a fighting withdrawal through the rugged terrain of the Markham and Ramu Valleys. It took the Australians a month to overcome a key Japanese position at Sattleberg. To prevent these Japanese from reaching Finschhafen on the coast, the Australian 20th Brigade landed farther west at Scarlet Beach on 22 September. Now isolated, the defenders of Finschhafen joined the Japanese exodus inland on 2 October. Adachi tried to retake Finschhafen by counterattacking Scarlett Beach on 20 October, but his forces were defeated. MacArthur had found a winning strategy. He used the Australians to engage the Japanese while his American forces bypassed Japanese strongholds.

On 23 December 1943, U.S. Marines invaded New Britain Island. The Allies then constructed air bases there, enabling them to neutralize Japanese aircraft from Rabaul. On 2 January 1944, the U.S. 126th Regiment invaded Saidor and began a coastal drive on Madang. Meanwhile, the Australians pursued the Japanese overland toward Bogadjim, where a supply road led to Madang. Japanese defenses that were centered around Shaggy Ridge were taken on 23 January.

On 29 February 1944, U.S. forces invaded the Admiralty Islands north of New Guinea, severing the Japanese Eighteenth Army's lifeline to Rabaul. Then, on 10 February, the Australians linked up with the Americans at Saidor. The Japanese High Command reacted to this by withdrawing their defense line to Wewak, supported by a new base at Hollandia in Dutch New Guinea. The Japanese then sent their 6th Air Division from the Netherlands East Indies to defend these bases. Radio intercepts revealed these plans to MacArthur, who ordered an air offensive against Wewak and Hollandia. From 30 March to 16 April, the Fifth Air Force obliterated the 6th Air Division, destroying 390 planes and killing 2,000 Japanese pilots and air personnel.

After the fall of Bogadjim on 17 April 1944, the road to Madang was open to the Allies. Adachi evacuated his Madang headquarters, intending to fall back on Wewak and Hollandia. On 24 April, the Australians entered Madang. Two days previously, U.S. forces had invaded Hollandia and Aitape.

The Allied capture of Aitape 125 miles east of Hollandia blocked the escape of the Eighteenth Army. Now desperate, Adachi used his dwindling resources to transport three regiments to Aitape. Their unexpected attack on 11 July drove the U.S. 32nd Division to the Driniumor River. Fighting continued until 25 August, when the Japanese retired to Wewak.

During October 1944, the Australians replaced the Americans at Aitape. MacArthur's return to the Philippines was to be an American operation, with the Australians consigned to containing the bypassed Japanese. But the Australian government wanted Wewak retaken. This pointless offensive had little air or naval support, as that support had gone to the Philippines. On 23 May 1945, Wewak fell to the Australians, and Adachi retreated into the Prince Alexander Range for a last stand. The remnants of the Eighteenth Army surrendered there on 13 September 1945.

New Zealand, Role in War

With a population of only 1.6 million people in 1939, New Zealand made a major effort in World War II; it suffered the highest proportion of soldiers killed of any Commonwealth participant, and its expenditure on the war as a percentage of gross national product equaled that of Britain. New Zealand declared war on Germany shortly before midnight on 3 September 1939 (the same date as Great Britain). Two days later, Prime Minister Michael Joseph Savage affirmed his country's support for Britain: "Where she goes, we go; where she stands, we stand." The only real opposition to New Zealand's participation in the war came from the country's small Com-

Labor resources of New Zealand, with a total population of less than 2 million, were strained by the demands of wartime. Women worked in farms and factories to ensure production of food and provide facilities for American soldiers in the South Pacific. (Photo ca. 1940, Library of Congress)

munist Party. Apart from mines laid off its ports by auxiliary cruisers, New Zealand never came under actual attack by Axis forces.

New Zealand immediately pledged to raise a division-strong expeditionary force to serve with Commonwealth forces, to train pilots for the Royal Air Force (RAF), and to expedite shipments of food—chiefly meat, butter, and cheese—to help feed Britain (before the war, 97 percent of New Zealand food exports went to the UK). Wellington also released the New Zealand Division of the Royal Navy for service at the discretion of the British government, and it transferred other assets, including aircraft and personnel, to British command. Finally, the government initiated programs to enhance New Zealand's own military capabilities.

In June 1940, the government introduced conscription. Price controls, wage stabilization, and rationing were all gradually implemented to secure adequate supplies of food for export to Britain and help feed U.S. troops in the Pacific and to protect the economy. In July 1940, the General Assembly

formed a war cabinet, and in 1942 a national unity government came into being. For the first time in its history, New Zealand established diplomatic missions with non-Commonwealth nations, including the United States.

During the war, some 306,000 men were called up for military service. In June 1942, New Zealand had 157,000 in its armed services, 50,000 of them serving overseas. This represented half the adult male population aged 18 to 45 and 30 percent of the adult male workforce. One effect of this mobilization was a dramatic increase of women in the workforce, including in war-related industries. Also, at its peak in 1942, some 75,000 women served in organizations under the Women's War Service Auxiliary. Efforts were also initiated to mobilize the Maori population of 90,000 people, including the formation of a Maori Battalion organized along tribal lines.

In 1939, the Royal New Zealand Air Force (RNZAF) consisted of 2 bomber squadrons. During the war, the government maintained 2 reconnaissance squadrons in New Zealand and 2 in Fiji. New Zealand's main contribution early

in the air war, however, was to train RAF aircrew. At the beginning of the war, more than 500 New Zealanders served in the RAF; at the end of the conflict there were more than 10,000, including those in 7 New Zealand squadrons. RNZAF servicemen were in Great Britain undergoing training when the war began. These crews and their planes fought with the RAF in the Battle of Britain, in which 129 RNZAF pilots died. RNZAF pilots also served on Malta and in Africa. By the end of the war, the RNZAF had 83 aces.

To protect against German raiders in the Pacific, the British turned over a variety of aircraft to New Zealand, including reconnaissance aircraft and bombers. However, most of the planes were outdated, and the entry of Japan into the war necessitated the formation of New Zealand-based air squadrons. These fell under the operational command of the United States.

The RNZAF made a significant contribution to the air war in the Pacific; 7 squadrons and a radar squadron supported the Guadalcanal Campaign and 5 fought in the battles for the Eastern Solomon Islands. Some 45,000 served in the RNZAF during the war, one-third of them in the Pacific. By the end of the war, the RNZAF had grown from 766 personnel and 102 aircraft to 42,000 personnel with 1,336 aircraft. One-quarter of pilots aboard British carriers at the end of the war were from New Zealand. The RNZAF recruited women, and by August 1943 the

Women's Auxiliary Air Force numbered 4,000 personnel.

In 1939, the New Zealand Division of the Royal Navy consisted of 2 new light cruisers, the *Achilles* and *Leander*; a minesweeper trawler; and 2 British escort vessels. The *Achilles* participated in the December Battle of the Río de la Plata against the German pocket battleship *Admiral Graf Spee*. Since the country's navy was initially part of the Royal Navy, some 7,000 New Zealanders who volunteered for service were assigned to

British ships. Meanwhile, efforts were made to increase the nation's own naval resources. During the war, the navy added 2 corvettes, 16 minesweepers, 12 antisubmarine patrol boats, and more than 100 other craft. In October 1941, King George VI authorized the formal creation of the Royal New Zealand Navy (RNZN) with its own command structure, independent of the Royal Navy.

RNZN forces concentrated on minesweeping and defensive minelaying operations and provided convoy protection

for merchant vessels in the Pacific. They also escorted troopships on their way to Europe and the Middle East and hunted German commerce raiders. When Japan entered the war, the RNZN vessels joined the British Far East Fleet, but after the sinking of the British Navy battleship *Prince of Wales* and battle cruiser *Repulse*, the nation's naval assets in the Pacific were placed under the auspices of the U.S. forces until the return of the British navy in 1944. New Zealand forces participated in the July 1943 Battle of Kolombangara. Women also served in the RNZN; in 1944, there were 500 women in the New Zealand section of the Women's Royal Naval Service.

The initial ground contribution came in the form of the Second New Zealand Expeditionary Force (2nd NZEF, so designated to distinguish it from the First Expeditionary Force of World War I). Major General Bernard Freyberg, who had won the Victoria Cross during the Battle of the Somme in 1916, commanded the 2nd NZEF, whose members were commonly referred to as the "Kiwis." The New Zealand Division (designated 2nd Division in June 1942) represented, in terms of percentage of population, the equivalent of 25 British divisions). In June 1940, the government began conscripting men, and over the next five years it called up 306,000 men. At the peak in September 1942, there were 157,000 New Zealanders in the armed services, of whom 50,000 were stationed overseas. This was an astonishing effort for such a small nation.

Troops from the New Zealand Division were sent to Egypt at the onset of the war and then fought in the Balkan Campaign in 1941. Following the evacuation of the British Expeditionary Force from Greece, Freyberg was appointed commander on Crete with two New Zealand brigades. There the Kiwis lost almost half their number as casualties or prisoners of war. In New Zealand, the Battle for Crete was seen as a testament to the toughness of the Kiwi troops. New Zealand troops fought in the Battle of El Alamein in 1942 and in the Italian Campaign.

After Japan entered the war, public sentiment demanded the return of troops to protect New Zealand from Japanese invasion. To forestall the recall of New Zealand forces from the Middle East, British Prime Minister Winston L. S. Churchill called on Washington to take up the slack, and the U.S. government agreed, as in the case of Australia, to reinforce New Zealand. The soldiers intermingled with the local population, and by the end of the war, there had been some 1,400 marriages between U.S. servicemen and New Zealand women. The New Zealand government attempted to raise another division of troops to fight in the Pacific, but after two years, it found it could neither spare the manpower nor did it have the financial resources. Consequently the division was disbanded. In 1944 the government released more than 9,000 men from this 3rd Division for civilian work, half of whom went into agriculture.

Kiwi forces fought in several battles in the Pacific, most notably in the Solomon Islands and in the invasion of the

During World War II, New Zealand suffered 11,671 dead, 15,749 wounded, and 8,469 taken prisoner, which was 6.7% of the population.

Treasury Islands in 1943. They also relieved American units for service elsewhere, including on Vella Lavella. Royal New Zealand Army (RNZA) units also provided a variety of combat support functions, including engineering and logistics for Allied forces in the Pacific. Women served in the RNZA as well. Formed in 1941, the Women's Army Auxiliary Corps had 4,600 members in July 1943.

In the war, New Zealand suffered 11,671 dead (6,839 in the army, 4,149 in the air force, 573 in the navy, and 110 in the merchant navy), 15,749 wounded, and 8,469 prisoners taken. This amounted to some 6.7 percent of the population.

Niemöller, Martin (1892–1984)

German clergyman and opponent of national socialism. Born on 14 January 1892 in Lippstadt, Westphalia, the son of a Lutheran pastor, Friedrich Gustav Emil Martin Niemöller joined the navy in 1910 and served with distinction as a U-boat captain during World War I. Following the war, Niemöller studied theology at the University of Münster and was ordained a Lutheran minister in 1924. In 1931, he accepted a pastoral post in Berlin-Dahlem.

Niemöller initially supported the National Socialists and voted for the party beginning in 1924. After Adolf Hitler came to power in January 1933, however, Niemöller became concerned about Nazi attempts to control the churches, and he opposed government interference in religious matters. He helped lead religious opposition to the regime and helped to found the Pastors Emergency League in September 1933 and

the Confessional Church, formed in opposition to Nazi-imposed church organization, in May 1934.

After a verbal confrontation with Hitler during a meeting in January 1934, Niemöller found himself targeted by the Nazi regime. Arrested in July 1937 by the Gestapo and tried on charges of “attacks against the State” and “abuse of the pulpit,” he received a sentence of seven months, but the court considered it already served. Immediately after the trial, the Gestapo again seized Niemöller and sent him to Sachsenhausen concentration camp as “the Führer’s personal prisoner.” In 1941, Niemöller was transferred to Dachau, where he remained for the rest of the war.

Surviving the concentration camps, Niemöller helped draft the Stuttgart Confession of Guilt. This document stated that German Protestant churches had been morally responsible for failing to resist the Nazis. He also opposed German rearmament and became a peace activist. Martin Niemöller died in Wiesbaden on 6 March 1984.

Nimitz, Chester William (1885–1966)

U.S. Navy Admiral of the Fleet and commander of the Pacific Fleet. Born far from the sea on 24 February 1885 in Fredericksburg, Texas, Chester Nimitz graduated from the U.S. Naval Academy in 1905. He then served with the U.S. Asiatic Fleet, steadily advancing in rank and position. Promoted to lieutenant in 1910, he assumed command of the submarine *Skipjack* in 1912. He then studied diesel engine construction in Europe and supervised construction of the U.S. Navy's first diesel ship engine. On U.S. entry into World War I in April 1917, Lieutenant Commander Nimitz served as chief of staff to the commander of submarines in the Atlantic Fleet (1917–1919).

Following the war, Nimitz was appointed to the Navy Department staff in Washington, and in 1920 he transferred to Pearl Harbor to oversee construction of a new submarine base there. Over the next 20 years, he served in a wide variety of submarine billets as well as aboard battleships and destroyers. He also spent several tours in Washington and helped establish the first Naval Reserve Officer Training Corps programs in American universities. He won promotion to rear admiral in 1938.

When Japan attacked Pearl Harbor in 1941, Nimitz was chief of the Bureau of Navigation. On 31 December 1941, on the recommendation of navy secretary Frank Knox, President Franklin D. Roosevelt promoted Nimitz to full admiral and appointed him commander of the U.S. Pacific Fleet, replacing Admiral Husband E. Kimmel at Pearl Harbor. Although a single U.S. command in the Pacific would have been far more advantageous, General Douglas MacArthur would not agree to serve under a naval officer. As a result, two commands emerged. As commander in chief, Pacific Ocean Area, Nimitz directed all U.S. military forces in the Central Pacific and provided support to MacArthur and his Southwest Pacific forces.

Although the Allies made the war against Japan secondary to their Europe First strategy, Nimitz did not delay his plans to halt Japanese expansion, retake Japan's gains, and push the war to the Japanese homeland. Using information provided by American code-breakers about Japanese plans, Nimitz halted the Japanese invasion of Port Moresby in the Battle of the Coral Sea in May 1942 and the Japanese effort to take Midway that

U.S. Admiral Chester W. Nimitz, commander in chief of the Pacific Fleet, 1944. (Bettmann/Corbis)

June. The latter battle transferred the initiative to the Americans. Nimitz and MacArthur cooperated in a series of island-hopping campaigns that progressed closer and closer to the Japanese mainland. Nimitz's forces took the Gilbert Islands in November 1943, the Marshall Islands in February 1944, and the Mariana Islands in August 1944. In October, he joined MacArthur's forces to retake the Philippines. Nimitz's accomplishments were recognized in December 1944 by his promotion to the newly established five-star rank of Admiral of the Fleet. In early 1945, Nimitz directed the offensives against Guam, Iwo Jima, and Okinawa. His forces were preparing to invade Japan when the Japanese surrendered. On 2 September, Nimitz signed the formal Japanese surrender aboard the battleship *Missouri* in Tokyo bay.

Nimitz returned to Washington in October and assumed the post of chief of naval operations. For the next two years, he supervised the postwar demobilization of men and ships and provided input into the development of nuclear-powered submarines. Nimitz retired in December 1947. In the following years, he briefly served as adviser to the secretary of the navy and for two years he was the United Nations commissioner for Kashmir. Nimitz died on 20 February 1966 near San Francisco, California.

Normandy Invasion (D day, 6 June 1944) and Campaign

The cross-Channel invasion of France. U.S. officials, principally army chief of staff General George C. Marshall, had long sought the earliest possible invasion of France as the way to win the war in the shortest possible time. They supported both GYMNAST, a British cross-Channel invasion contingency plan for late 1942, and ROUNDUP, a 48-division invasion of France projected to occur by April 1943. The failure of the Allied raid on Dieppe, France (Operation JUBILEE), on 19 August 1942, however, led the Americans to concede to the British position that a cross-Channel invasion was many months, if not years, in the future. Prime Minister Winston L. S. Churchill and British planners, meanwhile, sought to interest the United States in a more opportunistic approach that would include operations in the Mediterranean Theater, and the Americans reluctantly went along.

This led to Operation TORCH, the Allied invasion of North Africa, and to subsequent British and U.S. landings in Sicily and Italy. The United States insisted, however, that the Italy Campaign would be a limited effort. At the Tehran Conference in November 1943, Soviet leader Josef Stalin had pressed President Franklin D. Roosevelt and Churchill for the cross-Channel invasion. Stalin agreed to mount a major offensive by the Soviets on the Eastern Front to coincide with the landing. He also pressed Roosevelt to name the commander of the invasion force, and shortly after the conference Roosevelt appointed General Dwight D. Eisenhower to the post of Supreme Commander, Allied Expeditionary Forces.

Fortress Europe and its coasts of Holland, Belgium, and France bristled with all manner of German fortifications and booby traps. Organization Todt had begun erecting defenses there in mid-1942. Over the next two years, the Germans used

some 17.3 million cubic yards of concrete and 1.2 million tons of steel in thousands of fortifications. Field Marshal Erwin Rommel, who had command of Army Group B and the coastal defenses, disagreed with German commander in chief West Field Marshal Gerd von Rundstedt. Rommel, well aware from the campaign in North Africa what complete Allied domination of the air would mean, believed that, if it was to be stopped at all, the invasion had to be defeated on the beaches. Rommel told Adolf Hitler, “If we don’t manage to throw them back at once, the invasion will succeed in spite of the Atlantic Wall.” Rundstedt and Hitler placed their hopes in a large mobile reserve that would defeat the Allied forces once they were ashore. Indeed, Hitler seems to have welcomed the inva-

sion as a chance to engage and destroy the British and U.S. forces. In Britain, the Allied armies could not be touched; in France, they could be destroyed. Hitler was convinced that the Allied effort would result in another Dieppe. “Let them come,” he said. “They will get the thrashing of their lives.”

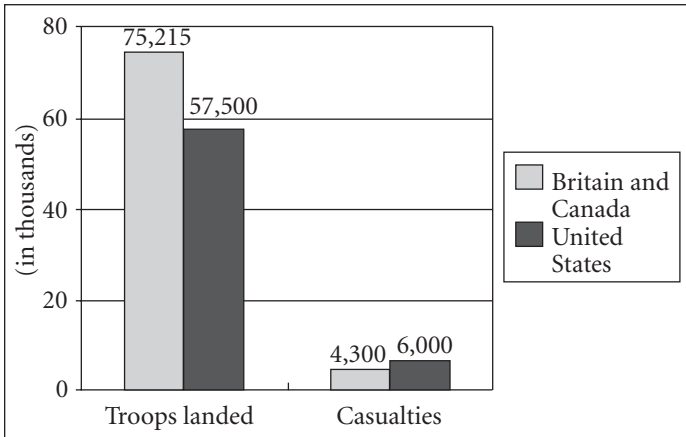

Rommel did what he could, supervising the construction of elaborate defenses, the placement of a half million foreshore obstacles, and the laying of some 4 million mines. Rommel had at his disposal in the Fifteenth Army in northern France and the Seventh Army in Normandy a total of 25 static coastal divisions, 16 infantry and parachute divisions, 20 armored and mechanized divisions, and 7 reserve divisions. The Germans were weak in the air and on the water, however. The Third Air Fleet in France deployed only 329 aircraft on D day, whereas German naval forces in the area consisted of 4 destroyers and 39 E-Boats. Germany also deployed several dozen U-boats, most from French ports, during the campaign.

Meanwhile, U.S. and British aircraft worked to soften the German defenses and isolate the beachheads. Between 1 April and 5 June 1944, Allied aircraft flew 200,000 sorties in support of the coming invasion and dropped 195,000 tons of bombs. The Allies lost 2,000 of their own aircraft in the process, but by D day they had largely isolated the landing areas, and they had achieved virtually total air supremacy.

The Germans also greatly strengthened the Channel port defenses, which Hitler ordered turned into fortresses. All of this was for nought because, as German Minister of Armaments Albert Speer noted, the Allies came over the beaches and “brought their own port with them. . . . Our whole plan of defense had proved irrelevant.” In one of the greatest military engineering achievements in history, thousands of men labored in Britain for months to build two large artificial harbors known as “Mulberries.” Plans called for these, after the

The Normandy invasion required more than 14,000 aircraft and 5,500 ships.

Allied Troops and Casualties, Normandy Invasion, D-Day

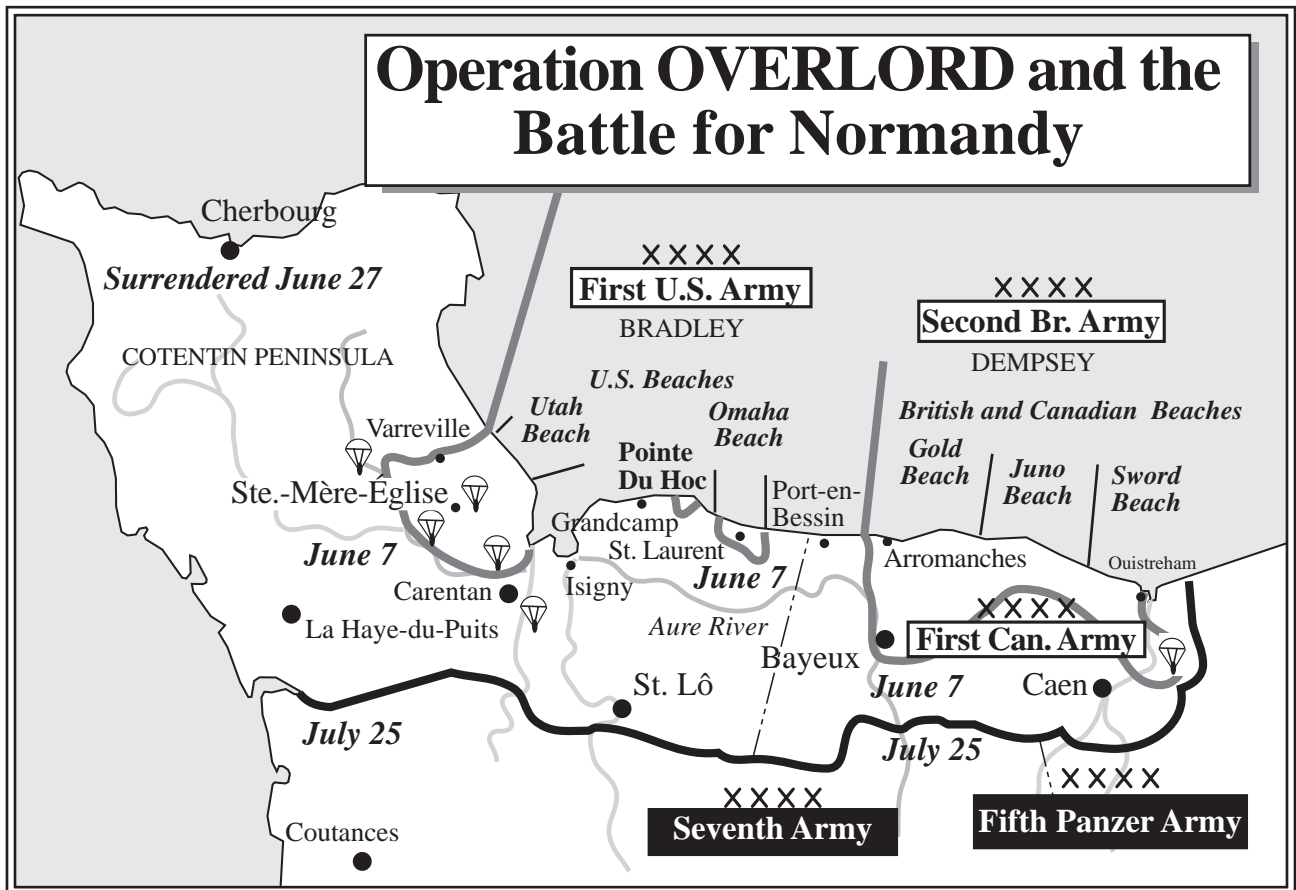

initial Allied landings, to be hauled across the Channel from Britain and sunk in place. Their importance to the Allied cause may be seen in that, by the end of October, 25 percent of stores, 20 percent of personnel, and 15 percent of vehicles had passed through Mulberry B.

The Allies worked out precise and elaborate plans for the mammoth cross-Channel invasion, code-named **OVERLORD**, to occur on the Cotentin Peninsula in Normandy. British Admiral Bertram H. Ramsay had overall command of the

naval operation, code-named **NEPTUNE**, and British General Bernard Montgomery exercised overall command of the land forces. The object of the operation was “to secure a lodgement on the continent, from which further offensive operations can be developed.”

The landing itself would be preceded by a night drop of paratroopers. General Marshall, an enthusiastic supporter of airborne forces, urged the use of five airborne divisions, but Eisenhower had his doubts, and as it transpired, only three were used: the British 6th and the U.S. 82nd and 101st. The lightly armed paratroopers, operating in conjunction with the French Resistance, had the vital task of securing the flanks of the lodgment and destroying key transportation choke points to prevent the Germans from reinforcing their beach defenses. The German 21st Panzer and 12th Schutzstaffel (SS) Panzer divisions were stationed just outside Caen. If they were permitted to reach the beaches, they could strike the amphibious forces from the flank and roll them up.

The amphibious assault would occur early in the morning after the airborne assault with 5 infantry divisions wading ashore along the 50-mile stretch of coast, divided into 5 sectors. The designated beaches were, from west to east, the U.S. 4th Infantry Division (Utah), the U.S. 1st Infantry (Omaha), the British 50th Infantry (Gold), the Canadian 3rd Infantry

American soldiers landing at Normandy under German fire during the D day invasion of France, 6 June 1944. (Bettmann/Corbis)

(Juno), and the British 3rd Infantry (Sword). Operation **OVERLORD** proved a vast undertaking. The airborne forces alone would require 1,340 C-47 transports and 2,500 gliders. Ten thousand aircraft would secure the skies. Naval support for the invasion would come from 138 bombardment warships, 221 destroyers and other convoy escorts, 287 minesweepers, 495 light craft, and 441 auxiliaries. In addition, there were 4,000 landing ships and other craft of various sizes.

Invasion commander General Eisenhower faced a difficult decision, given terrible weather in the days preceding the planned landing. Informed by his chief meteorologist that a break in the weather might occur, Eisenhower decided to proceed. This decision worked to the Allies' advantage, for the Germans did not expect a landing in such poor weather. The French Resistance was informed by radio code, and the airborne forces took off.

The airborne operation involving 23,400 U.S. and British paratroops occurred on schedule on the night of 5–6 June, but thick cloud banks over Normandy caused pilots to veer off course to avoid midair collisions. German antiaircraft fire,

jumpy flight crews, and Pathfinders who were immediately engaged in firefights on the ground and unable to set up their beacons led to premature drops and to paratroopers being scattered all over the peninsula. Some were even dropped into the English Channel, where they were dragged down by their heavy equipment. Gliders crashed into obstacles, and they and the paratroopers came down in fields that had been deliberately flooded by the Germans as a defensive measure. Much equipment was thus lost. Nonetheless, the wide scattering of forces caused confusion among the defenders as to the precise Allied plans. Officers collected as many men as they could, and improvised units were soon moving on the objectives, most of which were secured.

Success was likely if the Allies could establish a bridgehead large enough to allow them to build up their strength and overcome the German defenders. Once they broke out, the Allies would have the whole of France for maneuver, because their armies were fully mechanized and the bulk of the defending German forces were not. The only possibility of German success was for the defenders rapidly to introduce panzer

Bomb damage in Cherbourg, France in June 1944 during the Normandy Campaign. (National Archives)

reserves, but this step was fatally delayed by two factors. The first was Allied naval gunfire support and air superiority of 30:1 over Normandy itself (there were large numbers of ground-support aircraft, especially the P-47 Thunderbolt and the P-51 Mustang). The second factor was Hitler's failure immediately to commit resources available elsewhere. Hitler was convinced that the invasion at Normandy was merely a feint and that the main thrust would come in the Pas de Calais sector. Allied intelligence played a key role in deluding him.

The British "doublecross" system worked to perfection. Every German agent in Britain was either dead, jailed, or working for British intelligence. The British actually controlled the entire German spy network in the United Kingdom and used it to feed disinformation to the Germans. Operations FORTITUDE NORTH and FORTITUDE SOUTH also deceived Hitler. Operation FORTITUDE NORTH caused him to believe that the Allies intended to invade Norway from Scotland, leading him to maintain and even reinforce substantial German units there; FORTITUDE SOUTH led Hitler to believe that the main Allied effort in France would come in the form of a subsequent landing in the Pas de Calais area, the narrowest point of the English Channel, and that the lodgment in Normandy was only a feint. To this end the Allies created the "First U.S. Army Group" under

Lieutenant General George S. Patton, still without command following an incident in which he had slapped soldiers suffering from combat fatigue in Sicily. The Germans expected the aggressive Patton would command any Allied invasion of the Continent. First U.S. Army Group, a notional formation of 18 divisions and 4 corps headquarters, contributed nothing to OVERLORD but did confuse the Germans.

Not until late July did Hitler authorize the movement of the Fifteenth Panzer Army from the Pas de Calais to Normandy. In effect, the deception totally immobilized 19 German divisions east of the Seine. Although units of the Fifteenth Army were moved west to Normandy before that date, this was done piecemeal and hence they were much easier for the Allies to defeat.

Meanwhile, the Normandy invasion began. In the days before the invasion, some 2,700 vessels manned by 195,000 men were on the move. They transported 130,000 troops, 2,000 tanks, 12,000 other vehicles, and 10,000 tons of supplies. At about 5:30 A.M. on June 6, 1944, the bombardment ships opened up against the 50-mi-long invasion front, engaging the German shore batteries. The first U.S. assault troops landed 30 to 40 minutes later, and the British landing craft were ashore 2 hours later.

The landing was in jeopardy only on Omaha Beach, where, because of rough seas, only 5 of 32 amphibious duplex-drive tanks reached the shore. Support artillery was also lost when DUKW amphibious trucks were swamped by the waves. Some landing craft were hit and destroyed, and those troops of the 1st Infantry Division who gained the beach were soon pinned down by a withering German fire. U.S. First Army commander Lieutenant General Omar N. Bradley even considered withdrawal. At 9:50 A.M., the gunfire support ships opened up against the German shore batteries. Destroyers repeatedly risked running aground to provide close-in gunnery to assist the troops ashore; indeed several destroyers actually scraped bottom. It was nearly noon before the German defenders began to give way. The 1st Infantry Division overcame German opposition with sheer determination reinforced by the knowledge that there was no place to retreat.

The landings on the other beaches were much easier. Overall, for the first day, the Allies sustained some 10,300 casualties—4,300 British and Canadian and 6,000 U.S. A recent study suggests that a nighttime landing would have produced fewer casualties. The Allies had used nighttime landings with great success in the Mediterranean, but Montgomery believed that overwhelming Allied air and naval power would make a daytime landing preferable. Still, the losses were comparatively light.

Unfortunately for the Allies, during 19–20 June a force 6–7 storm blew out of the northwest and severely damaged Mulberry A in the American sector. It also sank well over 100 small craft and drove many more ashore, bringing to a halt the discharge of supplies. Vital ammunition stocks had to be flown in. Mulberry A was abandoned, but a strengthened Mulberry B provided supplies to both armies until the end of the war.

The Allies put ashore 75,215 British and Canadian troops and 57,500 U.S. forces on D day and 1 million men within a month. Eventually, the United States committed 60 divisions to the battle for the Continent. The British and Canadians never had more than 20, and as the disparity grew, so too did U.S. influence over military and political strategy. Churchill was understandably insistent that Montgomery exercise prudence and not sacrifice his men needlessly, which would reduce British influence even further.

The Allied ground offensive, meanwhile, proceeded more slowly than expected. Hitler ordered his armies to fight for every inch of ground rather than withdraw along phase lines as his generals wanted. This decision by Hitler at first delayed the Allied timetable. However, it also greatly accelerated the ultimate defeat and ensured that it would be costly. Complete Allied air superiority devastated the Germans by day and forced them to move largely at night. The French Resistance also played an important role, providing the invading Allied forces with intelligence information and impeding German

resupply efforts through sabotage and the destruction of rolling stock and bridges.

The Normandy countryside proved ideal defensive terrain. Over the centuries, the dividing lines between individual fields had been allowed to grow up into tangled hedgerows. This *bocage* resisted passage and slowed the Allied advance to a crawl. On June 17 and 18, the Germans blocked Montgomery's efforts to take the city of Caen. Major General J. Lawton Collins's U.S. VII Corps had more success on the Allied right, gradually pushing across the base of the Cotentin Peninsula. On 18 June, it turned north to liberate the important port of Cherbourg, while the remainder of Bradley's army maintained an aggressive defense. Cherbourg fell on 27 June, but its German defenders destroyed the harbor facilities, and it would take U.S. engineers under Major General Lucius Clay six weeks to get the harbor facilities back in operation.

Not until Operation COBRA on 25–31 July were the Allies able to break out. Bradley's U.S. First Army forced the German line west of Saint-Lô, and Collins's VII Corps made the main effort. All northern France was open for the highly mechanized Allied units to maneuver. On 15 August, Allied forces also came ashore on the French Mediterranean coast in Operation DRAGOON. The German defenders were now in full retreat, but it remained to be seen if the Allies could maintain their fast-lengthening supply lines and end the war in the west before the Germans had a chance to recover.

Norstad, Lauris (1907–1988)

U.S. Army Air Forces general. Born on 24 March 1907 in Minneapolis, Minnesota, Lauris Norstad graduated from the U.S. Military Academy in 1930. Commissioned in the cavalry, he was soon assigned to the Army Air Corps. After a series of operational assignments in the Air Corps, he graduated from the Air Corps Tactical School in 1939 and was promoted to captain the next year. In November 1940, he was the assistant chief of staff for intelligence at General Headquarters, Air Force. He was promoted to major in June 1941 and to lieutenant colonel in January 1942. In February 1942, Norstad served as a member of commander of Army Air Forces Lieutenant General Henry Arnold's personal advisory council and conducted studies on strategic issues. He was promoted to colonel in July 1942 and became the assistant chief of staff for operations of the Twelfth Air Force. In this capacity, he traveled to London and helped plan the air component of the invasion of North Africa, Operation TORCH.

After the invasion, Norstad also assumed broader responsibility as assistant chief of staff for operations for Northwest African Air Forces. Promoted to brigadier general in March 1943, that December he became director of operations of the Mediterranean Allied Air Forces. He helped plan and direct the air operations during the invasions of Sicily and Italy and air support for the campaign in Italy, including the interdiction efforts of Operations STRANGLE and DIADEM.

In August 1944, Norstad returned to Washington with dual responsibilities as chief of staff for the Twentieth Air Force and deputy chief of the air staff. His staff responsibilities changed when he was made assistant chief of the air staff for plans in May 1945. The next month, he was promoted to major general. In his Twentieth Air Force role, Norstad was directly involved in planning the final bombing campaign against Japan, including the dropping of the atomic bombs.

After the war, Norstad served as the director of plans and operations of the War Department, and in 1947 he became the first vice chief of staff for operations of the new U.S. Air Force. In October 1950, General Norstad began a series of senior European assignments in the North Atlantic Treaty Organization. He initially served as commander of U.S. Air Forces in Europe (1950–1953) with combined responsibility as Commander, Allied Air Forces Central Europe. In July 1952, he was

U.S. Air Force General Lauris Norstad, shown in 1956. (Bettmann/Corbis)

advanced to full general. He was then elevated to air deputy to the Supreme Allied Commander, Europe (1953–1956) and then to Supreme Allied Commander, Europe (and to commander in chief of U.S. European Command when it was created). He served as Supreme Allied Commander, Europe, from November 1956 until he retired in January 1963. Norstad died in Tucson, Arizona, on 12 September 1988.

North Africa, Role in the War

In 1939 all the countries of the Maghreb—the Mediterranean coastal region of North Africa stretching from the Atlantic

shoreline of Morocco to Libya's border with Egypt—were under administration by one or more of the European colonial powers of France, Spain, and Italy. This was a relatively recent development: although Spain had possessed tiny island enclaves along the Barbary coast since the late *reconquista* period, the first serious encroachment did not begin until 1830, when the French began their conquest in Algeria. Morocco and Libya had not been incorporated into the European orbit until the eve of World War I. Although the Maghreb had a long history of previous colonial suzerainty from Ottoman Turkey, the problems of administering such a vast and forbidding region—1.8 million square miles spread over 38 degrees of longitude—meant that Constantinople's hold had been traditionally weak, and the indigenous peoples were very conscious of their autonomous heritage. World War II was to provoke an even greater desire among the inhabitants for national independence, establishing the conditions for the tumultuous decolonization saga of the 1950s.

Each North African state was organized under unique constitutional arrangements, and the states' wartime experiences were a product of peculiar local circumstances and events; but several general conditions applied to some degree throughout the whole of the Maghreb. Geographically, the region was composed of a fertile coastal strip running along the Mediterranean shoreline that contained most of the farms and larger settlements and a barren desert hinterland broken by the Atlas mountain chain. The population was predominantly Arabic and Berber, the Berbers tending to live in semi-autonomous nomadic tribes away from the coast. About 10 to 15 percent of the inhabitants were colonists, a heterogeneous mixture of southern European stock—Spanish, French, Italian, and Maltese. This elite community owned most of the best land, controlled the local political and legal administrations, and was vociferously opposed to any attempt by their metropolitan governments to make concessions to the local population.

Resistance to the imperial regime usually came in three forms, either singly or in combination. If the Europeans had maintained a traditional client ruler, that ruler might—however complacent his manner—become the focus of patriotic opposition. Religious revivalists and unconquered tribal chieftains sometimes provided a premodern call to arms. Most significantly of all, the small class of local European-educated residents that had been nurtured to serve in each colony's petty bureaucracy became politicized during the 1920s and 1930s, spawning nationalist parties that demanded civic rights and representative assemblies. These parties were typically banned and their leaders incarcerated in periodic bouts of colonialist repression.

The outbreak of European war did not immediately disturb the Maghreb. The territories of French Morocco, Algeria, and Tunisia sent regiments of indigenous and settler

troops to man the Franco-German border, but their neighbors in Spanish Morocco and Italian Libya remained neutral. Italy's entry into the war on 10 June 1940 and the swift French collapse a few weeks later transformed the situation. For the next two years, Libya was a fiercely contested battleground in the war between the British Western Desert forces and the Italians, later reinforced to spectacular effect by German General Erwin Rommel's Afrika Korps. The French North African colonies spurned General Charles de Gaulle's entreaties to continue the war against the Axis powers, and Vichy administrators remained loyal to the Henri Pétain government—a decision made all the easier by the Royal Navy's preemptive strike on units of the French fleet at Mers-el-Kébir in northwest Algeria on 3 July 1940.

In November 1942, the combined Anglo-American forces of Operation TORCH landed on the Atlantic coast of Morocco, with subsidiary operations around Oran and Algiers. These met scattered and indifferent resistance, and after a few days the local Vichy authorities—who had already seen their home government overrun by the Germans as a retaliatory measure—capitulated to the Allies. The subsequent inheritance of French North Africa was a matter of intrigue, with claimants including the former Vichy commander in chief Admiral Jean Darlan (assassinated a month after the landings) and the feuding Free French commanders de Gaulle and General Henri Giraud.

Despite American opposition, de Gaulle proved more politically adept than his rivals, and it was ultimately the Gaullist-dominated Comité Français de la Libération Nationale that secured power. During this period, the Axis forces had been defeated in Egypt, and with Libya secured for the Allies, the final military encounter took place in Tunisia. In May 1943, the Germans and Italians were finally expelled from the African continent. France's triumphant reconquest of the Maghreb was at best a partial victory, however: its humiliation in 1940 had not gone unnoticed by the indigenous population, and the heady Allied rhetoric of liberation was seized on by local nationalists who saw little victory in a mere transition between imperial occupiers.

Each of the North African colonies was affected differently by the war. Algeria was the keystone of French North Africa, and uniquely among the Maghreb territories, it was administered as a metropolitan *département* with a governor-general answering to the Ministry of the Interior in Paris. Its 6.6 million Arab and 1 million European settler (*colon*) population lived mostly along the Mediterranean shore, with the massive Saharan hinterland given over to army patrols and scarcely governed Berber nomads. Moderate assimilationist reformers like the Young Algerians had given way by the 1920s to more radical nationalist campaigners, such as Ahmed Messali Hadj, who were subsequently persecuted by the colon-led authorities. An attempt by the Popular Front government in 1936 and

1937 to grant full French citizenship to certain Algerians without stripping them of their Islamic property and marriage rights—a traditional bar to naturalization—met with such tenacious resistance from the settlers that it was abandoned. After the armistice in 1940, the colons accepted the new Vichy regime with little outward dissent, the appointment of the highly esteemed General Maxime Weygand as the new delegate general for North Africa helping to smooth the transition. Their focus of attention remained the crushing of nationalist activism. In March 1941, Hadj's Parti Populaire Algérien was broken up and its leaders sentenced to long prison terms.

Following the TORCH landings and Algeria's reversion to the Allied cause, there were new nationalist initiatives, predominant among them the "Manifesto of the Algerian People" presented to the authorities in February 1943 by its author Ferhat Abbas (later first president of the Algerian Republic). Governor General Marcel Peyrouton provisionally accepted Abbas' manifesto, which called for wholesale reforms of the colony's legal and political structure and the end to the hegemony of the colon elite, but as French sympathies proved ever more lukewarm, Abbas' lobbying group, Amis du Manifeste et de la Liberté, was suppressed on charges of sedition. The Free French government did make some effort to address the changing realities of imperial politics: in 1943, de Gaulle spoke of a new compact with the indigenous peoples as a reward for their loyalty during the war, and the following year the Brazzaville Conference on colonial reconstruction expounded a new model of autonomous self-government, if not outright independence. But Algeria's wartime story ended disastrously on V-E Day when a celebratory crowd in Sétif turned into a pro-nationalist demonstration and was fired on by troops; a cycle of reprisals and even greater counterreprisals ensued in which tens of thousands of people, mostly Algerians, were killed. This souring of the hopes for a postwar rapprochement prefigured the brutal civil war of a decade later.

Unlike its larger neighbor, Tunisia was a protectorate (established in 1881) with a ruling indigenous monarch, the Bey of Tunis, who theoretically maintained absolute rule with only the "guidance" of the French resident general. Relations between the 200,000 settlers and 2.6 million indigenous people were somewhat less abrasive than in Algeria, but the colony had nonetheless gone through several political disturbances during the 1920s and 1930s. The most important nationalist force was the Destour, or Constitution, Party, which lobbied without success for a greater Arab role in Tunisian affairs. In 1934, lawyer Habib Bourguiba created a radical breakaway party, the Neo-Destour; four years later, this splinter group was broken up in a repressive purge, and Bourguiba was transported to a French metropolitan prison.

Politics under the Vichy regime were complicated by the evident Italian desire to include Tunisia in its regional sphere of influence. In June 1942, a new bey, Sidi Mohammed el

Moncef, took the throne: his obvious sympathy for the nationalists alienated the French authorities from him, but when Vichy fell in November 1942 he was feted by the Italians in the hope that they could win him over to their cause. Bourguiba and the other Neo-Destour leaders were also transferred to Italian custody as potential puppet rulers, but neither the monarch nor the attorney were persuaded by this line of reasoning. When Axis forces evacuated Tunisia in the spring of 1943, the bey was promptly deposed and Bourguiba, who had returned to Tunis that March, fled into exile.

On the western edge of the Maghreb, Morocco was also under a protectorate established after the 1912 Agadir crisis by the Treaty of Fez. Nominally a united country under a single sultan, Morocco was in reality partitioned between French and Spanish zones, with the town of Tangier (the traditional diplomatic center) having international status. The French, who controlled 90 percent of the country, spent the interwar years developing the cities of the Atlantic coastline, building a new administrative capital at Rabat, and expanding the port of Casablanca. By 1939, the population stood at 6.25 million, including about 190,000 European settlers. As with the other Maghreb colonies, Morocco had its persecuted nationalist parties such as the Comité d'Action Marocaine: there were also more traditional forms of interwar dissent, such as the so-called Rif Rebellion in 1926 and the Berber tribes' resistance to the "pacification" of the interior.

But it was Sultan Mohammed Ben Youssef who was at the heart of anti-French loyalties, especially after the Vichy takeover. He objected to the repeal of the 1872 Crémieux decree that had given North African Jews rights of citizenship and refused to accede to resident general Auguste Noguès' demand that he retire from the capital after the TORCH landings. Youssef's greatest coup was his private meeting with U.S. President Franklin D. Roosevelt during the 1943 Casablanca Conference, in which the American leader expressed his sympathy for eventual Moroccan independence. The following year, an Independence Party formally petitioned the occupying Allied administration for the right to self-government: the French responded with some unconvincing accusations of collaboration between nationalists and the Axis forces, and in accompanying riots in Fès, several demonstrators were killed.

Libya, the second largest but most sparsely populated of the Maghreb states, was occupied by Italy in 1911 during its war with Ottoman Turkey. The coastal provinces of Tripolitania and Cyrenaica fell relatively quickly, but pacification of the Berber hinterland continued for the next two decades and was accelerated with great brutality in the 1930s by generals such as Rodolfo Graziani and Pietro Badoglio. By the outbreak of war, Italian settlers made up about 10 percent of Libya's 900,000 people. The country's poverty and scattered population centers precluded the development of a strong nationalist movement before 1939, but the unpopularity of

the Italian regime was made evident by the enthusiasm with which Libyans greeted their British “conquerors” during the war. After Italy’s final ejection from its North African territory, few traces of colonial culture survived long.

North Africa Campaign (1940–1943)

The campaign in North Africa was fought over control of the Suez Canal. Great Britain depended on the canal for access to Middle Eastern oil and raw materials from Asia. The Suez Canal and the Mediterranean also formed the primary lifeline to Britain’s overseas dominions. The ground campaign in North Africa and the naval campaign for the Mediterranean, therefore, were two sides of the same strategic coin.

The fight to control North Africa began in October 1935 when Italy invaded Ethiopia (Abyssinia). Britain, meanwhile, stationed a significant military force in Egypt to protect the Suez Canal. Britain and France also agreed to divide the responsibility for maintaining naval control of the Mediterranean, with the main British base in Egypt at Alexandria.

Italy was the unknown variable in the Mediterranean strategic equation. A neutral Italy would mean that British access to the vital sea-lanes would remain reasonably secure. However, operating from its main base at Taranto in southern Italy and supported by Italian air force bases on Sicily and Sardinia, the seemingly powerful Italian navy had the potential to close off the Mediterranean. When Germany invaded France in June 1940, Italian dictator Benito Mussolini could not resist the opportunity to grab his share of the spoils. On 10 June, Italy declared war on Great Britain and France.

The British and Italian armies initially faced each other across the Libyan-Egyptian border in an area known as the Western Desert. Italian Marshal Rodolfo Graziani had some 250,000 ground troops in Libya, and General Sir Archibald Wavell, British commander in chief of the Middle East, had only 100,000 soldiers to defend Egypt, Sudan, and Palestine.

The British army, however, was far better organized, trained, equipped, and led.

Graziani reluctantly moved into Egypt on 13 September 1940, halting at Sidi Barrani just short of the British main positions at Mersa Matrûh. The Battle of Britain was then reaching its climax, and the beleaguered British were facing a possible German invasion. By October 1940, however, the threat from Operation SEA LION had eased, and the British began to reinforce Wavell. Through December, 126,000 more Commonwealth troops arrived in Egypt from Britain, Australia, New Zealand, and India. On 9 December, the Western Desert Force, commanded by General Sir Richard O’Connor, attacked at Sidi Barrani.

The British drove the Italian Tenth Army from Egypt and achieved a major victory on 3 January 1941 at Bardia, just inside Libya. Driving deeper into Cyrenaica (eastern Libya), the British captured the vital port of Tobruk on 22 January. Continuing forward, O’Connor trapped the Italian Tenth Army at Beda Fomm on 7 February 1941. In just two months, two British divisions advanced 500 miles, destroyed 10 Italian divisions, and captured 130,000 prisoners. The British suffered only 555 dead and some 1,400 wounded.

Shortly after the British successes in North Africa, Prime Minister Winston L. S. Churchill decided on 22 February to send British troops to Greece. Most of those forces were withdrawn from Cyrenaica, leaving Wavell with only five brigades in Libya. But just a few weeks earlier, German leader Adolf Hitler had decided to reinforce the Italians in North Africa with German forces. On 8 January, the Luftwaffe’s Fliegerkorps X started operating from bases in Sicily against Allied shipping headed for Benghazi in Libya. The British forward units in Libya were forced to resupply through Tobruk, more than 450 miles away. Two German divisions and two additional Italian divisions were sent to Libya from Italy. On 12 February, Lieutenant General Erwin Rommel took command of the German divisions. In short order, Rommel’s force grew into the three-division-strong Deutsches Afrika Korps.

Rommel probed El Agheila on 24 March and continued driving rapidly to the east, despite Hitler’s orders to maintain an overall defensive posture. The Germans surrounded Tobruk on 10 April but were unable to take the fortress by a coup de main. Rommel left a siege force of mostly Italian units and continued his drive toward the Egyptian border. But the Tobruk garrison held out for 240 days and tied down vital Axis manpower in Rommel’s rear area. Rommel’s main force, meanwhile, reached Sollum on the Egyptian border on 14 April, and the Germans occupied the key terrain of the Halfaya Pass.

Churchill pushed for an immediate counteroffensive, but Wavell wanted to gain control of the Halfaya Pass first. On 15 May, the British launched Operation BREVITY under the command of Brigadier William Gott. Rommel skillfully parried the thrust and then counterattacked. By 27 May, the Germans

recaptured the Halfaya Pass, but they then began to run out of supplies and had to halt. They dug in and reinforced their positions, using the 88 mm anti-aircraft guns in an anti-tank role. The British came to call the heavily fortified and fiercely defended pass “Hellfire Pass.”

Churchill continued to pressure Wavell for action. Operation *BATTLEAXE* began on 15 June with a frontal attack through the Halfaya Pass toward Sollum. The German 88 mm anti-aircraft guns stopped the British armor, and the Germans then counterattacked. The British lost 91 tanks, and Operation *BATTLEAXE* was over by 17 June. Churchill relieved Wavell four days later and replaced him the following month with General Sir Claude Auchinleck. General Sir Alan Cunningham (the brother of Admiral Andrew Cunningham) took command of the Western Desert Force, which had been redesignated the British Eighth Army.

Rommel’s force in North Africa slipped to near bottom priority for logistical sustainment after Germany attacked the Soviet Union in June 1941. By November 1941, Rommel had 414 tanks, 320 aircraft, and 9 divisions (three German), 4 of which were tied down in the siege of Tobruk. The British had some 700 tanks, 1,000 aircraft, and 8 (larger) divisions. Operation *CRUSADER* opened on 18 November with British XIII Corps advancing on the Halfaya Pass and XXX Corps

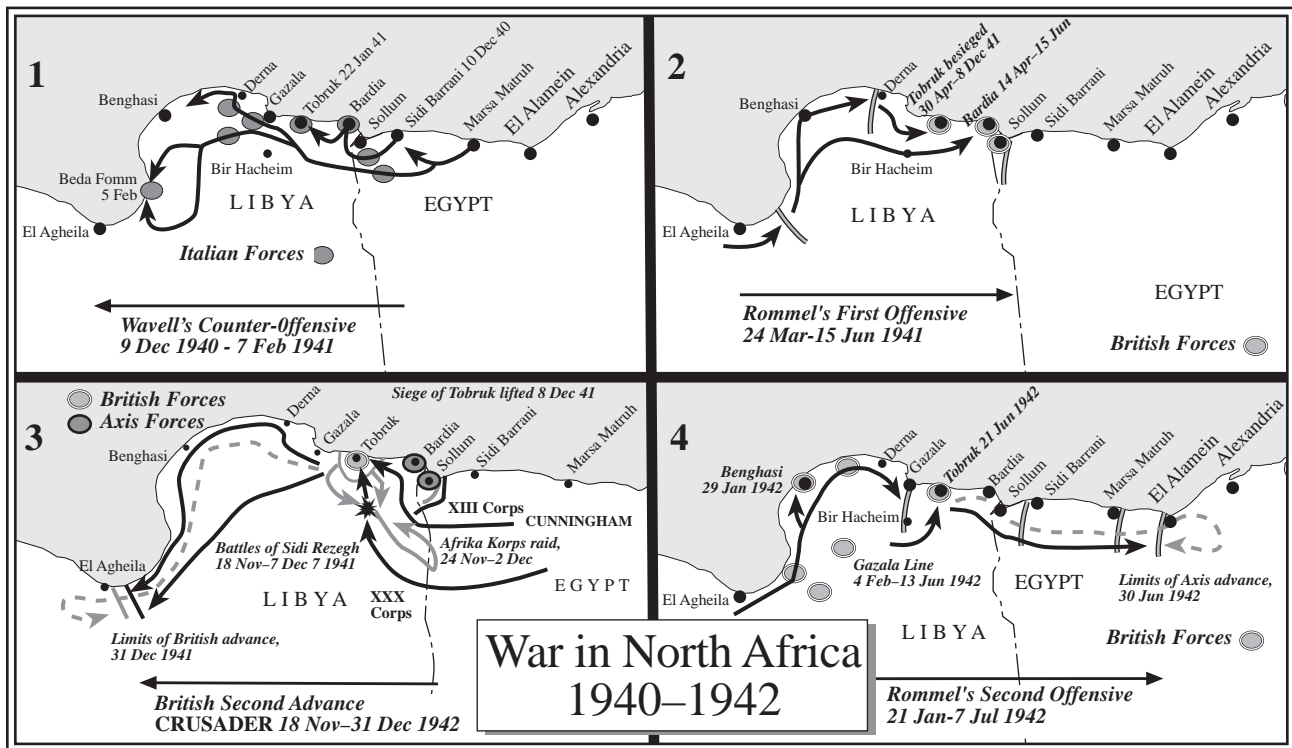

attempting to sweep around Rommel’s southern flank to reach Tobruk. Following a string of fierce tank battles on 22 and 23 November, Rommel drove deep into the British rear with two panzer divisions and the Ariete Armored Division in an attempt to relieve the Axis forces at Halfaya and simultaneously to cut off the Eighth Army.

As the British tank losses rose, Cunningham wanted to halt the operation. Auchinleck relieved Cunningham and replaced him with Major General Neil Ritchie. The British finally broke through to Tobruk on 29 November. Overwhelmed by attrition to his forces, Rommel began to withdraw on 7 December. The Germans retreated back across Cyrenaica, reaching El Agheila on 6 January 1942. Operation *CRUSADER* was a victory for the British, but they were unable to exploit it because of a lack of reinforcements.

Rommel launched his second offensive on 21 January 1942. Within days he drove the British back almost 300 miles, halting on 4 February between Gazala and Bir Hacheim. Both sides then concentrated on building up their strength for the next four months. Rommel resumed operations on 26 May with Operation *VENEZIA*, his attack against the Gazala Line. Both forces were roughly equal in strength, but Ritchie’s armored units were widely dispersed, whereas Rommel kept his concentrated. Rommel swept his armor around the Free

German Field Marshal Erwin Rommel talks to Afrika Korps troops within the defenses of the Libyan coastal town of Tobruk during the fighting in North Africa. (Hulton-Deutsch Collection/Corbis)

French Brigade at Bir Hacheim on the southern end of the line and turned north, cutting across the Allied rear. A secondary attack in the north by Axis forces pinned down the Allied forces there.

By 28 May, the Axis armored units behind the Allied lines were in trouble. Rommel had lost more than one-third of his tanks, and the rest were short of fuel and ammunition. On 29 May, the Italian Trieste Division managed to clear a path through the center of the Gazala Line, and that opening became a lifeline to Rommel's panzers. On 30 May, Rommel consolidated his remaining armor in a defensive position that came to be called "the Cauldron."

On 5-6 June, Rommel successfully beat back Ritchie's series of piecemeal counterattacks against the Cauldron. On 10-11 June, the Axis finally drove the Free French from Bir Hacheim, and on 11 June, Rommel's panzers broke out of the Cauldron. The Eighth Army once more started falling back to the Egyptian border. On 15 June, German tanks reached the coast, and Rommel shifted his attention to Tobruk, which fell on 21 June. Along with the vital port, the Axis forces captured 2,000 tons of much-needed fuel and 2,000 wheeled vehicles.

The British fell back to Mersa Matrûh about 100 miles inside Egypt. Rommel, now promoted to field marshal for his victory at Gazala, pursued. Auchinleck relieved Ritchie and personally assumed command of the Eighth Army. Rommel had only 60 operational tanks, but he still attacked at Mersa Matrûh on 26 June and routed four British divisions in three

days of fighting. The British fell back again another 120 miles to the east to the vicinity of El Alamein, less than 100 miles from Alexandria.

Auchinleck was determined to hold near El Alamein. Although under constant pressure from Rommel's forces, Auchinleck improvised a fluid defensive line anchored on Ruweisat Ridge a few miles south of the El Alamein perimeter. Rommel attacked on 1 July, intending to sweep around El Alamein, but Auchinleck skillfully battled Rommel to a standstill over the course of three weeks of fighting. Auchinleck then launched a major counterattack on 21-22 July but made no progress. Exhausted, both sides paused to regroup.

Despite the fact the British had finally halted Rommel's advance, Churchill relieved Auchinleck in early August and replaced him with General Sir Harold Alexander as commander in chief of the Middle East. Sir William Gott was promoted to general and placed in command of the Eighth Army. On 7 August, while flying to Cairo to take up his appointment, Gott was killed when a German fighter attacked his airplane. Churchill then selected Lieutenant General Bernard L. Montgomery to succeed Gott in command of the Eighth Army.

On 31 August 1942, Rommel launched what he believed would be the final attack to carry the Axis forces to the Nile. Montgomery, however, had made extensive preparations around El Alamein, based on a plan developed by Auchinleck. Montgomery also had the advantage of knowing Rommel's plan through ULTRA intercepts. Rommel intended to sweep

around to the south of Ruweisat Ridge and cut off El Alamein from the rear. However, the British had laid extensive minefields and had heavily fortified Alam Halfa Ridge behind and southeast of El Alamein. Rommel's attack ran short of fuel and stalled by 3 September. Montgomery counterattacked immediately but halted as soon as the Axis forces were pushed back to their starting positions. Taken together, the battles of Ruweisat Ridge and Alam Halfa were the real operational turning point of the war in North Africa.

Montgomery used the time after Alam Halfa to plan carefully a set-piece counterattack from El Alamein. Rommel, meanwhile, returned to Germany on sick leave. When Montgomery finally launched the attack, the British had an overall force superiority ratio of three to one. Rommel immediately returned from Germany when the battle of El Alamein started on 23 October 1942. The Allies tried for five days to break through the Axis positions and took 10,000 casualties in the process. On 31 October, Montgomery renewed the attack with strong support from the Royal Air Force. Critically short of fuel and ammunition, Rommel was forced to disengage on 3 November. The following day, the 1,400-mile Axis withdrawal to Tunisia began.

For the next three months, Montgomery followed rather than aggressively pursued Rommel and the Axis forces across the northern coast of Africa. Rommel reached the Tunisian border at the end of January 1943. By the time he got there, however, another Allied force was waiting for him.

On 8 November 1942, four days after Rommel began his long withdrawal, the British and Americans initiated Operation TORCH, the invasion of Northwest Africa. U.S. Lieutenant General Dwight D. Eisenhower had overall command. In a coordinated series of landings, the Western Task Force under Major General George S. Patton Jr. landed on the Atlantic coast near Casablanca; the Center Task Force under Major General Lloyd Fredendall landed just inside the Mediterranean around Oran; and the Eastern Task Force under Major General Charles Ryder landed near Algiers. Although all the landing sites were in Vichy French territory, the ultimate objectives of the operation were the Tunisian city of Tunis and the port and airfield complex at Bizerte.

The Germans reacted by sending troops from Sicily to Tunisia on 9 November. From the moment the Allies landed, the campaign in Northwest Africa and the race for Tunis were a logistical battle. The side that could mass forces more quickly would win. For the Germans, control of the Tunis complex was critical to prevent Rommel from being trapped between Montgomery in the east and the newly formed British First Army in the west. On 28 November, the Allies reached Tebourba, only 12 miles from Tunis, but an Axis counterattack drove them back 20 miles in seven days. In January 1943, the winter rains and resulting mud brought mech-

anized operations to a halt in northern Tunisia. The Axis side had temporarily won the race.

Waiting for better weather in the spring, the Allies continued to build up their forces. Lieutenant General Sir Kenneth Anderson's British First Army was organized into three corps—the British V Corps, the U.S. II Corps, and the French XIX Corps. The Axis forces in northern Tunisia now consisted of Colonel General Jürgen von Arnim's Fifth Panzer Army. Once Rommel's Panzerarmee Afrika crossed into southern Tunisia, it occupied positions in the old French fortifications of the Mareth Line. Rommel's 10 divisions were well below half strength, with a total of only 78,000 troops and 129 tanks. Before he had to face Montgomery, rapidly closing from the rear, Rommel intended to eliminate the threat of the British First Army to his north. On 14 February, the Germans launched the first leg of a two-pronged offensive, with von Arnim's forces attacking through the Faid Pass for Sidi Bou Zid. The following day, Rommel in the south attacked toward Gafsa. The bulk of Rommel's forces, however, remained along the Mareth Line. By 18 February, the Kasserine Pass was in Axis hands, and the U.S. Army had suffered its first major defeat at the hands of the Germans. Rommel tried to advance north through the Kasserine Pass on 19 February, but he did not get the support he expected from von Arnim. Hampered by a divided German command structure and the rapidly massing Allied reinforcements, the attack stalled.

The Allies recaptured Kasserine Pass on 25 February. Rommel returned to the Mareth Line and prepared to face Montgomery. When the Eighth Army reached Tunisia, the Allies reorganized their command structure along the lines agreed to at the Casablanca Conference. General Eisenhower became the Supreme Commander of all Allied forces in the Mediterranean west of Tripoli. Alexander became Eisenhower's deputy and simultaneously commander of the 18th Army Group, which controlled the First and Eighth Armies, and the now separate U.S. II Corps commanded by Patton. On 24 February, the Axis powers also realigned their command structure, with Rommel becoming the commander of Armeegruppe Afrika, which included the Afrika Korps, von Arnim's Fifth Panzer Army, and the Italian First Army under General Giovanni Messe. For the first time, the Axis powers had a unified command structure in Africa.

Montgomery's units crossed into Tunisia on 4 February, reaching Medenine on 16 February. Hoping to catch the British off balance, Rommel on 6 March attacked south from the Mareth Line. Warned by ULTRA, Montgomery was ready. Immediately following the failure of the Medenine attack, Rommel returned to Germany on sick leave. Von Arnim assumed overall Axis command, and Messe took command in south Tunisia. On 20 March, Montgomery attempted a night penetration of the center of Mareth Line. That attack

failed, and on 23 March he shifted the weight of his main attack around the southwestern flank of the line through the Matmata Hills. By 26 March, the British broke through the Tebaga gap, forcing the Italian First Army and the remainder of the Afrika Korps back to the north. Under continuous pressure from the Eighth Army on one side and U.S. II Corps on the other, the Axis forces withdrew north to Enfidaville.

On 7 April 1942, the Allied First and Eighth Armies linked up, squeezing the Axis forces into a tight pocket. On the east coast, the Eighth Army took Gabes on 6 April; Sfax on 10 April; Sousse on 12 April; and Enfidaville on 21 April. In the north, the U.S. II Corps, now under Lieutenant General Omar N. Bradley, took Mateur on 3 May and Bizerte on 7 May. Montgomery's 7th Armoured Division also captured Tunis on 7 May. The remaining Axis forces in Tunisia were caught in two pockets, one between Bizerte and Tunis and the other on isolated Cape Bon.

Von Arnim surrendered his forces on 12 May, and Meese surrendered his on 13 May. The Royal Navy, waiting in strength offshore, made sure that few Germans or Italians escaped to Sicily by sea. Axis losses in Tunisia alone totaled 40,000 dead or wounded, 240,000 prisoners, 250 tanks, 2,330 aircraft, and 232 vessels. British and American casualties were 33,000 and 18,558, respectively. For the entire North African Campaign, the British suffered 220,000 casualties. Total Axis losses came to 620,000, which included the loss of three field armies. The losses were large for what amounted to a secondary theater for both sides.

North Cape, Battle of (26 December 1943)

Naval battle fought between British and German naval units on 26 December 1943 off Norway. In the autumn of 1943, the western Allies agreed to send 40 merchant ships a month to the Soviet Union via the Arctic to Murmansk. The chief German resistance was likely to come from two German submarine flotillas in Norway, but German navy commander Grand Admiral Karl Dönitz sought to employ German surface units as well. Dönitz had planned to use the battleship *Tirpitz* for this purpose, but she had been damaged in a British midget submarine raid in September. Gaining permission from Adolf Hitler also proved difficult, but Dönitz persevered, and in December 1943 he was ready to attack. On 19 December, he informed Hitler that the Germans would attack the next eastbound convoy. ULTRA intercepts and increased German air, surface, and submarine activity provided advance warning to British Home Fleet commander Admiral Sir Bruce Fraser of the German plans.

On 20 December, convoy JW 55B of 19 merchant ships sailed eastbound, and two days later the corresponding homebound convoy of 22 merchant ships departed Kola Inlet. Each convoy had a close escort of about a dozen destroyers. Long-range protection of both convoys fell to Vice Admiral Robert Burnett with the cruisers *Norfolk*, *Belfast*, and *Sheffield*.

On 22 December, Luftwaffe reconnaissance aircraft spotted the eastbound convoy JW 55B. The British deciphered this sighting report and the order to all U-boats in the area to close with the convoy. Fraser guessed that German surface units in Norway, led by the battleship *Scharnhorst*, would join the hunt, and he departed Iceland on 23 December with the battleship *Duke of York* (flag), light cruiser *Jamaica*, and four destroyers. Fraser's intention was to position his own surface forces between the Germans and their base at Altenfjord.

On 25 December, the homeward convoy had cleared the danger point, and four of its destroyers were therefore shifted over to the outward convoy. Meanwhile, Burnett's cruisers

were closing from the southeast. German Rear Admiral Erich Bey led the *Scharnhorst* and five large fleet destroyers to sea on 25 December from Altenford. His orders were contradictory; he was to attack the convoy but not to engage heavy enemy units encountered. Early the next morning, the Admiralty signaled to Fraser that the *Scharnhorst* was most probably at sea.

Bey then ordered his destroyers to fan out ahead and sweep for the British convoy. The weather was appalling, marked by darkness and snow squalls. At 7:30 A.M. on 26 December, Bey detached his destroyers to look for the convoy to the southwest. They must have come very close to it, but they did not sight it, and in the process, they lost touch with the *Scharnhorst*.

At 9:00 A.M., the *Belfast* secured a radar contact on what proved to be the *Scharnhorst* about 30 miles from the convoy. The range then rapidly closed. At 9:30 A.M., the *Norfolk* opened fire and probably hit the *Scharnhorst* with her second or third 8-inch salvo, which may have knocked out the battle cruiser's radar and convinced Bey to break off the action without replying. The four British destroyers detached from the westbound convoy now reached Burnett. Rather than pursue the *Scharnhorst*—the traditional job for cruisers in a covering role—Burnett turned northwest to protect the convoy. He gave as his reasons the poor visibility, the *Scharnhorst's* superior speed in heavy seas, and his conviction that the Germans would renew the attack.

Bey did indeed return. Shortly after noon, the *Belfast* reported a radar contact. A second action ensued that involved all three British cruisers and lasted about 20 minutes. Again, the British observed hits on the German ship. The four destroyers were unable to carry out a torpedo attack because they were on Burnett's port bow, and the *Scharnhorst* turned away in the opposite direction.

Bey now headed south. This time Burnett pursued, continuously supplying position, course, and speed information that allowed Fraser to intercept. Fraser's ships were closing from one side and Burnett's from the other. The *Duke of York* picked up *Scharnhorst* on radar at 45,500 yards and locked in her gunnery radar at 25,800 yards. The *Scharnhorst* was hit with the first salvo; however, she was a fast and well-armored ship, and Bey responded with a burst of speed. Returning fire, he tried to open the range. He was almost successful, but a British salvo disabled one of the *Scharnhorst's* boiler rooms at a critical juncture, and Fraser's cruisers and destroyers fired from both flanks a total of 55 torpedoes, of which probably 11 hit. The *Scharnhorst* went down at 7:45 P.M. The British ships searched for survivors, but only 36 of the *Scharnhorst's* 3,000-man crew were recovered. The last capital-ship duel in European waters ended in a British victory.

Northeast Europe Theater

In August 1939, the Soviet Union and Germany concluded a nonaggression pact that allowed Adolf Hitler to begin his invasion of Poland without fear of Soviet intervention. In return, the Soviets acquired territory in the Baltic states and eastern Poland. With the defeat of France in June 1940, Soviet troops occupied the Baltic states of Lithuania, Latvia, and Estonia and then incorporated them into the Soviet Union.

World War II operations in northeastern Europe may be divided into three stages: the Russo-Finnish War of 1939–1940; the German invasion and conquest of Denmark and Norway in spring 1940; and the struggle in the Baltics, Finland, and northwestern Russia between the Soviet Union on the one side and Finland and Germany on the other from June 1941 until fall 1944. Sweden remained officially neutral during the war.

Soviet leader Josef Stalin initiated the Russo-Finnish War (also known as the Winter War) when Finnish leaders refused his demands for the Karelian isthmus and bases. Although Stalin offered more territory than he demanded (albeit in the far north), Finnish leaders believed the Soviets were bluffing. On 30 November 1939, five Soviet armies crossed the border. The main attack came in the southeast from the Leningrad area in the direction of Finland's second-largest city, Viipuri (Vyborg).

The unprepared Soviet forces were soon halted by deep snow and woods, but also by the fierce and stubborn Finnish resistance. A major share of blame for the failure of the Soviets to win the war quickly rested with Stalin, who had refused to take Finland seriously. Stalin personally intervened to reject the plan advanced by chief of staff Marshal Boris M. Shaposhnikov that entailed a careful buildup and employment of the best Soviet troops, even those from the Far East. Many of the Soviet units were poorly trained scratch formations. Worse, the Soviet troops were unprepared for winter fighting.

By January 1940, Soviet troops had moved deep into Finnish territory in the north. In the southwest, however, the Finns halted the main Soviet thrust at the so-called Mannerheim Line. After the Soviets regrouped and brought up reinforce-

Headlines announcing the German invasion of Norway, London, April 1940. (Hulton-Deutsch Collection/Corbis)

ments, it was only a matter of time before Finland was defeated. At the beginning of February, the Red Army began another determined attack, managing to achieve a breakthrough after two weeks. Finland surrendered on 12 March 1940.

Under the peace terms, Finland was forced to surrender more territory than Stalin had originally demanded, including eastern Karelia and large areas in the northeast as well as a naval base at Petsamo. Although Finland lost 25,000 men killed and a comparable number of wounded, the Soviets lost perhaps 250,000 killed and a comparable number of wounded. One consequence of the war was that it convinced Hitler that his armed forces could defeat the Soviet Union easily.

Hitler believed that the Allies intended to occupy Norway, and he was determined to beat them there. Securing Norway would guarantee the Germans access to vital Swedish iron ore, which in the winter came from the Norwegian port of Narvik. The many fjords along the Norwegian coast would also provide bases for German submarines and surface raiders into the north Atlantic, as well as airfields from which the Luftwaffe

might attack Britain. Acquiring Denmark would mean additional foodstuffs, especially dairy products, for the Reich.

The German assault on Norway and Denmark began on 9 April 1940. With virtually no military means to defend itself, Denmark succumbed in less than a day. The occupation of Norway, spearheaded by air attacks, saw the first real employment of paratroopers near Oslo and the port city of Stavanger. At the same time, German amphibious landings took place at Narvik, Trondheim, Bergen, Kristiansand, and Oslo. Allied forces landed in Norway beginning on 15 April. While British troops in the south had to be evacuated after two weeks, a combined Norwegian, British, French, and Polish force gained a foothold in the north, taking Narvik on 28 May. The Germans sent reinforcements to the north to recapture it. This, combined with the German invasion of France, forced the Allied expeditionary force to withdraw on 8 June. Norway capitulated two days later.

The Norwegian Campaign brought immense gains to Germany, but it also badly damaged the German surface navy.

Germany lost 3 cruisers and 10 destroyers, half of the navy total. Hitler had secured additional food production for the Reich and protection for his northern flank on the Baltic. Most important, the Kriegsmarine had locations for naval bases nearer to the Allied Atlantic convoy routes. From these bases, it would launch attacks into the North Atlantic and later the Allied PQ Arctic convoys bound for the Soviet Union.

Both Norway and Denmark were under occupation until the German capitulation. The Germans established a puppet state in Norway headed by home-grown Nazi Vidkun Quisling, whose name became synonymous with "traitor." King Haakon VII escaped abroad on June 7, and after the Allies evacuated Narvik, he set up a government-in-exile in Britain. Most of the country's 4.7 million tons of merchant shipping now passed into Allied hands, an invaluable addition. In 1941, 40 percent of foreign tonnage destined for English seaports was Norwegian. By the end of the war, Hitler had some 400,000 men and major artillery assets in Norway, providing security and protecting it against invasion although it was a serious drain on stretched German resources.

Operation BARBAROSSA, the attack on Soviet Russia, began in the early hours of 22 June 1941. Army Group North's 4th Panzer Group and Sixteenth Army advanced through Lithuania, Latvia, and Estonia toward the Russian border. At the northern end of the line, German troops were aided by Finnish forces. Finland rejoined the war against the Soviet Union as a cobelligerent. In the so-called Continuation War, 16 revamped Finnish divisions recaptured the territory lost earlier to the Soviet Union. The Finns refused, however, to shell Leningrad. In the winter of 1941, when Soviet lines were stretched to the breaking point, a determined Finnish assault would undoubtedly have given the Germans Leningrad, with uncertain consequences for the war in the east.

The Finns had originally planned to unite their troops with German Army Group North around Leningrad. On 1 September, they reached the former Finnish-Soviet border. Mannerheim now essentially went over to defensive operations. Soviet resistance stiffened, and after capturing Petrosawodsk and Medweschjegorsk on the western and northern shore of Lake Onega, the Finns established a defensive position slightly inside Soviet territory in December 1941.

To the south, German forces in Operation BARBAROSSA had come close enough to Leningrad by 1 September to start shelling the city. A week later, Leningrad had been cut off from the last land connection, and Hitler decided to starve the city into capitulation. Food supplies ran out after a month, and in November, 11,000 people died. Even though the Soviets managed to supply the city via the frozen Lake Ladoga in winter, up to 20,000 people died each day of starvation, exhaustion, and disease. Attempts to relieve the city between 19 August and the end of September 1942 were defeated by the German Eighteenth Army. On 11 January 1943, the Soviets

managed to establish a small corridor south of Lake Ladoga through which they could also deliver supplies. The siege ended in January 1944 after 900 days. Other than that, the northern sector of the Eastern Front saw only limited action between fall 1941 and January 1944.

Pressed by the Soviet Leningrad, Wolchow, and 2nd Baltic Fronts, German Army Group North then withdrew from the Leningrad area in January 1944 and fled toward the Baltic coast. By the end of April, the Soviets had recaptured most of their pre-June territory in the Baltics. As Army Group Center also had fallen back, Army Group North was now certain to be cut off. The 3rd Belorussian Front, the northern front of the Soviet drive on Army Group Center, took Vilnius on 13 July.

In July and August, the Red Army's three Baltic fronts occupied the eastern parts of Latvia and Lithuania. German army defensive positions fell in succession. Tallinn (Reval) fell on 22 September and the Germans fled to the islands of Dagö and Ösel. The Red Army captured Riga on 15 October. Already at the end of September, the whole of Army Group North was trapped in Courland, where it remained until the end of the war, although the German navy carried out perhaps its most brilliant operation of the war, evacuating many troops and German civilians by sea.

By October 1944, Soviet forces had advanced into Eastern Prussia, and fighting now took place inside Germany. After stopping at Memel, the 1st Baltic and the 2nd and 3rd Belorussian Fronts advanced on Königsberg (Kaliningrad) and the coast, trapping German troops and civilians against the Baltic Sea for the remainder of the war. Those who could not be evacuated surrendered on 9 May 1945 with the rest of the German army.

In June 1944, the Soviet Karelian and Leningrad Fronts began an invasion of Finland on both flanks of the Ladoga Lake. West of the lake, they overwhelmed defenses at the Mannerheim Line. Vyborg was taken on 20 July. To the north and east, even though they failed to achieve a breakthrough, the Soviets forced the Finns to retreat and took the Murmansk Railway. In northern Finland the Soviet Fourteenth Army threw back German forces at Liza, supported by a large amphibious landing near Petsamo.

In accordance with the 19 September 1944 armistice ending Finnish participation in the war, Finland had to help eject German forces from its soil, since Hitler refused to extract them. By the end of the month, the Germans had withdrawn completely into Norway. In late January 1945, the Soviets reached the coast west of Danzig and the mouth of the Vistula River. By the end of the month, the Soviets had passed Posen (Poznan). By early February, the Red Army had reached the Oder within 40 miles of Berlin, surrounding large German troop concentrations at Posen and Breslau. Neither side gave quarter in the bitter fighting, and as they advanced,

Soviet troops took their revenge on the Germans with as many as 3 million civilian casualties, as well as looting and rapes.

Norway, Air Service

In 1940, Norway had on order 60 U.S. Curtiss Hawk 75A-6 and A-8 fighters, 36 Douglas 8A-5 attack aircraft, and 24 Northrop N-3PB torpedo seaplanes. On order were 20 twin-engine Italian Caproni light bombers and 12 twin-engine German Heinkel He-115 torpedo floatplanes. When it was invaded in April 1940, Norway had only in service only 6 of the Heinkels and 4 of the Capronis. The Norwegians also had a collection of obsolete biplanes: Fokkers from 1935, MF.11 seaplanes from 1931, and 11 Gloster Gladiator fighters. Flying all these aircraft, Norwegian pilots fought gallantly but were overwhelmed by the Luftwaffe.

Following the German conquest of their country, Norwegian airmen in exile resumed combat, flying within the framework of the British Royal Air Force (RAF). New arrivals were trained at Island Airport near Toronto, Canada. In April 1941, the Norwegian Naval Air Service, based in Iceland, began operations as Squadron 330 of the RAF Coastal Command. Flying Northrop N-3PB single-engine seaplanes, the Norwegians flew convoy escort and antisubmarine patrol. In 1943, the squadron moved to the Shetland Islands and was equipped with long-range four-engine Short Sunderland flying boats.

A second naval squadron, Squadron 332, went into action in 1943. Based in Scotland, it flew Catalina flying boats and Beaufighter and Mosquito fighter-bombers. The Catalinas reconnoitered German shipping along the coast of Norway, which was then attacked by the Beaufighters and Mosquitoes.

In July 1941, Norwegian army pilots formed RAF Squadron 331. Based in the Orkney and Shetland Islands, it flew

Hurricane fighters in defense of the major naval base at Scapa Flow. A second Squadron, 332, was deployed in January 1942. That April, both units were equipped with Spitfire Vbs. Both formations were moved in May 1942 to North Weald air base outside London. Flying offensive operations across the Channel, the Norwegians distinguished themselves in heavy fighting. Consequently, they were among the first to receive the formidable Spitfire IX in October 1942. In 1943, Squadron 331 ranked first and Squadron 332 third in German warplanes shot down by the RAF. The leading Norwegian ace Svein Heglund destroyed 17 enemy fighters. Fourteen other Norwegian pilots were also aces.

In November 1944, the army and naval air arms combined to form the Norwegian air force. By the end of the war, this Luftforsvaret numbered 2,600 men and 79 combat warplanes.

Norway, Army

The Norwegian army of 1940 was an infantry force organized as a trained reserve within a framework of officer cadres. On mobilization, it would field 6 divisions containing 16 infantry regiments, 4 artillery regiments, 3 mounted infantry regiments, and support units. Norwegian soldiers were armed with the 1894 model Krag-Jørgensen 6.5 mm rifle and the Madsen light machine gun. Colt 7.92 mm machine guns and 81 mm mortars were in short supply. Artillery was of World War I vintage: 228 77-mm guns and 36 120-mm howitzers. Possessing no antitank guns, the Norwegians had no effective defense against German light tanks.

Army supply depots were located in the major population centers along the coast. Unfortunately, the Germans seized many of these depots by surprise when they invaded in April 1940. The swift German assault also disrupted Norwegian preparations, with the result that the army was only partly mobilized for hostilities.

In these chaotic conditions and under unremitting German air attack, Norwegian army commander General Otto Ruge waged a tenacious defensive campaign. Many Norwegian soldiers, cut off from their assigned units, joined any formation they could find. Such stubborn resistance enabled the royal family and government to escape capture and sail to England, where a Norwegian government-in-exile was established.

Abandoned by his British and French allies, Ruge surrendered his surviving forces on 10 June 1940.

Norwegians in exile mounted several commando operations against key objectives in Norway thereafter. However, most of these raids were undertaken within the framework of the British Special Operations Executive (SOE) organization. Norwegian ground forces in exile were devoted to preparing a peaceful and stable liberation of the homeland. Based in Scotland, the Norwegian Brigade mustered 4,000 men organized in two infantry regiments and one artillery battalion. Under British command, the Norwegians were outfitted with English weapons and equipment.

Within Norway, resistance to German occupation began immediately. Demobilized veterans formed the *Militär Organisasjonen* or *Milorg*. Initially quite successful, *Milorg* was devastated by Gestapo infiltration of its ranks in 1942 and subsequent mass executions. An outstanding leader, Jens Christian Hauge, enabled *Milorg* to recover from this setback. *Milorg* grew from 20,000 men in 1941 to 40,000 by 1945. Between fall 1944 and spring 1945, *Milorg* trained and armed its formations in three secret mountain bases. During the war, many Norwegians fled across the border to neighboring Sweden, and beginning in 1943, Swedish authorities permitted the training of Norwegian “police” in special camps. By 1945, about 14,000 Norwegians had received military training in Sweden.

As the war drew to a close, German forces in Finland withdrew into northern Norway, leaving a charred wasteland down to Lyngen Fjord. Into this vacuum, 3,200 Norwegian troops were sent from Scotland and Sweden. When German forces in Norway capitulated on 8 May 1945, *Milorg* mobilized. On 13 May, Crown Prince Olav, commander of all Norwegian forces, returned to Oslo. On 26 May, the rest of the Norwegian Brigade returned to Tromsø. Norway was liberated peacefully.

flict with Great Britain, Germany should seize Norway, the Shetland and Faroe Islands, and Iceland. Only thus could the German fleet escape the confines of the North Sea and gain a dominant strategic position in the North Atlantic. These arguments deeply influenced the leadership of the German navy. Admiral Erich Raeder, chief of the German navy, repeatedly pressed these views on Adolf Hitler.

At the outset of the war, however, Hitler supported neutrality in Scandinavia. This would ensure a continued flow of Swedish iron ore to Germany. The Swedish ores had an iron content of 60 percent, permitting great economies in the production of steel. Low in phosphorus, Swedish ore produced the best steel. Between December and April when the Baltic was frozen, iron ore from Swedish mines was sent by rail to the ice-free Norwegian port of Narvik and thence through neutral Norwegian coastal waters to German ports.

First Lord of the Admiralty Winston L. S. Churchill was keenly aware of the importance of this ore traffic and determined to halt it. The British and French planned an expedition to aid the Finns when the Soviet Union attacked Finland in November 1939, but in reality this plan was a cover for the Allied seizure of Narvik and the ore fields in northern Sweden. The end of the war in Finland compelled the Allies to abandon this plan. Churchill now sought to mine Norwegian waters, forcing German ore ships to sea where they could be taken. This violation of Norwegian neutrality would undoubtedly provoke a German reaction, allowing the British to land troops in Norway.

Convinced that the Allies were planning a Norwegian intervention, Hitler began in February 1940 to prepare for the German occupation of Denmark and Norway, Operation *WESERÜBUNG* (*WESER EXERCISE*). The invasion was scheduled for 20 March, but ice in the Baltic delayed it until 9 April. Meanwhile, the British began their minelaying operation in Norwegian territorial waters early on 8 April.

Churchill and the British were surprised by the magnitude of the German operation. For the assault on Norway, Hitler committed 5 infantry divisions, 2 regiments of mountain troops, and a battalion of light tanks: 66 PzKpfw Is and Iis. Operation *WESERÜBUNG* would also see the first use of paratroops (3 companies) in combat. To seize 6 Norwegian coastal cities, the German navy transported 8,850 soldiers in 2 battleships, a pocket battleship, 2 heavy cruisers, 3 light cruisers, 14 destroyers, and smaller vessels. The remaining 54,500 troops would be sent in once these objectives were secure.

The Luftwaffe amassed more than 1,000 aircraft for the operation. Fast, heavily armed twin-engine Me-110 fighters possessed the range required to operate in this theater. Flying from captured airfields, Stuka dive-bombers proved devastatingly accurate. The most daring feature of German air operations was the first large-scale use of transport aircraft to deploy troops, support units, and supplies into the attack. More than 500 took part.

Norway, German Conquest of (1940)

In 1929, German Admiral Wolfgang Wegener argued in *The Sea Strategy of the World War* that in the event of future con-

Soldiers handing over rifles and other firearms to German soldiers following their country's surrender to German forces, 2 May 1940. (Photo by Keystone/Getty Images)

Norwegian defenses were woefully deficient. Of 63 warships in the Norwegian navy, only 4 small destroyers and a minelayer were modern. All but 10 of the 150 Norwegian warplanes were obsolete biplanes. (On order were 152 modern warplanes, 120 of them from the United States.) The Norwegian army lacked sufficient numbers of heavy machine guns and artillery, and it possessed no antitank guns. Much of the Norwegian population lived in coastal cities where mobilization centers and arsenals were located. Surprise German attacks captured much Norwegian equipment and disrupted Norwegian mobilization.

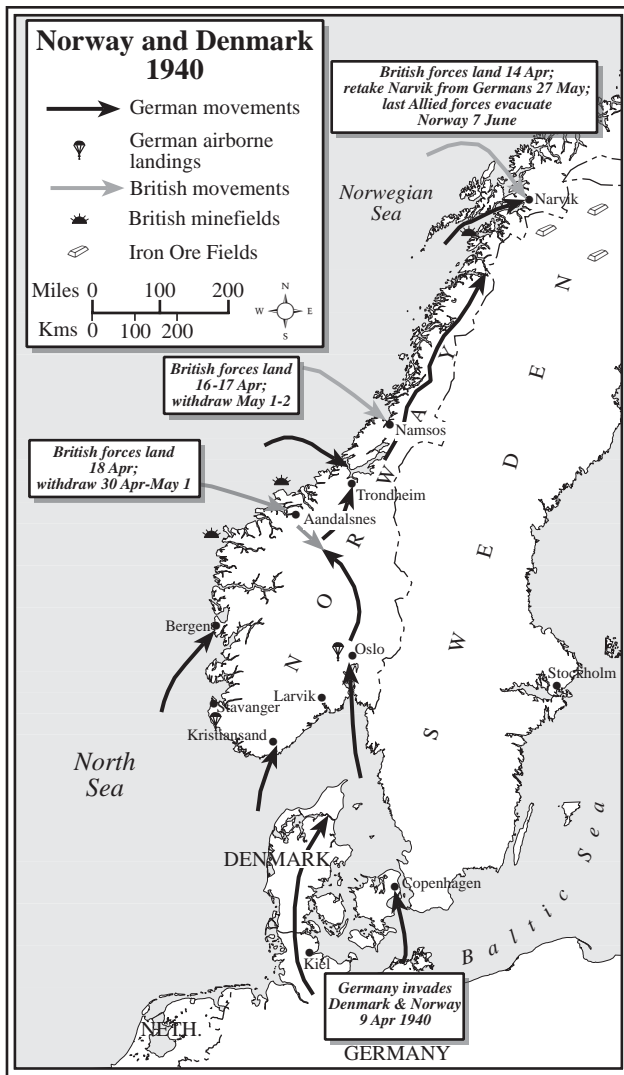

German preparations for the invasion were noted by British and Norwegian authorities. The British misread both the timing and the scale of the German attack, and Norwegian government attention was riveted on the British violation of Norway's neutrality. Thus the Norwegian Parliament authorized mobilization of the navy and air services but only 7,000 soldiers.

The Germans secured most of their immediate objectives. German paratroopers seized Sola, the largest Norwegian air base, and by 11 April, 200 German warplanes, especially Stukas, were flying from the captured airfield. The fortress of

Oscarsborg commanded the water approach to Oslo. It mounted 3 11-in. guns, installed in 1905, and a torpedo battery. Scorning the weaponry as antiquated, the Germans assumed Oscarsborg was no longer manned. Firing at point-blank range and using torpedoes, the Norwegians sank the German heavy cruiser *Blücher* with heavy loss of life, and the German convoy it had been escorting was forced to withdraw. The Germans then took Oslo's Fornebu airport, and transport planes landed two battalions of troops who soon occupied the Norwegian capital. But King Haakon VII and his family, the government, and the parliament had already left Oslo.

The British navy struck swiftly at the German fleet. On 10 April, British destroyers attacked German destroyers at Narvik. Backed by the old battleship *Warspite*, the British attacked again on 13 April, sinking the last of the 10 German destroyers. But British warships operating off the central Norwegian coast without fighter protection came under attack from approximately 90 Luftwaffe bombers. The Royal navy quickly decided not to risk major warships within range of German air power.

German army commander General Nikolaus von Falkenhorst organized his forces in highly mobile groups, effectively

supported by light tanks as ski troops from Bavaria and Austria repeatedly outflanked enemy defensive positions. Norwegian army commander General Otto Ruge sought to delay the German advance until Allied forces could arrive. Norwegian troops, poorly trained and armed, were in chaotic disorder and came under heavy air attack. But Ruge rallied his men and fought tenaciously in the narrow mountain valleys of central Norway. Such delaying actions made Allied expeditions to Norway possible.

The Allies committed 12,500 soldiers to central Norway. By 20 April, three battalions of British and three battalions of French mountain troops were at Namsos 127 miles northeast of Trondheim, and two British battalions (later reinforced by three additional battalions) were at Åndalsnes, 100 miles southwest of the major Norwegian city and transport hub. In a pincers movement, the two forces were intended to recapture Trondheim. But confusion in unit deployment led to chaos in logistical support in Britain. Allied troops arrived

without necessary items, from ski bindings to artillery. The swift advance of the Germans forced the British at Åndalsnes to turn south and wage a series of defensive battles. Meanwhile, a Luftwaffe airlift reinforced the garrison in Trondheim. Allied bases at Namsos and Åndalsnes were reduced to ashes by German bombing. To the disappointment of the Norwegians, the Allies abandoned central Norway by 3 May.

Isolated at Narvik, the three battalions of German mountain infantry were supplied by Ju-52 transports and seaplanes flying at maximum range. On 15 April, a British guards brigade that included Scottish, Irish, and Welsh battalions arrived at Harstad, 70 miles from Narvik. Three battalions of French mountain infantry arrived later. But conflicting orders and clashing command personalities deadlocked Allied operations in the north.

Beginning on 10 May, the Germans launched a massive attack against France, the Netherlands, and Belgium. Compelled to consolidate their forces, the Allies decided to seize Narvik, destroy its ore-loading facilities, and then evacuate the royal family and government of Norway and Allied troops.

Disputes between the British army and navy were put aside, and a new army commander, Lieutenant General Claude Auchinleck, arrived on 11 May. Reinforcements ably led by French Brigadier General Antoine-Marie Béthouart included four battalions of Free Polish infantry and two battalions of the French Foreign Legion. Norwegian troops held the mountains ringing the town. Six hundred local Norwegians improved the air base at Bardufoss, and 14 Gladiator biplanes and 16 modern Hurricanes successfully covered the seizure of Narvik and the subsequent evacuation of Allied forces. On 28 May, French, British, Polish, and Norwegian troops ousted the Germans from Narvik and drove them to the Swedish border. The evacuation of 25,000 Allied soldiers was completed by 8 June. A British cruiser transported the Norwegian monarch and government to Britain. General Ruge disbanded his forces, and hostilities ended in Norway on 10 June.

In fighting on land, the Germans lost 3,692 men killed and missing, the Norwegians 1,335, and the French and Poles 530. The English lost 1,896 dead, missing, and severely wounded. The Luftwaffe lost 242 aircraft; the British lost 112 aircraft. In fighting at sea, the British lost an aircraft carrier, 2 light cruisers, and 7 destroyers. The French and Poles each lost a destroyer. The Norwegian Campaign badly damaged the German surface navy; its losses included 1 heavy cruiser, 2 light cruisers, and 10 destroyers. It now had only 3 cruisers and 4 destroyers undamaged, although other damaged ships could be repaired.

After repairs at Narvik, the flow of Swedish iron ore—the main reason Germany conquered Norway—continued without interruption to the end of the war. The strategic advantage of Norwegian bases came into play as the war unfolded. Based in Norwegian fjords, the battleship *Tirpitz* pinned down much of the battleship strength of the Royal

German soldiers move heavy artillery forward in an attempt to stop Allied forces during their April 1940 invasion of Norway. (Hulton-Deutsch Collection/Corbis)

Navy. Convoys to Russia were decimated by the Luftwaffe flying from northern Norway and submarines. But Germany was never able to use Norway as a springboard to the Faroes, Shetlands, and Iceland. The British took the Faroes under their protection on 12 April and Iceland on 10 May. The keys to the North Atlantic remained firmly in Allied hands.

An unforeseen result of the Norwegian fiasco was the resignation of Prime Minister Neville Chamberlain on 10 May following the debacle in central Norway. Winston L. S. Churchill, ironically the architect of the disaster, then became prime minister. His leadership would be effectively employed in the difficult summer and fall of 1940. Based in London, indomitable King Haakon VII and his Free Norwegians continued the struggle to liberate their homeland.

Norway, Navy

The Norwegian navy of 1940 was largely an antiquated collection of obsolete warships and fishery protection ships. Norway had not fought since the Napoleonic Wars, and in

1933 the defense budget was the smallest in recent history. It grew in the late 1930s as world tensions increased, but the modest naval construction program was undertaken too late.

In 1940, the Norwegian navy consisted of two armored coast defense ships launched in 1900 and forming the Panserskipsdivisjon (armored ship division). Two other older coast defense ships lay disarmed at Horten, a naval base outside of Oslo. The first two would be sunk at Narvik in 1940, and the latter two would be captured by the Germans and rearmed as anti-aircraft guardships. In terms of modern ships, Norway had a minelayer and four 600-ton torpedo boats. Several destroyers and torpedo boats were under construction at the time of the German attack. The remainder of the fleet consisted of 4 destroyers and 11 torpedo boats, all built before 1920; 9 submarines, and miscellaneous warships, one of which dated from 1858!

Commander of the navy Rear Admiral H. E. Diesen was viewed as a political admiral. The officer corps had been gutted in the early 1930s as a consequence of budgetary constraints, and a substantial element within it supported Vidkun Quisling's Norwegian Nazi Party. However, most officers rallied to king and country when Germany invaded.

The dramatic event for the Norwegian navy in the war was the German invasion of Norway in April 1940. It was a surprise on two levels. It was a strategic surprise, as Norwegian leaders were more concerned by an invasion or limited naval action by the Allies, primarily the British navy. They did not foresee an attack from the smaller Germany, which would not have command of the seas. The Germans also achieved surprise at the operational level, although a steady stream of warnings of German warships and troopships moving north arrived in the hours before the attack.

After two months of fighting, 13 warships of the Norwegian navy and about 500 officers and sailors reached British ports. Only one of these ships was modern. The remaining Norwegian naval vessels were either sunk or incorporated into the German navy. The Norwegian navy used its older warships for training and patrol and minesweeping operations, and the Norwegian government-in-exile added to these ships more than 50 whaling ships that had been operating in the polar regions when Norway had been invaded. These 300- to 500-ton ships saw British and Norwegian service as minesweepers and in clandestine operations. More than 200 of the latter operations occurred in Norwegian waters as part of the "Shetland Bus."

During the war, the Norwegian navy secured under Lend-Lease 5 U.S. World War I-era destroyers and 7 British-built destroyers. It obtained an additional 3 submarines, 7 corvettes, 3 submarine chasers, and 1 patrol craft, together with 29 motor torpedo and motor launches that saw much action in the Channel and in Norwegian coastal waters.

Norwegian navy ships participated in the Battle of the Atlantic, helped protect the convoys to Murmansk, and took

part in Operations TORCH and OVERLORD. Of major combatants, Norway lost in battle 1 submarine while attempting to land agents in Norway, as well as 2 destroyers and 3 corvettes in the Atlantic. The Norwegian navy also operated a modest naval air arm from Scotland for patrols in the Norwegian and North Seas.

Norway's greatest contribution at sea during the war was its merchant marine. The fourth largest in the world, it amounted to more than 1,000 ships totaling more than 4.8 million tons. These supplied valuable revenue to the government-in-exile in London, but over 500 ships were lost in the course of the war. By 1945, Norway emerged with an effective and sizeable navy ready to help lead the way into collective military action under the banner of the North Atlantic Treaty Organization.

Norway, Role in War

When Norway regained independence in 1905, Danish Prince Carl was selected king of the new nation and assumed the throne as Haakon VII. In 1940, German leaders expected little or no resistance to their surprise assault on this nation of almost 3 million people. Against great odds, Haakon VII rallied his government and his people and fought the Germans. During the campaign, until he was removed to Great Britain by sea on 7 June, Haakon became known for his coolness under fire, decisiveness, and dry wit. Haakon was no stranger to London; as a prince he had married the daughter of Edward VII. He soon established an effective government-in-exile. Organized within the framework of the British armed forces, Free Norwegians fought with distinction in the Allied cause and suffered about 1,100 killed in the war.

In occupied Norway, German authorities attempted to impose Norwegian traitor Vidkun Quisling on the Norwegians. In 1931, Quisling had been minister of defense in an Agrarian Party government. He founded his own fascist party in 1933, but it garnered only 1.8 percent of the vote in the general elections of 1936. Nevertheless, Quisling attracted the support of Nazi ideologue Alfred Rosenberg, who arranged for Quisling to meet Adolf Hitler. German leaders, hoping for a bloodless occupation of Norway, saw in Quisling a promising means to that end. Following the invasion, however, Norwe-

gians overwhelmingly rejected Quisling. Although Quisling was styled minister president, the Germans treated him with scorn. After the war, Quisling was tried as a traitor and shot.

Resistance to German occupation began immediately after formal hostilities ceased on 10 June. Chief Justice of the Supreme Court Paal Berg organized it. Armed resistance was embodied in the *Militär Organisasjonen* or *Milorg*, recognized in October 1941 by the Norwegian government-in-exile as the Home Forces. Early in 1943, the exceptionally able Jens Christian Hauge thoroughly reorganized and unified *Milorg*. He also brought the civilian and armed resistance movements together.

Seeking to avoid reprisals against the small population, the resistance emphasized civil disobedience. When in 1942 Quisling attempted to make the schools a tool for Nazi indoctrination, the teachers refused to bow to his demands. They endured miserable conditions in concentration camps from May to the fall of 1942, when Quisling relented and allowed the schools to reopen and the teachers regained their freedom. Although the resistance stressed nonviolent means, 1,357 Norwegians lost their lives.

Norway made an immense contribution to the Allied war effort with its merchant fleet. With 4.7 million tons of shipping, the Norwegian merchant marine was the world's fourth largest and was among the most modern. The Norwegians possessed almost as much oil-tanker capacity as the larger British merchant fleet. Norwegian ships became an essential element in the Atlantic convoys so vital to survival and victory in the Mediterranean and European theaters. In 1941, 40 percent of foreign tonnage destined for English seaports was Norwegian. In the course of the war, 706 Norwegian merchant vessels, almost half of the total tonnage, were sunk. Of its 25,000 seamen, approximately 4,000 were killed.

Most military operations in Norway were executed within the framework of the British Special Operations Executive (SOE). In March and December 1941, commando and SOE raids were unleashed against fish oil factories in the Lofoten Islands that produced glycerin, which is used for explosives. But German reprisals against civilians were savage, and Norwegians held the raids responsible for these. A Norwegian section was then established in SOE. This group was entrusted with joint British-Norwegian planning of future operations in Norway.

A key objective proved to be the hydroelectric plant, Norsk Hydro, at Vemork in the mountains of Telemark, which the Germans were using to produce heavy water, in which hydrogen atoms were replaced by atoms of deuterium. The Germans planned to use heavy water as a moderating agent for a nuclear reactor. At great risk, Norwegian scientists and engineers conveyed the information necessary to attack the installation. On the night of 27–28 February 1943, a Norwegian team ably led by Lieutenant Joachim Ronneberg clambered down a steep ravine, crossed the frozen Maan River, and entered the plant by a tunnel. Containers of heavy water were destroyed and machinery was damaged, and the Norwegians escaped unscathed. Working strenuously, the Germans restored heavy water production by June. The Germans then planned to transfer the heavy water and production apparatus to Germany. The shipment had to traverse Lake Tinnsjö. On 20 February 1944, Lieutenant Knut Haukelid and his team sank the ferry in deep water. Ultimately, German nuclear research failed for many reasons, but delays caused by Norwegian sabotage put nuclear weapons out of German reach.

Following the conquest of Norway, Hitler remained deeply concerned about an Allied invasion of north and central Norway. The large-scale raids on the Lofotens greatly reinforced Hitler's fears. Indeed, Winston L. S. Churchill, throughout 1942, urged an Allied seizure of north Norway, which the British chiefs of staff wisely blocked. However, as Operation JUPITER, the plan was used as a cover for the real Allied invasion of North Africa in 1942. Playing to Hitler's fears, JUPITER as a deception measure was a brilliant success. By 1943, the Germans had 12 infantry divisions stationed in Norway and 250 batteries of heavy guns deployed at key points along the coast. Germany's steel and arms industry did depend heavily on high-quality Swedish iron ore sent in the winter months by rail to the ice-free Norwegian port of Narvik and then by ship through coastal waters to German ports. To protect this vital traffic, the German army felt compelled to screen the coast with troops and guns.

Until the end of the war, however, Hitler expected a major Allied invasion of Norway. Consequently, approximately 400,000 German troops, among the best soldiers in the German army, were stationed in Norway at the end of the conflict. The Germans also deployed to Norway some 1,000 guns of 100 mm or larger caliber. These were manned by 13 naval artillery battalions and 12 army coast artillery regiments. Thus Norway diverted a significant German force from the decisive Russian and European Theaters of the war.

Novikov, Aleksandr Aleksandrovich (1900–1976)

Soviet army marshal. Born in the village of Kryukovo in Kostroma Province on 19 November 1900, Aleksandr Novikov was called up for the Red Army in 1919 during the Civil War. He joined the Communist Party in 1920. He took part in the bloody suppression of the Kronstadt Revolt in March 1921, where he was impressed with the role of aircraft in a ground-attack role. In 1921, Novikov attended the field academy of the Red Army at Vystrel, and in 1927 he attended the Frunze Academy. In 1933, despite his defective eyesight, Novikov secured a transfer from the infantry to the air force and learned to fly. In 1935, he took command of the 42nd Light Bomber Squadron, and in March 1936 he won promotion to colonel.

Novikov managed to avoid the great purge of the military, although many of his colleagues were arrested and shot in 1937 and 1938. Novikov became chief of staff of the Karelian Front during the 1939–1940 Soviet-Finnish Winter War. As a major general, he commanded aviation in the Leningrad Military District, which became the Northern Front after the June 1941 German invasion of the Soviet Union.

Novikov became deputy commander of the Red Army Air Force in February 1942. Promoted to lieutenant general in April, he received command of the Red Army Air Force, a post he held until March 1946. In this position, Novikov was responsible for coordinating Soviet air assets in Stalingrad, Kursk, and Operation BAGRATION. Promoted to colonel general in 1943, Novikov was the first Soviet marshal of aviation and one of only two officers to be made chief marshal of aviation in the war. Following the defeat of Germany, Novikov directed air actions against the Japanese Guandong (Kwantung) Army in Manchuria.

Arrested in March 1946 in a purge of the military as Stalin removed war heroes, Novikov was held under strict confine-

ment from 1946 to 1953 but he was released in May 1953 following Josef Stalin's death. Rehabilitated the next month, he held a succession of important posts, including commander of long-range aviation units and deputy chief of staff of the now-independent Soviet air force in 1954–1955. Novikov retired in 1956 because of ill health. He died in Moscow on 3 February 1976.

Nuclear Weapons

Weapons using energy released from the nuclei of atoms to generate destructive power. Nuclear energy is created when atoms are split in fission or when atoms are combined in the fusion process. During the 1920s and 1930s, scientists suggested that the energy within atoms could be used to produce an incredible source of power, including the potential to create weapons significantly more destructive than any then in existence. Early in World War II, Germany, Japan, the Soviet Union, Great Britain, and the United States had research programs examining the potential of nuclear weapons.

Although the German nuclear program had significant potential because of a strong prewar scientific community, it failed to produce a weapon. Historians debate the reason for the German failure, with arguments citing a lack of resources and high-level support, basic technological and scientific errors or failures, and possible intentional slowdowns by German scientists. The Japanese program, with some assistance from Germany, made limited progress in basic research but did not come close to producing a viable weapon. Soviet nuclear research activities were disrupted by the German invasion in June 1941 and the occupation of the Soviet industrial heartland. However, the Soviet research effort was reborn in late 1942, motivated by appeals from Russian physicists and reports of nuclear advances in Germany as well as Britain and the United States. The Soviet nuclear weapons project continued throughout the war and afterward. Assisted by information provided by an active espionage network in the United States and Great Britain and the contributions of captured German scientists, the Soviets exploded a nuclear device on 29 August 1949.

Only the Americans, assisted by British, Canadian, and émigré scientists, were successful in developing an atomic

bomb during the war. The perception of a significant German scientific capability, reinforced by intelligence reports of progress in nuclear matters, was a strong motivation for the British and American research efforts. In the United States, émigré scientists including Leo Szilard and Enrico Fermi were key participants in and advocates of nuclear research. In August 1939, Albert Einstein wrote a letter to President Franklin D. Roosevelt that drew attention to the potential of the concept and gained increased government support for the American scientific research effort.

The U.S. government accelerated its nuclear research activities in August 1942 by creating a highly secret top-priority program that was given the cover designation of "Manhattan Engineer District," normally shortened to the MANHATTAN Project. Brigadier General (later Major General) Leslie Groves, a U.S. Army engineer, directed the program. The central research facility was established at Los Alamos, New Mexico, with support provided by a nationwide network of facilities including university laboratories, industrial sites, and major new nuclear production sites at Hanford, Washington, and Oak Ridge, Tennessee. The MANHATTAN Project was a massive undertaking that involved solving the theoretical foundations for nuclear fission and fusion designs and then the practical engineering challenge of creating a functional weapon.

The MANHATTAN Project produced two successful atomic bomb designs. Both designs brought sufficient fissile material together quickly to create a supercritical mass, which was triggered into a rapid fission chain reaction by an initiator that injected neutrons into the mass. The result was the explosive release of the binding nuclear energy. The simplest design used a gun assembly to fire one subcritical mass, termed a *bullet*, into a second subcritical mass, the target, to create a supercritical mass. The gun-assembly weapon used uranium-235 as fuel and was the design of the "Little Boy" bomb dropped on Hiroshima on 6 August 1945. The second approach used an implosion technique and plutonium-239 as the fuel. The implosion design used shaped conventional high-explosive charges to compress a subcritical mass into a denser mass that became supercritical. The implosion design was used for the first atomic test explosion on 16 July 1945, when a device named "Gadget" was detonated at the Trinity Site on the Alamogordo Bombing Range in New Mexico. The "Fat Man" bomb dropped on Nagasaki on 9 August 1945 was also an implosion design.

The two bomb designs included significant emphasis on safety. In addition to designed safety and arming procedures, key parts of the bombs were not inserted until after the B-29s of the 509th Composite Group took off from their base on Tinian Island. This procedure was intended to prevent a full nuclear explosion if an accident occurred, although the Little Boy design still had significant inherent safety problems. Both bombs used radar altimeters for fusing and had a barometric altimeter as a backup.

A dense column of smoke rises more than 60,000 feet into the air over the Japanese port of Nagasaki, the result of an atomic bomb (the second atomic weapon employed in warfare) dropped on that industrial center on 8 August 1945 from a U.S. B-29 Superfortress. (National Archives)

The effects of nuclear weapons are generally described in terms of a comparable amount of thousands of tons of conventional explosives, kilotons, of yield. The “Little Boy” bomb was estimated to have the explosive power of 15 kilotons and the “Fat Man” bomb 21 kilotons. This description does not fully describe the effects of these weapons, as in a normal bomb design approximately half of the yield was produced in blast energy, approximately one third of the energy was thermal radiation, and the remainder was released in the form of radiation.

Although the atomic bombs created by the MANHATTAN Project used nuclear fission, the fusion process had been considered in the theoretical discussions and was recognized as having even greater destructive potential. The fusion weapon design, often referred to as the “Super,” was not produced until after the war. Fusion weapons, known as thermonuclear weapons or hydrogen bombs, used a fission detonation to trigger the fusion reaction, which generated significantly higher destructive power. The United States detonated the first fusion device, with a yield of 10 megatons (million tons), in October 1952 in a South Pacific test. The development and use of atomic bombs in World War II and the subsequent development of thermonuclear weapons had a significant effect on postwar military forces and national security policies, especially in the form of deterrence doctrines that dominated the Cold War period.

Nuri al-Said (Nuri as-Said) Pasha (1888–1958)

Iraqi political leader. Born in Kirkuk (Iraq) in 1888, the son of a minor religious functionary, Nuri al-Said Pasha received

a military education. He graduated from a military academy in Istanbul in 1905 and the next year was commissioned an officer in the Ottoman army. Nuri first saw service in Iraq, and in 1910 he returned to Istanbul for additional training at the Staff College. He became active in politics and joined the Ahd Party in 1912.

During World War I, Nuri participated in military operations against the British but was captured. In 1916, he joined the Allied Sharifian Arab army led by Amir Faysal I, which was supported by Great Britain and commanded by Major General Edmund Allenby. Nuri then distinguished himself in battle in the Arab revolt against Ottoman rule. After the revolt, Faysal briefly led an Arab state with its capital in Damascus, where Nuri participated in its administration. He attended the Paris Peace Conference in 1919 as military adviser to Faysal and was appointed chief of staff of the Iraqi army in 1920. The French destroyed Faysal’s state in 1920, but in 1921 Faysal became the first king of Iraq. Nuri became prime minister in 1930.

While prime minister, on 30 June 1930, Nuri signed a treaty with British High Commissioner Sir Francis H. Humphrys that granted independence to Iraq. Nuri was prime minister on 14 different occasions. Pro-British, he supported the Hashemite dynasty under King Faysal. When Faysal died in 1933, much of the Iraqi population, especially the young, disagreed with Nuri’s views. Conflicts arose at the start of World War II when Nuri supported the British and declared war on Germany in 1940.

In April 1941, Rashid Ali Gailani staged a coup and forced Nuri and his supporters into exile. While Rashid was in power, he ignored Italy’s declaration of war against Britain and permitted anti-British propaganda and activities. In May 1941, however, the British sent in military forces and crushed the Rashid Ali regime. Nuri then returned to Iraq and served as prime minister with British sponsorship from 1941 to 1944. Nuri maintained political dominance and sought to create a union of Arab states with British support. A believer in Arab unity, he sought to unite Egypt, Iraq, Lebanon, Saudi Arabia, Syria, Trans-Jordan, and Yemen.

Iraq became a charter member of the Arab League in 1945. At the end of World War II, however, there was strong nationalist feeling in Iraq and resentment toward the West, while Nuri favored continued ties with the Western powers. In February 1958, Nuri sponsored a union with Jordan, but this led to another change of government. In July 1958, Iraqi army units led by Karim Kassem overthrew the monarchy. On 14 July 1958, Nuri al-Said was killed by an angry mob in Baghdad.

See Nuri al-Said Pasha.

O

O'Connor, Richard Nugent (1889–1981)

British army general. Born in Sringar, Kashmir, on 21 August 1889, Richard O'Connor was educated at Wellington College and the Royal Military College, Sandhurst, and was commissioned in the Scottish Rifles in 1909. In World War I, he was posted to the 7th Division on the Western Front and took part in some of the sharpest battles of the war, including the First Battle of Ypres, Neuve Chapelle, Givenchy, Loos, and the Somme. In June 1917, O'Connor assumed command as a temporary lieutenant colonel of the 1st Battalion, the Honourable Artillery Company, which participated in the Battle of Third Ypres (Passchendaele) in October. The 7th Division moved to Italy that November, where his battalion served with distinction.

O'Connor reverted to captain at the end of the war. Post-war service included attendance and an instructor assignment at the Staff College, Camberley. In 1936, he was again promoted to lieutenant colonel and commanded the 1st Camerons. O'Connor was almost immediately promoted and assumed command of the Peshawar Brigade on the northwest frontier in India. After two years there, he was promoted to major general and took charge of the 7th Division in Palestine, which also meant he was military governor of Jerusalem.

In June 1940, O'Connor moved his division to Egypt, and as a lieutenant general, he took command of the small Western Desert Force in Egypt. When Italian forces under Marshal Rodolfo Graziani invaded in September, O'Connor skillfully led his vastly outnumbered troops in Operation COMPASS to destroy an Italian army, capture vast numbers of prisoners and quantities of equipment and supplies, and secure the

port of Tobruk on 21–22 January 1941. In 10 weeks, at a cost of fewer than 2,000 casualties, his forces inflicted 12,000 killed and missing and took 138,000 prisoners, including 5 generals, 400 tanks, and 850 guns.

Following the arrival of the German Afrika Korps in North Africa in February 1941, Lieutenant General Erwin Rommel launched a counterattack in March that enjoyed success in large part because much of the Western Desert Force had been sent to fight in Greece. O'Connor was then commanding British troops in Egypt, but Wavell ordered him to the front to serve as adviser to his successor, Lieutenant General Philip Neame. O'Connor and Neame were captured by a German patrol on 6 April. Both men escaped from a prisoner-of-war camp in Italy in September 1943 and managed to reach Britain.

O'Connor returned to duty in January 1944 and commanded VIII Corps from the Normandy Invasion but was posted to India in November 1944 to head first the Eastern and then Northwestern Command, when he was promoted full general in April 1945. He later served as adjutant-general to the forces in 1946 and 1947. He retired in September 1947. O'Connor died in London on 17 June 1981.

Office of Strategic Services (OSS)

The Office of Strategic Services (OSS) was a U.S. foreign intelligence agency and forerunner of the Central Intelligence Agency. The OSS was created in June 1942 and disbanded on 1 October 1945. President Franklin D. Roosevelt established the OSS at the urging of Colonel William J. Donovan, a prominent lawyer and former U.S. assistant attorney general who served in the army during World War I, winning the Medal of Honor, and then took an interest in intelligence matters. At the beginning of World War II, Donovan, who had close connections with like-minded British intelligence operatives and with Roosevelt, persuaded the president that the United States needed a centralized civilian-run intelligence agency that would report directly to the White House. In July 1941, before the United States entered the war, Roosevelt established for this purpose the Office of Coordinator of Information, headed by Donovan. A few months after the Japanese attack on Pearl Harbor, this agency metamorphosed into the Office of Strategic Services, which was to report directly to the newly created Joint Chiefs of Staff.

The OSS undertook a wide variety of activities. In the United States, Donovan recruited academics for research and analysis functions. The OSS also mounted numerous covert activities, operating in both the European and Pacific war theaters. Ultimately, the OSS employed several thousand personnel. It had particularly close links with British intelligence services, which Donovan regarded as providing a desirable model for a potential U.S. agency. OSS European operations were based in London and headed by Colonel David K. E. Bruce, who subsequently became U.S. ambassador to France, West Germany, and Britain. OSS operatives (one of the more flamboyant ones was Allen W. Dulles, who spent the war in Switzerland cultivating contacts in Germany and Italy) infiltrated Axis-occupied territory, aiding resistance groups and providing the U.S. military with firsthand intelligence. In the Asian Theater, OSS agents worked closely with nationalist forces in China and Indochina, and as the war drew to a close they reported favorably though unavailingly to Washington on both the Chinese Communist movement led by Mao Zedong (Mao Tse-tung) and its Vietnamese counterpart headed by Ho Chi Minh.

Despite its successes, the OSS attracted fierce criticism from the American military, particularly General Douglas MacArthur, commander of U.S. forces in the southwest Pacific; military espionage operatives; and other rival intelligence agencies, such as the Federal Bureau of Investigation. Donovan's forthright style did little to allay such tensions. The OSS recruited its operatives disproportionately from the American social elite to which Donovan belonged, winning it the nickname "Oh So Social" and enabling detractors to denigrate its accomplishments. Immediately after the war ended, in September 1945 President Harry S. Truman disbanded the OSS, ignoring Donovan's forceful pleas to establish a centralized U.S. intelligence agency. Within a few months, however, rising Cold War tensions led Truman to reverse this decision. The OSS was the de facto precursor of the Central Intelligence Agency, established by presidential executive order in 1946 and, more formally, by act of Congress in 1947. Many CIA operatives, including several influential directors—among them Allen W. Dulles, Richard Helms, and William Colby—began their intelligence careers as OSS agents. The CIA's subsequent heavy reliance on covert operations was another legacy that can be traced directly to its World War II OSS heritage.

Oikawa Koshiro (1883–1958)

Japanese navy admiral and minister of the navy. Born in Iwate Prefecture on 8 February 1883, Oikawa Koshiro graduated from the Naval Academy in 1903 and from the Torpedo School in 1910 as a torpedo specialist. He entered the Naval War College in 1913 as a lieutenant commander. During 1915–1922, he was aide-de-camp to Crown Prince Hirohito. Oikawa took command of the 5th Destroyer Squadron in 1922, and as a captain he commanded the cruisers *Kinu* and *Tama*. In 1924, Oikawa became the chief of the Operations Department of the Naval General Staff. After promotion to rear admiral in 1928, he was assigned to be chief of staff of the Kure Naval District. In 1932, he assumed command of the 1st Air Squadron.

Appointed superintendent of the Naval Academy in 1933, Oikawa took command of the Third Fleet in 1935. Continuing his rapid rise, he became director of the Air Command in 1936. Promoted to vice admiral in 1938, he assumed command of the China Fleet. In 1940, he had charge of the Yokosuka Naval District. In September 1940, Oikawa was appointed minister of the navy.

As naval minister, Oikawa was involved in making two fateful decisions: the conclusion of the Tripartite Pact with Germany and Italy in September 1940 and the declarations of war against the United States and the United Kingdom. Although many in the Imperial Navy, including Admiral Yamamoto Isoroku, opposed the Tripartite Pact, Oikawa was pressured to approve it. Although he privately told Prime Minister Konoe Fumimaro that he lacked confidence in the navy's ability to fight the United States, he later refused to speak as plainly to other cabinet members. Many have criticized his attitude, which stemmed from his desire to get along with everyone. Oikawa left his post in October 1941, easily giving way to General Tōjō Hideki's rejection of his choice of Admiral Toyoda Soemu, a well-known opponent of army policies, to be his successor.

Oikawa next became superintendent of the Naval War College and military adviser to the emperor. In November 1943, he headed the new Grand Escort Command Headquarters, composed of four escort carriers and a naval air group, to protect Japanese convoys against U.S. submarine attack. In August 1944, he resumed his position as chief of the Naval General Staff, although mounting Japanese defeats led to his withdrawal in April 1945. Oikawa died at Tokyo on 9 May 1958.

Okamura Yasuji (1884–1966)

Japanese army general. Born in Tokyo on 5 May 1884, Okamura Yasuji graduated from the Military Academy in 1904 and the Army War College in 1913. Okamura had three periods of service on the army General Staff: 1914–1917, 1923–1925, and 1928. Promoted to major in 1919, he was resident officer in Europe in 1921 and 1922 and then in Shanghai from 1925 to 1927. Promoted to colonel, he commanded a regiment. As vice chief of staff of the Guandong (Kwantung) Army, Okamura

helped plan the Japanese takeover of Manchuria in 1931 and 1932. Promoted to major general and appointed deputy commanding general of the Shanghai Expeditionary Army in February 1932, Okamura was sent to break the boycott of Japanese goods following the takeover of Manchuria.

Okamura was next military attaché to the puppet Japanese state of Manzhouguo (Manchukuo) in 1933 and 1934. He was then chief of the Intelligence Division of the army General Staff in 1935 and 1936. Promoted to lieutenant general in 1936, Okamura commanded the 2nd Division in Manchuria from 1936 to 1938. Okamura played an important role in the Sino-Japanese War as commander of Eleventh Army in China from 1938 to 1940. He was well informed regarding Chinese affairs, especially the Nationalist government of Jiang Jieshi (Chiang Kai-shek), and was reluctant to escalate the war.

Promoted to full general in 1941, Okamura headed the North China Area Army. In 1944, he became commander of the Japanese Expeditionary Army in China and launched Operation ICHI-GŌ, a major offensive in central and south-eastern China, from mid-April 1944 to February 1945.

Employing 410,000 troops, the Japanese made major territorial gains and realized their goals of eliminating U.S. air bases in China for the strategic bombing of Japan and opening land communications from north China to French Indochina. Okamura halted the advance because he feared the Soviet Union would enter the war against Japan.

Although Okamura and his 1 million Japanese soldiers in China had never been defeated by the Chinese, he surrendered unconditionally in Nanjing (Nanking) on 9 September 1945. After the war, Okamura was brought to trial by the Nationalist government of China. Okamura had developed close ties with members of the Nationalist government, so it came as no surprise when he was found innocent. He then worked with the Nationalist government from 1946 to 1948. The Chinese Communists tried to capture him, but Okamura escaped to Japan. In February 1950, Okamura arranged to send his former staff officers, known as the Pai Tuan (White Company) to Taiwan to assist the Nationalist government there.
